without calling in the help of Aristonymus, who was next to him, or of Eurylochus of Lusias, though both of them were friends of his, he went ahead by himself and got beyond everyone. When Callimachus saw that he was going past him he seized hold of him by his shield. Meantime Aristonymus of Methydris ran past them, and after him Eurylochus of Lusias. All of these men were keen rivals of each other in doing brave things, and so, struggling amongst themselves, they took the place. For, once they were inside, no more stones were thrown down from above.

Then it was certainly a terrible sight. The women threw their children down from the rocks and then threw themselves after them, and the men did the same. While this was going on Aeneas of Stymphalus, a captain, saw one of them, who was wearing a fine garment, running to throw himself down, and he caught hold of him in order to stop him; but the man dragged him with him and they both went hurtling down over the rocks and were killed. Consequently very few prisoners were taken, but there were great numbers of oxen and asses and sheep.

Then came a seven days' march of a hundred and fifty miles through the country of the Chalybes. These were the most warlike of all the tribes on their way, and they fought with the Greeks at close quarters. They had body-armour of linen, reaching down to the groin, and instead of skirts to their armour they wore thick twisted cords. They also wore greaves and helmets, and carried on their belts a knife of about the size of the Spartan dagger. With these knives they cut the throats of those whom they managed to overpower, and then would cut off their heads and carry them as they marched, singing and dancing whenever their enemies were likely to see them. They also carried a spear with one point, about twenty feet long. They used to stay inside their settlements, and then, when the Greeks had gone past, they would follow behind and were always ready for a fight. They had their houses in fortified positions, and had brought all their provisions inside the fortifications. Consequently the Greeks could take nothing from them, but lived on the supplies which they had seized from the Taochi.

The Greeks arrived next at the river Harpasus which was four hundred feet across. Then they marched through the territory of the Scytheni, a four days' march of sixty miles over level ground until they came to some villages, where they stayed for three days and renewed their stocks of provisions. Then a four days' march of sixty miles brought them to a large, prosperous and inhabited city, which was called Gymnias. The governor of the country sent the Greeks a guide from this city, with the idea that he should lead them through country which was at war with

his own people. When the guide arrived, he said that in five days he would lead them to a place from which they could see the sea; and he said he was ready to be put to death if he failed to do so. So he led the way, and, when they had crossed the border into his enemies' country, he urged them to burn and lay waste the land, thus making it clear that it was for this purpose that he had come to them, and not because of any goodwill to the Greeks.

They came to the mountain on the fifth day, the name of the mountain being Thekes. When the men in front reached the summit and caught sight of the sea there was great shouting. Xenophon and the rear-guard heard it and thought that there were some more enemies attacking in the front, since there were natives of the country they had ravaged following them up behind, and the rear-guard had killed some of them and made prisoners of others in an ambush, and captured about twenty raw ox-hide shields, with the hair on. However, when the shouting got louder and drew nearer, and those who were constantly going forward started running towards the men in front who kept on shouting, and the more there were of them the more shouting there was, it looked then as though this was something of considerable importance. So Xenophon mounted his horse and, taking Lycius and the cavalry with him, rode forward to give support, and, quite soon, they heard the soldiers shouting out "The sea! The sea!" and passing the word down the column. Then certainly they all began to run, the rear-guard and all, and drove on the baggage animals and the horses at full speed; and when they had all got to the top, the soldiers, with tears in their eyes, embraced each other and their generals and captains. In a moment, at somebody or other's suggestion, they collected stones and made a great pile of them. On top they put a lot of raw ox-hides and staves and the shields which they had captured. The guide himself cut the shields into pieces and urged the others to do so too. Afterwards the Greeks sent the guide back and gave him as presents from the common store a horse, and a silver cup and a Persian robe and ten darics. What he particularly wanted was the rings which the soldiers had and he got a number of these from them. He pointed out to them a village where they could camp, and showed them the road by which they had to go to the country of the Macrones. It was then evening and he went away, traveling by night.

THEY ARRIVE AT TRAPEZUS

Then the Greeks did a three days' march of thirty miles through the country of the Macrones. On the first day they came to the river which

forms the boundary between the territories of the Macrones and the Scytheni. On their right there was a defensive position which looked a very awkward one, and on the left there was another river, into which flowed the river that formed the boundary and which they had to cross. The banks of this river were covered with trees which, though not large, were growing thickly together. The Greeks cut the trees down when they came up to them, being anxious to get away from the place as quickly as they could. The Macrones, armed with shields and spears, and wearing hair tunics, were drawn up in battle order facing the crossing-place. They kept shouting to each other and hurling stones which fell harmlessly into the river as they failed to reach the other side.

At this point one of the peltasts came up to Xenophon. He said that he had been a slave in Athens and that he knew the language of these people. "Indeed," he went on, "I think that this is my own country. If there is no objection, I should like to speak to them."

"There is no objection at all," Xenophon said. "Speak to them and find out first of all who they are."

He asked them this, and they replied that they were Macrones.

"Now ask them," said Xenophon, "why they are drawn up to oppose us and why they want to be our enemies."

Their reply to this was: "Because it is you who are invading our country."

The generals then told the man to say, "We are not coming with any hostile intentions. We have been making war on the King, and now we are going back to Greece and want to get to the sea."

The Macrones asked whether the Greeks would give pledges that they meant what they said, and they replied that they would like both to give and to receive pledges. The Macrones then gave the Greeks a native spear, and the Greeks gave them a Greek one, as they said that these were the usual pledges. Both sides called on the gods to witness the agreement.

After exchanging pledges, the Macrones immediately helped the Greeks to cut down the trees and made a path for them in order to help them across. They mixed freely with the Greeks and provided them, as well as they could, with opportunities for buying food, and led them through their country for three days, until they brought them to the Colchian frontier. There were mountains here, which, though high, were not steep, and the Colchians were drawn up in battle order on the mountains. At first the Greeks formed up opposite them in line, with the intention of advancing on the mountain in that formation; but in the end the generals decided to meet and discuss what would be the best

method of making the attack. Xenophon then expressed the opinion that it would be better to break up their present formation and to advance in columns. "The line," he said, "will lose its cohesion directly, since we shall find some parts of the mountain easy going and other parts difficult. It will immediately make the men lose heart, if after being drawn up in line they see the line broken. Then, if we advance in a line many ranks deep, the enemy will have men on both our flanks, and can use them however they like. On the other hand, if we go forward in a line which is only a few ranks deep, there would be nothing surprising in our line being broken through, with masses of missiles and men all falling on us together. And if this takes place at any single point, the whole line will suffer for it. No, I propose that we should form up with the companies in column, spaced out so as to cover the ground in such a way that the companies on our extreme flanks are beyond the two wings of the enemy. By adopting this plan we shall outflank the enemy's line, and, as we are advancing in columns, our bravest men will be the first to engage the enemy, and each officer will lead his company by the easiest route. As for the gaps between the columns, it will not be easy for the enemy to infiltrate, when there are companies both on his right and left; and it will not be easy to break through a company that is advancing in column. If any company is in difficulties, the nearest one will give support; and if at any point any one company can reach the summit, you can be sure that not a man among the enemy will stand his ground any longer."

This plan was agreed upon, and they formed the companies into columns. Xenophon rode along from the right wing to the left and said to the soldiers: "My friends, these people whom you see are the last obstacle which stops us from being where we have so long struggled to be. We ought, if we could, to eat them up alive."

When everyone was in position and they had formed the companies, there were about eighty companies of hoplites, each company with roughly the strength of a hundred. They formed up the peltasts and the archers in three divisions, one beyond the left flank, one beyond the right, and one in the centre, each division being about six hundred strong. The order was then passed along for the soldiers to make their vows and to sing the paean. When this was done, they moved forward. Chirisophus and Xenophon, with the peltasts attached to them, were advancing outside the flanks of the enemy's line, and, when the enemy observed this, they ran to meet them, some to the right, some to the left, and lost cohesion, leaving a great gap in the centre of their line. The peltasts in the Arcadian division, commanded by Aeschines the Acarna-

nian, thinking that the enemy were running away, raised their battle-cry and advanced at the double. They were the first to get to the top of the mountain, and the Arcadian hoplites, commanded by Cleanor of Orchomenus, came after them. As soon as they charged, the enemy failed to stand their ground and ran away in a disorganized flight.

The Greeks ascended the mountain and camped in a number of villages which were well stocked with food. There was nothing remarkable about them, except that there were great numbers of beehives in these parts, and all the soldiers who ate the honey went off their heads and suffered from vomiting and diarrhoea and were unable to stand upright. Those who had only eaten a little behaved as though they were drunk, and those who had eaten a lot were like mad people. Some actually died. So there were numbers of them lying on the ground, as though after a defeat, and there was a general state of despondency. However, they were all alive on the next day, and came to themselves at about the same hour as they had eaten the honey the day before. On the third and fourth days they were able to get up, and felt just as if they had been taking medicine.

A two days' march of twenty-one miles from here brought them to the sea at Trapezus, an inhabited Greek city on the Euxine, a colony of Sinope in Colchian territory. They stayed here, camping in the Colchian villages, for about thirty days, and, using these villages as their base, they ravaged the Colchian country. The people of Trapezus provided the Greeks with facilities for buying food, and gave them presents of oxen and barley and wine. They also negotiated with them on behalf of the Colchians in the neighbourhood, particularly those who lived in the plain, and from them too there arrived presents of oxen.

Then the Greeks prepared to offer the sacrifice which they had vowed. Enough cattle had come in for them to be able to sacrifice to Zeus the Saviour and to Heracles, for safe guidance, and to make the offerings which they had vowed to the other gods. They also held athletic sports on the mountain where they were camping. They elected as organizer and president of the sports the Spartan Dracontius, who had been an exile from his home since boyhood because he had accidentally killed another boy with a dagger.

When the sacrifice was finished, they gave the hides to Dracontius and told him to lead the way to the place where he had set out the course. He then pointed to the ground where they were actually standing, and said: "This hill is an excellent place for running, wherever one likes."

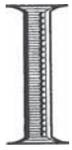

"But how," they asked, "will people be able to wrestle on ground that

is so hard and rough?" To which he replied: "All the worse for the man who gets thrown." Boys, mostly from among the prisoners, competed in the short-distance race, and more than sixty Cretans ran in the race over a long distance. There were also wrestling and boxing events, and all-in wrestling. It was a very fine performance, as there were many entrants for the events, and, with their comrades as spectators, the rivalry was keen. There was also a horse race in which they had to gallop down a steep bit of ground, turn round in the sea, and ride back to the altar. On the way down most of them had a thorough shaking, and on the way up, when the ground got very steep, the horses could scarcely get along at walking pace. So there was a lot of noise and laughter and people shouting out encouragements.

*The foregoing is Book IX
of Xenophon's ANABASIS or THE PERSIAN EXPEDITION
translated by Rex Warner.*

The Character of Socrates

from *Memorabilia*

I think that I have said enough to show that Socrates stated his own opinion plainly to those who consorted with him. I will now show that he also took pains to make them independent in doing the work that they were fitted for. For I never knew a man who was so careful to discover what each of his companions knew. Whatever it befits a gentleman to know he taught most zealously, so far as his own knowledge extended; if he was not entirely familiar with a subject, he took them to those who knew. He also taught them how far a well-educated man should make himself familiar with any given subject.

For instance, he said that the study of geometry should be pursued until the student was competent to measure a parcel of land accurately in case he wanted to take over, convey or divide it, or to compute the yield; and this knowledge was so easy to acquire, that anyone who gave his mind to mensuration knew the size of the piece and carried away a knowledge of the principles of land measurement. He was against carrying the study of geometry so far as to include the more complicated figures, on the ground that he could not see the use of them. Not that he was himself unfamiliar with them, but he said that they were enough to occupy a lifetime, to the complete exclusion of many other useful studies.

Similarly he recommended them to make themselves familiar with astronomy, but only so far as to be able to find the time of night, month and year, in order to use reliable evidence when planning a journey by land or sea, or setting the watch, and in all other affairs that are done in the night or month or year, by distinguishing the times and seasons aforesaid. This knowledge, again, was easily to be had from night hunters and pilots and others who made it their business to know such things. But he strongly deprecated studying astronomy so far as to include the knowledge of bodies revolving in different courses, and of planets and

comets, and wearing oneself out with the calculation of their distance from the earth, their periods of revolution and the causes of these. Of such researches, again he said that he could not see what useful purpose they served. He had indeed attended lectures on these subjects too; but these again, he said, were enough to occupy a lifetime to the complete exclusion of many useful studies.

In general, with regard to the phenomena of the heavens, he deprecated curiosity to learn how the deity contrives them: he held that their secrets could not be discovered by man, and believed that any attempt to search out what the gods had not chosen to reveal must be displeasing to them. He said that he who meddles with these matters runs the risk of losing his sanity as completely as Anaxagoras, who took an insane pride in his explanation of the divine machinery.

For that sage, in declaring the sun to be fire, ignored the facts that men can look at fire without inconvenience, but cannot gaze steadily at the sun; that their skin is blackened by the sun's rays, but not by fire. Further, he ignored the fact that sunlight is essential to the health of all vegetation, whereas if anything is heated by fire it withers. Again, when he pronounced the sun to be a red-hot stone, he ignored the fact that a stone in fire neither glows nor can resist it long, whereas the sun shines with unequalled brilliance forever.

He also recommended the study of arithmetic. But in this case as in the others he recommended avoidance of vain application; and invariably, whether theories or ascertained facts formed the subject of his conversation, he limited it to what was useful.

He also strongly urged his companions to take care of their health. "You should find out all you can," he said, "from those who know. Everyone should watch himself throughout his life, and notice what sort of meat and drink and what form of exercise suit his constitution, and how he should regulate them in order to enjoy good health. For by such attention to yourselves you can discover better than any doctor what suits your constitution."

When anyone was in need of help that human wisdom was unable to give he advised him to resort to divination; for he who knew the means whereby the gods give guidance to men concerning their affairs never lacked divine counsel.

As for his claim that he was forewarned by "the deity" what he ought to do and what not to do, some may think that it must have been a delusion because he was condemned to death. But they should remember two facts. First, he had already reached such an age that, had he not

died then, death must have come to him soon after. Secondly, he escaped the most irksome stage of life and the inevitable diminution of mental powers, and instead won glory by the moral strength revealed in the wonderful honesty and frankness and probity of his defence, and in the equanimity and manliness with which he bore the sentence of death.

In fact it is admitted that there is no record of death more nobly borne. For he was forced to live for thirty days after the verdict was given, because it was the month of the Delia, and the law did not allow any public execution to take place until the sacred embassy had returned from Delos. During this interval, as all his intimate acquaintances could see, he continued to live exactly as before; and, in truth, before that time he had been admired above all men for his cheerfulness and serenity. How, then, could man die more nobly? Or what death could be nobler than the death most nobly faced? What death more blessed than the noblest? Or what dearer to the gods than the most blessed?

I will repeat what Hermogenes, son of Hipponicus, told me about him. "When Meletus had actually formulated his indictment," he said, "Socrates talked freely in my presence, but made no reference to the case. I told him that he ought to be thinking about his defence. His first remark was, 'Don't you think that I have been preparing for it all my life?' And when I asked him how, he said that he had been constantly occupied in the consideration of right and wrong, and in doing what was right and avoiding what was wrong, which he regarded as the best preparation for a defence. Then I said, 'Don't you see, Socrates, that the juries in our courts are apt to be misled by argument, so that they often put the innocent to death, and acquit the guilty?' 'Ah, yes, Hermogenes,' he answered, 'but when I did try to think out my defence to the jury, the deity at once resisted.' 'Strange words,' said I; and he, 'Do you think it strange if it seems better to God that I should die now? Don't you see that to this day I never would acknowledge that any man had lived a better or a pleasanter life than I? For they live best, I think, who strive best to become as good as possible: and the pleasantest life is theirs who are conscious that they are growing in goodness. And to this day that has been my experience; and mixing with others and closely comparing myself with them, I have held without ceasing to this opinion of myself. And not I only, but my friends cease not to feel thus towards me, not because of their love for me (for why does not love make others feel thus towards their friends?), but because they think that they too would rise highest in goodness by being with me. But if I am to live on, haply I may be forced to pay the old man's forfeit—to become sand-blind and deaf and dull of

wit, slower to learn, quicker to forget, outstripped now by those who were behind me. Nay, but even were I unconscious of the change, life would be a burden to me; and if I knew, misery and bitterness would surely be my lot.

“ ‘But now, if I am to die unjustly, they who unjustly kill me will bear the shame of it. For if to do injustice is shameful, whatever is unjustly done must surely bring shame. But to me what shame is it that others fail to decide and act justly concerning me? I see that posterity judges differently of the dead according as they did or suffered injustice. I know that men will remember me too, and, if I die now, not as they will remember those who took my life. For I know that they will ever testify of me that I wronged no man at any time, nor corrupted any man, but strove ever to make my companions better.’ ”

This was the tenor of his conversation with Hermogenes and with the others. All who knew what manner of man Socrates was and who seek after virtue continue to this day to miss him beyond all others, as the chief of helpers in the quest of virtue. For myself, I have described him as he was: so religious that he did nothing without counsel from the gods; so just that he did no injury, however small, to any man, but conferred the greatest benefits on all who dealt with him; so self-controlled that he never chose the pleasanter rather than the better course; so wise that he was unerring in his judgment of the better and the worse, and needed no counsellor, but relied on himself for his knowledge of them; masterly in expounding and defining such things; no less masterly in putting others to the test, and convincing them of error and exhorting them to follow virtue and gentleness. To me then he seemed to be all that a truly good and happy man must be. But if there is any doubter, let him set the character of other men beside these things; then let him judge.

*The foregoing consists of Chapters VII–VIII
taken from Book IV
of Xenophon’s MEMORABILIA.*

William H. Prescott

1796–1859

William Hickling Prescott was born of a well-to-do New England family in Salem, Massachusetts, on May 4, 1796. His grandfather, Colonel William Prescott, had commanded the Colonial troops in the Battle of Bunker Hill. His father was a well-known lawyer.

While Prescott was at Harvard College, he was the victim of an accident that affected his entire later life. At the Commons dining hall, a fellow student threw a crust of bread across the table. It struck Prescott and blinded him in one eye. In spite of this he managed to complete his college education and was graduated with honors in 1814. He attempted after that to enter his father's law office, but doctors both at home and abroad felt that he must preserve the dimming vision in his remaining eye.

Prescott therefore withdrew from the law office and embarked on a literary career. He worked in a darkened study while assistants read aloud to him from source materials. He took notes with the help of a machine known as a noctograph, a frame with guide wires strung across it, which enabled him to write without running lines together. The assistant then read his notes back to him and Prescott committed them to memory. With the material firmly in his mind, he was able to shape and organize it during his everyday activities of walking or driving.

His first book, a *History of the Reign of Ferdinand and Isabella*, established his fame as a historian. With this background in Spanish history, Prescott turned next to *The Conquest of Mexico*. This was followed by the *History of the Conquest of Peru*, both books being translated into many languages. Prescott was working on an ambitious history of Philip II of Spain when he suffered a stroke in

1858. He continued working until January 28, 1859, when he died of another stroke.

Because of his infirmity, Prescott developed a memory for details as remarkable as Macaulay's. In this vivid chapter from *The Conquest of Mexico*, one can almost believe that Prescott was there when the Spanish soldiers under Hernando Cortés descended the mountains into the Valley of Mexico. The scene they beheld was so beautiful that Prescott writes: "In the warm glow of their feelings, they cried out 'It is the promised land!'" It was the island city of Tenochtitlán, or Mexico City, set in the midst of glimmering lakes. So explicit is Prescott's description that it is hard to realize that it was never seen by Prescott. Within a generation after Cortés conquered Mexico, this city was wrecked, its gardens destroyed, and the retreating waters had left desolate swamps behind. Prescott's account is based entirely on eyewitness records of the conquest, but it is as glowing as if he had been there himself.

The beauty, art, and wealth of the great Inca capital, which make the conquistadors themselves uneasily aware that they face more than ignorant savages, were to be ruthlessly destroyed or shipped to Spain. The tragic loss is felt throughout Prescott's book. In an early chapter he says: "The difficulty that meets us in the outset is, to find a justification of the right of conquest at all." On the other hand, he concedes that the Spaniards' zeal to convert the heathen Indians may have been as strong a motive as their personal greed and ambition.

Prescott shows us that the Aztec Empire was in its death throes. Montezuma, the product of generations of Aztec warrior kings, awaits Cortés in a paralysis of fear. Knowing the Spaniard can be merciless, he is yet incapable of a resolute defense. The Emperor prays now for his aged and feeble citizens and wonders how to protect them. He is lord of a domain which stretches from the

Notes from the artist: "Prescott is shown wearing an Aztec ceremonial bird costume. The surrounding illustrations depict Indian interpretations of Cortés' battles with the Aztecs."

prescott

Atlantic to the Pacific. Outlying cities pay unwilling tribute to his capital; young men and women are sent as human sacrifices to his gods. It is fatal for an empire to overextend itself, Gibbon said. Is this what the Aztecs have done? The cities which were conquered by Montezuma's ancestors are restless under his tyranny. But the gods Montezuma worships demand greater and greater sacrifices, which means more and more conquest.

Like the Romans, too, Montezuma and his noblemen have been softened by their own luxurious civilization. Only one prince wants to fight the Spaniards; the others want to treat with them, to bribe them to go away. Perhaps the Aztec Empire is declining, perhaps the warrior princes have lost faith in their own religion. They may have viewed Cortés and his men as another species of god. Certainly the horses and guns, which had never been seen before, evoked awe and consternation.

Somehow a handful of Spaniards had been able to overthrow a rich and numerous nation, and to bring an end to a whole civilization. The Spaniards were favored by a more advanced military art. They also knew exactly what they wanted, and were single and united in their purpose under Cortés, whereas the Indians were sadly divided. Was this perhaps the decisive factor? Could the Spaniards have succeeded against a united country? We can also ask ourselves whether the British could have conquered India without substantial aid from the Indians themselves? As we read history, we naturally form hypotheses. What is yours?

The Land of Montezuma

from *The Conquest of Mexico*

E

1519

verything being now restored to quiet in Cholula, the allied army of Spaniards and Tlascalans set forward in high spirits, and resumed the march on Mexico. The road lay through the beautiful savannas and luxuriant plantations that spread out for several leagues in every direction. On the march, they were met occasionally by embassies from the neighboring places, anxious to claim the protection of the white men, and to propitiate them by gifts, especially of gold, for which their appetite was generally known throughout the country.

Some of these places were allies of the Tlascalans, and all showed much discontent with the oppressive rule of Montezuma. The natives cautioned the Spaniards against putting themselves in his power by entering his capital; and they stated, as evidence of his hostile disposition, that he had caused the direct road to it to be blocked up, that the strangers might be compelled to choose another, which, from its narrow passes and strong positions, would enable him to take them at great disadvantage.

The information was not lost on Cortés, who kept a strict eye on the movements of the Mexican envoys, and redoubled his own precautions against surprise. Cheerful and active, he was ever where his presence was needed, sometimes in the van, at others in the rear, encouraging the weak, stimulating the sluggish, and striving to kindle in the breasts of others the same courageous spirit which glowed in his own. At night he never omitted to go the rounds, to see that every man was at his post. On one occasion, his vigilance had well-nigh proved fatal to him. He approached so near a sentinel that the man, unable to distinguish his person in the dark, leveled his crossbow at him, when fortunately an exclamation of the general, who gave the watchword of the night, arrested a movement which might else have brought the campaign to a close, and given a respite for some time longer to the empire of Montezuma.

The army came at length to the place mentioned by the friendly Indians, where the road forked, and one arm of it was found, as they had foretold, obstructed with large trunks of trees, and huge stones which had been strewn across it. Cortés inquired the meaning of this from the Mexican ambassadors. They said it was done by the emperor's orders, to prevent their taking a route which, after some distance, they would find nearly impracticable for the cavalry. They acknowledged, however, that it was the most direct road; and Cortés declaring that this was enough to decide him in favor of it, as the Spaniards made no account of obstacles, commanded the rubbish to be cleared away. Some of the timber might still be seen by the roadside, as Bernal Díaz tells us, many years after. The event left little doubt in the general's mind of the meditated treachery of the Mexicans. But he was too polite to betray his suspicions.

They were now leaving the pleasant champaign country, as the road wound up the bold sierra which separates the great plateaus of Mexico and Puebla. The air, as they ascended, became keen and piercing; and the blasts, sweeping down the frozen sides of the mountains, made the soldiers shiver in their thick harness of cotton, and benumbed the limbs of both men and horses.

They were passing between two of the highest mountains on the North American continent; Popocatépetl, "the hill that smokes," and Iztaccihuatl [Ixtacihuatl], or "white woman," a name suggested, doubtless, by the bright robe of snow spread over its broad and broken surface. A puerile supersition of the Indians regarded these celebrated mountains as gods, and Iztaccihuatl as the wife of her more formidable neighbor. A tradition of a higher character described the northern volcano as the abode of the departed spirits of wicked rulers, whose fiery agonies, in their prison house, caused the fearful bellowings and convulsions in times of eruption. It was the classic fable of antiquity. These superstitious legends had invested the mountain with a mysterious horror that made the natives shrink from attempting its ascent, which, indeed, was from natural causes a work of incredible difficulty.

The great *volcan*, as Popocatépetl was called, rose to the enormous height of 17,852 feet above the level of the sea; more than 2,000 feet above the "monarch of mountains"—the highest elevation in Europe.¹

1. By "the highest elevation in Europe" Prescott means Mont Blanc, in the French Alps. It is 15,771 feet high. Modern geographers, however, include the Caucasus among European mountains. Thus Mt. Elbrus, at 18,481 feet, is now said to be the highest point in Europe.

The height of Popocatépetl has been established as 17,887 feet. The highest point in Mexico is Citlaltepétl, at 18,701 feet [Ed.].

During the present century, it has rarely given evidence of its volcanic origin, and "the hill that smokes" has almost forfeited its claim to the appellation. But at the time of the Conquest it was frequently in a state of activity, and raged with uncommon fury while the Spaniards were at Tlascalca; an evil omen, it was thought, for the natives of Anahuac. Its head, gathered into a regular cone by the deposit of successive eruptions, wore the usual form of volcanic mountains, when not disturbed by the falling in of the crater. Soaring towards the skies, with its silver sheet of everlasting snow, it was seen far and wide over the broad plains of Mexico and Puebla, the first object which the morning sun greeted in his rising, the last where his evening rays were seen to linger, shedding a glorious effulgence over its head, that contrasted strikingly with the ruinous waste of sand and lava immediately below, and the deep fringe of funereal pines that shrouded its base.

The mysterious terrors which hung over the spot, and the wild love of adventure, made some of the Spanish cavaliers desirous to attempt the ascent, which the natives declared no man could accomplish and live. Cortés encouraged them in the enterprise, willing to show the Indians that no achievement was above the dauntless daring of his followers. One of his captains, accordingly, Diego Ordaz, with nine Spaniards, and several Tlascalans, encouraged by their example, undertook the ascent. It was attended with more difficulty than had been anticipated.

The lower region was clothed with a dense forest, so thickly matted that in some places it was scarcely possible to penetrate it. It grew thinner, however, as they advanced, dwindling, by degrees, into a straggling, stunted vegetation, till, at the height of somewhat more than thirteen thousand feet, it faded away altogether. The Indians who had held on thus far, intimidated by the strange subterraneous sounds of the volcano, even then in a state of combustion, now left them. The track opened on a black surface of glazed volcanic sand and of lava, the broken fragments of which, arrested in its boiling progress in a thousand fantastic forms, opposed continual impediments to their advance. Amidst these, one huge rock, the *Pico del Fraile*, a conspicuous object from below, rose to the perpendicular height of a hundred and fifty feet, compelling them to take a wide circuit. They soon came to the limits of perpetual snow, where new difficulties presented themselves, as the treacherous ice gave an imperfect footing, and a false step might precipitate them into the frozen chasms that yawned around. To increase their distress, respiration in these aerial regions became so difficult that every effort was attended with sharp pains in the head and limbs. Still they pressed on, till, drawing nearer the crater, such volumes of smoke, sparks and cinders were

belched forth from its burning entrails, and driven down the sides of the mountain, as nearly suffocated and blinded them. It was too much even for their hardy frames to endure, and, however reluctantly, they were compelled to abandon the attempt on the eve of its completion. They brought back some huge icicles—a curious sight in these tropical regions—as a trophy of their achievement, which, however imperfect, was sufficient to strike the minds of the natives with wonder by showing that with the Spaniards the most appalling and mysterious perils were only as pastimes. The undertaking was eminently characteristic of the bold spirit of the cavalier of that day, who, not content with the dangers that lay in his path, seems to court them from the mere Quixotic love of adventure. A report of the affair was transmitted to the emperor Charles V, and the family of Ordaz was allowed to commemorate the exploit by assuming a burning mountain on their escutcheon.

The general was not satisfied with the result. Two years after, he sent up another party, under Francisco Montaño, a cavalier of determined resolution. The object was to obtain sulphur to assist in making gunpowder for the army. The mountain was quiet at this time, and the expedition was attended with better success. The Spaniards, five in number, climbed to the very edge of the crater, which presented an irregular ellipse at its mouth, more than a league in circumference. Its depth might be from eight hundred to a thousand feet. A lurid flame burned gloomily at the bottom, sending up a sulphurous steam, which, cooling as it rose, was precipitated on the sides of the cavity. The party cast lots, and it fell on Montaño himself to descend in a basket into this hideous abyss, into which he was lowered by his companions to the depth of four hundred feet! This was repeated several times, till the adventurous cavalier had collected a sufficient quantity of sulphur for the wants of the army. This doughty enterprise excited general admiration at the time. Cortés concludes his report of it to the emperor with the judicious reflection that it would be less inconvenient, on the whole, to import their powder from Spain.

But it is time to return from our digression, which may, perhaps, be excused as illustrating, in a remarkable manner, the chimerical spirit of enterprise—not inferior to that in his own romances of chivalry—which glowed in the breast of the Spanish cavalier in the sixteenth century.

The army held on its march through the intricate gorges of the sierra. The route was nearly the same as that pursued at the present day by the courier from the capital to Puebla, by the way of Mecameca. It was not that usually taken by travelers from Veracruz, who follow the more cir-

cuitous road round the northern base of Iztaccihuatl as less fatiguing than the other, though inferior in picturesque scenery and romantic points of view. The icy winds that now swept down the sides of the mountains brought with them a tempest of arrowy sleet and snow, from which the Christians suffered even more than the Tlascalans, reared from infancy among the wild solitudes of their own native hills. As night came on, their sufferings would have been intolerable, but they luckily found a shelter in the commodious stone buildings which the Mexican government had placed at stated intervals along the roads for the accommodation of the traveler and their own couriers. It little dreamed it was providing a protection for its enemies.

The troops, refreshed by a night's rest, succeeded, early on the following day, in gaining the crest of the sierra of Aqualco, which stretches like a curtain between the two great mountains on the north and south. Their progress was now comparatively easy, and they marched forward with a buoyant step, as they felt they were treading the soil of Montezuma.

They had not advanced far, when, turning an angle of the sierra, they suddenly came on a view which more than compensated the toils of the preceding day. It was that of the Valley of Mexico, or Tenochtitlán, as more commonly called by the natives, which, with its picturesque assemblage of water, woodland, and cultivated plains, its shining cities and shadowy hills, was spread out like some gay and gorgeous panorama before them. In the highly rarefied atmosphere of these upper regions, even remote objects have a brilliancy of coloring and a distinctness of outline which seem to annihilate distance.² Stretching far away at their feet, were seen noble forests of oak, sycamore, and cedar, and beyond, yellow fields of maize and the towering maguey, intermingled with orchards and blooming gardens; for flowers, in such demand for their religious festivals, were even more abundant in this populous valley than in other parts of Anahuac. In the center of the great basin were beheld the lakes, occupying then a much larger portion of its surface than at present, their borders thickly studded with towns and hamlets, and, in the midst—like some Indian empress with her corona of pearls—the fair city of Mexico, with her white towers and pyramidal temples, reposing, as it were, on the bosom of the waters—the far-famed “Venice of the Aztecs.” High over all rose the royal hill of Chapultepec, the residence of the Mexican monarchs, crowned with the same grove of gigantic cypresses which at this day fling their broad shadows over the land. In the distance beyond the

2. The lake of Tezcuco, on which the capital of Mexico stood, is nearly 7,500 feet above sea level. The modern Mexico City is at an altitude of 7,349 feet [Ed.].

blue waters of the lake, and nearly screened by intervening foliage, was seen a shining speck, the rival capital of Tezcucó, and, still further on, the dark belt of porphyry, girdling the valley around, like a rich setting which Nature had devised for the fairest of her jewels.

Such was the beautiful vision which broke on the eyes of the conquerors. And even now, when so sad a change has come over the scene; when the stately forests have been laid low, and the soil, unsheltered from the fierce radiance of a tropical sun, is in many places abandoned to sterility; when the waters have retired, leaving a broad and ghastly margin white with the incrustation of salts, while the cities and hamlets on their borders have moldered into ruins;—even now that desolation broods over the landscape; so indestructible are the lines of beauty which Nature has traced on its features that no traveler, however cold, can gaze on them with any other emotions than those of astonishment and rapture.

What, then, must have been the emotions of the Spaniards when, after working their toilsome way into the upper air, the cloudy tabernacle parted before their eyes, and they beheld these fair scenes in all their pristine magnificence and beauty! It was like the spectacle which greeted the eyes of Moses from the summit of Pisgah, and, in the warm glow of their feelings, they cried out, “It is the promised land!”

But these feelings of admiration were soon followed by others of a very different complexion as they saw in all this the evidences of a civilization and power far superior to anything they had yet encountered. The more timid, disheartened by the prospect, shrunk from a contest so unequal, and demanded, as they had done on some former occasions, to be led back again to Veracruz. Such was not the effect produced on the sanguine spirit of the general. His avarice was sharpened by the display of the dazzling spoil at his feet; and, if he felt a natural anxiety at the formidable odds, his confidence was renewed as he gazed on the lines of his veterans, whose weather-beaten visages and battered armor told of battles won and difficulties surmounted, while his bold barbarians, with appetites whetted by the view of their enemies’ country, seemed like eagles on the mountains, ready to pounce upon their prey. By argument, entreaty, and menace, he endeavored to restore the faltering courage of the soldiers, urging them not to think of retreat, now that they had reached the goal for which they had panted and the golden gates were opened to receive them. In these efforts, he was well seconded by the brave cavaliers, who held honor as dear to them as fortune, until the dullest spirits caught somewhat of the enthusiasm of their leaders, and the general had

the satisfaction to see his hesitating columns, with their usual buoyant step, once more on their march down the slopes of the sierra.

With every step of their progress, the woods became thinner; patches of cultivated land more frequent; and hamlets were seen in the green and sheltered nooks, the inhabitants of which, coming out to meet them, gave the troops a kind reception. Everywhere they heard complaints of Montezuma, especially of the unfeeling manner in which he carried off their young men to recruit his armies, and their maidens for his harem. These symptoms of discontent were noticed with satisfaction by Cortés, who saw that Montezuma's "mountain-throne," as it was called, was, indeed, seated on a volcano, with the elements of combustion so active within that it seemed as if any hour might witness an explosion. He encouraged the disaffected natives to rely on his protection, as he had come to redress their wrongs. He took advantage, moreover, of their favorable dispositions to scatter among them such gleams of spiritual light as time and the preaching of Father Olmedo could afford.

He advanced by easy stages, somewhat retarded by the crowd of curious inhabitants gathered on the highways to see the strangers, and halting at every spot of interest or importance. On the road, he was met by another embassy from the capital. It consisted of several Aztec lords, freighted, as usual, with a rich largess of gold, and robes of delicate furs and feathers. The message of the emperor was couched in the same deprecatory terms as before. He even condescended to bribe the return of the Spaniards, by promising, in that event, four loads³ of gold to the general, and one to each of the captains, with a yearly tribute to their sovereign. So effectually had the lofty and naturally courageous spirit of the barbarian monarch been subdued by the influence of superstition!

But the man, whom the hostile array of armies could not daunt, was not to be turned from his purpose by a woman's prayers. He received the embassy with his usual courtesy, declaring, as before, that he could not answer it to his own sovereign if he were now to return without visiting the emperor in his capital. It would be much easier to arrange matters by a personal interview than by distant negotiation. The Spaniards came in the spirit of peace. Montezuma would so find it, but, should their presence prove burdensome to him, it would be easy for them to relieve him of it.

The Aztec monarch, meanwhile, was a prey to the most dismal apprehensions. It was intended that the embassy above noticed should reach

3. A load was about 50 pounds, or 800 ounces of gold—worth, at the present rate of \$35.00 to an ounce, about \$28,000 [Ed.].

the Spaniards before they crossed the mountains. When he learned that this was accomplished, and that the dread strangers were on their march across the valley, the very threshold of his capital, the last spark of hope died away in his bosom. Like one who suddenly finds himself on the brink of some dark and yawning gulf, he was too much bewildered to be able to rally his thoughts, or even to comprehend his situation. He was the victim of an absolute destiny, against which no foresight or precautions could have availed. It was as if the strange beings, who had thus invaded his shores, had dropped from some distant planet, so different were they from all he had ever seen, in appearance and manners; so superior—though a mere handful, in numbers—to the banded nations of Anahuac in strength and science, and all the fearful accompaniments of war! They were now in the valley. The huge mountain screen, which nature had so kindly drawn around it, for its defense, had been overleaped. The golden visions of security and repose, in which he had so long indulged, the lordly sway descended from his ancestors, his broad imperial domain, were all to pass away. It seemed like some terrible dream—from which he was now, alas! to awake to a still more terrible reality.

In a paroxysm of despair, he shut himself up in his palace, refused food, and sought relief in prayer and in sacrifice. But the oracles were dumb. He then adopted the more sensible expedient of calling a council of his principal and oldest nobles. Here was the same division of opinion which had before prevailed. Cacama, the young king of Tezcuco, his nephew, counseled him to receive the Spaniards courteously, as ambassadors, so styled by themselves, of a foreign prince. Cuitlahua, Montezuma's more warlike brother, urged him to muster his forces on the instant, and drive back the invaders from his capital, or die in its defense. But the monarch found it difficult to rally his spirits for this final struggle. With downcast eye and dejected mien, he exclaimed, "Of what avail is resistance, when the gods have declared themselves against us! Yet I mourn most for the old and infirm, the women and children, too feeble to fight or to fly. For myself and the brave men around me, we must bare our breasts to the storm, and meet it as we may!" Such are the sorrowful and sympathetic tones in which the Aztec emperor is said to have uttered the bitterness of his grief. He would have acted a more glorious part had he put his capital in a posture of defense, and prepared, like the last of the Palaeologi, to bury himself under its ruins.

He straightway prepared to send a last embassy to the Spaniards, with his nephew, the lord of Tezcuco, at its head, to welcome them to Mexico.

The Christian army, meanwhile, had advanced as far as Amaquemecan, a well-built town of several thousand inhabitants. They were kindly received by the cacique, lodged in large, commodious, stone buildings, and at their departure presented, among other things, with gold to the amount of three thousand *castellanos*. Having halted there a couple of days, they descended among flourishing plantations of maize and of maguey, the latter of which might be called the Aztec vineyards, towards the lake of Chalco. Their first resting place was Ajotzinco, a town of considerable size, with a great part of it then standing on piles in the water. It was the first specimen which the Spaniards had seen of this maritime architecture. The canals which intersected the city, instead of streets, presented an animated scene, from the number of barks which glided up and down freighted with provisions and other articles for the inhabitants. The Spaniards were particularly struck with the style and commodious structure of the houses, built chiefly of stone, and with the general aspect of wealth and even elegance which prevailed there.

Though received with the greatest show of hospitality, Cortés found some occasion for distrust in the eagerness manifested by the people to see and approach the Spaniards. Not content with gazing at them in the roads, some even made their way stealthily into their quarters, and fifteen or twenty unhappy Indians were shot down by the sentinels as spies. Yet there appears, as well as we can judge, at this distance of time, to have been no real ground for such suspicion. The undisguised jealousy of the Court, and the cautions he had received from his allies, while they very properly put the general on his guard, seem to have given an unnatural acuteness, at least in the present instance, to his perceptions of danger.

Early on the following morning, as the army was preparing to leave the place, a courier came, requesting the general to postpone his departure till after the arrival of the king of Tezcuco, who was advancing to meet him. It was not long before he appeared, borne in a palanquin or litter, richly decorated with plates of gold and precious stones, having pillars curiously wrought, supporting a canopy of green plumes, a favorite color with the Aztec princes. He was accompanied by a numerous suite of nobles and inferior attendants. As he came into the presence of Cortés, the lord of Tezcuco descended from his palanquin, and the obsequious officers swept the ground before him as he advanced. He appeared to be a young man of about twenty-five years of age, with a comely presence, erect and stately in his deportment. He made the Mexican saluta-

tion usually addressed to persons of high rank, touching the earth with his right hand, and raising it to his head. Cortés embraced him as he rose, when the young prince informed him that he came as the representative of Montezuma to bid the Spaniards welcome to his capital. He then presented the general with three pearls of uncommon size and luster. Cortés, in return, threw over Cacama's neck a chain of cut glass, which, where glass was as rare as diamonds, might be admitted to have a value as real as the latter. After this interchange of courtesies, and the most friendly and respectful assurances on the part of Cortés, the Indian prince withdrew, leaving the Spaniards strongly impressed with the superiority of his state and bearing over anything they had hitherto seen in the country.

Resuming its march, the army kept along the southern borders of the lake of Chalco, overshadowed, at that time, by noble woods, and by orchards glowing with autumnal fruits, of unknown names, but rich and tempting hues. More frequently it passed through cultivated fields waving with the yellow harvest, and irrigated by canals introduced from the neighboring lake, the whole showing a careful and economical husbandry, essential to the maintenance of a crowded population.

Leaving the mainland, the Spaniards came on the great dike or causeway which stretches some four or five miles in length, and divides Lake Chalco from Xochicalco on the west. It was a lance in breadth in the narrowest part, and in some places wide enough for eight horsemen to ride abreast. It was a solid structure of stone and lime, running directly through the lake, and struck the Spaniards as one of the most remarkable works which they had seen in the country.

As they passed along, they beheld the gay spectacle of multitudes of Indians darting up and down in their light pirogues, eager to catch a glimpse of the strangers, or bearing the products of the country to the neighboring cities. They were amazed, also, by the sight of the *chinampas*, or floating gardens—those wandering islands of verdure, to which we shall have occasion to return hereafter—teeming with flowers and vegetables, and moving like rafts over the waters. All round the margin, and occasionally far in the lake, they beheld little towns and villages, which, half-concealed by the foliage, and gathered in white clusters round the shore, looked in the distance like companies of wild swans riding quietly on the waves. A scene so new and wonderful filled their rude hearts with amazement. It seemed like enchantment; and they could find nothing to compare it with but the magical pictures in the *Amadis de Gaula*. Few

pictures, indeed, in that or any other legend of chivalry, could surpass the realities of their own experience. The life of the adventurer in the New World was romance put into action. What wonder, then, if the Spaniard of that day, feeding his imagination with dreams of enchantment at home, and with its realities abroad, should have displayed a Quixotic enthusiasm—a romantic exaltation of character, not to be comprehended by the colder spirits of other lands!

Midway across the lake the army halted at the town of Cuitlahuac, a place of moderate size, but distinguished by the beauty of the buildings,—the most beautiful, according to Cortés, that he had yet seen in the country. After taking some refreshment at this place, they continued their march along the dike. Though broader in this northern section, the troops found themselves much embarrassed by the throng of Indians, who, not content with gazing on them from the boats, climbed up the causeway, and lined the sides of the road. The general, afraid that his ranks might be disordered, and that too great familiarity might diminish a salutary awe in the natives, was obliged to resort not merely to command, but menace, to clear a passage. He now found, as he advanced, a considerable change in the feelings shown towards the government. He heard only of the pomp and magnificence, nothing of the oppressions, of Montezuma. Contrary to the usual fact, it seemed that the respect for the Court was greatest in its immediate neighborhood.

From the causeway, the army descended on that narrow point of land which divides the waters of the Chalco from the Tezcucan lake, but which in those days was overflowed for many a mile now laid bare. Traversing this peninsula, they entered the royal residence of Iztapalapan, a place containing twelve or fifteen thousand houses, according to Cortés. It was governed by Cuitlahua, the emperor's brother, who, to do greater honor to the general, had invited the lords of some neighboring cities, of the royal house of Mexico, like himself, to be present at the interview. This was conducted with much ceremony, and, after the usual present of gold and delicate stuffs, a collation was served to the Spaniards in one of the great halls of the palace. The excellence of the architecture here, also, excited the admiration of the general, who does not hesitate, in the glow of his enthusiasm, to pronounce some of the buildings equal to the best in Spain. They were of stone, and the spacious apartments had roofs of odorous cedarwood, while the walls were tapestried with fine cottons stained with brilliant colors.

But the pride of Iztapalapan, on which its lord had freely lavished his

care and his revenues, was its celebrated gardens. They covered an immense tract of land, were laid out in regular squares, and the paths intersecting them were bordered with trellises, supporting creepers and aromatic shrubs that loaded the air with their perfumes. The gardens were stocked with fruit trees imported from distant places, and with the gaudy family of flowers which belong to the Mexican flora, scientifically arranged, and growing luxuriant in the equable temperature of the tableland. The natural dryness of the atmosphere was counteracted by means of aqueducts and canals that carried water into all parts of the grounds.

In one quarter was an aviary, filled with numerous kinds of birds, remarkable in this region both for brilliancy of plumage and of song. The gardens were intersected by a canal communicating with the lake of Tezcuco, and of sufficient size for barges to enter from the latter. But the most elaborate piece of work was a huge reservoir of stone, filled to a considerable height with water well supplied with different sorts of fish. This basin was sixteen hundred paces in circumference, and was surrounded by a walk, made also of stone, wide enough for four persons to go abreast. The sides were curiously sculptured, and a flight of steps led to the water below, which fed the aqueducts above noticed, or, collected into fountains, diffused a perpetual moisture.

Such are the accounts transmitted of these celebrated gardens, at a period when similar horticultural establishments were unknown in Europe; and we might well doubt their existence in this semi-civilized land were it not a matter of such notoriety at the time, and so explicitly attested by the invaders. But a generation had scarcely passed after the Conquest before a sad change came over these scenes so beautiful. The town itself was deserted, and the shore of the lake was strewn with the wreck of buildings which once were its ornament and its glory. The gardens shared the fate of the city. The retreating waters withdrew the means of nourishment, converting the flourishing plains into a foul and unsightly morass, the haunt of loathsome reptiles; and the waterfowl built her nest in what had once been the palaces of princes!

In the city of Iztapalapan, Cortés took up his quarters for the night. We may imagine what a crowd of ideas must have pressed on the mind of the Conqueror, as, surrounded by these evidences of civilization, he prepared with his handful of followers to enter the capital of a monarch, who, as he had abundant reason to know, regarded him with distrust and aversion. This capital was now but a few miles distant, distinctly visible from Iztapalapan. And as its long lines of glittering edifices, struck by the

rays of the evening sun, trembled on the dark-blue waters of the lake, it looked like a thing of fairy creation, rather than the work of mortal hands. Into this city of enchantment Cortés prepared to make his entry on the following morning.

*The foregoing is Chapter VIII
from Prescott's
THE CONQUEST OF MEXICO.*

Haniel Long

1888–1956

The *Power Within Us* may be characterized as an adventure story, as history, as anthropology, as religion; and it will stand up under the scrutiny of all these disciplines. But its place as a classic is assured first of all by its beauty. It is a piece of prose that had to be written by a poet. It was.

Haniel Long was an American of our own day; he died in 1956, a respected critic, historian, and “minor” poet, unaware that in *The Power Within Us* he had produced a little book which should make, and continually magnify, his reputation. The son of a missionary, he was born in Rangoon, and brought up in Pittsburgh. After Exeter and Harvard, he did newspaper work and college teaching until 1929, when he moved with his family to Santa Fe, New Mexico.

There he remained, his heart committed to the American Southwest and to the Indians whose land it had been. Among them, and among their friends throughout the country, he was well known, both as a man of great feeling and also as a painstaking writer.

This masterpiece of feeling and writing is no longer than a long short story. As a story alone it is spellbinding in the heroic mold of *Robinson Crusoe*. A “civilized” man is shipwrecked and finds himself confronted with his naked condition, unarmed except by reason and faith. Lost to the sophisticated world in which he was reared, he encounters the true savage and, through this encounter, comes to know his own kind and himself.

Thus far, high adventure and wonderment. The Spaniard Nuñez Cabeza de Vaca crosses the United States—centuries before there was a United States—from Florida to the Pacific on foot. His eight-year odyssey (1528–36) ends in Spanish Mexico where, after having long since given up all idea of seeing country or countrymen again,

he is “rescued” by those gallants on horseback in whom he sees, to his horror, the man he once was. *The Power Within Us* is a report of his experience to his “Christian” master, the King of Spain.

But this is not fiction; it is truth. And Cabeza was no dreamy sailor boy of fiction equipped like an eagle scout with marvelous powers of improvisation and dexterity; he was a Spanish conquistador, a gentleman of that “irresistible” European culture bred to the mastery of armor and guns, of ships and horses, and of men. He was one of the officers of an imperial expedition of 578 glittering adventurers who believed that “on the pages of history we would share the glory of Cortés and his murderous band. . . .”

Wrecked on a coast they had intended to despoil, left to the mercy of natives they had thought to enslave, the 578 soon became 400, and then 40, and then four. There the story begins, the story of the human spirit stripped of all its fine disguises of power, pride, and pomp.

Through the whole tradition of the great books, beginning with the Greeks and the “barbarians,” the meaning of civilization is pondered and the meeting of civilized and uncivilized man recited. And as often as not the civilized man comes off second best, not merely in conquest but even in history’s long view of what is and is not civilized. Are the arts of civilization a net gain or a net loss? A loss, says Jean Jacques Rousseau, the French philosopher, who calls mankind back to the woods to enjoy the unadorned existence of the “noble savage.”

Cabeza de Vaca’s savages were not noble—nor were they ignoble. They were credulous, and their credulity awakened in the elegant Spaniard a nobility of soul which the life he had known had never aroused. Out of that surprised nobility—where else?—came power. In absolute helplessness, and in it alone, he found the strength to save others and thus himself, and to know himself, and to know what it is to be a man. *The Power Within Us*—a half hour or so of exciting reading—is a religious experience never to be forgotten.

The *Naufragios* (“Shipwrecks”) of Cabeza de Vaca was published in Spain in the middle of the 16th century and went through many forms before Haniel Long took hold of the historical materials and put them in their present version. To the actual documentation of the terrible expedition Mr. Long added, from his knowledge of the country, the people, and of man himself, the true triumph of the conquistador—a man’s conquest of himself in his search for the power to bear suffering.

The Power within Us

INTRODUCTORY NOTE

Along in late November, 1528, a handful of Spaniards, survivors of an ill-starred expedition to Florida, were washed ashore in the Gulf of Mexico, some think near the present site of Galveston. One of these men was Nuñez Cabeza de Vaca, thirty-eight years old, the lieutenant of the expedition, an adaptable man with some secret of growth in him. Despite the privations he had endured, this Nuñez led two other Spaniards and a Moor on a journey across the entire continent, barefoot and naked, which occupied them eight years.

After he reached Mexico City, Nuñez wrote a letter to his King, relating what had befallen him. It begins as the usual story of a European adventurer who leaves home to exploit people. But Nuñez little by little finds out that people are his brothers and sisters, and feels genuine concern for them. Stories require the right audience, and he seems afraid that His Majesty might not be interested in what he has to say, for it is the story of a disaster in Spanish colonial history and in the King's personal finances. In the world of the individual, nonetheless, it is a story of triumph, however lackadaisical the manner of its telling.

My account of Nuñez is not the account he sent the King, apart of course from the actual facts. But I believe it to be the account he wished to send the King. I preserve the core of his narrative, as translated by Fanny Bandelier, and I try to show what, quite plainly, was happening to the spirit of the man. That is, I allow him to speak as though unafraid of his King and his times. I wish him to address us four hundred years later, in this world of ours where human relation is still the difficult problem, and exploitation the cancer.

Nuñez found the limitless within the narrowly limited. He helped

when he had no means of helping, and gave when he had nothing to give. So, what is interesting is that at a certain point he ceases to be a historical personage and becomes a symbol. If he were alive today, he would be free to bring into the open the inwardness of his adventure. Thus he would greatly concern the present western world and our entire human world, for we are his proper audience.

In his emergency Nuñez slides out of theories and prejudices which unfit one to live on. Possibly the capacity to survive depends upon courage of spirit to accept one's fate. Possibly also, danger can be a real benefit to the physical man. Nuñez was remarkably flexible; he had what seems unlimited courage, unlimited strength. To him life itself was not different from hardship and danger, life was these things, and they are what make life good. His plight was hopeless, but he set in motion a train of thought and action which saved him. My attention wanders from the perfunctory narrative to the thing he refrains from confiding to the royal ear. That thing is a mystical feeling about the increase of life in a man from effort and from taking thought of his fellows. The weather-beaten explorer of the 16th century, lost in a thorny land among copper-colored savages and facing a blank future, discovered religion to be a reality of which he had never dreamed. His effort, his feeling for others, take novel paths; but underneath, quite apparently, lies an ageless and universal experience.

*Cabeza de Vaca's Relation
of His Journey from Florida to the Pacific
1528-1536*

Your Majesty, I am that Nuñez Cabeza de Vaca who lately sent you a Relation of his shipwrecks and mischances during the eight years he was absent from your dominions. In painful doubt whether my words were clear enough, I write again. My meanings being new to your Majesty and at a hasty glance unconcerned with your prestige, you might consider my narrative a poor occasion for exercising your serene power of understanding. The fault would then lie in me, not in what I have to say. Be my forgiving reader, your Majesty. Grant me your grace.

I was at the Battle of Ravenna in 1512. Between dawn and sunset that day perished a thousand score. Young as I was, Ravenna taught me something of how easy to tear asunder and destroy a man is, body and spirit. In the days that followed, in my desolation first confronted with slaughter, I saw a far-off light, heard a far-off strain of music. Such words serve as well as any: what can describe a happening in the shadows of the soul?

Again that far-off flicker of music came to me in the disorders at Seville in 1521, when I fought under the Duke of Medina-Sidonia.

Seven years passed without that flash of inward fire and I forgot about it. Seville was then a marvelous, disturbing world. I saw the heretics burning in the arms of the iron prophets. I saw Columbus as an old man, Magellan as a young man. The sailors came ashore with parrots and gold ingots and Indian girls.

Then I too sailed across the seas, Lord Treasurer of the expedition of Pámfilo Narvaez.

All that day when we were in sight of Tenerife I thought of my grandfather, the conqueror of the Grand Canary. In my childhood I was surrounded by the natives of that island, the Guanches, whom he brought home as slaves. I listened to their vague and melancholy singing, learned to be at ease with inarticulate people.

For the money to conquer the Grand Canary, perhaps your Majesty will remember, Pedro de Vera Mendoza had pawned to the Moor his two sons, my father and my uncle.

As I told your Majesty in my account of that journey, never had expedition more calamities than ours. Some of our ships foundered from hurricanes in the harbors of Cuba. The others we left behind deliberately in the lagoons of Florida.

Our greatest misfortune, aside from our greed and ignorance, lay in our commander, Pámfilo Narvaez himself. Pámfilo believed himself born under a lucky star, though nothing justified such a belief. Before Hernán Cortés he could have marched to Tenochtitlan. But he did not. When Cortés and his soldiers were richly quartered in the palaces of Montezuma, he could have replaced him in command. For that purpose was he dispatched from Havana by Velásquez. But Cortés came flying on horseback all the way to Veracruz, and talked Pámfilo's soldiers away from under his very nose. Pámfilo was not without a magnetism. But he was cocksure, a braggart, and what was worse, uncertain of the line between dream and reality. He forgot that Cortés burned his ships only after studying the jeweled emissaries of Montezuma, and becoming sure of the value of the quarry. Pámfilo had nothing to be sure of. And yet he pictured himself another Cortés, he pictured another Tenochtitlan concealed in the fronds of Florida. Having pictured these things he was as certain that they existed as of the vein in his neck.

Your Majesty is at liberty to picture *us* under this aging, adipose, credulous commander. Across that steaming land we marched with our armor glittering and our horses covered with gaudy trappings, 578 of us, towards utter ruin. Believing that on the page of history we would share the glory of Cortés and his murderous band . . .

Pámfilo would summon the copper-colored natives and tell them with gestures that he was searching for a city of the size and value of Tenochtitlan. The Indians had never heard of Tenochtitlan nor of Montezuma. But they had heard of a big town and pointed northward exclaiming, "Apaláchee!"

We marched and we marched, and had fevers and fevers. Yes, your Majesty is at liberty to picture us.

Apaláchee was no Tenochtitlan . . . We found it. It was in an immense swamp, a large impoverished settlement of thatched huts, a place of unbearable squalor.

There was nothing for it but seek the sea again and sail back to Cuba. Our arms and armor made us feel like dolts, and we wished we had pierced the jungle carrying carpenter's tools. For now, without ax, adz, or hammer, we had to build ourselves boats.

This is the tale of what men can and cannot do when they must do something or die. We built nine open boats. During the weeks it required, some of us went with scant food, and those whose palates allowed it devoured the horses.

Our 580 men had become 400 when at last we set sail and left behind us the Indian marksmen and the snakes, neither of which in Florida err when they strike.

Day after day tide and wind washed us out to sea and then washed us in to land, along a dazzling and uncertain coast. From thirst, and from the exposure to the frightful sun, our 400 became 40.

Who knows what was lost in these boats? Another Magellan, another Camões, another Cervantes, another St. John of the Cross. . .

No one has so sympathetic an imagination as your Majesty. You will understand what I am not telling you; that I saw men jump overboard, mad from thirst and sun. That I saw them swell and die slowly in delirium, heard their words and songs pour out the pitiful contents of their minds. That I saw men gnaw at corpses. And that these were Spanish gentlemen.

It is curious to have so graphic a lesson in what life may become. We had been a proud band, relying on our united strength, our armor, and our horses. Slowly our strength disunited, until nothing that we had in common remained to help any of us.

As I say, it is curious when one has nobody and nothing to rely upon outside of oneself.

Yet again that music, that fitful run and flash of brightness I first heard on the battlefield of Ravenna. Your Majesty is renowned as a patron of music; here was a music it is possible you may never have heard.

Somewhere on that coast a handful of us crawled ashore, and were fed and tended by kindly Indians till we regathered nervous vitality for the hopeless voyage to Cuba. We stripped and launched the boat, first putting our clothes aboard her. But a great comber capsized the rotten heavy hulk, imprisoning and drowning three of us. The others emerged mother-naked on the beach, shivering in the November wind of that overcast afternoon.

The Indians came back and found us as naked as they were, and our barge gone, and in tears. They sat down beside us and cried, too. I cried

all the harder, to think people so miserable had pity for us. I have informed your Majesty of their tears and mine. These simple Indians were the first relenting of nature to us in months and months. That evening, for fear we might die on the way, the Indians made fires at intervals along the path to their village, warming us at each fire. That night and many nights after we slept beside them on the oyster shells which floor their huts, wrapped in hides against the cold winds from the sea.

While we were subjects of your Majesty, we had everything life offers, and now we had nothing. To understand what it means to have nothing one must have nothing. No clothing against the weather might appear the worst. But for us poor skeletons who survived it, it was not.

The worst lay in parting little by little with the thoughts that clothe the soul of a European, and most of all of the idea that a man attains strength through dirk and dagger, and serving in your Majesty's guard. We had to surrender such fantasies till our inward nakedness was the nakedness of an unborn babe, starting life anew in a womb of sensations which in themselves can mysteriously nourish. Several years went by before I could relax in that living plexus for which even now I have no name; but only when at last I relaxed, could I see the possibilities of a life in which to be deprived of Europe was not to be deprived of too much.

Tempests came, we could pull no more roots from the sea channels, the canebreak yielded no more fish. People died in the flimsy lodges. News came that five Spaniards further down the coast, men from another barge, had eaten one another up till but one remained. This deed startled the innocence of our Indians. They debated whether to kill us, to be rid of us. Instead, they made us their beasts of burden.

In April the Indians went down to the sea taking us with them; for a whole month we ate the blackberries of the sand dunes. The Indians danced incessantly. They asked us to cure their sick. When we said we did not know how to cure, they withheld our food from us. We began to watch the procedure of their medicine men. It seemed to us both irreligious and uninstructed. Besides, we found the notion of healing Indians somewhat repellent, as your Majesty will understand. But we had to heal them or die. So we prayed for strength. We prayed on bended knees and in an agony of hunger. Then over each ailing Indian we made the sign of the Cross, and recited the Ave Maria and a Pater Noster. To our amazement the ailing said they were well. And not only they but the whole tribe went without food so that we might have it. Yet so great was the lack of food for us all, it seemed impossible that life could last.

Truly, it was to our amazement that the ailing said they were well. Being Europeans, we thought we had given away to doctors and priests our ability to heal. But here it was, still in our possession, even if we had only Indians to exercise it upon. It was ours after all, we were more than we had thought we were.

I am putting my words together for whatever intelligence there may be in the world. There is no other reality among men than this intelligence; Sire, it is greatly to your glory that you can incarnate it.

To be more than I thought I was—a sensation utterly new to me . . .

Starvation, nakedness, slavery: sensations utterly new to me, also . . . The last of my fellow Spaniards on the island dies . . . Nothing to eat after the sea roots sprouted but the blackberries of the sand dunes. Nothing to protect me from the attack of the terrible frost, or the terrible sun. No one who knew my language . . . And it endured for months, for years maybe . . . Everyone I saw as starved as I was. The human body emaciated, the lean cheek, the burning eye—the ribs showing, each rib distinct—the taut skin, the weak loins, the shrunken haunch and pap. In the whole world there can be no poverty like the poverty of these people. I could not stand it. I ran away . . .

At this time, as I remember it, I began to think of Indians as fellow human beings. If I introduce this idea it is to prepare your Majesty for other ideas which came to me later, in consequence.

These were days when I reasserted the pictures of my childhood, as a child turns his kaleidoscope. I saw the Guanche slaves anew, and as though I were one of them. I saw my grandfather through the eyes of his slaves. I remembered, now without laughing, how he had tricked the Guanches into slavery. He pretended to enlist them to sail from the Grand Canary to conquer Tenerife, and when he had them below decks he battened down the hatches and set sail for Cádiz . . .

My grandfather's brutality earned him the public denunciation of Bishop Juan de Frías. This too I remembered.

In this wilderness I became a trader, and went to and fro on the coast and a little inland. I went inland with sea shells and cockles, and a certain shell used to cut beans, which the natives value. I came out with hides, and red ocher for the face and hair, flint for arrow points, and tassels of deer hide. I came to be well known among the tribes, and found out the lay of the land.

One day I heard someone calling me by name, "Alvar Nuñez, Alvar Nuñez!" It was Alonso del Castillo, one of the captains of the expedition. He said that Pámfilo's barge had drifted ashore among unfriendly Indians, and left of its occupants were only himself and Captain Andrés Dorantes, and Dorantes' blackamoor, Estevanico. We hid ourselves in a thicket and laid our plans.

That summer, when the coast tribes came together for the summer orgies, we four made good our escape westward.

Thus our 580 had become 400, our 400, forty, and our forty, four.

Certain natives came to Castillo. From ribs to cleft they were having spasms, and they begged him to cure them. He prayed, and required us anxiously to pray with him. When he had done praying he made the sign of the Cross over the Indians, and their spasms left off. We knelt down to give thanks for this new amazement.

Through this region there are no trails, and I lost my way. I found a burning tree to spend that very cold night beside. In the morning I loaded myself with dry wood, and took two burning sticks. Thus with fuel and fire, I went on for five days, seeing nobody, but having the sun with me by day and Mazzaroth and Arcturus by night. These five days I felt a numbness of those organs which keep one aware of the misery of existence. When curing sick Indians, I have struggled to shut out the thought of Andrés and Alonso (for we are self-conscious, knowing one another's sins); and in the effort of praying I have felt as though something in me had broken, to give me the power of healing. But alone in this wilderness no tissue of the body hindered the mysterious power.

Nothing of me, your Majesty, existed then outside of that music I first heard at Ravenna.

The sixth day I found my companions, who had concluded that a snake must have bitten me. I told them we ought not to be self-conscious with one another. That power we had felt flowing in us and through us could not, in the nature of things, be acutely conscious of us as individuals. It must come rather as wind comes to the trees of a forest, or as the ocean continues to murmur in the sea shell it has thrown ashore.

A gulf deeper than ocean yawns between the old world and the new; and what by now I was accustomed to would startle a burgher of Madrid or of Salamanca.

At Seville in my youth, as I have said, I saw the heretics burning in the arms of the iron prophets. This picture was with me often. Perhaps, like me, those heretics had had to pick up their notions of the Invisible as they went through life, and without the assistance of book or priest. What I myself was learning came from many blinding days in an open boat, while men died beside me crying for their mothers; and from living among these simple Indians, who insisted on our curing them of their ills. And so my notions of the Invisible may differ from what the books say. I mention it in passing, your Majesty.

When he assailed my grandfather openly in his cathedral, calling him coward and fiend, did Juan de Frías follow a lesson he had learned by rote? That good bishop had a heart and mind to which life itself could speak, and speak forcibly.

Indians came bringing five persons shriveled and paralyzed and very ill. Each of the five offered Castillo silently his bows and arrows. Castillo prayed, we with him; in the morning the five were cured . . .

Indians came from many places. But Castillo was always afraid his sins would interfere with his working miracles. The Indians turned to me. I told Castillo it was no moment for indulging the idea of being sinful, and then I followed the Indians to their ranch. The dying man was dead; Dorantes and I found him with eyes upturned, and no pulse. I removed the mat that covered him and prayed. At last the something in me like a membrane broke, and I was confident the old man would rise up again. As he did. During the night the natives came to tell us he had talked, eaten and walked about. They gave us many presents, and we left them the happiest people on earth, for they had given away their very best.

Your Majesty may by now have had enough of our cures and curing, exertions outside of Holy Church, and for the sole benefit of miserable Indians. Yet so profound is your courtesy, I know, that you will let me reveal all that is within my heart. We found ourselves so pressed that Dorantes and the Moor, who had little taste for it, had to become medicine men, too. Boys and girls, men and women, old men and women, human bodies deformed, starved, wasted by affliction (only rarely one sound and firm) . . . Their eyes followed us every moment. I do not forget those eyes . . . Your Majesty, since I addressed you first, you have become more mysterious to me and more majestic, and this increases my sense of freedom in speaking to you. To the understanding of such days and events this additional narrative becomes necessary, like a real figure

to walk beside a ghost. Those eyes . . . they thrust me out of myself, into a world where nothing, if done for another, seems impossible.

Months went by as in a dream. The nerve of vision no longer rendered plausible that European world of which we had been a part. That world grew fantastic, and fantastic our countrymen there. We ourselves were only too real. From lack of clothing we had big sores and deep skin fissures on our backs and shoulders, and it hurt us to carry the hides we slept in. And it hurt us to find firewood among the cactus. My thighs and arms bled so much I stood it only by remembering—and yet whom or what did I remember? Was it a Person—was it a quality of life—was it an emotion? Was it even a remembering, was it not perhaps a listening?

Often for a time it rained gently at dusk, soothing our thighs and arms. In one such dusk we encountered squinting women in an opening. They were afraid to run away from the three pale figures and the shadowy blackamoor, for they took us to be gods floating about in the mist and rain. They led us to a village of fifty huts. Here we cured, and cured . . .

Our journey westward was but a long series of encounters. Your Majesty, encounters have become my meditation. The moment one accosts a stranger or is accosted by him is above all in this life the moment of drama. The eyes of Indians who crossed my trail have searched me to the very depths to estimate my *power*. It is true the world over. It is true of a Spaniard meeting another on the road between Toledo and Salamanca. Whoever we meet watches us intently at the quick strange moment of meeting, to see whether we are disposed to be friendly.

Seeing our bodies, seeing my own, and Alonso's, and Andrés', and the black Moor's, sometimes I think how once I was different, and we all were. What would Doña Alonza Maldonado and her husband Dr. Castillo of Salamanca think if they could see their little boy Alonso today, striding here ahead of me, lashed by starvation, scorched and baked by the sun, his hair and beard unkempt, small about the flanks, his body shriveled like a mummy?

In youth the human body drew me and was the object of my secret and natural dreams. But body after body has taken away from me that sensual phosphorescence which my youth delighted in. Within me is no disturbing interplay now, but only the steady currents of adaptation and of sympathy.

Your Majesty's piercing mind glides pliantly through what is interstitial and hidden. But upon me it was dawning only slowly that I had it in my discretion to grant life and health to others . . . Imagine me then perturbed; you are aware of what my training had been as one of your Majesty's soldiers.

Dark clouds rise to the south. To the west a great rainbow spreads its double arc. Alonso strides sturdily towards it. After him comes the Arab Negro from Azamor, whose black limbs endure every privation and still shine with superfluous sweat. For this blackamoor am I specially grateful. His reflections on our suffering do not reduce him to apathy. No adverse heats and chills deprive his loins of their strength. He is a sight to see, carrying a copper rattle in his hand, and on his shoulder a green and orange parrot.

There was the afternoon we crossed a big river, more than waist deep, as wide as the Guadalquivir at Seville, and with a swift current. I speak of it again because I loved it.

There was the village where each Indian wished to be the first to touch us, and we were squeezed almost to death in the sweating crowd . . .

. . . the village so solicitous to be blessed that Alonso fainted of exhaustion . . .

. . . the village where a new custom began: the Indians who came with us took from the villagers all their bows, arrows, shoes and beads. From that time on, those who accompanied us took tribute of those to whom they brought us. It made us uneasy, but the victims reassured us. They said they were too glad to see us to feel the loss of their property—and besides, they could make good their losses at the next village, who were very rich Indians. . .

. . . the plain where first we saw mountains, very low, like white sheep lying down . . .

. . . the village where they were so pertinacious about touching us all over that in three hours we could not get through with them . . .

. . . the village where many had one eye clouded, and others were totally blind from the same cause: which amazed us . . .

To clarify the same occurrences, words can be arranged differently, as no one knows better than your Majesty. It was a drunkenness, this feeling

I began to have of power to render life and happiness to others. Yet I was concerned about it. The concern was the important thing—not the wondering about the nature of the power, how widespread it might be, how deep, whether Andrés or Alonso or Estevanico had it in equal measure with me. What occupied me was whether I myself knew how to use it, whether I could master it, whether indeed it was for me to master—perhaps being a self-directing power that came through me. But after one accustoms oneself to the idea, it is good to be able to give out health and joy whether one man have it, or whether we all have it. Had this thought occurred to your Majesty? Never before had it occurred to me.

I said to Andrés, “If we reach Spain I shall petition His Majesty to return me to this land, with a troop of soldiers. And I shall teach the world how to conquer by gentleness, not by slaughter.” “Why then a troop of soldiers?” asked Dorantes, smiling. “Soldiers look for Indian girls and gold.” “Perhaps I could teach them otherwise.” “They would kill you, or tie you to a tree and leave you. What a dunce you are, Alvar Nuñez!”

“And what will *you* do if we reach Spain again?” I asked Andrés. “It will be enough to reach Mexico,” he answered. “I may look about for a rich widow, and spend the rest of my life as a rancher.” “I could not care for such a life,” I said. “To each his adventure,” replied Andrés.

It occurred to me that Andrés might be afraid of the great power at this period within us. I inquired of him. “Yes, I am afraid—who would not be?” he answered, earnestly.

Another day, after he had been silent a long time, Andrés said to us: “If I could always heal these people and help them, I might be willing to stay among them. I don’t know. But our present relation to them is caused by our novelty, our transiency, and the surprise at our good works. That state of things would wear off. Besides, it is not miracles these people need. They need everything fate has stripped us of in bringing us among them naked and on equal terms. Yet not quite equal. We can remember childhood and youth in a land where people live in stone houses, till the same fields year after year, build barns to store the harvests in. The towns are related to one another and support the mutual good. Each nobleman and alcalde is an avenue leading to the king; and king, alcalde, thief, and villager all bow to the will of God through Holy Church.”

I take my time thinking these words over. They are true and yet I cannot assent to them. Then I answer Andrés: “When these Indians call upon

us to have mercy and heal them, is the power they feel in us derived from stone houses, barns and tilled fields—from alcalde or nobleman, or from Holy Church, for that matter? Let the truth be said, Andrés: All that we learned across the water we have had to throw away. Only what we learned as babes in our mothers' arms has stayed with us to help others." "And what did we learn in our mothers' arms, good dunce?" asked Andrés, putting his arm round my shoulder.

. . . a mountain seven leagues long, the stones of which were iron slags . . .

. . . a night when the moon was round, and in its light a multitude of dwellings beside an unexpected and charming river . . .

. . . a man who some years since had been shot through the left side of the back with an arrow. He told me the wound make him feel sick all the while. I observed that the head of the arrow lay in the cartilage. I prayed for an hour, and then grasped the very sharp thin stone which served me as a knife, and cut open the breast. Feeling for the arrow-head, I thrust my hand into the palpitating tissue of the body. Your Majesty, that we human beings should be made of limp wet meat appeared to me as strange as that we should be also air and spirit; and in that hour nausea and a quick curiosity mingled with my pity. . . .

This cure was a misfortune to us; it gained us fame in every direction. We soon had with us three or four thousand persons. It went past human endurance to breathe on and make the sign of the Cross over every morsel they ate. In these parts mountain deer, quail, birds, rabbits abounded, and what they killed the Indians set before us. They would not touch it and would have died of hunger had we not yielded the blessing they asked for. Besides, they asked our permission for various things they felt like doing, and it soon wore us out. Even doing good, it appears, can lead to ennui, even the sight of the happiness one causes can satiate. And yet your Majesty will rejoice that heaven vouchsafed us a weariness such as this, perhaps never before experienced by a European.

Tribe after tribe, language after language . . . nobody's memory could recall them all. Always they robbed one another, but those who lost and those who gained were equally content.

Estevanico, the good black, the good link between the aloofness of white men and the warm spermatic life of the Indians. Men, women and children joked and played with him. What matter what he did, he

was not wearied of it. What matter what he did, the mystery failed not to act through him to heal and restore.

. . . fifty leagues through a land of desert, with nothing to eat and little to drink. Through villages where the women dressed in white deerskin and people lived in real houses . . . people the best formed we had seen, the liveliest and most capable, and those who best understood us . . .

. . . moonlight in another adobe village, and we four alternately standing or lying down in the center of the plaza, and the Indians running to us from all the houses with gifts, touching us and running back to their houses for more gifts, running to us again and touching us—a living glistening cobweb of runners in the moon—keeping up for hours this naked flash to and fro from center to periphery, periphery to center.

Your Majesty, such were the scenes in which I found myself treating all human beings alike. I screw up my courage to confess it. Perhaps it is the secret thing which life has it in itself to become—a long, long march on the road, meeting people, thrown into relations with them, having to meet demands often terrible and without the aid of mysterious power impossible: demands of healing and understanding, and constantly the exorcism of fear.

With a reasonable man and a timorous man and a carnal man as my companions and even part of me. And who is any of us that without starvation he can go through the kingdoms of starvation?

And seventeen successive days of starvation.

And a sunset, on a plain between very high mountains, with a people who for four months of the year eat only powdered straw . . .

And more starvation . . .

And permanent houses once more, where maize is harvested, and where they gave us brightly decorated blankets. For a hundred leagues good houses and harvested crops, the women better treated than anywhere else. They wear shoes, and blouses open in front and tied with deer string. At sunrise these people lift their clasped hands to the horizon and pass them over their bodies. At sunset they repeat the gesture. As I watched them at these devotions, I recalled a youngster from Cádiz, one of those who died of thirst beside me in the open boat. That boy drank in the beauty of Florida, watched palm and headland along the coast even

in his final delirium. I was sorry he had not lived on to see these natives lavishing their golden figures in the gold of dawn.

At last we found a sign of our countrymen—what through months and years we had been praying for. On the neck of an Indian a little silver buckle from a sword belt, with a horseshoe nail sewed inside it. . . . We questioned him. He said that men with beards like ours had come from heaven to that river; that they had horses, lances, and swords, and had lanced two Indians.

The country grew more and more doleful. The natives had fled to the mountains, leaving their fields. The land was fertile and full of streams, but the people were wan. They told us our countrymen had burned all the villages, taking with them half the men and all the women and children . . .

Then a day when Indians said that on the night before they had watched the Christians from behind some trees. They saw them take along many persons in chains.

Our countrymen, these slave catchers, were startled when they saw us approaching. Yet almost with their first words they began to recite their troubles. For many days they had been unable to find Indians to capture. They did not know what to do, and were on the point of starvation. The idea of enslaving our Indians occurred to them in due course, and they were vexed at us for preventing it. They had their interpreter make a fine speech. He told our Indians that we were as a matter of fact Christians too, but had gone astray for a long while, and were people of no luck and little heart. But the Christians on horseback were real Christians, and the lords of the land to be obeyed and served. Our Indians considered this point of view. They answered that the real Christians apparently lied, that we could not possibly be Christians. For we appeared out of sunrise, they out of sunset; we cured the sick, while they killed even the healthy; we went naked and barefoot, while they wore clothes, and rode horseback and stuck people with lances; we asked for nothing and gave away all we were given, while they never gave anybody anything and had no other aim than to steal.

Your Majesty will remember my indignation in my first narrative that Christians should be so wicked, especially such as had the advantages of being your subjects. I did not at the time understand the true source of my indignation. I do now, and I will explain it. In facing these marauders

I was compelled to face the Spanish gentleman I myself had been eight years before. It was not easy to think of it. Andrés and Alonso agreed that it was not easy. What, your Majesty, is so melancholy as to confront one's former unthinking and unfeeling self?

It was many days before I could endure the touch of clothing, many a night before I could sleep in a bed.

Shoes were the worst. In the Spanish settlements I dared not go barefoot, for provincials are the most easily shocked of Spaniards. I had not valued enough the pressure of earth on my naked feet while permitted that refreshment.

At first I did not notice other ways in which our ancient civilization was affecting me. Yet soon I observed a certain reluctance in me to do good to others. I would say to myself, "Need I exert what is left of me, I who have undergone tortures in an open boat and every privation and humiliation among the Indians, when there are strong healthy men about me, fresh from Holy Church and from school, who know their Christian duty?" We Europeans all talk this way to ourselves. It has become second nature to us. Each nobleman and *alcalde* and villager is an avenue that leads us to this way of talking; we can admit it privately, your Majesty, can we not? If a man need a cloak, we do not give it to him if we have our wits about us; nor are we to be caught stretching out our finger in aid of a miserable woman. Someone else will do it, we say. Our communal life dries up our milk: we are barren as the fields of Castile. We regard our native land as a power which acts of itself, and relieves us each of exertion. While with them I thought only about doing the Indians good. But back among my fellow countrymen, I had to be on my guard not to do them positive harm. If one lives where all suffer and starve, one acts on one's own impulse to help. But where plenty abounds, we surrender our generosity, believing that our country replaces us each and several. This is not so, and indeed a delusion. On the contrary the power or maintaining life in others lives within each of us, and from each of us does it recede when unused. It is a concentrated power. If you are not acquainted with it, your Majesty can have no inkling of what it is like, what it portends, or the ways in which it slips from one. In the name of God, your Majesty,

FAREWELL.

Pliny the Younger

c. 61–c. 113

Pliny the Younger (Gaius Plinius Caecilius Secundus) was born in A.D. 61 or 62 in Novum Comum, now the Como region of Italy. He was a member of a distinguished Roman family. His mother was Plinia, sister of Pliny the Elder; the latter adopted the boy in his will, thus making him his heir. Pliny the Younger inherited all the possessions of his famous and affluent uncle, including his valuable library, and including also his name.

The young man was educated in rhetoric under the celebrated Quintilian and had also as his guardian L. Verginius Rufus, who three times declined to become emperor. Thus, when at eighteen Pliny began his career as an advocate, he did so under the most favorable auspices. He held various and important public offices. He was a tribune of the plebs, or representative of the people in the Senate, a commissioner of the military treasury; and in the year 100, he was appointed a consul by the emperor Trajan. Tacitus and possibly Plutarch were also honored in this way by Trajan.

In 111, Pliny was made Governor of Bithynia. There it is supposed that he remained until his death, which probably occurred in 113. His extant works consist of a panegyric on Trajan, delivered at the time of Pliny's elevation to the consulship, and ten volumes of published letters. The tenth of these comprises correspondence with Trajan on administrative matters in Bithynia. Several of the letters are of particular interest, for they contain some of the first descriptions of early Christian ritual and practice.

The younger Pliny was a friend of the historian Tacitus, and many of his published letters were addressed to him. There is no date on

the two letters to Tacitus that are reprinted below. The events which they relate occurred in A.D. 79, when Pliny was eighteen, but the letters were not published until nearly thirty years had passed. It is thus not known when they were written. Nevertheless, they sound as if they were written while Pliny's memory was fresh. It is possible that they were rewritten long after the event from first drafts or notes. In any event, Tacitus had asked Pliny to describe the circumstances of the death of his famous uncle, and the letters do so. The fact that this death occurred as a result of the eruption of Vesuvius gives us an eyewitness account of that famous and terrible disaster.

The first letter has a solemn tone, as if the author knew that it would be preserved for the record. The eruption of Vesuvius which destroyed Pompeii and Herculaneum appears in it only as the rather remote background that gives emphasis to the stoic nobility of the elder Pliny's death. The latter was an important public official as well as a celebrated writer, and his nephew treats him here accordingly.

In the second letter, however, Pliny the Younger's youthfulness emerges. Imitating his uncle's stoicism, he reads Livy under a shower of ashes; and, refusing to flee, strikes what appear to be self-consciously noble attitudes. Nevertheless, he frankly admits his fear. The Stoics and Epicureans held that the world would end in fire. The young Pliny confesses that he believed that the final day had come.

Both of Pliny's letters are self-conscious and a little self-complacent, too. He has been criticized for this; he never wrote with the freedom and naturalness of, for example, Cicero. He always seemed to have one eye on posterity; and, even in the second letter, his protests that his personal experiences are of no importance have a hollow ring. Nevertheless, the qualities emerge that have made Pliny readable throughout the ages, and that may have helped his letters to survive.

There are touches of vainglory that may make us laugh, but at the same time the letters are so modern that we can almost conceive of Pliny as a young college friend writing about a modern disaster. We have read of the last days of Pompeii in our history books, and some may have visited its excavated ruins. But nothing makes that historic tragedy more real than this clear and vivid account of it by a boy, still shaken by fright.

The Eruption of Vesuvius

from *Letters*

TO TACITUS

our request that I would send you an account of my uncle's death, in order to transmit a more exact relation of it to posterity, deserves my acknowledgments; for, if this accident shall be celebrated by your pen, the glory of it, I am well assured, will be rendered for ever illustrious. And notwithstanding he perished by a misfortune, which, as it involved at the same time a most beautiful country in ruins, and destroyed so many populous cities, seems to promise him an everlasting remembrance; notwithstanding he has himself composed many and lasting works; yet I am persuaded the mentioning of him in your immortal writings will greatly contribute to render his name immortal. Happy I esteem those to be to whom by provision of the gods has been granted the ability either to do such actions as are worthy of being related or to relate them in a manner worthy of being read; but peculiarly happy are they who are blessed with both these uncommon talents: in the number of which my uncle, as his own writings and your history will evidently prove, may justly be ranked. It is with extreme willingness, therefore, that I execute your commands; and should indeed have claimed the task if you had not enjoined it. He was at that time with the fleet under his command at Misenum.¹ On the 24th of August, about one in the afternoon, my mother desired him to observe a cloud which appeared of a very unusual size and shape. He had just taken a turn in the sun,² and,

1. In the Bay of Naples.

2. The Romans used to lie or walk naked in the sun after anointing their bodies with oil, which was esteemed as greatly contributing to health, and therefore daily practiced by them. This custom, however, of anointing themselves is inveighed against by the satirists as in the number of their luxurious indulgences; but since we find the elder Pliny here, and the amiable Spurinna in a former letter, practicing

after bathing himself in cold water, and making a light luncheon, gone back to his books: he immediately arose and went out upon a rising ground from whence he might get a better sight of this very uncommon appearance. A cloud, from which mountain was uncertain at this distance (but it was found afterwards to come from Mount Vesuvius), was ascending, the appearance of which I cannot give you a more exact description of than by likening it to that of a pine tree, for it shot up to a great height in the form of a very tall trunk, which spread itself out at the top into a sort of branches; occasioned, I imagine, either by a sudden gust of air that impelled it, the force of which decreased as it advanced upwards, or the cloud itself, being pressed back again by its own weight, expanded in the manner I have mentioned; it appeared sometimes bright and sometimes dark and spotted, according as it was either more or less impregnated with earth and cinders. This phenomenon seemed to a man of such learning and research as my uncle extraordinary and worth further looking into. He ordered a light vessel to be got ready, and gave me leave, if I liked, to accompany him. I said I had rather go on with my work; and it so happened he had himself given me something to write out. As he was coming out of the house, he received a note from Rectina, the wife of Bassus, who was in the utmost alarm at the imminent danger which threatened her, for her villa lying at the foot of Mount Vesuvius, there was no way of escape but by sea; she earnestly entreated him therefore to come to her assistance. He accordingly changed his first intention, and what he had begun from a philosophical, he now carries out in a noble and generous spirit. He ordered the galleys to be put to sea, and went himself on board with an intention of assisting not only Rectina, but the several other towns which lay thickly strewn along that beautiful coast. Hastening then to the place from whence others fled with the utmost terror, he steered his course direct to the point of danger, and with so much calmness and presence of mind as to be able to make and dictate his observations upon the motion and all the phenomena of that dreadful scene. He was now so close to the mountain that the cinders, which grew thicker and hotter the nearer he approached, fell into the ships, together with pumice stones and black pieces of burning rock; they were in danger too not only of being aground by the sudden retreat of the sea but also from the vast fragments which rolled down from the mountain and obstructed all the shore. Here he stopped to consider

this method, we cannot suppose the thing itself was esteemed unmanly, but only when it was attended with some particular circumstances of an overrefined delicacy [Translator].

whether he should turn back again; to which the pilot advising him, "Fortune," said he, "favours the brave; steer to where Pomponianus is." Pomponianus was then at Stabiae,³ separated by a bay, which the sea, after several insensible windings, forms with the shore. He had already sent his baggage on board; for though he was not at that time in actual danger, yet being within sight of it, and indeed extremely near, if it should in the least increase, he was determined to put to sea as soon as the wind, which was blowing dead inshore, should go down. It was favourable, however, for carrying my uncle to Pomponianus, whom he found in the greatest consternation; he embraced him tenderly, encouraging and urging him to keep up his spirits, and, the more effectually to soothe his fears by seeming unconcerned himself, ordered a bath to be got ready, and then, after having bathed, sat down to supper with great cheerfulness, or at least (what is just as heroic) with every appearance of it. Meanwhile broad flames shone out in several places from Mount Vesuvius, which the darkness of the night contributed to render still brighter and clearer. But my uncle, in order to soothe the apprehensions of his friend, assured him it was only the burning of the villages, which the country people had abandoned to the flames; after this he retired to rest, and it is most certain he was so little disquieted as to fall into a sound sleep, for his breathing, which, on account of his corpulence, was rather heavy and sonorous, was heard by the attendants outside. The court which led to his apartment being now almost filled with stones and ashes, if he had continued there any time longer, it would have been impossible for him to have made his way out. So he was awoke and got up, and went to Pomponianus and the rest of his company, who were feeling too anxious to think of going to bed. They consulted together whether it would be most prudent to trust to the houses, which now rocked from side to side with frequent and violent concussions as though shaken from their very foundations; or fly to the open fields, where the calcined stones and cinders, though light indeed, yet fell in large showers, and threatened destruction. In this choice of dangers they resolved for the fields: a resolution which, while the rest of the company were hurried into by their fears, my uncle embraced upon cool and deliberate consideration. They went out then, having pillows tied upon their heads with napkins; and this was their whole defence against the storm of stones that fell round them. It was now day everywhere else, but *there* a deeper darkness prevailed than in the thickest night, which, however,

3. Now called Castellammare, in the Bay of Naples [Translator].

was in some degree alleviated by torches and other lights of various kinds. They thought proper to go farther down upon the shore to see if they might safely put out to sea, but found the waves still running extremely high and boisterous. There my uncle, laying himself down upon a sail-cloth, which was spread for him, called twice for some cold water, which he drank, when immediately the flames, preceded by a strong whiff of sulphur, dispersed the rest of the party, and obliged him to rise. He raised himself up with the assistance of two of his servants, and instantly fell down dead; suffocated, as I conjecture, by some gross and noxious vapour, having always had a weak throat, which was often inflamed. As soon as it was light again, which was not till the third day after this melancholy accident, his body was found entire, and without any marks of violence upon it, in the dress in which he fell, and looking more like a man asleep than dead. During all this time my mother and I, who were at Misenum—but this has no connection with your history, and you did not desire any particulars besides those of my uncle's death; so I will end here, only adding that I have faithfully related to you what I was either an eye-witness of myself or received immediately after the accident happened, and before there was time to vary the truth. You will pick out of this narrative whatever is most important, for a letter is one thing, a history another; it is one thing writing to a friend, another thing writing to the public. Farewell.

TO CORNELIUS TACITUS

The letter which, in compliance with your request, I wrote to you concerning the death of my uncle has raised, it seems, your curiosity to know what terrors and dangers attended me while I continued at Misenum, for there, I think, my account broke off:

Though my shock'd soul recoils, my tongue shall tell.

My uncle having left us, I spent such time as was left on my studies (it was on their account indeed that I had stopped behind), till it was time for my bath. After which I went to supper, and then fell into a short and uneasy sleep. There had been noticed for many days before a trembling of the earth, which did not alarm us much, as this is quite an ordinary occurrence in Campania; but it was so particularly violent that night that it not only shook but actually overturned, as it would seem, everything about us. My mother rushed into my chamber, where she found me rising in order to awaken her. We sat down in the open court of the

house, which occupied a small space between the buildings and the sea. As I was at that time but eighteen years of age, I know not whether I should call my behaviour, in this dangerous juncture, courage or folly; but I took up Livy, and amused myself with turning over that author, and even making extracts from him, as if I had been perfectly at my leisure. Just then, a friend of my uncle's, who had lately come to him from Spain, joined us, and observing me sitting by my mother with a book in my hand, reproved her for her calmness, and me at the same time for my careless security: nevertheless I went on with my author. Though it was now morning, the light was still exceedingly faint and doubtful; the buildings all around us tottered, and though we stood upon open ground, yet as the place was narrow and confined, there was no remaining without imminent danger: we therefore resolved to quit the town. A panic-stricken crowd followed us, and (as to a mind distracted with terror every suggestion seems more prudent than its own) pressed on us in dense array to drive us forward as we came out. Being at a convenient distance from the houses, we stood still, in the midst of a most dangerous and dreadful scene. The chariots, which we had ordered to be drawn out, were so agitated backwards and forwards, though upon the most level ground, that we could not keep them steady, even by supporting them with large stones. The sea seemed to roll back upon itself, and to be driven from its banks by the convulsive motion of the earth; it is certain at least the shore was considerably enlarged, and several sea animals were left upon it. On the other side, a black and dreadful cloud, broken with rapid, zigzag flashes, revealed behind it variously shaped masses of flame: these last were like sheet-lightning, but much larger. Upon this our Spanish friend, whom I mentioned above, addressing himself to my mother and me with great energy and urgency: "If your brother," he said, "if your uncle be safe, he certainly wishes you may be so too; but if he perished, it was his desire, no doubt, that you might both survive him: why therefore do you delay your escape a moment?" We could never think of our own safety, we said, while we were uncertain of his. Upon this our friend left us, and withdrew from the danger with the utmost precipitation. Soon afterwards, the cloud began to descend, and cover the sea. It had already surrounded and concealed the island of Capreae and the promontory of Misenum. My mother now besought, urged, even commanded me to make my escape at any rate, which, as I was young, I might easily do; as for herself, she said, her age and corpulency rendered all attempts of that sort impossible; however, she would willingly meet death if she could have the satisfaction of seeing that she was not

the occasion of mine. But I absolutely refused to leave her, and, taking her by the hand, compelled her to go with me. She complied with great reluctance, and not without many reproaches to herself for retarding my flight. The ashes now began to fall upon us, though in no great quantity. I looked back; a dense, dark mist seemed to be following us, spreading itself over the country like a cloud. "Let us turn out of the highroad," I said, "while we can still see, for fear that, should we fall in the road, we should be pressed to death in the dark by the crowds that are following us." We had scarcely sat down when night came upon us, not such as we have when the sky is cloudy, or when there is no moon, but that of a room when it is shut up, and all the lights put out. You might hear the shrieks of women, the screams of children, and the shouts of men; some calling for their children, others for their parents, others for their husbands, and seeking to recognize each other by the voices that replied; one lamenting his own fate, another that of his family; some wishing to die, from the very fear of dying; some lifting their hands to the gods; but the greater part convinced that there were now no gods at all, and that the final endless night of which we have heard had come upon the world.⁴ Among these there were some who augmented the real terrors by others imaginary or wilfully invented. I remember some who declared that one part of Misenum had fallen, that another was on fire; it was false, but they found people to believe them. It now grew rather lighter, which we imagined to be rather the forerunner of an approaching burst of flames (as in truth it was) than the return of day; however, the fire fell at a distance from us: then again we were immersed in thick darkness, and a heavy shower of ashes rained upon us, which we were obliged every now and then to stand up to shake off, otherwise we should have been crushed and buried in the heap. I might boast that, during all this scene of horror, not a sigh, or expression of fear, escaped me: my support was grounded in that miserable, though mighty, consolation that all mankind were involved in the same calamity, and that I was perishing with the world itself. At last this dreadful darkness was dissipated by degrees, like a cloud or smoke; the real day returned, and even the sun shone out, though with a lurid light, as when an eclipse is coming on. Every object that presented itself to our eyes (which were extremely weakened) seemed changed, being covered deep with ashes as if with snow. We returned to Misenum, where we refreshed ourselves as well as we could, and passed

4. The Stoic and Epicurean philosophers held that the world was to be destroyed by fire, and all things fall again into original chaos; not excepting even the national gods themselves from the destruction of this general conflagration [Translator].

an anxious night between hope and fear; though, indeed, with a much larger share of the latter, for the earthquake still continued, while many frenzied persons ran up and down heightening their own and their friends' calamities by terrible predictions. However, my mother and I, notwithstanding the danger we had passed, and that which still threatened us, had no thoughts of leaving the place till we could receive some news of my uncle.

And now, you will read this narrative without any view of inserting it in your history, of which it is not in the least worthy; and, indeed, you must put it down to your own request if it should appear not worth even the trouble of a letter. Farewell.

*The foregoing consists of Letters LXV and LXVI
translated by William Melmoth.*

Cornelius Tacitus

c. 55–c. 120

Tacitus (his given name may have been Publius or Gaius) was probably of noble Roman blood. Much of what little we can find out about him is in his own works and the letters of his friend, the Younger Pliny. “I know that your *Histories* will be immortal,” said Pliny. They are.

Nine emperors, Nero among them, governed or misgoverned Rome in his lifetime. Three of these—Vespasian, Titus, Domitian—lifted Tacitus rank by rank in the public service. Fame touched him early, as an orator. He married the daughter of Julius Agricola. In A.D. 79 or 80, Agricola became the first general to put all Britain under Roman control. His name was loud in the city. Domitian feared him as a rival. Agricola died “in the prime of a vigorous manhood,” probably poisoned.

Tacitus composed a burning memorial to his father-in-law (see below). Much earlier, he had published the *Dialogue on Orators*. Four years away from Rome may have given him the source for his *Germania*. This brings us our fullest early news of the Germans, as *Agricola* does of the Britons.

Under the insane terror of Domitian’s last years, Tacitus was forced to look on at the imperial murder of friends and fellow officials. It marked his mind with blackness and shadowed his two major works. Of these, the *Histories* laid down events from A.D. 69 to 97; the *Annals* traced out the disorders of Rome from Tiberius to Nero’s end in 68. These were written under the new “liberal” emperors, Nerva and Trajan.

In A.D. 97 Tacitus became a consul or chief magistrate. With his friend Pliny he convicted Marius Priscus, a notorious African governor accused of crimes against his subjects. An inscription found in

the twentieth century names Tacitus as proconsul of Asia Minor about 112. After that we hear no more of him.

Suppose you were a member of the Supreme Soviet under Joseph Stalin, dictator of Russia between 1927 and 1953. Day after day, during the state trials of the 1930's, you watched the old Bolsheviks, men whom you had lived and worked with, stand up and confess treason against the state. You yourself were forced to praise the dictator. You approved the death sentence. And all the while you knew that these acts of treason were unbelievable. You knew these men. They could never have betrayed their party and their country. It was a lie. Stalin feared them. He had ordered their destruction; and the whole engine of the state, even the accused themselves, moved to give a color of justice to what was in fact persecution and madness.

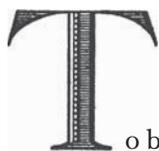

Then Stalin was dead, and after a while it became possible to tell at least some part of the truth. How would you feel? That is how Tacitus must have felt when the emperor Domitian was finally murdered. And what would you do? We know what Tacitus did. He set out to write the life story of one of Domitian's victims, an honorable man well known to him, his father-in-law and his friend. He called it *The Life of Gnaeus Julius Agricola*. He meant to make Agricola's name stand for all those other men of principle destroyed by the tyrant. Moreover, since Agricola had been a great Roman general, Tacitus would be writing history, too. History, he said, could do nothing better than "to let no worthy action be uncommemorated," to condemn "evil words and deeds" in the eyes of later ages.

His book would become in some measure a hymn of praise to a good soldier. He would, in fact, make Agricola a kind of ideal West Pointer. He would tell how he went to school at soldiering under Suetonius Paulinus in Britain; how "he would learn from the skillful, and keep pace with the bravest, would attempt nothing for display, would avoid nothing from fear." He would mention Agricola's term as governor of Asia, where he had to deal with a swindling proconsul, and his service in Aquitania. Then he would bring him back to Britain and show his talent as a soldier rising gradually to its crest at the battle of Mons Graupius. He would describe how Agricola returned to Rome, his prudent behavior in the face of great popularity, and his mysterious death. Tacitus' geography might be shaky,

and the speeches he gave to his characters were certainly made up; but he would be careful to set down only such matters as he believed to be fact, even as to the lack of evidence that Agricola had been poisoned.

Like his contemporary Plutarch, Tacitus was more a student of man than a historian; and in an age “so cruel, so hostile to all virtue,” he was more moralist than either. What we have called the great ideas were well known to him. He lived by them. History? It was his trade. Tyranny? Who knew it better than Tacitus? War and peace? He could hardly tell one from another in his time. Plainly he belonged to an aristocracy, the Roman senatorial class. More often than not, this was also an oligarchy—a rule by the prosperous few. Like the best men of his class, he lived according to the principles of courage and honor. And virtue? He gave us proof of this in the great speech which ends his *Agricola*. Meant as praise of Agricola, it is also his own confession. See, he says, our shame. In the madness of Domitian, we were faced with a moral conflict we could not solve: a conflict between loyalty to the empire and loyalty to a class, to justice, to truth itself. We could not act, and because of this the best men in Rome died.

The Life of Gnaeus Julius Agricola

o bequeath to posterity a record of the deeds and characters of distinguished men is an ancient practice which even the present age, careless as it is of its own sons, has not abandoned whenever some great and conspicuous excellence has conquered and risen superior to that failing, common to petty and to great states, blindness and hostility to goodness. But in days gone by, as there was a greater inclination and a more open path to the achievement of memorable actions, so the man of highest genius was led by the simple reward of a good conscience to hand on without partiality or self-seeking the remembrance of greatness. Many too thought that to write their own lives showed the confidence of integrity rather than presumption. Of Rutilius and Scaurus no one doubted the honesty or questioned the motives. So true is it that merit is best appreciated by the age in which it thrives most easily. But in these days, I, who have to record the life of one who has passed away, must crave an indulgence, which I should not have had to ask had I only to inveigh against an age so cruel, so hostile to all virtue.

We have read that the panegyrics pronounced by Arulenus Rusticus on Thræsea Pactus, and by Herennius Senecio on Helvidius Priscus, were made capital crimes, that not only their persons but their very books were objects of rage, and that the triumvirs were commissioned to burn in the forum those works of splendid genius. They fancied, forsooth, that in that fire the voice of the Roman people, the freedom of the Senate, and the conscience of the human race were perishing, while at the same time they banished the teachers of philosophy, and exiled every noble pursuit, that nothing good might anywhere confront them. Certainly we showed a magnificent example of patience; as a former age had witnessed the extreme of liberty, so we witnessed the extreme of servitude, when the informer robbed us of the interchange of speech and hearing. We should

have lost memory as well as voice, had it been as easy to forget as to keep silence.

Now at last our spirit is returning. And yet, though at the dawn of a most happy age Nerva Caesar blended things once irreconcilable, sovereignty and freedom, though Nerva Trajan is now daily augmenting the prosperity of the time, and though the public safety has not only our hopes and good wishes, but has also the certain pledge of their fulfillment, still, from the necessary condition of human frailty, the remedy works less quickly than the disease. As our bodies grow but slowly, perish in a moment, so it is easier to crush than to revive genius and its pursuits. Besides, the charm of indolence steals over us, and the idleness which at first we loathed we afterwards love. What if during those fifteen years, a large portion of human life, many were cut off by ordinary casualties, and the ablest fell victims to the Emperor's rage, if a few of us survive, I may almost say, not only others but our own selves, survive, though there have been taken from the midst of life those many years which brought the young in dumb silence to old age, and the old almost to the very verge and end of existence! Yet we shall not regret that we have told, though in language unskillful and unadorned, the story of past servitude, and borne our testimony to present happiness. Meanwhile this book, intended to do honor to Agricola, my father-in-law, will, as an expression of filial regard, be commended, or at least excused.

Gnaeus Julius Agricola was born at the ancient and famous colony of Forum Julii. Each of his grandfathers was an Imperial procurator, that is, of the highest equestrian rank. His father, Julius Graecinus, a member of the Senatorian order, and distinguished for his pursuit of eloquence and philosophy, earned for himself by these very merits the displeasure of Caius Caesar. He was ordered to impeach Marcus Silanus, and because he refused was put to death. His mother was Julia Procilla, a lady of singular virtue. Brought up by her side with fond affection, he passed his boyhood and youth in the cultivation of every worthy attainment. He was guarded from the enticements of the profligate not only by his own good and straightforward character, but also by having, when quite a child, for the scene and guide of his studies, Massilia, a place where refinement and provincial frugality were blended and happily combined. I remember that he used to tell us how in his early youth he would have imbibed a keener love of philosophy than became a Roman and a senator, had not his mother's good sense checked his excited and ardent spirit. It was the case of a lofty and aspiring soul craving with more eagerness than caution the beauty and splendor of great and glorious renown. But

it was soon mellowed by reason and experience, and he retained from his learning that most difficult of lessons—moderation.

He served his military apprenticeship in Britain to the satisfaction of Suetonius Paulinus, a painstaking and judicious officer, who, to test his merits, selected him to share his tent. Without the recklessness with which young men often make the profession of arms a mere pastime, and without indolence, he never availed himself of his tribune's rank or his inexperience to procure enjoyment or to escape from duty. He sought to make himself acquainted with the province and known to the army; he would learn from the skillful, and keep pace with the bravest, would attempt nothing for display, would avoid nothing from fear, and would be at once careful and vigilant.

Never indeed had Britain been more excited, or in a more critical condition. Veteran soldiers had been massacred, colonies burnt, armies cut off. The struggle was then for safety; it was soon to be for victory. And though all this was conducted under the leadership and direction of another, though the final issue and the glory of having won back the province belonged to the general, yet skill, experience, and ambition were acquired by the young officer. His soul too was penetrated with the desire of warlike renown, a sentiment unwelcome to an age which put a sinister construction on eminent merit, and made glory as perilous as infamy.

From Britain he went to Rome, to go through the regular course of office, and there allied himself with Domitia Decidiana, a lady of illustrious birth. The marriage was one which gave a man ambitious of advancement distinction and support. They lived in singular harmony, through their mutual affection and preference of each other to self. However, the good wife deserves the greater praise, just as the bad incurs a heavier censure.

Appointed Quaestor, the ballot gave him Asia for his province, Salvius Titianus for his proconsul. Neither the one nor the other corrupted him, though the province was rich and an easy prey to the wrongdoer, while the proconsul, a man inclined to every species of greed, was ready by all manner of indulgence to purchase a mutual concealment of guilt.

A daughter was there added to his family to be his stay and comfort, for shortly after he lost the son that had before been born to him. The year between his quaestorship and tribunate, as well as the year of the tribunate itself, he passed in retirement and inaction, for he knew those times of Nero when indolence stood for wisdom. His praetorship was passed in the same consistent quietude, for the usual judicial functions

did not fall to his lot. The games and the pageantry of his office he ordered according to the mean between strictness and profusion, avoiding extravagance, but not missing distinction. He was afterwards appointed by Galba to draw up an account of the temple offerings, and his searching scrutiny relieved the conscience of the state from the burden of all sacrileges but those committed by Nero.

The following year inflicted a terrible blow on his affections and his fortunes. Otho's fleet, while cruising idly about, cruelly ravaged Intemelii, a district of Liguria; his mother, who was living there on her own estate, was murdered. The estate itself and a large part of her patrimony were plundered. This was indeed the occasion of the crime. Agricola, who instantly set out to discharge the duties of affection, was overtaken by the tidings that Vespasian was aiming at the throne. He at once joined his party. Vespasian's early policy, and the government of Rome were directed by Mucianus, for Domitian was a mere youth, and from his father's elevation sought only the opportunities of indulgence.

Agricola, having been sent by Mucianus to conduct a levy of troops, and having done his work with integrity and energy, was appointed to command the 20th Legion, which had been slow to take the new oath of allegiance, and the retiring officer of which was reported to be acting disloyally. It was a trying and formidable charge for even officers of consular rank, and the late praetorian officer, perhaps from his own disposition, perhaps from that of the soldiers, was powerless to restrain them. Chosen thus at once to supersede and to punish, Agricola, with a singular moderation, wished it to be thought that he had found rather than made an obedient soldiery.

Britain was then under Vettius Bolanus, who governed more mildly than suited so turbulent a province. Agricola moderated his energy and restrained his ardor, that he might not grow too important, for he had learned to obey, and understood well how to combine expediency with honor. Soon afterwards Britain received for its governor a man of consular rank, Petilius Cerialis. Agricola's merits had now room for display. Cerialis let him share at first indeed only the toils and dangers, but before long the glory of war, often by way of trial putting him in command of part of the army, and sometimes, on the strength of the result, of larger forces. Never to enhance his own renown did Agricola boast of his exploits; he always referred his success, as though he were but an instrument, to his general and director. Thus by his valor in obeying orders and by his modesty of speech he escaped jealousy without losing distinction.

As he was returning from the command of the legion, Vespasian ad-

mitted him into the patrician order, and then gave him the province of Aquitania, a pre-eminently splendid appointment both from the importance of its duties and the prospect of the consulate to which the Emperor destined him. Many think the genius of the soldier wants subtlety, because military law, which is summary and blunt, and apt to appeal to the sword, finds no exercise for the refinements of the forum. Yet Agricola, from his natural good sense, though called to act among civilians, did his work with ease and correctness. And, besides, the times of business and relaxation were kept distinct. When his public and judicial duties required it, he was dignified, thoughtful, austere, and yet often merciful; when business was done with, he wore no longer the official character. He was altogether without harshness, pride, or the greed of gain. With a most rare felicity, his good nature did not weaken his authority, nor his strictness the attachment of his friends. To speak of uprightness and purity in such a man would be an insult to his virtues. Fame itself, of which even good men are often weakly fond, he did not seek by an ostentation of virtue or by artifice. He avoided rivalry with his colleagues, contention with his procurator, thinking such victories no honor and defeat disgrace. For somewhat less than three years he was kept in his governorship, and was then recalled with an immediate prospect of the consulate. A general belief went with him that the province of Britain was to be his, not because he had himself hinted it, but because he seemed worthy of it. Public opinion is not always mistaken; sometimes even it chooses the right man. He was consul, and I but a youth, when he betrothed to me his daughter, a maiden even then of noble promise. After his consulate he gave her to me in marriage, and was then at once appointed to the government of Britain, with the addition of the sacred office of the pontificate.

The geography and inhabitants of Britain, already described by many writers, I will speak of, not that my research and ability may be compared with theirs, but because the country was then for the first time thoroughly subdued. And so matters, which as being still not accurately known my predecessors embellished with their eloquence, shall now be related on the evidence of facts.

Britain, the largest of the islands which Roman geography includes, is so situated that it faces Germany on the east, Spain on the west; on the south it is even within sight of Gaul; its northern extremities, which have no shores opposite to them, are beaten by the waves of a vast open sea. The form of the entire country has been compared by Livy and Fabius Rusticus, the most graphic among ancient and modern historians, to an

oblong shield or battle-ax. And this no doubt is its shape without Caledonia, so that it has become the popular description of the whole island. There is, however, a large and irregular tract of land which juts out from its furthest shores, tapering off in a wedgelike form. Round these coasts of remotest ocean the Roman fleet then for the first time sailed, ascertained that Britain is an island, and simultaneously discovered and conquered what are called the Orcades, islands hitherto unknown. Thule too was descried in the distance, which as yet had been hidden by the snows of winter. Those waters, they say, are sluggish, and yield with difficulty to the oar, and are not even raised by the wind as other seas. The reason, I suppose, is that lands and mountains, which are the cause and origin of storms, are here comparatively rare, and also that the vast depths of that unbroken expanse are more slowly set in motion. But to investigate the nature of the ocean and the tides is no part of the present work, and many writers have discussed the subject. I would simply add that nowhere has the sea a wider dominion, that it has many currents running in every direction, that it does not merely flow and ebb within the limits of the shore, but penetrates and winds far inland, and finds a home among hills and mountains as though in its own domain.

Who were the original inhabitants of Britain, whether they were indigenous or foreign, is, as usual among barbarians, little known. Their physical characteristics are various, and from these conclusions may be drawn. The red hair and large limbs of the inhabitants of Caledonia point clearly to a German origin. The dark complexion of the Silures, their usually curly hair, and the fact that Spain is the opposite shore to them, are an evidence that Iberians of a former date crossed over and occupied these parts. Those who are nearest to the Gauls are also like them, either from the permanent influence of original descent, or because in countries which run out so far to meet each other climate has produced similar physical qualities. But a general survey inclines me to believe that the Gauls established themselves in an island so near to them. Their religious belief may be traced in the strongly marked British superstition. The language differs but little; there is the same boldness in challenging danger, and, when it is near, the same timidity in shrinking from it. The Britons, however, exhibit more spirit, as being a people whom a long peace has not yet enervated. Indeed we have understood that even the Gauls were once renowned in war; but, after a while, sloth following on ease crept over them, and they lost their courage along with their freedom. This too has happened to the long-conquered tribes of Britain; the rest are still what the Gauls once were.

Their strength is in infantry. Some tribes fight also with the chariot. The higher in rank is the charioteer; the dependants fight. They were once ruled by kings, but are now divided under chieftains into factions and parties. Our greatest advantage in coping with tribes so powerful is that they do not act in concert. Seldom is it that two or three states meet together to ward off a common danger. Thus, while they fight singly, all are conquered.

Their sky is obscured by continual rain and cloud. Severity of cold is unknown. The days exceed in length those of our part of the world; the nights are bright, and in the extreme north so short that between sunlight and dawn you can perceive but a slight distinction. It is said that, if there are no clouds in the way, the splendor of the sun can be seen throughout the night, and that he does not rise and set, but only crosses the heavens. The truth is that the low shadow thrown from the flat extremities of the earth's surface does not raise the darkness to any height, and the night thus fails to reach the sky and stars.

With the exception of the olive and vine, and plants which usually grow in warmer climates, the soil will yield, and even abundantly, all ordinary produce. It ripens indeed slowly, but is of rapid growth, the cause in each case being the same, namely, the excessive moisture of the soil and of the atmosphere. Britain contains gold and silver and other metals, as the prize of conquest. The ocean, too, produces pearls, but of a dusky and bluish hue. Some think that those who collect them have not the requisite skill, as in the Red Sea the living and breathing pearl is torn from the rocks, while in Britain they are gathered just as they are thrown up. I could myself more readily believe that the natural properties of the pearls are in fault than our keenness for gain.

The Britons themselves bear cheerfully the conscription, the taxes, and the other burdens imposed on them by the Empire, if there be no oppression. Of this they are impatient; they are reduced to subjection, not as yet to slavery. The deified Julius, the very first Roman who entered Britain with an army, though by a successful engagement he struck terror into the inhabitants and gained possession of the coast, must be regarded as having indicated rather than transmitted the acquisition to future generations. Then came the civil wars, and the arms of our leaders were turned against their country, and even when there was peace, there was a long neglect of Britain. This Augustus spoke of as policy, Tiberius as an inherited maxim. That Caius Caesar meditated an invasion of Britain is perfectly clear, but his purposes, rapidly formed, were easily changed, and his vast attempts on Germany had failed. Claudius was the first to

renew the attempt, and conveyed over into the island some legions and auxiliaries, choosing Vespasian to share with him the campaign, whose approaching elevation had this beginning. Several tribes were subdued and kings made prisoners, and destiny learned to know its favorite.

Aulus Plautius was the first governor of consular rank, and Ostorius Scapula the next. Both were famous soldiers, and by degrees the nearest portions of Britain were brought into the condition of a province, and a colony of veterans was also introduced. Some of the states were given to King Cogidumnus, who lived down to our day a most faithful ally. So was maintained the ancient and long-recognized practice of the Roman people, which seeks to secure among the instruments of dominion even kings themselves. Soon after, Didius Gallus consolidated the conquests of his predecessors, and advanced a very few positions into parts more remote, to gain the credit of having enlarged the sphere of government. Didius was succeeded by Veranius, who died within the year. Then Suetonius Paulinus enjoyed success for two years; he subdued several tribes and strengthened our military posts. Thus encouraged, he made an attempt on the island of Mona, as a place from which the rebels drew reinforcements; but in doing this he left his rear open to attack.

Relieved from apprehension by the legate's absence, the Britons dwelt much among themselves on the miseries of subjection, compared their wrongs, and exaggerated them in the discussion. "All we get by patience," they said, "is that heavier demands are exacted from us, as from men who will readily submit. A single king once ruled us; now two are set over us; a legate to tyrannize over our lives, a procurator to tyrannize over our property. Their quarrels and their harmony are alike ruinous to their subjects. The centurions of the one, the slaves of the other, combine violence with insult. Nothing is now safe from their avarice, nothing from their lust. In war it is the strong who plunders; now, it is for the most part by cowards and poltroons that our homes are rifled, our children torn from us, the conscription enforced, as though it were for our country alone that we could not die. For, after all, what a mere handful of soldiers has crossed over, if we Britons look at our own numbers. Germany did thus actually shake off the yoke, and yet its defense was a river, not the ocean. With us, fatherland, wives, parents, are the motives to war; with them, only greed and profligacy. They will surely fly, as did the now deified Julius, if once we emulate the valor of our sires. Let us not be panic-stricken at the result of one or two engagements. The miserable have more fury and greater resolution. Now even the gods are beginning to pity us, for they are keeping away the Roman general, and detaining

his army far from us in another island. We have already taken the hardest step; we are deliberating. And indeed, in all such designs, to dare is less perilous than to be detected.”

Rousing each other by this and like language, under the leadership of Boudicca, a woman of kingly descent (for they admit no distinction of sex in their royal successions), they all rose in arms. They fell upon our troops, which were scattered on garrison duty, stormed the forts, and burst into the colony itself, the headquarters, as they thought, of tyranny. In their rage and their triumph, they spared no variety of a barbarian’s cruelty. Had not Paulinus on hearing of the outbreak in the province rendered prompt succor, Britain would have been lost. By one successful engagement, he brought it back to its former obedience, though many, troubled by the conscious guilt of rebellion and by particular dread of the legate, still clung to their arms. Excellent as he was in other respects, his policy to the conquered was arrogant, and exhibited the cruelty of one who was avenging private wrongs. Accordingly Petronius Turpilianus was sent out to initiate a milder rule. A stranger to the enemy’s misdeeds and so more accessible to their penitence, he put an end to old troubles, and, attempting nothing more, handed the province over to Trebellius Maximus. Trebellius, who was somewhat indolent, and never ventured on a campaign, controlled the province by a certain courtesy in his administration. Even the barbarians now learned to excuse many attractive vices, and the occurrence of the civil war gave a good pretext for inaction. But we were sorely troubled with mutiny, as troops habituated to service grew demoralized by idleness. Trebellius, who had escaped the soldiers’ fury by flying and hiding himself, governed henceforth on sufferance, a disgraced and humbled man. It was a kind of bargain; the soldiers had their license, the general had his life; and so the mutiny cost no bloodshed. Nor did Vettius Bolanus, during the continuance of the civil wars, trouble Britain with discipline. There was the same inaction with respect to the enemy, and similar unruliness in the camp, only Bolanus, an upright man, whom no misdeeds made odious, had secured affection in default of the power of control.

When however Vespasian had restored to unity Britain as well as the rest of the world, in the presence of great generals and renowned armies the enemy’s hopes were crushed. They were at once panic-stricken by the attack of Petilius Cerialis on the state of the Brigantes, said to be the most prosperous in the entire province. There were many battles, some by no means bloodless, and his conquests, or at least his wars, embraced a large part of the territory of the Brigantes. Indeed he would have alto-

gether thrown into the shade the activity and renown of any other successor; but Julius Frontinus was equal to the burden, a great man as far as greatness was then possible, who subdued by his arms the powerful and warlike tribe of the Silures, surmounting the difficulties of the country as well as the valor of the enemy.

Such was the state of Britain, and such were the vicissitudes of the war, which Agricola found on his crossing over about midsummer. Our soldiers made it a pretext for carelessness, as if all fighting was over, and the enemy were biding their time. The Ordovices, shortly before Agricola's arrival, had destroyed nearly the whole of a squadron of allied cavalry quartered in their territory. Such a beginning raised the hopes of the country, and all who wished for war approved the precedent, and anxiously watched the temper of the new governor. Meanwhile Agricola, though summer was past and the detachments were scattered throughout the province, though the soldiers' confident anticipation of inaction for that year would be a source of delay and difficulty in beginning a campaign, and most advisers thought it best simply to watch all weak points, resolved to face the peril. He collected a force of veterans and a small body of auxiliaries; then as the Ordovices would not venture to descend into the plain, he put himself in front of the ranks to inspire all with the same courage against a common danger, and led his troops up a hill. The tribe was all but exterminated.

Well aware that he must follow up the prestige of his arms, and that in proportion to his first success would be the terror of the other tribes, he formed the design of subjugating the island of Mona, from the occupation of which Paulinus had been recalled, as I have already related, by the rebellion of the entire province. But, as his plans were not matured, he had no fleet. The skill and resolution of the general accomplished the passage. With some picked men of the auxiliaries, disencumbered of all baggage, who knew the shallows and had that national experience in swimming which enables the Britons to take care not only of themselves but of their arms and horses, he delivered so unexpected an attack that the astonished enemy who were looking for a fleet, a naval armament, and an assault by sea, thought that to such assailants nothing could be formidable or invincible. And so, peace having been sued for and the island given up, Agricola became great and famous as one who, when entering on his province, a time which others spend in vain display and a round of ceremonies, chose rather toil and danger. Nor did he use his success for self-glorification, or apply the name of campaigns and victories to the repression of a conquered people. He did not even describe his

achievements in a laureled letter. Yet by thus disguising his renown he really increased it, for men inferred the grandeur of his aspirations from his silence about services so great.

Next, with thorough insight into the feelings of his province, and taught also, by the experience of others, that little is gained by conquest if followed by oppression, he determined to root out the causes of war. Beginning first with himself and his dependants, he kept his household under restraint, a thing as hard to many as ruling a province. He transacted no public business through freedmen or slaves; no private leanings, no recommendations or entreaties of friends, moved him in the selection of centurions and soldiers, but it was ever the best man whom he thought most trustworthy. He knew everything, but did not always act on his knowledge. Trifling errors he treated with leniency, serious offenses with severity. Nor was it always punishment, but far oftener penitence, which satisfied him. He preferred to give office and power to men who would not transgress, rather than have to condemn a transgressor. He lightened the exaction of corn and tribute by an equal distribution of the burden, while he got rid of those contrivances for gain which were more intolerable than the tribute itself. Hitherto the people had been compelled to endure the farce of waiting by the closed granary and of purchasing corn unnecessarily and raising it to a fictitious price. Difficult byroads and distant places were fixed for them, so that states with a winter camp close to them had to carry corn to remote and inaccessible parts of the country, until what was within the reach of all became a source of profit to the few.

Agricola, by the repression of these abuses in his very first year of office, restored to peace its good name, when, from either the indifference or the harshness of his predecessors, it had come to be as much dreaded as war. When, however, summer came, assembling his forces, he continually showed himself in the ranks, praised good discipline, and kept the stragglers in order. He would himself choose the position of the camp, himself explore the estuaries and forests. Meanwhile he would allow the enemy no rest, laying waste his territory with sudden incursions, and, having sufficiently alarmed him, would then by forbearance display the allurements of peace. In consequence, many states, which up to that time had been independent, gave hostages, and laid aside their animosities; garrisons and forts were established among them with a skill and diligence with which no newly-acquired part of Britain had before been treated.

The following winter passed without disturbance, and was employed in salutary measures. For, to accustom to rest and repose through the charms of luxury a population scattered and barbarous and therefore inclined to war, Agricola gave private encouragement and public aid to the building of temples, courts of justice and dwelling houses, praising the energetic, and reproving the indolent. Thus an honorable rivalry took the place of compulsion. He likewise provided a liberal education for the sons of the chiefs, and showed such a preference for the natural powers of the Britons over the industry of the Gauls that they who lately disdained the tongue of Rome now coveted its eloquence. Hence, too, a liking sprang up for our style of dress, and the "toga" became fashionable. Step by step they were led to things which dispose to vice, the lounge, the bath, the elegant banquet. All this in their ignorance they called civilization, when it was but a part of their servitude.

The third year of his campaigns opened up new tribes, our ravages on the native population being carried as far as the Taus, an estuary so called. This struck such terror into the enemy that he did not dare to attack our army, harassed though it was by violent storms; and there was even time for the erection of forts. It was noted by experienced officers that no general had ever shown more judgment in choosing suitable positions, and that not a single fort established by Agricola was either stormed by the enemy or abandoned by capitulation or flight. Sorties were continually made; for these positions were secured from protracted siege by a year's supply. So winter brought with it no alarms, and each garrison could hold its own, as the baffled and despairing enemy, who had been accustomed often to repair his summer losses by winter successes, found himself repelled alike both in summer and winter.

Never did Agricola in a greedy spirit appropriate the achievements of others; the centurion and the prefect both found in him an impartial witness of their every action. Some persons used to say that he was too harsh in his reproofs, and that he was as severe to the bad as he was gentle to the good. But his displeasure left nothing behind it; reserve and silence in him were not to be dreaded. He thought it better to show anger than to cherish hatred.

The fourth summer he employed in securing what he had overrun. Had the valor of our armies and the renown of the Roman name permitted it, a limit to our conquests might have been found in Britain itself. Clota and Bodotria, estuaries which the tides of two opposite seas carry far back into the country, are separated by but a narrow strip of land.

This Agricola then began to defend with a line of forts, and, as all the country to the south was now occupied, the enemy were pushed into what might be called another island.

In the fifth year of the war Agricola, himself in the leading ship, crossed the Clota, and subdued in a series of victories tribes hitherto unknown. In that part of Britain which looks towards Ireland, he posted some troops, hoping for fresh conquests rather than fearing attack, inasmuch as Ireland, being between Britain and Spain and conveniently situated for the seas round Gaul, might have been the means of connecting with great mutual benefit the most powerful parts of the empire. Its extent is small when compared with Britain, but exceeds the islands of our seas. In soil and climate, in the disposition, temper, and habits of its population, it differs but little from Britain. We know most of its harbors and approaches, and that through the intercourse of commerce. One of the petty kings of the nation, driven out by internal faction, had been received by Agricola, who detained him under the semblance of friendship till he could make use of him. I have often heard him say that a single legion with a few auxiliaries could conquer and occupy Ireland, and that it would have a salutary effect on Britain for the Roman arms to be seen everywhere, and for freedom, so to speak, to be banished from its sight.

In the summer in which he entered on the sixth year of his office, his operations embraced the states beyond Bodotria, and, as he dreaded a general movement among the remoter tribes, as well as the perils which would beset an invading army, he explored the harbors with a fleet, which, at first employed by him as an integral part of his force, continued to accompany him. The spectacle of war thus pushed on at once by sea and land was imposing; while often infantry, cavalry, and marines, mingled in the same encampment and joyously sharing the same meals, would dwell on their own achievements and adventures, comparing, with a soldier's boastfulness, at one time the deep recesses of the forest and the mountain with the dangers of waves and storms, or, at another, battles by land with victories over the ocean. The Britons too, as we learned from the prisoners, were confounded by the sight of a fleet, as if, now that their inmost seas were penetrated, the conquered had their last refuge closed against them. The tribes inhabiting Caledonia flew to arms, and with great preparations, made greater by the rumors which always exaggerate the unknown, themselves advanced to attack our fortresses, and thus challenging a conflict, inspired us with alarm. To retreat south of the Bodotria, and to retire rather than to be driven out, was

the advice of timid pretenders to prudence, when Agricola learned that the enemy's attack would be made with more than one army. Fearing that their superior numbers and their knowledge of the country might enable them to hem him in, he too distributed his forces into three divisions, and so advanced.

This becoming known to the enemy, they suddenly changed their plan, and with their whole force attacked by night the ninth Legion, as being the weakest, and cutting down the sentries, who were asleep or panic-stricken, they broke into the camp. And now the battle was raging within the camp itself, when Agricola, who had learned from his scouts the enemy's line of march and had kept close on his track, ordered the most active soldiers of his cavalry and infantry to attack the rear of the assailants, while the entire army were shortly to raise a shout. Soon his standards glittered in the light of daybreak. A double peril thus alarmed the Britons, while the courage of the Romans revived; and feeling sure of safety, they now fought for glory. In their turn they rushed to the attack, and there was a furious conflict within the narrow passages of the gates till the enemy were routed. Both armies did their utmost, the one for the honor of having given aid, the other for that of not having needed support. Had not the flying enemy been sheltered by morasses and forests, this victory would have ended the war.

Knowing this, and elated by their glory, our army exclaimed that nothing could resist their valor—that they must penetrate the recesses of Caledonia, and at length after an unbroken succession of battles, discover the furthest limits of Britain. Those who but now were cautious and prudent became after the event eager and boastful. It is the singularly unfair peculiarity of war that the credit of success is claimed by all, while a disaster is attributed to one alone. But the Britons thinking themselves baffled, not so much by our valor as by our general's skillful use of an opportunity, abated nothing of their arrogant demeanor, arming their youth, removing their wives and children to a place of safety, and assembling together to ratify, with sacred rites, a confederacy of all their states. Thus, with angry feelings on both sides, the combatants parted.

The same summer a Usipian cohort, which had been levied in Germany and transported into Britain, ventured on a great and memorable exploit. Having killed a centurion and some soldiers, who, to impart military discipline, had been incorporated with their ranks and were employed at once to instruct and command them, they embarked on board three swift galleys with pilots pressed into their service. Under

the direction of one of them—for two of the three they suspected and consequently put to death—they sailed past the coast in the strangest way before any rumor about them was in circulation. After a while, dispersing in search of water and provisions, they encountered many of the Britons, who sought to defend their property. Often victorious, though now and then beaten, they were at last reduced to such an extremity of want as to be compelled to eat, at first, the feeblest of their number, and then victims selected by lot. Having sailed round Britain and lost their vessels from not knowing how to manage them, they were looked upon as pirates and were intercepted, first by the Suevi and then by the Frisii. Some who were sold as slaves in the way of trade, and were brought through the process of barter as far as our side of the Rhine, gained notoriety by the disclosure of this extraordinary adventure.

Early in the summer Agricola sustained a domestic affliction in the loss of a son born a year before, a calamity which he endured, neither with the ostentatious fortitude displayed by many brave men, nor, on the other hand, with womanish tears and grief. In his sorrow he found one source of relief in war. Having sent on a fleet, which by its ravages at various points might cause a vague and widespread alarm, he advanced with a lightly equipped force, including in its ranks some Britons of remarkable bravery, whose fidelity had been tried through years of peace, as far as the Grampian Mountains, which the enemy had already occupied. For the Britons, indeed, in no way cowed by the result of the late engagement, had made up their minds to be either avenged or enslaved, and convinced at length that a common danger must be averted by union, had, by embassies and treaties, summoned forth the whole strength of all their states. More than 30,000 armed men were now to be seen, and still there were pressing in all the youth of the country, with all whose old age was yet hale and vigorous, men renowned in war and bearing each decorations of his own. Meanwhile, among the many leaders, one superior to the rest in valor and in birth, Galgacus by name, is said to have thus harangued the multitude gathered around him and clamoring for battle:

“Whenever I consider the origin of this war and the necessities of our position, I have a sure confidence that this day, and this union of yours, will be the beginning of freedom to the whole of Britain. To all of us slavery is a thing unknown; there are no lands beyond us, and even the sea is not safe, menaced as we are by a Roman fleet. And thus in war and battle, in which the brave find glory, even the coward will find safety. Former contests, in which, with varying fortune, the Romans

were resisted, still left in us a last hope of succor, inasmuch as being the most renowned nation of Britain, dwelling in the very heart of the country, and out of sight of the shores of the conquered, we could keep even our eyes unpolluted by the contagion of slavery. To us who dwell on the uttermost confines of the earth and of freedom, this remote sanctuary of Britain's glory has up to this time been a defense. Now, however, the furthest limits of Britain are thrown open, and the unknown always passes for the marvelous. But there are no tribes beyond us, nothing indeed but waves and rocks, and the yet more terrible Romans, from whose oppression escape is vainly sought by obedience and submission. Robbers of the world, having by their universal plunder exhausted the land, they rifle the deep. If the enemy be rich, they are rapacious; if he be poor, they lust for dominion; neither the east nor the west has been able to satisfy them. Alone among men they covet with equal eagerness poverty and riches. To robbery, slaughter, plunder, they give the lying name of empire; they make a solitude and call it peace.

"Nature has willed that every man's children and kindred should be his dearest objects. Yet these are torn from us by conscriptions to be slaves elsewhere. Our wives and our sisters, even though they may escape violation from the enemy, are dishonored under the names of friendship and hospitality. Our goods and fortunes they collect for their tribute, our harvests for their granaries. Our very hands and bodies, under the lash and in the midst of insult, are worn down by the toil of clearing forests and morasses. Creatures born to slavery are sold once for all, and are, moreover, fed by their masters; but Britain is daily purchasing, is daily feeding, her own enslaved people. And as in a household the last comer among the slaves is always the butt of his companions, so we in a world long used to slavery, as the newest and the most contemptible, are marked out for destruction. We have neither fruitful plains, nor mines, nor harbors, for the working of which we may be spared. Valor, too, and high spirit in subjects, are offensive to rulers; besides, remoteness and seclusion, while they give safety, provoke suspicion. Since then you cannot hope for quarter, take courage, I beseech you, whether it be safety or renown that you hold most precious. Under a woman's leadership the Brigantes were able to burn a colony, to storm a camp, and had not success ended in supineness, might have thrown off the yoke. Let us, then, a fresh and unconquered people, never likely to abuse our freedom, show forthwith at the very first onset what heroes Caledonia has in reserve.

"Do you suppose that the Romans will be as brave in war as they are

licentious in peace? To our strifes and discords they owe their fame, and they turn the errors of an enemy to the renown of their own army, an army which, composed as it is of every variety of nations, is held together by success and will be broken up by disaster. These Gauls and Germans, and, I blush to say, these numerous Britons, who, though they lend their lives to support a stranger's rule, have been its enemies longer than its subjects, you cannot imagine to be bound by fidelity and affection. Fear and terror there certainly are, feeble bonds of attachment; remove them, and those who have ceased to fear will begin to hate. All the incentives to victory are on our side. The Romans have no wives to kindle their courage; no parents to taunt them with flight; many have either no country or one far away. Few in number, dismayed by their ignorance, looking around upon a sky, a sea, and forests which are all unfamiliar to them; hemmed in, as it were, and enmeshed, the Gods have delivered them into our hands. Be not frightened by idle display, by the glitter of gold and of silver, which can neither protect nor wound. In the very ranks of the enemy we shall find our own forces. Britons will acknowledge their own cause; Gauls will remember past freedom; the other Germans will abandon them, as but lately did the Usipii. Behind them there is nothing to dread. The forts are ungarrisoned; the colonies in the hands of aged men; what with disloyal subjects and oppressive rulers, the towns are ill-affected and rife with discord. On the one side you have a general and an army; on the other, tribute, the mines, and all the other penalties of an enslaved people. Whether you endure these forever, or instantly avenge them, this field is to decide. Think, therefore, as you advance to battle, at once of your ancestors and of your posterity."

They received his speech with enthusiasm, and as is usual among barbarians, with songs, shouts and discordant cries. And now was seen the assembling of troops and the gleam of arms, as the boldest warriors stepped to the front. As the line was forming, Agricola, who, though his troops were in high spirits and could scarcely be kept within the entrenchments, still thought it right to encourage them, spoke as follows—

"Comrades, this is the eighth year since, thanks to the greatness and good fortune of Rome and to your own loyalty and energy, you conquered Britain. In our many campaigns and battles, whether courage in meeting the foe, or toil and endurance in struggling, I may say, against nature herself, have been needed, I have ever been well satisfied with my soldiers, and you with your commander. And so you and I have passed beyond the limits reached by former armies or by former governors, and we now occupy the last confines of Britain, not merely in rumor

and report, but with an actual encampment and armed force. Britain has been both discovered and subdued. Often on the march, when morasses, mountains, and rivers were wearing out your strength, did I hear our bravest men exclaim, 'When shall we have the enemy before us?—when shall we fight?' He is now here, driven from his lair, and your wishes and your valor have free scope, and everything favors the conqueror, everything is adverse to the vanquished. For as it is a great and glorious achievement, if we press on, to have accomplished so great a march, to have traversed forests and to have crossed estuaries, so, if we retire, our present most complete success will prove our greatest danger. We have not the same knowledge of the country or the same abundance of supplies, but we have arms in our hands, and in them we have everything. For myself I have long been convinced that neither for an army nor for a general is retreat safe. Better, too, is an honorable death than a life of shame, and safety and renown are for us to be found together. And it would be no inglorious end to perish on the extreme confines of earth and of nature.

“If unknown nations and an untried enemy confronted you, I should urge you on by the example of other armies. As it is, look back upon your former honors, question your own eyes. These are the men who last year under cover of darkness attacked a single legion, whom you routed by a shout. Of all the Britons these are the most confirmed runaways, and this is why they have survived so long. Just as when the huntsman penetrates the forest and the thicket, all the most courageous animals rush out upon him, while the timid and feeble are scared away by the very sound of his approach, so the bravest of the Britons have long since fallen; and the rest are a mere crowd of spiritless cowards. You have at last found them, not because they have stood their ground, but because they have been overtaken. Their desperate plight, and the extreme terror that paralyzes them, have riveted their line to this spot, that you might achieve in it a splendid and memorable victory. Put an end to campaigns; crown your fifty years' service with a glorious day; prove to your country that her armies could never have been fairly charged with protracting a war or with causing a rebellion.”

While Agricola was yet speaking, the ardor of the soldiers was rising to its height, and the close of his speech was followed by a great outburst of enthusiasm. In a moment they flew to arms. He arrayed his eager and impetuous troops in such a manner that the auxiliary infantry, 8,000 in number, strengthened his center, while 3,000 cavalry were posted on his wings. The legions were drawn up in front of the intrenched camp; his

victory would be vastly more glorious if won without the loss of Roman blood, and he would have a reserve in case of repulse. The enemy, to make a formidable display, had posted himself on high ground; his van was on the plain, while the rest of his army rose in an archlike form up the slope of a hill. The plain between resounded with the noise and with the rapid movements of chariots and cavalry. Agricola, fearing that from the enemy's superiority of force he would be simultaneously attacked in front and on the flanks, widened his ranks, and though his line was likely to be too extended, and several officers advised him to bring up the legions, yet, so sanguine was he, so resolute in meeting danger, he sent away his horse and took his stand on foot before the colors.

The action began with distant fighting. The Britons with equal steadiness and skill used their huge swords and small shields to avoid or to parry the missiles of our soldiers, while they themselves poured on us a dense shower of darts, till Agricola encouraged three Batavian and two Tungrian cohorts to bring matters to the decision of close fighting with swords. Such tactics were familiar to these veteran soldiers, but were embarrassing to an enemy armed with small bucklers and unwieldy weapons. The swords of the Britons are not pointed, and do not allow them to close with the foe, or to fight in the open field. No sooner did the Batavians begin to close with the enemy, to strike them with their shields, to disfigure their faces, and overthrowing the force on the plain to advance their line up the hill, than the other auxiliary cohorts joined with eager rivalry in cutting down all the nearest of the foe. Many were left behind half-dead, some even unwounded, in the hurry of victory. Meantime the enemy's cavalry had fled, and the charioteers had mingled in the engagement of the infantry. But although these at first spread panic, they were soon impeded by the close array of our ranks and by the inequalities of the ground. The battle had anything but the appearance of a cavalry action, for men and horses were carried along in confusion together, while chariots, destitute of guidance, and terrified horses without drivers dashed as panic urged them, sideways, or in direct collision against the ranks.

Those of the Britons who, having as yet taken no part in the engagement, occupied the hilltops, and who without fear for themselves sat idly disdaining the smallness of our numbers, had begun gradually to descend and to hem in the rear of the victorious army, when Agricola, who feared this very movement, opposed their advance with four squadrons of cavalry held in reserve by him for any sudden emergencies of battle. Their repulse and rout was as severe as their onset had been furious.

Thus the enemy's design recoiled on himself, and the cavalry which by the general's order had wheeled round from the van of the contending armies attacked his rear. Then, indeed, the open plain presented an awful and hideous spectacle. Our men pursued, wounded, made prisoners of the fugitives only to slaughter them when others fell in their way. And now the enemy, as prompted by their various dispositions, fled in whole battalions with arms in their hands before a few pursuers, while some, who were unarmed, actually rushed to the front and gave themselves up to death. Everywhere there lay scattered arms, corpses, and mangled limbs, and the earth reeked with blood. Even the conquered now and then felt a touch of fury and of courage. On approaching the woods, they rallied, and as they knew the ground, they were able to pounce on the foremost and least cautious of the pursuers. Had not Agricola, who was present everywhere, ordered a force of strong and lightly equipped cohorts, with some dismounted troopers for the denser parts of the forest, and a detachment of cavalry where it was not so thick, to scour the woods like a party of huntsmen, serious loss would have been sustained through the excessive confidence of our troops. When, however, the enemy saw that we again pursued them in firm and compact array, they fled no longer in masses as before, each looking for his comrade; but dispersing and avoiding one another, they sought the shelter of distant and pathless wilds. Night and weariness of bloodshed put an end to the pursuit. About 10,000 of the enemy were slain; on our side there fell 360 men, and among them Aulus Atticus, the commander of the cohort, whose youthful impetuosity and mettlesome steed had borne him into the midst of the enemy.

Elated by their victory and their booty, the conquerors passed a night of merriment. Meanwhile the Britons, wandering amidst the mingled wailings of men and women, were dragging off their wounded, calling to the unhurt, deserting their homes, and in their rage actually firing them, choosing places of concealment only instantly to abandon them. One moment they would take counsel together, the next, part company, while the sight of those who were dearest to them sometimes melted their hearts, but oftener roused their fury. It was an undoubted fact that some of them vented their rage on their wives and children, as if in pity for their lot. The following day showed more fully the extent of the calamity, for the silence of desolation reigned everywhere: the hills were forsaken, houses were smoking in the distance, and no one was seen by the scouts. These were dispatched in all directions; and it having been ascertained that the track of the flying enemy was uncertain, and that

there was no attempt at rallying, it being also impossible, as summer was now over, to extend the war, Agricola led back his army into the territory of the Boresti. He received hostages from them, and then ordered the commander of the fleet to sail round Britain. A force for this purpose was given him, which great panic everywhere preceded. Agricola himself, leading his infantry and cavalry by slow marches, so as to overawe the newly-conquered tribes by the very tardiness of his progress, brought them into winter quarters, while the fleet with propitious breezes and great renown entered the harbor of Trutulium, to which it had returned after having coasted along the entire southern shore of the island.

Of this series of events, though not exaggerated in the dispatches of Agricola by any boastfulness of language, Domitian heard, as was his wont, with joy in his face but anxiety in his heart. He felt conscious that all men laughed at his late mock triumph over Germany, for which there had been purchased from traders people whose dress and hair might be made to resemble those of captives, whereas now a real and splendid victory, with the destruction of thousands of the enemy, was being celebrated with just applause. It was, he thought, a very alarming thing for him that the name of a subject should be raised above that of the Emperor; it was to no purpose that he had driven into obscurity the pursuit of forensic eloquence and the graceful accomplishments of civil life, if another were to forestall the distinctions of war. To other glories he could more easily shut his eyes, but the greatness of a good general was a truly imperial quality. Harassed by these anxieties, and absorbed in an incommunicable trouble, a sure prognostic of some cruel purpose, he decided that it was best for the present to suspend his hatred until the freshness of Agricola's renown and his popularity with the army should begin to pass away.

For Agricola was still the governor of Britain. Accordingly the Emperor ordered that the usual triumphal decorations, the honor of a laureled statue, and all that is commonly given in place of the triumphal procession, with the addition of many laudatory expressions, should be decreed in the senate, together with a hint to the effect that Agricola was to have the province of Syria, then vacant by the death of Atilius Rufus, a man of consular rank, and generally reserved for men of distinction. It was believed by many persons that one of the freedmen employed on confidential services was sent to Agricola, bearing a dispatch in which Syria was offered him, and with instructions to deliver it should he be in Britain; that this freedman in crossing the straits met Agricola, and without even saluting him made his way back to Domitian;

though I cannot say whether the story is true, or is only a fiction invented to suit the Emperor's character.

Meanwhile Agricola had handed over his province in peace and safety to his successor. And not to make his entrance into Rome conspicuous by the concourse of welcoming throngs, he avoided the attentions of his friends by entering the city at night, and at night too, according to orders, proceeded to the palace, where, having been received with a hurried embrace and without a word being spoken, he mingled in the crowd of courtiers. Anxious henceforth to temper the military renown, which annoys men of peace, with other merits, he studiously cultivated retirement and leisure, simple in dress, courteous in conversation, and never accompanied but by one or two friends, so that the many who commonly judge of great men by their external grandeur, after having seen and attentively surveyed him, asked the secret of a greatness which but few could explain.

During this time he was frequently accused before Domitian in his absence, and in his absence acquitted. The cause of his danger lay not in any crime, nor in any complaint of injury, but in a ruler who was the foe of virtue, in his own renown, and in that worst class of enemies—the men who praise. And then followed such days for the commonwealth as would not suffer Agricola to be forgotten; days when so many of our armies were lost in Moesia, Dacia, Germany, and Pannonia, through the rashness or cowardice of our generals, when so many of our officers were besieged and captured with so many of our auxiliaries, when it was no longer the boundaries of empire and the banks of rivers which were imperiled, but the winter quarters of our legions and the possession of our territories. And so when disaster followed upon disaster, and the entire year was marked by destruction and slaughter, the voice of the people called Agricola to the command; for they all contrasted his vigor, firmness, and experience in war, with the inertness and timidity of other generals. This talk, it is quite certain, assailed the ears of the Emperor himself, while affection and loyalty in the best of his freedmen, malice and envy in the worst, kindled the anger of a prince ever inclined to evil. And so at once, by his own excellences and by the faults of others, Agricola was hurried headlong to a perilous elevation.

The year had now arrived in which the proconsulate of Asia or Africa was to fall to him by lot, and, as Civica had been lately murdered, Agricola did not want a warning, or Domitian a precedent. Persons well acquainted with the Emperor's feelings came to ask Agricola, as if on their own account, whether he would go. First they hinted their purpose

by praises of tranquillity and leisure; then offered their services in procuring acceptance for his excuses; and at last, throwing off all disguise, brought him by entreaties and threats to Domitian. The Emperor, armed beforehand with hypocrisy, and assuming a haughty demeanor, listened to his prayer that he might be excused, and having granted his request allowed himself to be formally thanked, nor blushed to grant so sinister a favor. But the salary usually granted to a proconsul, and which he had himself given to some governors, he did not bestow on Agricola, either because he was offended at its not having been asked, or was warned by his conscience that he might be thought to have purchased the refusal which he had commanded. It is, indeed, human nature to hate the man whom you have injured; yet the Emperor, notwithstanding his irascible temper and an implacability proportioned to his reserve, was softened by the moderation and prudence of Agricola, who neither by a perverse obstinacy nor an idle parade of freedom challenged fame or provoked his fate. Let it be known to those whose habit it is to admire the disregard of authority, that there may be great men even under bad emperors, and that obedience and submission, when joined to activity and vigor, may attain a glory which most men reach only by a perilous career, utterly useless to the state, and closed by an ostentatious death.

The end of his life, a deplorable calamity to us and a grief to his friends, was regarded with concern even by strangers and those who knew him not. The common people and this busy population continually inquired at his house, and talked of him in public places and in private gatherings. No man when he heard of Agricola's death could either be glad or at once forget it. Men's sympathy was increased by a prevalent rumor that he was destroyed by poison. For myself, I have nothing which I should venture to state for fact. Certainly during the whole of his illness the Emperor's chief freedmen and confidential physicians came more frequently than is usual with a court which pays its visits by means of messengers. This was, perhaps, solicitude, perhaps espionage. Certain it is, that on the last day the very agonies of his dying moments were reported by a succession of couriers, and no one believed that there would be such haste about tidings which would be heard with regret. Yet in his manner and countenance the Emperor displayed some signs of sorrow, for he could now forget his enmity, and it was easier to conceal his joy than his fear. It was well known that on reading the will, in which he was named coheir with Agricola's excellent wife and most dutiful daughter, he expressed delight, as if it had been a complimentary choice. So blinded and perverted was his mind by incessant flattery

that he did not know that it was only a bad Emperor whom a good father would make his heir.

Agricola was born on the 13th of June, in the third consulate of Caius Caesar; he died on the 23rd of August, during the consulate of Collega and Priscus, being in the fifty-sixth year of his age. Should posterity wish to know something of his appearance, it was graceful rather than commanding. There was nothing formidable in his appearance; a gracious look predominated. One would easily believe him a good man, and willingly believe him to be great. As for himself, though taken from us in the prime of a vigorous manhood, yet, as far as glory is concerned, his life was of the longest. Those true blessings, indeed, which consist in virtue, he had fully attained; and on one who had reached the honors of a consulate and a triumph, what more had fortune to bestow? Immense wealth had no attractions for him, and wealth he had, even to splendor. As his daughter and his wife survived him, it may be thought that he was even fortunate—fortunate, in that while his honors had suffered no eclipse, while his fame was at its height, while his kindred and his friends still prospered, he escaped from the evil to come. For, though to survive until the dawn of this most happy age and to see a Trajan on the throne was what he would speculate upon in previsions and wishes confided to my ears, yet he had this mighty compensation for his premature death, that he was spared those later years during which Domitian, leaving now no interval or breathing space of time, but, as it were, with one continuous blow, drained the lifeblood of the Commonwealth.

Agricola did not see the senate house besieged, or the senate hemmed in by armed men, or so many of our consulars falling at one single massacre, or so many of Rome's noblest ladies exiles and fugitives. Carus Metius had as yet the distinction of but one victory, and the noisy counsels of Messalinus were not heard beyond the walls of Alba, and Massa Baebius was then answering for his life. It was not long before our hands dragged Helvidius to prison, before we gazed on the dying looks of Manricus and Rusticus, before we were steeped in Senecio's innocent blood. Even Nero turned his eyes away, and did not gaze upon the atrocities which he ordered; with Domitian it was the chief part of our miseries to see and to be seen, to know that our sighs were being recorded, to have, ever ready to note the pallid looks of so many faces, that savage countenance reddened with the hue with which he defied shame.

Thou wast indeed fortunate, Agricola, not only in the splendor of thy life, but in the opportune moment of thy death. Thou submittedst to thy

fate, so they tell us who were present to hear thy last words, with courage and cheerfulness, seeming to be doing all thou couldst to give thine Emperor full acquittal. As for me and thy daughter, besides all the bitterness of a father's loss, it increases our sorrow that it was not permitted us to watch over thy failing health, to comfort thy weakness, to satisfy ourselves with those looks, those embraces. Assuredly we should have received some precepts, some utterances to fix in our inmost hearts. This is the bitterness of our sorrow, this the smart of our wound, that from the circumstance of so long an absence thou wast lost to us four years before. Doubtless, best of fathers, with that most loving wife at thy side, all the dues of affection were abundantly paid thee, yet with too few tears thou wast laid to thy rest, and in the light of thy last day there was something for which thine eyes longed in vain.

If there is any dwelling place for the spirits of the just; if, as the wise believe, noble souls do not perish with the body, rest thou in peace; and call us, thy family, from weak regrets and womanish laments to the contemplation of thy virtues, for which we must not weep nor beat the breast. Let us honor thee not so much with transitory praises as with our reverence, and, if our powers permit us, with our emulation. That will be true respect, that the true affection of thy nearest kin. This, too, is what I would enjoin on daughter and wife, to honor the memory of that father, that husband, by pondering in their hearts all his words and acts, by cherishing the features and lineaments of his character rather than those of his person. It is not that I would forbid the likenesses which are wrought in marble or in bronze; but as the faces of men, so all similitudes of the face are weak and perishable things, while the fashion of the soul is everlasting, such as may be expressed not in some foreign substance, or by the help of art, but in our own lives. Whatever we loved, whatever we admired in Agricola, survives, and will survive in the hearts of men, in the succession of the ages, in the fame that waits on noble deeds. Over many indeed, of those who have gone before, as over the inglorious and ignoble, the waves of oblivion will roll; Agricola, made known to posterity by history and tradition, will live forever.

François Guizot

1787–1874

François Pierre Guillaume Guizot is famous both as a historian and as a statesman. As a historian, he is the author of several important works on European history; as a statesman, he had a long and impressive political career, climaxed by his becoming chief minister of the government of France.

Guizot was born at Nîmes, France, in 1787. His father died on the scaffold in 1794, a victim of the Reign of Terror which followed the French Revolution. François and his mother fled to Geneva, where he remained until he was eighteen. In 1805 he went to Paris to study law. He soon abandoned the law to do literary and historical work, including an annotated translation of Gibbon's *Decline and Fall of the Roman Empire*.¹ His writings brought him considerable fame, and at the age of 25 he was appointed professor of modern history at the famous Sorbonne in Paris.

Guizot's political career began in 1814, when he became a member of the government formed under Louis XVIII, the restored monarch of France. Though he was a conservative and a monarchist, Guizot's political views were too liberal for the king, and he soon fell out of favor. In 1820 he left the government and returned to his lectures at the Sorbonne.

Guizot's political opinions were even less acceptable to Louis's successor, Charles X, and in 1822 he was forbidden to continue his lectures. During the next few years, he did his most important historical research and writing. His works of this period include: *History of Representative Government*, *History of the English Revolution*, *History of Civilization in Europe*, and *History of Civilization in*

¹ See *Great Books of the Western World*.

France. In 1828, as the result of a change in government, he was permitted to resume his lectures. He was enthusiastically received upon his return to the podium, and the lectures he gave during the next two years were very popular. His lecture on "Civilization" was the first of this series.

Guizot returned to political life in 1830, when he was elected to the Chamber of Deputies. He was appointed to various ministry positions during the next decade, and in 1840 he was named Minister of Foreign Affairs. This made him head of the government. He held that position until his government fell in 1848. One of his chief political opponents during this period was Alexis de Tocqueville. The downfall of Guizot's government is usually attributed to his unwillingness to make any concessions of principle.

Guizot never again took part in French politics. After a brief exile in London, he returned to France to write his memoirs and a history of France for young people. He died in 1874 at the age of 86.

Civilization and civilized are words we come across frequently in reading and in conversation. We usually pass over them quickly because we feel certain that we know what they mean. But how well do we understand them? Do we know what standards are used to determine whether a nation or a people is civilized? Do we know what qualities must be present in a culture for it to be considered a civilization? Most of us do not. No doubt it would be impossible to arrive at definitions for these terms which would satisfy everyone, but we can find out how a great historian of culture defines them by reading Guizot's lecture on "Civilization."

Guizot maintains that the most essential element in a civilization is progress: "The idea of progress, of development, appears to me the fundamental idea contained in the word civilization." The progress should be both social and individual. By social progress Guizot means a constant advance toward "an increasing production of the means of giving strength and happiness to society" and "a more equitable distribution, among individuals, of the strength." The progress of the individual is marked by "the development of the individual, internal life, the development of man himself, of his faculties, his sentiments, his ideas." Though at times it may appear that progress takes place in one of these areas and not in the other, Guizot insists that this cannot happen. "All the great developments of the

internal man," he writes, "have turned to the profit of society; all the great developments of the social state to the profit of individual man."

In recent years, when discussing nations and peoples, we have tried to avoid using such words as uncivilized and barbaric because they seem to suggest inferiority. Instead we use words like underdeveloped and emergent. In a similar fashion, we substitute advanced and industrialized for civilized. But these substituted words are almost as difficult to define as the words they replace. What are the characteristics of an underdeveloped nation? What is an advanced society? It is important that we find answers to questions like these, so that we will know in what direction we should attempt to lead the peoples of the emergent nations. Guizot's discussion of the concept of civilization will help us to answer them.

Civilization

from *History of Civilization in Europe* ¹

I have used the term European civilization, because it is evident that there is a European civilization; that a certain unity pervades the civilization of the various European states; that, notwithstanding infinite diversities of time, place and circumstance, this civilization takes its first rise in facts almost wholly similar, proceeds everywhere upon the same principles, and tends to produce well-nigh everywhere analogous results. There is, then, a European civilization, and it is to the subject of this aggregate civilization that I will request your attention.

Again, it is evident that this civilization cannot be traced back, that its history cannot be derived from the history of any single European state. If, on the one hand, it is manifestly characterized by brevity, on the other, its variety is no less prodigious; it has not developed itself with completeness in any one particular country. The features of its physiognomy are widespread; we must seek the elements of its history, now in France, now in England, now in Germany, now in Spain.

We of France occupy a favorable position for pursuing the study of European civilization. Flattery of individuals, even of our country, should be at all times avoided: it is without vanity, I think, we may say that France has been the center, the focus of European civilization. I do not pretend, it were monstrous to do so, that she has always, and in every direction, marched at the head of nations. At different epochs, Italy has taken the lead of her, in the arts; England, in political institutions; and there may be other respects under which, at particular periods, other European nations have manifested a superiority to her; but it is impossi-

1. Omitted here are the opening remarks in which Guizot announces to his lecture audience his intention to treat of the history of European civilization, its origin, its progress, its aim, and its character [Ed.].

ble to deny that whenever France has seen herself thus outstripped in the career of civilization, she has called up fresh vigor, has sprung forward with a new impulse, and has soon found herself abreast with, or in advance of, all the rest. And not only has this been the peculiar fortune of France, but we have seen that when the civilizing ideas and institutions which have taken their rise in other lands have sought to extend their sphere, to become fertile and general, to operate for the common benefit of European civilization, they have been necessitated to undergo, to a certain extent, a new preparation in France; and it has been from France, as from a second native country, that they have gone forth to the conquest of Europe. There is scarcely any great idea, any great principle of civilization which, prior to its diffusion, has not passed in this way through France.

And for this reason: there is in the French character something sociable, something sympathetic, something which makes its way with greater facility and effect than does the national genius of any other people; whether from our language, whether from the turn of our mind, of our manners, certain it is that our ideas are more popular than those of other people, present themselves more clearly and intelligibly to the masses and penetrate among them more readily; in a word, perspicuity, sociability, sympathy are the peculiar characteristics of France, of her civilization, and it is these qualities which rendered her eminently fit to march at the very head of European civilization.

In entering, therefore, upon the study of this great fact, it is no arbitrary or conventional choice to take France as the center of this study; we must needs do so if we would place ourselves, as it were, in the very heart of civilization, in the very heart of the fact we are about to consider.

I use the term *fact*, and I do so purposely; civilization is a fact like any other—a fact susceptible, like any other, of being studied, described, narrated.

For some time past, there has been much talk of the necessity of limiting history to the narration of facts: nothing can be more just; but we must always bear in mind that there are far more facts to narrate, and that the facts themselves are far more various in their nature than people are at first disposed to believe; there are material, visible facts, such as wars, battles, the official acts of governments; there are moral facts, none the less real that they do not appear on the surface; there are individual facts which have denominations of their own; there are general facts, without any particular designation, to which it is impossible to assign any precise date, which it is impossible to bring within strict limits, but which

are yet no less facts than the rest, historical facts, facts which we cannot exclude from history without mutilating history.

The very portion of history which we are accustomed to call its philosophy, the relation of events to each other, the connection which unites them, their causes and their effects—these are all facts, these are all history, just as much as the narratives of battles, and of other material and visible events. Facts of this class it is doubtless more difficult to disentangle and explain; we are more liable to error in giving an account of them, and it is no easy thing to give them life and animation, to exhibit them in clear and vivid colors; but this difficulty in no degree changes their nature; they are none the less an essential element of history.

Civilization is one of these facts; general, hidden, complex fact; very difficult, I allow, to describe, to relate, but which none the less for that exists, which none the less for that has a right to be described and related. We may raise as to this fact a great number of questions; we may ask, it has been asked, whether it is a good or an evil? Some bitterly deplore it; others rejoice at it. We may ask whether it is a universal fact, whether there is a universal civilization of the human species, a destiny of humanity; whether the nations have handed down from age to age something which has never been lost, which must increase, form a larger and larger mass, and thus pass on to the end of time? For my own part, I am convinced that there is, in reality, a general destiny of humanity, a transmission of the aggregate of civilization; and, consequently, a universal history of civilization to be written. But without raising questions so great, so difficult to solve, if we restrict ourselves to a definite limit of time and space, if we confine ourselves to the history of a certain number of centuries, of a certain people, it is evident that within these bounds, civilization is a fact which can be described, related—which is history. I will at once add that this history is the greatest of all, that it includes all.

And, indeed, does it not seem to yourselves that the fact civilization is the fact *par excellence*—the general and definitive fact, in which all the others terminate, into which they all resolve themselves? Take all the facts which compose the history of a nation, and which we are accustomed to regard as the elements of its life; take its institutions, its commerce, its industry, its wars, all the details of its government: when we would consider these facts in their aggregate, in their connection, when we would estimate them, judge them, we ask in what they have contributed to the civilization of that nation, what part they have taken in it, what influence they have exercised over it. It is in this way that we not only form a complete idea of them but measure and appreciate their

true value; they are, as it were, rivers, of which we ask what quantity of water it is they contribute to the ocean? For civilization is a sort of ocean, constituting the wealth of a people, and on whose bosom all the elements of the life of that people, all the powers supporting its existence, assemble and unite. This is so true that even facts, which from their nature are odious, pernicious, which weigh painfully upon nations, despotism, for example, and anarchy, if they have contributed in some way to civilization, if they have enabled it to make an onward stride, up to a certain point we pardon them, we overlook their wrongs, their evil nature; in a word, wherever we recognize civilization, whatever the facts which have created it, we are tempted to forget the price it has cost.

There are, moreover, facts which, properly speaking, we cannot call social; individual facts, which seem to interest the human soul rather than the public life: such are religious creeds and philosophical ideas, sciences, letters, arts. These facts appear to address themselves to man with a view to his moral perfection, his intellectual gratification; to have for their object his internal amelioration, his mental pleasure, rather than his social condition. But, here again, it is with reference to civilization that these very facts are often considered, and claim to be considered.

At all times, in all countries, religion has assumed the glory of having civilized the people; sciences, letters, arts, all the intellectual and moral pleasures, have claimed a share in this glory; and we have deemed it a praise and an honor to them when we have recognized this claim on their part. Thus, facts the most important and sublime in themselves, independently of all external result, and simply in their relations with the soul of man, increase in importance, rise in sublimity from their affinity with civilization. Such is the value of this general fact, that it gives value to everything it touches. And not only does it give value; there are even occasions when the facts of which we speak, religious creeds, philosophical ideas, letters, arts, are especially considered and judged of with reference to their influence upon civilization; an influence which becomes, up to a certain point and during a certain time, the conclusive measure of their merit, of their value.

What, then, I will ask, before undertaking its history, what, considered only in itself, what is this so grave, so vast, so precious fact, which seems the sum, the expression of the whole life of nations?

I shall take care here not to fall into pure philosophy; not to lay down some ratiocinative principle, and then deduce from it the nature of civilization as a result; there would be many chances of error in this method. And here again we have a fact to verify and describe.

For a long period, and in many countries, the word *civilization* has been in use; people have attached to the word ideas more or less clear, more or less comprehensive; but there it is in use, and those who use it attach some meaning or other to it. It is the general, human, popular meaning of this word that we must study. There is almost always in the usual acceptation of the most general terms more accuracy than in the definitions, apparently more strict, more precise, of science. It is common sense which gives to words their ordinary signification, and common sense is the characteristic of humanity. The ordinary signification of a word is formed by gradual progress and in the constant presence of facts; so that when a fact presents itself which seems to come within the meaning of a known term, it is received into it, as it were, naturally; the signification of the term extends itself, expands, and by degrees the various facts, the various ideas which from the nature of the things themselves men should include under this word, are included.

When the meaning of a word, on the other hand, is determined by science, this determination, the work of one individual, or of a small number of individuals, takes place under the influence of some particular fact which has struck upon the mind. Thus, scientific definitions are, in general, much more narrow, and, hence, much less accurate, much less true, at bottom, than the popular meanings of the terms. In studying as a fact the meaning of the word *civilization*, in investigating all the ideas which are comprised within it, according to the common sense of mankind, we shall make a much greater progress toward a knowledge of the fact itself than by attempting to give it ourselves a scientific definition, however more clear and precise the latter might appear at first.

I will commence this investigation by endeavoring to place before you some hypotheses: I will describe a certain number of states of society, and we will then inquire whether general instinct would recognize in them the condition of a people civilizing itself; whether we recognize in them the meaning which mankind attaches to the word *civilization*.

First, suppose a people whose external life is easy, is full of physical comfort; they pay few taxes, they are free from suffering; justice is well administered in their private relations—in a word, material existence is for them altogether happy and happily regulated. But at the same time, the intellectual and moral existence of this people is studiously kept in a state of torpor and inactivity; of, I will not say, oppression, for they do not understand the feeling, but of compression. We are not without instances of this state of things. There has been a great number of small aristocratic republics in which the people have been thus treated like flocks of sheep,

well kept and materially happy, but without moral and intellectual activity. Is this civilization? Is this a people civilizing itself?

Another hypothesis: here is a people whose material existence is less easy, less comfortable, but still supportable. On the other hand, moral and intellectual wants have not been neglected, a certain amount of mental pasture has been served out to them; elevated, pure sentiments are cultivated in them; their religious and moral views have attained a certain degree of development; but great care is taken to stifle in them the principle of liberty; the intellectual and moral wants, as in the former case the material wants, are satisfied; each man has meted out to him his portion of truth; no one is permitted to seek it for himself. Immobility is the characteristic of moral life; it is the state into which have fallen most of the populations of Asia; wherever theocratic dominations keep humanity in check; it is the state of the Hindus, for example. I ask the same question here as before; is this a people civilizing itself?

I change altogether the nature of the hypothesis: here is a people among whom is a great display of individual liberties, but where disorder and inequality are excessive: it is the empire of force and of chance; every man, if he is not strong, is oppressed, suffers, perishes; violence is the predominant feature of the social state. No one is ignorant that Europe has passed through this state. Is this a civilized state? It may, doubtless, contain principles of civilization which will develop themselves by successive degrees; but the fact which dominates in such a society is, assuredly, not that which the common sense of mankind calls civilization.

I take a fourth and last hypothesis: the liberty of each individual is very great, inequality among them is rare, and at all events, very transient. Every man does very nearly just what he pleases, and differs little in power from his neighbor; but there are very few general interests, very few public ideas, very little society—in a word, the faculties and existence of individuals appear and then pass away, wholly apart and without acting upon each other, or leaving any trace behind them; the successive generations leave society at the same point at which they found it: this is the state of savage tribes; liberty and equality are there, but assuredly not civilization.

I might multiply these hypotheses, but I think we have before us enough to explain what is the popular and natural meaning of the word civilization.

It is clear that none of the states I have sketched corresponds, according to the natural good sense of mankind, to this term. Why? It appears to me that the first fact comprised in the word civilization (and this re-

sults from the different examples I have rapidly placed before you) is the fact of progress, of development; it presents at once the idea of a people marching onward, not to change its place, but to change its condition; of a people whose culture is conditioning itself, and ameliorating itself. The idea of progress, of development, appears to me the fundamental idea contained in the word civilization. What is this progress? What this development? Herein is the greatest difficulty of all.

The etymology of the word would seem to answer in a clear and satisfactory manner: it says that it is the perfecting of civil life, the development of society, properly so called, of the relations of men among themselves.

Such is, in fact, the first idea which presents itself to the understanding when the word civilization is pronounced; we at once figure forth to ourselves the extension, the greatest activity, the best organization of the social relations: on the one hand, an increasing production of the means of giving strength and happiness to society; on the other, a more equitable distribution, among individuals, of the strength.

Is this all? Have we here exhausted all the natural, ordinary meaning of the word civilization? Does the fact contain nothing more than this?

It is almost as if we asked: Is the human species after all a mere anthill, a society in which all that is required is order and physical happiness, in which the greater the amount of labor, and the more equitable the division of the fruits of labor, the more surely is the object attained, the progress accomplished?

Our instinct at once feels repugnant to so narrow a definition of human destiny. It feels at the first glance that the word civilization comprehends something more extensive, more complex, something superior to the simple perfection of the social relations, of social power and happiness.

Fact, public opinion, the generally received meaning of the term, are in accordance with this instinct.

Take Rome in the palmy days of the republic, after the Second Punic War, at the time of its greatest virtues, when it was marching to the empire of the world, when its social state was evidently in progress. Then take Rome under Augustus, at the epoch when her decline began, when, at all events, the progressive movement of society was arrested, when evil principles were on the eve of prevailing: yet there is no one who does not think and say that the Rome of Augustus was more civilized than the Rome of Fabricius or of Cincinnatus.

Let us transport ourselves beyond the Alps: let us take the France of

the seventeenth and eighteenth centuries: it is evident that, in a social point of view, considering the actual amount and distribution of happiness among individuals, the France of the seventeenth and eighteenth centuries was inferior to some other countries of Europe, to Holland and to England, for example. I believe that in Holland and in England the social activity was greater, was increasing more rapidly, distributing its fruit more fully, than in France, yet ask general good sense, and it will say that the France of the seventeenth and eighteenth centuries was the most civilized country in Europe. Europe has not hesitated in her affirmative reply to the question: traces of this public opinion, as to France, are found in all the monuments of European literature.

We might point out many other states in which the prosperity is greater, is of more rapid growth, is better distributed among individuals than elsewhere, and in which, nevertheless, by the spontaneous instinct, the general good sense of men, the civilization is judged inferior to that of countries not so well portioned out in a purely social sense.

What does this mean; what advantages do these latter countries possess? What is it gives them, in the character of civilized countries, this privilege; what so largely compensates in the opinion of mankind for what they so lack in other respects?

A development other than that of social life has been gloriously manifested by them; the development of the individual, internal life, the development of man himself, of his faculties, his sentiments, his ideas. If society with them be less perfect than elsewhere, humanity stands forth in more grandeur and power. There remain, no doubt, many social conquests to be made; but immense intellectual and moral conquests are accomplished; worldly goods, social rights, are wanting to many men; but many great men live and shine in the eyes of the world. Letters, sciences, the arts, display all their splendor. Wherever mankind beholds these great signs, these signs glorified by human nature, wherever it sees created these treasures of sublime enjoyment, it there recognizes and names civilization.

Two facts, then, are comprehended in this great fact; it subsists on two conditions, and manifests itself by two symptoms: the development of social activity and that of individual activity; the progress of society and the progress of humanity. Wherever the external condition of man extends itself, vivifies, ameliorates itself; wherever the internal nature of man displays itself with luster, with grandeur; at these two signs, and often despite the profound imperfection of the social state, mankind with loud applause proclaims civilization.

Such, if I do not deceive myself, is the result of simple and purely common-sense examination of the general opinion of mankind. If we interrogate history, properly so called, if we examine what is the nature of the great crises of civilization, of those facts which, by universal consent, have propelled it onward, we shall constantly recognize one or other of the two elements I have just described. They are always crises of individual or social development, facts which have changed the internal man, his creed, his manners, or his external condition, his position in his relation with his fellows. Christianity, for example, not merely on its first appearance, but during the first stages of its existence, Christianity in no degree addressed itself to the social state; it announced aloud that it would not meddle with the social state; it ordered the slave to obey his master; it attacked none of the great evils, the great wrongs of the society of that period. Yet who will deny that Christianity was a great crisis of civilization? Why was it so? Because it changed the internal man, creeds, sentiments; because it regenerated the moral man, the intellectual man.

We have seen a crisis of another nature, a crisis which addressed itself, not to the internal man, but to his external condition; one which changed and regenerated society. This also was assuredly one of the decisive crises of civilization. Look through all history, you will find everywhere the same result; you will meet with no important fact instrumental in the development of civilization, which has not exercised one or other of the two sorts of influence I have spoken of.

Such, if I mistake not, is the natural and popular meaning of the term; you have here the fact, I will not say defined, but described, verified almost completely, or, at all events, in its general features. We have before us the two elements of civilization. Now comes the question, would one of these two suffice to constitute it; would the development of the social state, the development of the individual man, separately presented, be civilization? Would the human race recognize it as such, or have the two facts so intimate and necessary a relation between them, that if they are not simultaneously produced, they are notwithstanding inseparable, and sooner or later one brings on the other?

We might, as it appears to me, approach this question on three several sides. We might examine the nature itself of the two elements of civilization, and ask ourselves whether by that alone they are or are not closely united with, and necessary to, each other. We might inquire of history whether they had manifested themselves isolately, apart the one from the other, or whether they had invariably produced the one the other.

We may, lastly, consult upon this question the common opinion of mankind—common sense. I will address myself first to common sense.

When a great change is accomplished in the state of a country, when there is operated in it a large development of wealth and power, a revolution in the distribution of the social means, this new fact encounters adversaries, undergoes opposition: this is inevitable. What is the general cry of the adversaries of the change? They say that this progress of the social state does not ameliorate, does not regenerate in like manner, in a like degree, the moral, the internal state of man; that it is a false, delusive progress, the result of which is detrimental to morality, to man. The friends of social development energetically repel this attack; they maintain, on the contrary, that the progress of society necessarily involves and carries with it the progress of morality; that when the external life is better regulated, the internal life is refined and purified. Thus stands the question between the adversaries and partisans of the new state.

Reverse the hypothesis: suppose the moral development in progress: what do the laborers in this progress generally promise? What, in the origin of societies, have promised the religious rulers, the sages, the poets, who have labored to soften and to regulate men's manners? They have promised the amelioration of the social condition, the more equitable distribution of the social means. What, then, I ask you, is involved in these disputes, these promises? What do they mean? What do they imply?

They imply that in the spontaneous, instinctive conviction of mankind, the two elements of civilization, the social development and the moral development, are closely connected together; that at sight of the one, man at once looks forward to the other. It is to this natural instinctive conviction that those who are maintaining or combating one or other of the two developments address themselves, when they affirm or deny their union. It is well understood that if we can persuade mankind that the amelioration of the social state will be adverse to the internal progress of individuals, we shall have succeeded in decrying and enfeebling the revolution in operation throughout society. On the other hand, when we promise mankind the amelioration of society by means of the amelioration of the individual, it is well understood that the tendency is to place faith in these promises, and it is accordingly made use of with success. It is evidently, therefore, the instinctive belief of humanity that the movements of civilization are connected the one with the other, and reciprocally produce the one the other.

If we address ourselves to the history of the world, we shall receive the same answer. We shall find that all the great developments of the

internal man have turned to the profit of society; all the great developments of the social state to the profit of individual man. We find the one or other of the two facts predominating, manifesting itself with striking effect, and impressing upon the movement in progress a distinctive character. It is, sometimes, only after a very long interval of time, after a thousand obstacles, a thousand transformations, that the second fact, developing itself, comes to complete the civilization which the first had commenced. But if you examine them closely, you will soon perceive the bond which unites them. The march of Providence is not restricted to narrow limits; it is not bound, and it does not trouble itself, to follow out today the consequences of the principle which it laid down yesterday. The consequences will come in due course, when the hour for them has arrived, perhaps not till hundreds of years have passed away; though its reasoning may appear to us slow, its logic is none the less true and sound. To Providence, time is as nothing; it strides through time as the gods of Homer through space: it makes but one step, and ages have vanished behind it. How many centuries, what infinite events passed away before the regeneration of the moral man by Christianity exercised upon the regeneration of the social state its great and legitimate influence? Yet who will deny that it any the less succeeded?

If from history we extend our inquiries to the nature itself of the two facts which constitute civilization, we are infallibly led to the same result. There is no one who has not experienced this in his own case. When a moral change is operated in man, when he acquires an idea, or a virtue, or a faculty, more than he had before—in a word, when he develops himself individually, what is the desire, what the want, which at the same moment takes possession of him? It is the desire, the want, to communicate the new sentiment to the world about him, to give realization to his thoughts externally. As soon as a man acquires anything, as soon as his being takes in his own conviction a new development, assumes an additional value, forthwith he attaches to this new development, this fresh value, the idea of possession; he feels himself impelled, compelled, by his instinct, by an inward voice, to extend to others the change, the amelioration, which has been accomplished in his own person. We owe the great reformers solely to this cause; the mighty men who have changed the face of the world, after having changed themselves, were urged onward, were guided on their course, by no other want than this. So much for the alteration which is operated in the internal man; now to the other. A revolution is accomplished in the state of society; it is

better regulated, rights and property are more equitably distributed among its members—that is to say, the aspect of the world becomes purer and more beautiful, the action of government, the conduct of men in their mutual relations, more just, more benevolent. Do you suppose that this improved aspect of the world, this amelioration of external facts, does not react upon the interior of man, upon humanity? All that is said as to the authority of examples, of customs, of noble models, is founded upon this only: that an external fact, good, well regulated, leads sooner or later, more or less completely, to an internal fact of the same nature, the same merit; that a world better regulated, a world more just, renders man himself more just; that the inward is reformed by the outward, as the outward by the inward; that the two elements of civilization are closely connected the one with the other; that centuries, that obstacles of all sorts, may interpose between them; that it is possible they may have to undergo a thousand transformations in order to regain each other; but sooner or later they will rejoin each other: this is the law of their nature, the general fact of history, the instinctive faith of the human race.

I think I have thus not exhausted the subject, very far from it, but exhibited in a well-nigh complete, though cursory, manner, the fact of civilization; I think I have described it, settled its limits, and stated the principal, the fundamental questions to which it gives rise. I might stop here; but I cannot help touching upon a question which meets me at this point; one of those questions which are not historical questions, properly so called; which are questions, I will not call them hypothetical, but conjectural; questions of which man holds but one end, the other end being permanently beyond his reach; questions of which he cannot make the circuit, nor view on more than one side; and yet questions not the less real, not the less calling upon him for thought; for they present themselves before him, despite himself, at every moment.

Of those two developments of which we have spoken, and which constitute the fact of civilization, the development of society on the one hand and of humanity on the other, which is the end, which is the means? Is it to perfect his social condition, to ameliorate his existence on earth, that man develops himself, his faculties, sentiments, ideas, his whole being?—or rather, is not the amelioration of the social condition, the progress of society, society itself, the theater, the occasion, the *mobile*, of the development of the individual; in a word, is society made to serve the individual, or the individual to serve society? On the answer to this question inevitably depends that whether the destiny of man is purely social;

whether society drains up and exhausts the whole man; or whether he bears within him something intrinsic—something superior to his existence on earth.

A man whom I am proud to call my friend, a man who has passed through meetings like our own to assume the first place in assemblies less peaceable and more powerful, a man all whose words are engraven on the hearts of those who hear them, M. Royer-Collard, has solved this question according to his own conviction, at least, in his speech on the Sacrilege Bill. I find in that speech these two sentences: “Human societies are born, live and die, on the earth; it is there their destinies are accomplished. . . . But they contain not the whole man. After he has engaged himself to society, there remains to him the noblest part of himself, those high faculties by which he elevates himself to God, to a future life, to unknown felicity in an invisible world. . . . We, persons individual and indetachable, veritable beings endowed with immortality, we have a different destiny from that of states.”

I will add nothing to this; I will not undertake to treat the question itself; I content myself with stating it. It is met with at the history of civilization: when the history of civilization is completed, when there is nothing more to say as to our present existence, man inevitably asks himself whether all is exhausted, whether he has reached the end of all things. This then is the last, the highest of all those problems to which history of civilization can lead. It is sufficient for me to have indicated its position and its grandeur.

From all I have said it is evident that the history of civilization might be treated in two methods, drawn from two sources, considered under two different aspects. The historian might place himself in the heart of the human mind for a given period, a series of ages, or among the determinate people; he might study, describe, relate all the events, all the transformations, all the revolutions which had been accomplished in the internal man; and when he should arrive at the end he would have a history of civilization among the people, and in the period he had selected. He may proceed in another manner: instead of penetrating the internal man, he may take his stand—he may place himself in the midst of the world; instead of describing the vicissitudes of the ideas, the sentiments of the individual being, he may describe external facts, the events, the changes of the social state. These two portions, these two histories of civilization are closely connected with each other; they are the reflection, the image of each other. Yet, they may be separated; perhaps, indeed, they ought to be so, at least at the onset, in order that both the one and

the other may be treated of in detail, and with perspicuity. For my part I do not propose to study with you the history of civilization in the interior of the human soul; it is the history of external events of the visible and social world that I shall occupy myself with. I had wished, indeed, to exhibit to you the whole fact of civilization, such as I can conceive it in all its complexity and extent, to set forth before you all the high questions which may arise from it. At present I restrict myself; mark out my field of inquiry within narrower limits; it is only the history of the social state that I purpose investigating.

We shall begin by seeking all the elements of European civilization in its cradle at the fall of the Roman Empire; we will study with attention society, such as it was, in the midst of those famous ruins. We will endeavor not to resuscitate but to place its elements side by side, and when we have done so, we will endeavor to make them move and follow them in their developments through the fifteen centuries which have elapsed since that epoch.

I believe that when we have got but a very little way into this study, we shall acquire the conviction that civilization is as yet very young; that the world has by no means as yet measured the whole of its career. Assuredly human thought is at this time very far from being all that it is capable of becoming; we are very far from comprehending the whole future of humanity: let each of us descend into his own mind, let him interrogate himself as to the utmost possible good he has formed a conception of and hopes for; let him then compare his idea with what actually exists in the world; he will be convinced that society and civilization are very young; that notwithstanding the length of the road they have come, they have incomparably further to go. This will lessen nothing of the pleasure that we shall take in the contemplation of our actual condition. As I endeavor to place before you the great crises in the history of civilization in Europe during the last fifteen centuries, you will see to what a degree, even up in our own days, the condition of man has been laborious, stormy, not only in the outward and social state, but inwardly in the life of the soul. During all those ages, the human mind has had to suffer as much as the human race; you will see that in modern times, for the first time, perhaps, the human mind has attained a state, as yet very imperfect, but still a state in which reigns some peace, some harmony. It is the same with society; it has evidently made immense progress, the human condition is easy and just, compared with what it was previously; we may almost when thinking of our ancestors apply to ourselves the verses of Lucretius:

*Suave mari magno, turbantibus æquora ventis,
E terrâ magnum alterius spectare laborem.*

[’Tis pleasant, in a great storm, to contemplate, from a safe position on shore, the perils of some ships tossed about by the furious winds and the stormy ocean.]

We may say of ourselves, without too much pride, as Sthenelus in Homer:

Thank Heaven, we are infinitely better than those who went before us.

Let us be careful, however, not to give ourselves up too much to the idea of our happiness and amelioration, or we may fall into two grave dangers, pride and indolence; we may conceive an overconfidence in the power and success of the human mind, in our own enlightenment, and, at the same time, suffer ourselves to become enervated by the luxurious ease of our condition. It appears to me that we are constantly fluctuating between a tendency to complain upon light grounds, on the one hand, and to be content without reason, on the other. We have a susceptibility of spirit, a craving, an unlimited ambition in the thought, in our desire, in the movement of the imagination; but when it comes to the practical work of life, when we are called upon to give ourselves any trouble, to make any sacrifices, to use any efforts to attain the object, our arms fall down listlessly by our sides, and we give the matter up in despair, with a facility equaled only by the impatience with which we had previously desired its attainment. We must beware how we allow ourselves to yield to either of these defects. Let us accustom ourselves duly to estimate beforehand the extent of our force, our capacity, our knowledge; and let us aim at nothing which we feel we cannot attain legitimately, justly, regularly, and with unfailing regard to the principles upon which our civilization itself rests. We seem at times tempted to adopt the principles which, as a general rule, we assail and hold up to scorn—the principles, the right of the strongest of barbarian Europe; the brute force, the violence, the downright lying which were matters of course, of daily occurrence, four or five hundred years ago. But when we yield for a moment to this desire, we find in ourselves neither the perseverance nor the savage energy of the men of that period, who, suffering greatly from their condition, were naturally anxious, and incessantly essaying, to emancipate themselves from it. We, of the present day, are content with our condition; let us not expose it to danger by indulging in vague desires, the time for realizing which has not come. Much has been given to us, much will be required of us; we must render to posterity a strict account

of our conduct; the public, the government, all are now subjected to discussion, examination, responsibility. Let us attach ourselves firmly, faithfully, undeviatingly, to the principles of our civilization—justice, legality, publicity, liberty; and let us never forget that while we ourselves require, and with reason, that all things shall be open to our inspection and inquiry, we ourselves are under the eye of the world, and shall, in our turn, be discussed, be judged.

The foregoing is Lecture I
from Guizot's HISTORY OF CIVILIZATION IN EUROPE.

Henry Adams

1838–1918

Henry Adams was born in Boston in 1838, the grandson of the sixth President of the United States and the great-grandson of the second. Although a man of such ancestry was more or less expected to seek a career in politics, neither Henry's times nor his temperament permitted him to do so. The sort of scholar-statesman he might have been was inconceivable in the later nineteenth century—the Gilded Age—while the analytical turn of mind that had been a family trait emerged in him as a fatal habit of self-doubt. He became instead a historian, spending his life in the study of the social forces over which he could have no active control.

In this profession, Adams achieved by common consent the highest rank among his countrymen. His writings, celebrated for their style, convey the witty and ironic detachment with which he viewed every subject, most of all himself. They show as well the scientific and philosophical concerns of his unrelenting intelligence. As such they have always seemed more than ordinarily interesting. Yet Adams scorned his work, or pretended to, believing that it had made no difference in his day. Convinced that his life had been a failure, he said so at the end of his autobiography, *The Education of Henry Adams*, the one book by which he has become best known. He was

Notes from the artist: "The head of Adams, with a background suggesting his work Mont-Saint-Michel and Chartres. At left is Mont-Saint-Michel atop its rock pinnacle; at right is a saint from the sculpture on the north porch of Chartres Cathedral."

Henry Adams

the author of a number of other books. He died in 1918 at Washington, D.C., where as a spectator of power he had chiefly lived.

Adams' *History of the United States* appeared, in nine volumes, 1889–91. It is one of the major achievements of American historical writing. Some modern historians suggest that it is deficient in not emphasizing the economic forces at work during the period, but all critics agree that the first six chapters of the work constitute one of the best and most illuminating social surveys of any epoch in American history. Two of these chapters—the first and sixth—are reprinted here.

The first chapter poses a problem. It recounts the physical and economic resources available to Americans in 1800—the reader will perhaps be surprised to discover how slim they actually were—and asks, implicitly and on every page, how it was possible to make, in less than a century, the America which Henry Adams knew. To say nothing of the America we know! For, since Adams wrote, we have come as far again in the direction that he is discussing as his countrymen had come since the beginning of his century.

The sixth chapter suggests a possible solution to the problem. According to Adams, American society, despite its pathetically inadequate resources in men and money, was “sound and healthy in every part”—“except for Negro slavery.” But, he tells us, that was not enough. There was something else about America which puzzled almost every visitor. This was, to put it very simply, a dream.

“What was it,” Adams asks, echoing the question put by so many jaded Europeans in the early years of the last century, “that . . . turned the European peasant into a new man within half an hour after landing at New York?” It was something, evidently, that few or no educated foreigners could see. But Jefferson saw it. It was, essentially, an “emotion which caused the poorest peasant in Europe to see what was invisible to poet and philosopher—the dim outline of a mountain summit across the ocean, rising high above the mist and mud of American democracy.” And the results of it we see ourselves.

Adams was a pessimist. In other works, he questioned the reality, or at least the direction, of social progress. His pessimism is not particularly evident here. He is as amazed and as full of admiration as any American must be who looks back on his country's relatively

short history. He feels that, despite our faults, despite our errors and mistakes, we have come a long way. Nevertheless, some trace of Adams' pessimism may be found in the last paragraph of the sixth chapter.

He asks a series of questions about the American dream, and about the American effort to achieve it. Could American society "produce," he wonders, "or was it compatible with, the differentiation of a higher variety of the human race?" He concludes that "nothing less than this was necessary for its complete success." He forces us to ask whether the American story is a success story after all. In spite of the distance we have come, have we come far enough? Have we done all that we could do? Or is the hardest victory still to be won?

The United States in 1800

from *History of the United States of America*

PHYSICAL AND ECONOMICAL CONDITIONS

According to the census of 1800, the United States of America contained 5,308,483 persons. In the same year the British Islands contained upwards of fifteen millions; the French Republic, more than twenty-seven millions. Nearly one-fifth of the American people were Negro slaves; the true political population consisted of four and a half million free whites, or less than one million able-bodied males, on whose shoulders fell the burden of a continent. Even after two centuries of struggle the land was still untamed; forest covered every portion, except here and there a strip of cultivated soil; the minerals lay undisturbed in their rocky beds, and more than two-thirds of the people clung to the seaboard within fifty miles of tidewater, where alone the wants of civilized life could be supplied. The center of population rested within eighteen miles of Baltimore, north and east of Washington. Except in political arrangement, the interior was little more civilized than in 1750, and was not much easier to penetrate than when La Salle and Hennepin found their way to the Mississippi more than a century before.

A great exception broke this rule. Two wagon roads crossed the Allegheny Mountains in Pennsylvania,—one leading from Philadelphia to Pittsburgh; one from the Potomac to the Monongahela; while a third passed through Virginia southwestward to the Holston River and Knoxville in Tennessee, with a branch through the Cumberland Gap into Kentucky. By these roads and by trails less passable from North and South Carolina, or by waterways from the lakes, between four and five hundred thousand persons had invaded the country beyond the Alleghenies. At Pittsburgh and on the Monongahela existed a society, already old,

numbering seventy or eighty thousand persons, while on the Ohio River the settlements had grown to an importance which threatened to force a difficult problem on the union of the older states. One hundred and eighty thousand whites, with forty thousand Negro slaves, made Kentucky the largest community west of the mountains; and about ninety thousand whites and fourteen thousand slaves were scattered over Tennessee. In the territory north of the Ohio less progress had been made. A New England colony existed at Marietta; some fifteen thousand people were gathered at Cincinnati; halfway between the two, a small town had grown up at Chillicothe, and other villages or straggling cabins were to be found elsewhere; but the whole Ohio territory contained only forty-five thousand inhabitants. The entire population, both free and slave, west of the mountains, reached not yet half a million; but already they were partly disposed to think themselves, and the old thirteen states were not altogether unwilling to consider them, the germ of an independent empire, which was to find its outlet, not through the Alleghenies to the seaboard, but by the Mississippi River to the Gulf.

Nowhere did eastern settlements touch the western. At least one hundred miles of mountainous country held the two regions everywhere apart. The shore of Lake Erie, where alone contact seemed easy, was still unsettled. The Indians had been pushed back to the Cuyahoga River, and a few cabins were built on the site of Cleveland; but in 1800, as in 1700, this intermediate region was only a portage where emigrants and merchandise were transferred from Lake Erie to the Muskingum and Ohio valleys. Even western New York remained a wilderness: Buffalo was not laid out; Indian titles were not extinguished; Rochester did not exist; and the county of Onondaga numbered a population of less than eight thousand. In 1799 Utica contained fifty houses, mostly small and temporary. Albany was still a Dutch city, with some five thousand inhabitants; and the tide of immigration flowed slowly through it into the valley of the Mohawk, while another stream from Pennsylvania, following the Susquehanna, spread toward the Genesee country.

The people of the old thirteen states, along the Atlantic seaboard, thus sent westward a wedge-shaped mass of nearly half a million persons, penetrating by the Tennessee, Cumberland, and Ohio rivers toward the western limit of the Union. The Indians offered sharp resistance to this invasion, exacting life for life, and yielding only as their warriors perished. By the close of the century the wedge of white settlements, with its apex at Nashville and its flanks covered by the Ohio and Tennessee rivers, nearly split the Indian country in halves. The northern half—con-

sisting of the later States of Wisconsin, Michigan, Illinois, and Indiana, and one third of Ohio—contained Wyandottes and Shawanese, Miamis, Kickapoos, and other tribes, able to send some five thousand warriors to hunt or fight. In the southern half, powerful confederates of Creeks, Cherokees, Chickasaws, and Choctaws lived and hunted where the states of Mississippi, Alabama, and the western parts of Georgia, Tennessee, and Kentucky were to extend; and so weak was the state of Georgia, which claimed the southwestern territory for its own, that a well-concerted movement of Indians might without much difficulty have swept back its white population of one hundred thousand toward the ocean or across the Savannah River. The Indian power had been broken in halves, but each half was still terrible to the colonists on the edges of their vast domain, and was used as a political weapon by the governments whose territory bounded the Union on the north and south. The governors general of Canada intrigued with the northwestern Indians that they might hold in check any aggression from Washington; while the Spanish governors of West Florida and Louisiana maintained equally close relations with the Indian confederacies of the Georgia territory.

With the exception that half a million people had crossed the Alleghenies and were struggling with difficulties all their own, in an isolation like that of Jutes or Angles in the fifth century, America, so far as concerned physical problems, had changed little in fifty years. The old landmarks remained nearly where they stood before. The same bad roads and difficult rivers, connecting the same small towns, stretched into the same forests in 1800 as when the armies of Braddock and Amherst pierced the western and northern wilderness, except that these roads extended a few miles farther from the seacoast. Nature was rather man's master than his servant, and the five million Americans struggling with the untamed continent seemed hardly more competent to their task than the beavers and buffalo which had for countless generations made bridges and roads of their own.

Even by water, along the seaboard, communication was as slow and almost as irregular as in colonial times. The wars in Europe caused a sudden and great increase in American shipping employed in foreign commerce, without yet leading to general improvement in navigation. The ordinary seagoing vessel carried a freight of about two hundred and fifty tons; the largest merchant ships hardly reached four hundred tons; the largest frigate in the United States navy, the "line-of-battle ship in disguise," had a capacity of fifteen hundred and seventy-six tons. Elabo-

rately rigged as ships or brigs, the small merchant craft required large crews and were slow sailers; but the voyage to Europe was comparatively more comfortable and more regular than the voyage from New York to Albany, or through Long Island Sound to Providence. No regular packet plied between New York and Albany. Passengers waited till a sloop was advertised to sail; they provided their own bedding and supplies; and within the nineteenth century Captain Elias Bunker won much fame by building the sloop "Experiment," of one hundred and ten tons, to start regularly on a fixed day for Albany, for the convenience of passengers only, supplying beds, wine, and provisions for the voyage of one hundred and fifty miles. A week on the North River or on the Sound was an experience not at all unknown to travelers.

While little improvement had been made in water travel, every increase of distance added to the difficulties of the westward journey. The settler who after buying wagon and horses hauled his family and goods across the mountains might buy or build a broad flat-bottomed ark, to float with him and his fortunes down the Ohio, in constant peril of upsetting or of being sunk; but only light boats with strong oars could mount the stream, or boats forced against the current by laboriously poling in shallow water. If he carried his tobacco and wheat down the Mississippi to the Spanish port of New Orleans, and sold it, he might return to his home in Kentucky or Ohio by a long and dangerous journey on horseback through the Indian country from Natchez to Nashville, or he might take ship to Philadelphia, if a ship were about to sail, and again cross the Alleghenies. Compared with river travel, the sea was commonly an easy and safe highway. Nearly all the rivers which penetrated the interior were unsure, liable to be made dangerous by freshets, and both dangerous and impassable by drought; yet such as they were, these streams made the main paths of traffic. Through the mountainous gorges of the Susquehanna the produce of western New York first found an outlet; the Cuyahoga and Muskingum were the first highway from the Lakes to the Ohio; the Ohio itself, with its great tributaries the Cumberland and the Tennessee, marked the lines of western migration; and every stream which could at high water float a boat was thought likely to become a path for commerce. As General Washington, not twenty years earlier, hoped that the brawling waters of the Cheat and Youghiogheny might become the channel of trade between Chesapeake Bay and Pittsburgh, so the Americans of 1800 were prepared to risk life and property on any streamlet that fell foaming down either flank of the Alleghenies. The experience of mankind proved trade to be dependent on

water communications, and as yet Americans did not dream that the experience of mankind was useless to them.

If America was to be developed along the lines of water communication alone, by such means as were known to Europe, Nature had decided that the experiment of a single republican government must meet extreme difficulties. The valley of the Ohio had no more to do with that of the Hudson, the Susquehanna, the Potomac, the Roanoke, and the Santee than the valley of the Danube with that of the Rhône, the Po, or the Elbe. Close communication by land could alone hold the great geographical divisions together either in interest or in fear. The union of New England with New York and Pennsylvania was not an easy task even as a problem of geography, and with an ocean highway; but the union of New England with the Carolinas, and of the seacoast with the interior, promised to be a hopeless undertaking. Physical contact alone could make one country of these isolated empires, but to the patriotic American of 1800, struggling for the continued existence of an embryo nation, with machinery so inadequate, the idea of ever bringing the Mississippi River, either by land or water, into close contact with New England, must have seemed wild. By water, an Erie Canal was already foreseen; by land, centuries of labor could alone conquer those obstacles which Nature permitted to be overcome.

In the minds of practical men, the experience of Europe left few doubts on this point. After two thousand years of public labor and private savings, even despotic monarchs, who employed the resources of their subjects as they pleased, could in 1800 pass from one part of their European dominions to another little more quickly than they might have done in the age of the Antonines. A few short canals had been made, a few bridges had been built, an excellent post road extended from Madrid to St. Petersburg; but the heavy diligence that rumbled from Calais to Paris required three days for its journey of one hundred and fifty miles, and if travelers ventured on a trip to Marseilles they met with rough roads and hardships like those of the Middle Ages. Italy was in 1800 almost as remote from the north of Europe as when carriage roads were first built. Neither in time nor in thought was Florence or Rome much nearer to London in Wordsworth's youth than in the youth of Milton or Gray. Indeed, such changes as had occurred were partly for the worse, owing to the violence of revolutionary wars during the last ten years of the eighteenth century. Horace Walpole at his life's close saw about him a world which in many respects was less civilized than when as a boy he made the grand tour of Europe.

While so little had been done on the great highways of European travel, these highways were themselves luxuries which furnished no sure measure of progress. The post horses toiled as painfully as ever through the sand from Hamburg to Berlin, while the coach between York and London rolled along an excellent road at the rate of ten miles an hour; yet neither in England nor on the Continent was the post road a great channel of commerce. No matter how good the road, it could not compete with water, nor could heavy freights in great quantities be hauled long distances without extravagant cost. Water communication was as necessary for European commerce in 1800 as it had been for the Phoenicians and Egyptians; the Rhine, the Rhône, the Danube, the Elbe were still the true commercial highways, and except for government post roads, Europe was as dependent on these rivers in the eighteenth century as in the thirteenth. No certainty could be offered of more rapid progress in the coming century than in the past; the chief hope seemed to lie in the construction of canals.

While Europe had thus consumed centuries in improving paths of trade, until merchandise could be brought by canal a few score miles from the Rhône to the Loire and Seine, to the Garonne and the Rhine, and while all her wealth and energy had not yet united the Danube with other river systems, America was required to construct, without delay, at least three great roads and canals, each several hundred miles long, across mountain ranges, through a country not yet inhabited, to points where no great markets existed—and this under constant peril of losing her political union, which could not even by such connections be with certainty secured. After this should be accomplished, the Alleghenies must still remain between the eastern and western states, and at any known rate of travel Nashville could not be reached in less than a fortnight or three weeks from Philadelphia. Meanwhile the simpler problem of bringing New England nearer to Virginia and Georgia had not advanced even with the aid of a direct ocean highway. In becoming politically independent of England, the old thirteen provinces developed little more commercial intercourse with each other in proportion to their wealth and population than they had maintained in colonial days. The material ties that united them grew in strength no more rapidly than the ties which bound them to Europe. Each group of states lived a life apart.

Even the lightly equipped traveler found a short journey no slight effort. Between Boston and New York was a tolerable highway, along which, thrice a week, light stagecoaches carried passengers and the mail, in three days. From New York a stagecoach started every weekday

for Philadelphia, consuming the greater part of two days in the journey; and the road between Paulus Hook, the modern Jersey City, and Hackensack was declared by the newspapers in 1802 to be as bad as any other part of the route between Maine and Georgia. South of Philadelphia the road was tolerable as far as Baltimore, but between Baltimore and the new city of Washington it meandered through forests; the driver chose the track which seemed least dangerous, and rejoiced if in wet seasons he reached Washington without miring or upsetting his wagon. In the northern states, four miles an hour was the average speed for any coach between Bangor and Baltimore. Beyond the Potomac the roads became steadily worse, until south of Petersburg even the mails were carried on horseback. Except for a stagecoach which plied between Charleston and Savannah, no public conveyance of any kind was mentioned in the three southernmost states.

The stagecoach was itself a rude conveyance, of a kind still familiar to experienced travelers. Twelve persons, crowded into one wagon, were jolted over rough roads, their bags and parcels, thrust inside, cramping their legs, while they were protected from the heat and dust of midsummer and the intense cold and driving snow of winter only by leather flaps buttoned to the roof and sides. In fine, dry weather this mode of travel was not unpleasant, when compared with the heavy vehicles of Europe and the hard English turnpikes; but when spring rains drew the frost from the ground the roads became nearly impassable, and in winter, when the rivers froze, a serious peril was added, for the Susquehanna or the North River at Paulus Hook must be crossed in an open boat—an affair of hours at best, sometimes leading to fatal accidents. Smaller annoyances of many kinds were habitual. The public, as a rule, grumbled less than might have been expected, but occasionally newspapers contained bitter complaints. An angry Philadelphian, probably a foreigner, wrote in 1796 that, “with a few exceptions, brutality, negligence, and filching are as naturally expected by people accustomed to traveling in America as a mouth, a nose, and two eyes are looked for in a man’s face.” This sweeping charge, probably unjust, and certainly supported by little public evidence, was chiefly founded on the experience of an alleged journey from New York:

At Bordentown we went into a second boat where we met with very sorry accommodation. This was about four o’clock in the afternoon. We had about twenty miles down the Delaware to reach Philadelphia. The captain, who had a most provoking tongue, was a boy about eighteen years of age. He and a few companions despatched a dozen or eighteen

bottles of porter. We ran three different times against other vessels that were coming up the stream. The women and children lay all night on the bare boards of the cabin floor. . . . We reached Arch Street wharf about eight o'clock on the Wednesday morning, having been about sixteen hours on a voyage of twenty miles.

In the southern states the difficulties and perils of travel were so great as to form a barrier almost insuperable. Even Virginia was no exception to this rule. At each interval of a few miles the horseman found himself stopped by a river, liable to sudden freshets, and rarely bridged. Jefferson in his frequent journeys between Monticello and Washington was happy to reach the end of the hundred miles without some vexatious delay. "Of eight rivers between here and Washington," he wrote to his attorney general in 1801, "five have neither bridges nor boats."

Expense caused an equally serious obstacle to travel. The usual charge in the northern states was six cents a mile by stage. In the year 1796, according to Francis Baily, president of the Royal Astronomical Society, three or four stages ran daily from Baltimore to Philadelphia, the fare six dollars, with charges amounting to two dollars and a quarter a day at the inns on the road. Baily was three days in making the journey. From Philadelphia to New York he paid the same fare and charges, arriving in one day and a half. The entire journey of two hundred miles cost him twenty-one dollars. He remarked that traveling on the main lines of road in the settled country was about as expensive as in England, and when the roads were good, about as rapid. Congress allowed its members six dollars for every twenty miles traveled. The actual cost, including hotel expenses, could hardly have fallen below ten cents a mile.

Heavy traffic never used stage routes if it could find cheaper. Commerce between one state and another, or even between the seaboard and the interior of the same state, was scarcely possible on any large scale unless navigable water connected them. Except the great highway to Pittsburgh, no road served as a channel of commerce between different regions of the country. In this respect New England east of the Connecticut was as independent of New York as both were independent of Virginia, and as Virginia in her turn was independent of Georgia and South Carolina. The chief value of interstate communication by land rested in the postal system; but the post furnished another illustration of the difficulties which barred progress. In the year 1800 one general mail route extended from Portland in Maine to Louisville in Georgia, the time required for the trip being twenty days. Between New York and Petersburg in Virginia was a daily service; between New York and Boston, and

also between Petersburg and Augusta, the mail was carried thrice a week. Branching from the main line at New York, a mail went to Canandaigua in ten days; from Philadelphia another branch line went to Lexington in sixteen days, to Nashville in twenty-two days. Thus more than twenty thousand miles of post road, with nine hundred post offices, proved the vastness of the country and the smallness of the result; for the gross receipts for postage in the year ending Oct. 1, 1801, were only \$320,000.

Throughout the land the eighteenth century ruled supreme. Only within a few years had the New Englander begun to abandon his struggle with a barren soil, among granite hills, to learn the comforts of easier existence in the valleys of the Mohawk and Ohio; yet the New England man was thought the shrewdest and most enterprising of Americans. If the Puritans and the Dutch needed a century or more to reach the Mohawk, when would they reach the Mississippi? The distance from New York to the Mississippi was about one thousand miles; from Washington to the extreme southwestern military post, below Natchez, was about twelve hundred. Scarcely a portion of western Europe was three hundred miles distant from some sea, but a width of three hundred miles was hardly more than an outskirt of the United States. No civilized country had yet been required to deal with physical difficulties so serious, nor did experience warrant conviction that such difficulties could be overcome.

If the physical task which lay before the American people had advanced but a short way toward completion, little more change could be seen in the economical conditions of American life. The man who in the year 1800 ventured to hope for a new era in the coming century could lay his hand on no statistics that silenced doubt. The machinery of production showed no radical difference from that familiar to ages long past. The Saxon farmer of the eighth century enjoyed most of the comforts known to Saxon farmers of the eighteenth. The eorls and ceorls of Offa and Ecgbert could not read or write, and did not receive a weekly newspaper with such information as newspapers in that age could supply; yet neither their houses, their clothing, their food and drink, their agricultural tools and methods, their stock, nor their habits were so greatly altered or improved by time that they would have found much difficulty in accommodating their lives to that of their descendants in the eighteenth century. In this respect America was backward. Fifty or a hundred miles inland more than half the houses were log cabins, which might or might not enjoy the luxury of a glass window. Throughout the South and West houses showed little attempt at luxury; but even in New England the ordinary

farmhouse was hardly so well built, so spacious, or so warm as that of a well-to-do contemporary of Charlemagne. The cloth which the farmer's family wore was still homespun. The hats were manufactured by the village hatter; the clothes were cut and made at home; the shirts, socks, and nearly every other article of dress were also homemade. Hence came a marked air of rusticity which distinguished country from town—awkward shapes of hat, coat, and trousers, which gave to the Yankee caricature those typical traits that soon disappeared almost as completely as coats of mail and steel headpieces. The plow was rude and clumsy; the sickle as old as Tubal-cain, and even the cradle not in general use; the flail was unchanged since the Aryan exodus; in Virginia, grain was still commonly trodden out by horses. Enterprising gentlemen-farmers introduced threshing machines and invented scientific plows; but these were novelties. Stock was as a rule not only unimproved, but ill cared for. The swine ran loose; the cattle were left to feed on what pasture they could find, and even in New England were not housed until the severest frosts, on the excuse that exposure hardened them. Near half a century afterward a competent judge asserted that the general treatment of cows in New England was fair matter of presentment by a grand jury. Except among the best farmers, drainage, manures, and rotation of crops were uncommon. The ordinary cultivator planted his corn as his father had planted it, sowing as much rye to the acre, using the same number of oxen to plow, and getting in his crops on the same day. He was even known to remove his barn on account of the manure accumulated round it, although the New England soil was never so rich as to warrant neglect to enrich it. The money for which he sold his wheat and chickens was of the Old World; he reckoned in shillings or pistareens, and rarely handled an American coin more valuable than a large copper cent.

At a time when the wealth and science of London and Paris could not supply an article so necessary as a common sulphur match, the backwardness of remote country districts could hardly be exaggerated. Yet remote districts were not the only sufferers. Of the whole United States New England claimed to be the most civilized province, yet New England was a region in which life had yet gained few charms of sense and few advantages over its rivals. Wilson, the ornithologist, a Pennsylvania Scotchman, a confirmed grumbler, but a shrewd judge, and the most thorough of American travelers, said in 1808: "My journey through almost the whole of New England has rather lowered the Yankees in my esteem. Except a few neat academies, I found their schoolhouses equally ruinous and deserted with ours; fields covered with stones; stone fences; scrubby

oaks and pine trees; wretched orchards; scarcely one grainfield in twenty miles; the taverns along the road dirty, and filled with loungers brawling about lawsuits and politics; the people snappish and extortioners, lazy, and two hundred years behind the Pennsylvanians in agricultural improvements." The description was exaggerated, for Wilson forgot to speak of the districts where fields were not covered with stones, and where wheat could be grown to advantage. Twenty years earlier, Albert Gallatin, who knew Pennsylvania well, having reached Hartford on his way to Boston, wrote: "I have seen nothing in America equal to the establishments on the Connecticut River." Yet Wilson's account described the first general effect of districts in the New England states, where agriculture was backward and the country poor. The houses were thin wooden buildings, not well suited to the climate; the churches were unwarmed; the clothing was poor; sanitary laws were few, and a bathroom or a soil pipe was unknown. Consumption, typhoid, scarlet fever, diphtheria, and rheumatic fevers were common; habits of drinking were still a scourge in every family, and dyspepsia destroyed more victims than were consumed by drink. Population increased slowly, as though the conditions of life were more than usually hard. A century earlier, Massachusetts was supposed to contain sixty thousand inhabitants. Governor Hutchinson complained that while the other colonies quadrupled their numbers, Massachusetts failed to double its population in fifty years. In 1790 the state contained 378,000 people, not including the province of Maine; in 1800 the number rose to 423,000, which showed that a period of more rapid growth had begun, for the emigration into other states was also large.

A better measure of the difficulties with which New England struggled was given by the progress of Boston, which was supposed to have contained about eighteen thousand inhabitants as early as 1730, and twenty thousand in 1770. For several years after the Revolution it numbered less than twenty thousand, but in 1800 the census showed twenty-five thousand inhabitants. In appearance, Boston resembled an English market town, of a kind even then old-fashioned. The footways or sidewalks were paved, like the crooked and narrow streets, with round cobblestones, and were divided from the carriage way only by posts and a gutter. The streets were almost unlighted at night, a few oil lamps rendering the darkness more visible and the rough pavement rougher. Police hardly existed. The system of taxation was defective. The town was managed by selectmen, the elected instruments of town meetings whose jealousy of granting power was even greater than their objection to spending money, and whose hostility to city government was not to be overcome.

Although on all sides increase of ease and comfort was evident, and roads, canals, and new buildings, public and private, were already in course of construction on a scale before unknown, yet in spite of more than a century and a half of incessant industry, intelligent labor, and pinching economy Boston and New England were still poor. A few merchants enjoyed incomes derived from foreign trade, which allowed them to imitate in a quiet way the style of the English mercantile class; but the clergy and the lawyers, who stood at the head of society, lived with much economy. Many a country clergyman, eminent for piety and even for hospitality, brought up a family and laid aside some savings on a salary of five hundred dollars a year. President Dwight, who knew well the class to which he belonged, eulogizing the life of Abijah Weld, pastor of Attleborough, declared that on a salary of two hundred and twenty dollars a year Mr. Weld brought up eleven children, besides keeping a hospitable house and maintaining charity to the poor.

On the Exchange a few merchants had done most of the business of Boston since the peace of 1783, but a mail thrice a week to New York, and an occasional arrival from Europe or the departure of a ship to China, left ample leisure for correspondence and even for gossip. The habits of the commercial class had not been greatly affected by recent prosperity. Within ten or fifteen years before 1800 three banks had been created to supply the commercial needs of Boston. One of these was a branch Bank of the United States, which employed there whatever part of its capital it could profitably use; the two others were local banks, with capital of \$1,600,000, toward which the state subscribed \$400,000. Altogether the banking capital of Boston might amount to two millions and a half. A number of small banks, representing in all about two and a half millions more, were scattered through the smaller New England towns. The extraordinary prosperity caused by the French wars opened to Boston a new career. Wealth and population were doubling; the exports and imports of New England were surprisingly large, and the shipping was greater than that of New York and Pennsylvania combined; but Boston had already learned, and was to learn again, how fleeting were the riches that depended on foreign commerce, and conservative habits were not easily changed by a few years of accidental gain.

Of manufactures New England had many, but none on a large scale. The people could feed or clothe themselves only by household industry; their whale oil, salt fish, lumber, and rum were mostly sent abroad; but they freighted coasters with turners' articles, home-made linens and cloths, cheese, butter, shoes, nails, and what were called Yankee No-

tions of all sorts, which were sent to Norfolk and the Southern ports, and often peddled from the deck, as goods of every sort were peddled on the flatboats of the Ohio. Two or three small mills spun cotton with doubtful success; but England supplied ordinary manufactures more cheaply and better than Massachusetts could hope to do. A tri-weekly mail and a few coasting sloops provided for the business of New England with domestic ports. One packet sloop plied regularly to New York.

The state of New York was little in advance of Massachusetts and Maine. In 1800 for the first time New York gained the lead in population by the difference between 589,000 and 573,000. The valuation of New York for the direct tax in 1799 was \$100,000,000; that of Massachusetts was \$84,000,000. New York was still a frontier state, and although the city was European in its age and habits, travelers needed to go few miles from the Hudson in order to find a wilderness like that of Ohio and Tennessee. In most material respects the state was behind New England; outside the city was to be seen less wealth and less appearance of comfort. The first impression commonly received of any new country was from its inns, and on the whole few better tests of material condition then existed. President Dwight, though maintaining that the best old-fashioned inns of New England were in their way perfect, being in fact excellent private houses, could not wholly approve what he called the modern inns, even in Connecticut; but when he passed into New York he asserted that everything suffered an instant change for the worse. He explained that in Massachusetts the authorities were strict in refusing licenses to any but respectable and responsible persons, whereas in New York licenses were granted to anyone who would pay for them—which caused a multiplication of dramshops, bad accommodations, and a gathering of loafers and tipplers about every tavern porch, whose rude appearance, clownish manners, drunkenness, swearing, and obscenity confirmed the chief of Federalist clergymen in his belief that democracy had an evil influence on morals.

Far more movement was to be seen, and accumulation was more rapid than in colonial days; but little had yet been done for improvement, either by government or by individuals, beyond some provision for extending roads and clearing watercourses behind the advancing settlers. If Washington Irving was right, Rip Van Winkle, who woke from his long slumber about the year 1800, saw little that was new to him, except the head of President Washington where that of King George had once hung, and strange faces instead of familiar ones. Except in numbers, the city was relatively no farther advanced than the country. Between 1790 and

1800 its population rose from 33,000 to 60,000; and if Boston resembled an old-fashioned English market town, New York was like a foreign seaport, badly paved, undrained, and as foul as a town surrounded by the tides could be. Although the Manhattan Company was laying wooden pipes for a water supply, no sanitary regulations were enforced, and every few years—as in 1798 and 1803—yellow fever swept away crowds of victims, and drove the rest of the population, panic stricken, into the highlands. No day police existed; constables were still officers of the courts; the night police consisted of two captains, two deputies, and seventy-two men. The estimate for the city's expenses in 1800 amounted to \$130,000. One marked advantage New York enjoyed over Boston, in the possession of a city government able to introduce reforms. Thus, although still medieval in regard to drainage and cleanliness, the town had taken advantage of recurring fires to rebuild some of the streets with brick sidewalks and curbstones. Travelers dwelt much on this improvement, which only New York and Philadelphia had yet adopted, and Europeans agreed that both had the air of true cities: that while Boston was the Bristol of America, New York was the Liverpool, and Philadelphia the London.

In respect to trade and capital, New York possessed growing advantages, supplying half New Jersey and Connecticut, a part of Massachusetts, and all the rapidly increasing settlements on the branches of the Hudson; but no great amount of wealth, no considerable industry or new creation of power was yet to be seen. Two banks, besides the branch Bank of the United States, supplied the business wants of the city, and employed about the same amount of capital in loans and discounts as was required for Boston. Besides these city institutions but two other banks existed in the state—at Hudson and at Albany.

The proportion of capital in private hands seemed to be no larger. The value of exports from New York in 1800 was but \$14,000,000; the net revenue on imports for 1799 was \$2,373,000, against \$1,607,000 collected in Massachusetts. Such a foreign trade required little capital, yet these values represented a great proportion of all the exchanges. Domestic manufactures could not compete with foreign, and employed little bank credit. Speculation was slow, mostly confined to lands which required patience to exchange or sell. The most important undertakings were turnpikes, bridges such as Boston built across the Charles, or new blocks of houses; and a canal, such as Boston designed to the Merrimack, overstrained the resources of capital. The entire banking means of the United States in 1800 would not have answered the stockjobbing purposes of one great operator of Wall Street in 1875. The nominal capital of all the banks,

including the Bank of the United States, fell short of \$29,000,000. The limit of credit was quickly reached, for only the richest could borrow more than fifteen or twenty thousand dollars at a time, and the United States government itself was gravely embarrassed whenever obliged to raise money. In 1798 the secretary of the treasury could obtain five million dollars only by paying eight per cent interest for a term of years; and in 1814 the government was forced to stop payments for the want of twenty millions.

The precise value of American trade was uncertain, but in 1800 the gross exports and imports of the United States may have balanced at about seventy-five million dollars. The actual consumption of foreign merchandise amounted perhaps to the value of forty or fifty million dollars, paid in wheat, cotton, and other staples, and by the profits on the shipping employed in carrying West India produce to Europe. The amount of American capital involved in a trade of fifty millions, with credits of three, six, and nine months, must have been small, and the rates of profit large.

As a rule American capital was absorbed in shipping or agriculture, whence it could not be suddenly withdrawn. No stock exchange existed, and no broker exclusively engaged in stockjobbing, for there were few stocks. The national debt, of about eighty millions, was held abroad, or as a permanent investment at home. States and municipalities had not learned to borrow. Except for a few banks and insurance offices, turnpikes, bridges, canals, and land companies, neither bonds nor stocks were known. The city of New York was so small as to make extravagance difficult; the Battery was a fashionable walk, Broadway a country drive, and Wall Street an uptown residence. Great accumulations of wealth had hardly begun. The patroon was still the richest man in the state. John Jacob Astor was a fur merchant living where the Astor House afterward stood, and had not yet begun those purchases of real estate which secured his fortune. Cornelius Vanderbilt was a boy six years old, playing about his father's ferryboat at Staten Island. New York City itself was what it had been for a hundred years past—a local market.

As a national capital New York made no claim to consideration. If Bostonians for a moment forgot their town meetings, or if Virginians overcame their dislike for cities and pavements, they visited and admired, not New York, but Philadelphia. "Philadelphia," wrote the Duc de Liancourt, "is not only the finest city in the United States, but may be deemed one of the most beautiful cities in the world." In truth, it surpassed any of its size on either side of the Atlantic for most of the comforts and some of the

elegancies of life. While Boston contained twenty-five thousand inhabitants and New York sixty thousand, the census of 1800 showed that Philadelphia was about the size of Liverpool—a city of seventy thousand people. The repeated ravages of yellow fever roused there a regard for sanitary precautions and cleanliness; the city, well paved and partly drained, was supplied with water in wooden pipes, and was the best-lighted town in America; its market was a model, and its jail was intended also for a model—although the first experiment proved unsuccessful, because the prisoners went mad or idiotic in solitary confinement. In and about the city flourished industries considerable for the time. The iron-works were already important; paper and gunpowder, pleasure carriages and many other manufactures were produced on a larger scale than elsewhere in the Union. Philadelphia held the seat of government until July, 1800, and continued to hold the Bank of the United States, with its capital of ten millions, besides private banking capital to the amount of five millions more. Public spirit was more active in Pennsylvania than in New York. More roads and canals were building; a new turnpike ran from Philadelphia to Lancaster, and the great highway to Pittsburgh was a more important artery of national life than was controlled by any other state. The exports of Pennsylvania amounted to \$12,000,000, and the custom-house produced \$1,350,000. The state contained six hundred thousand inhabitants—a population somewhat larger than that of New York.

Of all parts of the Union, Pennsylvania seemed to have made most use of her national advantages; but her progress was not more rapid than the natural increase of population and wealth demanded, while to deal with the needs of America, man's resources and his power over Nature must be increased in a ratio far more rapid than that which governed his numbers. Nevertheless, Pennsylvania was the most encouraging spectacle in the field of vision. Baltimore, which had suddenly sprung to a population and commerce greater than those of Boston, also offered strong hope of future improvement; but farther South the people showed fewer signs of change.

The city of Washington, rising in a solitude on the banks of the Potomac, was a symbol of American nationality in the southern states. The contrast between the immensity of the task and the paucity of means seemed to challenge suspicion that the nation itself was a magnificent scheme like the federal city, which could show only a few log cabins and Negro quarters where the plan provided for the traffic of London and the elegance of Versailles. When in the summer of 1800 the government was transferred to what was regarded by most persons as a fever-stricken morass, the half-finished White House stood in a naked field overlooking

the Potomac, with two awkward department buildings near it, a single row of brick houses and a few isolated dwellings within sight, and nothing more; until across a swamp, a mile and a half away, the shapeless, unfinished Capitol was seen, two wings without a body, ambitious enough in design to make more grotesque the nature of its surroundings. The conception proved that the United States understood the vastness of their task, and were willing to stake something on their faith in it. Never did hermit or saint condemn himself to solitude more consciously than Congress and the Executive in removing the government from Philadelphia to Washington: the discontented men clustered together in eight or ten boardinghouses as near as possible to the Capitol, and there lived, like a convent of monks, with no other amusement or occupation than that of going from their lodgings to the chambers and back again. Even private wealth could do little to improve their situation, for there was nothing which wealth could buy; there were in Washington no shops or markets, skilled labor, commerce, or people. Public efforts and lavish use of public money could alone make the place tolerable; but Congress doled out funds for this national and personal object with so sparing a hand that their Capitol threatened to crumble in pieces and crush Senate and House under the ruins, long before the building was complete.

A government capable of sketching a magnificent plan, and willing to give only a halfhearted pledge for its fulfilment; a people eager to advertise a vast undertaking beyond their present powers, which when completed would become an object of jealousy and fear—this was the impression made upon the traveler who visited Washington in 1800, and mused among the unraised columns of the Capitol upon the destiny of the United States. As he traveled farther south his doubts were strengthened, for across the Potomac he could detect no sign of a new spirit. Manufactures had no existence. Alexandria owned a bank with half a million of capital, but no other was to be found between Washington and Charleston, except the branch Bank of the United States at Norfolk, nor any industry to which loans and discounts could safely be made. Virginia, the most populous and powerful of all the States, had a white population of 514,000, nearly equal to that of Pennsylvania and New York, besides about 350,000 slaves. Her energies had pierced the mountains and settled the western territory before the slow-moving northern people had torn themselves from the safer and more comfortable life by the seaboard; but the Virginia ideal was patriarchal, and an American continent on the Virginia type might reproduce the virtues of Cato, and perhaps the eloquence of Cicero, but was little likely to produce anything more practical in the way

of modern progress. The Shenandoah Valley rivaled Pennsylvania and Connecticut in richness and skill of husbandry; but even agriculture, the favorite industry in Virginia, had suffered from the competition of Kentucky and Tennessee, and from the emigration which had drawn away fully one hundred thousand people. The land was no longer very productive. Even Jefferson, the most active-minded and sanguine of all Virginians—the inventor of the first scientific plow, the importer of the first threshing machine known in Virginia, the experimenter with a new drilling machine, the owner of one hundred and fifty slaves and ten thousand acres of land, whose Negroes were trained to carpentry, cabinetmaking, housebuilding, weaving, tailoring, shoemaking—claimed to get from his land no more than six or eight bushels of wheat to an acre, and had been forced to abandon the more profitable cultivation of tobacco. Except in a few favored districts like the Shenandoah Valley, land in Virginia did not average eight bushels of wheat to an acre. The cultivation of tobacco had been almost the sole object of landowners, and even where the lands were not exhausted, a bad system of agriculture and the force of habit prevented improvement.

The great planters lavished money in vain on experiments to improve their crops and their stock. They devoted themselves to the task with energy and knowledge; but they needed a diversity of interests and local markets, and except at Baltimore these were far from making their appearance. Neither the products, the markets, the relative amount of capital, nor the machinery of production had perceptibly changed. “The Virginians are not generally rich,” said the Duc de Liancourt, “especially in net revenue. Thus one often finds a well-served table, covered with silver, in a room where for ten years half the window panes have been missing, and where they will be missed for ten years more. There are few houses in a passable state of repair, and of all parts of the establishment those best cared for are the stables.” Wealth reckoned in slaves or land was plenty; but the best Virginians, from President Washington downward, were most outspoken in their warnings against the Virginia system both of slavery and agriculture.

The contrast between Virginia and Pennsylvania was the subject of incessant comment.

In Pennsylvania [said Robert Sutcliffe, an English Friend who published travels made in 1804–1806] we meet great numbers of wagons drawn by four or more fine fat horses, the carriages firm and well made, and covered with stout good linen, bleached almost white; and it is not uncommon to see ten or fifteen together travelling cheerfully along the

road, the driver riding on one of his horses. Many of these come more than three hundred miles to Philadelphia from the Ohio, Pittsburg, and other places, and I have been told by a respectable Friend, a native of Philadelphia, that more than one thousand covered carriages frequently come to Philadelphia market. . . . The appearance of things in the Slave States is quite the reverse of this. We sometimes meet a ragged black boy or girl driving a team consisting of a lean cow and a mule; sometimes a lean bull or an ox and a mule; and I have seen a mule, a bull, and a cow each miserable in its appearance, composing one team, with a half-naked black slave or two riding or driving as occasion suited. The carriage or wagon, if it may be called such, appeared in as wretched a condition as the team and its driver. Sometimes a couple of horses, mules, or cows would be dragging a hogshead of tobacco, with a pivot or axle driven into each end of the hogshead, and something like a shaft attached, by which it was drawn or rolled along the road. I have seen two oxen and two slaves pretty fully employed in getting along a single hogshead; and some of these come from a great distance inland.

In the middle of these primitive sights, Sutcliffe was startled by a contrast such as Virginia could always show. Between Richmond and Fredericksburg—

In the afternoon, as our road lay through the woods, I was surprised to meet a family party travelling along in as elegant a coach as is usually met with in the neighborhood of London, and attended by several gayly dressed footmen.

The country south of Virginia seemed unpromising even to Virginians. In the year 1796 President Washington gave to Sir John Sinclair his opinion upon the relative value of American lands. He then thought the valley of Virginia the garden of America; but he would say nothing to induce others to settle in more southern regions.

The uplands of North and South Carolina and Georgia are not dissimilar in soil [he wrote] but as they approach the lower latitudes are less congenial to wheat, and are supposed to be proportionably more unhealthy. Towards the seaboard of all the Southern States, and farther south more so, the lands are low, sandy, and unhealthy; for which reason I shall say little concerning them, for as I should not choose to be an inhabitant of them myself, I ought not to say anything that would induce others to be so. . . . I understand that from thirty to forty dollars per acre may be denominated the medium price in the vicinity of the Susquehanna in the State of Pennsylvania, from twenty to thirty on the Potomac in what is called the Valley, . . . and less, as I have noticed before, as you proceed southerly.

Whatever was the cause, the state of North Carolina seemed to offer few temptations to immigrants or capital. Even in white population ranking fifth among the sixteen states, her 478,000 inhabitants were unknown to the world. The beautiful upper country attracted travelers neither for pleasure nor for gain, while the country along the seacoast was avoided except by hardy wanderers. The grumbling Wilson, who knew every nook and corner of the United States, and who found New England so dreary, painted this part of North Carolina in colors compared with which his sketch of New England was gay. "The taverns are the most desolate and beggarly imaginable; bare, bleak, and dirty walls, one or two old broken chairs and a bench form all the furniture. The white females seldom make their appearance. At supper you sit down to a meal the very sight of which is sufficient to deaden the most eager appetite, and you are surrounded by half-a-dozen dirty, half-naked blacks, male and female, whom any man of common scent might smell a quarter of a mile off. The house itself is raised upon props four or five feet, and the space below is left open for the hogs, with whose charming vocal performance the wearied traveler is serenaded the whole night long." The landscape pleased him no better—"immense solitary pine savannahs, through which the road winds among stagnant ponds; dark, sluggish creeks of the color of brandy, over which are thrown high wooden bridges without railings," crazy and rotten.

North Carolina was relatively among the poorest states. The exports and imports were of trifling value, less than one-tenth of those returned for Massachusetts, which were more than twice as great as those of North Carolina and Virginia together. That under these conditions America should receive any strong impulse from such a quarter seemed unlikely; yet perhaps for the moment more was to be expected from the Carolinas than from Virginia. Backward as these states in some respects were, they possessed one new element of wealth which promised more for them than anything Virginia could hope. The steam engines of Watt had been applied in England to spinning, weaving, and printing cotton; an immense demand had risen for that staple, and the cotton gin had been simultaneously invented. A sudden impetus was given to industry; land which had been worthless and estates which had become bankrupt acquired new value, and in 1800 every planter was growing cotton, buying Negroes, and breaking fresh soil. North Carolina felt the strong flood of prosperity, but South Carolina, and particularly the town of Charleston, had most to hope. The exports of South Carolina were nearly equal in value to those of Massachusetts or Pennsylvania; the imports were equally large. Charles-

ton might reasonably expect to rival Boston, New York, Philadelphia, and Baltimore. In 1800 these cities still stood, as far as concerned their foreign trade, within some range of comparison; and between Boston, Baltimore, and Charleston, many plausible reasons could be given for thinking that the last might have the most brilliant future. The three towns stood abreast. If Charleston had but about eighteen thousand inhabitants, this was the number reported by Boston only ten years before, and was five thousand more than Baltimore then boasted. Neither Boston nor Baltimore saw about them a vaster region to supply, or so profitable a staple to export. A cotton crop of two hundred thousand pounds sent abroad in 1791 grew to twenty millions in 1801, and was to double again by 1803. An export of fifty thousand bales was enormous, yet was only the beginning. What use might not Charleston, the only considerable town in the entire South, make of this golden flood?

The town promised hopefully to prove equal to its task. Nowhere in the Union was intelligence, wealth, and education greater in proportion to numbers than in the little society of cotton and rice planters who ruled South Carolina; and they were in 1800 not behind—they hoped soon to outstrip—their rivals. If Boston was building a canal to the Merrimack, and Philadelphia one along the Schuylkill to the Susquehanna, Charleston had nearly completed another which brought the Santee River to its harbor, and was planning a road to Tennessee which should draw the whole interior within reach. Nashville was nearer to Charleston than to any other seaport of the Union, and Charleston lay nearest to the rich trade of the West Indies. Not even New York seemed more clearly marked for prosperity than this solitary southern city, which already possessed banking capital in abundance, intelligence, enterprise, the traditions of high culture and aristocratic ambition, all supported by slave labor, which could be indefinitely increased by the African slave trade.

If any portion of the United States might hope for a sudden and magnificent bloom, South Carolina seemed entitled to expect it. Rarely had such a situation, combined with such resources, failed to produce some wonderful result. Yet as Washington warned Sinclair, these advantages were counterbalanced by serious evils. The climate in summer was too relaxing. The sun was too hot. The seacoast was unhealthy, and at certain seasons even deadly to the whites. Finally, if history was a guide, no permanent success could be prophesied for a society like that of the low country in South Carolina, where some thirty thousand whites were surrounded by a dense mass of nearly one hundred thousand Negro slaves. Even Georgia, then only partially settled, contained sixty thousand slaves

and but one hundred thousand whites. The cotton states might still argue that if slavery, malaria, or summer heat barred civilization, all the civilization that was ever known must have been blighted in its infancy; but although the future of South Carolina might be brilliant, like that of other oligarchies in which only a few thousand freemen took part, such a development seemed to diverge far from the path likely to be followed by northern society, and bade fair to increase and complicate the social and economical difficulties with which Americans had to deal.

A probable valuation of the whole United States in 1800 was eighteen hundred million dollars, equal to \$328 for each human being, including slaves; or \$418 to each free white. This property was distributed with an approach to equality, except in a few of the southern states. In New York and Philadelphia a private fortune of one hundred thousand dollars was considered handsome, and three hundred thousand was great wealth. Inequalities were frequent; but they were chiefly those of a landed aristocracy. Equality was so far the rule that every white family of five persons might be supposed to own land, stock, or utensils, a house and furniture, worth about two thousand dollars; and as the only considerable industry was agriculture, their scale of life was easy to calculate—taxes amounting to little or nothing, and wages averaging about a dollar a day.

Not only were these slender resources, but they were also of a kind not easily converted to the ready uses required for rapid development. Among the numerous difficulties with which the Union was to struggle, and which were to form the interest of American history, the disproportion between the physical obstacles and the material means for overcoming them was one of the most striking.

AMERICAN IDEALS

Nearly every foreign traveler who visited the United States during these early years carried away an impression sober if not sad. A thousand miles of desolate and dreary forest, broken here and there by settlements; along the seacoast a few flourishing towns devoted to commerce; no arts, a provincial literature, a cancerous disease of Negro slavery, and differences of political theory fortified within geographical lines—what could be hoped for such a country except to repeat the story of violence and brutality which the world already knew by heart, until repetition for thousands of years had wearied and sickened mankind? Ages must probably pass before the interior could be thoroughly settled; even Jef-

person, usually a sanguine man, talked of a thousand years with acquiescence, and in his first Inaugural Address, at a time when the Mississippi River formed the western boundary, spoke of the country as having "room enough for our descendants to the hundredth and thousandth generation." No prudent person dared to act on the certainty that when settled, one government could comprehend the whole; and when the day of separation should arrive, and America should have her Prussia, Austria, and Italy, as she already had her England, France, and Spain, what else could follow but a return to the old conditions of local jealousies, wars, and corruption which had made a slaughterhouse of Europe?

The mass of Americans were sanguine and self-confident, partly by temperament, but partly also by reason of ignorance; for they knew little of the difficulties which surrounded a complex society. The Duc de Liancourt, like many critics, was struck by this trait. Among other instances, he met with one in the person of a Pennsylvania miller, Thomas Lea, "a sound American patriot, persuading himself that nothing good is done, and that no one has any brains, except in America; that the wit, the imagination, the genius of Europe are already in decrepitude"; and the duke added: "This error is to be found in almost all Americans,—legislators, administrators, as well as millers, and is less innocent there." In the year 1796 the House of Representatives debated whether to insert in the Reply to the President's Speech a passing remark that the nation was "the freest and most enlightened in the world," a nation as yet in swaddling clothes, which had neither literature, arts, sciences, nor history; nor even enough nationality to be sure that it was a nation. The moment was peculiarly ill-chosen for such a claim, because Europe was on the verge of an outburst of genius. Goethe and Schiller, Mozart and Haydn, Kant and Fichte, Cavendish and Herschel were making way for Walter Scott, Wordsworth, and Shelley, Heine and Balzac, Beethoven and Hegel, Oersted and Cuvier, great physicists, biologists, geologists, chemists, mathematicians, metaphysicians, and historians by the score. Turner was painting his earliest landscapes, and Watt completing his latest steam engine; Napoleon was taking command of the French armies, and Nelson of the English fleets; investigators, reformers, scholars, and philosophers swarmed, and the influence of enlightenment, even amid universal war, was working with an energy such as the world had never before conceived. The idea that Europe was in her decrepitude proved only ignorance and want of enlightenment, if not of freedom, on the part of Americans who could only excuse their error by pleading that notwithstanding these objections, in matters which for the moment most

concerned themselves Europe was a full century behind America. If they were right in thinking that the next necessity of human progress was to lift the average man upon an intellectual and social level with the most favored, they stood at least three generations nearer than Europe to their common goal. The destinies of the United States were certainly staked, without reserve or escape, on the soundness of this doubtful and even improbable principle, ignoring or overthrowing the institutions of church, aristocracy, family, army, and political intervention, which long experience had shown to be needed for the safety of society. Europe might be right in thinking that without such safeguards society must come to an end; but even Europeans must concede that there was a chance, if no greater than one in a thousand, that America might, at least for a time, succeed. If this stake of temporal and eternal welfare stood on the winning card; if man actually should become more virtuous and enlightened, by mere process of growth, without church or paternal authority; if the average human being could accustom himself to reason with the logical processes of Descartes and Newton!—what then?

Then, no one could deny that the United States would win a stake such as defied mathematics. With all the advantages of science and capital, Europe must be slower than America to reach the common goal. American society might be both sober and sad, but except for Negro slavery it was sound and healthy in every part. Stripped for the hardest work, every muscle firm and elastic, every ounce of brain ready for use, and not a trace of superfluous flesh on his nervous and supple body, the American stood in the world a new order of man. From Maine to Florida, society was in this respect the same, and was so organized as to use its human forces with more economy than could be approached by any society of the world elsewhere. Not only were artificial barriers carefully removed, but every influence that could appeal to ordinary ambition was applied. No brain or appetite active enough to be conscious of stimulants could fail to answer the intense incentive. Few human beings, however sluggish, could long resist the temptation to acquire power; and the elements of power were to be had in America almost for the asking. Reversing the Old World system, the American stimulant increased in energy as it reached the lowest and most ignorant class, dragging and whirling them upward as in the blast of a furnace. The penniless and homeless Scotch or Irish immigrant was caught and consumed by it; for every stroke of the ax and the hoe made him a capitalist, and made gentlemen of his children. Wealth was the strongest agent for moving the mass of mankind; but political power was hardly less tempting to the more intelligent and

better-educated swarms of American-born citizens, and the instinct of activity, once created, seemed heritable and permanent in the race.

Compared with this lithe young figure, Europe was actually in decrepitude. Mere class distinctions, the patois or dialect of the peasantry, the fixity of residence, the local costumes and habits marking a history that lost itself in the renewal of identical generations, raised from birth barriers which paralyzed half the population. Upon this mass of inert matter rested the Church and the State, holding down activity of thought. Endless wars withdrew many hundred thousand men from production, and changed them into agents of waste; huge debts, the evidence of past wars and bad government, created interests to support the system and fix its burdens on the laboring class; courts, with habits of extravagance that shamed common sense, helped to consume private economies. All this might have been borne; but behind this stood aristocracies, sucking their nourishment from industry, producing nothing themselves, employing little or no active capital or intelligent labor, but pressing on the energies and ambition of society with the weight of an incubus. Picturesque and entertaining as these social anomalies were, they were better fitted for the theatre or for a museum of historical costumes than for an active workshop preparing to compete with such machinery as America would soon command. From an economical point of view, they were as incongruous as would have been the appearance of a medieval knight in helmet and armor, with battle-ax and shield, to run the machinery of Arkwright's cotton mill; but besides their bad economy they also tended to prevent the rest of society from gaining a knowledge of its own capacities. In Europe, the conservative habit of mind was fortified behind power. During nearly a century Voltaire himself—the friend of kings, the wit and poet, historian and philosopher of his age—had carried on, in daily terror, in exile and excommunication, a protest against an intellectual despotism contemptible even to its own supporters. Hardly was Voltaire dead, when Priestley, as great a man if not so great a wit, trying to do for England what Voltaire tried to do for France, was mobbed by the people of Birmingham and driven to America. Where Voltaire and Priestley failed, common men could not struggle; the weight of society stifled their thought. In America the balance between conservative and liberal forces was close; but in Europe conservatism held the physical power of government. In Boston a young Buckminster might be checked for a time by his father's prayers or commands in entering that path that led toward freer thought; but youth beckoned him on, and every reward that society could offer was dangled before his eyes. In London or Paris,

Rome, Madrid, or Vienna, he must have sacrificed the worldly prospects of his life.

Granting that the American people were about to risk their future on a new experiment, they naturally wished to throw aside all burdens of which they could rid themselves. Believing that in the long run interest, not violence, would rule the world, and that the United States must depend for safety and success on the interests they could create, they were tempted to look upon war and preparations for war as the worst of blunders; for they were sure that every dollar capitalized in industry was a means of overthrowing their enemies more effective than a thousand dollars spent on frigates or standing armies. The success of the American system was, from this point of view, a question of economy. If they could relieve themselves from debts, taxes, armies, and government interference with industry, they must succeed in outstripping Europe in economy of production; and Americans were even then partly aware that if their machine were not so weakened by these economies as to break down in the working, it must of necessity break down every rival. If their theory was sound, when the day of competition should arrive, Europe might choose between American and Chinese institutions, but there would be no middle path; she might become a confederated democracy, or a wreck.

Whether these ideas were sound or weak, they seemed self-evident to those northern democrats who, like Albert Gallatin, were comparatively free from slave-owning theories, and understood the practical forces of society. If Gallatin wished to reduce the interference of government to a minimum, and cut down expenditures to nothing, he aimed not so much at saving money as at using it with the most certain effect. The revolution of 1800 was in his eyes chiefly political, because it was social; but as a revolution of society, he and his friends hoped to make it the most radical that had occurred since the downfall of the Roman Empire. Their ideas were not yet cleared by experience, and were confused by many contradictory prejudices, but wanted neither breadth nor shrewdness.

Many apparent inconsistencies grew from this undeveloped form of American thought, and gave rise to great confusion in the different estimates of American character that were made both at home and abroad.

That Americans should not be liked was natural; but that they should not be understood was more significant by far. After the downfall of the French Republic they had no right to expect a kind word from Europe, and during the next twenty years they rarely received one. The liberal movement of Europe was cowed, and no one dared express democratic

sympathies until the Napoleonic tempest had passed. With this attitude Americans had no right to find fault, for Europe cared less to injure them than to protect herself. Nevertheless, observant readers could not but feel surprised that none of the numerous Europeans who then wrote or spoke about America seemed to study the subject seriously. The ordinary traveler was apt to be little more reflective than a bee or an ant, but some of these critics possessed powers far from ordinary; yet Talleyrand alone showed that had he but seen America a few years later than he did, he might have suggested some sufficient reason for apparent contradictions that perplexed him in the national character. The other travelers—great and small, from the Duc de Liancourt to Basil Hall, a long and suggestive list—were equally perplexed. They agreed in observing the contradictions, but all, including Talleyrand, saw only sordid motives. Talleyrand expressed extreme astonishment at the apathy of Americans in the face of religious sectarians; but he explained it by assuming that the American ardor of the moment was absorbed in money-making. The explanation was evidently insufficient, for the Americans were capable of feeling and showing excitement, even to their great pecuniary injury, as they frequently proved; but in the foreigner's range of observation, love of money was the most conspicuous and most common trait of American character. "There is, perhaps, no civilized country in the world," wrote Félix de Beaujour, soon after 1800, "where there is less generosity in the souls, and in the heads fewer of those illusions which make the charm or the consolation of life. Man here weighs everything, calculates everything, and sacrifices everything to his interest." An Englishman named Fearon, in 1818, expressed the same idea with more distinctness: "In going to America, I would say generally, the emigrant must expect to find, not an economical or cleanly people; not a social or generous people; not a people of enlarged ideas; not a people of liberal opinions, or toward whom you can express your thoughts free as air; not a people friendly to the advocates of liberty in Europe; not a people who understand liberty from investigation and principle; not a people who comprehend the meaning of words 'honor' and 'generosity.'" Such quotations might be multiplied almost without limit. Rapacity was the accepted explanation of American peculiarities; yet every traveler was troubled by inconsistencies that required explanations of a different kind. "It is not in order to hoard that the Americans are rapacious," observed Liancourt as early as 1796. The extravagance, or what economical Europeans thought extravagance, with which American women were allowed and encouraged to spend money, was as notorious in 1790 as a

century later; the recklessness with which Americans often risked their money, and the liberality with which they used it, were marked even then, in comparison with the ordinary European habit. Europeans saw such contradictions, but made no attempt to reconcile them. No foreigner of that day—neither poet, painter, nor philosopher—could detect in American life anything higher than vulgarity; for it was something beyond the range of their experience, which education and culture had not framed a formula to express. Moore came to Washington, and found there no loftier inspiration than any Federalist rhymester of Dennie's school.

Take Christians, Mohawks, democrats and all,
 From the rude wigwam to the Congress hall,—
 From man the savage, whether slaved or free,
 To man the civilized, less tame than he:
 'T is one dull chaos, one unfertile strife
 Betwixt half-polished and half-barbarous life;
 Where every ill the ancient world can brew
 Is mixed with every grossness of the new;
 Where all corrupts, though little can entice,
 And nothing's known of luxury but vice.

Moore's two small volumes of *Epistles*, printed in 1807, contained much more so-called poetry of the same tone—poetry more polished and less respectable than that of Barlow and Dwight; while, as though to prove that the Old World knew what grossness was, he embalmed in his lines the slanders which the Scotch libeler Callender invented against Jefferson:

The weary statesman for repose hath fled
 From halls of council to his negro's shed;
 Where, blest, he woos some black Aspasias's grace,
 And dreams of freedom in his slave's embrace.

To leave no doubt of his meaning, he explained in a footnote that his allusion was to the President of the United States; and yet even Moore, trifler and butterfly as he was, must have seen, if he would, that between the morals of politics and society in America and those then prevailing in Europe, there was no room for comparison—there was room only for contrast.

Moore was but an echo of fashionable England in his day. He seldom affected moral sublimity; and had he in his wanderings met a race of embodied angels, he would have sung of them or to them in the slightly erotic notes which were so well received in the society he loved to fre-

quent and flatter. His remarks upon American character betrayed more temper than truth; but even in this respect he expressed only the common feeling of Europeans, which was echoed by the Federalist society of the United States. Englishmen especially indulged in unbounded invective against the sordid character of American society, and in shaping their national policy on this contempt they carried their theory into practice with so much energy as to produce its own refutation. To their astonishment and anger, a day came when the Americans, in defiance of self-interest and in contradiction of all the qualities ascribed to them, insisted on declaring war; and readers of this narrative will be surprised at the cry of incredulity, not unmixed with terror, with which Englishmen started to their feet when they woke from their delusion on seeing what they had been taught to call the meteor flag of England, which had burned terrific at Copenhagen and Trafalgar, suddenly waver and fall on the bloody deck of the "Guerriere." Fearon and Beaujour, with a score of other contemporary critics, could see neither generosity, economy, honor, nor ideas of any kind in the American breast; yet the obstinate repetition of these denials itself betrayed a lurking fear of the social forces whose strength they were candid enough to record. What was it that, as they complained, turned the European peasant into a new man within half an hour after landing at New York? Englishmen were never at a loss to understand the poetry of more prosaic emotions. Neither they nor any of their kindred failed in later times to feel the "large excitement" of the country boy, whose "spirit leaped within him to be gone before him," when the lights of London first flared in the distance; yet none seemed ever to feel the larger excitement of the American immigrant. Among the Englishmen who criticized the United States was one greater than Moore—one who thought himself at home only in the stern beauty of a moral presence. Of all poets, living or dead, Wordsworth felt most keenly what he called the still, sad music of humanity; yet the highest conception he could create of America was not more poetical than that of any Cumberland beggar he might have met in his morning walk:

Long-wished-for sight, the Western World appeared;
 And when the ship was moored, I leaped ashore
 Indignantly,—resolved to be a man,
 Who, having o'er the past no power, would live
 No longer in subjection to the past,
 With abject mind—from a tyrannic lord
 Inviting penance, fruitlessly endured.
 So, like a fugitive whose feet have cleared

Some boundary which his followers may not cross
 In prosecution of their deadly chase,
 Respiring, I looked round. How bright the sun,
 The breeze how soft! Can anything produced
 In the Old World compare, thought I, for power
 And majesty, with this tremendous stream
 Sprung from the desert? And behold a city
 Fresh, youthful, and aspiring! . . .

Sooth to say,
 On nearer view, a motley spectacle
 Appeared, of high pretensions—unreproved
 But by the obstreperous voice of higher still;
 Big passions strutting on a petty stage,
 Which a detached spectator may regard
 Not unamused. But ridicule demands
 Quick change of objects; and to laugh alone,
 . . . in the very centre of the crowd
 To keep the secret of a poignant scorn,
 . . . is least fit
 For the gross spirit of mankind.

Thus Wordsworth, although then at his prime, indulging in what sounded like a boast that he alone had felt the sense sublime of something interfused, whose dwelling is the light of setting suns, and the round ocean, and the living air, and the blue sky, and in the mind of man—even he, to whose moods the heavy and the weary weight of all this unintelligible world was lightened by his deeper sympathies with nature and the soul, could do no better, when he stood in the face of American democracy, than “keep the secret of a poignant scorn.”

Possibly the view of Wordsworth and Moore, of Weld, Dennie, and Dickens was right. The American democrat possessed little art of expression, and did not watch his own emotions with a view of uttering them either in prose or verse; he never told more of himself than the world might have assumed without listening to him. Only with diffidence could history attribute to such a class of men a wider range of thought or feeling than they themselves cared to proclaim. Yet the difficulty of denying or even ignoring the wider range was still greater, for no one questioned the force or the scope of an emotion which caused the poorest peasant in Europe to see what was invisible to poet and philosopher—the dim outline of a mountain summit across the ocean, rising high above the mist and mud of American democracy. As though to call attention to some such difficulty, European and American critics, while affirming that

Americans were a race without illusions or enlarged ideas, declared in the same breath that Jefferson was a visionary whose theories would cause the heavens to fall upon them. Year after year, with endless iteration, in every accent of contempt, rage, and despair, they repeated this charge against Jefferson. Every foreigner and Federalist agreed that he was a man of illusions, dangerous to society and unbounded in power of evil; but if this view of his character was right, the same visionary qualities seemed also to be a national trait, for everyone admitted that Jefferson's opinions, in one form or another, were shared by a majority of the American people.

Illustrations might be carried much further, and might be drawn from every social class and from every period in national history. Of all presidents, Abraham Lincoln has been considered the most typical representative of American society, chiefly because his mind, with all its practical qualities, also inclined, in certain directions, to idealism. Lincoln was born in 1809, the moment when American character stood in lowest esteem. Ralph Waldo Emerson, a more distinct idealist, was born in 1803. William Ellery Channing, another idealist, was born in 1780. Men like John Fitch, Oliver Evans, Robert Fulton, Joel Barlow, John Stevens, and Eli Whitney were all classed among visionaries. The whole society of Quakers belonged in the same category. The records of the popular religious sects abounded in examples of idealism and illusion to such an extent that the masses seemed hardly to find comfort or hope in any authority, however old or well established. In religion as in politics, Americans seemed to require a system which gave play to their imagination and their hopes.

Some misunderstanding must always take place when the observer is at cross purposes with the society he describes. Wordsworth might have convinced himself by a moment's thought that no country could act on the imagination as America acted upon the instincts of the ignorant and poor, without some quality that deserved better treatment than poignant scorn; but perhaps this was only one among innumerable cases in which the unconscious poet breathed an atmosphere which the self-conscious poet could not penetrate. With equal reason he might have taken the opposite view—that the hard, practical, money-getting American democrat, who had neither generosity nor honor nor imagination, and who inhabited cold shades where fancy sickened and where genius died, was in truth living in a world of dream, and acting a drama more instinct with poetry than all the avatars of the East, walking in gardens of emerald and rubies, in ambition already ruling the world and guiding

Nature with a kinder and wiser hand than had ever yet been felt in human history. From this point his critics never approached him—they stopped at a stone’s throw; and at the moment when they declared that the man’s mind had no illusions, they added that he was a knave or a lunatic. Even on his practical and sordid side, the American might easily have been represented as a victim to illusion. If the Englishman had lived as the American speculator did—in the future—the hyperbole of enthusiasm would have seemed less monstrous. “Look at my wealth!” cried the American to his foreign visitor. “See these solid mountains of salt and iron, of lead, copper, silver, and gold! See these magnificent cities scattered broadcast to the Pacific! See my cornfields rustling and waving in the summer breeze from ocean to ocean, so far that the sun itself is not high enough to mark where the distant mountains bound my golden seas! Look at this continent of mine, fairest of created worlds, as she lies turning up to the sun’s never failing caress her broad and exuberant breasts, overflowing with milk for her hundred million children! See how she glows with youth, health, and love!” Perhaps it was not altogether unnatural that the foreigner, on being asked to see what needed centuries to produce, should have looked about him with bewilderment and indignation. “Gold! cities! cornfields! continents! Nothing of the sort! I see nothing but tremendous wastes, where sickly men and women are dying of homesickness or are scalped by savages! mountain ranges a thousand miles long, with no means of getting to them, and nothing in them when you get there! swamps and forests choked with their own rotten ruins! nor hope of better for a thousand years! Your story is a fraud, and you are a liar and swindler!”

Met in this spirit, the American, half-perplexed and half-defiant, retaliated by calling his antagonist a fool, and by mimicking his heavy tricks of manner. For himself he cared little, but his dream was his whole existence. The men who denounced him admitted that they left him in his forest swamp quaking with fever, but clinging in the delirium of death to the illusions of his dazzled brain. No class of men could be required to support their convictions with a steadier faith, or pay more devotedly with their persons for the mistakes of their judgment. Whether imagination or greed led them to describe more than actually existed, they still saw no more than any inventor or discoverer must have seen in order to give him the energy of success. They said to the rich as to the poor, “Come and share our limitless riches! Come and help us bring to light these unimaginable stores of wealth and power!” The poor came, and from them were seldom heard complaints of deception or delusion.

Within a moment, by the mere contact of a moral atmosphere, they saw the gold and jewels, the summer cornfields and the glowing continent. The rich for a long time stood aloof—they were timid and narrow-minded; but this was not all—between them and the American democrat was a gulf.

The charge that Americans were too fond of money to win the confidence of Europeans was a curious inconsistency; yet this was a common belief. If the American deluded himself and led others to their death by baseless speculations; if he buried those he loved in a gloomy forest where they quaked and died while he persisted in seeing there a splendid, healthy, and well-built city—no one could deny that he sacrificed wife and child to his greed for gain, that the dollar was his god, and a sordid avarice his demon. Yet had this been the whole truth, no European capitalist would have hesitated to make money out of his grave; for, avarice against avarice, no more sordid or meaner type existed in America than could be shown on every 'change in Europe. With much more reason Americans might have suspected that in America Englishmen found everywhere a silent influence, which they found nowhere in Europe, and which had nothing to do with avarice or with the dollar, but, on the contrary, seemed likely at any moment to sacrifice the dollar in a cause and for an object so illusory that most Englishmen could not endure to hear it discussed. European travelers who passed through America noticed that everywhere, in the White House at Washington and in log cabins beyond the Alleghenies, except for a few Federalists, every American, from Jefferson and Gallatin down to the poorest squatter, seemed to nourish an idea that he was doing what he could to overthrow the tyranny which the past had fastened on the human mind. Nothing was easier than to laugh at the ludicrous expressions of this simple-minded conviction, or to cry out against its coarseness, or grow angry with its prejudices; to see its nobler side, to feel the beatings of a heart underneath the sordid surface of a gross humanity, was not so easy. Europeans seemed seldom or never conscious that the sentiment could possess a noble side, but found only matter for complaint in the remark that every American democrat believed himself to be working for the overthrow of tyranny, aristocracy, hereditary privilege, and priesthood, wherever they existed. Even where the American did not openly proclaim this conviction in words, he carried so dense an atmosphere of the sentiment with him in his daily life as to give respectable Europeans an uneasy sense of remoteness.

Of all historical problems, the nature of a national character is the

most difficult and the most important. Readers will be troubled, at almost every chapter of the coming narrative,¹ by the want of some formula to explain what share the popular imagination bore in the system pursued by government. The acts of the American people during the administrations of Jefferson and Madison were judged at the time by no other test. According as bystanders believed American character to be hard, sordid, and free from illusion, they were severe and even harsh in judgment. This rule guided the governments of England and France. Federalists in the United States, knowing more of the circumstances, often attributed to the democratic instinct a visionary quality which they regarded as sentimentality, and charged with many bad consequences. If their view was correct, history could occupy itself to no better purpose than in ascertaining the nature and force of the quality which was charged with results so serious; but nothing was more elusive than the spirit of American democracy. Jefferson, the literary representative of the class, spoke chiefly for Virginians, and dreaded so greatly his own reputation as a visionary that he seldom or never uttered his whole thought. Gallatin and Madison were still more cautious. The press in no country could give shape to a mental condition so shadowy. The people themselves, although millions in number, could not have expressed their finer instincts had they tried, and might not have recognized them if expressed by others.

In the early days of colonization, every new settlement represented an idea and proclaimed a mission. Virginia was founded by a great, liberal movement aiming at the spread of English liberty and empire. The Pilgrims of Plymouth, the Puritans of Boston, the Quakers of Pennsylvania, all avowed a moral purpose, and began by making institutions that consciously reflected a moral idea. No such character belonged to the colonization of 1800. From Lake Erie to Florida, in long, unbroken line, pioneers were at work, cutting into the forests with the energy of so many beavers, and with no more express moral purpose than the beavers they drove away. The civilization they carried with them was rarely illumined by an idea; they sought room for no new truth, and aimed neither at creating, like the Puritans, a government of saints, nor, like the Quakers, one of love and peace; they left such experiments behind them, and wrestled only with the hardest problems of frontier life. No wonder that foreign observers, and even the educated, well-to-do Americans of the seacoast, could seldom see anything to admire in the ignorance and brutality of

1. Henry Adams is here referring to the later chapters of his *History of the United States* [Ed.].

frontiersmen, and should declare that virtue and wisdom no longer guided the United States! What they saw was not encouraging. To a new society, ignorant and semibarbarous, a mass of demagogues insisted on applying every stimulant that could inflame its worst appetites, while at the same instant taking away every influence that had hitherto helped to restrain its passions. Greed for wealth, lust for power, yearning for the blank void of savage freedom such as Indians and wolves delighted in—these were the fires that flamed under the caldron of American society, in which, as conservatives believed, the old, well-proven, conservative crust of religion, government, family, and even common respect for age, education, and experience was rapidly melting away, and was indeed already broken into fragments, swept about by the seething mass of scum ever rising in greater quantities to the surface.

Against this Federalist and conservative view of democratic tendencies, democrats protested in a thousand forms, but never in any mode of expression which satisfied them all, or explained their whole character. Probably Jefferson came nearest to the mark, for he represented the hopes of science as well as the prejudices of Virginia; but Jefferson's writings may be searched from beginning to end without revealing the whole measure of the man, far less of the movement. Here and there in his letters a suggestion was thrown out, as though by chance, revealing larger hopes—as in 1815, at a moment of despondency, he wrote: "I fear from the experience of the last twenty-five years that morals do not of necessity advance hand in hand with the sciences." In 1800, in the flush of triumph, he believed that his task in the world was to establish a democratic republic, with the sciences for an intellectual field, and physical and moral advancement keeping pace with their advance. Without an excessive introduction of more recent ideas, he might be imagined to define democratic progress, in the somewhat affected precision of his French philosophy: "Progress is either physical or intellectual. If we can bring it about that men are on the average an inch taller in the next generation than in this; if they are an inch larger round the chest; if their brain is an ounce or two heavier, and their life a year or two longer,—that is progress. If fifty years hence the average man shall invariably argue from two ascertained premises where he now jumps to a conclusion from a single supposed revelation,—that is progress! I expect it to be made here, under our democratic stimulants, on a great scale, until every man is potentially an athlete in body and an Aristotle in mind." To this doctrine the New Englander replied, "What will you do for moral progress?" Every possible answer to this question opened a chasm. No doubt

Jefferson held the faith that men would improve morally with their physical and intellectual growth; but he had no idea of any moral improvement other than that which came by nature. He could not tolerate a priesthood, a state church, or revealed religion. Conservatives, who could tolerate no society without such pillars of order, were, from their point of view, right in answering, "Give us rather the worst despotism of Europe—there our souls at least may have a chance of salvation!" To their minds vice and virtue were not relative, but fixed terms. The Church was a divine institution. How could a ship hope to reach port when the crew threw overboard sails, spars, and compass, unshipped their rudder, and all the long day thought only of eating and drinking? Nay, even should the new experiment succeed in a worldly sense, what was a man profited if he gained the whole world, and lost his own soul? The Lord God was a jealous God, and visited the sins of the parents upon the children; but what worse sin could be conceived than for a whole nation to join their chief in chanting the strange hymn with which Jefferson, a new false prophet, was deceiving and betraying his people: "It does me no injury for my neighbor to say there are twenty Gods or no God!"

On this ground conservatism took its stand, as it had hitherto done with success in every similar emergency in the world's history, and fixing its eyes on moral standards of its own, refused to deal with the subject as further open to argument. The two parties stood facing opposite ways, and could see no common ground of contact.

Yet even then one part of the American social system was proving itself to be rich in results. The average American was more intelligent than the average European, and was becoming every year still more active-minded as the new movement of society caught him up and swept him through a life of more varied experiences. On all sides the national mind responded to its stimulants. Deficient as the American was in the machinery of higher instruction; remote, poor; unable by any exertion to acquire the training, the capital, or even the elementary textbooks he needed for a fair development of his natural powers—his native energy and ambition already responded to the spur applied to them. Some of his triumphs were famous throughout the world; for Benjamin Franklin had raised high the reputation of American printers, and the actual President of the United States, who signed with Franklin the treaty of peace with Great Britain, was the son of a small farmer, and had himself kept a school in his youth. In both these cases social recognition followed success; but the later triumphs of the American mind were becoming more and

more popular. John Fitch was not only one of the poorest but one of the least-educated Yankees who ever made a name; he could never spell with tolerable correctness, and his life ended as it began—in the lowest social obscurity. Eli Whitney was better educated than Fitch, but had neither wealth, social influence, nor patron to back his ingenuity. In the year 1800 Eli Terry, another Connecticut Yankee of the same class, took into his employ two young men to help him make wooden clocks, and this was the capital on which the greatest clock manufactory in the world began its operations. In 1797 Asa Whittemore, a Massachusetts Yankee, invented a machine to make cards for carding wool, which “operated as if it had a soul,” and became the foundation for a hundred subsequent patents. In 1790 Jacob Perkins, of Newburyport, invented a machine capable of cutting and turning out two hundred thousand nails a day; and then invented a process for transferring engraving from a very small steel cylinder to copper, which revolutionized cotton printing. The British traveler Weld, passing through Wilmington, stopped, as Liancourt had done before him, to see the great flour mills on the Brandywine. “The improvements,” he said, “which have been made in the machinery of the flour mills in America are very great. The chief of these consist in a new application of the screw, and the introduction of what are called elevators, the idea of which was evidently borrowed from the chain-pump.” This was the invention of Oliver Evans, a native of Delaware, whose parents were in very humble life, but who was himself, in spite of every disadvantage, an inventive genius of the first order. Robert Fulton, who in 1800 was in Paris with Joel Barlow, sprang from the same source in Pennsylvania. John Stevens, a native of New York, belonged to a more favored class, but followed the same impulses. All these men were the outcome of typical American society, and all their inventions transmuted the democratic instinct into a practical and tangible shape. Who would undertake to say that there was a limit to the fecundity of this teeming source? Who that saw only the narrow, practical, money-getting nature of the devices could venture to assert that as they wrought their end and raised the standard of millions, they would not also raise the creative power of those millions to a higher plane? If the priests and barons who set their names to Magna Carta had been told that in a few centuries every swineherd and cobbler’s apprentice would write and read with an ease such as few kings could then command, and reason with better logic than any university could then practice, the priest and baron would have been more incredulous than any man who was told in 1800 that within another five centuries the plowboy would go afield whistling a

sonata of Beethoven, and figure out in quaternions the relation of his furrows. The American democrat knew so little of art that among his popular illusions he could not then nourish artistic ambition; but leaders like Jefferson, Gallatin, and Barlow might without extravagance count upon a coming time when the diffused ease and education should bring the masses into familiar contact with higher forms of human achievement, and their vast creative power, turned toward a nobler culture, might rise to the level of that democratic genius which found expression in the Parthenon; might revel in the delights of a new Buonarroti [Michelangelo] and a richer Titian; might create for five hundred million people the America of thought and art which alone could satisfy their omnivorous ambition.

Whether the illusions, so often affirmed and so often denied to the American people, took such forms or not, these were in effect the problems that lay before American society: Could it transmute its social power into the higher forms of thought? Could it provide for the moral and intellectual needs of mankind? Could it take permanent political shape? Could it give new life to religion and art? Could it create and maintain in the mass of mankind those habits of mind which had hitherto belonged to men of science alone? Could it physically develop the convolutions of the human brain? Could it produce, or was it compatible with, the differentiation of a higher variety of the human race? Nothing less than this was necessary for its complete success.

*The foregoing consists of Chapters I and VI
from Volume I of Henry Adams'*

HISTORY OF THE UNITED STATES OF AMERICA.

John Bagnell Bury

1861–1927

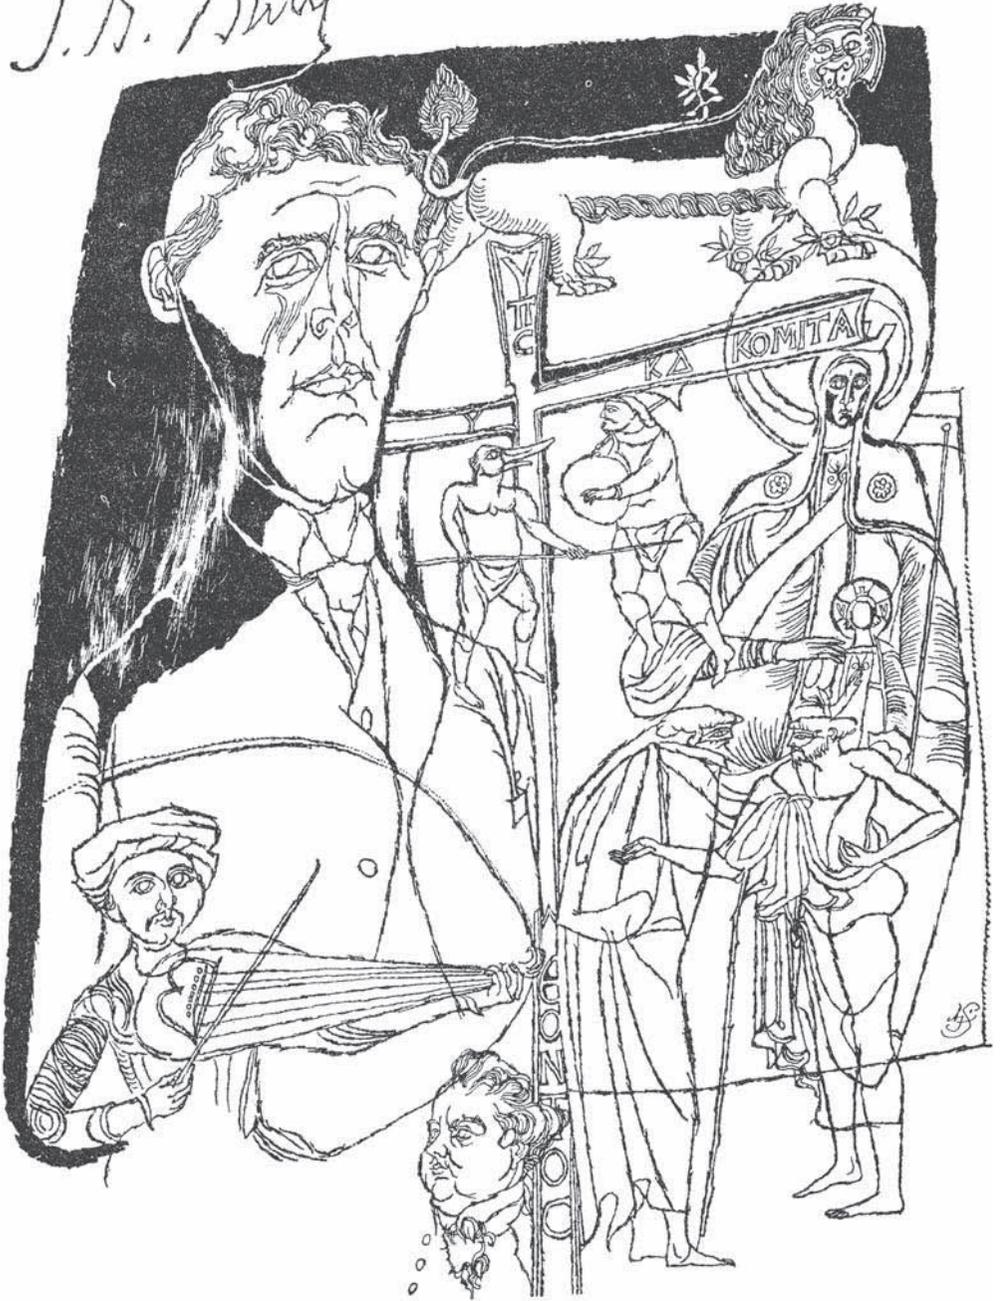

John Bagnell Bury, classicist and historian, was born at Monaghan, Ireland, in 1861, the son of an Anglican clergyman of more than ordinary learning. The boy was taught Greek and Latin at an early age. By the time he was ten he had exhausted the ingenuity of his tutor at Foyle College, Londonderry, who could find no question in Greek grammar too difficult for his pupil. Subsequently, Bury carried off all the prizes in classics at Trinity College, Dublin, from which he was graduated in 1882.

In 1885 he was made a fellow of the College, having achieved distinction as a philologist with two books on the *Odes* of Pindar. He had by then become interested in history, however, and in 1889 he published a work on the later Roman Empire that was received with high praise. In consequence of this, he was in 1895 appointed to a professorship in history. Thereafter he produced a steady stream of scholarly books, including an annotated edition of Gibbon in seven volumes (1896–1900), and a *History of Greece to the Death of Alexander the Great* (1900) which at once became a standard text.

As these works firmly established Bury's reputation, he was the logical choice for Regius Professor of Modern History at Cambridge when Lord Acton died; and, being appointed to that august chair in 1902, he occupied it until his death in 1927. Throughout his later

Notes from the artist: "The portrait of Bury is surrounded with Greek and Byzantine designs, reflecting his writings on early Mediterranean history. At the bottom is a small head of Gibbon, whose Decline and Fall was annotated by Bury in a seven-volume edition."

J. B. Bury

life he continued to publish works which ranged from the most detailed monographs to the widely read *History of Freedom of Thought* (1913) and *The Idea of Progress* (1920). In all, his bibliography amounted to no less than 369 items, while his erudition extended to perhaps a dozen languages, including Hebrew, Sanskrit, and Hungarian.

In this chapter of *The Ancient Greek Historians*, Bury appraises the work of the “Father of History,” as Herodotus has been called. He was not the first historian, however, any more than Hippocrates, who is termed the “Father of Medicine,” was the first physician. So much does not come out of nothing. We are amazed at the complexity of the medical tradition that lay behind Hippocrates; we are surprised also by the amount of historical literature that had accumulated in fifth-century Greece, which Herodotus could have absorbed before he set out on his most important journeys to Babylonia and Egypt. Other much older civilizations, such as the Indian, had little sense of history, or even of chronology.

In explaining the long geographical sections of *The History*,¹ Bury says that Herodotus was following the example set by Hecataeus and his “school,” and points out that the geography of Egypt and Scythia had a “practical interest” for Athenians. The geography is not something imported from outside, as had been supposed, but is a calculated part of the story. So also are the numerous digressions. They add piquancy and charm, and rest the mind from a too continuous narrative. The invented dialogues also enliven *The History*, lending verisimilitude and fascination. Herodotus’ aim, unlike the modern scientific historian’s, was to capture the mind of the ordinary reader.

In his dialogues, digressions, and epic sweep, Herodotus followed the model of his greatest master—the poet Homer. The *Iliad*, as you will remember, abounds in digressions and resounding speeches, and it also recounts the war of Greeks and Ionians. Herodotus’ epic theme, in *The History*, is not merely the military conflict of Greece and Persia, but also the clash of two very different civilizations—the liberty of “Hellenic constitutionalism” v. “oriental autocracy.” Although he was born in Ionia, under the sway of Persia, Herodotus’

¹ For *The History of Herodotus* see *Great Books of the Western World*, Vol. 6.

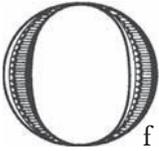

sympathies are clearly with the Greeks, or rather, the Athenians. In this respect also, as Bury implies, he was not a scientific historian.

Yet in spite of his bias, which most of us probably share, Herodotus wrote “universal history,” depicting life on both sides of the trenches, and thus giving us “a lesson in the unity of history”—“the common history of man.” He (and his immediate predecessors) also made an important advance in de-mythologizing human history. In the *Iliad*, the gods are the principal actors or at least pull the strings, whereas in *The History* they are gently pushed aside and deflated by irony. Not entirely, to be sure, for portents and other supernatural influences are still accepted, not only as reports, but as facts. Yet Herodotus’ skepticism, though mixed with naïve, often piquant, gullibility, was a signal advance in the writing of history.

Bury thinks Herodotus’ maxims of historical criticism are all valid. The historian should “suspect superhuman and miraculous occurrences, which contradict ordinary experience.” When there is a conflict of evidence, he *should* “keep an open mind,” and observations of results and “first-hand oral information” *are* more trustworthy than “stories at second hand.” Bury regrets only that Herodotus did not follow his own maxims more consistently. He calls attention to numbers of glaring errors of fact and interpretation in *The History*, some of which are enough in themselves “to stamp Herodotus as more of an epic poet than a historian.”

This judgment, in spite of Bury’s praise, is so severe that the generous reader may want to make some defense of Herodotus. Could we not say that the business of the historian is not only to report the facts correctly, but also to construct a plausible picture of the past—to make it live? This is Herodotus’ special talent. His version of the Persian War will outlive better-documented accounts, partly because it captures the true color and momentum of the period.

Herodotus

f the life of Herodotus, son of Lyxes, of Halicarnassus, we know hardly anything except what may be gleaned from his own statements. Born early in the fifth century, he left his birthplace before 454 B.C., banished by Lygdamis the tyrant, who put his cousin Panyassis, the epic poet, to death. He stayed apparently for some time in Samos, and then went to Athens, whence he proceeded to Italy as one of the first citizens of the new colony of Thurii (443 B.C.). He survived the first years of the Peloponnesian War (431–0 B.C.). Into this framework we have to fit his travels, which included the coasts of the Euxine, Babylon, Phoenicia, Egypt, and probably Cyrene. It is not necessary to discuss the disputed subject of the chronology of his journeys. I need only say that his most important journeys, those to Babylonia and Egypt, were probably undertaken in the later period of his life, while he was a citizen of Thurii. The years which elapsed between his banishment from his native city and his departure for his new home seem to have been spent in Greece, perhaps chiefly at Athens, and to have been devoted, as we shall see, to investigating and composing the story of the invasion of Xerxes. Though he may naturally have visited Athens again, on his way to or from the East, there is no evidence to entitle us to presume, as some have thought, that he deserted Thurii permanently and dwelled at Athens during the last years of his life.

The argument of his history is a narrative of the relations between the Greeks and the oriental powers from the accession of Croesus to the capture of Sestos in 478 B.C.—a “modern” history in the fullest sense of the term. The division into nine books is not due to the author himself, for in his day such divisions had not yet come into fashion. But the Alexandrine editor who was responsible for it was a man of extraordinary insight. His distribution perfectly exhibits the construction of the book and could not be improved by any change. But it can be rendered more

perspicuous by observing that each of the nine books is truly a subdivision and that the primary partition is a threefold one. The work falls naturally into three sections, each consisting of three parts. The first section, or triad of books, comprises the reigns of Cyrus and Cambyses, and the accession of Darius; the second deals with the reign of Darius; the third with that of Xerxes. The first is mainly concerned with Asia including Egypt; the second with Europe; the third with Hellas. The first displays the rise and the triumphs of the power of Persia; the last relates the defeat of Persia by Greece; while the middle triad represents a chequered picture, Persian failure in Scythia and at Marathon, Greek failure in Ionia. And each of the nine subdivisions has a leading theme which constitutes a minor unity. Cyrus is the theme of the first book, Egypt of the second, Scythia of the fourth, the Ionian rebellion of the fifth, Marathon of the sixth. The seventh describes the invasion of Xerxes up to his success at Thermopylae; the eighth relates the reversal of fortune at Salamis; the final triumphs of Greece at Plataea and Mycale occupy the ninth. In the third alone the unity is less marked; yet there is a central interest in the dynastic revolution which set Darius on the throne. Thus the unity of the whole composition sharply displays itself in three parts, of which each again is threefold. The simplicity with which this architectural symmetry has been managed, without any apparent violence, constraint, or formality, was an achievement of consummate craft. The writer's management of the digressions, for which he is notorious, is hardly less striking, exhibiting a rare skill in the choice of the best and perhaps the only fitting places to stow away loose material he wished to make use of.

But, perfect as is the architectural unity of the work of Herodotus, it would seem that the plan as it was finally carried out was not conceived when he commenced to write, and that the unity was achieved not in conformity to a design thought out from the beginning, but by a process of expansion due to an afterthought. There is a variety of internal evidence which points convincingly to the conclusion that the last three books were composed before the first six, and there are indications that he wrote this portion between 456 and 445 B.C., before he began his travels. The natural inference is that he originally contemplated no more than a history of the invasion of Xerxes; and that it was in the course of his travels that he conceived the idea of a larger work, of which the "Invasion of Xerxes" should form the finale. The idea doubtless shaped itself gradually; and the first six books were not composed in the order in which they stand. But the author has worked with such skill that only a searching analysis has detected the series of facts which demonstrate the

priority of the last three books and make it clear that the Persian War was his original inspiration.

At whatever moment the idea of expanding his original history to its fuller compass presented itself, whether it was suggested by his journeys or prompted him to become a traveller, it was certainly connected closely with his travels, and the occurrence of long geographical excursus is one of the most striking features of the expansion.

So strongly marked indeed is the geographical element, so long are the geographical sections, in the work of Herodotus, that some critics have been led to think that considerable parts of it were originally intended to form part of a geography, and were afterwards incorporated in his history. There is nothing that compels us to adopt a hypothesis of this kind. Association with geography was a characteristic of the early historical literature of the Greeks, and these excursus in Herodotus attest the influence of the Hecataean school, and were natural in the work of a historian who was himself a traveller. And it is worth observing that when he was writing, both Egypt and Scythia, the subjects of his longest historico-geographical digressions, had a particular practical interest for the Athenians; and of the Greek public it was unquestionably the Athenians to whom the historian designed his work pre-eminently to appeal. I need only remind you of the Athenian adventure in Egypt in the middle of the fifth century and of the voyage of Pericles in the Euxine Sea. It has even been conjectured that this Periclean expedition (444 B.C.) was the occasion of the historian's visit to the Pontic regions. However this may be, it is not insignificant, in judging these digressions, that Egypt and Scythia possessed, at the time Herodotus wrote, an interest of a political kind, subordinate indeed to that of Persia, but distinctly actual.

It is also to be noted that the digressions in general had an artistic justification. They are an epic feature, deliberately designed; one of the epic notes of the work. Homer was the literary master of Herodotus; without imitating him in any obvious way, the first great master of prose studied and caught the secrets of his effects. By means of digressions he achieved epic variety. We cannot do better than read the observations of the accomplished literary critic Dionysius. "Herodotus knew that every narrative of great length wearies the ears of the hearer, if it dwell without a break on the same subject; but, if pauses are introduced at intervals, it affects the mind agreeably. And so he desired to lend variety to his work and imitated Homer. If we take up his book, we admire it to the last syllable, and always want more."

Besides diversifying his work with digressions and episodes, Herodotus

adopted another epic feature, not less characteristic. Like Homer, the historian makes his characters speak. He introduces not only short and pointed conversations, but dialogues and orations of considerable length. For instance, Xerxes, Mardonius, and Artabanus make each a speech in council before it is decided to invade Greece. I may recall the conversations of Solon with Croesus, of Xerxes with Artabanus and with Demaratus; and the speech made by the Corinthian envoy when the Spartans were considering the policy of forcing Athens to restore the Peisistratids. If the historian were charged with abusing this artifice by introducing in the Corinthian envoy's speech a long episode from Corinthian history, which is really quite irrelevant, he could appeal to the discourses of Phoenix and Nestor in Homer; and this case illustrates the fact that in introducing speeches he was influenced by the Ionian epic and not by the Athenian drama. It is impossible to say whether any of the older prose writers had adopted this practice, which makes the scenes vivid and the work alive. The bits of Hecataeus we possess are too brief to judge; but I may note that in one case at least he put words into the mouth of an actor.

The Homeric qualities of Herodotus, which communicate to his history an epic flavour, accord with the object to produce a work which like Homer should fascinate the minds of men. It was his aim to hold his audience or readers entertained; to do for his own world in prose what Homer had done for the ancient world in numbers. We cannot tell how far any of his prose predecessors had sought to make their works attractive or entertaining, or whether the influence of epic poetry affected their method of presentation. But we may confidently say that Herodotus was the first who discerned in "modern" history the possibilities of a treatment which was epic, and not Hesiodic but Homeric, in spirit and style.

His theme, the struggle of Greece with the Orient, possessed for him a deeper meaning than the political result of the Persian War. It was the contact and collision of two different types of civilization, of peoples of two different characters and different political institutions. In the last division of his work, where the final struggle of Persia and Greece is related, this contrast between the slavery of the barbarian and the liberty of the Greek, between oriental autocracy and Hellenic constitutionalism, is ever present and is forcibly brought out. But the contrast of Hellenic with oriental culture pervades the whole work; it informs the unity of the external theme with the deeper unity of an inner meaning. It is the key-note of the history of Herodotus. The digressions and stories which delay the action, besides their intrinsic interest, and besides their epic

use as pleasant pauses, have also the value of sounding that note, and of contributing distinctly, but without emphasis or iteration, towards impressing that contrast on the reader's mind. The interview, for example, of Croesus with Solon, the self-confident Eastern potentate with the thoughtful, self-controlled Greek, strikes this chord loudly; and most of the oriental and Hellenic stories are calculated to suggest the antithesis which finds its supreme expression, and is more elaborately wrought out, in the final collision of the Persian Wars.

In the execution of this conception the Herodotean work has assumed the character of a study in the history of civilization. Just as the Homeric poems present a large and living picture of the culture of ancient Greece, so the history of Herodotus gives us panoramic views in the Hellenic civilization of the sixth century, and describes the cultures of all the Eastern peoples who directly or indirectly come within range.

And if it is a study in the history of civilization, we may also say that it has certain features of a universal history. It is not universal either in space or in time. Not in time; it does not attempt to go back far in Greek history, and only touches upon the ancient period incidentally. Not in space, for it hardly touches upon the western Greeks at all, and does not include what Hecataeus would have supplied about the peoples of the western Mediterranean. But it has the higher quality of what we mean by universal history or *Weltgeschichte*, in focusing under one point of view, and fitting into a connected narrative, the histories of the various peoples who came into relations with one another, within a given range; so that they are drawn out of their isolation and recognized to have a meaning, greater or less, in the common history of man. Within that range, which is determined by his theme, Herodotus is irreproachably comprehensive; and his book, though he never formulates the idea, is a lesson in the unity of history.

Although Herodotus does not enter upon the history of the heroic period, he has frequently occasion to refer to mythical tradition, and here he shows himself distinctly a sceptic. Not that he was a rationalist in regard to theology generally, or had any clear and consistent philosophical view. He looked upon human life as under the control of superhuman powers, who in exercising their incalculable government were prompted by motives of envy and nemesis or righteous anger, who acted to some extent on principles of justice and retribution, and who might communicate knowledge to men by means of oracles, portents, or dreams. But any further converse of gods with men, any divine appearances alleged to have happened in recent times, Herodotus is not prepared to

accept, though he is never dogmatic. His philosophy was not strong enough to deny that the gods had ever carried on the sort of intercourse with men that is described in the epics, or generated human progeny; for his ultimate line between the divine and the human was not fast. But it was a great comfort for common sense and everyday experience, to push the age in which such things could happen as far back as possible. Herodotus reveals unmistakably his incredulity about all the mythical wonders in which, according to tradition, ancestors of living people, some fifteen or twenty generations back, played bright or shady parts. He accepted the genealogies, but when he got to Perseus or Hercules, he did not regard them as sons of a god. Hercules is the son of Amphytrion, Helen is the daughter of Tyndareus. Sometimes he relates legends or tells tales involving superhuman agency, but he never takes any responsibility for them, and occasionally treats them with delicate irony. He mentions a legend of the Thessalians that the ravine through which the Peneus makes its way to the sea was wrought by Poseidon. "Their tale is plausible; and any one who thinks that Poseidon shakes the earth and that clefts produced by earthquakes are the works of that god would on seeing this mountain-ravine ascribe it to Poseidon. For it appeared to me to be the result of an earthquake." Gibbon might have taken lessons in the art of irony from Herodotus as well as from Pascal. Consider again the admirable caution with which he speaks of the divine snake said to live on the Athenian Acropolis. "The Athenians say that a great snake lives in the Sanctuary as guardian of the citadel; and they present a honey-cake every month as to a creature existing." This commits him to nothing.

But though disposed to accept only what experience led him to regard as possible, in any given case, Herodotus, as I have said, did not draw theoretically a hard and fast line between the human and the divine; and he did not reject as ridiculous the notion that at one time gods moved visibly on the earth and consorted with men. Why then did he reject the divine parentage of heroes like Hercules and Perseus? It is important to comprehend the reason for this scepticism which he derived from Hecataeus. I touched on this point in the first lecture. It was not due to the canons of Ionian science or to the influence of Ionian philosophy. It was due to the study of comparative mythology which had opened for Hecataeus a new perspective of the world's history. The Egyptian studies which Herodotus pursued in the footsteps of the Milesian traveller taught him that human history in that country went back for thousands of years before the age of the gods was reached. The Egyptians, for

instance, had a god corresponding to Hercules, and they reckoned that 17,000 years had elapsed since he had appeared in Egypt. Hence the conclusion which Herodotus accepts that there was an ancient god Hercules, but that he must be sharply distinguished from the human son of Amphitryon, ancestor of the Heraclidae.¹ The Greek tradition that the age in which gods walked the earth was still current some eight or nine hundred years ago could not be true. For even apart from the suggestions of comparative mythology, it was inadmissible to suppose that while Egypt was in a prosaic age of mere men, Greece was trodden by deities and the scene of miracles; and the Egyptian tradition was vouched for by records. The argument demolished the received mythology of the heroic age so far as it was superhuman.

Herodotus deserves credit for having accepted the argument, to which contemporary writers like Pherecydes were deaf; and if he asks pardon from the gods and heroes for his boldness, this does not mean that he felt hesitation or reluctance; it was merely an insincere and graceful genuflection. He was doing what a Christian preacher sometimes does when having delivered an extremely heterodox sermon he winds up with a formal homage to orthodox dogma. Herodotus is extremely courteous, perhaps ironically courteous, to both parties. He says, as it were, to the gods and heroes, "Please, do not be angry with me—supposing you to exist. But at this time of day, you know, one must really draw the line somewhere." On the other hand he says to the infidels who disbelieve in oracular prophecy, "I know you will think me credulous. But still in this case the evidence is so remarkably clear that I do not see my way to resisting it." The mythological argument, however, of which I am speaking was not due to Herodotus himself. He may have put it in his own way, and added some points, but he owed it, as I have said, to Hecataeus. It has long been recognized that his description of Egypt is not an original work, put together exclusively from his own observations and inquiries, but largely reproduces the account which Hecataeus had given in his *Map of the World*. When Herodotus visited Egypt, he doubtless had the book of Hecataeus with him, and used it like a barrister's brief for cross-examining the temple-servants and guiding him in his investigations. He added corrections and new information, but the great Ionian supplied the groundwork. He does not say so; he does not acknowledge his debt to Hecataeus; for, as you know, the ancients had very different views from the moderns about literary obligations. It was not the fashion or etiquette

1. Similarly Pan son of Penelope, Dionysus son of Semele, are to be distinguished from the synonymous gods.

to name your authorities except for some special reason—for instance, to criticize them, or to display your own learning; and you were not considered a plagiarist if you plundered somebody else's work without mentioning his name. Hecataeus brought out the importance of the Nile by the striking phrase that Egypt was the gift of the river; Herodotus adopts the phrase as if it were his own. One of the most convincing tests by which suspected plagiarism can be established is the occurrence of the same mistakes. Now Herodotus reproduces the errors which Hecataeus had committed about the hippopotamus. But there are a whole series of points in which we can trace the contact between the two writers in regard to Egypt. As for the mythology, we are left in no doubt because Herodotus names Hecataeus in this connection. "When Hecataeus was in Thebes he told his pedigree to the priests and connected himself with a god in the sixteenth generation. And the priests did to him what they did to me, though *I* did not relate *my* pedigree. They took him into the hall of the temple and showed him wooden statues of the high priests. The high priesthood descends from father to son, and each high priest sets up his own statue in his lifetime. They counted 345 statues, and they set this genealogy against that of Hecataeus, but *they* did not derive their pedigree from a god or a hero."

The author's motive in naming his predecessor here is, obviously, to rally him for having "given himself away" by stating his own genealogy and divine ancestry to the priests. "*I* was not so incautious" is the implication. But we have no right to infer that Hecataeus had not already drawn the sceptical conclusions which Herodotus explains. The sceptical words with which Hecataeus introduced his *Genealogies* show that he was not deaf to the lessons in history which he learned in Egyptian temples. His very expression when he says that "the *logoi* of the Hellenes are absurd," not "the stories of the poets," suggests the contrast of non-Hellenes whose *logoi* he had compared. The distinction of what the Greeks say from what the Persians, Phoenicians, or Egyptians say often recurs in Herodotus, and is an echo, I believe, from Hecataeus. But we have another proof. Herodotus cites the Egyptian priests as dating the age of the gods in relation to the reign of Amasis [Ahmose]. As the visit of Hecataeus to Egypt would have fallen not long after the death of Amasis, the dating indicates that Herodotus was copying the statement of Hecataeus.

The note of scepticism, perhaps we may say the characteristic note of Ionian scepticism, is struck in the first paragraphs of the Herodotean work. It opens with the statement of a theory that the wars of the Greeks

and Persians were the manifestation of a secular antagonism between Asia and Europe—what our English historian, Freeman, was fond of calling the Eternal Question. This at least is the abstract way we should formulate the tenor of the statement which I may abbreviate as follows: “The quarrel began thus: Phoenician traders carried off from Argos Io, the king’s daughter. Subsequently Greek adventurers from Crete carried off the princess Europa from Tyre. The next aggression came from the Greek side, when the Argonauts ravished Medea from Colchis. The Asiatic reply to this outrage was the rape of Helen by Paris. The Trojan War, which followed, generated in Asia a feeling of hostility to the Greeks, and the Persian War was the ultimate issue of this feeling.” But the theory was not originated by Herodotus. He disavows all responsibility. It was a theory of the Persians, he tells us, and he states it only to set it aside in his ironical way.

The whole passage reads as if it might be the condensation of a friendly discussion between a Greek and a Persian as to the responsibility for the Persian War. It was undeniable that the Persians and not the Greeks had been the aggressors; the conquest of Ionia by Cyrus had been the beginning. The Persian advocate could only remove the blame from Asia by going farther back. The summary I gave of the argument does not reproduce its flavour, and I will take the liberty of throwing it into the form of a dialogue.

Persian. The Greeks had no business in Asia. They belong to Europe, and they should have stayed there. Their expedition against Troy was the first trespass; it began their encroachments on a continent which belongs to Asiatic peoples of whom the Persians are the heirs.

Greek. Oh, but you are forgetting that on that occasion the Trojans were the offenders; Paris carried off Helen.

Persian. That was no sufficient reason; but even if it were, the act of Paris was only a reprisal for the Greek crimes of carrying off Medea and Europa. And the Asiatics were far too sensible to make a *causa belli* of such foolish elopements.

Greek. Well, if you go back so far, you must go back farther still. What about the rape of Io from Argos?

Persian. Well, yes, I admit it. That was a Phoenician business, and we Persians must allow that the Phoenicians began the mischief, though we hold you really responsible, through your folly in taking such an affair seriously. Only fools would make war on account of such escapades. Men of the world know that, if these women were carried off, they were not more reluctant than they should be.

Evidently we have here an invention of Ionian *esprit*. The nature of the argument, dealing as it does entirely with Greek legend, shows that the Persian was a fictitious disputant; and the attribution of the theory to a Persian is an effect of literary subtlety quite in the manner of Voltaire. Though Herodotus thought little of this speculation about ancient wrongs, he seems to have taken it as seriously meant. "Whatever we think about all this," he says, "I will begin with the first Eastern monarch who undoubtedly committed injustice against Greece, Croesus, who subdued Ionia without provocation." But it is highly significant that he should place in the portals of his work a speculation which set mythical tradition in a ridiculous light.

The passage I have discussed is one of several that evince those acute tendencies in the Hellenic mind which culminated in the movement of the Sophists. For instance, the story of the wife of Intaphernes. She chose to save her brother rather than her husband or children, on the ground that husband and children might be replaced but she could never have another brother. That is a clever Ionian subtlety; there is no reason to suppose that it was invented in the period of the Sophists. Or take the demonstration of the power of custom by Darius. He dismayed some Greeks by the question what they would take to eat their dead fathers, and then equally horrified some Indians of a tribe who ate dead parents, by asking them how much they would take to cremate theirs. The immense power of custom was an observation redolent of the age of the Wise Men; Pindar, whom Herodotus quotes, designated Custom as king of the world; and the idea afterwards became the basis of sophistic theories. The story quoted by Herodotus is a drastic Ionian illustration.

Again, the famous discussion of the comparative merits of democracy, aristocracy, and monarchy by the seven Persian conspirators who overthrew the false Smerdis belongs also to pre-sophistic speculation. It is obviously a fiction; for the discussion was appropriate in the Greek world, but was quite out of place in Persia. But it was not a fiction of Herodotus, for he states expressly (careful though he generally is not to commit himself) that these opinions were really uttered by the Persian noblemen, although some of the Greeks consider this incredible. The historian was taken in, just as he was taken in by the persiflage about the rapes of the fair women of legend. There can hardly be much doubt that some publicist threw his reflections on the comparative merits of constitutions into the shape of this historical deliberation. The distinction of three fundamental types of constitution is older than the period of the Sophists; it is recognized in an ode of Pindar not later than 473 B.C., and

it was then probably a commonplace. We may suspect that we have to do with some publication of the first half of the fifth century.

Now there is one feature common to these passages. Greek ideas and reflections are transferred to an Eastern setting or connected with Persian history. Their origin was assuredly Ionian.² They betray the naïve interest of the Ionians in their masters, and show the Greek mind projecting its own reflections into a world of which it had only a half-knowledge, with the instinct of making that world more interesting and sympathetic.³

But I must return to the scepticism of Herodotus. I have already observed that in the historical post-Homeric period the mythopoeic faculty of the Greeks did not slumber, but myth now took the form of the historical anecdote, or, as the Germans call it, *historische Nouvelle*. Here they showed consummate felicity in constructing stories with historical background, historical actors, historical motives, and possessing, many of them, a perpetual value because they are seasoned with worldly wisdom and enshrine some criticism of life. These tales differ from the old myths not only in the tendency to point a moral but also in the circumstance that for the most part they do not involve physical impossibilities, though they may imply highly improbable coincidences, or what we may call psychical or political impossibilities. The work of Herodotus is richly furnished with these tales; he had a wonderful flair for a good story; and the gracious garrulity with which he tells historical anecdotes is one of the charms which will secure him readers till the world's end. Gibbon happily observed that Herodotus "sometimes writes for children and sometimes for philosophers"; the anecdotes he relates often appeal to both. He accepts them generally at their face value, and most of them have been taken as more or less literally true till very recent times. The story of the intercourse between Croesus and Solon was rejected as fiction only because it seemed impossible to reconcile it with chro-

2. The clear allusion of Otanes, in his defence of democracy, to the Athenian constitution under the lot-system does not necessitate by any means an Athenian origin. It may be conjectured that the peculiar privileged position which Otanes and his descendants were said to have held in the Persian realm suggested the idea of transferring this singularly Hellenic discussion to Susa. Otanes, it is said, was exempted from subjection to the kings because, though he was the leading organizer of the conspiracy, he resigned all claims to the throne which Darius secured. He was thus neither ruler nor subject, an anomalous position which in Greece had a sort of parallel in the membership of a democracy. Hence the suggestion that Otanes believed in democracy, and, when he did not convince his fellow-conspirators, obtained for himself personally and his family the freedom which a democracy bestows.

3. I have been here expressing dissent from the view of some critics that the passages enumerated indicate sophistic influence.

nology. But we are now more sceptical about good stories of this type, and we have come to see how often they are wrought upon, or woven into, some ancient *motif*, which is adapted to a historical setting. The tale of the funeral pyre of Croesus sprang from the burning of the Assyrian god Sandan; it was an up-to-date version of the legend of Sardanapalus. The story of the ring of Polycrates turns on an old motive, the finding of something lost in a fish's belly, but its point in connection with Polycrates has been explained only the other day. The casting of the ring into the sea was symbolic of thalassocracy; it was the same mythical ring as that of Minos, which in the poem of Bacchylides Theseus sought in the halls of Amphitrite; its recovery was fatal to the ruler of the seas.

Herodotus is the Homer of this later form of historical myths, in which the supernatural machinery consisted of oracles or significant dreams or marvellous coincidences. They corresponded to his wavering standard of the credible and probable, which generally excluded what seemed physically impossible. For instance, he positively refuses to believe that statues assumed a sitting posture. He duly records the story that a certain man dived under water a distance of several miles. It was the private opinion of Herodotus that that man arrived in a boat.

Perhaps the story of the miraculous deliverance of Delphi from the Persians may be taken to illustrate the ill-defined limits of his faith. Their oracle declared to the Delphian priests that the god would himself provide for the safety of his sanctuary, and when the Persians came they were repelled, with great havoc, by lightning and by the fall of huge boulders from Parnassus. Herodotus relates this without any hint of scepticism, though he emphasizes the miraculous nature of the events. Now you observe that there is nothing impossible in the alleged physical occurrences; the marvel lies in the opportunity of the coincidence and the fulfilment of the oracular announcement. Against a marvel of this order Herodotus had no prejudice. But another miracle was said to have happened on the same occasion. Certain sacred arms, which were preserved within the shrine and were too sacred to be profaned by human touch, were suddenly discovered lying in a heap in front of the temple. A rationalist—Euripides, for instance—would find no difficulty in such an occurrence, assuming the fact to be certain. Herodotus accepts it as a genuine marvel, without any suggestion that human agency, notwithstanding Delphic asseverations to the contrary, might have been concerned in the matter; and the notable thing is that he considers it less wonderful than the intervention of the physical forces which overwhelmed the Persians. If such a phenomenon as the removal of the arms

presented itself to us for criticism—supposing the fact were assured beyond a doubt, and supposing human agency were absolutely excluded by the circumstances—we should regard it as something incomparably more extraordinary than the unquestionably wonderful coincidence of the storm of lightning.⁴ Here, in fact, Herodotus has failed to draw the line at what is physically impossible. The truth is that his faith and doubt are alike instinctive; he had never thought the problem out for himself; he had never clearly defined the border between the domains of the credible and the incredible. And so in this episode he has no sooner given us a lesson in faith than he relapses into reserve. For there was yet another marvel to be told. It was said that two armed warriors of superhuman stature pursued the flying Persians and dealt death among their broken ranks. But Herodotus carefully avoids the responsibility of accepting this story. He gives it on the authority of the Persians; he qualifies it by the phrase “as I am informed”; and he adds that the Delphians identified the two warriors with local heroes.

The contrast of the *naïveté* of Herodotus with his scepticism imparts to his epic a very piquant quality. Credulity alternates with a cautious reserve, which is especially noticeable when he is aware of more than one version of an occurrence. He is an expert in the art of not committing himself. He says in one passage, “I am bound to state what is said, but I am not bound to believe.” Of the tale that Zalmoxis lived for three years in a subterranean chamber, he professes agnosticism: “I do not disbelieve nor do I absolutely believe it.” Occasionally he criticizes and rejects a story, for instance the charge against the Alcmaeonids of treachery at Marathon; but his common practice is to state conflicting accounts and leave the matter there. This method, as it happens, is much more satisfactory to a modern critic than if Herodotus had selected one version, or had attempted to blend different versions together. But it shows him in the light of a collector of historical material, and an accomplished artist in arranging and presenting it, rather than as what we mean by a historian, who considers it his business to sift the evidence, and decide, if possible, between conflicting accounts.

We are often tempted to think of Herodotus as an Ionian, although he was not a native of Ionia. He wrote in Ionic; and he cannot be severed from the school of the Ionian historians, to whom his work owed a great deal more than appears on the surface. But if he had heard himself described as an Ionian writer, he would have been vastly indignant. He

4. I do not add the fall of the rocks; for this might have been engineered. The rocks were shown to Herodotus in the temple of Athena Pronaïa (ch. 39); this was just the sort of evidence which would impress him.

is at great pains to dissociate himself from Ionia and Ionian interests. In his account of the Ionian revolt and of the part which the Ionians played in the war with Xerxes, he shows a hardly veiled contempt for a people which, as he says, had been thrice enslaved. He tells us that the name "Ionian was one of no great repute." He is careful to record, without any comment, the Scythian opinion that the Ionians were the most cowardly and unmanly people in the world. He takes frequent opportunities of criticizing adversely the views of Ionian writers. Now I think we may say that this antagonistic attitude was not due entirely or principally to the fact that he belonged by birth to Dorian Halicarnassus. He does indeed insist on the difference of Dorian and Ionian, but the contrast on which his anti-Ionian feeling depended was one within the Ionian race itself—the distinction of the Athenians from the Ionians of Asia. We saw that Herodotus was at Athens before he went to Italy, and his connection with Athens impressed its mark on his political views. He was a warm admirer of the Athenians, and looked with favour and enthusiasm on their empire. He participated in their experiment of colonizing Thurii, became a citizen of their daughter-city. But even if we had not this external proof of his political sympathy, his work testifies to it abundantly. The whole account not only of the Marathonian campaign but of the war with Xerxes is one that redounds to the glory of Athens and flatters Athenian pride. It is, in fact, written mainly from the Athenian point of view, and represents largely, though not exclusively, the Athenian version. The Spartans and the part they took in the war are often handled with irony—for example, they were always arriving too late because they were celebrating a feast. The Corinthians are treated almost with malice. The story would have had a very different complexion if it had been written in the Spartan interest; and even though we have no philo-Spartan historian of the time, a very good case has been made out for the view that Sparta showed as true heroism as Athens. Further, Herodotus takes opportunities to set forth the mythistorical claims of Athens to a hegemony of the Greeks, and represents Athens as asserting those claims at the time of the Persian War. This is an anachronism. At that time Sparta was admittedly the leader and dictator; Athens was a member of the Peloponnesian confederacy, and the strife for supremacy had not begun. Thus the situation is construed in the light of the sequel; history is distorted in the interest of politics; and the grounds of the claim to hegemony which Herodotus ascribes to the Athenians of that time are the stock arguments which we find used in Athenian funeral orations to illustrate and justify the Athenian Empire. In the *Epitaphius* which Pericles pronounced over the citizens killed in the Samian War (439 B.C.) these arguments from

myth and history were doubtless marshalled; and that Herodotus was present and listened to it is a conjecture of Eduard Meyer, which has some plausibility, since we find that a famous picturesque phrase used by the orator, likening the dead soldiers to the spring taken out of the year, was adopted by the historian and placed in a new setting.

Admiration for the Athenian Empire in the third quarter of the fifth century meant admiration for Pericles, the chief inspirer of Athenian policy, and the sympathy of Herodotus with Pericles is revealed in the single passage in which he mentions him, where he records the anecdote of his mother's dream that a lion would be born to her. It is revealed, too, in sympathy with the Alcmaeonid family.⁵

His strong phil-Athenian feelings cannot be disconnected from his tone of prejudice and disparagement in treating the Ionians. When the immediate danger of Persian subjection was over, and the Ionian cities which had been leagued with Athens as an equal were brought to submit to her as a mistress, there was little love lost. The Ionian record of the war was one which would have failed to satisfy Athenian patriots as certainly as the Herodotean narrative must have failed to please the Ionians. Herodotus expressly argued that the Athenians were "truly the saviours of Greece"; but he did more: he gave currency and authority to a story which embodied Athenian tradition and justified Athenian Empire, and with such cunning and tact that it has been permanently effective. His admiration for Athens was bound up with his belief in democratic freedom. Until the Peisistratids were overthrown, he says, Athens was an ordinary undistinguished city; but when the Athenians abolished the tyranny and won their freedom, they became by far the first state in Greece.

Herodotus then was a phil-Athenian democrat. If the story is true that the Athenians bestowed on him ten talents (about 12,000 dollars) in recognition of the merits of his work, it was a small remuneration for the service he rendered to the renown of their city. But that he did this service does not degrade his work into anything that could be described as a partisan publication in the offensive sense. It was pragmatic; it reflected the author's political beliefs, and exhibited a strong bias in the preference given to Athenian sources. But it was the work of a historian

5. v. 71 rests on the Alcmaeonid tradition. It has been suggested that this sympathy of Herodotus may explain his curious treatment of Themistocles. To this statesman Athens chiefly owed the decisive role she played in the war, and though his good counsels are recognized, he is also treated in an unfriendly spirit of detraction, and represented as an intriguer rather than as a statesman. This looks as if the memory of Themistocles were under a cloud, and this partial obscuration were reflected in Herodotus. Afterwards, Thucydides made a point of doing him justice.

who cannot help being partial; it was not the work of a partisan who becomes a historian for the sake of his cause.

Something more particular must be said about the Herodotean story of the Persian invasion. A self-flattering version of the war had become a tradition at Athens. We have an early sketch of it, in a poetical form, in the *Persae* of Aeschylus (472 B.C.); but Herodotus was probably the first to write it down in a historical form, some twenty years later. Oral traditions (gathered at Athens, Sparta, Delphi, and elsewhere) appear profusely in his work, as every one knows. But he could not have constructed his history of the course of the war from oral traditions alone, or composed such a narrative of events, in which he was too young to take part, thirty years or so afterwards, without the help of some earlier record. We have seen that he depended on Hecataeus for Egypt, though this was just one of the portions of his work where autopsy, and information collected orally, might have sufficed. There is little doubt that Hecataeus was his main guide for early oriental history, and that the same writer was also used for the descriptions of Scythia and Libya, along with other geographical works of the Ionian school. When we come to the invasion of Darius and Xerxes, we find, as we might expect, clear indications that Herodotus here too had a written guide. Throughout the narrative, in the last three books, of the events after Marathon to the end of the second invasion, the historian has naturally to pass backwards and forwards from the Persians to the Greeks. Now there is a remarkable contrast between the character of the narrative when the writer takes us to Susa or to the Persian camp and when he transports us to the cities or tents of the Greeks. In the accounts of what the Greeks did, we are constantly confronted with more than one story, representing various oral traditions which reflect different local interests. But when we follow the movements of the Persians, we have a continuous chronological narrative, by no means always credible, but all of a piece and marked by enumerations and details which point to a more or less contemporary written source, and a source of which Persian, not Greek, history was formally the subject. This source contributes the main thread of the narrative, round which Herodotus has wrought all the additional supplementary and illustrative material he managed to collect. The chronology of Persian events after Marathon is orderly and distinct, contrasting with the uncertainties which beset the digressions on Greek history, such as that on the Spartan kings Cleomenes and Demaratus. Now we know of a history of the Persian War prior to Herodotus, the book of Dionysius of Miletus. I spoke of it in the last lecture, and I also pointed

out that the Persian history of Charon of Lampsacus may, not improbably, have come down to the invasion of Xerxes. Either of these books would satisfy the condition that the war was treated as an episode in Persian, not Greek, history, so that it is not unlikely that one of these may have been the source of Herodotus.

Into the warp thus furnished by an older writer is wrought a woof of Athenian tradition, varied here and there by tissue from other sources. And it is noteworthy how in the last three books, comprising the invasion of Xerxes, the imminence of a divine direction of human affairs is strongly accentuated. The sceptical tone is less apparent here than in other parts of the work. From the beginning of the seventh book the dominant note is changed, at least this is the impression I receive; the atmosphere becomes charged with a certain solemnity; it is, I think we might say, rather Athenian than Ionian. Is this difference due to the influence of those Athenian dramas which had glorified the subject, the tragedies of Phrynichus and Aeschylus?

The catastrophe which befalls the Persian expedition is not conceived as the work of jealous gods annoyed by the conspicuous wealth or success of mere mortals. It is rather a divine punishment of the insolence and rashness that are often born of prosperity. This is the Aeschylean doctrine:

Zeus is a judge who visits heavily
All whose self-glorious spirit vaults too high.

This Athenian influence in the last books of Herodotus accords with my conjecture that Athens was his headquarters during a part of the ten years or so which elapsed between his banishment and his sailing for Italy.

Herodotus then made a considerable use of older writers⁶—of whom he only names Hecataeus, and usually for the purpose of hinting something uncomplimentary. As the works of these writers have perished, it is very difficult to form a fair estimate of the achievements of Herodotus himself as a historical investigator—apart from his transcendent gifts as an artist

6. A complete library of Greek prose works on history would have been very small in 450 B.C., and it would not have been very much larger in 430 B.C. It is difficult to suppose that Herodotus would not have been acquainted with all the historical literature that had been published, or that the works of Dionysius and Charon could have escaped him. Besides Hecataeus the only historian to whom he refers is Scylax (iv. 44), but he mentions him as an explorer and not as an author, though obviously his brief account of the exploration is taken from the report of Scylax. Could he have failed to know the book of this Carian writer on Heraclides of Mylasa? It is remarkable that he ignores the part played by Heraclides of Artemisium. Heraclides is mentioned v. 121. The geographical works of the Ionians are referred to in iv. 36.

and man of letters. His great service consisted probably in the collection of unwritten material concerning modern Greek history; this floating matter he wrought with masterly skill into a framework of facts constructed by predecessors. His maxims of historical criticism may be set down as three: (1) Suspect superhuman and miraculous occurrences, which contradict ordinary experience. But this, in his application of it, leaves a wide room for portents, and it does not cover oracles and dreams. (2) When you are confronted by conflicting evidence or differing versions of the same event, keep an open mind; *audi alteram partem* [I have heard the other side]. But this does not save him from a biased acceptance of Athenian tradition. (3) Autopsy and first-hand oral information are superior to stories at second hand, whether written or oral.⁷ This tends to take the naïve form, "I know, for I was there myself," and it placed the historian at the mercy of the vergers and guides in Egyptian temples.

I may illustrate by a couple of examples how Herodotus was sometimes unfortunate in his information gathered on the spot. When he visited Egypt he saw on the Great Pyramid inscriptions which disappeared in the Middle Ages. Probably they were of religious import, appropriate to a royal tomb. But Herodotus tells us that they enumerated the sums of money which were expended on the onions and leeks consumed by the workmen who built the pyramid. This was the interpretation with which the guide satisfied the Greek traveller's curiosity. The other instance I will quote appertains to Babylonian history. Herodotus saw at Babylon the great buildings of a king, with whose name even those of us who have not studied Babylonian annals are probably familiar—King Nebuchadrezzar. He is correctly informed as to the time at which they were built—five generations after the reign of Queen Sammuamat, whom he calls Semiramis. But autopsy did not keep him from falling into a droll error about the potentate who built them. Nebuchadrezzar has had rather bad luck. In the book of Daniel he is metamorphosed into a beast of the field; in Herodotus he is forced to masquerade as a woman. We have to discover his identity under the mask of Queen Nitocris.

We must give full credit to Herodotus for having recognized the principles of criticism which I have indicated, though his application of them is

7. Compare, *e.g.*, ii. 99. I have little doubt that Herodotus visited and examined the battle-field of Plataea. Our difficulties in reconstructing the battle (elucidated by Grundy, Woodhouse, and Macan) from his description are not an objection. We may remember that the account of the Battle of Lake Trasimenus by Polybius, who had visited the place and was a master of military science, lends itself to different interpretations. The features of the Pass of Thermopylae as described by Herodotus can be recognized by any traveller to-day; but he can hardly have been there, for he orients it N.S. instead of E.W.

unsatisfactory and sporadic. They are maxims of permanent validity; properly qualified they lie at the basis of the modern developments of what is called historical methodology. But notwithstanding the profession of these axioms of common sense, he was in certain ways so lacking in common sense that parts of his work might seem to have been written by a precocious child. He undertook to write the history of a great war; but he did not possess the most elementary knowledge of the conditions of warfare. His fantastic statement of the impossible numbers of the army of Xerxes exhibits an incompetence which is almost incredible and is alone enough to stamp Herodotus as more of an epic poet than a historian. It matters not whether he worked out the arithmetic for himself or accepted it entirely on authority; this is a case in which to accept is as heinous as to invent. Heinous for a historian; and if we judge Herodotus by the lowest standard as a historian of a war, this case invalidates his claim to competence. But as an epic story-teller he escapes triumphantly. His Catalogue of the Persian host is a counterpart to the Catalogue of the *Iliad*:

mython d' hos hot aoidos epistamenos katelexas.

[as when a bard skillfully recounts a tale.]

His incompetence in military matters is shown, in another way, in his account of the campaign of Thermopylae and Artemisium. The key to their actions lay—and it required no technical training or experience to discern this—in the close connection and interdependence of the Persian land army and the Persian fleet, a fact which governed the Greek measures for defence. Herodotus, though he mentions several things which imply this and enable us more or less to penetrate the strategy of the combatants, fails completely to realize the situation and treats the naval and the land operations as if they were independent.

In his relation of the Persian War, Herodotus does not neglect the chronology, and it is perhaps as satisfactory as we could expect. But it may fairly be questioned whether the credit for this is not to be imputed to an earlier writer—Dionysius or Charon—whom he had the discretion to follow. It is significant that he does not give any formal date which a Greek reader could easily interpret, until he mentions, almost by the way, that the Persian invasion of Attica occurred in the archonship of Calliades.⁸

8. He signalizes the years 490–481 by reference to the year of Marathon, but he does not mention the eponymous archon of that year. Even if he had done so a reader would have required a list of Attic archons in order to follow his dates intelligently. Herodotus does not assist his readers by reckoning back from a fixed point which they could realize. Thucydides saw that without such a point dates were entirely in the air, and he dated backward from the first year of the Peloponnesian War.

But while chronology fares pretty well in the last three books, the whole work shows that, while the author copied the dates which his sources supplied, he never attempted to grapple with the chronological difficulties of Greek history, although so many of the episodes which he related raised the problem of synchronizing Hellenic tradition with oriental records. We have no reason to suppose that he avoided the problem because he judged it insoluble; his indifference to it is another manifestation of his epic, quasi-historical mind.

The first phase of Greek historiography culminates and achieves its glory in Herodotus. He reflects its features—its eager research into geography and ethnography (the indispensable groundwork of history), and its predominant interest in the East. He adopts from Hecataeus a critical attitude towards the ancient myths, aided by a rudimentary comparative mythology. But these elements are transfigured by the magic of his epic art and the spell of a higher historical idea. He was the Homer of the Persian War, and that war originally inspired him. His work presents a picture of sixth-century civilization; and it is also a universal history in so far as it gathers the greater part of the known world into a narrative which is concentrated upon a single issue. It is fortunate for literature that he was not too critical; if his criticism had been more penetrating and less naïve, he could not have been a second Homer. He belonged entirely in temper and mentality to the period before the sophistic illumination, which he lived to see but not to understand. . . .

The foregoing consists of Lecture II
from Bury's THE ANCIENT GREEK HISTORIANS.

Lucian

c. 125–190

The Greek satirist Lucian was born at Samosata in northern Syria. The little we know about him comes mostly from his own writings. He tells how he was briefly apprenticed to an uncle, a sculptor, and one day was beaten for breaking a slab of marble. When he returned home he dreamed of two women—one representing Statuary, the other Literature. Each begged him to follow her, and he chose Literature.

After practicing law in Antioch for a time, he journeyed to Macedonia, Greece, Italy, and Gaul, as an itinerant rhetorician and sophist. Back in Athens around 165 A.D., he labored twenty years on his satirical dialogues and composed his best works. Late in his life he accepted a government post in Egypt, a step that took some explaining on his part, for he had previously denounced those who hire out their talents.

Lucian is credited with some eighty works, including dialogues, such as *Sale of Lives* and *Dialogues of the Dead*, and the Olympian fables, which ridicule the pretensions and absurdity of philosophers of the time. In *The True History* he parodies adventure stories. He also wrote romances and autobiographies. Of special interest are his references to the sincerity of the Christians and to that “great man” who was crucified in Palestine.

Some of the writings which go under the name of Lucian are of doubtful authenticity. His dialogues, however, his literary criticism, and such romances as *The True History* are undoubtedly his. They are a model of satirical style and are generally admired. It is easy to see why Gibbon was so fond of them, and how *The True History* could have been the inspiration of Swift’s *Gulliver’s Travels*.

Lucian has been described as a sophist, a skeptic, and a blasphemer. The Greek sophists were accused of “making the worse appear the better cause.” Whether Lucian was a sophist in this sense would depend on your point of view—on which cause you regard as “the better.” He certainly attacked cherished popular beliefs and customs relentlessly. His ideal was to show no mercy for shams, and to tell the truth always, and laughingly.

The Way to Write History opens with an account of an imaginary epidemic at Abdera, where the inhabitants had been infected with a melodramatic fever after watching a famous tragic actor. Another absurd epidemic has hit the educated class of his day, Lucian says—the fever to become a historian. These would-be historians have taken it upon themselves to imitate the classic style of Thucydides and Herodotus. They seek in this way to gain some credit for their inaccurate and garbled versions of Roman history. The examples he gives of their fatuous pretensions and stupidity—their bombast and self-seeking flattery—serve as amusing warnings of how history should *not* be written. Some think they have done a good job if they praise the “right” side or the “right” men, but history has no favorites. These writers confuse history with panegyric, Lucian says, and probably he would say the same of some of our present-day historians.

Nothing excuses inaccuracy, Lucian says, neither the pretext of entertaining the reader, nor the desire for poetic beauty. When poetry is confused with history, the result “is nothing but poetry without the wings.” Nothing can replace facts, and “facts are not to be collected at haphazard, but with careful, laborious, repeated investigation.” On the other hand, the facts are not to be recorded indiscriminately. Too much detail is wearisome and pointless. A selection must be made, but does Lucian give us a principle of selection? How are we to distinguish the essential facts from the incidental?

Lucian seems to say that no one can tell you in advance what facts will be the important ones. What is required is “political insight” and this is “a gift of nature, which can never be learned.” You will have to decide for yourself how far this is true. The other main trait required by the historian—a good style—can be acquired, according to Lucian, by a loving study of the classics and diligent practice. Is a

lucid, forceful style, then, within reach of everyone? Courage, as would be expected, is a third essential of the historian.

Thucydides is Lucian's ideal historian, and he draws many lessons from *The Peloponnesian War*. It was Thucydides who drew the critical line between the bad and the good historian. Whereas the former makes "a bid for present reputation," the latter seeks to make his work "a possession forever," and to be of service to mankind if history should repeat itself. The issues are clearly drawn, and such questions as these confront us: Are good histories permanent, or do they have to be rewritten by later centuries in the light of new knowledge? And how far does history repeat itself, providing lessons for succeeding generations?

The Way to Write History

My dear Philo,

There is a story of a curious epidemic at Abdera, just after the accession of King Lysimachus. It began with the whole population's exhibiting feverish symptoms, strongly marked and unintermittent from the very first attack. About the seventh day, the fever was relieved, in some cases by a violent flow of blood from the nose, in others by perspiration not less violent. The mental effects, however, were most ridiculous; they were all stage-struck, mouthing blank verse and ranting at the top of their voices. Their favorite recitation was the *Andromeda* of Euripides; one after another would go through the great speech of Perseus; the whole place was full of pale ghosts, who were our seventh-day tragedians vociferating,

O Love, who lord'st it over Gods and men,

and the rest of it. This continued for some time, till the coming of winter put an end to their madness with a sharp frost. I find the explanation of the form it took in this fact: Archelaus was then the great tragic actor, and in the middle of the summer, during some very hot weather, he had played the *Andromeda* there; most of them took the fever in the theater, and convalescence was followed by a relapse—into tragedy, the *Andromeda* haunting their memories, and Perseus hovering, Gorgon's head in hand, before the mind's eye.

Well, to compare like with like, the majority of our educated class is now suffering from an Abderite epidemic. They are not stage-struck; indeed, that would have been a minor infatuation—to be possessed with other people's verses, not bad ones either. No, but from the beginning of the present excitements—the barbarian war, the Armenian disaster, the succession of victories—you cannot find a man but is writing history; nay,

everyone you meet is a Thucydides, a Herodotus, a Xenophon. The old saying must be true, and war be the father of all things, seeing what a litter of historians it has now teemed forth at a birth.

Such sights and sounds, my Philo, brought into my head that old anecdote about the Sinopean. A report that Philip was marching on the town had thrown all Corinth into a bustle; one was furbishing his arms, another wheeling stones, a third patching the wall, a fourth strengthening a battlement, everyone making himself useful somehow or other. Diogenes having nothing to do—of course, no one thought of giving *him* a job—was moved by the sight to gird up his philosopher's cloak and begin rolling his tub dwelling energetically up and down the Craneum; an acquaintance asked, and got, the explanation: "I do not want to be thought the only idler in such a busy multitude; I am rolling my tub to be like the rest."

I too am reluctant to be the only dumb man at so vociferous a season. I do not like walking across the stage, like a "super," in gaping silence; so I decided to roll *my* cask as best I could. I do not intend to write a history, or attempt actual narrative; I am not courageous enough for that; have no apprehensions on my account. I realize the danger of rolling the thing over the rocks, especially if it is only a poor little jar of brittle earthenware like mine; I should very soon knock against some pebble and find myself picking up the pieces. Come, I will tell you my idea for campaigning in safety, and keeping well out of range.

Give a wide berth to all that foam and spray,

and to the anxieties which vex the historian—that I shall be wise enough to do; but I propose to give a little advice, and lay down a few principles for the benefit of those who do venture. I shall have a share in their building, if not in the dedicatory inscription; my finger tips will at least have touched their wet mortar.

However, most of them see no need for advice here: *there might as well be an art of talking, seeing, or eating; history writing is perfectly easy, comes natural, is a universal gift; all that is necessary is the faculty of translating your thoughts into words.* But the truth is—you know it without my telling, old friend—it is *not* a task to be lightly undertaken, or carried through without effort; no, it needs as much care as any sort of composition whatever, if one means to create "a possession for ever," as Thucydides calls it. Well, I know I shall not get a hearing from many of them, and some will be seriously offended—especially any who have finished and produced their work; in cases where its first reception was

favorable, it would be folly to expect the authors to recast or correct. Has it not the stamp of finality? Is it not almost a state document? Yet even they may profit by my words; *we* are not likely to be attacked again; we have disposed of all our enemies; but there might be a Celto-Gothic or an Indo-Bactrian war; then our friends' composition might be improved by the application of my measuring rod—always supposing that they recognize its correctness. Failing that, let them do their own mensuration with the old foot rule; the doctor will not particularly mind, though all Abdera insists on spouting the *Andromeda*.

Advice has two provinces—one of choice, the other of avoidance; let us first decide what the historian is to avoid—of what faults he must purge himself—and then proceed to the measures he must take for putting himself on the straight high road. This will include the manner of his beginning, the order in which he should marshal his facts, the questions of proportion, of discreet silence, of full or cursory narration, of comment and connection. Of all that, however, later on; for the present we deal with the vices to which bad writers are liable. As to those faults of diction, construction, meaning, and general amateurishness, which are common to every kind of composition, to discuss them is neither compatible with my space nor relevant to my purpose.

But there are mistakes peculiar to history; your own observation will show you just those which a constant attendance at authors' readings ¹ has impressed on me; you have only to keep your ears open at every opportunity. It will be convenient, however, to refer by the way to a few illustrations in recent histories. Here is a serious fault to begin with. It is the fashion to neglect the examination of facts, and give the space gained to eulogies of generals and commanders; those of their own side they exalt to the skies, the other side they disparage intemperately. They forget that between history and panegyric there is a great gulf fixed, barring communication; in musical phrase, the two things are a couple of octaves apart. The panegyrist has only one concern—to commend and gratify his living theme some way or other; if misrepresentation will serve his purpose, he has no objection to that. History, on the other hand, abhors the intrusion of any least scruple of falsehood; it is like the windpipe, which the doctors tell us will not tolerate a morsel of stray food.

1. These were very common in Roman Imperial times, for purposes of advertisement, of eliciting criticism, etc. "The audience at recitations may be compared with the modern literary reviews, discharging the functions of a preventive and emendatory, not merely of a correctional, tribunal. Before publication a work might thus be known to more hearers than it would now find readers." Mayor, *Juvenal*, iii. 9.

Another thing these gentlemen seem not to know is that poetry and history offer different wares, and have their separate rules. Poetry enjoys unrestricted freedom; it has but one law—the poet's fancy. He is inspired and possessed by the Muses; if he chooses to horse his car with winged steeds, or set others agallop over the sea or standing corn, none challenges his right. His Zeus, with a single cord, may haul up earth and sea, and hold them dangling together—there is no fear the cord may break, the load come tumbling down and be smashed to atoms. In a complimentary picture of Agamemnon, there is nothing against his having Zeus's head and eyes, his brother Poseidon's chest, Ares' belt—in fact, the son of Atreus and Aërope will naturally be an epitome of all divinity; Zeus or Poseidon or Ares could not singly or severally provide the requisite perfections. But, if history adopts such servile arts, it is nothing but poetry without the wings; the exalted tones are missing; and imposition of other kinds without the assistance of meter is only the more easily detected. It is surely a great, a superlative weakness, this inability to distinguish history from poetry. What, bedizen history, like her sister, with tale and eulogy and their attendant exaggerations? As well take some mighty athlete with muscles of steel, rig him up with purple drapery and meretricious ornament, rouge and powder his cheeks; faugh, what an object would one make of him with such defilements!

I would not be understood to exclude eulogy from history altogether; it is to be kept to its place and, used with moderation, is not to tax the reader's patience. I shall presently show, indeed, that in all such matters an eye is to be had to posterity. It is true, there is a school which makes a pretty division of history into the agreeable and the useful, and defends the introduction of panegyric on the ground that it is agreeable, and pleases the general reader. But nothing could be further from the truth. In the first place the division is quite a false one; history has only one concern and aim, and that is the useful; which again has one single source, and that is truth. The agreeable is no doubt an addition, if it is present; so is beauty to an athlete; but a Nicostratus, who is a fine fellow and proves himself a better man than either of his opponents, gets his recognition as a Hercules, however ugly his face may be; and if one opponent is the handsome Alcaeus himself—handsome enough to make Nicostratus in love with him, says the story—that does not affect the issue. History too, if it can deal incidentally in the agreeable, will attract a multitude of lovers; but so long as it does its proper business efficiently—and that is the establishment of truth—it may be indifferent to beauty.

It is further to be remarked that in history sheer extravagance has not

even the merit of being agreeable; and the extravagance of eulogy is doubly repulsive, as extravagance and as eulogy; at least it is only welcome to the vulgar majority, not to that critical, that perhaps hyper-critical, audience, whom no slip can escape, who are all eyes like Argus but keener than he, who test every word as a money-changer might his coins, rejecting the false on the spot but accepting the good and heavy and true. It is they that we should have in mind as we write history, and never heed the others, though they applaud till they crack their voices. If you neglect the critics, and indulge in the cloying sweetness of tales and eulogies and such baits, you will soon find your history a "Hercules in Lydia." No doubt you have seen some picture of him: he is Omphale's slave, dressed up in an absurd costume, his lion skin and club transferred to her, as though she were the true Hercules, while he, in saffron robe and purple jacket, is combing wool and wincing under Omphale's slipper. A degrading spectacle it is—the dress loose and flapping open, and all that was man in him turned to woman.

The vulgar may very likely extend their favor to this; but the select (whose judgment you disregard) will get a good deal of entertainment out of your heterogeneous, disjointed, fragmentary stuff. There is nothing which has not a beauty of its own; but take it out of its proper sphere, and the misuse turns its beauty to ugliness. Eulogy, I need hardly say, may possibly please one person, the eulogized, but will disgust everyone else; this is particularly so with the monstrous exaggerations which are in fashion; the authors are so intent on the patron hunt that they cannot relinquish it without a full exhibition of servility; they have no idea of finesse, never mask their flattery, but blurt out their unconvincing bald tale anyhow.

The consequence is, they miss even their immediate end; the objects of their praise are more inclined (and quite right too) to dislike and discard them for toadies—if they are men of spirit, at any rate. Aristobulus inserted in his history an account of a single combat between Alexander and Porus, and selected this passage to read aloud to the former; he reckoned that his best chance of pleasing was to invent heroic deeds for the king, and heighten his achievements. Well, they were on board ship in the Hydaspes; Alexander took hold of the book and tossed it overboard; "the author should have been treated the same way, by rights," he added, "for presuming to fight duels for me like that, and shoot down elephants singlehanded." A very natural indignation in Alexander, of a piece with his treatment of the intrusive architect; this person offered to convert the whole of Mount Athos into a colossal statue of the king—who however

decided that he was a toady, and actually gave him less employment in ordinary than before.

The fact is, there is nothing agreeable in these things, except to anyone who is fool enough to enjoy commendations which the slightest inquiry will prove to be unfounded; of course there *are* ugly persons—women more especially—who ask artists to paint them as beautiful as they can; they think they will be really better looking if the painter heightens the rose a little and distributes a good deal of the lily. There you have the origin of the present crowd of historians, intent only upon the passing day, the selfish interest, the profit which they reckon to make out of their work; execration is their desert—in the present for their undisguised clumsy flattery, in the future for the stigma which their exaggerations bring upon history in general. If anyone takes some admixture of the agreeable to be an absolute necessity, let him be content with the independent beauties of style; these are agreeable without being false; but they are usually neglected now for the better foisting upon us of irrelevant substitutes.

Passing from that point, I wish to put on record some fresh recollections of Ionian histories—supported, now I think of it, by Greek analogies also of recent date—both concerned with the war already alluded to. You may trust my report, the Graces be my witness; I would take oath to its truth if it were polite to swear on paper. One writer started with invoking the Muses to lend a hand. What a tasteful exordium! How suited to the historic spirit! How appropriate to the style! When he had got a little way on, he compared our ruler to Achilles, and the Parthian king to Thersites; he forgot that Achilles would have done better if he had had Hector instead of Thersites to beat, if there had been a man of might fleeing in front,

But at his heels a mightier far than he.

He next proceeded to say something handsome about himself, as a fit chronicler of such brilliant deeds. As he got near his point of departure, he threw in a word for his native town of Miletus, adding that he was thus improving on Homer, who never so much as mentioned his birthplace. And he concluded his preface with a plain express promise to advance our cause and personally wage war against the barbarians to the best of his ability. The actual history, and recital of the causes of hostilities, began with these words: “The detestable Vologesus (whom Heaven confound!) commenced war on the following pretext.”

Enough of him. Another is a keen emulator of Thucydides, and by way

of close approximation to his model starts with his own name—most graceful of beginnings, redolent of Attic thyme! Look at it: “Crepereius Calpurnianus of Pompeiopolis wrote the history of the war between Parthia and Rome, how they warred one upon the other, beginning with the commencement of the war.” After that exordium, what need to describe the rest—what harangues he delivers in Armenia, resuscitating our old friend the Corcyrean envoy—what a plague he inflicts on Nisibis (which would not espouse the Roman cause), lifting the whole thing bodily from Thucydides—except the Pelasgicum and the Long Walls, where the victims of the earlier plague found shelter; there the difference ends; like the other, “it began in Ethiopia, whence it descended to Egypt,” and to most of the Parthian Empire, where it very discreetly remained. I left him engaged in burying the poor Athenians in Nisibis, and knew quite well how he would continue after my exit. Indeed it is a pretty common belief at present that you are writing like Thucydides if you just use his actual words, *mutatis mutandis* [having made the necessary changes]. Ah, and I almost forgot to mention one thing: this same writer gives many names of weapons and military engines in Latin—*phossa* for trench, *pons* for bridge, and so forth. Just think of the dignity of history, and the Thucydidean style—the Attic embroidered with these Latin words, like a toga relieved and picked out with the purple stripe—so harmonious!

Another puts down a bald list of events, as prosy and commonplace as a private’s or a carpenter’s or a sutler’s diary. However, there is more sense in this poor man’s performance; he flies his true colors from the first; he has cleared the ground for some educated person who knows how to deal with history. The only fault I have to find with him is that he inscribes his volumes with a solemnity rather disproportioned to the rank of their contents—“Parthian History, by Callimorphus, Surgeon of the 6th Pikemen, volume so-and-so.” Ah, yes, and there is a lamentable preface, which closes with the remark that, since Asclepius is the son of Apollo, and Apollo director of the Muses and patron of all culture, it is very proper for a doctor to write history. Also, he starts in Ionic, but very soon, for no apparent reason, abandons it for everyday Greek, still keeping the Ionic *e*’s and *k*’s and *ou*’s, but otherwise writing like ordinary people—rather too ordinary, indeed.

Perhaps I should balance him with a philosophic historian; this gentleman’s name I will conceal, and merely indicate his attitude, as revealed in a recent publication at Corinth. Much had been expected of him, but not enough; starting straight off with the first sentence of the preface,

he subjects his readers to a dialectic catechism, his thesis being the highly philosophic one that no one but a philosopher should write history. Very shortly there follows a second logical process, itself followed by a third; in fact the whole preface is one mass of dialectic figures. There is flattery, indeed, *ad nauseam*, eulogy vulgar to the point of farce; but never without the logical trimmings, always that dialectical catechism. I confess it strikes me as a vulgarity also, hardly worthy of a philosopher with so long and white a beard, when he gives it in his preface as our ruler's special good fortune that philosophers should consent to record his actions; he had better have left us to reach that conclusion for ourselves—if at all.

Again, it would be a sinful neglect to omit the man who begins like this: "I devise to tell of Romans and Persians"; then a little later, "For 'twas Heaven's decree that the Persians should suffer evils"; and again, "One Osroes there was, whom Hellenes name Oxyroes"—and much more in that style. He corresponds, you see, to one of my previous examples; only he is a second Herodotus, and the other a second Thucydides.

There is another distinguished artist in words—again rather more Thucydidean than Thucydides—who gives, according to his own idea, the clearest, most convincing descriptions of every town, mountain, plain, or river. I wish my bitterest foe no worse fate than the reading of them. Frigid? Caspian snows, Celtic ice are warm in comparison. A whole book hardly suffices him for the emperor's shield—the Gorgon on its boss, with eyes of blue and white and black, rainbow girdle, and snakes twined and knotted. Why, Vologesus's breeches or his bridle. God bless me, they take up several thousand lines apiece; the same for the look of Osroes' hair as he swims the Tigris—or what the cave was like that sheltered him, ivy and myrtle and bay clustered all together to shut out every ray of light. You observe how indispensable it all is to the history; without the scene, how could we have comprehended the action?

It is helplessness about the real essentials, or ignorance of what should be given, that makes them take refuge in word painting—landscapes, caves, and the like; and when they do come upon a series of important matters, they are just like a slave whose master has left him his money and made him a rich man; he does not know how to put on his clothes or take his food properly: partridges or sweetbreads or hare are served, but he rushes in and fills himself up with pea soup or salt fish till he is fit to burst. Well, the man I spoke of gives the most unconvincing wounds and singular deaths: someone has his big toe injured and dies on the spot; the general Priscus calls out, and seven-and-twenty of the enemy fall

dead at the sound. As to the numbers killed, he actually falsifies dispatches; at Europus he slaughters 70,236 of the enemy, while the Romans lose two and have seven wounded! How any man of sense can tolerate such stuff, I do not know.

Here is another point quite worth mention. This writer has such a passion for unadulterated Attic, and for refining speech to the last degree of purity, that he metamorphoses the Latin names and translates them into Greek: Saturninus figures as Cronius, Fronto must be Phrontis, Titianus Titianus, with queerer transmogrifications yet. Further, on the subject of Severian's death, he accuses all other writers of a blunder in putting him to the sword; he is really to have starved himself to death, as the most painless method; the fact, however, is that it was all over in three days, whereas seven days is the regular time for starvation; are we perhaps to conceive an Osroes waiting about for Severian to complete the process, and putting off his assault till after the seventh day?

Then, Philo, how shall we class the historians who indulge in poetical phraseology? "The catapult rocked responsive," they say; "Loud thundered the breach"; or, somewhere else in this delectable history, "Thus Edessa was girdled with clash of arms, and all was din and turmoil," or, "The general pondered in his heart how to attack the wall." Only he fills up the interstices with such wretched common lower-class phrases as "The military prefect wrote His Majesty," "The troops were procuring the needful," "They got a wash² and put in an appearance," and so on. It is like an actor with one foot raised on a high buskin, and the other in a slipper.

You will find others writing brilliant high-sounding prefaces of outrageous length, raising great expectations of the wonders to follow—and then comes a poor little appendix of a—history; it is like nothing in the world but a child—say the Eros you must have seen in a picture—playing in an enormous mask of Hercules or a Titan; *parturiunt montes* [the mountains labor (and bring forth mice)], cries the audience, very naturally. That is not the way to do things; the whole should be homogeneous and uniform, and the body in proportion to the head—not a helmet of gold, a ridiculous breastplate patched up out of rags or rotten leather, shield of wicker, and pigskin greaves. You will find plenty of historians prepared to set the Rhodian Colossus' head on the body of a dwarf; others

2. It has been suggested that Lucian's criticism is for practical purposes out of date; but Prescott writes: "He was surrounded by a party of friends, who had *dropped in*, it seems, after mass, to inquire after the state of his health, some of whom had remained to partake of his repast."

on the contrary show us headless bodies, and plunge into the facts without exordium. These plead the example of Xenophon, who starts with, "Darius and Parysatis had two children"; if they only knew it, there is such a thing as a *virtual* exordium, not realized as such by everybody; but of that hereafter.

However, any mistake in mere expression or arrangement is excusable; but when you come to fancy geography, differing from the other not by miles or leagues but by whole days' journeys, where is the classical model for that? One writer has taken so little trouble with his facts—never met a Syrian, I suppose, nor listened to the stray information you may pick up at the barber's—that he thus locates Europus: "Europus lies in Mesopotamia, two days' journey from the Euphrates, and is a colony from Edessa." Not content with that, this enterprising person has in the same book taken up my native Samosata and shifted it, citadel, walls, and all, into Mesopotamia, giving it the two rivers for boundaries, and making them shave past it, all but touching the walls on either side. I suspect you would laugh at me, Philo, if I were to set about convincing you that I am neither Parthian nor Mesopotamian, as this whimsical colony planter makes me.

By the way, he has also a very attractive tale of Severian, learned, he assures us on oath, from one of the actual fugitives. According to this, he would not die by the sword, the rope, or poison, but contrived a death which should be tragic and impressive. He was the owner of some large goblets of the most precious glass; having made up his mind to die, he broke the largest of these, and used a splinter of it for the purpose, cutting his throat with the glass. A dagger or a lancet, good enough instruments for a manly and heroic death, he could not come at, forsooth!

Then, as Thucydides composed a funeral oration over the first victims of that old war, our author feels it incumbent on him to do the same for Severian; they all challenge Thucydides, you see, little as he can be held responsible for the Armenian troubles. So he buries Severian, and then solemnly ushers up to the grave, as Pericles' rival, one Afranius Silo, a centurion; the flood of rhetoric which follows is so copious and remarkable that it drew tears from me—ye Graces!—tears of laughter; most of all where the eloquent Afranius, drawing to a close, makes mention, with weeping and distressful moans, of all those costly dinners and toasts. But he is a very Ajax in his conclusion. He draws his sword, gallantly as an Afranius should, and in sight of all cuts his throat over the grave—and God knows it was high time for an execution, if oratory can be felony.

The historian states that all the spectators admired and lauded Afranius; as for me, I was inclined to condemn him on general grounds—he had all but given a catalogue of sauces and dishes, and shed tears over the memory of departed cakes—but his capital offense was that he had not cut the historian-tragedian's throat before he left this life himself.

I assure you, my friend, I could largely increase my list of such offenders; but one or two more will suffice before proceeding to the second part of my undertaking, the suggestions for improvement. There are some, then, who leave alone, or deal very cursorily with, all that is great and memorable; amateurs and not artists, they have no selective faculty, and loiter over copious labored descriptions of the veriest trifles; it is as if a visitor to Olympia, instead of examining, commending or describing to his stay-at-home friends the general greatness and beauty of the Zeus, were to be struck with the exact symmetry and polish of its footstool, or the proportions of its shoe, and give all his attention to these minor points.

For instance, I have known a man get through the Battle of Europus in less than seven whole lines, and then spend twenty mortal hours on a dull and perfectly irrelevant tale about a Moorish trooper. The trooper's name was Mausacas; he wandered up the hills in search of water, and came upon some Syrian yokels getting their lunch; at first they were afraid of him, but when they found he was on the right side, they invited him to share the meal; for one of them had traveled in the Moorish country, having a brother serving in the army. Then come long stories and descriptions of how he hunted there, and saw a great herd of elephants at pasture, and was nearly eaten up by a lion, and what huge fish he had bought at Caesarea. So this quaint historian leaves the terrible carnage to go on at Europus, and lets the pursuit, the forced armistice, the settling of outposts, shift for themselves, while he lingers far into the evening watching Malchion the Syrian cheapen big mackerel at Caesarea; if night had not come all too soon, I dare say he would have dined with him when the fish was cooked. If all this had not been accurately set down in the history, what sad ignorance we should have been left in! The loss to the Romans would have been irreparable if Mausacas the Moor had got nothing to quench his thirst, and come back fasting to camp. Yet I am willfully omitting innumerable details of yet greater importance—the arrival of a flute girl from the next village, the exchange of gifts (Mausacas' was a spear, Malchion's a brooch), and other incidents most essential to the Battle of Europus. It is no exaggeration to say that such

writers never give the rose a glance, but devote all their curiosity to the thorns on its stem.

Another entertaining person, who has never set foot outside Corinth, nor traveled as far as its harbor—not to mention seeing Syria or Armenia—starts with words which impressed themselves on my memory: “Seeing is believing: I therefore write what I have seen, not what I have been told.” His personal observation has been so close that he describes the Parthian “Dragons” (they use this ensign as a numerical formula—a thousand men to the Dragon, I believe): they are huge live dragons, he says, breeding in Persian territory beyond Iberia; these are first fastened to great poles and hoisted up aloft, striking terror at a distance while the advance is going on; then, when the battle begins, they are released and set on the enemy; numbers of our men, it seems, were actually swallowed by them, and others strangled or crushed in their coils; of all this he was an eyewitness, taking his observations, however, from a safe perch up a tree. Thank goodness he did not come to close quarters with the brutes! We should have lost a very remarkable historian, and one who did doughty deeds in this war with his own right hand; for he had many adventures, and was wounded at Sura (in the course of a stroll from the Craneum to Lerna, apparently). All this he used to read to a Corinthian audience, which was perfectly aware that he had never so much as seen a battle picture. Why, he did not know one weapon or engine from another; the names of maneuvers and formations had no meaning for him; flank or front, line or column, it was all one.

Then there is a splendid fellow who has boiled down into the compass of five hundred lines (or less, to be accurate) the whole business from beginning to end—campaigns in Armenia, in Syria, in Mesopotamia, on the Tigris, and in Media; and having done it, he calls it a history. His title very narrowly misses being longer than his book: “An account of the late campaigns of the Romans in Armenia, Mesopotamia, and Media, by Antiochianus, victor at the festival of Apollo”; he had probably won some junior flat race.

I have known one writer compile a history of the future, including the capture of Vologesus, the execution of Osroes (he is to be thrown to the lions), and, crowning all, our long-deferred triumph. In this prophetic vein, he sweeps hastily on to the end of his work; yet he finds time for the foundation in Mesopotamia of a city, greatest of the great, and fairest of the fair; he is still debating, however, whether the most appropriate name will be Victoria, Concord, or Peacetown; that is yet unsettled; we must leave the fair city unnamed for the present; but it is already thickly

populated—with empty dreams and literary drivelings. He has also pledged himself to an account of coming events in India, and a circumnavigation of the Atlantic; nay, the pledge is half redeemed; the preface to the *India* is complete; the third legion, the Celtic contingent, and a small Moorish division have crossed the Indus in full force under Cassius; our most original historian will soon be posting us up in their doings—their method of “receiving elephants,” for instance—in letters dated Muziris or Oxydracae.

These people’s uneducated antics are infinite; they have no eyes for the noteworthy, nor, if they had eyes, any adequate faculty of expression; invention and fiction provide their matter, and belief in the first word that comes their style; they pride themselves on the number of books they run to, and yet more on their titles; for these again are quite absurd: *So-and-so’s so many books of Parthian victories*; *The Parthis*, book I; *The Parthis*, book II—quite a rival to the *Atthis*, eh? Another does it (I have read the book) still more neatly—*The Parthony of Demetrius of Sagalassus*. I do not wish to ridicule or make a jest of these pretty histories; I write for a practical purpose: anyone who avoids these and similar errors is already well on the road to historical success; nay, he is almost there if the logical axiom is correct that, with incompatibles, denial of the one amounts to affirmation of the other.

“Well,” I may be told, “you have now a clear field; the thorns and brambles have all been extirpated, the debris of others’ buildings has been carted off, the rough places have been made smooth; come, do a little construction yourself, and show that you are not only good at destroying, but capable of yourself planning a model in which criticism itself shall find nothing to criticize.”

Well then, my perfect historian must start with two indispensable qualifications: the one is political insight, the other the faculty of expression; the first is a gift of nature, which can never be learned; the second should have been acquired by long practice, unremitting toil, and loving study of the classics. There is nothing technical here, and no room for any advice of mine; this essay does not profess to bestow insight and acumen on those who are not endowed with them by nature; valuable, or invaluable rather, would it have been if it could recast and modify like that, transmute lead into gold, tin into silver, magnify a Conon or Leotrophides into Titormus or Milo.

But what is the function of professional advice? Not the creation of qualities which should be already there, but the indication of their proper use. No trainer, of course—let him be Iccus, Herodicus, Theon, or who

he may—will suggest that he can take a Perdicas and make an Olympic victor of him, fit to face Theagenes of Thasos or Polydamas of Scotussa; what he *will* tell you is that, given a constitution that will stand training, his system will considerably improve it. So with us—we are not to have every failure cast in our teeth if we claim to have invented a system for so great and difficult a subject. We do not offer to take the first comer and make a historian of him—only to point out to anyone who has natural insight and acquired literary skill certain straight roads (they may or may not be so in reality) which will bring him with less waste of time and effort to his goal.

I do not suppose you will object that the man with insight has no need of system and instruction upon the things he is ignorant of; in that case he might have played the harp or flute untaught, and in fact have been omniscient. But, as things are at present, he cannot perform in these ways untaught, though with some assistance he will learn very easily, and soon be able to get along by himself.

You now know what sort of a pupil I (like the trainer) insist upon. He must not be weak either at understanding or at making himself understood, but a man of penetration, a capable administrator—potentially, that is—with a soldierly spirit (which does not however exclude the civil spirit), and some military experience; at the least he must have been in camp, seen troops drilled or maneuvered, know a little about weapons and military engines, the differences between line and column, cavalry and infantry tactics (with the reasons for them), frontal and flank attacks; in a word, none of your armchair strategists relying wholly on hearsay.

But first and foremost, let him be a man of independent spirit, with nothing to fear or hope from anybody; else he will be a corrupt judge open to undue influences. If Philip's eye is knocked out at Olynthus by Aster the Amphipolite archer, it is not his business to exclaim, but just to show him as he is; he is not to think whether Alexander will be annoyed by a circumstantial account of the cruel murder of Clitus at table. If a Cleon has the ear of the assembly, and a monopoly of the tribune, he will not shrink on that account from describing him as a pestilent madman; all Athens will not stop him from dwelling on the Sicilian disaster, the capture of Demosthenes, the death of Nicias, the thirst, the foul water, and the shooting down of the drinkers. He will consider very rightly that no man of sense will blame him for recounting the effects of misfortune or folly in their entirety; he is not the author, but only the reporter of them. If a fleet is destroyed, it is not he who sinks it; if there is a

roul, he is not in pursuit—unless perhaps he ought to have prayed for better things, and omitted to do so. Of course, if silence or contradiction would have put matters right, Thucydides might with a stroke of the pen have knocked down the counterwall on Epipolae, sent Hermocrates' trireme to the bottom, let daylight through the accursed Gylippus before he had done blocking the roads with wall and trench, and, finally, have cast the Syracusans into their own quarries and sent the Athenians cruising round Sicily and Italy with Alcibiades' first high hopes still on board. Alas, not Fate itself may undo the work of Fate.

The historian's one task is to tell the thing as it happened. This he cannot do if he is Artaxerxes' physician, trembling before him, or hoping to get a purple cloak, a golden chain, a horse of the Nisaeon breed in payment for his laudations. A fair historian, a Xenophon, a Thucydides, will not accept that position. He may nurse some private dislikes, but he will attach far more importance to the public good, and set the truth high above his hate; he may have his favorites, but he will not spare their errors. For history, I say again, has this and this only for its own; if a man will start upon it, he must sacrifice to no god but Truth; he must neglect all else; his sole rule and unerring guide is this—to think not of those who are listening to him now, but of the yet unborn who shall seek his converse.

Anyone who is intent only upon the immediate effect may reasonably be classed among the flatterers; and History has long ago realized that flattery is as little congenial to her as the arts of personal adornment to an athlete's training. An anecdote of Alexander is to the point. "Ah, Onesicritus," said he, "how I should like to come to life again for a little while, and see how your stuff strikes people by that time; at present they have good enough reason to praise and welcome it; that is their way of angling for a share of my favor." On the same principle some people actually accept Homer's history of Achilles, full of exaggerations as it is; the one great guarantee which they recognize of his truth is the fact that his subject was not living; that leaves him no motive for lying.

There stands my model, then: fearless, incorruptible, independent, a believer in frankness and veracity; one that will call a spade a spade, make no concession to likes and dislikes, nor spare any man for pity or respect or propriety; an impartial judge, kind to all, but too kind to none; a literary cosmopolite with neither suzerain nor king, never heeding what this or that man may think, but setting down the thing that befell.

Thucydides is our noble legislator; he marked the admiration that met

Herodotus and gave the Muses' names to his nine books; and thereupon he drew the line which parts a good historian from a bad: our work is to be a possession forever, not a bid for present reputation; we are not to seize upon the sensational, but bequeath the truth to them that come after; he applies the test of use, and defines the end which a wise historian will set before himself: it is that, should history ever repeat itself, the records of the past may give present guidance.

Such are to be my historian's principles. As for diction and style, he is not to set about his work armed to the teeth from the rhetorician's arsenal of impetuosity and incisiveness, rolling periods, close-packed arguments, and the rest; for him a serener mood. His matter should be homogeneous and compact, his vocabulary fit to be understood of the people, for the clearest possible setting forth of his subject.

For to those marks which we set up for the historic spirit—frankness and truth—corresponds one at which the historic style should first of all aim, namely, a lucidity which leaves nothing obscure, impartially avoiding abstruse out-of-the-way expressions, and the illiberal jargon of the market; we wish the vulgar to comprehend, the cultivated to commend us. Ornament should be unobtrusive, and never smack of elaboration, if it is not to remind us of overseasoned dishes.

The historian's spirit should not be without a touch of the poetical; it needs, like poetry, to employ impressive and exalted tones, especially when it finds itself in the midst of battle array and conflicts by land or sea; it is then that the poetic gale must blow to speed the vessel on, and help her ride the waves in majesty. But the diction is to be content with *terra firma*, rising a little to assimilate itself to the beauty and grandeur of the subject, but never startling the hearer, nor forgetting a due restraint; there is great risk at such times of its running wild and falling into poetic frenzy; and then it is that writers should hold themselves in with bit and bridle; with them as with horses an uncontrollable temper means disaster. At these times it is best for the spirit to go ahorseback, and the expression to run beside on foot, holding on to the saddle so as not to be outstripped.

As to the marshaling of your words, a moderate compromise is desirable between the harshness which results from separating what belongs together, and the jingling concatenations—one may almost call them—which are so common; one extreme is a definite vice, and the other repellent.

Facts are not to be collected at haphazard, but with careful, laborious, repeated investigation; when possible, a man should have been present

and seen for himself; failing that, he should prefer the disinterested account, selecting the informants least likely to diminish or magnify from partiality. And here comes the occasion for exercising the judgment in weighing probabilities.

The material once complete, or nearly so, an abstract should be made of it, and a rough draft of the whole work put down, not yet distributed into its parts; the detailed arrangement should then be introduced, after which adornment may be added, the diction receive its color, the phrasing and rhythm be perfected.

The historian's position should now be precisely that of Zeus in Homer, surveying now the Mysians', now the Thracian horsemen's land. Even so *he* will survey now his own party (telling us what we looked like to him from his post of vantage), now the Persians, and yet again both at once if they come to blows. And when they are face to face, his eyes are not to be on one division, nor yet on one man, mounted or afoot—unless it be a Brasidas leading the forlorn hope, or a Demosthenes repelling it; his attention should be for the generals first of all; their exhortations should be recorded, the dispositions they make, and the motives and plans that prompted them. When the engagement has begun, he should give us a bird's-eye view of it, show the scales oscillating, and accompany pursuers and pursued alike.

All this, however, with moderation; a subject is not to be ridden to death; no neglect of proportion, no childish engrossment, but easy transitions. He should call a halt here, while he crosses over to another set of operations which demands attention; that settled up, he can return to the first set, now ripe for him; he must pass swiftly to each in turn, keeping his different lines of advance as nearly as possible level, fly from Armenia to Media, thence swoop straight upon Iberia, and then take wing for Italy, everywhere present at the nick of time.

He has to make of his brain a mirror, unclouded, bright, and true of surface; then he will reflect events as they presented themselves to him, neither distorted, discolored, nor variable. Historians are not writing fancy school essays; what they have to say is before them, and will get itself said somehow, being solid fact; their task is to arrange and put it into words; they have not to consider what to say, but how to say it. The historian, we may say, should be like Phidias, Praxiteles, Alcamenes, or any great sculptor. They similarly did not create the gold, silver, ivory, or other material they used; it was ready to their hands, provided by Athens, Elis, or Argos; they only made the model, sawed, polished, cemented, proportioned the ivory, and plated it with gold; that was what

their art consisted in—the right arrangement of their material. The historian's business is similar—to superinduce upon events the charm of order, and set them forth in the most lucid fashion he can manage. When subsequently a hearer feels as though he were looking at what is being told him, and expresses his approval, then our historical Phidias' work has reached perfection, and received its appropriate reward.

When all is ready, a writer will sometimes start without formal preface if there is no pressing occasion to clear away preliminaries by that means, though even then his explanation of what he is to say constitutes a virtual preface.

When a formal preface is used, one of the three objects to which a public speaker devotes his exordium may be neglected; the historian, that is, has not to bespeak good will—only attention and an open mind. The way to secure the reader's attention is to show that the affairs to be narrated are great in themselves, throw light on destiny, or come home to his business and bosom; and as to the open mind, the lucidity in the body of the work, which is to secure that, will be facilitated by a preliminary view of the causes in operation and a precise summary of events.

Prefaces of this character have been employed by the best historians—by Herodotus, “to the end that what befell may not grow dim by lapse of time, seeing that it was great and wondrous, and showed forth with Greeks vanquishing and barbarians vanquished”; and by Thucydides, “believing that that war would be great and memorable beyond any previous one; for indeed great calamities took place during its course.”

After the preface, long or short in proportion to the subject, should come an easy natural transition to the narrative; for the body of the history which remains is nothing from beginning to end but a long narrative; it must therefore be graced with the narrative virtues—smooth, level, and consistent progress, neither soaring nor crawling, and the charm of lucidity—which is attained, as I remarked above, partly by the diction, and partly by the treatment of connected events. For, though all parts must be independently perfected, when the first is complete the second will be brought into essential connection with it, and attached like one link of a chain to another; there must be no possibility of separating them; no mere bundle of parallel threads; the first is not simply to be next to the second, but part of it, their extremities intermingling.

Brevity is always desirable, and especially where matter is abundant; and the problem is less a grammatical than a substantial one; the solution, I mean, is to deal summarily with all immaterial details, and give adequate treatment to the principal events; much, indeed, is better

omitted altogether. Suppose yourself giving a dinner, and extremely well provided; there is pastry, game, kickshaws without end, wild boar, hare, sweetbreads; well, you will not produce among these a pike or a bowl of pea soup just because they are there in the kitchen; you will dispense with such common things.

Restraint in descriptions of mountains, walls, rivers, and the like is very important; you must not give the impression that you are making a tasteless display of word painting, and expatiating independently while the history takes care of itself. Just a light touch—no more than meets the need of clearness—and you should pass on, evading the snare, and denying yourself all such indulgences. You have the mighty Homer's example in such a case; poet as he is, he yet hurries past Tantalus and Ixion, Tityus and the rest of them. If Parthenius, Euphorion, or Callimachus had been in his place, how many lines do you suppose it would have taken to get the water to Tantalus' lip; how many more to set Ixion spinning? Better still, mark how Thucydides—a very sparing dealer in description—leaves the subject at once, as soon as he has given an idea (very necessary and useful, too) of an engine or a siege operation, of the conformation of Epipolae, or the Syracusan harbor. It may occur to you that his account of the plague is long; but you must allow for the subject; then you will appreciate his brevity; *he* is hastening on; it is only that the weight of matter holds him back in spite of himself.

When it comes in your way to introduce a speech, the first requirement is that it should suit the character both of the speaker and of the occasion; the second is (once more) lucidity; but in these cases you have the counsel's right of showing your eloquence.

Not so with praise or censure; these should be sparing, cautious, avoiding hypercriticism and producing proofs, always brief, and never intrusive; historical characters are not prisoners on trial. Without these precautions you will share the ill name of Theopompus, who delights in flinging accusations broadcast, makes a business of the thing in fact, and of himself rather a public prosecutor than a historian.

It may occasionally happen that some extraordinary story has to be introduced; it should be simply narrated, without guarantee of its truth, thrown down for anyone to make what he can of it; the writer takes no risks and shows no preference.

But the general principle I would have remembered—it will ever be on my lips—is this: do not write merely with an eye to the present, that those now living may commend and honor you; aim at eternity, compose for posterity, and from it ask your reward. And that reward?

That it be said of you, "This was a man indeed, free and free-spoken; flattery and servility were not in him; he was truth all through." It is a name which a man of judgment might well prefer to all the fleeting hopes of the present.

Do you know the story of the great Cnidian architect? He was the builder of that incomparable work, whether for size or beauty, the Pharos tower. Its light was to warn ships far out at sea, and save them from running on the Paraetonia, a spot so fatal to all who get among its reefs that escape is said to be hopeless. When the building was done, he inscribed on the actual masonry his own name, but covered this up with plaster, on which he then added the name of the reigning king. He knew that, as happened later, letters and plaster would fall off together, and reveal the words:

SOSTRATUS SON OF DEXIPHANES OF CNIDUS
ON BEHALF OF ALL MARINERS
TO THE SAVIOUR GODS

He looked not, it appears, to that time, nor to the space of his own little life, but to this time, and to all time, as long as his tower shall stand and his art abide.

So too should the historian write, consorting with Truth and not with flattery, looking to the future hope, not to the gratification of the flattered.

There is your measuring-line for just history. If anyone be found to use it well, I have not written in vain; if none, yet have I rolled my tub on the Craneum.

Great Documents

Great documents do not have “authors”; though individual human beings write the words they contain, they are by definition more than the products of single men. Great documents express the beliefs, ideas, feelings, and knowledge of a great many people. They reflect the age in which they are written.

This is true even when we know, as we do of The Declaration of Independence, for example, that a document was principally the work of one man. The significance of the Declaration does not lie in any originality on Jefferson’s part, but in the fact that it was an eloquent and forceful statement of the ideas about law and liberty which prevailed among his countrymen, and which still, we hope, prevail among them today.

In addition to The Declaration of Independence, we include here five documents which are of immense importance in the western tradition of political thought. They range over nearly three hundred years and, when we consider the Charter of the United Nations and the Universal Declaration of Human Rights, over most of the countries of the earth. They incorporate much of the best thinking about the relation of man to the state that has emerged in the modern era.

The first document, The English Bill of Rights, is the most important of the statutes which, taken together with a large body of traditional opinion, make up what we call the British Constitution. It dates back to the seventeenth century and the reign of William and Mary. Parliament had been led by certain extreme acts of their predecessor, James II, to draw up the Declaration of Right, which defined the relation between the king and his subjects. When William and Mary were offered the English crown in 1688, their acceptance depended upon their assent to the Declaration. They assented; and, in 1689, a statute based upon the Declaration—the Bill of Rights—was enacted into law. The spirit, though not always the letter, of this

statute has influenced constitutional law in all of the English-speaking countries.

The Virginia Declaration of Rights was drafted by George Mason. It was adopted with revisions by the Virginia Convention on June 12, 1776. It was very influential in America (where it served as the model for the American Bill of Rights) and in France.

The Declaration of the Rights of Man and of the Citizen was drafted by the Marquis de Lafayette. It was adopted by the French Constituent Assembly on August 26, 1789, and was included as a preamble to the Constitution of 1791. It reflects the ideas of Rousseau and the American Declaration of Independence, and it exerted a dynamic influence upon the French Revolution. It has been a source of continuing inspiration to the French, particularly to the liberals who fought against reactionary regimes after the fall of Napoleon.

The Charter of the United Nations was drafted at the Dumbarton Oaks Conference of 1944, by representatives from the United States, the Soviet Union, Great Britain, and China. A fifty-nation conference at San Francisco accepted the draft with only a few minor revisions; it became the UN Charter on June 26, 1945.

The Universal Declaration of Human Rights was drafted by the United Nations Commission on Human Rights, under the chairmanship of Eleanor Roosevelt. It was adopted by the General Assembly on December 10, 1948.

All but one of the documents reprinted here are attempts to define the limits of government and the rights of man—as man and as citizen. Three of these documents speak of “inalienable” rights; one refers to them as “inherent.” What is the purpose of such statements of human rights? Why are they necessary? If the rights of man are, indeed, inalienable, how can any government take them away?

We know—from recent as well as ancient history—that such rights are not, in fact, inalienable. Many societies have not recognized them. In other societies, men who once had them have been temporarily—and perhaps permanently—deprived of them.

What then is the role played by declarations of human rights? No simple answer to the question is possible, but perhaps the best brief statement which can be made on the subject is that the rights which these documents call inalienable or inherent are rights of which men *should not* be deprived. They belong to man by reason of his nature as man. They set up a standard by which the justice of a government can be measured. As such, at least in the United States, England, and France, they have served effectively.

The English Bill of Rights

1689

Whereas the Lords Spiritual and Temporal, and Commons, assembled at Westminster, lawfully, fully, and freely representing all the estates of the people of this realm, did, upon the thirteenth day of February, in the year of our Lord one thousand six hundred eighty-eight, present unto their Majesties, then called and known by the names and style of William and Mary, Prince and Princess of Orange, being present in their proper persons, a certain declaration in writing, made by the said Lords and Commons, in the words following, viz.:

Whereas the late King James II, by the assistance of divers evil counsellors, judges, and ministers employed by him, did endeavour to subvert and extirpate the Protestant religion, and the laws and liberties of this kingdom:

1. By assuming and exercising a power of dispensing with and suspending of laws, and the execution of laws, without consent of Parliament.

2. By committing and prosecuting divers worthy prelates for humbly petitioning to be excused from concurring to the same assumed power.

3. By issuing and causing to be executed a commission under the Great Seal for erecting a court, called the Court of Commissioners for Ecclesiastical Causes.

4. By levying money for and to the use of the Crown, by pretence of prerogative, for other time, and in other manner than the same was granted by Parliament.

5. By raising and keeping a standing army within this kingdom in time of peace, without consent of Parliament, and quartering soldiers contrary to law.

6. By causing several good subjects, being Protestants, to be disarmed, at the same time when Papists were both armed and employed contrary to law.

7. By violating the freedom of election of members to serve in Parliament.

8. By prosecutions in the Court of King's Bench, for matters and causes cognizable only in Parliament; and by diverse other arbitrary and illegal courses.

9. And whereas of late years, partial, corrupt, and unqualified persons have been returned and served on juries in trials, and particularly divers jurors in trials for high treason, which were not freeholders.

10. And excessive bail hath been required of persons committed in criminal cases, to elude the benefit of the laws made for the liberty of the subject.

11. And excessive fines have been imposed; and illegal and cruel punishments inflicted.

12. And several grants and promises made of fines and forfeitures, before any conviction of judgment against the persons upon whom the same were to be levied.

All which are utterly and directly contrary to the known laws and statutes, and freedom of this realm.

And whereas the said late King James II, have abdicated the government, and the throne being thereby vacant, his Highness the Prince of Orange (whom it hath pleased Almighty God to make the glorious instrument of delivering this kingdom from popery and arbitrary power) did (by the advice of the Lords Spiritual and Temporal, and divers principal persons of the Commons) cause letters to be written to the Lords Spiritual and Temporal, being Protestants, and other letters to the several counties, cities, universities, boroughs, and Cinque Ports, for the choosing of such persons as represent them, as were of right to be sent to Parliament, to meet and sit at Westminster upon the two-and-twentieth day of January, in this year one thousand six hundred eighty and eight, in order to such an establishment, as that their religion, laws, and liberties might not again be in danger of being subverted; upon which letters, elections have been accordingly made.

And thereupon the said Lords Spiritual and Temporal, and Commons, pursuant to their respective letters and elections, being now assembled in a full and free representation of this nation, taking into their most serious consideration the best means for attaining the ends aforesaid, do in the first place (as their ancestors in like case have usually done), for the vindicating and asserting their ancient rights and liberties, declare:

1. That the pretended power of suspending of laws, or the execution of laws, by regal authority, without consent of parliament, is illegal.

2. That the pretended power of dispensing with laws, or the execution of laws, by regal authority, as it hath been assumed and exercised of late, is illegal.

3. That the commission for erecting the late Court of Commissioners for Ecclesiastical Causes, and all others commissions and courts of like nature, are illegal and pernicious.

4. That levying money for or to the use of the Crown, by pretence of prerogative, without grant of parliament, for longer time or in other manner than the same is or shall be granted, is illegal.

5. That it is the right of the subject to petition the king, and all commandments and prosecutions for such petitioning are illegal.

6. That the raising or keeping a standing army within the kingdom in time of peace, unless it be with consent of parliament, is against law.

7. That the subjects which are Protestants may have arms for their defence suitable to their conditions, and as allowed by law.

8. That election of members of parliament ought to be free.

9. That the freedom of speech, and debates or proceedings in parliament, ought not to be impeached or questioned in any court or place out of parliament.

10. That excessive bail ought not to be required, nor excessive fines imposed; nor cruel and unusual punishment inflicted.

11. That jurors ought to be duly impanelled and returned, and jurors which pass upon men in trials for high treason ought to be freeholders.

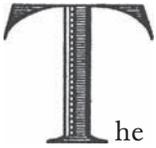

12. That all grants and promises of fine and forfeitures of particular persons before conviction are illegal and void.

13. And that for redress of all grievances, and for the amending, strengthening and preserving of the laws, parliaments ought to be held frequently.

And they do claim, demand, and insist upon all and singular the premises, as their undoubted rights and liberties; and that no declarations, judgments, doings or proceedings, to the prejudice of the people in any of the said premises, ought in any wise to be drawn hereafter into consequence or example. . . .

Declaration of the Rights of Man and of the Citizen

1789

he representatives of the people of France, formed into a National Assembly, considering that ignorance, neglect, or contempt of human rights are the sole causes of public misfortunes and corruptions of government, have resolved to set forth in a solemn declaration these natural, imprescriptible, and inalienable rights, that this declaration being constantly present to the minds of the members of the body social, they may be ever kept attentive to their rights and their duties; that the acts of the legislative and executive powers of government, being capable of being every moment compared with the end of political institutions, may be more respected; and also, that the future claims of the citizens, being directed by simple and incontestable principles, may always tend to the maintenance of the Constitution and the general happiness.

For these reasons the National Assembly doth recognize and declare, in the presence of the Supreme Being, and with the hope of His blessing and favor, the following *sacred* rights of men and of citizens:

I. Men are born, and always continue, free and equal in respect of their rights. Civil distinctions, therefore, can be founded only on public utility.

II. The end of all political associations is the preservation of the natural and imprescriptible rights of man; and these rights are Liberty, Property, Security, and Resistance of Oppression.

III. The nation is essentially the source of all sovereignty; nor can any individual, or any body of men, be entitled to any authority which is not expressly derived from it.

IV. Political liberty consists in the power of doing whatever does not injure another. The exercise of the natural rights of every man has no other limits than those which are necessary to secure to every *other* man the free exercise of the same rights; and these limits are determinable only by the law.

V. The law ought to prohibit only actions hurtful to society. What is not prohibited by the law should not be hindered; nor should anyone be compelled to that which the law does not require.

VI. The law is an expression of the will of the community. All citizens have a right to concur, either personally or by their representatives, in its formation. It should be the same to all, whether it protects or punishes; and all being equal in its sight are equally eligible to all honors, places, and employments, according to their different abilities, without any other distinction than that created by their virtues and talents.

VII. No man should be accused, arrested, or held in confinement, except in cases determined by the law, and according to the forms which it has prescribed. All who promote, solicit, execute, or cause to be executed, arbitrary orders, ought to be punished, and every citizen called upon, or apprehended by virtue of the law, ought immediately to obey, and renders himself culpable by resistance.

VIII. The law ought to impose no other penalties but such as are absolutely and evidently necessary; and no one ought to be punished, but in virtue of a law promulgated before the offense, and legally applied.

IX. Every man being presumed innocent till he has been convicted, whenever his detention becomes indispensable, all rigor to him, more than is necessary to secure his person, ought to be provided against by the law.

X. No man ought to be molested on account of his opinions, not even on account of his religious opinions, provided his avowal of them does not disturb the public order established by the law.

XI. The unrestrained communication of thoughts and opinions being one of the most precious rights of man, every citizen may speak, write, and publish freely, provided he is responsible for the abuse of this liberty, in cases determined by the law.

XII. A public force being necessary to give security to the rights of men and of citizens, that force is instituted for the benefit of the community and not for the particular benefit of the persons with whom it is entrusted.

XIII. A common contribution being necessary for the support of the

public force, and for defraying the other expenses of government, it ought to be divided equally among the members of the community, according to their abilities.

XIV. Every citizen has a right, either by himself or his representative, to a free voice in determining the necessity of public contributions, the appropriations of them, and their amount, mode of assessment, and duration.

XV. Every community has a right to demand of all its agents an account of their conduct.

XVI. Every community in which a separation of powers and a security of rights is not provided for wants a constitution.

XVII. The right to property being inviolable and sacred, no one ought to be deprived of it, except in cases of evident public necessity, legally ascertained, and on condition of a previous just indemnity.

The Virginia Declaration of Rights

June 12, 1776

declaration of rights made by the representatives of the good people of Virginia, assembled in full and free convention; which rights do pertain to them and their posterity, as the basis and foundation of government.

SECTION 1. That all men are by nature equally free and independent and have certain inherent rights, of which, when they enter into a state of society, they cannot, by any compact, deprive or divest their posterity; namely, the enjoyment of life and liberty, with the means of acquiring and possessing property, and pursuing and obtaining happiness and safety.

SECTION 2. That all power is vested in, and consequently derived from, the people; that magistrates are their trustees and servants and at all times amenable to them.

SECTION 3. That government is, or ought to be, instituted for the common benefit, protection, and security of the people, nation, or community; of all the various modes and forms of government, that is best which is capable of producing the greatest degree of happiness and safety and is most effectually secured against the danger of maladministration; and that, when any government shall be found inadequate or contrary to these purposes, a majority of the community hath an indubitable, inalienable, and indefeasible right to reform, alter, or abolish it, in such manner as shall be judged most conducive to the public weal.

SECTION 4. That no man, or set of men, are entitled to exclusive or separate emoluments or privileges from the community, but in consideration of public services; which, not being descendible, neither ought the offices of magistrate, legislator, or judge to be hereditary.

SECTION 5. That the legislative and executive powers of the state should be separate and distinct from the judiciary; and that the members

of the two first may be restrained from oppression, by feeling and participating the burdens of the people, they should, at fixed periods, be reduced to a private station, return into that body from which they were originally taken, and the vacancies be supplied by frequent, certain, and regular elections, in which all, or any part, of the former members, to be again eligible, or ineligible, as the laws shall direct.

SECTION 6. That elections of members to serve as representatives of the people, in assembly, ought to be free; and that all men, having sufficient evidence of permanent common interest with, and attachment to, the community, have the right of suffrage and cannot be taxed or deprived of their property for public uses without their own consent, or that of their representatives so elected, nor bound by any law to which they have not, in like manner, assented for the public good.

SECTION 7. That all power of suspending laws, or the execution of laws, by any authority, without consent of the representatives of the people, is injurious to their rights and ought not to be exercised.

SECTION 8. That in all capital or criminal prosecutions a man hath a right to demand the cause and nature of his accusation, to be confronted with the accusers and witnesses, to call for evidence in his favor, and to a speedy trial by an impartial jury of twelve men of his vicinage, without whose unanimous consent he cannot be found guilty; nor can he be compelled to give evidence against himself; that no man be deprived of his liberty, except by the law of the land or the judgment of his peers.

SECTION 9. That excessive bail ought not to be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted.

SECTION 10. That general warrants, whereby an officer or messenger may be commanded to search suspected places without evidence of a fact committed, or to seize any person or persons not named, or whose offense is not particularly described and supported by evidence, are grievous and oppressive and ought not to be granted.

SECTION 11. That in controversies respecting property, and in suits between man and man, the ancient trial by jury is preferable to any other and ought to be held sacred.

SECTION 12. That the freedom of the press is one of the great bulwarks of liberty and can never be restrained but by despotic governments.

SECTION 13. That a well-regulated militia, composed of the body of the people, trained to arms, is the proper, natural, and safe defense of a free state; that standing armies, in time of peace, should be avoided as dangerous to liberty; and that in all cases the military should be under strict subordination to, and governed by, the civil power.

SECTION 14. That the people have a right to uniform government;

and, therefore, that no government separate from or independent of the government of Virginia ought to be erected or established within the limits thereof.

SECTION 15. That no free government, or the blessings of liberty, can be preserved to any people, but by a firm adherence to justice, moderation, temperance, frugality, and virtue, and by frequent recurrence to fundamental principles.

SECTION 16. That religion, or the duty which we owe to our Creator, and the manner of discharging it, can be directed only by reason and conviction, not by force or violence; and therefore all men are equally entitled to the free exercise of religion, according to the dictates of conscience; and that it is the mutual duty of all to practice Christian forbearance, love, and charity toward each other.

The Declaration of Independence

A DECLARATION

BY THE REPRESENTATIVES OF THE UNITED STATES OF AMERICA

IN CONGRESS ASSEMBLED, JULY 4, 1776

hen, in the course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume among the powers of the earth, the separate and equal station to which the laws of nature and of nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable rights, that among these are life, liberty and the pursuit of happiness. That to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed, that whenever any form of government becomes destructive of these ends, it is the right of the people to alter or to abolish it, and to institute new government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their safety and happiness. Prudence, indeed, will dictate that governments long established should not be changed for light and transient causes; and accordingly all experience hath shown, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same object, evinces a design to reduce them under absolute despotism, it is their right, it is their duty, to throw off such government, and to provide new guards for their future security. Such has been the patient sufferance of these colonies; and such

is now the necessity which constrains them to alter their former systems of government. The history of the present King of Great Britain is a history of repeated injuries and usurpations, all having in direct object the establishment of an absolute tyranny over these states. To prove this, let facts be submitted to a candid world.

He has refused his assent to laws, the most wholesome and necessary for the public good.

He has forbidden his governors to pass laws of immediate and pressing importance, unless suspended in their operation till his assent should be obtained; and when so suspended, he has utterly neglected to attend to them.

He has refused to pass other laws for the accommodation of large districts of people, unless those people would relinquish the right of representation in the legislature, a right inestimable to them and formidable to tyrants only.

He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public records, for the sole purpose of fatiguing them into compliance with his measures.

He has dissolved representative houses repeatedly, for opposing with manly firmness his invasions on the rights of the people.

He has refused for a long time, after such dissolutions, to cause others to be elected; whereby the legislative powers, incapable of annihilation, have returned to the people at large for their exercise; the state remaining in the meantime exposed to all the dangers of invasion from without, and convulsions within.

He has endeavored to prevent the population of these States; for that purpose obstructing the laws for naturalization of foreigners; refusing to pass others to encourage their migrations hither, and raising the conditions of new appropriations of lands.

He has obstructed the administration of justice, by refusing his assent to laws for establishing judiciary powers.

He has made judges dependent on his will alone, for the tenure of their offices, and the amount and payment of their salaries.

He has erected a multitude of new offices, and sent hither swarms of officers to harass our people, and eat out their substance.

He has kept among us, in times of peace, standing armies without the consent of our legislatures.

He has affected to render the military independent of and superior to the civil power.

He has combined with others to subject us to a jurisdiction foreign to

our Constitution, and unacknowledged by our laws; giving his assent to their acts of pretended legislation:

For quartering large bodies of armed troops among us:

For protecting them, by a mock trial, from punishment for any murders which they should commit on the inhabitants of these States:

For cutting off our trade with all parts of the world:

For imposing taxes on us without our consent:

For depriving us, in many cases, of the benefit of trial by jury:

For transporting us beyond seas to be tried for pretended offenses:

For abolishing the free system of English laws in a neighboring province, establishing therein an arbitrary government, and enlarging its boundaries so as to render it at once an example and fit instrument for introducing the same absolute rule into these colonies:

For taking away our charters, abolishing our most valuable laws, and altering fundamentally the forms of our governments:

For suspending our own legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever.

He has abdicated government here, by declaring us out of his protection and waging war against us.

He has plundered our seas, ravaged our coasts, burnt our towns, and destroyed the lives of our people.

He is at this time transporting large armies of foreign mercenaries to complete the works of death, desolation and tyranny, already begun with circumstances of cruelty and perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the head of a civilized nation.

He has constrained our fellow citizens taken captive on the high seas to bear arms against their country, to become the executioners of their friends and brethren or to fall themselves by their hands.

He has excited domestic insurrections amongst us, and has endeavored to bring on the inhabitants of our frontiers, the merciless Indian savages, whose known rule of warfare is an undistinguished destruction of all ages, sexes and conditions.

In every stage of these oppressions we have petitioned for redress in the most humble terms. Our repeated petitions have been answered only by repeated injury. A prince whose character is thus marked by every act which may define a tyrant is unfit to be the ruler of a free people.

Nor have we been wanting in attentions to our British brethren. We have warned them from time to time of attempts by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have ap-

pealed to their native justice and magnanimity, and we have conjured them by the ties of our common kindred to disavow these usurpations, which would inevitably interrupt our connections and correspondence. They too have been deaf to the voice of justice and of consanguinity. We must, therefore, acquiesce in the necessity which denounces our separation, and hold them, as we hold the rest of mankind, enemies in war, in peace friends.

We, therefore, the representatives of the United States of America, in general Congress, assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the name, and by authority of the good people of these colonies, solemnly publish and declare, that these united colonies are, and of right ought to be free and independent states; that they are absolved from all allegiance to the British Crown, and that all political connection between them and the state of Great Britain is and ought to be totally dissolved; and that as free and independent states, they have full power to levy war, conclude peace, contract alliances, establish commerce, and to do all other acts and things which independent states may of right do. And for the support of this declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other our lives, our fortunes and our sacred honor.

Charter of the United Nations

1945

Whereas the peoples of the United Nations determined

to save succeeding generations from the scourge of war, which twice in our lifetime has brought untold sorrow to mankind, and

to reaffirm faith in fundamental human rights, in the dignity and worth of the human person, in the equal rights of men and women and of nations large and small, and

to establish conditions under which justice and respect for the obligations arising from treaties and other sources of international law can be maintained, and

to promote social progress and better standards of life in larger freedom,
and for these ends

to practice tolerance and live together in peace with one another as good neighbors, and

to unite our strength to maintain international peace and security, and

to ensure, by the acceptance of principles and the institution of methods, that armed force shall not be used, save in the common interest, and

to employ international machinery for the promotion of the economic and social advancement of all peoples,

have resolved to combine our efforts to accomplish these aims.

Accordingly, our respective Governments, through representatives assembled in the city of San Francisco, who have exhibited their full powers found to be in good and due form, have agreed to the present Charter of the United Nations and do hereby establish an international organization to be known as the United Nations.

CHAPTER I

PURPOSES AND PRINCIPLES

ARTICLE 1

The Purposes of the United Nations are:

1. To maintain international peace and security, and to that end: to take effective collective measures for the prevention and removal of threats to the peace, and for the suppression of acts of aggression or other breaches of the peace, and to bring about by peaceful means, and in conformity with the principles of justice and international law, adjustment or settlement of international disputes or situations which might lead to a breach of the peace;

2. To develop friendly relations among nations based on respect for the principle of equal rights and self-determination of peoples, and to take other appropriate measures to strengthen universal peace;

3. To achieve international co-operation in solving international problems of an economic, social, cultural, or humanitarian character, and in promoting and encouraging respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language, or religion; and

4. To be a center for harmonizing the actions of nations in the attainment of these common ends.

ARTICLE 2

The Organization and its Members, in pursuit of the Purposes stated in Article 1, shall act in accordance with the following Principles.

1. The Organization is based on the principle of the sovereign equality of all its Members.

2. All Members, in order to ensure to all of them the rights and benefits resulting from membership, shall fulfill in good faith the obligations assumed by them in accordance with the present Charter.

3. All Members shall settle their international disputes by peaceful means in such a manner that international peace and security, and justice, are not endangered.

4. All Members shall refrain in their international relations from the threat or use of force against the territorial integrity or political independence of any state, or in any other manner inconsistent with the Purposes of the United Nations.

5. All Members shall give the United Nations every assistance in any action it takes in accordance with the present Charter, and shall refrain from giving assistance to any state against which the United Nations is taking preventive or enforcement action.

6. The Organization shall ensure that states which are not Members of the United Nations act in accordance with these Principles so far as may be necessary for the maintenance of international peace and security.

7. Nothing contained in the present Charter shall authorize the United Nations to intervene in matters which are essentially within the domestic jurisdiction of any state or shall require the Members to submit such matters to settlement under the present Charter; but this principle shall not prejudice the application of enforcement measures under Chapter VII.

CHAPTER II

MEMBERSHIP

ARTICLE 3

The original Members of the United Nations shall be the states which, having participated in the United Nations Conference on International Organization at San Francisco, or having previously signed the Declaration by United Nations of January 1, 1942, sign the present Charter and ratify it in accordance with Article 110.

ARTICLE 4

1. Membership in the United Nations is open to all other peace-loving states which accept the obligations contained in the present Charter and, in the judgment of the Organization, are able and willing to carry out these obligations.

2. The admission of any such state to membership in the United Nations will be effected by a decision of the General Assembly upon the recommendation of the Security Council.

ARTICLE 5

A Member of the United Nations against which preventive or enforcement action has been taken by the Security Council may be suspended from the exercise of the rights and privileges of membership by the General Assembly upon the recommendation of the Security Council. The exercise of these rights and privileges may be restored by the Security Council.

ARTICLE 6

A Member of the United Nations which has persistently violated the Principles contained in the present Charter may be expelled from the Organization by the General Assembly upon the recommendation of the Security Council.

CHAPTER III

ORGANS

ARTICLE 7

1. There are established as the principal organs of the United Nations: a General Assembly, a Security Council, an Economic and Social Council, a Trusteeship Council, an International Court of Justice, and a Secretariat.

2. Such subsidiary organs as may be found necessary may be established in accordance with the present Charter.

ARTICLE 8

The United Nations shall place no restrictions on the eligibility of men and women to participate in any capacity and under conditions of equality in its principal and subsidiary organs.

CHAPTER IV

THE GENERAL ASSEMBLY

Composition

ARTICLE 9

1. The General Assembly shall consist of all the Members of the United Nations.

2. Each Member shall have not more than five representatives in the General Assembly.

Functions and Powers

ARTICLE 10

The General Assembly may discuss any questions or any matters within the scope of the present Charter or relating to the powers and functions of any organs provided for in the present Charter, and except as provided in Article 12, may make recommendations to the Members of the

United Nations or to the Security Council or to both on any such questions or matters.

ARTICLE 11

1. The General Assembly may consider the general principles of cooperation in the maintenance of international peace and security, including the principles governing disarmament and the regulation of armaments, and may make recommendations with regard to such principles to the Members or to the Security Council or to both.

2. The General Assembly may discuss any questions relating to the maintenance of international peace and security brought before it by any Member of the United Nations, or by the Security Council, or by a state which is not a Member of the United Nations in accordance with Article 35, paragraph 2, and, except as provided in Article 12, may make recommendations with regard to any such questions to the state or states concerned or to the Security Council or to both. Any such question on which action is necessary shall be referred to the Security Council by the General Assembly either before or after discussion.

3. The General Assembly may call the attention of the Security Council to situations which are likely to endanger international peace and security.

4. The powers of the General Assembly set forth in this Article shall not limit the general scope of Article 10.

ARTICLE 12

1. While the Security Council is exercising in respect of any dispute or situation the functions assigned to it in the present Charter, the General Assembly shall not make any recommendation with regard to that dispute or situation unless the Security Council so requests.

2. The Secretary-General, with the consent of the Security Council, shall notify the General Assembly at each session of any matters relative to the maintenance of international peace and security which are being dealt with by the Security Council and shall similarly notify the General Assembly, or the Members of the United Nations if the General Assembly is not in session, immediately the Security Council ceases to deal with such matters.

ARTICLE 13

1. The General Assembly shall initiate studies and make recommendations for the purpose of:

a. promoting international co-operation in the political field and encouraging the progressive development of international law and its codification;

b. promoting international co-operation in the economic, social, cultural, educational, and health fields, and assisting in the realization of human rights and fundamental freedoms for all without distinction as to race, sex, language, or religion.

2. The further responsibilities, functions, and powers of the General Assembly with respect to matters mentioned in paragraph 1 (b) above are set forth in Chapters IX and X.

ARTICLE 14

Subject to the provisions of Article 12, the General Assembly may recommend measures for the peaceful adjustment of any situation, regardless of origin, which it deems likely to impair the general welfare or friendly relations among nations, including situations resulting from a violation of the provisions of the present Charter setting forth the Purposes and Principles of the United Nations.

ARTICLE 15

1. The General Assembly shall receive and consider annual and special reports from the Security Council; these reports shall include an account of the measures that the Security Council has decided upon or taken to maintain international peace and security.

2. The General Assembly shall receive and consider reports from the other organs of the United Nations.

ARTICLE 16

The General Assembly shall perform such functions with respect to the international trusteeship system as are assigned to it under Chapters XII and XIII, including the approval of the trusteeship agreements for areas not designated as strategic.

ARTICLE 17

1. The General Assembly shall consider and approve the budget of the Organization.

2. The expenses of the Organization shall be borne by the Members as apportioned by the General Assembly.

3. The General Assembly shall consider and approve any financial and budgetary arrangements with specialized agencies referred to in Article

57 and shall examine the administrative budgets of such specialized agencies with a view to making recommendations to the agencies concerned.

Voting

ARTICLE 18

1. Each Member of the General Assembly shall have one vote.
2. Decisions of the General Assembly on important questions shall be made by a two-thirds majority of the Members present and voting. These questions shall include: recommendations with respect to the maintenance of international peace and security, the election of the nonpermanent Members of the Security Council, the election of the Members of the Economic and Social Council, the election of Members of the Trusteeship Council in accordance with paragraph 1 (c) of Article 86, the admission of new Members to the United Nations, the suspension of the rights and privileges of membership, the expulsion of Members, questions relating to the operation of the trusteeship system, and budgetary questions.
3. Decisions on other questions, including the determination of additional categories of questions to be decided by a two-thirds majority, shall be made by a majority of the Members present and voting.

ARTICLE 19

A Member of the United Nations which is in arrears in the payment of its financial contributions to the Organization shall have no vote in the General Assembly if the amount of its arrears equals or exceeds the amount of the contributions due from it for the preceding two full years. The General Assembly may, nevertheless, permit such a Member to vote if it is satisfied that the failure to pay is due to conditions beyond the control of the Member.

Procedure

ARTICLE 20

The General Assembly shall meet in regular annual sessions and in such special sessions as occasion may require. Special sessions shall be convoked by the Secretary-General at the request of the Security Council or of a majority of the Members of the United Nations.

ARTICLE 21

The General Assembly shall adopt its own rules of procedure. It shall elect its President for each session.

ARTICLE 22

The General Assembly may establish such subsidiary organs as it deems necessary for the performance of its functions.

CHAPTER V

THE SECURITY COUNCIL

Composition

ARTICLE 23

1. The Security Council shall consist of eleven Members of the United Nations. The Republic of China, France, the Union of Soviet Socialist Republics, the United Kingdom of Great Britain and Northern Ireland, and the United States of America shall be permanent Members of the Security Council. The General Assembly shall elect six other Members of the United Nations to be nonpermanent Members of the Security Council, due regard being specially paid, in the first instance to the contribution of Members of the United Nations to the maintenance of international peace and security and to the other purposes of the Organization, and also to equitable geographical distribution.

2. The nonpermanent Members of the Security Council shall be elected for a term of two years. In the first election of the nonpermanent Members, however, three shall be chosen for a term of one year. A retiring Member shall not be eligible for immediate re-election.

3. Each Member of the Security Council shall have one representative.

Functions and Powers

ARTICLE 24

1. In order to ensure prompt and effective action by the United Nations, its Members confer on the Security Council primary responsibility for the maintenance of international peace and security, and agree that in carrying out its duties under this responsibility the Security Council acts on their behalf.

2. In discharging these duties the Security Council shall act in accordance with the Purposes and Principles of the United Nations. The specific powers granted to the Security Council for the discharge of these duties are laid down in Chapters VI, VII, VIII, and XII.

3. The Security Council shall submit annual and, when necessary, special reports to the General Assembly for its consideration.

ARTICLE 25

The Members of the United Nations agree to accept and carry out the decisions of the Security Council in accordance with the present Charter.

ARTICLE 26

In order to promote the establishment and maintenance of international peace and security with the least diversion for armaments of the world's human and economic resources, the Security Council shall be responsible for formulating, with the assistance of the Military Staff Committee referred to in Article 47, plans to be submitted to the Members of the United Nations for the establishment of a system for the regulation of armaments.

Voting

ARTICLE 27

1. Each Member of the Security Council shall have one vote.
2. Decisions of the Security Council on procedural matters shall be made by an affirmative vote of seven Members.
3. Decisions of the Security Council on all other matters shall be made by an affirmative vote of seven Members including the concurring votes of the permanent Members; provided that, in decisions under Chapter VI, and under paragraph 3 of Article 52, a party to a dispute shall abstain from voting.

Procedure

ARTICLE 28

1. The Security Council shall be so organized as to be able to function continuously. Each Member of the Security Council shall for this purpose be represented at all times at the seat of the Organization.
2. The Security Council shall hold periodic meetings at which each of its Members may, if it so desires, be represented by a member of the government or by some other specially designated representative.
3. The Security Council may hold meetings at such places other than the seat of the Organization as in its judgment will best facilitate its work.

ARTICLE 29

The Security Council may establish such subsidiary organs as it deems necessary for the performance of its functions.

ARTICLE 30

The Security Council shall adopt its own rules of procedure, including the method of selecting its President.

ARTICLE 31

Any Member of the United Nations which is not a Member of the Security Council may participate, without vote, in the discussion of any question brought before the Security Council whenever the latter considers that the interests of that Member are specially affected.

ARTICLE 32

Any Member of the United Nations which is not a Member of the Security Council or any state which is not a Member of the United Nations, if it is a party to a dispute under consideration by the Security Council, shall be invited to participate, without vote, in the discussion relating to the dispute. The Security Council shall lay down such conditions as it deems just for the participation of a state which is not a Member of the United Nations.

CHAPTER VI

PACIFIC SETTLEMENT OF DISPUTES

ARTICLE 33

1. The parties to any dispute, the continuance of which is likely to endanger the maintenance of international peace and security, shall, first of all, seek a solution by negotiation, enquiry, mediation, conciliation, arbitration, judicial settlement, resort to regional agencies or arrangements, or other peaceful means of their own choice.

2. The Security Council shall, when it deems necessary, call upon the parties to settle their dispute by such means.

ARTICLE 34

The Security Council may investigate any dispute, or any situation which might lead to international friction or give rise to a dispute, in order to determine whether the continuance of the dispute or situation is likely to endanger the maintenance of international peace and security.

ARTICLE 35

1. Any Member of the United Nations may bring any dispute, or any situation of the nature referred to in Article 34, to the attention of the Security Council or of the General Assembly.

2. A state which is not a Member of the United Nations may bring to the attention of the Security Council or of the General Assembly any dispute to which it is a party if it accepts in advance, for the purposes of the dispute, the obligations of pacific settlement provided in the present Charter.

3. The proceedings of the General Assembly in respect of matters brought to its attention under this Article will be subject to the provisions of Articles 11 and 12.

ARTICLE 36

1. The Security Council may, at any stage of a dispute of the nature referred to in Article 33 or of a situation of like nature, recommend appropriate procedures or methods of adjustment.

2. The Security Council should take into consideration any procedures for the settlement of the dispute which have already been adopted by the parties.

3. In making recommendations under this Article the Security Council should also take into consideration that legal disputes should as a general rule be referred by the parties to the International Court of Justice in accordance with the provisions of the Statute of the Court.

ARTICLE 37

1. Should the parties to a dispute of the nature referred to in Article 33 fail to settle it by the means indicated in that Article, they shall refer it to the Security Council.

2. If the Security Council deems that the continuance of the dispute is in fact likely to endanger the maintenance of international peace and security, it shall decide whether to take action under Article 36 or to recommend such terms of settlement as it may consider appropriate.

ARTICLE 38

Without prejudice to the provisions of Articles 33 to 37, the Security Council may, if all the parties to any dispute so request, make recommendations to the parties with a view to a pacific settlement of the dispute.

CHAPTER VII

ACTION WITH RESPECT TO THREATS TO THE PEACE,
BREACHES OF THE PEACE, AND ACTS OF AGGRESSION

ARTICLE 39

The Security Council shall determine the existence of any threat to the peace, breach of the peace, or act of aggression and shall make recommendations, or decide what measures shall be taken in accordance with Articles 41 and 42, to maintain or restore international peace and security.

ARTICLE 40

In order to prevent an aggravation of the situation, the Security Council may, before making the recommendations or deciding upon the measures provided for in Article 39, call upon the parties concerned to comply with such provisional measures as it deems necessary or desirable. Such provisional measures shall be without prejudice to the rights, claims, or position of the parties concerned. The Security Council shall duly take account of failure to comply with such provisional measures.

ARTICLE 41

The Security Council may decide what measures not involving the use of armed force are to be employed to give effect to its decisions, and it may call upon the Members of the United Nations to apply such measures. These may include complete or partial interruption of economic relations and of rail, sea, air, postal, telegraphic, radio, and other means of communication and the severance of diplomatic relations.

ARTICLE 42

Should the Security Council consider that measures provided for in Article 41 would be inadequate or have proved to be inadequate, it may take such action by air, sea, or land forces as may be necessary to maintain or restore international peace and security. Such action may include demonstrations, blockade, and other operations by air, sea, or land forces of Members of the United Nations.

ARTICLE 43

1. All Members of the United Nations, in order to contribute to the maintenance of international peace and security, undertake to make available to the Security Council, on its call and in accordance with a

special agreement or agreements, armed forces, assistance, and facilities, including rights of passage, necessary for the purpose of maintaining international peace and security.

2. Such agreement or agreements shall govern the numbers and types of forces, their degree of readiness and general location, and the nature of the facilities and assistance to be provided.

3. The agreement or agreements shall be negotiated as soon as possible on the initiative of the Security Council. They shall be concluded between the Security Council and Members or between the Security Council and groups of Members and shall be subject to ratification by the signatory states in accordance with their respective constitutional processes.

ARTICLE 44

When the Security Council has decided to use force it shall, before calling upon a Member not represented on it to provide armed forces in fulfillment of the obligations assumed under Article 43, invite that Member, if the Member so desires, to participate in the decisions of the Security Council concerning the employment of contingents of that Member's armed forces.

ARTICLE 45

In order to enable the United Nations to take urgent military measures, Members shall hold immediately available national air-force contingents for combined international enforcement action. The strength and degree of readiness of these contingents and plans for their combined action shall be determined, within the limits laid down in the special agreement or agreements referred to in Article 43, by the Security Council with the assistance of the Military Staff Committee.

ARTICLE 46

Plans for the application of armed force shall be made by the Security Council with the assistance of the Military Staff Committee.

ARTICLE 47

1. There shall be established a Military Staff Committee to advise and assist the Security Council on all questions relating to the Security Council's military requirements for the maintenance of international peace and security, the employment and command of forces placed at its disposal, the regulation of armaments, and possible disarmament.

2. The Military Staff Committee shall consist of the Chiefs of Staff of the permanent members of the Security Council or their representatives. Any Member of the United Nations not permanently represented on the Committee shall be invited by the Committee to be associated with it when the efficient discharge of the Committee's responsibilities requires the participation of that Member in its work.

3. The Military Staff Committee shall be responsible under the Security Council for the strategic direction of any armed forces placed at the disposal of the Security Council. Questions relating to the command of such forces shall be worked out subsequently.

4. The Military Staff Committee, with the authorization of the Security Council and after consultation with appropriate regional agencies, may establish regional subcommittees.

ARTICLE 48

1. The action required to carry out the decisions of the Security Council for the maintenance of international peace and security shall be taken by all the Members of the United Nations or by some of them, as the Security Council may determine.

2. Such decisions shall be carried out by the Members of the United Nations directly and through their action in the appropriate international agencies of which they are Members.

ARTICLE 49

The Members of the United Nations shall join in affording mutual assistance in carrying out the measures decided upon by the Security Council.

ARTICLE 50

If preventive or enforcement measures against any state are taken by the Security Council, any other state, whether a Member of the United Nations or not, which finds itself confronted with special economic problems arising from the carrying out of those measures shall have the right to consult the Security Council with regard to a solution of those problems.

ARTICLE 51

Nothing in the present Charter shall impair the inherent right of individual or collective self-defense if an armed attack occurs against a Member of the United Nations, until the Security Council has taken the

measures necessary to maintain international peace and security. Measures taken by Members in the exercise of this right of self-defense shall be immediately reported to the Security Council and shall not in any way affect the authority and responsibility of the Security Council under the present Charter to take at any time such action as it deems necessary in order to maintain or restore international peace and security.

CHAPTER VIII

REGIONAL ARRANGEMENTS

ARTICLE 52

1. Nothing in the present Charter precludes the existence of regional arrangements or agencies for dealing with such matters relating to the maintenance of international peace and security as are appropriate for regional action, provided that such arrangements or agencies and their activities are consistent with the Purposes and Principles of the United Nations.

2. The Members of the United Nations entering into such arrangements or constituting such agencies shall make every effort to achieve pacific settlement of local disputes through such regional arrangements or by such regional agencies before referring them to the Security Council.

3. The Security Council shall encourage the development of pacific settlement of local disputes through such regional arrangements or by such regional agencies either on the initiative of the states concerned or by reference from the Security Council.

4. This Article in no way impairs the application of Articles 34 and 35.

ARTICLE 53

1. The Security Council shall, where appropriate, utilize such regional arrangements or agencies for enforcement action under its authority. But no enforcement action shall be taken under regional arrangements or by regional agencies without the authorization of the Security Council, with the exception of measures against any enemy state, as defined in paragraph 2 of this Article, provided for pursuant to Article 107 or in regional arrangements directed against renewal of aggressive policy on the part of any such state, until such time as the Organization may, on request of the Governments concerned, be charged with the responsibility for preventing further aggression by such a state.

2. The term enemy state as used in paragraph 1 of this Article applies to any state which during the Second World War has been an enemy of any signatory of the present Charter.

ARTICLE 54

The Security Council shall at all times be kept fully informed of activities undertaken or in contemplation under regional arrangements or by regional agencies for the maintenance of international peace and security.

CHAPTER IX

INTERNATIONAL ECONOMIC AND SOCIAL COOPERATION

ARTICLE 55

With a view to the creation of conditions of stability and well-being which are necessary for peaceful and friendly relations among nations based on respect for the principle of equal rights and self-determination of peoples, the United Nations shall promote:

- a. higher standards of living, full employment, and conditions of economic and social progress and development;
- b. solutions of international economic, social, health, and related problems; and international cultural and educational co-operation; and
- c. universal respect for, and observance of, human rights and fundamental freedoms for all without distinction as to race, sex, language, or religion.

ARTICLE 56

All Members pledge themselves to take joint and separate action in co-operation with the Organization for the achievement of the purposes set forth in Article 55.

ARTICLE 57

1. The various specialized agencies, established by intergovernmental agreement and having wide international responsibilities, as defined in their basic instruments, in economic, social, cultural, educational, health, and related fields, shall be brought into relationship with the United Nations in accordance with the provisions of Article 63.

2. Such agencies thus brought into relationship with the United Nations are hereinafter referred to as specialized agencies.

ARTICLE 58

The Organization shall make recommendations for the co-ordination of the policies and activities of the specialized agencies.

ARTICLE 59

The Organization shall, where appropriate, initiate negotiations among the states concerned for the creation of any new specialized agencies required for the accomplishment of the purposes set forth in Article 55.

ARTICLE 60

Responsibility for the discharge of the functions of the Organization set forth in this Chapter shall be vested in the General Assembly and, under the authority of the General Assembly, in the Economic and Social Council, which shall have for this purpose the powers set forth in Chapter X.

CHAPTER X

THE ECONOMIC AND SOCIAL COUNCIL

Composition

ARTICLE 61

1. The Economic and Social Council shall consist of eighteen Members of the United Nations elected by the General Assembly.

2. Subject to the provisions of paragraph 3, six Members of the Economic and Social Council shall be elected each year for a term of three years. A retiring Member shall be eligible for immediate re-election.

3. At the first election, eighteen Members of the Economic and Social Council shall be chosen. The term of office of six Members so chosen shall expire at the end of one year, and of six other Members at the end of two years, in accordance with arrangements made by the General Assembly.

4. Each Member of the Economic and Social Council shall have one representative.

Functions and Powers

ARTICLE 62

1. The Economic and Social Council may make or initiate studies and reports with respect to international economic, social, cultural, educa-

tional, health and related matters and may make recommendations with respect to any such matters to the General Assembly, to the Members of the United Nations, and to the specialized agencies concerned.

2. It may make recommendations for the purpose of promoting respect for, and observance of, human rights and fundamental freedoms for all.

3. It may prepare draft conventions for submission to the General Assembly, with respect to matters falling within its competence.

4. It may call, in accordance with the rules prescribed by the United Nations, international conferences on matters falling within its competence.

ARTICLE 63

1. The Economic and Social Council may enter into agreements with any of the agencies referred to in Article 57, defining the terms on which the agency concerned shall be brought into relationship with the United Nations. Such agreements shall be subject to approval by the General Assembly.

2. It may co-ordinate the activities of the specialized agencies through consultation with and recommendations to such agencies and through recommendations to the General Assembly and to the Members of the United Nations.

ARTICLE 64

1. The Economic and Social Council may take appropriate steps to obtain regular reports from the specialized agencies. It may make arrangements with the Members of the United Nations and with the specialized agencies to obtain reports on the steps taken to give effect to its own recommendations and to recommendations on matters falling within its competence made by the General Assembly.

2. It may communicate its observations on these reports to the General Assembly.

ARTICLE 65

The Economic and Social Council may furnish information to the Security Council and shall assist the Security Council upon its request.

ARTICLE 66

1. The Economic and Social Council shall perform such functions as fall within its competence in connection with the carrying out of the recommendations of the General Assembly.

2. It may, with the approval of the General Assembly, perform services at the request of Members of the United Nations and at the request of specialized agencies.

3. It shall perform such other functions as are specified elsewhere in the present Charter or as may be assigned to it by the General Assembly.

Voting

ARTICLE 67

1. Each Member of the Economic and Social Council shall have one vote.

2. Decisions of the Economic and Social Council shall be made by a majority of the Members present and voting.

Procedure

ARTICLE 68

The Economic and Social Council shall set up commissions in economic and social fields and for the promotion of human rights, and such other commissions as may be required for the performance of its functions.

ARTICLE 69

The Economic and Social Council shall invite any Member of the United Nations to participate, without vote, in its deliberations on any matter of particular concern to that Member.

ARTICLE 70

The Economic and Social Council may make arrangements for representatives of the specialized agencies to participate, without vote, in its deliberations and in those of the commissions established by it, and for its representatives to participate in the deliberations of the specialized agencies.

ARTICLE 71

The Economic and Social Council may make suitable arrangements for consultation with nongovernmental organizations which are concerned with matters within its competence. Such arrangements may be made with international organizations and, where appropriate, with na-

tional organizations after consultation with the Member of the United Nations concerned.

ARTICLE 72

The Economic and Social Council shall adopt its own rules of procedure, including the method of selecting its President.

2. The Economic and Social Council shall meet as required in accordance with its rules, which shall include provision for the convening of meetings on the request of a majority of its Members.

CHAPTER XI

DECLARATION REGARDING NONSELF-GOVERNING
TERRITORIES

ARTICLE 73

Members of the United Nations which have or assume responsibilities for the administration of territories whose peoples have not yet attained a full measure of self-government recognize the principle that the interests of the inhabitants of these territories are paramount, and accept as a sacred trust the obligation to promote to the utmost, within the system of international peace and security established by the present Charter, the well-being of the inhabitants of these territories, and, to this end:

a. to ensure, with due respect for the culture of the peoples concerned, their political, economic, social, and educational advancement, their just treatment, and their protection against abuses;

b. to develop self-government, to take due account of the political aspirations of the peoples, and to assist them in the progressive development of their free political institutions, according to the particular circumstances of each territory and its peoples and their varying stages of advancement;

c. to further international peace and security;

d. to promote constructive measures of development, to encourage research, and to co-operate with one another and, when and where appropriate, with specialized international bodies with a view to the practical achievement of the social, economic, and scientific purposes set forth in this Article; and

e. to transmit regularly to the Secretary-General for information purposes, subject to such limitation as security and constitutional considerations may require, statistical and other information of a technical nature

relating to economic, social, and educational conditions in the territories for which they are respectively responsible other than those territories to which Chapters XII and XIII apply.

ARTICLE 74

Members of the United Nations also agree that their policy in respect of the territories to which this Chapter applies, no less than in respect to their metropolitan areas, must be based on the general principle of good-neighborliness, due account being taken of the interests and well-being of the rest of the world, in social, economic, and commercial matters.

CHAPTER XII

INTERNATIONAL TRUSTEESHIP SYSTEM

ARTICLE 75

The United Nations shall establish under its authority an international trusteeship system for the administration and supervision of such territories as may be placed thereunder by subsequent individual agreements. These territories are hereinafter referred to as trust territories.

ARTICLE 76

The basic objectives of the trusteeship system, in accordance with the Purposes of the United Nations laid down in Article 1 of the present Charter, shall be:

- a. to further international peace and security;
- b. to promote the political, economic, social, and educational advancement of the inhabitants of the trust territories, and their progressive development towards self-government or independence as may be appropriate to the particular circumstances of each territory and its peoples and the freely expressed wishes of the peoples concerned, and as may be provided by the terms of each trusteeship agreement;
- c. to encourage respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language, or religion, and to encourage recognition of the interdependence of the peoples of the world; and
- d. to ensure equal treatment in social, economic, and commercial matters for all Members of the United Nations and their nationals, and also equal treatment for the latter in the administration of justice, without prejudice to the attainment of the foregoing objectives and subject to the provisions of Article 80.

ARTICLE 77

1. The trusteeship system shall apply to such territories in the following categories as may be placed thereunder by means of trusteeship agreements:

- a. territories now held under mandate;
- b. territories which may be detached from enemy states as a result of the Second World War; and
- c. territories voluntarily placed under the system by states responsible for their administration.

2. It will be a matter for subsequent agreement as to which territories in the foregoing categories will be brought under the trusteeship system and upon what terms.

ARTICLE 78

The trusteeship system shall not apply to territories which have become Members of the United Nations, relationship among which shall be based on respect for the principle of sovereign equality.

ARTICLE 79

The terms of trusteeship for each territory to be placed under the trusteeship system, including any alteration or amendment, shall be agreed upon by the states directly concerned, including the mandatory power in the case of territories held under mandate by a Member of the United Nations, and shall be approved as provided for in Articles 83 and 85.

ARTICLE 80

1. Except as may be agreed upon in individual trusteeship agreements, made under Articles 77, 79, and 81, placing each territory under the trusteeship system, and until such agreements have been concluded, nothing in this Chapter shall be construed in or of itself to alter in any manner the rights whatsoever of any states or any peoples or the terms of existing international instruments to which Members of the United Nations may respectively be parties.

2. Paragraph 1 of this Article shall not be interpreted as giving grounds for delay or postponement of the negotiation and conclusion of agreements for placing mandated and other territories under the trusteeship system as provided for in Article 77.

ARTICLE 81

The trusteeship agreement shall in each case include the terms under which the trust territory will be administered and designate the authority which will exercise the administration of the trust territory. Such authority, hereinafter called the administering authority, may be one or more states or the Organization itself.

ARTICLE 82

There may be designated, in any trusteeship agreement, a strategic area or areas which may include part or all of the trust territory to which the agreement applies, without prejudice to any special agreement or agreements made under Article 43.

ARTICLE 83

1. All functions of the United Nations relating to strategic areas, including the approval of the terms of the trusteeship agreements and of their alteration or amendment, shall be exercised by the Security Council.

2. The basic objectives set forth in Article 76 shall be applicable to the people of each strategic area.

3. The Security Council shall, subject to the provisions of the trusteeship agreements and without prejudice to security considerations, avail itself of the assistance of the Trusteeship Council to perform those functions of the United Nations under the trusteeship system relating to political, economic, social, and educational matters in the strategic areas.

ARTICLE 84

It shall be the duty of the administering authority to ensure that the trust territory shall play its part in the maintenance of international peace and security. To this end the administering authority may make use of volunteer forces, facilities, and assistance from the trust territory in carrying out the obligations towards the Security Council undertaken in this regard by the administering authority, as well as for local defense and the maintenance of law and order within the trust territory.

ARTICLE 85

1. The functions of the United Nations with regard to trusteeship agreements for all areas not designated as strategic, including the approval of the terms of the trusteeship agreements and of their alteration or amendment, shall be exercised by the General Assembly.

2. The Trusteeship Council, operating under the authority of the General Assembly, shall assist the General Assembly in carrying out these functions.

CHAPTER XIII

THE TRUSTEESHIP COUNCIL

Composition

ARTICLE 86

1. The Trusteeship Council shall consist of the following Members of the United Nations:

- a. those Members administering trust territories;
- b. such of those Members mentioned by name in Article 23 as are not administering trust territories; and
- c. as many other Members elected for three-year terms by the General Assembly as may be necessary to ensure that the total number of members of the Trusteeship Council is equally divided between those Members of the United Nations which administer trust territories and those which do not.

2. Each Member of the Trusteeship Council shall designate one specially qualified person to represent it therein.

Functions and Powers

ARTICLE 87

The General Assembly and, under its authority, the Trusteeship Council, in carrying out their functions, may:

- a. consider reports submitted by the administering authority;
- b. accept petitions and examine them in consultation with the administering authority;
- c. provide for periodic visits to the respective trust territories at times agreed upon with the administering authority; and
- d. take these and other actions in conformity with the terms of the trusteeship agreements.

ARTICLE 88

The Trusteeship Council shall formulate a questionnaire on the political, economic, social, and educational advancement of the inhabitants of each trust territory, and the administering authority for each trust territory within the competence of the General Assembly shall make an annual report to the General Assembly upon the basis of such questionnaire.

Voting

ARTICLE 89

1. Each Member of the Trusteeship Council shall have one vote.
2. Decisions of the Trusteeship Council shall be made by a majority of the Members present and voting.

Procedure

ARTICLE 90

1. The Trusteeship Council shall adopt its own rules of procedure, including the method of selecting its President.
2. The Trusteeship Council shall meet as required in accordance with its rules, which shall include provision for the convening of meetings on the request of a majority of its Members.

ARTICLE 91

The Trusteeship Council shall, when appropriate, avail itself of the assistance of the Economic and Social Council and of the specialized agencies in regard to matters with which they are respectively concerned.

CHAPTER XIV

THE INTERNATIONAL COURT OF JUSTICE

ARTICLE 92

The International Court of Justice shall be the principal judicial organ of the United Nations. It shall function in accordance with the annexed Statute, which is based upon the Statute of the Permanent Court of International Justice and forms an integral part of the present Charter.

ARTICLE 93

1. All Members of the United Nations are *ipso facto* parties to the Statute of the International Court of Justice.
2. A state which is not a Member of the United Nations may become a party to the Statute of the International Court of Justice on conditions to be determined in each case by the General Assembly upon the recommendation of the Security Council.

ARTICLE 94

1. Each Member of the United Nations undertakes to comply with the decision of the International Court of Justice in any case to which it is a party.

2. If any party to a case fails to perform the obligations incumbent upon it under a judgment rendered by the Court, the other party may have recourse to the Security Council, which may, if it deems necessary, make recommendations or decide upon measures to be taken to give effect to the judgment.

ARTICLE 95

Nothing in the present Charter shall prevent Members of the United Nations from entrusting the solution of their differences to other tribunals by virtue of agreements already in existence or which may be concluded in the future.

ARTICLE 96

1. The General Assembly or the Security Council may request the International Court of Justice to give an advisory opinion on any legal question.

2. Other organs of the United Nations and specialized agencies, which may at any time be so authorized by the General Assembly, may also request advisory opinions of the Court on legal questions arising within the scope of their activities.

CHAPTER XV

THE SECRETARIAT

ARTICLE 97

The Secretariat shall comprise a Secretary-General and such staff as the Organization may require. The Secretary-General shall be appointed by the General Assembly upon the recommendation of the Security Council. He shall be the chief administrative officer of the Organization.

ARTICLE 98

The Secretary-General shall act in that capacity in all meetings of the General Assembly, of the Security Council, of the Economic and Social Council, and of the Trusteeship Council, and shall perform such other

functions as are entrusted to him by these organs. The Secretary-General shall make an annual report to the General Assembly on the work of the Organization.

ARTICLE 99

The Secretary-General may bring to the attention of the Security Council any matter which in his opinion may threaten the maintenance of international peace and security.

ARTICLE 100

1. In the performance of their duties the Secretary-General and the staff shall not seek or receive instructions from any government or from any other authority external to the Organization. They shall refrain from any action which might reflect on their position as international officials responsible only to the Organization.

2. Each Member of the United Nations undertakes to respect the exclusively international character of the responsibilities of the Secretary-General and the staff and not to seek to influence them in the discharge of their responsibilities.

ARTICLE 101

1. The staff shall be appointed by the Secretary-General under regulations established by the General Assembly.

2. Appropriate staffs shall be permanently assigned to the Economic and Social Council, the Trusteeship Council, and, as required, to other organs of the United Nations. These staffs shall form a part of the Secretariat.

3. The paramount consideration in the employment of the staff and in the determination of the conditions of service shall be the necessity of securing the highest standards of efficiency, competence, and integrity. Due regard shall be paid to the importance of recruiting the staff on as wide a geographical basis as possible.

CHAPTER XVI

MISCELLANEOUS PROVISIONS

ARTICLE 102

1. Every treaty and every international agreement entered into by any Member of the United Nations after the present Charter comes into force

shall as soon as possible be registered with the Secretariat and published by it.

2. No party to any such treaty or international agreement which has not been registered in accordance with the provisions of paragraph 1 of this Article may invoke that treaty or agreement before any organ of the United Nations.

ARTICLE 103

In the event of a conflict between the obligations of the Members of the United Nations under the present Charter and their obligations under any other international agreement, their obligations under the present Charter shall prevail.

ARTICLE 104

The Organization shall enjoy in the territory of each of its Members such legal capacity as may be necessary for the exercise of its functions and the fulfillment of its purposes.

ARTICLE 105

1. The Organization shall enjoy in the territory of each of its Members such privileges and immunities as are necessary for the fulfillment of its purposes.

2. Representatives of the Members of the United Nations and officials of the Organization shall similarly enjoy such privileges and immunities as are necessary for the independent exercise of their functions in connection with the Organization.

3. The General Assembly may make recommendations with a view to determining the details of the application of paragraphs 1 and 2 of this Article or may propose conventions to the Members of the United Nations for this purpose.

CHAPTER XVII

TRANSITIONAL SECURITY ARRANGEMENTS

ARTICLE 106

Pending the coming into force of such special agreements referred to in Article 43 as in the opinion of the Security Council enable it to begin the exercise of its responsibilities under Article 42, the parties to the Four-Nation Declaration, signed at Moscow, October 30, 1943, and

France, shall, in accordance with the provisions of paragraph 5 of that Declaration, consult with one another and as occasion requires with other Members of the United Nations with a view to such joint action on behalf of the Organization as may be necessary for the purpose of maintaining international peace and security.

ARTICLE 107

Nothing in the present Charter shall invalidate or preclude action, in relation to any state which during the Second World War has been an enemy of any signatory to the present Charter, taken or authorized as a result of that war by the Governments having responsibility for such action.

CHAPTER XVIII

AMENDMENTS

ARTICLE 108

Amendments to the present Charter shall come into force for all Members of the United Nations when they have been adopted by a vote of two thirds of the Members of the General Assembly and ratified in accordance with their respective constitutional processes by two thirds of the Members of the United Nations, including all the permanent Members of the Security Council.

ARTICLE 109

1. A General Conference of the Members of the United Nations for the purpose of reviewing the present Charter may be held at a date and place to be fixed by a two-thirds vote of the Members of the General Assembly and by a vote of any seven Members of the Security Council. Each Member of the United Nations shall have one vote in the conference.

2. Any alteration of the present Charter recommended by a two-thirds vote of the conference shall take effect when ratified in accordance with their respective constitutional processes by two thirds of the Members of the United Nations including all the permanent Members of the Security Council.

3. If such a conference has not been held before the tenth annual session of the General Assembly following the coming into force of the present Charter, the proposal to call such a conference shall be placed on the agenda of that session of the General Assembly, and the confer-

ence shall be held if so decided by a majority vote of the Members of the General Assembly and by a vote of any seven Members of the Security Council.

CHAPTER XIX

RATIFICATION AND SIGNATURE

ARTICLE 110

1. The present Charter shall be ratified by the signatory states in accordance with their respective constitutional processes.

2. The ratifications shall be deposited with the Government of the United States of America, which shall notify all the signatory states of each deposit as well as the Secretary-General of the Organization when he has been appointed.

3. The present Charter shall come into force upon the deposit of ratifications by the Republic of China, France, the Union of Soviet Socialist Republics, the United Kingdom of Great Britain and Northern Ireland, and the United States of America, and by a majority of the other signatory states. A protocol of the ratifications deposited shall thereupon be drawn up by the Government of the United States of America which shall communicate copies thereof to all the signatory states.

4. The states signatory to the present Charter which ratify it after it has come into force will become original Members of the United Nations on the date of the deposit of their respective ratifications.

ARTICLE 111

The present Charter, of which the Chinese, French, Russian, English, and Spanish texts are equally authentic, shall remain deposited in the archives of the Government of the United States of America. Duly certified copies thereof shall be transmitted by that Government to the Governments of the other signatory states.

IN FAITH WHEREOF the representatives of the Governments of the United Nations have signed the present Charter.

DONE at the city of San Francisco the twenty-sixth day of June, one thousand nine hundred and forty-five.

Universal Declaration of Human Rights

1948

PREAMBLE

WHEREAS recognition of the inherent dignity and of the equal and inalienable rights of all members of the human family is the foundation of freedom, justice and peace in the world, and

WHEREAS disregard and contempt for human rights have resulted in barbarous acts which have outraged the conscience of mankind, and the advent of a world in which human beings shall enjoy freedom of speech and belief and freedom from fear and want has been proclaimed as the highest aspiration of the common people, and

WHEREAS it is essential, if man is not to be compelled to have recourse, as a last resort, to rebellion against tyranny and oppression that human rights should be protected by the rule of law, and

WHEREAS it is essential to promote the development of friendly relations between nations, and

WHEREAS the peoples of the United Nations have in the Charter reaffirmed their faith in fundamental human rights, in the dignity and worth of the human person and in the equal rights of men and women, and determined to promote social progress and better standards of life in larger freedom, and

WHEREAS the Member States have pledged themselves to achieve, in co-operation with the United Nations, the promotion of universal respect for and observance of human rights and fundamental freedoms, and

WHEREAS a common understanding of these rights and freedoms is of the greatest importance for the full realization of this pledge,

Now therefore,

THE GENERAL ASSEMBLY

PROCLAIMS this Declaration of Human Rights as a common standard

of achievement for all peoples and all nations, to the end that every individual and every organ of society, keeping this declaration constantly in mind, shall strive by teaching and education to promote respect for these rights and freedoms and by progressive measures, national and international, to secure their universal and effective recognition and observance, both among the peoples of member states themselves and among the peoples of territories under their jurisdiction.

ARTICLE 1. All human beings are born free and equal, in dignity and rights. They are endowed with reason and conscience, and should act towards one another in a spirit of brotherhood.

ARTICLE 2. Everyone is entitled to all the rights and freedoms set forth in this declaration, without distinction of any kind, such as race, color, sex, language, religion, political or other opinion, national or social origin, property, birth or other status.

Furthermore, no distinction shall be made on the basis of the political, jurisdictional or international status of the country or territory to which a person belongs, whether it be independent, Trust, Nonself-Governing or under any other limitation of sovereignty.

ARTICLE 3. Everyone has the right to life, liberty and security of person.

ARTICLE 4. No one shall be held in slavery or servitude; slavery and the slave trade shall be prohibited in all their forms.

ARTICLE 5. No one shall be subjected to torture or to cruel, inhuman or degrading treatment or punishment.

ARTICLE 6. Everyone has the right to recognition everywhere as a person before the law.

ARTICLE 7. All are equal before the law and are entitled without any discrimination to equal protection of the law. All are entitled to equal protection against any discrimination in violation of this Declaration and against any incitement to such discrimination.

ARTICLE 8. Everyone has the right to an effective remedy by the competent national tribunals for acts violating the fundamental rights granted him by the Constitution or by law.

ARTICLE 9. No one shall be subjected to arbitrary arrest, detention or exile.

ARTICLE 10. Everyone is entitled in full equality to a fair and public hearing by an independent and impartial tribunal, in the determination of his rights and obligations and of any criminal charge against him.

ARTICLE 11. 1. Everyone with a penal offense has the right to be presumed innocent until proved guilty according to law in a public trial at which he has had all the guarantees necessary for his defense.

2. No one shall be held guilty of any penal offense on account of any act or omission which did not constitute a penal offense, under national or international law, at the time when it was committed. Nor shall a heavier penalty be imposed than the one that was applicable at the time the penal offense was committed.

ARTICLE 12. No one shall be subjected to arbitrary interference with his privacy, family, home or correspondence, nor to attacks upon his honor and reputation. Everyone has the right to the protection of the law against such interference or attacks.

ARTICLE 13. 1. Everyone has the right to freedom of movement and residence within the borders of each state.

2. Everyone has the right to leave any country, including his own, and to return to his country.

ARTICLE 14. 1. Everyone has the right to seek and to enjoy in other countries asylum from persecution.

2. This right may not be invoked in the case of prosecutions genuinely arising from nonpolitical crimes or from acts contrary to the purposes and principles of the United Nations.

ARTICLE 15. 1. Everyone has the right to a nationality.

2. No one shall be arbitrarily deprived of his nationality nor denied the right to change his nationality.

ARTICLE 16. 1. Men and women of full age, without any limitation due to race, nationality or religion, have the right to marry and to found a family. They are entitled to equal rights as to marriage, during marriage and at its dissolution.

2. Marriage shall be entered into only with the free and full consent of the intending spouses.

3. The family is the natural and fundamental group unit of society and is entitled to protection by society and the State.

ARTICLE 17. 1. Everyone has the right to own property alone as well as in association with others.

2. No one shall be arbitrarily deprived of his property.

ARTICLE 18. Everyone has the right to freedom of thought, conscience and religion; this right includes freedom to change his religion or belief, and freedom, either alone or in community with others and in public or private, to manifest his religion or belief in teaching, practice, worship and observance.

ARTICLE 19. Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers.

ARTICLE 20. 1. Everyone has the right to freedom of peaceful assembly and association.

2. No one may be compelled to belong to an association.

ARTICLE 21. 1. Everyone has the right to take part in the Government of his country, directly or through freely chosen representatives.

2. Everyone has the right of equal access to public service in his country.

3. The will of the people shall be the basis of the authority of government; this will shall be expressed in periodic and genuine elections which shall be by universal and equal suffrage and shall be held by secret vote or by equivalent free voting procedures.

ARTICLE 22. Everyone, as a member of society, has the right to social security and is entitled to the realization, through national effort and international co-operation and in accordance with the organization and resources of each state, of the economic, social and cultural rights indispensable for his dignity and the free development of his personality.

ARTICLE 23. 1. Everyone has the right to work, to free choice of employment, to just and favorable conditions of work and to protection against unemployment.

2. Everyone, without any discrimination, has the right to equal pay for equal work.

3. Everyone who works has the right to just and favorable remuneration insuring for himself and his family an existence worthy of human dignity, and supplemented, if necessary, by other means of social protection.

4. Everyone has the right to form and to join trade unions for the protection of his interests.

ARTICLE 24. Everyone has the right to rest and leisure, including reasonable limitation of working hours and periodic holidays with pay.

ARTICLE 25. 1. Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age or other lack of livelihood in circumstances beyond his control.

2. Motherhood and childhood are entitled to special care and assistance. All children, whether born in or out of wedlock, shall enjoy the same social protection.

ARTICLE 26. 1. Everyone has the right to education. Education shall be free, at least in the elementary and fundamental stages. Elementary education shall be compulsory. Technical and professional education

shall be made generally available, and higher education shall be equally accessible to all on the basis of merit.

2. Education shall be directed to the full development of the human personality and to the strengthening of respect for human rights and fundamental freedoms. It shall promote understanding, tolerance and friendship among all nations, racial or religious groups, and shall further the activities of the United Nations for the maintenance of peace.

3. Parents have a prior right to choose the kind of education that shall be given to their children.

ARTICLE 27. 1. Everyone has the right freely to participate in the cultural life of the community, to enjoy the arts and to share in scientific advancement and its benefits.

2. Everyone has the right to the protection of the moral and material interests resulting from any scientific, literary or artistic production of which he is the author.

ARTICLE 28. Everyone is entitled to a social and international order in which the rights and freedoms set forth in this declaration can be fully realized.

ARTICLE 29. 1. Everyone has duties to the community in which alone the free and full development of his personality is possible.

2. In the exercise of his rights and freedoms, everyone shall be subject only to such limitations as are determined by law solely for the purpose of securing due recognition and respect for the rights and freedoms of others and of meeting the just requirements of morality, public order and the general welfare in a democratic society.

3. These rights and freedoms may in no case be exercised contrary to the purposes and principles of the United Nations.

ARTICLE 30. Nothing in this declaration may be interpreted as implying for any state, group or person, any right to engage in any activity or to perform any act aimed at the destruction of any of the rights and freedoms set forth herein.

Thomas Paine

1737–1809

Thomas Paine was born in Norfolk, England, where his father was a Quaker corset maker. Working hard as a sailor, teacher, and exciseman until 1762, and then as a government customs official, he developed a hearty and lasting sympathy with the poor. In 1774 Benjamin Franklin, then in London, persuaded him to migrate to America, and gave him letters of introduction to influential men. On his arrival, he became the editor of the *Pennsylvania Magazine*. In January of 1776, he wrote a pamphlet called *Common Sense*, which, as George Washington said, “worked a powerful change in the minds of many men.” By July the ground had been prepared for the signing of The Declaration of Independence.

During the Revolutionary War, Paine was a volunteer aide-de-camp to General Greene, and at this time wrote the first of a series of articles which were later published as *The Crisis*. This, too, had an enormous effect on American opinion. In recognition of his services Paine was granted an estate in New Rochelle, New York, Congress voted him gifts of money, and he was offered various government positions.

In 1787 Paine sailed for England to exhibit one of his inventions—a pierless iron bridge. He soon fell to writing his *The Rights of Man*, which was an answer to Edmund Burke’s famous *Reflections on the Revolution in France*. When Paine’s book appeared it created so great a stir that the British government did its best to suppress it. In 1792 Paine was indicted for treason, but luckily escaped to France before the trial. He was made a member of the French Revolutionary Convention, but he antagonized Robespierre by opposing the execution of Louis XVI, and was imprisoned. After Robespierre’s death, Paine was released and reinstated in the Convention. His *Age of*

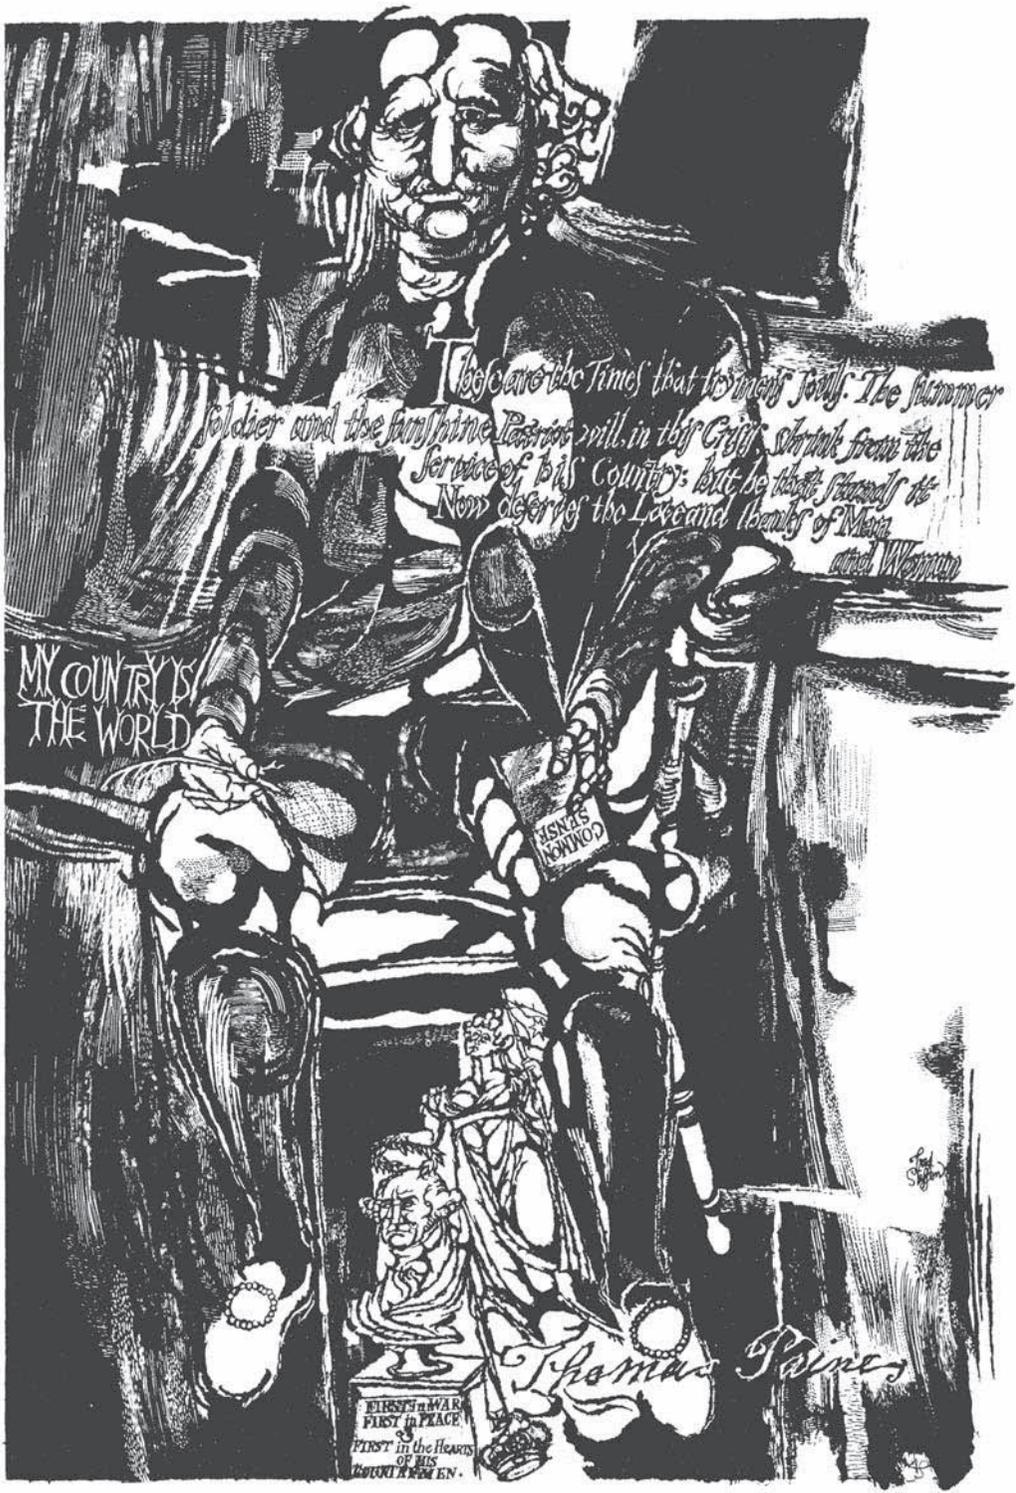

Reason, the first part of which appeared in 1794, infuriated conservatives everywhere. But Jefferson took care that it was circulated in the United States and, announcing that its principles were his own, was elected President in 1800. An acrimonious letter to George Washington, however, made Paine many enemies. When he returned to America in 1802 he was coldly received, and lived on his New York estate in obscurity until his death in 1809.

The first issue of *The Crisis* is written with fire and logical precision. “These are the times that try men’s souls,” Paine begins. “The summer soldier and the sunshine patriot will, in this crisis, shrink from the service of his country.” But he who stands firm will deserve the gratitude of all. As he wrote, the seasoned British armies were advancing, and the untrained patriots had suffered cruel reverses. The colonies were not giving united support to the defending troops. Thousands of Tories were lending open or secret aid to the British, and spreading rumors which weakened morale and disrupted military operations.

The time had passed when such men could be blandly tolerated. Every Tory, Paine declared, “is a coward, for a servile, slavish, self-interested fear is the foundation of Toryism.” He denounces those who are hostile, fearful, or lukewarm to the American cause, but he never ceases to reason with them. Would they not fight off a robber who broke into their house? Is it any different when a “stupid, stubborn, worthless, brutish” king seeks to bend them to his absolute will? And can they expect mercy from a man who has refused to do justice? Are they not like the Tory innkeeper who prefers to see peace in *his* day, than live to see it in his child’s day?

What should we think, Paine asks, of a colony that came to terms with the Indians, and left other colonies exposed to massacre? Is the case any different when the Hessians and British are the invaders? A colony that surrenders to the British will fare worse than the rest.

Notes from the artist: “Paine in his old age, tired and disillusioned, executed in a manner derivative from old woodcuts and steel engravings. Below is Liberty, stepping upon the crown of England to place the wreath of victory upon the head of Washington.”

The same the Times that tis men's Jolly. The plummer
Soldier and the sunshine Patriot will, in thy Crisis, shrink from the
Service of his Country: but he that stands it
Now deserves the Love and Thanks of Men
and Women

MY COUNTRY IS
THE WORLD

MANK'S
HOWDO

FIRST in WAR
FIRST in PEACE
&
FIRST in the HEARTS
OF HIS
COUNTRYMEN.

Thomas Paine

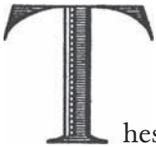

His arguments multiply. But there is a limit to tolerance. The Tories who will not listen to reason must be driven from the country. And this, as we know, is what happened to many. Far more were persuaded by Paine's appeal to stand by their fighting countrymen.

Paine was universally acclaimed for his wartime pamphlets. His later writings are more controversial, and raised up legions of enemies both in England and in America. Did the fault lie in his character—his truculence? He was clearly not a diplomat like Franklin, nor a conservative like Hamilton. It is hard to see how he could have strenuously campaigned for republicanism, toleration, freedom of speech, and equal rights for all men without incurring the wrath of many important people. Enemies are often proof of a man's sincerity and striking force. The graduated income tax and other tax reforms favoring the poor which Paine advocated, though long since adopted in the United States, were far ahead of his time. Prime Minister Pitt agreed privately that Paine was right, but was quoted as saying: "If I were to encourage Tom Paine's opinions, we should have a bloody revolution." He had Paine indicted for treason.

Paine, like his friend Jefferson, went further than his contemporaries in espousing democracy. Edmund Burke, though he had defended the American Revolution, could not abide the French Revolution. In his *Reflections*, he carried his opposition to the impious doings of the French so far that it became a denial of the democratic principle itself. The people of England, "utterly disclaim the right to choose their own governors," he wrote, and "they will resist the practical assertion of it with their lives and fortunes."

Paine writes in *The Rights of Man*: "That men should take up arms and spend their lives and fortunes, *not* to maintain their rights, but to maintain that they have *not* rights" is, he says, very queer indeed. Perhaps, then, Paine made enemies because he was too advanced and consistent a democrat. Could it be also that he was *needlessly* shocking and provocative; or were the shock and provocation needed?

A Call to Patriots— December 23, 1776 from *The Crisis*

These are the times that try men's souls. The summer soldier and the sunshine patriot will, in this crisis, shrink from the service of his country; but he that stands it now deserves the love and thanks of man and woman. Tyranny, like hell, is not easily conquered; yet we have this consolation with us, that the harder the conflict, the more glorious the triumph. What we obtain too cheap, we esteem too lightly: 'Tis dearness only that gives everything its value. Heaven knows how to put a proper price upon its goods; and it would be strange, indeed, if so celestial an article as freedom should not be highly rated. Britain, with an army to enforce her tyranny, has declared that she has a right (not only to tax) but "to bind us in all cases whatsoever," and if being bound in that manner is not slavery, then is there not such a thing as slavery upon earth. Even the expression is impious, for so unlimited a power can belong only to God.

Whether the independence of the continent was declared too soon, or delayed too long, I will not now enter into as an argument; my own simple opinion is that had it been eight months earlier it would have been much better. We did not make a proper use of last winter, neither could we while we were in a dependent state. However, the fault, if it were one, was all our own; we have none to blame but ourselves. But no great deal is lost yet; all that Howe has been doing for this month past is rather a ravage than a conquest, which the spirit of the Jerseys a year ago would have quickly repulsed, and which time and a little resolution will soon recover.

I have as little superstition in me as any man living, but my secret opinion has ever been, and still is, that God Almighty will not give up a peo-

ple to military destruction, or leave them unsupportedly to perish, who had so earnestly and so repeatedly sought to avoid the calamities of war by every decent method which wisdom could invent. Neither have I so much of the infidel in me as to suppose that He has relinquished the government of the world, and given us up to the care of devils; and as I do not, I cannot see on what grounds the king of Britain can look up to heaven for help against us: A common murderer, a highwayman, or a housebreaker has as good a pretense as he.

'Tis surprising to see how rapidly a panic will sometimes run through a country. All nations and ages have been subject to them: Britain has trembled like an ague at the report of a French fleet of flat-bottomed boats; and in the fourteenth century the whole English army, after ravaging the kingdom of France, was driven back like men petrified with fear; and this brave exploit was performed by a few broken forces collected and headed by a woman, Joan of Arc. Would that heaven might inspire some Jersey maid to spirit up her countrymen, and save her fair fellow sufferers from ravage and ravishment! Yet panics, in some cases, have their uses; they produce as much good as hurt. Their duration is always short; the mind soon grows through them, and acquires a firmer habit than before. But their peculiar advantage is that they are the touchstones of sincerity and hypocrisy, and bring things and men to light which might otherwise have lain forever undiscovered. In fact, they have the same effect on secret traitors which an imaginary apparition would have upon a private murderer. They sift out the hidden thoughts of man, and hold them up in public to the world. Many a disguised Tory has lately shown his head, that shall penitentially solemnize with curses the day on which Howe arrived upon the Delaware.

As I was with the troops at Fort Lee, and marched with them to the edge of Pennsylvania, I am well acquainted with many circumstances which those who lived at a distance know but little or nothing of. Our situation there was exceedingly cramped, the place being on a narrow neck of land between the North River and the Hackensack. Our force was inconsiderable, being not one-fourth so great as Howe could bring against us. We had no army at hand to have relieved the garrison had we shut ourselves up and stood on the defense. Our ammunition, light artillery, and the best part of our stores had been removed upon the apprehension that Howe would endeavor to penetrate the Jerseys, in which case Fort Lee could be of no use to us; for it must occur to every thinking man, whether in the army or not, that these kind of field forts are only for temporary purposes, and last in use no longer than the enemy directs

his force against the particular object, which such forts are raised to defend. Such was our situation and condition at Fort Lee on the morning of the 20th of November, when an officer arrived with information that the enemy with 200 boats had landed about seven or eight miles above. Major General Greene, who commanded the garrison, immediately ordered them under arms, and sent express to his Excellency General Washington at the town of Hackensack, distant by the way of the ferry six miles. Our first object was to secure the bridge over the Hackensack, which laid up the river between the enemy and us, about six miles from us, and three from them. General Washington arrived in about three-quarters of an hour, and marched at the head of the troops towards the bridge, which place I expected we should have a brush for; however they did not choose to dispute it with us, and the greatest part of our troops went over the bridge, the rest over the ferry, except some which passed at a mill on a small creek, between the bridge and the ferry, and made their way through some marshy grounds up to the town of Hackensack, and there passed the river. We brought off as much baggage as the wagons could contain; the rest was lost. The simple object was to bring off the garrison, and to march them on till they could be strengthened by the Jersey or Pennsylvania militia, so as to be enabled to make a stand. We stayed four days at Newark, collected in our outposts with some of the Jersey militia, and marched out twice to meet the enemy on information of their being advancing, though our numbers were greatly inferior to theirs. Howe, in my little opinion, committed a great error in generalship in not throwing a body of forces off from Staten Island through Amboy, by which means he might have seized all our stores at Brunswick, and intercepted our march into Pennsylvania: But if we believe the power of hell to be limited, we must likewise believe that their agents are under some providential control.

I shall not now attempt to give all the particulars of our retreat to the Delaware; suffice it for the present to say that both officers and men, though greatly harassed and fatigued, frequently without rest, covering, or provision, the inevitable consequences of a long retreat, bore it with a manly and a martial spirit. All their wishes were one, which was that the country would turn out and help them to drive the enemy back. Voltaire has remarked that King William never appeared to full advantage but in difficulties and in action; the same remark may be made on General Washington, for the character fits him. There is a natural firmness in some minds which cannot be unlocked by trifles, but which, when unlocked, discovers a cabinet of fortitude; and I reckon it among those kind of pub-

lic blessings, which we do not immediately see, that God hath blest him with uninterrupted health, and given him a mind that can even flourish upon care.

I shall conclude this paper with some miscellaneous remarks on the state of our affairs; and shall begin with asking the following question: Why is it that the enemy have left the New England provinces, and made these middle ones the seat of war? The answer is easy: New England is not infested with Tories, and we are. I have been tender in raising the cry against these men, and used numberless arguments to show them their danger, but it will not do to sacrifice a world to either their folly or their baseness. The period is now arrived in which either they or we must change our sentiments, or one or both must fall. And what is a Tory? Good God! what is he? I should not be afraid to go with a hundred Whigs against a thousand Tories were they to attempt to get into arms. Every Tory is a coward, for a servile, slavish, self-interested fear is the foundation of Toryism; and a man under such influence, though he may be cruel, never can be brave.

But, before the line of irrecoverable separation be drawn between us, let us reason the matter together: Your conduct is an invitation to the enemy, yet not one in a thousand of you has heart enough to join him. Howe is as much deceived by you as the American cause is injured by you. He expects you will all take up arms, and flock to his standard with muskets on your shoulders. Your opinions are of no use to him unless you support him personally, for 'tis soldiers, and not Tories, that he wants.

I once felt all that kind of anger which a man ought to feel against the mean principles that are held by the Tories: A noted one, who kept a tavern at Amboy, was standing at his door, with as pretty a child in his hand, about eight or nine years old, as most I ever saw, and after speaking his mind as freely as he thought was prudent, finished with this unfatherly expression, "Well! give me peace in my day." Not a man lives on the continent but fully believes that a separation must some time or other finally take place, and a generous parent should have said, "If there must be trouble, let it be in my day that my child may have peace"; and this single reflection, well applied, is sufficient to awaken every man to duty. Not a place upon earth might be so happy as America. Her situation is remote from all the wrangling world, and she has nothing to do but to trade with them. A man may easily distinguish in himself between temper and principle, and I am as confident as I am that God governs the world that America will never be happy till she gets clear of foreign dominion. Wars, without ceasing, will break out till that period arrives,

and the continent must in the end be conqueror; for though the flame of liberty may sometimes cease to shine, the coal never can expire.

America did not, nor does not, want force; but she wanted a proper application of that force. Wisdom is not the purchase of a day, and it is no wonder that we should err at first setting off. From an excess of tenderness, we were unwilling to raise an army, and trusted our cause to the temporary defense of a well-meaning militia. A summer's experience has now taught us better; yet with those troops, while they were collected, we were able to set bounds to the progress of the enemy, and, thank God! they are again assembling. I always considered a militia as the best troops in the world for a sudden exertion, but they will not do for a long campaign. Howe, it is probable, will make an attempt on this city; should he fail on this side the Delaware, he is ruined; if he succeeds, our cause is not ruined. He stakes all on his side against a part on ours; admitting he succeeds, the consequence will be that armies from both ends of the continent will march to assist their suffering friends in the middle states; for he cannot go everywhere, it is impossible. I consider Howe as the greatest enemy the Tories have; he is bringing a war into their country, which, had it not been for him and partly for themselves, they had been clear of. Should he now be expelled, I wish with all the devotion of a Christian that the names of Whig and Tory may never more be mentioned; but should the Tories give him encouragement to come, or assistance if he come, I as sincerely wish that our next year's arms may expel them from the continent, and the Congress appropriate their possessions to the relief of those who have suffered in well-doing. A single successful battle next year will settle the whole. America could carry on a two-years war by the confiscation of the property of disaffected persons, and be made happy by their expulsion. Say not that this is revenge; call it rather the soft resentment of a suffering people who, having no object in view but the good of all, have staked their own all upon a seemingly doubtful event. Yet it is folly to argue against determined hardness; eloquence may strike the ear, and the language of sorrow draw forth the tear of compassion, but nothing can reach the heart that is steeled with prejudice.

Quitting this class of men, I turn with the warm ardor of a friend to those who have nobly stood, and are yet determined to stand, the matter out: I call not upon a few, but upon all; not on this state or that state, but on every state; up and help us; lay your shoulders to the wheel; better have too much force than too little, when so great an object is at stake. Let it be told to the future world that in the depth of winter, when noth-

ing but hope and virtue could survive, that the city and the country, alarmed at one common danger, came forth to meet and to repulse it. Say not that thousands are gone, turn out your tens of thousands; throw not the burden of the day upon Providence but “show your faith by your works” that God may bless you. It matters not where you live, or what rank of life you hold, the evil or the blessing will reach you all. The far and the near, the home counties and the back, the rich and the poor will suffer or rejoice alike. The heart that feels not now is dead. The blood of his children will curse his cowardice who shrinks back at a time when a little might have saved the whole, and made them happy. I love the man that can smile in trouble, that can gather strength from distress, and grow brave by reflection. ’Tis the business of little minds to shrink; but he whose heart is firm, and whose conscience approves his conduct, will pursue his principles unto death. My own line of reasoning is to myself as straight and clear as a ray of light. Not all the treasures of the world, so far as I believe, could have induced me to support an offensive war, for I think it murder; but if a thief break into my house, burn and destroy my property, and kill or threaten to kill me, or those that are in it, and to “bind me in all cases whatsoever” to his absolute will, am I to suffer it? What signifies it to me whether he who does it is a king or a common man; my countryman or not my countryman; whether it is done by an individual villain or an army of them? If we reason to the root of things, we shall find no difference; neither can any just cause be assigned why we should punish in the one case and pardon in the other. Let them call me rebel, and welcome, I feel no concern from it; but I should suffer the misery of devils were I to make a whore of my soul by swearing allegiance to one whose character is that of a sottish, stupid, stubborn, worthless, brutish man. I conceive likewise a horrid idea in receiving mercy from a being who at the last day shall be shrieking to the rocks and mountains to cover him, and fleeing with terror from the orphan, the widow, and the slain of America.

There are cases which cannot be overdone by language, and this is one. There are persons too who see not the full extent of the evil which threatens them; they solace themselves with hopes that the enemy, if they succeed, will be merciful. It is the madness of folly to expect mercy from those who have refused to do justice; and even mercy where conquest is the object is only a trick of war: The cunning of the fox is as murderous as the violence of the wolf; and we ought to guard equally against both. Howe’s first object is partly by threats and partly by promise to terrify or

seduce the people to deliver up their arms, and receive mercy. The ministry recommended the same plan to Gage, and this is what the Tories call making their peace; “a peace which passeth all understanding” indeed! A peace which would be the immediate forerunner of a worse ruin than any we have yet thought of. Ye men of Pennsylvania, do reason upon these things! Were the back counties to give up their arms, they would fall an easy prey to the Indians, who are all alarmed. This perhaps is what some Tories would not be sorry for. Were the home counties to deliver up their arms, they would be exposed to the resentment of the back counties, who would then have it in their power to chastise their defection at pleasure. And were any one state to give up its arms, that state must be garrisoned by all Howe’s army of Britons and Hessians to preserve it from the anger of the rest. Mutual fear is a principal link in the chain of mutual love, and woe be to that state that breaks the compact. Howe is mercifully inviting you to barbarous destruction, and men must be either rogues or fools that will not see it. I dwell not upon the powers of imagination; I bring reason to your ears; and in language as plain as A, B, C, hold up truth to your eyes.

I thank God that I fear not. I see no real cause for fear. I know our situation well, and can see the way out of it. While our army was collected, Howe dared not risk a battle, and it is no credit to him that he decamped from the White Plains, and waited a mean opportunity to ravage the defenseless Jerseys; but it is great credit to us that, with a handful of men, we sustained an orderly retreat for near a hundred miles, brought off our ammunition, all our fieldpieces, the greatest part of our stores, and had four rivers to pass. None can say that our retreat was precipitate, for we were near three weeks in performing it, that the country might have time to come in. Twice we marched back to meet the enemy and remained out till dark. The sign of fear was not seen in our camp, and had not some of the cowardly and disaffected inhabitants spread false alarms through the country, the Jerseys had never been ravaged. Once more we are again collected and collecting; our new army at both ends of the continent is recruiting fast, and we shall be able to open the next campaign with sixty thousand men, well armed and clothed. This is our situation, and who will may know it. By perseverance and fortitude we have the prospect of a glorious issue; by cowardice and submission, the sad choice of a variety of evils—a ravaged country—a depopulated city—habitations without safety, and slavery without hope—our homes turned into barracks and bawdy houses for Hessians, and a future race to provide

for whose fathers we shall doubt of. Look on this picture and weep over it! And if there yet remains one thoughtless wretch who believes it not, let him suffer it unlamented.

The foregoing is Number 1
of THE CRISIS PAPERS.

George Washington

1732–1799

George Washington, the undisputed “father of his country,” was born on February 22 (New Style; Feb. 11, Old Style), 1732, in Westmoreland County, Virginia. The son of a large Virginia landowner who died when George was only eleven, he spent most of his youth at the Mount Vernon estate with his beloved half brother Lawrence, who was many years his senior. Although he got little schooling, he taught himself some mathematics, and at the age of fifteen had begun his career as a surveyor. This, of course, was not to be his main profession. Notwithstanding his reported distaste for deception and fighting, he was soon drawn into military operations against the French on the Ohio frontier. In 1755 he was an aid to General Braddock in his disastrous campaign against Fort Duquesne, and was then, at the age of twenty-three, made commander of all the Virginia forces.

At the death of his half brother, Washington inherited the plantation at Mount Vernon. Shortly thereafter he married a wealthy widow, Martha Dandridge Custis, who brought him 15,000 acres and 150 slaves. Washington was now a gentleman farmer and a very wealthy man. He took a great interest in farming and experimental agriculture, and became a member of the Virginia House of Burgesses. As a leader of the opposition to British colonial policy in Virginia, he served as a delegate to the Continental Congress in 1774–75, which was organizing the defense of the colonies. In 1775 he was made Commander in Chief of the Continental Army.

Washington’s task was to lead the poorly trained and poorly paid Continental troops to a decisive victory over the seasoned British armies, led by top-notch officers. He himself had no experience in large-scale military operations. Money and supplies of all sorts were

grievously short. Most of the thirteen states, newly declared independent, were organizing their governments. There were many conflicts among them and they were weakened within by British sympathizers. The Continental Congress was without force or authority. Yet, as we all know, the war was won after five bitter years. The British surrendered at Yorktown in 1781.

Washington retired in 1783 after dismissing the army, but he was not able to remain a private citizen for long. The thirteen states were torn with dissension, and there was an imperative need for “a more perfect union” if the new nation was to endure and expand westward. Eventually, in 1787, the Constitutional Convention was called. All the great prestige of Washington was necessary to secure the adoption of the new United States Constitution, which greatly restricted the powers of the independent states. There was no question who would be chosen as the first President of the United States, nor could anyone but Washington have done so much, in the first few years, to stabilize the government and unify the country. After eight years in office, he retired gratefully in 1797, and lived his last two years peacefully on his Mount Vernon estate.

First in war, first in peace, and first in the hearts of his countrymen” is almost too good to be true, and yet it is true, in large measure, of Washington. It does not mean that he was always unanimously approved. We remember that in 1777 the war, under his leadership, had gone so disastrously that high officers and members of the Congress tried to have him removed from the command. Sectionalism also played a part in this serious intrigue, which, however, Washington successfully countered. The winter in Valley Forge, however, was one of appalling misery for the battered and freezing army. Washington felt great sympathy for the troops, but he never lost heart; his courage was an example to all. In the spring new strength came, and the war took a brighter turn. It is this unwavering forti-

Notes from the artist: “. . . an equestrian portrait of Washington done in a style to suggest the quaint illustrations of his age. The background is the famous cherry tree, and the quotation is from the Rules of Civility, a set of moral precepts that Washington transcribed in a copybook when he was fourteen years old.”

Labour to keep alive in your breast that little spark of celestial
fire, called
conscience.

G. Washington

tude and greatness with which he met every crisis that outweigh his shortcomings, and keep his image enshrined in our memory.

Washington's letter to the governors of all the states in 1783 grappled with the big problems of that time. After the five terrible years of war, there was a natural craving for ease and comfort, and a tendency also to return to the old conflicts that divided sections of the country, states, classes, individuals. Washington pleads for fraternal unity. He argues that "it is indispensable to the happiness of the individual states that there should be lodged somewhere a supreme power to regulate and govern the general concerns of the confederated republic, without which the Union cannot be of long duration."

The obligations contracted during the war must be honorably discharged, and the ignominy of national bankruptcy averted. It would be a shameful thing if the soldiers who have won the war should now, deprived of their promised pay, be obliged to beg for food from door to door. "It therefore is more than a common debt, it is a debt of honor; it can never be considered as a pension or gratuity."

The Farewell Address, thirteen years later, touches on some of the same themes, but also on new ones. Washington has been President now for two terms, and has refused to consider a third. In his first administration he had struck a balance between the conservative Federalists and the liberal Republicans, making Hamilton Secretary of the Treasury and Jefferson Secretary of State. But in his second administration he had swung to the Federalists' side, and had been roundly censured by the Republicans.

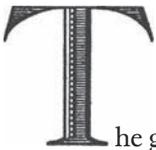

Now he appeals again for national unity and solidarity. Bear in mind the common bonds of brotherhood, he counsels. "With slight shades of difference, you have the same religion, manners, habits, and political principles. You have in a common cause fought and triumphed together." Independence and liberty have been won by collective efforts and are collective blessings.

He warns again against the dangers of sectionalism, and insists that strong government, with properly balanced powers, provides the only guarantee, in a large country, of the continued enjoyment of liberty.

What is most novel and controversial in the *Address* is the warning against entangling alliances. Existing treaties should be honored in full, Washington says, but "it is unnecessary and would be unwise to extend them. . . . There can be no greater error than to expect . . . real favors from nation to nation."

Should we take this dictum of Washington's to apply to all nations or only to small or weak ones? The United States of 1796 could not have entered an equal alliance with a strong power. A wide ocean favored its independence on one side, and the vast territory on the other side aroused just fears of foreign penetration. But the strength and circumstances of other countries are very different. Are the nations who choose neutrality today strong or weak? Finally, can a policy which seemed wise in those days be maintained inflexibly in our contemporary world?

Circular Letter
to the Governors of All the States
on Disbanding the Army

he great object, for which I had the honor to hold an appointment in the service of my country, being accomplished, I am now preparing to resign it into the hands of Congress, and to return to that domestic retirement which, it is well known, I left with the greatest reluctance; a retirement for which I have never ceased to sigh, through a long and painful absence, and in which (remote from the noise and trouble of the world) I meditate to pass the remainder of my life, in a state of undisturbed repose. But before I carry this resolution into effect, I think it a duty incumbent on me to make this my last official communication; to congratulate you on the glorious events which Heaven has been pleased to produce in our favor; to offer my sentiments respecting some important subjects which appear to me to be intimately connected with the tranquillity of the United States; to take my leave of your Excellency as a public character; and to give my final blessing to that country in whose service I have spent the prime of my life, for whose sake I have consumed so many anxious days and watchful nights, and whose happiness, being extremely dear to me, will always constitute no inconsiderable part of my own.

Impressed with the liveliest sensibility on this pleasing occasion, I will claim the indulgence of dilating the more copiously on the subjects of our mutual felicitation. When we consider the magnitude of the prize we contended for, the doubtful nature of the contest, and the favorable manner in which it has terminated, we shall find the greatest possible reason for gratitude and rejoicing. This is a theme that will afford infinite delight to every benevolent and liberal mind, whether the event in contemplation be considered as the source of present enjoyment, or the

parent of future happiness; and we shall have equal occasion to felicitate ourselves on the lot which Providence has assigned us, whether we view it in a natural, a political, or moral point of light.

The citizens of America, placed in the most enviable condition, as the sole lords and proprietors of a vast tract of continent, comprehending all the various soils and climates of the world, and abounding with all the necessaries and conveniences of life, are now, by the late satisfactory pacification, acknowledged to be possessed of absolute freedom and independency. They are, from this period, to be considered as the actors on a most conspicuous theater, which seems to be peculiarly designated by Providence for the display of human greatness and felicity. Here they are not only surrounded with everything which can contribute to the completion of private and domestic enjoyment, but Heaven has crowned all its other blessings by giving a fairer opportunity for political happiness than any other nation has ever been favored with. Nothing can illustrate these observations more forcibly than a recollection of the happy conjuncture of times and circumstances under which our republic assumed its rank among the nations. The foundation of our empire was not laid in the gloomy age of ignorance and superstition, but at an epoch when the rights of mankind were better understood and more clearly defined than at any former period. The researches of the human mind after social happiness have been carried to a great extent; the treasures of knowledge, acquired by the labors of philosophers, sages, and legislators through a long succession of years, are laid open for our use, and their collected wisdom may be happily applied in the establishment of our forms of government. The free cultivation of letters, the unbounded extension of commerce, the progressive refinement of manners, the growing liberality of sentiment, and, above all, the pure and benign light of revelation have had a meliorating influence on mankind and increased the blessings of society. At this auspicious period, the United States came into existence as a nation; and, if their citizens should not be completely free and happy, the fault will be entirely their own.

Such is our situation, and such are our prospects; but notwithstanding the cup of blessing is thus reached out to us; notwithstanding happiness is ours, if we have a disposition to seize the occasion and make it our own; yet it appears to me there is an option still left to the United States of America, that it is in their choice, and depends upon their conduct, whether they will be respectable and prosperous, or contemptible and miserable, as a nation. This is the time of their political probation; this is the moment when the eyes of the whole world are turned upon them;

this is the moment to establish or ruin their national character forever; this is the favorable moment to give such a tone to our federal government as will enable it to answer the ends of its institution, or this may be the ill-fated moment for relaxing the powers of the Union, annihilating the cement of the confederation, and exposing us to become the sport of European politics, which may play one state against another, to prevent their growing importance, and to serve their own interested purposes. For, according to the system of policy the states shall adopt at this moment, they will stand or fall; and by their confirmation or lapse it is yet to be decided whether the Revolution must ultimately be considered as a blessing or a curse; a blessing or a curse not to the present age alone, for with our fate will the destiny of unborn millions be involved.

With this conviction of the importance of the present crisis, silence in me would be a crime. I will therefore speak to your Excellency the language of freedom and of sincerity without disguise. I am aware, however, that those who differ from me in political sentiment may perhaps remark I am stepping out of the proper line of my duty, and may possibly ascribe to arrogance or ostentation what I know is alone the result of the purest intention. But the rectitude of my own heart, which disdains such unworthy motives; the part I have hitherto acted in life; the determination I have formed of not taking any share in public business hereafter; the ardent desire I feel, and shall continue to manifest, of quietly enjoying in private life, after all the toils of war, the benefits of a wise and liberal government will, I flatter myself, sooner or later convince my countrymen that I could have no sinister views in delivering, with so little reserve, the opinions contained in this address.

There are four things which, I humbly conceive, are essential to the well-being, I may even venture to say to the existence, of the United States as an independent power.

First. An indissoluble union of the states under one federal head.

Secondly. A sacred regard to public justice.

Thirdly. The adoption of a proper peace establishment; and,

Fourthly. The prevalence of that pacific and friendly disposition among the people of the United States which will induce them to forget their local prejudices and policies; to make those mutual concessions which are requisite to the general prosperity; and, in some instances, to sacrifice their individual advantages to the interest of the community.

These are the pillars on which the glorious fabric of our independency and national character must be supported. Liberty is the basis; and

whoever would dare to sap the foundation, or overturn the structure, under whatever specious pretext he may attempt it, will merit the bitterest execration, and the severest punishment, which can be inflicted by his injured country.

On the three first articles I will make a few observations, leaving the last to the good sense and serious consideration of those immediately concerned.

Under the first head, although it may not be necessary or proper for me, in this place, to enter into a particular disquisition on the principles of the Union, and to take up the great question which has been frequently agitated, whether it be expedient and requisite for the states to delegate a larger proportion of power to Congress, or not, yet it will be a part of my duty, and that of every true patriot, to assert without reserve, and to insist upon, the following positions: That, unless the states will suffer Congress to exercise those prerogatives they are undoubtedly invested with by the constitution, everything must very rapidly tend to anarchy and confusion. That it is indispensable to the happiness of the individual states that there should be lodged somewhere a supreme power to regulate and govern the general concerns of the confederated republic, without which the Union cannot be of long duration. That there must be a faithful and pointed compliance, on the part of every state, with the late proposals and demands of Congress, or the most fatal consequences will ensue. That whatever measures have a tendency to dissolve the Union, or contribute to violate or lessen the sovereign authority, ought to be considered as hostile to the liberty and independency of America, and the authors of them treated accordingly. And lastly, that unless we can be enabled, by the concurrence of the states, to participate of the fruits of the Revolution, and enjoy the essential benefits of civil society, under a form of government so free and uncorrupted, so happily guarded against the danger of oppression, as has been devised and adopted by the Articles of Confederation, it will be a subject of regret that so much blood and treasure have been lavished for no purpose, that so many sufferings have been encountered without a compensation, and that so many sacrifices have been made in vain.

Many other considerations might here be adduced to prove that, without an entire conformity to the spirit of the Union, we cannot exist as an independent power. It will be sufficient for my purpose to mention but one or two which seem to me of the greatest importance. It is only in our united character, as an empire, that our independence is acknowledged, that our power can be regarded, or our credit supported, among

foreign nations. The treaties of the European powers with the United States of America will have no validity on a dissolution of the Union. We shall be left nearly in a state of nature; or we may find, by our own unhappy experience, that there is a natural and necessary progression from the extreme of anarchy to the extreme of tyranny, and that arbitrary power is most easily established on the ruins of liberty abused to licentiousness.

As to the second article, which respects the performance of public justice, Congress have, in their late address to the United States, almost exhausted the subject; they have explained their ideas so fully, and have enforced the obligations the states are under to render complete justice to all the public creditors, with so much dignity and energy that, in my opinion, no real friend to the honor or independency of America can hesitate a single moment, respecting the propriety of complying with the just and honorable measures proposed. If their arguments do not produce conviction, I know of nothing that will have greater influence, especially when we recollect that the system referred to, being the result of the collected wisdom of the continent, must be esteemed, if not perfect, certainly the least objectionable of any that could be devised; and that, if it shall not be carried into immediate execution, a national bankruptcy, with all its deplorable consequences, will take place before any different plan can possibly be proposed and adopted. So pressing are the present circumstances, and such is the alternative now offered to the states.

The ability of the country to discharge the debts which have been incurred in its defense is not to be doubted; an inclination, I flatter myself, will not be wanting. The path of our duty is plain before us; honesty will be found, on every experiment, to be the best and only true policy. Let us then, as a nation, be just; let us fulfill the public contracts, which Congress had undoubtedly a right to make for the purpose of carrying on the war, with the same good faith we suppose ourselves bound to perform our private engagements. In the meantime, let an attention to the cheerful performance of their proper business, as individuals and as members of society, be earnestly inculcated on the citizens of America; then will they strengthen the hands of government, and be happy under its protection; everyone will reap the fruit of his labors, everyone will enjoy his own acquisitions, without molestation and without danger.

In this state of absolute freedom and perfect security, who will grudge to yield a very little of his property to support the common interest of

society and ensure the protection of government? Who does not remember the frequent declarations, at the commencement of the war, that we should be completely satisfied if, at the expense of one half, we could defend the remainder of our possessions? Where is the man to be found who wishes to remain indebted for the defense of his own person and property to the exertions, the bravery, and the blood of others without making one generous effort to repay the debt of honor and gratitude? In what part of the continent shall we find any man, or body of men, who would not blush to stand up and propose measures purposely calculated to rob the soldier of his stipend, and the public creditor of his due? And were it possible that such a flagrant instance of injustice could ever happen, would it not excite the general indignation, and tend to bring down upon the authors of such measures the aggravated vengeance of Heaven? If, after all, a spirit of disunion, or a temper of obstinacy and perverseness, should manifest itself in any of the states; if such an ungracious disposition should attempt to frustrate all the happy effects that might be expected to flow from the Union; if there should be a refusal to comply with the requisition for funds to discharge the annual interest of the public debts; and if that refusal should revive again all those jealousies and produce all those evils which are now happily removed, Congress, who have, in all their transactions, shown a great degree of magnanimity and justice, will stand justified in the sight of God and man; and the state alone which puts itself in opposition to the aggregate wisdom of the continent, and follows such mistaken and pernicious counsels, will be responsible for all the consequences.

For my own part, conscious of having acted, while a servant of the public, in the manner I conceived best suited to promote the real interests of my country; having, in consequence of my fixed belief, in some measure pledged myself to the Army that their country would finally do them complete and ample justice; and not wishing to conceal any instance of my official conduct from the eyes of the world, I have thought proper to transmit to your Excellency the enclosed collection of papers, relative to the half pay and commutation granted by Congress to the officers of the Army. From these communications, my decided sentiments will be clearly comprehended, together with the conclusive reasons which induced me, at an early period, to recommend the adoption of this measure, in the most earnest and serious manner. As the proceedings of Congress, the Army, and myself are open to all, and contain, in my opinion, sufficient information to remove the prejudices and errors which may have been entertained by any, I think it unnecessary to say anything

more than just to observe that the resolutions of Congress now alluded to are undoubtedly as absolutely binding upon the United States as the most solemn acts of confederation or legislation.

As to the idea, which, I am informed, has in some instances prevailed, that the half pay and commutation are to be regarded merely in the odious light of a pension, it ought to be exploded forever. That provision should be viewed as it really was, a reasonable compensation offered by Congress at a time when they had nothing else to give to the officers of the Army for services then to be performed. It was the only means to prevent a total dereliction of the service. It was a part of their hire. I may be allowed to say, it was the price of their blood, and of your independency; it is therefore more than a common debt, it is a debt of honor; it can never be considered as a pension or gratuity, nor be canceled until it is fairly discharged.

With regard to a distinction between officers and soldiers, it is sufficient that the uniform experience of every nation of the world, combined with our own, proves the utility and propriety of the discrimination. Rewards, in proportion to the aids the public derives from them, are unquestionably due to all its servants. In some lines, the soldiers have perhaps generally had as ample a compensation for their services, by the large bounties which have been paid to them, as their officers will receive in the proposed commutation; in others if, besides the donation of lands, the payment of arrearages of clothing and wages (in which articles all the component parts of the army must be put upon the same footing), we take into the estimate the *douceurs* many of the soldiers have received, and the gratuity of one year's full pay, which is promised to all, possibly their situation (every circumstance being duly considered) will not be deemed less eligible than that of the officers. Should a further reward, however, be judged equitable, I will venture to assert no one will enjoy greater satisfaction than myself on seeing an exemption from taxes for a limited time (which has been petitioned for in some instances) or any other adequate immunity or compensation granted to the brave defenders of their country's cause; but neither the adoption nor rejection of this proposition will in any manner affect, much less militate against, the act of Congress by which they have offered five years' full pay, in lieu of the half pay for life, which had been before promised to the officers of the Army.

Before I conclude the subject of public justice, I cannot omit to mention the obligations this country is under to that meritorious class of veteran noncommissioned officers and privates who have been discharged

for inability, in consequence of the resolution of Congress of the 23d of April, 1782, on an annual pension for life. Their peculiar sufferings, their singular merits, and claims to that provision need only be known to interest all the feelings of humanity in their behalf. Nothing but a punctual payment of their annual allowance can rescue them from the most complicated misery; and nothing could be a more melancholy and distressing sight than to behold those who have shed their blood or lost their limbs in the service of their country without a shelter, without a friend, and without the means of obtaining any of the necessaries or comforts of life, compelled to beg their daily bread from door to door. Suffer me to recommend those of this description belonging to your state to the warmest patronage of your Excellency and your legislature.

It is necessary to say but a few words on the third topic which was proposed, and which regards particularly the defense of the Republic, as there can be little doubt but Congress will recommend a proper peace establishment for the United States, in which a due attention will be paid to the importance of placing the militia of the Union upon a regular and respectable footing. If this should be the case, I would beg leave to urge the great advantage of it in the strongest terms. The militia of this country must be considered as the palladium of our security, and the first effectual resort in case of hostility. It is essential, therefore, that the same system should pervade the whole; that the formation and discipline of the militia of the continent should be absolutely uniform; and that the same species of arms, accouterments, and military apparatus should be introduced in every part of the United States. No one, who has not learned it from experience, can conceive the difficulty, expense, and confusion which result from a contrary system, or the vague arrangements which have hitherto prevailed.

If, in treating of political points, a greater latitude than usual has been taken in the course of this address, the importance of the crisis, and the magnitude of the objects in discussion, must be my apology. It is, however, neither my wish nor expectation that the preceding observations should claim any regard, except so far as they shall appear to be dictated by a good intention, consonant to the immutable rules of justice, calculated to produce a liberal system of policy, and founded on whatever experience may have been acquired by a long and close attention to public business. Here I might speak with the more confidence from my actual observations; and if it would not swell this letter (already too prolix) beyond the bounds I had prescribed to myself, I could demonstrate to every mind open to conviction that in less time, and with much

less expense than has been incurred, the war might have been brought to the same happy conclusion if the resources of the continent could have been properly drawn forth; that the distresses and disappointments which have very often occurred have, in too many instances, resulted more from a want of energy in the Continental government than a deficiency of means in the particular states; that the inefficacy of measures arising from the want of an adequate authority in the supreme power, from a partial compliance with the requisitions of Congress in some of the states, and from a failure of punctuality in others, while it tended to damp the zeal of those which were more willing to exert themselves, served also to accumulate the expenses of the war, and to frustrate the best concerted plans; and that the discouragement occasioned by the complicated difficulties and embarrassments in which our affairs were by this means involved would have long ago produced the dissolution of any army less patient, less virtuous, and less persevering than that which I have had the honor to command. But, while I mention these things, which are notorious facts, as the defects of our federal constitution, particularly in the prosecution of a war, I beg it may be understood that, as I have ever taken a pleasure in gratefully acknowledging the assistance and support I have derived from every class of citizens, so shall I always be happy to do justice to the unparalleled exertions of the individual states on many interesting occasions.

I have thus freely disclosed what I wished to make known before I surrendered up my public trust to those who committed it to me. The task is now accomplished. I now bid adieu to your Excellency as the chief magistrate of your state, at the same time I bid a last farewell to the cares of office, and all the employments of public life.

It remains, then, to be my final and only request that your Excellency will communicate these sentiments to your legislature at their next meeting, and that they may be considered as the legacy of one who has ardently wished, on all occasions, to be useful to his country, and who, even in the shade of retirement, will not fail to implore the Divine benediction upon it.

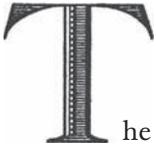

I now make it my earnest prayer that God would have you, and the state over which you preside, in His holy protection; that He would incline the hearts of the citizens to cultivate a spirit of subordination and obedience to government; to entertain a brotherly affection and love for one another, for their fellow citizens of the United States at large, and particularly for their brethren who have served in the field; and finally, that He would most graciously be pleased to dispose us all to do justice,

to love mercy, and to demean ourselves with that charity, humility, and pacific temper of mind which were the characteristics of the Divine Author of our blessed religion, and without a humble imitation of whose example in these things we can never hope to be a happy nation.

I have the honor to be, with much esteem and respect, Sir, your Excellency's most obedient and most humble servant.

The Farewell Address

TO THE PEOPLE
OF THE UNITED STATES

Friends and Fellow-Citizens:

The period for a new election of a citizen to administer the executive government of the United States being not far distant, and the time actually arrived when your thoughts must be employed in designating the person who is to be clothed with that important trust, it appears to me proper, especially as it may conduce to a more distinct expression of the public voice, that I should now apprise you of the resolution I have formed to decline being considered among the number of those out of whom a choice is to be made.

I beg you, at the same time, to do me the justice to be assured that this resolution has not been taken without a strict regard to all the considerations appertaining to the relation which binds a dutiful citizen to his country—and that, in withdrawing the tender of service which silence in my situation might imply, I am influenced by no diminution of zeal for your future interest, no deficiency of grateful respect for your past kindness; but am supported by a full conviction that the step is compatible with both.

The acceptance of, and continuance hitherto in, the office to which your suffrages have twice called me have been a uniform sacrifice of inclination to the opinion of duty, and to a deference for what appeared to be your desire. I constantly hoped that it would have been much earlier in my power, consistently with motives which I was not at liberty to disregard, to return to that retirement from which I had been reluctantly drawn. The strength of my inclination to do this, previous to the last election, had even led to the preparation of an address to declare it to you; but mature reflection on the then perplexed and critical posture of our affairs with foreign nations, and the unanimous advice of persons entitled to my confidence, impelled me to abandon the idea.

I rejoice that the state of your concerns, external as well as internal, no longer renders the pursuit of inclination incompatible with the sentiment of duty, or propriety; and am persuaded, whatever partiality may be retained for my services, that in the present circumstances of our country you will not disapprove my determination to retire.

The impressions with which I first undertook the arduous trust were explained on the proper occasion. In the discharge of this trust, I will only say that I have, with good intentions, contributed towards the organization and administration of the government the best exertions of which a very fallible judgment was capable. Not unconscious in the outset of the inferiority of my qualifications, experience in my own eyes, perhaps still more in the eyes of others, has strengthened the motives to diffidence of myself; and every day the increasing weight of years admonishes me more and more that the shade of retirement is as necessary to me as it will be welcome. Satisfied that if any circumstances have given peculiar value to my services, they were temporary, I have the consolation to believe that, while choice and prudence invite me to quit the political scene, patriotism does not forbid it.

In looking forward to the moment which is intended to terminate the career of my public life, my feelings do not permit me to suspend the deep acknowledgment of that debt of gratitude which I owe to my beloved country—for the many honors it has conferred upon me; still more for the steadfast confidence with which it has supported me; and for the opportunities I have thence enjoyed of manifesting my inviolable attachment by services faithful and persevering, though in usefulness unequal to my zeal. If benefits have resulted to our country from these services, let it always be remembered to your praise, and as an instructive example in our annals, that under circumstances in which the passions agitated in every direction were liable to mislead, amidst appearances sometimes dubious—vicissitudes of fortune often discouraging—in situations in which not infrequently want of success has countenanced the spirit of criticism, the constancy of your support was the essential prop of the efforts and a guarantee of the plans by which they were effected. Profoundly penetrated with this idea, I shall carry it with me to the grave, as a strong incitement to unceasing vows that Heaven may continue to you the choicest tokens of its beneficence—that your union and brotherly affection may be perpetual—that the free constitution, which is the work of your hands, may be sacredly maintained—that its administration in every department may be stamped with wisdom and virtue—that, in fine, the happiness of the people of these states, under the

auspices of liberty, may be made complete by so careful a preservation and so prudent a use of this blessing as will acquire to them the glory of recommending it to the applause, the affection, and adoption of every nation which is yet a stranger to it.

Here, perhaps, I ought to stop. But a solicitude for your welfare, which cannot end but with my life, and the apprehension of danger, natural to that solicitude, urge me on an occasion like the present to offer to your solemn contemplation, and to recommend to your frequent review, some sentiments which are the result of much reflection, of no inconsiderable observation, and which appear to me all-important to the permanency of your felicity as a people. These will be offered to you with the more freedom as you can only see in them the disinterested warnings of a parting friend who can possibly have no personal motive to bias his counsels. Nor can I forget, as an encouragement to it, your indulgent reception of my sentiments on a former and not dissimilar occasion.

Interwoven as is the love of liberty with every ligament of your hearts, no recommendation of mine is necessary to fortify or confirm the attachment.

The unity of government, which constitutes you one people, is also now dear to you. It is justly so, for it is a main pillar in the edifice of your real independence; the support of your tranquillity at home; your peace abroad; of your safety; of your prosperity; of that very liberty which you so highly prize. But as it is easy to foresee that from different causes, and from different quarters, much pain will be taken, many artifices employed, to weaken in your minds the conviction of this truth; as this is the point in your political fortress against which the batteries of internal and external enemies will be most constantly and actively (though often covertly and insidiously) directed, it is of infinite moment that you should properly estimate the immense value of your national Union to your collective and individual happiness; that you should cherish a cordial, habitual, and immovable attachment to it, accustoming yourselves to think and speak of it as of the palladium of your political safety and prosperity, watching for its preservation with jealous anxiety, discountenancing whatever may suggest even a suspicion that it can in any event be abandoned, and indignantly frowning upon the first dawning of every attempt to alienate any portion of our country from the rest, or to enfeeble the sacred ties which now link together the various parts.

For this you have every inducement of sympathy and interest. Citizens by birth or choice of a common country, that country has a right to concentrate your affections. The name of American, which belongs to you,

in your national capacity, must always exalt the just pride of patriotism more than any appellation derived from local discriminations. With slight shades of difference, you have the same religion, manners, habits, and political principles. You have in a common cause fought and triumphed together. The independence and liberty you possess are the work of joint councils and joint efforts of common dangers, sufferings, and successes.

But these considerations, however powerfully they address themselves to your sensibility, are greatly outweighed by those which apply more immediately to your interest. Here every portion of our country finds the most commanding motives for carefully guarding and preserving the Union of the whole.

The North in an unrestrained intercourse with the South, protected by the equal laws of a common government, finds in the productions of the latter great additional resources of maritime and commercial enterprise—and precious materials of manufacturing industry. The South in the same intercourse, benefiting by the agency of the North, sees its agriculture grow and its commerce expand. Turning partly into its own channels the seamen of the North, it finds its particular navigation invigorated; and, while it contributes, in different ways, to nourish and increase the general mass of the national navigation, it looks forward to the protection of a maritime strength to which itself is unequally adapted. The East, in a like intercourse with the West, already finds, and in the progressive improvement of interior communications, by land and water, will more and more find, a valuable vent for the commodities which it brings from abroad, or manufactures at home. The West derives from the East supplies requisite to its growth and comfort—and what is perhaps of still greater consequence, it must of necessity owe the secure enjoyment of indispensable outlets for its own productions to the weight, influence, and the future maritime strength of the Atlantic side of the Union, directed by an indissoluble community of interest, as one nation. Any other tenure by which the West can hold this essential advantage, whether derived from its own separate strength, or from an apostate and unnatural connection with any foreign power, must be intrinsically precarious.

While then every part of our country thus feels an immediate and particular interest in union, all the parts combined cannot fail to find in the united mass of means and efforts, greater strength, greater resource, proportionably greater security from external danger, a less frequent interruption of their peace by foreign nations; and, what is of inestimable value! they must derive from union an exemption from those broils and wars between themselves which so frequently afflict neighboring coun-

tries not tied together by the same government, which their own rivalships alone would be sufficient to produce, but which opposite foreign alliances, attachments, and intrigues would stimulate and embitter. Hence likewise they will avoid the necessity of those overgrown military establishments which under any form of government are inauspicious to liberty, and which are to be regarded as particularly hostile to republican liberty: In this sense it is that your Union ought to be considered as a main prop of your liberty, and that the love of the one ought to endear to you the preservation of the other.

These considerations speak a persuasive language to every reflecting and virtuous mind, and exhibit the continuance of the Union as a primary object of patriotic desire. Is there a doubt whether a common government can embrace so large a sphere? Let experience solve it. To listen to mere speculation in such a case were criminal. We are authorized to hope that a proper organization of the whole, with the auxiliary agency of governments for the respective subdivisions, will afford a happy issue to the experiment. 'Tis well worth a fair and full experiment. With such powerful and obvious motives to union affecting all parts of our country, while experience shall not have demonstrated its impracticability, there will always be reason to distrust the patriotism of those who in any quarter may endeavor to weaken its bands.

In contemplating the causes which may disturb our Union, it occurs as matter of serious concern that any ground should have been furnished for characterizing parties by geographical discriminations—Northern and Southern—Atlantic and Western; whence designing men may endeavor to excite a belief that there is a real difference of local interests and views. One of the expedients of party to acquire influence within particular districts is to misrepresent the opinions and aims of other districts. You cannot shield yourselves too much against the jealousies and heart-burnings which spring from these misrepresentations; they tend to render alien to each other those who ought to be bound together by fraternal affection. The inhabitants of our western country have lately had a useful lesson on this head. They have seen, in the negotiation by the executive, and in the unanimous ratification by the Senate, of the treaty with Spain, and in the universal satisfaction at that event throughout the United States, a decisive proof how unfounded were the suspicions propagated among them of a policy in the general government and in the Atlantic states unfriendly to their interests in regard to the Mississippi. They have been witnesses to the formation of two treaties, that with Great Britain and that with Spain, which secure to them everything they could

desire, in respect to our foreign relations, towards confirming their prosperity. Will it not be their wisdom to rely for the preservation of these advantages on the Union by which they were procured? Will they not henceforth be deaf to those advisers, if such there are, who would sever them from their brethren, and connect them with aliens?

To the efficacy and permanency of your Union, a government for the whole is indispensable. No alliances however strict between the parts can be an adequate substitute. They must inevitably experience the infractions and interruptions which all alliances in all times have experienced. Sensible of this momentous truth, you have improved upon your first essay by the adoption of a constitution of government better calculated than your former for an intimate Union, and for the efficacious management of your common concerns. This government, the offspring of our own choice uninfluenced and unawed, adopted upon full investigation and mature deliberation, completely free in its principles, in the distribution of its powers, uniting security with energy, and containing within itself a provision for its own amendment, has a just claim to your confidence and your support. Respect for its authority, compliance with its laws, acquiescence in its measures are duties enjoined by the fundamental maxims of true liberty. The basis of our political systems is the right of the people to make and to alter their constitutions of government. But the constitution which at any time exists, 'till changed by an explicit and authentic act of the whole people, is sacredly obligatory upon all. The very idea of the power and the right of the people to establish government presupposes the duty of every individual to obey the established government.

All obstructions to the execution of the laws, all combinations and associations, under whatever plausible character, with the real design to direct, control, counteract, or awe the regular deliberation and action of the constituted authorities are destructive of this fundamental principle, and of fatal tendency. They serve to organize faction, to give it an artificial and extraordinary force; to put, in the place of the delegated will of the nation, the will of a party, often a small but artful and enterprising minority of the community; and, according to the alternate triumphs of different parties, to make the public administration the mirror of the ill-concerted and incongruous projects of faction rather than the organ of consistent and wholesome plans digested by common councils and modified by mutual interests. However combinations or associations of the above description may now and then answer popular ends, they are likely, in the course of time and things, to become potent engines by

which cunning, ambitious, and unprincipled men will be enabled to subvert the power of the people and to usurp for themselves the reins of government, destroying afterwards the very engines which have lifted them to unjust dominion.

Towards the preservation of your government and the permanency of your present happy state, it is requisite not only that you steadily discountenance irregular oppositions to its acknowledged authority but also that you resist with care the spirit of innovation upon its principles, however specious the pretexts. One method of assault may be to effect, in the forms of the Constitution, alterations which will impair the energy of the system, and thus to undermine what cannot be directly overthrown. In all the changes to which you may be invited, remember that time and habit are at least as necessary to fix the true character of governments as of other human institutions—that experience is the surest standard by which to test the real tendency of the existing constitution of a country—that facility in changes upon the credit of mere hypothesis and opinion exposes to perpetual change from the endless variety of hypothesis and opinion—and remember, especially, that for the efficient management of your common interests, in a country so extensive as ours, a government of as much vigor as is consistent with the perfect security of liberty is indispensable. Liberty itself will find in such a government, with powers properly distributed and adjusted, its surest guardian. It is indeed little else than a name where the government is too feeble to withstand the enterprises of faction, to confine each member of the society within the limits prescribed by the laws, and to maintain all in the secure and tranquil enjoyment of the rights of person and property.

I have already intimated to you the danger of parties in the state, with particular reference to the founding of them on geographical discriminations. Let me now take a more comprehensive view, and warn you in the most solemn manner against the baneful effects of the spirit of party generally.

This spirit, unfortunately, is inseparable from our nature, having its root in the strongest passions of the human mind. It exists under different shapes in all governments, more or less stifled, controlled, or repressed; but in those of the popular form, it is seen in its greatest rankness, and is truly their worst enemy.

The alternate domination of one faction over another, sharpened by the spirit of revenge natural to party dissension, which in different ages and countries has perpetrated the most horrid enormities, is itself a frightful despotism. But this leads at length to a more formal and per-

manent despotism. The disorders and miseries which result gradually incline the minds of men to seek security and repose in the absolute power of an individual: and sooner or later the chief of some prevailing faction, more able or more fortunate than his competitors, turns this disposition to the purposes of his own elevation on the ruins of public liberty.

Without looking forward to an extremity of this kind (which nevertheless ought not to be entirely out of sight), the common and continual mischiefs of the spirit of party are sufficient to make it the interest and duty of a wise people to discourage and restrain it.

It serves always to distract the public councils and enfeeble the public administration. It agitates the community with ill-founded jealousies and false alarms, kindles the animosity of one part against another, foment occasionally riot and insurrection. It opens the doors to foreign influence and corruption, which find a facilitated access to the government itself through the channels of party passions. Thus the policy and the will of one country are subjected to the policy and will of another.

There is an opinion that parties in free countries are useful checks upon the administration of the government, and serve to keep alive the spirit of liberty. This within certain limits is probably true, and, in governments of a monarchical cast, patriotism may look with indulgence, if not with favor, upon the spirit of party. But in those of the popular character, in governments purely elective, it is a spirit not to be encouraged. From their natural tendency, it is certain there will always be enough of that spirit for every salutary purpose, and there being constant danger of excess, the effort ought to be, by force of public opinion, to mitigate and assuage it. A fire not to be quenched, it demands a uniform vigilance to prevent its bursting into a flame, lest, instead of warming, it should consume.

It is important, likewise, that the habits of thinking in a free country should inspire caution in those entrusted with its administration to confine themselves within their respective constitutional spheres, avoiding in the exercise of the powers of one department to encroach upon another. The spirit of encroachment tends to consolidate the powers of all the departments in one, and thus to create, whatever the form of government, a real despotism. A just estimate of that love of power, and proneness to abuse it, which predominates in the human heart is sufficient to satisfy us of the truth of this position. The necessity of reciprocal checks in the exercise of political power, by dividing and distributing it into different depositories, and constituting each the guardian of the public weal

against invasions by the others, has been evinced by experiments ancient and modern, some of them in our country and under our own eyes. To preserve them must be as necessary as to institute them. If in the opinion of the people the distribution or modification of the constitutional powers be in any particular wrong, let it be corrected by an amendment in the way which the Constitution designates. But let there be no change by usurpation; for though this, in one instance, may be the instrument of good, it is the customary weapon by which free governments are destroyed. The precedent must always greatly overbalance in permanent evil any partial or transient benefit which the use can at any time yield.

Of all the dispositions and habits which lead to political prosperity, religion and morality are indispensable supports. In vain would that man claim the tribute of patriotism who should labor to subvert these great pillars of human happiness, these firmest props of the duties of men and citizens. The mere politician, equally with the pious man, ought to respect and to cherish them. A volume could not trace all their connections with private and public felicity. Let it simply be asked where is the security for property, for reputation, for life if the sense of religious obligation desert the oaths which are the instruments of investigation in courts of justice? And let us with caution indulge the supposition that morality can be maintained without religion. Whatever may be conceded to the influence of refined education on minds of peculiar structure, reason and experience both forbid us to expect that national morality can prevail in exclusion of religious principle.

'Tis substantially true that virtue or morality is a necessary spring of popular government. The rule indeed extends with more or less force to every species of free government. Who that is a sincere friend to it can look with indifference upon attempts to shake the foundation of the fabric?

Promote, then, as an object of primary importance, institutions for the general diffusion of knowledge. In proportion as the structure of a government gives force to public opinion, it is essential that public opinion should be enlightened.

As a very important source of strength and security, cherish public credit. One method of preserving it is to use it as sparingly as possible: avoiding occasions of expense by cultivating peace, but remembering also that timely disbursements to prepare for danger frequently prevent much greater disbursements to repel it—avoiding likewise the accumulation of debt, not only by shunning occasions of expense but by vigorous exertions in time of peace to discharge the debts which unavoidable wars may

have occasioned, not ungenerously throwing upon posterity the burden which we ourselves ought to bear. The execution of these maxims belongs to your representatives, but it is necessary that public opinion should co-operate. To facilitate to them the performance of their duty, it is essential that you should practically bear in mind that towards the payment of debts there must be revenue—that to have revenue there must be taxes—that no taxes can be devised which are not more or less inconvenient and unpleasant—that the intrinsic embarrassment inseparable from the selection of the proper objects (which is always a choice of difficulties) ought to be a decisive motive for a candid construction of the conduct of the government in making it, and for a spirit of acquiescence in the measures for obtaining revenue which the public exigencies may at any time dictate.

Observe good faith and justice towards all nations. Cultivate peace and harmony with all. Religion and morality enjoin this conduct; and can it be that good policy does not equally enjoin it? It will be worthy of a free, enlightened, and, at no distant period, a great nation to give to mankind the magnanimous and too novel example of a people always guided by an exalted justice and benevolence. Who can doubt that in the course of time and things, the fruits of such a plan would richly repay any temporary advantages which might be lost by a steady adherence to it? Can it be that Providence has not connected the permanent felicity of a nation with its virtue? The experiment, at least, is recommended by every sentiment which ennobles human nature. Alas! is it rendered impossible by its vices?

In the execution of such a plan nothing is more essential than that permanent, inveterate antipathies against particular nations and passionate attachments for others should be excluded; and that in place of them just and amicable feelings towards all should be cultivated. The nation which indulges towards another an habitual hatred or an habitual fondness is in some degree a slave. It is a slave to its animosity or to its affection, either of which is sufficient to lead it astray from its duty and its interest. Antipathy in one nation against another disposes each more readily to offer insult and injury, to lay hold of slight causes of umbrage, and to be haughty and intractable, when accidental or trifling occasions of dispute occur. Hence frequent collisions, obstinate, envenomed and bloody contests. The nation promoted by ill will and resentment sometimes impels to war the government, contrary to the best calculations of policy. The government sometimes participates in the national propensity, and adopts through passion what reason would reject; at other times, it

makes the animosity of the nation subservient to projects of hostility instigated by pride, ambition, and other sinister and pernicious motives. The peace often, sometimes perhaps the liberty, of nations has been the victim.

So likewise a passionate attachment of one nation for another produces a variety of evils. Sympathy for the favorite nation, facilitating the illusion of an imaginary common interest in cases where no real common interest exists, and infusing into one the enmities of the other, betrays the former into a participation in the quarrels and wars of the latter, without adequate inducement or justification. It leads also to concessions to the favorite nation of privileges denied to others, which is apt doubly to injure the nation making the concessions: by unnecessarily parting with what ought to have been retained, and by exciting jealousy, ill will, and a disposition to retaliate in the parties from whom equal privileges are withheld; and it gives to ambitious, corrupted, or deluded citizens (who devote themselves to the favorite nation) facility to betray or sacrifice the interests of their own country without odium, sometimes even with popularity—gilding with the appearances of a virtuous sense of obligation, a commendable deference for public opinion, or a laudable zeal for public good the base or foolish compliances of ambition, corruption, or infatuation.

As avenues to foreign influence in innumerable ways, such attachments are particularly alarming to the truly enlightened and independent patriot. How many opportunities do they afford to tamper with domestic factions, to practice the arts of seduction, to mislead public opinion, to influence or awe the public councils! Such an attachment of a small or weak towards a great and powerful nation dooms the former to be the satellite of the latter.

Against the insidious wiles of foreign influence, I conjure you to believe me, fellow citizens, the jealousy of a free people ought to be *constantly* awake, since history and experience prove that foreign influence is one of the most baneful foes of republican government. But that jealousy to be useful must be impartial; else it becomes the instrument of the very influence to be avoided, instead of a defense against it. Excessive partiality for one foreign nation and excessive dislike of another cause those whom they actuate to see danger only on one side, and serve to veil and even second the arts of influence on the other. Real patriots, who may resist the intrigues of the favorite, are liable to become suspected and odious; while its tools and dupes usurp the applause and confidence of the people to surrender their interests.

The great rule of conduct for us in regard to foreign nations is, in extending our commercial relations, to have with them as little *political* connection as possible. So far as we have already formed engagements, let them be fulfilled with perfect good faith. Here let us stop.

Europe has a set of primary interests, which to us have none, or a very remote, relation. Hence she must be engaged in frequent controversies, the causes of which are essentially foreign to our concerns. Hence therefore it must be unwise in us to implicate ourselves by artificial ties in the ordinary vicissitudes of her politics, or the ordinary combinations and collisions of her friendships, or enmities.

Our detached and distant situation invites and enables us to pursue a different course. If we remain one people, under an efficient government, the period is not far off when we may defy material injury from external annoyance; when we may take such an attitude as will cause the neutrality we may at any time resolve upon to be scrupulously respected. When belligerent nations, under the impossibility of making acquisitions upon us, will not lightly hazard the giving us provocation; when we may choose peace or war, as our interest guided by our justice shall counsel.

Why forego the advantages of so peculiar a situation? Why quit our own to stand upon foreign ground? Why, by interweaving our destiny with that of any part of Europe, entangle our peace and prosperity in the toils of European ambition, rivalry, interest, humor, or caprice?

'Tis our true policy to steer clear of permanent alliances with any portion of the foreign world; so far, I mean, as we are now at liberty to do it—for let me not be understood as capable of patronizing infidelity to existing engagements (I hold the maxim no less applicable to public than to private affairs that honesty is always the best policy). I repeat it, therefore, let those engagements be observed in their genuine sense. But in my opinion it is unnecessary and would be unwise to extend them.

Taking care always to keep ourselves, by suitable establishments, on a respectably defensive posture, we may safely trust to temporary alliances for extraordinary emergencies.

Harmony, liberal intercourse with all nations are recommended by policy, humanity, and interest. But even our commercial policy should hold an equal and impartial hand: neither seeking nor granting exclusive favors or preferences; consulting the natural course of things; diffusing and diversifying by gentle means the streams of commerce, but forcing nothing; establishing with powers so disposed—in order to give trade a stable course, to define the rights of our merchants, and to enable

the government to support them—conventional rules of intercourse, the best that present circumstances and mutual opinion will permit, but temporary, and liable to be from time to time abandoned or varied, as experience and circumstances shall dictate; constantly keeping in view that 'tis folly in one nation to look for disinterested favors from another, that it must pay with a portion of its independence for whatever it may accept under that character, that by such acceptance, it may place itself in the condition of having given equivalents for nominal favors and yet of being reproached with ingratitude for not giving more. There can be no greater error than to expect or calculate upon real favors from nation to nation. 'Tis an illusion which experience must cure, which a just pride ought to discard.

In offering to you, my countrymen, these counsels of an old and affectionate friend, I dare not hope they will make the strong and lasting impression I could wish—that they will control the usual current of the passions, or prevent our nation from running the course which has hitherto marked the destiny of nations. But if I may even flatter myself that they may be productive of some partial benefit; some occasional good; that they may now and then recur to moderate the fury of party spirit, to warn against the mischiefs of foreign intrigue, to guard against the impostures of pretended patriotism, this hope will be a full recompense for the solicitude for your welfare, by which they have been dictated.

How far in the discharge of my official duties, I have been guided by the principles which have been delineated, the public records and other evidences of my conduct must witness to you, and to the world. To myself, the assurance of my own conscience is that I have at least believed myself to be guided by them.

In relation to the still subsisting war in Europe, my proclamation of the 22d of April, 1793, is the index to my plan. Sanctioned by your approving voice and by that of your representatives in both houses of Congress, the spirit of that measure has continually governed me—uninfluenced by any attempts to deter or divert me from it.

After deliberate examination with the aid of the best lights I could obtain, I was well satisfied that our country, under all the circumstances of the case, had a right to take, and was bound in duty and interest, to take a neutral position. Having taken it, I determined, as far as should depend upon me, to maintain it with moderation, perseverance, and firmness.

The considerations which respect the right to hold this conduct, it is not necessary on this occasion to detail. I will only observe that according

to my understanding of the matter that right, so far from being denied by any of the belligerent powers, has been virtually admitted by all.

The duty of holding a neutral conduct may be inferred, without anything more, from the obligation which justice and humanity impose on every nation, in cases in which it is free to act, to maintain inviolate the relations of peace and amity towards other nations.

The inducements of interest for observing that conduct will best be referred to your own reflections and experience. With me, a predominant motive has been to endeavor to gain time to our country to settle and mature its yet recent institutions, and to progress without interruption to that degree of strength and consistency which is necessary to give it, humanly speaking, the command of its own fortunes.

Though, in reviewing the incidents of my administration, I am unconscious of intentional error, I am nevertheless too sensible of my defects not to think it probable that I may have committed many errors. Whatever they may be I fervently beseech the Almighty to avert or mitigate the evils to which they may tend. I shall also carry with me the hope that my country will never cease to view them with indulgence; and that after forty-five years of my life dedicated to its service, with an upright zeal, the faults of incompetent abilities will be consigned to oblivion, as myself must soon be to the mansions of rest.

Relying on its kindness in this as in other things, and actuated by that fervent love towards it which is so natural to a man who views in it the native soil of himself and his progenitors for several generations, I anticipate with pleasing expectation that retreat in which I promise myself to realize, without alloy, the sweet enjoyment of partaking, in the midst of my fellow citizens, the benign influence of good laws under a free government—the ever favorite object of my heart, and the happy reward, as I trust, of our mutual cares, labors, and dangers.

Thomas Jefferson

1743–1826

Thomas Jefferson, the son of prosperous landowners, was born in Albemarle County, Virginia, in 1743. After being graduated from the College of William and Mary in Williamsburg, Jefferson took up the study of law. In 1769 he was elected to the Virginia House of Burgesses, and while there he wrote his *Summary View of the Rights of British America* and his *Reply to Lord North*. These exercised such a wide influence that Jefferson was sent to represent Virginia in the Continental Congress.

In 1776, after drafting the Declaration of Independence, Jefferson returned to Virginia as a member of its legislature. Later, as its governor, he was determined to revise its laws. He is responsible for the statute on religious liberty which was adopted in 1786, and for revisions of the inheritance laws which broke up the large estates. Jefferson also tried unsuccessfully to abolish slavery, and, with limited success, to institute free public education.

In 1783 Jefferson was elected to the United States Congress, where he instituted our present decimal system of currency. Two years later he followed Franklin as ambassador to France, returning in 1789 to serve as Secretary of State in the new government under Washington. Jefferson often found himself in conflict with the Federalist group, led by Hamilton, which favored a stronger central govern-

Notes from the artist: "The head of Jefferson is adapted from a contemporary gold-leaf portrait that hung in Monticello during Jefferson's retirement. Above his head is a facsimile of Jefferson's handwritten draft of The Declaration of Independence."

A Declaration by the Representatives of the UNITED STATES OF AMERICA, in General Congress assembled.

When in the course of human events it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume among the powers of the earth, the separate and equal station to which the laws of nature and of nature's god entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable rights, that among these are life, liberty, and the pursuit of happiness; that to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed.

J. J. [Signature]

ment, tied to property and financial interests. In 1796 Jefferson became Vice-President under John Adams, and was elected President himself in 1800.

During his two terms in office, Jefferson successfully conducted the Tripoli War against the Barbary pirates, negotiated the purchase of the Louisiana Territory from Napoleon, and launched the Lewis and Clark northwest expedition. At the age of sixty-five, Jefferson retired and returned to his home, Monticello, which he had designed himself. For the next few years he devoted himself to his many interests, including farming, invention, music, and philosophical correspondence. But his greatest preoccupation was the building of the University of Virginia, the basic plan of which was his.

Jefferson died in 1826 on July 4th, fifty years after the publication of *The Declaration of Independence*. He wrote his own epitaph. It reads: "Here was buried Thomas Jefferson, author of the Declaration of American Independence, of the statute of Virginia for religious freedom, and father of the University of Virginia."

The form of republicanism and democracy which has developed in the United States probably owes more to the ideas of Jefferson than to those of any other man. He had written in *The Declaration of Independence* "that all men are created equal," and that they have unalienable rights to "life, liberty and the pursuit of happiness." This was "self-evident," and not a matter to be debated pro and con. Every man is as good as another, if not a little better, became the American creed. The French aristocrat Tocqueville, in 1835, was dismayed by the degree to which equalitarianism had pervaded American institutions and manners. Like Plato, he feared the rule of ignorance. In Jefferson's opinion there was absolutely nothing wrong with the people that education would not cure: man is indefinitely perfectible.

Popular rule or democracy had been little tried, and was certainly not proved, in 1781, when Jefferson wrote the following essay. Distrust of the people and a trend back to oligarchy or monarchy were found among the greatest leaders, especially Hamilton and his Federalists. They feared the people; Jefferson feared "the selfishness of the leaders independent of the people." In Virginia they wished to concentrate power in a few hands to meet effectively the British invasion then proceeding; he struggled to preserve the constitution

and majority rule, in war as in peace. Otherwise, men who had just escaped from an old tyranny might well be fighting for a new one.

The constitution of the state of Virginia was born of inexperience, Jefferson argued, and was full of faults and hazards. A majority of the citizens who are in the militia and pay taxes have no representation in the legislature, and where there is representation, it is often unequal and unjust. The two houses of legislature are chosen by the same electors and represent the same interests, and the executive and judiciary are dependent on them. Instead of a balance of powers, each checking the presumption of the others, the constitution had resulted in an “*elective despotism*.”

Forcefully and wittily, Jefferson argues against the power of the House of Delegates to determine for itself when it has a quorum. Amidst the difficulties occasioned by the invasion, the House might decide to fix the quorum at forty, but if this can be done, it also *could be* reduced to one. A precedent, though well intentioned, may be perilous. What is needed, Jefferson contends, is a convention to correct and clarify the constitution. The people should not be compelled, when their rights are violated, to either rebel or surrender them. These rights must be unmistakably guaranteed in the constitution.

Jefferson's impressions of his colleagues, Washington and Franklin, speak for themselves. In spite of his shortcomings, Washington looms monumental and serene, and we see Franklin's charm and persuasiveness peer through his anecdotes.

The Virginia Constitution

from *Notes on Virginia*

Queen Elizabeth by her letters patent, bearing date March 25, 1584, licensed Sir Walter Raleigh to search for remote heathen lands, not inhabited by Christian people, and granted to him in fee simple all the soil within two hundred leagues of the places where his people should, within six years, make their dwellings or abidings; reserving only to herself and her successors their allegiance and one-fifth part of all the gold and silver ore they should obtain. Sir Walter immediately sent out two ships, which visited Wococon Island in North Carolina, and the next year dispatched seven with one hundred and seven men, who settled in Roanoke Island, about latitude $35^{\circ} 50'$. Here Okisko, king of the Weopomeiocs, in a full council of his people is said to have acknowledged himself the homager of the Queen of England, and, after her, of Sir Walter Raleigh. A supply of fifty men were sent in 1586, and one hundred and fifty in 1587. With these last Sir Walter sent a governor, appointed him twelve assistants, gave them a charter of incorporation, and instructed them to settle on Chesapeake Bay. They landed, however, at Hatorask. In 1588, when a fleet was ready to sail with a new supply of colonists and necessaries, they were detained by the Queen to assist against the Spanish Armada. Sir Walter having now expended £40,000 in these enterprises, obstructed occasionally by the crown without a shilling of aid from it, was under a necessity of engaging others to adventure their money. He, therefore, by deed bearing date the 7th of March, 1589, by the name of Sir Walter Raleigh, Chief Governor of Assamàcòmoc, (probably Acomàc,) alias Wingadacoia, alias Virginia, granted to Thomas Smith and others, in consideration of their adventuring certain sums of money, liberty to trade to this new country free from all customs and taxes for seven years, excepting the fifth part of the gold and silver ore to be obtained; and stipulated with them and the other assistants, then in Virginia, that he

would confirm the deed of incorporation which he had given in 1587, with all the prerogatives, jurisdictions, royalties and privileges granted to him by the Queen. Sir Walter, at different times, sent five other adventurers hither, the last of which was in 1602; for in 1603 he was attainted and put into close imprisonment, which put an end to his cares over his infant colony. What was the particular fate of the colonists he had before sent and seated has never been known, whether they were murdered, or incorporated with the savages.

Some gentlemen and merchants, supposing that by the attainder of Sir Walter Raleigh the grant to him was forfeited, not inquiring overcarefully whether the sentence of an English court could affect lands not within the jurisdiction of that court, petitioned King James for a new grant of Virginia to them. He accordingly executed a grant to Sir Thomas Gates and others, bearing date the 9th of March, 1607, under which, in the same year, a settlement was effected at Jamestown, and ever after maintained. Of this grant, however, no particular notice need be taken, as it was superseded by letters patent of the same King, of May 23, 1609, to the Earl of Salisbury and others, incorporating them by the name of "The Treasurer and company of Adventurers and Planters of the City of London for the first colony in Virginia," granting to them and their successors all the lands in Virginia from Point Comfort along the seacoast, to the northward two hundred miles, and from the same point along the seacoast to the southward two hundred miles, and all the space from this precinct on the seacoast up into the land, west and northwest, from sea to sea, and the islands within one hundred miles of it, with all the communities, jurisdictions, royalties, privileges, franchises, and preeminencies, within the same, and thereto and thereabouts, by sea and land, appertaining in as ample manner as had before been granted to any adventurer; to be held of the King and his successors, in common socage, yielding one-fifth part of the gold and silver ore to be therein found, for all manner of services; establishing a council in England for the direction of the enterprise, the members of which were to be chosen and displaced by the voice of the majority of the company and adventurers, and were to have the nomination and revocation of governors, officers, and ministers, which by them should be thought needful for the colony, the power of establishing laws and forms of government and magistracy, obligatory not only within the colony, but also on the seas in going and coming to and from it; authorizing them to carry thither any persons who should consent to go, freeing them forever from all taxes and impositions on any goods or merchandise on importations into the colony, or exporta-

tion out of it, except the five per cent due for custom on all goods imported into the British dominions, according to the ancient trade of merchants; which five per cent only being paid they might, within thirteen months, re-export the same goods into foreign parts, without any custom, tax, or other duty, to the King or any of his officers, or deputies; with powers of waging war against those who should annoy them; giving to the inhabitants of the colony all the rights of natural subjects, as if born and abiding in England; and declaring that these letters should be construed, in all doubtful parts, in such manner as should be most for the benefit of the grantees.

Afterwards on the 12th of March, 1612, by other letters patent, the King added to his former grants all islands in any part of the ocean between the 30th and 41st degrees of latitude, and within three hundred leagues of any of the parts before granted to the treasurer and company, not being possessed or inhabited by any other Christian prince or state, nor within the limits of the northern colony.

In pursuance of the authorities given to the company by these charters, and more especially of that part in the charter of 1609 which authorized them to establish a form of government, they on the 24th of July, 1621, by charter under their common seal, declared that from thenceforward there should be two supreme councils in Virginia, the one to be called the Council of State, to be placed and displaced by the treasurer, council in England, and company from time to time, whose office was to be that of assisting and advising the governor; the other to be called the General Assembly, to be convened by the governor once yearly or oftener, which was to consist of the Council of State, and two burgesses out of every town, hundred, or plantation, to be respectively chosen by the inhabitants. In this all matters were to be decided by the greater part of the votes present; reserving to the governor a negative voice; and they were to have power to treat, consult, and conclude all emergent occasions concerning the public weal, and to make laws for the behoof and government of the colony, imitating and following the laws and policy of England as nearly as might be; providing that these laws should have no force till ratified in a general court of the company in England, and returned under their common seal; and declaring that, after the government of the colony should be well framed and settled, no orders of the council in England should bind the colony unless ratified in the said General Assembly. The King and company quarreled, and by a mixture of law and force the latter were ousted of all their rights without retribution, after having

expended one hundred thousand pounds in establishing the colony, without the smallest aid from government. King James suspended their powers by proclamation of July 15, 1624, and Charles I took the government into his own hands. Both sides had their partisans in the colony, but, in truth, the people of the colony in general thought themselves little concerned in the dispute. There being three parties interested in these several charters, what passed between the first and second it was thought could not affect the third. If the King seized on the powers of the company, they only passed into other hands, without increase or diminution, while the rights of the people remained as they were. But they did not remain so long. The northern parts of their country were granted away to the lords Baltimore and Fairfax; the first of these obtaining also the rights of separate jurisdiction and government. And in 1650 the Parliament, considering itself as standing in the place of their deposed King, and as having succeeded to all his powers, without as well as within the realm, began to assume a right over the colonies, passing an act for inhibiting their trade with foreign nations. This succession to the exercise of kingly authority gave the first color for parliamentary interference with the colonies, and produced that fatal precedent which they continued to follow after they had retired, in other respects, within their proper functions. When this colony, therefore, which still maintained its opposition to Cromwell and the Parliament, was induced in 1651 to lay down their arms, they previously secured their most essential rights by a solemn convention, which, having never seen in print, I will here insert literally from the records.

ARTICLES agreed on and concluded at James Cittie in Virginia for the surrendering and settling of that plantation under the obedience and government of the commonwealth of England by the commissioners of the Councill of State by authoritie of the parliamt of England, and by the Grand assembly of the Governour, Councill, and Burgesses of that countrey.

First it is agreed and consted that the plantation of Virginia, and all the inhabitants thereof, shall be and remain in due obedience and subjection to the Commonwealth of England, according to the laws there established, and that this submission and subscription bee acknowledged a voluntary act not forced nor constrained by a conquest upon the countrey, and that they shall have and enjoy such freedoms and priviledges as belong to the free borne people of England, and that the former government by the Commissions and Instructions be void and null.

2ly. That the Grand assembly as formerly shall convene and transact

the affairs of Virginia, wherein nothing is to be acted or done contrairie to the government of the Commonwealth of England and the lawes there established.

3ly. That there shall be a full and totall remission and indempntie of all acts, words, or writings done or spoken against the parliament of England in relation to the same.

4ly. That Virginia shall have and enjoy the antient bounds and lymitts granted by the charters of the former kings, and that we shall seek a new charter from the parliament to that purpose against any that have intrincht upon the rights thereof.

5ly. That all the pattents of land granted under the colony seal by any of the precedent governours shall be and remaine in their full force and strength.

6ly. That the priviledge of haveing ffiftie acres of land for every person transported in that collonie shall continue as formerly granted.

7ly. That the people of Virginia have free trade as the people of England do enjoy to all places and with all nations according to the lawes of that commonwealth, and that Virginia shall enjoy all priviledges equall with any English plantations in America.

8ly. That Virginia shall be free from all taxes, customs and impositions whatsoever, and none to be imposed on them without consent of the Grand assembly; and soe that neither fforts nor castle bee erected or garrisons maintained without their consent.

9ly. That noe charge shall be required from this country in respect of this present ffleet.

10ly. That for the future settlement of the countrey in their due obedience, the engagement shall be tendred to all the inhabitants according to act of parliament made to that purpose, that all persons who shall refuse to subscribe the said engagement, shall have a yeare's time if they please to remove themselves and their estates out of Virginia, and in the meantime during the said yeare to have equall justice as formerly.

11ly. That the use of the booke of common prayer shall be permitted for one yeare ensueinge with referrence to the consent of the major part of the parishes, provided that those which relate to kingshipp or that government be not used publiquely, and the continuance of ministers in their places, they not misdemeaning themselves, and the payment of their accustomed dues and agreements made with them respectively shall be left as they now stand dureing this ensueing yeare.

12ly. That no man's cattell shall be questioned as the companies, unless such as have been entrusted with them or have disposed of them without order.

13ly. That all ammunition, powder and armes, other than for private use, shall be delivered up, securitie being given to make satisfaction for it.

14ly. That all goods allreadie brought hither by the Dutch or others which are now on shoar shall be free from surprizall.

15ly. That the quittrents granted unto us by the late kinge for seven yeares bee confirmed.

16ly. That the commissioners for the parliament subscribeing these articles engage themselves and the honour of parliament for the full performance thereof; and that the present governour, and the councill, and the burgesses do likewise subscribe and engage the whole collony on their parts.

RICHARD BENNETT.—Seale.

WILLIAM CLAIBORNE.—Seale.

EDMOND CURTIS.—Seale.

These articles were signed and sealed by the Commissioners of the Councill of state for the Commonwealth of England the twelveth day of March 1651.

The colony supposed that by this solemn convention, entered into with arms in their hands, they had secured the ancient limits of their country, its free trade, its exemption from taxation but by their own Assembly, and exclusion of military force from among them. Yet in every of these points was this convention violated by subsequent Kings and Parliaments, and other infractions of their constitution equally dangerous committed. Their General Assembly, which was composed of the Council of State and Burgesses, sitting together and deciding by plurality of voices, was split into two houses, by which the Council obtained a separate negative on their laws. Appeals from their Supreme Court, which had been fixed by law in their General Assembly, were arbitrarily revoked to England, to be there heard before the King and Council. Instead of four hundred miles on the seacoast, they were reduced, in the space of thirty years, to about one hundred miles. Their trade with foreigners was totally suppressed, and when carried to Great Britain, was there loaded with imposts. It is unnecessary, however, to glean up the several instances of injury, as scattered through American and British history, and the more especially as, by passing on to the accession of the present King, we shall find specimens of them all, aggravated, multiplied and crowded within a small compass of time, so as to evince a fixed design of considering our rights natural, conventional and chartered as mere nullities. The following is an epitome of the first sixteen years of his reign: The colonies were taxed internally and externally; their essential interests sacrificed to individuals in Great Britain; their legislatures suspended; charters annulled; trials by juries taken away; their persons subjected to transportation

across the Atlantic, and to trial before foreign judicatories; their supplications for redress thought beneath answer; themselves published as cowards in the councils of their mother country and courts of Europe; armed troops sent among them to enforce submission to these violences; and actual hostilities commenced against them. No alternative was presented but resistance, or unconditional submission. Between these could be no hesitation. They closed in the appeal to arms. They declared themselves independent states. They confederated together into one great republic; thus securing to every state the benefit of a union of their whole force. In each state separately a new form of government was established. Of ours particularly the following are the outlines: The executive powers are lodged in the hands of a governor, chosen annually, and incapable of acting more than three years in seven. He is assisted by a council of eight members. The judiciary powers are divided among several courts, as will be hereafter explained. Legislation is exercised by two houses of Assembly: the one called the House of Delegates, composed of two members from each county, chosen annually by the citizens, possessing an estate for life in one hundred acres of uninhabited land, or twenty-five acres with a house on it, or in a house or lot in some town; the other called the Senate, consisting of twenty-four members, chosen quadrennially by the same electors, who for this purpose are distributed into twenty-four districts. The concurrence of both houses is necessary to the passage of a law. They have the appointment of the governor and council, the judges of the superior courts, auditors, attorney general, treasurer, register of the land office, and delegates to Congress. As the dismemberment of the state had never had its confirmation, but, on the contrary, had always been the subject of protestation and complaint, that it might never be in our own power to raise scruples on that subject, or to disturb the harmony of our new confederacy, the grants to Maryland, Pennsylvania, and the two Carolinas were ratified.

This Constitution was formed when we were new and unexperienced in the science of government. It was the first, too, which was formed in the whole United States. No wonder then that time and trial have discovered very capital defects in it.

1. The majority of the men in the state, who pay and fight for its support, are unrepresented in the legislature, the roll of freeholders entitled to vote not including generally the half of those on the roll of the militia, or of the taxgatherers.

2. Among those who share the representation, the shares are very unequal. Thus the county of Warwick, with only one hundred fighting

men, has an equal representation with the county of Loudon, which has one thousand seven hundred and forty-six. So that every man in Warwick has as much influence in the government as seventeen men in Loudon. But lest it should be thought that an equal interspersion of small among large counties through the whole state may prevent any danger of injury to particular parts of it, we will divide it into districts, and show the proportions of land, of fighting men, and of representation in each. . . .

3. The Senate is, by its constitution, too homogeneous with the House of Delegates. Being chosen by the same electors, at the same time, and out of the same subjects, the choice falls of course on men of the same description. The purpose of establishing different houses of legislation is to introduce the influence of different interests or different principles. Thus in Great Britain it is said their constitution relies on the House of Commons for honesty, and the Lords for wisdom; which would be a rational reliance if honesty were to be bought with money, and if wisdom were hereditary. In some of the American states, the delegates and senators are so chosen as that the first represent the persons, and the second the property of the state. But with us, wealth and wisdom have equal chance for admission into both houses. We do not, therefore, derive from the separation of our legislature into two houses those benefits which a proper complication of principles are capable of producing, and those which alone can compensate the evils which may be produced by their dissensions.

4. All the powers of government, legislative, executive, and judiciary, result to the legislative body. The concentrating these in the same hands is precisely the definition of despotic government. It will be no alleviation that these powers will be exercised by a plurality of hands, and not by a single one. One hundred and seventy-three despots would surely be as oppressive as one. Let those who doubt it turn their eyes on the republic of Venice. As little will it avail us that they are chosen by ourselves. An *elective despotism* was not the government we fought for, but one which should not only be founded on free principles, but in which the powers of government should be so divided and balanced among several bodies of magistracy as that no one could transcend their legal limits without being effectually checked and restrained by the others. For this reason that convention which passed the ordinance of government laid its foundation on this basis, that the legislative, executive, and judiciary departments should be separate and distinct, so that no person should exercise the powers of more than one of them at the same time.

But no barrier was provided between these several powers. The judiciary and executive members were left dependent on the legislative for their subsistence in office, and some of them for their continuance in it. If, therefore, the legislature assumes executive and judiciary powers, no opposition is likely to be made; nor, if made, can it be effectual; because in that case they may put their proceedings into the form of an act of Assembly, which will render them obligatory on the other branches. They have, accordingly, in many instances, decided rights which should have been left to judiciary controversy; and the direction of the executive, during the whole time of their session, is becoming habitual and familiar. And this is done with no ill intention. The views of the present members are perfectly upright. When they are led out of their regular province, it is by art in others, and inadvertence in themselves. And this will probably be the case for some time to come. But it will not be a very long time. Mankind soon learn to make interested uses of every right and power which they possess, or may assume. The public money and public liberty, intended to have been deposited with three branches of magistracy, but found inadvertently to be in the hands of one only, will soon be discovered to be sources of wealth and dominion to those who hold them; distinguished, too, by this tempting circumstance, that they are the instrument as well as the object of acquisition. With money we will get men, said Caesar, and with men we will get money. Nor should our Assembly be deluded by the integrity of their own purposes, and conclude that these unlimited powers will never be abused, because themselves are not disposed to abuse them. They should look forward to a time, and that not a distant one, when a corruption in this, as in the country from which we derive our origin, will have seized the head of government, and be spread by them through the body of the people; when they will purchase the voices of the people, and make them pay the price. Human nature is the same on every side of the Atlantic, and will be alike influenced by the same causes. The time to guard against corruption and tyranny is before they shall have gotten hold of us. It is better to keep the wolf out of the fold than to trust to drawing his teeth and claws after he shall have entered. To render these considerations the more cogent, we must observe in addition:

5. That the ordinary legislature may alter the Constitution itself. On the discontinuance of Assemblies, it became necessary to substitute in their place some other body, competent to the ordinary business of government, and to the calling forth the powers of the state for the maintenance of our opposition to Great Britain. Conventions were therefore

introduced, consisting of two delegates from each county, meeting together and forming one house, on the plan of the former House of Burgesses, to whose places they succeeded. These were at first chosen anew for every particular session. But in March, 1775, they recommended to the people to choose a convention which should continue in office a year. This was done, accordingly, in April, 1775, and in the July following that convention passed an ordinance for the election of delegates in the month of April annually. It is well known that in July, 1775, a separation from Great Britain and establishment of republican government had never yet entered into any person's mind. A convention, therefore, chosen under that ordinance cannot be said to have been chosen for the purposes which certainly did not exist in the minds of those who passed it. Under this ordinance, at the annual election in April, 1776, a convention for the year was chosen. Independence and the establishment of a new form of government were not even yet the objects of the people at large. One extract from the pamphlet called *Common Sense* had appeared in the Virginia papers in February, and copies of the pamphlet itself had got in a few hands. But the idea had not been opened to the mass of the people in April, much less can it be said that they had made up their minds in its favor.

So that the electors of April, 1776, no more than the legislators of July, 1775, not thinking of independence and a permanent republic, could not mean to vest in these delegates powers of establishing them, or any authorities other than those of the ordinary legislature. So far as a temporary organization of government was necessary to render our opposition energetic, so far their organization was valid. But they received in their creation no powers but what were given to every legislature before and since. They could not, therefore, pass an act transcendent to the powers of other legislatures. If the present Assembly pass an act, and declare it shall be irrevocable by subsequent Assemblies, the declaration is merely void, and the act repealable, as other acts are. So far, and no farther authorized, they organized the government by the ordinance entitled a constitution or form of government. It pretends to no higher authority than the other ordinances of the same session; it does not say that it shall be perpetual; that it shall be unalterable by other legislatures; that it shall be transcendent above the powers of those who they knew would have equal power with themselves. Not only the silence of the instrument is a proof they thought it would be alterable, but their own practice also; for this very convention, meeting as a House of Delegates in General Assembly with the Senate in the autumn of that year, passed acts of assembly in

contradiction to their ordinance of government; and every Assembly from that time to this has done the same. I am safe, therefore, in the position that the Constitution itself is alterable by the ordinary legislature. Though this opinion seems founded on the first elements of common sense, yet is the contrary maintained by some persons, (1) Because, say they, the conventions were vested with every power necessary to make effectual opposition to Great Britain. But to complete this argument, they must go on, and say further that effectual opposition could not be made to Great Britain without establishing a form of government perpetual and unalterable by the legislature; which is not true. An opposition which at some time or other was to come to an end could not need a perpetual institution to carry it on; and a government amendable as its defects should be discovered was as likely to make effectual resistance as one that should be unalterably wrong. Besides, the Assemblies were as much vested with all powers requisite for resistance as the conventions were. If, therefore, these powers included that of modeling the form of government in the one case, they did so in the other. The Assemblies then as well as the conventions may model the government; that is, they may alter the ordinance of the government. (2) They urge that if the convention had meant that this instrument should be alterable, as their other ordinances were, they would have called it an ordinance; but they have called it a *constitution*, which, *ex vi termini*, means “an act above the power of the ordinary legislature.” I answer that *constitutio*, *constitutium*, *statutum*, *lex*, are convertible terms. . . . Thus in the statute 25 Hen. VIII. c. 19, § 1, “*Constitutions* and *ordinances*” are used as synonymous. The term *constitution* has many other significations in physics and politics; but in jurisprudence, whenever it is applied to any act of the legislature, it invariably means a statute, law, or ordinance, which is the present case. No inference then of a different meaning can be drawn from the adoption of this title; on the contrary, we might conclude that, by their affixing to it a term synonymous with ordinance or statute. But of what consequence is their meaning, where their power is denied? If they meant to do more than they had power to do, did this give them power? It is not the name, but the authority that renders an act obligatory. . . . To get rid of the magic supposed to be in the word *constitution*, let us translate it into its definition as given by those who think it above the power of the law; and let us suppose the convention, instead of saying, “We the ordinary legislature establish a *constitution*,” had said, “We the ordinary legislature establish an act *above the power of the ordinary legislature*.” Does not this expose the absurdity of the at-

tempt? (3) But, say they, the people have acquiesced, and this has given it an authority superior to the laws. It is true that the people did not rebel against it; and was that a time for the people to rise in rebellion? Should a prudent acquiescence, at a critical time, be construed into a confirmation of every illegal thing done during that period? Besides, why should they rebel? At an annual election they had chosen delegates for the year to exercise the ordinary powers of legislation, and to manage the great contest in which they were engaged. These delegates thought the contest would be best managed by an organized government. They therefore, among others, passed an ordinance of government. They did not presume to call it perpetual and unalterable. They well knew they had no power to make it so; that our choice of them had been for no such purpose, and at a time when we could have no such purpose in contemplation. Had an unalterable form of government been meditated, perhaps we should have chosen a different set of people. There was no cause then for the people to rise in rebellion. But to what dangerous lengths will this argument lead? Did the acquiescence of the colonies under the various acts of power exercised by Great Britain in our infant state confirm these acts, and so far invest them with the authority of the people as to render them unalterable, and our present resistance wrong? On every unauthoritative exercise of power by the legislature must the people rise in rebellion, or their silence be construed into a surrender of that power to them? If so, how many rebellions should we have had already? One certainly for every session of Assembly. The other states in the Union have been of opinion that to render a form of government unalterable by ordinary acts of Assembly, the people must delegate persons with special powers. They have accordingly chosen special conventions to form and fix their governments. The individuals then who maintain the contrary opinion in this country should have the modesty to suppose it possible that they may be wrong, and the rest of America right. But if there be only a possibility of their being wrong, if only a plausible doubt remains of the validity of the ordinance of government, is it not better to remove that doubt by placing it on a bottom which none will dispute? If they be right we shall only have the unnecessary trouble of meeting once in convention. If they be wrong, they expose us to the hazard of having no fundamental rights at all. True it is, this is no time for deliberating on forms of government. While an enemy is within our bowels, the first object is to expel him. But when this shall be done, when peace shall be established, and leisure given us for intrenching within good forms the rights for which we have bled, let no man be found indolent

enough to decline a little more trouble for placing them beyond the reach of question. If anything more be requisite to produce a conviction of the expediency of calling a convention at a proper season to fix our form of government, let it be the reflection:

6. That the Assembly exercises a power of determining the quorum of their own body which may legislate for us. After the establishment of the new form they adhered to the *Lex majoris partis*, founded in common law as well as common right. It is the natural law of every Assembly of men whose numbers are not fixed by any other law. They continued for some time to require the presence of a majority of their whole number to pass an act. But the British Parliament fixes its own quorum; our former Assemblies fixed their own quorum; and one precedent in favor of power is stronger than a hundred against it. The House of Delegates, therefore, have lately voted that, during the present dangerous invasion, forty members shall be a house to proceed to business. They have been moved to this by the fear of not being able to collect a house. But this danger could not authorize them to call that a house which was none; and if they may fix it at one number, they may at another, till it loses its fundamental character of being a representative body. As this vote expires with the present invasion, it is probable the former rule will be permitted to revive; because at present no ill is meant. The power, however, of fixing their own quorum has been avowed, and a precedent set. From forty it may be reduced to four, and from four to one; from a house to a committee, from a committee to a chairman or speaker, and thus an oligarchy or monarchy be substituted under forms supposed to be regular. "All bad precedents arise out of good; but where power comes into the hands of the ignorant or the indifferent, that new precedent proceeds from the worthy and the fit to the unworthy and the unfit."

When, therefore, it is considered that there is no legal obstacle to the assumption by the Assembly of all the powers legislative, executive, and judiciary, and that these may come to the hands of the smallest rag of delegation, surely the people will say, and their representatives, while yet they have honest representatives, will advise them to say, that they will not acknowledge as laws any acts not considered and assented to by the major part of their delegates.

In enumerating the defects of the Constitution, it would be wrong to count among them what is only the error of particular persons. In December, 1776, our circumstances being much distressed, it was proposed in the House of Delegates to create a *dictator*, invested with every power legislative, executive, and judiciary, civil and military, of life and of

death, over our persons and over our properties; and in June, 1781, again under calamity, the same proposition was repeated, and wanted a few votes only of being passed. One who entered into this contest from a pure love of liberty, and a sense of injured rights, who determined to make every sacrifice, and to meet every danger, for the re-establishment of those rights on a firm basis, who did not mean to expend his blood and substance for the wretched purpose of changing this matter for that, but to place the powers of governing him in a plurality of hands of his own choice, so that the corrupt will of no one man might in future oppress him, must stand confounded and dismayed when he is told that a considerable portion of that plurality had mediated the surrender of them into a single hand, and, in lieu of a limited monarchy, to deliver him over to a despotic one! How must we find his efforts and sacrifices abused and baffled, if he may still, by a single vote, be laid prostrate at the feet of one man! In God's name, from whence have they derived this power? Is it from our ancient laws? None such can be produced. Is it from any principle in our new Constitution expressed or implied? Every lineament expressed or implied is in full opposition to it. Its fundamental principle is that the state shall be governed as a commonwealth. It provides a republican organization, proscribes under the name of *prerogative* the exercise of all powers undefined by the laws; places on this basis the whole system of our laws; and by consolidating them together chooses that they should be left to stand or fall together, never providing for any circumstances, nor admitting that such could arise, wherein either should be suspended; no, not for a moment. Our ancient laws expressly declare that those who are but delegates themselves shall not delegate to others powers which require judgment and integrity in their exercise. Or was this proposition moved on a supposed right in the movers of abandoning their posts in a moment of distress? The same laws forbid the abandonment of that post, even on ordinary occasions; and much more a transfer of their powers into other hands and other forms without consulting the people. They never admit the idea that these, like sheep or cattle, may be given from hand to hand without an appeal to their own will. Was it from the necessity of the case? Necessities which dissolve a government do not convey its authority to an oligarchy or a monarchy. They throw back into the hands of the people the powers they had delegated, and leave them as individuals to shift for themselves. A leader may offer but not impose himself, nor be imposed on them. Much less can their necks be submitted to his sword, their breath to be held at his will or caprice. The necessity which should operate these tremendous effects should at

least be palpable and irresistible. Yet in both instances, where it was feared, or pretended with us, it was belied by the event. It was belied, too, by the preceding experience of our sister states, several of whom had grappled through greater difficulties without abandoning their forms of government. When the proposition was first made, Massachusetts had found even the government of committees sufficient to carry them through an invasion. But we at the time of that proposition were under no invasion. When the second was made, there had been added to this example those of Rhode Island, New York, New Jersey, and Pennsylvania, in all of which the republican form had been found equal to the task of carrying them through the severest trials. In this state alone did there exist so little virtue that fear was to be fixed in the hearts of the people, and to become the motive of their exertions and principle of their government? The very thought alone was treason against the people; was treason against mankind in general, as riveting forever the chains which bow down their necks, by giving to their oppressors a proof, which they would have trumpeted through the universe, of the imbecility of republican government, in times of pressing danger, to shield them from harm. Those who assume the right of giving away the reins of government in any case must be sure that the herd, whom they hand on to the rods and hatchet of the dictator, will lay their necks on the block when they shall nod to them. But if our assemblies supposed such a recognition in the people, I hope they mistook their character. I am of opinion that the government, instead of being braced and invigorated for greater exertions under their difficulties, would have been thrown back upon the bungling machinery of county committees for administration, till a convention could have been called, and its wheels again set into regular motion. What a cruel moment was this for creating such an embarrassment, for putting to the proof the attachment of our countrymen to republican government! Those who meant well, of the advocates of this measure (and most of them meant well, for I know them personally, had been their fellow laborer in the common cause, and had often proved the purity of their principles), had been seduced in their judgment by the example of an ancient republic, whose constitution and circumstances were fundamentally different. They had sought this precedent in the history of Rome, where alone it was to be found, and where at length, too, it had proved fatal. They had taken it from a republic rent by the most bitter factions and tumults, where the government was of a heavy-handed unfeeling aristocracy, over a people ferocious, and rendered desperate by poverty and wretchedness; tumults which could not be allayed under

the most trying circumstances, but by the omnipotent hand of a single despot. Their constitution, therefore, allowed a temporary tyrant to be erected, under the name of a dictator; and that temporary tyrant, after a few examples, became perpetual. They misapplied this precedent to a people mild in their dispositions, patient under their trial, united for the public liberty, and affectionate to their leaders. But if from the constitution of the Roman government there resulted to their Senate a power of submitting all their rights to the will of one man, does it follow that the Assembly of Virginia have the same authority? What clause in our constitution has substituted that of Rome, by way of residuary provision, for all cases not otherwise provided for? Or if they may step *ad libitum* into any other form of government for precedents to rule us by, for what oppression may not a precedent be found in this world of the *bellum omnium in omnia* [war of all against all]? Searching for the foundations of this proposition, I can find none which may pretend a color of right or reason, but the defect before developed, that there being no barrier between the legislative, executive, and judiciary departments, the legislature may seize the whole; that having seized it, and possessing a right to fix their own quorum, they may reduce that quorum to one, whom they may call a chairman, speaker, dictator, or by any other name they please. Our situation is indeed perilous, and I hope my countrymen will be sensible of it, and will apply, at a proper season, the proper remedy; which is a convention to fix the Constitution, to amend its defects, to bind up the several branches of government by certain laws, which, when they transgress, their acts shall become nullities; to render unnecessary an appeal to the people, or in other words a rebellion, on every infraction of their rights, on the peril that their acquiescence shall be construed into an intention to surrender those rights.

*The foregoing is taken
from Thomas Jefferson's* NOTES ON VIRGINIA.

First Inaugural Address

C

Friends and Fellow Citizens:

Called upon to undertake the duties of the first executive office of our country, I avail myself of the presence of that portion of my fellow citizens which is here assembled, to express my grateful thanks for the favor with which they have been pleased to look toward me, to declare a sincere consciousness that the task is above my talents, and that I approach it with those anxious and awful presentiments which the greatness of the charge and the weakness of my powers so justly inspire. A rising nation, spread over a wise and fruitful land, traversing all the seas with the rich productions of their industry, engaged in commerce with nations who feel power and forget right, advancing rapidly to destinies beyond the reach of mortal eye—when I contemplate these transcendent objects, and see the honor, the happiness, and the hopes of this beloved country committed to the issue and the auspices of this day, I shrink from the contemplation, and humble myself before the magnitude of the undertaking. Utterly, indeed, should I despair did not the presence of many whom I here see remind me that, in the other high authorities provided by our constitution, I shall find resources of wisdom, of virtue, and of zeal on which to rely under all difficulties. To you, then, gentlemen, who are charged with the sovereign functions of legislation, and to those associated with you, I look with encouragement for that guidance and support which may enable us to steer with safety the vessel in which we are all embarked amid the conflicting elements of a troubled world.

During the contest of opinion through which we have passed, the animation of discussion and of exertions has sometimes worn an aspect which might impose on strangers unused to think freely and to speak and to write what they think; but this being now decided by the voice of the nation, announced according to the rules of the constitution, all will, of course, arrange themselves under the will of the law, and unite in com-

mon efforts for the common good. All, too, will bear in mind this sacred principle, that though the will of the majority is in all cases to prevail, that will, to be rightful, must be reasonable; that the minority possess their equal rights, which equal laws must protect, and to violate which would be oppression. Let us, then, fellow citizens, unite with one heart and one mind. Let us restore to social intercourse that harmony and affection without which liberty and even life itself are but dreary things. And let us reflect that having banished from our land that religious intolerance under which mankind so long bled and suffered, we have yet gained little if we countenance a political intolerance as despotic, as wicked, and capable of as bitter and bloody persecutions. During the throes and convulsions of the ancient world, during the agonizing spasms of infuriated man, seeking through blood and slaughter his long-lost liberty, it was not wonderful that the agitations of the billows should reach even this distant and peaceful shore; that this should be more felt and feared by some and less by others; that this should divide opinions as to measures of safety. But every difference of opinion is not a difference of principle. We have called by different names brethren of the same principle. We are all republicans—we are federalists. If there be any among us who would wish to dissolve this Union or to change its republican form, let them stand undisturbed as monuments of the safety with which error of opinion may be tolerated where reason is left free to combat it. I know, indeed, that some honest men fear that a republican government cannot be strong; that this government is not strong enough. But would the honest patriot, in the full tide of successful experiment, abandon a government which has so far kept us free and firm, on the theoretic and visionary fear that this government, the world's best hope, may by possibility want energy to preserve itself? I trust not. I believe this, on the contrary, the strongest government on earth. I believe it is the only one where every man, at the call of the laws, would fly to the standard of the law, and would meet invasions of the public order as his own personal concern. Sometimes it is said that man cannot be trusted with the government of himself. Can he, then, be trusted with the government of others? Or have we found angels in the forms of kings to govern him? Let history answer this question.

Let us, then, with courage and confidence pursue our own federal and republican principles, our attachment to our union and representative government. Kindly separated by nature and a wide ocean from the exterminating havoc of one quarter of the globe; too high-minded to endure the degradations of the others; possessing a chosen country, with room

enough for our descendants to the hundredth and thousandth generation; entertaining a due sense of our equal right to the use of our own faculties, to the acquisitions of our industry, to honor and confidence from our fellow citizens, resulting not from birth but from our actions and their sense of them; enlightened by a benign religion, professed, indeed, and practiced in various forms, yet all of them including honesty, truth, temperance, gratitude, and the love of man; acknowledging and adoring an overruling Providence, which by all its dispensations proves that it delights in the happiness of man here and his greater happiness hereafter; with all these blessings, what more is necessary to make us a happy and prosperous people? Still one thing more, fellow citizens—a wise and frugal government, which shall restrain men from injuring one another, which shall leave them otherwise free to regulate their own pursuits of industry and improvement, and shall not take from the mouth of labor the bread it has earned. This is the sum of good government, and this is necessary to close the circle of our felicities.

About to enter, fellow citizens, on the exercise of duties which comprehend everything dear and valuable to you, it is proper that you should understand what I deem the essential principles of our government, and consequently those which ought to shape its administration. I will compress them within the narrowest compass they will bear, stating the general principle, but not all its limitations. Equal and exact justice to all men, of whatever state or persuasion, religious or political; peace, commerce, and honest friendship with all nations—entangling alliances with none; the support of the state governments in all their rights, as the most competent administrations for our domestic concerns and the surest bulwarks against antirepublican tendencies; the preservation of the general government in its whole constitutional vigor, as the sheet anchor of our peace at home and safety abroad; a jealous care of the right of election by the people—a mild and safe corrective of abuses which are lopped by the sword of the revolution where peaceable remedies are unprovided; absolute acquiescence in the decisions of the majority—the vital principle of republics, from which there is no appeal but to force, the vital principle and immediate parent of despotism; a well-disciplined militia—our best reliance in peace and for the first moments of war, till regulars may relieve them; the supremacy of the civil over the military authority; economy in the public expense, that labor may be lightly burdened; the honest payment of our debts and sacred preservation of the public faith; encouragement of agriculture, and of commerce as its handmaid; the diffusion of information and the arraignment of all abuses at

the bar of public reason, freedom of religion; freedom of the press; freedom of person under the protection of the habeas corpus; and trial by juries impartially selected—these principles form the bright constellation which has gone before us, and guided our steps through an age of revolution and reformation. The wisdom of our sages and the blood of our heroes have been devoted to their attainment. They should be the creed of our political faith—the text of civil instruction—the touchstone by which to try the services of those we trust; and should we wander from them in moments of error or alarm, let us hasten to retrace our steps and to regain the road which alone leads to peace, liberty, and safety.

I repair, then, fellow citizens, to the post you have assigned me. With experience enough in subordinate offices to have seen the difficulties of this, the greatest of all, I have learned to expect that it will rarely fall to the lot of imperfect man to retire from this station with the reputation and the favor which bring him into it. Without pretensions to that high confidence reposed in our first and great revolutionary character, whose pre-eminent services had entitled him to the first place in his country's love, and destined for him the fairest page in the volume of faithful history, I ask so much confidence only as may give firmness and effect to the legal administration of your affairs. I shall often go wrong through defect of judgment. When right, I shall often be thought wrong by those whose positions will not command a view of the whole ground. I ask your indulgence for my own errors, which will never be intentional; and your support against the errors of others, who may condemn what they would not if seen in all its parts. The approbation implied by your suffrage is a consolation to me for the past; and my future solicitude will be to retain the good opinion of those who have bestowed it in advance, to conciliate that of others by doing them all the good in my power, and to be instrumental to the happiness and freedom of all.

Relying, then, on the patronage of your good will, I advance with obedience to the work, ready to retire from it whenever you become sensible how much better choice it is in your power to make. And may that Infinite Power which rules the destinies of the universe lead our councils to what is best, and give them a favorable issue for your peace and prosperity.

Biographical Sketches

THE CHARACTER OF GEORGE WASHINGTON

I think I knew General Washington intimately and thoroughly; and were I called on to delineate his character, it should be in terms like these.

His mind was great and powerful, without being of the very first order; his penetration strong, though not so acute as that of a Newton, Bacon, or Locke; and as far as he saw, no judgment was ever sounder. It was slow in operation, being little aided by invention or imagination, but sure in conclusion. Hence the common remark of his officers, of the advantage he derived from councils of war, where hearing all suggestions, he selected whatever was best; and certainly no general ever planned his battles more judiciously. But if deranged during the course of the action, if any member of his plan was dislocated by sudden circumstances, he was slow in re-adjustment. The consequence was that he often failed in the field, and rarely against an enemy in station, as at Boston and York. He was incapable of fear, meeting personal dangers with the calmest unconcern. Perhaps the strongest feature in his character was prudence, never acting until every circumstance, every consideration, was maturely weighed; refraining if he saw a doubt, but, when once decided, going through with his purpose, whatever obstacles opposed. His integrity was most pure, his justice the most inflexible I have ever known, no motives of interest or consanguinity, of friendship or hatred, being able to bias his decision. He was, indeed, in every sense of the words, a wise, a good, and a great man. His temper was naturally irritable and high toned; but reflection and resolution had obtained a firm and habitual ascendancy over it. If ever, however, it broke its bonds, he was most tremendous in his wrath. In his expenses he was honorable, but exact; liberal in contributions to whatever promised utility; but frowning and unyielding on all visionary projects, and all unworthy calls on his charity. His heart was

not warm in its affections; but he exactly calculated every man's value, and gave him a solid esteem proportioned to it. His person, you know, was fine, his stature exactly what one would wish, his deportment easy, erect and noble; the best horseman of his age, and the most graceful figure that could be seen on horseback. Although in the circle of his friends, where he might be unreserved with safety, he took a free share in conversation, his colloquial talents were not above mediocrity, possessing neither copiousness of ideas, nor fluency of words. In public, when called on for a sudden opinion, he was unready, short and embarrassed. Yet he wrote readily, rather diffusely, in an easy and correct style. This he had acquired by conversation with the world, for his education was merely reading, writing and common arithmetic, to which he added surveying at a later day. His time was employed in action chiefly, reading little, and that only in agriculture and English history. His correspondence became necessarily extensive, and, with journalizing his agricultural proceedings, occupied most of his leisure hours within doors. On the whole, his character was, in its mass, perfect, in nothing bad, in few points indifferent; and it may truly be said that never did nature and fortune combine more perfectly to make a man great, and to place him in the same constellation with whatever worthies have merited from man an everlasting remembrance. For his was the singular destiny and merit, of leading the armies of his country successfully through an arduous war, for the establishment of its independence; of conducting its councils through the birth of a government, new in its forms and principles, until it had settled down into a quiet and orderly train; and of scrupulously obeying the laws through the whole of his career, civil and military, of which the history of the world furnishes no other example.

. . . I am satisfied the great body of republicans think of him as I do. We were, indeed, dissatisfied with him on his ratification of the British treaty. But this was short lived. We knew his honesty, the wiles with which he was encompassed, and that age had already begun to relax the firmness of his purposes; and I am convinced he is more deeply seated in the love and gratitude of the republicans than in the Pharisaical homage of the federal monarchists. For he was no monarchist from preference of his judgment. The soundness of that gave him correct views of the rights of man, and his severe justice devoted him to them. He has often declared to me that he considered our new Constitution as an experiment on the practicability of republican government, and with what dose of liberty man could be trusted for his own good; that he was determined the experiment should have a fair trial, and would lose the last drop of

his blood in support of it. And these declarations he repeated to me the oftener and more pointedly because he knew my suspicions of Colonel Hamilton's views, and probably had heard from him the same declarations which I had, to wit, "that the British constitution, with its unequal representation, corruption and other existing abuses, was the most perfect government which had ever been established on earth, and that a reformation of those abuses would make it an impracticable government." I do believe that General Washington had not a firm confidence in the durability of our government. He was naturally distrustful of men, and inclined to gloomy apprehensions; and I was ever persuaded that a belief that we must at length end in something like a British constitution had some weight in his adoption of the ceremonies of levees, birthdays, pompous meetings with Congress, and other forms of the same character, calculated to prepare us gradually for a change which he believed possible, and to let it come on with as little shock as might be to the public mind.

These are my opinions of General Washington, which I would vouch at the judgment seat of God, having been formed on an acquaintance of thirty years. I served with him in the Virginia legislature from 1769 to the Revolutionary War, and again, a short time in Congress, until he left us to take command of the army. During the war and after it we corresponded occasionally, and in the four years of my continuance in the office of Secretary of State, our intercourse was daily, confidential and cordial. After I retired from that office, great and malignant pains were taken by our federal monarchists, and not entirely without effect, to make him view me as a theorist, holding French principles of government, which would lead infallibly to licentiousness and anarchy. And to this he listened the more easily, from my known disapprobation of the British treaty. I never saw him afterwards, or these malignant insinuations should have been dissipated before his just judgment, as mists before the sun. I felt on his death, with my countrymen, that "verily a great man hath fallen this day in Israel."

ANECDOTES OF BENJAMIN FRANKLIN

Our revolutionary process, as is well known, commenced by petitions, memorials, remonstrances, etc., from the old Congress. These were followed by a non-importation agreement, as a pacific instrument of coercion. While that was before us, and sundry exceptions, as of arms, ammunition, etc., were moved from different quarters of the house, I was sitting by Dr. Franklin and observed to him that I thought we should

except books; that we ought not to exclude science, even coming from an enemy. He thought so too, and I proposed the exception, which was agreed to. Soon after it occurred that medicine should be excepted, and I suggested that also to the Doctor. "As to that," said he, "I will tell you a story. When I was in London, in such a year, there was a weekly club of physicians, of which Sir John Pringle was president, and I was invited by my friend Dr. Fothergill to attend when convenient. Their rule was to propose a thesis one week and discuss it the next. I happened there when the question to be considered was whether physicians had, on the whole, done most good or harm? The young members, particularly, having discussed it very learnedly and eloquently till the subject was exhausted, one of them observed to Sir John Pringle, that although it was not usual for the President to take part in a debate, yet they were desirous to know his opinion on the question. He said they must first tell him whether, under the appellation of physicians, they meant to include *old women*; if they did he thought they had done more good than harm, otherwise more harm than good."

The Confederation of the States, while on the carpet before the old Congress, was strenuously opposed by the smaller States, under apprehensions that they would be swallowed up by the larger ones. We were long engaged in the discussion; it produced great heats, much ill humor, and intemperate declarations from some members. Dr. Franklin at length brought the debate to a close with one of his little apologues. He observed that "at the time of the union of England and Scotland, the Duke of Argyle was most violently opposed to that measure, and among other things predicted that, as the whale had swallowed Jonah, so Scotland would be swallowed by England. However," said the Doctor, "when Lord Bute came into the government, he soon brought into its administration so many of his countrymen, that it was found in event that Jonah swallowed the whale." This little story produced a *general* laugh, and restored good humor, and the article of difficulty was passed.

When Dr. Franklin went to France, on his revolutionary mission, his eminence as a philosopher, his venerable appearance, and the cause on which he was sent, rendered him extremely popular. For all ranks and conditions of men there entered warmly into the American interest. He was, therefore, feasted and invited into all the court parties. At these he sometimes met the old Duchess of Bourbon, who, being a chess player of about his force, they very generally played together. Happening once

to put her king into prize, the Doctor took it. "Ah," said she, "we do not take kings so." "We do in America," said the Doctor.

At one of these parties the Emperor Joseph III, then at Paris incognito, under the title of Count Falkenstein, was overlooking the game in silence, while the company was engaged in animated conversations on the American question. "How happens it M.le Comte," said the Duchess, "that while we all feel so much interest in the cause of the Americans, you say nothing for them?" "I am a king by trade," said he.

When the Declaration of Independence was under the consideration of Congress, there were two or three unlucky expressions in it which gave offense to some members. The words "Scotch and other foreign auxiliaries" excited the ire of a gentleman or two of that country. Severe strictures on the conduct of the British king, in negotiating our repeated repeals of the law which permitted the importation of slaves, were disapproved by some Southern gentlemen, whose reflections were not yet matured to the full abhorrence of that traffic. Although the offensive expressions were immediately yielded these gentlemen continued their depredations on other parts of the instrument. I was sitting by Dr. Franklin, who perceived that I was not insensible to these mutilations. "I have made it a rule," said he, "whenever in my power, to avoid becoming the draughtsmen of papers to be reviewed by a public body. I took my lesson from an incident which I will relate to you. When I was a journeyman printer, one of my companions, an apprentice hatter, having served out his time, was about to open shop for himself. His first concern was to have a handsome signboard, with a proper inscription. He composed it in these words, 'John Thompson, *Hatter, makes and sells hats* for ready money,' with a figure of a hat subjoined; but he thought he would submit it to his friends for their amendments. The first he showed it to thought the word '*Hatter*' tautologous, because followed by the words 'makes hats,' which show he was a hatter. It was struck out. The next observed that the word '*makes*' might as well be omitted, because his customers would not care who made the hats. If good and to their mind, they would buy, by whomsoever made. He struck it out. A third said he thought the words '*for ready money*' were useless, as it was not the custom of the place to sell on credit. Everyone who purchased expected to pay. They were parted with, and the inscription now stood, 'John Thompson sells hats.' '*Sells hats!*' says his next friend. Why nobody will expect you to give them away, what then is the use of that word? It was stricken out, and '*hats*' followed it, the rather as there was one painted on the board.

So the inscription was reduced ultimately to 'John Thompson' with the figure of a hat subjoined."

The Doctor told me at Paris the two following anecdotes of the Abbé Raynal. He had a party to dine with him one day at Passy, of whom one half were Americans, the other half French, and among the last was the Abbé. During the dinner he got on his favorite theory of the degeneracy of animals, and even of man, in America, and urged it with his usual eloquence. The Doctor at length noticing the accidental stature and position of his guests, at table, "Come," says he, "M. l'Abbé, let us try this question by the fact before us. We are here one half Americans, and one half French, and it happens that the Americans have placed themselves on one side of the table, and our French friends are on the other. Let both parties rise, and we will see on which side nature has degenerated." It happened that his American guests were Carmichael, Harmer, Humphreys, and others of the finest stature and form; while those of the other side were remarkably diminutive, and the Abbé himself particularly was a mere shrimp. He parried the appeal, however, by a complimentary admission of exceptions, among which the Doctor himself was a conspicuous one.

The Doctor and Silas Deane were in conversation one day at Passy, on the numerous errors in the Abbé's *Histoire des deux Indes*, when he happened to step in. After the usual salutations, Silas Deane said to him, "The Doctor and myself, Abbé, were just speaking of the errors of fact into which you have been led in your history." "Oh, no Sir," said the Abbé, "that is impossible. I took the greatest care not to insert a single fact for which I had not the most unquestionable authority." "Why," says Deane, "there is the story of Polly Baker, and the eloquent apology you have put into her mouth, when brought before a court of Massachusetts to suffer punishment under a law which you cite, for having had a bastard. I know there never was such a law in Massachusetts." "Be assured," said the Abbé, "you are mistaken, and that that is a true story. I do not immediately recollect indeed the particular information on which I quote it; but I am certain that I had for it unquestionable authority." Doctor Franklin, who had been for some time shaking with unrestrained laughter at the Abbé's confidence in his authority for that tale, said, "I will tell you, Abbé, the origin of that story. When I was a printer and editor of a newspaper, we were sometimes slack of news, and to amuse our customers, I used to fill up our vacant columns with anecdotes and fables, and fancies of my own, and this of Polly Baker is a story of my making,

on one of these occasions.” The Abbé, without the least disconcert, exclaimed with a laugh, “Oh, very well, Doctor, I had rather relate your stories than other men’s truths.”

*“The Character of George Washington” is taken
from Jefferson’s letter to Dr. Walter Jones, written January 2, 1814;
the “Anecdotes of Benjamin Franklin” are taken
from a letter to Robert Walsh, written December 4, 1818.*

Benjamin Franklin

1706–1790

Benjamin Franklin—workman, printer, inventor, scientist, philosopher, and statesman—was the fifteenth child of a New England soap- and candlemaker. He was born in Boston in 1706, and attended school there till the age of ten. In Philadelphia, at seventeen, he had learned the printer's trade, and had started his career as an author in the *New England Courant*. With a promise of help from Governor Keith of Pennsylvania, he sailed for England in 1724, to get equipment to set up a printing firm of his own. The promise proved hollow, however, and he returned to Philadelphia two years later a wiser man.

Then the remarkable success story began. In 1730 Franklin was owner of his own printing shop and publisher of the *Pennsylvania Gazette*, and had become an author. In *Poor Richard's Almanack*, which he published from the early 1730's through 1757, he drew an unforgettable picture of Yankee commonsense, shrewdness, thrift, and enterprise. His pithy sayings epitomized, and helped to shape, the new American. So successful were Franklin's printing operations that he was able to retire from business at forty-two, and to devote himself to science.

Although engrossed in many enterprises, Franklin had somehow found time to study literature, history, technological problems, science, and foreign languages. His self-taught genius was eventually acknowledged by scholars and scientists in many countries. His most spectacular achievement was his demonstration—by way of a kite sailed in a thunderstorm—that lightning is electricity. His most lasting achievement may have been the founding of the American Philosophical Society in 1743, and the Academy of Philadelphia in 1751.

Franklin also found time to hold various public offices. He was

post-master general for the northern colonies (1753–74), a delegate to the Albany Congress (1754), and twenty years later he was made president of the Pennsylvania Executive Council. On several important diplomatic missions to England and to France, his shrewdness, wit, amiability, and scientific reputation made a strong impression, and difficult negotiations prospered.

He had sought a compromise with England, but when he saw this was impossible, he threw all his weight behind the Revolution. He died at the age of eighty-four, full of honor—a highly original American, but also a very typical one.

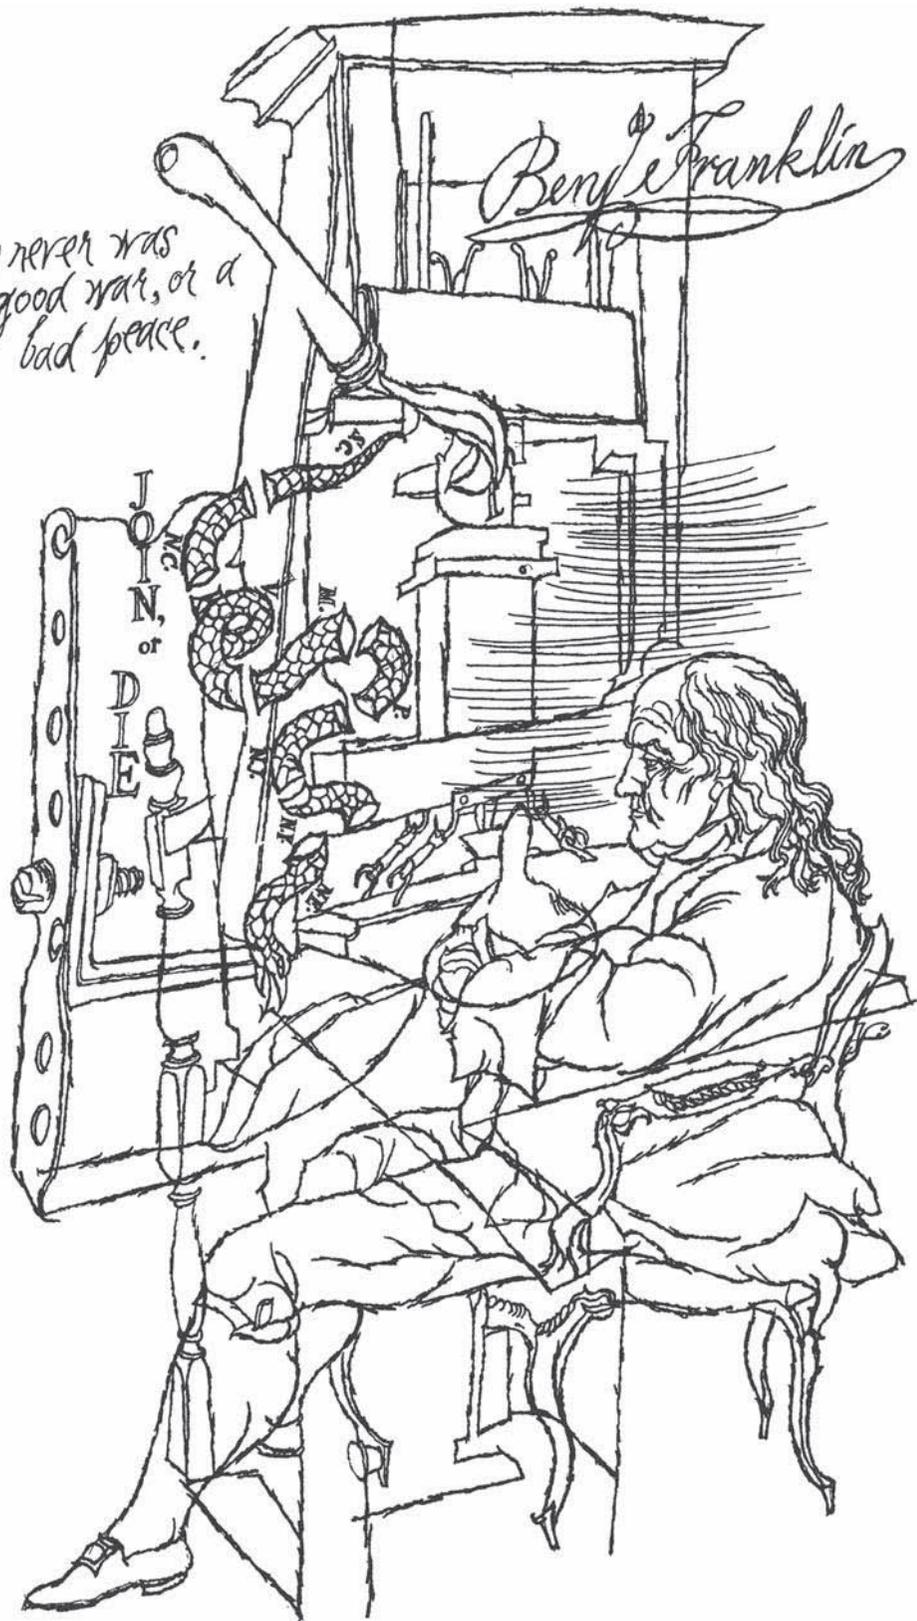

In 1743 Franklin proposed the establishment of a Philosophical Society. He had observed the lack of communication in what he called “a long tract of continent.” Reading newspapers from other colonies, he became aware of intellectual interests scattered over a wide area. It was obvious that some regular means of exchanging ideas was needed. The model for the proposed Philosophical Society was The Royal Society of London, which had been founded in 1660. Franklin knew what a great part The Royal Society had played in advancing science in England, and hoped for similar developments, though on a smaller scale, in the New World.

Like The Royal Society, Franklin’s Philosophical Society was to combine technology with pure science, was to promote shipping, industry, and agriculture, as well as mathematics, physics, chemistry, and the biological sciences. He believed that science and technology were interdependent, and that the one would fructify the other. As science advanced, the colonies would be strengthened economically. Life would be made far easier and richer by laborsaving machinery and improvements in agriculture. Men might be transported from place to place with great rapidity, he said—sustained in the air. In short, Franklin had great hopes for technology, and they have been fully confirmed.

Notes from the artist: “The seated portrait of Franklin is based upon a rare, contemporary water color. In the background are suggestions of Franklin’s private career as a printer and his public career as a diplomat and patriot. The segmented snake, representing the colonies, was designed by Franklin more than twenty years before the American Revolution. The quotation is from a letter to Josiah Quincy.”

*There never was
a good war, or a
bad peace.*

Benjamin Franklin

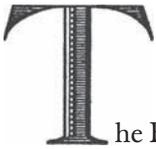

As early as 1743, Franklin proposed the founding of an educational institution—an Academy—in Philadelphia, and he projected it in a pamphlet which he himself printed in 1749. The school opened under his sponsorship in 1751.

It is well to remember that Pennsylvania had few schools at the time of Franklin; the teachers were poorly prepared and even more poorly paid. A few children of the wealthy were educated by tutors, but the rest had few opportunities. It was typical of Franklin's practical turn of mind and also of his sincerity that he not only *proposed* the establishment of the Academy but also took a keen interest in the financial arrangements which would alone make it possible. Separating well-to-do citizens from their money for educational purposes was something new and painful. Yet Franklin's efforts were successful. The school weathered financial drought and eventually became the University of Pennsylvania.

Franklin's ideas on education were a combination of old and new, and forecast the kind of education which was to prevail in the United States. He proposed that the students learn "those things that are likely to be most useful and most ornamental." The emphasis on the useful was new, and so was the provision for exercise and sports to promote health. The recommendation that the masters "look on the students as in some sort their children" and "treat them with familiarity and affection" was novel and humane.

Franklin's central idea was that learning and learning alone confers "benignity of mind" and "an ability to serve mankind, one's country, friends, and family." This ideal is worth comparing with the aims of education as expressed by other writers included in this set—Swift, Bacon, Schopenhauer, Dewey, and Faraday.

A Proposal for Promoting Useful Knowledge among the British Plantations in America

The English are possessed of a long tract of continent, from Nova Scotia to Georgia, extending north and south through different climates, having different soils, producing different plants, mines, and minerals, and capable of different improvements, manufactures, etc.

The first drudgery of settling new colonies, which confines the attention of people to mere necessaries, is now pretty well over; and there are many in every province in circumstances that set them at ease, and afford leisure to cultivate the finer arts and improve the common stock of knowledge. To such of these who are men of speculation, many hints must from time to time arise, many observations occur, which if well examined, pursued, and improved might produce discoveries to the advantage of some or all of the British plantations, or to the benefit of mankind in general.

But as from the extent of the country such persons as widely separated, and seldom can see and converse or be acquainted with each other, so that many useful particulars remain uncommunicated, die with the discoverers, and are lost to mankind; it is, to remedy this inconvenience for the future, proposed:

That one society be formed of *virtuosi* or ingenious men, residing in the several colonies, to be called The American Philosophical Society, who are to maintain a constant correspondence.

That Philadelphia, being the city nearest the center of the continent colonies, communicating with all of them northward and southward by post, and with all the islands by sea, and having the advantage of a good growing library, be the center of the Society.

That at Philadelphia there be always at least seven members, viz., a physician, a botanist, a mathematician, a chemist, a mechanician, a

geographer, and a general natural philosopher, besides a president, treasurer, and secretary.

That these members meet once a month, or oftener, at their own expense, to communicate to each other their observations and experiments; to receive, read, and consider such letters, communications, or queries as shall be sent from distant members; to direct the dispersing of copies of such communications as are valuable, to other distant members, in order to procure their sentiments thereupon.

That the subjects of the correspondence be: all new-discovered plants, herbs, trees, roots, their virtues, uses, etc.; methods of propagating them, and making such as are useful, but particular to some plantations, more general; improvements of vegetable juices, as ciders, wines, etc.; new methods of curing or preventing diseases; all new-discovered fossils in different countries, as mines, minerals, and quarries; new and useful improvements in any branch of mathematics; new discoveries in chemistry, such as improvements in distillation, brewing, and assaying of ores; new mechanical inventions for saving labor, as mills and carriages, and for raising and conveying of water, draining of meadows, etc.; all new arts, trades, and manufactures that may be proposed or thought of; surveys, maps, and charts of particular parts of the seacoasts or inland countries; course and junction of rivers and great roads, situation of lakes and mountains, nature of the soil and productions; new methods of improving the breed of useful animals; introducing other sorts from foreign countries; new improvements in planting, gardening, and clearing land; and all philosophical experiments that let light into the nature of things, tend to increase the power of man over matter, and multiply the conveniences or pleasures of life.

That a correspondence, already begun by some intended members, shall be kept up by this Society with the Royal Society of London, and with the Dublin Society.

That every member shall have abstracts sent him quarterly, of everything valuable communicated to the Society's Secretary at Philadelphia; free of all charge except the yearly payment hereafter mentioned.

That, by permission of the postmaster-general, such communications pass between the Secretary of the Society and the members, postage free.

That, for defraying the expense of such experiments as the Society shall judge proper to cause to be made, and other contingent charges for the common good, every member sent a piece of eight per annum to the treasurer, at Philadelphia, to form a common stock, to be disbursed by order of the President with the consent of the majority of the members

that can conveniently be consulted thereupon, to such persons and places where and by whom the experiments are to be made, and otherwise as there shall be occasion; of which disbursements an exact account shall be kept, and communicated yearly to every member.

That, at the first meetings of the members at Philadelphia, such rules be formed for regulating their meetings and transactions for the general benefit as shall be convenient and necessary; to be afterwards changed and improved as there shall be occasion, wherein due regard is to be had to the advice of distant members.

That, at the end of every year, collections be made and printed of such experiments, discoveries, and improvements as may be thought of public advantage; and that every member have a copy sent him.

That the business and duty of the Secretary be to receive all letters intended for the Society, and lay them before the President and members at their meetings; to abstract, correct, and methodize such papers as require it, and as he shall be directed to do by the President, after they have been considered, debated, and digested in the Society; to enter copies thereof in the Society's books, and make out copies for distant members; to answer their letters by direction of the President, and keep records of all material transactions of the Society.

Benjamin Franklin, the writer of this Proposal, offers himself to serve the Society as their secretary till they shall be provided with one more capable.

Proposals Relating to the Education of Youth in Pennsylvania

ADVERTISEMENT TO THE READER

It has long been regretted as a misfortune to the youth of this province that we have no academy in which they might receive the accomplishments of a regular education. The following paper of hints towards forming a plan for that purpose is so far approved by some public-spirited gentlemen, to whom it has been privately communicated, that they have directed a number of copies to be made by the press, and properly distributed, in order to obtain the sentiments and advice of men of learning, understanding, and experience in these matters; and have determined to use their interest and best endeavours to have the scheme, when completed, carried gradually into execution; in which they have reason to believe they shall have the hearty concurrence and assistance of many who are well-wishers to their country. Those who incline to favor the design with their advice, either as to the parts of learning to be taught, the order of study, the method of teaching, the economy of the school, or any other matter of importance to the success of the undertaking are desired to communicate their sentiments as soon as may be, by letter directed to B. FRANKLIN, *Printer*, in Philadelphia.

PROPOSALS

The good education of youth has been esteemed by wise men in all ages as the surest foundation of the happiness both of private families and of commonwealths. Almost all governments have therefore made it a principal object of their attention to establish and endow with proper revenues such seminaries of learning as might supply the succeeding age

with men qualified to serve the public with honor to themselves, and to their country.

Many of the first settlers of these provinces were men who had received a good education in Europe, and to their wisdom and good management we owe much of our present prosperity. But their hands were full, and they could not do all things. The present race are not thought to be generally of equal ability: for though the American youth are allowed not to want capacity, yet the best capacities require cultivation, it being truly with them as with the best ground, which unless well tilled and sowed with profitable seed produces only ranker weeds.

That we may obtain the advantages arising from an increase in knowledge, and prevent as much as may be the mischievous consequences that would attend a general ignorance among us, the following hints are offered towards forming a plan for the education of the youth of Pennsylvania, viz.

It is proposed:

That some persons of leisure and public spirit apply for a charter by which they may be incorporated, with power to erect an academy for the education of youth, to govern the same, provide masters, make rules, receive donations, purchase lands, etc., and to add to their number, from time to time, such other persons as they shall judge suitable.

That the members of the corporation make it their pleasure, and in some degree their business, to visit the Academy often, encourage and countenance the youth, countenance and assist the masters, and by all means in their power advance the usefulness and reputation of the design; that they look on the students as in some sort their children, treat them with familiarity and affection, and, when they have behaved well, and gone through their studies, and are to enter the world, zealously unite, and make all the interest that can be made to establish them, whether in business, offices, marriages, or any other thing for their advantage, preferably to all other persons whatsoever even of equal merit.

And if men may, and frequently do, catch such a taste for cultivating flowers, for planting, grafting, inoculating [grafting], and the like, as to despise all other amusements for their sake, why may not we expect they should acquire a relish for that more useful culture of young minds? Thompson says,

'Tis joy to see the human blossoms blow,
When infant reason grows apace, and calls
For the kind hand of an assiduous care.
Delightful task! to rear the tender thought,

To teach the young idea how to shoot;
 To pour the fresh instruction o'er the mind,
 To breathe th' enliv'ning spirit, and to fix
 The generous purpose in the glowing breast.

That a house be provided for the Academy, if not in the town, not many miles from it; the situation high and dry, and if it may be, not far from a river, having a garden, orchard, meadow, and a field or two.

That the house be furnished with a library (if in the country; if in the town, the town libraries may serve) with maps of all countries, globes, some mathematical instruments, and apparatus for experiments in natural philosophy, and for mechanics; prints of all kinds, prospects, buildings, machines, etc.

That the rector be a man of good understanding, good morals, diligent and patient, learned in the languages and sciences, and a correct pure speaker and writer of the English tongue; to have such tutors under him as shall be necessary.

That the boarding scholars diet together, plainly, temperately, and frugally.

That, to keep them in health, and to strengthen and render active their bodies, they be frequently exercised in running, leaping, wrestling, and swimming, etc.

That they have peculiar habits to distinguish them from other youth, if the Academy be in or near the town; for this, among other reasons, that their behavior may be the better observed.

As to their studies, it would be well if they could be taught everything that is useful, and everything that is ornamental: but art is long, and their time is short. It is therefore proposed that they learn those things that are likely to be most useful and most ornamental. Regard being had to the several professions for which they are intended.

All should be taught to write a fair hand, and swift, as that is useful for all. And with it may be learned something of drawing, by imitation of prints, and some of the first principles of perspective.

Arithmetic, accounts, and some of the first principles of geometry and astronomy.

The English language might be taught by grammar; in which some of our best writers, as Tillotson, Addison, Pope, Algernon Sidney, Cato's Letters, etc., should be classics: the styles principally to be cultivated being the clear and the concise. Reading should also be taught, and pronouncing, properly, distinctly, emphatically; not with an even tone, which underdoes, nor a theatrical, which overdoes nature.

To form their style they should be put on writing letters to each other, making abstracts of what they read; or writing the same things in their own words; telling or writing stories lately read, in their own expressions. All to be revised and corrected by the tutor, who should give his reasons, and explain the force and import of words, etc.

To form their pronunciation they may be put on making declamations, repeating speeches, delivering orations, etc.; the tutor assisting at the rehearsals, teaching, advising, correcting their accent, etc.

But if history be made a constant part of their reading, such as the translations of the Greek and Roman historians, and the modern histories of ancient Greece and Rome, etc., may not almost all kinds of useful knowledge be that way introduced to advantage, and with pleasure to the student? As

Geography, by reading with maps, and being required to point out the places where the greatest actions were done, to give their old and new names, with the bounds, situation, extent of the countries concerned, etc.

Chronology, by the help of Helvicus or some other writer of the kind, who will enable them to tell when those events happened, what princes were contemporaries, what states or famous men flourished about that time, etc. The several principal epochs to be first well fixed in their memories.

Ancient customs, religious and civil, being frequently mentioned in history, will give occasion for explaining them; in which the prints of medals, basso-relievos, and ancient monuments will greatly assist.

Morality, by descanting and making continual observations on the causes of the rise or fall of any man's character, fortune, power, etc. mentioned in history; the advantages of temperance, order, frugality, industry, perseverance, etc. Indeed, the general natural tendency of reading good history must be to fix in the minds of youth deep impressions of the beauty and usefulness of virtue of all kinds, public spirit, fortitude, etc.

History will show the wonderful effects of oratory in governing, turning, and leading great bodies of mankind, armies, cities, nations. When the minds of youth are struck with admiration at this, then is the time to give them the principles of that art which they will study with taste and application. Then they may be made acquainted with the best models among the ancients, their beauties being particularly pointed out to them. Modern political oratory being chiefly performed by the pen and press, its advantages over the ancient in some respects are to be shown; as that its effects are more extensive, more lasting, etc.

History will also afford frequent opportunities of showing the necessity of a public religion, from its usefulness to the public; the advantage of a religious character among private persons; the mischiefs of superstition, etc.; and the excellency of the Christian religion above all others ancient or modern.

History will also give occasion to expatiate on the advantage of civil orders and constitutions; how men and their properties are protected by joining in societies and establishing government; their industry encouraged and rewarded, arts invented, and life made more comfortable: the advantages of liberty, mischiefs of licentiousness, benefits arising from good laws and a due execution of justice, etc. Thus may the first principles of sound politics be fixed in the minds of youth.

On historical occasions, questions of right and wrong, justice and injustice will naturally arise, and may be put to youth, which they may debate in conversation and in writing. When they ardently desire victory, for the sake of the praise attending it, they will begin to feel the want, and be sensible of the use of logic, or the art of reasoning to discover truth, and of arguing to defend it, and convince adversaries. This would be the time to acquaint them with the principles of that art. Grotius, Pufendorf, and some other writers of the same kind may be used on these occasions to decide their disputes. Public disputes warm the imagination, whet the industry, and strengthen the natural abilities.

When youth are told that the great men whose lives and actions they read in history spoke two of the best languages that ever were, the most expressive, copious, beautiful; and that the finest writings, the most correct compositions, the most perfect productions of human wit and wisdom are in those languages, which have endured ages, and will endure while there are men; that no translation can do them justice, or give the pleasure found in reading the originals; that those languages contain all science; that one of them is become almost universal, being the language of learned men in all countries; that to understand them is a distinguishing ornament, etc., they may be thereby made desirous of learning those languages, and their industry sharpened in the acquisition of them. All intended for divinity should be taught the Latin and Greek; for physics, the Latin, Greek, and French; for law, the Latin and French; merchants, the French, German, and Spanish: And though all should not be compelled to learn Latin, Greek, or the modern foreign languages, yet none that have an ardent desire to learn them should be refused; their English, arithmetic, and other studies absolutely necessary being at the same time not neglected.

If the new Universal History were also read, it would give a connected idea of human affairs, so far as it goes, which should be followed by the best modern histories, particularly of our mother country; then of these colonies, which should be accompanied with observations on their rise, increase, use to Great Britain, encouragements, discouragements, etc., the means to make them flourish, secure their liberties, etc.

With the history of men, times, and nations should be read at proper hours or days some of the best histories of nature, which would not only be delightful to youth, and furnish them with matter for their letters, etc., as well as other history, but afterwards of great use to them, whether they are merchants, handicraftsmen, or divines; enabling the first the better to understand many commodities, drugs, etc.; the second to improve his trade or handicraft by new mixtures, materials, etc.; and the last to adorn his discourses by beautiful comparisons, and strengthen them by new proofs of divine providence. The conversation of all will be improved by it, as occasions frequently occur of making natural observations, which are instructive, agreeable, and entertaining in almost all companies. Natural history will also afford opportunities of introducing many observations relating to the preservation of health which may be afterwards of great use. Arbuthnot on air and aliment, Sanctorius on perspiration, Lémery on foods, and some others may now be read, and a very little explanation will make them sufficiently intelligible to youth.

While they are reading natural history, might not a little gardening, planting, grafting, inoculating, etc., be taught and practiced; and now and then excursions made to the neighboring plantations of the best farmers, their methods observed and reasoned upon for the information of youth? The improvement of agriculture being useful to all, and skill in it no disparagement to any.

The history of commerce, of the invention of arts, rise of manufactures, progress of trade, change of its seats, with the reasons, causes, etc., may also be made entertaining to youth, and will be useful to all. And this, with the accounts in other history of the prodigious force and effect of engines and machines used in war, will naturally introduce a desire to be instructed in mechanics, and to be informed of the principles of that art by which weak men perform such wonders, labor is saved, manufactures expedited, etc. This will be the time to show them prints of ancient and modern machines, to explain them, to let them be copied, and to give lectures in mechanical philosophy.

With the whole should be constantly inculcated and cultivated that benignity of mind which shows itself in searching for and seizing every

opportunity to serve and to oblige; and is the foundation of what is called good breeding, highly useful to the possessor, and most agreeable to all.

The idea of what is true merit should also be often presented to youth, explained and impressed on their minds, as consisting in an inclination joined with an ability to serve mankind, one's country, friends and family; which ability is (with the blessing of God) to be acquired or greatly increased by true learning, and should indeed be the great aim and end of all learning.

Jean de Crèvecoeur

1735–1813

Born at Caen, Normandy, January 31, 1735, Michel Guillaume Jean de Crèvecoeur (the name in French means “heartbreak”) got his later schooling in England and served four years as an officer and map maker under General Montcalm in Canada. Soon after 1759, when Wolfe broke the French power at Quebec, Crèvecoeur seems to have moved down into the American colonies. He changed his name to J. Hector St. John, became a citizen, and married Mehitable Tippet of Yonkers, New York.

They settled on a large farm in Orange County, New York, and had three children. There Crèvecoeur must have written his *Letters from an American Farmer*. The Revolution brought a day-and-night terror of Indian raids and made enemies of friends and neighbors (the farmer in the book actually decides to take his family and live with friendly Indians). Crèvecoeur was apparently called back to France by his father. He took his eldest son along. They were imprisoned by the British in New York. When they finally sailed, their ship was wrecked off the Irish coast.

In London, Crèvecoeur sold his book for thirty guineas (about \$153). Quickly it went through eight editions in five countries. It was published in Philadelphia in 1793. He became a celebrated man, admired by Hazlitt, Lamb, and Coleridge, the friend of Franklin, Buffon, and Mme D’Houdetot. Crèvecoeur translated and enlarged his book in French. Back in America as consul to three of the new states in 1784, he found his wife dead and his younger children in the care of Boston friends.

He brought the children together in New York, set up a packet-ship service between France and America, and went back to studying botany. Later he fattened the French *Letters* into a three-volume

work. He was recalled to France in 1790. There he wrote a second three-volume book, this one about his travels in Pennsylvania and New York. Crèvecoeur died in 1813. In the 1920's, a batch of his unpublished English essays came to light in a French attic. The publication of these, coupled with D. H. Lawrence's praise of him, revived his reputation.

He seems so familiar, such a cheerful, everyday friend, that we can hardly believe he was alive when the United States was born. He reminds us of Jefferson and of Rousseau. They share the tone of the Age of Reason. In this tone, we feel the classical idealism of Greece and Rome, strained through Plutarch. Like Virgil and Horace, Crèvecoeur lived in a time of wars and civil wars. The farm in Orange County, like Horace's farm in the Sabine Hills, was his moment of paradise. But already there was a strain of the new Romantic century in him. It came out strongly in his views of nature. He was an amateur in that great company of early American naturalists—Audubon, John and William Bartram, Alexander Wilson, Rafinesque—who discovered an earthly heaven in their new country. Thoreau would come after them.

As a man of the Age of Reason, Crèvecoeur was also a man of ideas. These come to a kind of focus in his essay "The Making of Americans," in *Letters from an American Farmer*. Perhaps he was not the first to ask that question, but he seems to have been the first to make a real try at answering it. He brings an imaginary Englishman to look at us and thereby displays the already broad difference between Englishman and American. We are blended together, Crèvecoeur writes, out of all kinds of Europeans. This is the first we hear of the melting pot. He thinks—and here, perhaps, he was largely mistaken—that religions will combine as nationalities do.

"Some few towns excepted," he says, "we are all tillers of the earth. . . ." So he thinks of Americans, by and large, as farmers, and of labor as a good. He speaks of a man's liberty and happiness on his own acres; of his love for wife and children, and the domestic virtue that springs from this; of the mild laws and encouraging government that make it possible; of the equality each man feels in rejecting the aristocracy of Europe. He sees the hideous evil and the still unjust gentleness of slavery. He observes the one and the many, and shows

us half a dozen typical immigrants. Tocqueville,¹ who visited the United States a generation later, in the 1830's, gives us a wider and more thoughtful view of democracy's workings and shows us the American types already in being.

What would Crèvecoeur think of us now, in the second half of the twentieth century? We are largely gathered in cities. He felt that our hope lay in freedom on the land. Like so many other eighteenth- and nineteenth-century Americans, he thought of country living as more favorable to virtue. Was he right, then or now? Would he consider our tract houses in the suburbs much the same thing as farmers living on their own land? Would he feel that we have abolished the whole injustice of slavery, or that there is more yet to be done? Would he find reasons for the bigness of our government, the complexity of our techniques, our ambitions on the moon? How would he feel the first time he encountered a parking meter or took off in a jet airplane? Read him, this eighteenth-century American who had such high hopes for us, and see if you can guess whether we would please him or disappoint him.

The Making of Americans

from *Letters from an American Farmer*

wish I could be acquainted with the feelings and thoughts which must agitate the heart and present themselves to the mind of an enlightened Englishman when he first lands on this continent. He must greatly rejoice that he lived at a time to see this fair country discovered and settled; he must necessarily feel a share of national pride when he views the chain of settlements which embellishes these extended shores. When he says to himself, this is the work of my countrymen, who, when convulsed by factions, afflicted by a variety of miseries and wants, restless and impatient, took refuge here. They brought along with them their national genius, to which they principally owe what liberty they enjoy, and what substance they possess. Here he sees the industry of his native country displayed in a new manner, and traces in their works the embryos of all the arts, sciences, and ingenuity which flourish in Europe. Here he beholds fair cities, substantial villages, extensive fields, an immense country filled with decent houses, good roads, orchards, meadows, and bridges, where a hundred years ago all was wild, woody, and uncultivated! What a train of pleasing ideas this fair spectacle must suggest; it is a prospect which must inspire a good citizen with the most heartfelt pleasure. The difficulty consists in the manner of viewing so extensive a scene. He is arrived on a new continent; a modern society offers itself to his contemplation, different from what he had hitherto seen. It is not composed, as in Europe, of great lords who possess everything, and of a herd of people who have nothing. Here are no aristocratical families, no courts, no kings, no bishops, no ecclesiastical dominion, no invisible power giving to a few a very visible one; no great manufacturers employing thousands, no great refinements of luxury. The rich and the poor are not so far removed from each other as they are in Europe. Some few towns excepted, we are all tillers of the earth, from Nova Scotia to West Florida. We are a people

of cultivators, scattered over an immense territory, communicating with each other by means of good roads and navigable rivers, united by the silken bands of mild government, all respecting the laws without dreading their power, because they are equitable. We are all animated with the spirit of an industry which is unfettered and unrestrained, because each person works for himself. If he travels through our rural districts he views not the hostile castle and the haughty mansion, contrasted with the clay-built hut and miserable cabin, where cattle and men help to keep each other warm, and dwell in meanness, smoke, and indigence. A pleasing uniformity of decent competence appears throughout our habitations. The meanest of our log houses is a dry and comfortable habitation. Lawyer or merchant are the fairest titles our towns afford; that of a farmer is the only appellation of the rural inhabitants of our country. It must take some time ere he can reconcile himself to our dictionary, which is but short in words of dignity and names of honor. There, on a Sunday, he sees a congregation of respectable farmers and their wives, all clad in neat homespun, well mounted or riding in their own humble wagons. There is not among them an esquire, saving the unlettered magistrate. There he sees a parson as simple as his flock, a farmer who does not riot on the labor of others. We have no princes for whom we toil, starve, and bleed: we are the most perfect society now existing in the world. Here man is free as he ought to be; nor is this pleasing equality so transitory as many others are. Many ages will not see the shores of our great lakes replenished with inland nations, nor the unknown bounds of North America entirely peopled. Who can tell how far it extends? Who can tell the millions of men whom it will feed and contain? for no European foot has as yet traveled half the extent of this mighty continent!

The next wish of this traveler will be to know whence came all these people? They are a mixture of English, Scotch, Irish, French, Dutch, Germans, and Swedes. From this promiscuous breed, that race now called Americans has arisen. The eastern provinces must indeed be excepted, as being the unmixed descendants of Englishmen. I have heard many wish that they had been more intermixed also: for my part, I am no wisher, and think it much better as it has happened. They exhibit a most conspicuous figure in this great and variegated picture; they too enter for a great share in the pleasing perspective displayed in these thirteen provinces. I know it is fashionable to reflect on them, but I respect them for what they have done; for the accuracy and wisdom with which they have settled their territory; for the decency of their manners; for their early love of letters; their ancient college, the first in this hemisphere; for their

industry, which to me who am but a farmer is the criterion of everything. There never was a people, situated as they are, who with so ungrateful a soil have done more in so short a time. Do you think that the monarchical ingredients which are more prevalent in other governments have purged them from all foul stains? Their histories assert the contrary.

In this great American asylum, the poor of Europe have by some means met together, and in consequence of various causes; to what purpose should they ask one another what countrymen they are? Alas, two-thirds of them had no country. Can a wretch who wanders about, who works and starves, whose life is a continual scene of sore affliction or pinching penury; can that man call England or any other kingdom his country? A country that had no bread for him, whose fields procured him no harvest, who met with nothing but the frowns of the rich, the severity of the laws, with jails and punishments; who owned not a single foot of the extensive surface of this planet? No! urged by a variety of motives, here they came. Everything has tended to regenerate them; new laws, a new mode of living, a new social system; here they are become men: in Europe they were as so many useless plants, wanting vegetative mold and refreshing showers; they withered, and were mowed down by want, hunger, and war; but now by the power of transplantation, like all other plants they have taken root and flourished! Formerly they were not numbered in any civil lists of their country, except in those of the poor; here they rank as citizens. By what invisible power has this surprising metamorphosis been performed? By that of the laws and that of their industry. The laws, the indulgent laws, protect them as they arrive, stamping on them the symbol of adoption; they receive ample rewards for their labors; these accumulated rewards procure them lands; those lands confer on them the title of freemen, and to that title every benefit is affixed which men can possibly require. This is the great operation daily performed by our laws. From whence proceed these laws? From our government. Whence the government? It is derived from the original genius and strong desire of the people ratified and confirmed by the crown. This is the great chain which links us all, this is the picture which every province exhibits, Nova Scotia excepted. There the crown has done all; either there were no people who had genius, or it was not much attended to: the consequence is that the province is very thinly inhabited indeed; the power of the crown in conjunction with the mosquitoes has prevented men from settling there. Yet some parts of it flourished once, and it contained a mild, harmless set of people. But for the fault of a few leaders, the whole were banished. The greatest political

error the crown ever committed in America was to cut off men from a country which wanted nothing but men!

What attachment can a poor European emigrant have for a country where he had nothing? The knowledge of the language, the love of a few kindred as poor as himself were the only cords that tied him: his country is now that which gives him land, bread, protection, and consequence: *Ubi panis ibi patria* ["Where there is bread, there is my country"] is the motto of all emigrants. What then is the American, this new man? He is either a European or the descendant of a European, hence that strange mixture of blood, which you will find in no other country. I could point out to you a family whose grandfather was an Englishman, whose wife was Dutch, whose son married a French woman, and whose present four sons have now four wives of different nations. He is an American who, leaving behind him all his ancient prejudices and manners, receives new ones from the new mode of life he has embraced, the new government he obeys, and the new rank he holds. He becomes an American by being received in the broad lap of our great Alma Mater. Here individuals of all nations are melted into a new race of men, whose labors and posterity will one day cause great changes in the world. Americans are the western pilgrims, who are carrying along with them that great mass of arts, sciences, vigor, and industry which began long since in the east; they will finish the great circle. The Americans were once scattered all over Europe; here they are incorporated into one of the finest systems of population which has ever appeared, and which will hereafter become distinct by the power of the different climates they inhabit. The American ought therefore to love this country much better than that wherein either he or his forefathers were born. Here the rewards of his industry follow with equal steps the progress of his labor; his labor is founded on the basis of nature, self-interest; can it want a stronger allurement? Wives and children, who before in vain demanded of him a morsel of bread, now, fat and frolicsome, gladly help their father to clear those fields whence exuberant crops are to arise to feed and to clothe them all; without any part being claimed, either by a despotic prince, a rich abbot, or a mighty lord. Here religion demands but little of him; a small voluntary salary to the minister, and gratitude to God; can he refuse these? The American is a new man, who acts upon new principles; he must therefore entertain new ideas, and form new opinions. From involuntary idleness, servile dependence, penury, and useless labor, he has passed to toils of a very different nature, rewarded by ample subsistence. This is an American.

British America is divided into many provinces, forming a large association scattered along a coast 1500 miles extent and about 200 wide. This society I would fain examine, at least such as it appears in the middle provinces; if it does not afford that variety of tinges and gradations which may be observed in Europe, we have colors peculiar to ourselves. For instance, it is natural to conceive that those who live near the sea must be very different from those who live in the woods; the intermediate space will afford a separate and distinct class.

Men are like plants; the goodness and flavor of the fruit proceeds from the peculiar soil and exposition in which they grow. We are nothing but what we derive from the air we breathe, the climate we inhabit, the government we obey, the system of religion we profess, and the nature of our employment. Here you will find but few crimes; these have acquired as yet no root among us. I wish I were able to trace all my ideas; if my ignorance prevents me from describing them properly, I hope I shall be able to delineate a few of the outlines, which are all I propose.

Those who live near the sea feed more on fish than on flesh, and often encounter that boisterous element. This renders them more bold and enterprising; this leads them to neglect the confined occupations of the land. They see and converse with a variety of people; their intercourse with mankind becomes extensive. The sea inspires them with a love of traffic, a desire of transporting produce from one place to another; and leads them to a variety of resources which supply the place of labor. Those who inhabit the middle settlements, by far the most numerous, must be very different; the simple cultivation of the earth purifies them, but the indulgences of the government, the soft remonstrances of religion, the rank of independent freeholders must necessarily inspire them with sentiments very little known in Europe among people of the same class. What do I say? Europe has no such class of men; the early knowledge they acquire, the early bargains they make, give them a great degree of sagacity. As freemen they will be litigious; pride and obstinacy are often the cause of lawsuits; the nature of our laws and governments may be another. As citizens it is easy to imagine that they will carefully read the newspapers, enter into every political disquisition, freely blame or censure governors and others. As farmers they will be careful and anxious to get as much as they can, because what they get is their own. As northern men they will love the cheerful cup. As Christians, religion curbs them not in their opinions; the general indulgence leaves every one to think for himself in spiritual matters; the laws inspect our actions, our thoughts are left to God. Industry, good living, selfishness, litigiousness, country politics, the

pride of freemen, religious indifference are their characteristics. If you recede still farther from the sea, you will come into more modern settlements; they exhibit the same strong lineaments in a ruder appearance. Religion seems to have still less influence, and their manners are less improved.

Now we arrive near the great woods, near the last inhabited districts; there men seem to be placed still farther beyond the reach of government, which in some measure leaves them to themselves. How can it pervade every corner; as they were driven there by misfortunes, necessity of beginnings, desire of acquiring large tracts of land, idleness, frequent want of economy, ancient debts, the reunion of such people does not afford a very pleasing spectacle. When discord, want of unity and friendship, when either drunkenness or idleness prevail in such remote districts, contention, inactivity, and wretchedness must ensue. There are not the same remedies to these evils as in a long-established community. The few magistrates they have are in general little better than the rest; they are often in a perfect state of war; that of man against man, sometimes decided by blows, sometimes by means of the law; that of man against every wild inhabitant of these venerable woods, of which they are come to dispossess them. There men appear to be no better than carnivorous animals of a superior rank, living on the flesh of wild animals when they can catch them, and when they are not able, they subsist on grain. He who would wish to see America in its proper light, and have a true idea of its feeble beginnings and barbarous rudiments, must visit our extended line of frontiers where the last settlers dwell, and where he may see the first labors of settlement, the mode of clearing the earth, in all their different appearances; where men are left wholly dependent on their native tempers, and on the spur of uncertain industry, which often fails when not sanctified by the efficacy of a few moral rules. There, remote from the power of example, and check of shame, many families exhibit the most hideous parts of our society. They are a kind of forlorn hope, preceding by ten or twelve years the most respectable army of veterans which come after them. In that space, prosperity will polish some, vice and the law will drive off the rest, who, uniting again with others like themselves, will recede still farther, making room for more industrious people, who will finish their improvements, convert the log house into a convenient habitation, and rejoicing that the first heavy labors are finished, will change in a few years that hitherto barbarous country into a fine, fertile, well-regulated district. Such is our progress, such is the march of the Europeans toward the interior parts of this continent. In all societies

there are offcasts; this impure part serves as our precursors or pioneers; my father himself was one of that class, but he came upon honest principles, and was therefore one of the few who held fast; by good conduct and temperance, he transmitted to me his fair inheritance, when not above one in fourteen of his contemporaries had the same good fortune.

Forty years ago this smiling country was thus inhabited; it is now purged, a general decency of manners prevails throughout, and such has been the fate of our best countries.

Exclusive of those general characteristics, each province has its own, founded on the government, climate, mode of husbandry, customs, and peculiarity of circumstances. Europeans submit insensibly to these great powers, and become, in the course of a few generations, not only Americans in general, but either Pennsylvanians, Virginians, or provincials under some other name. Whoever traverses the continent must easily observe those strong differences, which will grow more evident in time. The inhabitants of Canada, Massachusetts, the middle provinces, the southern ones will be as different as their climates; their only points of unity will be those of religion and language.

As I have endeavored to show you how Europeans become Americans, it may not be disagreeable to show you likewise how the various Christian sects introduced wear out, and how religious indifference becomes prevalent. When any considerable number of a particular sect happen to dwell contiguous to each other, they immediately erect a temple, and there worship the Divinity agreeably to their own peculiar ideas. Nobody disturbs them. If any new sect springs up in Europe, it may happen that many of its professors will come and settle in America. As they bring their zeal with them, they are at liberty to make proselytes if they can, and to build a meeting and to follow the dictates of their consciences; for neither the government nor any other power interferes. If they are peaceable subjects, and are industrious, what is it to their neighbors how and in what manner they think fit to address their prayers to the Supreme Being? But if the sectaries are not settled close together, if they are mixed with other denominations, their zeal will cool for want of fuel, and will be extinguished in a little time. Then the Americans become as to religion, what they are as to country, allied to all. In them the name of Englishman, Frenchman, and European is lost, and in like manner, the strict modes of Christianity as practised in Europe are lost also. This effect will extend itself still farther hereafter, and though this may appear to you as a strange idea, yet it is a very true one. I shall

be able perhaps hereafter to explain myself better, in the meanwhile, let the following example serve as my first justification.

Let us suppose you and I to be traveling; we observe that in this house, to the right, lives a Catholic, who prays to God as he has been taught, and believes in transubstantiation; he works and raises wheat, he has a large family of children, all hale and robust; his belief, his prayers offend nobody. About one mile farther on the same road, his next neighbor may be a good honest plodding German Lutheran, who addresses himself to the same God, the God of all, agreeably to the modes he has been educated in, and believes in consubstantiation; by so doing he scandalizes nobody; he also works in his fields, embellishes the earth, clears swamps, etc. What has the world to do with his Lutheran principles? He persecutes nobody, and nobody persecutes him; he visits his neighbors, and his neighbors visit him. Next to him lives a seceder, the most enthusiastic of all sectaries; his zeal is hot and fiery, but separated as he is from others of the same complexion, he has no congregation of his own to resort to, where he might cabal and mingle religious pride with worldly obstinacy. He likewise raises good crops, his house is handsomely painted, his orchard is one of the fairest in the neighborhood. How does it concern the welfare of the country, or of the province at large, what this man's religious sentiments are, or really whether he has any at all? He is a good farmer; he is a sober, peaceable, good citizen: William Penn himself would not wish for more. This is the visible character, the invisible one is only guessed at, and is nobody's business. Next again lives a Low Dutchman, who implicitly believes the rules laid down by the synod of Dort. He conceives no other idea of a clergyman than that of an hired man; if he does his work well he will pay him the stipulated sum; if not he will dismiss him, and do without his sermons, and let his church be shut up for years. But notwithstanding this coarse idea, you will find his house and farm to be the neatest in all the country; and you will judge by his wagon and fat horses that he thinks more of the affairs of this world than of those of the next. He is sober and laborious; therefore he is all he ought to be as to the affairs of this life; as for those of the next, he must trust to the great Creator. Each of these people instruct their children as well as they can, but these instructions are feeble compared to those which are given to the youth of the poorest class in Europe. Their children will therefore grow up less zealous and more indifferent in matters of religion than their parents. The foolish vanity, or rather the fury of making proselytes, is unknown here; they have no time, the seasons call

for all their attention, and thus in a few years, this mixed neighborhood will exhibit a strange religious medley that will be neither pure Catholicism nor pure Calvinism. A very perceptible indifference even in the first generation will become apparent; and it may happen that the daughter of the Catholic will marry the son of the seceder, and settle by themselves at a distance from their parents. What religious education will they give their children? A very imperfect one. If there happens to be in the neighborhood any place of worship, we will suppose a Quakers' meeting; rather than not show their fine clothes, they will go to it, and some of them may perhaps attach themselves to that society. Others will remain in a perfect state of indifference; the children of these zealous parents will not be able to tell what their religious principles are, and their grandchildren still less. The neighborhood of a place of worship generally leads them to it, and the action of going thither is the strongest evidence they can give of their attachment to any sect. The Quakers are the only people who retain a fondness for their own mode of worship; for be they ever so far separated from each other, they hold a sort of communion with the society, and seldom depart from its rules, at least in this country. Thus all sects are mixed as well as all nations; thus religious indifference is imperceptibly disseminated from one end of the continent to the other; which is at present one of the strongest characteristics of the Americans. Where this will reach no one can tell; perhaps it may leave a vacuum fit to receive other systems. Persecution, religious pride, the love of contradiction are the food of what the world commonly calls religion. These motives have ceased here: zeal in Europe is confined, here it evaporates in the great distance it has to travel; there it is a grain of powder enclosed, here it burns away in the open air, and consumes without effect.

But to return to our backsettlers. I must tell you that there is something in the proximity of the woods which is very singular. It is with men as it is with the plants and animals that grow and live in the forests; they are entirely different from those that live in the plains. I will candidly tell you all my thoughts, but you are not to expect that I shall advance any reasons. By living in or near the woods, their actions are regulated by the wildness of the neighborhood. The deer often come to eat their grain, the wolves to destroy their sheep, the bears to kill their hogs, the foxes to catch their poultry. This surrounding hostility immediately puts the gun into their hands; they watch these animals, they kill some; and thus by defending their property, they soon become professed hunters; this is the progress; once hunters, farewell to the plow. The chase

renders them ferocious, gloomy, and unsociable: a hunter wants no neighbor; he rather hates them, because he dreads the competition. In a little time their success in the woods makes them neglect their tillage. They trust to the natural fecundity of the earth, and therefore do little; carelessness in fencing often exposes what little they sow to destruction; they are not at home to watch; in order therefore to make up the deficiency, they go oftener to the woods. That new mode of life brings along with it a new set of manners, which I cannot easily describe. These new manners, being grafted on the old stock, produce a strange sort of lawless profligacy, the impressions of which are indelible. The manners of the Indian natives are respectable, compared with this European medley. Their wives and children live in sloth and inactivity; and having no proper pursuits, you may judge what education the latter receive. Their tender minds have nothing else to contemplate but the example of their parents; like them they grow up a mongrel breed, half civilized, half savage, except nature stamps on them some constitutional propensities. That rich, that voluptuous sentiment is gone that struck them so forcibly; the possession of their freeholds no longer conveys to their minds the same pleasure and pride. To all these reasons you must add their lonely situation, and you cannot imagine what an effect on manners the great distances they live from each other has! Consider one of the last settlements in its first view: of what is it composed? Europeans who have not that sufficient share of knowledge they ought to have in order to prosper; people who have suddenly passed from oppression, dread of government, and fear of laws into the unlimited freedom of the woods. This sudden change must have a very great effect on most men, and on that class particularly. Eating of wild meat, whatever you may think, tends to alter their temper, though all the proof I can adduce is that I have seen it; and having no place of worship to resort to, what little society this might afford is denied them. The Sunday meetings, exclusive of religious benefits, were the only social bonds that might have inspired them with some degree of emulation in neatness. Is it then surprising to see men thus situated, immersed in great and heavy labors, degenerate a little? It is rather a wonder the effect is not more diffusive. The Moravians and the Quakers are the only instances in exception to what I have advanced. The first never settle singly, it is a colony of the society which emigrates; they carry with them their forms, worship, rules, and decency: the others never begin so hard, they are always able to buy improvements, in which there is a great advantage, for by that time the country is recovered from its first barbarity. Thus our bad people are

those who are half cultivators and half hunters; and the worst of them are those who have degenerated altogether into the hunting state. As old plowmen and new men of the woods, as Europeans and new made Indians, they contract the vices of both; they adopt the moroseness and ferocity of a native, without his mildness, or even his industry at home. If manners are not refined, at least they are rendered simple and inoffensive by tilling the earth; all our wants are supplied by it, our time is divided between labor and rest, and leaves none for the commission of great misdeeds. As hunters it is divided between the toil of the chase, the idleness of repose, or the indulgence of inebriation. Hunting is but a licentious idle life, and if it does not always pervert good dispositions, yet, when it is united with bad luck, it leads to want: want stimulates that propensity to rapacity and injustice, too natural to needy men, which is the fatal gradation. After this explanation of the effects which follow by living in the woods, shall we yet vainly flatter ourselves with the hope of converting the Indians? We should rather begin with converting our backsettlers; and now if I dare mention the name of religion, its sweet accents would be lost in the immensity of these woods. Men thus placed are not fit either to receive or remember its mild instructions; they want temples and ministers, but as soon as men cease to remain at home, and begin to lead an erratic life, let them be either tawny or white, they cease to be its disciples.

Thus have I faintly and imperfectly endeavored to trace our society from the sea to our woods! Yet you must not imagine that every person who moves back acts upon the same principles, or falls into the same degeneracy. Many families carry with them all their decency of conduct, purity of morals, and respect of religion; but these are scarce, the power of example is sometimes irresistible. Even among these backsettlers, their depravity is greater or less, according to what nation or province they belong. Were I to adduce proofs of this, I might be accused of partiality. If there happen to be some rich intervals, some fertile bottoms, in those remote districts, the people will there prefer tilling the land to hunting, and will attach themselves to it; but even on these fertile spots you may plainly perceive the inhabitants to acquire a great degree of rusticity and selfishness.

It is in consequence of this straggling situation, and the astonishing power it has on manners, that the backsettlers of both the Carolinas, Virginia, and many other parts have been long a set of lawless people; it has been even dangerous to travel among them. Government can do nothing in so extensive a country; better it should wink at these

irregularities than that it should use means inconsistent with its usual mildness. Time will efface those stains: in proportion as the great body of population approaches them they will reform, and become polished and subordinate. Whatever has been said of the four New England provinces, no such degeneracy of manners has ever tarnished their annals; their backsettlers have been kept within the bounds of decency, and government, by means of wise laws, and by the influence of religion. What a detestable idea such people must have given to the natives of the Europeans! They trade with them, the worst of people are permitted to do that which none but persons of the best characters should be employed in. They get drunk with them, and often defraud the Indians. Their avarice, removed from the eyes of their superiors, knows no bounds; and aided by a little superiority of knowledge, these traders deceive them, and even sometimes shed blood. Hence those shocking violations, those sudden devastations which have so often stained our frontiers, when hundreds of innocent people have been sacrificed for the crimes of a few. It was in consequence of such behavior that the Indians took the hatchet against the Virginians in 1774. Thus are our first steps trod, thus are our first trees felled, in general, by the most vicious of our people; and thus the path is opened for the arrival of a second and better class, the true American freeholders; the most respectable set of people in this part of the world: respectable for their industry, their happy independence, the great share of freedom they possess, the good regulation of their families, and for extending the trade and the dominion of our mother country.

Europe contains hardly any other distinctions but lords and tenants; this fair country alone is settled by freeholders, the possessors of the soil they cultivate, members of the government they obey, and the framers of their own laws by means of their representatives. This is a thought which you have taught me to cherish; our difference from Europe, far from diminishing, rather adds to our usefulness and consequence as men and subjects. Had our forefathers remained there, they would only have crowded it, and perhaps prolonged those convulsions which had shook it so long. Every industrious European who transports himself here may be compared to a sprout growing at the foot of a great tree; it enjoys and draws but a little portion of sap; wrench it from the parent roots, transplant it, and it will become a tree bearing fruit also. Colonists are therefore entitled to the consideration due to the most useful subjects; a hundred families barely existing in some parts of Scotland, will here in six years, cause an annual exportation of 10,000 bushels of wheat: 100 bushels being but a common quantity for an industrious family to sell if

they cultivate good land. It is here then that the idle may be employed, the useless become useful, and the poor become rich; but by riches I do not mean gold and silver, we have but little of those metals; I mean a better sort of wealth, cleared lands, cattle, good houses, good clothes, and an increase of people to enjoy them.

There is no wonder that this country has so many charms, and presents to Europeans so many temptations to remain in it. A traveler in Europe becomes a stranger as soon as he quits his own kingdom; but it is otherwise here. We know, properly speaking, no strangers; this is every person's country; the variety of our soils, situations, climates, governments, and produce, hath something which must please everybody. No sooner does a European arrive, no matter of what condition, than his eyes are opened upon the fair prospect; he hears his language spoken, he retraces many of his own country manners, he perpetually hears the names of families and towns with which he is acquainted; he sees happiness and prosperity in all places disseminated; he meets with hospitality, kindness, and plenty everywhere; he beholds hardly any poor, he seldom hears of punishments and executions; and he wonders at the elegance of our towns, those miracles of industry and freedom. He cannot admire enough our rural districts, our convenient roads, good taverns, and our many accommodations; he involuntarily loves a country where everything is so lovely. When in England, he was a mere Englishman; here he stands on a larger portion of the globe, not less than its fourth part, and may see the productions of the north, in iron and naval stores; the provisions of Ireland, the grain of Egypt, the indigo, the rice of China. He does not find, as in Europe, a crowded society, where every place is overstocked; he does not feel that perpetual collision of parties, that difficulty of beginning, that contention which oversets so many. There is room for everybody in America; has he any particular talent, or industry? he exerts it in order to procure a livelihood, and it succeeds. Is he a merchant? the avenues of trade are infinite; is he eminent in any respect? he will be employed and respected. Does he love a country life? pleasant farms present themselves; he may purchase what he wants, and thereby become an American farmer. Is he a laborer, sober and industrious? he need not go many miles, nor receive many informations before he will be hired, well fed at the table of his employer, and paid four or five times more than he can get in Europe. Does he want uncultivated lands? thousands of acres present themselves, which he may purchase cheap. Whatever be his talents or inclinations, if they are moderate, he may satisfy them. I do not mean that everyone who comes

will grow rich in a little time; no, but he may procure an easy, decent maintenance, by his industry. Instead of starving he will be fed, instead of being idle he will have employment; and these are riches enough for such men as come over here. The rich stay in Europe, it is only the middling and the poor that emigrate. Would you wish to travel in independent idleness, from north to south, you will find easy access, and the most cheerful reception at every house; society without ostentation, good cheer without pride, and every decent diversion which the country affords, with little expense. It is no wonder that the European who has lived here a few years is desirous to remain; Europe with all its pomp is not to be compared to this continent for men of middle stations or laborers.

A European, when he first arrives, seems limited in his intentions, as well as in his views; but he very suddenly alters his scale; two hundred miles formerly appeared a very great distance, it is now but a trifle; he no sooner breathes our air than he forms schemes, and embarks in designs he never would have thought of in his own country. There the plenitude of society confines many useful ideas, and often extinguishes the most laudable schemes which here ripen into maturity. Thus Europeans become Americans.

"The Making of Americans"
consists of the first part of Letter III
in LETTERS FROM AN AMERICAN FARMER.

Alexis de Tocqueville

1805–1859

Undoubtedly the most illustrious of all political analysts since Aristotle and Machiavelli.” This is the way Wilhelm Dilthey, the famous German philosopher, describes Alexis de Tocqueville. It is an estimate with which many philosophers and political scientists would agree.

Alexis Charles Henri Maurice Clérel de Tocqueville was born in Verneuil on July 29, 1805. His family had been part of the French nobility prior to the Revolution of 1789, and he grew up in an atmosphere where the aristocratic values had been preserved. He received much of his early education at home, and at eighteen took up the study of law. When he was twenty-one, he became a magistrate at Versailles under the government of Charles X.

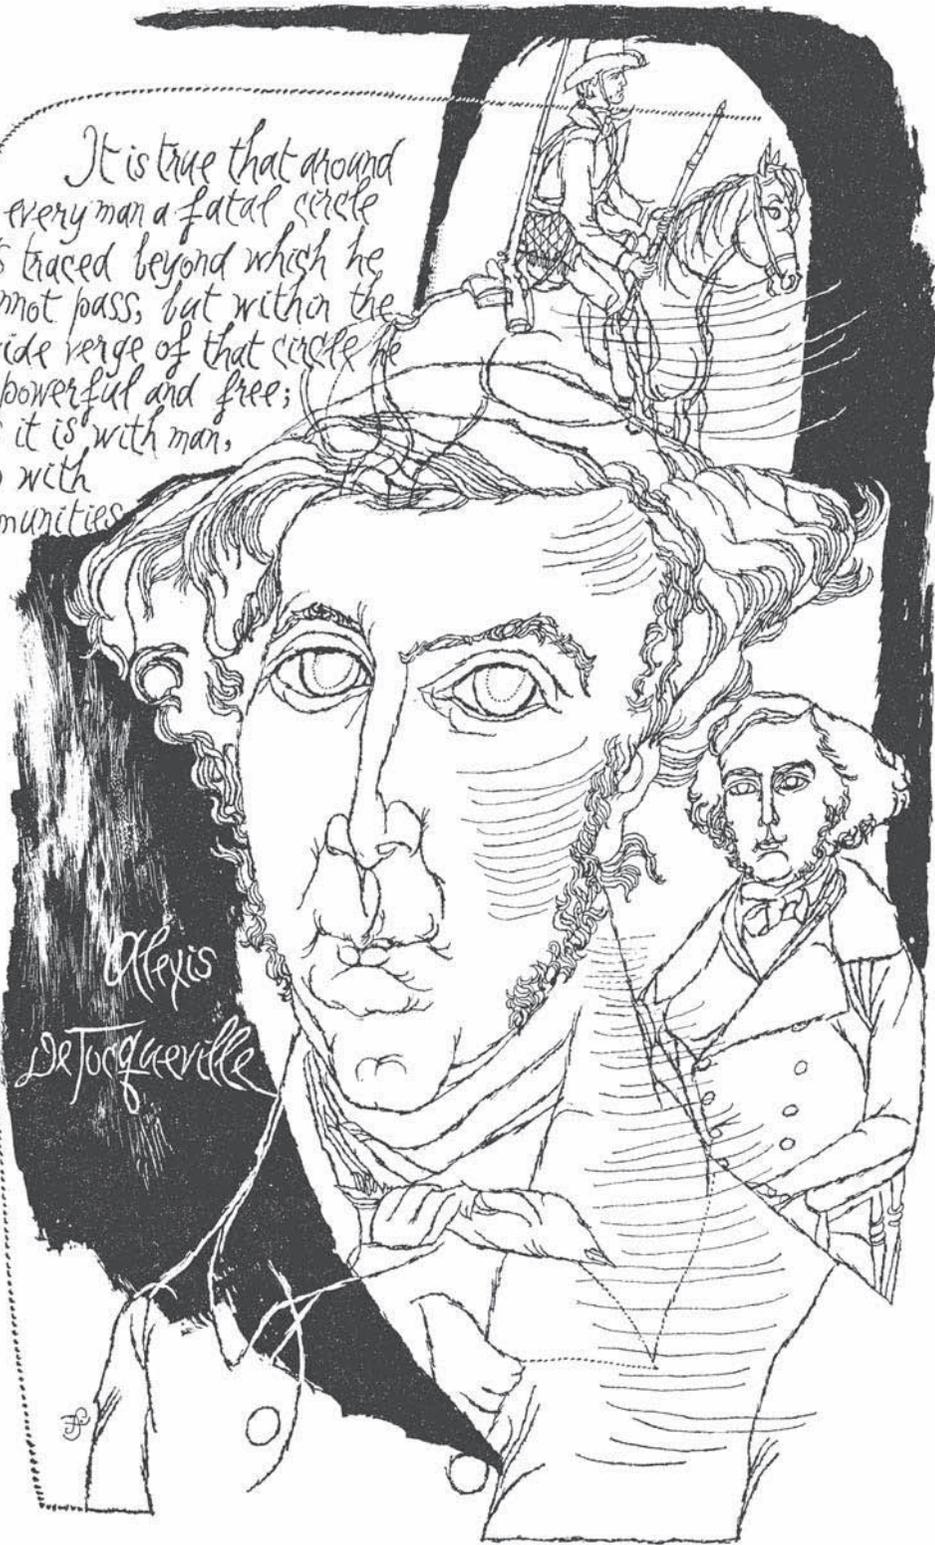

Charles’s government was toppled by the Revolution of 1830, and Tocqueville sought some way to dissociate himself from the new government without appearing disloyal. Along with his close friend Gustave de Beaumont, he petitioned the government for a commission to survey the penal institutions in America. The prison survey was only a pretext. His primary aim was to view at first hand the democratic system as it operated in the United States. The commission was granted, and he and Beaumont sailed for America, arriving in New York City in May, 1831. From there they began a tour that

Notes from the artist: “Head study of Tocqueville beneath a quotation from Democracy in America. At right is Gustave de Beaumont, whose sketch of Tocqueville entitled ‘Ready for the Wilderness’ was the basis for the equestrian portrait.”

It is true that around every man a fatal circle is traced beyond which he cannot pass, but within the wide verge of that circle he is powerful and free; as it is with man, so with communities.

Alexis
DeTocqueville

F

took them as far north as Canada and as far south as New Orleans. They traveled more than seven thousand miles by steamer, stagecoach, and horseback before returning to France the following February.

Once the report on American prisons was completed, Tocqueville turned to the work that was the real purpose of his travels—*Democracy in America*. The first part appeared in 1835. It was received with great enthusiasm and soon was translated into several languages. The second part appeared in 1840. It was also well received, but it did not generate as much excitement as its predecessor. In commenting on the complete work, John Stuart Mill said that it constituted “the beginning of a new era in the science of politics.”

The success of *Democracy in America* advanced Tocqueville to the front rank of French political thinkers. He was honored widely and eventually was persuaded to return to politics. He was elected to the Chamber of Deputies in 1839, where he remained until 1851. Then, withdrawing from public life, he began preparing the work that many consider his masterpiece, *L'Ancien Régime et la Révolution*. Its first volume, published in 1856, was even more successful than *Democracy in America*. Unfortunately, ill-health prevented him from completing the other volumes. He died in Cannes at the age of fifty-three.

D*emocracy in America* is one of the most remarkable books ever written. Based upon observations made by a twenty-six-year-old man during a period of only nine months, it has never been surpassed as an analysis of American society. Even today, more than one hundred and thirty years after Tocqueville visited the United States, it is still one of the best commentaries available on American institutions, practices, beliefs, and attitudes.

One of the reasons why *Democracy in America* has been of such lasting value is that Tocqueville was not so much interested in America as in democracy. Of all the nations that were then being transformed into democracies, the United States was the one in which the development of democracy had been “most peaceful and most complete.” By comparing what he knew of other societies with what he observed in America, Tocqueville could see the effects of democracy upon social institutions and upon the lives and characters of men. He took great pains to distinguish between the effects

that seemed to be characteristic of democracy in general and those that were peculiar to American democracy. As a result, he was able to see below the surface of American society to its underlying principles and tendencies.

Tocqueville's great interest in democratic societies stemmed from his conviction that democracy was the wave of the future; the movement towards it was "universal" and "irresistible." The democratic revolution was already under way in Europe, and its outcome was anticipated with fear by some, with hope by others. These hopes and fears were, in almost every instance, based upon ignorance. Tocqueville's aim was to provide his countrymen (and other Europeans) with the truth about democracy, its "evils and the advantages." He elaborated upon his purpose in a letter to a friend: "I wished to show what a democratic people really was in our day. . . . To those who have fancied an ideal democracy, a brilliant and easily realized dream, I endeavored to show that they had clothed the picture in false colors. . . . To those for whom the word *democracy* is synonymous with destruction, anarchy, spoliation, and murder, I have tried to show that under a democratic government the fortunes and rights of society may be respected, liberty preserved, and religion honored."

Because of space limitations, only part of *Democracy in America* is reprinted here. The complete work covers almost every important aspect of American life, and the high level of observation and analysis is sustained throughout.

Observations on American Life and Government

from *Democracy in America*

INTRODUCTION

Among the novel objects that attracted my attention during my stay in the United States, nothing struck me more forcibly than the general equality of conditions. I readily discovered the prodigious influence which this primary fact exercises on the whole course of society, by giving a certain direction to public opinion, and a certain tenor to the laws; by imparting new maxims to the governing powers, and peculiar habits to the governed.

I speedily perceived that the influence of this fact extends far beyond the political character and the laws of the country, and that it has no less empire over civil society than over the government; it creates opinions, engenders sentiments, suggests the ordinary practices of life, and modifies whatever it does not produce.

The more I advanced in the study of American society, the more I perceived that the equality of conditions is the fundamental fact from which all others seem to be derived, and the central point at which all my observations constantly terminated.

I then turned my thoughts to our own hemisphere, where I imagined that I discerned something analogous to the spectacle which the New World presented to me. I observed that the equality of conditions is daily progressing towards those extreme limits which it seems to have reached in the United States; and that the democracy which governs the American communities appears to be rapidly rising into power in Europe.

I hence conceived the idea of the book which is now before the reader.

It is evident to all alike that a great democratic revolution is going on among us; but there are two opinions as to its nature and consequences. To some it appears to be a novel accident, which as such may still be checked; to others it seems irresistible because it is the most uniform, the most ancient, and the most permanent tendency which is to be found in history.

Let us recollect the situation of France seven hundred years ago, when the territory was divided among a small number of families who were the owners of the soil and the rulers of the inhabitants; the right of governing descended with the family inheritance from generation to generation; force was the only means by which man could act on man; and landed property was the sole source of power.

Soon, however, the political power of the clergy was founded, and began to exert itself: the clergy opened its ranks to all classes, to the poor and the rich, the villain and the lord; equality penetrated into the government through the church, and the being who as a serf must have vegetated in perpetual bondage took his place as a priest in the midst of nobles, and not unfrequently above the heads of kings.

The different relations of men became more complicated and more numerous as society gradually became more stable and more civilized. Thence the want of civil laws was felt; and the order of legal functionaries soon rose from the obscurity of the tribunals and their dusty chambers to appear at the court of the monarch, by the side of the feudal barons in their ermine and their mail.

While the kings were ruining themselves by their great enterprises, and the nobles exhausting their resources by private wars, the lower orders were enriching themselves by commerce. The influence of money began to be perceptible in state affairs. The transactions of business opened a new road to power, and the financier rose to a station of political influence in which he was at once flattered and despised.

Gradually the spread of mental acquirements, and the increasing taste for literature and art, opened chances of success to talent; science became a means of government, intelligence led to social power, and the man of letters took a part in the affairs of the state.

The value attached to the privileges of birth decreased in the exact proportion in which new paths were struck out to advancement. In the eleventh century nobility was beyond all price; in the thirteenth it might be purchased; it was conferred for the first time in 1270; and equality was thus introduced into the government by the aristocracy itself.

In the course of these seven hundred years, it sometimes happened

that in order to resist the authority of the crown, or to diminish the power of their rivals, the nobles granted a certain share of political rights to the people. Or, more frequently, the king permitted the lower orders to enjoy a degree of power, with the intention of repressing the aristocracy.

In France the kings have always been the most active and the most constant of levelers. When they were strong and ambitious, they spared no pains to raise the people to the level of the nobles; when they were temperate or weak, they allowed the people to rise above themselves. Some assisted the democracy by their talents, others by their vices. Louis XI and Louis XIV reduced every rank beneath the throne to the same subjection; Louis XV descended, himself and all his court, into the dust.

As soon as land was held on any other than a feudal tenure, and personal property began in its turn to confer influence and power, every improvement which was introduced in commerce or manufacture was a fresh element of the equality of conditions. Henceforward every new discovery, every new want which it engendered, and every new desire which craved satisfaction, was a step towards the universal level. The taste for luxury, the love of war, the sway of fashion, and the most superficial as well as the deepest passions of the human heart, cooperated to enrich the poor and to impoverish the rich.

From the time when the exercise of the intellect became the source of strength and of wealth, it is impossible not to consider every addition to science, every fresh truth, and every new idea as a germ of power placed within the reach of the people. Poetry, eloquence, and memory, the grace of wit, the glow of imagination, the depth of thought, and all the gifts which are bestowed by Providence with an equal hand turned to the advantage of the democracy; and even when they were in the possession of its adversaries, they still served its cause by throwing into relief the natural greatness of man; its conquests spread, therefore, with those of civilization and knowledge; and literature became an arsenal, where the poorest and the weakest could always find weapons to their hand.

In perusing the pages of our history, we shall scarcely meet with a single great event, in the lapse of seven hundred years, which has not turned to the advantage of equality.

The Crusades and the wars of the English decimated the nobles and divided their possessions: the erection of communities introduced an element of democratic liberty into the bosom of feudal monarchy; the invention of firearms equalized the villain and the noble on the field of battle; printing opened the same resources to the minds of all classes;

the post was organized so as to bring the same information to the door of the poor man's cottage, and to the gate of the palace; and Protestantism proclaimed that all men are alike able to find the road to heaven. The discovery of America offered a thousand new paths to fortune and placed riches and power within the reach of the adventurous and the obscure.

If we examine what has happened in France at intervals of fifty years, beginning with the eleventh century, we shall invariably perceive that a twofold revolution has taken place in the state of society. The noble has gone down on the social ladder, and the *roturier* has gone up; the one descends as the other rises. Every half-century brings them nearer to each other, and they will very shortly meet.

Nor is this phenomenon at all peculiar to France. Whithersoever we turn our eyes we shall witness the same continual revolution throughout the whole of Christendom.

The various occurrences of national existence have everywhere turned to the advantage of democracy; all men have aided it by their exertions: those who have intentionally labored in its cause, and those who have served it unwittingly; those who have fought for it and those who have declared themselves its opponents have all been driven along in the same track, have all labored to one end, some ignorantly and some unwillingly; all have been blind instruments in the hands of God.

The gradual development of the equality of conditions is therefore a providential fact, and it possesses all the characteristics of a divine decree: it is universal, it is durable, it constantly eludes all human interference, and all events as well as all men contribute to its progress.

Would it, then, be wise to imagine that a social impulse which dates from so far back can be checked by the efforts of a generation? Is it credible that the democracy which has annihilated the feudal system, and vanquished kings, will respect the citizen and the capitalist? Will it stop now that it is grown so strong, and its adversaries so weak?

None can say which way we are going, for all terms of comparison are wanting: the equality of conditions is more complete in the Christian countries of the present day than it has been at any time, or in any part of the world, so that the extent of what already exists prevents us from foreseeing what may be yet to come.

The whole book which is here offered to the public has been written under the impression of a kind of religious dread produced in the author's mind by the contemplation of so irresistible a revolution, which has advanced for centuries in spite of such amazing obstacles, and which is still proceeding in the midst of the ruins it has made.

It is not necessary that God himself should speak in order to disclose to us the unquestionable signs of His will; we can discern them in the habitual course of nature, and in the invariable tendency of events: I know, without a special revelation, that the planets move in the orbits traced by the Creator's finger.

If the men of our time were led by attentive observation, and by sincere reflection, to acknowledge that the gradual and progressive development of social equality is at once the past and future of their history, this solitary truth would confer the sacred character of a divine decree upon the change. To attempt to check democracy would be in that case to resist the will of God; and the nations would then be constrained to make the best of the social lot awarded to them by Providence.

The Christian nations of our age seem to me to present a most alarming spectacle; the impulse which is bearing them along is so strong that it cannot be stopped, but it is not yet so rapid that it cannot be guided: their fate is in their hands; yet a little while and it may be so no longer.

The first duty which is at this time imposed upon those who direct our affairs is to educate the democracy; to warm its faith, if that be possible; to purify its morals; to direct its energies; to substitute a knowledge of business for its inexperience, and an acquaintance with its true interests for its blind propensities; to adapt its government to time and place, and to modify it in compliance with the occurrences and the actors of the age.

A new science of politics is indispensable to a new world.

This, however, is what we think of least; launched in the middle of a rapid stream, we obstinately fix our eyes on the ruins which may still be descried upon the shore we have left, while the current sweeps us along, and drives us backwards toward the gulf.

In no country in Europe has the great social revolution which I have been describing made such rapid progress as in France; but it has always been borne on by chance. The heads of the state have never had any forethought for its exigencies, and its victories have been obtained without their consent or without their knowledge. The most powerful, the most intelligent, and the most moral classes of the nation have never attempted to connect themselves with it in order to guide it. The people has consequently been abandoned to its wild propensities, and it has grown up like those outcasts who receive their education in the public streets, and who are unacquainted with aught but the vices and wretchedness of society. The existence of a democracy was seemingly unknown, when on a sudden it took possession of the supreme power. Everything was then submitted to its caprices; it was worshiped as the idol of

strength; until, when it was enfeebled by its own excesses, the legislator conceived the rash project of annihilating its power, instead of instructing it and correcting its vices; no attempt was made to fit it to govern, but all were bent on excluding it from the government.

The consequence of this has been that the democratic revolution has been effected only in the material parts of society, without that concomitant change in laws, ideas, customs and manners which was necessary to render such a revolution beneficial. We have gotten a democracy, but without the conditions which lessen its vices and render its natural advantages more prominent; and although we already perceive the evils it brings, we are ignorant of the benefits it may confer.

While the power of the crown, supported by the aristocracy, peaceably governed the nations of Europe, society possessed, in the midst of its wretchedness, several different advantages which can now scarcely be appreciated or conceived.

The power of a part of his subjects was an insurmountable barrier to the tyranny of the prince; and the monarch, who felt the almost divine character which he enjoyed in the eyes of the multitude, derived a motive for the just use of his power from the respect which he inspired.

High as they were placed above the people, the nobles could not but take that calm and benevolent interest in its fate which the shepherd feels towards his flock; and without acknowledging the poor as their equals, they watched over the destiny of those whose welfare Providence had entrusted to their care.

The people never having conceived the idea of a social condition different from its own, and entertaining no expectation of ever ranking with its chiefs, received benefits from them without discussing their rights. It grew attached to them when they were clement and just, and it submitted without resistance or servility to their exactions, as to the inevitable visitations of the arm of God. Custom, and the manners of the time, had moreover created a species of law in the midst of violence, and established certain limits to oppression.

As the noble never suspected that anyone would attempt to deprive him of the privileges which he believed to be legitimate, and as the serf looked upon his own inferiority as a consequence of the immutable order of nature, it is easy to imagine that a mutual exchange of good will took place between two classes so differently gifted by fate. Inequality and wretchedness were then to be found in society; but the souls of neither rank of men were degraded.

Men are not corrupted by the exercise of power or debased by the

habit of obedience; but by the exercise of a power which they believe to be illegal and by obedience to a rule which they consider to be usurped and oppressive.

On one side was wealth, strength, and leisure, accompanied by the refinements of luxury, the elegance of taste, the pleasures of wit, and the religion of art. On the other was labor, and a rude ignorance; but in the midst of this coarse and ignorant multitude, it was not uncommon to meet with energetic passions, generous sentiments, profound religious convictions, and independent virtues.

The body of a state thus organized might boast of its stability, its power, and, above all, of its glory.

But the scene is now changed; and gradually the two ranks mingle; the divisions which once severed mankind are lowered; property is divided, power is held in common, the light of intelligence spreads, and the capacities of all classes are equally cultivated; the state becomes democratic, and the empire of democracy is slowly and peaceably introduced into the institutions and the manners of the nation.

I can conceive a society in which all men would profess an equal attachment and respect for the laws of which they are the common authors; in which the authority of the state would be respected as necessary, though not as divine; and the loyalty of the subject to the chief magistrate would not be a passion, but a quiet and rational persuasion. Every individual being in the possession of rights which he is sure to retain, a kind of manly reliance and reciprocal courtesy would arise between all classes, alike removed from pride and meanness.

The people, well acquainted with its true interests, would allow that, in order to profit by the advantages of society, it is necessary to satisfy its demands. In this state of things, the voluntary association of the citizens might supply the individual exertions of the nobles, and the community would be alike protected from anarchy and from oppression.

I admit that in a democratic state thus constituted society will not be stationary, but the impulses of the social body may be regulated and directed forwards; if there be less splendor than in the halls of an aristocracy, the contrast of misery will be less frequent also; the pleasures of enjoyment may be less excessive, but those of comfort will be more general; the sciences may be less perfectly cultivated, but ignorance will be less common; the impetuosity of the feelings will be repressed, and the habits of the nation softened; there will be more vices and fewer crimes.

In the absence of enthusiasm and of an ardent faith, great sacrifices may be obtained from the members of a commonwealth by an appeal to

their understandings and their experience; each individual will feel the same necessity for uniting with his fellow citizens to protect his own weakness; and as he knows that if they are to assist he must co-operate, he will readily perceive that his personal interest is identified with the interest of the community.

The nation, taken as a whole, will be less brilliant, less glorious, and perhaps less strong; but the majority of the citizens will enjoy a greater degree of prosperity, and the people will remain quiet, not because it despairs of amelioration, but because it is conscious of the advantages of its condition.

If all the consequences of this state of things were not good or useful, society would at least have appropriated all such as were useful and good; and having once and forever renounced the social advantages of aristocracy, mankind would enter into possession of all the benefits which democracy can afford.

But here it may be asked what we have adopted in the place of those institutions, those ideas, and those customs of our forefathers which we have abandoned.

The spell of royalty is broken, but it has not been succeeded by the majesty of the laws; the people has learned to despise all authority, but fear now extorts a larger tribute of obedience than that which was formerly paid by reverence and by love.

I perceive that we have destroyed those independent beings which were able to cope with tyranny singlehanded; but it is the government that has inherited the privileges of which families, corporations, and individuals have been deprived; the weakness of the whole community has therefore succeeded that influence of a small body of citizens, which, if it was sometimes oppressive, was often conservative.

The division of property has lessened the distance which separated the rich from the poor; but it would seem that the nearer they draw to each other, the greater is their mutual hatred, and the more vehement the envy and the dread with which they resist each other's claims to power; the notion of right is alike insensible to both classes, and force affords to both the only argument for the present, and the only guarantee for the future.

The poor man retains the prejudices of his forefathers without their faith, and their ignorance without their virtues; he has adopted the doctrine of self-interest as the rule of his actions, without understanding the science which controls it, and his egotism is no less blind than his devotedness was formerly.

If society is tranquil, it is not because it relies upon its strength and its well-being, but because it knows its weakness and its infirmities; a single effort may cost it its life; everybody feels the evil, but no one has courage or energy enough to seek the cure; the desires, the regret, the sorrows, and the joys of the time produce nothing that is visible or permanent, like the passions of old men which terminate in impotence.

We have, then, abandoned whatever advantages the old state of things afforded, without receiving any compensation from our present condition; we have destroyed an aristocracy, and we seem inclined to survey its ruins with complacency, and to fix our abode in the midst of them.

The phenomena which the intellectual world presents are not less deplorable. The democracy of France, checked in its course or abandoned to its lawless passions, has overthrown whatever crossed its path, and has shaken all that it has not destroyed. Its empire on society has not been gradually introduced, or peaceably established, but it has constantly advanced in the midst of disorder and the agitation of a conflict. In the heat of the struggle each partisan is hurried beyond the limits of his opinions by the opinions and the excesses of his opponents, until he loses sight of the end of his exertions, and holds a language which disguises his real sentiments or secret instincts. Hence arises the strange confusion which we are witnessing.

I cannot recall to my mind a passage in history more worthy of sorrow and of pity than the scenes which are happening under our eyes; it is as if the natural bond which unites the opinions of man to his tastes, and his actions to his principles, was now broken; the sympathy which has always been acknowledged between the feelings and the ideas of mankind appears to be dissolved, and all the laws of moral analogy to be abolished.

Zealous Christians may be found among us whose minds are nurtured in the love and knowledge of a future life, and who readily espouse the cause of human liberty as the source of all moral greatness. Christianity, which has declared that all men are equal in the sight of God, will not refuse to acknowledge that all citizens are equal in the eye of the law. But, by a singular concurrence of events, religion is entangled in those institutions which democracy assails, and it is not unfrequently brought to reject the equality it loves, and to curse that cause of liberty as a foe, which it might hallow by its alliance.

By the side of these religious men I discern others whose looks are turned to the earth more than to heaven; they are the partisans of liberty,

not only as the source of the noblest virtues, but more especially as the root of all solid advantages; and they sincerely desire to extend its sway, and to impart its blessings to mankind. It is natural that they should hasten to invoke the assistance of religion, for they must know that liberty cannot be established without morality, nor morality without faith; but they have seen religion in the ranks of their adversaries, and they inquire no further; some of them attack it openly, and the remainder are afraid to defend it.

In former ages slavery has been advocated by the venal and slavish-minded, while the independent and the warmhearted were struggling without hope to save the liberties of mankind. But men of high and generous characters are now to be met with whose opinions are at variance with their inclinations, and who praise that servility which they have themselves never known. Others, on the contrary, speak in the name of liberty, as if they were able to feel its sanctity and its majesty, and loudly claim for humanity those rights which they have always disowned.

There are virtuous and peaceful individuals whose pure morality, quiet habits, affluence, and talents fit them to be the leaders of the surrounding population; their love of their country is sincere, and they are prepared to make the greatest sacrifices to its welfare, but they confound the abuses of civilization with its benefits, and the idea of evil is inseparable in their minds from that of novelty.

Not far from this class is another party, whose object is to materialize mankind, to hit upon what is expedient without heeding what is just, to acquire knowledge without faith, and prosperity apart from virtue; assuming the title of the champions of modern civilization, and placing themselves in a station which they usurp with insolence, and from which they are driven by their own unworthiness.

Where are we then?

The religionists are the enemies of liberty, and the friends of liberty attack religion; the high-minded and the noble advocate subjection, and the meanest and most servile minds preach independence; honest and enlightened citizens are opposed to all progress, while men without patriotism and without principles are the apostles of civilization and of intelligence.

Has such been the fate of the centuries which have preceded our own? and has man always inhabited a world, like the present, where nothing is linked together, where virtue is without genius, and genius without honor; where the love of order is confounded with a taste for oppression,

and the holy rites of freedom with a contempt of law; where the light thrown by conscience on human actions is dim, and where nothing seems to be any longer forbidden or allowed, honorable or shameful, false or true?

I cannot, however, believe that the Creator made man to leave him in an endless struggle with the intellectual miseries which surround us: God destines a calmer and a more certain future to the communities of Europe; I am unacquainted with His designs, but I shall not cease to believe in them because I cannot fathom them, and I had rather mistrust my own capacity than His justice.

There is a country in the world where the great revolution which I am speaking of seems nearly to have reached its natural limits; it has been effected with ease and simplicity—say rather that this country has attained the consequences of the democratic revolution which we are undergoing without having experienced the revolution itself.

The emigrants who fixed themselves on the shores of America in the beginning of the seventeenth century severed the democratic principle from all the principles which repressed it in the old communities of Europe, and transplanted it unalloyed to the New World. It has there been allowed to spread in perfect freedom, and to put forth its consequences in the laws by influencing the manners of the country.

It appears to me beyond a doubt that sooner or later we shall arrive, like the Americans, at an almost complete equality of conditions. But I do not conclude from this that we shall ever be necessarily led to draw the same political consequences which the Americans have derived from a similar social organization. I am far from supposing that they have chosen the only form of government which a democracy may adopt; but the identity of the efficient cause of laws and manners in the two countries is sufficient to account for the immense interest we have in becoming acquainted with its effects in each of them.

It is not, then, merely to satisfy a legitimate curiosity that I have examined America: my wish has been to find instruction by which we may ourselves profit. Whoever should imagine that I have intended to write a panegyric would be strangely mistaken, and on reading this book he will perceive that such was not my design; nor has it been my object to advocate any form of government in particular, for I am of opinion that absolute excellence is rarely to be found in any legislation. I have not even affected to discuss whether the social revolution, which I believe to be irresistible, is advantageous or prejudicial to mankind. I have acknowledged this revolution as a fact already accomplished or on the

eve of its accomplishment; and I have selected the nation, from among those which have undergone it, in which its development has been the most peaceful and the most complete, in order to discern its natural consequences, and, if it be possible, to distinguish the means by which it may be rendered profitable. I confess that in America I saw more than America; I sought the image of democracy itself, with its inclinations, its character, its prejudices, and its passions, in order to learn what we have to fear or to hope from its progress.

In the first part of this work I have attempted to show the tendency given to the laws by the democracy of America, which is abandoned almost without restraint to its instinctive propensities, and to exhibit the course it prescribes to the government and the influence it exercises on affairs. I have sought to discover the evils and the advantages which it produces. I have examined the precautions used by the Americans to direct it, as well as those which they have not adopted, and I have undertaken to point out the causes which enable it to govern society. I do not know whether I have succeeded in making known what I saw in America, but I am certain that such has been my sincere desire, and that I have never, knowingly, molded facts to ideas, instead of ideas to facts.

Whenever a point could be established by the aid of written documents, I have had recourse to the original text, and to the most authentic and approved works. I have cited my authorities in the notes, and anyone may refer to them. Whenever an opinion, a political custom, or a remark on the manners of the country was concerned, I endeavored to consult the most enlightened men I met with. If the point in question was important or doubtful, I was not satisfied with one testimony, but I formed my opinion on the evidence of several witnesses. Here the reader must necessarily believe me upon my word. I could frequently have quoted names which are either known to him, or which deserve to be so, in proof of what I advance; but I have carefully abstained from this practice. A stranger frequently hears important truths at the fireside of his host, which the latter would perhaps conceal from the ear of friendship; he consoles himself with his guest for the silence to which he is restricted, and the shortness of the traveler's stay takes away all fear of his indiscretion. I carefully noted every conversation of this nature as soon as it occurred, but these notes will never leave my writing case; I had rather injure the success of my statements than add my name to the list of those strangers who repay the generous hospitality they have received by subsequent chagrin and annoyance.

I am aware that, notwithstanding my care, nothing will be easier than to criticize this book, if anyone ever chooses to criticize it.

Those readers who may examine it closely will discover the fundamental idea which connects the several parts together. But the diversity of the subjects I have had to treat is exceedingly great, and it will not be difficult to oppose an isolated fact to the body of facts which I quote, or an isolated idea to the body of ideas I put forth. I hope to be read in the spirit which has guided my labors, and that my book may be judged by the general impression it leaves, as I have formed my own judgment not on any single reason, but upon the mass of evidence.

It must not be forgotten that the author who wishes to be understood is obliged to push all his ideas to their utmost theoretical consequences, and often to the verge of what is false or impracticable; for if it be necessary sometimes to quit the rules of logic in active life, such is not the case in discourse, and a man finds that almost as many difficulties spring from inconsistency of language as usually arise from consistency of conduct.

I conclude by pointing out myself what many readers will consider the principal defect of the work. This book is written to favor no particular views, and in composing it I have entertained no design of serving or attacking any party. I have undertaken not to see differently, but to look further than parties, and while they are busied for the morrow, I have turned my thoughts to the future. . . .

Social Condition of the Anglo-Americans

A social condition is commonly the result of circumstances, sometimes of laws, oftener still of these two causes united; but wherever it exists, it may justly be considered as the source of almost all the laws, the usages, and the ideas which regulate the conduct of nations: whatever it does not produce it modifies.

It is therefore necessary, if we would become acquainted with the legislation and the manners of a nation, to begin by the study of its social condition.

THE STRIKING CHARACTERISTIC OF THE SOCIAL CONDITION
OF THE ANGLO-AMERICANS IS ITS ESSENTIAL DEMOCRACY

Many important observations suggest themselves upon the social condition of the Anglo-Americans; but there is one which takes precedence

of all the rest. The social condition of the Americans is eminently democratic; this was its character at the foundation of the Colonies, and is still more strongly marked at the present day.

I have stated in the preceding chapter that great equality existed among the emigrants who settled on the shores of New England. The germ of aristocracy was never planted in that part of the Union. The only influence which obtained there was that of intellect; the people were used to reverence certain names as the emblems of knowledge and virtue. Some of their fellow citizens acquired a power over the rest which might truly have been called aristocratic, if it had been capable of transmission from father to son.

This was the state of things to the east of the Hudson: to the southwest of that river, and in the direction of the Floridas, the case was different. In most of the states situated to the southwest of the Hudson, some great English proprietors had settled, who had imported with them aristocratic principles and the English law of descent. I have explained the reasons why it was impossible ever to establish a powerful aristocracy in America; these reasons existed with less force to the southwest of the Hudson. In the South, one man, aided by slaves, could cultivate a great extent of country; it was therefore common to see rich landed proprietors. But their influence was not altogether aristocratic as that term is understood in Europe, since they possessed no privileges; and the cultivation of their estates being carried on by slaves, they had no tenants depending on them, and consequently no patronage. Still, the great proprietors south of the Hudson constituted a superior class, having ideas and tastes of its own, and forming the center of political action. This kind of aristocracy sympathized with the body of the people, whose passions and interests it easily embraced; but it was too weak and too short-lived to excite either love or hatred for itself. This was the class which headed the insurrection in the South, and furnished the best leaders of the American Revolution.

At the period of which we are now speaking society was shaken to its center: the people, in whose name the struggle had taken place, conceived the desire of exercising the authority which it had acquired; its democratic tendencies were awakened; and having thrown off the yoke of the mother country, it aspired to independence of every kind. The influence of individuals gradually ceased to be felt, and custom and law united together to produce the same result.

But the law of descent was the last step to equality. I am surprised that ancient and modern jurists have not attributed to this law a greater influ-

ence on human affairs.¹ It is true that these laws belong to civil affairs; but they ought nevertheless to be placed at the head of all political institutions; for, while political laws are only the symbol of a nation's condition, they exercise an incredible influence upon its social state. They have, moreover, a sure and uniform manner of operating upon society, affecting, as it were, generations yet unborn.

Through their means man acquires a kind of preternatural power over the future lot of his fellow creatures. When the legislator has regulated the law of inheritance, he may rest from his labor. The machine once put in motion will go on for ages, and advance, as if self-guided, towards a given point. When framed in a particular manner, this law unites, draws together, and vests property and power in a few hands: its tendency is clearly aristocratic. On opposite principles its action is still more rapid; it divides, distributes, and disperses both property and power. Alarmed by the rapidity of its progress, those who despair of arresting its motion endeavor to obstruct it by difficulties and impediments; they vainly seek to counteract its effect by contrary efforts: but it gradually reduces or destroys every obstacle, until by its incessant activity the bulwarks of the influence of wealth are ground down to the fine and shifting sand which is the basis of democracy. When the law of inheritance permits, still more when it decrees, the equal division of a father's property among all his children, its effects are of two kinds: it is important to distinguish them from each other, although they tend to the same end.

In virtue of the law of partible inheritance, the death of every proprietor brings about a kind of revolution in property: not only do his possessions change hands, but their very nature is altered, since they are parceled into shares which become smaller and smaller at each division. This is the direct and, as it were, the physical effect of the law. It follows, then, that in countries where equality of inheritance is established by law, property, and especially landed property, must have a tendency to perpetual diminution. The effects, however, of such legislation would only be perceptible after a lapse of time if the law was abandoned to its own working, for supposing the family to consist of two children (and in a country peopled as France is the average number is not above

1. I understand by the law of descent all those laws whose principal object is to regulate the distribution of property after the death of its owner. The law of entail is of this number: it certainly prevents the owner from disposing of his possessions before his death; but this is solely with the view of preserving them entire for the heir. The principal object, therefore, of the law of entail is to regulate the descent of property after the death of its owner: its other provisions are merely means to this end.

three), these children, sharing among them the fortune of both parents, would not be poorer than their father or mother.

But the law of equal division exercises its influence not merely upon the property itself, but it affects the minds of the heirs and brings their passions into play. These indirect consequences tend powerfully to the destruction of large fortunes, and especially of large domains.

Among nations whose law of descent is founded upon the right of primogeniture, landed estates often pass from generation to generation without undergoing division. The consequence of which is that family feeling is to a certain degree incorporated with the estate. The family represents the estate, the estate the family; whose name, together with its origin, its glory, its power, and its virtues, is thus perpetuated in an imperishable memorial of the past, and a sure pledge of the future.

When the equal partition of property is established by law, the intimate connection is destroyed between family feeling and the preservation of the paternal estate: the property ceases to represent the family, for as it must inevitably be divided after one or two generations, it has evidently a constant tendency to diminish, and must in the end be completely dispersed. The sons of the great landed proprietor, if they are few in number, or if fortune befriends them, may indeed entertain the hope of being as wealthy as their father, but not that of possessing the same property as he did; their riches must necessarily be composed of elements different from his.

Now, from the moment that you divest the landowner of that interest in the preservation of his estate which he derives from association, from tradition, and from family pride, you may be certain that sooner or later he will dispose of it; for there is a strong pecuniary interest in favor of selling, as floating capital produces higher interest than real property, and is more readily available to gratify the passions of the moment.

Great landed estates which have once been divided never come together again; for the small proprietor draws from his land a better revenue, in proportion, than the large owner does from his; and of course he sells it at a higher rate.² The calculations of gain, therefore, which decide the rich man to sell his domain will still more powerfully influence him against buying small estates to unite them into a large one.

What is called family pride is often founded upon an illusion of self-

2. I do not mean to say that the small proprietor cultivates his land better, but he cultivates it with more ardor and care, so that he makes up by his labor for his want of skill.

love. A man wishes to perpetuate and immortalize himself, as it were, in his great-grandchildren. Where the *esprit de famille* ceases to act, individual selfishness comes into play. When the idea of family becomes vague, indeterminate, and uncertain, a man thinks of his present convenience; he provides for the establishment of his succeeding generation and no more.

Either a man gives up the idea of perpetuating his family, or at any rate he seeks to accomplish it by other means than that of a landed estate.

Thus not only does the law of partible inheritance render it difficult for families to preserve their ancestral domains entire, but it deprives them of the inclination to attempt it, and compels them in some measure to co-operate with the law in their own extinction.

The law of equal distribution proceeds by two methods: by acting upon things, it acts upon persons; by influencing persons, it affects things. By these means the law succeeds in striking at the root of landed property, and dispersing rapidly both families and fortunes.³

Most certainly it is not for us Frenchmen of the nineteenth century, who daily witness the political and social changes which the law of partition is bringing to pass, to question its influence. It is perpetually conspicuous in our country, overthrowing the walls of our dwellings and removing the landmarks of our fields. But although it has produced great effects in France, much still remains for it to do. Our recollections, opinions, and habits present powerful obstacles to its progress.

In the United States it has nearly completed its work of destruction, and there we can best study its results. The English laws concerning the transmission of property were abolished in almost all the states at the time of the Revolution. The law of entail was so modified as not to interrupt the free circulation of property. The first generation having passed away, estates began to be parceled out; and the change became more

3. Land being the most stable kind of property, we find, from time to time, rich individuals who are disposed to make great sacrifices in order to obtain it, and who willingly forfeit a considerable part of their income to make sure of the rest. But these are accidental cases. The preference for landed property is no longer found habitually in any class but among the poor. The small landowner, who has less information, less imagination, and fewer passions than the great one, is generally occupied with the desire of increasing his estate: and it often happens that by inheritance, by marriage, or by the chances of trade, he is gradually furnished with the means. Thus, to balance the tendency which leads men to divide their estates, there exists another, which incites them to add to them. This tendency, which is sufficient to prevent estates from being divided ad infinitum, is not strong enough to create great territorial possessions, certainly not to keep them up in the same family.

and more rapid with the progress of time. At this moment, after a lapse of a little more than sixty years, the aspect of society is totally altered; the families of the great landed proprietors are almost all commingled with the general mass. In the state of New York, which formerly contained many of these, there are but two who still keep their heads above the stream; and they must shortly disappear. The sons of these opulent citizens are become merchants, lawyers, or physicians. Most of them have lapsed into obscurity. The last trace of hereditary ranks and distinctions is destroyed—the law of partition has reduced all to one level.

I do not mean that there is any deficiency of wealthy individuals in the United States; I know of no country, indeed, where the love of money has taken stronger hold on the affections of men, and where a profounder contempt is expressed for the theory of the permanent equality of property. But wealth circulates with inconceivable rapidity, and experience shows that it is rare to find two succeeding generations in the full enjoyment of it.

This picture, which may perhaps be thought to be overcharged, still gives a very imperfect idea of what is taking place in the new states of the West and Southwest. At the end of the last century a few bold adventurers began to penetrate into the valleys of the Mississippi, and the mass of the population very soon began to move in that direction: communities unheard of till then were seen to emerge from the wilds; states whose names were not in existence a few years before claimed their place in the American Union; and in the western settlements we may behold democracy arrived at its utmost extreme. In these states, founded offhand, and, as it were, by chance, the inhabitants are but of yesterday. Scarcely known to one another, the nearest neighbors are ignorant of each other's history. In this part of the American continent, therefore, the population has not experienced the influence of great names and great wealth, nor even that of the natural aristocracy of knowledge and virtue. None are there to wield that respectable power which men willingly grant to the remembrance of a life spent in doing good before their eyes. The new states of the West are already inhabited; but society has no existence among them.

It is not only the fortunes of men which are equal in America; even their acquirements partake in some degree of the same uniformity. I do not believe that there is a country in the world where, in proportion to the population, there are so few uninstructed, and at the same time so few learned, individuals. Primary instruction is within the reach of everybody; superior instruction is scarcely to be obtained by any. This is

not surprising; it is in fact the necessary consequence of what we have advanced above. Almost all the Americans are in easy circumstances, and can therefore obtain the first elements of human knowledge.

In America there are comparatively few who are rich enough to live without a profession. Every profession requires an apprenticeship, which limits the time of instruction to the early years of life. At fifteen they enter upon their calling, and thus their education ends at the age when ours begins. Whatever is done afterwards is with a view to some special and lucrative object: a science is taken up as a matter of business, and the only branch of it which is attended to is such as admits of an immediate practical application.

In America most of the rich men were formerly poor; most of those who now enjoy leisure were absorbed in business during their youth; the consequence of which is that when they might have had a taste for study, they had no time for it, and when the time is at their disposal they have no longer the inclination.

There is no class, then, in America, in which the taste for intellectual pleasures is transmitted with hereditary fortune and leisure, and by which the labors of the intellect are held in honor. Accordingly there is an equal want of the desire and the power of application to these objects.

A middling standard is fixed in America for human knowledge. All approach as near to it as they can: some as they rise, others as they descend. Of course, an immense multitude of persons are to be found who entertain the same number of ideas on religion, history, science, political economy, legislation, and government. The gifts of intellect proceed directly from God, and man cannot prevent their unequal distribution. But in consequence of the state of things which we have here represented, it happens that although the capacities of men are widely different, as the Creator has doubtless intended they should be, they are submitted to the same method of treatment.

In America the aristocratic element has always been feeble from its birth; and if at the present day it is not actually destroyed, it is at any rate so completely disabled that we can scarcely assign to it any degree of influence in the course of affairs.

The democratic principle, on the contrary, has gained so much strength by time, by events, and by legislation as to have become not only predominant but all-powerful. There is no family or corporate authority, and it is rare to find even the influence of individual character enjoy any durability.

America, then, exhibits in her social state a most extraordinary phe-

nomenon. Men are there seen on a greater equality in point of fortune and intellect, or, in other words, more equal in their strength, than in any other country of the world, or in any age of which history has preserved the remembrance.

POLITICAL CONSEQUENCES OF THE SOCIAL CONDITION
OF THE ANGLO-AMERICANS

The political consequences of such a social condition as this are easily deducible.

It is impossible to believe that equality will not eventually find its way into the political world as it does everywhere else. To conceive of men remaining forever unequal upon one single point, yet equal on all others, is impossible; they must come in the end to be equal upon all.

Now I know of only two methods of establishing equality in the political world; every citizen must be put in possession of his rights, or rights must be granted to no one. For nations which are arrived at the same stage of social existence as the Anglo-Americans, it is therefore very difficult to discover a medium between the sovereignty of all and the absolute power of one man: and it would be vain to deny that the social condition which I have been describing is equally liable to each of these consequences.

There is, in fact, a manly and lawful passion for equality which excites men to wish all to be powerful and honored. This passion tends to elevate the humble to the rank of the great; but there exists also in the human heart a depraved taste for equality, which impels the weak to attempt to lower the powerful to their own level, and reduces men to prefer equality in slavery to inequality with freedom. Not that those nations whose social condition is democratic naturally despise liberty; on the contrary, they have an instinctive love of it. But liberty is not the chief and constant object of their desires; equality is their idol: they make rapid and sudden efforts to obtain liberty; and if they miss their aim, resign themselves to their disappointment; but nothing can satisfy them except equality, and rather than lose it they resolve to perish.

On the other hand, in a state where the citizens are nearly on an equality, it becomes difficult for them to preserve their independence against the aggressions of power. No one among them being strong enough to engage in the struggle with advantage, nothing but a general combination can protect their liberty. And such a union is not always to be found.

From the same social position, then, nations may derive one or the other of two great political results; these results are extremely different from each other, but they may both proceed from the same cause.

The Anglo-Americans are the first nations who, having been exposed to this formidable alternative, have been happy enough to escape the dominion of absolute power. They have been allowed by their circumstances, their origin, their intelligence, and especially by their moral feeling, to establish and maintain the sovereignty of the people.

*The Principle of the Sovereignty of the
People in America*

Whenever the political laws of the United States are to be discussed, it is with the doctrine of the sovereignty of the people that we must begin.

The principle of the sovereignty of the people, which is to be found, more or less, at the bottom of almost all human institutions, generally remains concealed from view. It is obeyed without being recognized, or if for a moment it be brought to light, it is hastily cast back into the gloom of the sanctuary.

“The will of the nation” is one of those expressions which have been most profusely abused by the wily and the despotic of every age. To the eyes of some it has been represented by the venal suffrages of a few of the satellites of power; to others, by the votes of a timid or an interested minority; and some have even discovered it in the silence of a people, on the supposition that the fact of submission established the right of command.

In America, the principle of the sovereignty of the people is not either barren or concealed, as it is with some other nations; it is recognized by the customs and proclaimed by the laws; it spreads freely, and arrives without impediment at its most remote consequences. If there be a country in the world where the doctrine of the sovereignty of the people can be fairly appreciated, where it can be studied in its application to the affairs of society, and where its dangers and its advantages may be foreseen, that country is assuredly America.

I have already observed that, from their origin, the sovereignty of the people was the fundamental principle of the greater number of British colonies in America. It was far, however, from then exercising as much influence on the government of society as it now does. Two obstacles, the one external, the other internal, checked its invasive progress.

It could not ostensibly disclose itself in the laws of colonies which were still constrained to obey the mother country: it was therefore obliged to spread secretly, and to gain ground in the provincial assemblies, and especially in the townships.

American society was not yet prepared to adopt it with all its consequences. The intelligence of New England, and the wealth of the country to the south of the Hudson, (as I have shown in the preceding chapter,) long exercised a sort of aristocratic influence which tended to retain the exercise of social authority in the hands of a few. The public functionaries were not universally elected, and the citizens were not all of them electors. The electoral franchise was everywhere placed within certain limits, and made dependent on a certain qualification, which was exceedingly low in the North, and more considerable in the South.

The American Revolution broke out, and the doctrine of the sovereignty of the people, which had been nurtured in the townships and municipalities, took possession of the state. Every class was enlisted in its cause; battles were fought, and victories obtained for it, until it became the law of laws.

A no less rapid change was effected in the interior of society, where the law of descent completed the abolition of local influences.

At the very time when this consequence of the laws and of the revolution was apparent to every eye, victory was irrevocably pronounced in favor of the democratic cause. All power was, in fact, in its hands, and resistance was no longer possible. The higher orders submitted without a murmur and without a struggle to an evil which was thenceforth inevitable. The ordinary fate of falling powers awaited them; each of their several members followed his own interest; and as it was impossible to wring the power from the hands of a people which they did not detest sufficiently to brave, their only aim was to secure its good will at any price. The most democratic laws were consequently voted by the very men whose interests they impaired: and thus, although the higher classes did not excite the passions of the people against their order, they accelerated the triumph of the new state of things; so that, by a singular change, the democratic impulse was found to be most irresistible in the very states where the aristocracy had the firmest hold.

The state of Maryland, which had been founded by men of rank, was the first to proclaim universal suffrage, and to introduce the most democratic forms into the conduct of its government.

When a nation modifies the elective qualification, it may easily be foreseen that sooner or later that qualification will be entirely abolished.

There is no more invariable rule in the history of society: the further electoral rights are extended, the greater is the need of extending them; for after each concession the strength of the democracy increases, and its demands increase with its strength. The ambition of those who are below the appointed rate is irritated in exact proportion to the great number of those who are above it. The exception at last becomes the rule, concession follows concession, and no stop can be made short of universal suffrage.

At the present day the principle of the sovereignty of the people has acquired, in the United States, all the practical development which the imagination can conceive. It is unencumbered by those fictions which have been thrown over it in other countries, and it appears in every possible form according to the exigency of the occasion. Sometimes the laws are made by the people in a body, as at Athens; and sometimes its representatives, chosen by universal suffrage, transact business in its name, and almost under its immediate control.

In some countries a power exists which, though it is in a degree foreign to the social body, directs it, and forces it to pursue a certain track. In others the ruling force is divided, being partly within and partly without the ranks of the people. But nothing of the kind is to be seen in the United States; there society governs itself for itself. All power centers in its bosom; and scarcely an individual is to be met with who would venture to conceive, or, still less, to express, the idea of seeking it elsewhere. The nation participates in the making of its laws by the choice of its legislators, and in the execution of them by the choice of the agents of the executive government; it may almost be said to govern itself, so feeble and so restricted is the share left to the administration, so little do the authorities forget their popular origin and the power from which they emanate. . . .

Liberty of the Press in the United States

The influence of the liberty of the press does not affect political opinions alone, but it extends to all the opinions of men, and it modifies customs as well as laws. In another part of this work I shall attempt to determine the degree of influence which the liberty of the press has exercised upon civil society in the United States, and to point out the direction which it has given to the ideas, as well as the tone which it has imparted to the character and the feelings, of the Anglo-Americans, but at

present I purpose simply to examine the effects produced by the liberty of the press in the political world.

I confess that I do not entertain that firm and complete attachment to the liberty of the press which things that are supremely good in their very nature are wont to excite in the mind; and I approve of it more from a recollection of the evils it prevents than from a consideration of the advantages it ensures.

If anyone could point out an intermediate, and yet a tenable, position between the complete independence and the entire subjection of the public expression of opinion, I should perhaps be inclined to adopt it; but the difficulty is to discover this position. If it is your intention to correct the abuses of unlicensed printing and to restore the use of orderly language, you may in the first instance try the offender by a jury; but if the jury acquits him, the opinion which was that of a single individual becomes the opinion of the country at large. Too much and too little has therefore hitherto been done: if you proceed, you must bring the delinquent before permanent magistrates; but even here the cause must be heard before it can be decided; and the very principles which no book would have ventured to avow are blazoned forth in the pleadings, and what was obscurely hinted at in a single composition is then repeated in a multitude of other publications. The language in which a thought is embodied is the mere carcass of the thought, and not the idea itself; tribunals may condemn the form, but the sense and spirit of the work is too subtle for their authority: too much has still been done to recede, too little to attain your end; you must therefore proceed. If you establish a censorship of the press, the tongue of the public speaker will still make itself heard, and you have only increased the mischief. The powers of thought do not rely, like the powers of physical strength, upon the number of their mechanical agents, nor can a host of authors be reckoned like the troops which compose an army; on the contrary, the authority of a principle is often increased by the smallness of the number of men by whom it is expressed. The words of a strong-minded man, which penetrate amidst the passions of a listening assembly, have more power than the vociferations of a thousand orators; and if it be allowed to speak freely in any public place, the consequence is the same as if free speaking was allowed in every village. The liberty of discourse must therefore be destroyed as well as the liberty of the press; this is the necessary term of your efforts; but if your object was to repress the abuses of liberty, they have brought you to the feet of a despot. You have been led from

the extreme of independence to the extreme of subjection, without meeting with a single tenable position for shelter or repose.

There are certain nations which have peculiar reasons for cherishing the liberty of the press, independently of the general motives which I have just pointed out. For in certain countries which profess to enjoy the privileges of freedom, every individual agent of the government may violate the laws with impunity, since those whom he oppresses cannot prosecute him before the courts of justice. In this case the liberty of the press is not merely a guarantee, but it is the only guarantee of their liberty and their security which the citizens possess. If the rulers of these nations proposed to abolish the independence of the press, the people would be justified in saying: "Give us the right of prosecuting your offenses before the ordinary tribunals, and perhaps we may then waive our right of appeal to the tribunal of public opinion."

But in the countries in which the doctrine of the sovereignty of the people ostensibly prevails, the censorship of the press is not only dangerous, but it is absurd. When the right of every citizen to cooperate in the government of society is acknowledged, every citizen must be presumed to possess the power of discriminating between the different opinions of his contemporaries, and of appreciating the different facts from which inferences may be drawn. The sovereignty of the people and the liberty of the press may therefore be looked upon as correlative institutions; just as the censorship of the press and universal suffrage are two things which are irreconcilably opposed, and which cannot long be retained among the institutions of the same people. Not a single individual of the twelve millions who inhabit the territory of the United States has as yet dared to propose any restrictions to the liberty of the press. The first newspaper over which I cast my eyes, upon my arrival in America, contained the following article:

In all this affair, the language of Jackson has been that of a heartless despot, solely occupied with the preservation of his own authority. Ambition is his crime, and it will be his punishment too: intrigue is his native element, and intrigue will confound his tricks, and will deprive him of his power: he governs by means of corruption, and his immoral practices will redound to his shame and confusion. His conduct in the political arena has been that of a shameless and lawless gamester. He succeeded at the time, but the hour of retribution approaches, and he will be obliged to disgorge his winnings, to throw aside his false dice, and to end his days in some retirement, where he may curse his madness at his leisure; for repentance is a virtue with which his heart is likely to remain for ever unacquainted.

It is not uncommonly imagined in France that the virulence of the press originates in the uncertain social condition, in the political excitement, and the general sense of consequent evil which prevail in that country; and it is therefore supposed that as soon as society has resumed a certain degree of composure, the press will abandon its present vehemence. I am inclined to think that the above causes explain the reason of the extraordinary ascendancy it has acquired over the nation, but that they do not exercise much influence upon the tone of its language. The periodical press appears to me to be actuated by passions and propensities independent of the circumstances in which it is placed; and the present position of America corroborates this opinion.

America is perhaps, at this moment, the country of the whole world which contains the fewest germs of revolution; but the press is not less destructive in its principles than in France, and it displays the same violence without the same reasons for indignation. In America, as in France, it constitutes a singular power, so strangely composed of mingled good and evil that it is at the same time indispensable to the existence of freedom, and nearly incompatible with the maintenance of public order. Its power is certainly much greater in France than in the United States, though nothing is more rare in the latter country than to hear of a prosecution having been instituted against it. The reason of this is perfectly simple: the Americans having once admitted the doctrine of the sovereignty of the people, apply it with perfect consistency. It was never their intention to found a permanent state of things with elements which undergo daily modifications; and there is consequently nothing criminal in an attack upon the existing laws, provided it be not attended with a violent infraction of them. They are moreover of opinion that courts of justice are unable to check the abuses of the press; and that as the subtlety of human language perpetually eludes the severity of judicial analysis, offenses of this nature are apt to escape the hand which attempts to apprehend them. They hold that to act with efficacy upon the press, it would be necessary to find a tribunal not only devoted to the existing order of things but capable of surmounting the influence of public opinion, a tribunal which should conduct its proceedings without publicity, which should pronounce its decrees without assigning its motives, and punish the intentions even more than the language of an author. Whosoever should have the power of creating and maintaining a tribunal of this kind would waste his time in prosecuting the liberty of the press; for he would be the supreme master of the whole community, and he would be as free to rid himself of the authors as of their writings. In this

question, therefore, there is no medium between servitude and extreme license; in order to enjoy the inestimable benefits which the liberty of the press ensures, it is necessary to submit to the inevitable evils which it engenders. To expect to acquire the former and to escape the latter is to cherish one of those illusions which commonly mislead nations in their times of sickness, when, tired with faction and exhausted by effort, they attempt to combine hostile opinions and contrary principles upon the same soil.

The small influence of the American journals is attributable to several reasons, among which are the following:

The liberty of writing, like all other liberty, is most formidable when it is a novelty; for a people which has never been accustomed to cooperate in the conduct of state affairs places implicit confidence in the first tribune who arouses its attention. The Anglo-Americans have enjoyed this liberty ever since the foundation of the settlements; moreover, the press cannot create human passions by its own power, however skillfully it may kindle them where they exist. In America politics are discussed with animation and a varied activity, but they rarely touch those deep passions which are excited whenever the positive interest of a part of the community is impaired; but in the United States the interests of the community are in a most prosperous condition. A single glance upon a French and an American newspaper is sufficient to show the difference which exists between the two nations on this head. In France the space allotted to commercial advertisements is very limited, and the intelligence is not considerable, but the most essential part of the journal is that which contains the discussion of the politics of the day. In America three quarters of the enormous sheet which is set before the reader are filled with advertisements, and the remainder is frequently occupied by political intelligence or trivial anecdotes. It is only from time to time that one finds a corner devoted to passionate discussions like those with which the journalists of France are wont to indulge their readers.

It has been demonstrated by observation, and discovered by the innate sagacity of the pettiest as well as the greatest of despots, that the influence of a power is increased in proportion as its direction is rendered more central. In France the press combines a twofold centralization; almost all its power is centered in the same spot, and vested in the same hands, for its organs are far from numerous. The influence of a public press thus constituted upon a skeptical nation must be unbounded. It is an enemy with which a government may sign an occasional truce, but which it is difficult to resist for any length of time.

Neither of these kinds of centralization exists in America. The United States have no metropolis; the intelligence as well as the power of the country are dispersed abroad, and instead of radiating from a point, they cross each other in every direction: the Americans have established no central control over the expression of opinion, any more than over the conduct of business. These are circumstances which do not depend on human foresight; but it is owing to the laws of the Union that there are no licenses to be granted to printers, no securities demanded from editors as in France, and no stamp duty as in France and England. The consequence of this is that nothing is easier than to set up a newspaper, and a small number of readers suffices to defray the expenses of the editor.

The number of periodical and occasional publications which appears in the United States actually surpasses belief. The most enlightened Americans attribute the subordinate influence of the press to this excessive dissemination; and it is adopted as an axiom of political science in that country that the only way to neutralize the effect of public journals is to multiply them indefinitely. I cannot conceive that a truth which is so self-evident should not already have been more generally admitted in Europe; it is comprehensible that the persons who hope to bring about revolutions by means of the press should be desirous of confining its action to a few powerful organs, but it is perfectly incredible that the partisans of the existing state of things, and the natural supporters of the laws, should attempt to diminish the influence of the press by concentrating its authority. The governments of Europe seem to treat the press with the courtesy of the knights of old; they are anxious to furnish it with the same central power which they have found to be so trusty a weapon, in order to enhance the glory of their resistance to its attacks.

In America there is scarcely a hamlet which has not its own newspaper. It may readily be imagined that neither discipline nor unity of design can be communicated to so multifarious a host, and each one is consequently led to fight under his own standard. All the political journals of the United States are indeed arrayed on the side of the administration or against it; but they attack and defend it in a thousand different ways. They cannot succeed in forming those great currents of opinion which overwhelm the most solid obstacles. This division of the influence of the press produces a variety of other consequences which are scarcely less remarkable. The facility with which journals can be established induces a multitude of individuals to take a part in them; but as the extent of competition precludes the possibility of considerable profit, the

most distinguished classes of society are rarely led to engage in these undertakings. But such is the number of the public prints that even if they were a source of wealth writers of ability could not be found to direct them all. The journalists of the United States are usually placed in a very humble position, with a scanty education and a vulgar turn of mind. The will of the majority is the most general of laws, and it establishes certain habits which form the characteristics of each peculiar class of society; thus it dictates the etiquette practiced at courts and the etiquette of the bar. The characteristics of the French journalist consist in a violent, but frequently an eloquent and lofty, manner of discussing the politics of the day; and the exceptions to this habitual practice are only occasional. The characteristics of the American journalist consist in an open and coarse appeal to the passions of the populace; and he habitually abandons the principles of political science to assail the characters of individuals, to track them into private life, and disclose all their weaknesses and errors.

Nothing can be more deplorable than this abuse of the powers of thought; I shall have occasion to point out hereafter the influence of the newspapers upon the taste and the morality of the American people, but my present subject exclusively concerns the political world. It cannot be denied that the effects of this extreme license of the press tend indirectly to the maintenance of public order. The individuals who are already in the possession of a high station in the esteem of their fellow citizens are afraid to write in the newspapers, and they are thus deprived of the most powerful instrument which they can use to excite the passions of the multitude to their own advantage.⁴

The personal opinions of the editors have no kind of weight in the eyes of the public; the only use of a journal is that it imparts the knowledge of certain facts, and it is only by altering or distorting those facts that a journalist can contribute to the support of his own views.

But although the press is limited to these resources, its influence in America is immense. It is the power which impels the circulation of political life through all the districts of that vast territory. Its eye is constantly open to detect the secret springs of political designs, and to summon the leaders of all parties to the bar of public opinion. It rallies the interests of the community round certain principles, and it draws up the creed which factions adopt; for it affords a means of intercourse between

4. They only write in the papers when they choose to address the people in their own name; as, for instance, when they are called upon to repel calumnious imputations, and to correct a misstatement of facts.

parties which hear and which address each other without ever having been in immediate contact. When a great number of the organs of the press adopt the same line of conduct, their influence becomes irresistible; and public opinion, when it is perpetually assailed from the same side, eventually yields to the attack. In the United States each separate journal exercises but little authority; but the power of the periodical press is only second to that of the people.

In the United States the democracy perpetually raises fresh individuals to the conduct of public affairs; and the measures of the administration are consequently seldom regulated by the strict rules of consistency or of order. But the general principles of the government are more stable, and the opinions most prevalent in society are generally more durable than in many other countries. When once the Americans have taken up an idea, whether it be well or ill founded, nothing is more difficult than to eradicate it from their minds. The same tenacity of opinion has been observed in England, where, for the last century, greater freedom of conscience and more invincible prejudices have existed than in all the other countries of Europe. I attribute this consequence to a cause which may at first sight appear to have a very opposite tendency, namely, to the liberty of the press. The nations among which this liberty exists are as apt to cling to their opinions from pride as from conviction. They cherish them because they hold them to be just, and because they exercised their own free will in choosing them; and they maintain them, not only because they are true, but because they are their own. Several other reasons conduce to the same end.

It was remarked by a man of genius that "ignorance lies at the two ends of knowledge." Perhaps it would have been more correct to have said that absolute convictions are to be met with at the two extremities, and that doubt lies in the middle; for the human intellect may be considered in three distinct states, which frequently succeed one another.

A man believes implicitly because he adopts a proposition without inquiry. He doubts as soon as he is assailed by the objections which his inquiries may have aroused. But he frequently succeeds in satisfying these doubts, and then he begins to believe afresh. He no longer lays hold on a truth in its most shadowy and uncertain form, but he sees it clearly before him, and he advances onwards by the light it gives him.⁵

5. It may, however, be doubted whether this rational and self-guiding conviction arouses as much fervor or enthusiastic devotedness in men as their first dogmatical belief.

When the liberty of the press acts upon men who are in the first of these three states, it does not immediately disturb their habit of believing implicitly without investigation, but it constantly modifies the objects of their intuitive convictions. The human mind continues to discern but one point upon the whole intellectual horizon, and that point is in continual motion. Such are the symptoms of sudden revolutions, and of the misfortunes which are sure to befall those generations which abruptly adopt the unconditional freedom of the press.

The circle of novel ideas is, however, soon terminated; the touch of experience is upon them, and the doubt and mistrust which their uncertainty produces become universal. We may rest assured that the majority of mankind will either believe they know not wherefore or will not know what to believe. Few are the beings who can ever hope to attain to that state of rational and independent conviction which true knowledge can beget, in defiance of the attacks of doubt.

It has been remarked that in times of great religious fervor men sometimes change their religious opinions; whereas in times of general skepticism everyone clings to his own persuasion. The same thing takes place in politics under the liberty of the press. In countries where all the theories of social science have been contested in their turn, the citizens who have adopted one of them stick to it, not so much because they are assured of its excellence as because they are not convinced of the superiority of any other. In the present age, men are not very ready to die in defense of their opinions, but they are rarely inclined to change them; and there are fewer martyrs as well as fewer apostates.

Another still more valid reason may yet be adduced: when no abstract opinions are looked upon as certain, men cling to the mere propensities and external interests of their position, which are naturally more tangible and more permanent than any opinions in the world.

It is not a question of easy solution whether the aristocracy or the democracy is most fit to govern a country. But it is certain that democracy annoys one part of the community, and that aristocracy oppresses another part. When the question is reduced to the simple expression of the struggle between poverty and wealth, the tendency of each side of the dispute becomes perfectly evident without further controversy.

Political Associations in the United States

In no country in the world has the principle of association been more successfully used, or more unsparingly applied to a multitude of different objects, than in America. Besides the permanent associations which are

established by law under the names of townships, cities, and counties, a vast number of others are formed and maintained by the agency of private individuals.

The citizen of the United States is taught from his earliest infancy to rely upon his own exertions in order to resist the evils and the difficulties of life. He looks upon the social authority with an eye of mistrust and anxiety, and he only claims its assistance when he is quite unable to shift without it. This habit may even be traced in the schools of the rising generation, where the children in their games are wont to submit to rules which they have themselves established, and to punish misdemeanors which they have themselves defined. The same spirit pervades every act of social life. If a stoppage occurs in a thoroughfare, and the circulation of the public is hindered, the neighbors immediately constitute a deliberative body; and this extemporaneous assembly gives rise to an executive power which remedies the inconvenience before anybody has thought of recurring to an authority superior to that of the persons immediately concerned. If the public pleasures are concerned, an association is formed to provide for the splendor and the regularity of the entertainment. Societies are formed to resist enemies which are exclusively of a moral nature, and to diminish the vice of intemperance. In the United States associations are established to promote public order, commerce, industry, morality, and religion; for there is no end which the human will, seconded by the collective exertions of individuals, despairs of attaining.

I shall hereafter have occasion to show the effects of association upon the course of society, and I must confine myself for the present to the political world. When once the right of association is recognized, the citizens may employ it in several different ways.

An association consists simply in the public assent which a number of individuals give to certain doctrines; and in the engagement which they contract to promote the spread of those doctrines by their exertions. The right of associating with these views is very analogous to the liberty of unlicensed writing; but societies thus formed possess more authority than the press. When an opinion is represented by a society, it necessarily assumes a more exact and explicit form. It numbers its partisans, and compromises their welfare in its cause; they, on the other hand, become acquainted with each other, and their zeal is increased by their number. An association unites the efforts of minds which have a tendency to diverge, in one single channel, and urges them vigorously towards one single end which it points out.

The second degree in the right of association is the power of meeting.

When an association is allowed to establish centers of action at certain important points in the country, its activity is increased, and its influence extended. Men have the opportunity of seeing each other; means of execution are more readily combined; and opinions are maintained with a degree of warmth and energy which written language cannot approach.

Lastly, in the exercise of the right of political association, there is a third degree: the partisans of an opinion may unite in electoral bodies, and choose delegates to represent them in a central assembly. This is, properly speaking, the application of the representative system to a party.

Thus, in the first instance, a society is formed between individuals professing the same opinion, and the tie which keeps it together is of a purely intellectual nature: in the second case, small assemblies are formed which only represent a faction of the party. Lastly, in the third case, they constitute a separate nation in the midst of the nation, a government within the government. Their delegates, like the real delegates of the majority, represent the entire collective force of their party; and they enjoy a certain degree of that national dignity and great influence which belong to the chosen representatives of the people. It is true that they have not the right of making the laws; but they have the power of attacking those which are in being, and of drawing up beforehand those which they may afterwards cause to be adopted.

If, in a people which is imperfectly accustomed to the exercise of freedom, or which is exposed to violent political passions, a deliberating minority, which confines itself to the contemplation of future laws, be placed in juxtaposition to the legislative majority, I cannot but believe that public tranquillity incurs very great risks in that nation. There is doubtless a very wide difference between proving that one law is in itself better than another, and proving that the former ought to be substituted for the latter. But the imagination of the populace is very apt to overlook this difference, which is so apparent to the minds of thinking men. It sometimes happens that a nation is divided into two nearly equal parties, each of which affects to represent the majority. If, in immediate contiguity to the directing power, another power be established which exercises almost as much moral authority as the former, it is not to be believed that it will long be content to speak without acting, or that it will always be restrained by the abstract consideration of the nature of associations, which are meant to direct but not to enforce opinions, to suggest but not to make the laws.

The more we consider the independence of the press in its principal consequences, the more are we convinced that it is the chief, and, so to speak, the constitutive element of freedom in the modern world. A nation which is determined to remain free is therefore right in demanding the unrestrained exercise of this independence. But the *unrestrained* liberty of political association cannot be entirely assimilated to the liberty of the press. The one is at the same time less necessary and more dangerous than the other. A nation may confine it within certain limits without forfeiting any part of its self-control; and it may sometimes be obliged to do so in order to maintain its own authority.

In America the liberty of association for political purposes is unbounded. An example will show in the clearest light to what an extent this privilege is tolerated.

The question of the tariff, or of free trade, produced a great manifestation of party feeling in America: the tariff was not only a subject of debate as a matter of opinion, but it exercised a favorable or a prejudicial influence upon several very powerful interests of the states. The North attributed a great portion of its prosperity, and the South all its sufferings, to this system; insomuch that for a long time the tariff was the sole source of the political animosities which agitated the Union.

In 1831, when the dispute was raging with the utmost virulence, a private citizen of Massachusetts proposed to all the enemies of the tariff, by means of the public prints, to send delegates to Philadelphia in order to consult together upon the means which were most fitted to promote freedom of trade. This proposal circulated in a few days from Maine to New Orleans by the power of the printing press; the opponents of the tariff adopted it with enthusiasm, meetings were formed on all sides, and delegates were named. The majority of these individuals were well known, and some of them had earned a considerable degree of celebrity. South Carolina alone, which afterwards took up arms in the same cause, sent sixty-three delegates. On the 1st October, 1831, this assembly, which according to the American custom had taken the name of a convention, met at Philadelphia; it consisted of more than two hundred members. Its debates were public, and they at once assumed a legislative character; the extent of the powers of Congress, the theories of free trade, and the different clauses of the tariff were discussed in turn. At the end of ten days' deliberation the convention broke up, after having published an address to the American people, in which it declared:

I. That Congress had not the right of making a tariff, and that the existing tariff was unconstitutional;

II. That the prohibition of free trade was prejudicial to the interests of all nations, and to that of the American people in particular.

It must be acknowledged that the unrestrained liberty of political association has not hitherto produced in the United States those fatal consequences which might perhaps be expected from it elsewhere. The right of association was imported from England, and it has always existed in America, so that the exercise of this privilege is now amalgamated with the manners and customs of the people. At the present time, the liberty of association has become a necessary guarantee against the tyranny of the majority. In the United States, as soon as a party has become preponderant, all the public authority passes under its control. Its private supporters occupy all the places, and have all the force of the administration at their disposal. As the most distinguished partisans of the other side of the question are unable to surmount the obstacles which exclude them from power, they require some means of establishing themselves upon their own basis, and of opposing the moral authority of the minority to the physical power which domineers over it. Thus a dangerous expedient is used to obviate a still more formidable danger.

The omnipotence of the majority appears to me to present such extreme perils to the American republics that the dangerous measure which is used to repress it seems to be more advantageous than prejudicial. And here I am about to advance a proposition which may remind the reader of what I said before in speaking of municipal freedom: There are no countries in which associations are more needed to prevent the despotism of faction or the arbitrary power of a prince than those which are democratically constituted. In aristocratic nations, the body of the nobles and the more opulent part of the community are in themselves natural associations, which act as checks upon the abuses of power. In countries in which these associations do not exist, if private individuals are unable to create an artificial and a temporary substitute for them, I can imagine no permanent protection against the most galling tyranny; and a great people may be oppressed by a small faction, or by a single individual, with impunity.

The meeting of a great political convention (for there are conventions of all kinds), which may frequently become a necessary measure, is always a serious occurrence, even in America, and one which is never looked forward to, by the judicious friends of the country, without alarm.

This was very perceptible in the Convention of 1831, at which the exertions of all the most distinguished members of the assembly tended to moderate its language, and to restrain the subjects which it treated within certain limits. It is probable, in fact, that the Convention of 1831 exercised a very great influence upon the minds of the malcontents, and prepared them for the open revolt against the commercial laws of the Union which took place in 1832.

It cannot be denied that the unrestrained liberty of association for political purposes is the privilege which a people is longest in learning how to exercise. If it does not throw the nation into anarchy, it perpetually augments the chances of that calamity. On one point, however, this perilous liberty offers a security against dangers of another kind; in countries where associations are free, secret societies are unknown. In America there are numerous factions, but no conspiracies.

The most natural privilege of man, next to the right of acting for himself, is that of combining his exertions with those of his fellow creatures, and of acting in common with them. I am therefore led to conclude that the right of association is almost as inalienable as the right of personal liberty. No legislator can attack it without impairing the very foundations of society. Nevertheless, if the liberty of association is a fruitful source of advantages and prosperity to some nations, it may be perverted or carried to excess by others, and the element of life may be changed into an element of destruction. A comparison of the different methods which associations pursue, in those countries in which they are managed with discretion, as well as in those where liberty degenerates into license, may perhaps be thought useful both to governments and to parties.

The greater part of Europeans look upon an association as a weapon which is to be hastily fashioned, and immediately tried in the conflict. A society is formed for discussion, but the idea of impending action prevails in the minds of those who constitute it: it is, in fact, an army; and the time given to parley serves to reckon up the strength and to animate the courage of the host, after which they direct their march against the enemy. Resources which lie within the bounds of the law may suggest themselves, to the persons who compose it, as means, but never as the only means, of success.

Such, however, is not the manner in which the right of association is understood in the United States. In America the citizens who form the

minority associate, in order, in the first place, to show their numerical strength, and so to diminish the moral authority of the majority; and, in the second place, to stimulate competition, and to discover those arguments which are most fitted to act upon the majority: for they always entertain hopes of drawing over their opponents to their own side, and of afterwards disposing of the supreme power in their name. Political associations in the United States are therefore peaceable in their intentions, and strictly legal in the means which they employ; and they assert with perfect truth that they only aim at success by lawful expedients.

The difference which exists between the Americans and ourselves depends on several causes. In Europe there are numerous parties so diametrically opposed to the majority that they can never hope to acquire its support, and at the same time they think that they are sufficiently strong in themselves to struggle and to defend their cause. When a party of this kind forms an association, its object is not to conquer but to fight. In America, the individuals who hold opinions very much opposed to those of the majority are no sort of impediment to its power; and all other parties hope to win it over to their own principles in the end. The exercise of the right of association becomes dangerous in proportion to the impossibility which excludes great parties from acquiring the majority. In a country like the United States, in which the differences of opinion are mere differences of hue, the right of association may remain unrestrained without evil consequences. The inexperience of many of the European nations in the enjoyment of liberty leads them only to look upon the liberty of association as a right of attacking the government. The first notion which presents itself to a party, as well as to an individual, when it has acquired a consciousness of its own strength, is that of violence: the notion of persuasion arises at a later period, and is only derived from experience. The English, who are divided into parties which differ most essentially from each other, rarely abuse the right of association, because they have long been accustomed to exercise it. In France, the passion for war is so intense that there is no undertaking so mad, or so injurious to the welfare of the state, that a man does not consider himself honored in defending it, at the risk of his life.

But perhaps the most powerful of the causes which tend to mitigate the excesses of political association in the United States is universal suffrage. In countries in which universal suffrage exists, the majority is never doubtful, because neither party can pretend to represent that portion of the community which has not voted. The associations which are formed are aware, as well as the nation at large, that they do not represent the

majority: this is, indeed, a condition inseparable from their existence; for if they did represent the preponderating power, they would change the law instead of soliciting its reform. The consequence of this is that the moral influence of the government which they attack is very much increased, and their own power is very much enfeebled.

In Europe there are few associations which do not affect to represent the majority, or which do not believe that they represent it. This conviction or this pretension tends to augment their force amazingly, and contributes no less to legalize their measures. Violence may seem to be excusable in defense of the cause of oppressed right. Thus it is, in the vast labyrinth of human laws, that extreme liberty sometimes corrects the abuses of license, and that extreme democracy obviates the dangers of democratic government. In Europe, associations consider themselves, in some degree, as the legislative and executive councils of the people, which is unable to speak for itself. In America, where they only represent a minority of the nation, they argue and they petition.

The means which the associations of Europe employ are in accordance with the end which they propose to obtain. As the principal aim of these bodies is to act and not to debate, to fight rather than to persuade, they are naturally led to adopt a form of organization which differs from the ordinary customs of civil bodies, and which assumes the habits and the maxims of military life. They centralize the direction of their resources as much as possible, and they entrust the power of the whole party to a very small number of leaders.

The members of these associations reply to a watchword, like soldiers on duty; they profess the doctrine of passive obedience; say, rather, that in uniting together they at once abjure the exercise of their own judgment and free will: and the tyrannical control which these societies exercise is often far more insupportable than the authority possessed over society by the government which they attack. Their moral force is much diminished by these excesses, and they lose the powerful interest which is always excited by a struggle between oppressors and the oppressed. The man who in given cases consents to obey his fellows with servility, and who submits his activity, and even his opinions, to their control, can have no claim to rank as a free citizen.

The Americans have also established certain forms of government which are applied to their associations, but these are invariably borrowed from the forms of the civil administration. The independence of each individual is formally recognized; the tendency of the members of the association points, as it does in the body of the community, towards the same end, but they are not obliged to follow the same track. No one ab-

juries the exercise of his reason and his free will; but everyone exerts that reason and that will for the benefit of a common undertaking.

Government of the Democracy in America

I am well aware of the difficulties which attend this part of my subject, but although every expression which I am about to make use of may clash, upon some one point, with the feelings of the different parties which divide my country, I shall speak my opinion with the most perfect openness.

In Europe we are at a loss how to judge the true character and the more permanent propensities of democracy, because in Europe two conflicting principles exist, and we do not know what to attribute to the principles themselves, and what to refer to the passions which they bring into collision. Such, however, is not the case in America; there the people reigns without any obstacle, and it has no perils to dread, and no injuries to avenge. In America, democracy is swayed by its own free propensities: its course is natural, and its activity is unrestrained; the United States consequently afford the most favorable opportunity of studying its real character. And to no people can this inquiry be more vitally interesting than to the French nation, which is blindly driven onwards by a daily and irresistible impulse, towards a state of things which may prove either despotic or republican, but which will assuredly be democratic.

UNIVERSAL SUFFRAGE

I have ready observed that universal suffrage has been adopted in all the states of the Union: it consequently occurs among different populations which occupy very different positions in the scale of society. I have had opportunities of observing its effects in different localities, and among races of men who are nearly strangers to each other by their language, their religion, and their manner of life; in Louisiana as well as in New England, in Georgia and in Canada. I have remarked that universal suffrage is far from producing in America either all the good or all the evil consequences which are assigned to it in Europe, and that its effects differ very widely from those which are usually attributed to it.

CHOICE OF THE PEOPLE AND INSTINCTIVE PREFERENCES OF THE AMERICAN DEMOCRACY

Many people in Europe are apt to believe without saying it, or to say without believing it, that one of the great advantages of universal suf-

frage is that it entrusts the direction of public affairs to men who are worthy of the public confidence. They admit that the people is unable to govern for itself, but they aver that it is always sincerely disposed to promote the welfare of the state, and that it instinctively designates those persons who are animated by the same good wishes, and who are the most fit to wield the supreme authority. I confess that the observations I made in America by no means coincide with these opinions. On my arrival in the United States, I was surprised to find so much distinguished talent among the subjects, and so little among the heads of the government. It is a well-authenticated fact that at the present day the most able men in the United States are very rarely placed at the head of affairs; and it must be acknowledged that such has been the result in proportion as democracy has outstepped all its former limits. The race of American statesmen has evidently dwindled most remarkably in the course of the last fifty years.

Several causes may be assigned to this phenomenon. It is impossible, notwithstanding the most strenuous exertions, to raise the intelligence of the people above a certain level. Whatever may be the facilities of acquiring information, whatever may be the profusion of easy methods and of cheap science, the human mind can never be instructed and educated without devoting a considerable space of time to those objects.

The greater or the lesser possibility of subsisting without labor is therefore the necessary boundary of intellectual improvement. This boundary is more remote in some countries, and more restricted in others; but it must exist somewhere as long as the people is constrained to work in order to procure the means of physical subsistence, that is to say, as long as it retains its popular character. It is therefore quite as difficult to imagine a state in which all the citizens should be very well informed as a state in which they should all be wealthy: these two difficulties may be looked upon as correlative. It may very readily be admitted that the mass of the citizens are sincerely disposed to promote the welfare of their country; nay more, it may even be allowed that the lower classes are less apt to be swayed by considerations of personal interest than the higher orders; but it is always more or less impossible for them to discern the best means of attaining the end which they desire with sincerity. Long and patient observation, joined to a multitude of different notions, is required to form a just estimate of the character of a single individual; and can it be supposed that the vulgar have the power of succeeding in an inquiry which misleads the penetration of genius itself? The people has neither the time nor the means which are essential to the prosecution of an investigation of this kind: its conclusions are hastily formed from a

superficial inspection of the more prominent features of a question. Hence it often assents to the clamor of a mountebank who knows the secret of stimulating its tastes, while its truest friends frequently fail in their exertions.

Moreover, the democracy is not only deficient in that soundness of judgment which is necessary to select men really deserving of its confidence, but it has neither the desire nor the inclination to find them out. It cannot be denied that democratic institutions have a very strong tendency to promote the feeling of envy in the human heart, not so much because they afford to everyone the means of rising to the level of any of his fellow citizens as because those means perpetually disappoint the persons who employ them. Democratic institutions awaken and foster a passion for equality which they can never entirely satisfy. This complete equality eludes the grasp of the people at the very moment at which it thinks to hold it fast, and “flies,” as Pascal says, “with eternal flight”; the people is excited in the pursuit of an advantage which is more precious because it is not sufficiently remote to be unknown, or sufficiently near to be enjoyed. The lower orders are agitated by the chance of success, they are irritated by its uncertainty; and they pass from the enthusiasm of pursuit to the exhaustion of ill success, and lastly to the acrimony of disappointment. Whatever transcends their own limits appears to be an obstacle to their desires, and there is no kind of superiority, however legitimate it may be, which is not irksome in their sight.

It has been supposed that the secret instinct which leads the lower orders to remove their superiors as much as possible from the direction of public affairs is peculiar to France. This, however, is an error; the propensity to which I allude is not inherent in any particular nation, but in democratic institutions in general; and although it may have been heightened by peculiar political circumstances, it owes its origin to a higher cause.

In the United States, the people is not disposed to hate the superior classes of society; but it is not very favorably inclined towards them, and it carefully excludes them from the exercise of authority. It does not entertain any dread of distinguished talents, but it is rarely captivated by them; and it awards its approbation very sparingly to such as have risen without the popular support.

While the natural propensities of democracy induce the people to reject the most distinguished citizens as its rulers, these individuals are no less apt to retire from a political career, in which it is almost impossible

to retain their independence or to advance without degrading themselves. This opinion has been very candidly set forth by Chancellor Kent, who says, in speaking with great eulogiums of that part of the Constitution which empowers the executive to nominate the judges: "It is indeed probable that the men who are best fitted to discharge the duties of this high office would have too much reserve in their manners, and too much austerity in their principles, for them to be returned by the majority at an election where universal suffrage is adopted." Such were the opinions which were printed without contradiction in America in the year 1830!

I hold it to be sufficiently demonstrated that universal suffrage is by no means a guarantee of the wisdom of the popular choice; and that whatever its advantages may be, this is not one of them.

CAUSES WHICH MAY PARTLY CORRECT THESE TENDENCIES OF THE DEMOCRACY

When a state is threatened by serious dangers, the people frequently succeeds in selecting the citizens who are the most able to save it. It has been observed that man rarely retains his customary level in presence of very critical circumstances; he rises above, or he sinks below his usual condition, and the same thing occurs in nations at large. Extreme perils sometimes quench the energy of a people instead of stimulating it; they excite, without directing its passions; and instead of clearing, they confuse its powers of perception. The Jews deluged the smoking ruins of their temple with the carnage of the remnant of their host. But it is more common, both in the case of nations and in that of individuals, to find extraordinary virtues arising from the very imminence of the danger. Great characters are then thrown into relief, as the edifices which are concealed by the gloom of night are illuminated by the glare of a conflagration. At those dangerous times genius no longer abstains from presenting itself in the arena; and the people, alarmed by the perils of its situation, buries its envious passions in a short oblivion. Great names may then be drawn from the urn of election.

I have already observed that the American statesmen of the present day are very inferior to those who stood at the head of affairs fifty years ago. This is as much a consequence of the circumstances as of the laws of the country. When America was struggling in the high cause of independence to throw off the yoke of another country, and when it was about to usher a new nation into the world, the spirits of its inhabitants were roused to the height which their great efforts required. In this general

excitement, the most distinguished men were ready to forestall the wants of the community, and the people clung to them for support and placed them at its head. But events of this magnitude are rare; and it is from an inspection of the ordinary course of affairs that our judgment must be formed.

If passing occurrences sometimes act as checks upon the passions of democracy, the intelligence and the manners of the community exercise an influence which is not less powerful, and far more permanent. This is extremely perceptible in the United States.

In New England the education and the liberties of the communities were engendered by the moral and religious principles of their founders. Where society has acquired a sufficient degree of stability to enable it to hold certain maxims and to retain fixed habits, the lower orders are accustomed to respect intellectual superiority, and to submit to it without complaint, although they set at nought all those privileges which wealth and birth have introduced among mankind. The democracy in New England consequently makes a more judicious choice than it does elsewhere.

But as we descend towards the South, to those states in which the constitution of society is more modern and less strong, where instruction is less general, and where the principles of morality, of religion, and of liberty are less happily combined, we perceive that the talents and the virtues of those who are in authority become more and more rare.

Lastly, when we arrive at the new southwestern states, in which the constitution of society dates but from yesterday, and presents an agglomeration of adventurers and speculators, we are amazed at the persons who are invested with public authority, and we are led to ask by what force, independent of the legislation and of the men who direct it, the state can be protected, and society be made to flourish.

There are certain laws of a democratic nature which contribute, nevertheless, to correct, in some measure, the dangerous tendencies of democracy. On entering the House of Representatives of Washington, one is struck by the vulgar demeanor of that great assembly. The eye frequently does not discover a man of celebrity within its walls. Its members are almost all obscure individuals whose names present no associations to the mind: they are mostly village lawyers, men in trade, or even persons belonging to the lower classes of society. In a country in which education is very general, it is said that the representatives of the people do not always know how to write correctly.

At a few yards' distance from this spot is the door of the Senate, which

contains within a small space a large proportion of the celebrated men of America. Scarcely an individual is to be perceived in it who does not recall the idea of an active and illustrious career: the Senate is composed of eloquent advocates, distinguished generals, wise magistrates, and statesmen of note, whose language would at all times do honor to the most remarkable parliamentary debates of Europe.

What then is the cause of this strange contrast, and why are the most able citizens to be found in one assembly rather than in the other? Why is the former body remarkable for its vulgarity and its poverty of talent, while the latter seems to enjoy a monopoly of intelligence and of sound judgment? Both of these assemblies emanate from the people; both of them are chosen by universal suffrage; and no voice has hitherto been heard to assert, in America, that the Senate is hostile to the interests of the people. From what cause, then, does so startling a difference arise? The only reason which appears to me adequately to account for it is that the House of Representatives is elected by the populace directly, and that the Senate is elected by elected bodies. The whole body of the citizens names the legislature of each state, and the federal Constitution converts these legislatures into so many electoral bodies, which return the members of the Senate. The senators are elected by an indirect application of universal suffrage: for the legislatures which name them are not aristocratic or privileged bodies which exercise the electoral franchise in their own right; but they are chosen by the totality of the citizens; they are generally elected every year, and new members may constantly be chosen who will employ their electoral rights in conformity with the wishes of the public. But this transmission of the popular authority through an assembly of chosen men operates an important change in it, by refining its discretion and improving the forms which it adopts. Men who are chosen in this manner accurately represent the majority of the nation which governs them; but they represent the elevated thoughts which are current in the community, the generous propensities which prompt its nobler actions, rather than the petty passions which disturb, or the vices which disgrace it.

The time may be already anticipated at which the American republics will be obliged to introduce the plan of election by an elected body more frequently into their system of representation, or they will incur no small risk of perishing miserably among the shoals of democracy.

And here I have no scruple in confessing that I look upon this peculiar system of election as the only means of bringing the exercise of political power to the level of all classes of the people. Those thinkers

who regard this institution as the exclusive weapon of a party, and those who fear, on the other hand, to make use of it, seem to me to fall into as great an error in the one case as in the other.

INFLUENCE WHICH THE AMERICAN DEMOCRACY
HAS EXERCISED ON THE LAWS RELATING TO ELECTIONS

When elections recur at long intervals, the state is exposed to violent agitation every time they take place. Parties exert themselves to the utmost in order to gain a prize which is so rarely within their reach; and as the evil is almost irremediable for the candidates who fail, the consequences of their disappointed ambition may prove most disastrous. If, on the other hand, the legal struggle can be repeated within a short space of time, the defeated parties take patience.

When elections occur frequently, their recurrence keeps society in a perpetual state of feverish excitement, and imparts a continual instability to public affairs.

Thus, on the one hand the state is exposed to the perils of a revolution, on the other to perpetual mutability; the former system threatens the very existence of the government, the latter is an obstacle to all steady and consistent policy. The Americans have preferred the second of these evils to the first; but they were led to this conclusion by their instinct much more than by their reason; for a taste for variety is one of the characteristic passions of democracy. An extraordinary mutability has, by this means, been introduced into their legislation.

Many of the Americans consider the instability of their laws as a necessary consequence of a system whose general results are beneficial. But no one in the United States affects to deny the fact of this instability, or to contend that it is not a great evil.

Hamilton, after having demonstrated the utility of a power which might prevent, or which might at least impede, the promulgation of bad laws, adds, "It may perhaps be said that the power of preventing bad laws includes that of preventing good ones; and may be used to the one purpose as well as to the other. But this objection will have little weight with those who can properly estimate the mischiefs of that inconstancy and mutability in the laws which form the greatest blemish in the character and genius of our governments."⁶

And again in No. 62 of the same work, he observes: ". . . The facility and excess of law-making seem to be the diseases to which our govern-

6. *The Federalist*, No. 73, *Great Books of the Western World* [Ed.].

ments are most liable. . . . [To trace the mischievous effects of] the mutability in the public councils arising from a rapid succession of new members [would fill a volume]. Every new election in the States is found to change one half of the representatives. From this change of men must proceed a change of opinions [and of] measures, . . . [which] forfeits the respect and confidence of other nations, . . . poisons the blessing of liberty itself. . . [and diminishes] the attachment and reverence . . . of the people towards a political system which betrays so many marks of infirmity. . . .”⁷

Jefferson himself, the greatest democrat whom the democracy of America has as yet produced, pointed out the same evils.

“The instability of our laws,” said he in a letter to Madison, “is really a very serious inconvenience. I think that we ought to have obviated it by deciding that a whole year should always be allowed to elapse between the bringing in of a bill and the final passing of it. It should afterwards be discussed and put to the vote without the possibility of making any alteration in it; and if the circumstances of the case required a more speedy decision, the question should not be decided by a simple majority, but by a majority of at least two-thirds of both houses.”

PUBLIC OFFICERS UNDER THE CONTROL OF THE DEMOCRACY IN AMERICA

Public officers in the United States are commingled with the crowd of citizens; they have neither palaces, nor guards, nor ceremonial costumes. This simple exterior of the persons in authority is connected, not only with the peculiarities of the American character, but with the fundamental principles of that society. In the estimation of the democracy, a government is not a benefit, but a necessary evil. A certain degree of power must be granted to public officers, for they would be of no use without it. But the ostensible semblance of authority is by no means indispensable to the conduct of affairs; and it is needlessly offensive to the susceptibility of the public. The public officers themselves are well aware that they only enjoy the superiority over their fellow citizens which they derive from their authority, upon condition of putting themselves on a level with the whole community by their manners. A public officer in the United States is uniformly civil, accessible to all the world, attentive to all requests, and obliging in his replies. I was pleased by

7. *The Federalist*, No. 62, *Great Books of the Western World* [Ed.].

these characteristics of a democratic government; and I was struck by the manly independence of the citizens, who respect the office more than the officer, and who are less attached to the emblems of authority than to the man who bears them.

I am inclined to believe that the influence which costumes really exercise, in an age like that in which we live, has been a good deal exaggerated. I never perceived that a public officer in America was the less respected while he was in the discharge of his duties because his own merit was set off by no adventitious signs. On the other hand, it is very doubtful whether a peculiar dress contributes to the respect which public characters ought to have for their own position, at least when they are not otherwise inclined to respect it. When a magistrate (and in France such instances are not rare) indulges his trivial wit at the expense of the prisoner, or derides the predicament in which a culprit is placed, it would be well to deprive him of his robes of office, to see whether he would recall some portion of the natural dignity of mankind when he is reduced to the apparel of a private citizen.

A democracy may, however, allow a certain show of magisterial pomp, and clothe its officers in silks and gold, without seriously compromising its principles. Privileges of this kind are transitory: they belong to the place, and are distinct from the individual; but if public officers are not uniformly remunerated by the state, the public charges must be entrusted to men of opulence and independence, who constitute the basis of an aristocracy; and if the people still retains its right of election, that election can only be made from a certain class of citizens.

When a democratic republic renders offices which had formerly been remunerated gratuitous, it may safely be believed that that state is advancing to monarchical institutions; and when a monarchy begins to remunerate such officers as had hitherto been unpaid, it is a sure sign that it is approaching towards a despotic or a republican form of government. The substitution of paid for unpaid functionaries is of itself, in my opinion, sufficient to constitute a serious revolution.

I look upon the entire absence of gratuitous functionaries in America as one of the most prominent signs of the absolute dominion which democracy exercises in that country. All public services, of whatsoever nature they may be, are paid; so that everyone has not merely a right, but also the means of performing them. Although, in democratic states, all the citizens are qualified to occupy stations in the government, all are not tempted to try for them. The number and the capacities of the

candidates are more apt to restrict the choice of electors than the conditions of the candidateship.

In nations in which the principle of election extends to every place in the state, no political career can, properly speaking, be said to exist. Men are promoted as if by chance to the rank which they enjoy, and they are by no means sure of retaining it. The consequence is that in tranquil times public functions offer but few lures to ambition. In the United States the persons who engage in the perplexities of political life are individuals of very moderate pretensions. The pursuit of wealth generally diverts men of great talents and of great passions from the pursuit of power: and it very frequently happens that a man does not undertake to direct the fortune of the state until he has discovered his incompetence to conduct his own affairs. The vast number of very ordinary men who occupy public stations is quite as attributable to these causes as to the bad choice of the democracy. In the United States, I am not sure that the people would return the men of superior abilities who might solicit its support, but it is certain that men of this description do not come forward.

ARBITRARY POWER OF MAGISTRATES⁸ UNDER THE RULE OF THE AMERICAN DEMOCRACY

In two different kinds of government the magistrates exercise a considerable degree of arbitrary power; namely, under the absolute government of a single individual, and under that of a democracy.

This identical result proceeds from causes which are nearly analogous.

In despotic states the fortune of no citizen is secure; and public officers are not more safe than private individuals. The sovereign, who has under his control the lives, the property, and sometimes the honor of the men whom he employs, does not scruple to allow them a great latitude of action because he is convinced that they will not use it to his prejudice. In despotic states the sovereign is so attached to the exercise of his power that he dislikes the constraint even of his own regulations; and he is well pleased that his agents should follow a somewhat fortuitous line of conduct, provided he be certain that their actions will never counteract his desires.

In democracies, as the majority has every year the right of depriving

8. I here use the word magistrates in the widest sense in which it can be taken; I apply it to all the officers to whom the execution of the laws is entrusted.

the officers whom it has appointed of their power, it has no reason to fear any abuse of their authority. As the people is always able to signify its wishes to those who conduct the government, it prefers leaving them to make their own exertions, to prescribing an invariable rule of conduct which would at once fetter their activity and the popular authority.

It may even be observed, on attentive consideration, that under the rule of a democracy the arbitrary power of the magistrate must be still greater than in despotic states. In the latter, the sovereign has the power of punishing all the faults with which he becomes acquainted, but it would be vain for him to hope to become acquainted with all those which are committed. In the former the sovereign power is not only supreme, but it is universally present. The American functionaries are, in point of fact, much more independent in the sphere of action which the law traces out for them than any public officer in Europe. Very frequently the object which they are to accomplish is simply pointed out to them, and the choice of the means is left to their own discretion.

In New England, for instance, the selectmen of each township are bound to draw up the list of persons who are to serve on the jury; the only rule which is laid down to guide them in their choice is that they are to select citizens possessing the elective franchise and enjoying a fair reputation.⁹ In France the lives and liberties of the subjects would be thought to be in danger if a public officer of any kind was entrusted with so formidable a right. In New England the same magistrates are empowered to post the names of habitual drunkards in public houses, and to prohibit the inhabitants of a town from supplying them with liquor.¹⁰ A censorial power of this excessive kind would be revolting to the population of the most absolute monarchies; here, however, it is submitted to without difficulty.

Nowhere has so much been left by the law to the arbitrary determination of the magistrate as in democratic republics, because this arbitrary power is unattended by any alarming consequences. It may even be asserted that the freedom of the magistrate increases as the elective franchise is extended, and as the duration of the time of office is shortened. Hence arises the great difficulty which attends the conversion of a democratic republic into a monarchy. The magistrate ceases to be elective,

9. See the Act of 27th February, 1813. General Collection of the Laws of Massachusetts, vol. ii., p. 331. It should be added that the jurors are afterwards drawn from these lists by lot.

10. See Act of 28th February, 1787. General Collection of the Laws of Massachusetts, vol. i., p. 302.

but he retains the rights and the habits of an elected officer, which lead directly to despotism.

It is only in limited monarchies that the law, which prescribes the sphere in which public officers are to act, superintends all their measures. The cause of this may be easily detected. In limited monarchies the power is divided between the king and the people, both of whom are interested in the stability of the magistrate. The king does not venture to place the public officers under the control of the people, lest they should be tempted to betray his interests; on the other hand, the people fears lest the magistrates should serve to oppress the liberties of the country if they were entirely dependent upon the crown: they cannot therefore be said to depend on either the one or the other. The same cause which induces the king and the people to render public officers independent suggests the necessity of such securities as may prevent their independence from encroaching upon the authority of the former and the liberties of the latter. They consequently agree as to the necessity of restricting the functionary to a line of conduct laid down beforehand, and they are interested in confining him by certain regulations which he cannot evade.

INSTABILITY OF THE ADMINISTRATION IN THE UNITED STATES

The authority which public men possess in America is so brief, and they are so soon commingled with the ever-changing population of the country, that the acts of a community frequently leave fewer traces than the occurrences of a private family. The public administration is, so to speak, oral and traditionary. But little is committed to writing, and that little is wafted away forever, like the leaves of the sibyl, by the smallest breeze.

The only historical remains in the United States are the newspapers; but if a number be wanting, the chain of time is broken, and the present is severed from the past. I am convinced that in fifty years it will be more difficult to collect authentic documents concerning the social condition of the Americans at the present day, than it is to find remains of the administration of France during the Middle Ages; and if the United States were ever invaded by barbarians, it would be necessary to have recourse to the history of other nations, in order to learn anything of the people which now inhabits them.

The instability of the administration has penetrated into the habits of

the people: it even appears to suit the general taste, and no one cares for what occurred before his time. No methodical system is pursued; no archives are formed; and no documents are brought together when it would be very easy to do so. Where they exist little store is set upon them; and I have among my papers several original public documents which were given to me in answer to some of my inquiries. In America society seems to live from hand to mouth, like an army in the field. Nevertheless, the art of administration may undoubtedly be ranked as a science, and no sciences can be improved if the discoveries and observations of successive generations are not connected together in the order in which they occur. One man, in the short space of his life, remarks a fact; another conceives an idea; the former invents a means of execution, the latter reduces a truth to a fixed proposition; and mankind gathers the fruits of individual experience upon its way, and gradually forms the sciences. But the persons who conduct the administration in America can seldom afford any instruction to each other; and when they assume the direction of society, they simply possess those attainments which are most widely disseminated in the community, and no experience peculiar to themselves. Democracy, carried to its furthest limits, is therefore prejudicial to the art of government; and for this reason, it is better adapted to a people already versed in the conduct of an administration than to a nation which is uninitiated in public affairs.

This remark, indeed, is not exclusively applicable to the science of administration. Although a democratic government is founded upon a very simple and natural principle, it always presupposes the existence of a high degree of culture and enlightenment in society.¹¹ At the first glance it may be imagined to belong to the earliest ages of the world; but maturer observation will convince us that it could only come last in the succession of human history.

CHARGES LEVIED BY THE STATE UNDER
THE RULE OF THE
AMERICAN DEMOCRACY

Before we can affirm whether a democratic form of government is economical or not, we must establish a suitable standard of comparison. The question would be one of easy solution, if we were to attempt to draw a parallel between a democratic republic and an absolute monarchy. The

11. It is needless to observe that I speak here of the democratic form of government as applied to a people, not merely to a tribe.

public expenditure would be found to be more considerable under the former than under the latter; such is the case with all free states compared to those which are not so. It is certain that despotism ruins individuals by preventing them from producing wealth, much more than by depriving them of the wealth they have produced: it dries up the source of riches, while it usually respects acquired property. Freedom, on the contrary, engenders far more benefits than it destroys; and the nations which are favored by free institutions invariably find that their resources increase even more rapidly than their taxes.

My present object is to compare free nations to each other and to point out the influence of democracy upon the finances of a state.

Communities, as well as organic bodies, are subject to certain fixed rules in their formation which they cannot evade. They are composed of certain elements which are common to them at all times and under all circumstances. The people may always be mentally divided into three distinct classes. The first of these classes consists of the wealthy; the second, of those who are in easy circumstances; and the third is composed of those who have little or no property, and who subsist more especially by the work which they perform for the two superior orders. The proportion of the individuals who are included in these three divisions may vary according to the condition of society; but the divisions themselves can never be obliterated.

It is evident that each of these classes will exercise an influence, peculiar to its own propensities, upon the administration of the finances of the state. If the first of the three exclusively possesses the legislative power, it is probable that it will not be sparing of the public funds, because the taxes which are levied on a large fortune only tend to diminish the sum of superfluous enjoyment, and are, in point of fact, but little felt. If the second class has the power of making the laws, it will certainly not be lavish of taxes, because nothing is so onerous as a large impost which is levied upon a small income. The government of the middle classes appears to me to be the most economical, though perhaps not the most enlightened, and certainly not the most generous, of free governments.

But let us now suppose that the legislative authority is vested in the lowest orders: there are two striking reasons which show that the tendency of the expenditure will be to increase, not to diminish.

As the great majority of those who create the laws are possessed of no property upon which taxes can be imposed, all the money which is spent for the community appears to be spent to their advantage, at no cost of

their own; and those who are possessed of some little property readily find means of regulating the taxes so that they are burdensome to the wealthy and profitable to the poor, although the rich are unable to take the same advantage when they are in possession of the government.

In countries in which the poor¹² should be exclusively invested with the power of making the laws, no great economy of public expenditure ought to be expected: that expenditure will always be considerable, either because the taxes do not weigh upon those who levy them or because they are levied in such a manner as not to weigh upon those classes. In other words, the government of the democracy is the only one under which the power which lays on taxes escapes the payment of them.

It may be objected (but the argument has no real weight) that the true interest of the people is indissolubly connected with that of the wealthier portion of the community, since it cannot but suffer by the severe measures to which it resorts. But is it not the true interest of kings to render their subjects happy; and the true interest of nobles to admit recruits into their order on suitable grounds? If remote advantages had power to prevail over the passions and the exigencies of the moment, no such thing as a tyrannical sovereign or an exclusive aristocracy could ever exist.

Again, it may be objected that the poor are never invested with the sole power of making the laws; but I reply that wherever universal suffrage has been established, the majority of the community unquestionably exercises the legislative authority; and if it be proved that the poor always constitute the majority, it may be added, with perfect truth, that in the countries in which they possess the elective franchise, they possess the sole power of making laws. But it is certain that in all the nations of the world the greater number has always consisted of those persons who hold no property, or of those whose property is insufficient to exempt them from the necessity of working in order to procure an easy subsistence. Universal suffrage does therefore in point of fact invest the poor with the government of society.

The disastrous influence which popular authority may sometimes exercise upon the finances of a state was very clearly seen in some of the democratic republics of antiquity, in which the public treasure was exhausted in order to relieve indigent citizens, or to supply the games and

12. The word *poor* is used here, and throughout the remainder of this chapter, in a relative, not in an absolute, sense. Poor men in America would often appear rich in comparison with the poor of Europe; but they may with propriety be styled poor in comparison with their more affluent countrymen.

theatrical amusements of the populace. It is true that the representative system was then very imperfectly known, and that, at the present time, the influence of popular passions is less felt in the conduct of public affairs; but it may be believed that the delegate will in the end conform to the principles of his constituents, and favor their propensities as much as their interests.

The extravagance of democracy is, however, less to be dreaded in proportion as the people acquires a share of property, because on the one hand the contributions of the rich are then less needed, and on the other, it is more difficult to lay on taxes which do not affect the interests of the lower classes. On this account universal suffrage would be less dangerous in France than in England, because in the latter country the property on which taxes may be levied is vested in fewer hands. America, where the great majority of the citizens is possessed of some fortune, is in a still more favorable position than France.

There are still further causes which may increase the sum of public expenditure in democratic countries. When the aristocracy governs, the individuals who conduct the affairs of state are exempted, by their own station in society, from every kind of privation; they are contented with their position; power and renown are the objects for which they strive; and, as they are placed far above the obscurer throng of citizens, they do not always distinctly perceive how the well-being of the mass of the people ought to redound to their own honor. They are not indeed callous to the sufferings of the poor, but they cannot feel those miseries as acutely as if they were themselves partakers of them. Provided that the people appear to submit to its lot, the rulers are satisfied, and they demand nothing further from the government. An aristocracy is more intent upon the means of maintaining its influence than upon the means of improving its condition.

When, on the contrary, the people is invested with the supreme authority, the perpetual sense of their own miseries impels the rulers of society to seek for perpetual ameliorations. A thousand different objects are subjected to improvement; the most trivial details are sought out as susceptible of amendment; and those changes which are accompanied with considerable expense are more especially advocated, since the object is to render the condition of the poor more tolerable, who cannot pay for themselves.

Moreover, all democratic communities are agitated by an ill-defined excitement, and by a kind of feverish impatience, that engenders a multitude of innovations, almost all of which are attended with expense.

In monarchies and aristocracies the natural taste which the rulers have for power and for renown is stimulated by the promptings of ambition, and they are frequently incited by these temptations to very costly undertakings. In democracies, where the rulers labor under privations, they can only be courted by such means as improve their well-being, and these improvements cannot take place without a sacrifice of money. When a people begins to reflect upon its situation, it discovers a multitude of wants to which it had not before been subject, and to satisfy these exigencies recourse must be had to the coffers of the state. Hence it arises that the public charges increase in proportion as civilization spreads, and that imposts are augmented as knowledge pervades the community.

The last cause which frequently renders a democratic government dearer than any other is that a democracy does not always succeed in moderating its expenditure, because it does not understand the art of being economical. As the designs which it entertains are frequently changed, and the agents of those designs are still more frequently removed, its undertakings are often ill conducted or left unfinished: in the former case the state spends sums out of all proportion to the end which it proposes to accomplish; in the second, the expense itself is unprofitable.

TENDENCIES OF THE AMERICAN DEMOCRACY AS REGARDS THE SALARIES OF PUBLIC OFFICERS

There is a powerful reason which usually induces democracies to economize upon the salaries of public officers. As the number of citizens who dispense the remuneration is extremely large in democratic countries, so the number of persons who can hope to be benefited by the receipt of it is comparatively small. In aristocratic countries, on the contrary, the individuals who appoint high salaries have almost always a vague hope of profiting by them. These appointments may be looked upon as a capital which they create for their own use, or at least as a resource for their children.

It must however be allowed that a democratic state is most parsimonious towards its principal agents. In America the secondary officers are much better paid, and the dignitaries of the administration much worse, than they are elsewhere.

These opposite effects result from the same cause: the people fixes the salaries of the public officers in both cases; and the scale of remuneration is determined by the consideration of its own wants. It is held to be fair

that the servants of the public should be placed in the same easy circumstances as the public itself;¹³ but when the question turns upon the salaries of the great officers of state, this rule fails, and chance alone can guide the popular decision. The poor have no adequate conception of the wants which the higher classes of society may feel. The sum which is scanty to the rich appears enormous to the poor man whose wants do not extend beyond the necessaries of life; and in his estimation the governor of a state with his two or three hundred a year is a very fortunate and enviable being.¹⁴ If you undertake to convince him that the representative of a great people ought to be able to maintain some show of splendor in the eyes of foreign nations, he will perhaps assent to your meaning; but when he reflects on his own humble dwelling, and on the hard-earned produce of his wearisome toil, he remembers all that he could do with a salary which you say is insufficient, and he is startled or almost frightened at the sight of such uncommon wealth. Besides, the secondary public officer is almost on a level with the people, while the others are raised above it. The former may therefore excite his interest, but the latter begins to arouse his envy.

This is very clearly seen in the United States, where the salaries seem to decrease as the authority of those who receive them augments.¹⁵

13. The easy circumstances in which secondary functionaries are placed in the United States result also from another cause, which is independent of the general tendencies of democracy: every kind of private business is very lucrative, and the state would not be served at all if it did not pay its servants. The country is in the position of a commercial undertaking, which is obliged to sustain an expensive competition, notwithstanding its tastes for economy.
14. The state of Ohio, which contains a million of inhabitants, gives its governor a salary of only 1,200 dollars (£260) a year.
15. To render this assertion perfectly evident, it will suffice to examine the scale of salaries of the agents of the federal government. I have added the salaries attached to the corresponding officers in France under the constitutional monarchy, to complete the comparison.

UNITED STATES		FRANCE	
<i>Treasury Department</i>		<i>Ministère de Finances</i>	
Messenger	700\$. (150 <i>l.</i>)	Huissier	1500 fr. (60 <i>l.</i>)
Clerk with lowest salary	1000\$. (217 <i>l.</i>)	Clerk with lowest salary	1000 to 1800 fr. (40 <i>l.</i> to 72 <i>l.</i>)
Clerk with highest salary	1600\$. (347 <i>l.</i>)	Clerk with highest salary	3200 to 3600 fr. (128 <i>l.</i> to 144 <i>l.</i>)
Chief Clerk	2000\$. (434 <i>l.</i>)	Secrétaire-général	20,000 fr. (800 <i>l.</i>)
Secretary of State	6000\$. (1,300 <i>l.</i>)	The Minister	80,000 fr. (3,200 <i>l.</i>)
The President	25,000\$. (5,400 <i>l.</i>)	The King	12,000,000 fr. (480,000 <i>l.</i>)

I have perhaps done wrong in selecting France as my standard of comparison. In France the democratic tendencies of the nation exercise an ever increasing influence upon the government, and the Chambers show a disposition to raise the low salaries and to lower the principal ones. Thus, the Minister of Finance, who

Under the rule of an aristocracy it frequently happens, on the contrary, that while the high officers are receiving munificent salaries, the inferior ones have not more than enough to procure the necessaries of life. The reason of this fact is easily discoverable from causes very analogous to those to which I have just alluded. If a democracy is unable to conceive the pleasures of the rich, or to witness them without envy, an aristocracy is slow to understand, or, to speak more correctly, is unacquainted with the privations of the poor. The poor man is not (if we use the term aright) the fellow of the rich one; but he is a being of another species. An aristocracy is therefore apt to care but little for the fate of its subordinate agents; and their salaries are only raised when they refuse to perform their service for too scanty a remuneration.

It is the parsimonious conduct of democracy towards its principal officers which has countenanced a supposition of far more economical propensities than any which it really possesses. It is true that it scarcely allows the means of honorable subsistence to the individuals who conduct its affairs; but enormous sums are lavished to meet the exigencies or to facilitate the enjoyments of the people.¹⁶ The money raised by taxation may be better employed, but it is not saved. In general, democracy gives largely to the community, and very sparingly to those who govern it. The reverse is the case in aristocratic countries, where the money of the state is expended to the profit of the persons who are at the head of affairs.

DIFFICULTY OF DISTINGUISHING THE CAUSES
WHICH CONTRIBUTE TO THE ECONOMY
OF THE AMERICAN GOVERNMENT

We are liable to frequent errors in the research of those facts which exercise a serious influence upon the fate of mankind, since nothing is more difficult than to appreciate their real value. One people is naturally inconsistent and enthusiastic, another is sober and calculating, and these

received 160,000 fr. under the empire, receives 80,000 fr. in 1835; the *Directeurs-Généraux* of Finance, who then received 50,000 fr., now receive only 20,000 fr. [If the author could have foreseen the possibility of the restoration of the Empire in France, he would have anticipated the revival of the Imperial rate of public salaries, which has since taken place.—1861.]

16. See the American budgets for the cost of indigent citizens and gratuitous instruction. In 1831, £ 50,000 were spent in the state of New York for the maintenance of the poor: and at least £ 200,000 were devoted to gratuitous instruction (*William's New York Annual Register*, 1832, pp. 205 and 243). The state of New York contained only 1,900,000 inhabitants in the year 1830; which is not more than double the amount of population in the *Département du Nord* in France.

characteristics originate in their physical constitution, or in remote causes with which we are unacquainted.

There are nations which are fond of parade and the bustle of festivity, and which do not regret the costly gaieties of an hour. Others, on the contrary, are attached to more retiring pleasures, and seem almost ashamed of appearing to be pleased. In some countries the highest value is set upon the beauty of public edifices; in others the productions of art are treated with indifference, and everything which is unproductive is looked down upon with contempt. In some renown, in others money, is the ruling passion.

Independently of the laws, all these causes concur to exercise a very powerful influence upon the conduct of the finances of the state. If the Americans never spend the money of the people in galas, it is not only because the imposition of taxes is under the control of the people, but because the people takes no delight in public rejoicings. If they repudiate all ornament from their architecture, and set no store on any but the more practical and homely advantages, it is not only because they live under democratic institutions, but because they are a commercial nation. The habits of private life are continued in public; and we ought carefully to distinguish that economy which depends upon their institutions from that which is the natural result of their manners and customs.

WHETHER THE EXPENDITURE OF THE UNITED STATES CAN BE COMPARED TO THAT OF FRANCE

Many attempts have recently been made in France to compare the public expenditure of that country with the expenditure of the United States; all these attempts have, however, been unattended by success; and a few words will suffice to show that they could not have had a satisfactory result.

In order to estimate the amount of the public charges of a people, two preliminaries are indispensable: it is necessary, in the first place, to know the wealth of that people; and in the second, to learn what portion of that wealth is devoted to the expenditure of the state. To show the amount of taxation without showing the resources which are destined to meet the demand is to undertake a futile labor; for it is not the expenditure but the relation of the expenditure to the revenue which it is desirable to know.

The same rate of taxation which may easily be supported by a wealthy contributor will reduce a poor one to extreme misery. The wealth of na-

tions is composed of several distinct elements, of which population is the first, real property the second, and personal property the third. The first of these three elements may be discovered without difficulty. Among civilized nations it is easy to obtain an accurate census of the inhabitants; but the two others cannot be determined with so much facility. It is difficult to take an exact account of all the lands in a country which are under cultivation, with their natural or their acquired value; and it is still more impossible to estimate the entire personal property which is at the disposal of a nation, and which eludes the strictest analysis by the diversity and the number of shapes under which it may occur. And, indeed, we find that the most ancient civilized nations of Europe, including even those in which the administration is most central, have not succeeded, as yet, in determining the exact condition of their wealth.

In America the attempt has never been made; for how would such an investigation be possible in a country where society has not yet settled into habits of regularity and tranquillity; where the national government is not assisted by a multitude of agents whose exertions it can command, and direct to one sole end; and where statistics are not studied because no one is able to collect the necessary documents, or to find time to peruse them? Thus the primary elements of the calculations which have been made in France cannot be obtained in the Union; the relative wealth of the two countries is unknown: the property of the former is not accurately determined, and no means exist of computing that of the latter.

I consent therefore, for the sake of the discussion, to abandon this necessary term of the comparison, and I confine myself to a computation of the actual amount of taxation, without investigating the relation which subsists between the taxation and the revenue. But the reader will perceive that my task has not been facilitated by the limits which I here lay down for my researches.

It cannot be doubted that the central administration of France, assisted by all the public officers who are at its disposal, might determine with exactitude the amount of the direct and indirect taxes levied upon the citizens. But this investigation, which no private individual can undertake, has not hitherto been completed by the French government, or, at least, its results have not been made public. We are acquainted with the sum total of the charges of the state; we know the amount of the departmental expenditure; but the expenses of the communal divisions have not been computed, and the amount of the public expenses of France is consequently unknown.

If we now turn to America, we shall perceive that the difficulties are multiplied and enhanced. The Union publishes an exact return of the amount of its expenditure; the budgets of the four and twenty states furnish similar returns of their revenues; but the expenses incident to the affairs of the counties and the townships are unknown.¹⁷

The authority of the federal government cannot oblige the provincial governments to throw any light upon this point; and even if these governments were inclined to afford their simultaneous co-operation, it may be doubted whether they possess the means of procuring a satisfactory answer. Independently of the natural difficulties of the task, the political organization of the country would act as a hindrance to the success of their efforts. The county and town magistrates are not appointed by the authorities of the state, and they are not subjected to their control. It is therefore very allowable to suppose that if the state were desirous of obtaining the returns which we require, its design would be counteracted by the neglect of those subordinate officers whom it would be obliged to employ.¹⁸ It is in point of fact useless to inquire what the Americans

17. The Americans, as we have seen, have four separate budgets, the Union, the states, the counties, and the townships having each severally their own. During my stay in America I made every endeavor to discover the amount of the public expenditure in the townships and counties of the principal states of the Union, and I readily obtained the budget of the larger townships, but I found it quite impossible to procure that of the smaller ones. I possess, however, some documents relating to county expenses which, although incomplete, are still curious. I have to thank Mr. Richards, Mayor of Philadelphia, for the budgets of thirteen of the counties of Pennsylvania, viz. Lebanon, Centre, Franklin, Fayette, Montgomery, Luzerne, Dauphin, Butler, Alleghany, Columbia, Northampton, Northumberland, and Philadelphia, for the year 1830. Their population at that time consisted of 495,207 inhabitants. On looking at the map of Pennsylvania, it will be seen that these thirteen counties are scattered in every direction, and so generally affected by the causes which usually influence the condition of a country that they may easily be supposed to furnish a correct average of the financial state of the counties of Pennsylvania in general: and thus upon reckoning that the expenses of these counties amounted in the year 1830 to about £ 72,330, or nearly 3*s.* for each inhabitant, and calculating that each of them contributed in the same year about 10*s.* 2*d.* towards the Union, and about 3*s.* to the state of Pennsylvania, it appears that they each contributed as their share of all the public expenses (except those of the townships) the sum of 16*s.* 2*d.* This calculation is doubly incomplete, as it applies only to a single year and to one part of the public charges; but it has at least the merit of not being conjectural.

18. Those who have attempted to draw a comparison between the expenses of France and America have at once perceived that no such comparison could be drawn between the total expenditure of the two countries; but they have endeavored to contrast detached portions of this expenditure. It may readily be shown that this second system is not at all less defective than the first.

If I attempt to compare the French budget with the budget of the Union, it must be remembered that the latter embraces much fewer objects than the central government of the former country, and that the expenditure must consequently

might do to forward this inquiry, since it is certain that they have hitherto done nothing at all. There does not exist a single individual at the present day, in America or in Europe, who can inform us what each citizen of the Union annually contributes to the public charges of the nation.¹⁹

Hence we must conclude that it is no less difficult to compare the social expenditure than it is to estimate the relative wealth of France and America. I will even add that it would be dangerous to attempt this comparison; for when statistics are not based upon computations which are strictly accurate, they mislead instead of guiding aright. The mind is

be much smaller. If I contrast the budgets of the departments to those of the states which constitute the Union, it must be observed that as the power and control exercised by the states is much greater than that which is exercised by the departments, their expenditure is also more considerable. As for the budgets of the counties, nothing of the kind occurs in the French system of finances; and it is, again, doubtful whether the corresponding expenses should be referred to the budget of the state or to those of the municipal divisions.

Municipal expenses exist in both countries, but they are not always analogous. In America the townships discharge a variety of offices which are reserved in France to the departments or to the state. It may, moreover, be asked what is to be understood by the municipal expenses of America. The organization of the municipal bodies or townships differs in the several states. Are we to be guided by what occurs in New England or in Georgia, in Pennsylvania or in the state of Illinois?

A kind of analogy may very readily be perceived between certain budgets in the two countries; but as the elements of which they are composed always differ more or less, no fair comparison can be instituted between them.

19. Even if we knew the exact pecuniary contributions of every French and American citizen to the coffers of the state, we should only come at a portion of the truth. Governments do not only demand supplies of money, but they call for personal services, which may be looked upon as equivalent to a given sum. When a state raises an army, besides the pay of the troops which is furnished by the entire nation, each soldier must give up his time, the value of which depends on the use he might make of it if he were not in the service. The same remark applies to the militia: the citizen who is in the militia devotes a certain portion of valuable time to the maintenance of the public peace, and he does in reality surrender to the state those earnings which he is prevented from gaining. Many other instances might be cited in addition to these. The governments of France and of America both levy taxes of this kind, which weigh upon the citizens; but who can estimate with accuracy their relative amount in the two countries?

This, however, is not the last of the difficulties which prevent us from comparing the expenditure of the Union with that of France. The French government contracts certain obligations which do not exist in America, and vice versa. The French government pays the clergy; in America the voluntary principle prevails. In America there is a legal provision for the poor; in France they are abandoned to the charity of the public. The French public officers are paid by a fixed salary, in America they are allowed certain perquisites. In France contributions in kind take place on very few roads; in America upon almost all the thoroughfares: in the former country the roads are free to all travelers; in the latter turnpikes abound. All these differences in the manner in which contributions are levied in the two countries enhance the difficulty of comparing their expenditure; for there are certain expenses which the citizens would not be subject to, or which would at any rate be much less considerable, if the state did not take upon itself to act in the name of the public.

easily imposed upon by the false affectation of exactitude, which prevails even in the misstatements of the science, and it adopts with confidence the errors which are apparelled in the forms of mathematical truth.

We abandon, therefore, our numerical investigation, with the hope of meeting with data of another kind. In the absence of positive documents, we may form an opinion as to the proportion which the taxation of a people bears to its real prosperity, by observing whether its external appearance is flourishing; whether, after having discharged the calls of the state, the poor man retains the means of subsistence, and the rich the means of enjoyment; and whether both classes are contented with their position, seeking, however, to ameliorate it by perpetual exertions, so that industry is never in want of capital, nor capital unemployed by industry. The observer who draws his inferences from these signs will, undoubtedly, be led to the conclusion that the American of the United States contributes a much smaller portion of his income to the state than the citizen of France. Nor, indeed, can the result be otherwise.

A portion of the French debt is the consequence of two successive invasions; and the Union has no similar calamity to fear. A nation placed upon the continent of Europe is obliged to maintain a large standing army; the isolated position of the Union enables it to have only 6,000 soldiers. The French have a fleet of 300 sail; the Americans have 52 vessels. How, then, can the inhabitant of the Union be called upon to contribute as largely as the inhabitant of France? No parallel can be drawn between the finances of two countries so differently situated.

It is by examining what actually takes place in the Union, and not by comparing the Union with France, that we may discover whether the American government is really economical. On casting my eyes over the different republics which form the confederation, I perceive that their governments lack perseverance in their undertakings, and that they exercise no steady control over the men whom they employ. Whence I naturally infer that they must often spend the money of the people to no purpose, or consume more of it than is really necessary to their undertakings. Great efforts are made, in accordance with the democratic origin of society, to satisfy the exigencies of the lower orders, to open the career of power to their endeavors, and to diffuse knowledge and comfort among them. The poor are maintained, immense sums are annually devoted to public instruction, all services whatsoever are remunerated, and the most subordinate agents are liberally paid. If this kind of government appears to me to be useful and rational, I am nevertheless constrained to admit that it is expensive.

Wherever the poor direct public affairs and dispose of the national resources, it appears certain that as they profit by the expenditure of the state, they are apt to augment that expenditure.

I conclude therefore, without having recourse to inaccurate computations, and without hazarding a comparison which might prove incorrect, that the democratic government of the Americans is not a cheap government, as is sometimes asserted; and I have no hesitation in predicting that if the people of the United States is ever involved in serious difficulties, its taxation will speedily be increased to the rate of that which prevails in the greater part of the aristocracies and the monarchies of Europe.

CORRUPTION AND VICIES OF THE RULERS IN A DEMOCRACY,
AND CONSEQUENT EFFECTS UPON PUBLIC MORALITY

A distinction must be made when the aristocratic and the democratic principles mutually inveigh against each other as tending to facilitate corruption. In aristocratic governments the individuals who are placed at the head of affairs are rich men, who are solely desirous of power. In democracies statesmen are poor, and they have their fortunes to make. The consequence is that in aristocratic states the rulers are rarely accessible to corruption, and have very little craving for money; while the reverse is the case in democratic nations.

But in aristocracies, as those who are desirous of arriving at the head of affairs are possessed of considerable wealth, and as the number of persons by whose assistance they may rise is comparatively small, the government is, if I may use the expression, put up to a sort of auction. In democracies, on the contrary, those who are covetous of power are very seldom wealthy, and the number of citizens who confer that power is extremely great. Perhaps in democracies the number of men who might be bought is by no means smaller, but buyers are rarely to be met with; and, besides, it would be necessary to buy so many persons at once that the attempt is rendered nugatory.

Many of the men who have been in the administration in France during the last forty years have been accused of making their fortunes at the expense of the state or of its allies, a reproach which was rarely addressed to the public characters of the ancient monarchy. But in France the practice of bribing electors is almost unknown, while it is notoriously and publicly carried on in England. In the United States I never heard a man accused of spending his wealth in corrupting the populace; but I

have often heard the probity of public officers questioned; still more frequently have I heard their success attributed to low intrigues and immoral practices.

If, then, the men who conduct the government of an aristocracy sometimes endeavor to corrupt the people, the heads of a democracy are themselves corrupt. In the former case the morality of the people is directly assailed; in the latter, an indirect influence is exercised upon the people which is still more to be dreaded.

As the rulers of democratic nations are almost always exposed to the suspicion of dishonorable conduct, they in some measure lend the authority of the government to the base practices of which they are accused. They thus afford an example which must prove discouraging to the struggles of virtuous independence, and must foster the secret calculations of a vicious ambition. If it be asserted that evil passions are displayed in all ranks of society; that they ascend the throne by hereditary right; and that despicable characters are to be met with at the head of aristocratic nations as well as in the sphere of a democracy, this objection has but little weight in my estimation. The corruption of men who have casually risen to power has a coarse and vulgar infection in it, which renders it contagious to the multitude. On the contrary, there is a kind of aristocratic refinement and an air of grandeur in the depravity of the great, which frequently prevents it from spreading abroad.

The people can never penetrate into the perplexing labyrinth of court intrigue, and it will always have difficulty in detecting the turpitude which lurks under elegant manners, refined tastes, and graceful language. But to pillage the public purse and to vend the favors of the state are arts which the meanest villain may comprehend, and hope to practice in his turn.

In reality it is far less prejudicial to witness the immorality of the great than to witness that immorality which leads to greatness. In a democracy, private citizens see a man of their own rank in life who rises from that obscure position, and who becomes possessed of riches and of power in a few years. The spectacle excites their surprise and their envy, and they are led to inquire how the person who was yesterday their equal is today their ruler. To attribute his rise to his talents or his virtues is unpleasant, for it is tacitly to acknowledge that they are themselves less virtuous and less talented than he was. They are therefore led (and not unfrequently their conjecture is a correct one) to impute his success mainly to some one of his defects; and an odious mixture is thus formed of the ideas of turpitude and power, unworthiness and success, utility and dishonor.

EFFORTS OF WHICH A DEMOCRACY IS CAPABLE

I here warn the reader that I speak of a government which implicitly follows the real desires of the people, and not of a government which simply commands in its name. Nothing is so irresistible as a tyrannical power commanding in the name of the people, because, while it exercises that moral influence which belongs to the decision of the majority, it acts at the same time with the promptitude and the tenacity of a single man.

It is difficult to say what degree of exertion a democratic government may be capable of making at a crisis in the history of the nation. But no great democratic republic has hitherto existed in the world. To style the oligarchy which ruled over France in 1793 by that name would be to offer an insult to the republican form of government. The United States afford the first example of the kind.

The American Union has now subsisted for half a century, in the course of which time its existence has only once been attacked, namely, during the War of Independence. At the commencement of that long war, various occurrences took place which betokened an extraordinary zeal for the service of the country.²⁰ But as the contest was prolonged, symptoms of private egotism began to show themselves. No money was poured into the public treasury; few recruits could be raised to join the army; the people wished to acquire independence, but was very ill disposed to undergo the privations by which alone it could be obtained. "Tax laws," says Hamilton in the *Federalist*, "have in vain been multiplied; new methods to enforce the collection have in vain been tried; the public expectation has been uniformly disappointed, and the treasuries of the States have remained empty. The popular system of administration inherent in the nature of popular government, coinciding with the real scarcity of money incident to a languid and mutilated state of trade, has hitherto defeated every experiment for extensive collections, and has at length taught the different legislatures the folly of attempting them."²¹

The United States have not had any serious war to carry on ever since that period. In order, therefore, to appreciate the sacrifices which democratic nations may impose upon themselves, we must wait until the

20. One of the most singular of these occurrences was the resolution which the Americans took of temporarily abandoning the use of tea. Those who know that men usually cling more to their habits than to their life will doubtless admire this great though obscure sacrifice which was made by a whole people.

21. *The Federalist*, No. 12, *Great Books of the Western World* [Ed.].

American people is obliged to put half its entire income at the disposal of the government, as was done by the English; or until it sends forth a twentieth part of its population to the field of battle, as was done by France.

In America the use of conscription is unknown, and men are induced to enlist by bounties. The notions and habits of the people of the United States are so opposed to compulsory enlistment, that I do not imagine it can ever be sanctioned by the laws. What is termed the conscription in France is assuredly the heaviest tax upon the population of that country; yet how could a great continental war be carried on without it? The Americans have not adopted the British impressment of seamen, and they have nothing which corresponds to the French system of maritime conscription; the navy, as well as the merchant service, is supplied by voluntary service. But it is not easy to conceive how a people can sustain a great maritime war without having recourse to one or the other of these two systems. Indeed, the Union, which has fought with some honor upon the seas, has never possessed a very numerous fleet, and the equipment of the small number of American vessels has always been excessively expensive.

I have heard American statesmen confess that the Union will have great difficulty in maintaining its rank on the seas without adopting the system of impressment or of maritime conscription; but the difficulty is to induce the people, which exercises the supreme authority, to submit to impressment or any compulsory system.

It is incontestable that in times of danger a free people displays far more energy than one which is not so. But I incline to believe that this is more especially the case in those free nations in which the democratic element preponderates. Democracy appears to me to be much better adapted for the peaceful conduct of society, or for an occasional effort of remarkable vigor, than for the hardy and prolonged endurance of the storms which beset the political existence of nations. The reason is very evident: it is enthusiasm which prompts men to expose themselves to dangers and privations; but they will not support them long without reflection. There is more calculation, even in the impulses of bravery, than is generally attributed to them; and although the first efforts are suggested by passion, perseverance is maintained by a distinct regard of the purpose in view. A portion of what we value is exposed in order to save the remainder.

But it is this distinct perception of the future, founded upon a sound

judgment and an enlightened experience, which is most frequently wanting in democracies. The populace is more apt to feel than to reason; and if its present sufferings are great, it is to be feared that the still greater sufferings attendant upon defeat will be forgotten.

Another cause tends to render the efforts of a democratic government less persevering than those of an aristocracy. Not only are the lower classes less awakened than the higher orders to the good or evil chances of the future, but they are liable to suffer far more acutely from present privations. The noble exposes his life, indeed, but the chance of glory is equal to the chance of harm. If he sacrifices a large portion of his income to the state, he deprives himself for a time of the pleasures of affluence; but to the poor man death is embellished by no pomp or renown, and the imposts which are irksome to the rich are fatal to him.

This relative impotence of democratic republics is, perhaps, the greatest obstacle to the foundation of a republic of this kind in Europe. In order that such a state should subsist in one country of the Old World, it would be necessary that similar institutions should be introduced into all the other nations.

I am of opinion that a democratic government tends in the end to increase the real strength of society; but it can never combine, upon a single point and at a given time, so much power as an aristocracy or a monarchy. If a democratic country remained during a whole century subject to a republican government, it would probably at the end of that period be more populous and more prosperous than the neighboring despotic states. But it would have incurred the risk of being conquered much oftener than they would in that lapse of years.

SELF-CONTROL OF THE AMERICAN DEMOCRACY

The difficulty which a democracy has in conquering the passions, and subduing the exigencies of the moment, with a view to the future, is conspicuous in the most trivial occurrences of the United States. The people which is surrounded by flatterers has great difficulty in surmounting its inclinations; and whenever it is solicited to undergo a privation or any kind of inconvenience, even to attain an end which is sanctioned by its own rational conviction, it almost always refuses to comply at first. The deference of the Americans to the laws has been very justly applauded; but it must be added that in America the legislation is made by the people and for the people. Consequently, in the United States the law favors

those classes which are most interested in evading it elsewhere. It may therefore be supposed that an offensive law, which should not be acknowledged to be one of immediate utility, would either not be enacted or would not be obeyed.

In America there is no law against fraudulent bankruptcies, not because they are few but because there are a great number of bankruptcies. The dread of being prosecuted as a bankrupt acts with more intensity upon the mind of the majority of the people than the fear of being involved in losses or ruin by the failure of other parties; and a sort of guilty tolerance is extended by the public conscience to an offense which everyone condemns in his individual capacity. In the new states of the Southwest, the citizens generally take justice into their own hands, and murders are of very frequent occurrence. This arises from the rude manners and the ignorance of the inhabitants of those deserts, who do not perceive the utility of investing the law with adequate force, and who prefer duels to prosecutions.

Someone observed to me one day, in Philadelphia, that almost all crimes in America are caused by the abuse of intoxicating liquors, which the lower classes can procure in great abundance from their excessive cheapness. "How comes it," said I, "that you do not put a duty upon brandy?" "Our legislators," rejoined my informant, "have frequently thought of this expedient; but the task of putting it in operation is a difficult one: a revolt might be apprehended; and the members who should vote for a law of this kind would be sure of losing their seats." "Whence I am to infer," replied I, "that the drinking population constitutes the majority in your country, and that temperance is somewhat unpopular."

When these things are pointed out to the American statesmen, they content themselves with assuring you that time will operate the necessary change, and that the experience of evil will teach the people its true interests. This is frequently true: although a democracy is more liable to error than a monarch or a body of nobles, the chances of its regaining the right path, when once it has acknowledged its mistake, are greater also, because it is rarely embarrassed by internal interests which conflict with those of the majority and resist the authority of reason. But a democracy can only obtain truth as the result of experience, and many nations may forfeit their existence while they are awaiting the consequences of their errors.

The great privilege of the Americans does not simply consist in their being more enlightened than other nations but in their being able to re-

pair the faults they may commit. To which it must be added that a democracy cannot derive substantial benefit from past experience unless it be arrived at a certain pitch of knowledge and civilization. There are tribes and peoples whose education has been so vicious, and whose character presents so strange a mixture of passion, of ignorance, and of erroneous notions upon all subjects, that they are unable to discern the causes of their own wretchedness, and they fall a sacrifice to ills with which they are unacquainted.

I have crossed vast tracts of country that were formerly inhabited by powerful Indian nations which are now extinct; I have myself passed some time in the midst of mutilated tribes, which witness the daily decline of their numerical strength and of the glory of their independence; and I have heard these Indians themselves anticipate the impending doom of their race. Every European can perceive means which would rescue these unfortunate beings from inevitable destruction. They alone are insensible to the expedient; they feel the woe which year after year heaps upon their heads, but they will perish to a man without accepting the remedy. It would be necessary to employ force to induce them to submit to the protection and the constraint of civilization.

The incessant revolutions which have convulsed the South American provinces for the last quarter of a century have frequently been adverted to with astonishment, and expectations have been expressed that those nations would speedily return to their *natural state*. But can it be affirmed that the turmoil of revolution is not actually the most natural state of the South American Spaniards at the present time? In that country society is plunged into difficulties from which all its efforts are insufficient to rescue it. The inhabitants of that fair portion of the Western Hemisphere seem obstinately bent on pursuing the work of inward havoc. If they fall into a momentary repose from the effects of exhaustion, that repose prepares them for a fresh state of frenzy. When I consider their condition, which alternates between misery and crime, I should be inclined to believe that despotism itself would be a benefit to them if it were possible that the words despotism and benefit could ever be united in my mind.

CONDUCT OF FOREIGN AFFAIRS
BY THE AMERICAN DEMOCRACY

We have seen that the federal Constitution entrusts the permanent direction of the external interests of the nation to the President and the

Senate,²² which tends in some degree to detach the general foreign policy of the Union from the control of the people. It cannot therefore be asserted, with truth, that the external affairs of state are conducted by the democracy.

The policy of America owes its rise to Washington, and after him to Jefferson, who established those principles which it observes at the present day. Washington said in the admirable letter which he addressed to his fellow citizens, and which may be looked upon as his political bequest to the country:

The great rule of conduct for us in regard to foreign nations is, in extending our commercial relations, to have with them as little *political* connection as possible. So far as we have already formed engagements, let them be fulfilled with perfect good faith. Here let us stop.

Europe has a set of primary interests, which to us have none, or a very remote relation. Hence, she must be engaged in frequent controversies, the causes of which are essentially foreign to our concerns. Hence, therefore, it must be unwise in us to implicate ourselves, by artificial ties, in the ordinary vicissitudes of her politics, or the ordinary combinations and collisions of her friendships or enmities.

Our detached and distant situation invites and enables us to pursue a different course. If we remain one people, under an efficient government, the period is not far off when we may defy material injury from external annoyance; when we may take such an attitude as will cause the neutrality we may at any time resolve upon to be scrupulously respected; when belligerent nations, under the impossibility of making acquisitions upon us, will not lightly hazard the giving us provocation; when we may choose peace or war, as our interest, guided by justice, shall counsel.

Why forgo the advantages of so peculiar a situation? Why quit our own to stand upon foreign ground? Why, by interweaving our destiny with that of any part of Europe, entangle our peace and prosperity in the toils of European ambition, rivalry, interest, humour, or caprice?

It is our true policy to steer clear of permanent alliances with any portion of the foreign world; so far, I mean, as we are now at liberty to do it; for let me not be understood as capable of patronizing infidelity to existing engagements. I hold the maxim no less applicable to public than to private affairs, that honesty is always the best policy. I repeat it, there-

22. "The President," says the Constitution, Art. II., sect. 2, § 2, "shall have power, by and with the advice and consent of the Senate, to make treaties, provided two-thirds of the senators present concur." The reader is reminded that the senators are returned for a term of six years, and that they are chosen by the legislature of each state.

fore, let those engagements be observed in their genuine sense; but in my opinion it is unnecessary, and would be unwise, to extend them.

Taking care always to keep ourselves, by suitable establishments, in a respectable defensive posture, we may safely trust to temporary alliances for extraordinary emergencies.

In a previous part of the same letter, Washington makes the following admirable and just remark: "The nation which indulges towards another an habitual hatred, or an habitual fondness, is in some degree a slave. It is a slave to its animosity or to its affection, either of which is sufficient to lead it astray from its duty and its interest."

The political conduct of Washington was always guided by these maxims. He succeeded in maintaining his country in a state of peace, while all the other nations of the globe were at war; and he laid it down as a fundamental doctrine that the true interest of the Americans consisted in a perfect neutrality with regard to the internal dissensions of the European powers.

Jefferson went still further, and he introduced a maxim into the policy of the Union which affirms that "the Americans ought never to solicit any privileges from foreign nations, in order not to be obliged to grant similar privileges themselves."

These two principles, which were so plain and so just as to be adapted to the capacity of the populace, have greatly simplified the foreign policy of the United States. As the Union takes no part in the affairs of Europe, it has, properly speaking, no foreign interests to discuss, since it has at present no powerful neighbors on the American continent. The country is as much removed from the passions of the Old World by its position as by the line of policy which it has chosen; and it is neither called upon to repudiate nor to espouse the conflicting interests of Europe; while the dissensions of the New World are still concealed within the bosom of the future.

The Union is free from all pre-existing obligations; and it is consequently enabled to profit by the experience of the old nations of Europe without being obliged, as they are, to make the best of the past and to adapt it to their present circumstances, or to accept that immense inheritance which they derive from their forefathers—an inheritance of glory mingled with calamities, and of alliances conflicting with national antipathies. The foreign policy of the United States is reduced by its very nature to await the chances of the future history of the nation; and for the present it consists more in abstaining from interference than in exerting its activity.

It is therefore very difficult to ascertain, at present, what degree of sagacity the American democracy will display in the conduct of the foreign policy of the country; and upon this point its adversaries, as well as its advocates, must suspend their judgment. As for myself, I have no hesitation in avowing my conviction that it is most especially in the conduct of foreign relations that democratic governments appear to me to be decidedly inferior to governments carried on upon different principles. Experience, instruction, and habit may almost always succeed in creating a species of practical discretion in democracies, and that science of the daily occurrences of life which is called good sense. Good sense may suffice to direct the ordinary course of society; and among a people whose education has been provided for, the advantages of democratic liberty in the internal affairs of the country may more than compensate for the evils inherent in a democratic government. But such is not always the case in the mutual relations of foreign nations.

Foreign politics demand scarcely any of those qualities which a democracy possesses; and they require, on the contrary, the perfect use of almost all those faculties in which it is deficient. Democracy is favorable to the increase of the internal resources of a state; it tends to diffuse a moderate independence; it promotes the growth of public spirit, and fortifies the respect which is entertained for law in all classes of society: and these are advantages which only exercise an indirect influence over the relations which one people bears to another. But a democracy is unable to regulate the details of an important undertaking, to persevere in a design, and to work out its execution in the presence of serious obstacles. It cannot combine its measures with secrecy, and it will not await their consequences with patience. These are qualities which more especially belong to an individual or to an aristocracy; and they are precisely the means by which an individual people attains to a predominant position.

If, on the contrary, we observe the natural defects of aristocracy, we shall find that their influence is comparatively innoxious in the direction of the external affairs of a state. The capital fault of which aristocratic bodies may be accused is that they are more apt to contrive their own advantage than that of the mass of the people. In foreign politics it is rare for the interest of the aristocracy to be in any way distinct from that of the people.

The propensity which democracies have to obey the impulse of passion rather than the suggestions of prudence, and to abandon a mature design for the gratification of a momentary caprice, was very clearly seen in

America on the breaking out of the French Revolution. It was then as evident to the simplest capacity as it is at the present time, that the interest of the Americans forbade them to take any part in the contest which was about to deluge Europe with blood, but which could by no means injure the welfare of their own country. Nevertheless the sympathies of the people declared themselves with so much violence in behalf of France, that nothing but the inflexible character of Washington, and the immense popularity which he enjoyed, could have prevented the Americans from declaring war against England. And even then, the exertions which the austere reason of that great man made to repress the generous but imprudent passions of his fellow citizens very nearly deprived him of the sole recompense which he had ever claimed—that of his country's love. The majority then reprobated the line of policy which he adopted, and which has since been unanimously approved by the nation.²³

If the Constitution and the favor of the public had not entrusted the direction of the foreign affairs of the country to Washington, it is certain that the American nation would at that time have taken the very measures which it now condemns.

Almost all the nations which have ever exercised a powerful influence upon the destinies of the world, by conceiving, following up, and executing vast designs—from the Romans to the English—have been governed by aristocratic institutions. Nor will this be a subject of wonder when we recollect that nothing in the world has so absolute a fixity of purpose as an aristocracy. The mass of the people may be led astray by ignorance or passion; the mind of a king may be biased, and his perseverance in his designs may be shaken—besides which a king is not immortal—but an aristocratic body is too numerous to be led astray by the blandishments of intrigue; and yet not numerous enough to yield readily

23. See the fifth volume of Marshall's *Life of Washington*. "In a government constituted like that of the United States," he says, "it is impossible for the chief magistrate, however firm he may be, to oppose for any length of time the torrent of popular opinion; and the prevalent opinion of that day seemed to incline to war. In fact, in the session of Congress held at the time, it was frequently seen that Washington had lost the majority in the House of Representatives." The violence of the language used against him in public was extreme, and in a political meeting they did not scruple to compare him indirectly to the treacherous Arnold. "By the opposition," says Marshall, "the friends of the administration were declared to be an aristocratic and corrupt faction, who, from a desire to introduce monarchy, were hostile to France and under the influence of Britain; that they were a paper nobility, whose extreme sensibility at every measure which threatened the funds, induced a tame submission to injuries and insults, which the interests and honour of the nation required them to resist."

to the intoxicating influence of unreflecting passion: it has the energy of a firm and enlightened individual added to the power which it derives from its perpetuity.

*What the Real Advantages Are
Which American Society Derives
from the Government of the Democracy*

Before I enter upon the subject of the present chapter, I am induced to remind the reader of what I have more than once adverted to in the course of this book. The political institutions of the United States appear to me to be one of the forms of government which a democracy may adopt; but I do not regard the American Constitution as the best, or as the only one which a democratic people may establish. In showing the advantages which the Americans derive from the government of democracy, I am therefore very far from meaning, or from believing, that similar advantages can only be obtained from the same laws.

GENERAL TENDENCY OF THE LAWS UNDER THE RULE
OF THE AMERICAN DEMOCRACY
AND HABITS OF THOSE WHO APPLY THEM

The defects and the weaknesses of a democratic government may very readily be discovered; they are demonstrated by the most flagrant instances, while its beneficial influence is less perceptibly exercised. A single glance suffices to detect its evil consequences, but its good qualities can only be discerned by long observation. The laws of the American democracy are frequently defective or incomplete. They sometimes attack vested rights, or give a sanction to others which are dangerous to the community; but even if they were good, the frequent changes which they undergo would be an evil. How comes it, then, that the American republics prosper, and maintain their position?

In the consideration of laws, a distinction must be carefully observed between the end at which they aim, and the means by which they are directed to that end; between their absolute, and their relative excellence. If it be the intention of the legislator to favor the interests of the minority at the expense of the majority, and if the measures he takes to accomplish the object he has in view with the least possible expense of time and exertion, the law may be well drawn up, although its purpose be bad; and the more efficacious it is, the greater is the mischief which it causes.

Democratic laws generally tend to promote the welfare of the greatest possible number; for they emanate from the majority of the citizens, who are subject to error, but who cannot have an interest opposed to their own advantage. The laws of an aristocracy tend, on the contrary, to concentrate wealth and power in the hands of the minority, because an aristocracy, by its very nature, constitutes a minority. It may therefore be asserted, as a general proposition, that the purpose of a democracy in the conduct of its legislation is useful to a greater number of citizens than that of an aristocracy. This is, however, the sum total of its advantages.

Aristocracies are infinitely more expert in the science of legislation than democracies ever can be. They are possessed of a self-control which protects them from the errors of temporary excitement; and they form lasting designs which they mature with the assistance of favorable opportunities. Aristocratic government proceeds with the dexterity of art; it understands how to make the collective force of all its laws converge at the same time to a given point. Such is not the case with democracies, whose laws are almost always ineffective or inopportune. The means of democracy are therefore more imperfect than those of aristocracy, and the measures which it unwittingly adopts are frequently opposed to its own cause; but the object it has in view is more useful.

Let us now imagine a community so organized by nature, or by its constitution, that it can support the transitory action of bad laws, and that it can await, without destruction, the general tendency of the legislation: we shall then be able to conceive that a democratic government, notwithstanding its defects, will be most fitted to conduce to the prosperity of this community. This is precisely what has occurred in the United States; and I repeat what I have before remarked, that the great advantage of the Americans consists in their being able to commit faults which they may afterwards repair.

An analogous observation may be made respecting public officers. It is easy to perceive that the American democracy frequently errs in the choice of the individuals to whom it entrusts the power of the administration; but it is more difficult to say why the state prospers under their rule. In the first place it is to be remarked that if in a democratic state the governors have less honesty and less capacity than elsewhere, the governed on the other hand are more enlightened and more attentive to their interests. As the people in democracies is more incessantly vigilant in its affairs, and more jealous of its rights, it prevents its representatives from abandoning that general line of conduct which its own interest pre-

scribes. In the second place it must be remembered that if the democratic magistrate is more apt to misuse his power, he possesses it for a shorter period of time. But there is yet another reason which is still more general and conclusive. It is no doubt of importance to the welfare of nations that they should be governed by men of talents and virtue; but it is perhaps still more important that the interests of those men should not differ from the interests of the community at large; for if such were the case, virtues of a high order might become useless, and talents might be turned to a bad account. I say that it is important that the interests of the persons in authority should not conflict with or oppose the interests of the community at large; but I do not insist upon their having the same interests as the *whole* population, because I am not aware that such a state of things ever existed in any country.

No political form has hitherto been discovered which is equally favorable to the prosperity and the development of all the classes into which society is divided. These classes continue to form, as it were, a certain number of distinct nations in the same nation; and experience has shown that it is no less dangerous to place the fate of these classes exclusively in the hands of any one of them, than it is to make one people the arbiter of the destiny of another. When the rich alone govern, the interest of the poor is always endangered; and when the poor make the laws, that of the rich incurs very serious risks. The advantage of democracy does not consist, therefore, as has sometimes been asserted, in favoring the prosperity of all, but simply in contributing to the well-being of the greatest possible number.

The men who are entrusted with the direction of public affairs in the United States are frequently inferior, both in point of capacity and of morality, to those whom aristocratic institutions would raise to power. But their interest is identified and confounded with that of the majority of their fellow citizens. They may frequently be faithless, and frequently mistaken; but they will never systematically adopt a line of conduct opposed to the will of the majority; and it is impossible that they should give a dangerous or an exclusive tendency to the government.

The maladministration of a democratic magistrate is a mere isolated fact, which only occurs during the short period for which he is elected. Corruption and incapacity do not act as common interests which may connect men permanently with one another. A corrupt or an incapable magistrate will not concert his measures with another magistrate, simply because that individual is as corrupt and as incapable as himself; and these two men will never unite their endeavors to promote the corrup-

tion and inaptitude of their remote posterity. The ambition and the maneuvers of the one will serve, on the contrary, to unmask the other. The vices of a magistrate, in democratic states, are usually peculiar to his own person.

But under aristocratic governments public men are swayed by the interest of their order, which, if it is sometimes confounded with the interests of the majority, is very frequently distinct from them. This interest is the common and lasting bond which unites them together: it induces them to coalesce, and to combine their efforts in order to attain an end which does not always ensure the greatest happiness of the greatest number; and it serves not only to connect the persons in authority but to unite them to a considerable portion of the community, since a numerous body of citizens belongs to the aristocracy without being invested with official functions. The aristocratic magistrate is therefore constantly supported by a portion of the community, as well as by the government of which he is a member.

The common purpose which connects the interest of the magistrates in aristocracies with that of a portion of their contemporaries identifies it with that of future generations; their influence belongs to the future as much as to the present. The aristocratic magistrate is urged at the same time towards the same point by the passions of the community, by his own, and I may almost add by those of his posterity. Is it, then, wonderful that he does not resist such repeated impulses? And indeed aristocracies are often carried away by the spirit of their order without being corrupted by it; and they unconsciously fashion society to their own ends, and prepare it for their own descendants.

The English aristocracy is perhaps the most liberal which ever existed, and no body of men has ever, uninterruptedly, furnished so many honorable and enlightened individuals to the government of a country. It cannot, however, escape observation that in the legislation of England the good of the poor has been sacrificed to the advantage of the rich, and the rights of the majority to the privileges of the few. The consequence is that England, at the present day, combines the extremes of fortune in the bosom of her society; and her perils and calamities are almost equal to her power and her renown.

In the United States, where the public officers have no interests to promote connected with their caste, the general and constant influence of the government is beneficial, although the individuals who conduct it are frequently unskillful and sometimes contemptible. There is indeed a secret tendency in democratic institutions to render the exertions of

the citizens subservient to the prosperity of the community, notwithstanding their private vices and mistakes; while in aristocratic institutions there is a secret propensity which, notwithstanding the talents and the virtues of those who conduct the government, leads them to contribute to the evils which oppress their fellow creatures. In aristocratic governments public men may frequently do injuries which they do not intend; and in democratic states they produce advantages which they never thought of.

PUBLIC SPIRIT IN THE UNITED STATES

There is one sort of patriotic attachment which principally arises from that instinctive, disinterested and undefinable feeling which connects the affections of man with his birthplace. This natural fondness is united to a taste for ancient customs, and to a reverence for ancestral traditions of the past; those who cherish it love their country as they love the mansion of their fathers. They enjoy the tranquillity which it affords them; they cling to the peaceful habits which they have contracted within its bosom; they are attached to the reminiscences which it awakens, and they are even pleased by the state of obedience in which they are placed. This patriotism is sometimes stimulated by religious enthusiasm, and then it is capable of making the most prodigious efforts. It is in itself a kind of religion: it does not reason, but it acts from the impulse of faith and of sentiment. By some nations the monarch has been regarded as a personification of the country; and the fervor of patriotism being converted into the fervor of loyalty, they took a sympathetic pride in his conquests, and gloried in his power. At one time, under the ancient monarchy, the French felt a sort of satisfaction in the sense of their dependence upon the arbitrary pleasure of their king, and they were wont to say with pride, "We are the subjects of the most powerful king in the world."

But, like all instinctive passions, this kind of patriotism is more apt to prompt transient exertion than to supply the motives of continuous endeavor. It may save the state in critical circumstances, but it will not unfrequently allow the nation to decline in the midst of peace. While the manners of a people are simple, and its faith unshaken; while society is steadily based upon traditional institutions, whose legitimacy has never been contested, this instinctive patriotism is wont to endure.

But there is another species of attachment to a country which is more rational than the one we have been describing. It is perhaps less gener-

ous and less ardent, but it is more fruitful and more lasting; it is coeval with the spread of knowledge, it is nurtured by the laws, it grows by the exercise of civil rights, and, in the end, it is confounded with the personal interest of the citizen. A man comprehends the influence which the prosperity of his country has upon his own welfare; he is aware that the laws authorize him to contribute his assistance to that prosperity, and he labors to promote it as a portion of his interest in the first place, and as a portion of his right in the second.

But epochs sometimes occur, in the course of the existence of a nation, at which the ancient customs of a people are changed, public morality destroyed, religious belief disturbed, and the spell of tradition broken, while the diffusion of knowledge is yet imperfect, and the civil rights of the community are ill secured, or confined within very narrow limits. The country then assumes a dim and dubious shape in the eyes of the citizens; they no longer behold it in the soil which they inhabit, for that soil is to them a dull inanimate clod; nor in the usages of their forefathers, which they have been taught to look upon as a debasing yoke; nor in religion, for that they doubt; nor in the laws, which do not originate in their own authority; nor in the legislator, whom they fear and despise. The country is lost to their senses, they can neither discover it under its own nor under borrowed features, and they entrench themselves within the dull precincts of a narrow egotism. They are emancipated from prejudice without having acknowledged the empire of reason; they are neither animated by the instinctive patriotism of monarchical subjects nor by the thinking patriotism of republican citizens; but they have stopped halfway between the two, in the midst of confusion and of distress.

In this predicament, to retreat is impossible, for a people cannot restore the vivacity of its earlier times any more than a man can return to the innocence and the bloom of childhood; such things may be regretted, but they cannot be renewed. The only thing, then, which remains to be done is to proceed, and to accelerate the union of private with public interests, since the period of disinterested patriotism is gone by forever.

I am certainly very far from averring that, in order to obtain this result, the exercise of political rights should be immediately granted to all the members of the community. But I maintain that the most powerful and perhaps the only means of interesting men in the welfare of their country which we still possess is to make them partakers in the government. At the present time civic zeal seems to me to be inseparable from

the exercise of political rights; and I hold that the number of citizens will be found to augment or to decrease in Europe in proportion as those rights are extended.

In the United States, the inhabitants were thrown but as yesterday upon the soil which they now occupy, and they brought neither customs nor traditions with them there; they meet each other for the first time with no previous acquaintance; in short, the instinctive love of their country can scarcely exist in their minds; but everyone takes as zealous an interest in the affairs of his township, his county, and of the whole state as if they were his own, because everyone, in his sphere, takes an active part in the government of society.

The lower orders in the United States are alive to the perception of the influence exercised by the general prosperity upon their own welfare; and simple as this observation is, it is one which is but too rarely made by the people. But in America the people regards this prosperity as the result of its own exertions; the citizen looks upon the fortune of the public as his private interest, and he co-operates in its success, not so much from a sense of pride or of duty, as from what I shall venture to term cupidity.

It is unnecessary to study the institutions and the history of the Americans in order to discover the truth of this remark, for their manners render it sufficiently evident. As the American participates in all that is done in his country, he thinks himself obliged to defend whatever may be censured; for it is not only his country which is attacked upon these occasions, but it is himself. The consequence is that his national pride resorts to a thousand artifices, and to all the petty tricks of individual vanity.

Nothing is more embarrassing in the ordinary intercourse of life than this irritable patriotism of the Americans. A stranger may be very well inclined to praise many of the institutions of their country, but he begs permission to blame some of the peculiarities which he observes—a permission which is however inexorably refused. America is therefore a free country, in which, lest anybody should be hurt by your remarks, you are not allowed to speak freely of private individuals or of the state; of the citizens or of the authorities; of public or of private undertakings; or, in short, of anything at all, except it be of the climate and the soil; and even then Americans will be found ready to defend either the one or the other as if they had been contrived by the inhabitants of the country.

In our times, option must be made between the patriotism of all and the government of a few, for the force and activity which the first con-

fers are irreconcilable with the guarantees of tranquillity which the second furnishes.

NOTION OF RIGHTS IN THE UNITED STATES

After the idea of virtue, I know no higher principle than that of right; or to speak more accurately, these two ideas are commingled in one. The idea of right is simply that of virtue introduced into the political world. It is the idea of right which enabled men to define anarchy and tyranny; and which taught them to remain independent without arrogance, as well as to obey without servility. The man who submits to violence is debased by his compliance; but when he obeys the mandate of one who possesses that right of authority which he acknowledges in a fellow creature, he rises in some measure above the person who delivers the command. There are no great men without virtue, and there are no great nations—it may almost be added that there would be no society—without the notion of rights; for what is the condition of a mass of rational and intelligent beings who are only united together by the bond of force?

I am persuaded that the only means which we possess at the present time of inculcating the notion of rights, and of rendering it, as it were, palpable to the senses, is to invest all the members of the community with the peaceful exercise of certain rights: this is very clearly seen in children, who are men without the strength and the experience of manhood. When a child begins to move in the midst of the objects which surround him, he is instinctively led to turn everything which he can lay his hands upon to his own purposes; he has no notion of the property of others; but as he gradually learns the value of things, and begins to perceive that he may in his turn be deprived of his possessions, he becomes more circumspect, and he observes those rights in others which he wishes to have respected in himself. The principle which the child derives from the possession of his toys is taught to the man by the objects which he may call his own. In America those complaints against property in general, which are so frequent in Europe, are never heard, because in America there are no paupers; and as everyone has property of his own to defend, everyone recognizes the principle upon which he holds it.

The same thing occurs in the political world. In America the lowest classes have conceived a very high notion of political rights, because they exercise those rights; and they refrain from attacking those of other people in order to ensure their own from attack. While in Europe the

same classes sometimes recalcitrate even against the supreme power, the American submits without a murmur to the authority of the pettiest magistrate.

This truth is exemplified by the most trivial details of national peculiarities. In France very few pleasures are exclusively reserved for the higher classes; the poor are admitted wherever the rich are received; and they consequently behave with propriety, and respect whatever contributes to the enjoyments in which they themselves participate. In England, where wealth has a monopoly of amusement as well as of power, complaints are made that whenever the poor happen to steal into the enclosures which are reserved for the pleasures of the rich, they commit acts of wanton mischief: can this be wondered at, since care has been taken that they should have nothing to lose?

The government of the democracy brings the notion of political rights to the level of the humblest citizens, just as the dissemination of wealth brings the notion of property within the reach of all the members of the community; and I confess that, to my mind, this is one of its greatest advantages. I do not assert that it is easy to teach men to exercise political rights; but I maintain that when it is possible, the effects which result from it are highly important: and I add that if there ever was a time at which such an attempt ought to be made, that time is our own. It is clear that the influence of religious belief is shaken, and that the notion of divine rights is declining; it is evident that public morality is vitiated, and the notion of moral rights is also disappearing: these are general symptoms of the substitution of argument for faith, and of calculation for the impulses of sentiment. If, in the midst of this general disruption, you do not succeed in connecting the notion of rights with that of personal interest, which is the only immutable point in the human heart, what means will you have of governing the world except by fear? When I am told that since the laws are weak and the populace is wild, since passions are excited and the authority of virtue is paralyzed no measures must be taken to increase the rights of the democracy, I reply that it is for these very reasons that some measures of the kind must be taken; and I am persuaded that governments are still more interested in taking them than society at large, because governments are liable to be destroyed, and society cannot perish.

I am not, however, inclined to exaggerate the example which America furnishes. In those states the people are invested with political rights at a time when they could scarcely be abused, for the citizens were few in number and simple in their manners. As they have increased, the Ameri-

cans have not augmented the power of the democracy, but they have, if I may use the expression, extended its dominions.

It cannot be doubted that the moment at which political rights are granted to a people that had before been without them, is a very critical, though it be a necessary one. A child may kill before he is aware of the value of life; and he may deprive another person of his property before he is aware that his own may be taken away from him. The lower orders, when first they are invested with political rights, stand, in relation to those rights, in the same position as the child does to the whole of nature, and the celebrated adage may then be applied to them, *Homo puer robustus* [A man is a robust child]. This truth may even be perceived in America. The states in which the citizens have enjoyed their rights longest are those in which they make the best use of them.

It cannot be repeated too often that nothing is more fertile in prodigies than the art of being free; but there is nothing more arduous than the apprenticeship of liberty. Such is not the case with despotic institutions; despotism often promises to make amends for a thousand previous ills; it supports the right, it protects the oppressed, and it maintains public order. The nation is lulled by the temporary prosperity which accrues to it, until it is roused to a sense of its own misery. Liberty, on the contrary, is generally established in the midst of agitation, it is perfected by civil discord, and its benefits cannot be appreciated until it is already old.

RESPECT FOR THE LAW IN THE UNITED STATES

It is not always feasible to consult the whole people, either directly or indirectly, in the formation of the law; but it cannot be denied that when such a measure is possible, the authority of the law is very much augmented. This popular origin, which impairs the excellence and the wisdom of legislation, contributes prodigiously to increase its power. There is an amazing strength in the expression of the determination of a whole people; and when it declares itself, the imagination of those who are most inclined to contest it is overawed by its authority. The truth of this fact is very well known by parties; and they consequently strive to make out a majority whenever they can. If they have not the greater numbers of voters on their side, they assert that the true majority abstained from voting; and if they are foiled even there, they have recourse to the body of those persons who had no votes to give.

In the United States, except slaves, servants, and paupers in the receipt of relief from the townships, there is no class of persons who do not exer-

cise the elective franchise, and who do not indirectly contribute to make the laws. Those who design to attack the laws must consequently either modify the opinion of the nation or trample upon its decision.

A second reason, which is still more weighty, may be further adduced; in the United States everyone is personally interested in enforcing the obedience of the whole community to the law; for as the minority may shortly rally the majority to its principles, it is interested in professing that respect for the decrees of the legislator which it may soon have occasion to claim for its own. However irksome an enactment may be, the citizen of the United States complies with it, not only because it is the work of the majority, but because it originates in his own authority; and he regards it as a contract to which he is himself a party.

In the United States, then, that numerous and turbulent multitude does not exist which always looks upon the law as its natural enemy, and accordingly surveys it with fear and with distrust. It is impossible, on the other hand, not to perceive that all classes display the utmost reliance upon the legislation of their country, and that they are attached to it by a kind of parental affection.

I am wrong, however, in saying all classes; for as in America the European scale of authority is inverted, the wealthy are there placed in a position analogous to that of the poor in the Old World, and it is the opulent classes which frequently look upon the law with suspicion. I have already observed that the advantage of democracy is not, as has been sometimes asserted, that it protects the interests of the whole community, but simply that it protects those of the majority. In the United States, where the poor rule, the rich have always some reason to dread the abuses of their power. This natural anxiety of the rich may produce a sullen dissatisfaction, but society is not disturbed by it; for the same reason which induces the rich to withhold their confidence in the legislative authority makes them obey its mandates: their wealth, which prevents them from making the law, prevents them from withstanding it. Among civilized nations revolts are rarely excited except by such persons as have nothing to lose by them; and if the laws of a democracy are not always worthy of respect, at least they always obtain it, for those who usually infringe the laws have no excuse for not complying with the enactments they have themselves made, and by which they are themselves benefited, while the citizens whose interests might be promoted by the infraction of them are induced, by their character and their station, to submit to the decisions of the legislature, whatever they may be. Besides which, the people in America obeys the law not only because it emanates from the

popular authority, but because that authority may modify it in any points which may prove vexatary; a law is observed because it is a self-imposed evil in the first place, and an evil of transient duration in the second.

ACTIVITY WHICH PERVADES ALL THE BRANCHES
OF THE BODY POLITIC IN THE UNITED STATES;
INFLUENCE WHICH IT EXERCISES UPON SOCIETY

On passing from a country in which free institutions are established to one where they do not exist, the traveler is struck by the change: in the former all is bustle and activity; in the latter everything is calm and motionless. In the one, amelioration and progress are the general topics of inquiry; in the other, it seems as if the community only aspired to repose in the enjoyment of the advantages which it has acquired. Nevertheless, the country which exerts itself so strenuously to promote its welfare is generally more wealthy and more prosperous than that which appears to be so contented with its lot; and when we compare them together, we can scarcely conceive how so many new wants are daily felt in the former, while so few seem to occur in the latter.

If this remark is applicable to those free countries in which monarchical and aristocratic institutions subsist, it is still more striking with regard to democratic republics. In these states it is not only a portion of the people which is busied with the amelioration of its social condition, but the whole community is engaged in the task; and it is not the exigencies and the convenience of a single class for which a provision is to be made, but the exigencies and the convenience of all ranks of life.

It is not impossible to conceive the surpassing liberty which the Americans enjoy; some idea may likewise be formed of the extreme equality which subsists among them, but the political activity which pervades the United States must be seen in order to be understood. No sooner do you set foot upon the American soil than you are stunned by a kind of tumult; a confused clamor is heard on every side; and a thousand simultaneous voices demand the immediate satisfaction of their social wants. Everything is in motion around you; here, the people of one quarter of a town are met to decide upon the building of a church; there, the election of a representative is going on; a little further, the delegates of a district are posting to the town in order to consult upon some local improvements; or in another place the laborers of a village quit their plows to deliberate upon the project of a road or a public school. Meetings are called for the sole purpose of declaring their disapprobation of the line of conduct

pursued by the government; while in other assemblies the citizens salute the authorities of the day as the fathers of their country. Societies are formed which regard drunkenness as the principal cause of the evils under which the state labors, and which solemnly bind themselves to give a constant example of temperance.²⁴

The great political agitation of the American legislative bodies, which is the only kind of excitement that attracts the attention of foreign countries, is a mere episode or a sort of continuation of that universal movement which originates in the lowest classes of the people and extends successively to all the ranks of society. It is impossible to spend more efforts in the pursuit of enjoyment.

The cares of political life engross a most prominent place in the occupation of a citizen in the United States; and almost the only pleasure of which an American has any idea is to take a part in the government, and to discuss the part he has taken. This feeling pervades the most trifling habits of life; even the women frequently attend public meetings, and listen to political harangues as a recreation after their household labors. Debating clubs are to a certain extent a substitute for theatrical entertainments: an American cannot converse, but he can discuss; and when he attempts to talk he falls into a dissertation. He speaks to you as if he was addressing a meeting; and if he should chance to warm in the course of the discussion, he will infallibly say "Gentlemen," to the person with whom he is conversing.

In some countries the inhabitants display a certain repugnance to avail themselves of the political privileges with which the law invests them; it would seem that they set too high a value upon their time to spend it on the interests of the community; and they prefer to withdraw within the exact limits of a wholesome egotism, marked out by four sunk fences and a quickset hedge. But if an American were condemned to confine his activity to his own affairs, he would be robbed of one half of his existence; he would feel an immense void in the life which he is accustomed to lead, and his wretchedness would be unbearable.²⁵ I am persuaded that if ever a despotic government is established in America, it will find

24. At the time of my stay in the United States the temperance societies already consisted of more than 270,000 members; and their effect had been to diminish the consumption of fermented liquors by 500,000 gallons per annum in the state of Pennsylvania alone.

25. The same remark was made at Rome under the first Caesars. Montesquieu somewhere alludes to the excessive despondency of certain Roman citizens who, after the excitement of political life, were all at once flung back into the stagnation of private life.

it more difficult to surmount the habits which free institutions have engendered, than to conquer the attachment of the citizens to freedom.

This ceaseless agitation which democratic government has introduced into the political world influences all social intercourse. I am not sure that upon the whole this is not the greatest advantage of democracy; and I am much less inclined to applaud it for what it does than for what it causes to be done.

It is incontestable that the people frequently conducts public business very ill; but it is impossible that the lower orders should take a part in public business without extending the circle of their ideas, and without quitting the ordinary routine of their mental acquirements. The humblest individual who is called upon to co-operate in the government of society acquires a certain degree of self-respect; and as he possesses authority, he can command the services of minds much more enlightened than his own. He is canvassed by a multitude of applicants who seek to deceive him in a thousand different ways, but who instruct him by their deceit. He takes a part in political undertakings which did not originate in his own conception, but which give him a taste for undertakings of the kind. New ameliorations are daily pointed out in the property which he holds in common with others, and this gives him the desire of improving that property which is more peculiarly his own. He is perhaps neither happier nor better than those who came before him, but he is better informed and more active. I have no doubt that the democratic institutions of the United States, joined to the physical constitution of the country, are the cause (not the direct, as is so often asserted, but the indirect cause) of the prodigious commercial activity of the inhabitants. It is not engendered by the laws, but the people learns how to promote it by the experience derived from legislation.

When the opponents of democracy assert that a single individual performs the duties which he undertakes much better than the government of the community, it appears to me that they are perfectly right. The government of an individual, supposing an equality of instruction on either side, is more consistent, more persevering, and more accurate than that of a multitude, and it is much better qualified judiciously to discriminate the characters of the men it employs. If any deny what I advance, they have certainly never seen a democratic government, or have formed their opinion upon very partial evidence. It is true that even when local circumstances and the disposition of the people allow democratic institutions to subsist, they never display a regular and methodical system of government. Democratic liberty is far from accomplishing all

the projects it undertakes, with the skill of an adroit despotism. It frequently abandons them before they have borne their fruits, or risks them when the consequences may prove dangerous; but in the end it produces more than any absolute government, and if it do fewer things well, it does a greater number of things. Under its sway, the transactions of the public administration are not nearly so important as what is done by private exertion. Democracy does not confer the most skillful kind of government upon the people, but it produces that which the most skillful governments are frequently unable to awaken, namely, an all-pervading and restless activity, a superabundant force, and an energy which is inseparable from it, and which may, under favorable circumstances, beget the most amazing benefits. These are the true advantages of democracy.

In the present age, when the destinies of Christendom seem to be in suspense, some hasten to assail democracy as its foe while it is yet in its early growth; and others are ready with their vows of adoration for this new deity which is springing forth from chaos: but both parties are very imperfectly acquainted with the object of their hatred or of their desires; they strike in the dark, and distribute their blows by mere chance.

We must first understand what the purport of society and the aim of government is held to be. If it be your intention to confer a certain elevation upon the human mind, and to teach it to regard the things of this world with generous feelings, to inspire men with a scorn of mere temporal advantage, to give birth to living convictions, and to keep alive the spirit of honorable devotedness; if you hold it to be a good thing to refine the habits, to embellish the manners, to cultivate the arts of a nation, and to promote the love of poetry, of beauty, and of renown; if you would constitute a people not unfitted to act with power upon all other nations, nor unprepared for those high enterprises which, whatever be the result of its efforts, will leave a name forever famous in time—if you believe such to be the principal object of society, you must avoid the government of democracy, which would be a very uncertain guide to the end you have in view.

But if you hold it to be expedient to divert the moral and intellectual activity of man to the production of comfort, and to the acquirement of the necessaries of life; if a clear understanding be more profitable to man than genius; if your object be not to stimulate the virtues of heroism, but to create habits of peace; if you had rather witness vices than crimes, and are content to meet with fewer noble deeds, provided offenses be diminished in the same proportion; if, instead of living in the midst of a brilliant state of society, you are contented to have prosperity around

you; if, in short, you are of opinion that the principal object of a government is not to confer the greatest possible share of power and of glory upon the body of the nation, but to ensure the greatest degree of enjoyment, and the least degree of misery to each of the individuals who compose it—if such be your desires, you can have no surer means of satisfying them than by equalizing the conditions of men and establishing democratic institutions.

But if the time be past at which such a choice was possible, and if some superhuman power impel us towards one or the other of these two governments without consulting our wishes, let us at least endeavor to make the best of that which is allotted to us; and let us so inquire into its good and its evil propensities as to be able to foster the former, and repress the latter to the utmost. . . .

CONCLUSION

I have now nearly reached the close of my inquiry; hitherto, in speaking of the future destiny of the United States, I have endeavored to divide my subject into distinct portions in order to study each of them with more attention. My present object is to embrace the whole from one single point; the remarks I shall make will be less detailed, but they will be more sure. I shall perceive each object less distinctly, but I shall descry the principal facts with more certainty. A traveler who has just left the walls of an immense city climbs the neighboring hill; as he goes further off he loses sight of the men whom he has so recently quitted; their dwellings are confused in a dense mass; he can no longer distinguish the public squares, and he can scarcely trace out the great thoroughfares; but his eye has less difficulty in following the boundaries of the city, and for the first time he sees the shape of the vast whole. Such is the future destiny of the British race in North America to my eye; the details of the stupendous picture are overhung with shade, but I conceive a clear idea of the entire subject.

The territory now occupied or possessed by the United States of America forms about one-twentieth part of the habitable earth. But extensive as these confines are, it must not be supposed that the Anglo-American race will always remain within them; indeed, it has already far overstepped them.

There was once a time at which we also might have created a great French nation in the American wilds, to counterbalance the influence of the English upon the destinies of the New World. France formerly possessed a territory in North America scarcely less extensive than the

whole of Europe. The three greatest rivers of that continent then flowed within her dominions. The Indian tribes which dwelt between the mouth of the St. Lawrence and the delta of the Mississippi were unaccustomed to any other tongue but ours; and all the European settlements scattered over that immense region recalled the traditions of our country. Louisbourg, Montmorency, Duquesne, Saint-Louis, Vincennes, New Orleans (for such were the names they bore) are words dear to France and familiar to our ears.

But a concourse of circumstances, which it would be tedious to enumerate,²⁶ have deprived us of this magnificent inheritance. Wherever the French settlers were numerically weak and partially established they have disappeared; those who remain are collected on a small extent of country, and are now subject to other laws. The 400,000 French inhabitants of Lower Canada constitute, at the present time, the remnant of an old nation lost in the midst of a new people. A foreign population is increasing around them unceasingly and on all sides which already penetrates among the ancient masters of the country, predominates in their cities, and corrupts their language. This population is identical with that of the United States; it is therefore with truth that I asserted that the British race is not confined within the frontiers of the Union, since it already extends to the northeast.

To the northwest nothing is to be met with but a few insignificant Russian settlements; but to the southwest, Mexico presents a barrier to the Anglo-Americans. Thus, the Spaniards and the Anglo-Americans are, properly speaking, the only two races which divide the possession of the New World. The limits of separation between them have been settled by a treaty; but although the conditions of that treaty are exceedingly favorable to the Anglo-Americans, I do not doubt that they will shortly infringe this arrangement. Vast provinces, extending beyond the frontiers of the Union towards Mexico, are still destitute of inhabitants. The natives of the United States will forestall the rightful occupants of these solitary regions. They will take possession of the soil, and establish social institutions, so that when the legal owner arrives at length, he will find the wilderness under cultivation, and strangers quietly settled in the midst of his inheritance.

The lands of the New World belong to the first occupant, and they are the natural reward of the swiftest pioneer. Even the countries which are

26. The foremost of these circumstances is that nations which are accustomed to free institutions and municipal government are better able than any others to found prosperous colonies. The habit of thinking and governing for oneself is indispensable in a new country, where success necessarily depends, in a great measure, upon the individual exertions of the settlers.

already peopled will have some difficulty in securing themselves from this invasion. I have already alluded to what is taking place in the province of Texas. The inhabitants of the United States are perpetually migrating to Texas, where they purchase land; and although they conform to the laws of the country, they are gradually founding the empire of their own language and their own manners. The province of Texas is still part of the Mexican dominions, but it will soon contain no Mexicans; the same thing has occurred whenever the Anglo-Americans have come into contact with populations of a different origin.

It cannot be denied that the British race has acquired an amazing preponderance over all the other European races in the New World; and that it is very superior to them in civilization, in industry, and in power. As long as it is only surrounded by desert or thinly-peopled countries, as long as it encounters no dense populations upon its route, through which it cannot work its way, it will assuredly continue to spread. The lines marked out by treaties will not stop it; but it will everywhere transgress these imaginary barriers.

The geographical position of the British race in the New World is peculiarly favorable to its rapid increase. Above its northern frontiers the icy regions of the Pole extend; and a few degrees below its southern confines lies the burning climate of the Equator. The Anglo-Americans are therefore placed in the most temperate and habitable zone of the continent.

It is generally supposed that the prodigious increase of population in the United States is posterior to their Declaration of Independence. But this is an error: the population increased as rapidly under the colonial system as it does at the present day; that is to say, it doubled in about twenty-two years. But this proportion, which is now applied to millions, was then applied to thousands of inhabitants; and the same fact which was scarcely noticeable a century ago is now evident to every observer.

The British subjects in Canada, who are dependent on a king, augment and spread almost as rapidly as the British settlers of the United States, who live under a republican government. During the War of Independence, which lasted eight years, the population continued to increase without intermission in the same ratio. Although powerful Indian nations allied with the English existed, at that time, upon the western frontiers, the emigration westward was never checked. While the enemy laid waste the shores of the Atlantic, Kentucky, the western parts of Pennsylvania, and the states of Vermont and of Maine were filling with inhabitants. Nor did the unsettled state of the Constitution, which succeeded the war, prevent the increase of the population, or stop its progress across the

wilds. Thus, the difference of laws, the various conditions of peace and war, of order and of anarchy, have exercised no perceptible influence upon the gradual development of the Anglo-Americans. This may be readily understood; for the fact is that no causes are sufficiently general to exercise a simultaneous influence over the whole of so extensive a territory. One portion of the country always offers a sure retreat from the calamities which afflict another part; and however great may be the evil, the remedy which is at hand is greater still.

It must not, then, be imagined that the impulse of the British race in the New World can be arrested. The dismemberment of the Union, and the hostilities which might ensue, the abolition of republican institutions, and the tyrannical government which might succeed it may retard this impulse, but they cannot prevent it from ultimately fulfilling the destinies to which that race is reserved. No power upon earth can close upon the emigrants that fertile wilderness which offers resources to all industry and a refuge from all want. Future events, of whatever nature they may be, will not deprive the Americans of their climate or of their inland seas, of their great rivers or of their exuberant soil. Nor will bad laws, revolutions, and anarchy, be able to obliterate that love of prosperity and that spirit of enterprise which seem to be the distinctive characteristics of their race, or to extinguish that knowledge which guides them on their way.

Thus, in the midst of the uncertain future, one event at least is sure. At a period which may be said to be near (for we are speaking of the life of a nation), the Anglo-Americans will alone cover the immense space contained between the polar regions and the tropics, extending from the coasts of the Atlantic to the shores of the Pacific Ocean. The territory which will probably be occupied by the Anglo-Americans at some future time may be computed to equal three-quarters of Europe in extent.²⁷ The climate of the Union is upon the whole preferable to that of Europe, and its natural advantages are not less great; it is therefore evident that its population will at some future time be proportionate to our own. Europe, divided as it is between so many different nations, and torn as it has been by incessant wars and the barbarous manners of the Middle Ages, has notwithstanding attained a population of 410 inhabitants to the square league. What cause can prevent the United States from having as numerous a population in time?

Many ages must elapse before the divers offsets of the British race in

27. The United States already extend over a territory equal to one-half of Europe. The area of Europe is 500,000 square leagues, and its population 205,000,000 of inhabitants.

America cease to present the same homogeneous characteristics: and the time cannot be foreseen at which a permanent inequality of conditions will be established in the New World. Whatever differences may arise, from peace or from war, from freedom or oppression, from prosperity or want, between the destinies of the different descendants of the great Anglo-American family, they will at least preserve an analogous social condition, and they will hold in common the customs and the opinions to which that social condition has given birth.

In the Middle Ages, the tie of religion was sufficiently powerful to imbue all the different populations of Europe with the same civilization. The British of the New World have a thousand other reciprocal ties; and they live at a time when the tendency to equality is general among mankind. The Middle Ages were a period when everything was broken up; when each people, each province, each city, and each family, had a strong tendency to maintain its distinct individuality. At the present time an opposite tendency seems to prevail, and the nations seem to be advancing to unity. Our means of intellectual intercourse unite the most remote parts of the earth; and it is impossible for men to remain strangers to each other, or to be ignorant of the events which are taking place in any corner of the globe. The consequence is that there is less difference, at the present day, between the Europeans and their descendants in the New World than there was between certain towns in the thirteenth century which were only separated by a river. If this tendency to assimilation brings foreign nations closer to each other, it must a fortiori prevent the descendants of the same people from becoming aliens to each other.

The time will therefore come when one hundred and fifty millions of men will be living in North America,²⁸ equal in condition, the progeny of one race, owing their origin to the same cause, and preserving the same civilization, the same language, the same religion, the same habits, the same manners, and imbued with the same opinions, propagated under the same forms. The rest is uncertain, but this is certain; and it is a fact new to the world—a fact fraught with such portentous consequences as to baffle the efforts even of the imagination.

There are, at the present time, two great nations in the world which seem to tend towards the same end, although they started from different points: I allude to the Russians and the Americans. Both of them have grown up unnoticed; and while the attention of mankind was directed

28. This would be a population proportionate to that of Europe, taken at a mean rate of 410 inhabitants to the square league.

elsewhere, they have suddenly assumed a most prominent place among the nations; and the world learned their existence and their greatness at almost the same time.

All other nations seem to have nearly reached their natural limits, and only to be charged with the maintenance of their power; but these are still in the act of growth: ²⁹ all the others are stopped, or continue to advance with extreme difficulty; these are proceeding with ease and with celerity along a path to which the human eye can assign no term. The American struggles against the natural obstacles which oppose him; the adversaries of the Russian are men: the former combats the wilderness and savage life; the latter, civilization with all its weapons and its arts: the conquests of the one are therefore gained by the plowshare; those of the other, by the sword. The Anglo-American relies upon personal interest to accomplish his ends, and gives free scope to the unguided exertions and common sense of the citizens; the Russian centers all the authority of society in a single arm: the principal instrument of the former is freedom; of the latter, servitude. Their starting point is different, and their courses are not the same; yet each of them seems to be marked out by the will of Heaven to sway the destinies of half the globe.

29. Russia is the country in the Old World in which population increases most rapidly in proportion.

*The foregoing consists of the Introduction,
Chapters III, IV, XI–XIV, and the Conclusion
of Volume I of de Tocqueville's DEMOCRACY IN AMERICA,
translated by Henry Reeve.*

*Why Democratic Nations
Show a More Ardent and Enduring Love
of Equality than of Liberty*

The first and most intense passion which is engendered by the equality of conditions is, I need hardly say, the love of that same equality. My readers will therefore not be surprised that I speak of it before all others.

Everybody has remarked that in our time, and especially in France, this passion for equality is every day gaining ground in the human heart. It has been said a hundred times that our contemporaries are far more ardently and tenaciously attached to equality than to freedom; but, as I do not find that the causes of the fact have been sufficiently analyzed, I shall endeavor to point them out.

It is possible to imagine an extreme point at which freedom and equality would meet and be confounded together. Let us suppose that all the members of the community take a part in the government, and that each one of them has an equal right to take a part in it. As none is different from his fellows, none can exercise a tyrannical power: men will be perfectly free, because they will all be entirely equal; and they will all be perfectly equal, because they will be entirely free. To this ideal state democratic nations tend. Such is the completest form that equality can assume upon earth; but there are a thousand others which, without being equally perfect, are not less cherished by those nations.

The principle of equality may be established in civil society, without prevailing in the political world. Equal rights may exist of indulging in the same pleasures, of entering the same professions, of frequenting the same places—in a word, of living in the same manner and seeking wealth by the same means, although all men do not take an equal share in the government.

A kind of equality may even be established in the political world, though there should be no political freedom there. A man may be the equal of all his countrymen save one, who is the master of all without distinction, and who selects equally from among them all the agents of his power.

Several other combinations might be easily imagined by which very

great equality would be united to institutions more or less free, or even to institutions wholly without freedom.

Although men cannot become absolutely equal unless they be entirely free, and consequently equality, pushed to its furthest extent, may be confounded with freedom, yet there is good reason for distinguishing the one from the other. The taste which men have for liberty and that which they feel for equality are, in fact, two different things; and I am not afraid to add that, among democratic nations, they are two unequal things.

Upon close inspection, it will be seen that there is in every age some peculiar and preponderating fact with which all others are connected; this fact almost always gives birth to some pregnant idea or some ruling passion, which attracts to itself, and bears away in its course, all the feelings and opinions of the time: it is like a great stream, towards which each of the surrounding rivulets seem to flow.

Freedom has appeared in the world at different times and under various forms; it has not been exclusively bound to any social condition, and it is not confined to democracies. Freedom cannot, therefore, form the distinguishing characteristic of democratic ages. The peculiar and preponderating fact which marks those ages as its own is the equality of conditions; the ruling passion of men in those periods is the love of this equality. Ask not what singular charm the men of democratic ages find in being equal, or what special reasons they may have for clinging so tenaciously to equality rather than to the other advantages which society holds out to them: equality is the distinguishing characteristic of the age they live in; that, of itself, is enough to explain that they prefer it to all the rest.

But independently of this reason there are several others which will at all times habitually lead men to prefer equality to freedom.

If a people could ever succeed in destroying, or even in diminishing, the equality which prevails in its own body, this could only be accomplished by long and laborious efforts. Its social condition must be modified, its laws abolished, its opinions superseded, its habits changed, its manners corrupted. But political liberty is more easily lost; to neglect to hold it fast is to allow it to escape.

Men therefore not only cling to equality because it is dear to them; they also adhere to it because they think it will last forever.

That political freedom may compromise in its excesses the tranquillity, the property, the lives of individuals, is obvious to the narrowest and most unthinking minds. But, on the contrary, none but attentive and clear-sighted men perceive the perils with which equality threatens us,

and they commonly avoid pointing them out. They know that the calamities they apprehend are remote, and flatter themselves that they will only fall upon future generations, for which the present generation takes but little thought. The evils which freedom sometimes brings with it are immediate; they are apparent to all, and all are more or less affected by them. The evils which extreme equality may produce are slowly disclosed; they creep gradually into the social frame; they are only seen at intervals, and at the moment at which they become most violent, habit already causes them to be no longer felt.

The advantages which freedom brings are only shown by length of time; and it is always easy to mistake the cause in which they originate. The advantages of equality are instantaneous, and they may constantly be traced from their source.

Political liberty bestows exalted pleasures, from time to time, upon a certain number of citizens. Equality every day confers a number of small enjoyments on every man. The charms of equality are every instant felt, and are within the reach of all; the noblest hearts are not insensible to them, and the most vulgar souls exult in them. The passion which equality engenders must therefore be at once strong and general. Men cannot enjoy political liberty unpurchased by some sacrifices, and they never obtain it without great exertions. But the pleasures of equality are self-proffered: each of the petty incidents of life seems to occasion them, and in order to taste them nothing is required but to live.

Democratic nations are at all times fond of equality, but there are certain epochs at which the passion they entertain for it swells to the height of fury. This occurs at the moment when the old social system, long menaced, completes its own destruction after a last intestine struggle, and when the barriers of rank are at length thrown down. At such times men pounce upon equality as their booty, and they cling to it as to some precious treasure which they fear to lose. The passion for equality penetrates on every side into men's hearts, expands there, and fills them entirely. Tell them not that by this blind surrender of themselves to an exclusive passion they risk their dearest interests: they are deaf. Show them not freedom escaping from their grasp, while they are looking another way: they are blind—or rather, they can discern but one sole object to be desired in the universe.

What I have said is applicable to all democratic nations: what I am about to say concerns the French alone. Among most modern nations, and especially among all those of the continent of Europe, the taste and the idea of freedom only began to exist and to extend itself at the time

when social conditions were tending to equality, and as a consequence of that very equality. Absolute kings were the most efficient levelers of ranks among their subjects. Among these nations equality preceded freedom; equality was therefore a fact of some standing when freedom was still a novelty: the one had already created customs, opinions, and laws belonging to it, when the other, alone and for the first time, came into actual existence. Thus the latter was still only an affair of opinion and of taste, while the former had already crept into the habits of the people, possessed itself of their manners, and given a particular turn to the smallest actions in their lives. Can it be wondered that the men of our own time prefer the one to the other?

I think that democratic communities have a natural taste for freedom: left to themselves, they will seek it, cherish it, and view any privation of it with regret. But for equality, their passion is ardent, insatiable, incessant, invincible: they call for equality in freedom; and if they cannot obtain that, they still call for equality in slavery. They will endure poverty, servitude, barbarism—but they will not endure aristocracy.

This is true at all times, and especially true in our own. All men and all powers seeking to cope with this irresistible passion will be overthrown and destroyed by it. In our age, freedom cannot be established without it, and despotism itself cannot reign without its support.

Of Individualism in Democratic Countries

I have shown how it is that in ages of equality every man seeks for his opinions within himself: I am now about to show how it is that, in the same ages, all his feelings are turned towards himself alone. *Individualism* is a novel expression, to which a novel idea has given birth. Our fathers were only acquainted with egotism. Egotism is a passionate and exaggerated love of self which leads a man to connect everything with his own person and to prefer himself to everything in the world. Individualism is a mature and calm feeling which disposes each member of the community to sever himself from the mass of his fellow creatures, and to draw apart with his family and his friends; so that, after he has thus formed a little circle of his own, he willingly leaves society at large to itself. Egotism originates in blind instinct: individualism proceeds from erroneous judgment more than from depraved feelings; it originates as much in the deficiencies of the mind as in the perversity of the heart.

Egotism blights the germ of all virtue: individualism, at first, only saps the virtues of public life; but, in the long run, it attacks and destroys all

others, and is at length absorbed in downright egotism. Egotism is a vice as old as the world, which does not belong to one form of society more than to another; individualism is of democratic origin, and it threatens to spread in the same ratio as the equality of conditions.

Among aristocratic nations, as families remain for centuries in the same condition, often on the same spot, all generations become as it were contemporaneous. A man almost always knows his forefathers, and respects them: he thinks he already sees his remote descendants, and he loves them. He willingly imposes duties on himself towards the former and the latter; and he will frequently sacrifice his personal gratifications to those who went before and to those who will come after him.

Aristocratic institutions have, moreover, the effect of closely binding every man to several of his fellow citizens. As the classes of an aristocratic people are strongly marked and permanent, each of them is regarded by its own members as a sort of lesser country, more tangible and more cherished than the country at large. As in aristocratic communities all the citizens occupy fixed positions, one above the other, the result is that each of them always sees a man above himself whose patronage is necessary to him, and below himself another man whose co-operation he may claim.

Men living in aristocratic ages are therefore almost always closely attached to something placed out of their own sphere, and they are often disposed to forget themselves. It is true that in those ages the notion of human fellowship is faint, and that men seldom think of sacrificing themselves for mankind; but they often sacrifice themselves for other men. In democratic ages, on the contrary, when the duties of each individual to the race are much more clear, devoted service to any one man becomes more rare; the bond of human affection is extended, but it is relaxed.

Among democratic nations new families are constantly springing up, others are constantly falling away, and all that remain change their condition; the woof of time is every instant broken, and the track of generations effaced. Those who went before are soon forgotten; of those who will come after no one has any idea: the interest of man is confined to those in close propinquity to himself.

As each class approximates to other classes, and intermingles with them, its members become indifferent and as strangers to one another. Aristocracy had made a chain of all the members of the community, from the peasant to the king: democracy breaks that chain, and severs every link of it.

As social conditions become more equal, the number of persons in-

creases who, although they are neither rich enough nor powerful enough to exercise any great influence over their fellow creatures, have nevertheless acquired or retained sufficient education and fortune to satisfy their own wants. They owe nothing to any man, they expect nothing from any man; they acquire the habit of always considering themselves as standing alone, and they are apt to imagine that their whole destiny is in their own hands.

Thus not only does democracy make every man forget his ancestors, but it hides his descendants, and separates his contemporaries from him; it throws him back forever upon himself alone, and threatens in the end to confine him entirely within the solitude of his own heart.

*Individualism Stronger at the Close
of a Democratic Revolution than at Other Periods*

The period when the construction of democratic society upon the ruins of an aristocracy has just been completed is especially that at which this separation of men from one another, and the egotism resulting from it, most forcibly strike the observation. Democratic communities not only contain a large number of independent citizens, but they are constantly filled with men who, having entered but yesterday upon their independent condition, are intoxicated with their new power. They entertain a presumptuous confidence in their strength, and as they do not suppose that they can henceforward ever have occasion to claim the assistance of their fellow creatures, they do not scruple to show that they care for nobody but themselves.

An aristocracy seldom yields without a protracted struggle, in the course of which implacable animosities are kindled between the different classes of society. These passions survive the victory, and traces of them may be observed in the midst of the democratic confusion which ensues.

Those members of the community who were at the top of the late gradations of rank cannot immediately forget their former greatness; they will long regard themselves as aliens in the midst of the newly composed society. They look upon all those whom this state of society has made their equals as oppressors, whose destiny can excite no sympathy; they have lost sight of their former equals, and feel no longer bound by a common interest to their fate: each of them, standing aloof, thinks that he is reduced to care for himself alone. Those, on the contrary, who were formerly at the foot of the social scale, and who have been brought up to the common level by a sudden revolution, cannot enjoy their newly

acquired independence without secret uneasiness; and if they meet with some of their former superiors on the same footing as themselves, they stand aloof from them with an expression of triumph and of fear.

It is, then, commonly at the outset of democratic society that citizens are most disposed to live apart. Democracy leads men not to draw near to their fellow creatures; but democratic revolutions lead them to shun each other, and perpetuate in a state of equality the animosities which the state of inequality engendered.

The great advantage of the Americans is that they have arrived at a state of democracy without having to endure a democratic revolution, and that they are born equal instead of becoming so.

*That the Americans Combat the Effects
of Individualism by Free Institutions*

Despotism, which is of a very timorous nature, is never more secure of continuance than when it can keep men asunder; and all its influence is commonly exerted for that purpose. No vice of the human heart is so acceptable to it as egotism: a despot easily forgives his subjects for not loving him, provided they do not love each other. He does not ask them to assist him in governing the state; it is enough that they do not aspire to govern it themselves. He stigmatizes as turbulent and unruly spirits those who would combine their exertions to promote the prosperity of the community; and, perverting the natural meaning of words, he applauds as good citizens those who have no sympathy for any but themselves.

Thus the vices which despotism engenders are precisely those which equality fosters. These two things mutually and perniciously complete and assist each other. Equality places men side by side, unconnected by any common tie; despotism raises barriers to keep them asunder: the former predisposes them not to consider their fellow creatures; the latter makes general indifference a sort of public virtue.

Despotism then, which is at all times dangerous, is more particularly to be feared in democratic ages. It is easy to see that in those same ages men stand most in need of freedom. When the members of a community are forced to attend to public affairs, they are necessarily drawn from the circle of their own interests, and snatched at times from self-observation. As soon as a man begins to treat of public affairs in public, he begins to perceive that he is not so independent of his fellow men as he had at first imagined, and that, in order to obtain their support, he must often lend them his co-operation.

When the public is supreme, there is no man who does not feel the value of public good will, or who does not endeavor to court it by drawing to himself the esteem and affection of those among whom he is to live. Many of the passions which congeal and keep asunder human hearts are then obliged to retire and hide below the surface. Pride must be dissembled; disdain dares not break out; egotism fears its own self. Under a free government, as most public offices are elective, the men whose elevated minds or aspiring hopes are too closely circumscribed in private life constantly feel that they cannot do without the population which surrounds them. Men learn at such times to think of their fellow men from ambitious motives; and they frequently find it, in a manner, their interest to forget themselves.

I may here be met by an objection derived from electioneering intrigues, the meannesses of candidates, and the calumnies of their opponents. These are opportunities for animosity which occur the oftener the more frequent elections become. Such evils are doubtless great, but they are transient; whereas the benefits which attend them remain. The desire of being elected may lead some men for a time to violent hostility; but this same desire leads all men in the long run mutually to support each other; and, if it happens that an election accidentally severs two friends, the electoral system brings a multitude of citizens permanently together, who would always have remained unknown to each other. Freedom engenders private animosities, but despotism gives birth to general indifference.

The Americans have combated by free institutions the tendency of equality to keep men asunder, and they have subdued it. The legislators of America did not suppose that a general representation of the whole nation would suffice to ward off a disorder at once so natural to the frame of democratic society, and so fatal; they also thought that it would be well to infuse political life into each portion of the territory, in order to multiply to an infinite extent opportunities of acting in concert for all the members of the community, and to make them constantly feel their mutual dependence on each other. The plan was a wise one. The general affairs of a country only engage the attention of leading politicians, who assemble from time to time in the same places; and as they often lose sight of each other afterwards, no lasting ties are established between them. But if the object be to have the local affairs of a district conducted by the men who reside there, the same persons are always in contact, and they are, in a manner, forced to be acquainted, and to adapt themselves to one another.

It is difficult to draw a man out of his own circle to interest him in the

destiny of the state, because he does not clearly understand what influence the destiny of the state can have upon his own lot. But if it be proposed to make a road cross the end of his estate, he will see at a glance that there is a connection between this small public affair and his greatest private affairs; and he will discover, without its being shown to him, the close tie which unites private to general interest. Thus, far more may be done by entrusting to the citizens the administration of minor affairs than by surrendering to them the control of important ones, towards interesting them in the public welfare and convincing them that they constantly stand in need one of the other in order to provide for it. A brilliant achievement may win for you the favor of a people at one stroke; but to earn the love and respect of the population which surrounds you, a long succession of little services rendered and of obscure good deeds—a constant habit of kindness, and an established reputation for disinterestedness—will be required. Local freedom, then, which leads a great number of citizens to value the affection of their neighbors and of their kindred, perpetually brings men together and forces them to help one another, in spite of the propensities which sever them.

In the United States the more opulent citizens take great care not to stand aloof from the people; on the contrary, they constantly keep on easy terms with the lower classes: they listen to them, they speak to them every day. They know that the rich in democracies always stand in need of the poor; and that in democratic ages you attach a poor man to you more by your manner than by benefits conferred. The magnitude of such benefits, which sets off the difference of conditions, causes a secret irritation to those who reap advantage from them; but the charm of simplicity of manners is almost irresistible: their affability carries men away, and even their want of polish is not always displeasing. This truth does not take root at once in the minds of the rich. They generally resist it as long as the democratic revolution lasts, and they do not acknowledge it immediately after that revolution is accomplished. They are very ready to do good to the people, but they still choose to keep them at arm's length; they think that is sufficient, but they are mistaken. They might spend fortunes thus without warming the hearts of the population around them; that population does not ask them for the sacrifice of their money, but of their pride.

It would seem as if every imagination in the United States were upon the stretch to invent means of increasing the wealth and satisfying the wants of the public. The best-informed inhabitants of each district constantly use their information to discover new truths which may augment

the general prosperity; and, if they have made any such discoveries, they eagerly surrender them to the mass of the people.

When the vices and weaknesses frequently exhibited by those who govern in America are closely examined, the prosperity of the people occasions—but improperly occasions—surprise. Elected magistrates do not make the American democracy flourish; it flourishes because the magistrates are elective.

It would be unjust to suppose that the patriotism and the zeal which every American displays for the welfare of his fellow citizens are wholly insincere. Although private interest directs the greater part of human actions in the United States, as well as elsewhere, it does not regulate them all. I must say that I have often seen Americans make great and real sacrifices to the public welfare; and I have remarked a hundred instances in which they hardly ever failed to lend faithful support to each other. The free institutions which the inhabitants of the United States possess, and the political rights of which they make so much use, remind every citizen, and in a thousand ways, that he lives in society. They every instant impress upon his mind the notion that it is the duty as well as the interest of men to make themselves useful to their fellow creatures; and as he sees no particular ground of animosity to them, since he is never either their master or their slave, his heart readily leans to the side of kindness. Men attend to the interests of the public, first by necessity, afterwards by choice: what was intentional becomes an instinct; and by dint of working for the good of one's fellow citizens, the habit and the taste for serving them is at length acquired.

Many people in France consider equality of conditions as one evil, and political freedom as a second. When they are obliged to yield to the former, they strive at least to escape from the latter. But I contend that in order to combat the evils which equality may produce there is only one effectual remedy—namely, political freedom.

*Of the Use Which the Americans Make of Public
Associations in Civil Life*

I do not propose to speak of those political associations by the aid of which men endeavor to defend themselves against the despotic influence of a majority, or against the aggressions of regal power. That subject I have already treated.¹ If each citizen did not learn, in proportion as he

1. See p. 596, *supra*.

individually becomes more feeble and consequently more incapable of preserving his freedom singlehanded, to combine with his fellow citizens for the purpose of defending it, it is clear that tyranny would unavoidably increase together with equality.

Those associations only which are formed in civil life, without reference to political objects, are here adverted to. The political associations which exist in the United States are only a single feature in the midst of the immense assemblage of associations in that country. Americans of all ages, all conditions, and all dispositions, constantly form associations. They have not only commercial and manufacturing companies, in which all take part, but associations of a thousand other kinds—religious, moral, serious, futile, extensive or restricted, enormous or diminutive. The Americans make associations to give entertainments, to found establishments for education, to build inns, to construct churches, to diffuse books, to send missionaries to the antipodes; and in this manner they found hospitals, prisons, and schools. If it be proposed to advance some truth, or to foster some feeling by the encouragement of a great example, they form a society. Wherever, at the head of some new undertaking, you see the government in France, or a man of rank in England, in the United States you will be sure to find an association.

I met with several kinds of associations in America, of which I confess I had no previous notion; and I have often admired the extreme skill with which the inhabitants of the United States succeed in proposing a common object to the exertions of a great many men, and in getting them voluntarily to pursue it.

I have since traveled over England, whence the Americans have taken some of their laws and many of their customs; and it seemed to me that the principle of association was by no means so constantly or so adroitly used in that country. The English often perform great things singly; whereas the Americans form associations for the smallest undertakings. It is evident that the former people consider association as a powerful means of action, but the latter seem to regard it as the only means they have of acting.

Thus the most democratic country on the face of the earth is that in which men have in our time carried to the highest perfection the art of pursuing in common the object of their common desires, and have applied this new science to the greatest number of purposes. Is this the result of accident? or is there in reality any necessary connection between the principle of association and that of equality?

Aristocratic communities always contain, among a multitude of per-

sons who by themselves are powerless, a small number of powerful and wealthy citizens, each of whom can achieve great undertakings singlehanded. In aristocratic societies men do not need to combine in order to act, because they are strongly held together. Every wealthy and powerful citizen constitutes the head of a permanent and compulsory association, composed of all those who are dependent upon him, or whom he makes subservient to the execution of his designs.

Among democratic nations, on the contrary, all the citizens are independent and feeble; they can do hardly anything by themselves, and none of them can oblige his fellow men to lend him their assistance. They all, therefore, fall into a state of incapacity, if they do not learn voluntarily to help each other. If men living in democratic countries had no right and no inclination to associate for political purposes, their independence would be in great jeopardy; but they might long preserve their wealth and their cultivation: whereas if they never acquired the habit of forming associations in ordinary life, civilization itself would be endangered. A people among which individuals should lose the power of achieving great things singlehanded, without acquiring the means of producing them by united exertions, would soon relapse into barbarism.

Unhappily, the same social condition which renders associations so necessary to democratic nations renders their formation more difficult among those nations than among all others. When several members of an aristocracy agree to combine, they easily succeed in doing so: as each of them brings great strength to the partnership, the number of its members may be very limited; and when the members of an association are limited in number, they may easily become mutually acquainted, understand each other, and establish fixed regulations. The same opportunities do not occur among democratic nations, where the associated members must always be very numerous for their association to have any power.

I am aware that many of my countrymen are not in the least embarrassed by this difficulty. They contend that the more enfeebled and incompetent the citizens become, the more able and active the government ought to be rendered, in order that society at large may execute what individuals can no longer accomplish. They believe this answers the whole difficulty, but I think they are mistaken.

A government might perform the part of some of the largest American companies; and several states, members of the Union, have already attempted it; but what political power could ever carry on the vast multitude of lesser undertakings which the American citizens perform every day with the assistance of the principle of association? It is easy to fore-

see that the time is drawing near when man will be less and less able to produce, of himself alone, the commonest necessities of life. The task of the governing power will therefore perpetually increase, and its very efforts will extend it every day. The more it stands in the place of associations, the more will individuals, losing the notion of combining together, require its assistance: these are causes and effects which unceasingly engender each other. Will the administration of the country ultimately assume the management of all the manufactures which no single citizen is able to carry on? And if a time at length arrives, when, in consequence of the extreme subdivision of landed property, the soil is split into an infinite number of parcels, so that it can only be cultivated by companies of husbandmen, will it be necessary that the head of the government should leave the helm of state to follow the plow? The morals and the intelligence of a democratic people would be as much endangered as its business and manufactures if the government ever wholly usurped the place of private companies.

Feelings and opinions are recruited, the heart is enlarged, and the human mind is developed by no other means than by the reciprocal influence of men upon each other. I have shown that these influences are almost null in democratic countries; they must therefore be artificially created, and this can only be accomplished by associations.

When the members of an aristocratic community adopt a new opinion, or conceive a new sentiment, they give it a station, as it were, beside themselves, upon the lofty platform where they stand; and opinions or sentiments so conspicuous to the eyes of the multitude are easily introduced into the minds or hearts of all around. In democratic countries the governing power alone is naturally in a condition to act in this manner; but it is easy to see that its action is always inadequate, and often dangerous. A government can no more be competent to keep alive and to renew the circulation of opinions and feelings among a great people, than to manage all the speculations of productive industry. No sooner does a government attempt to go beyond its political sphere and to enter upon this new track than it exercises, even unintentionally, an insupportable tyranny; for a government can only dictate strict rules, the opinions which it favors are rigidly enforced, and it is never easy to discriminate between its advice and its commands. Worse still will be the case if the government really believes itself interested in preventing all circulation of ideas; it will then stand motionless and oppressed by the heaviness of voluntary torpor. Governments therefore should not be the only active powers: associations ought, in democratic nations, to stand in lieu of

those powerful private individuals whom the equality of conditions has swept away.

As soon as several of the inhabitants of the United States have taken up an opinion or a feeling which they wish to promote in the world, they look out for mutual assistance; and as soon as they have found each other out, they combine. From that moment they are no longer isolated men, but a power seen from afar, whose actions serve for an example, and whose language is listened to. The first time I heard in the United States that a hundred thousand men had bound themselves publicly to abstain from spirituous liquors, it appeared to me more like a joke than a serious engagement; and I did not at once perceive why these temperate citizens could not content themselves with drinking water by their own firesides. I at last understood that these hundred thousand Americans, alarmed by the progress of drunkenness around them, had made up their minds to patronize temperance. They acted just in the same way as a man of high rank who should dress very plainly, in order to inspire the humbler orders with a contempt of luxury. It is probable that if these hundred thousand men had lived in France, each of them would singly have memorialized the government to watch the public houses all over the kingdom.

Nothing, in my opinion, is more deserving of our attention than the intellectual and moral associations of America. The political and industrial associations of that country strike us forcibly; but the others elude our observation, or if we discover them, we understand them imperfectly, because we have hardly ever seen anything of the kind. It must, however, be acknowledged that they are as necessary to the American people as the former, and perhaps more so.

In democratic countries the science of association is the mother of science; the progress of all the rest depends upon the progress it has made.

Among the laws which rule human societies there is one which seems to be more precise and clear than all others. If men are to remain civilized, or to become so, the art of associating together must grow and improve, in the same ratio in which the equality of conditions is increased. . . .

Influence of Democracy on Kindred

I have just examined the changes which the equality of conditions produces in the mutual relations of the several members of the commu-

nity among democratic nations, and among the Americans in particular. I would now go deeper, and inquire into the closer ties of kindred. My object here is not to seek for new truths, but to show in what manner facts already known are connected with my subject.

It has been universally remarked that in our time the several members of a family stand upon an entirely new footing towards each other; that the distance which formerly separated a father from his sons has been lessened; and that paternal authority, if not destroyed, is at least impaired.

Something analogous to this, but even more striking, may be observed in the United States. In America the family, in the Roman and aristocratic signification of the word, does not exist. All that remains of it are a few vestiges in the first years of childhood, when the father exercises, without opposition, that absolute domestic authority which the feebleness of his children renders necessary, and which their interest, as well as his own incontestable superiority, warrants. But as soon as the young American approaches manhood, the ties of filial obedience are relaxed day by day: master of his thoughts, he is soon master of his conduct. In America there is, strictly speaking, no adolescence: at the close of boyhood the man appears, and begins to trace out his own path.

It would be an error to suppose that this is preceded by a domestic struggle, in which the son has obtained by a sort of moral violence the liberty that his father refused him. The same habits, the same principles which impel the one to assert his independence, predispose the other to consider the use of that independence as an incontestable right. The former does not exhibit any of those rancorous or irregular passions which disturb men long after they have shaken off an established authority; the latter feels none of that bitter and angry regret which is apt to survive a bygone power. The father foresees the limits of his authority long beforehand, and when the time arrives he surrenders it without a struggle. The son looks forward to the exact period at which he will be his own master; and he enters upon his freedom without precipitation and without effort, as a possession which is his own and which no one seeks to wrest from him.²

2. The Americans however have not yet thought fit to strip the parent, as has been done in France, of one of the chief elements of parental authority, by depriving him of the power of disposing of his property at his death. In the United States there are no restrictions on the powers of a testator.

In this respect, as in almost all others, it is easy to perceive that if the political legislation of the Americans is much more democratic than that of the French, the civil legislation of the latter is infinitely more democratic than that of the former. This may easily be accounted for. The civil legislation of France was the

It may perhaps not be without utility to show how these changes which take place in family relations are closely connected with the social and political revolution which is approaching its consummation under our own observation.

There are certain great social principles, which a people either introduces everywhere, or tolerates nowhere. In countries which are aristocratically constituted with all the gradations of rank, the government never makes a direct appeal to the mass of the governed: as men are united together, it is enough to lead the foremost—the rest will follow. This is equally applicable to the family, as to all aristocracies which have a head.

Among aristocratic nations, social institutions recognize, in truth, no one in the family but the father; children are received by society at his hands; society governs him, he governs them. Thus the parent has not only a natural right, but he acquires a political right, to command them. He is the author and the support of his family, but he is also its constituted ruler.

In democracies, where the government picks out every individual singly from the mass, to make him subservient to the general laws of the community, no such intermediate person is required: a father is there, in the eye of the law, only a member of the community, older and richer than his sons.

When most of the conditions of life are extremely unequal, and the inequality of these conditions is permanent, the notion of a superior grows upon the imaginations of men: if the law invested him with no privileges, custom and public opinion would concede them. When, on the contrary, men differ but little from each other, and do not always remain in dissimilar conditions of life, the general notion of a superior becomes weaker and less distinct: it is vain for legislation to strive to place him who obeys very much beneath him who commands; the manners of the time bring the two men nearer to one another, and draw them daily towards the same level.

work of a man who saw that it was his interest to satisfy the democratic passions of his contemporaries in all that was not directly and immediately hostile to his own power. He was willing to allow some popular principles to regulate the distribution of property and the government of families, provided they were not to be introduced into the administration of public affairs. While the torrent of democracy overwhelmed the civil laws of the country, he hoped to find an easy shelter behind its political institutions. This policy was at once both adroit and selfish: but a compromise of this kind could not last; for in the end political institutions never fail to become the image and expression of civil society; and in this sense it may be said that nothing is more political in a nation than its civil legislation.

Although the legislation of an aristocratic people should grant no peculiar privileges to the heads of families, I shall not be the less convinced that their power is more respected and more extensive than in a democracy; for I know that, whatsoever the laws may be, superiors always appear higher and inferiors lower in aristocracies than among democratic nations.

When men live more for the remembrance of what has been than for the care of what is, and when they are more given to attend to what their ancestors thought than to think themselves, the father is the natural and necessary tie between the past and the present—the link by which the ends of these two chains are connected. In aristocracies, then, the father is not only the civil head of the family, but the oracle of its traditions, the expounder of its customs, the arbiter of its manners. He is listened to with deference, he is addressed with respect, and the love which is felt for him is always tempered with fear.

When the condition of society becomes democratic and men adopt as their general principle that it is good and lawful to judge of all things for oneself, using former points of belief not as a rule of faith but simply as a means of information, the power which the opinions of a father exercise over those of his sons diminishes as well as his legal power.

Perhaps the subdivision of estates which democracy brings with it contributes more than anything else to change the relations existing between a father and his children. When the property of the father of a family is scanty, his son and himself constantly live in the same place, and share the same occupations: habit and necessity bring them together, and force them to hold constant communication; the inevitable consequence is a sort of familiar intimacy, which renders authority less absolute and which can ill be reconciled with the external forms of respect.

Now in democratic countries the class of those who are possessed of small fortunes is precisely that which gives strength to the notions, and a particular direction to the manners, of the community. That class makes its opinions preponderate as universally as its will, and even those who are most inclined to resist its commands are carried away in the end by its example. I have known eager opponents of democracy who allowed their children to address them with perfect colloquial equality.

Thus, at the same time that the power of aristocracy is declining, the austere, the conventional, and the legal part of parental authority vanishes, and a species of equality prevails around the domestic hearth. I know not, upon the whole, whether society loses by the change, but I am inclined to believe that man individually is a gainer by it. I think that, in

proportion as manners and laws become more democratic, the relation of father and son becomes more intimate and more affectionate; rules and authority are less talked of; confidence and tenderness are oftentimes increased, and it would seem that the natural bond is drawn closer in proportion as the social bond is loosened.

In a democratic family the father exercises no other power than that with which men love to invest the affection and the experience of age; his orders would perhaps be disobeyed, but his advice is for the most part authoritative. Though he be not hedged in with ceremonial respect, his sons at least accost him with confidence; no settled form of speech is appropriated to the mode of addressing him, but they speak to him constantly, and are ready to consult him day by day: the master and the constituted ruler have vanished—the father remains.

Nothing more is needed, in order to judge of the difference between the two states of society in this respect, than to peruse the family correspondence of aristocratic ages. The style is always correct, ceremonious, stiff, and so cold that the natural warmth of the heart can hardly be felt in the language. The language, on the contrary, addressed by a son to his father in democratic countries is always marked by mingled freedom, familiarity and affection, which at once show that new relations have sprung up in the bosom of the family.

A similar revolution takes place in the mutual relations of children. In aristocratic families, as well as in aristocratic society, every place is marked out beforehand. Not only does the father occupy a separate rank, in which he enjoys extensive privileges, but even the children are not equal among themselves. The age and sex of each irrevocably determine his rank, and secure to him certain privileges: most of these distinctions are abolished or diminished by democracy.

In aristocratic families the eldest son, inheriting the greater part of the property and almost all the rights of the family, becomes the chief, and to a certain extent, the master, of his brothers. Greatness and power are for him—for them, mediocrity and dependence. Nevertheless it would be wrong to suppose that, among aristocratic nations, the privileges of the eldest son are advantageous to himself alone, or that they excite nothing but envy and hatred in those around him. The eldest son commonly endeavors to procure wealth and power for his brothers, because the general splendor of the house is reflected back on him who represents it; the younger sons seek to back the elder brother in all his undertakings, because the greatness and power of the head of the family better enable him to provide for all its branches. The different members of an aristo-

cratic family are therefore very closely bound together; their interests are connected, their minds agree, but their hearts are seldom in harmony.

Democracy also binds brothers to each other, but by very different means. Under democratic laws all the children are perfectly equal, and consequently independent: nothing brings them forcibly together, but nothing keeps them apart; and as they have the same origin, as they are trained under the same roof, as they are treated with the same care, and as no peculiar privilege distinguishes or divides them, the affectionate and youthful intimacy of early years easily springs up between them. Scarcely any opportunities occur to break the tie thus formed at the outset of life; for their brotherhood brings them daily together without embarrassing them. It is not then by interest, but by common associations and by the free sympathy of opinion and of taste, that democracy unites brothers to each other. It divides their inheritance, but it allows their hearts and minds to mingle together.

Such is the charm of these democratic manners, that even the partisans of aristocracy are caught by it; and after having experienced it for some time, they are by no means tempted to revert to the respectful and frigid observances of aristocratic families. They would be glad to retain the domestic habits of democracy, if they might throw off its social conditions and its laws; but these elements are indissolubly united, and it is impossible to enjoy the former without enduring the latter.

The remarks I have made on filial love and fraternal affection are applicable to all the passions which emanate spontaneously from human nature itself.

If a certain mode of thought or feeling is the result of some peculiar condition of life, when that condition is altered nothing whatever remains of the thought or feeling. Thus a law may bind two members of the community very closely to one another; but that law being abolished, they stand asunder. Nothing was more strict than the tie which united the vassal to the lord under the feudal system: at the present day the two men know not each other: the fear, the gratitude, and the affection which formerly connected them have vanished, and not a vestige of the tie remains.

Such, however, is not the case with those feelings which are natural to mankind. Whenever a law attempts to tutor these feelings in any particular manner, it seldom fails to weaken them; by attempting to add to their intensity, it robs them of some of their elements, for they are never stronger than when left to themselves.

Democracy, which destroys or obscures almost all the old conventional rules of society, and which prevents men from readily assenting to new ones, entirely effaces most of the feelings to which these conventional rules have given rise; but it only modifies some others, and frequently imparts to them a degree of energy and sweetness unknown before.

Perhaps it is not impossible to condense into a single proposition the whole meaning of this chapter, and of several others that preceded it. Democracy loosens social ties, but it draws the ties of nature more tight; it brings kindred more closely together, while it places the various members of the community more widely apart.

*Education of Young Women
in the United States*

No free communities ever existed without morals; and, as I observed in the former part of this work, morals are the work of woman. Consequently, whatever affects the condition of women, their habits, and their opinions has great political importance in my eyes.

Among almost all Protestant nations young women are far more the mistresses of their own actions than they are in Catholic countries. This independence is still greater in Protestant countries like England, which have retained or acquired the right of self-government; the spirit of freedom is then infused into the domestic circle by political habits and by religious opinions. In the United States the doctrines of Protestantism are combined with great political freedom and a most democratic state of society; and nowhere are young women surrendered so early or so completely to their own guidance.

Long before an American girl arrives at the age of marriage, her emancipation from maternal control begins. She has scarcely ceased to be a child, when she already thinks for herself, speaks with freedom, and acts on her own impulse. The great scene of the world is constantly open to her view. Far from seeking concealment, it is every day disclosed to her more completely, and she is taught to survey it with a firm and calm gaze. Thus the vices and dangers of society are early revealed to her; as she sees them clearly, she views them without illusions, and braves them without fear; for she is full of reliance on her own strength, and her reliance seems to be shared by all who are about her.

An American girl scarcely ever displays that virginal bloom in the

midst of young desires, or that innocent and ingenuous grace which usually attend the European woman in the transition from girlhood to youth. It is rarely that an American woman at any age displays childish timidity or ignorance. Like the young women of Europe, she seeks to please, but she knows precisely the cost of pleasing. If she does not abandon herself to evil, at least she knows that it exists; and she is remarkable rather for purity of manners than for chastity of mind.

I have been frequently surprised, and almost frightened, at the singular address and happy boldness with which young women in America contrive to manage their thoughts and their language, amidst all the difficulties of stimulating conversation; a philosopher would have stumbled at every step along the narrow path which they trod without accidents and without effort. It is easy indeed to perceive that, even amidst the independence of early youth, an American woman is always mistress of herself: she indulges in all permitted pleasures, without yielding herself up to any of them; and her reason never allows the reins of self-guidance to drop, though it often seems to hold them loosely.

In France, where remnants of every age are still so strangely mingled in the opinions and tastes of the people, women commonly receive a reserved, retired, and almost conventual education, as they did in aristocratic times; and then they are suddenly abandoned, without a guide and without assistance, in the midst of all the irregularities inseparable from democratic society.

The Americans are more consistent. They have found out that in a democracy the independence of individuals cannot fail to be very great, youth premature, tastes ill restrained, customs fleeting, public opinion often unsettled and powerless, paternal authority weak, and marital authority contested. Under these circumstances, believing that they had little chance of repressing in woman the most vehement passions of the human heart, they held that the surer way was to teach her the art of combating those passions for herself. As they could not prevent her virtue from being exposed to frequent danger, they determined that she should know how best to defend it; and more reliance was placed on the free vigor of her will than on safeguards which have been shaken or overthrown. Instead then of inculcating mistrust of herself, they constantly seek to enhance her confidence in her own strength of character. As it is neither possible nor desirable to keep a young woman in perpetual and complete ignorance, they hasten to give her a precocious knowledge on all subjects. Far from hiding the corruptions of the world from her, they prefer that she should see them at once and train herself to shun them;

and they hold it of more importance to protect her conduct than to be overscrupulous of her innocence.

Although the Americans are a very religious people, they do not rely on religion alone to defend the virtue of woman; they seek to arm her reason also. In this they have followed the same method as in several other respects: they first make the most vigorous efforts to bring individual independence to exercise a proper control over itself, and they do not call in the aid of religion until they have reached the utmost limits of human strength.

I am aware that an education of this kind is not without danger; I am sensible that it tends to invigorate the judgment at the expense of the imagination, and to make cold and virtuous women instead of affectionate wives and agreeable companions to man. Society may be more tranquil and better regulated, but domestic life has often fewer charms. These however are secondary evils, which may be braved for the sake of higher interests. At the stage at which we are now arrived the time for choosing is no longer within our control; a democratic education is indispensable to protect women from the dangers with which democratic institutions and manners surround them.

*The Young Woman
in the Character of a Wife*

In America the independence of woman is irrecoverably lost in the bonds of matrimony: if an unmarried woman is less constrained there than elsewhere, a wife is subjected to stricter obligations. The former makes her father's house an abode of freedom and of pleasure; the latter lives in the home of her husband as if it were a cloister. Yet these two different conditions of life are perhaps not so contrary as may be supposed, and it is natural that the American women should pass through the one to arrive at the other.

Religious peoples and trading nations entertain peculiarly serious notions of marriage: the former consider the regularity of woman's life as the best pledge and most certain sign of the purity of her morals; the latter regard it as the highest security for the order and prosperity of the household. The Americans are at the same time a puritanical people and a commercial nation. Their religious opinions, as well as their trading habits, consequently lead them to require much abnegation on the part of women, and a constant sacrifice of her pleasures to her duties which is seldom demanded of her in Europe. Thus in the United States the inex-

orable opinion of the public carefully circumscribes woman within the narrow circle of domestic interests and duties, and forbids her to step beyond it.

Upon her entrance into the world a young American woman finds these notions firmly established; she sees the rules which are derived from them; she is not slow to perceive that she cannot depart for an instant from the established usages of her contemporaries, without putting in jeopardy her peace of mind, her honor, nay even her social existence; and she finds the energy required for such an act of submission in the firmness of her understanding and in the virile habits which her education has given her. It may be said that she has learned by the use of her independence to surrender it without a struggle and without a murmur when the time comes for making the sacrifice.

But no American woman falls into the toils of matrimony as into a snare held out to her simplicity and ignorance. She has been taught beforehand what is expected of her, and voluntarily and freely does she enter upon this engagement. She supports her new condition with courage, because she chose it. As in America paternal discipline is very relaxed and the conjugal tie very strict, a young woman does not contract the latter without considerable circumspection and apprehension. Precocious marriages are rare. Thus American women do not marry until their understandings are exercised and ripened; whereas in other countries most women generally only begin to exercise and to ripen their understandings after marriage.

I by no means suppose, however, that the great change which takes place in all the habits of women in the United States as soon as they are married ought solely to be attributed to the constraint of public opinion; it is frequently imposed upon themselves by the sole effort of their own will. When the time for choosing a husband is arrived, that cold and stern reasoning power which has been educated and invigorated by the free observation of the world teaches an American woman that a spirit of levity and independence in the bonds of marriage is a constant subject of annoyance, not of pleasure; it tells her that the amusements of the girl cannot become the recreations of the wife, and that the sources of a married woman's happiness are in the home of her husband. As she clearly discerns beforehand the only road which can lead to domestic happiness, she enters upon it at once, and follows it to the end without seeking to turn back.

The same strength of purpose which the young wives of America dis-

play, in bending themselves at once and without repining to the austere duties of their new condition, is no less manifest in all the great trials of their lives. In no country in the world are private fortunes more precarious than in the United States. It is not uncommon for the same man, in the course of his life, to rise and sink again through all the grades which lead from opulence to poverty. American women support these vicissitudes with calm and unquenchable energy: it would seem that their desires contract, as easily as they expand, with their fortunes.

The greater part of the adventurers who migrate every year to people the western wilds, belong, as I observed in the former part of this work, to the old Anglo-American race of the northern states. Many of these men, who rush so boldly onwards in pursuit of wealth, were already in the enjoyment of a competency in their own part of the country. They take their wives along with them, and make them share the countless perils and privations which always attend the commencement of these expeditions. I have often met, even on the verge of the wilderness, with young women who, after having been brought up amidst all the comforts of the large towns of New England had passed, almost without any intermediate stage, from the wealthy abode of their parents to a comfortless hovel in a forest. Fever, solitude, and a tedious life had not broken the springs of their courage. Their features were impaired and faded, but their looks were firm: they appeared to be at once sad and resolute. I do not doubt that these young American women had amassed, in the education of their early years, that inward strength which they displayed under these circumstances. The early culture of the girl may still therefore be traced, in the United States, under the aspect of marriage: her part is changed, her habits are different, but her character is the same.

*That the Equality of Conditions
Contributes to the Maintenance
of Good Morals in America*

Some philosophers and historians have said, or have hinted, that the strictness of female morality was increased or diminished simply by the distance of a country from the equator. This solution of the difficulty was an easy one; and nothing was required but a globe and a pair of compasses to settle in an instant one of the most difficult problems in the condition of mankind. But I am not aware that this principle of the materialists is supported by facts. The same nations have been chaste or

dissolute, at different periods of their history; the strictness or the laxity of their morals depended therefore on some variable cause, not only on the natural qualities of their country, which were invariable. I do not deny that in certain climates the passions which are occasioned by the mutual attraction of the sexes are peculiarly intense; but I am of opinion that this natural intensity may always be excited or restrained by the condition of society and by political institutions.

Although the travelers who have visited North America differ on a great number of points, they all agree in remarking that morals are far more strict there than elsewhere. It is evident that on this point the Americans are very superior to their progenitors, the English. A superficial glance at the two nations will establish the fact.

In England, as in all other countries of Europe, public malice is constantly attacking the frailties of women. Philosophers and statesmen are heard to deplore that morals are not sufficiently strict, and the literary productions of the country constantly lead one to suppose so. In America all books, novels not excepted, suppose women to be chaste, and no one thinks of relating affairs of gallantry.

No doubt this great regularity of American morals originates partly in the country, in the race of the people, and in their religion: but all these causes, which operate elsewhere, do not suffice to account for it; recourse must be had to some special reason.

This reason appears to me to be the principle of equality and the institutions derived from it. Equality of conditions does not of itself engender regularity of morals, but it unquestionably facilitates and increases it.

Among aristocratic nations birth and fortune frequently make two such different beings of man and woman that they can never be united to each other. Their passions draw them together, but the condition of society, and the notions suggested by it, prevent them from contracting a permanent and ostensible tie. The necessary consequence is a great number of transient and clandestine connections. Nature secretly avenges herself for the constraint imposed upon her by the laws of man.

This is not so much the case when the equality of conditions has swept away all the imaginary, or the real, barriers which separated man from woman. No girl then believes that she cannot become the wife of the man who loves her; and this renders all breaches of morality before marriage very uncommon: for, whatever be the credulity of the passions, a woman will hardly be able to persuade herself that she is beloved, when her lover is perfectly free to marry her and does not.

The same cause operates, though more indirectly, on married life. Nothing better serves to justify an illicit passion, either to the minds of those who have conceived it or to the world which looks on, than compulsory or accidental marriages.³

In a country in which a woman is always free to exercise her power of choosing, and in which education has prepared her to choose rightly, public opinion is inexorable to her faults. The rigor of the Americans arises in part from this cause. They consider marriages as a covenant which is often onerous, but every condition of which the parties are strictly bound to fulfill, because they knew all those conditions beforehand and were perfectly free not to have contracted them.

The very circumstances which render matrimonial fidelity more obligatory also render it more easy.

In aristocratic countries the object of marriage is rather to unite property than persons; hence the husband is sometimes at school and the wife at nurse when they are betrothed. It cannot be wondered at if the conjugal tie which holds the fortunes of the pair united allows their hearts to rove; this is the natural result of the nature of the contract. When, on the contrary, a man always chooses a wife for himself, without any external coercion or even guidance, it is generally a conformity of tastes and opinions which brings a man and a woman together, and this same conformity keeps and fixes them in close habits of intimacy.

Our forefathers had conceived a very strange notion on the subject of marriage: as they had remarked that the small number of love matches which occurred in their time almost always turned out ill, they resolutely inferred that it was exceedingly dangerous to listen to the dictates of the heart on the subject. Accident appeared to them to be a better guide than choice.

Yet it was not very difficult to perceive that the examples which they witnessed did in fact prove nothing at all. For in the first place, if demo-

3. The literature of Europe sufficiently corroborates this remark. When a European author wishes to depict in a work of imagination any of those great catastrophes in matrimony which so frequently occur among us, he takes care to bespeak the compassion of the reader by bringing before him ill-assorted or compulsory marriages. Although habitual tolerance has long since relaxed our morals, an author could hardly succeed in interesting us in the misfortunes of his characters, if he did not first palliate their faults. This artifice seldom fails: the daily scenes we witness prepare us long beforehand to be indulgent. But American writers could never render these palliations probable to their readers; their customs and laws are opposed to it; and as they despair of rendering levity of conduct pleasing, they cease to depict it. This is one of the causes to which must be attributed the small number of novels published in the United States.

cratic nations leave a woman at liberty to choose her husband, they take care to give her mind sufficient knowledge, and her will sufficient strength, to make so important a choice: whereas the young women who, among aristocratic nations, furtively elope from the authority of their parents to throw themselves of their own accord into the arms of men whom they have had neither time to know, nor ability to judge of, are totally without those securities. It is not surprising that they make a bad use of their freedom of action the first time they avail themselves of it; nor that they fall into such cruel mistakes, when, not having received a democratic education, they choose to marry in conformity to democratic customs. But this is not all. When a man and woman are bent upon marriage in spite of the differences of an aristocratic state of society, the difficulties to be overcome are enormous. Having broken or relaxed the bonds of filial obedience, they have then to emancipate themselves by a final effort from the sway of custom and the tyranny of opinion; and when at length they have succeeded in this arduous task, they stand estranged from their natural friends and kinsmen: the prejudice they have crossed separates them from all and places them in a situation which soon breaks their courage and sours their hearts.

If, then, a couple married in this manner are first unhappy and afterwards criminal, it ought not to be attributed to the freedom of their choice, but rather to their living in a community in which this freedom of choice is not admitted.

Moreover it should not be forgotten that the same effort which makes a man violently shake off a prevailing error commonly impels him beyond the bounds of reason; that, to dare to declare war, in however just a cause, against the opinion of one's age and country, a violent and adventurous spirit is required, and that men of this character seldom arrive at happiness or virtue, whatever be the path they follow. And this, it may be observed by the way, is the reason why in the most necessary and righteous revolutions it is so rare to meet with virtuous or moderate revolutionary characters. There is then no just ground for surprise if a man, who in an age of aristocracy chooses to consult nothing but his own opinion and his own taste in the choice of a wife, soon finds that infractions of morality and domestic wretchedness invade his household; but when this same line of action is in the natural and ordinary course of things, when it is sanctioned by parental authority and backed by public opinion, it cannot be doubted that the internal peace of families will be increased by it, and conjugal fidelity more rigidly observed.

Almost all men in democracies are engaged in public or professional

life; and on the other hand the limited extent of common incomes obliges a wife to confine herself to the house, in order to watch in person and very closely over the details of domestic economy. All these distinct and compulsory occupations are so many natural barriers which, by keeping the two sexes asunder, render the solicitations of the one less frequent and less ardent—the resistance of the other more easy.

Not indeed that the equality of conditions can ever succeed in making men chaste, but it may impart a less dangerous character to their breaches of morality. As no one has then either sufficient time or opportunity to assail a virtue armed in self-defense, there will be at the same time a great number of courtesans and a great number of virtuous women. This state of things causes lamentable cases of individual hardship, but it does not prevent the body of society from being strong and alert: it does not destroy family ties, or enervate the morals of the nation. Society is endangered not by the great profligacy of a few, but by laxity of morals among all. In the eyes of a legislator, prostitution is less to be dreaded than intrigue.

The tumultuous and constantly harassed life which equality makes men lead, not only distracts them from the passion of love, by denying them time to indulge in it, but it diverts them from it by another more secret but more certain road. All men who live in democratic ages more or less contract the ways of thinking of the manufacturing and trading classes; their minds take a serious, deliberate, and positive turn; they are apt to relinquish the ideal, in order to pursue some visible and proximate object, which appears to be the natural and necessary aim of their desires. Thus the principle of equality does not destroy the imagination, but lowers its flight to the level of the earth.

No men are less addicted to reverie than the citizens of a democracy; and few of them are ever known to give way to those idle and solitary meditations which commonly precede and produce the great emotions of the heart. It is true they attach great importance to procuring for themselves that sort of deep, regular, and quiet affection which constitutes the charm and safeguard of life, but they are not apt to run after those violent and capricious sources of excitement which disturb and abridge it.

I am aware that all this is only applicable in its full extent to America, and cannot at present be extended to Europe. In the course of the last half century, while laws and customs have impelled several European nations with unexampled force towards democracy, we have not had occasion to observe that the relations of man and woman have become more orderly or more chaste. In some places the very reverse may be detected:

some classes are more strict—the general morality of the people appears to be more lax. I do not hesitate to make the remark, for I am as little disposed to flatter my contemporaries as to malign them.

This fact must distress, but it ought not to surprise us. The propitious influence which a democratic state of society may exercise upon orderly habits is one of those tendencies which can only be discovered after a time. If the equality of conditions is favorable to purity of morals, the social commotion by which conditions are rendered equal is adverse to it. In the last fifty years, during which France has been undergoing this transformation, that country has rarely had freedom, always disturbance. Amidst this universal confusion of notions and this general stir of opinions—amidst this incoherent mixture of the just and the unjust, of truth and falsehood, of right and might—public virtue has become doubtful, and private morality wavering. But all revolutions, whatever may have been their object or their agents, have at first produced similar consequences; even those which have in the end drawn the bonds of morality more tightly began by loosening them. The violations of morality which the French frequently witness do not appear to me to have a permanent character; and this is already betokened by some curious signs of the times.

Nothing is more wretchedly corrupt than an aristocracy which retains its wealth when it has lost its power, and which still enjoys a vast deal of leisure after it is reduced to mere vulgar pastimes. The energetic passions and great conceptions which animated it heretofore leave it then; and nothing remains to it but a host of petty consuming vices, which cling about it like worms upon a carcass.

No one denies that the French aristocracy of the last century was extremely dissolute; whereas established habits and ancient belief still preserved some respect for morality among the other classes of society. Nor will it be contested that at the present day the remnants of that same aristocracy exhibit a certain severity of morals; while laxity of morals appears to have spread among the middle and lower ranks. So that the same families which were most profligate fifty years ago are nowadays the most exemplary, and democracy seems only to have strengthened the morality of the aristocratic classes. The French Revolution, by dividing the fortunes of the nobility, by forcing them to attend assiduously to their affairs and to their families, by making them live under the same roof with their children, and in short by giving a more rational and serious turn to their minds, has imparted to them, almost without their being aware of it, a reverence for religious belief, a love of order, of tranquil

pleasures, of domestic endearments, and of comfort; whereas the rest of the nation, which had naturally these same tastes, was carried away into excesses by the effort which was required to overthrow the laws and political habits of the country.

The old French aristocracy has undergone the consequences of the Revolution, but it neither felt the revolutionary passions, nor shared in the anarchical excitement which produces that crisis; it may easily be conceived that this aristocracy feels the salutary influence of the revolution in its manners before those who achieve it. It may therefore be said, though at first it seems paradoxical, that, at the present day, the most antidemocratic classes of the nation principally exhibit the kind of morality which may reasonably be anticipated from democracy. I cannot but think that when we shall have obtained all the effects of this democratic revolution, after having got rid of the tumult it has caused, the observations which are now only applicable to the few will gradually become true of the whole community.

*How the Americans Understand the Equality
of the Sexes*

I have shown how democracy destroys or modifies the different inequalities which originate in society: but is this all? or does it not ultimately affect that great inequality of man and woman which has seemed, up to the present day, to be eternally based in human nature? I believe that the social changes which bring nearer to the same level the father and son, the master and servant, and superiors and inferiors generally speaking, will raise woman and make her more and more the equal of man. But here, more than ever, I feel the necessity of making myself clearly understood; for there is no subject on which the coarse and lawless fancies of our age have taken a freer range.

There are people in Europe who, confounding together the different characteristics of the sexes, would make of man and woman beings not only equal but alike. They would give to both the same functions, impose on both the same duties, and grant to both the same rights; they would mix them in all things—their occupations, their pleasures, their business. It may readily be conceived that by thus attempting to make one sex equal to the other both are degraded; and from so preposterous a medley of the works of nature, nothing could ever result but weak men and disorderly women.

It is not thus that the Americans understand that species of democratic

equality which may be established between the sexes. They admit that as nature has appointed such wide differences between the physical and moral constitution of man and woman, her manifest design was to give a distinct employment to their various faculties; and they hold that improvement does not consist in making beings so dissimilar do pretty nearly the same things, but in getting each of them to fulfill their respective tasks in the best possible manner. The Americans have applied to the sexes the great principle of political economy which governs the manufactures of our age, by carefully dividing the duties of man from those of woman, in order that the great work of society may be the better carried on.

In no country has such constant care been taken as in America to trace two clearly distinct lines of action for the two sexes, and to make them keep pace one with the other, but in two pathways which are always different. American women never manage the outward concerns of the family, or conduct a business, or take a part in political life; nor are they, on the other hand, ever compelled to perform the rough labor of the fields, or to make any of those laborious exertions which demand the exertion of physical strength. No families are so poor as to form an exception to this rule. If on the one hand an American woman cannot escape from the quiet circle of domestic employments, on the other hand she is never forced to go beyond it. Hence it is that the women of America, who often exhibit a masculine strength of understanding and a manly energy, generally preserve great delicacy of personal appearance and always retain the manners of women, although they sometimes show that they have the hearts and minds of men.

Nor have the Americans ever supposed that one consequence of democratic principles is the subversion of marital power, or the confusion of the natural authorities in families. They hold that every association must have a head in order to accomplish its object, and that the natural head of the conjugal association is man. They do not therefore deny him the right of directing his partner; and they maintain that in the smaller association of husband and wife, as well as in the great social community, the object of democracy is to regulate and legalize the powers which are necessary, not to subvert all power.

This opinion is not peculiar to one sex, and contested by the other: I never observed that the women of America consider conjugal authority as a fortunate usurpation of their rights, nor that they thought themselves degraded by submitting to it. It appeared to me, on the contrary, that they attach a sort of pride to the voluntary surrender of their own will,

and make it their boast to bend themselves to the yoke, not to shake it off. Such at least is the feeling expressed by the most virtuous of their sex; the others are silent; and in the United States it is not the practice for a guilty wife to clamor for the rights of women while she is trampling on her holiest duties.

It has often been remarked that in Europe a certain degree of contempt lurks even in the flattery which men lavish upon women: although a European frequently affects to be the slave of woman, it may be seen that he never sincerely thinks her his equal. In the United States men seldom compliment women, but they daily show how much they esteem them. They constantly display an entire confidence in the understanding of a wife, and a profound respect for her freedom; they have decided that her mind is just as fitted as that of a man to discover the plain truth, and her heart as firm to embrace it; and they have never sought to place her virtue, any more than his, under the shelter of prejudice, ignorance, and fear.

It would seem that in Europe, where man so easily submits to the despotic sway of women, they are nevertheless curtailed of some of the greatest qualities of the human species, and considered as seductive but imperfect beings; and (what may well provoke astonishment) women ultimately look upon themselves in the same light, and almost consider it as a privilege that they are entitled to show themselves futile, feeble, and timid. The women of America claim no such privileges.

Again it may be said that in our morals we have reserved strange immunities to man; so that there is, as it were, one virtue for his use, and another for the guidance of his partner; and that, according to the opinion of the public, the very same act may be punished alternately as a crime, or only as a fault. The Americans know not this iniquitous division of duties and rights; among them the seducer is as much dishonored as his victim.

It is true that the Americans rarely lavish upon women those eager attentions which are commonly paid them in Europe; but their conduct to women always implies that they suppose them to be virtuous and refined; and such is the respect entertained for the moral freedom of the sex, that in the presence of a woman the most guarded language is used, lest her ear should be offended by an expression. In America a young unmarried woman may, alone and without fear, undertake a long journey.

The legislators of the United States, who have mitigated almost all the penalties of criminal law, still make rape a capital offense, and no crime is visited with more inexorable severity by public opinion. This may be

accounted for; as the Americans can conceive nothing more precious than a woman's honor, and nothing which ought so much to be respected as her independence, they hold that no punishment is too severe for the man who deprives her of them against her will. In France, where the same offense is visited with far milder penalties, it is frequently difficult to get a verdict from a jury against the prisoner. Is this a consequence of contempt of decency or contempt of women? I cannot but believe that it is a contempt of one and of the other.

Thus the Americans do not think that man and woman have either the duty or the right to perform the same offices, but they show an equal regard for both their respective parts; and though their lot is different, they consider both of them as beings of equal value. They do not give to the courage of woman the same form or the same direction as to that of man; but they never doubt her courage: and if they hold that man and his partner ought not always to exercise their intellect and understanding in the same manner, they at least believe the understanding of the one to be as sound as that of the other, and her intellect to be as clear. Thus, then, while they have allowed the social inferiority of woman to subsist, they have done all they could to raise her morally and intellectually to the level of man; and in this respect they appear to me to have excellently understood the true principle of democratic improvement.

As for myself, I do not hesitate to avow that, although the women of the United States are confined within the narrow circle of domestic life, and their situation is in some respects one of extreme dependence, I have nowhere seen woman occupying a loftier position; and if I were asked, now that I am drawing to the close of this work, in which I have spoken of so many important things done by the Americans, to what the singular prosperity and growing strength of that people ought mainly to be attributed, I should reply—to the superiority of their women.

*The foregoing consists of Book II, Chapters I–V,
and Book III, Chapters VIII–XII,
of Volume II of de Tocqueville's DEMOCRACY IN AMERICA,
translated by Henry Reeve.*

Henry David Thoreau

1817–1862

Henry David Thoreau, the famous poet-naturalist and philosopher, is remembered as much for his life as for his writings. He is the outstanding American example of the individual who is determined to live according to his own lights, no matter how unconventional his life may be. He has become a symbol of rebellion and nonconformity.

Thoreau was born in Concord, Massachusetts, on July 12, 1817. As a boy he spent much of his time roaming the outdoors, but there was little else in his early life to suggest his later eccentricity. His career at Harvard College (1833–1837) was an unexceptional one. It was while at Harvard that he first came under the spell of Ralph Waldo Emerson. He was deeply stirred by a reading of Emerson's *Nature*,¹ and for many years Emerson was to be the most important intellectual influence in his life.

After graduating from college, Thoreau taught school briefly. Then, with his brother, John, he made a boat trip that became the subject of one of his major works, *A Week on the Concord and Merrimack Rivers*. From 1841 to 1843 he lived with the Emerson family, working as a handy man. It was shortly after leaving the Emerson household that he decided to move to Walden Pond, at that time part of the uninhabited wilds of Massachusetts.

Thoreau had several reasons for moving to Walden Pond, but probably of greatest importance was his desire to live as simply as possible. He was convinced that most of the trappings of civilization were unnecessary for human happiness. He thought it was a great mistake for men to spend so much of their time working to obtain

¹ See Vol. 10, pp. 512–524, in this set.

things they did not really need. The result was, he said, that “the mass of men lead lives of quiet desperation.” He wanted to prove—to himself and to others—that life could be simpler and more joyful.

Thoreau lived at Walden Pond for two years, renouncing everything he considered inessential. (“Few lives contain so many renunciations,” said Emerson.) His shelter was a cabin measuring ten feet by fifteen feet that he had built with his own hands. His diet consisted mainly of rice, bread made from rye and Indian meal, potatoes, and wild fruit. Occasionally he ate fish or some salt pork. During the first eight months of his stay, his expenses (including the cost of his cabin) amounted to sixty-two dollars. His account of his experiences at Walden Pond, entitled *Walden*, is one of the classics of American literature.

After the Walden experiment, Thoreau engaged in a variety of activities. He worked as a surveyor, gave lectures, made excursions to Cape Cod and the Maine woods, and wrote essays for periodicals. He also became involved in the abolitionist movement and, during the last years of his life, was greatly distressed by the failure of the United States government to do anything about freeing the slaves. He died early in May, 1862, of tuberculosis.

When obedience to the laws of the state requires an individual to act against his conscience, which should he obey—the law or his conscience? One traditional answer to this question is that given by Socrates in the *Crito*. Socrates says that the individual “must do what his city and country order him; or he must change their view of what is just.”² In other words, the individual has the right to persuade the state to *change* the law, but so long as the law remains unchanged, he must obey it.

In *Civil Disobedience*, Thoreau gives the opposite answer. For

Simplify*

Henry D. Thoreau

him, loyalty of conscience takes precedence over loyalty to the state. If a man's conscience tells him that a law is unjust, he must oppose the law. But it is not enough merely to express disapproval, or to promise to vote against the law at the next election. The individual should take action to hinder the law's enforcement. He should refuse to do what the law orders, even if it means imprisonment. Thoreau was convinced that a dedicated minority—even a minority of one—could exert great political influence. “A minority is powerless when it conforms to the majority,” he said, “but it is irresistible when it clogs by its whole weight.”

Civil Disobedience is the most widely read and influential of Thoreau's political essays. Mohandas Gandhi, the great Indian leader, acknowledged his indebtedness to it for many of his ideas concerning nonviolent resistance. It has also played an important role in the attack upon racial segregation in the United States.

A Plea for Captain John Brown is, in many respects, a perfect companion piece to *Civil Disobedience*. Opinions about John Brown vary widely, but for Thoreau he was an extraordinary example of the man of conscience who has devoted his life to the cause of justice—the type of man he had called for in *Civil Disobedience*. Thoreau had been impressed with John Brown ever since their first meeting in 1857, and his *Plea* was inspired by Brown's arrest at Harpers Ferry, Virginia, in 1859.

The Harpers Ferry incident was only one part of John Brown's lifelong fight against slavery. He and his five sons had been active in the struggle to determine whether Kansas would be a free state or a slave state. He had personally ordered the murder of five proslavery settlers in retaliation for the killing of five free-state settlers. He remained in Kansas until 1859, when he began working on a scheme to establish a refuge for fugitive slaves in the mountains of Virginia. The attack upon Harpers Ferry was part of this scheme. The attack failed, and Brown and his associates were captured, convicted of treason, and hanged. In the eyes of the abolitionists (including Thoreau) Brown was a martyr; southerners thought him a madman and a scoundrel. The full truth about John Brown will probably never be known, but Thoreau's *Plea* is a moving testament to the force of his personality.

Civil Disobedience

I heartily accept the motto, "That government is best which governs least"; and I should like to see it acted up to more rapidly and systematically. Carried out, it finally amounts to this, which also I believe, "That government is best which governs not at all"; and when men are prepared for it, that will be the kind of government which they will have. Government is at best but an expedient; but most governments are usually, and all governments are sometimes, inexpedient. The objections which have been brought against a standing army, and they are many and weighty, and deserve to prevail, may also at last be brought against a standing government. The standing army is only an arm of the standing government. The government itself, which is only the mode which the people have chosen to execute their will, is equally liable to be abused and perverted before the people can act through it. Witness the present Mexican War, the work of comparatively a few individuals using the standing government as their tool; for, in the outset, the people would not have consented to this measure.

This American government—what is it but a tradition, though a recent one, endeavoring to transmit itself unimpaired to posterity, but each instant losing some of its integrity? It has not the vitality and force of a single living man; for a single man can bend it to his will. It is a sort of wooden gun to the people themselves. But it is not the less necessary for this; for the people must have some complicated machinery or other, and hear its din, to satisfy that idea of government which they have. Governments show thus how successfully men can be imposed on, even impose on themselves, for their own advantage. It is excellent, we must all allow. Yet this government never of itself furthered any enterprise, but by the alacrity with which it got out of its way. *It* does not keep the country free. *It* does not settle the West. *It* does not educate. The character inherent in the American people has done all that has been accomplished; and it would have done somewhat more, if the government had not

sometimes got in its way. For government is an expedient by which men would fain succeed in letting one another alone; and, as has been said, when it is most expedient, the governed are most let alone by it. Trade and commerce, if they were not made of India rubber, would never manage to bounce over the obstacles which legislators are continually putting in their way; and, if one were to judge these men wholly by the effects of their actions and not partly by their intentions, they would deserve to be classed and punished with those mischievous persons who put obstructions on the railroads.

But, to speak practically and as a citizen, unlike those who call themselves no-government men, I ask for, not at once no government, but *at once* a better government. Let every man make known what kind of government would command his respect, and that will be one step toward obtaining it.

After all, the practical reason why, when the power is once in the hands of the people, a majority are permitted, and for a long period continue, to rule is not because they are most likely to be in the right, nor because this seems fairest to the minority, but because they are physically the strongest. But a government in which the majority rule in all cases cannot be based on justice, even as far as men understand it. Can there not be a government in which majorities do not virtually decide right and wrong, but conscience?—in which majorities decide only those questions to which the rule of expediency is applicable? Must the citizen ever for a moment, or in the least degree, resign his conscience to the legislator? Why has every man a conscience, then? I think that we should be men first, and subjects afterward. It is not desirable to cultivate a respect for the law, so much as for the right. The only obligation which I have a right to assume is to do at any time what I think right. It is truly enough said, that a corporation has no conscience; but a corporation of conscientious men is a corporation *with* a conscience. Law never made men a whit more just; and, by means of their respect for it, even the well-disposed are daily made the agents of injustice. A common and natural result of an undue respect for law is that you may see a file of soldiers, colonel, captain, corporal, privates, powder monkeys, and all, marching in admirable order over hill and dale to the wars, against their wills, ay, against their common sense and consciences, which makes it very steep marching indeed, and produces a palpitation of the heart. They have no doubt that it is a damnable business in which they are concerned; they are all peaceably inclined. Now, what are they? Men at all? or small movable forts and magazines, at the service of some unscrupulous man

in power? Visit the navy yard, and behold a marine, such a man as an American government can make, or such as it can make a man with its black arts—a mere shadow and reminiscence of humanity, a man laid out alive and standing, and already, as one may say, buried under arms with funeral accompaniments, though it may be,

Not a drum was heard, not a funeral note,
As his corse to the rampart we hurried;
Not a soldier discharged his farewell shot
O'er the grave where our hero we buried.

The mass of men serve the state thus, not as men mainly, but as machines, with their bodies. They are the standing army, and the militia, jailers, constables, *posse comitatus*, etc. In most cases there is no free exercise whatever of the judgment or of the moral sense; but they put themselves on a level with wood and earth and stones; and wooden men can perhaps be manufactured that will serve the purpose as well. Such command no more respect than men of straw or a lump of dirt. They have the same sort of worth only as horses and dogs. Yet such as these even are commonly esteemed good citizens. Others—as most legislators, politicians, lawyers, ministers, and officeholders—serve the state chiefly with their heads; and, as they rarely make any moral distinctions, they are as likely to serve the Devil, without *intending* it, as God. A very few, as heroes, patriots, martyrs, reformers in the great sense, and *men*, serve the state with their consciences also, and so necessarily resist it for the most part; and they are commonly treated as enemies by it. A wise man will only be useful as a man, and will not submit to be “clay,” and “stop a hole to keep the wind away,” but leave that office to his dust at least:

I am too highborn to be propertied,
To be a secondary at control,
Or useful serving man and instrument
To any sovereign state throughout the world.

He who gives himself entirely to his fellow men appears to them useless and selfish; but he who gives himself partially to them is pronounced a benefactor and philanthropist.

How does it become a man to behave toward this American government today? I answer that he cannot without disgrace be associated with it. I cannot for an instant recognize that political organization as *my* government which is the *slave's* government also.

All men recognize the right of revolution; that is, the right to refuse allegiance to, and to resist, the government, when its tyranny or its inefficiency are great and unendurable. But almost all say that such is not the case now. But such was the case, they think, in the Revolution of '75. If one were to tell me that this was a bad government because it taxed certain foreign commodities brought to its ports, it is most probable that I should not make an ado about it, for I can do without them. All machines have their friction; and possibly this does enough good to counter-balance the evil. At any rate, it is a great evil to make a stir about it. But when the friction comes to have its machine, and oppression and robbery are organized, I say, let us not have such a machine any longer. In other words, when a sixth of the population of a nation which has undertaken to be the refuge of liberty are slaves, and a whole country is unjustly overrun and conquered by a foreign army, and subjected to military law, I think that it is not too soon for honest men to rebel and revolutionize. What makes this duty the more urgent is the fact that the country so overrun is not our own, but ours is the invading army.

Paley, a common authority with many on moral questions, in his chapter on the "Duty of Submission to Civil Government," resolves all civil obligation into expediency; and he proceeds to say, "that so long as the interest of the whole society requires it, that is, so long as the established government cannot be resisted or changed without public inconveniency, it is the will of God that the established government be obeyed, and no longer. . . . This principle being admitted, the justice of every particular case of resistance is reduced to a computation of the quantity of the danger and grievance on the one side, and of the probability and expense of redressing it on the other." Of this, he says, every man shall judge for himself. But Paley appears never to have contemplated those cases to which the rule of expediency does not apply, in which a people, as well as an individual, must do justice, cost what it may. If I have unjustly wrested a plank from a drowning man, I must restore it to him though I drown myself. This, according to Paley, would be inconvenient. But he that would save his life, in such a case, shall lose it. This people must cease to hold slaves, and to make war on Mexico, though it cost them their existence as a people.

In their practice, nations agree with Paley; but does any one think that Massachusetts does exactly what is right at the present crisis?

A drab of state, a cloth-o'-silver slut,
To have her train borne up, and her soul trail in the dirt.

Practically speaking, the opponents to a reform in Massachusetts are not a hundred thousand politicians at the South, but a hundred thousand merchants and farmers here, who are more interested in commerce and agriculture than they are in humanity, and are not prepared to do justice to the slave and to Mexico, *cost what it may*. I quarrel not with far-off foes, but with those who, near at home, co-operate with, and do the bidding of, those far away, and without whom the latter would be harmless. We are accustomed to say that the mass of men are unprepared; but improvement is slow, because the few are not materially wiser or better than the many. It is not so important that many should be as good as you, as that there be some absolute goodness somewhere; for that will leaven the whole lump. There are thousands who are *in opinion* opposed to slavery and to the war, who yet in effect do nothing to put an end to them; who, esteeming themselves children of Washington and Franklin, sit down with their hands in their pockets, and say that they know not what to do, and do nothing; who even postpone the question of freedom to the question of free trade, and quietly read the prices current along with the latest advices from Mexico after dinner, and, it may be, fall asleep over them both. What is the price current of an honest man and patriot today? They hesitate, and they regret, and sometimes they petition; but they do nothing in earnest and with effect. They will wait, well disposed, for others to remedy the evil, that they may no longer have it to regret. At most, they give only a cheap vote, and a feeble countenance and Godspeed, to the right, as it goes by them. There are nine hundred and ninety-nine patrons of virtue to one virtuous man. But it is easier to deal with the real possessor of a thing than with the temporary guardian of it.

All voting is a sort of gaming, like checkers or backgammon, with a slight moral tinge to it, a playing with right and wrong, with moral questions; and betting naturally accompanies it. The character of the voters is not staked. I cast my vote, perchance, as I think right; but I am not vitally concerned that that right should prevail. I am willing to leave it to the majority. Its obligation, therefore, never exceeds that of expediency. Even voting *for the right* is *doing* nothing for it. It is only expressing to men feebly your desire that it should prevail. A wise man will not leave the right to the mercy of chance, nor wish it to prevail through the power of the majority. There is but little virtue in the action of masses of men. When the majority shall at length vote for the abolition of slavery, it will be because they are indifferent to slavery, or because there is but little slavery left to be abolished by their vote. *They* will then be the only

slaves. Only *his* vote can hasten the abolition of slavery who asserts his own freedom by his vote.

I hear of a convention to be held at Baltimore, or elsewhere, for the selection of a candidate for the Presidency, made up chiefly of editors, and men who are politicians by profession; but I think, what is it to any independent, intelligent, and respectable man what decision they may come to? Shall we not have the advantage of his wisdom and honesty, nevertheless? Can we not count upon some independent votes? Are there not many individuals in the country who do not attend conventions? But no: I find that the respectable man, so called, has immediately drifted from his position, and despairs of his country, when his country has more reason to despair of him. He forthwith adopts one of the candidates thus selected as the only *available* one, thus proving that he is himself *available* for any purposes of the demagogue. His vote is of no more worth than that of any unprincipled foreigner or hireling native, who may have been bought. O for a man who is a *man*, and, as my neighbor says, has a bone in his back which you cannot pass your hand through! Our statistics are at fault: the population has been returned too large. How many *men* are there to a square thousand miles in this country? Hardly one. Does not America offer any inducement for men to settle here? The American has dwindled into an Odd Fellow, one who may be known by the development of his organ of gregariousness, and a manifest lack of intellect and cheerful self-reliance; whose first and chief concern, on coming into the world, is to see that the almshouses are in good repair; and, before yet he has lawfully donned the virile garb, to collect a fund for the support of the widows and orphans that may be; who, in short, ventures to live only by the aid of the mutual insurance company, which has promised to bury him decently.

It is not a man's duty, as a matter of course, to devote himself to the eradication of any, even the most enormous wrong; he may still properly have other concerns to engage him; but it is his duty, at least, to wash his hands of it, and, if he gives it no thought longer, not to give it practically his support. If I devote myself to other pursuits and contemplations, I must first see, at least, that I do not pursue them sitting upon another man's shoulders. I must get off him first, that he may pursue his contemplations too. See what gross inconsistency is tolerated. I have heard some of my townsmen say, "I should like to have them order me out to help put down an insurrection of the slaves, or to march to Mexico—see if I would go"; and yet these very men have each, directly by their allegiance, and so indirectly, at least, by their money, furnished a substi-

tute. The soldier is applauded who refuses to serve in an unjust war by those who do not refuse to sustain the unjust government which makes the war; is applauded by those whose own act and authority he disregards and sets at naught; as if the state were penitent to that degree that it hired one to scourge it while it sinned, but not to that degree that it left off sinning for a moment. Thus, under the name of Order and Civil Government, we are all made at last to pay homage to and support our own meanness. After the first blush of sin comes its indifference; and from immoral it becomes, as it were, *unmoral*, and not quite unnecessary to that life which we have made.

The broadest and most prevalent error requires the most disinterested virtue to sustain it. The slight reproach to which the virtue of patriotism is commonly liable, the noble are most likely to incur. Those who, while they disapprove of the character and measures of a government, yield to it their allegiance and support are undoubtedly its most conscientious supporters, and so frequently the most serious obstacles to reform. Some are petitioning the state to dissolve the Union, to disregard the requisitions of the President. Why do they not dissolve it themselves—the union between themselves and the state—and refuse to pay their quota into its treasury? Do not they stand in the same relation to the state that the state does to the Union? And have not the same reasons prevented the state from resisting the Union which have prevented them from resisting the state?

How can a man be satisfied to entertain an opinion merely, and enjoy *it*? Is there any enjoyment in it, if his opinion is that he is aggrieved? If you are cheated out of a single dollar by your neighbor, you do not rest satisfied with knowing that you are cheated, or with saying that you are cheated, or even with petitioning him to pay you your due; but you take effectual steps at once to obtain the full amount, and see that you are never cheated again. Action from principle, the perception and the performance of right, changes things and relations; it is essentially revolutionary, and does not consist wholly with anything which was. It not only divides states and churches, it divides families; ay, it divides the *individual*, separating the diabolical in him from the divine.

Unjust laws exist: shall we be content to obey them, or shall we endeavor to amend them, and obey them until we have succeeded, or shall we transgress them at once? Men generally, under such a government as this, think that they ought to wait until they have persuaded the majority to alter them. They think that, if they should resist, the remedy would be worse than the evil. But it is the fault of the government itself that the

remedy *is* worse than the evil. *It* makes it worse. Why is it not more apt to anticipate and provide for reform? Why does it not cherish its wise minority? Why does it cry and resist before it is hurt? Why does it not encourage its citizens to be on the alert to point out its faults, and *do* better than it would have them? Why does it always crucify Christ, and excommunicate Copernicus and Luther, and pronounce Washington and Franklin rebels?

One would think that a deliberate and practical denial of its authority was the only offense never contemplated by government; else why has it not assigned its definite, its suitable and proportionate penalty? If a man who has no property refuses but once to earn nine shillings for the state, he is put in prison for a period unlimited by any law that I know, and determined only by the discretion of those who placed him there; but if he should steal ninety times nine shillings from the state, he is soon permitted to go at large again.

If the injustice is part of the necessary friction of the machine of government, let it go, let it go: perchance it will wear smooth—certainly the machine will wear out. If the injustice has a spring, or a pulley, or a rope, or a crank, exclusively for itself, then perhaps you may consider whether the remedy will not be worse than the evil; but if it is of such a nature that it requires you to be the agent of injustice to another, then, I say, break the law. Let your life be a counterfriction to stop the machine. What I have to do is to see, at any rate, that I do not lend myself to the wrong which I condemn.

As for adopting the ways which the state has provided for remedying the evil, I know not of such ways. They take too much time, and a man's life will be gone. I have other affairs to attend to. I came into this world, not chiefly to make this a good place to live in, but to live in it, be it good or bad. A man has not everything to do, but something; and because he cannot do *everything*, it is not necessary that he should do *something* wrong. It is not my business to be petitioning the governor or the legislature any more than it is theirs to petition me; and if they should not hear my petition, what should I do then? But in this case the state has provided no way: its very Constitution is the evil. This may seem to be harsh and stubborn and unconciliatory; but it is to treat with the utmost kindness and consideration the only spirit that can appreciate or deserves it. So is all change for the better, like birth and death, which convulse the body.

I do not hesitate to say that those who call themselves Abolitionists should at once effectually withdraw their support, both in person and

property, from the government of Massachusetts and not wait till they constitute a majority of one before they suffer the right to prevail through them. I think that it is enough if they have God on their side, without waiting for that other one. Moreover, any man more right than his neighbors constitutes a majority of one already.

I meet this American government, or its representative, the state government, directly, and face to face, once a year—no more—in the person of its taxgatherer; this is the only mode in which a man situated as I am necessarily meets it; and it then says distinctly, Recognize me; and the simplest, most effectual and, in the present posture of affairs, the indispensablest mode of treating with it on this head, of expressing your little satisfaction with and love for it, is to deny it then. My civil neighbor, the taxgatherer, is the very man I have to deal with—for it is, after all, with men and not with parchment that I quarrel—and he has voluntarily chosen to be an agent of the government. How shall he ever know well what he is and does as an officer of the government, or as a man, until he is obliged to consider whether he shall treat me, his neighbor, for whom he has respect, as a neighbor and well-disposed man, or as a maniac and disturber of the peace, and see if he can get over this obstruction to his neighborliness without a ruder and more impetuous thought or speech corresponding with his action. I know this well, that if one thousand, if one hundred, if ten men whom I could name—if ten *honest* men only—ay, if *one* HONEST man, in this state of Massachusetts, *ceasing to hold slaves*, were actually to withdraw from this copartnership, and be locked up in the county jail therefor, it would be the abolition of slavery in America. For it matters not how small the beginning may seem to be: what is once well done is done forever. But we love better to talk about it: that we say is our mission. Reform keeps many scores of newspapers in its service, but not one man. If my esteemed neighbor, the state's ambassador, who will devote his days to the settlement of the question of human rights in the council chamber, instead of being threatened with the prisons of Carolina, were to sit down the prisoner of Massachusetts, that state which is so anxious to foist the sin of slavery upon her sister—though at present she can discover only an act of inhospitality to be the ground of a quarrel with her—the legislature would not wholly waive the subject the following winter.

Under a government which imprisons any unjustly, the true place for a just man is also a prison. The proper place today, the only place which Massachusetts has provided for her freer and less desponding spirits, is in her prisons, to be put out and locked out of the state by her own act,

as they have already put themselves out by their principles. It is there that the fugitive slave, and the Mexican prisoner on parole, and the Indian come to plead the wrongs of his race should find them; on that separate but more free and honorable ground, where the state places those who are not *with* her but *against* her, the only house in a slave state in which a free man can abide with honor. If any think that their influence would be lost there, and their voices no longer afflict the ear of the state, that they would not be as an enemy within its walls, they do not know by how much truth is stronger than error, nor how much more eloquently and effectively he can combat injustice who has experienced a little in his own person. Cast your whole vote, not a strip of paper merely, but your whole influence. A minority is powerless while it conforms to the majority; it is not even a minority then; but it is irresistible when it clogs by its whole weight. If the alternative is to keep all just men in prison, or give up war and slavery, the state will not hesitate which to choose. If a thousand men were not to pay their tax bills this year, that would not be a violent and bloody measure, as it would be to pay them, and enable the state to commit violence and shed innocent blood. This is, in fact, the definition of a peaceable revolution, if any such is possible. If the taxgatherer, or any other public officer, asks me, as one has done, "But what shall I do?" my answer is, "If you really wish to do anything, resign your office." When the subject has refused allegiance, and the officer has resigned his office, then the revolution is accomplished. But even suppose blood should flow. Is there not a sort of blood shed when the conscience is wounded? Through this wound a man's real manhood and immortality flow out, and he bleeds to an everlasting death. I see this blood flowing now.

I have contemplated the imprisonment of the offender, rather than the seizure of his goods—though both will serve the same purpose—because they who assert the purest right, and consequently are most dangerous to a corrupt state, commonly have not spent much time in accumulating property. To such the state renders comparatively small service, and a slight tax is wont to appear exorbitant, particularly if they are obliged to earn it by special labor with their hands. If there were one who lived wholly without the use of money, the state itself would hesitate to demand it of him. But the rich man—not to make any invidious comparison—is always sold to the institution which makes him rich. Absolutely speaking, the more money, the less virtue; for money comes between a man and his objects, and obtains them for him; and it was certainly no great virtue to obtain it. It puts to rest many questions which

he would otherwise be taxed to answer; while the only new question which it puts is the hard but superfluous one, how to spend it. Thus his moral ground is taken from under his feet. The opportunities of living are diminished in proportion as what are called the "means" are increased. The best thing a man can do for his culture when he is rich is to endeavor to carry out those schemes which he entertained when he was poor. Christ answered the Herodians according to their condition. "Show me the tribute money," said he—and one took a penny out of his pocket; if you use money which has the image of Caesar on it and which he has made current and valuable, that is, *if you are men of the state*, and gladly enjoy the advantages of Caesar's government, then pay him back some of his own when he demands it. "Render therefore to Caesar that which is Caesar's, and to God those things which are God's," leaving them no wiser than before as to which was which; for they did not wish to know.

When I converse with the freest of my neighbors, I perceive that, whatever they may say about the magnitude and seriousness of the question, and their regard for the public tranquillity, the long and the short of the matter is that they cannot spare the protection of the existing government, and they dread the consequences to their property and families of disobedience to it. For my own part, I should not like to think that I ever rely on the protection of the state. But, if I deny the authority of the state when it presents its tax bill, it will soon take and waste all my property, and so harass me and my children without end. This is hard. This makes it impossible for a man to live honestly, and at the same time comfortably, in outward respects. It will not be worth the while to accumulate property; that would be sure to go again. You must hire or squat somewhere, and raise but a small crop, and eat that soon. You must live within yourself, and depend upon yourself always tucked up and ready for a start, and not have many affairs. A man may grow rich in Turkey even, if he will be in all respects a good subject of the Turkish government. Confucius said: "If a state is governed by the principles of reason, poverty and misery are subjects of shame; if a state is not governed by the principles of reason, riches and honors are the subjects of shame." No: until I want the protection of Massachusetts to be extended to me in some distant southern port, where my liberty is endangered, or until I am bent solely on building up an estate at home by peaceful enterprise, I can afford to refuse allegiance to Massachusetts, and her right to my property and life. It costs me less in every sense to incur the penalty of disobedience to the state than it would to obey. I should feel as if I were worth less in that case.

Some years ago, the state met me in behalf of the church, and commanded me to pay a certain sum toward the support of a clergyman whose preaching my father attended, but never I myself. "Pay," it said, "or be locked up in the jail." I declined to pay, But, unfortunately, another man saw fit to pay it. I did not see why the schoolmaster should be taxed to support the priest, and not the priest the schoolmaster; for I was not the state's schoolmaster, but I supported myself by voluntary subscription. I did not see why the lyceum should not present its tax bill, and have the state to back its demand, as well as the church. However, at the request of the selectmen, I condescended to make some such statement as this in writing: "Know all men by these presents, that I, Henry Thoreau, do not wish to be regarded as a member of any incorporated society which I have not joined." This I gave to the town clerk; and he has it. The state, having thus learned that I did not wish to be regarded as a member of that church, has never made a like demand on me since; though it said that it must adhere to its original presumption that time. If I had known how to name them, I should then have signed off in detail from all the societies which I never signed on to; but I did not know where to find a complete list.

I have paid no poll tax for six years. I was put into a jail once on this account, for one night; and, as I stood considering the walls of solid stone, two or three feet thick, the door of wood and iron, a foot thick, and the iron grating which strained the light, I could not help being struck with the foolishness of that institution which treated me as if I were mere flesh and blood and bones, to be locked up. I wondered that it should have concluded at length that this was the best use it could put me to, and had never thought to avail itself of my services in some way. I saw that, if there was a wall of stone between me and my townsmen, there was a still more difficult one to climb or break through before they could get to be as free as I was. I did not for a moment feel confined, and the walls seemed a great waste of stone and mortar. I felt as if I alone of all my townsmen had paid my tax. They plainly did not know how to treat me, but behaved like persons who are underbred. In every threat and in every compliment there was a blunder; for they thought that my chief desire was to stand the other side of that stone wall. I could not but smile to see how industriously they locked the door on my meditations, which followed them out again without let or hindrance, and *they* were really all that was dangerous. As they could not reach me, they had resolved to punish my body; just as boys, if they cannot come at some

person against whom they have a spite, will abuse his dog. I saw that the state was half-witted, that it was timid as a lone woman with her silver spoons, and that it did not know its friends from its foes, and I lost all my remaining respect for it, and pitied it.

Thus the state never intentionally confronts a man's sense, intellectual or moral, but only his body, his senses. It is not armed with superior wit or honesty, but with superior physical strength. I was not born to be forced. I will breathe after my own fashion. Let us see who is the strongest. What force has a multitude? They only can force me who obey a higher law than I. They force me to become like themselves. I do not hear of *men* being *forced* to live this way or that by masses of men. What sort of life were that to live? When I meet a government which says to me, "Your money or your life," why should I be in haste to give it my money? It may be in a great strait, and not know what to do: I cannot help that. It must help itself; do as I do. It is not worth the while to snivel about it. I am not responsible for the successful working of the machinery of society. I am not the son of the engineer. I perceive that, when an acorn and a chestnut fall side by side, the one does not remain inert to make way for the other, but both obey their own laws, and spring and grow and flourish as best they can, till one, perchance, overshadows and destroys the other. If a plant cannot live according to its nature, it dies; and so a man.

The night in prison was novel and interesting enough. The prisoners in their shirt sleeves were enjoying a chat and the evening air in the doorway when I entered. But the jailer said, "Come, boys, it is time to lock up"; and so they dispersed, and I heard the sound of their steps returning into the hollow apartments. My roommate was introduced to me by the jailer as "a first-rate fellow and a clever man." When the door was locked, he showed me where to hang my hat, and how he managed matters there. The rooms were whitewashed once a month; and this one, at least, was the whitest, most simply furnished, and probably the neatest apartment in the town. He naturally wanted to know where I came from, and what brought me there; and, when I had told him, I asked him in my turn how he came there, presuming him to be an honest man, of course; and, as the world goes, I believe he was. "Why," said he, "they accuse me of burning a barn; but I never did it." As near as I could discover, he had probably gone to bed in a barn when drunk, and smoked his pipe there; and so a barn was burnt. He had the reputation of being a clever man, had been there some three months waiting for his trial to come on, and

would have to wait as much longer; but he was quite domesticated and contented, since he got his board for nothing, and thought that he was well treated.

He occupied one window, and I the other; and I saw that if one stayed there long, his principal business would be to look out the window. I had soon read all the tracts that were left there, and examined where former prisoners had broken out, and where a grate had been sawed off, and heard the history of the various occupants of that room; for I found that even here there was a history and a gossip which never circulated beyond the walls of the jail. Probably this is the only house in the town where verses are composed which are afterward printed in a circular form, but not published. I was shown quite a long list of verses which were composed by some young men who had been detected in an attempt to escape, who avenged themselves by singing them.

I pumped my fellow prisoner as dry as I could, for fear I should never see him again; but at length he showed me which was my bed, and left me to blow out the lamp.

It was like traveling into a far country, such as I had never expected to behold, to lie there for one night. It seemed to me that I never had heard the town clock strike before, nor the evening sounds of the village; for we slept with the windows open, which were inside the grating. It was to see my native village in the light of the Middle Ages, and our Concord was turned into a Rhine stream, and visions of knights and castles passed before me. They were the voices of old burghers that I heard in the streets. I was an involuntary spectator and auditor of whatever was done and said in the kitchen of the adjacent village inn—a wholly new and rare experience to me. It was a closer view of my native town. I was fairly inside of it. I never had seen its institutions before. This is one of its peculiar institutions; for it is a shire town. I began to comprehend what its inhabitants were about.

In the morning, our breakfasts were put through the hole in the door, in small oblong-square tin pans made to fit, and holding a pint of chocolate with brown bread, and an iron spoon. When they called for the vessels again, I was green enough to return what bread I had left; but my comrade seized it, and said that I should lay that up for lunch or dinner. Soon after he was let out to work at haying in a neighboring field, whither he went every day, and would not be back till noon; so he bade me good day, saying that he doubted if he should see me again.

When I came out of prison—for someone interfered, and paid that tax—I did not perceive that great changes had taken place on the common,

such as he observed who went in a youth and emerged a tottering and gray-headed man; and yet a change had to my eyes come over the scene—the town, and state, and country—greater than any that mere time could effect. I saw yet more distinctly the state in which I lived. I saw to what extent the people among whom I lived could be trusted as good neighbors and friends; that their friendship was for summer weather only; that they did not greatly propose to do right; that they were a distinct race from me by their prejudices and superstitions, as the Chinamen and Malays are; that in their sacrifices to humanity they ran no risks, not even to their property; that after all they were not so noble but they treated the thief as he had treated them, and hoped, by a certain outward observance and a few prayers, and by walking in a particular straight though useless path from time to time, to save their souls. This may be to judge my neighbors harshly; for I believe that many of them are not aware that they have such an institution as the jail in their village.

It was formerly the custom in our village when a poor debtor came out of jail for his acquaintances to salute him, looking through their fingers, which were crossed to represent the grating of a jail window, “How do ye do?” My neighbors did not thus salute me, but first looked at me, and then at one another, as if I had returned from a long journey. I was put into jail as I was going to the shoemaker’s to get a shoe which was mended. When I was let out the next morning, I proceeded to finish my errand, and, having put on my mended shoe, joined a huckleberry party, who were impatient to put themselves under my conduct; and in half an hour—for the horse was soon tackled—was in the midst of a huckleberry field, on one of our highest hills, two miles off, and then the state was nowhere to be seen.

This is the whole history of “My Prisons.”

I have never declined paying the highway tax, because I am as desirous of being a good neighbor as I am of being a bad subject; and as for supporting schools, I am doing my part to educate my fellow countrymen now. It is for no particular item in the tax bill that I refuse to pay it. I simply wish to refuse allegiance to the state, to withdraw and stand aloof from it effectually. I do not care to trace the course of my dollar, if I could, till it buys a man or a musket to shoot with—the dollar is innocent—but I am concerned to trace the effects of my allegiance. In fact, I quietly declare war with the state, after my fashion, though I will still make what use and get what advantage of her I can, as is usual in such cases.

If others pay the tax which is demanded of me, from a sympathy with the state, they do but what they have already done in their own case, or rather they abet injustice to a greater extent than the state requires. If they pay the tax from a mistaken interest in the individual taxed, to save his property, or prevent his going to jail, it is because they have not considered wisely how far they let their private feelings interfere with the public good.

This, then, is my position at present. But one cannot be too much on his guard in such a case, lest his action be biased by obstinacy or an undue regard for the opinions of men. Let him see that he does only what belongs to himself and to the hour.

I think sometimes, Why, this people mean well, they are only ignorant; they would do better if they knew how: why give your neighbors this pain to treat you as they are not inclined to? But I think again, This is no reason why I should do as they do, or permit others to suffer much greater pain of a different kind. Again, I sometimes say to myself, When many millions of men, without heat, without ill will, without personal feeling of any kind, demand of you a few shillings only, without the possibility, such is their constitution, of retracting or altering their present demand, and without the possibility, on your side, of appeal to any other millions, why expose yourself to this overwhelming brute force? You do not resist cold and hunger, the winds and the waves, thus obstinately; you quietly submit to a thousand similar necessities. You do not put your head into the fire. But just in proportion as I regard this as not wholly a brute force, but partly a human force, and consider that I have relations to those millions as to so many millions of men, and not of mere brute or inanimate things, I see that appeal is possible, first and instantaneously, from them to the Maker of them, and, secondly, from them to themselves. But if I put my head deliberately into the fire, there is no appeal to fire or to the Maker of fire, and I have only myself to blame. If I could convince myself that I have any right to be satisfied with men as they are, and to treat them accordingly, and not according, in some respects, to my requisitions and expectations of what they and I ought to be, then, like a good Mussulman and fatalist, I should endeavor to be satisfied with things as they are, and say it is the will of God. And, above all, there is this difference between resisting this and a purely brute or natural force, that I can resist this with some effect; but I cannot expect, like Orpheus, to change the nature of the rocks and trees and beasts.

I do not wish to quarrel with any man or nation. I do not wish to split hairs, to make fine distinctions, or set myself up as better than my neigh-

bors. I seek rather, I may say, even an excuse for conforming to the laws of the land. I am but too ready to conform to them. Indeed, I have reason to suspect myself on this head; and each year, as the taxgatherer comes round, I find myself disposed to review the acts and position of the general and state governments, and the spirit of the people, to discover a pretext for conformity.

We must affect our country as our parents,
And if at any time we alienate
Our love or industry from doing it honor,
We must respect effects and teach the soul
Matter of conscience and religion,
And not desire of rule or benefit.

I believe that the state will soon be able to take all my work of this sort out of my hands, and then I shall be no better a patriot than my fellow countrymen. Seen from a lower point of view, the Constitution, with all its faults, is very good; the law and the courts are very respectable; even this state and this American government are, in many respects, very admirable, and rare things, to be thankful for, such as a great many have described them; but seen from a point of view a little higher, they are what I have described them; seen from a higher still, and the highest, who shall say what they are, or that they are worth looking at or thinking of at all?

However, the government does not concern me much, and I shall bestow the fewest possible thoughts on it. It is not many moments that I live under a government, even in this world. If a man is thought-free, fancy-free, imagination-free, that which *is not* never for a long time appearing *to be* to him, unwise rulers or reformers cannot fatally interrupt him.

I know that most men think differently from myself; but those whose lives are by profession devoted to the study of these or kindred subjects content me as little as any. Statesmen and legislators, standing so completely within the institution, never distinctly and nakedly behold it. They speak of moving society, but have no resting place without it. They may be men of a certain experience and discrimination, and have no doubt invented ingenious and even useful systems, for which we sincerely thank them; but all their wit and usefulness lie within certain not very wide limits. They are wont to forget that the world is not governed by policy and expediency. Webster never goes behind government, and so cannot speak with authority about it. His words are wisdom to those leg-

islators who contemplate no essential reform in the existing government; but for thinkers, and those who legislate for all time, he never once glances at the subject. I know of those whose serene and wise speculations on this theme would soon reveal the limits of his mind's range and hospitality. Yet, compared with the cheap professions of most reformers, and the still cheaper wisdom and eloquence of politicians in general, his are almost the only sensible and valuable words, and we thank Heaven for him. Comparatively, he is always strong, original, and, above all, practical. Still, his quality is not wisdom, but prudence. The lawyer's truth is not Truth, but consistency or a consistent expediency. Truth is always in harmony with herself, and is not concerned chiefly to reveal the justice that may consist with wrongdoing. He well deserves to be called, as he has been called, the Defender of the Constitution. There are really no blows to be given by him but defensive ones. He is not a leader, but a follower. His leaders are the men of '87. "I have never made an effort," he says, "and never propose to make an effort; I have never countenanced an effort, and never mean to countenance an effort, to disturb the arrangement as originally made, by which the various States came into the Union." Still thinking of the sanction which the Constitution gives to slavery, he says, "Because it was a part of the original compact, let it stand." Notwithstanding his special acuteness and ability, he is unable to take a fact out of its merely political relations, and behold it as it lies absolutely to be disposed of by the intellect—what, for instance, it behooves a man to do here in America today with regard to slavery—but ventures, or is driven, to make some such desperate answer as the following, while professing to speak absolutely, and as a private man—from which what new and singular code of social duties might be inferred? "The manner," says he, "in which the governments of those States where slavery exists are to regulate it is for their own consideration, under their responsibility to their constituents, to the general laws of propriety, humanity, and justice, and to God. Associations formed elsewhere, springing from a feeling of humanity, or other cause, have nothing whatever to do with it. They have never received any encouragement from me, and they never will."

They who know of no purer sources of truth, who have traced up its stream no higher, stand, and wisely stand, by the Bible and the Constitution, and drink at it there with reverence and humility; but they who behold where it comes trickling into this lake or that pool, gird up their loins once more, and continue their pilgrimage toward its fountainhead.

No man with a genius for legislation has appeared in America. They

are rare in the history of the world. There are orators, politicians, and eloquent men by the thousand; but the speaker has not yet opened his mouth to speak who is capable of settling the much-vexed questions of the day. We love eloquence for its own sake, and not for any truth which it may utter, or any heroism it may inspire. Our legislators have not yet learned the comparative value of free trade and of freedom, of union, and of rectitude to a nation. They have no genius or talent for comparatively humble questions of taxation and finance, commerce and manufactures and agriculture. If we were left solely to the wordy wit of legislators in Congress for our guidance, uncorrected by the seasonable experience and the effectual complaints of the people, America would not long retain her rank among the nations. For eighteen hundred years, though perchance I have no right to say it, the New Testament has been written; yet where is the legislator who has wisdom and practical talent enough to avail himself of the light which it sheds on the science of legislation?

The authority of government, even such as I am willing to submit to—for I will cheerfully obey those who know and can do better than I, and in many things even those who neither know nor can do so well—is still an impure one: to be strictly just, it must have the sanction and consent of the governed. It can have no pure right over my person and property but what I concede to it. The progress from an absolute to a limited monarchy, from a limited monarchy to a democracy, is a progress toward a true respect for the individual. Even the Chinese philosopher was wise enough to regard the individual as the basis of the empire. Is a democracy, such as we know it, the last improvement possible in government? Is it not possible to take a step further toward recognizing and organizing the rights of man? There will never be a really free and enlightened state until the state comes to recognize the individual as a higher and independent power, from which all its own power and authority are derived, and treats him accordingly. I please myself with imagining a state at last which can afford to be just to all men, and to treat the individual with respect as a neighbor; which even would not think it inconsistent with its own repose if a few were to live aloof from it, not meddling with it, nor embraced by it, who fulfilled all the duties of neighbors and fellow men. A state which bore this kind of fruit, and suffered it to drop off as fast as it ripened, would prepare the way for a still more perfect and glorious state, which also I have imagined, but not yet anywhere seen.

A Plea for Captain John Brown

I trust that you will pardon me for being here. I do not wish to force my thoughts upon you, but I feel forced myself. Little as I know of Captain Brown, I would fain do my part to correct the tone and statements of the newspapers, and of my countrymen generally, respecting his character and actions. It costs us nothing to be just. We can at least express our sympathy with, and admiration of, him and his companions, and that is what I now propose to do.

First, as to his history. I will endeavor to omit, as much as possible, what you have already read. I need not describe his person to you, for probably most of you have seen and will not soon forget him. I am told that his grandfather, John Brown, was an officer in the Revolution; that he himself was born in Connecticut about the beginning of this century, but early went with his father to Ohio. I heard him say that his father was a contractor who furnished beef to the army there, in the War of 1812; that he accompanied him to the camp, and assisted him in that employment, seeing a good deal of military life—more, perhaps, than if he had been a soldier; for he was often present at the councils of the officers. Especially, he learned by experience how armies are supplied and maintained in the field—a work which, he observed, requires at least as much experience and skill as to lead them in battle. He said that few persons had any conception of the cost, even the pecuniary cost, of firing a single bullet in war. He saw enough, at any rate, to disgust him with a military life; indeed, to excite in him a great abhorrence of it; so much so, that though he was tempted by the offer of some petty office in the army, when he was about eighteen, he not only declined that, but he also refused to train when warned, and was fined for it. He then resolved that he would never have anything to do with any war, unless it were a war for liberty.

When the troubles in Kansas began, he sent several of his sons thither to strengthen the party of the Free State men, fitting them out with such weapons as he had; telling them that if the troubles should increase, and there should be need of him, he would follow, to assist them with his hand and counsel. This, as you all know, he soon after did; and it was through his agency, far more than any other's, that Kansas was made free.

For a part of his life he was a surveyor, and at one time he was engaged in woolgrowing, and he went to Europe as an agent about that business. There, as everywhere, he had his eyes about him, and made many original observations. He said, for instance, that he saw why the soil of England was so rich, and that of Germany (I think it was) so poor, and he thought of writing to some of the crowned heads about it. It was because in England the peasantry live on the soil which they cultivate, but in Germany they are gathered into villages at night. It is a pity that he did not make a book of his observations.

I should say that he was an old-fashioned man in his respect for the Constitution, and his faith in the permanence of this Union. Slavery he deemed to be wholly opposed to these, and he was its determined foe.

He was by descent and birth a New England farmer, a man of great common sense, deliberate and practical as that class is, and tenfold more so. He was like the best of those who stood at Concord Bridge once, on Lexington Common, and on Bunker Hill, only he was firmer and higher principled than any that I have chanced to hear of as there. It was no abolition lecturer that converted him. Ethan Allen and Stark, with whom he may in some respects be compared, were rangers in a lower and less important field. They could bravely face their country's foes, but he had the courage to face his country herself when she was in the wrong. A western writer says, to account for his escape from so many perils, that he was concealed under a "rural exterior"; as if, in that prairie land, a hero should, by good rights, wear a citizen's dress only.

He did not go to the college called Harvard, good old Alma Mater as she is. He was not fed on the pap that is there furnished. As he phrased it, "I know no more of grammar than one of your calves." But he went to the great university of the West, where he sedulously pursued the study of Liberty, for which he had early betrayed a fondness, and having taken many degrees, he finally commenced the public practice of Humanity in Kansas, as you all know. Such were *his humanities*, and not any study of grammar. He would have left a Greek accent slanting the wrong way, and righted up a falling man.

He was one of that class of whom we hear a great deal, but, for the

most part, see nothing at all—the Puritans. It would be in vain to kill him. He died lately in the time of Cromwell, but he reappeared here. Why should he not? Some of the Puritan stock are said to have come over and settled in New England. They were a class that did something else than celebrate their forefathers' day, and eat parched corn in remembrance of that time. They were neither Democrats nor Republicans, but men of simple habits, straightforward, prayerful; not thinking much of rulers who did not fear God, not making many compromises, nor seeking after available candidates.

"In his camp," as one has recently written, and as I have myself heard him state, "he permitted no profanity; no man of loose morals was suffered to remain there, unless, indeed, as a prisoner of war. 'I would rather,' said he, 'have the smallpox, yellow fever, and cholera, all together in my camp, than a man without principle. . . . It is a mistake, sir, that our people make, when they think that bullies are the best fighters, or that they are the fit men to oppose these southerners. Give me men of good principles, God-fearing men, men who respect themselves, and with a dozen of them I will oppose any hundred such men as these Buford ruffians.' " He said that if one offered himself to be a soldier under him, who was forward to tell what he could or would do if he could only get sight of the enemy, he had but little confidence in him.

He was never able to find more than a score or so of recruits whom he would accept, and only about a dozen, among them his sons, in whom he had perfect faith. When he was here some years ago, he showed to a few a little manuscript book—his "orderly book" I think he called it—containing the names of his company in Kansas, and the rules by which they bound themselves; and he stated that several of them had already sealed the contract with their blood. When someone remarked that, with the addition of a chaplain, it would have been a perfect Cromwellian troop, he observed that he would have been glad to add a chaplain to the list, if he could have found one who could fill that office worthily. It is easy enough to find one for the United States Army. I believe that he had prayers in his camp morning and evening, nevertheless.

He was a man of Spartan habits, and at sixty was scrupulous about his diet at your table, excusing himself by saying that he must eat sparingly and fare hard, as became a soldier, or one who was fitting himself for difficult enterprises, a life of exposure.

A man of rare common sense and directness of speech, as of action; a transcendentalist above all, a man of ideas and principles—that was what distinguished him. Not yielding to a whim or transient impulse, but

carrying out the purpose of a life. I noticed that he did not overstate anything, but spoke within bounds. I remember, particularly, how, in his speech here, he referred to what his family had suffered in Kansas, without ever giving the least vent to his pent-up fire. It was a volcano with an ordinary chimney flue. Also referring to the deeds of certain Border Ruffians, he said, rapidly paring away his speech, like an experienced soldier, keeping a reserve of force and meaning, "They had a perfect right to be hung." He was not in the least a rhetorician, was not talking to Buncombe or his constituents anywhere, had no need to invent anything but to tell the simple truth, and communicate his own resolution; therefore he appeared incomparably strong, and eloquence in Congress and elsewhere seemed to me at a discount. It was like the speeches of Cromwell compared with those of an ordinary king.

As for his tact and prudence, I will merely say, that at a time when scarcely a man from the Free States was able to reach Kansas by any direct route, at least without having his arms taken from him, he, carrying what imperfect guns and other weapons he could collect, openly and slowly drove an oxcart through Missouri, apparently in the capacity of a surveyor, with his surveying compass exposed in it, and so passed unsuspected, and had ample opportunity to learn the designs of the enemy. For some time after his arrival he still followed the same profession. When, for instance, he saw a knot of the ruffians on the prairie, discussing, of course, the single topic which then occupied their minds, he would, perhaps, take his compass and one of his sons, and proceed to run an imaginary line right through the very spot on which that conclave had assembled, and when he came up to them, he would naturally pause and have some talk with them, learning their news, and, at last, all their plans perfectly; and having thus completed his real survey he would resume his imaginary one, and run on his line till he was out of sight.

When I expressed surprise that he could live in Kansas at all, with a price set upon his head, and so large a number, including the authorities, exasperated against him, he accounted for it by saying, "It is perfectly well understood that I will not be taken." Much of the time for some years he has had to skulk in swamps, suffering from poverty and from sickness, which was the consequence of exposure, befriended only by Indians and a few whites. But though it might be known that he was lurking in a particular swamp, his foes commonly did not care to go in after him. He could even come out into a town where there were more Border Ruffians than Free State men, and transact some business, without delaying long, and yet not be molested; for, said he, "no little hand-

ful of men were willing to undertake it, and a large body could not be got together in season."

As for his recent failure, we do not know the facts about it. It was evidently far from being a wild and desperate attempt. His enemy, Mr. Vallandigham, is compelled to say that "it was among the best planned and executed conspiracies that ever failed."

Not to mention his other successes, was it a failure, or did it show a want of good management, to deliver from bondage a dozen human beings, and walk off with them by broad daylight, for weeks if not months, at a leisurely pace, through one state after another, for half the length of the North, conspicuous to all parties, with a price set upon his head, going into a courtroom on his way and telling what he had done, thus convincing Missouri that it was not profitable to try to hold slaves in his neighborhood?—and this, not because the government menials were lenient, but because they were afraid of him.

Yet he did not attribute his success, foolishly, to "his star," or to any magic. He said, truly, that the reason why such greatly superior numbers quailed before him was, as one of his prisoners confessed, because they *lacked a cause*—a kind of armor which he and his party never lacked. When the time came, few men were found willing to lay down their lives in defense of what they knew to be wrong; they did not like that this should be their last act in this world.

But to make haste to *his* last act, and its effects.

The newspapers seem to ignore, or perhaps are really ignorant of the fact that there are at least as many as two or three individuals to a town throughout the North who think much as the present speaker does about him and his enterprise. I do not hesitate to say that they are an important and growing party. We aspire to be something more than stupid and timid chattels, pretending to read history and our Bibles, but desecrating every house and every day we breathe in. Perhaps anxious politicians may prove that only seventeen white men and five Negroes were concerned in the late enterprise; but their very anxiety to prove this might suggest to themselves that all is not told. Why do they still dodge the truth? They are so anxious because of a dim consciousness of the fact, which they do not distinctly face, that at least a million of the free inhabitants of the United States would have rejoiced if it had succeeded. They at most only criticize the tactics. Though we wear no crape, the thought of that man's position and probable fate is spoiling many a man's day here at the North for other thinking. If anyone who has seen him

here can pursue successfully any other train of thought, I do not know what he is made of. If there is any such who gets his usual allowance of sleep, I will warrant him to fatten easily under any circumstances which do not touch his body or purse. I put a piece of paper and a pencil under my pillow, and when I could not sleep I wrote in the dark.

On the whole, my respect for my fellow men, except as one may outweigh a million, is not being increased these days. I have noticed the cold-blooded way in which newspaper writers and men generally speak of this event, as if an ordinary malefactor, though one of unusual "pluck"—as the Governor of Virginia is reported to have said, using the language of the cockpit, "the gamest man he ever saw"—had been caught, and were about to be hung. He was not dreaming of his foes when the governor thought he looked so brave. It turns what sweetness I have to gall, to hear, or hear of, the remarks of some of my neighbors. When we heard at first that he was dead, one of my townsmen observed that "he died as the fool dieth"; which, pardon me, for an instant suggested a likeness in him dying to my neighbor living. Others, craven hearted, said disparagingly that "he threw his life away," because he resisted the government. Which way have they thrown *their* lives, pray?—such as would praise a man for attacking singly an ordinary band of thieves or murderers. I hear another ask, Yankee-like, "What will he gain by it?" as if he expected to fill his pockets by this enterprise. Such a one has no idea of gain but in this worldly sense. If it does not lead to a "surprise" party, if he does not get a new pair of boots, or a vote of thanks, it must be a failure. "But he won't gain anything by it." Well, no, I don't suppose he could get four-and-sixpence a day for being hung, take the year round; but then he stands a chance to save a considerable part of his soul—and *such* a soul!—when *you* do not. No doubt you can get more in your market for a quart of milk than for a quart of blood, but that is not the market that heroes carry their blood to.

Such do not know that like the seed is the fruit, and that, in the moral world, when good seed is planted, good fruit is inevitable, and does not depend on our watering and cultivating; that when you plant, or bury, a hero in his field, a crop of heroes is sure to spring up. This is a seed of such force and vitality that it does not ask our leave to germinate.

The momentary charge at Balaklava, in obedience to a blundering command, proving what a perfect machine the soldier is, has, properly enough, been celebrated by a poet laureate; but the steady, and for the most part successful, charge of this man, for some years, against the le-

gions of slavery, in obedience to an infinitely higher command, is as much more memorable than that as an intelligent and conscientious man is superior to a machine. Do you think that that will go unsung?

“Served him right,” “A dangerous man,” “He is undoubtedly insane.” So they proceed to live their sane, and wise, and altogether admirable lives, reading their Plutarch a little, but chiefly pausing at that feat of Putnam, who was let down into a wolf’s den; and in this wise they nourish themselves for brave and patriotic deeds sometime or other. The Tract Society could afford to print that story of Putnam. You might open the district schools with the reading of it, for there is nothing about slavery or the church in it; unless it occurs to the reader that some pastors are *wolves* in sheep’s clothing. “The American Board of Commissioners for Foreign Missions,” even, might dare to protest against *that* wolf. I have heard of boards, and of American boards, but it chances that I never heard of this particular lumber till lately. And yet I hear of northern men, and women, and children, by families, buying a “life membership” in such societies as these. A life membership in the grave! You can get buried cheaper than that.

Our foes are in our midst and all about us. There is hardly a house but is divided against itself, for our foe is the all but universal woodenness of both head and heart, the want of vitality in man, which is the effect of our vice; and hence are begotten fear, superstition, bigotry, persecution, and slavery of all kinds. We are mere figureheads upon a hulk, with livers in the place of hearts. The curse is the worship of idols, which at length changes the worshipper into a stone image himself; and the New Englander is just as much an idolater as the Hindu. This man was an exception, for he did not set up even a political graven image between him and his God.

A church that can never have done with excommunicating Christ while it exists! Away with your broad and flat churches, and your narrow and tall churches! Take a step forward, and invent a new style of outhouses. Invent a salt that will save you, and defend our nostrils.

The modern Christian is a man who has consented to say all the prayers in the liturgy, provided you will let him go straight to bed and sleep quietly afterward. All his prayers begin with “Now I lay me down to sleep,” and he is forever looking forward to the time when he shall go to his “*long rest*.” He has consented to perform certain old-established charities, too, after a fashion, but he does not wish to hear of any newfangled ones; he doesn’t wish to have any supplementary articles added to the contract, to fit it to the present time. He shows the whites of his eyes

on the Sabbath, and the blacks all the rest of the week. The evil is not merely a stagnation of blood, but a stagnation of spirit. Many, no doubt, are well disposed, but sluggish by constitution and by habit, and they cannot conceive of a man who is actuated by higher motives than they are. Accordingly they pronounce this man insane, for they know that *they* could never act as he does, as long as they are themselves.

We dream of foreign countries, of other times and races of men, placing them at a distance in history or space; but let some significant event like the present occur in our midst, and we discover, often, this distance and this strangeness between us and our nearest neighbors. *They* are our Austrias, and Chinas, and South Sea Islands. Our crowded society becomes well spaced all at once, clean and handsome to the eye, a city of magnificent distances. We discover why it was that we never got beyond compliments and surfaces with them before; we become aware of as many versts between us and them as there are between a wandering Tartar and a Chinese town. The thoughtful man becomes a hermit in the thoroughfares of the market place. Impassable seas suddenly find their level between us, or dumb steppes stretch themselves out there. It is the difference of constitution, of intelligence, and faith, and not streams and mountains, that make the true and impassable boundaries between individuals and between states. None but the like-minded can come plenipotentiary to our court.

I read all the newspapers I could get within a week after this event, and I do not remember in them a single expression of sympathy for these men. I have since seen one noble statement, in a Boston paper, not editorial. Some voluminous sheets decided not to print the full report of Brown's words to the exclusion of other matter. It was as if a publisher should reject the manuscript of the New Testament, and print Wilson's last speech. The same journal which contained this pregnant news was chiefly filled, in parallel columns, with the reports of the political conventions that were being held. But the descent to them was too steep. They should have been spared this contrast—been printed in an extra, at least. To turn from the voices and deeds of earnest men to the *cackling* of political conventions! Office seekers and speechmakers, who do not so much as lay an honest egg, but wear their breasts bare upon an egg of chalk! Their great game is the game of straws, or rather that universal aboriginal game of the platter, at which the Indians cried *hub, bub!* Exclude the reports of religious and political conventions, and publish the words of a living man.

But I object not so much to what they have omitted as to what they

have inserted. Even the *Liberator* called it “a misguided, wild, and apparently insane—effort.” As for the herd of newspapers and magazines, I do not chance to know an editor in the country who will deliberately print anything which he knows will ultimately and permanently reduce the number of his subscribers. They do not believe that it would be expedient. How then can they print truth? If we do not say pleasant things, they argue, nobody will attend to us. And so they do like some traveling auctioneers, who sing an obscene song, in order to draw a crowd around them. Republican editors, obliged to get their sentences ready for the morning edition, and accustomed to look at everything by the twilight of politics, express no admiration, nor true sorrow even, but call these men “deluded fanatics,” “mistaken men,” “insane,” or “crazed.” It suggests what a *sane* set of editors we are blessed with, *not* “mistaken men”; who know very well on which side their bread is buttered, at least.

A man does a brave and humane deed, and at once, on all sides, we hear people and parties declaring, “I didn’t do it, nor countenance *him* to do it, in any conceivable way. It can’t be fairly inferred from my past career.” I, for one, am not interested to hear you define your position. I don’t know that I ever was or ever shall be. I think it is mere egotism, or impertinent at this time. Ye needn’t take so much pains to wash your skirts of him. No intelligent man will ever be convinced that he was any creature of yours. He went and came, as he himself informs us, “under the auspices of John Brown and nobody else.” The Republican party does not perceive how many his *failure* will make to vote more correctly than they would have them. They have counted the votes of Pennsylvania & Co., but they have not correctly counted Captain Brown’s vote. He has taken the wind out of their sails—the little wind they had—and they may as well lie to and repair.

What though he did not belong to your clique! Though you may not approve of his method or his principles, recognize his magnanimity. Would you not like to claim kindredship with him in that, though in no other thing he is like, or likely, to you? Do you think that you would lose your reputation so? What you lost at the spile, you would gain at the bung.

If they do not mean all this, then they do not speak the truth, and say what they mean. They are simply at their old tricks still.

“It was always conceded to him,” says *one who calls him crazy*, “that he was a conscientious man, very modest in his demeanor, apparently inoffensive, until the subject of slavery was introduced, when he would exhibit a feeling of indignation unparalleled.”

The slave ship is on her way, crowded with its dying victims; new

cargoes are being added in mid-ocean; a small crew of slaveholders, countenanced by a large body of passengers, is smothering four millions under the hatches, and yet the politician asserts that the only proper way by which deliverance is to be obtained is by "the quiet diffusion of the sentiments of humanity," without any "outbreak." As if the sentiments of humanity were ever found unaccompanied by its deeds, and you could disperse them, all finished to order, the pure article, as easily as water with a watering pot, and so lay the dust. What is that that I hear cast overboard? The bodies of the dead that have found deliverance. That is the way we are "diffusing" humanity, and its sentiments with it.

Prominent and influential editors, accustomed to deal with politicians, men of an infinitely lower grade, say, in their ignorance, that he acted "on the principle of revenge." They do not know the man. They must enlarge themselves to conceive of him. I have no doubt that the time will come when they will begin to see him as he was. They have got to conceive of a man of faith and of religious principle, and not a politician or an Indian; of a man who did not wait till he was personally interfered with or thwarted in some harmless business" before he gave his life to the cause of the oppressed.

If Walker may be considered the representative of the South, I wish I could say that Brown was the representative of the North. He was a superior man. He did not value his bodily life in comparison with ideal things. He did not recognize unjust human laws, but resisted them as he was bid. For once we are lifted out of the trivialness and dust of politics into the region of truth and manhood. No man in America has ever stood up so persistently and effectively for the dignity of human nature, knowing himself for a man, and the equal of any and all governments. In that sense he was the most American of us all. He needed no babbling lawyer, making false issues, to defend him. He was more than a match for all the judges that American voters, or officeholders of whatever grade, can create. He could not have been tried by a jury of his peers, because his peers did not exist. When a man stands up serenely against the condemnation and vengeance of mankind, rising above them literally *by a whole body*—even though he were of late the vilest murderer, who has settled that matter with himself—the spectacle is a sublime one—didn't ye know it, ye *Liberators*, ye *Tribunes*, ye *Republicans*?—and we become criminal in comparison. Do yourselves the honor to recognize him. He needs none of your respect.

As for the Democratic journals, they are not human enough to affect me at all. I do not feel indignation at anything they may say.

I am aware that I anticipate a little, that he was still, at the last ac-

counts, alive in the hands of his foes; but that being the case, I have all along found myself thinking and speaking of him as physically dead.

I do not believe in erecting statues to those who still live in our hearts, whose bones have not yet crumbled in the earth around us, but I would rather see the statue of Captain Brown in the Massachusetts Statehouse yard than that of any other man whom I know. I rejoice that I live in this age, that I am his contemporary.

What a contrast, when we turn to that political party which is so anxiously shuffling him and his plot out of its way, and looking around for some available slaveholder, perhaps, to be its candidate, at least for one who will execute the Fugitive Slave Law, and all those other unjust laws which he took up arms to annul!

Insane! A father and six sons, and one son-in-law, and several more men besides—as many at least as twelve disciples—all struck with insanity at once; while the sane tyrant holds with a firmer gripe than ever his four millions of slaves, and a thousand sane editors, his abettors, are saving their country and their bacon! Just as insane were his efforts in Kansas. Ask the tyrant who is his most dangerous foe, the sane man or the insane? Do the thousands who know him best, who have rejoiced at his deeds in Kansas, and have afforded him material aid there, think him insane? Such a use of this word is a mere trope with most who persist in using it, and I have no doubt that many of the rest have already in silence retracted their words.

Read his admirable answers to Mason and others. How they are dwarfed and defeated by the contrast! On the one side, half-brutish, half-timid questioning; on the other, truth, clear as lightning, crashing into their obscene temples. They are made to stand with Pilate, and Gessler, and the Inquisition. How ineffectual their speech and action! and what a void their silence! They are but helpless tools in this great work. It was no human power that gathered them about this preacher.

What have Massachusetts and the North sent a few *sane* representatives to Congress for, of late years?—to declare with effect what kind of sentiments? All their speeches put together and boiled down—and probably they themselves will confess it—do not match for manly directness and force, and for simple truth, the few casual remarks of crazy John Brown on the floor of the Harpers Ferry enginehouse—that man whom you are about to hang, to send to the other world, though not to represent *you* there. No, he was not our representative in any sense. He was too fair a specimen of a man to represent the like of us. Who, then, *were* his constituents? If you read his words understandingly you will find out. In his

case there is no idle eloquence, no made, nor maiden speech, no compliments to the oppressor. Truth is his inspirer, and earnestness the polisher of his sentences. He could afford to lose his Sharps rifles, while he retained his faculty of speech—a Sharps rifle of infinitely surer and longer range.

And the *New York Herald* reports the conversation *verbatim!* It does not know of what undying words it is made the vehicle.

I have no respect for the penetration of any man who can read the report of that conversation and still call the principle in it insane. It has the ring of a saner sanity than an ordinary discipline and habits of life, than an ordinary organization, secure. Take any sentence of it—"Any questions that I can honorably answer, I will; not otherwise. So far as I am myself concerned, I have told everything truthfully. I value my word, sir." The few who talk about his vindictive spirit, while they really admire his heroism, have no test by which to detect a noble man, no amalgam to combine with his pure gold. They mix their own dross with it.

It is a relief to turn from these slanders to the testimony of his more truthful, but frightened jailers and hangmen. Governor Wise speaks far more justly and appreciatingly of him than any northern editor, or politician, or public personage, that I chance to have heard from. I know that you can afford to hear him again on this subject. He says: "They are themselves mistaken who take him to be a madman. . . . He is cool, collected, and indomitable, and it is but just to him to say that he was humane to his prisoners. . . . And he inspired me with great trust in his integrity as a man of truth. He is a fanatic, vain and garrulous" (I leave that part to Mr. Wise), "but firm, truthful, and intelligent. His men, too, who survive, are like him. . . . Colonel Washington says that he was the coolest and firmest man he ever saw in defying danger and death. With one son dead by his side, and another shot through, he felt the pulse of his dying son with one hand, and held his rifle with the other, and commanded his men with the utmost composure, encouraging them to be firm, and to sell their lives as dear as they could. Of the three white prisoners, Brown, Stevens, and Coppoc, it was hard to say which was most firm."

Almost the first northern men whom the slaveholder has learned to respect!

The testimony of Mr. Vallandigham, though less valuable, is of the same purport, that "it is vain to underrate either the man or his conspiracy. . . . He is the farthest possible removed from the ordinary ruffian, fanatic, or madman."

“All is quiet at Harpers Ferry,” say the journals. What is the character of that calm which follows when the law and the slaveholder prevail? I regard this event as a touchstone designed to bring out, with glaring distinctness, the character of this government. We needed to be thus assisted to see it by the light of history. It needed to see itself. When a government puts forth its strength on the side of injustice, as ours to maintain slavery and kill the liberators of the slave, it reveals itself a merely brute force, or worse, a demoniacal force. It is the head of the pluguglies. It is more manifest than ever that tyranny rules. I see this government to be effectually allied with France and Austria in oppressing mankind. There sits a tyrant holding fettered four millions of slaves; here comes their heroic liberator. This most hypocritical and diabolical government looks up from its seat on the gasping four millions, and inquires with an assumption of innocence: “What do you assault me for? Am I not an honest man? Cease agitation on this subject, or I will make a slave of you, too, or else hang you.”

We talk about a *representative* government; but what a monster of a government is that where the noblest faculties of the mind, and the *whole* heart, are not *represented*. A semihuman tiger or ox, stalking over the earth, with its heart taken out and the top of its brain shot away. Heroes have fought well on their stumps when their legs were shot off, but I never heard of any good done by such a government as that.

The only government that I recognize—and it matters not how few are at the head of it, or how small its army—is that power that establishes justice in the land, never that which establishes injustice. What shall we think of a government to which all the truly brave and just men in the land are enemies, standing between it and those whom it oppresses? A government that pretends to be Christian and crucifies a million Christs every day!

Treason! Where does such treason take its rise? I cannot help thinking of you as you deserve, ye governments. Can you dry up the fountains of thought? High treason, when it is resistance to tyranny here below, has its origin in, and is first committed by, the power that makes and forever recreates man. When you have caught and hung all these human rebels, you have accomplished nothing but your own guilt, for you have not struck at the fountainhead. You presume to contend with a foe against whom West Point cadets and rifled cannon *point* not. Can all the art of the cannon founder tempt matter to turn against its maker? Is the form in which the founder thinks he casts it more essential than the constitution of it and of himself?

The United States have a coffle of four millions of slaves. They are determined to keep them in this condition; and Massachusetts is one of the confederated overseers to prevent their escape. Such are not all the inhabitants of Massachusetts, but such are they who rule and are obeyed here. It was Massachusetts, as well as Virginia, that put down this insurrection at Harpers Ferry. She sent the marines there, and she will have to *pay the penalty of her sin*.

Suppose that there is a society in this state that out of its own purse and magnanimity saves all the fugitive slaves that run to us, and protects our colored fellow citizens, and leaves the other work to the government, so called. Is not that government fast losing its occupation, and becoming contemptible to mankind? If private men are obliged to perform the offices of government, to protect the weak and dispense justice, then the government becomes only a hired man, or clerk, to perform menial or indifferent services. Of course, that is but the shadow of a government whose existence necessitates a Vigilant Committee. What should we think of the Oriental Cadi even, behind whom worked in secret a Vigilant Committee? But such is the character of our Northern states generally; each has its Vigilant Committee. And, to a certain extent, these crazy governments recognize and accept this relation. They say, virtually, "We'll be glad to work for you on these terms, only don't make a noise about it." And thus the government, its salary being insured, withdraws into the back shop, taking the Constitution with it, and bestows most of its labor on repairing that. When I hear it at work sometimes, as I go by, it reminds me, at best, of those farmers who in winter contrive to turn a penny by following the coopering business. And what kind of spirit is their barrel made to hold? They speculate in stocks, and bore holes in mountains, but they are not competent to lay out even a decent highway. The only *free* road, the Underground Railroad, is owned and managed by the Vigilant Committee. *They* have tunneled under the whole breadth of the land. Such a government is losing its power and respectability as surely as water runs out of a leaky vessel, and is held by one that can contain it.

I hear many condemn these men because they were so few. When were the good and the brave ever in a majority? Would you have had him wait till that time came?—till you and I came over to him? The very fact that he had no rabble or troop of hirelings about him would alone distinguish him from ordinary heroes. His company was small indeed, because few could be found worthy to pass muster. Each one who there laid down his life for the poor and oppressed was a picked man, culled

out of many thousands, if not millions; apparently a man of principle, of rare courage, and devoted humanity; ready to sacrifice his life at any moment for the benefit of his fellow man. It may be doubted if there were as many more their equals in these respects in all the country—I speak of his followers only—for their leader, no doubt, scoured the land far and wide, seeking to swell his troop. These alone were ready to step between the oppressor and the oppressed. Surely they were the very best men you could select to be hung. That was the greatest compliment which this country could pay them. They were ripe for her gallows. She has tried a long time, she has hung a good many, but never found the right one before.

When I think of him, and his six sons, and his son-in-law, not to enumerate the others, enlisted for this fight, proceeding coolly, reverently, humanely to work, for months if not years, sleeping and waking upon it, summering and wintering the thought, without expecting any reward but a good conscience, while almost all America stood ranked on the other side—I say again that it affects me as a sublime spectacle. If he had had any journal advocating "*his cause*,"; any organ, as the phrase is, monotonously and wearisomely playing the same old tune, and then passing round the hat, it would have been fatal to his efficiency. If he had acted in any way so as to be let alone by the government, he might have been suspected. It was the fact that the tyrant must give place to him, or he to the tyrant, that distinguished him from all the reformers of the day that I know.

It was his peculiar doctrine that a man has a perfect right to interfere by force with the slaveholder, in order to rescue the slave. I agree with him. They who are continually shocked by slavery have some right to be shocked by the violent death of the slaveholder, but no others. Such will be more shocked by his life than by his death. I shall not be forward to think him mistaken in his method who quickest succeeds to liberate the slave. I speak for the slave when I say that I prefer the philanthropy of Captain Brown to that philanthropy which neither shoots me nor liberates me. At any rate, I do not think it is quite sane for one to spend his whole life in talking or writing about this matter, unless he is continuously inspired, and I have not done so. A man may have other affairs to attend to. I do not wish to kill nor to be killed, but I can foresee circumstances in which both these things would be by me unavoidable. We preserve the so-called peace of our community by deeds of petty violence every day. Look at the policeman's billy and handcuffs! Look at the jail! Look at the gallows! Look at the chaplain of the regiment! We

are hoping only to live safely on the outskirts of *this* provisional army. So we defend ourselves and our henroosts, and maintain slavery. I know that the mass of my countrymen think that the only righteous use that can be made of Sharps rifles and revolvers is to fight duels with them, when we are insulted by other nations, or to hunt Indians, or shoot fugitive slaves with them, or the like. I think that for once the Sharps rifles and the revolvers were employed in a righteous cause. The tools were in the hands of one who could use them.

The same indignation that is said to have cleared the temple once will clear it again. The question is not about the weapon, but the spirit in which you use it. No man has appeared in America, as yet, who loved his fellow man so well, and treated him so tenderly. He lived for him. He took up his life and he laid it down for him. What sort of violence is that which is encouraged, not by soldiers, but by peaceable citizens, not so much by laymen as by ministers of the Gospel, not so much by the fighting sects as by the Quakers, and not so much by Quaker men as by Quaker women?

This event advertises me that there is such a fact as death—the possibility of a man's dying. It seems as if no man had ever died in America before; for in order to die you must first have lived. I don't believe in the hearses, and palls, and funerals that they have had. There was no death in the case, because there had been no life; they merely rotted or sloughed off, pretty much as they had rotted or sloughed along. No temple's veil was rent, only a hole dug somewhere. Let the dead bury their dead. The best of them fairly ran down like a clock. Franklin, Washington—they were let off without dying; they were merely missing one day. I hear a good many pretend that they are going to die; or that they have died, for aught that I know. Nonsense! I'll defy them to do it. They haven't got life enough in them. They'll deliquesce like fungi, and keep a hundred eulogists mopping the spot where they left off. Only half a dozen or so have died since the world began. Do you think that you are going to die, Sir? No! There's no hope of you. You haven't got your lesson yet. You've got to stay after school. We make a needless ado about capital punishment—taking lives, when there is no life to take. *Memento mori!* We don't understand that sublime sentence which some worthy got sculptured on his gravestone once. We've interpreted it in a groveling and sniveling sense; we've wholly forgotten how to die.

But be sure you do die nevertheless. Do your work, and finish it. If you know how to begin, you will know when to end.

These men, in teaching us how to die, have at the same time taught us

how to live. If this man's acts and words do not create a revival, it will be the severest possible satire on the acts and words that do. It is the best news that America has ever heard. It has already quickened the feeble pulse of the North, and infused more and more generous blood into her veins and heart than any number of years of what is called commercial and political prosperity could. How many a man who was lately contemplating suicide has now something to live for!

One writer says that Brown's peculiar monomania made him to be "dreaded by the Missourians as a supernatural being." Sure enough, a hero in the midst of us cowards is always so dreaded. He is just that thing. He shows himself superior to nature. He has a spark of divinity in him.

Unless above himself he can
Erect himself, how poor a thing is man!

Newspaper editors argue also that it is a proof of his *insanity* that he thought he was appointed to do this work which he did—that he did not suspect himself for a moment! They talk as if it were impossible that a man could be "divinely appointed" in these days to do any work whatever; as if vows and religion were out of date as connected with any man's daily work; as if the agent to abolish slavery could only be somebody appointed by the President, or by some political party. They talk as if a man's death were a failure, and his continued life, be it of whatever character, were a success.

When I reflect to what a cause this man devoted himself, and how religiously, and then reflect to what cause his judges and all who condemn him so angrily and fluently devote themselves, I see that they are as far apart as the heavens and earth are asunder.

The amount of it is, our "*leading men*" are a harmless kind of folk, and they know *well enough* that *they* were not divinely appointed, but elected by the votes of their party.

Who is it whose safety requires that Captain Brown be hung? Is it indispensable to any northern man? Is there no resource but to cast this man also to the Minotaur? If you do not wish it, say so distinctly. While these things are being done, beauty stands veiled and music is a screeching lie. Think of him—of his rare qualities!—such a man as it takes ages to make, and ages to understand; no mock hero, nor the representative of any party. A man such as the sun may not rise upon again in this benighted land. To whose making went the costliest material, the finest

adamant; sent to be the redeemer of those in captivity; and the only use to which you can put him is to hang him at the end of a rope! You who pretend to care for Christ crucified, consider what you are about to do to him who offered himself to be the savior of four millions of men.

Any man knows when he is justified, and all the wits in the world cannot enlighten him on that point. The murderer always knows that he is justly punished; but when a government takes the life of a man without the consent of his conscience, it is an audacious government, and is taking a step towards its own dissolution. Is it not possible that an individual may be right and a government wrong? Are laws to be enforced simply because they were made? or declared by any number of men to be good, if they are *not* good? Is there any necessity for a man's being a tool to perform a deed of which his better nature disapproves? Is it the intention of lawmakers that *good* men shall be hung ever? Are judges to interpret the law according to the letter, and not the spirit? What right have *you* to enter into a compact with yourself that you *will* do thus or so, against the light within you? Is it for *you* to *make up* your mind, to form any resolution whatever, and not accept the convictions that are forced upon you, and which ever pass your understanding? I do not believe in lawyers, in that mode of attacking or defending a man, because you descend to meet the judge on his own ground, and, in cases of the highest importance, it is of no consequence whether a man breaks a human law or not. Let lawyers decide trivial cases. Businessmen may arrange that among themselves. If they were the interpreters of the everlasting laws which rightfully bind man, that would be another thing. A counterfeiting law-factory, standing half in a slave land and half in a free! What kind of laws for free men can you expect from that?

I am here to plead his cause with you. I plead not for his life, but for his character—his immortal life; and so it becomes your cause wholly, and is not his in the least. Some eighteen hundred years ago Christ was crucified; this morning, perchance, Captain Brown was hung. These are the two ends of a chain which is not without its links. He is not Old Brown any longer; he is an angel of light.

I see now that it was necessary that the bravest and humanest man in all the country should be hung. Perhaps he saw it himself. I *almost fear* that I may yet hear of his deliverance, doubting if a prolonged life, if *any* life, can do as much good as his death.

“Misguided!” “Garrulous!” “Insane!” “Vindictive!” So ye write in your easy chairs, and thus he wounded responds from the floor of the armory,

clear as a cloudless sky, true as the voice of nature is: "No man sent me here; it was my own prompting and that of my Maker. I acknowledge no master in human form."

And in what a sweet and noble strain he proceeds, addressing his captors, who stand over him: "I think, my friends, you are guilty of a great wrong against God and humanity, and it would be perfectly right for anyone to interfere with you so far as to free those you willfully and wickedly hold in bondage."

And, referring to his movement: "It is, in my opinion, the greatest service a man can render to God."

"I pity the poor in bondage that have none to help them; that is why I am here; not to gratify any personal animosity, revenge, or vindictive spirit. It is my sympathy with the oppressed and the wronged, that are as good as you, and as precious in the sight of God."

You don't know your testament when you see it.

"I want you to understand that I respect the rights of the poorest and weakest of colored people, oppressed by the slave power, just as much as I do those of the most wealthy and powerful."

"I wish to say, furthermore, that you had better, all you people at the South, prepare yourselves for a settlement of that question, that must come up for settlement sooner than you are prepared for it. The sooner you are prepared the better. You may dispose of me very easily. I am nearly disposed of now; but this question is still to be settled—this Negro question, I mean; the end of that is not yet."

I foresee the time when the painter will paint that scene, no longer going to Rome for a subject; the poet will sing it; the historian record it; and, with the Landing of the Pilgrims and the Declaration of Independence, it will be the ornament of some future national gallery, when at least the present form of slavery shall be no more here. We shall then be at liberty to weep for Captain Brown. Then, and not till then, we will take our revenge.

Abraham Lincoln

1809–1865

Nothing in Abraham Lincoln's early life was designed to make him the great figure that he became. His father, Thomas, was a wandering homesteader, and Lincoln's family roved through three states in his early years, from Kentucky, where Lincoln was born on February 12, 1809, to Indiana and to Illinois. During those years Lincoln farmed, chopped trees, operated a flatboat on the Ohio River, and worked as a clerk in a store at New Salem, Illinois. In 1832, during the Black Hawk War against the Indians, Lincoln signed up in the local militia and was elected captain by the men of his company. At twenty-three he was already recognized as a natural leader.

During his early political career Lincoln was encouraged to study for the law. He did so on his own, as he said, never "in a college or an academy as a student." In 1836 he received a license to practice and soon established his office in Springfield, Illinois, where he met and married Mary Todd, the future mother of his four sons.

Lincoln first won national prominence when he campaigned against Stephen A. Douglas for the United States Senate. A series of debates with Douglas did not win him the election but brought him to the attention of the country. In the 1860 Republican National Convention Lincoln was nominated for President and won the national election. By the time Lincoln was inaugurated some southern states had already seceded from the Union. The country was soon plunged into civil war, and Lincoln was faced with the exhausting duties of a wartime President. He was re-elected in 1864, when the end of the war was in view and the task of reconstruction loomed ahead. Unfortunately, Lincoln never lived to see the country through that difficult period. He was shot by the actor John Wilkes Booth

on April 14, 1865, only five days after the end of the war, and died on the following morning. As the funeral train carried his body back to Springfield, thousands mourned the man who had served them through their great crisis.

Abraham Lincoln's speeches and writings were designed to clarify and direct the events of his period. Some of his speeches, such as the Gettysburg Address, are unexcelled in precision and power. It is more than likely that he could have been a great creative writer. He had no formal education, but the books he read as a boy had the happiest of influences upon him—such books as the *Bible*, *Pilgrims Progress*, *Robinson Crusoe*, and Aesop's *Fables*. His later readings in history and law, and his study of Euclid's *Elements* and of English grammar served to point and polish his prose style. His writings have the pungency of the fables, the precision of mathematics, and the splendid resonance of the Bible.

With one exception all of the selections here are addressed to the public. The exception is a brief note found in his papers—the “Meditation on the Divine Will.” It is interesting because in this private speculation Lincoln echoes a note which runs through many of his important speeches. It is the thought that God must have willed this contest where each side believed itself to be in the right. He adds despairingly: “Yet the contest proceeds.”

Lincoln's first speech in the East was made on February 27 at Cooper Institute in New York, shortly before he was nominated for the Presidency. Here he is the sharp-witted, hard-hitting lawyer, flaying the Democrats and defending the Republican policy of restricting the institution of slavery. Ridiculing the stand taken by proslavery Democrats, he says that they are “for the ‘gur-reat pur-rinciple’ that ‘if one man would enslave another, no third man should object,’ fantastically called ‘Popular Sovereignty.’ ” He points out that the United States Constitution, which southerners invoke, gives

Notes from the artist: “. . . a double portrait of Lincoln in a semisurrealistic style was used to suggest the two sides of his career, statesman and humanitarian. At left is an interpretation of an old slave sale poster, while at the right are facsimiles of two of Lincoln's notes.”

them no right to take slaves to free territories, and he shows that Jefferson regarded slavery as an evil, to be eventually eradicated. "Let us have faith that right makes might," he says in closing, "and . . . dare to do our duty."

On March 4, 1861, when Lincoln took the oath of office, southern states were already seceding from the Union. In his *First Inaugural Address*, Lincoln takes a humane and conciliatory point of view, argues the irrationality of war, and pleads for "a patient confidence in the ultimate justice of the people." This is more than the lawyer speaking; this is the man who has just taken on an appalling responsibility and is making a last effort to stave off the impending disaster.

In the deceptively simple *Gettysburg Address* of November 19, 1863, Lincoln states the ideal of government to which he rededicates the forces of the Union—so "that these dead shall not have died in vain." The re-establishment of the Union and the restoration of peace was always foremost in his mind. In his *Second Inaugural Address*, of March 4, 1865, even before the end of the war, he urged the people, while prosecuting the war to its end, to have "malice toward none," and "charity for all."

The letter to Horace Greeley of August 22, 1862, shows Lincoln in the unenviable role of conciliating the radical and the moderate elements of his government. In his last, prophetic address, which urged an understanding of the defeated South, he shows the strain of his prolonged debate with those who might still destroy the Union. Here the man who was nicknamed "Father Abraham" pleads for his recalcitrant children: "Finding themselves safely at home," he says, "it would be utterly immaterial whether they had ever been abroad."

It is little wonder that the admiration of Lincoln has become a cement binding all sections of the Union, which he did so much to preserve.

*Address at Cooper Institute*¹

B

February 27, 1860

ut enough! Let all who believe that “our fathers, who framed the government under which we live, understood this question just as well, and even better, than we do now,” speak as they spoke, and act as they acted upon it. This is all Republicans ask—all Republicans desire—in relation to slavery. As those fathers marked it, so let it be again marked, as an evil not to be extended, but to be tolerated and protected only because of and so far as its actual presence among us makes that toleration and protection a necessity. Let all the guaranties those fathers gave it be, not grudgingly, but fully and fairly maintained. For this Republicans contend, and with this, so far as I know or believe, they will be content.

And now, if they would listen—as I suppose they will not—I would address a few words to the Southern people.

I would say to them: You consider yourselves a reasonable and a just people; and I consider that in the general qualities of reason and justice you are not inferior to any other people. Still, when you speak of us Republicans, you do so only to denounce us as reptiles, or, at the best, as no better than outlaws. You will grant a hearing to pirates or murderers, but nothing like it to “Black Republicans.” In all your contentions with one another, each of you deems an unconditional condemnation of “Black Republicanism” as the first thing to be attended to. Indeed, such condemnation of us seems to be an indispensable prerequisite—license, so to speak—among you to be admitted or permitted to speak at all. Now, can you, or not, be prevailed upon to pause and to consider whether this is quite just to us, or even to yourselves? Bring forward your charges and specifications, and then be patient long enough to hear us deny or justify.

You say we are sectional. We deny it. That makes an issue; and the burden of proof is upon you. You produce your proof; and what is it?

1. This selection excludes Lincoln’s opening statements on the founding fathers’ attitude toward slavery.

Why, that our party has no existence in your section—gets no votes in your section. The fact is substantially true; but does it prove the issue? If it does, then in case we should, without change of principle, begin to get votes in your section, we should thereby cease to be sectional. You cannot escape this conclusion; and yet, are you willing to abide by it: If you are, you will probably soon find that we have ceased to be sectional, for we shall get votes in your section this very year. You will then begin to discover, as the truth plainly is, that your proof does not touch the issue. The fact that we get no votes in your section is a fact of your making, and not of ours. And if there be fault in that fact, that fault is primarily yours, and remains so until you show that we repel you by some wrong principle or practice. If we do repel you by any wrong principle or practice, the fault is ours; but this brings you to where you ought to have started—to a discussion of the right or wrong of our principle. If our principle, put in practice, would wrong your section for the benefit of ours, or for any other object, then our principle, and we with it, are sectional, and are justly opposed and denounced as such. Meet us, then, on the question of whether our principle, put in practice, would wrong your section; and so meet us as if it were possible that something may be said on our side. Do you accept the challenge? No! Then you really believe that the principle which “our fathers who framed the government under which we live” thought so clearly right as to adopt it, and endorse it again and again, upon their official oaths, is in fact so clearly wrong as to demand your condemnation without a moment’s consideration.

Some of you delight to flaunt in our faces the warning against sectional parties given by Washington in his Farewell Address. Less than eight years before Washington gave that warning, he had, as President of the United States, approved and signed an act of Congress, enforcing the prohibition of slavery in the Northwestern Territory, which act embodied the policy of the government upon that subject up to and at the very moment he penned that warning; and about one year after he penned it, he wrote Lafayette that he considered that prohibition a wise measure, expressing in the same connection his hope that we should at some time have a confederacy of free states.

Bearing this in mind, and seeing that sectionalism has since arisen upon this same subject, is that warning a weapon in your hands against us, or in our hands against you? Could Washington himself speak, would he cast the blame of that sectionalism upon us, who sustain his policy, or upon you who repudiate it? We respect that warning of Washington,

and we commend it to you, together with his example pointing to the right application of it.

But you say you are conservative—eminently conservative—while we are revolutionary, destructive, or something of the sort. What is conservatism? Is it not adherence to the old and tried, against the new and untried? We stick to, contend for, the identical old policy on the point in controversy which was adopted by “our fathers who framed the government under which we live”; while you with one accord reject, and scout, and spit upon that old policy, and insist upon substituting something new. True, you disagree among yourselves as to what that substitute shall be. You are divided on new propositions and plans, but you are unanimous in rejecting and denouncing the old policy of the fathers. Some of you are for reviving the foreign slave trade; some for a Congressional slave code for the territories; some for Congress forbidding the territories to prohibit slavery within their limits; some for maintaining slavery in the territories through the judiciary; some for the “gur-reat pur-rinciple” that “if one man would enslave another, no third man should object,” fantastically called “Popular Sovereignty”; but never a man among you in favor of federal prohibition of slavery in federal territories, according to the practice of “Our fathers who framed the government under which we live.” Not one of all your various plans can show a precedent or an advocate in the century within which our government originated. Consider, then, whether your claim of conservatism for yourselves, and your charge of destructiveness against us, are based on the most clear and stable foundations.

Again, you say we have made the slavery question more prominent than it formerly was. We deny it. We admit that it is more prominent, but we deny that we made it so. It was not we, but you, who discarded the old policy of the fathers. We resisted, and still resist, your innovation; and thence comes the greater prominence of the question. Would you have that question reduced to its former proportions? Go back to that old policy. What has been will be again, under the same conditions. If you would have the peace of the old times, readopt the precepts and policy of the old times.

You charge that we stir up insurrections among your slaves. We deny it; and what is your proof? Harper’s Ferry! John Brown!!² John Brown

2. John Brown, an abolitionist, had attempted in 1859 to incite a slave rebellion by seizing the federal arsenal at Harper’s Ferry, Virginia. He was captured and executed by Virginia. Lincoln was here carefully dissociating the Republican party from the extreme elements represented by Brown.

was no Republican; and you have failed to implicate a single Republican in his Harper's Ferry enterprise. If any member of our party is guilty in that matter, you know it or you do not know it. If you do know it, you are inexcusable for not designating the man and proving the fact. If you do not know it, you are inexcusable for asserting it, and especially for persisting in the assertion after you have tried and failed to make the proof. You need not be told that persisting in a charge which one does not know to be true is simply malicious slander.

Some of you admit that no Republican designedly aided or encouraged the Harper's Ferry affair; but still insist that our doctrines and declarations necessarily lead to such results. We do not believe it. We know we hold to no doctrine, and make no declaration, which were not held to and made by "our fathers who framed the government under which we live." You never dealt fairly by us in relation to this affair. When it occurred, some important state elections were near at hand, and you were in evident glee with the belief that, by charging the blame upon us, you could get an advantage of us in those elections. The elections came, and your expectations were not quite fulfilled. Every Republican man knew that, as to himself at least, your charge was a slander, and he was not much inclined by it to cast his vote in your favor. Republican doctrines and declarations are accompanied with a continual protest against any interference whatever with your slaves, or with you about your slaves. Surely, this does not encourage them to revolt. True, we do, in common with "our fathers, who framed the government under which we live," declare our belief that slavery is wrong; but the slaves do not hear us declare even this. For anything we say or do, the slaves would scarcely know there is a Republican party. I believe they would not, in fact, generally know it but for your misrepresentations of us, in their hearing. In your political contests among yourselves, each faction charges the other with sympathy with Black Republicanism; and then, to give point to the charge, defines Black Republicanism to simply be insurrection, blood and thunder among the slaves.

Slave insurrections are no more common now than they were before the Republican party was organized. What induced the Southampton insurrection,³ twenty-eight years ago, in which, at least, three times as many lives were lost as at Harper's Ferry? You can scarcely stretch your very elastic fancy to the conclusion that Southampton was "got up by Black Republicanism." In the present state of things in the United States,

3. A slave uprising in Virginia in 1831.

I do not think a general, or even a very extensive, slave insurrection is possible. The indispensable concert of action cannot be attained. The slaves have no means of rapid communication; nor can incendiary freemen, black or white, supply it. The explosive materials are everywhere in parcels; but there neither are, nor can be supplied, the indispensable connecting trains.

Much is said by Southern people about the affection of slaves for their masters and mistresses; and a part of it, at least, is true. A plot for an uprising could scarcely be devised and communicated to twenty individuals before some one of them, to save the life of a favorite master or mistress, would divulge it. This is the rule; and the slave revolution in Haiti⁴ was not an exception to it, but a case occurring under peculiar circumstances. The gunpowder plot of British history, though not connected with slaves, was more in point. In that case, only about twenty were admitted to the secret; and yet one of them, in his anxiety to save a friend, betrayed the plot to that friend, and, by consequence, averted the calamity. Occasional poisonings from the kitchen, and open or stealthy assassinations in the field, and local revolts extending to a score or so, will continue to occur as the natural results of slavery; but no general insurrection of slaves, as I think, can happen in this country for a long time. Whoever much fears, or much hopes for such an event, will be alike disappointed.

In the language of Mr. Jefferson, uttered many years ago, "It is still in our power to direct the process of emancipation, and deportation, peaceably, and in such slow degrees, as that the evil will wear off insensibly; and their places be, *pari passu*, filled up by free white laborers. If, on the contrary, it is left to force itself on, human nature must shudder at the prospect held up."

Mr. Jefferson did not mean to say, nor do I, that the power of emancipation is in the federal government. He spoke of Virginia; and, as to the power of emancipation, I speak of the slaveholding states only. The federal government, however, as we insist, has the power of restraining the extension of the institution—the power to insure that a slave insurrection shall never occur on any American soil which is now free from slavery.

John Brown's effort was peculiar. It was not a slave insurrection. It was an attempt by white men to get up a revolt among slaves, in which the slaves refused to participate. In fact, it was so absurd that the slaves, with all their ignorance, saw plainly enough it could not succeed. That

4. A revolution in 1791.

affair, in its philosophy, corresponds with the many attempts, related in history, at the assassination of kings and emperors. An enthusiast broods over the oppression of a people till he fancies himself commissioned by Heaven to liberate them. He ventures the attempt, which ends in little else than his own execution. Orsini's⁵ attempt on Louis Napoleon, and John Brown's attempt at Harper's Ferry, were, in their philosophy, precisely the same. The eagerness to cast blame on old England in the one case, and on New England in the other, does not disprove the sameness of the two things.

And how much would it avail you, if you could, by the use of John Brown, Helper's book,⁶ and the like, break up the Republican organization? Human action can be modified to some extent, but human nature cannot be changed. There is a judgment and a feeling against slavery in this nation, which cast at least a million and a half of votes. You cannot destroy that judgment and feeling—that sentiment—by breaking up the political organization which rallies around it. You can scarcely scatter and disperse an army which has been formed into order in the face of your heaviest fire; but if you could, how much would you gain by forcing the sentiment which created it out of the peaceful channel of the ballot box, into some other channel? What would that other channel probably be? Would the number of John Browns be lessened or enlarged by the operation?

But you will break up the Union rather than submit to a denial of your constitutional rights.

That has a somewhat reckless sound; but it would be palliated, if not fully justified, were we proposing, by the mere force of numbers, to deprive you of some right, plainly written down in the Constitution. But we are proposing no such thing.

When you make these declarations you have a specific and well-understood allusion to an assumed constitutional right of yours, to take slaves into the federal territories, and to hold them there as property. But no such right is specifically written in the Constitution. That instrument is literally silent about any such right. We, on the contrary, deny that such a right has any existence in the Constitution, even by implication.

Your purpose, then, plainly stated, is that you will destroy the government, unless you be allowed to construe and enforce the Constitution as

5. Felice Orsini, an Italian who attempted to assassinate Louis Napoleon in 1858.

6. Hinton R. Helper, author of *The Impending Crisis of the South*, an attack upon slavery by a former North Carolinian which infuriated the South.

you please, on all points in dispute between you and us. You will rule or ruin in all events.

This, plainly stated, is your language. Perhaps you will say the Supreme Court has decided the disputed constitutional question in your favor. Not quite so. But waiving the lawyer's distinction between dictum and decision, the Court have decided the question for you in a sort of way. The Court have substantially said, it is your constitutional right to take slaves into the federal territories, and to hold them there as property. When I say the decision was made in a sort of way, I mean it was made in a divided court, by a bare majority of the judges, and they not quite agreeing with one another in the reasons for making it; that it is so made as that its avowed supporters disagree with one another about its meaning, and that it was mainly based upon a mistaken statement of fact—the statement in the opinion that “the right of property in a slave is distinctly and expressly affirmed in the Constitution.”

An inspection of the Constitution will show that the right of property in a slave is not “*distinctly* and *expressly* affirmed” in it. Bear in mind, the judges do not pledge their judicial opinion that such right is *impliedly* affirmed in the Constitution; but they pledge their veracity that it is “*distinctly* and *expressly*” affirmed there—“distinctly,” that is, not mingled with anything else—“expressly,” that is, in words meaning just that, without the aid of an inference, and susceptible of no other meaning.

If they had only pledged their judicial opinion that such right is affirmed in the instrument by implication, it would be open to others to show that neither the word “slave” nor “slavery” is to be found in the Constitution, nor the word “property” even, in any connection with language alluding to the things slave, or slavery, and that wherever in that instrument the slave is alluded to, he is called a “person”; and wherever his master's legal right in relation to him is alluded to, it is spoken of as “service or labor which may be due”—as a debt payable in service or labor. Also, it would be open to show, by contemporaneous history, that this mode of alluding to slaves and slavery, instead of speaking of them, was employed on purpose to exclude from the Constitution the idea that there could be property in man.

To show all this is easy and certain.

When this obvious mistake of the judges shall be brought to their notice, is it not reasonable to expect that they will withdraw the mistaken statement, and reconsider the conclusion based upon it?

And then it is to be remembered that “our fathers, who framed the government under which we live”—the men who made the Constitution—decided this same constitutional question in our favor, long ago—decided it without division among themselves, when making the decision; without division among themselves about the meaning of it after it was made, and, so far as any evidence is left, without basing it upon any mistaken statement of fact.

Under all these circumstances, do you really feel yourselves justified to break up this government, unless such a court decision as yours is shall be at once submitted to as a conclusive and final rule of political action? But you will not abide the election of a Republican president! In that supposed event, you say, you will destroy the Union; and then, you say, the great crime of having destroyed it will be upon us! That is cool. A highwayman holds a pistol to my ear, and mutters through his teeth, “Stand and deliver, or I shall kill you, and then you will be a murderer!”

To be sure, what the robber demanded of me—my money—was my own; and I had a clear right to keep it; but it was no more my own than my vote is my own; and the threat of death to me, to extort my money, and the threat of destruction to the Union, to extort my vote, can scarcely be distinguished in principle.

A few words now to Republicans. It is exceedingly desirable that all parts of this great confederacy shall be at peace, and in harmony, one with another. Let us Republicans do our part to have it so. Even though much provoked, let us do nothing through passion and ill temper. Even though the Southern people will not so much as listen to us, let us calmly consider their demands, and yield to them if, in our deliberate view of our duty, we possibly can. Judging by all they say and do, and by the subject and nature of their controversy with us, let us determine, if we can, what will satisfy them.

Will they be satisfied if the territories be unconditionally surrendered to them? We know they will not. In all their present complaints against us, the territories are scarcely mentioned. Invasions and insurrections are the rage now. Will it satisfy them, if, in the future, we have nothing to do with invasions and insurrections? We know it will not. We so know, because we know we never had anything to do with invasions and insurrections; and yet this total abstaining does not exempt us from the charge and the denunciation.

The question recurs, what will satisfy them? Simply this: We must not only let them alone, but we must, somehow, convince them that we do let them alone. This, we know by experience, is no easy task. We have

been so trying to convince them from the very beginning of our organization, but with no success. In all our platforms and speeches we have constantly protested our purpose to let them alone; but this has had no tendency to convince them. Alike unavailing to convince them is the fact that they have never detected a man of us in any attempt to disturb them.

These natural, and apparently adequate means all failing, what will convince them? This, and this only: cease to call slavery *wrong*, and join them in calling it *right*. And this must be done thoroughly—done in *acts* as well as in *words*. Silence will not be tolerated—we must place ourselves avowedly with them. Senator Douglas' new sedition law must be enacted and enforced, suppressing all declarations that slavery is wrong, whether made in politics, in presses, in pulpits, or in private. We must arrest and return their fugitive slaves with greedy pleasure. We must pull down our free state constitutions. The whole atmosphere must be disinfected from all taint of opposition to slavery, before they will cease to believe that all their troubles proceed from us.

I am quite aware they do not state their case precisely in this way. Most of them would probably say to us, "Let us alone, *do* nothing to us, and *say* what you please about slavery." But we do let them alone—have never disturbed them—so that, after all, it is what we say which dissatisfies them. They will continue to accuse us of doing, until we cease saying.

I am also aware they have not, as yet, in terms, demanded the overthrow of our free-state constitutions. Yet those constitutions declare the wrong of slavery, with more solemn emphasis, than do all other sayings against it; and when all these other sayings shall have been silenced, the overthrow of these constitutions will be demanded, and nothing be left to resist the demand. It is nothing to the contrary that they do not demand the whole of this just now. Demanding what they do, and for the reason they do, they can voluntarily stop nowhere short of this consummation. Holding, as they do, that slavery is morally right, and socially elevating, they cannot cease to demand a full national recognition of it, as a legal right, and a social blessing.

Nor can we justifiably withhold this, on any ground save our conviction that slavery is wrong. If slavery is right, all words, acts, laws, and constitutions against it are themselves wrong, and should be silenced, and swept away. If it is right, we cannot justly object to its nationality—its universality; if it is wrong, they cannot justly insist upon its extension—its enlargement. All they ask, we could readily grant, if we thought slavery right; all we ask, they could as readily grant, if they thought it wrong. Their thinking it right, and our thinking it wrong, is the precise

fact upon which depends the whole controversy. Thinking it right, as they do, they are not to blame for desiring its full recognition, as being right; but, thinking it wrong, as we do, can we yield to them? Can we cast our votes with their view, and against our own? In view of our moral, social, and political responsibilities, can we do this?

Wrong as we think slavery is, we can yet afford to let it alone where it is, because that much is due to the necessity arising from its actual presence in the nation; but can we, while our votes will prevent it, allow it to spread into the national territories, and to overrun us here in these free states? If our sense of duty forbids this, then let us stand by our duty, fearlessly and effectively. Let us be diverted by none of those sophistical contrivances wherewith we are so industriously plied and belabored—contrivances such as groping for some middle ground between the right and the wrong, vain as the search for a man who should be neither a living man nor a dead man—such as a policy of “don’t care” on a question about which all true men do care—such as Union appeals beseeching true Union men to yield to Disunionists, reversing the divine rule, and calling, not the sinners, but the righteous to repentance—such as invocations to Washington, imploring men to unsay what Washington said, and undo what Washington did.

Neither let us be slandered from our duty by false accusations against us, nor frightened from it by menaces of destruction to the government nor of dungeons to ourselves. LET US HAVE FAITH THAT RIGHT MAKES MIGHT, AND IN THAT FAITH, LET US, TO THE END, DARE TO DO OUR DUTY AS WE UNDERSTAND IT.

First Inaugural Address

March 4, 1861

Fellow citizens of the United States:

In compliance with a custom as old as the government itself, I appear before you to address you briefly, and to take, in your presence, the oath prescribed by the Constitution of the United States, to be taken by the President "before he enters on the execution of his office."

I do not consider it necessary, at present, for me to discuss those matters of administration about which there is no special anxiety, or excitement.

Apprehension seems to exist among the people of the Southern states that by the accession of a Republican administration their property, and their peace, and personal security are to be endangered. There has never been any reasonable cause for such apprehension. Indeed, the most ample evidence to the contrary has all the while existed, and been open to their inspection. It is found in nearly all the published speeches of him who now addresses you. I do but quote from one of those speeches when I declare that "I have no purpose, directly or indirectly, to interfere with the institution of slavery in the states where it exists. I believe I have no lawful right to do so, and I have no inclination to do so." Those who nominated and elected me did so with full knowledge that I had made this and many similar declarations, and had never recanted them. And more than this, they placed in the platform, for my acceptance, and as a law to themselves, and to me, the clear and emphatic resolution which I now read:

Resolved, That the maintenance inviolate of the rights of the states, and especially the right of each state to order and control its own domestic institutions according to its own judgment exclusively, is essential to that balance of power on which the perfection and endurance of our political fabric depend; and we denounce the lawless invasion by armed

force of the soil of any state or territory, no matter under what pretext, as among the gravest of crimes.”

I now reiterate these sentiments: and in doing so, I only press upon the public attention the most conclusive evidence of which the case is susceptible, that the property, peace and security of no section are to be in anywise endangered by the now incoming administration. I add too that all the protection which, consistently with the Constitution and the laws, can be given will be cheerfully given to all the states when lawfully demanded, for whatever cause—as cheerfully to one section as to another.

There is much controversy about the delivering up of fugitives from service or labor. The clause I now read is as plainly written in the Constitution as any other of its provisions:

“No person held to service or labor in one state, under the law thereof, escaping into another, shall, in consequence of any law or regulation therein, be discharged from such service or labor, but shall be delivered up on claim of the party to whom such service or labor may be due.”

It is scarcely questioned that this provision was intended by those who made it for the reclaiming of what we call fugitive slaves; and the intention of the lawgiver is the law. All members of Congress swear their support to the whole Constitution—to this provision as much as to any other. To the proposition, then, that slaves whose cases come within the terms of this clause “shall be delivered up,” their oaths are unanimous. Now, if they would make the effort in good temper, could they not, with nearly equal unanimity, frame and pass a law by means of which to keep good that unanimous oath?

There is some difference of opinion whether this clause should be enforced by national or by state authority; but surely that difference is not a very material one. If the slave is to be surrendered, it can be of but little consequence to him, or to others, by which authority it is done. And should anyone, in any case, be content that his oath shall go unkept, on a merely unsubstantial controversy as to *how* it shall be kept?

Again, in any law upon this subject, ought not all the safeguards of liberty known in civilized and humane jurisprudence to be introduced, so that a free man be not, in any case, surrendered as a slave? And might it not be well, at the same time, to provide by law for the enforcement of that clause in the Constitution which guarantees that “The citizen of each state shall be entitled to all privileges and immunities of citizens in the several states?”

I take the official oath today, with no mental reservations, and with no

purpose to construe the Constitution or laws by any hypercritical rules. And while I do not choose now to specify particular acts of Congress as proper to be enforced, I do suggest that it will be much safer for all, both in official and private stations, to conform to, and abide by, all those acts which stand unrepealed, than to violate any of them, trusting to find impunity in having them held to be unconstitutional.

It is seventy-two years since the first inauguration of a President under our national Constitution. During that period fifteen different and greatly distinguished citizens have, in succession, administered the executive branch of the government. They have conducted it through many perils; and, generally, with great success. Yet, with all this scope for precedent, I now enter upon the same task for the brief constitutional term of four years, under great and peculiar difficulty. A disruption of the federal Union heretofore only menaced is now formidably attempted.

I hold, that in contemplation of universal law, and of the Constitution, the Union of these states is perpetual. Perpetuity is implied, if not expressed, in the fundamental law of all national governments. It is safe to assert that no government proper ever had a provision in its organic law for its own termination. Continue to execute all the express provisions of our national Constitution, and the Union will endure forever—it being impossible to destroy it, except by some action not provided for in the instrument itself.

Again, if the United States be not a government proper, but an association of states in the nature of contract merely, can it, as a contract, be peaceably unmade by less than all the parties who made it? One party to a contract may violate it—break it so to speak; but does it not require all to lawfully rescind it?

Descending from these general principles, we find the proposition that, in legal contemplation, the Union is perpetual, confirmed by the history of the Union itself. The Union is much older than the Constitution. It was formed in fact by the Articles of Association in 1774. It was matured and continued by the Declaration of Independence in 1776. It was further matured and the faith of all the then thirteen states expressly plighted and engaged that it should be perpetual, by the Articles of Confederation in 1778. And finally, in 1787, one of the declared objects for ordaining and establishing the Constitution was “*to form a more perfect union.*”

But if destruction of the Union, by one, or by a part only, of the states, be lawfully possible, the Union is *less* perfect than before the Constitution, having lost the vital element of perpetuity.

It follows from these views that no state, upon its own mere motion, can lawfully get out of the Union—that *resolves* and *ordinances* to that effect are legally void; and that acts of violence, within any state or states, against the authority of the United States are insurrectionary or revolutionary, according to circumstances.

I therefore consider that, in view of the Constitution and the laws, the Union is unbroken; and, to the extent of my ability, I shall take care, as the Constitution itself expressly enjoins upon me, that the laws of the Union be faithfully executed in all the states. Doing this I deem to be only a simple duty on my part; and I shall perform it, so far as practicable, unless my rightful masters, the American people, shall withhold the requisite means, or, in some authoritative manner, direct the contrary. I trust this will not be regarded as a menace, but only as the declared purpose of the Union that it *will* constitutionally defend, and maintain, itself.

In doing this there needs to be no bloodshed or violence; and there shall be none, unless it be forced upon the national authority. The power confided to me will be used to hold, occupy, and possess the property and places belonging to the government, and to collect the duties and imposts; but beyond what may be necessary for these objects, there will be no invasion—no using of force against or among the people anywhere. Where hostility to the United States, in any interior locality, shall be so great and so universal as to prevent competent resident citizens from holding the federal offices, there will be no attempt to force obnoxious strangers among the people for that object. While the strict legal right may exist in the government to enforce the exercise of these offices, the attempt to do so would be so irritating, and so nearly impracticable with all, that I deem it better to forego, for the time, the uses of such offices.

The mails, unless repelled, will continue to be furnished in all parts of the Union. So far as possible, the people everywhere shall have that sense of perfect security which is most favorable to calm thought and reflection. The course here indicated will be followed, unless current events, and experience, shall show a modification, or change, to be proper; and in every case and exigency, my best discretion will be exercised, according to circumstances actually existing, and with a view and a hope of a peaceful solution of the national troubles, and the restoration of fraternal sympathies and affections.

That there are persons in one section or another who seek to destroy the Union at all events, and are glad of any pretext to do it, I will neither

affirm or deny; but if there be such, I need address no word to them. To those, however, who really love the Union, may I not speak?

Before entering upon so grave a matter as the destruction of our national fabric, with all its benefits, its memories, and its hopes, would it not be wise to ascertain precisely why we do it? Will you hazard so desperate a step, while there is any possibility that any portion of the ills you fly from have no real existence? Will you, while the certain ills you fly to are greater than all the real ones you fly from? Will you risk the commission of so fearful a mistake?

All profess to be content in the Union, if all constitutional rights can be maintained. Is it true, then, that any right, plainly written in the Constitution, has been denied? I think not. Happily the human mind is so constituted that no party can reach to the audacity of doing this. Think, if you can, of a single instance in which a plainly written provision of the Constitution has ever been denied. If, by the mere force of numbers, a majority should deprive a minority of any clearly written constitutional right, it might, in a moral point of view, justify revolution—certainly would if such right were a vital one. But such is not our case. All the vital rights of minorities, and of individuals, are so plainly assured to them, by affirmations and negations, guarantees and prohibitions, in the Constitution that controversies never arise concerning them. But no organic law can ever be framed with a provision specifically applicable to every question which may occur in practical administration. No foresight can anticipate, nor any document of reasonable length contain express provisions for, all possible questions. Shall fugitives from labor be surrendered by national or by state authority? The Constitution does not expressly say. *May* Congress prohibit slavery in the territories? The Constitution does not expressly say. *Must* Congress protect slavery in the territories? The Constitution does not expressly say.

From questions of this class spring all our constitutional controversies, and we divide upon them into majorities and minorities. If the minority will not acquiesce, the majority must, or the government must cease. There is no other alternative; for continuing the government is acquiescence on one side or the other. If a minority, in such case, will secede rather than acquiesce, they make a precedent which, in turn, will divide and ruin them; for a minority of their own will secede from them whenever a majority refuses to be controlled by such minority. For instance, why may not any portion of a new confederacy, a year or two hence, arbitrarily secede again, precisely as portions of the present Union now

claim to secede from it. All who cherish disunion sentiments are now being educated to the exact temper of doing this. Is there such perfect identity of interests among the states to compose a new Union as to produce harmony only, and prevent renewed secession?

Plainly, the central idea of secession is the essence of anarchy. A majority, held in restraint by constitutional checks, and limitations, and always changing easily with deliberate changes of popular opinions and sentiments, is the only true sovereign of a free people. Whoever rejects it does, of necessity, fly to anarchy or to despotism. Unanimity is impossible; the rule of a minority, as a permanent arrangement, is wholly inadmissible; so that, rejecting the majority principle, anarchy, or despotism in some form, is all that is left.

I do not forget the position assumed by some, that constitutional questions are to be decided by the Supreme Court; nor do I deny that such decisions must be binding in any case upon the parties to a suit, as to the object of that suit, while they are also entitled to very high respect and consideration, in all parallel cases, by all other departments of the government. And while it is obviously possible that such decision may be erroneous in any given case, still the evil effect following it, being limited to that particular case, with the chance that it may be overruled and never become a precedent for other cases, can better be borne than could the evils of a different practice. At the same time the candid citizen must confess that if the policy of the government, upon vital questions affecting the whole people, is to be irrevocably fixed by decisions of the Supreme Court, the instant they are made, in ordinary litigation between parties, in personal actions, the people will have ceased to be their own rulers, having, to that extent, practically resigned their government into the hands of that eminent tribunal. Nor is there, in this view, any assault upon the court, or the judges. It is a duty, from which they may not shrink, to decide cases properly brought before them; and it is no fault of theirs, if others seek to turn their decisions to political purposes.

One section of our country believes slavery is *right*, and ought to be extended, while the other believes it is *wrong*, and ought not to be extended. This is the only substantial dispute. The fugitive slave clause of the Constitution, and the law for the suppression of the foreign slave trade, are each as well enforced, perhaps, as any law can ever be in a community where the moral sense of the people imperfectly supports the law itself. The great body of the people abide by the dry legal obligation in both cases, and a few break over in each. This, I think, cannot be

perfectly cured; and it would be worse in both cases *after* the separation of the sections than before. The foreign slave trade, now imperfectly suppressed, would be ultimately revived without restriction in one section; while fugitive slaves, now only partially surrendered, would not be surrendered at all by the other.

Physically speaking, we cannot separate. We cannot remove our respective sections from each other, nor build an impassable wall between them. A husband and wife may be divorced, and go out of the presence, and beyond the reach, of each other; but the different parts of our country cannot do this. They cannot but remain face to face; and intercourse, either amicable or hostile, must continue between them. Is it possible then to make that intercourse more advantageous, or more satisfactory, *after* separation than *before*? Can aliens make treaties easier than friends can make laws? Can treaties be more faithfully enforced between aliens than laws can among friends? Suppose you go to war, you cannot fight always; and when, after much loss on both sides, and no gain on either, you cease fighting, the identical old questions, as to terms of intercourse, are again upon you.

This country, with its institutions, belongs to the people who inhabit it. Whenever they shall grow weary of the existing government, they can exercise their *constitutional* right of amending it, or their *revolutionary* right to dismember or overthrow it. I cannot be ignorant of the fact that many worthy and patriotic citizens are desirous of having the national Constitution amended. While I make no recommendation of amendments, I fully recognize the rightful authority of the people over the whole subject, to be exercised in either of the modes prescribed in the instrument itself; and I should, under existing circumstances, favor, rather than oppose, a fair opportunity being afforded the people to act upon it.

I will venture to add that, to me, the convention mode seems preferable, in that it allows amendments to originate with the people themselves, instead of only permitting them to take or reject propositions originated by others, not especially chosen for the purpose, and which might not be precisely such as they would wish to either accept or refuse. I understand a proposed amendment to the Constitution—which amendment, however, I have not seen—has passed Congress, to the effect that the federal government shall never interfere with the domestic institutions of the states, including that of persons held to service. To avoid misconstruction of what I have said, I depart from my purpose not to

speaking of particular amendments, so far as to say that, holding such a provision to now be implied constitutional law, I have no objection to its being made express, and irrevocable.

The chief magistrate derives all his authority from the people, and they have conferred none upon him to fix terms for the separation of the states. The people themselves can do this also if they choose; but the executive, as such, has nothing to do with it. His duty is to administer the present government, as it came to his hands, and to transmit it, unimpaired by him, to his successor.

Why should there not be a patient confidence in the ultimate justice of the people? Is there any better, or equal, hope in the world? In our present differences, is either party without faith of being in the right? If the Almighty Ruler of nations, with his eternal truth and justice, be on your side of the North, or on yours of the South, that truth, and that justice, will surely prevail, by the judgment of this great tribunal, the American people.

By the frame of the government under which we live, this same people have wisely given their public servants but little power for mischief; and have, with equal wisdom, provided for the return of that little to their own hands at very short intervals.

While the people retain their virtue, and vigilance, no administration, by any extreme of wickedness or folly, can very seriously injure the government, in the short space of four years.

My countrymen, one and all, think calmly and well upon this whole subject. Nothing valuable can be lost by taking time. If there be an object to *hurry* any of you, in hot haste, to a step which you would never take deliberately, that object will be frustrated by taking time; but no good object can be frustrated by it. Such of you as are now dissatisfied still have the old Constitution unimpaired, and, on the sensitive point, the laws of your own framing under it; while the new administration will have no immediate power, if it would, to change either. If it were admitted that you who are dissatisfied hold the right side in the dispute, there still is no single good reason for precipitate action. Intelligence, patriotism, Christianity, and a firm reliance on Him, who has never yet forsaken this favored land, are still competent to adjust, in the best way, all our present difficulty.

In *your* hands, my dissatisfied fellow countrymen, and not in *mine*, is the momentous issue of civil war. The government will not assail *you*. You can have no conflict, without being yourselves the aggressors. *You* have no oath registered in Heaven to destroy the government, while *I*

shall have the most solemn one to “preserve, protect and defend” it.

I am loath to close. We are not enemies, but friends. We must not be enemies. Though passion may have strained, it must not break our bonds of affection. The mystic chords of memory, stretching from every battlefield and patriot grave to every living heart and hearthstone all over this broad land, will yet swell the chorus of the Union, when again touched, as surely they will be, by the better angels of our nature.

Letter to Horace Greeley

EXECUTIVE MANSION,
Washington, August 22, 1862

I Hon. Horace Greeley:
Dear Sir:

I have just read yours of the 19th addressed to myself through the New York *Tribune*. If there be in it any statements, or assumptions of fact, which I may know to be erroneous, I do not now and here controvert them. If there be in it any inferences which I may believe to be falsely drawn, I do not now and here, argue against them. If there be perceptible in it an impatient and dictatorial tone, I waive it in deference to an old friend, whose heart I have always supposed to be right.

As to the policy I “seem to be pursuing,” as you say, I have not meant to leave anyone in doubt.

I would save the Union. I would save it the shortest way under the Constitution. The sooner the national authority can be restored, the nearer the Union will be “the Union as it was.” If there be those who would not save the Union unless they could at the same time *save* slavery, I do not agree with them. If there be those who would not save the Union unless they could at the same time *destroy* slavery, I do not agree with them. My paramount object in this struggle *is* to save the Union, and *is not* either to save or to destroy slavery. If I could save the Union without freeing *any* slave, I would do it; and if I could save it by freeing *all* the slaves, I would do it; and if I could save it by freeing some and leaving others alone, I would also do that. What I do about slavery, and the colored race, I do because I believe it helps to save the Union; and what I forbear, I forbear because I do *not* believe it would help to save the Union. I shall do *less* whenever I shall believe what I am doing hurts the cause, and I shall do *more* whenever I shall believe doing more will help the cause. I shall try to correct errors when shown to be errors; and I shall adopt new views so fast as they shall appear to be true views.

I have here stated my purpose according to my view of *official* duty; and I intend no modification of my oft-expressed *personal* wish that all men everywhere could be free.

Yours,

A. Lincoln

Meditation on the Divine Will

T

[September 2, 1862?]

he will of God prevails. In great contests each party claims to act in accordance with the will of God. Both *may* be, and one *must* be, wrong. God can not be *for* and *against* the same thing at the same time. In the present civil war it is quite possible that God's purpose is something different from the purpose of either party—and yet the human instrumentalities, working just as they do, are of the best adaptation to effect His purpose. I am almost ready to say this is probably true—that God wills this contest, and wills that it shall not end yet. By His mere quiet power, on the minds of the now contestants, He could have either *saved* or *destroyed* the Union without a human contest. Yet the contest began. And having begun He could give the final victory to either side any day. Yet the contest proceeds.

The Gettysburg Address

November 19, 1863

Fourscore and seven years ago our fathers brought forth on this continent a new nation conceived in liberty and dedicated to the proposition that all men are created equal. Now we are engaged in a great civil war testing whether that nation, or any nation so conceived and so dedicated, can long endure. We are met on a great battlefield of that war. We have come to dedicate a portion of that field as a final resting place for those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this. But, in a larger sense, we cannot dedicate, we cannot consecrate, we cannot hallow this ground. The brave men, living and dead, who struggled here have consecrated it far above our poor power to add or detract. The world will little note nor long remember what we say here, but it can never forget what they did here. It is for us the living rather to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us—that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion—that we here highly resolve that these dead shall not have died in vain, that this nation under God shall have a new birth of freedom, and that government of the people, by the people, for the people, shall not perish from the earth.

Second Inaugural Address

March 4, 1865

At this second appearing to take the oath of the presidential office, there is less occasion for an extended address than there was at the first. Then a statement, somewhat in detail, of a course to be pursued seemed fitting and proper. Now, at the expiration of four years, during which public declarations have been constantly called forth on every point and phase of the great contest which still absorbs the attention and engrosses the energies of the nation, little that is new could be presented. The progress of our arms, upon which all else chiefly depends, is as well known to the public as to myself; and it is, I trust, reasonably satisfactory and encouraging to all. With high hope for the future, no prediction in regard to it is ventured.

On the occasion corresponding to this four years ago, all thoughts were anxiously directed to an impending civil war. All dreaded it—all sought to avert it. While the inaugural address was being delivered from this place, devoted altogether to *saving* the Union without war, insurgent agents were in the city seeking to *destroy* it without war—seeking to dissolve the Union, and divide effects, by negotiation. Both parties deprecated war; but one of them would *make* war rather than let the nation survive; and the other would *accept* war rather than let it perish. And the war came.

One-eighth of the whole population were colored slaves, not distributed generally over the Union, but localized in the Southern part of it. These slaves constituted a peculiar and powerful interest. All knew that this interest was, somehow, the cause of the war. To strengthen, perpetuate, and extend this interest was the object for which the insurgents would rend the Union, even by war; while the government claimed no right to do more than to restrict the territorial enlargement of it. Neither party expected for the war the magnitude, or the duration, which it has already attained. Neither anticipated that the *cause* of the conflict might

cease with, or even before, the conflict itself should cease. Each looked for an easier triumph, and a result less fundamental and astounding. Both read the same Bible, and pray to the same God; and each invokes His aid against the other. It may seem strange that any men should dare to ask a just God's assistance in wringing their bread from the sweat of other men's faces; but let us judge not that we be not judged. The prayers of both could not be answered; that of neither has been answered fully. The Almighty has His own purposes. "Woe unto the world because of offenses! for it must needs be that offenses come; but woe to that man by whom the offense cometh!" If we shall suppose that American slavery is one of those offenses which, in the providence of God, must needs come, but which, having continued through His appointed time, He now wills to remove, and that He gives to both North and South this terrible war as the woe due to those by whom the offense came, shall we discern therein any departure from those divine attributes which the believers in a living God always ascribe to Him? Fondly do we hope—ferently do we pray—that this mighty scourge of war may speedily pass away. Yet, if God wills that it continue, until all the wealth piled by the bondman's two hundred and fifty years of unrequited toil shall be sunk, and until every drop of blood drawn with the lash shall be paid by another drawn with the sword, as was said three thousand years ago, so still it must be said "the judgments of the Lord are true and righteous altogether."

With malice toward none; with charity for all; with firmness in the right as God gives us to see the right, let us strive on to finish the work we are in; to bind up the nation's wounds; to care for him who shall have borne the battle, and for his widow, and his orphan—to do all which may achieve and cherish a just and a lasting peace, among ourselves and with all nations.

Last Public Address

W

April 11, 1865

we meet this evening, not in sorrow, but in gladness of heart. The evacuation of Petersburg and Richmond and the surrender of the principal insurgent army give hope of a righteous and speedy peace whose joyous expression cannot be restrained. In the midst of this, however, He from Whom all blessings flow must not be forgotten. A call for a national thanksgiving is being prepared, and will be duly promulgated. Nor must those whose harder part gives us the cause of rejoicing be overlooked. Their honors must not be parceled out with others. I myself was near the front, and had the high pleasure of transmitting much of the good news to you; but no part of the honor, for plan or execution, is mine. To General Grant, his skillful officers, and brave men, all belongs. The gallant navy stood ready, but was not in reach to take active part.

By these recent successes the reinauguration of the national authority—reconstruction—which has had a large share of thought from the first, is pressed much more closely upon our attention. It is fraught with great difficulty. Unlike the case of a war between independent nations, there is no authorized organ for us to treat with. No one man has authority to give up the rebellion for any other man. We simply must begin with, and mould from, disorganized and discordant elements. Nor is it a small additional embarrassment that we, the loyal people, differ among ourselves as to the mode, manner, and means of reconstruction.

As a general rule, I abstain from reading the reports of attacks upon myself, wishing not to be provoked by that to which I cannot properly offer an answer. In spite of this precaution, however, it comes to my knowledge that I am much censured for some supposed agency in setting up, and seeking to sustain, the new state government of Louisiana. In this I have done just so much as, and no more than, the public knows. In the annual message of December, 1863, and the accompanying proclamation, I presented *a* plan of reconstruction (as the phrase goes)

which, I promised, if adopted by any state, would be acceptable to, and sustained by, the executive government of the nation. I distinctly stated that this was not the only plan which might possibly be acceptable; and I also distinctly protested that the executive claimed no right to say when or whether members should be admitted to seats in Congress from such states. This plan was, in advance, submitted to the then Cabinet, and distinctly approved by every member of it. One of them suggested that I should then, and in that connection, apply the Emancipation Proclamation to the theretofore excepted parts of Virginia and Louisiana; that I should drop the suggestion about apprenticeship for freed people, and that I should omit the protest against my own power in regard to the admission of members to Congress; but even he approved every part and parcel of the plan which has since been employed or touched by the action of Louisiana.

The new constitution of Louisiana, declaring emancipation for the whole state, practically applies the proclamation to the part previously excepted. It does not adopt apprenticeship for freed people; and it is silent, as it could not well be otherwise, about the admission of members to Congress. So that, as it applies to Louisiana, every member of the Cabinet fully approved the plan. The message went to Congress, and I received many commendations of the plan, written and verbal; and not a single objection to it, from any professed emancipationist, came to my knowledge until after the news reached Washington that the people of Louisiana had begun to move in accordance with it. From about July, 1862, I had corresponded with different persons supposed to be interested in seeking a reconstruction of a state government for Louisiana. When the message of 1863, with the plan before mentioned, reached New Orleans, General Banks wrote me that he was confident the people, with his military co-operation, would reconstruct substantially on that plan. I wrote to him and some of them to try it; they tried it, and the result is known. Such has been my only agency in getting up the Louisiana government. As to sustaining it, my promise is out, as before stated. But, as bad promises are better broken than kept, I shall treat this as a bad promise and break it, whenever I shall be convinced that keeping it is adverse to the public interest. But I have not yet been so convinced.

I have been shown a letter on this subject, supposed to be an able one, in which the writer expresses regret that my mind has not seemed to be definitely fixed on the question whether the seceded states, so called, are in the Union or out of it. It would perhaps add astonishment to his regret were he to learn that since I have found professed Union men

endeavoring to make that question, I have purposely forborne any public expression upon it. As appears to me that question has not been, nor yet is, a practically material one, and that any discussion of it, while it thus remains practically immaterial, could have no effect other than the mischievous one of dividing our friends. As yet, whatever it may become, that question is bad as the basis of a controversy, and good for nothing at all—a merely pernicious abstraction.

We all agree that the seceded states, so called, are out of their proper practical relation with the Union; and that the sole object of the government, civil and military, in regard to those states is to again get them into their proper practical relation. I believe that it is not only possible, but in fact easier, to do this without deciding, or even considering, whether these states have ever been out of the Union, than with it. Finding themselves safely at home, it would be utterly immaterial whether they had ever been abroad. Let us all join in doing the acts necessary to restoring the proper practical relations between these states and the Union; and each forever after innocently indulge his own opinion whether, in doing the act, he brought the states from without into the Union, or only gave them proper assistance, they never having been out of it.

The amount of constituency, so to speak, on which the new Louisiana government rests would be more satisfactory to all if it contained fifty, thirty, or even twenty thousand, instead of only about twelve thousand, as it does. It is also unsatisfactory to some that the elective franchise is not given to the colored man. I would myself prefer that it were now conferred on the very intelligent, and on those who serve our cause as soldiers. Still the question is not whether the Louisiana government, as it stands, is quite all that is desirable. The question is “Will it be wiser to take it as it is, and help to improve it; or to reject and disperse it?” “Can Louisiana be brought into proper practical relation with the Union sooner by sustaining or by discarding her new state government?”

Some twelve thousand voters in the heretofore slave state of Louisiana have sworn allegiance to the Union, assumed to be the rightful political power of the state, held elections, organized a state government, adopted a free-state constitution, giving the benefit of public schools equally to black and white, and empowering the legislature to confer the elective franchise upon the colored man. Their legislature has already voted to ratify the constitutional amendment recently passed by Congress, abolishing slavery throughout the nation. These twelve thousand persons are thus fully committed to the Union, and to perpetual freedom in the state—committed to the very things, and nearly all things, the nation wants—and they ask the nation’s recognition, and its assistance to make good

their committal. Now, if we reject and spurn them, we do our utmost to disorganize and disperse them. We in effect say to the white men, "You are worthless or worse; we will neither help you nor be helped by you." To the blacks we say, "This cup of liberty which these, your old masters, hold to your lips we will dash from you, and leave you to the chances of gathering the spilled and scattered contents in some vague and undefined when, where, and how." If this course, discouraging and paralyzing both white and black, has any tendency to bring Louisiana into proper practical relations with the Union, I have so far been unable to perceive it. If, on the contrary, we recognize and sustain the new government of Louisiana, the converse of all this is made true. We encourage the hearts and nerve the arms of the twelve thousand to adhere to their work, and argue for it, and proselyte for it, and fight for it, and feed it, and grow it, and ripen it to a complete success. The colored man, too, in seeing all united for him, is inspired with vigilance, and energy, and daring, to the same end. Grant that he desires the elective franchise, will he not attain it sooner by saving the already advanced steps toward it, than by running backward over them? Concede that the new government of Louisiana is only to what it should be as the egg is to the fowl, we shall sooner have the fowl by hatching the egg than by smashing it. Again, if we reject Louisiana, we also reject one vote in favor of the proposed amendment to the national constitution. To meet this proposition, it has been argued that no more than three-fourths of those states which have not attempted secession are necessary to validly ratify the amendment. I do not commit myself against this, further than to say that such a ratification would be questionable, and sure to be persistently questioned; while a ratification by three-fourths of all the states would be unquestioned and unquestionable.

I repeat the question. Can Louisiana be brought into proper practical relation with the Union sooner by sustaining or by discarding her new state government?

What has been said of Louisiana will apply generally to other states. And yet so great peculiarities pertain to each state; and such important and sudden changes occur in the same state; and, withal, so new and unprecedented is the whole case that no exclusive and inflexible plan can safely be prescribed as to details and collaterals. Such exclusive and inflexible plan would surely become a new entanglement. Important principles may, and must, be inflexible.

In the present "situation," as the phrase goes, it may be my duty to make some new announcement to the people of the South. I am considering, and shall not fail to act, when satisfied that action will be proper.

Sir Francis Bacon

1561–1626

The world to which Bacon addresses himself in these essays—indeed, in all of his essays—is both a greater and a smaller thing than the world that Henry Adams, for example, talks about. It is smaller in so far as it lacks both a future and a past, having only a present. Yet it is greater, too, in that its present has a permanence which the passage of three hundred years has very little modified. For the subject of these essays is superior to history, being the world as it exists at any time—the world that has young men and old, parents and children, marriage and single life, great place, seditions and troubles, custom and education, followers and friends, usury (or interest), and riches—the world, in short, that does not move or change. It is the world we have always with us, being human; and to know it is to recognize ourselves.

Not that in any sense it is the best world possible; it is merely the best one going, and the worst, since it is the only one there is. Bacon is serene about this, as any man may be whose philosopher in worldly matters is Machiavelli. Perhaps a better world can be conceived. In terms of these essays, it might combine the virtues of youth and age, just as it might be altogether free of civil strife, or cause men to act according to their knowledge rather than from habit. But none of those things happens to be true, Bacon reminds us, in the world that confronts us, of which we are obliged to make, he says, the best use we can.

Nor is there after all any lack of motion in such a world, lest we think it tame or dull. The motion is made by men as they move through it—as they rise, for instance, in the hierarchy of its stations.

¹ For a biography of Sir Francis Bacon, see Vol. 5, pp. 90–92, in this set.

Bacon, who did just that, is concerned to counsel those who do it after him, and to save them also from falling as he fell. Both things can happen in his world, which stands still while men attempt to master it, and waits too while one collects the truth about it in these brief and brilliant essays.

Of Youth and Age

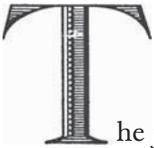

A man that is young in years may be old in hours, if he have lost no time. But that happeneth rarely. Generally, youth is like the first cogitations, not so wise as the second. For there is a youth in thoughts, as well as in ages. And yet the invention of young men is more lively than that of old; and imaginations stream into their minds better, and as it were more divinely. Natures that have much heat and great and violent desires and perturbations are not ripe for action till they have passed the meridian of their years; as it was with Julius Caesar, and Septimius Severus. Of the latter of whom it is said, *Juventutem egit erroribus, imo furoribus, plenam* [He spent a youth full of errors, even of madness]. And yet he was the ablest emperor, almost, of all the list. But reposed natures may do well in youth. As it is seen in Augustus Caesar, Cosmus Duke of Florence, Gaston de Foix, and others. On the other side, heat and vivacity in age is an excellent composition for business.

Young men are fitter to invent than to judge; fitter for execution than for counsel; and fitter for new projects than for settled business. For the experience of age, in things that fall within the compass of it, directeth them; but in new things, abuseth them. The errors of young men are the ruin of business; but the errors of aged men amount but to this, that more might have been done, or sooner. Young men, in the conduct and manage of actions, embrace more than they can hold; stir more than they can quiet; fly to the end, without consideration of the means and degrees; pursue some few principles which they have chanced upon absurdly; care not to innovate, which draws unknown inconveniences; use extreme remedies at first; and that which doubleth all errors, will not acknowledge or retract them; like an unready horse, that will neither stop nor turn. Men of age object too much, consult too long, adventure too little, repent too soon, and seldom drive business home to the full period, but content

themselves with a mediocrity of success. Certainly it is good to compound employments of both; for that will be good for the present, because the virtues of either age may correct the defects of both; and good for succession, that young men may be learners, while men in age are actors; and, lastly, good for extern accidents, because authority followeth old men, and favour and popularity youth. But for the moral part, perhaps youth will have the pre-eminence, as age hath for the politic.

A certain rabbin, upon the text, "Your young men shall see visions, and your old men shall dream dreams," inferreth that young men are admitted nearer to God than old, because vision is a clearer revelation than a dream. And certainly, the more a man drinketh of the world, the more it intoxicateth: and age doth profit rather in the powers of understanding, than in the virtues of the will and affections. There be some have an over-early ripeness in their years, which fadeth betimes. These are, first, such as have brittle wits, the edge whereof is soon turned; such as was Hermogenes the rhetorician, whose books are exceeding subtle; who afterwards waxed stupid. A second sort is of those that have some natural dispositions which have better grace in youth than in age; such as is a fluent and luxuriant speech; which becomes youth well, but not age: so Tully saith of Hortensius, *Idem manebat, neque idem decebat* [He continued in the same manner, even when it no longer became him]. The third is of such as take too high a strain at the first, and are magnanimous more than tract of years can uphold. As was Scipio Africanus, of whom Livy saith in effect, *Ultima primis cedebant* [His last days were not equal to his first].

Of Parents and Children

The joys of parents are secret; and so are their griefs and fears. They cannot utter the one; nor they will not utter the other. Children sweeten labours; but they make misfortunes more bitter. They increase the cares of life; but they mitigate the remembrance of death. The perpetuity by generation is common to beasts; but memory, merit, and noble works are proper to men. And surely a man shall see the noblest works and foundations have proceeded from childless men; which have sought to express the images of their minds, where those of their bodies have failed. So the care of posterity is most in them that have no posterity. They that are the first raisers of their houses are most indulgent towards their children; beholding them as the continuance not only of their kind but of their work; and so both children and creatures.

The difference in affection of parents towards their several children is many times unequal; and sometimes unworthy; especially in the mother; as Solomon saith, "A wise son rejoiceth the father, but an ungracious son shames the mother." A man shall see, where there is a house full of children, one or two of the eldest respected, and the youngest made wantons; but in the midst some that are as it were forgotten, who many times nevertheless prove the best. The illiberality of parents in allowance towards their children is an harmful error; makes them base; acquaints them with shifts; makes them sort with mean company; and makes them surfeit more when they come to plenty. And therefore the proof is best, when men keep their authority towards their children, but not their purse. Men have a foolish manner (both parents and schoolmasters and servants) in creating and breeding an emulation between brothers during childhood, which many times sorteth to discord when they are men, and disturbeth families. The Italians make little difference between children and nephews or near kinsfolk; but so they be of the lump, they care not

though they pass not through their own body. And, to say truth, in nature it is much a like matter; insomuch that we see a nephew sometimes resembleth an uncle or a kinsman more than his own parents; as the blood happens. Let parents choose betimes the vocations and courses they mean their children should take; for then they are most flexible; and let them not too much apply themselves to the disposition of their children, as thinking they will take best to that which they have most mind to. It is true, that if the affection or aptness of the children be extraordinary, then it is good not to cross it; but generally the precept is good, *optimum elige, suave et facile illud faciet consuetudo* [choose the best; habit will make it pleasant and easy]. Younger brothers are commonly fortunate, but seldom or never where the elder are disinherited.

Of Marriage and Single Life

He that hath wife and children hath given hostages to fortune; for they are impediments to great enterprises, either of virtue or mischief. Certainly the best works, and of greatest merit for the public, have proceeded from the unmarried or childless men; which both in affection and means have married and endowed the public. Yet it were great reason that those that have children should have greatest care of future times; unto which they know they must transmit their dearest pledges. Some there are, who though they lead a single life, yet their thoughts do end with themselves, and account future times impertinences. Nay, there are some other that account wife and children but as bills of charges. Nay more, there are some foolish, rich, covetous men that take a pride in having no children, because they may be thought so much the richer. For perhaps they have heard some talk, "Such an one is a great rich man," and another except to it, "Yea, but he hath a great charge of children"; as if it were an abatement to his riches. But the most ordinary cause of a single life is liberty, especially in certain self-pleasing and humorous minds, which are so sensible of every restraint, as they will go near to think their girdles and garters to be bonds and shackles. Unmarried men are best friends, best masters, best servants; but not always best subjects; for they are light to run away; and almost all fugitives are of that condition.

A single life doth well with churchmen; for charity will hardly water the ground where it must first fill a pool. It is indifferent for judges and magistrates; for if they be facile and corrupt, you shall have a servant five times worse than a wife. For soldiers, I find the generals commonly in their hortatives put men in mind of their wives and children; and I think the despising of marriage amongst the Turks maketh the vulgar soldier more base. Certainly wife and children are a kind of discipline of

humanity; and single men, though they may be many times more charitable, because their means are less exhaust, yet, on the other side, they are more cruel and hardhearted (good to make severe inquisitors), because their tenderness is not so oft called upon.

Grave natures, led by custom, and therefore constant, are commonly loving husbands; as was said of Ulysses, *vetulam suam praetulit immortalitati* [he preferred his aged wife to immortality]. Chaste women are often proud and forward, as presuming upon the merit of their chastity. It is one of the best bonds both of chastity and obedience in the wife if she think her husband wise; which she will never do if she find him jealous. Wives are young men's mistresses; companions for middle age; and old men's nurses. So as a man may have a quarrel to marry when he will. But yet he was reputed one of the wise men that made answer to the question, when a man should marry?—"A young man not yet, an elder man not at all." It is often seen that bad husbands have very good wives; whether it be that it raiseth the price of their husband's kindness when it comes; or that the wives take a pride in their patience. But this never fails if the bad husbands were of their own choosing, against their friends' consent; for then they will be sure to make good their own folly.

Of Great Place

Men in great place are thrice servants: servants of the sovereign or state; servants of fame; and servants of business. So as they have no freedom; neither in their persons, nor in their actions, nor in their times. It is a strange desire, to seek power and to lose liberty: or to seek power over others and to lose power over a man's self. The rising unto place is laborious; and by pains men come to greater pains; and it is sometimes base; and by indignities men come to dignities. The standing is slippery, and the regress is either a downfall, or at least an eclipse, which is a melancholy thing. *Cum non sis qui fueris, non esse cur velis vivere* [When you are not what you were, there is no reason for you to wish to live longer]. Nay, retire men cannot when they would, neither will they when it were reason; but are impatient of privateness, even in age and sickness, which require the shadow; like old townsmen, that will be still sitting at their street door, though thereby they offer age to scorn. Certainly great persons had need to borrow other men's opinions, to think themselves happy; for if they judge by their own feeling, they cannot find it: but if they think with themselves what other men think of them, and that other men would fain be as they are, then they are happy as it were by report; when perhaps they find the contrary within. For they are the first that find their own griefs, though they be the last that find their own faults.

Certainly men in great fortunes are strangers to themselves, and while they are in the puzzle of business they have no time to tend their health either of body or mind. *Illi mors gravis incubat, qui notus nimis omnibus, ignotus moritur sibi* [Death lies heavily upon him who, too well-known to all, dies unknown to himself]. In place there is licence to do good and evil; whereof the latter is a curse: for in evil the best condition is not to will; the second not to can. But power to do good is the true and lawful end of aspiring. For good thoughts (though God accept them) yet towards men are little better than good dreams, except they be put in act;

and that cannot be without power and place, as the vantage and commanding ground. Merit and good works is the end of man's motion; and conscience of the same is the accomplishment of man's rest. For if a man can be partaker of God's theatre, he shall likewise be partaker of God's rest. *Et conversus Deus, ut aspiceret opera quae fecerunt manus suae, vidit quod omnia essent bona nimis* [And God turned to consider the works of his own hands, and he saw that they were all exceedingly good]; and then the sabbath.

In the discharge of thy place set before thee the best examples; for imitation is a globe of precepts. And after a time set before thee thine own example; and examine thyself strictly whether thou didst not best at first. Neglect not also the examples of those that have carried themselves ill in the same place; not to set off thyself by taxing their memory, but to direct thyself what to avoid. Reform therefore, without bravery or scandal of former times and persons; but yet set it down to thyself as well to create good precedents as to follow them. Reduce things to the first institution, and observe wherein and how they have degenerate; but yet ask counsel of both times; of the ancient time, what is best; and of the latter time, what is fittest. Seek to make thy course regular, that men may know beforehand what they may expect; but be not too positive and peremptory; and express thyself well when thou digressest from thy rule. Preserve the right of thy place; but stir not questions of jurisdiction: and rather assume thy right in silence and *de facto*, than voice it with claims and challenges. Preserve likewise the rights of inferior places; and think it more honour to direct in chief than to be busy in all. Embrace and invite helps and advices touching the execution of thy place; and do not drive away such as bring thee information, as meddlers; but accept of them in good part.

The vices of authority are chiefly four: delays, corruption, roughness, and facility. For delays; give easy access; keep times appointed; go through with that which is in hand, and interlace not business but of necessity. For corruption; do not only bind thine own hands or thy servants' hands from taking, but bind the hands of suitors also from offering. For integrity used doth the one; but integrity professed, and with a manifest detestation of bribery, doth the other. And avoid not only the fault, but the suspicion. Whosoever is found variable, and changeth manifestly without manifest cause, giveth suspicion of corruption. Therefore always when thou changest thine opinion or course, profess it plainly, and declare it, together with the reasons that move thee to change; and do not think to steal it. A servant or a favourite, if he be inward, and no

other apparent cause of esteem, is commonly thought but a byway to close corruption. For roughness; it is a needless cause of discontent: severity breedeth fear, but roughness breedeth hate. Even reproofs from authority ought to be grave, and not taunting. As for facility; it is worse than bribery. For bribes come but now and then; but if importunity or idle respects lead a man, he shall never be without. As Solomon saith, "To respect persons is not good; for such a man will transgress for a piece of bread." It is most true that was anciently spoken, "A place showeth the man." And it showeth some to the better, and some to the worse. *Omnium consensu capax imperii, nisi imperasset* [Had he not been emperor, all would have agreed that he was worthy of holding supreme power], saith Tacitus of Galba; but of Vespasian he saith, *Solus imperantium, Vespasianus mutatus in melius* [Vespasian alone was changed for the better by the possession of power], though the one was meant of sufficiency, the other of manners and affection. It is an assured sign of a worthy and generous spirit, whom honour amends. For honour is, or should be, the place of virtue; and as in nature things move violently to their place and calmly in their place, so virtue in ambition is violent, in authority settled and calm. All rising to great place is by a winding stair; and if there be factions, it is good to side a man's self whilst he is in the rising, and to balance himself when he is placed. Use the memory of thy predecessor fairly and tenderly; for if thou dost not, it is a debt will sure be paid when thou art gone. If thou have colleagues, respect them, and rather call them when they look not for it, than exclude them when they have reason to look to be called. Be not too sensible or too remembering of thy place in conversation and private answers to suitors; but let it rather be said, "When he sits in place he is another man."

Of Seditions and Troubles

S

hepherds of people had need know the calendars of tempests in state; which are commonly greatest when things grow to equality; as natural tempests are greatest about the *Equinoctia*. And as there are certain hollow blasts of wind and secret swellings of seas before a tempest, so are there in states:

*Ille etiam caecos instare tumultus
Saepe monet, fraudesque et operta tumescere bella.*

[Often a violent commotion gives warning of dark disturbances, of deception and secret war ready to burst forth.—Virgil.]

Libels and licentious discourses against the state, when they are frequent and open; and in like sort, false news often running up and down to the disadvantage of the state, and hastily embraced; are amongst the signs of troubles. Virgil giving the pedigree of Fame, saith “she was sister to the Giants”:

*Illam Terra parens, ira irritata Deorum,
Extremam (ut perhibent) Coeo Enceladoque sororem
Progenit.*

[Mother Earth, in wrath at the anger of the gods, brought forth that youngest sister (as they assert) of Coeus and Enceladus.]

As if fames were the relics of seditions past; but they are no less indeed the preludes of seditions to come. Howsoever he noteth it right, that seditious tumults and seditious fames differ no more but as brother and sister, masculine and feminine; especially if it come to that, that the best actions of a state, and the most plausible, and which ought to give greatest contentment, are taken in ill sense, and traduced: for that shows the envy great, as Tacitus saith, *conflata magna invidia, seu bene seu male gesta premunt* [when great ill will is kindled against the government, both

good and evil actions are oppressive]. Neither doth it follow, that because these fames are a sign of troubles, that the suppressing of them with too much severity should be a remedy of troubles. For the despising of them many times checks them best; and the going about to stop them doth but make a wonder long-lived. Also that kind of obedience which Tacitus speaketh of, is to be held suspected: *Erant in officio, sed tamen qui mallent mandata imperantium interpretari, quam exequi* [There are those in office who prefer interpreting commands to executing them]; disputing, excusing, cavilling upon mandates and directions, is a kind of shaking off the yoke, and assay of disobedience; especially if in those disputings they which are for the direction speak fearfully and tenderly, and those that are against it audaciously.

Also, as Machiavel noteth well, when princes, that ought to be common parents, make themselves as a party, and lean to a side, it is as a boat that is overthrown by uneven weight on the one side; as was well seen in the time of Henry the Third of France; for first himself entered league for the extirpation of the Protestants; and presently after the same league was turned upon himself. For when the authority of princes is made but an accessory to a cause, and that there be other bands that tie faster than the band of sovereignty, kings begin to be put almost out of possession.

Also, when discords, and quarrels, and factions are carried openly and audaciously, it is a sign the reverence of government is lost. For the motions of the greatest persons in a government ought to be as the motions of the planets under *primum mobile*; (according to the old opinion) which is, that every of them is carried swiftly by the highest motion, and softly in their own motion. And therefore, when great ones in their own particular motion move violently, and, as Tacitus expresseth it well, *liberius quam ut imperantium meminissent* [more unrestrained than they would be if they were mindful of government], it is a sign the orbs are out of frame. For reverence is that wherewith princes are girt from God; who threateneth the dissolving thereof; *Solvam cingula regum* [I will loose the girdles of kings].

So when any of the four pillars of government are mainly shaken or weakened (which are Religion, Justice, Counsel, and Treasure), men had need to pray for fair weather. But let us pass from this part of predictions (concerning which, nevertheless, more light may be taken from that which followeth); and let us speak first of the Materials of seditions; then of the Motives of them; and thirdly of the Remedies.

Concerning the Materials of seditions. It is a thing well to be considered; for the surest way to prevent seditions (if the times do bear it)

is to take away the matter of them. For if there be fuel prepared, it is hard to tell whence the spark shall come that shall set it on fire. The matter of seditions is of two kinds; much poverty and much discontentment. It is certain, so many overthrown estates, so many votes for troubles. Lucan noteth well the state of Rome before the civil war,

*Hinc usura vorax, rapidumque in tempore foenus,
Hinc concussa fides, et multis utile bellum.*

[Hence ravenous usury, and short-term interest
Hence shaken credit, and war which is advantageous to many.]

This same *multis utile bellum* is an assured and infallible sign of a state disposed to seditions and troubles. And if this poverty and broken estate in the better sort be joined with a want and necessity in the mean people, the danger is imminent and great. For the rebellions of the belly are the worst. As for discontentments, they are in the politic body like to humours in the natural, which are apt to gather a preternatural heat and to inflame. And let no prince measure the danger of them by this, whether they be just or unjust: for that were to imagine people to be too reasonable; who do often spurn at their own good: nor yet by this, whether the griefs whereupon they rise be in fact great or small: for they are the most dangerous discontentments where the fear is greater than the feeling: *Dolendi modus, timendi non item* [Pain has a limit, but fear has none]. Besides, in great oppressions, the same things that provoke the patience, do withal mate the courage; but in fears it is not so. Neither let any prince or state be secure concerning discontentments, because they have been often, or have been long, and yet no peril hath ensued: for as it is true that every vapour or fume doth not turn into a storm; so it is nevertheless true that storms, though they blow over divers times, yet may fall at last; and, as the Spanish proverb noteth well, “The cord breaketh at the last by the weakest pull.”

The Causes and Motives of seditions are innovation in religion; taxes; alteration of laws and customs; breaking of privileges; general oppression; advancement of unworthy persons; strangers; dearths; disbanded soldiers; factions grown desperate; and whatsoever, in offending people, joineth and knitteth them in a common cause.

For the Remedies; there may be some general preservatives, whereof we will speak: as for the just cure, it must answer to the particular disease; and so be left to counsel rather than rule.

The first remedy or prevention is to remove by all means possible that material cause of sedition whereof we spake; which is, want and poverty

in the estate. To which purpose serveth the opening and well-balancing of trade; the cherishing of manufactures; the banishing of idleness; the repressing of waste and excess by sumptuary laws; the improvement and husbanding of the soil; the regulating of prices of things vendible; the moderating of taxes and tributes, and the like. Generally, it is to be foreseen that the population of a kingdom (especially if it be not mown down by wars) do not exceed the stock of the kingdom which should maintain them. Neither is the population to be reckoned only by number; for a smaller number that spend more and earn less, do wear out an estate sooner than a greater number that live lower and gather more. Therefore the multiplying of nobility and other degrees of quality in an over proportion to the common people doth speedily bring a state of necessity; and so doth likewise an overgrown clergy; for they bring nothing to the stock; and in like manner, when more are bred scholars than preferments can take off.

It is likewise to be remembered, that forasmuch as the increase of any estate must be upon the foreigner (for whatsoever is somewhere gotten is somewhere lost), there be but three things which one nation selleth unto another; the commodity as nature yieldeth it; the manufacture; and the vecture, or carriage. So that if these three wheels go, wealth will flow as in a spring tide. And it cometh many times to pass that *materiam superabit opus*; that the work and carriage is more worth than the material, and enricheth a state more; as is notably seen in the Low-Countrymen, who have the best mines above ground in the world.

Above all things, good policy is to be used that the treasure and monies in a state be not gathered into few hands. For otherwise a state may have a great stock, and yet starve. And money is like muck, not good except it be spread. This is done chiefly by suppressing, or at the least keeping a strait hand upon the devouring trades of usury, ingrossing, great pasturages, and the like.

For removing discontentments, or at least the danger of them, there is in every state (as we know) two portions of subjects: the noblesse and the commonalty. When one of these is discontent, the danger is not great; for common people are of slow motion, if they be not excited by the greater sort; and the greater sort are of small strength, except the multitude be apt and ready to move of themselves. Then is the danger, when the greater sort do but wait for the troubling of the waters amongst the meaner, that then they may declare themselves. The poets feign that the rest of the gods would have bound Jupiter; which he hearing of, by the counsel of Pallas, sent for Briareus, with his hundred hands, to come in to

his aid. An emblem, no doubt, to show how safe it is for monarchs to make sure of the good will of common people.

To give moderate liberty for griefs and discontentments to evaporate (so it be without too great insolency or bravery), is a safe way. For he that turneth the humours back, and maketh the wound bleed inwards, endangereth malign ulcers and pernicious imposthumations.

The part of Epimetheus might well become Prometheus, in the case of discontentments; for there is not a better provision against them. Epimetheus, when griefs and evils flew abroad, at last shut the lid, and kept hope in the bottom of the vessel. Certainly, the politic and artificial nourishing and entertaining of hopes, and carrying men from hopes to hopes, is one of the best antidotes against the poison of discontentments. And it is a certain sign of a wise government and proceeding, when it can hold men's hearts by hopes, when it cannot by satisfaction; and when it can handle things in such manner, as no evil shall appear so peremptory but that it hath some outlet of hope: which is the less hard to do, because both particular persons and factions are apt enough to flatter themselves, or at least to brave that they believe not.

Also the foresight and prevention, that there be no likely or fit head whereunto discontented persons may resort, and under whom they may join, is a known, but an excellent point of caution. I understand a fit head to be one that hath greatness and reputation; that hath confidence with the discontented party, and upon whom they turn their eyes; and that is thought discontented in his own particular: which kind of persons are either to be won and reconciled to the state, and that in a fast and true manner; or to be fronted with some other of the same party, that may oppose them, and so divide the reputation. Generally, the dividing and breaking of all factions and combinations that are adverse to the state, and setting them at distance, or at least distrust, among themselves, is not one of the worst remedies. For it is a desperate case, if those that hold with the proceeding of the state be full of discord and faction, and those that are against it be entire and united.

I have noted that some witty and sharp speeches which have fallen from princes have given fire to seditions. Caesar did himself infinite hurt in that speech, *Sylla nescivit literas, non potuit dictare* [Sylla was not a scholar, he was unable to dictate]: for it did utterly cut off that hope which men had entertained, that he would at one time or other give over his dictatorship. Galba undid himself by that speech, *legi a se militem, non emi* [that he had levied his soldiers, not bought them]: for it put the soldiers out of hope of the donative. Probus likewise, by that speech,

Si vixero, non opus erit amplius Romano imperio militibus [If I live, there will be no more work for soldiers in the Roman Empire]: a speech of great despair for the soldiers. And many the like. Surely princes had need, in tender matters and ticklish times, to beware what they say; especially in these short speeches, which fly abroad like darts, and are thought to be shot out of their secret intentions. For as for large discourses, they are flat things, and not so much noted.

Lastly, let princes, against all events, not be without some great person, one or rather more, of military valour, near unto them, for the repressing of seditions in their beginnings. For without that, there useth to be more trepidation in court upon the first breaking out of troubles than were fit. And the state runneth the danger of that which Tacitus saith; *Atque is habitus animorum fuit, ut pessimum facinus auderent pauci, plures vel- lent, omnes paterentur* [And such was their state of mind that a few were ready to attempt mischief, more to wish it, and all to permit it]. But let such military persons be assured, and well reputed of, rather than factious and popular; holding also good correspondence with the other great men in the state; or else the remedy is worse than the disease.

Of Custom and Education

M

en's thoughts are much according to their inclination; their discourse and speeches according to their learning and infused opinions; but their deeds are after as they have been accustomed. And therefore as Machiavel well noteth (though in an evil-favoured instance), there is no trusting to the force of nature nor to the bravery of words, except it be corroborate by custom. His instance is, that for the achieving of a desperate conspiracy, a man should not rest upon the fierceness of any man's nature, or his resolute undertakings; but take such an one as hath had his hands formerly in blood. But Machiavel knew not a friar Clement, nor a Ravillac, nor a Jaureguy, nor a Baltazar Gerard; yet his rule holdeth still, that nature, nor the engagement of words, are not so forcible as custom. Only superstition is now so well advanced, that men of the first blood are as firm as butchers by occupation; and votary resolution is made equipollent to custom even in matter of blood. In other things the predominancy of custom is everywhere visible; insomuch as a man would wonder to hear men profess, protest, engage, give great words, and then do just as they have done before; as if they were dead images, and engines moved only by the wheels of custom.

We see also the reign or tyranny of custom, what it is. The Indians (I mean the sect of their wise men) lay themselves quietly upon a stack of wood, and so sacrifice themselves by fire. Nay the wives strive to be burned with the corpses of their husbands. The lads of Sparta, of ancient time, were wont to be scourged upon the altar of Diana, without so much as queching [flinching]. I remember, in the beginning of Queen Elizabeth's time of England, an Irish rebel condemned put up a petition to the Deputy that he might be hanged in a withe, and not in an halter; because it had been so used with former rebels. There be monks in Russia, for penance, that will sit a whole night in a vessel of water, till they be en-

gaged with hard ice. Many examples may be put of the force of custom, both upon mind and body. Therefore, since custom is the principal magistrate of man's life, let men by all means endeavour to obtain good customs. Certainly custom is most perfect when it beginneth in young years: this we call education; which is, in effect, but an early custom. So we see, in languages the tongue is more pliant to all expressions and sounds, the joints are more supple to all feats of activity and motions, in youth than afterwards. For it is true that late learners cannot so well take the ply; except it be in some minds that have not suffered themselves to fix, but have kept themselves open and prepared to receive continual amendment, which is exceeding rare. But if the force of custom simple and separate be great, the force of custom copulate and conjoined and collegiate is far greater. For there example teacheth, company comforteth, emulation quickeneth, glory raiseth: so as in such places the force of custom is in his exaltation. Certainly the great multiplication of virtues upon human nature resteth upon societies well ordained and disciplined. For commonwealths and good governments do nourish virtue grown, but do not much mend the seeds. But the misery is that the most effectual means are now applied to the ends least to be desired.

Of Followers and Friends

Costly followers are not to be liked; lest while a man maketh his train longer, he make his wings shorter. I reckon to be costly, not them alone which charge the purse, but which are wearisome and importune in suits. Ordinary followers ought to challenge no higher conditions than countenance, recommendation, and protection from wrongs. Factious followers are worse to be liked, which follow not upon affection to him with whom they range themselves, but upon discontentment conceived against some other; whereupon commonly ensueth that ill intelligence that we many times see between great personages. Likewise glorious followers, who make themselves as trumpets of the commendation of those they follow, are full of inconvenience; for they taint business through want of secrecy; and they export honour from a man, and make him a return in envy. There is a kind of followers likewise which are dangerous, being indeed espials; which inquire the secrets of the house, and bear tales of them to others. Yet such men, many times, are in great favour; for they are officious, and commonly exchange tales. The following by certain estates of men, answerable to that which a great person himself professeth (as of soldiers to him that hath been employed in the wars, and the like), hath ever been a thing civil, and well taken even in monarchies; so it be without too much pomp or popularity. But the most honourable kind of following is to be followed as one that apprehendeth to advance virtue and desert in all sorts of persons. And yet, where there is no eminent odds in sufficiency, it is better to take with the more passable, than with the more able. And besides, to speak truth, in base times active men are of more use than virtuous. It is true that in government it is good to use men of one rank equally: for to countenance some extraordinarily, is to make them insolent, and the rest discontent; because they may claim a due. But contrariwise, in favour, to use men with much difference and

election is good; for it maketh the persons preferred more thankful, and the rest more officious: because all is of favour.

It is good discretion not to make too much of any man at the first; because one cannot hold out that proportion. To be governed (as we call it) by one, is not safe; for it shows softness, and gives a freedom to scandal and disreputation; for those that would not censure or speak ill of a man immediately, will talk more boldly of those that are so great with them, and thereby wound their honour. Yet to be distracted with many is worse; for it makes men to be of the last impression, and full of change. To take advice of some few friends is ever honourable; for lookers-on many times see more than gamesters; and the vale best discovereth the hill. There is little friendship in the world, and least of all between equals, which was wont to be magnified. That that is, is between superior and inferior, whose fortunes may comprehend the one the other.

Of Usury

Many have made witty invectives against Usury. They say that it is a pity the devil should have God's part, which is the tithe. That the usurer is the greatest sabbath-breaker, because his plough goeth every Sunday. That the usurer is the drone that Virgil speaketh of:

Ignavum fucos pecus a praeseptibus arcent.

[They prohibit the drones, a slothful swarm, access to the beehives.]

That the usurer breaketh the first law that was made for mankind after the fall, which was, *in sudore vultus tui comedes panem tuum* [in the sweat of thy face shalt thou eat bread], not *in sudore vultus alieni* [in the sweat of another]. That usurers should have orange-tawny bonnets, because they do judaize. That it is against nature for money to beget money; and the like. I say this only, that usury is a *concessum propter duritiam cordis* [thing permitted through hardness of heart]; for since there must be borrowing and lending, and men are so hard of heart as they will not lend freely, usury must be permitted. Some others have made suspicious and cunning propositions of banks, discovery of men's estates, and other inventions. But few have spoken of usury usefully. It is good to set before us the incommodities and commodities of usury, that the good may be either weighed out or culled out; and warily to provide, that while we make forth to that which is better, we meet not with that which is worse.

The discommodities of usury are, first, that it makes fewer merchants. For were it not for this lazy trade of usury, money would not lie still, but would in great part be employed upon merchandising; which is the *vena porta* [gate vein] of wealth in a state. The second, that it makes poor merchants. For as a farmer cannot husband his ground so well if he sit at a great rent; so the merchant cannot drive his trade so well, if he sit at great usury. The third is incident to the other two; and that is the decay of customs of kings or states, which ebb or flow with merchandising. The

fourth, that it bringeth the treasure of a realm or state into a few hands. For the usurer being at certainties, and others at uncertainties, at the end of the game most of the money will be in the box; and ever a state flourisheth when wealth is most equally spread. The fifth, that it beats down the price of land; for the employment of money is chiefly either merchandising or purchasing; and usury waylays both. The sixth, that it doth dull and damp all industries, improvements, and new inventions, wherein money would be stirring, if it were not for this slug. The last, that it is the canker and ruin of many men's estates; which in process of time breeds a public poverty.

On the other side, the commodities of usury are, first, that howsoever usury in some respect hindereth merchandising, yet in some other it advanceth it; for it is certain that the greatest part of trade is driven by young merchants, upon borrowing at interest; so as if the usurer either call in or keep back his money, there will ensue presently a great stand of trade. The second is that were it not for this easy borrowing upon interest, men's necessities would draw upon them a most sudden undoing; in that they would be forced to sell their means (be it lands or goods) far under foot; and so, whereas usury doth but gnaw upon them, bad markets would swallow them quite up. As for mortgaging or pawning, it will little mend the matter: for either men will not take pawns without use; or if they do, they will look precisely for the forfeiture. I remember a cruel monied man in the country that would say, "The devil take this usury, it keep us from forfeitures of mortgages and bonds." The third and last is that it is a vanity to conceive that there would be ordinary borrowing without profit; and it is impossible to conceive the number of inconveniences that will ensue, if borrowing be cramped. Therefore to speak of the abolishing of usury is idle. All states have ever had it, in one kind or rate, or other. So as that opinion must be sent to Utopia.

To speak now of the reformation and reiglement of usury; how the discommodities of it may be best avoided, and the commodities retained. It appears by the balance of commodities and discommodities of usury, two things are to be reconciled. The one, that the tooth of usury be grinded, that it bite not too much; the other, that there be left open a means to invite monied men to lend to the merchants, for the continuing and quickening of trade. This cannot be done, except you introduce two several sorts of usury, a less and a greater. For if you reduce usury to one low rate, it will ease the common borrower, but the merchant will be to seek for money. And it is to be noted, that the trade of merchandise,

being the most lucrative, may bear usury at a good rate: other contracts not so.

To serve both intentions, the way would be briefly thus. That there be two rates of usury; the one free, and general for all; the other under licence only, to certain persons and in certain places of merchandising. First therefore, let usury in general be reduced to five in the hundred; and let that rate be proclaimed to be free and current; and let the state shut itself out to take any penalty for the same. This will preserve borrowing from any general stop or dryness. This will ease infinite borrowers in the country. This will, in good part, raise the price of land, because land purchased at sixteen years' purchase will yield six in the hundred, and somewhat more; whereas this rate of interest yields but five. This by like reason will encourage and edge industrious and profitable improvements; because many will rather venture in that kind than take five in the hundred, especially having been used to greater profit. Secondly, let there be certain persons licensed to lend to known merchants upon usury at a higher rate; and let it be with the cautions following. Let the rate be, even with the merchant himself, somewhat more easy than that he used formerly to pay; for by that means all borrowers shall have some ease by this reformation, be he merchant, or whosoever. Let it be no bank or common stock, but every man be master of his own money. Not that I altogether mislike banks, but they will hardly be brooked, in regard of certain suspicions. Let the state be answered some small matter for the licence, and the rest left to the lender; for if the abatement be but small, it will no whit discourage the lender. For he, for example, that took before ten or nine in the hundred, will sooner descend to eight in the hundred, than give over his trade of usury, and go from certain gains to gains of hazard. Let these licensed lenders be in number indefinite, but restrained to certain principal cities and towns of merchandising; for then they will be hardly able to colour other men's monies in the country: so as the licence of nine will not suck away the current rate of five; for no man will lend his monies far off, nor put them into unknown hands.

If it be objected that this doth in a sort authorize usury, which before was in some places but permissive; the answer is, that it is better to mitigate usury by declaration, than to suffer it to rage by connivance.

Of Riches

I cannot call Riches better than the baggage of virtue. The Roman word is better, *impedimenta*. For as the baggage is to an army, so is riches to virtue. It cannot be spared nor left behind, but it hindereth the march; yea and the care of it sometimes loseth or disturbeth the victory. Of great riches there is no real use, except it be in the distribution; the rest is but conceit. So saith Solomon, “Where much is, there are many to consume it; and what hath the owner but the sight of it with his eyes?” The personal fruition in any man cannot reach to feel great riches: there is a custody of them; or a power of dole and donative of them; or a fame of them; but no solid use to the owner. Do you not see what feigned prices are set upon little stones and rarities? And what works of ostentation are undertaken, because there might seem to be some use of great riches? But then you will say, they may be of use to buy men out of dangers or troubles. As Solomon saith, “Riches are as a strong hold, in the imagination of the rich man.” But this is excellently expressed, that it is in imagination, and not always in fact. For certainly great riches have sold more men than they have bought out. Seek not proud riches, but such as thou mayest get justly, use soberly, distribute cheerfully, and leave contentedly. Yet have no abstract nor friarly contempt of them. But distinguish, as Cicero saith well of Rabirius Posthumus, *In studio rei amplificandae apparebat, non avaritiae praedam, sed instrumentum bonitati quaeri* [In his efforts to increase his substance, it was evident that he did not seek a prey for avarice but an instrument for doing good]. Harken also to Solomon, and beware of hasty gathering of riches; *Qui festinat ad divitias, non erit insons* [He who makes haste to acquire riches shall not be innocent].

The poets feign that when Plutus (which is Riches) is sent from Jupiter, he limps and goes slowly; but when he is sent from Pluto, he runs and is swift of foot. Meaning that riches gotten by good means and just labour pace slowly; but when they come by the death of others (as by the course of inheritance, testaments, and the like), they come tumbling upon a

man. But it might be applied likewise to Pluto, taking him for the devil. For when riches come from the devil (as by fraud and oppression and unjust means), they come upon speed. The ways to enrich are many, and most of them foul. Parsimony is one of the best, and yet is not innocent; for it withholdeth men from works of liberality and charity. The improvement of the ground is the most natural obtaining of riches; for it is our great mother's blessing, the earth's; but it is slow. And yet where men of great wealth do stoop to husbandry, it multiplieth riches exceedingly. I knew a nobleman in England that had the greatest audits of any man in my time; a great grazier, a great sheep-master, a great timber man, a great collier, a great corn-master, a great lead-man, and so of iron, and a number of the like points of husbandry. So as the earth seemed a sea to him, in respect of the perpetual importation.

It was truly observed by one, that himself came very hardly to a little riches, and very easily to great riches. For when a man's stock is come to that, that he can expect the prime of markets, and overcome those bargains which for their greatness are few men's money, and be partner in the industries of younger men, he cannot but increase mainly.

The gains of ordinary trades and vocations are honest; and furthered by two things chiefly; by diligence, and by a good name for good and fair dealing. But the gains of bargains are of a more doubtful nature; when men shall wait upon others' necessity, broke by servants and instruments to draw them on, put off others cunningly that would be better chapmen, and the like practices, which are crafty and naught. As for the chopping of bargains, when a man buys not to hold but to sell over again, that commonly grindeth double, both upon the seller and upon the buyer. Sharings do greatly enrich, if the hands be well chosen that are trusted. Usury is the certainest means of gain, though one of the worst; as that whereby a man doth eat his bread *in sudore vultus alieni* [in the sweat of another's face]; and besides, doth plough upon Sundays. But yet certain though it be, it hath flaws; for that the scriveners and brokers do value unsound men to serve their own turn. The fortune in being the first in an invention or in a privilege doth cause sometimes a wonderful overgrowth in riches; as it was with the first sugar man in the Canaries. Therefore if a man can play the true logician, to have as well judgment as invention, he may do great matters; especially if the times be fit. He that resteth upon gains certain shall hardly grow to great riches; and he that puts all upon adventures doth oftentimes break and come to poverty: it is good therefore to guard adventures with certainties that may uphold losses. Monopolies, and coemption of wares for resale, where they are not restrained, are

great means to enrich; especially if the party have intelligence what things are like to come into request, and so store himself beforehand. Riches gotten by service, though it be of the best rise, yet when they are gotten by flattery, feeding humours, and other servile conditions, they may be placed amongst the worst. As for fishing for testaments and executorships (as Tacitus saith of Seneca, *testamenta et orbos tanquam indagine capi* [he took executorships and guardianships as with a net]), it is yet worse; by how much men submit themselves to meaner persons than in service.

Believe not much them that seem to despise riches; for they despise them that despair of them; and none worse when they come to them. Be not penny-wise; riches have wings, and sometimes they fly away of themselves, sometimes they must be sent flying to bring in more. Men leave their riches either to their kindred, or to the public; and moderate portions prosper best in both. A great state left to an heir, is as a lure to all the birds of prey round about to seize on him, if he be not the better stablished in years and judgment. Likewise glorious gifts and foundations are like sacrifices without salt; and but the painted sepulchres of alms, which soon will putrefy and corrupt inwardly. Therefore measure not thine advancements by quantity, but frame them by measure, and defer not charities till death; for certainly, if a man weigh it rightly, he that doth so is rather liberal of another man's than of his own.

*The foregoing essays
are from a collection of Bacon's essays
entitled ESSAYS: CIVIL AND MORAL.*

Jonathan Swift

1667–1745

Jonathan Swift was born in Dublin, of English parents, on November 30, 1667. The generosity of his examiners gave him a degree at Trinity College. He crossed to England and in 1689 became secretary to Sir William Temple at Moor Park. Except for an interval as a clergyman near Belfast, Swift remained at Moor Park until Sir William died in 1699.

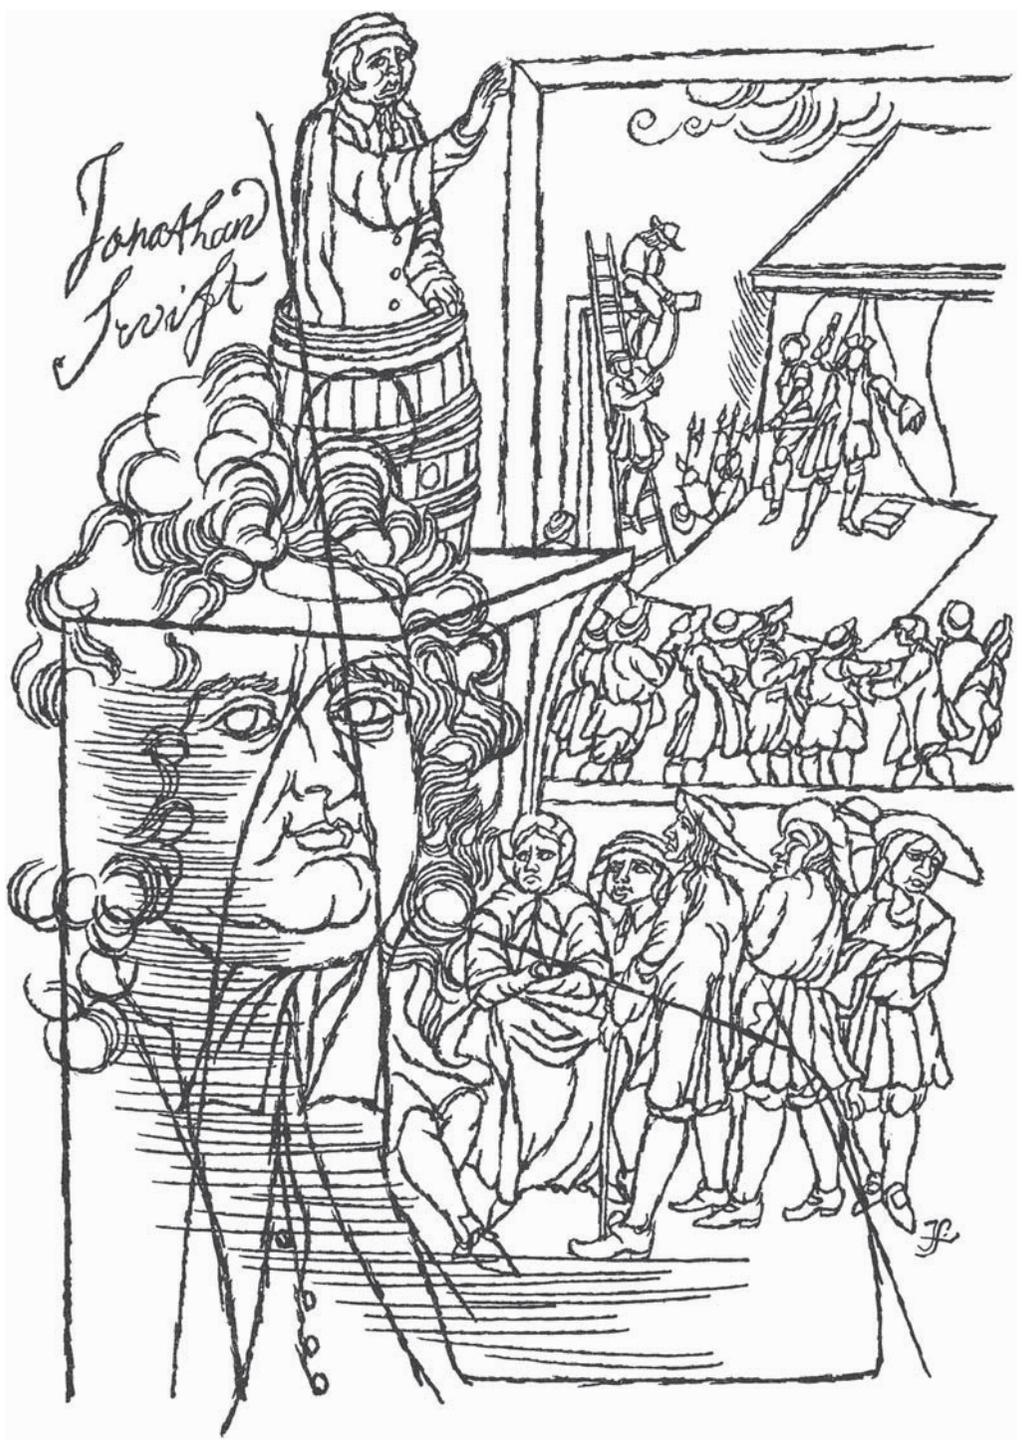

There Swift became tutor and friend to Esther Johnson, a child who would grow up to be the “Stella” of his *Journal to Stella*. There, too, he wrote *The Battle of the Books* and *A Tale of a Tub*. After Temple’s death, Swift found a clerical post at Laracor, near Dublin. He took a D.D. in 1701. That same year, at Swift’s invitation, Stella and a woman companion settled in Laracor.

Swift spent much time in London. He was friendly with Pope, Steele, and Addison. In 1708 he published the “Isaac Bickerstaff” letters, a hoax on a notorious London astrologer. Swift had been a Whig in politics. But when the Whigs fell from office, he became the intimate of the new Tory ministers, Oxford and Bolingbroke. As their principal writer, he got hold of considerable power, which he enjoyed.

Queen Anne appointed him Dean of St. Patrick’s, Dublin. He was hardly welcomed when he took office in 1713. A little later the Queen

Notes from the artist: “Portrait of Swift in clerical garb . . . the background is a scene from his A Tale of a Tub, a brilliant satire on, among other things, the clergy.”

Jonathan
Swift

died, and the Tory ministry fell. Swift supported Oxford and even offered to share his imprisonment. Then he retired to his Dublin cathedral. His relations with Stella were complicated by the devotion of Esther Vanhomrigh, the daughter of a Dublin merchant, who appears as the “Vanessa” of his writings.

He is said to have spent “a third of his income on charities.” In 1724 his *Drapier Letters*, an attack on an unjust coinage system, put all Ireland in a rage. Two years later, the anonymous *Gulliver’s Travels* was published. By 1742 his mental condition was such that guardians were appointed. He died on October 19, 1745, and was buried beside Stella, his “violent friend,” in the crypt of St. Patrick’s.

Taine speaks of Swift’s “exaggerated and terrible pride” that “made the haughtiness of the most powerful ministers and most mighty lords bow beneath his arrogance.” It was one aspect of his force of personality. This force was condensed, in all Swift’s work, by the pressure of his necessity to fit human life into an unchanging frame of reason. So we have the massive, rolling onset of his prose. Its clarity, exactness, and power make it a fit instrument for its purpose. It has great social leverage. We think of Swift as the greatest satirist in English.

One of the signs of a good writer is that we can intersect his work at many angles. We can find more than one level of meaning in it. This is true even in such a simple case as Swift’s *Resolutions when I Come to Be Old*. On the surface, it is just what the title suggests: a man writing a memorandum to himself in the form of a list of axioms intended to govern a wise old age. Would they, in fact, do that? We are inclined to think that they might, at least in the social sense.

Then we notice that all but one of the axioms begin with *not*. The exception is a check on the rest. The author is laying down acts and types of behavior to be avoided, not things to be done. Ricardo Quintana points out that the situations mentioned are “the stock ones of social comedy.” But is it not possible that Swift and the authors of the social comedies had both observed the same types of behavior in a more or less standardized society? And is it not true that Swift here catches certain traits of old men in any civilized society?

In *An Essay on Modern Education*, we observe once more that

Swift is concerned, not with the needs or wishes of the individual, but with those of an aristocratic society which he must be taught to serve. As an old friend of the philosopher George Berkeley and his wife, Swift was often persuaded to read to Mrs. Berkeley from her favorite book, Robert Boyle's *Meditations*. He wrote a parody, *A Meditation upon a Broomstick*, and read it out to her as if it were one of Boyle's. Only Swift could have conceived the broomstick as a comic symbol of man and then stood it on its head.

Swift, Berkeley, and Edmund Burke were all outraged by the British misgovernment of Ireland in the eighteenth century. *A Modest Proposal* is one fruit of that outrage. We are told that there are tens of thousands of unwanted babies in Ireland. They cannot be provided for. Very well, says Swift. Let us sell them and eat them. The argument is faultless and masterly. It is delivered in the enlightened tone of a man who proposes a new kind of stock-raising for the benefit of the country. There is nothing at all wrong with it except that it is inhuman. But is it more inhuman than allowing these same children to starve to death? Irony, satire, humor, reason gone mad—Swift brings all these to bear on a problem that still troubles the human race.

Resolutions
when
I Come to Be Old

N

ot to marry a young woman.

Not to keep young company, unless they really desire it.

Not to be peevish, or morose, or suspicious.

Not to scorn present ways, or wits, or fashions, or men, or war, etc.

Not to be fond of children.

Not to tell the same story over and over to the same people.

Not to be covetous.

Not to neglect decency, or cleanliness, for fear of falling into nastiness.

Not to be over-severe with young people, but give allowances for their youthful follies and weaknesses.

Not to be influenced by or give ear to knavish tattling servants, or others.

Not to be too free of advice, nor trouble any but those that desire it.

To desire some good friends to inform me which of these resolutions I break or neglect, and wherein; and reform accordingly.

Not to talk much, nor of myself.

Not to boast of my former beauty, or strength, or favour with ladies, etc.

Not to hearken to flatteries, nor conceive I can be beloved by a young woman; *et eos qui haereditatem captant, odisse ac vitare* [and to hate and avoid those who seek a legacy].

Not to be positive or opinionative.

Not to set up for observing all these rules, for fear I should observe none.

An Essay on Modern Education

From frequently reflecting upon the course and method of educating youth in this and a neighbouring kingdom, with the general success and consequence thereof, I am come to this determination, that education is always the worse in proportion to the wealth of and grandeur of the parents; nor do I doubt in the least that if the whole world were now under the dominion of one monarch (provided I might be allowed to choose where he should fix the seat of his empire) the only son and heir of that monarch would be the worst educated mortal that ever was born since the creation; and I doubt [fear] the same proportion will hold through all degrees and titles, from an emperor downwards to the common gentry.

I do not say that this hath been always the case, for in better times it was directly otherwise, and a scholar may fill half his Greek and Roman shelves with authors of the noblest birth, as well as highest virtue; nor do I tax all nations at present with this defect, for I know there are some to be excepted, and particularly Scotland, under all the disadvantages of its climate and soil, if that happiness be not rather owing even to those very disadvantages. What is then to be done if this reflection must fix on two countries, which will be most ready to take offense, and which of all others it will be least prudent or safe to offend?

But there is one circumstance yet more dangerous and lamentable: For if, according to the *postulatum* already laid down, the higher quality any youth is of, he is in greater likelihood to be worse educated, it behoves me to dread and keep far from the verge of *scandalum magnatum*.

Retracting therefore that hazardous *postulatum*, I shall venture no further at present than to say that perhaps some additional care in educating the sons of nobility and principal gentry might not be ill em-

ployed. If this be not delivered with softness enough, I must for the future be silent.

In the mean time, let me ask only two questions, which relate to England. I ask first how it comes about that for above sixty years past the chief conduct of affairs hath been generally placed in the hands of new men, with very few exceptions? The noblest blood of England having been shed in the Great Rebellion, many great families became extinct, or supported only by minors. When the king was restored, very few of those lords remained who began or at least had improved their education under the happy reign of King James or King Charles I, of which lords the two principal were the Marquis of Ormond and the Earl of Southampton. The minors have, or had, during the Rebellion and usurpation, either received too much tincture of bad principles from those fanatic times or, coming to age at the Restoration, fell into the vices of that dissolute reign.

I date from this era the corrupt method of education among us, and the consequence thereof, in the necessity the crown lay under of introducing new men into the chief conduct of public affairs, or to the office of what we now call prime ministers, men of art, knowledge, application, and insinuation, merely for want of a supply among the nobility. They were generally (though not always) of good birth, sometimes younger brothers, at other times such who, although inheriting good estates, yet happened to be well educated and provided with learning; such under that King were Hyde, Bridgeman, Clifford, Osborn, Godolphin, Ashley-Cooper; few or none under the short reign of King James II. Under King William: Somers, Montagu, Churchill, Vernon, Boyle, and many others. Under the Queen: Harley, St. John, Harcourt, Trevor, who indeed were persons of the best private families but unadorned with titles. So in the following reign, Mr. Robert Walpole was for many years prime minister, in which post he still happily continues. His brother Horace is ambassador extraordinary to France. Mr. Addison and Mr. Craggs, without the least allowance to support them, have been secretaries of state.

If the facts have been thus for above sixty years past (whereof I could with a little further recollection produce many more instances), I would ask again how it hath happened that in a nation plentifully abounding with nobility so great share in the most competent parts of public management hath been for so long a period chiefly entrusted to commoners, unless some omissions or defects of the highest import may be charged upon those to whom the care of educating our noble youth hath been committed? For if there be any difference between human creatures in

the point of natural parts, as we usually call them, it should seem that the advantage lies on the side of children born from noble and wealthy parents, the same traditional sloth and luxury which render their body weak and effeminate perhaps refining and giving a freer motion to the spirits beyond what can be expected from the gross, robust issue of meaner mortals. Add to this the peculiar advantages which all young noblemen possess by the privileges of their birth, such as a free access to courts, and a universal deference paid to their persons.

But as my Lord Bacon charged it for a fault on princes that they are impatient to compass ends without giving themselves the trouble of consulting or executing the means, so perhaps it may be the disposition of young nobles, either from the indulgence of parents, tutors, and governors or their own inactivity, that they expect the accomplishments of a good education without the least expense of time or study to acquire them.

What I said last I am ready to retract, for the case is infinitely worse; and the very maxims set up to direct modern education are enough to destroy all the seeds of knowledge, honour, wisdom, and virtue among us. The current opinion prevails that the study of Greek and Latin is loss of time; that public schools by mingling the sons of noblemen with those of the vulgar engage the former in bad company; that whipping breaks the spirits of lads well born; that universities make young men pedants; that to dance, fence, speak French, and know how to behave yourself among great persons of both sexes comprehends the whole duty of a gentleman.

I cannot but think this wise system of education hath been much cultivated among us by those worthies of the Army who during the last war, returning from Flanders at the close of each campaign, became the dictators of behaviour, dress, and politeness to all those youngsters who frequent chocolate-coffee-gaming-houses, drawing-rooms, operas, levees, and assemblies; where a colonel by his pay, perquisites, and plunder was qualified to outshine many peers of the realm; and by the influence of an exotic habit and demeanor, added to other foreign accomplishments, gave the law to the whole town, and was copied as the standard pattern of whatever was refined in dress, equipage, conversation, or diversions.

I remember in those times an admired original of that vocation sitting in a coffee-house near two gentlemen, whereof one was of the clergy, who were engaged in some discourse that savoured of learning; this officer thought fit to interpose, and professing to deliver the sentiments of his fraternity, as well as his own (and probably did so of too many among

them), turning to the clergyman, spoke in the following manner, “D—n me, Doctor, say what you will, the army is the only school for gentlemen. Do you think my Lord Marlborough beat the French with Greek and Latin? D—n me, a scholar when he comes into good company, what is he but an ass? D—n me, I would be glad by G-d to see any of your scholars with his nouns, and his verbs, and his philosophy, and trigonometry, what a figure he would make at a siege or blockade, or rencountering—D—n me,” etc. After which he proceeded with a volley of military terms less significant, sounding worse, and harder to be understood than any that were ever coined by the commentators upon Aristotle. I would not here be thought to charge the soldiery with ignorance and contempt of learning, without allowing exceptions, of which I have known many; but, however, the worse example, especially in a great majority, will certainly prevail.

I have heard that the late Earl of Oxford, in the time of his ministry, never passed by White’s Chocolate-House (the common rendezvous of infamous sharpers and noble cullies) without bestowing a curse upon that famous academy as the bane of half the English nobility. I have likewise been told another passage concerning that great minister, which, because it gives a humorous idea of one principal ingredient in modern education, take as follows. Le-Sack, the famous French dancing-master, in great admiration, asked a friend whether it were true that Mr. Harley was made an earl and Lord Treasurer? And finding it confirmed, said, “Well, I wonder what the devil the Queen could see in him, for I attended him two years, and he was the greatest dunce that ever I taught.”

Another hindrance to good education, and I think the greatest of any, is that pernicious custom in rich and noble families of entertaining French tutors in their houses. These wretched pedagogues are enjoined by the father to take special care that the boy shall be perfect in his French; by the mother that master must not walk till he is hot, nor be suffered to play with other boys, nor be wet in his feet, nor daub his clothes, and to see that dancing-master attends constantly and does his duty; she further insists that the child be not kept too long poring on his book, because he is subject to sore eyes and of a weakly constitution.

By these methods, the young gentleman is in every article as fully accomplished at eight years old as at eight and twenty, age adding only to the growth of his person and his vice; so that if you should look at him in his boyhood through the magnifying end of a perspective, and in his manhood through the other, it would be impossible to spy any difference: the same airs, the same strut, the same cock of his hat, and posture of

his sword (as far as the change of fashions will allow), the same understanding, the same compass of knowledge, with the very same absurdity, impudence, and impertinence of tongue.

He is taught from the nursery that he must inherit a great estate, and hath no need to mind his book, which is a lesson he never forgets to the end of his life. His chief solace is to steal down and play at span-farthing with the page, or young blackamoor, or little favourite footboy, one of which is his principal confident and bosom friend.

There is one young lord in this town who, by an unexampled piece of good fortune, was miraculously snatched out of the gulf of ignorance, confined to a public school for a due term of years, well whipped when he deserved it, clad no better than his comrades and always their playfellow on the same foot, had no precedence in the school but what was given him by his merit and lost it whenever he was negligent. It is well known how many mutinies were bred at this unprecedented treatment, what complaints among his relations, and other great ones of both sexes; that his stockings with silver clocks were ravished from him; that he wore his own hair; that his dress was undistinguished; that he was not fit to appear at a ball or assembly, nor suffered to go to either: And it was with the utmost difficulty that he became qualified for his present removal, where he may probably be farther persecuted, and possibly with success, if the firmness of a very worthy governor and his own good dispositions will not preserve him. I confess I cannot but wish he may go on in the way he began, because I have a curiosity to know by so singular an experiment whether truth, honour, justice, temperance, courage, and good sense, acquired by a school and college education, may not produce a very tolerable lad, although he should happen to fail in one or two of those accomplishments which in the general vogue are held so important to the finishing of a gentleman.

It is true, I have known an academical education to have been exploded in public assemblies, and have heard more than one or two persons of high rank declare they could learn nothing more at Oxford and Cambridge than to drink ale and smoke tobacco; wherein I firmly believed them, and could have added some hundred examples from my own observation in one of those universities; but they all were of young heirs sent thither only for form, either from schools where they were not suffered by their careful parents to stay above three months in the year, or from under the management of French family-tutors, who yet often attended them to their college to prevent all possibility of their improvement. But I never yet knew any one person of quality who followed his

studies at the university, and carried away his just proportion of learning, that was not ready upon all occasions to celebrate and defend that course of education, and to prove a patron of learned men.

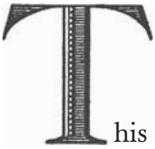

There is one circumstance in a learned education which ought to have much weight, even with those who have no learning at all. The books read at school and colleges are full of incitements to virtue and discouragements from vice, drawn from the wisest reasons, the strongest motives, and the most influencing examples. Thus, young minds are filled early with an inclination to good and an abhorrence of evil, both which increase in them according to the advances they make in literature; and, although they may be, and too often are, drawn by the temptations of youth, and the opportunities of a large fortune, into some irregularities when they come forward into the great world, it is ever with reluctance and compunction of mind, because their bias to virtue still continues. They may stray sometimes out of infirmity or compliance, but they will soon return to the right road and keep it always in view. I speak only of those excesses which are too much the attendants of youth and warmer blood, for, as to the points of honour, truth, justice, and other noble gifts of the mind wherein the temperature of the body hath no concern, they are seldom or ever known to be wild.

I have engaged myself very unwarily in too copious a subject for so short a paper. The present scope I would aim at is to prove that some proportion of human knowledge appears requisite to those who, by their birth or fortune, are called to the making of laws and, in a subordinate way, to the execution of them; and that such knowledge is not to be obtained without a miracle under the frequent, corrupt, and sottish methods of educating those who are born to wealth or titles. For I would have it remembered that I do by no means confine these remarks to young persons of noble birth, the same errors running through all families where there is wealth enough to afford that their sons (at least the eldest) may be good for nothing. Why should my son be a scholar when it is not intended that he should live by his learning? By this rule, if what is commonly said be true, that money answers all things, why should my son be honest, temperate, just, or charitable, since he hath no intention to depend upon any of these qualities for a maintenance?

When all is done, perhaps upon the whole the matter is not so bad as I would make it; and God, who works good out of evil, acting only by the ordinary cause and rule of nature, permits this continual circulation of human things for His own unsearchable ends. The father grows rich by avarice, injustice, oppression; he is a tyrant in the neighbourhood over

slaves and beggars, whom he calls his tenants. Why should he desire to have qualities infused into his son which himself never possessed, or knew, or found the want of in the acquisition of his wealth? The son bred in sloth and idleness becomes a spendthrift, a cully, a profligate, and goes out of the world a beggar, as his father came in. Thus the former is punished for his own sins, as well as for those of the latter. The dunghill, having raised a huge mushroom of short duration, is now spread to enrich other men's lands. It is indeed of worse consequence where noble families are gone to decay, because their titles and privileges outlive their estates; and politicians tell us that nothing is more dangerous to the public than a numerous nobility without merit or fortune. But even here, God hath likewise prescribed some remedy in the order of nature, so many great families coming to an end by the sloth, luxury, and abandoned lusts, which enervated their breed through every succession, producing gradually a more effeminate race, wholly unfit for propagation.

A Meditation upon a Broomstick

his single stick, which you now behold ingloriously lying in that neglected corner, I once knew in a flourishing state in a forest. It was full of sap, full of leaves, and full of boughs. But now in vain does the busy art of man pretend to vie with nature by tying that withered bundle of twigs to its sapless trunk. 'Tis now at best but the reverse of what it was, a tree turned upside down, the branches on the earth, and the root in the air. 'Tis now handled by every dirty wench, condemned to do her drudgery, and, by a capricious kind of fate, destined to make other things clean, and be nasty itself. At length, worn to the stumps in the service of the maids, 'tis either thrown out-of-doors or condemned to the last use of kindling a fire. When I beheld this, I sighed and said within myself, Surely mortal man is a broomstick; nature sent him into the world strong and lusty in a thriving condition, wearing his own hair on his head, the proper branches of this reasoning vegetable, till the axe of intemperance has lopped off his green boughs and left him a withered trunk. He then flies to art and puts on a periwig, valuing himself upon an unnatural bundle of hairs, all covered with powder that never grew on his head; but now should this our broomstick pretend to enter the scene, proud of those birchen spoils it never bore, and all covered with dust, though the sweepings of the finest lady's chamber, we should be apt to ridicule and despise its vanity. Partial judges that we are of our own excellencies and other men's defaults!

But a broomstick, perhaps you will say, is an emblem of a tree standing on its head; and pray what is man but a topsy-turvy creature, his animal faculties perpetually mounted on his rational, his head where his heels should be, groveling on the earth! And yet, with all his faults, he sets up to be a universal reformer and corrector of abuses, a remover of grievances, rakes into every slut's corner of nature, bringing hidden cor-

ruptions to the light, and raises a mighty dust where there was none before, sharing deeply all the while in the very same pollutions he pretends to sweep away. His last days are spent in slavery to women, and generally the least deserving; till worn to the stumps, like his brother Bezom, he is either kicked out-of-doors or made use of to kindle flames for others to warm themselves by.

A Modest Proposal
for
Preventing the Children of Ireland
from Being a Burden
to Their Parents or Country

It is a melancholy object to those who walk through this great town or travel in the country when they see the streets, the roads and cabindoors crowded with beggars of the female sex, followed by three, four, or six children, all in rags, and importuning every passenger for an alms. These mothers, instead of being able to work for their honest livelihood, are forced to employ all their time in strolling to beg sustenance for their helpless infants, who, as they grow up, either turn thieves for want of work, or leave their dear native country, to fight for the pretender in Spain, or sell themselves to the Barbadoes.

I think it is agreed by all parties that this prodigious number of children in the arms, or on the backs, or at the heels of their mothers, and frequently of their fathers, is in the present deplorable state of the kingdom a very great additional grievance; and therefore whoever could find out a fair, cheap and easy method of making these children sound and useful members of the Commonwealth would deserve so well of the public as to have his statue set up for a preserver of the nation.

But my intention is very far from being confined to provide only for the children of professed beggars; it is of a much greater extent, and shall take in the whole number of infants at a certain age who are born of parents in effect as little able to support them as those who demand our charity in the streets.

As to my own part, having turned my thoughts, for many years, upon

this important subject, and maturely weighed the several schemes of other projectors, I have always found them grossly mistaken in their computation. It is true, a child just dropt from its dam may be supported by her milk for a solar year with little other nourishment, at most not above the value of two shillings, which the mother may certainly get, or the value in scraps, by her lawful occupation of begging; and it is exactly at one year old that I propose to provide for them in such a manner as, instead of being a charge upon their parents or the parish, or wanting food and raiment for the rest of their lives, they shall, on the contrary, contribute to the feeding and partly to the clothing of many thousands.

There is likewise another great advantage in my scheme, that it will prevent those voluntary abortions, and that horrid practice of women murdering their bastard children, alas! too frequent among us, sacrificing the poor innocent babes, I doubt, more to avoid the expense than the shame, which would move tears and pity in the most savage and inhuman breast.

The number of souls in this kingdom being usually reckoned one million and a half, of these I calculate there may be about two hundred thousand couple whose wives are breeders; from which number I subtract thirty thousand couples who are able to maintain their own children, although I apprehend there cannot be so many under the present distresses of the kingdom; but this being granted, there will remain a hundred and seventy thousand breeders. I again subtract fifty thousand, for those women who miscarry, or whose children die by accident or disease within the year. There only remain a hundred and twenty thousand children of poor parents annually born. The question therefore is how this number shall be reared and provided for. Which, as I have already said, under the present situation of affairs is utterly impossible by all the methods hitherto proposed, for we can neither employ them in handicraft or agriculture: we neither build houses (I mean in the country) nor cultivate land. They can very seldom pick up a livelihood by stealing till they arrive at six years old, except where they are of towardly parts; although, I confess, they learn the rudiments much earlier; during which time they can however be properly looked upon only as probationers, as I have been informed by a principal gentleman in the county of Cavan, who protested to me that he never knew above one or two instances under the age of six, even in a part of the kingdom so renowned for the quickest proficiency in that art.

I am assured by our merchants that a boy or a girl before twelve years old is no saleable commodity, and even when they come to this age, they

will not yield above three pounds, or three pounds and half a crown at most, on the exchange; which cannot turn to account either to the parents or kingdom, the charge of nutriment and rags having been at least four times that value.

I shall now therefore humbly propose my own thoughts, which I hope will not be liable to the least objection.

I have been assured by a very knowing American of my acquaintance in London that a young healthy child well nursed is at a year old a most delicious nourishing and wholesome food, whether stewed, roasted, baked, or boiled; and I make no doubt that it will equally serve in a fricassee or a ragout.

I do therefore humbly offer it to public consideration, that of the hundred and twenty thousand children already computed, twenty thousand may be reserved for breed, whereof only one-fourth part to be males; which is more than we allow to sheep, black cattle, or swine, and my reason is that these children are seldom the fruits of marriage, a circumstance not much regarded by our savages; therefore, one male will be sufficient to serve four females. That the remaining hundred thousand may at a year old be offered in sale to the persons of quality and fortune, through the kingdom, always advising the mother to let them suck plentifully in the last month so as to render them plump and fat for a good table. A child will make two dishes at an entertainment for friends, and when the family dines alone, the fore or hind quarter will make a reasonable dish, and seasoned with a little pepper or salt will be very good boiled on the fourth day, especially in winter.

I have reckoned upon a medium that a child just born will weigh 12 pounds, and in a solar year, if tolerably nursed, increase to 28 pounds.

I grant this food will be somewhat dear, and therefore very proper for landlords, who, as they have already devoured most of the parents, seem to have the best title to the children.

Infant's flesh will be in season throughout the year, but more plentiful in March, and a little before and after; for we are told by a grave author, an eminent French physician, that fish being a prolific diet, there are more children born in Roman Catholic countries about nine months after Lent than at any other season; therefore reckoning a year after Lent, the markets will be more glutted than usual, because the number of popish infants is at least three to one in this kingdom, and therefore it will have one other collateral advantage, by lessening the number of papists among us.

I have already computed the charge of nursing a beggar's child (in

which list I reckon all cottagers, labourers, and four-fifths of the farmers) to be about two shillings per annum, rags included; and I believe no gentleman would repine to give ten shillings for the carcass of a good fat child, which, as I have said, will make four dishes of excellent nutritive meat, when he hath only some particular friend, or his own family to dine with him. Thus the squire will learn to be a good landlord, and grow popular among his tenants, the mother will have eight shillings neat profit, and be fit for work till she produces another child.

Those who are more thrifty (as I must confess the times require) may flay the carcass; the skin of which, artificially dressed, will make admirable gloves for ladies, and summer boots for fine gentlemen.

As to our city of Dublin, shambles may be appointed for this purpose, in the most convenient parts of it, and butchers we may be assured will not be wanting; although I rather recommend buying the children alive, and dressing them hot from the knife, as we do roasting pigs.

A very worthy person, a true lover of his country, and whose virtues I highly esteem, was lately pleased, in discoursing on this matter, to offer a refinement upon my scheme. He said that many gentlemen of this kingdom having of late destroyed their deer, he conceived that the want of venison might be well supplied by the bodies of young lads and maidens, not exceeding fourteen years of age, nor under twelve, so great a number of both sexes in every country being now ready to starve for want of work and service: and these to be disposed of by their parents if alive, or otherwise by their nearest relations. But with due deference to so excellent a friend, and so deserving a patriot, I cannot be altogether in his sentiments; for as to the males, my American acquaintance assured me from frequent experience that their flesh was generally tough and lean, like that of our schoolboys, by continual exercise, and their taste disagreeable, and to fatten them would not answer the charge. Then as to the females, it would, I think with humble submission, be a loss to the public, because they soon would become breeders themselves. And besides it is not improbable that some scrupulous people might be apt to censure such a practice (although indeed very unjustly) as a little bordering upon cruelty, which, I confess, hath always been with me the strongest objection against any project, how soever well intended.

But in order to justify my friend, he confessed that this expedient was put into his head by the famous Sallmanaazor, a native of the island Formosa, who came from thence to London, above twenty years ago, and in conversation told my friend that in his country when any young person happened to be put to death, the executioner sold the carcass to

persons of quality, as a prime dainty, and that, in his time, the body of a plump girl of fifteen, who was crucified for an attempt to poison the Emperor, was sold to His Imperial Majesty's prime minister of state, and other great mandarins of the court, in joints from the gibbet, at four hundred crowns. Neither indeed can I deny that if the same use were made of several plump young girls in this town, who, without one single groat to their fortunes, cannot stir abroad without a chair, and appear at a playhouse and assemblies in foreign fineries, which they never will pay for, the kingdom would not be the worse.

Some persons of a desponding spirit are in great concern about that vast number of poor people who are aged, diseased, or maimed, and I have been desired to employ my thoughts on what course may be taken to ease the nation of so grievous an encumbrance. But I am not in the least pain upon that matter, because it is very well known that they are every day dying, and rotting, by cold and famine, and filth, and vermin, as fast as can be reasonably expected. And as to the younger labourers, they are now in almost as hopeful a condition. They cannot get work, and consequently pine away for want of nourishment to a degree that if at any time they are accidentally hired to common labour, they have not strength to perform it, and thus the country and themselves are happily delivered from the evils to come.

I have too long digressed, and therefore shall return to my subject. I think the advantages by the proposal which I have made are obvious and many, as well as of the highest importance.

For first, as I have already observed, it would greatly lessen the number of papists, with whom we are yearly overrun, being the principal breeders of the nation, as well as our most dangerous enemies, and who stay at home on purpose with a design to deliver the kingdom to the pretender, hoping to take their advantage by the absence of so many good Protestants, who have chosen rather to leave their country than stay at home and pay tithes against their conscience to an episcopal curate.

Secondly, the poorer tenants will have something valuable of their own which by law may be made liable to distress, and help to pay their landlord's rent, their corn and cattle being already seized, and money a thing unknown.

Thirdly, whereas the maintenance of a hundred thousand children, from two years old and upwards, cannot be computed at less than ten shillings a piece per annum, the nation's stock will be thereby increased fifty thousand pounds per annum, besides the profit of a new dish, intro-

duced to the tables of all gentlemen of fortune in the kingdom who have any refinement in taste, and the money will circulate among ourselves, the goods being entirely of our own growth and manufacture.

Fourthly, the constant breeders, besides the gain of eight shillings sterling per annum, by the sale of their children, will be rid of the charge of maintaining them after the first year.

Fifthly, this food would likewise bring great custom to taverns, where the vintners will certainly be so prudent as to procure the best receipts for dressing it to perfection; and consequently have their houses frequented by all the fine gentlemen, who justly value themselves upon their knowledge in good eating; and a skilful cook, who understands how to oblige his guests, will contrive to make it as expensive as they please.

Sixthly, this would be a great inducement to marriage, which all wise nations have either encouraged by rewards or enforced by laws and penalties. It would increase the care and tenderness of mothers towards their children, when they were sure of a settlement for life to the poor babes, provided in some sort by the public to their annual profit instead of expense; we should soon see an honest emulation among the married women which of them could bring the fattest child to the market. Men would become as fond of their wives during the time of their pregnancy as they are now of their mares in foal, their cows in calf, or sows when they are ready to farrow, nor offer to beat or kick them (as is too frequent a practice) for fear of a miscarriage.

Many other advantages might be enumerated. For instance, the addition of some thousand carcasses in our exportation of barreled beef, the propagation of swine's flesh, and improvement in the art of making good bacon, so much wanted among us by the great destruction of pigs, too frequent at our tables, which are no way comparable in taste or magnificence to a well-grown, fat yearling child, which roasted whole will make a considerable figure at a Lord Mayor's feast or any other public entertainment. But this, and many others, I omit, being studious of brevity.

Supposing that one thousand families in this city would be constant customers for infant's flesh, besides others who might have it at merry meetings, particularly at weddings and christenings, I compute that Dublin would take off annually about twenty thousand carcasses, and the rest of the kingdom (where probably they will be sold somewhat cheaper) the remaining eighty thousand.

I can think of no one objection that will possibly be raised against this proposal, unless it should be urged that the number of people will be thereby much lessened in the kingdom. This I freely own, and 'twas in-

deed one principal design in offering it to the world. I desire the reader will observe that I calculate my remedy for this one individual kingdom of Ireland, and for no other that ever was, is, or, I think, ever can be upon earth. Therefore let no man talk to me of other expedients: of taxing our absentees at five shillings a pound; of using neither clothes nor household furniture except what is of our own growth and manufacture; of utterly rejecting the materials and instruments that promote foreign luxury; of curing the expensiveness of pride, vanity, idleness, and gaming in our women; of introducing a vein of parsimony, prudence, and temperance; of learning to love our country, wherein we differ even from Laplanders, and the inhabitants of Topinamboo; of quitting our animosities and factions, nor act any longer like the Jews, who were murdering one another at the very moment their city was taken; of being a little cautious not to sell our country and consciences for nothing; of teaching landlords to have at least one degree of mercy towards their tenants. Lastly, of putting a spirit of honesty, industry, and skill into our shopkeepers, who, if a resolution could now be taken to buy only our native goods, would immediately unite to cheat and exact upon us in the price, the measure, and the goodness, nor could ever yet be brought to make one fair proposal of just dealing, though often and earnestly invited to it.

Therefore I repeat, let no man talk to me of these and the like expedients till he hath at least some glimpse of hope that there will ever be some hearty and sincere attempt to put them in practice.

But as to myself, having been wearied out for many years with offering vain, idle, visionary thoughts, and at length utterly despairing of success, I fortunately fell upon this proposal, which, as it is wholly new, so it hath something solid and real, of no expense and little trouble, full in our own power, and whereby we can incur no danger in disobliging England. For this kind of commodity will not bear exportation, the flesh being of too tender a consistence to admit a long continuance in salt, although perhaps I could name a country which would be glad to eat up our whole nation without it.

After all, I am not so violently bent upon my own opinion as to reject any offer, proposed by wise men, which shall be found equally innocent, cheap, easy, and effectual. But before something of that kind shall be advanced in contradiction to my scheme, and offering a better, I desire the author or authors will be pleased maturely to consider two points: first, as things now stand, how they will be able to find food and raiment for a hundred thousand useless mouths and backs. And secondly, there being a round million of creatures in human figure throughout this kingdom

whose whole subsistence put into a common stock would leave them in debt two millions of pounds sterling, adding those who are beggars by profession to the bulk of farmers, cottagers, and labourers, with their wives and children, who are beggars in effect; I desire those politicians who dislike my overture, and may perhaps be so bold to attempt an answer, that they will first ask the parents of these mortals whether they would not at this day think it a great happiness to have been sold for food at a year old in the manner I prescribe, and thereby have avoided such a perpetual scene of misfortunes as they have since gone through, by the oppression of landlords, the impossibility of paying rent without money or trade, the want of common sustenance, with neither house nor clothes to cover them from the inclemencies of the weather, and the most inevitable prospect of entailing the like or greater miseries upon their breed for ever.

I profess in the sincerity of my heart that I have not the least personal interest in endeavouring to promote this necessary work, having no other motive than the public good of my country, by advancing our trade, providing for infants, relieving the poor, and giving some pleasure to the rich. I have no children by which I can propose to get a single penny, the youngest being nine years old, and my wife past child-bearing.

David Hume ¹

1711–1776

The essay form, in which Hume gracefully expresses his ideas here, had its beginning as far back as Plutarch and Montaigne. It is usually a short, informal, often personal bit of writing, on some nontechnical subject of general interest. Reading a good essay is like sitting around the fireplace while a master conversationalist, at his best, explains and defends his extraordinary views on an ordinary subject. Happily, these essays, except for the last, are also contributions to economic theory.

The first essay is provocative enough for anyone. For centuries it had been assumed, without question, that luxuries and the refinements of life are vices which produce effeminacy and loss of martial courage. The civilized man's taste for fine foods, wines, apparel, and the like, had been compared unfavorably with the rough manners and sterling virtues of the barbarian. Is not this absurd, Hume asks. "No gratification, however sensual, can of itself be esteemed vicious," he claims. It becomes so only when it leads a man to neglect his duty to his family and friends. There is nothing abominable, after all, in pleasure or its refinements. They give men something to live and fight for. The French and English, devoted to the arts and to the art of fine living, are as courageous as they come. They have great wealth and highly developed industries too. Is there any answer to this commonsensical argument?

In the second essay, Hume tells us that money is a great stimulator of industry and of refined tastes and luxuries. Yet it does not follow that the more a nation has, the better off it is. A nation never suffers internally from a shortage of money or gold. If it had only half as

¹ For a biography of David Hume, see Vol. 5, pp. 99–101, in this set.

much, its commodities would cost half as much; if it had twice as much, they would cost twice as much. Money is a mere symbol of the exchange value of commodities. In a very simple economy, goods are bartered and money is not needed. Yet such an economy remains simple and rude: wants are primitive and undiversified; industry does not develop; the arts are neglected.

“The quantity of gold and silver is in itself altogether indifferent,” according to Hume, for the wealth of a nation consists of its men and commodities, and depends on how well the commodities are marketed and how widely money is circulated. Although the increase of gold and money does not by itself increase wealth, it spurs the industry of the people. As a result, goods are produced more cheaply and prices do not rise proportionately. Moreover, prices and wages do not rise at once. There is a lag, and this also benefits the economy, for it stimulates demand.

A very perceptive and logical essay, you will admit, but has not Hume forgotten that gold is not a mere symbol but also a commodity, the price of which may vary?

Of the Balance of Trade seeks to deflate another very widespread conviction, namely, that an unfavorable balance of trade will eventually ruin a country, draining off its gold to other nations. Hume argues, against the free traders here, that if a country loses gold in trade, the domestic cost of labor and commodities will decline. Sales abroad will then increase, and gold will flow back into the country. The trade balance will cease to be unfavorable. A correction in the opposite direction will occur when the trade balance is favorable. In the same way, water always maintains the same level. Parliaments can pass laws to maintain a favorable trade balance, but they will be found ineffective or harmful. Is this always so?

Most of us nowadays would agree with Hume that the best taxes are those levied on luxuries, and that taxes on commodities are far better than poll taxes. We would tend to approve the reasons he gives. But we may not be so sure that eighteenth-century artisans could easily absorb moderate taxes without increasing their wages.

In Hume's last essay, we might question whether fact is really more entertaining, as well as more profitable, than fiction. And are we like children if we do not read history? How can a study of history be so profitable if history never repeats itself? Could Hume answer that *types* of situations recur, and that human nature, at any rate, is always the same?

Of Refinement in the Arts

Luxury is a word of uncertain signification, and may be taken in a good as well as in a bad sense. In general, it means great refinement in the gratification of the senses; and any degree of it may be innocent or blameable, according to the age, or country, or condition of the person. The bounds between the virtue and the vice cannot here be exactly fixed more than in other moral subjects. To imagine that the gratifying of any sense, or the indulging of any delicacy in meat, drink, or apparel, is of itself a vice can never enter into a head that is not disordered by the frenzies of enthusiasm. I have, indeed, heard of a monk abroad, who, because the windows of his cell opened upon a noble prospect, made a covenant with his eyes never to turn that way, or receive so sensual a gratification. And such is the crime of drinking champagne or burgundy preferably to small beer or porter. These indulgences are only vices when they are pursued at the expense of some virtue, as liberality or charity; in like manner as they are follies when for them a man ruins his fortune, and reduces himself to want and beggary. Where they entrench upon no virtue, but leave ample subject whence to provide for friends, family, and every proper object of generosity or compassion, they are entirely innocent, and have in every age been acknowledged such by almost all moralists. To be entirely occupied with the luxury of the table, for instance, without any relish for the pleasures of ambition, study, or conversation, is a mark of stupidity, and is incompatible with any vigour of temper or genius. To confine one's expense entirely to such a gratification, without regard to friends or family, is an indication of a heart destitute of humanity or benevolence. But if a man reserve time sufficient for all laudable pursuits, and money sufficient for all generous purposes, he is free from every shadow of blame or reproach.

Since luxury may be considered either as innocent or blameable, one

may be surprised at those preposterous opinions which have been entertained concerning it; while men of libertine principles bestow praises even on vicious luxury, and represent it as highly advantageous to society; and on the other hand, men of severe morals blame even the most innocent luxury, and represent it as the source of all the corruptions, disorders, and factions incident to civil government. We shall here endeavour to correct both these extremes, by proving, first, that the ages of refinement are both the happiest and most virtuous; secondly, that wherever luxury ceases to be innocent, it also ceases to be beneficial; and when carried a degree too far, is a quality pernicious, though perhaps not the most pernicious, to political society.

To prove the first point, we need but consider the effects of refinement both on private and on public life. Human happiness, according to the most received notions, seems to consist in three ingredients: action, pleasure, and indolence. And though these ingredients ought to be mixed in different proportions, according to the particular disposition of the person, yet no one ingredient can be entirely wanting, without destroying, in some measure, the relish of the whole composition. Indolence or repose, indeed, seems not of itself to contribute much to our enjoyment; but, like sleep, is requisite as an indulgence to the weakness of human nature, which cannot support an uninterrupted course of business or pleasure. That quick march of the spirits which takes a man from himself, and chiefly gives satisfaction, does in the end exhaust the mind, and requires some intervals of repose, which, though agreeable for a moment, yet, if prolonged, beget a languor and lethargy that destroys all enjoyment. Education, custom, and example have a mighty influence in turning the mind to any of these pursuits; and it must be owned that where they promote a relish for action and pleasure, they are so far favourable to human happiness. In times when industry and the arts flourish, men are kept in perpetual occupation, and enjoy, as their reward, the occupation itself, as well as those pleasures which are the fruit of their labour. The mind acquires new vigour; enlarges its powers and faculties; and by an assiduity in honest industry, both satisfies its natural appetites and prevents the growth of unnatural ones, which commonly spring up when nourished by ease and idleness. Banish those arts from society, you deprive men both of action and of pleasure; and leaving nothing but indolence in their place, you even destroy the relish of indolence, which never is agreeable but when it succeeds to labour, and recruits the spirits exhausted by too much application and fatigue.

Another advantage of industry and of refinements in the mechanical

arts is that they commonly produce some refinements in the liberal; nor can one be carried to perfection without being accompanied, in some degree, with the other. The same age which produces great philosophers and politicians, renowned generals and poets usually abounds with skilful weavers, and ship-carpenters. We cannot reasonably expect that a piece of woollen cloth will be brought to perfection in a nation which is ignorant of astronomy, or where ethics are neglected. The spirit of the age affects all the arts; and the minds of men, being once roused from their lethargy, and put into a fermentation, turn themselves on all sides, and carry improvements into every art and science. Profound ignorance is totally banished, and men enjoy the privilege of rational creatures to think as well as to act, to cultivate the pleasures of the mind as well as those of the body.

The more these refined arts advance, the more sociable men become: nor is it possible that when enriched with science, and possessed of a fund of conversation, they should be contented to remain in solitude, or live with their fellow-citizens in that distant manner which is peculiar to ignorant and barbarous nations. They flock into cities; love to receive and communicate knowledge; to show their wit or their breeding; their taste in conversation or living, in clothes or furniture. Curiosity allures the wise; vanity the foolish; and pleasure both. Particular clubs and societies are everywhere formed: both sexes meet in an easy and sociable manner; and the tempers of men, as well as their behaviour, refine apace. So that besides the improvements which they receive from knowledge and the liberal arts, it is impossible but they must feel an increase of humanity from the very habit of conversing together, and contribute to each other's pleasure and entertainment. Thus industry, knowledge, and humanity are linked together by an indissoluble chain, and are found, from experience as well as reason, to be peculiar to the more polished, and, what are commonly denominated, the more luxurious ages.

Nor are these advantages attended with disadvantages that bear any proportion to them. The more men refine upon pleasure, the less they indulge in excess of any kind; because nothing is more destructive to true pleasure than such excesses. One may safely affirm that the Tartars are oftener guilty of beastly gluttony, when they feast on their dead horses, than European courtiers with all their refinements of cookery. And if libertine love, or even infidelity to the marriage-bed, be more frequent in polite ages, when it is often regarded only as a piece of gallantry, drunkenness, on the other hand, is much less common: a vice more odious, and more pernicious both to mind and body. And in this

matter I would appeal not only to an Ovid or a Petronius but to a Seneca or a Cato. We know that Caesar, during Catiline's conspiracy, being necessitated to put into Cato's hands a *billet-doux* which discovered an intrigue with Servilia, Cato's own sister, that stern philosopher threw it back to him with indignation; and in the bitterness of his wrath, gave him the appellation of drunkard, as a term more opprobrious than that with which he could more justly have reproached him.

But industry, knowledge, and humanity are not advantageous in private life alone: they diffuse their beneficial influence on the public, and render the government as great and flourishing as they make individuals happy and prosperous. The increase and consumption of all the commodities which serve to the ornament and pleasure of life are advantageous to society; because at the same time that they multiply those innocent gratifications to individuals, they are a kind of storehouse of labour, which, in the exigencies of state, may be turned to public service. In a nation where there is no demand for such superfluities, men sink into indolence, lose all enjoyment of life, and are useless to the public, which cannot maintain or support its fleets and armies from the industry of such slothful members.

The bounds of all the European kingdoms are, at present, nearly the same they were two hundred years ago: But what a difference is there in the power and grandeur of those kingdoms? Which can be ascribed to nothing but the increase of art and industry. When Charles VIII of France invaded Italy, he carried with him about 20,000 men: Yet this armament so exhausted the nation, as we learn from Guicciardini, that for some years it was not able to make so great an effort. The late king of France, in time of war, kept in pay above 400,000 men; though from Mazarin's death to his own, he was engaged in a course of wars that lasted near thirty years.

This industry is much promoted by the knowledge inseparable from ages of art and refinement; as, on the other hand, this knowledge enables the public to make the best advantage of the industry of its subjects. Laws, order, police, discipline: these can never be carried to any degree of perfection before human reason has refined itself by exercise, and by an application to the more vulgar arts, at least, of commerce and manufacture. Can we expect that a government will be well modelled by a people who know not how to make a spinning-wheel, or to employ a loom to advantage? Not to mention that all ignorant ages are infested with superstition, which throws the government off its bias, and disturbs men in the pursuit of their interest and happiness.

Knowledge in the arts of government naturally begets mildness and moderation, by instructing men in the advantages of humane maxims above rigour and severity, which drive subjects into rebellion, and make the return to submission impracticable, by cutting off all hopes of pardon. When the tempers of men are softened as well as their knowledge improved, this humanity appears still more conspicuous, and is the chief characteristic which distinguishes a civilized age from times of barbarity and ignorance. Factions are then less inveterate, revolutions less tragical, authority less severe and seditions less frequent. Even foreign wars abate of their cruelty; and after the field of battle, where honour and interest steel men against compassion as well as fear, the combatants divest themselves of the brute, and resume the man.

Nor need we fear that men, by losing their ferocity, will lose their martial spirit, or become less undaunted and vigorous in defence of their country or their liberty. The arts have no such effect in enervating either the mind or body. On the contrary, industry, their inseparable attendant, adds new force to both. And if anger, which is said to be the whetstone of courage, loses somewhat of its asperity by politeness and refinement, a sense of honour, which is a stronger, more constant, and more governable principle, acquires fresh vigour by that elevation of genius which arises from knowledge and a good education. Add to this that courage can neither have any duration nor be of any use when not accompanied with discipline and martial skill, which are seldom found among a barbarous people. The ancients remarked that Datames was the only barbarian that ever knew the art of war. And Pyrrhus, seeing the Romans marshal their army with some art and skill, said with surprise, "These barbarians have nothing barbarous in their discipline!" It is observable that, as the old Romans, by applying themselves solely to war, were almost the only uncivilized people that ever possessed military discipline so the modern Italians are the only civilized people, among Europeans, that ever wanted courage and a martial spirit. Those who would ascribe this effeminacy of the Italians to their luxury, or politeness, or application to the arts need but consider the French and English, whose bravery is as uncontestable as their love for the arts, and their assiduity in commerce. The Italian historians give us a more satisfactory reason for this degeneracy of their countrymen. They show us how the sword was dropped at once by all the Italian sovereigns; while the Venetian aristocracy was jealous of its subjects, the Florentine democracy applied itself entirely to commerce; Rome was governed by priests, and Naples by women. War then became the business of soldiers of fortune, who spared one another, and to the

astonishment of the world, could engage a whole day in what they called a battle, and return at night to their camp, without the least bloodshed.

What has chiefly induced severe moralists to declaim against refinement in the arts is the example of ancient Rome, which joining to its poverty and rusticity, virtue and public spirit, rose to such a surprising height of grandeur and liberty; but having learned from its conquered provinces the Asiatic luxury, fell into every kind of corruption; whence arose sedition and civil wars, attended at last with the total loss of liberty. All the Latin classics, whom we peruse in our infancy, are full of these sentiments, and universally ascribe the ruin of their state to the arts and riches imported from the East: insomuch that Sallust represents a taste for painting as a vice no less than lewdness and drinking. And so popular were these sentiments, during the later ages of the republic, that this author abounds in praises of the old rigid Roman virtue, though himself the most egregious instance of modern luxury and corruption; speaks contemptuously of the Grecian eloquence, though the most elegant writer in the world; nay, employs preposterous digressions and declamations to this purpose, though a model of taste and correctness.

But it would be easy to prove that these writers mistook the cause of the disorders in the Roman state, and ascribed to luxury and the arts what really proceeded from an ill-modelled government, and the unlimited extent of conquests. Refinement on the pleasures and conveniences of life has no natural tendency to beget venality and corruption. The value which all men put upon any particular pleasure depends on comparison and experience; nor is a porter less greedy of money, which he spends on bacon and brandy, than a courtier, who purchases champagne and ortolans. Riches are valuable at all times, and to all men, because they always purchase pleasures, such as men are accustomed to, and desire: Nor can anything restrain or regulate the love of money, but a sense of honour and virtue; which, if it be not nearly equal at all times, will naturally abound most in ages of knowledge and refinement.

Of all European kingdoms, Poland seems the most defective in the arts of war as well as peace, mechanical as well as liberal; yet it is there that venality and corruption do most prevail. The nobles seem to have preserved their crown elective for no other purpose than regularly to sell it to the highest bidder. This is almost the only species of commerce with which that people are acquainted.

The liberties of England, so far from decaying since the improvements in the arts, have never flourished so much as during that period. And though corruption may seem to increase of late years, this is chiefly to

be ascribed to our established liberty, when our princes have found the impossibility of governing without parliaments, or of terrifying parliaments by the phantom of prerogative. Not to mention that this corruption or venality prevails much more among the electors than the elected; and therefore cannot justly be ascribed to any refinements in luxury.

If we consider the matter in a proper light, we shall find that a progress in the arts is rather favourable to liberty, and has a natural tendency to preserve, if not produce, a free government. In rude unpolished nations, where the arts are neglected, all labour is bestowed on the cultivation of the ground; and the whole society is divided into two classes: proprietors of land, and their vassals or tenants. The latter are necessarily dependent, and fitted for slavery and subjection; especially where they possess no riches, and are not valued for their knowledge in agriculture, as must always be the case where the arts are neglected. The former naturally erect themselves into petty tyrants; and must either submit to an absolute master, for the sake of peace and order, or if they will preserve their independency, like the ancient barons, they must fall into feuds and contests among themselves, and throw the whole society into such confusion as is perhaps worse than the most despotic government. But where luxury nourishes commerce and industry, the peasants, by a proper cultivation of the land, become rich and independent; while the tradesmen and merchants acquire a share of the property, and draw authority and consideration to that middling rank of men who are the best and firmest basis of public liberty. These submit not to slavery, like the peasants, from poverty and meanness of spirit; and having no hopes of tyrannizing over others, like the barons, they are not tempted, for the sake of that gratification, to submit to the tyranny of their sovereign. They covet equal laws, which may secure their property, and preserve them from monarchical, as well as aristocratical, tyranny.

The lower house is the support of our popular government; and all the world acknowledges that it owed its chief influence and consideration to the increase of commerce, which threw such a balance of property into the hands of the commons. How inconsistent then is it to blame so violently a refinement in the arts, and to represent it as the bane of liberty and public spirit!

To declaim against present times, and magnify the virtue of remote ancestors, is a propensity almost inherent in human nature: And as the sentiments and opinions of civilized ages alone are transmitted to posterity, hence it is that we meet with so many severe judgments pro-

nounced against luxury, and even science; and hence it is that at present we give so ready an assent to them. But the fallacy is easily perceived by comparing different nations that are contemporaries, where we both judge more impartially and can better set in opposition those manners with which we are sufficiently acquainted. Treachery and cruelty, the most pernicious and most odious of all vices, seem peculiar to uncivilized ages; and by the refined Greeks and Romans were ascribed to all the barbarous nations which surrounded them. They might justly, therefore, have presumed that their own ancestors, so highly celebrated, possessed no greater virtue, and were as much inferior to their posterity in honour and humanity as in taste and science. An ancient Frank or Saxon may be highly extolled: But I believe every man would think his life or fortune much less secure in the hands of a Moor or Tartar, than in those of a French or English gentleman, the rank of men the most civilized in the most civilized nations.

We come now to the second position which we propose to illustrate, to wit, that as innocent luxury, or a refinement in the arts and conveniences of life, is advantageous to the public, so wherever luxury ceases to be innocent, it also ceases to be beneficial; and when carried a degree farther, begins to be a quality pernicious, though, perhaps, not the most pernicious, to political society.

Let us consider what we call vicious luxury. No gratification, however sensual, can of itself be esteemed vicious. A gratification is only vicious when it engrosses all a man's expense, and leaves no ability for such acts of duty and generosity as are required by his situation and fortune. Suppose that he correct the vice, and employ part of his expense in the education of his children, in the support of his friends, and in relieving the poor: would any prejudice result to society? On the contrary, the same consumption would arise; and that labour which, at present, is employed only in producing a slender gratification to one man would relieve the necessitous, and bestow satisfaction on hundreds. The same care and toil that raise a dish of peas at Christmas would give bread to a whole family during six months. To say that without a vicious luxury the labour would not have been employed at all is only to say that there is some other defect in human nature, such as indolence, selfishness, inattention to others, for which luxury, in some measure, provides a remedy; as one poison may be an antidote to another. But virtue, like wholesome food, is better than poisons, however corrected.

Suppose the same number of men that are present in Great Britain,

with the same soil and climate; I ask, is it not possible for them to be happier, by the most perfect way of life that can be imagined, and by the greatest reformation that Omnipotence itself could work in their temper and disposition? To assert that they cannot appears evidently ridiculous. As the land is able to maintain more than all its present inhabitants, they could never, in such a Utopian state, feel any other ills than those which arise from bodily sickness; and these are not the half of human miseries. All other ills spring from some vice, either in ourselves or others; and even many of our diseases proceed from the same origin. Remove the vices, and the ills follow. You must only take care to remove all the vices. If you remove part, you may render the matter worse. By banishing vicious luxury, without curing sloth and an indifference to others, you only diminish industry in the state, and add nothing to men's charity or their generosity. Let us, therefore, rest contented with asserting that two opposite vices in a state may be more advantageous than either of them alone; but let us never pronounce vice in itself advantageous. Is it not very inconsistent for an author to assert in one page that moral distinctions are inventions of politicians for public interest, and in the next page maintain that vice is advantageous to the public? And indeed it seems upon any system of morality little less than a contradiction in terms to talk of a vice which is in general beneficial to society.¹

I thought this reasoning necessary in order to give some light to a philosophical question which has been much disputed in England. I call it a philosophical question, not a political one. For whatever may be the consequence of such a miraculous transformation of mankind as would endow them with every species of virtue, and free them from every species of vice, this concerns not the magistrate, who aims only at possibilities. He cannot cure every vice by substituting a virtue in its place. Very often he can only cure one vice by another; and in that case, he ought to prefer what is least pernicious to society. Luxury, when excessive, is the source of many ills; but is in general preferable to sloth and idleness, which would commonly succeed in its place, and are more hurtful both to private persons and to the public. When sloth reigns, a mean

1. Prodigality is not to be confounded with a refinement in the arts. It even appears that that vice is much less frequent in the cultivated ages. Industry and gain beget this frugality among the lower and middle ranks of men, and in all the busy professions. Men of high rank, indeed, it may be pretended, are more allured by the pleasures, which become more frequent. But idleness is the great source of prodigality at all times; and there are pleasures and vanities in every age, which allure men equally when they are unacquainted with better enjoyments. Not to mention that the high interest paid in rude times quickly consumes the fortunes of the landed gentry, and multiplies their necessities.

uncultivated way of life prevails among individuals, without society, without enjoyment. And if the sovereign, in such a situation, demands the service of his subjects, the labour of the state suffices only to furnish the necessaries of life to the labourers, and can afford nothing to those who are employed in the public service.

Of Money

Money is not, properly speaking, one of the subjects of commerce; but only the instrument which men have agreed upon to facilitate the exchange of one commodity for another. It is none of the wheels of trade: It is the oil which renders the motion of the wheels more smooth and easy. If we consider any one kingdom by itself, it is evident that the greater or less plenty of money is of no consequence; since the prices of commodities are always proportioned to the plenty of money, and a crown in Harry VII's time served the same purpose as a pound does at present. It is only the public which draws any advantage from the greater plenty of money; and that only in its wars and negotiations with foreign states. And this is the reason why all rich and trading countries from Carthage to Great Britain and Holland have employed mercenary troops, which they hired from their poorer neighbours. Were they to make use of their native subjects, they would find less advantage from their superior riches, and from their great plenty of gold and silver, since the pay of all their servants must rise in proportion to the public opulence. Our small army of 20,000 men is maintained at as great expense as a French army twice as numerous. The English fleet, during the late war, required as much money to support it as all the Roman legions which kept the whole world in subjection during the time of the emperors.¹

The greater number of people and their greater industry are serviceable in all cases; at home and abroad, in private and in public. But the greater

1. A private soldier in the Roman infantry had a denarius a day, somewhat less than eightpence. The Roman emperors had commonly 25 legions in pay, which, allowing 5,000 men to a legion, makes 125,000. Tacit., *Ann.* lib. iv, 5. It is true, there were also auxiliaries to the legions; but their numbers are uncertain, as well as their pay. To consider only the legionaries, the pay of the private men could not exceed 1,600,000 pounds. Now, the parliament in the last war commonly allowed for the fleet 2,500,000. We have therefore 900,000 over for the officers and other expenses of the Roman legions. There seem to have been but few officers in the Roman armies, in comparison of what are employed in all our modern troops, except some Swiss corps. And these officers had very small pay: a centurion, for in-

plenty of money is very limited in its use, and may even sometimes be a loss to a nation in its commerce with foreigners.

There seems to be a happy concurrence of causes in human affairs which checks the growth of trade and riches, and hinders them from being confined entirely to one people; as might naturally at first be dreaded from the advantages of an established commerce. Where one nation has gotten the start of another in trade, it is very difficult for the latter to regain the ground it has lost; because of the superior industry and skill of the former, and the greater stocks of which its merchants are possessed, and which enable them to trade on so much smaller profits. But these advantages are compensated, in some measure, by the low price of labour in every nation which has not an extensive commerce, and does not much abound in gold and silver. Manufactures therefore gradually shift their places, leaving those countries and provinces which they have already enriched, and flying to others, whither they are allured by the cheapness of provisions and labour; till they have enriched these also, and are again banished by the same causes. And, in general, we may observe that the dearness of everything, from plenty of money, is a disadvantage which attends an established commerce, and sets bounds to it in every country, by enabling the poorer states to undersell the richer in all foreign markets.

This has made me entertain a doubt concerning the benefit of banks and paper credit, which are so generally esteemed advantageous to every nation. That provisions and labour should become dear by the increase of trade and money is, in many respects, an inconvenience; but an inconvenience that is unavoidable, and the effect of that public wealth and prosperity which are the end of all our wishes. It is compensated by the advantages which we reap from the possession of these precious metals, and the weight which they give the nation in all foreign wars and negotiations. But there appears no reason for increasing that inconvenience by a counterfeit money, which foreigners will not accept of in any payment, and which any great disorder in the state will reduce to nothing. There are, it is true, many people in every rich state, who, having large sums of money, would prefer paper with good security, as being of more easy

stance, only double a common soldier. And as the soldiers from their pay (*Tacit., Ann. lib. i, 17*) bought their own clothes, arms, tents, and baggage, this must also diminish considerably the other charges of the army. So little expensive was that mighty government, and so easy was its yoke over the world. And, indeed, this is the more natural conclusion from the foregoing calculations. For money, after the conquest of Egypt, seems to have been nearly in as great plenty at Rome as it is at present in the richest of the European kingdoms.

transport and more safe custody. If the public provide not a bank, private bankers will take advantage of this circumstance; as the goldsmiths formerly did in London, or as the bankers do at present in Dublin: And therefore it is better, it may be thought, that a public company should enjoy the benefit of that paper credit which always will have place in every opulent kingdom. But to endeavour artificially to increase such a credit can never be the interest of any trading nation; but must lay them under disadvantages, by increasing money beyond its natural proportion to labour and commodities, and thereby heightening their price to the merchant and manufacturer. And in this view, it must be allowed that no bank could be more advantageous than such a one as locked up all the money it received, and never augmented the circulating coin, as is usual, by returning part of its treasure into commerce. A public bank, by this expedient, might cut off much of the dealings of private bankers and money-jobbers; and though the state bore the charge of salaries to the directors and tellers of this bank (for, according to the preceding supposition, it would have no profit from its dealings), the national advantage, resulting from the low price of labour and the destruction of paper credit, would be a sufficient compensation. Not to mention that so large a sum, lying ready at command, would be a convenience in times of great public danger and distress; and what part of it was used might be replaced at leisure, when peace and tranquility was restored to the nation.

But of this subject of paper credit we shall treat more largely hereafter. And I shall finish this essay on money by proposing and explaining two observations, which may, perhaps, serve to employ the thoughts of our speculative politicians.

It was a shrewd observation of Anacharsis the Scythian, who had never seen money in his own country, that gold and silver seemed to him of no use to the Greeks, but to assist them in numeration and arithmetic. It is indeed evident that money is nothing but the representation of labour and commodities, and serves only as a method of rating or estimating them. Where coin is in greater plenty; as a greater quantity of it is required to represent the same quantity of goods; it can have no effect, either good or bad, taking a nation within itself; any more than it would make an alteration on a merchant's books, if instead of the Arabian method of notation, which requires few characters, he should make use of the Roman, which requires a great many. Nay, the greater quantity of money, like the Roman characters, is rather inconvenient, and requires greater trouble both to keep and transport it. But notwithstanding this

conclusion, which must be allowed just, it is certain that since the discovery of the mines in America, industry has increased in all the nations of Europe, except in the possessors of those mines; and this may justly be ascribed, among other reasons, to the increase of gold and silver. Accordingly we find that in every kingdom into which money begins to flow in greater abundance than formerly, everything takes a new face: labour and industry gain life; the merchant becomes more enterprising, the manufacturer more diligent and skilful, and even the farmer follows his plough with greater alacrity and attention. This is not easily to be accounted for, if we consider only the influence which a greater abundance of coin has in the kingdom itself, by heightening the price of commodities, and obliging every one to pay a great number of these little yellow or white pieces for everything he purchases. And as to foreign trade, it appears that great plenty of money is rather disadvantageous, by raising the price of every kind of labour.

To account, then, for this phenomenon, we must consider that though the high price of commodities be a necessary consequence of the increase of gold and silver, yet it follows not immediately upon that increase; but some time is required before the money circulates through the whole state, and makes its effect be felt on all ranks of people. At first, no alteration is perceived; by degrees the price rises, first of one commodity, then of another; till the whole at last reaches a just proportion with the new quantity of specie which is in the kingdom. In my opinion, it is only in this interval or intermediate situation, between the acquisition of money and rise of prices, that the increasing quantity of gold and silver is favourable to industry. When any quantity of money is imported into a nation, it is not at first dispersed into many hands; but is confined to the coffers of a few persons, who immediately seek to employ it to advantage. Here are a set of manufacturers or merchants, we shall suppose, who have received returns of gold and silver for goods which they sent to Cadiz. They are thereby enabled to employ more workmen than formerly, who never dream of demanding higher wages, but are glad of employment from such good paymasters. If workmen become scarce, the manufacturer gives higher wages, but at first requires an increase of labour; and this is willingly submitted to by the artisan, who can now eat and drink better to compensate his additional toil and fatigue. He carries his money to market, where he finds everything at the same price as formerly, but returns with greater quantity and of better kinds, for the use of his family. The farmer and gardener, finding that all their commodities are

taken off, apply themselves with alacrity to the raising more; and at the same time can afford to take better and more cloths from their tradesmen, whose price is the same as formerly, and their industry only whetted by so much new gain. It is easy to trace the money in its progress through the whole commonwealth, where we shall find that it must first quicken the diligence of every individual before it increase the price of labour.

And that the specie may increase to a considerable pitch, before it have this latter effect, appears, among other instances, from the frequent operations of the French king on the money; where it was always found that the augmenting of the numerary value did not produce a proportional rise of the prices, at least for some time. In the last year of Louis XIV money was raised three-sevenths, but prices augmented only one. Corn in France is now sold at the same price, or for the same number of livres, it was in 1683; though silver was then at 30 livres the mark, and is now at 50.² Not to mention the great addition of gold and silver, which may have come into that kingdom since the former period.

From the whole of this reasoning we may conclude that it is of no manner of consequence, with regard to the domestic happiness of a state, whether money be in a greater or less quantity. The good policy of the magistrate consists only in keeping it, if possible, still increasing; because, by that means, he keeps alive a spirit of industry in the nation, and increases the stock of labour, in which consists all real power and riches. A nation whose money decreases is actually, at that time, weaker and more miserable than another nation which possesses no more money, but is on the increasing hand. This will be easily accounted for, if we consider that

2. These facts I give upon the authority of M. du Tot in his *Reflections politiques*, an author of reputation. Though I must confess that the facts which he advances on other occasions are often so suspicious as to make his authority less in this matter. However, the general observation that the augmenting of the money in France does not at first proportionably augment the prices is certainly just.

By the by, this seems to be one of the best reasons which can be given for a gradual and universal increase of the denomination of money, though it has been entirely overlooked in all those volumes which have been written on that question by Melon, du Tot, and Paris de Verney. Were all our money, for instance, recoin'd, and a penny's worth of silver taken from every shilling, the new shilling would probably purchase everything that could have been bought by the old; the prices of everything would thereby be insensibly diminished; foreign trade enlivened; and domestic industry, by the circulation of a great number of pounds and shillings, would receive some increase and encouragement. In executing such a project, it would be better to make the new shilling pass for 24 halfpence, in order to preserve the illusion, and make it be taken for the same. And as a recoinage of our silver begins to be requisite, by the continual wearing of our shillings and sixpences, it may be doubtful whether we ought to imitate the example in King William's reign, when the clipped money was raised to the old standard.

the alterations in the quantity of money, either on one side or the other, are not immediately attended with proportionable alterations in the price of commodities. There is always an interval before matters be adjusted to their new situation; and this interval is as pernicious to industry when gold and silver are diminishing as it is advantageous when these metals are increasing. The workman has not the same employment from the manufacturer and merchant, though he pays the same price for everything in the market. The farmer cannot dispose of his corn and cattle, though he must pay the same rent to his landlord. The poverty, and beggary, and sloth which must ensue are easily forseen.

The second observation which I proposed to make with regard to money may be explained after the following manner. There are some kingdoms, and many provinces in Europe (and all of them were once in the same condition), where money is so scarce that the landlord can get none at all from his tenants; but is obliged to take his rent in kind, and either to consume it himself or transport it to places where he may find a market. In those countries, the prince can levy few or no taxes, but in the same manner: And as he will receive small benefit from impositions so paid, it is evident that such a kingdom has little force even at home; and cannot maintain fleets and armies to the same extent as if every part of it abounded in gold and silver. There is surely a greater disproportion between the force of Germany at present and what it was three centuries ago³ than there is in its industry, people, and manufactures. The Austrian dominions in the empire are in general well peopled and well cultivated, and are of great extent; but have not a proportionable weight in the balance of Europe; proceeding, as is commonly supposed, from the scarcity of money. How do all these facts agree with that principle of reason that the quantity of gold and silver is in itself altogether indifferent? According to that principle wherever a sovereign has numbers of subjects, and these have plenty of commodities, he should of course be great and powerful, and they rich and happy, independent of the greater or lesser abundance of the precious metals. These admit of divisions and subdivisions to a great extent; and where the pieces might become so small as to be in danger of being lost, it is easy to mix the gold or silver with a baser metal, as is practised in some countries of Europe, and by that means raise the pieces to a bulk more sensible and convenient. They still serve the same purposes of exchange, whatever their number may be, or whatever colour they may be supposed to have.

3. The Italians gave to the Emperor Maximilian the nickname of Poccidanari. None of the enterprises of that prince ever succeeded, for want of money.

To these difficulties I answer that the effect, here supposed to flow from scarcity of money, really arises from the manners and customs of the people; and that we mistake, as is too usual, a collateral effect for a cause. The contradiction is only apparent; but it requires some thought and reflection to discover the principles by which we can reconcile reason to experience.

It seems a maxim almost self-evident that the prices of everything depend on the proportion between commodities and money, and that any considerable alteration on either has the same effect, either of heightening or lowering the price. Increase the commodities, they become cheaper; increase the money, they rise in their value. As, on the other hand, a diminution of the former, and that of the latter, have contrary tendencies.

It is also evident that the prices do not so much depend on the absolute quantity of commodities and that of money which are in a nation as on that of the commodities which come or may come to market and of the money which circulates. If the coin be locked up in chests, it is the same thing with regard to prices as if it were annihilated; if the commodities be hoarded in magazines and granaries, a like effect follows. As the money and commodities in these cases never meet, they cannot affect each other. Were we, at any time, to form conjectures concerning the price of provisions, the corn which the farmer must reserve for seed and for the maintenance of himself and family ought never to enter into the estimation. It is only the overplus, compared to the demand, that determines the value.

To apply these principles, we must consider that in the first and more uncultivated ages of any state, ere fancy has confounded her wants with those of nature, men, content with the produce of their own fields, or with those rude improvements which they themselves can work upon them, have little occasion for exchange, or least for money, which, by agreement, is the common measure of exchange. The wool of the farmer's own flock, spun in his own family, and wrought by a neighbouring weaver, who receives his payment in corn or wool, suffices for furniture and clothing. The carpenter, the smith, the mason, the tailor are retained by wages of a like nature; and the landlord himself, dwelling in the neighbourhood, is content to receive his rent in the commodities raised by the farmer. The greater part of these he consumes at home, in rustic hospitality; the rest, perhaps, he disposes of for money to the neighbouring town, whence he draws the few materials of his expense and luxury.

But after men begin to refine on all these enjoyments, and live not always at home, nor are content with what can be raised in their neigh-

bourhood, there is more exchange and commerce of all kinds, and more money enters into that exchange. The tradesmen will not be paid in corn, because they want something more than barely to eat. The farmer goes beyond his own parish for the commodities he purchases, and cannot always carry his commodities to the merchant who supplies him. The landlord lives in the capital, or in a foreign country; and demands his rent in gold and silver, which can easily be transported to him. Great undertakers, and manufacturers, and merchants arise in every commodity; and these can conveniently deal in nothing but in specie. And consequently, in this situation of society, the coin enters into many more contracts, and by that means is much more employed than in the former.

The necessary effect is that, provided the money increase not in the nation, everything must become much cheaper in times of industry and refinement than in rude, uncultivated ages. It is the proportion between the circulating money and the commodities in the market which determines the prices. Goods that are consumed at home, or exchanged with other goods in the neighbourhood, never come to market; they affect not in the least the current specie; with regard to it they are as if totally annihilated; and consequently this method of using them sinks the proportion on the side of the commodities, and increases the prices. But after money enters into all contracts and sales, and is everywhere the measure of exchange, the same national cash has a much greater task to perform; all commodities are then in the market; the sphere of circulation is enlarged; it is the same case as if that individual sum were to serve a larger kingdom; and therefore, the proportion being here lessened on the side of the money, everything must become cheaper, and the prices gradually fall.

By the most exact computations that have been formed all over Europe, after making allowance for the alteration in the numerary value or the denomination, it is found that the prices of all things have only risen three or, at most, four times since the discovery of the West Indies. But will any one assert that there is not much more than four times the coin in Europe that was in the fifteenth century, and the centuries preceding it? The Spaniards and Portuguese from their mines, the English, French, and Dutch by their African trade, and by their interlopers in the West Indies, bring home about six millions a year, of which not above a third goes to the East Indies. This sum alone, in ten years, would probably double the ancient stock of money in Europe. And no other satisfactory reason can be given why all prices have not risen to a much more exorbitant height, except that which is derived from a change of customs

and manners. Besides that more commodities are produced by additional industry, the same commodities come more to market, after men depart from their ancient simplicity of manners. And though this increase has not been equal to that of money, it has, however, been considerable, and has preserved the proportion between coin and commodities nearer the ancient standard.

Were the question proposed, Which of these methods of living in the people, the simple or refined, is the most advantageous to the state or public? I should, without much scruple, prefer the latter, in a view to politics at least; and should produce this as an additional reason for the encouragement of trade and manufactures.

While men live in the ancient simple manner, and supply all their necessaries from domestic industry or from the neighbourhood, the sovereign can levy no taxes in money from a considerable part of his subjects; and if he will impose on them any burdens, he must take payment in commodities, with which alone they abound; a method attended with such great and obvious inconveniencies that they need not here be insisted on. All the money he can pretend to raise must be from his principal cities, where alone it circulates; and these, it is evident, cannot afford him so much as the whole state could, did gold and silver circulate throughout the whole. But besides this obvious diminution of the revenue, there is another cause of the poverty of the public in such a situation. Not only the sovereign receives less money, but the same money goes not so far as in times of industry and general commerce. Everything is dearer where the gold and silver are supposed equal; and that because fewer commodities come to market, and the whole coin bears a higher proportion to what is to be purchased by it; whence alone the prices of everything are fixed and determined.

Here then we may learn the fallacy of the remark, often to be met with in historians, and even in common conversation, that any particular state is weak, though fertile, populous, and well cultivated, merely because it wants money. It appears that the want of money can never injure any state within itself: for men and commodities are the real strength of any community. It is the simple manner of living which here hurts the public, by confining the gold and silver to few hands, and preventing its universal diffusion and circulation. On the contrary, industry and refinements of all kinds incorporate it with the whole state, however small its quantity may be: they digest it into every vein, so to speak; and make it enter into every transaction and contract. No hand is entirely empty of it. And as the prices of everything fall by that means, the sovereign has a double ad-

vantage: he may draw money by his taxes from every part of the state; and what he receives goes farther in every purchase and payment.

We may infer, from a comparison of prices, that money is not more plentiful in China, than it was in Europe three centuries ago: But what immense power is that empire possessed of, if we may judge by the civil and military establishment maintained by it? Polybius tells us that provisions were so cheap in Italy during his time that in some places the stated price for a meal at the inns was a *semis* a head, little more than a farthing! Yet the Roman power had even then subdued the whole known world. About a century before that period, the Carthaginian ambassador said, by way of raillery, that no people lived more sociably among themselves than the Romans; for that in every entertainment which, as foreign ministers, they received, they still observed the same plate at every table. The absolute quantity of the precious metals is a matter of great indifference. There are only two circumstances of any importance, namely, their gradual increase, and their thorough concoction and circulation through the state; and the influence of both these circumstances has here been explained.

Of the Balance of Trade

It is very usual, in nations ignorant of the nature of commerce, to prohibit the exportation of commodities, and to preserve among themselves whatever they think valuable and useful. They do not consider that in this prohibition they act directly contrary to their intention; and that the more is exported of any commodity, the more will be raised at home, of which they themselves will always have the first offer.

It is well known to the learned that the ancient laws of Athens rendered the exportation of figs criminal; that being supposed a species of fruit so excellent in Attica that the Athenians deemed it too delicious for the palate of any foreigner. And in this ridiculous prohibition they were so much in earnest that informers were thence called sycophants among them, from two Greek words which signify figs and discoverer. There are proofs in many old acts of parliament of the same ignorance in the nature of commerce, particularly in the reign of Edward III. And to this day, in France, the exportation of corn is almost always prohibited; in order, as they say, to prevent famines; though it is evident that nothing contributes more to the frequent famines which so much distress that fertile country.

The same jealous fear, with regard to money, has also prevailed among several nations; and it required both reason and experience to convince any people that these prohibitions serve to no other purpose than to raise the exchange against them, and produce a still greater exportation.

These errors, one may say, are gross and palpable: But there still prevails, even in nations well acquainted with commerce, a strong jealousy with regard to the balance of trade, and a fear that all their gold and silver may be leaving them. This seems to me, almost in every case, a groundless apprehension; and I should as soon dread that all our springs and rivers should be exhausted as that money should abandon a kingdom

where there are people and industry. Let us carefully preserve these latter advantages; and we need never be apprehensive of losing the former.

It is easy to observe that all calculations concerning the balance of trade are founded on very uncertain facts and suppositions. The customhouse books are allowed to be an insufficient ground of reasoning; nor is the rate of exchange much better; unless we consider it with all nations, and know also the proportions of the several sums remitted; which one may safely pronounce impossible. Every man who has ever reasoned on this subject has always proved his theory, whatever it was, by facts and calculations, and by an enumeration of all the commodities sent to all foreign kingdoms.

The writings of Mr. Gee struck the nation with a universal panic when they saw it plainly demonstrated, by a detail of particulars, that the balance was against them for so considerable a sum as must leave them without a single shilling in five or six years. But luckily, twenty years have since elapsed, with an expensive foreign war; yet is it commonly supposed that money is still more plentiful among us than in any former period.

Nothing can be more entertaining on this head than Dr. Swift, an author so quick in discerning the mistakes and absurdities of others. He says, in his short view of the state of Ireland, that the whole cash of that kingdom formerly amounted but to 500,000 pounds; that out of this the Irish remitted every year a neat million to England, and had scarcely any other source from which they could compensate themselves, and little other foreign trade than the importation of French wines, for which they paid ready money. The consequence of this situation, which must be owned to be disadvantageous, was that in a course of three years the current money of Ireland, from 500,000 pounds was reduced to less than two. And at present, I suppose, in a course of 30 years it is absolutely nothing. Yet I know not how that opinion of the advance of riches in Ireland, which gave the Doctor so much indignation, seems still to continue, and gain ground with everybody.

In short, this apprehension of the wrong balance of trade appears of such a nature that it discovers itself wherever one is out of humour with the ministry, or is in low spirits; and as it can never be refuted by a particular detail of all the exports which counterbalance the imports, it may here be proper to form a general argument that they may prove the impossibility of this event as long as we preserve our people and our industry.

Suppose four-fifths of all the money in Great Britain to be annihilated in one night, and the nation reduced to the same condition, with regard to specie, as in the reigns of the Harrys and Edwards, what would be the consequence? Must not the price of all labour and commodities sink in proportion, and everything be sold as cheap as they were in those ages? What nation could then dispute with us in any foreign market, or pretend to navigate or to sell manufactures at the same price, which to us would afford sufficient profit? In how little time, therefore, must this bring back the money which we had lost, and raise us to the level of all the neighbouring nations? Where, after we have arrived, we immediately lose the advantage of the cheapness of labour and commodities; and the farther flowing in of money is stopped by our fulness and repletion.

Again, suppose that all the money of Great Britain were multiplied fivefold in a night, must not the contrary effect follow? Must not all labour and commodities rise to such an exorbitant height that no neighbouring nations could afford to buy from us; while their commodities, on the other hand, became comparatively so cheap that, in spite of all the laws which could be formed, they would be run in upon us, and our money flow out; till we fall to a level with foreigners, and lose that great superiority of riches, which had laid us under such disadvantages?

Now, it is evident, that the same causes which would correct these exorbitant inequalities, were they to happen miraculously, must prevent their happening in the common course of nature, and must forever, in all neighbouring nations, preserve money nearly proportionable to the art and industry of each nation. All water, wherever it communicates, remains always at a level. Ask naturalists the reason; they tell you that were it to be raised in any one place, the superior gravity of that part not being balanced must depress it, till it meet a counterpoise; and that the same cause, which redresses the inequality when it happens, must forever prevent it, without some violent external operation.¹

Can one imagine that it had ever been possible, by any laws, or even by any art or industry, to have kept all the money in Spain which the galleons have brought from the Indies? Or that all commodities could be sold in France for a tenth of the price which they would yield on the other side of the Pyrenees, without finding their way thither, and drain-

1. There is another cause, though more limited in its operation, which checks the wrong balance of trade, to every particular nation to which the kingdom trades. When we import more goods than we export, the exchange turns against us, and this becomes a new encouragement to export; as much as the charge of carriage and insurance of the money which becomes due would amount to. For the exchange can never rise but a little higher than that sum.

ing from that immense treasure? What other reason, indeed, is there why all nations, at present, gain in their trade with Spain and Portugal, but because it is impossible to heap up money, more than any fluid, beyond its proper level? The sovereigns of these countries have shown that they wanted not inclination to keep their gold and silver to themselves had it been in any degree practicable.

But as any body of water may be raised above the level of the surrounding element, if the former has no communication with the latter, so in money, if the communication be cut off, by any material or physical impediment (for all laws alone are ineffectual), there may, in such a case, be a very great inequality of money. Thus the immense distance of China, together with the monopolies of our India companies, obstructing the communication, preserve in Europe the gold and silver, especially the latter, in much greater plenty than they are found in that kingdom. But, notwithstanding this great obstruction, the force of the causes abovementioned is still evident. The skill and ingenuity of Europe in general surpasses perhaps that of China, with regard to manual arts and manufactures; yet are we never able to trade thither without great disadvantage. And were it not for the continual recruits which we receive from America, money would soon sink in Europe, and rise in China, till it came nearly to a level in both places. Nor can any reasonable man doubt but that industrious nation, were they as near us as Poland or Barbary, would drain us of the overplus of our specie, and draw to themselves a larger share of the West Indian treasures. We need not have recourse to a physical attraction, in order to explain the necessity of this operation. There is a moral attraction, arising from the interests and passions of men, which is full as potent and infallible.

How is the balance kept in the provinces of every kingdom among themselves but by the force of this principle, which makes it impossible for money to lose its level, and either to rise or sink beyond the proportion of the labour and commodities which are in each province? Did not long experience make people easy on this head, what a fund of gloomy reflections might calculations afford to a melancholy Yorkshireman, while he computed and magnified the sums drawn to London by taxes, absentees, commodities, and found on comparison the opposite articles so much inferior? And no doubt, had the Heptarchy subsisted in England, the legislature of each state had been continually alarmed by the fear of a wrong balance; and as it is probable that the mutual hatred of these states would have been extremely violent on account of their close neighbourhood, they would have loaded and oppressed all commerce, by a

jealous and superfluous caution. Since the union has removed the barriers between Scotland and England, which of these nations gains from the other by this free commerce? Or if the former kingdom has received any increase of riches, can it reasonably be accounted for by anything but the increase of its art and industry? It was a common apprehension in England before the union, as we learn from L'Abbe du Bos, that Scotland would soon drain them of their treasure were an open trade allowed; and on the other side the Tweed a contrary apprehension prevailed: With what justice in both, time has shown.

What happens in small portions of mankind must take place in greater. The provinces of the Roman empire, no doubt, kept their balance with each other, and with Italy, independent of the legislature; as much as the several counties of Great Britain, or the several parishes of each county. And any man who travels over Europe at this day may see, by the prices of commodities, that money, in spite of the absurd jealousy of princes and states, has brought itself nearly to a level; and that the difference between one kingdom and another is not greater in this respect than it is often between different provinces of the same kingdom. Men naturally flock to capital cities, seaports, and navigable rivers. There we find more men, more industry, more commodities, and consequently more money; but still the latter difference holds proportion with the former, and the level is preserved.²

Our jealousy and our hatred of France are without bounds; and the former sentiment, at least, must be acknowledged reasonable and well grounded. These passions have occasioned innumerable barriers and obstructions upon commerce, where we are accused of being commonly the aggressors. But what have we gained by the bargain? We lost the French market for our woollen manufactures, and transferred the commerce of wine to Spain and Portugal, where we buy worse liquor at a higher price. There are few Englishmen who would not think their coun-

2. It must carefully be remarked, that throughout this discourse, wherever I speak of the level of money, I mean always its proportional level to the commodities, labour, industry, and skill, which is in the several states. And I assert, that where these advantages are double, triple, quadruple, to what they are in the neighbouring states, the money infallibly will also be double, triple, quadruple. The only circumstance that can obstruct the exactness of these proportions, is the expense of transporting the commodities from one place to another; and this expense is sometimes unequal. Thus the corn, cattle, cheese, butter, of Derbyshire, cannot draw the money of London, so much as the manufactures of London draw the money of Derbyshire. But this objection is only a seeming one: For so far as the transport of commodities is expensive, so far is the communication between the places obstructed and imperfect.

try absolutely ruined were French wines sold in England so cheap and in such abundance as to supplant, in some measure, all ale, and homebrewed liquors: But would we lay aside prejudice, it would not be difficult to prove that nothing could be more innocent, perhaps advantageous. Each new acre of vineyard planted in France, in order to supply England with wine, would make it requisite for the French to take the produce of an English acre, sown in wheat or barley, in order to subsist themselves; and it is evident that we should thereby get command of the better commodity.

There are many edicts of the French king prohibiting the planting of new vineyards, and ordering all those which are lately planted to be grubbed up: so sensible are they, in that country, of the superior value of corn above every other product.

Mareschal Vauban complains often, and with reason, of the absurd duties which load the entry of those wines of Languedoc, Guienne, and other southern provinces that are imported into Brittany and Normandy. He entertained no doubt but these latter provinces could preserve their balance, notwithstanding the open commerce which he recommends. And it is evident that a few leagues more navigation to England would make no difference; or if it did, that it must operate alike on the commodities of both kingdoms.

There is indeed one expedient by which it is possible to sink, and another by which we may raise money beyond its natural level in any kingdom; but these cases, when examined, will be found to resolve into our general theory, and to bring additional authority to it.

I scarcely know any method of sinking money below its level but those institutions of banks, funds, and paper credit, which are so much practised in this kingdom. These render paper equivalent to money, circulate it throughout the whole state, make it supply the place of gold and silver, raise proportionably the price of labour and commodities, and by that means either banish a great part of those precious metals, or prevent their farther increase. What can be more short-sighted than our reasonings on this head? We fancy because an individual would be much richer were his stock of money doubled than the same good effect would follow were the money of every one increased; not considering that this would raise as much the price of every commodity, and reduce every man, in time, to the same condition as before. It is only in our public negotiations and transactions with foreigners that a greater stock of money is advantageous; and as our paper is there absolutely insignificant, we feel, by

its means, all the ill effects arising from a great abundance of money, without reaping any of the advantages.³

Suppose that there are 12 millions of paper, which circulate in the kingdom as money (for we are not to imagine that all our enormous funds are employed in that shape), and suppose the real cash of the kingdom to be 18 millions: Here is a state which is found by experience to be able to hold a stock of 30 millions. I say, if it be able to hold it, it must of necessity have acquired it in gold and silver had we not obstructed the entrance of these metals by this new invention of paper. Whence would it have acquired that sum? From all the kingdoms of the world. But why? Because if you remove these 12 millions, money in this state is below its level compared with our neighbours; and we must immediately draw from all of them till we be full and saturate, so to speak, and can hold no more. By our present politics, we are as careful to stuff the nation with this fine commodity of bank-bills and chequer-notes as if we were afraid of being overburdened with the precious metals.

It is not to be doubted but the great plenty of bullion in France is, in a great measure, owing to the want of paper credit. The French have no banks: merchants bills do not there circulate as with us: Usury or lending on interest is not directly permitted; so that many have large sums in their coffers: great quantities of plate are used in private houses; and all the churches are full of it. By this means, provisions and labour still remain cheaper among them than in nations that are not half so rich in gold and silver. The advantages of this situation, in point of trade as well as in great public emergencies, are too evident to be disputed.

The same fashion a few years ago prevailed in Genoa, which still has place in England and Holland, of using services of china-ware instead of plate; but the senate, foreseeing the consequence, prohibited the use of that brittle commodity beyond a certain extent; while the use of silverplate was left unlimited. And I suppose, in their late distresses, they felt the good effect of this ordinance. Our tax on plate is, perhaps, in this view, somewhat impolitic.

Before the introduction of paper money into our colonies, they had gold and silver sufficient for their circulation. Since the introduction of that commodity, the least inconveniency that has followed is the total banish-

3. We observed . . . [previously] that money when increasing gives encouragement to industry during the interval between the increase of money and rise of the prices. A good effect of this nature may follow too from paper credit; but it is dangerous to precipitate matters, at the risk of losing all by the failing of that credit, as must happen upon any violent shock in public affairs.

ment of the precious metals. And after the abolition of paper, can it be doubted but money will return, while these colonies possess manufactures and commodities, the only thing valuable in commerce, and for whose sake alone all men desire money.

What pity Lycurgus did not think of paper credit, when he wanted to banish gold and silver from Sparta! It would have served his purpose better than the lumps of iron he made use of as money; and would also have prevented more effectually all commerce with strangers, as being of so much less real and intrinsic value.

It must, however, be confessed that as all these questions of trade and money are extremely complicated, there are certain lights in which this subject may be placed so as to represent the advantages of paper credit and banks to be superior to their disadvantages. That they banish specie and bullion from a state is undoubtedly true; and whoever looks no farther than this circumstance does well to condemn them; but specie and bullion are not of so great consequence as not to admit of a compensation, and even an overbalance from the increase of industry and of credit, which may be promoted by the right use of paper money. It is well known of what advantage it is to a merchant to be able to discount his bills upon occasion; and everything that facilitates this species of traffic is favourable to the general commerce of a state. But private bankers are enabled to give such credit by the credit they receive from the depositing of money in their shops; and the bank of England in the same manner, from the liberty it has to issue its notes in all payments. There was an invention of this kind, which was fallen upon some years ago by the banks of Edinburgh; and which, as it is one of the most ingenious ideas that has been executed in commerce, has also been thought advantageous to Scotland. It is there called a Bank-Credit; and is of this nature: A man goes to the bank and finds surety to the amount, we shall suppose, of a thousand pounds. This money, or any part of it, he has the liberty of drawing out whenever he pleases, and he pays only the ordinary interest for it, while it is in his hands. He may, when he pleases, repay any sum so small as twenty pounds, and the interest is discounted from the very day of the repayment. The advantages resulting from this contrivance are manifold. As a man may find surety nearly to the amount of his substance, and his bank-credit is equivalent to ready money, a merchant does hereby in a manner coin his houses, his household furniture, the goods in his warehouse, the foreign debts due to him, his ships at sea; and can, upon occasion, employ them in all payments, as if they were the current money of the country. If a man borrow a thousand pounds from a private hand,

besides that it is not always to be found when required, he pays interest for it, whether he be using it or not: His bank-credit costs him nothing except during the very moment in which it is of service to him: and this circumstance is of equal advantage as if he had borrowed money at much lower interest. Merchants, likewise from this invention, acquire a great facility in supporting each other's credit, which is a considerable security against bankruptcies. A man, when his own bank-credit is exhausted, goes to any of his neighbours who is not in the same condition; and he gets the money, which he replaces at his convenience.

After this practice had taken place during some years at Edinburgh, several companies of merchants at Glasgow carried the matter farther. They associated themselves into different banks, and issued notes so low as ten shillings, which they used in all payments for goods, manufactures, tradesmen's labour of all kinds; and these notes, from the established credit of the companies, passed as money in all payments throughout the country. By this means, a stock of five thousand pounds was able to perform the same operations as if it were six or seven; and merchants were thereby enabled to trade to a greater extent, and to require less profit in all their transactions. But whatever other advantages result from these inventions, it must still be allowed that besides giving too great facility to credit, which is dangerous, they banish the precious metals: and nothing can be a more evident proof of it than a comparison of the past and present condition of Scotland in that particular. It was found, upon the recoinage made after the union, that there was near a million of specie in that country: But notwithstanding the great increase of riches, commerce, and manufactures of all kinds, it is thought that even where there is no extraordinary drain made by England, the current specie will not now amount to a third of that sum.

But as our projects of paper credit are almost the only expedient by which we can sink money below its level, so, in my opinion, the only expedient by which we can raise money above it is a practice which we should all exclaim against as destructive, namely, the gathering of large sums into a public treasure, locking them up, and absolutely preventing their circulation. The fluid not communicating with the neighbouring element may, by such an artifice, be raised to what height we please. To prove this, we need only return to our first supposition, of annihilating the half or any part of our cash, where we found that the immediate consequence of such an event would be the attraction of an equal sum from all the neighbouring kingdoms. Nor does there seem to be any necessary bounds set, by the nature of things, to this practice of hoarding. A small

city, like Geneva, continuing this policy for ages, might engross nine-tenths of the money of Europe. There seems, indeed, in the nature of man, an invincible obstacle to that immense growth of riches. A weak state, with an enormous treasure, will soon become a prey to some of its poorer but more powerful neighbours. A great state would dissipate its wealth in dangerous and ill-concerted projects; and probably destroy, with it, what is much more valuable, the industry, morals, and numbers of its people. The fluid, in this case, raised to too great a height, bursts and destroys the vessel that contains it; and mixing itself with the surrounding element, soon falls to its proper level.

So little are we commonly acquainted with this principle that though all historians agree in relating uniformly so recent an event as the immense treasure amassed by Harry VII (which they make amount to 2,700,000 pounds), we rather reject their concurring testimony than admit of a fact which agrees so ill with our inveterate prejudices. It is indeed probable that this sum might be three-fourths of all the money in England. But where is the difficulty in conceiving that such a sum might be amassed in twenty years by a cunning, rapacious, frugal, and almost absolute monarch? Nor is it probable that the diminution of circulating money was ever sensibly felt by the people, or ever did them any prejudice. The sinking of the prices of all commodities would immediately replace it, by giving England the advantage in its commerce with the neighbouring kingdoms.

Have we not an instance in the small republic of Athens with its allies, who, in about fifty years, between the Median and Peloponnesian wars, amassed a sum not much inferior to that of Harry VII? For all the Greek historians and orators agree that the Athenians collected in the citadel more than 10,000 talents, which they afterwards dissipated in their own ruin, in rash and imprudent enterprises. But when this money was set a running, and began to communicate with the surrounding fluid, what was the consequence? Did it remain in the state? No. For we find, by the memorable census mentioned by Demosthenes and Polybius, that, in about fifty years afterwards, the whole value of the republic, comprehending lands, houses, commodities, slaves, and money, was less than 6,000 talents.

What an ambitious high-spirited people was this, to collect and keep in their treasury, with a view to conquests, a sum, which it was every day in the power of the citizens, by a single vote, to distribute among themselves, and which would have gone near to triple the riches of every individual! For we must observe that the numbers and private riches of the Athe-

nians are said, by ancient writers, to have been no greater at the beginning of the Peloponnesian War than at the beginning of the Macedonian.

Money was little more plentiful in Greece during the age of Philip and Perseus than in England during that of Harry VII: Yet these two monarchs in thirty years collected from the small kingdom of Macedon, a larger treasure than that of the English monarch. Paulus Aemilius brought to Rome about 1,700,000 pounds sterling. Pliny says, 2,400,000. And that was but a part of the Macedonian treasure. The rest was dissipated by the resistance and flight of Perseus.

We may learn from Stanian that the canton of Berne had 300,000 pounds lent at interest, and had above six times as much in their treasury. Here then is a sum hoarded of 1,800,000 pounds sterling, which is at least quadruple what should naturally circulate in such a petty state; and yet no one who travels in the Pais de Vaux, or any part of that canton, observes any want of money more than could be supposed in a country of that extent, soil, and situation. On the contrary, there are scarce any inland provinces in the continent of France or Germany where the inhabitants are at this time so opulent, though that canton has vastly increased its treasure since 1714, the time when Stanian wrote his judicious account of Switzerland.⁴

The account given by Appian of the treasure of the Ptolemies is so prodigious that one cannot admit of it; and so much the less because the historian says that the other successors of Alexander were also frugal, and had many of them treasures not much inferior. For this saving humour of the neighbouring princes must necessarily have checked the frugality of the Egyptian monarchs, according to the foregoing theory. The sum he mentions is 740,000 talents, or 191,166,666 pounds 13 shillings and 4 pence, according to Dr. Arbuthnot's computation. And yet Appian says that he extracted his account from the public records; and he was himself a native of Alexandria.

From these principles we may learn what judgment we ought to form of those numberless bars, obstructions, and imposts which all nations of Europe, and none more than England, have put upon trade; from an exorbitant desire of amassing money, which never will heap up beyond its level, while it circulates; or from an ill grounded apprehension of losing their specie, which never will sink below it. Could anything scatter our

4. The poverty which Stanian speaks of is only to be seen in the most mountainous cantons, where there is no commodity to bring money. And even there the people are not poorer than in the diocese of Saltsburgh on the one hand, or Savoy on the other.

riches, it would be such impolitic contrivances. But this general ill effect, however, results from them, that they deprive neighbouring nations of that free communication and exchange which the Author of the world has intended, by giving them soils, climates, and geniuses, so different from each other.

Our modern politics embrace the only method of banishing money, the using of paper credit; they reject the only method of amassing it, the practice of hoarding; and they adopt a hundred contrivances, which serve to no purpose but to check industry, and rob ourselves and our neighbours of the common benefits of art and nature.

All taxes, however, upon foreign commodities are not to be regarded as prejudicial or useless, but those only which are founded on the jealousy above-mentioned. A tax on German linen encourages home manufactures, and thereby multiplies our people and industry. A tax on brandy increases the sale of rum, and supports our southern colonies. And as it is necessary that imposts should be levied for the support of government, it may be thought more convenient to lay them on foreign commodities, which can easily be intercepted at the port, and subjected to the impost. We ought, however, always to remember the maxim of Dr. Swift that in the arithmetic of the customs, two and two make not four, but often make only one. It can scarcely be doubted, but if the duties on wine were lowered to a third, they would yield much more to the government than at present: Our people might thereby afford to drink commonly a better and more wholesome liquor; and no prejudice would ensue to the balance of trade, of which we are so jealous. The manufacture of ale beyond the agriculture is but inconsiderable, and gives employment to few hands. The transport of wine and corn would not be much inferior.

But are there not frequent instances, you will say, of states and kingdoms which were formerly rich and opulent and are now poor and beggarly? Has not the money left them with which they formerly abounded? I answer, if they lose their trade, industry, and people, they cannot expect to keep their gold and silver: for these precious metals will hold proportion to the former advantages. When Lisbon and Amsterdam got the East-India trade from Venice and Genoa, they also got the profits and money which arose from it. Where the seat of government is transferred, where expensive armies are maintained at a distance, where great funds are possessed by foreigners, there naturally follows from these causes a diminution of the specie. But these, we may observe, are violent and forcible methods of carrying away money, and are in time commonly attended with the transport of people and industry. But

where these remain, and the drain is not continued, the money always finds its way back again, by a hundred canals, of which we have no notion or suspicion. What immense treasures have been spent, by so many nations, in Flanders, since the revolution, in the course of three long wars! More money perhaps than the half of what is at present in Europe. But what has now become of it? Is it in the narrow compass of the Austrian provinces? No, surely: It has most of it returned to the several countries whence it came, and has followed that art and industry by which at first it was acquired. For above a thousand years, the money of Europe has been flowing to Rome, by an open and sensible current; but it has been emptied by many secret and insensible canals: and the want of industry and commerce renders at present the papal dominions the poorest territory in all Italy.

In short, a government has great reason to preserve with care its people and its manufactures. Its money it may safely trust to the course of human affairs, without fear or jealousy. Or if it ever give attention to this latter circumstance, it ought only to be so far as it affects the former.

Of Taxes

here is a prevailing maxim, among some reasoners, that every new tax creates a new ability in the subject to bear it, and that each increase of public burdens increases proportionably the industry of the people. This maxim is of such a nature as is most likely to be abused; and is so much the more dangerous as its truth cannot be altogether denied: but it must be owned, when kept within certain bounds, to have some foundation in reason and experience.

When a tax is laid upon commodities which are consumed by the common people, the necessary consequence may seem to be either that the poor must retrench something from their way of living or raise their wages, so as to make the burden of the tax fall entirely upon the rich. But there is a third consequence which often follows upon taxes, namely, that the poor increase their industry, perform more work, and live as well as before, without demanding more for their labour. Where taxes are moderate, are laid on gradually, and affect not the necessaries of life, this consequence naturally follows; and it is certain that such difficulties often serve to excite the industry of a people, and render them more opulent and laborious than others who enjoy the greatest advantages. For we may observe, as a parallel instance, that the most commercial nations have not always possessed the greatest extent of fertile land; but, on the contrary, that they have laboured under many natural disadvantages. Tyre, Athens, Carthage, Rhodes, Genoa, Venice, Holland are strong examples to this purpose. And in all history, we find only three instances of large and fertile countries which have possessed much trade: the Netherlands, England, and France. The two former seem to have been allured by the advantages of their maritime situation, and the necessity they lay under of frequenting foreign ports in order to procure what their own climate refused them. And as to France, trade has come late into that kingdom, and seems to have been the effect of reflection and observation in an ingenious and enterprising people, who remarked the riches ac-

quired by such of the neighbouring nations as cultivated navigation and commerce.

The places mentioned by Cicero as possessed of the greatest commerce in his time are Alexandria, Colchus, Tyre, Sidon, Andros, Cyprus, Pamphylia, Lycia, Rhodes, Chios, Byzantium, Lesbos, Smyrna, Miletum, Coos. All these, except Alexandria, were either small islands or narrow territories. And that city owed its trade entirely to the happiness of its situation.

Since therefore some natural necessities or disadvantages may be thought favourable to industry, why may not artificial burdens have the same effect? Sir William Temple, we may observe, ascribes the industry of the Dutch entirely to necessity, proceeding from their natural disadvantages; and illustrates his doctrine by a striking comparison with Ireland, "where," says he, "by the largeness and plenty of the soil, and scarcity of people, all things necessary to life are so cheap that an industrious man, by two days labour, may gain enough to feed him the rest of the week. Which I take to be a very plain ground of the laziness attributed to the people. For men naturally prefer ease before labour, and will not take pains if they can live idle; though when, by necessity, they have been inured to it, they cannot leave it, being grown a custom necessary to their health, and to their very entertainment. Nor perhaps is the change harder from constant ease to labour than from constant labour to ease." After which the author proceeds to confirm his doctrine, by enumerating, as above, the places where trade has most flourished, in ancient and modern times, and which are commonly observed to be such narrow confined territories as beget a necessity for industry.¹

The best taxes are such as are levied upon consumptions, especially those of luxury, because such taxes are least felt by the people. They

1. 'Tis always observed, in years of scarcity, if it be not extreme, that the poor labour more, and really live better than in years of great plenty, when they indulge themselves in idleness and riot. I have been told, by a considerable manufacturer, that in the year 1740, when bread and provisions of all kinds were very dear, his workmen not only made a shift to live but paid debts which they had contracted in former years that were much more favourable and abundant.

This doctrine, therefore, with regard to taxes, may be admitted in some degree: But beware of the abuse. Exorbitant taxes, like extreme necessity, destroy industry, by producing despair; and even before they reach this pitch, they raise the wages of the labourer and manufacturer, and heighten the price of all commodities. An attentive disinterested legislature will observe the point when the emolument ceases, and the prejudice begins: But as the contrary character is much more common, 'tis to be feared that taxes all over Europe are multiplying to such a degree as will entirely crush all art and industry; tho', perhaps, their first increase, together with other circumstances, might have contributed to the growth of these advantages.

seem, in some measure, voluntary, since a man may choose how far he will use the commodity which is taxed; they are paid gradually, and insensibly; they naturally produce sobriety and frugality, if judiciously imposed; and being confounded with the natural price of the commodity, they are scarcely perceived by the consumers. Their only disadvantage is that they are expensive in the levying.

Taxes upon possessions are levied without expense, but have every other disadvantage. Most states, however, are obliged to have recourse to them, in order to supply the deficiencies of the other.

But the most pernicious of all taxes are the arbitrary. They are commonly converted, by their management, into punishments on industry; and also, by their unavoidable inequality are more grievous than by the real burden which they impose. It is surprising, therefore, to see them have place among any civilized people.

In general, all poll-taxes, even when not arbitrary, which they commonly are, may be esteemed dangerous: because it is so easy for the sovereign to add a little more, and a little more, to the sum demanded, that these taxes are apt to become altogether oppressive and intolerable. On the other hand, a duty upon commodities checks itself; and a prince will soon find that an increase of the impost is no increase of his revenue. It is not easy, therefore, for a people to be altogether ruined by such taxes.

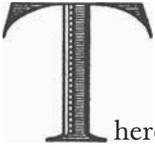

Historians inform us that one of the chief causes of the destruction of the Roman state was the alteration which Constantine introduced into the finances, by substituting a universal poll-tax in lieu of almost all the tithes, customs, and excises which formerly composed the revenue of the empire. The people, in all the provinces, were so grinded and oppressed by the publicans that they were glad to take refuge under the conquering arms of the barbarians, whose dominion, as they had fewer necessities and less art, was found preferable to the refined tyranny of the Romans.

It is an opinion, zealously promoted by some political writers, that since all taxes, as they pretend, fall ultimately upon land, it were better to lay them originally there, and abolish every duty upon consumptions. But it is denied that all taxes fall ultimately upon land. If a duty be laid upon any commodity consumed by an artisan, he has two obvious expedients for paying it: he may retrench somewhat of his expense, or he may increase his labour. Both these resources are more easy and natural than that of heightening his wages. We see that in years of scarcity, the weaver either consumes less or labours more or employs both these expedients of frugality and industry, by which he is enabled to reach the end of the year. It is but just that he should subject himself to the same hardships,

if they deserve the name, for the sake of the public, which gives him protection. By what contrivance can he raise the price of his labour? The manufacturer who employs him will not give him more: neither can he, because the merchant, who exports the cloth, cannot raise its price, being limited by the price which it yields in foreign markets. Every man, to be sure, is desirous of pushing off from himself the burden of any tax which is imposed, and of laying it upon others: but as every man has the same inclination, and is upon the defensive, no set of men can be supposed to prevail altogether in this contest. And why the landed gentleman should be the victim of the whole, and should not be able to defend himself as well as others are, I cannot readily imagine. All tradesmen, indeed, would willingly prey upon him, and divide him among them, if they could: but this inclination they always have, though no taxes were levied; and the same methods by which he guards against the imposition of tradesmen before taxes will serve him afterwards, and make them share the burden with him. They must be very heavy taxes, indeed, and very injudiciously levied, which the artisan will not, of himself, be enabled to pay, by superior industry and frugality, without raising the price of his labour.

I shall conclude this subject with observing that we have, with regard to taxes, an instance of what frequently happens in political institutions, that the consequences of things are diametrically opposite to what we should expect on the first appearance. It is regarded as a fundamental maxim of the Turkish government that the Grand Signior, though absolute master of the lives and fortunes of each individual, has no authority to impose a new tax; and every Ottoman prince who has made such an attempt either has been obliged to retract or has found the fatal effects of his perseverance. One would imagine that this prejudice or established opinion were the firmest barrier in the world against oppression; yet it is certain that its effect is quite contrary. The emperor, having no regular method of increasing his revenue, must allow all the bashaws and governors to oppress and abuse the subjects: and these he squeezes after their return from their government. Whereas, if he could impose a new tax, like our European princes, his interest would so far be united with that of his people that he would immediately feel the bad effects of these disorderly levies of money, and would find that a pound raised by a general imposition would have less pernicious effects than a shilling taken in so unequal and arbitrary a manner.

Of the Study of History

There is nothing which I would recommend more earnestly to my female readers than the study of history as an occupation, of all others, the best suited both to their sex and education, much more instructive than their ordinary books of amusement, and more entertaining than those serious compositions which are usually to be found in their closets. Among other important truths which they may learn from history they may be informed of two particulars, the knowledge of which may contribute very much to their quiet and repose: that our sex, as well as theirs, are far from being such perfect creatures as they are apt to imagine, and that Love is not the only passion which governs the male world, but is often overcome by avarice, ambition, vanity, and a thousand other passions. Whether they be the false representations of mankind in those two particulars which endear romances and novels so much to the fair sex, I know not; but must confess that I am sorry to see them have such an aversion to matter of fact, and such an appetite for falsehood. I remember I was once desired by a young beauty, for whom I had some passion, to send her some novels and romances for her amusement in the country; but was not so ungenerous as to take the advantage which such a course of reading might have given me, being resolved not to make use of poisoned arms against her. I therefore sent her Plutarch's *Lives*, assuring her, at the same time, that there was not a word of truth in them from beginning to end. She perused them very attentively, 'till she came to the lives of Alexander and Caesar, whose names she had heard of by accident; and then returned me the book, with many reproaches for deceiving her.

I may indeed be told that the fair sex have no such aversion to history as I have represented, provided it be secret history, and contain some memorable transaction proper to excite their curiosity. But as I do not find that truth, which is the basis of history, is at all regarded in those anec-

dotes, I cannot admit of this as a proof of their passion for that study. However this may be, I see not why the same curiosity might not receive a more proper direction, and lead them to desire accounts of those who lived in past ages, as well as of their contemporaries. What is it to Cleora whether Fulvia entertains a secret commerce of love with Philander or not? Has she not equal reason to be pleased when she is informed (what is whispered about among historians) that Cato's sister had an intrigue with Caesar, and palmed her son, Marcus Brutus, upon her husband for his own, tho' in reality he was her gallant's? And are not the loves of Messalina or Julia as proper subjects of discourse as any intrigue that this city has produced of late years?

But I know not whence it comes that I have been thus seduced into a kind of raillery against the ladies: unless, perhaps, it proceed from the same cause which makes the person who is the favourite of the company be often the object of their good-natured jests and pleasantries. We are pleased to address ourselves after any manner to one who is agreeable to us; and, at the same time, presume that nothing will be taken amiss by a person who is secure of the good opinion and affections of every one present. I shall now proceed to handle my subject more seriously, and shall point out the many advantages which flow from the study of history, and show how well suited it is to every one, but particularly to those who are debarred the severer studies, by the tenderness of their complexion, and the weakness of their education. The advantages found in history seem to be of three kinds, as it amuses the fancy, as it improves the understanding, and as it strengthens virtue.

In reality, what more agreeable entertainment to the mind than to be transported into the remotest ages of the world, and to observe human society, in its infancy, making the first faint essays towards the arts and sciences. To see the policy of government, and the civility of conversation, refining by degrees, and everything which is ornamental to human life advancing towards its perfection. To remark the rise, progress, declension, and final extinction of the most flourishing empires: the virtues which contributed to their greatness, and the vices which drew on their ruin. In short, to see all human race, from the beginning of time, pass, as it were, in review before us; appearing in their true colours, without any of those disguises which, during their lifetime, so much perplexed the judgment of the beholders. What spectacle can be imagined so magnificent, so various, so interesting? What amusement, either of the senses or imagination, can be compared with it? Shall those trifling pastimes which engross so much of our time be preferred as more satisfactory,

and more fit to engage our attention? How perverse must that taste be which is capable of so wrong a choice of pleasures?

But history is a most improving part of knowledge, as well as an agreeable amusement; and a great part of what we commonly call erudition, and value so highly, is nothing but an acquaintance with historical facts. An extensive knowledge of this kind belongs to men of letters; but I must think it an unpardonable ignorance in persons of whatever sex or condition not to be acquainted with the history of their own country, together with the histories of ancient Greece and Rome. A woman may behave herself with good manners, and have even some vivacity in her turn of wit; but where her mind is so unfurnished, 'tis impossible her conversation can afford any entertainment to men of sense and reflection.

I must add that history is not only a valuable part of knowledge but opens the door to many other parts, and affords materials to most of the sciences. And indeed, if we consider the shortness of human life, and our limited knowledge, even of what passes in our own time, we must be sensible that we should be forever children in understanding were it not for this invention, which extends our experience to all past ages, and to the most distant nations; making them contribute as much to our improvement in wisdom as if they had actually lain under our observation. A man acquainted with history may, in some respect, be said to have lived from the beginning of the world, and to have been making continual additions to his stock of knowledge in every century.

There is also an advantage in that experience which is acquired by history above what is learned by the practice of the world, that it brings us acquainted with human affairs, without diminishing in the least from the most delicate sentiments of virtue. And, to tell the truth, I know not any study or occupation so unexceptionable as history in this particular. Poets can paint virtue in the most charming colours; but, as they address themselves entirely to the passions, they often become advocates for vice. Even philosophers are apt to bewilder themselves in the subtlety of their speculations; and we have seen some go as far as to deny the reality of all moral distinctions. But I think it a remark worthy the attention of the speculative that the historians have been, almost without exception, the true friends of virtue, and have always represented it in its proper colours, however they may have erred in their judgments of particular persons. Machiavel himself discovers a true sentiment of virtue in his history of Florence. When he talks as a politician, in his general reasonings, he considers poisoning, assassination and perjury as lawful arts of power; but when he speaks as a historian, in his particular narrations, he shows so

keen an indignation against vice, and so warm an approbation of virtue, in many passages, that I could not forbear applying to him that remark of Horace, that if you chase away nature, tho' with ever so great indignity, she will always return upon you. Nor is this combination of historians in favour of virtue at all difficult to be accounted for. When a man of business enters into life and action, he is more apt to consider the characters of men as they have relation to his interest than as they stand in themselves; and has his judgment warped on every occasion by the violence of his passion. When a philosopher contemplates characters and manners in his closet, the general abstract view of the objects leaves the mind so cold and unmoved that the sentiments of nature have no room to play, and he scarce feels the difference between vice and virtue. History keeps in a just medium betwixt these extremes, and places the objects in their true point of view. The writers of history, as well as the readers, are sufficiently interested in the characters and events to have a lively sentiment of blame or praise; and, at the same time, have no particular interest or concern to pervert their judgment.

*The foregoing essays are from a collection
of Hume's essays entitled*

ESSAYS MORAL, POLITICAL AND LITERARY.

Plutarch

c. 46–120

The Greek biographer and philosopher Plutarch was born in Chaeronea in Boeotia. Little is known of his life, and not all of that is strictly reliable. He studied in Athens under Ammonius Saccas, the founder of Neoplatonism, and later lectured on philosophy in Rome. It is reported that the emperor Trajan gave him consular rank and that later the emperor Hadrian made him procurator of Greece. It is known, in any case, that he returned to his native Boeotia, where he officiated as a priest of Apollo at Delphi, and it was there that he died. A letter to his wife on the death of their only daughter has been preserved. Plutarch consoles her for her loss in tender and high-minded words and speaks of the four sons who remain to them and need their care.

The fame of Plutarch rests largely on his *Parallel Lives*,¹ in which he recounted the lives and fortunes of forty-six Greek and Roman statesmen and military leaders. Each Roman hero is paired with a Greek hero who is parallel to him in merits and in the odds he faced. He makes a close comparison of the abilities and moral excellence of the Greek hero with his Roman counterpart, which was a useful thing for a Greek to do at this time, when Greek influence was often resented in Rome. Those who wish to investigate will find that the Greeks come off very well in the comparison.

The influence of the *Parallel Lines* has been immense, but it would be difficult to trace because it is so often taken for granted. It was read for pleasure and instruction by most eminent writers and by statesmen when they were literate, and some learned all they knew about Plato and Aristotle from the absorbing biographies of Plu-

¹ See *Great Books of the Western World*.

tarch. Platonic ideas of the virtues and nobility proper to princes and generals were thus painlessly infused. As a girl Queen Elizabeth I read North's new English translation of the *Lives* with delight. Shakespeare took history, plots, and characters from North's translation, as in *Julius Caesar*, *Coriolanus*, and *Antony and Cleopatra*, and in the last play adopted some passages, including one long one, almost without a change. The *Lives* has not only proved a rich source for literature but also for the history of the classic world.

The essay that follows is from Plutarch's *Moralia*, which consists of about sixty essays dealing with a great variety of topics, mostly ethical. The treatment of even abstract subjects is concrete and pictorial: we are given one episode after another to illustrate the point. The frequent quotations from Greek dramatists, and from poems which are otherwise irretrievably lost, are an added attraction.

The essay which you are to read, like the others, is packed with anecdotes. If this seems surprising to you, try to think of a better way of putting across ethical ideas. Suppose you were going to maintain that lack of anger is a worse fault than truculence, or too much anger. You could give your reasons, but to convince your listener you would be obliged to give instances and illustrations or anecdotes. Anecdotes, Plutarch said, throw a sudden light on a man's character, rendering his "natural dispositions more plain than the famous battles won, wherein are slain ten thousand men." Montaigne and Francis Bacon were greatly influenced by the anecdotal style of Plutarch's essays. The essay form itself owes a great deal to his example.

Plutarch's essay *Of Bashfulness* is an ingenious development of Aristotle's theory that the virtues are means between extremes—between passions which are both vicious. In the *Nicomachean Ethics*, Aristotle points out that both shamelessness and bashfulness

Notes from the artist: "The portrait of Plutarch is done in the manner of a Greek vase, the background incorporating other elements of Greek design. The head in the foreground is that of Pericles, subject of one of Plutarch's Parallel Lives."

PIVARCHI

are disapproved, and yet the modest man is praised. This is because the bashful man “is ashamed of everything,” and the shameless man “is not ashamed of anything.” In between these extremes is the modest man, who is ashamed on the proper occasions, for the right reasons, and in an appropriate degree.

Out of this abstract analysis comes all Plutarch’s rich elaboration. He is particularly concerned to show the evils that flow from bashfulness. If you have always regarded too little shame as a worse fault than too much, you may well change your mind before you have finished this essay. You may even discover that you are a little inclined toward bashfulness yourself. Consider some of the marks of bashfulness given by Plutarch. Do you lend money to a friend who importunes you, though you yourself are short and know that you will be embarrassed later? Do you invite a man to your party when he brings up the subject, though you know he will spoil things for other guests? Is it hard to say No? Or, when seriously ill, do you send for the best doctor available in town, or do you call in a doctor friend who would otherwise be offended? And what do you say when your friend reads you his poem which is wretched, and waits for your praise?

More important than anything else—are you developing your talents and prospects sufficiently, or do you hate to push yourself forward and to be conspicuous? “Too much anxiety and timidity lest we may do wrong,” Plutarch says, “is also to be avoided; because many men have become cowards and been deterred from generous undertakings.” Fear of malice and envy, as well as the dangers and difficulties, holds them back.

In reading this essay you will find a number of names you do not know but do not be disturbed. You can find most of them in the Index of the *Lives* and the rest in a classical dictionary.

Of Bashfulness

Some plants there are, in their own nature wild and barren, and hurtful to seed and garden sets, which yet among able husbandmen pass for infallible signs of a rich and promising soil. In like manner, some passions of the mind not good in themselves yet serve as first shoots and promises of a disposition which is naturally good, and also capable of much improvement by cultivation. Among these I rank bashfulness, the subject of our present discourse; no ill sign indeed, but the cause and occasion of a great deal of harm. For the bashful oftentimes run into the same enormities as the most hardened and impudent, with this difference only, that the former feel a regret for such miscarriages, but the latter take a pleasure and satisfaction therein. The shameless person is without sense of grief for his baseness, and the bashful is in distress at the very appearance of it. For bashfulness is only modesty in the excess, and is aptly enough named *dusopia* [the being put out of countenance], since the face is in some sense confused and dejected with the mind. For as that grief which casts down the eyes is termed dejection, so that kind of modesty which cannot look another in the face is called bashfulness. The orator, speaking of a shameless fellow, said he carried harlots, not virgins, in his eyes; on the other hand, the sheepishly bashful betrays no less the effeminacy and softness of his mind in his looks, palliating his weakness, which exposes him to the mercy of impudence, with the specious name of modesty. Cato indeed was wont to say of young persons, he had a greater opinion of such as were subject to color than of those that looked pale; teaching us thereby to look with greater apprehension on the heinousness of an action than on the reprimand which might follow, and to be more afraid of the suspicion of doing an ill thing than of the danger of it. However, too much anxiety and timidity lest we may do wrong is also to be avoided; because many men have become cowards and been deterred from generous undertakings, no less for fear of calumny and detraction than by the danger or difficulty of such attempts.

While therefore we must not suffer the weakness in the one case to pass unnoticed, neither must we abet or countenance invincible impudence in the other, such as is reported of Anaxarchus,

Whose doglike carriage and effrontery,
Despising infamy, outfaced disgrace.

A convenient mien between both is rather to be endeavored after, by repressing the over impudent, and animating the too meek temper. But as this kind of cure is difficult, so is the restraining such excesses not without danger; for as a gardener, in stubbing up some wild or useless bushes, makes at them carelessly with his spade, or burns them off the ground, but in dressing a vine, or grafting an apple, or pruning an olive, carries his hand with the greatest wariness and deliberation, that he may not unluckily injure the tree; so a philosopher, in removing envy, that useless and untractable plant, or covetousness or immoderate love of pleasure from the mind of youth, may cut deep safely, and make a large scar; but if he be to apply his discourse to some more sensible or delicate part, such as the restraining excess of bashfulness, it lies upon him to be very careful not to cut off or eradicate modesty with the contrary vice. For nurses who too often wipe away the dirt from their infants are apt to tear their flesh and put them to pain. And in like manner we must not so far extirpate all bashfulness in youth as to leave them careless or impudent; but as those that pull down private houses adjoining to the temples of the Gods prop up such parts as are contiguous to them, so in undermining bashfulness, due regard is to be had to adjacent modesty, good nature, and humanity. And yet these are the very qualities by which bashfulness insinuates itself and becomes fixed in a man, flattering him that he is good-natured, courteous, and civil, and has common sense, and that he is not obstinate and inexorable. The Stoics, therefore, in their discourses of modesty, distinguish all along betwixt that and bashfulness, leaving not so much as ambiguity of terms for a pretense to the vice. However, asking their good leave, we shall make bold to use such words indifferently in either sense; or rather we shall follow the example of Homer, whose authority we have for it, that

Much harm oftimes from modesty befalls,
Much good oftimes.¹

1. *The Iliad*, Book XXIV, 44 [Cf. *Great Books of the Western World* (Ed.).]

And it was not done amiss of him to make mention of the hurtfulness of it first, because modesty becomes profitable only through reason, which cuts off what is superfluous and leaves a just mean behind.

In the first place, therefore, the bashful man must be persuaded and satisfied that that distemper of the mind is prejudicial to him, and that nothing which is so can be eligible. And withal, he must be cautious how he suffers himself to be cajoled and led by the nose with the titles of courteous or sociable, in exchange for those of grave, great, and just; nor like Pegasus in Euripides, who, when Bellerophon mounted him,

With trembling stooped more than his lord desired,

must he debase himself and yield to all who make their addresses to him, for fear of appearing hard and ungentle.

It is recorded of Bocchoris, king of Egypt, a man of a very cruel nature, that the goddess Isis sent a kind of a serpent (called aspis), which winding itself about his head cast a shadow over him from above, and was a means to him of determining causes according to equity. But bashfulness, on the contrary, happening upon remiss and spiritless tempers, suffers them not to express their dislike of anything or to argue against it, but perverts many times the sentence of arbitrators, and stops the mouths of skillful pleaders, forcing them often to act and speak contrary to their conviction. And the most reckless man will always tyrannize and domineer over such a one, forcing his bashfulness by his own strength of impudence. Upon this account it is that bashfulness, like a low piece of soft ground, can make no resistance and decline no encounter, but is exposed to the meanest actions and vilest passions. But, above all, this is the worst guardian of raw and inexperienced youth. For, as Brutus said, he seems to have had but an ill education that has not learned to deny any thing. And no better overseer is it of the marriage bed or the woman's apartment; as the repentant lady in Sophocles accuses the spark that had debauched her,

Thy tongue, thy flattering tongue prevailed.

So this vice, happening upon a disposition inclinable to debauchery, prepares and opens the way, and leaves all things easy and accessible to such as are ready to prefer their wicked designs. Presents and treats are irresistible baits for common mercenary creatures; but importunity, befriended with bashfulness on their side, has sometimes undone the modestest women. I omit what inconveniences this kind of modesty occasions, when it obliges men to lend their money to such whose credit is blown upon in

the world, or to give bail for those they dare not trust; we do this, it is true, with an ill will, and in our heart reflect upon that old saying, Be bail, and pay for it, yet cannot make use of it in our practice.

How many this fault has ruined, it is no easy thing to recount. Creon in the play gave a very good lesson for others to follow, when he told Medea,

'Tis better now to brave thy direst hate,
Than curse a foolish easiness too late.²

Yet afterwards, being wrought upon through his bashfulness to grant her but one day longer, he ruined himself and family by it. For the same reason, some, suspecting designs against them of murder or poisoning, have neglected to provide for their safety. Thus Dion could not be ignorant of the treachery of Callippus, yet thought it unfit to entertain such thoughts of his pretended friend and guest, and so perished. So again, Antipater, the son of Cassander, having entertained Demetrius at supper, and being engaged by him for the next night, because he was unwilling to distrust one who had trusted him, went, and had his throat cut after supper. Polysperchon had promised Cassander for a hundred talents to murder Hercules, the son of Alexander by Barsine. Upon this he invites him to sup; but the young man, having some suspicion of the thing, pretends himself indisposed. Polysperchon coming to him said: "Sir, above all things endeavor after your father's courteous behavior and obliging way to his friends, unless haply you look on us with suspicion as if we were compassing your health." The young man out of mere modesty was prevailed upon to go, and was strangled as he sat at meat. It is not therefore (as some will have us believe) insignificant or ridiculous, but on the contrary very wise advice, which Hesiod gives,

Welcome a friend, but never call thy foe.

Be not bashful and mealy-mouthed in refusing him that you are satisfied has a pique against you; but never reject him that seemeth to put his trust in you. For if you invite, you must expect to be invited again; and sometime or other your entertainment will be repaid you, if bashfulness have once softened or turned the edge of that diffidence which ought to be your guard.

To the end therefore that we may get the better of this disease, which is the cause of so many evils, we must make our first attempts (as our cus-

2. Euripides, *Medea*, 290. [Cf. *Great Books of the Western World* (Ed.).]

tom is in other things) upon matters of no great difficulty. As, if one drink to you after you have taken what is sufficient, be not so foolishly modest to do violence to your nature, but rather venture to pass the glass. Another, it may be, would tempt you to play at dice while drinking; be not overpersuaded into a compliance, for fear of being the subject of his drollery, but reply with Xenophanes, when Lasus of Hermione called him coward because he refused to play at dice: "Yes," said he, "I confess myself the greatest coward in the world, for I dare not do an ill thing." Again, you light upon an impertinent talker, that sticks upon you like a burr; don't be bashful, but break off the discourse, and pursue your business. These evasions and repulses, whereby our resolution and assurance are exercised in matters of less moment, will accustom us to it by degrees in greater occasions. And here it will be but seasonable to give you a passage, as it is recorded of Demosthenes. The Athenians having one time been moved to send succors to Harpalus, and themselves to engage in a war against Alexander, it happened that Philoxenus, Alexander's admiral, unexpectedly arrived on their coast; and the people being so astonished as to be speechless for very fear, Demosthenes cried out: "How would they endure the sun who are not able to look against a lamp! Or how would you comport yourself in weightier concerns, while your prince or the people had an awe over you, if you cannot refuse a glass of wine when an acquaintance offers it, or turn off an impertinent babbler, but suffer the eternal trifler to walk over you without telling him, 'Another time, good sir, at present I am in haste.'"

Besides all this, the exercising such a resolution is of great use in praising others. If one of my friend's harpers play lewdly, or a comedian he has hired at a great rate murder a piece of Menander in the acting, although the vulgar clap their hands and admire, I think it no moroseness or ill breeding to sit silently all the while, without servilely joining in the common applauses contrary to my judgment. For if you scruple to deal openly with him in these cases, what will you do, should he repeat to you an insipid composition of his own, or submit to your revisal a ridiculous oration? You will applaud, of course, and enter yourself into the list of common parasites and flatterers! But how then can you direct him impartially in the greatest administrations of his life? How be free with him where he fails in any duties of his trust or marriage, or neglects the offices incumbent on him as a member of the community? I must confess, I cannot by any means approve of the reply Pericles made to a friend who besought him to give false evidence, and that too upon oath, when he thus answered: "As far as the altar I am wholly at your service." Methinks he

went too far. But he that has long before accustomed himself not to commend any thing against his judgment, or applaud an ill voice, or seem pleased with indecent scurrilities will never suffer things to come to that issue; nor will anyone be so bold as to solicit him in this manner: "Swear on my side, give false evidence, or bring in an unjust verdict."

After the same manner we may learn to refuse such as come to borrow considerable sums of us, if we have used to deny in little matters where refusal is easy. As Archelaus, king of Macedon, sat at supper, one of his retinue, a fellow who thought there was nothing so honest as to receive, begged of him a golden cup. But the king commanded a waiter to give it immediately to Euripides: "For you, sir," said he, "are fit indeed to ask anything, but to receive nothing; and he deserves to receive, though he lacks the confidence to ask." Thus wisely did he make his judgment, and not bashful timidity, his guide in bestowing favors. Yet we oftentimes, when the honesty, nearness, and necessities of our friends and relations are not motives sufficient to prevail with us to their relief, can give profusely to impudence and importunity, not out of any willingness to bestow our money so ill, but merely for want of confidence and resolution to deny. This was the case of Antigonus the elder. Being wearied out with the importunity of Bias, "Give," said he to his servants, "one talent to Bias and necessity." Yet at other times he was as expert at encountering such addresses as any prince, and dismissed them with as remarkable answers. Thus a certain Cynic one day begging of him a groat, he made answer, "That is not for a prince to give." And the poor man replying, "Then bestow a talent," he reparteed briskly, "Nor that for a Cynic or for a dog to receive." Diogenes went about begging to all the statues in the Ceramicus; and his answer to some that wondered at his fancy in it was he was practicing how to bear a repulse. But indeed it chiefly lies upon us to exercise ourselves in smaller matters to refuse an unreasonable request, that we may not be at loss how to refuse on occasions of greater magnitude. For no one, as Demosthenes says, who has spent all the money that he had in unnecessary expenses will have plenty of money that he has not for his necessary expenses. And our disgrace is increased manyfold, if we want what is necessary or decent, and abound in trifles and fopperies.

Yet bashfulness is not only a bad steward of our estate, but even in weightier concerns it refuses to hearken to the wholesome advice of right reason. Thus, in a dangerous fit of sickness, we send not to the ablest physician, for fear of giving offense to another of our acquaintance. Or, in taking tutors and governors for our children, we make choice of such as obtrude themselves upon us, not such as are better qualified for that service.

Or, in our lawsuits, we regard not to obtain counsel learned in the law, because we must gratify the son of some friend or relation, and give him an opportunity to show himself in the world. Nay, lastly, you shall find some that bear the name of philosophers, who call themselves Epicureans or Stoics, not out of choice, or upon the least conviction, but merely to oblige their friends or acquaintance, who have taken advantage of their modesty. Since then the case is so with us, we ought to prepare and exercise ourselves in things that we daily meet with and of course, not so much as indulging that foolish weakness in the choice of a barber or fuller, or in lodging in a paltry inn when better accommodation is to be had, to oblige the landlord who has cringed to us. But if it be merely to break ourselves of such follies, in those cases still we should make use of the best, though the difference be but inconsiderable: as the Pythagoreans were strict in observing not to cross their right knee with the left, or to use an even number with an odd, though all things else were indifferent. We must observe also, when we celebrate a sacrifice or keep a wedding or make a public entertainment, to deny ourselves so far as not to invite any that have been extremely complacent to us or that put themselves upon us, before those who are known for their good humor or whose conversation is like to prove beneficial. For he that has accustomed himself thus far will hardly be caught and surprised, nay, rather he shall not so much as be tempted, in greater instances.

And thus much may suffice concerning exercising ourselves. My first use of what has been said is to observe that all passions and distempers of the mind are still accompanied with those very evils which by their means we hoped to avoid. Thus disgrace pursues ambition; pain and indisposition, sensuality; softness and effeminacy are fretted with troubles; contentiousness, with disappointment and defeats. But this is nowhere more conspicuous than in bashfulness, which, endeavoring to avoid the smoke of reproach, throws itself into the fire. Such men, wanting confidence to withstand those that unreasonably importune them, afterwards feel shame before those who justly accuse them, and for fear of a slight private rebuke incur more public disgrace. For example, not having the heart to deny a friend that comes to borrow, in short time they are reduced to the same extremity themselves, and exposed openly. Some again, after promising to help friends in a lawsuit, are ashamed to face the opposite party, and are forced to hide their heads and run away. Many have been so unreasonably weak in this particular as to accept of disadvantageous proposals of marriage for a daughter or sister, and upon second thoughts have been forced to bring themselves off with an arrant lie.

One made this observation of the people of Asia, that they were all slaves to one man, merely because they could not pronounce that syllable No; but he spake only in raillery. But now the bashful man, though he be not able to say one word, has but to raise his brows or nod downward, as if he minded not, and he may decline many ungrateful and unreasonable offices. Euripides was wont to say, "Silence is an answer to a wise man"; but we seem to have greater occasion for it in our dealings with fools and unreasonable persons, for men of breeding and sense will be satisfied with reason and fair words. Upon this account we should be always provided with some notable sayings and choice apothegms of famous and excellent men, to repeat to the bashful—such as that of Phocion to Antipater, "You cannot have me for both a friend and a flatterer"; and that of his to the Athenians, when they called upon him to come in for his share to defray the expenses of a festival, "I am ashamed," said he, pointing to Callicles his creditor, "to contribute towards your follies, without paying this man his due." For, as Thucydides says, "It is an ill thing to be ashamed of one's poverty, but much worse not to make use of lawful endeavors to avoid it."³ But he that is so foolishly good-natured that he cannot answer one that comes to borrow,

My friend, no silver white have I in all my caves,

but gives him a promise to be better provided,

The wretch has made himself a slave to shame,
And drags a tiresome, though an unforged chain.

Persaeus, being about to accommodate a friend with a sum of money, paid it publicly in the market, and made the conditions before a banker, remembering, it may be, that of Hesiod,

Seem not thy brother's honesty to doubt;
Yet, smiling, call a witness to his hand.

But when his friend marveled and asked, "How now, so formally and according to law?" "Yea," quoth he, "because I would receive my money again as a friend, and not have to trouble the law to recover it." For many out of bashfulness, not taking care to have good security at first, have been forced afterwards to break with their friends, and to have recourse to law for their money.

Again, Plato writing to Dionysius, by Helicon of Cyzicus, gives the bearer a good character for honesty and moderation, but withal in the

3. *The Peloponnesian War*, Book II, 400 [Cf. *Great Books of the Western World* (Ed.).]

postscript tells him, "Yet this I write of a man, who, as such, is by nature an animal subject to change." Xenocrates, though a man of rigid morals, was prevailed upon by this kind of modesty to recommend to Polysperchon a person, as it proved in the end, not so honest as he was reputed. For when the Macedonian in compliment bade him call for whatever he wanted, he presently desired a talent of silver. Polysperchon ordered it accordingly to be paid him, but dispatched away letters immediately to Xenocrates, advising him for the future to be better acquainted with those he recommended. Now all this came to pass through Xenocrates's ignorance of his man; but we oftentimes give testimonials and squander away our money to advance such as we are very well satisfied have no qualification or desert to recommend them, and this too with the forfeiture of our reputation, and without the pleasure that men have who are profuse upon whores and flatterers, but all the while in an agony, and struggling with that impudence which does violence to our reason. Whereas, if at any time, that verse can here be properly used,

I know the dreadful consequence, and fear,⁴

when such persons are at a man to forswear himself, or to give a wrong sentence, or to vote for an unjust bill, or lastly to be bound for one that will never be able to pay the debt.

All passions of the mind have repentance still pursuing them closely, but it overtakes this of bashfulness in the very act. For we give with regret, and we are in confusion while we bear false witness; our reputation is questioned when we engage for others, and when we fail we are condemned by all men. From this imperfection also it proceeds that many things are imposed upon us not in our power to perform, as to recommend such a man to court, or to carry up an address to the governor, because we dare not, or at least we will not, confess that we are unknown to the prince or that another has more of his ear. Lysander, on the other hand, when he was in disgrace at court, but yet for his great services was thought to preserve something of his former esteem with Agesilaus, made no scruple to dismiss suitors, directing them to such as were more powerful with the king. For it is no disgrace not to be able to do everything; but to undertake or pretend to what you are not made for is not only shameful but extremely troublesome and vexatious.

But to proceed to another head, we must perform all reasonable and good offices to those that deserve them, not forced thereto by fear of

4. Euripides, *Medea*, 1078. [Cf. *Great Books of the Western World* (Ed.).]

shame, but cheerfully and readily. But where anything prejudicial or unhandsome is required of us, we ought to remember the story that is related of Zeno. Meeting a young man of his acquaintance that slunk away under a wall, as if he would not be seen, and having learned from him that he withdrew from a friend that importuned him to perjure himself, "What," replied he, "you novice! is that fellow not afraid or ashamed to require of thee what is unreasonable and unjust, and darest thou not stand against him in that which is just and honest?" For he that first started that doctrine, that knavery is the best defense against a knave, was but an ill teacher, advising us to keep off wickedness by imitating it. But for such as presume upon our modesty, to keep them off with their own weapons, and not gratify their unreasonable impudence with an easy compliance, is but just and good, and the duty of every wise man.

Neither is it a hard matter to put off some mean and ordinary people, which will be apt to prove troublesome to you in that nature. Some shift them off with a jest or a smart repartee; as Theocritus, being asked in the bath to lend his strigil [scraper] by two persons, whereof one was a stranger to him, and the other a notorious thief, made answer: "You, sir, I know not well enough, and you I know too well." And Lysimache, the priestess of Minerva Polias in Athens, when the muleteers that brought the provision for the festival desired her to let them drink, replied, "No; for I fear it may grow into a custom." So again, when a captain's son, a young fluttering bully but a great coward, petitioned Antigonus for promotion, the latter answered: "Sir, it is my way to reward my soldiers for their valor, not their parentage."

But if he that is importunate with us prove a man of great honor or interest (and such persons are not easily answered with excuses, when they come for our vote in the senate or judicial cases), at such a time perhaps it will be neither easy nor necessary to behave ourselves to them as Cato did towards Catulus. Catulus, a person of the highest rank among the Romans, and at that time censor, once waited on Cato, who was then quaestor and still a young man, on behalf of a friend whom Cato had fined; and when he had used a great deal of importunity to no purpose, yet would not be denied, Cato grew out of patience, and told him, "It would be an unseemly sight to have the censor dragged hence by my officers." Catulus at this went away, out of countenance and very angry. But consider whether the answers of Agesilaus and Themistocles have not in them much more of candor and equity. Agesilaus, being bidden by his own father to give sentence contrary to law, replied: "I have been always taught by you to be observant of the laws, and I shall endeavor to obey

you at this time, by doing nothing contrary to them.” And Themistocles, when Simonides tempted him to commit a piece of injustice, said: “You would be no good poet, should you break the laws of verse; and should I judge against the law, I should make no better magistrate.”

For it is not because of blunders in metre in lyric songs, as Plato observes, that cities and friends are set at variance to their utter ruin and destruction, but because of their blunders with regard to law and justice. Yet there are a sort of men that can be very curious and critical in their verses and letters and lyric measures, and yet would persuade others to neglect that justice and honesty which all men ought to observe in offices, in passing judgments, and in all actions. But these men are to be dealt with after the following manner. An orator perhaps presses you to show him favor in a cause to be heard before you, or a demagogue importunes you when you are a senator: tell him you are ready to please him, on condition that he make a solecism in the beginning of his oration, or be guilty of some barbarous expression in his narration. These terms, for shame, he will not accept; for some we see so superstitiously accurate as not to allow of two vowels meeting one another. Again, you are moved by a person of quality to something of ill reputation: bid him come over the market place at full noon dancing, or making buffoonlike grimaces; if he refuse, question him once more whether he think it a more heinous offense to make a solecism or a grimace than to break a law or to perjure one’s self, or to show more favor to a rascal than to an honest man. Nicostratus the Argive, when Archidamus promised him a vast sum of money and his choice of the Spartan ladies in marriage if he would deliver up the town Cromnum into his hands, returned him this answer: He could no longer believe him descended from Hercules, he said, because Hercules traversed the world to destroy wicked men, but Archidamus made it his business to debauch those that were good. In like manner, if one that stands upon his quality or reputation presses us to do anything dishonorable, we must tell him freely he acts not as becomes a person of his character in the world.

But if it be a man of no quality that shall importune you, you may inquire of the covetous man whether he would lend you a considerable sum without any other security than your word; desire the proud man to give you the higher seat; or the ambitious, to quit his pretensions to some honor that lies fair for him. For, to deal plainly, it is a shameful thing that these men should continue so stiff, so resolute, and so unmoved in their vicious habits, while we, who profess ourselves lovers of justice and honesty, have too little command of ourselves not to give up and betray basely the cause of virtue. If they that would practice upon our modesty do this out of de-

sire of glory or power, why should we contract disgrace or infamy to ourselves to advance the authority or set off the reputation of others—like those who bestow the reward wrongfully in public games, or betray their trust in collecting the poll, who confer indeed garlands and honors upon other men, but at the same time forfeit their own reputation and good word? But suppose it be matter of interest only that puts them upon it; why should it not appear an unreasonable piece of service for us to forego our reputation and conscience to no other purpose than to satisfy another man's avarice or make his coffers the heavier? After all, these I am afraid are the grand motives with most men in such cases, and they are even conscious that they are guilty; as men that are challenged and compelled to take too large a glass raise a hundred scruples and make as many grimaces before they drink.

This weakness of the mind may be compared to a constitution of body that can endure neither heat nor cold. For let them be praised by those that thus impudently set upon them, and they are at once mollified and broken by the flattery; but let them be blamed or so much as suspected by the same men after their suit has been refused, and they are ready to die for woe and fear. We ought therefore to prepare and fortify ourselves against both extremes, so as to be made a prey neither to such as pretend to frighten nor to such as would cajole us. Thucydides is of opinion, since there is a necessary connection between envy and great undertakings, that he takes the wisest counsel who incurs envy by aiming the highest.⁵ But we who esteem it less difficult to avoid the envy of all men than to escape the censure of those we live among ought to order things so as rather to grapple with the unjust hatred of evil men than to deserve their just accusation after we have served their base ends. We ought to go armed against that false and counterfeit praise such men are apt to fling upon us, not suffering ourselves like swine to be scratched and tickled by them, till, having got the advantage of us, they use us after their own pleasure. For they that reach out their ears to flatterers differ very little from such as stand fair and quiet to be tripped up, excepting that the former catch the more disgraceful fall. These put up with the affronts and forbear the correction of wicked men, to get the reputation of good-natured or merciful; or else are drawn into needless and perilous quarrels at the instance of flatterers, who bear them in hand all the while for the only men of judgment, the only men not to be caught with flattery, and

5. *The Peloponnesian War*, II, 64. [See *Great Books of the Western World* (Ed.).]

call them the only men who have mouths and voices. Bion used to compare these men to pitchers: "Take them," said he, "by the ears, and you may move them as you please." Thus Alexinus, the sophist, was reporting many scandalous things in the lyceum of Stilpo the Megarian; but when one present informed him that Stilpo always spake very honorably of him, "Why truly," says he, "he is one of the most obliging and best of men." But now Menedemus, when it was told him that Alexinus often praised him, replied: "That may be, but I always talk against him; for he must be bad who either praises a bad man or is blamed by an honest one." So wary was he of being caught by such baits, agreeably to that precept of Hercules in Antisthenes, who cautioned his sons not to be thankful to such as were used to praise them, thereby meaning no more than that they should be so far from being wheedled thereby as not even to return their flatteries. That of Pindar was very apposite, and enough to be said in such a case: when one told him, "I cry you up among all men, and speak to your advantage on all occasions"; "And I," replied he, "am always very thankful in that I take care you shall not tell a lie."

I shall conclude with one general rule, of sovereign use against all the passions and diseases of the mind, but particularly beneficial to such as labor under the present distemper, bashfulness. And it is this: whenever they have given way to this weakness, let them store up carefully such failings in their memory, and taking therein deep and lively impressions of what remorse and disquiet they occasioned, bestow much time in reflecting upon them and keeping them fresh. For as travelers that have got a dangerous fall against such a stone, or sailors shipwrecked upon a particular promontory, keeping the image of their misfortune continually before them, appear fearful and apprehensive not only of the same but even the like dangers; so they that keep in mind the disgraceful and prejudicial effects of bashfulness will soon be enabled to restrain themselves in like cases, and will not easily slip again on any occasion.

*"Of Bashfulness" is from a collection
of Plutarch's essays
entitled MORALIA.*

Robert Louis Stevenson¹

1850–1894

This thoroughly delightful essay has depth and insight too. It pays honor to the wistful dreams and incantations of youth and to the spark of youth and poetry that remains in grown men. It derides Zola and the realists for pretending that the meaning of life lies in humdrum, vulgar, conventional circumstance, and for suppressing joy. “For to miss the joy,” Stevenson says, “is to miss all. In the joy of the actors lies the sense of any action . . . hence the haunting and truly spectral unreality of realistic books.” But if the motive force of human striving is joy and hidden symbols, would not the true realist be the romancer?

Stevenson knows how to pack a great deal of romance into a gaunt realistic setting. The rugged seacoast, the scattering of houses and scraggy vegetation, a few Dickens-like characters furnish the background of the boys’ doings. For those who can see, it also has its enchantments. Stevenson shows us how a mood of mixed fear and exultation was mirrored in the sea: “. . . the coil of equinoctial tempests; . . . the boats with their reefed lugsails scudding for the harbour mouth, where danger lay. . . .” The cold eye of the realists, watching the boys at their round of amusements, would see nothing wonderful. They played golf, they went fishing, swam in the sea, and gazed from an eminence at the surrounding country and the steeples of nearby towns. Commonplace pleasures? Yes, when viewed objectively.

The greatest joy which they had was quite different. It would appear to a casual observer to be the last word in silliness. Stevenson tells how the boys made a ritual of hiding bull’s-eye lanterns under

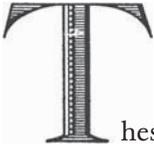

¹ For a biography of Stevenson, see Vol. 2, pp. 284–286, in this set.

their top-coats and huddling together in secret discussions at night. So concealed, the lanterns served no purpose, or so it seemed, except to convey a preposterous sense of mystery. Zola, Stevenson says, would have missed the inner meaning and would have turned out a masterly picture of “shallowness and dullness.”

Stevenson’s own interpretation of the strange ritual is rich but oblique, and he leaves a great deal to you, the reader. Why does the boy exult and sing over the knowledge that, in the dark night unknown to anyone, he carries under his top-coat a hidden flame? Does the flame symbolize a secret strength, a magical power? And could the boys, in their secret nighttime conversations, have been concerned with anything as important as “the possibilities of existence?”

More than one key will sometimes fit the same lock. Each reader has his hidden lantern and is likely to see this thing according to his own light.

The Lantern-Bearers

These boys congregated every autumn about a certain easterly fisher-village, where they tasted in a high degree the glory of existence. The place was created seemingly on purpose for the diversion of young gentlemen. A street or two of houses, mostly red and many of them tiled; a number of fine trees clustered about the manse and the kirkyard, and turning the chief street into a shady alley; many little gardens more than usually bright with flowers; nets a-drying, and fisherwives scolding in the backward parts; a smell of fish, a genial smell of seaweed; whiffs of blowing sand at the street-corners; shops with golf-balls and bottled lollipops; another shop with penny pickwicks (that remarkable cigar) and the *London Journal*, dear to me for its startling pictures, and a few novels, dear for their suggestive names: such, as well as memory serves me, were the ingredients of the town. These you are to conceive posted on a spit between two sandy bays, and sparsely flanked with villas—enough for the boys to lodge in with their subsidiary parents, not enough (not yet enough) to cocknify the scene: a haven in the rocks in front; in front of that, a file of gray islets; to the left, endless links and sand wreaths, a wilderness of hiding-holes, alive with popping rabbits and soaring gulls; to the right, a range of seaward crags, one rugged brow beyond another, the ruins of a mighty and ancient fortress on the brink of one; coves between—now charmed into sunshine quiet, now whistling with wind and clamorous with bursting surges; the dens and sheltered hollows redolent of thyme and southernwood, the air at the cliff's edge brisk and clean and pungent of the sea—in front of all, the Bass Rock, tilted seaward like a doubtful bather, the surf ringing it with white, the solan geese hanging round its summit like a great and glittering smoke. This choice piece of seaboard was sacred, besides, to the wrecker; and the Bass, in the eye of fancy, still flew the colours of King James; and in the ear of fancy the arches of Tantallon still rang with horseshoe iron, and echoed to the commands of Bell-the-Cat.

There was nothing to mar your days, if you were a boy summering in that part, but the embarrassment of pleasure. You might golf if you wanted; but I seem to have been better employed. You might secrete yourself in the Lady's Walk, a certain sunless dingle of elders, all mossed over by the damp as green as grass, and dotted here and there by the streamside with roofless walls, the cold homes of anchorites. To fit themselves for life, and with a special eye to acquire the art of smoking, it was even common for the boys to harbour there; and you might have seen a single penny pickwick, honestly shared in lengths with a blunt knife, bestrew the glen with these apprentices. Again, you might join our fishing parties, where we sat perched as thick as solan geese, a covey of little anglers, boy and girl, angling over each other's heads, to the much entanglement of lines and loss of podleys and consequent shrill recrimination—shrill as the geese themselves. Indeed, had that been all, you might have done this often; but though fishing be a fine pastime, the podley is scarce to be regarded as a dainty for the table; and it was a point of honour that a boy should eat all that he had taken. Or again, you might climb the Law, where the whale's jaw-bone stood landmark in the buzzing wind, and behold the face of many counties, and the smoke and spires of many towns, and the sails of distant ships. You might bathe, now in the flaws of fine weather, that we pathetically call our summer, now in a gale of wind, with the sand scourging your bare hide, your clothes thrashing abroad from underneath their guardian stone, the froth of the great breakers casting you headlong ere it had drowned your knees. Or you might explore the tidal rocks, above all in the ebb of springs, when the very roots of the hills were for the nonce discovered; following my leader from one group to another, groping in slippery tangle for the wreck of ships, wading in pools after the abominable creatures of the sea, and ever with an eye cast backward on the march of the tide and the menaced line of your retreat. And then you might go Crusoeing, a word that covers all extempore eating in the open air: digging perhaps a house under the margin of the links, kindling a fire of the sea-ware, and cooking apples there—if they were truly apples, for I sometimes suppose the merchant must have played us off with some inferior and quite local fruit, capable of resolving, in the neighbourhood of fire, into mere sand and smoke and iodine; or perhaps pushing to Tantallon, you might lunch on sandwiches and visions in the grassy court, while the wind hummed in the crumbling turrets; or clambering along the coast, eat geans (the worst, I must suppose, in Christendom) from an adventurous gean tree that had taken root under a cliff, where it was shaken with an ague of east wind, and sil-

vered after gales with salt, and grew so foreign among its bleak surroundings that to eat of its produce was an adventure in itself.

There are mingled some dismal memories with so many that were joyous. Of the fisherwife, for instance, who had cut her throat at Cauty Bay; and of how I ran with the other children to the top of the Quadrant, and beheld a posse of silent people escorting a cart, and on the cart, bound in a chair, her throat bandaged, and the bandage all bloody—horror!—the fisherwife herself, who continued thenceforth to hag-ride my thoughts, and even to-day (as I recall the scene) darkens daylight. She was lodged in the little old jail in the chief street; but whether or no she died there, with a wise terror of the worst, I never inquired. She had been tipping; it was but a dingy tragedy; and it seems strange and hard that, after all these years, the poor crazy sinner should be still pilloried on her cart in the scrap-book of my memory. Nor shall I readily forget a certain house in the Quadrant where a visitor died, and a dark old woman continued to dwell alone with the dead body; nor how this old woman conceived a hatred to myself and one of my cousins, and in the dread hour of the dusk, as we were clambering on the garden-walls, opened a window in that house of mortality and cursed us in a shrill voice and with a marrowy choice of language. It was a pair of very colourless urchins that fled down the lane from this remarkable experience! But I recall with a more doubtful sentiment, compounded out of fear and exultation, the coil of equinoctial tempests; trumpeting squalls, scouring flaws of rain; the boats with their reefed lugsails scudding for the harbour mouth, where danger lay, for it was hard to make when the wind had an east in it; the wives clustered with blowing shawls at the pier-head, where (if fate was against them) they might see boat and husband and sons—their whole wealth and their whole family—engulfed under their eyes; and (what I saw but once) a troop of neighbours forcing such an unfortunate homeward, and she squalling and battling in their midst, a figure scarcely human, a tragic maenad.

These are things that I recall with interest; but what my memory dwells upon the most, I have been all this while withholding. It was a sport peculiar to the place, and indeed to a week or so of our two months' holiday there. Maybe it still flourishes in its native spot; for boys and their pastimes are swayed by periodic forces inscrutable to man; so that tops and marbles reappear in their due season, regular like the sun and moon; and the harmless art of knucklebones has seen the fall of the Roman Empire and the rise of the United States. It may still flourish in its native spot, but

nowhere else, I am persuaded; for I tried myself to introduce it on Tweedside, and was defeated lamentably; its charm being quite local, like a country wine that cannot be exported.

The idle manner of it was this:

Toward the end of September, when school-time was drawing near and the nights were already black, we would begin to sally from our respective villas, each equipped with a tin bull's-eye lantern. The thing was so well known that it had worn a rut in the commerce of Great Britain; and the grocers, about the due time, began to garnish their windows with our particular brand of luminary. We wore them buckled to the waist upon a cricket belt, and over them, such was the rigour of the game, a buttoned top-coat. They smelled noisomely of blistered tin; they never burned aright, though they would always burn our fingers; their use was naught; the pleasure of them merely fanciful; and yet a boy with a bull's-eye under his top-coat asked for nothing more. The fishermen used lanterns about their boats, and it was from them, I suppose, that we had got the hint; but theirs were not bull's-eyes, nor did we ever play at being fishermen. The police carried them at their belts, and we had plainly copied them in that; yet we did not pretend to be policemen. Burglars, indeed, we may have had some haunting thoughts of; and we had certainly an eye to past ages when lanterns were more common, and to certain story-books in which we had found them to figure very largely. But take it for all in all, the pleasure of the thing was substantive; and to be a boy with a bull's-eye under his top-coat was good enough for us.

When two of these asses met, there would be an anxious "Have you got your lantern?" and a gratified "Yes!" That was the shibboleth, and very needful too; for, as it was the rule to keep our glory contained, none could recognize a lantern-bearer, unless (like the polecat) by the smell. Four or five would sometimes climb into the belly of a ten-man lugger, with nothing but the thwarts above them—for the cabin was usually locked—or choose out some hollow of the links where the wind might whistle overhead. There the coats would be unbuttoned and the bull's-eyes discovered; and in the chequering glimmer, under the huge windy hall of the night, and cheered by a rich steam of toasting tinware, these fortunate young gentlemen would crouch together in the cold sand of the links or on the scaly bilges of the fishing-boat, and delight themselves with inappropriate talk. Woe is me that I may not give some specimens—some of their foresights of life, or deep inquiries into the rudiments of man and nature, these were so fiery and so innocent, they were so richly silly, so ro-

manically young. But the talk, at any rate, was but a condiment; and these gatherings themselves only accidents in the career of the lantern-bearer. The essence of this bliss was to walk by yourself in the black night; the slide shut, the top-coat buttoned; not a ray escaping, whether to conduct your footsteps or to make your glory public: a mere pillar of darkness in the dark; and all the while, deep down in the privacy of your fool's heart, to know you had a bull's-eye at your belt, and to exult and sing over the knowledge.

It is said that a poet has died young in the breast of the most stolid. It may be contended, rather, that this (somewhat minor) bard in almost every case survives, and is the spice of life to his possessor. Justice is not done to the versatility and the unplumbed childishness of man's imagination. His life from without may seem but a rude mound of mud; there will be some golden chamber at the heart of it, in which he dwells delighted; and for as dark as his pathway seems to the observer, he will have some kind of a bull's-eye at his belt.

It would be hard to pick out a career more cheerless than that of Dancer, the miser, as he figures in the "Old Bailey Reports," a prey to the most sordid persecutions, the butt of his neighbourhood, betrayed by his hired man, his house beleaguered by the impish schoolboy, and he himself grinding and fuming and impotently fleeing to the law against these pin-pricks. You marvel at first that any one should willingly prolong a life so destitute of charm and dignity; and then you call to memory that had he chosen, had he ceased to be a miser, he could have been freed at once from these trials, and might have built himself a castle and gone escorted by a squadron. For the love of more recondite joys, which we cannot estimate, which, it may be, we should envy, the man had willingly foregone both comfort and consideration. "His mind to him a kingdom was"; and sure enough, digging into that mind, which seems at first a dust-heap, we unearth some priceless jewels. For Dancer must have had the love of power and the disdain of using it, a noble character in itself; disdain of many pleasures, a chief part of what is commonly called wisdom; disdain of the inevitable end, that finest trait of mankind; scorn of men's opinions, another element of virtue; and at the back of all, a conscience just like yours and mine, whining like a cur, swindling like a thimble-rigger, but still pointing (there or thereabout) to some conventional standard. Here were a cabinet portrait to which Hawthorne perhaps had done justice; and yet not Hawthorne either, for he was mildly minded, and it lay not in him to create for us that throb of the miser's pulse, his

fretful energy of gusto, his vast arms of ambition clutching in he knows not what: insatiable, insane, a god with a muck-rake. Thus, at least, looking in the bosom of the miser, consideration detects the poet in the full tide of life, with more, indeed, of the poetic fire than usually goes to epics; and tracing that mean man about his cold hearth, and to and fro in his uncomfortable house, spies within him a blazing bonfire of delight. And so with others who do not live by bread alone but by some cherished and perhaps fantastic pleasure; who are meat salesmen to the external eye, and possibly to themselves are Shakespeares, Napoleons, or Beethovens; who have not one virtue to rub against another in the field of active life, and yet perhaps, in the life of contemplation, sit with the saints. We see them on the street, and we can count their buttons; but heaven knows in what they pride themselves! Heaven knows where they have set their treasure!

There is one fable that touches very near the quick of life: the fable of the monk who passed into the woods, heard a bird break into song, hearkened for a trill or two, and found himself on his return a stranger at his convent gates; for he had been absent fifty years, and of all his comrades there survived but one to recognize him. It is not only in the woods that this enchanter carols, though perhaps he is native there. He sings in the more doleful places. The miser hears him and chuckles, and the days are moments. With no more apparatus than an ill-smelling lantern, I have evoked him on the naked links. All life that is not merely mechanical is spun out of two strands: seeking for that bird and hearing him. And it is just this that makes life so hard to value, and the delight of each so incommunicable. And it is just a knowledge of this, and a remembrance of those fortunate hours in which the bird has sung to us, that fills us with such wonder when we turn the pages of the realist. There, to be sure, we find a picture of life in so far as it consists of mud and of old iron, cheap desires and cheap fears, that which we are ashamed to remember and that which we are careless whether we forget; but of the note of that time-devouring nightingale we hear no news.

The case of these writers of romance is most obscure. They have been boys and youths; they have lingered outside the window of the beloved, who was then most probably writing to some one else; they have sat before a sheet of paper, and felt themselves mere continents of congested poetry, not one line of which would flow; they have walked alone in the woods; they have walked in cities under the countless lamps; they have been to sea; they have hated; they have feared; they have longed to knife a man, and maybe done it; the wild taste of life has stung their palate.

Or, if you deny them all the rest, one pleasure at least they have tasted to the full—their books are there to prove it—the keen pleasure of successful literary composition. And yet they fill the globe with volumes whose cleverness inspires me with despairing admiration, and whose consistent falsity to all I care to call existence, with despairing wrath. If I had no better hope than to continue to revolve among the dreary and petty businesses, and to be moved by the paltry hopes and fears with which they surround and animate their heroes, I declare I would die now. But there has never an hour of mine gone quite so dully yet; if it were spent waiting at a railway junction, I would have some scattering thoughts, I could count some grains of memory, compared to which the whole of one of these romances seems but dross.

These writers would retort (if I take them properly) that this was very true; that it was the same with themselves and other persons of (what they call) the artistic temperament; that in this we were exceptional, and should apparently be ashamed of ourselves; but that our works must deal exclusively with (what they call) the average man, who was a prodigious dull fellow, and quite dead to all but the paltriest considerations. I accept the issue. We can only know others by ourselves. The artistic temperament (a plague on the expression!) does not make us different from our fellow-men, or it would make us incapable of writing novels; and the average man (a murrain on the word!) is just like you and me, or he would not be average. It was Whitman who stamped a kind of Birmingham sacredness upon the latter phrase; but Whitman knew very well, and showed very nobly, that the average man was full of joys and full of a poetry of his own. And this harping on life's dullness and man's meanness is a loud profession of incompetence; it is one of two things: the cry of the blind eye, *I cannot see*, or the complaint of the dumb tongue, *I cannot utter*. To draw a life without delights is to prove I have not realized it. To picture a man without some sort of poetry—well, it goes near to prove my case, for it shows an author may have little enough. To see Dancer only as a dirty, old, small-minded, impotently fuming man, in a dirty house, besieged by Harrow boys, and probably beset by small attorneys, is to show myself as keen an observer as . . . the Harrow boys. But these young gentlemen (with a more becoming modesty) were content to pluck Dancer by the coat-tails; they did not suppose they had surprised his secret or could put him living in a book: and it is there my error would have lain. Or say that in the same romance—I continue to call these books romances, in the hope of giving pain—say that in the same romance, which now begins really to take shape, I should leave to speak of Dancer,

and follow instead the Harrow boys; and say that I came on some such business as that of my lantern-bearers on the links; and described the boys as very cold, spat upon by flurries of rain, and drearily surrounded, all of which they were; and their talk as silly and indecent, which it certainly was. I might upon these lines, and had I Zola's genius, turn out, in a page or so, a gem of literary art, render the lantern-light with the touches of a master, and lay on the indecency with the ungrudging hand of love; and when all was done, what a triumph would my picture be of shallowness and dullness! How it would have missed the point! How it would have belied the boys! To the ear of the stenographer, the talk is merely silly and indecent; but ask the boys themselves, and they are discussing (as it is highly proper they should) the possibilities of existence. To the eye of the observer they are wet and cold and drearily surrounded; but ask themselves, and they are in the heaven of a recondite pleasure, the ground of which is an ill-smelling lantern.

For, to repeat, the ground of a man's joy is often hard to hit. It may hinge at times upon a mere accessory, like the lantern; it may reside, like Dancer's, in the mysterious inwards of psychology. It may consist with perpetual failure, and find exercise in the continued chase. It has so little bond with externals (such as the observer scribbles in his notebook) that it may even touch them not; and the man's true life, for which he consents to live, lies altogether in the field of fancy. The clergyman, in his spare hours, may be winning battles, the farmer sailing ships, the banker reaping triumph in the arts: all leading another life, plying another trade from that they chose, like the poet's housebuilder, who, after all is cased in stone,

By his fireside, as impotent fancy prompts,
Rebuilds it to his liking.

In such a case the poetry runs underground. The observer (poor soul, with his documents!) is all abroad. For to look at the man is but to court deception. We shall see the trunk from which he draws his nourishment; but he himself is above and abroad in the green dome of foliage, hummed through by winds and nested in by nightingales. And the true realism were that of the poets, to climb up after him like a squirrel, and catch some glimpse of the heaven for which he lives. And the true realism, always and everywhere, is that of the poets: to find out where joy resides, and give it a voice far beyond singing.

For to miss the joy is to miss all. In the joy of the actors lies the sense of

any action. That is the explanation, that the excuse. To one who has not the secret of the lanterns, the scene upon the links is meaningless. And hence the haunting and truly spectral unreality of realistic books. Hence, when we read the English realists, the incredulous wonder with which we observe the hero's constancy under the submerging tide of dullness, and how he bears up with his jibbing sweetheart, and endures the chatter of idiot girls, and stands by his whole unfeatured wilderness of an existence, instead of seeking relief in drink or foreign travel. Hence in the French, in that meat market of middle-aged sensuality, the disgusted surprise with which we see the hero drift sidelong, and practically quite untempted, into every description of misconduct and dishonour. In each, we miss the personal poetry, the enchanted atmosphere, that rainbow work of fancy that clothes what is naked and seems to ennoble what is base; in each, life falls dead like dough, instead of soaring away like a balloon into the colours of the sunset; each is true, each inconceivable; for no man lives in the external truth, among salts and acids, but in the warm, phantasmagoric chamber of his brain, with the painted windows and the storied walls.

Of this falsity we have had a recent example from a man who knows far better—Tolstoy's *Powers of Darkness*. Here is a piece full of force and truth, yet quite untrue. For before Mikita was led into so dire a situation he was tempted, and temptations are beautiful at least in part; and a work which dwells on the ugliness of crime, and gives no hint of any loveliness in the temptation, sins against the modesty of life, and even when a Tolstoy writes it, sinks to melodrama. The peasants are not understood; they saw their life in fairer colours; even the deaf girl was clothed in poetry for Mikita, or he had never fallen. And so, once again, even an Old Bailey melodrama, without some brightness of poetry and lustre of existence, falls into the inconceivable and ranks with fairy tales.

In nobler books we are moved with something like the emotions of life; and this emotion is very variously provoked. We are so moved when Levine labours in the field, when André sinks beyond emotion, when Richard Feverel and Lucy Desborough meet beside the river, when Antony, "not cowardly, puts off his helmet," when Kent has infinite pity on the dying Lear, when, in Dostoevsky's *Despised and Rejected*, the uncomplaining hero drains his cup of suffering and virtue. These are notes that please the great heart of man. Not only love, and the fields, and the bright face of danger but sacrifice and death and unmerited suffering humbly supported touch in us the vein of the poetic. We love to think of them, we

long to try them, we are humbly hopeful that we may prove heroes also.

We have heard, perhaps, too much of lesser matters. Here is the door, here is the open air. *Itur in antiquam silvam* [The way leads to an ancient wood].

*“The Lantern-Bearers” is from a collection
of Stevenson’s essays
entitled ACROSS THE PLAINS.*

John Ruskin

1819–1900

John Ruskin, critic of art and of society, was born in London in 1819, the only child of Scottish parents, who were first cousins. His father was a prosperous wine merchant with a taste for art and literature, his mother a handsome, devoted woman with a stern Calvinist sense of duty. Their son's childhood was strictly supervised. Ruskin never owned a toy, was ignorant of all games, could neither dance nor ride to his dying day. On the other hand, he was a bookworm when he was five, by seven had begun to write a work of his own which grew to four volumes, and by the age of twenty had written a large body of poetry, drama, and romance, very little of which survives. He had also traveled almost everywhere in the civilized world and had acquired an exhaustive aesthetic education. Regarded by his parents as a prodigy, he was saved only by his own fine nature from being a prig.

Following his graduation in 1842 from Oxford, Ruskin began a career as an art critic that lasted for twenty years. He wrote *Modern Painters* in five volumes; the first volume, published in 1843, contained the famous defense of J. M. W. Turner, whose reputation Ruskin created. Two other works of this period were *The Seven Lamps of Architecture*, in which he laid down the principle that the

Notes from the artist: "A landscape of fantasy surrounds the portrait of Ruskin. A wild olive plant, a bird, and a flower recall some of the subjects of Ruskin's works. Hidden among the foliage at the right is a profile of Michelangelo, suggesting Ruskin's writings on art; while below, at left, is J. A. M. Whistler, who sued for libel after Ruskin attacked his painting."

Joan Rushiz

art of a people is an expression of their life, and *The Stones of Venice*, which gave the city a special fame it has never lost.

After 1860 Ruskin turned from the study of art to social criticism. He had been stirred by the social injustice of the age and was henceforth to write endless articles and give countless lectures on the subject. None of these was as substantial as his works on art. Yet they were more forceful, so that he became famous as a social essayist. Among the collections of his pieces were *Unto This Last* (1862) and *Sesame and Lilies* (1865), where he laid out a scheme for society that was frankly utopian.

From 1869 to 1884 he was professor of art at Oxford, though he never ceased his social comment; indeed, art and social criticism had become one for him. In 1878 he suffered the first of a series of mental breakdowns which caused him increasing distress and made heavy work impossible. He also gave away to friends, charities, and various social objects the very large fortune which he had inherited from his father, as well as the considerable income from the sale of his books. The latter is said to have amounted to £4,000 a year—in modern money, perhaps \$50,000. The last ten years of his life were spent in the care of friends, virtually in retirement. He died in 1900, probably the most celebrated figure in social criticism of his time.

The essays of Ruskin, as those of Emerson, tend to be inspired sermons; they exhort to honesty, achievement, truth, and to justice and a social conscience. But whereas Emerson remained serene and confident, Ruskin could sometimes denounce wholesale, as in the present essay, all the new gods and the distinctive progress of his age. Yet his wit was never caustic and unforgiving like Carlyle's, and there was more poetic sadness and nostalgia than wrath in his condemnation of the friends and life around him.

We are astounded to read the list of the things he denounces, for they are now mostly regarded as essentials of the good life. They include modern science; technology (which reduces the hours of labor while increasing its product); rapid transportation; and the kind of equality of individuals which goes along with democratic institutions. What can Ruskin be thinking of? What does he want to take the place of these modern innovations? He wants "admiration, hope, and love" to flourish. But admiration requires recognition of superiority and is supposedly inconsistent with equality, and love

and hope do not go with factories and materialistic science. To live again as we should, we must free our civilization from the contempt of “the Middle Ages and of their chivalry.”

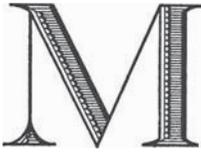

But let us be sympathetic; that is the way to understanding. Is it not true that the greatest love stories are laid in medieval times or share something of its atmosphere? Is it not true, as Carlyle claimed, that machines are the death of heroes—of the heroic spirit and devotion? Was it not a long time before romance could adapt itself to industrial life? We must remember also that when Ruskin wrote, industry was still new and raw. It had covered the beautiful English countryside with smoke and ugly chimneys and factories. The workers, deprived of a plot of land to work, and even of clean air, worked long hours for a pittance and lived in dingy squalor. Money there was in the factory system, of course, but it was siphoned into the hands of a few who cared nothing for beauty nor for simple human worth.

We have now tried to be fair, but when all has been said in defense of Ruskin’s medievalism—and there is a great deal more that could be added—we may still be unconvinced. Have not the Middle Ages been overrated? Was this period especially favorable to admiration, hope, and love? The enormously high mortality rate, spreading heartbreak with a prodigal hand, was a cruel reversal of both hope and love. And how much can we admire the knights and their tournaments, whose work was mostly destruction?

We will want to ask ourselves, also, how far the “progress” which Ruskin deplored could have been arrested, even if this was what was needed. Perhaps what he should have demanded was a reform, not a termination, of industrial civilization. From this point of view we can learn a great deal from Ruskin.

An Idealist's Arraignment of the Age

For lo, the winter is past,
The rain is over and gone,
The flowers appear on the earth,
The time of the singing of birds is come,
Arise, oh my fair one, my dove,
And come.

y Friends,

It has been asked of me, very justly, why I have hitherto written to you of things you were little likely to care for, in words which it was difficult for you to understand. I have no fear but that you will one day understand all my poor words—the saddest of them perhaps too well. But I have great fear that you may never come to understand these written above, which are part of a king's love-song, in one sweet May, of many long since gone. I fear that for you the wild winter's rain may never pass, the flowers never appear on the earth; that for you no bird may ever sing; for you no perfect love arise and fulfil your life in peace. "And why not for us as for others?" Will you answer me so, and take my fear for you as an insult? Nay, it is no insult; nor am I happier than you. For me the birds do not sing, nor ever will. But they would for you, if you cared to have it so. When I told you that you would never understand that love-song, I meant only that you would not desire to understand it.

Are you again indignant with me? Do you think, though you should labour and grieve and be trodden down in dishonour all your days, at least you can keep that one joy of love and that one honour of home? Had you,

indeed, kept that, you had kept all. But no men yet, in the history of the race, have lost it so piteously. In many a country and many an age, women have been compelled to labour for their husbands' wealth or bread; but never until now were they so homeless as to say, like the poor Samaritan, "I have no husband." Women of every country and people have sustained without complaint the labour of fellowship; for the women of the latter days in England it has been reserved to claim the privilege of isolation.

This, then, is the end of your universal education and civilization, and contempt of the ignorance of the Middle Ages and of their chivalry. Not only do you declare yourselves too indolent to labour for daughters and wives, and too poor to support them, but you have made the neglected and distracted creatures hold it for an honour to be independent of you and shriek for some hold of the mattock for themselves. Believe it or not, as you may, there has not been so low a level of thought reached by any race since they grew to be male and female out of star-fish or chickweed or whatever else they have been made from by natural selection—according to modern science.

That modern science, also, economic and of other kinds, has reached its climax at last. For it seems to be the appointed function of the nineteenth century to exhibit in all things the elect pattern of perfect folly, for a warning to the farthest future. Thus the statement of principle which I quoted to you in my last letter, from the circular of the Emigration Society, that it is over-production which is the cause of distress, is accurately the most foolish thing, not only hitherto ever said by men, but which it is possible for men ever to say, respecting their own business. It is a kind of opposite pole (or negative acme of mortal stupidity) to Newton's discovery of gravitation as an acme of mortal wisdom: as no wise being on earth will ever be able to make such another wise discovery, so no foolish being on earth will ever be capable of saying such another foolish thing through all the ages.

And the same crisis has been exactly reached by our natural science and by our art. It has several times chanced to me, since I began these papers, to have the exact thing shown or brought to me that I wanted for illustration, just in time; and it happened that, on the very day on which I published my last letter, I had to go to the Kensington Museum, and there I saw the most perfectly and roundly ill-done thing which, as yet, in my whole life, I ever saw produced by art. It had a tablet in front of it, bearing this inscription:

Statue in black and white marble, a Newfoundland Dog standing on a Serpent, which rests on a marble cushion, the pedestal ornamented with *pietra dura* fruits in relief.—*English. Present Century*. No. 1.

It was so very right for me, the Kensington people having been good enough to number it "1," the thing itself being almost incredible in its oneness; and, indeed, such a punctual accent over the iota of miscreation, so absolutely and exquisitely miscreant, that I am not myself capable of conceiving a number two or three, or any rivalry or association with it whatsoever. The extremity of its unvirtue consisted, observe, mainly in the quantity of instruction which was abused in it. It showed that the persons who produced it had seen everything, and practised everything; and misunderstood everything they saw, and misapplied everything they did. They had seen Roman work and Florentine work and Byzantine work and Gothic work; and misunderstanding of everything had passed through them as the mud does through earthworms, and here at last was their worm-cast of a production.

But the second chance that came to me that day was more significant still. From the Kensington Museum I went to an afternoon tea, at a house where I was sure to meet some nice people. And among the first I met was an old friend who had been hearing some lectures on botany at the Kensington Museum, and been delighted by them. She is the kind of person who gets good out of everything, and she was quite right in being delighted; besides that, as I found by her account of them, the lectures were really interesting and pleasantly given. She had expected botany to be dull, and had not found it so, and "had learned so much." On hearing this I proceeded naturally to inquire what; for my idea of her was that before she went to the lectures at all she had known more botany than she was likely to learn by them. So she told me that she had learned first of all that there "were seven sorts of leaves." Now, I have always a great suspicion of the number seven; because when I wrote *The Seven Lamps of Architecture*, it required all the ingenuity I was master of to prevent them from becoming eight, or even nine, on my hands. So I thought to myself that it would be very charming if there were only seven sorts of leaves; but that, perhaps, if one looked the woods and forests of the world carefully through, it was just possible that one might discover as many as eight sorts; and then where would my friend's new knowledge of botany be? So I said, "That was very pretty; but what more?" Then my friend told me that she had no idea, before, that petals were leaves. On which I thought to myself that it would not have been any great harm to

her if she had remained under her old impression that petals were petals. But I said, "That was very pretty, too; and what more?" So then my friend told me that the lecturer said "the object of his lectures would be entirely accomplished if he could convince his hearers that there was no such thing as a flower." Now, in that sentence you have the most perfect and admirable summary given you of the general temper and purposes of modern science. It gives lectures on botany, of which the object is to show that there is no such thing as a flower; on humanity, to show that there is no such thing as a man; and on theology, to show there is no such thing as a God. No such thing as a man, but only a mechanism; no such thing as a God, but only a series of forces. The two faiths are essentially one: if you feel yourself to be only a machine, constructed to be a regulator of minor machinery, you will put your statue of such science on your Holborn Viaduct, and necessarily recognize only major machinery as regulating you.

I must explain the real meaning to you, however, of that saying of the botanical lecturer, for it has a wide bearing. Some fifty years ago the poet Goethe discovered that all the parts of plants had a kind of common nature and would change into each other. Now, this was a true discovery and a notable one; and you will find that, in fact, all plants are composed of essentially two parts—the leaf and root; one loving the light, the other darkness; one liking to be clean, the other to be dirty; one liking to grow for the most part up, the other for the most part down; and each having faculties and purposes of its own. But the pure one, which loves the light, has, above all things, the purpose of being married to another leaf, and having child-leaves and children's children of leaves, to make the earth fair forever. And when the leaves marry, they put on wedding-ropes and are more glorious than Solomon in all his glory, and they have feasts of honey; and we call them "Flowers."

In a certain sense, therefore, you see the botanical lecturer was quite right. There are no such things as flowers—there are only leaves. Nay, farther than this, there may be a dignity in the less happy but unwithering leaf, which is, in some sort, better than the brief lily of its bloom—which the great poets always knew well, Chaucer before Goethe, and the writer of the *First Psalm* before Chaucer. The botanical lecturer was, in a deeper sense than he knew, right.

But in the deepest sense of all, the botanical lecturer was, to the extremity of wrongness, wrong; for leaf and root and fruit exist, all of them, only that there may be flowers. He disregarded the life and passion of the creature, which were its essence. Had he looked for these, he would have

recognized that in the thought of Nature herself there is in a plant nothing else but its flowers.

Now, in exactly the sense that modern science declares there is no such thing as a flower, it has declared there is no such thing as a man but only a transitional form of ascidians and apes. It may or may not be true—it is not of the smallest consequence whether it be or not. The real fact is that, seen with human eyes, there is nothing else but Man; that all animals and beings beside him are only made that they may change into him; that the world truly exists only in the presence of Man, acts only in the passion of Man. The essence of light is in his eyes, the centre of force in his soul, the pertinence of action in his deeds. And all true science—which my Savoyard guide rightly scorned me when he thought I had not—all true science is *savoir vivre*. But all your modern science is the contrary of that. It is *savoir mourir*. And of its very discoveries, such as they are, it cannot make use.

That telegraphic signalling was a discovery; and conceivably, some day, may be a useful one. And there was some excuse for your being a little proud when, about last sixth of April (Coeur de Lion's death-day, and Albrecht Dürer's), you knotted a copper wire all the way to Bombay, and flashed a message along it and back. But what was the message, and what the answer? Is India the better for what you said to her? Are you the better for what she replied? If not, you have only wasted an all-round-the-world's length of copper wire—which is, indeed, about the sum of your doing. If you had had, perchance, two words of common sense to say, though you had taken wearisome time and trouble to send them—though you had written them slowly in gold, and sealed them with a hundred seals, and sent a squadron of ships of the line to carry the scroll; and the squadron had fought its way round the Cape of Good Hope, through a year of storms, with loss of all its ships but one—the two words of common sense would have been worth the carriage, and more. But you have not anything like so much as that to say, either to India or to any other place.

You think it a great triumph to make the sun draw brown landscapes for you. That was also a discovery, and some day may be useful. But the sun had drawn landscapes before for you, not in brown, but in green and blue and all imaginable colors, here in England. Not one of you ever looked at them then; not one of you cares for the loss of them now, when you have shut the sun out with smoke, so that he can draw nothing more except brown blots through a hole in a box. There was a rocky valley between Buxton and Bakewell, once upon a time, divine as the Vale of

Tempe; you might have seen the gods there morning and evening—Apollo and all the sweet Muses of the Light—walking in fair procession on the lawns of it and to and fro among the pinnacles of its crags. You cared neither for gods nor grass, but for cash (which you did not know the way to get); you thought you could get it by what the *Times* calls “Railroad Enterprise.” You enterprised a railroad through the valley—you blasted its rocks away, heaped thousands of tons of shale into its lovely stream. The valley is gone, and the gods with it; and now every fool in Buxton can be at Bakewell in half an hour, and every fool in Bakewell at Buxton; which you think a lucrative process of exchange—you fools everywhere.

To talk at a distance, when you have nothing to say though you were ever so near; to go fast from this place to that, with nothing to do either at one or the other—these are powers certainly. Much more, power of increased production, if you indeed had got it, would be something to boast of. But are you so entirely sure that you *have* got it—that the mortal disease of plenty and afflictive affluence of good things are all you have to dread?

Observe. A man and a woman, with their children, properly trained, are able easily to cultivate as much ground as will feed them, to build as much wall and roof as will lodge them, and to spin and weave as much cloth as will clothe them. They can all be perfectly happy and healthy in doing this. Supposing that they invent machinery which will build, plough, thresh, cook, and weave, and that they have none of these things any more to do, but may read, or play croquet or cricket, all day long, I believe myself that they will neither be so good nor so happy as without the machines. But I waive my belief in this matter for the time. I will assume that they become more refined and moral persons, and that idleness is in future to be the mother of all good. But observe, I repeat, the power of your machine is only in enabling them to be idle. It will not enable them to live better than they did before, nor to live in greater numbers. Get your heads quite clear on this matter. Out of so much ground only so much living is to be got, with or without machinery. You may set a million of steam-ploughs to work on an acre, if you like—out of that acre only a given number of grains of corn will grow, scratch or scorch it as you will. So that the question is not at all whether, by having more machines, more of you can live. No machines will increase the possibilities of life. They only increase the possibilities of idleness. Suppose, for instance, you could get the oxen in your plough driven by a goblin, who would ask for no pay, not even a cream bowl (you have nearly managed to get it

driven by an iron goblin, as it is), well, your furrow will take no more seeds than if you had held the stilts yourself. But instead of holding them you sit, I presume, on a bank beside the field, under an eglantine—watch the goblin at his work, and read poetry. Meantime, your wife in the house has also got a goblin to weave and wash for her. And she is lying on the sofa, reading poetry.

Now, as I said, I don't believe you would be happier so, but I am willing to believe it; only, since you are already such brave mechanists, show me at least one or two places where you *are* happier. Let me see one small example of approach to this seraphic condition. I can show you examples, millions of them, of happy people made happy by their own industry. Farm after farm I can show you in Bavaria, Switzerland, the Tyrol, and such other places, where men and women are perfectly happy and good, without any iron servants. Show me, therefore, some English family, with its fiery familiar, happier than these. Or bring me—for I am not invincible by any kind of evidence—bring me the testimony of an English family or two to their increased felicity. Or if you cannot do so much as that, can you convince even themselves of it? They are perhaps happy, if only they knew how happy they were. Virgil thought so, long ago, of simple rustics; but you hear at present your steam-propelled rustics are crying out that they are anything else than happy, and that they regard their boasted progress “in the light of a monstrous Sham.” I must tell you one little thing, however, which greatly perplexes my imagination of the relieved ploughman sitting under his rose-bower, reading poetry. I have told it you before, indeed, but I forget where. There was really a great festivity, and expression of satisfaction in the new order of things, down in Cumberland, a little while ago; some first of May, I think it was, a country festival such as the old heathens, who had no iron servants, used to keep with piping and dancing. So I thought, from the liberated country people—their work all done for them by goblins—we should have some extraordinary piping and dancing. But there was no dancing at all, and they could not even provide their own piping. They had their goblin to pipe for them. They walked in procession after their steam-plough, and their steam-plough whistled to them occasionally in the most melodious manner it could. Which seemed to me, indeed, a return to more than Arcadian simplicity; for in old Arcadia plough-boys truly whistled as they went, for want of thought, whereas here was verily a large company walking without thought but not having any more even the capacity of doing their own whistling.

But next, as to the inside of the house. Before you got your power-looms a woman could always make herself a chemise and petticoat of bright

and pretty appearance. I have seen a Bavarian peasant-woman at church in Munich looking a much grander creature, and more beautifully dressed, than any of the crossed and embroidered angels in Hesse's high-art frescoes (which happened to be just above her, so that I could look from one to the other). Well, here you are, in England, served by household demons, with five hundred fingers at least, weaving, for one that used to weave in the days of Minerva. You ought to be able to show me five hundred dresses for one that used to be; tidiness ought to have become five-hundred-fold tidier; tapestry should be increased into *cinquecento*-fold iridescence of tapestry. Not only your peasant-girl ought to be lying on the sofa, reading poetry, but she ought to have in her wardrobe five hundred petticoats instead of one. Is that, indeed, your issue? or are you only on a curiously crooked way to it?

It is just possible, indeed, that you may not have been allowed to get the use of the goblin's work—that other people may have got the use of it, and you none; because, perhaps, you have not been able to evoke goblins wholly for your own personal service, but have been borrowing goblins from the capitalist and paying interest, in the "position of William," on ghostly self-going planes. But suppose you had laid by capital enough, yourselves, to hire all the demons in the world—nay, all that are inside of it—are you quite sure you know what you might best set them to work at, and what "useful things" you should command them to make for you? I told you, last month, that no economist going (whether by steam or ghost) knew what are useful things and what are not. Very few of you know, yourselves, except by bitter experience of the want of them. And no demons, either of iron or spirit, can ever make them.

There are three material things, not only useful, but essential to life. No one "knows how to live" till he has got them.

These are pure air, water, and earth.

There are three immaterial things, not only useful, but essential to life. No one knows how to live till he has got them also.

These are admiration, hope, and love.

Admiration—the power of discerning and taking delight in what is beautiful in visible form and lovely in human character; and, necessarily, striving to produce what is beautiful in form and to become what is lovely in character.

Hope—the recognition, by true foresight, of better things to be reached hereafter, whether by ourselves or others; necessarily issuing in the straightforward and undisappointable effort to advance, according to our proper power, the gaining of them.

Love—both of family and neighbour, faithful and satisfied.

These are the six chiefly useful things to be got by political economy, when it *has* become a science. I will briefly tell you what modern political economy—the great *savoir mourir*—is doing with them.

The first three, I said, are pure air, water, and earth.

Heaven gives you the main elements of these. You can destroy them at your pleasure, or increase, almost without limit, the available quantities of them.

You can vitiate the air by your manner of life and of death to any extent. You might easily vitiate it so as to bring such a pestilence on the globe as would end all of you. You or your fellows, German and French, are at present vitiating it to the best of your power in every direction—chiefly at this moment with corpses and animal and vegetable ruin in war, changing men, horses, and garden-stuff into noxious gas. But everywhere, and all day long, you are vitiating it with foul chemical exhalations; and the horrible nests, which you call towns, are little more than laboratories for the distillation into heaven of venomous smokes and smells, mixed with effluvia from decaying animal matter and infectious miasmata from purulent disease. On the other hand, your power of purifying the air, by dealing properly and swiftly with all substances in corruption, by absolutely forbidding noxious manufactures, and by planting in all soils the trees which cleanse and invigorate earth and atmosphere, is literally infinite. You might make every breath of air you draw, food.

Secondly, your power over the rain and river-waters of the earth is infinite. You can bring rain where you will, by planting wisely and tending carefully; drought where you will, by ravage of woods and neglect of the soil. You might have the rivers of England as pure as the crystal of the rock; beautiful in falls, in lakes, in living pools; so full of fish that you might take them out with your hands instead of nets. Or you may do always as you have done now—turn every river of England into a common sewer, so that you cannot so much as baptize an English baby but with filth, unless you hold its face out in the rain; and even *that* falls dirty.

Then for the third, earth, meant to be nourishing for you and blossoming. You have learned about it that there is no such thing as a flower; and as far as your scientific hands and scientific brains, inventive of explosive and deathful instead of blossoming and life-giving dust, can contrive, you have turned the Mother Earth, Demeter, into the Avenger-Earth, Tisiphone—with the voice of your brother's blood crying out of it in one wild harmony round all its murderous sphere.

That is what you have done for the three material useful things.

Then for the three immaterial useful things. For admiration, you have learned contempt and conceit. There is no lovely thing ever yet done by man that you care for or can understand; but you are persuaded you are able to do much finer things yourselves. You gather and exhibit together, as if equally instructive, what is infinitely bad with what is infinitely good. You do not know which is which; you instinctively prefer the bad, and do more of it. You instinctively hate the good, and destroy it.

Then, secondly, for hope. You have not so much spirit of it in you as to begin any plan which will not pay for ten years; nor so much intelligence of it in you (either politicians or workmen) as to be able to form one clear idea of what you would like your country to become.

Then, thirdly, for love. You were ordered by the Founder of your religion to love your neighbour as yourselves. You have founded an entire science of political economy on what you have stated to be the constant instinct of man—the desire to defraud his neighbour. And you have driven your women mad, so that they ask no more for love nor for fellowship with you; but stand against you, and ask for “Justice.”

Are there any of you who are tired of all this? Any of you, landlords or tenants? Employers or workmen? Are there any landlords, any masters, who would like better to be served by men than by iron devils? Any tenants, any workmen, who can be true to their leaders and to each other? Who can vow to work and to live faithfully, for the sake of the joy of their homes?

Will any such give the tenth of what they have and of what they earn, not to emigrate with, but to stay in England with, and do what is in their hands and hearts to make her a happy England?

I am not rich (as people now estimate riches), and great part of what I have is already engaged in maintaining art-workmen, or for other objects more or less of public utility. The tenth of whatever is left to me, estimated as accurately as I can (you shall see the accounts), I will make over to you in perpetuity, with the best security that English law can give, on Christmas Day of this year, with engagement to add the tithe of whatever I earn afterwards. Who else will help, with little or much? The object of such fund being to begin, and gradually—no matter how slowly—to increase, the buying and securing of land in England, which shall not be built upon, but cultivated by Englishmen with their own hands and such help of force as they can find in wind and wave. I do not care with how many or how few this thing is begun, nor on what inconsiderable scale—if it be but in two or three poor men's gardens. So much, at least, I can

buy, myself, and give them. If no help come, I have done and said what I could, and there will be an end. If any help come to me, it is to be on the following conditions:

We will try to make some small piece of English ground beautiful, peaceful, and fruitful. We will have no steam-engines upon it, and no railroads; we will have no untended or unthought-of creatures on it; none wretched but the sick; none idle but the dead. We will have no liberty upon it, but instant obedience to known law and appointed persons; no equality upon it, but recognition of every betterness that we can find, and reprobation of every worseness. When we want to go anywhere, we will go there quietly and safely, not at forty miles an hour in the risk of our lives; when we want to carry anything anywhere, we will carry it either on the backs of beasts or on our own, or in carts or boats. We will have plenty of flowers and vegetables in our gardens, plenty of corn and grass in our fields—and few bricks. We will have some music and poetry; the children shall learn to dance to it and sing it; perhaps some of the old people, in time, may also. We will have some art, moreover; we will at least try if, like the Greeks, we can't make some pots. The Greeks used to paint pictures of gods on their pots. We, probably, cannot do as much; but we may put some pictures of insects on them, and reptiles—butterflies and frogs, if nothing better. There was an excellent old potter in France who used to put frogs and vipers into his dishes, to the admiration of mankind; we can surely put something nicer than that. Little by little, some higher art and imagination may manifest themselves among us, and feeble rays of science may dawn for us—botany, though too dull to dispute the existence of flowers; and history, though too simple to question the nativity of men; nay, even perhaps an uncalculating and uncovetous wisdom, as of rude Magi presenting, at such nativity, gifts of gold and frankincense.

Faithfully yours,

JOHN RUSKIN

in Ruskin's FORS CLAVIGERA.

William James

1842–1910

William James was born in New York City on January 11, 1842. His father, Henry James, Sr., was heir to a fortune which made him independent and enabled him to live as a student and a man of the world. There were five children, the future novelist Henry James being the second. Despite its size, the James family was constantly traveling. As a result the children received their early education mostly from schools and private tutors in England, France, Switzerland, and Germany.

William James was slow in discovering his vocation. He studied painting with Hunt in Newport, attended the scientific school and then medical school at Harvard, accompanied the Agassiz expedition to Brazil, and pursued the study of psychology in Germany, before he became, in 1872, instructor of anatomy and physiology at Harvard. Two years later he began teaching psychology and set up the first laboratory in America in experimental psychology. From then until he completed his *Principles of Psychology*¹ his energies were mainly devoted to this subject.

Yet James had always been interested in the problems of philosophy. From 1890, when his great work on psychology was first published, until his death he devoted himself almost entirely to philosophy. Besides his teaching at Harvard, where he was appointed professor of philosophy, he gave many lectures and became a highly popular speaker, in demand from coast to coast. The first volume of his lectures appeared in 1897 under the title of *The Will to Believe and Other Essays in Popular Philosophy*.² In 1901–02 he delivered the Gifford Lectures on natural religion at the University

² See Vol. 10, pp. 39–57, in this set for the title essay.

of Edinburgh; these were published as *The Varieties of Religious Experience*. He developed his own philosophy of pragmatism in a book of that title published in 1907 and met the criticism of it in *The Meaning of Truth* (1909) and *A Pluralistic Universe* (1909). These works are written in a nontechnical and vigorous style. He was engaged in giving a more technical analysis and expression to his philosophy when he died, August 26, 1910.

The three essays presented here were first given as lectures. In them James gives an analysis and defense of individualism. The essay *On a Certain Blindness in Human Beings* he describes as “providing the perception on which my whole individualistic philosophy is based.” He takes the position that each individual is of unique value and the source of what he calls “vital significance.” Realization of this can lead to great personal joy and exhilaration. James gives high praise to the essay by Stevenson entitled *The Lantern-Bearers*,³ which expresses this insight.

If the individual is a source of unique value, it becomes a central problem of education to find ways of recognizing and releasing the energies of the individual. This is the main topic considered in *The Energies of Men*. Convinced that most men use only a small part of their powers, James asks how they may be brought to the top of their abilities. Among the “energy-releasing” agents, he considers the excitement of the unusual stimulus, the example of others or rivalry with them, the demands of duty, or the challenge of a new task. He notes that ascetic exercises aimed at disciplining the will may serve the same purpose, as may also the opposition of new and different ideas.

James constantly opposes anything that prevents the appreciation of individual worth. The opinion that man is merely the creature of

³ See Vol. 7, pp. 112–121, in this set.

Notes from the artist: “William James in his later years. Woven into his beard are drawings of his mother and father, as well as figures from James’s own sketchbook. The quotation is taken from his collected letters, while on his coat is a facsimile of the title page of Pragmatism.”

his environment is, to James, among the worst offenders in this respect. In *Great Men and Their Environment* he attacks *this* opinion as it is expressed in what is known as Social Darwinism. James maintains that this is a wholly erroneous and misleading extension of the Darwinian theory of evolution.

In these essays James does more than merely pose the problem of individualism. He also explores some of its more important possibilities and does this in a way that merits comparison with such a classic statement as that of John Stuart Mill in his essay *On Liberty*.⁴

On a Certain Blindness in Human Beings

Our judgments concerning the worth of things, big or little, depend on the *feelings* the things arouse in us. Where we judge a thing to be precious in consequence of the *idea* we frame of it, this is only because the idea is itself associated already with a feeling. If we were radically feelingless, and if ideas were the only things our mind could entertain, we should lose all our likes and dislikes at a stroke, and be unable to point to any one situation or experience in life more valuable or significant than any other.

Now the blindness in human beings, of which this discourse will treat, is the blindness with which we all are afflicted in regard to the feelings of creatures and people different from ourselves.

We are practical beings, each of us with limited functions and duties to perform. Each is bound to feel intensely the importance of his own duties and the significance of the situations that call these forth. But this feeling is in each of us a vital secret, for sympathy with which we vainly look to others. The others are too much absorbed in their own vital secrets to take an interest in ours. Hence the stupidity and injustice of our opinions, so far as they deal with the significance of alien lives. Hence the falsity of our judgments, so far as they presume to decide in an absolute way on the value of other persons' conditions or ideals.

Take our dogs and ourselves, connected as we are by a tie more intimate than most ties in this world; and yet, outside of that tie of friendly fondness, how insensible, each of us, to all that makes life significant for the other!—we to the rapture of bones under hedges, or smells of trees and lampposts, they to the delights of literature and art. As you sit reading the most moving romance you ever fell upon, what sort of a judge is your fox terrier of your behavior? With all his good will toward you, the nature of your conduct is absolutely excluded from his

comprehension. To sit there like a senseless statue when you might be taking him to walk and throwing sticks for him to catch! What queer disease is this that comes over you every day, of holding things and staring at them like that for hours together, paralyzed of motion and vacant of all conscious life? The African savages came nearer the truth; but they, too, missed it when they gathered wonderingly round one of our American travelers who, in the interior, had just come into possession of a stray copy of the *New York Commercial Advertiser* and was devouring it column by column. When he got through, they offered him a high price for the mysterious object; and, being asked for what they wanted it, they said: "For an eye medicine"—that being the only reason they could conceive of for the protracted bath which he had given his eyes upon its surface.

The spectator's judgment is sure to miss the root of the matter, and to possess no truth. The subject judged knows a part of the world of reality which the judging spectator fails to see, knows more while the spectator knows less; and, wherever there is conflict of opinion and difference of vision, we are bound to believe that the truer side is the side that feels the more, and not the side that feels the less.

Let me take a personal example of the kind that befalls each one of us daily:

Some years ago, while journeying in the mountains of North Carolina, I passed by a large number of "coves," as they call them there, or heads of small valleys between the hills, which had been newly cleared and planted. The impression on my mind was one of unmitigated squalor. The settler had in every case cut down the more manageable trees, and left their charred stumps standing. The larger trees he had girdled and killed in order that their foliage should not cast a shade. He had then built a log cabin, plastering its chinks with clay, and had set up a tall zigzag rail fence around the scene of his havoc to keep the pigs and cattle out. Finally, he had irregularly planted the intervals between the stumps and trees with Indian corn, which grew among the chips; and there he dwelt with his wife and babes—an ax, a gun, a few utensils, and some pigs and chickens feeding in the woods being the sum total of his possessions.

The forest had been destroyed; and what had "improved" it out of existence was hideous, a sort of ulcer, without a single element of artificial grace to make up for the loss of Nature's beauty. Ugly, indeed, seemed the life of the squatter, scudding, as the sailors say, under bare poles, beginning again away back where our first ancestors started, and by

hardly a single item the better off for all the achievements of the intervening generations.

“Talk about going back to nature!” I said to myself, oppressed by the dreariness, as I drove by. Talk of a country life for one’s old age and for one’s children! Never thus, with nothing but the bare ground and one’s bare hands to fight the battle! Never, without the best spoils of culture woven in! The beauties and commodities gained by the centuries are sacred. They are our heritage and birthright. No modern person ought to be willing to live a day in such a state of rudimentariness and denudation.

Then I said to the mountaineer who was driving me, “What sort of people are they who have to make these new clearings?” “All of us,” he replied. “Why, we ain’t happy here unless we are getting one of these coves under cultivation.” I instantly felt that I had been losing the whole inward significance of the situation. Because to me the clearings spoke of naught but denudation, I thought that to those whose sturdy arms and obedient axes had made them they could tell no other story. But, when *they* looked on the hideous stumps, what they thought of was personal victory. The chips, the girdled trees, and the vile split rails spoke of honest sweat, persistent toil and final reward. The cabin was a warrant of safety for self and wife and babes. In short, the clearing, which to me was a mere ugly picture on the retina, was to them a symbol redolent with moral memories and sang a very paean of duty, struggle, and success.

I had been as blind to the peculiar ideality of their conditions as they certainly would also have been to the ideality of mine had they had a peep at my strange indoor academic ways of life at Cambridge.

Wherever a process of life communicates an eagerness to him who lives it, there the life becomes genuinely significant. Sometimes the eagerness is more knit up with the motor activities, sometimes with the perceptions, sometimes with the imagination, sometimes with reflective thought. But, wherever it is found, there is the zest, the tingle, the excitement of reality; and there *is* “importance” in the only real and positive sense in which importance ever anywhere can be.

Robert Louis Stevenson has illustrated this by a case, drawn from the sphere of the imagination, in an essay which I really think deserves to become immortal, both for the truth of its matter and the excellence of its form.

Toward the end of September [Stevenson writes], when school-time was drawing near and the nights were already black, we would begin to

sally from our respective villas, each equipped with a tin bull's-eye lantern. The thing was so well known that it had worn a rut in the commerce of Great Britain; and the grocers, about the due time, began to garnish their windows with our particular brand of luminary. We wore them buckled to the waist upon a cricket belt, and over them, such was the rigour of the game, a buttoned top-coat. They smelled noisomely of blistered tin; they never burned aright, though they would always burn our fingers; their use was naught; the pleasure of them merely fanciful; and yet a boy with a bull's-eye under his top-coat asked for nothing more. The fishermen used lanterns about their boats, and it was from them, I suppose, that we had got the hint; but theirs were not bull's-eyes, nor did we ever play at being fishermen. The police carried them at their belts, and we had plainly copied them in that; yet we did not pretend to be policemen. Burglars, indeed, we may have had some haunting thought of; and we had certainly an eye to past ages when lanterns were more common, and to certain story-books in which we had found them to figure very largely. But take it for all in all, the pleasure of the thing was substantive; and to be a boy with a bull's-eye under his top-coat was good enough for us.

When two of these asses met, there would be an anxious "Have you got your lantern?" and a gratified "Yes!" That was the shibboleth, and very needful too; for, as it was the rule to keep our glory contained, none could recognize a lantern-bearer, unless (like the polecat) by the smell. Four or five would sometimes climb into the belly of a ten-man lugger, with nothing but the thwarts above them—for the cabin was usually locked—or choose out some hollow of the links where the wind might whistle overhead. Then the coats would be unbuttoned, and the bull's-eyes discovered; and in the chequering glimmer, under the huge, windy hall of the night, and cheered by a rich steam of toasting tinware, these fortunate young gentlemen would crouch together in the cold sand of the links, or on the scaly bilges of the fishing-boat, and delight themselves with inappropriate talk. Woe is me that I may not give some specimens. . . . But the talk, at any rate, was but a condiment; and these gatherings themselves only accidents in the career of the lantern-bearer. The essence of this bliss was to walk by yourself in the black night; the slide shut, the top-coat buttoned; not a ray escaping, whether to conduct your footsteps or to make your glory public: a mere pillar of darkness in the dark; and all the while, deep down in the privacy of your fool's heart, to know you had a bull's-eye at your belt, and to exult and sing over the knowledge.

It is said that a poet has died young in the breast of the most stolid. It may be contended, rather, that this (somewhat minor) bard in almost

every case survives, and is the spice of life to his possessor. Justice is not done to the versatility and the unplumbed childishness of man's imagination. His life from without may seem but a rude mound of mud; there will be some golden chamber at the heart of it, in which he dwells delighted; and for as dark as his pathway seems to the observer, he will have some kind of bull's-eye at his belt.

. . . There is one fable that touches very near the quick of life: the fable of the monk who passed into the woods, heard a bird break into song, hearkened for a trill or two, and found himself on his return a stranger at his convent gates; for he had been absent fifty years, and of all his comrades there survived but one to recognize him. It is not only in the woods that this enchanter carols, though perhaps he is native there. He sings in the most doleful places. The miser hears him and chuckles, and the days are moments. With no more apparatus than an ill-smelling lantern, I have evoked him on the naked links. All life that is not merely mechanical is spun out of two strands: seeking for that bird and hearing him. And it is just this that makes life so hard to value, and the delight of each so incommunicable. And it is just a knowledge of this, and a remembrance of those fortunate hours in which the bird has sung to us, that fills us with such wonder when we turn to the pages of the realist. There, to be sure, we find a picture of life in so far as it consists of mud and of old iron, cheap desires and cheap fears, that which we are ashamed to remember and that which we are careless whether we forget; but of the note of that time-devouring nightingale we hear no news.

. . . Say that I came [in such a realistic romance] on some such business as that of my lantern-bearers on the links; and described the boys as very cold, spat upon by flurries of rain, and drearily surrounded, all of which they were; and their talk as silly and indecent, which it certainly was. . . . To the eye of the observer they are wet and cold and drearily surrounded; but ask themselves, and they are in the heaven of a recondite pleasure, the ground of which is an ill-smelling lantern.

For, to repeat, the ground of a man's joy is often hard to hit. It may hinge at times upon a mere accessory, like the lantern; it may reside . . . in the mysterious inwards of psychology. . . . It has so little bond with externals . . . that it may even touch them not; and the man's true life, for which he consents to live, lies altogether in the field of fancy. . . . In such a case the poetry runs underground. The observer (poor soul, with his documents!) is all abroad. For to look at the man is but to court deception. We shall see the trunk from which he draws his nourishment; but he himself is above and abroad in the green dome of foliage, hummed through by winds and nested in by nightingales. And the true realism were that of the poets, to climb up after him like a squirrel, and

catch some glimpse of the heaven for which he lives. And the true realism, always and everywhere, is that of the poets: to find out where joy resides, and give it a voice far beyond singing.

For to miss the joy is to miss all. In the joy of the actors lies the sense of any action. That is the explanation, that the excuse. To one who has not the secret of the lanterns, the scene upon the links is meaningless. And hence the haunting and truly spectral unreality of realistic books. . . . In each, we miss the personal poetry, the enchanted atmosphere, that rainbow work of fancy that clothes what is naked and seems to ennoble what is base; in each, life falls dead like dough, instead of soaring away like a balloon into the colours of the sunset; each is true, each inconceivable; for no man lives in the external truth, among salts and acids, but in the warm, phantasmagoric chamber of his brain, with the painted windows and the storied wall.¹

These paragraphs are the best thing I know in all Stevenson. "To miss the joy is to miss all." Indeed, it is. Yet we are but finite, and each one of us has some single specialized vocation of his own. And it seems as if energy in the service of its particular duties might be got only by hardening the heart toward everything unlike them. Our deadness toward all but one particular kind of joy would thus be the price we inevitably have to pay for being practical creatures. Only in some pitiful dreamer, some philosopher, poet, or romancer, or when the common practical man becomes a lover, does the hard externality give way, and a gleam of insight into the ejective world, as Clifford called it, the vast world of inner life beyond us, so different from that of outer seeming, illuminate our mind. Then the whole scheme of our customary values gets confounded, then our self is riven and its narrow interests fly to pieces, then a new center and a new perspective must be found.

The change is well described by my colleague, Josiah Royce:

What, then, is our neighbor? Thou hast regarded his thought, his feeling, as somehow different from thine. Thou hast said, "A pain in him is not like a pain in me, but something far easier to bear." He seems to thee a little less living than thou; his life is dim, it is cold, it is a pale fire beside thy own burning desires. . . . So, dimly and by instinct hast thou lived with thy neighbor, and hast known him not, being blind. Thou hast made [of him] a thing, no Self at all. Have done with this illusion, and simply try to learn the truth. Pain is pain, joy is joy, everywhere, even as in thee. In all the songs of the forest birds; in all the cries of the wounded and dying, struggling in the captor's power; in the boundless

1. *The Lantern-Bearers*. [See Vol. 7, pp. 112–121, in this set (Ed.).]

sea where the myriads of water creatures strive and die; amid all the countless hordes of savage men; in all sickness and sorrow; in all exultation and hope, everywhere, from the lowest to the noblest, the same conscious, burning, willful life is found, endlessly manifold as the forms of the living creatures, unquenchable as the fires of the sun, real as these impulses that even now throb in thine own little selfish heart. Lift up thy eyes, behold that life, and then turn away, and forget it as thou canst; but, if thou hast *known* that, thou hast begun to know thy duty.

This higher vision of an inner significance in what, until then, we had realized only in the dead external way often comes over a person suddenly; and, when it does so, it makes an epoch in his history. As Emerson says, there is a depth in those moments that constrains us to ascribe more reality to them than to all other experiences. The passion of love will shake one like an explosion, or some act will awaken a remorseful compunction that hangs like a cloud over all one's later day.

This mystic sense of hidden meaning starts upon us often from nonhuman natural things. I take this passage from *Obermann*, a French novel that had some vogue in its day:

Paris, March 7.—It was dark and rather cold. I was gloomy, and walked because I had nothing to do. I passed by some flowers placed breast-high upon a wall. A jonquil in bloom was there. It is the strongest expression of desire: it was the first perfume of the year. I felt all the happiness destined for man. This unutterable harmony of souls, the phantom of the ideal world, arose in me complete. I never felt anything so great or so instantaneous. I know not what shape, what analogy, what secret of relation it was that made me see in this flower a limitless beauty . . . I shall never enclose in a conception this power, this immensity that nothing will express; this form that nothing will contain; this ideal of a better world which one feels, but which it would seem that nature has not made.

Wordsworth and Shelley are similarly full of this sense of a limitless significance in natural things. In Wordsworth it was a somewhat austere and moral significance—a “lonely cheer.”

To every natural form, rock, fruit, or flower,
 Even the loose stones that cover the highway,
 I gave a moral life: I saw them feel,
 Or linked them to some feeling: the great mass
 Lay bedded in some quickening soul, and all
 That I beheld respired with inward meaning.²

2. *The Prelude*, Book III.

“Authentic tidings of invisible things!” Just what this hidden presence in nature was, which Wordsworth so rapturously felt, and in the light of which he lived, tramping the hills for days together, the poet never could explain logically or in articulate conceptions. Yet to the reader who may himself have had gleaming moments of a similar sort, the verses in which Wordsworth simply proclaims the fact of them come with a heart-satisfying authority:

Magnificent
 The morning rose, in memorable pomp,
 Glorious as e'er I had beheld. In front
 The sea lay laughing at a distance; near,
 The solid mountains shone, bright as the clouds,
 Grain-tinctured, drenched in empyrean light;
 And in the meadows and the lower grounds
 Was all the sweetness of a common dawn—
 Dews, vapours, and the melody of birds,
 And labourers going forth to till the fields.

Ah! need I say, dear Friend, that to the brim
 My heart was full; I made no vows, but vows
 Were then made for me; bond unknown to me
 Was given, that I should be, else sinning greatly,
 A dedicated Spirit. On I walked
 In thankful blessedness, which yet survives.³

As Wordsworth walked, filled with his strange inner joy, responsive thus to the secret life of nature round about him, his rural neighbors, tightly and narrowly intent upon their own affairs, their crops and lambs and fences, must have thought him a very insignificant and foolish personage. It surely never occurred to any one of them to wonder what was going on inside of *him* or what it might be worth. And yet that inner life of his carried the burden of a significance that has fed the souls of others, and fills them to this day with inner joy.

Richard Jefferies has written a remarkable autobiographic document entitled *The Story of My Heart*. It tells in many pages of the rapture with which in youth the sense of the life of nature filled him. On a certain hilltop he says:

I was utterly alone with the sun and the earth. Lying down on the grass, I spoke in my soul to the earth, the sun, the air, and the distant sea, far beyond sight. . . . With all the intensity of feeling which exalted me, all the intense communion I held with the earth, the sun and

3. *The Prelude*, Book IV.

sky, the stars hidden by the light, with the ocean—in no manner can the thrilling depth of these feelings be written—with these I prayed as if they were the keys of an instrument. . . . The great sun, burning with light, the strong earth—dear earth—the warm sky, the pure air, the thought of ocean, the inexpressible beauty of all filled me with a rapture, an ecstasy, an inflatus. With this inflatus, too, I prayed. . . . The prayer, this soul-emotion, was in itself not for an object: it was a passion. I hid my face in the grass. I was wholly prostrated, I lost myself in the wrestle, I was rapt and carried away. . . . Had any shepherd accidentally seen me lying on the turf he would only have thought I was resting a few minutes. I made no outward show. Who could have imagined the whirlwind of passion that was going on in me as I reclined there!

Surely, a worthless hour of life when measured by the usual standards of commercial value. Yet in what other *kind* of value can the preciousness of any hour, made precious by any standard, consist if it consist not in feelings of excited significance like these, engendered in someone by what the hour contains?

Yet so blind and dead does the clamor of our own practical interests make us to all other things that it seems almost as if it were necessary to become worthless as a practical being if one is to hope to attain to any breadth of insight into the impersonal world of worths as such, to have any perception of life's meaning on a large objective scale. Only your mystic, your dreamer, or your insolvent tramp or loafer can afford so sympathetic an occupation, an occupation which will change the usual standards of human value in the twinkling of an eye, giving to foolishness a place ahead of power, and laying low in a minute the distinctions which it takes a hard-working conventional man a lifetime to build up. You may be a prophet at this rate; but you cannot be a worldly success.

Walt Whitman, for instance, is accounted by many of us a contemporary prophet. He abolishes the usual human distinctions, brings all conventionalisms into solution, and loves and celebrates hardly any human attributes save those elementary ones common to all members of the race. For this he becomes a sort of ideal tramp, a rider on omnibus tops and ferryboats, and, considered either practically or academically, a worthless, unproductive being. His verses are but ejaculations—things mostly without subject or verb, a succession of interjections on an immense scale. He felt the human crowd as rapturously as Wordsworth felt the mountains, felt it as an overpoweringly significant presence, simply to absorb one's mind in which should be business sufficient and worthy to fill the

days of a serious man. As he crosses Brooklyn ferry, this is what he feels:

Flood-tide below me! I watch you face to face;
 Clouds of the west! sun there half an hour high! I see you also face to face.
 Crowds of men and women attired in the usual costumes! how curious you
 are to me!

On the ferryboats, the hundreds and hundreds that cross, returning home,
 are more curious to me than you suppose;
 And you that shall cross from shore to shore years hence are more to me,
 and more in my meditations, than you might suppose.

.....
 Others will enter the gates of the ferry, and cross from shore to shore;
 Others will watch the run of the flood-tide;
 Others will see the shipping of Manhattan north and west, and the heights of
 Brooklyn to the south and east;
 Others will see the islands large and small;
 Fifty years hence, others will see them as they cross, the sun half an hour
 high;
 A hundred years hence, or ever so many hundred years hence, others will
 see them,
 Will enjoy the sunset, the pouring in of the flood-tide, the falling back to the
 sea of the ebb-tide.

It avails not, neither time or place—distance avails not;

.....
 Just as you feel when you look on the river and sky, so I felt;
 Just as any of you is one of a living crowd, I was one of a crowd;
 Just as you are refreshed by the gladness of the river and the bright flow, I
 was refreshed;
 Just as you stand and lean on the rail, yet hurry with the swift current, I
 stood, yet was hurried;
 Just as you look on the numberless masts of ships, and the thick-stemmed
 pipes of steamboats, I looked.
 I too many and many a time crossed the river, the sun half an hour high;
 I watched the Twelfth-month sea-gulls—I saw them high in the air, floating
 with motionless wings, oscillating their bodies,
 I saw how the glistening yellow lit up parts of their bodies, and left the rest
 in strong shadow,
 I saw the slow-wheeling circles, and the gradual edging toward the south.

.....
 Saw the white sails of schooners and sloops—saw the ships at anchor,
 The sailors at work in the rigging, or out astride the spars,

.....
 The scallop-edged waves in the twilight, the ladled cups, the frolicsome crests
 and glistening,

The stretch afar growing dimmer and dimmer, the gray walls of the granite
storehouses by the docks,

.....
On the neighboring shore, the fires from the foundry chimneys burning
high . . . into the night,

Casting their flicker of black . . . into the clefts of streets.

These, and all else, were to me the same as they are to you;⁴

And so on, through the rest of a divinely beautiful poem. And, if you wish to see what this hoary loafer considered the most worthy way of profiting by life's heaven-sent opportunities, read the delicious volume of his letters to a young car conductor who had become his friend:

NEW YORK, Oct. 9, 1868

DEAR PETE—It is splendid here this forenoon—bright and cool. I was out early taking a short walk by the river only two squares from where I live. . . . Shall I tell you about [my life] just to fill up? I generally spend the forenoon in my room writing, etc., then take a bath, fix up, and go out about twelve and loaf somewhere or call on someone down town or on business, or perhaps, if it is very pleasant and I feel like it, ride a trip with some driver friend on Broadway, from 23rd Street to Bowling Green, three miles each way. (Every day I find I have plenty to do, every hour is occupied with something.) You know it is a never ending amusement and study and recreation for me to ride a couple of hours on a pleasant afternoon on a Broadway stage in this way. You see everything as you pass, a sort of living, endless panorama—shops and splendid buildings and great windows: on the broad sidewalks crowds of women richly dressed continually passing, altogether different, superior in style and looks from any to be seen anywhere else—in fact a perfect stream of people—men, too, dressed in high style, and plenty of foreigners—and then in the streets the thick crowd of carriages, stages, carts, hotel and private coaches, and in fact all sorts of vehicles and many first-class teams, mile after mile, and the splendor of such a great street and so many tall, ornamental, noble buildings, many of them of white marble, and the gaiety and motion on every side: you will not wonder how much attraction all this is on a fine day to a great loafer like me, who enjoys so much seeing the busy world move by him and exhibiting itself for his amusement while he takes it easy and just looks on and observes.

Truly a futile way of passing the time, some of you may say, and not altogether creditable to a grownup man. And yet, from the deepest point of view, who knows the more of truth and who knows the less—

4. *Crossing Brooklyn Ferry.*

Whitman on his omnibus top, full of the inner joy with which the spectacle inspires him, or you, full of the disdain which the futility of his occupation excites?

When your ordinary Brooklynite or New Yorker, leading a life replete with too much luxury, or tired and careworn about his personal affairs, crosses the ferry or goes up Broadway, *his* fancy does not thus soar away "into the colours of the sunset," as did Whitman's, nor does he inwardly realize at all the indisputable fact that this world never did anywhere or at any time contain more of essential divinity, or of eternal meaning, than is embodied in the fields of vision over which his eyes so carelessly pass. There is life; and there, a step away, is death. There is the only kind of beauty there ever was. There is the old human struggle and its fruits together. There is the text and the sermon, the real and the ideal in one. But to the jaded and unquickened eye it is all dead and common, pure vulgarism, flatness, and disgust. "Hech! it is a sad sight!" says Carlyle, walking at night with someone who appeals to him to note the splendor of the stars. And that very repetition of the scene to new generations of men in *secula seculorum* [for ever and ever], that eternal recurrence of the common order, which so fills a Whitman with mystic satisfaction, is to a Schopenhauer, with the emotional anesthesia, the feeling of "awful inner emptiness" from out of which he views it all, the chief ingredient of the tedium it instills. What is life on the largest scale, he asks, but the same recurrent inanities, the same dog barking, the same fly buzzing forevermore? Yet of the kind of fiber of which such inanities consist is the material woven of all the excitements, joys, and meanings that ever were, or ever shall be, in this world.

To be rapt with satisfied attention, like Whitman, to the mere spectacle of the world's presence is one way, and the most fundamental way, of confessing one's sense of its unfathomable significance and importance. But how can one attain to the feeling of the vital significance of an experience if one have it not to begin with? There is no receipt which one can follow. Being a secret and a mystery, it often comes in mysteriously unexpected ways. It blossoms sometimes from out of the very grave wherein we imagined that our happiness was buried. Benvenuto Cellini, after a life all in the outer sunshine, made of adventures and artistic excitements, suddenly finds himself cast into a dungeon in the Castle of San Angelo. The place is horrible. Rats and wet and mold possess it. His leg is broken and his teeth fall out, apparently with scurvy. But his thoughts turn to God as they have never turned before. He gets a Bible, which he reads during the one hour in the twenty-four in which a wandering ray of daylight penetrates his cavern. He has religious visions. He

sings psalms to himself and composes hymns. And thinking, on the last day of July, of the festivities customary on the morrow in Rome, he says to himself: "All these past years I celebrated this holiday with the vanities of the world: from this year henceforward I will do it with the divinity of God. And then I said to myself, 'Oh, how much more happy I am for this present life of mine than for all those things remembered!'"

But the great understander of these mysterious ebbs and flows is Tolstoy. They throb all through his novels. In his *War and Peace*, the hero, Pierre, is supposed to be the richest man in the Russian Empire. During the French invasion he is taken prisoner and dragged through much of the retreat. Cold, vermin, hunger, and every form of misery assail him, the result being a revelation to him of the real scale of life's values.

Here only, and for the first time, he appreciated, because he was deprived of it, the happiness of eating when he was hungry, of drinking when he was thirsty, of sleeping when he was sleepy, and of talking when he felt the desire to exchange some words. . . . Later in life he always recurred with joy to this month of captivity, and never failed to speak with enthusiasm of the powerful and ineffaceable sensations, and especially of the moral calm which he had experienced at this epoch. When at daybreak, on the morrow of his imprisonment, he saw [I abridge here Tolstoy's description] the mountains with their wooded slopes disappearing in the grayish mist; when he felt the cool breeze caress him; when he saw the light drive away the vapors, and the sun rise majestically behind the clouds and cupolas, and the crosses, the dew, the distance, the river, sparkle in the splendid, cheerful rays—his heart overflowed with emotion. This emotion kept continually with him and increased a hundredfold as the difficulties of his situation grew graver. . . . He learned that man is meant for happiness and that this happiness is in him, in the satisfaction of the daily needs of existence, and that unhappiness is the fatal result not of our need but of our abundance. . . . When calm reigned in the camp, and the embers paled and little by little went out, the full moon had reached the zenith. The woods and the fields round about lay clearly visible; and, beyond the inundation of light which filled them, the view plunged into the limitless horizon. Then Pierre cast his eyes upon the firmament, filled at that hour with myriads of stars. "All that is mine," he thought. "All that is in me, is me! And that is what they think they have taken prisoner! That is what they have shut up in a cabin!" So he smiled and turned in to sleep among his comrades.⁵

The occasion and the experience, then, are nothing. It all depends on

5. See *Great Books of the Western World* [Ed.].

the capacity of the soul to be grasped, to have its life currents absorbed by what is given. "Crossing a bare common," says Emerson, "in snow puddles, at twilight, under a clouded sky, without having in my thoughts any occurrence of special good fortune, I have enjoyed a perfect exhilaration. I am glad to the brink of fear."

Life is always worth living if one have such responsive sensibilities. But we of the highly educated classes (so called) have most of us got far, far away from Nature. We are trained to seek the choice, the rare, the exquisite exclusively, and to overlook the common. We are stuffed with abstract conceptions and glib with verbalities and verbosity; and in the culture of these higher functions the peculiar sources of joy connected with our simpler functions often dry up, and we grow stone-blind and insensible to life's more elementary and general goods and joys.

The remedy under such conditions is to descend to a more profound and primitive level. To be imprisoned or shipwrecked or forced into the army would permanently show the good of life to many an overeducated pessimist. Living in the open air and on the ground, the lopsided beam of the balance slowly rises to the level line; and the oversensibilities and insensibilities even themselves out. The good of all the artificial schemes and fevers fades and pales; and that of seeing, smelling, tasting, sleeping, and daring and doing with one's body grows and grows. The savages and children of Nature, to whom we deem ourselves so much superior, certainly are alive where we are often dead, along these lines; and, could they write as glibly as we do, they would read us impressive lectures on our impatience for improvement and on our blindness to the fundamental static goods of life. "Ah! my brother," said a chieftain to his white guest, "thou wilt never know the happiness of both thinking of nothing and doing nothing. This, next to sleep, is the most enchanting of all things. Thus we were before our birth, and thus we shall be after death. Thy people . . . when they have finished reaping one field, they begin to plow another; and, if the day were not enough, I have seen them plow by moonlight. What is their life to ours—the life that is naught to them? Blind that they are, they lose it all! But we live in the present."

The intense interest that life can assume when brought down to the nonthinking level, the level of pure sensorial perception, has been beautifully described by a man who can write, Mr. W. H. Hudson, in his volume *Idle Days in Patagonia*.

I spent the greater part of one winter [says this admirable author] at a point on the Rio Negro seventy or eighty miles from the sea.

. . . It was my custom to go out every morning on horse-back with my gun and, followed by one dog, to ride away from the valley; and no sooner would I climb the terrace and plunge into the gray, universal thicket than I would find myself as completely alone as if five hundred instead of only five miles separated me from the valley and river. So wild and solitary and remote seemed that gray waste, stretching away into infinitude, a waste untrodden by man, and where the wild animals are so few that they have made no discoverable path in the wilderness of thorns. . . . Not once nor twice nor thrice, but day after day I returned to this solitude, going to it in the morning as if to attend a festival, and leaving it only when hunger and thirst and the westering sun compelled me. And yet I had no object in going—no motive which could be put into words; for, although I carried a gun, there was nothing to shoot—the shooting was all left behind in the valley. . . . Sometimes I would pass a whole day without seeing one mammal, and perhaps not more than a dozen birds of any size. The weather at that time was cheerless, generally with a gray film of cloud spread over the sky, and a bleak wind, often cold enough to make my bridle-hand quite numb. . . . At a slow pace, which would have seemed intolerable under other circumstances, I would ride about for hours together at a stretch. On arriving at a hill, I would slowly ride to its summit, and stand there to survey the prospect. On every side it stretched away in great undulations, wild and irregular. How gray it all was! Hardly less so near at hand than on the haze-wrapped horizon where the hills were dim and the outline obscured by distance. Descending from my outlook, I would take up my aimless wanderings again, and visit other elevations to gaze on the same landscape from another point; and so on for hours. And at noon I would dismount, and sit or lie on my folded poncho for an hour or longer. One day in these rambles I discovered a small grove composed of twenty or thirty trees, growing at a convenient distance apart, that had evidently been resorted to by a herd of deer or other wild animals. This grove was on a hill differing in shape from other hills in its neighbourhood; and, after a time, I made a point of finding and using it as a resting-place every day at noon. I did not ask myself why I made choice of that one spot, sometimes going out of my way to sit there, instead of sitting down under any one of the millions of trees and bushes on any other hillside. I thought nothing about it, but acted unconsciously. Only afterwards it seemed to me that, after having rested there once, each time I wished to rest again, the wish came associated with the image of that particular clump of trees, with polished stems and clean bed of sand beneath; and in a short time I formed a habit of returning, animal-like, to repose at that same spot.

It was, perhaps, a mistake to say that I would sit down and rest, since I was never tired; and yet, without being tired, that noonday pause, during which I sat for an hour without moving, was strangely grateful. All

day there would be no sound, not even the rustling of a leaf. One day, while *listening* to the silence, it occurred to my mind to wonder what the effect would be if I were to shout aloud. This seemed at the time a horrible suggestion which almost made me shudder. But during those solitary days it was a rare thing for any thought to cross my mind. In the state of mind I was in, thought had become impossible. My state was one of *suspense and watchfulness*; yet I had no expectation of meeting an adventure, and felt as free from apprehension as I feel now while sitting in a room in London. The state seemed familiar rather than strange, and accompanied by a strong feeling of elation; and I did not know that something had come between me and my intellect until I returned to my former self—to thinking and the old insipid existence [again].

I had undoubtedly *gone back*; and that state of intense watchfulness or alertness, rather, with suspension of the higher intellectual faculties, represented the mental state of the pure savage. He thinks little, reasons little, having a surer guide in his [mere sensory perceptions]. He is in perfect harmony with nature, and is nearly on a level, mentally, with the wild animals he preys on, and which in their turn sometimes prey on him.

For the spectator, such hours as Mr. Hudson writes of form a mere tale of emptiness, in which nothing happens, nothing is gained, and there is nothing to describe. They are meaningless and vacant tracts of time. To him who feels their inner secret, they tingle with an importance that unutterably vouches for itself. I am sorry for the boy or girl, or man or woman, who has never been touched by the spell of this mysterious sensorial life, with its irrationality, if so you like to call it, but its vigilance and its supreme felicity. The holidays of life are its most vitally significant portions, because they are, or at least should be, covered with just this kind of magically irresponsible spell.

And now what is the result of all these considerations and quotations? It is negative in one sense, but positive in another. It absolutely forbids us to be forward in pronouncing on the meaninglessness of forms of existence other than our own; and it commands us to tolerate, respect, and indulge those whom we see harmlessly interested and happy in their own ways, however unintelligible these may be to us. Hands off: neither the whole of truth nor the whole of good is revealed to any single observer, although each observer gains a partial superiority of insight from the peculiar position in which he stands. Even prisons and sickrooms have their special revelations. It is enough to ask of each of us that he should be faithful to his own opportunities and make the most of his own blessings, without presuming to regulate the rest of the vast field.

The Energies of Men

Everyone knows what it is to start a piece of work, either intellectual or muscular, feeling stale—or *oold*, as an Adirondack guide once put it to me. And everybody knows what it is to “warm up” to his job. The process of warming up gets particularly striking in the phenomenon known as “second wind.” On usual occasions we make a practice of stopping an occupation as soon as we meet the first effective layer (so to call it) of fatigue. We have then walked, played, or worked “enough,” so we desist. That amount of fatigue is an efficacious obstruction on this side of which our usual life is cast. But if an unusual necessity forces us to press onward, a surprising thing occurs. The fatigue gets worse up to a certain critical point, when gradually or suddenly it passes away, and we are fresher than before. We have evidently tapped a level of new energy, masked until then by the fatigue obstacle usually obeyed. There may be layer after layer of this experience. A third and a fourth “wind” may supervene. Mental activity shows the phenomenon as well as physical, and in exceptional cases we may find, beyond the very extremity of fatigue distress, amounts of ease and power that we never dreamed ourselves to own—sources of strength habitually not taxed at all, because habitually we never push through the obstruction, never pass those early critical points.

For many years I have mused on the phenomenon of second wind, trying to find a physiological theory. It is evident that our organism has stored-up reserves of energy that are ordinarily not called upon, but that may be called upon: deeper and deeper strata of combustible or explosible material, discontinuously arranged, but ready for use by anyone who probes so deep, and repairing themselves by rest as well as do the superficial strata. Most of us continue living unnecessarily near our surface. Our energy budget is like our nutritive budget. Physiologists say that a man is in “nutritive equilibrium” when day after day he neither gains nor loses weight. But the odd thing is that this condition

may obtain on astonishingly different amounts of food. Take a man in nutritive equilibrium, and systematically increase or lessen his rations. In the first case he will begin to gain weight, in the second case to lose it. The change will be the greatest on the first day, less on the second, less still on the third, and so on, till he has gained all that he will gain, or lost all that he will lose, on that altered diet. He is now in nutritive equilibrium again, but with a new weight; and this neither lessens nor increases because his various combustion processes have adjusted themselves to the changed dietary. He gets rid, in one way or another, of just as much N,C,H, etc., as he takes in per diem.

Just so one can be in what I might call "efficiency equilibrium" (neither gaining nor losing power when once the equilibrium is reached) on astonishingly different quantities of work, no matter in what direction the work may be measured. It may be physical work, intellectual work, moral work, or spiritual work.

Of course there are limits: the trees don't grow into the sky. But the plain fact remains that men the world over possess amounts of resource which only very exceptional individuals push to their extremes of use. But the very same individual, pushing his energies to their extreme, may in a vast number of cases keep the pace up day after day, and find no "reaction" of a bad sort, so long as decent hygienic conditions are preserved. His more active rate of energizing does not wreck him; for the organism adapts itself and, as the rate of waste augments, augments correspondingly the rate of repair.

I say the *rate* and not the *time* of repair. The busiest man needs no more hours of rest than the idler. Some years ago Professor Patrick, of the Iowa State University, kept three young men awake for four days and nights. When his observations on them were finished, the subjects were permitted to sleep themselves out. All awoke from this sleep completely refreshed, but the one who took the longest to restore himself from his long vigil only slept one-third more time than was regular with him.

If my reader will put together these two conceptions, first, that few men live at their maximum of energy, and second, that anyone may be in vital equilibrium at very different rates of energizing, he will find, I think, that a very pretty practical problem of national economy, as well as of individual ethics, opens upon his view. In rough terms, we may say that a man who energizes below his normal maximum fails by just so much to profit by his chance at life; and that a nation filled with such men is inferior to a nation run at higher pressure. The problem is, then, how can men be trained up to their most useful pitch of energy? And

how can nations make such training most accessible to all their sons and daughters. This, after all, is only the general problem of education, formulated in slightly different terms.

“Rough” terms, I said just now, because the words “energy” and “maximum” may easily suggest only *quantity* to the reader’s mind, whereas in measuring the human energies of which I speak, qualities as well as quantities have to be taken into account. Everyone feels that his total *power* rises when he passes to a higher qualitative level of life.

Writing is higher than walking, thinking is higher than writing, deciding higher than thinking, deciding “no” higher than deciding “yes”—at least the man who passes from one of these activities to another will usually say that each later one involves a greater element of *inner work* than the earlier ones, even though the total heat given out or the foot-pounds expended by the organism may be less. Just how to conceive this inner work physiologically is as yet impossible, but psychologically we all know what the word means. We need a particular spur or effort to start us upon inner work; it tires us to sustain it; and when long sustained, we know how easily we lapse. When I speak of “energizing,” and its rates and levels and sources, I mean therefore our inner as well as our outer work.

Let no one think, then, that our problem of individual and national economy is solely that of the maximum of pounds raisable against gravity, the maximum of locomotion, or of agitation of any sort, that human beings can accomplish. That might signify little more than hurrying and jumping about in unco-ordinated ways; whereas inner work, though it so often reinforces outer work, quite as often means its arrest. To relax, to say to ourselves (with the “new thoughters”), “Peace! be still!” is sometimes a great achievement of inner work. When I speak of human energizing in general, the reader must therefore understand that sum total of activities, some outer and some inner, some muscular, some emotional, some moral, some spiritual, of whose waxing and waning in himself he is at all times so well aware. How to keep it at an appreciable maximum? How not to let the level lapse? That is the great problem. But the work of men and women is of innumerable kinds, each kind being, as we say, carried on by a particular faculty; so the great problem splits into two subproblems thus:

1. What are the limits of human faculty in various directions?
2. By what diversity of means, in the differing types of human beings, may the faculties be stimulated to their best results?

Read in one way, these two questions sound both trivial and familiar:

there is a sense in which we have all asked them ever since we were born. Yet *as a methodical program of scientific inquiry*, I doubt whether they have ever been seriously taken up. If answered fully, almost the whole of mental science and of the science of conduct would find a place under them. I propose, in what follows, to press them on the reader's attention in an informal way.

The first point to agree upon in this enterprise is that *as a rule men habitually use only a small part of the powers which they actually possess and which they might use under appropriate conditions*.

Everyone is familiar with the phenomenon of feeling more or less alive on different days. Everyone knows on any given day that there are energies slumbering in him which the incitements of that day do not call forth, but which he might display if these were greater. Most of us feel as if a sort of cloud weighed upon us, keeping us below our highest notch of clearness in discernment, sureness in reasoning, or firmness in deciding. Compared with what we ought to be, we are only half awake. Our fires are damped, our drafts are checked. We are making use of only a small part of our possible mental and physical resources. In some persons this sense of being cut off from their rightful resources is extreme, and we then get the formidable neurasthenic and psychasthenic conditions, with life grown into one tissue of impossibilities, that so many medical books describe.

Stating the thing broadly, the human individual thus lives usually far within his limits; he possesses powers of various sorts which he habitually fails to use. He energizes below his *maximum*, and he behaves below his *optimum*. In elementary faculty, in co-ordination, in power of *inhibition* and control, in every conceivable way, his life is contracted like the field of vision of an hysteric subject—but with less excuse, for the poor hysteric is diseased, while in the rest of us it is only an inveterate *habit*—the habit of inferiority to our full self—that is bad.

Admit so much, then, and admit also that the charge of being inferior to their full self is far truer of some men than of others; then the practical question ensues: *to what do the better men owe their escape? And, in the fluctuations which all men feel in their own degree of energizing, to what are the improvements due when they occur?*

In general terms the answer is plain:

Either some unusual stimulus fills them with emotional excitement, or some unusual idea of necessity induces them to make an extra effort of will. *Excitements, ideas, and efforts*, in a word, are what carry us over the dam.

In those "hyperesthetic" conditions which chronic invalidism so often brings in its train, the dam has changed its normal place. The slightest functional exercise gives a distress which the patient yields to and stops. In such cases of "habit neurosis" a new range of power often comes in consequence of the "bullying treatment," of efforts which the doctor obliges the patient, much against his will, to make. First comes the very extremity of distress, then follows unexpected relief. There seems no doubt that *we are each and all of us to some extent victims of habit neurosis*. We have to admit the wider potential range and the habitually narrow actual use. We live subject to arrest by degrees of fatigue which we have come only from habit to obey. Most of us may learn to push the barrier farther off, and to live in perfect comfort on much higher levels of power.

Country people and city people, as a class, illustrate this difference. The rapid rate of life, the number of decisions in an hour, the many things to keep account of, in a busy city-man's or woman's life, seem monstrous to a country brother. He doesn't see how we live at all. A day in New York or Chicago fills him with terror. The danger and noise make it appear like a permanent earthquake. But *settle* him there, and in a year or two he will have caught the pulse beat. He will vibrate to the city's rhythms; and if he only succeeds in his avocation, whatever that may be, he will find a joy in all the hurry and the tension, he will keep the pace as well as any of us, and get as much out of himself in any week as he ever did in ten weeks in the country.

The stimuli of those who successfully respond and undergo the transformation here are duty, the example of others, and crowd pressure and contagion. The transformation, moreover, is a chronic one: the new level of energy becomes permanent. The duties of new offices of trust are constantly producing this effect on human beings appointed to them. The physiologists call a stimulus "dynamogenic" when it increases the muscular contractions of men to whom it is applied; but appeals can be dynamogenic morally as well as muscularly. We are witnessing here in America today the dynamogenic effect of a very exalted political office upon the energies of an individual who had already manifested a healthy amount of energy before the office came.

Humbler examples show perhaps still better what chronic effects duty's appeal may produce in chosen individuals. John Stuart Mill somewhere says that women excel men in the power of keeping up sustained moral excitement. Every case of illness nursed by wife or mother is a proof of this; and where can one find greater examples of

sustained endurance than in those thousands of poor homes where the woman successfully holds the family together and keeps it going by taking all the thought and doing all the work—nursing, teaching, cooking, washing, sewing, scrubbing, saving, helping neighbors, “choring” outside—where does the catalogue end? If she does a bit of scolding now and then who can blame her? But often she does just the reverse—keeping the children clean and the man good tempered, and soothing and smoothing the whole neighborhood into finer shape.

Eighty years ago a certain Montyon left to the Académie Française a sum of money to be given in small prizes to the best examples of “virtue” of the year. The academy’s committees, with great good sense, have shown a partiality to virtues simple and chronic, rather than to her spasmodic and dramatic flights; and the exemplary housewives reported on have been wonderful and admirable enough. In Paul Bourget’s report for this year we find numerous cases, of which this is a type: Jeanne Chaix, eldest of six children; mother insane; father chronically ill. Jeanne, with no money but her wages at a pasteboard-box factory, directs the household, brings up the children, and successfully maintains the family of eight, which thus subsists, morally as well as materially, by the sole force of her valiant will. In some of these French cases charity to outsiders is added to the inner family burden; or helpless relatives, young or old, are adopted, as if the strength were inexhaustible and ample for every appeal. Details are too long to quote here; but human nature, responding to the call of duty, appears nowhere sublimer than in the person of these humble heroines of family life.

Turning from more chronic to acuter proofs of human nature’s reserves of power, we find that the stimuli that carry us over the usually effective dam are most often the classic emotional ones: love, anger, crowd contagion or despair. Despair lames most people, but it wakes others fully up. Every siege or shipwreck or polar expedition brings out some hero who keeps the whole company in heart. Last year there was a terrible colliery explosion at Courrières in France. Two hundred corpses, if I remember rightly, were exhumed. After twenty days of excavation, the rescuers heard a voice. “*Me voici* [Here I am],” said the first man unearthed. He proved to be a collier named Nemy, who had taken command of thirteen others in the darkness, disciplined them and cheered them, and brought them out alive. Hardly any of them could see or speak or walk when brought into the day. Five days later, a different type of vital endurance was unexpectedly unburied in the person of one Berton who,

isolated from any but dead companions, had been able to sleep away most of his time.

A new position of responsibility will usually show a man to be a far stronger creature than was supposed. Cromwell's and Grant's careers are the stock examples of how war will wake a man up. I owe to Professor C. E. Norton, my colleague, the permission to print part of a private letter from Colonel Baird-Smith written shortly after the six weeks' siege of Delhi, in 1857, for the victorious issue of which that excellent officer was chiefly to be thanked. He writes as follows:

. . . My poor wife had some reason to think that war and disease between them had left very little of a husband to take under nursing when she got him again. An attack of camp-scurvy had filled my mouth with sores, shaken every joint in my body, and covered me all over with sores and livid spots, so that I was marvellously unlovely to look upon. A smart knock on the ankle-joint from the splinter of a shell that burst in my face, in itself a mere *bagatelle* of a wound, had been of necessity neglected under the pressing and incessant calls upon me, and had grown worse and worse until the whole foot below the ankle became a black mass and seemed to threaten mortification. I insisted, however, on being allowed to use it till the place was taken, mortification or no; and though the pain was sometimes horrible, I carried my point and kept up to the last. On the day after the assault I had an unlucky fall on some bad ground, and it was an open question for a day or two whether I hadn't broken my arm at the elbow. Fortunately it turned out to be only a severe sprain, but I am still conscious of the wrench it gave me. To crown the whole pleasant catalogue, I was worn to a shadow by a constant diarrhoea, and consumed as much opium as would have done credit to my father-in-law (Thomas De Quincey). However, thank God, I have a good share of Tapleyism in me and come out strong under difficulties. I think I may confidently say that no man ever saw me out of heart, or ever heard one croaking word from me even when our prospects were gloomiest. We were sadly scourged by the cholera, and it was almost appalling to me to find that out of twenty-seven officers present, I could only muster fifteen for the operations of the attack. However, it was done, and after it was done came the collapse. Don't be horrified when I tell you that for the whole of the actual siege, and in truth for some little time before, I almost lived on brandy. Appetite for food I had none, but I forced myself to eat just sufficient to sustain life, and I had an incessant craving for brandy as the strongest stimulant I could get. Strange to say, I was quite unconscious of its affecting me in the slightest degree. *The excitement of the work was so great that no lesser one*

seemed to have any chance against it, and I certainly never found my intellect clearer or my nerves stronger in my life. It was only my wretched body that was weak, and the moment the real work was done by our becoming complete masters of Delhi, I broke down without delay and discovered that if I wished to live I must continue no longer the system that had kept me up until the crisis was passed. With it passed away as if in a moment all desire to stimulate, and a perfect loathing of my late staff of life took possession of me.

Such experiences show how profound is the alteration in the manner in which, under excitement, our organism will sometimes perform its physiological work. The processes of repair become different when the reserves have to be used, and for weeks and months the deeper use may go on.

Morbid cases, here as elsewhere, lay the normal machinery bare. In the first number of Dr. Morton Prince's *Journal of Abnormal Psychology*, Dr. Janet has discussed five cases of morbid impulse, with an explanation that is precious for my present point of view. One is a girl who eats, eats, eats, all day. Another walks, walks, walks, and gets her food from an automobile that escorts her. Another is a dipsomaniac. A fourth pulls out her hair. A fifth wounds her flesh and burns her skin. Hitherto such freaks of impulse have received Greek names (as bulimia, dromomania, etc.) and been scientifically disposed of as "episodic syndromata of hereditary degeneration." But it turns out that Janet's cases are all what he calls psychasthenics, or victims of a chronic sense of weakness, torpor, lethargy, fatigue, insufficiency, impossibility, unreality and powerlessness of will; and that in each and all of them the particular activity pursued, deleterious though it be, has the temporary result of raising the sense of vitality and making the patient feel alive again. These things reanimate: they would reanimate *us*, but it happens that in each patient the particular freak activity chosen is the only thing that does reanimate; and therein lies the morbid state. The way to treat such persons is to discover to them more usual and useful ways of throwing their stores of vital energy into gear.

Colonel Baird-Smith, needing to draw on altogether extraordinary stores of energy, found that brandy and opium were ways of throwing them into gear.

Such cases are humanly typical. We are all to some degree oppressed, unfree. We don't come to our own. It is there, but we don't get at it. The threshold must be made to shift. Then many of us find that an eccentric activity—a "spree," say—relieves. There is no doubt that to some men

sprees and excesses of almost any kind are medicinal, temporarily at any rate, in spite of what the moralists and doctors say.

But when the normal tasks and stimulations of life don't put a man's deeper levels of energy on tap, and he requires distinctly deleterious excitements, his constitution verges on the abnormal. The normal opener of deeper and deeper levels of energy is the will. The difficulty is to use it, to make the effort which the word volition implies. But if we *do* make it (or if a god, though he were only the god Chance, makes it through us), it will act dynamogenically on us for a month. It is notorious that a single successful effort of moral volition, such as saying "no" to some habitual temptation, or performing some courageous act, will launch a man on a higher level of energy for days and weeks, will give him a new range of power. "In the act of uncorking a whiskey bottle which I had brought home to get drunk upon," said a man to me, "I suddenly found myself running out into the garden, where I smashed it on the ground. I felt so happy and uplifted after this act that for two months I wasn't tempted to touch a drop."

The emotions and excitements due to usual situations are the usual inciters of the will. But these act discontinuously; and in the intervals the shallower levels of life tend to close in and shut us off. Accordingly the best practical knowers of the human soul have invented the thing known as methodical ascetic discipline to keep the deeper levels constantly in reach. Beginning with easy tasks, passing to harder ones, and exercising day by day, it is, I believe, admitted that disciples of asceticism can reach very high levels of freedom and power of will.

Ignatius Loyola's spiritual exercises must have produced this result in innumerable devotees. But the most venerable ascetic system, and the one whose results have the most voluminous experimental corroboration is undoubtedly the Yoga system in Hindustan. From time immemorial, by Hatha Yoga, Raja Yoga, Karma Yoga, or whatever code of practice it might be, Hindu aspirants to perfection have trained themselves, month in and out, for years. The result claimed, and certainly in many cases accorded by impartial judges, is strength of character, personal power, unshakability of soul. In an article in the *Philosophical Review*, from which I am largely copying here, I have quoted at great length the experience with Hatha Yoga of a very gifted European friend of mine who, by persistently carrying out for several months its methods of fasting from food and sleep, its exercises in breathing and thought concentration, and its fantastic posture gymnastics, seems to have succeeded in waking up deeper and deeper levels of will and moral and intellectual

power in himself, and to have escaped from a decidedly menacing brain condition of the "circular" type, from which he had suffered for years.

Judging by my friend's letters, of which the last I have is written fourteen months after the Yoga training began, there can be no doubt of his relative regeneration. He has undergone material trials with indifference, traveled third-class on Mediterranean steamers, and fourth-class on African trains, living with the poorest Arabs and sharing their unaccustomed food, all with equanimity. His devotion to certain interests has been put to heavy strain, and nothing is more remarkable to me than the changed moral tone with which he reports the situation. A profound modification has unquestionably occurred in the running of his mental machinery. The gearing has changed, and his will is available otherwise than it was.

My friend is a man of very peculiar temperament. Few of us would have had the will to start upon the yoga training, which, once started, seemed to conjure the further will power needed out of itself. And not all of those who could launch themselves would have reached the same results. The Hindus themselves admit that in some men the results may come without call or bell. My friend writes to me: "You are quite right in thinking that religious crises, love crises, indignation crises may awaken in a very short time powers similar to those reached by years of patient Yoga practice."

Probably most medical men would treat this individual's case as one of what it is fashionable now to call by the name of "self-suggestion," or "expectant attention"—as if those phrases were explanatory, or meant more than the fact that certain men can be influenced, while others cannot be influenced, by certain sorts of ideas. This leads me to say a word about ideas considered as dynamogenic agents, or stimuli for unlocking what would otherwise be unused reservoirs of individual power.

One thing that ideas do is to contradict other ideas and keep us from believing them. An idea that thus negates a first idea may itself in turn be negated by a third idea, and the first idea may thus regain its natural influence over our belief and determine our behavior. Our philosophic and religious development proceeds thus by credulities, negations, and the negating of negations.

But whether for arousing or for stopping belief, ideas may fail to be efficacious, just as a wire at one time alive with electricity may at another time be dead. Here our insight into causes fails us, and we can only note results in general terms. In general, whether a given idea shall be a

live idea depends more on the person into whose mind it is injected than on the idea itself. Which is the suggestive idea for this person, and which for that one? Mr. Fletcher's disciples regenerate themselves by the idea (and the fact) that they are chewing, and rechewing, and superchewing their food. Dr. Dewey's pupils regenerate themselves by going without their breakfast—a fact, but also an ascetic idea. Not everyone can use these ideas with the same success.

But apart from such individually varying susceptibilities, there are common lines along which men simply as men tend to be inflammable by ideas. As certain objects naturally awaken love, anger, or cupidity, so certain ideas naturally awaken the energies of loyalty, courage, endurance, or devotion. When these ideas are effective in an individual's life, their effect is often very great indeed. They may transfigure it, unlocking innumerable powers which, but for the idea, would never have come into play. "Fatherland," "the Flag," "the Union," "Holy Church," "the Monroe Doctrine," "Truth," "Science," "Liberty," Garibaldi's phrase "Rome or Death," etc., are so many examples of energy-releasing ideas. The social nature of such phrases is an essential factor of their dynamic power. They are forces of detent in situations in which no other force produces equivalent effects, and each is a force of detent only in a specific group of men.

The memory that an oath or vow has been made will nerve one to abstinences and efforts otherwise impossible; witness the "pledge" in the history of the temperance movement. A mere promise to his sweetheart will clean up a youth's life all over—at any rate for a time. For such effects an educated susceptibility is required. The idea of one's "honor," for example, unlocks energy only in those of us who have had the education of a "gentleman," so called.

That delightful being Prince Pueckler-Muskau writes to his wife from England that he has invented "a sort of artificial resolution respecting things that are difficult of performance. My device," he continues, "is this: *I give my word of honor most solemnly to myself* to do or to leave undone this or that. I am of course extremely cautious in the use of this expedient, but when once the word is given, even though I afterwards think I have been precipitate or mistaken, I hold it to be perfectly irrevocable, whatever inconveniences I foresee likely to result. If I were capable of breaking my word after such mature consideration, I should lose all respect for myself—and what man of sense would not prefer death to such an alternative? . . . When the mysterious formula is pronounced, no alteration in my own view, nothing short of physical impossi-

bilities, must, for the welfare of my soul, alter my will. . . . I find something very satisfactory in the thought that man has the power of framing such props and weapons out of the most trivial materials, indeed out of nothing, merely by the force of his will, which thereby truly deserves the name of omnipotent.”

Conversions, whether they be political, scientific, philosophic, or religious, form another way in which bound energies are let loose. They unify us, and put a stop to ancient mental interferences. The result is freedom, and often a great enlargement of power. A belief that thus settles upon an individual always acts as a challenge to his will. But, for the particular challenge to operate, he must be the right challengee. In religious conversions we have so fine an adjustment that the idea may be in the mind of the challengee for years before it exerts its effects; and why it should do so then is often so far from obvious that the event is taken for a miracle of grace, and not a natural occurrence. Whatever it is, it may be a high-water mark of energy, in which “noes,” once impossible, are easy, and in which a new range of “yeses” gains the right of way.

We are just now witnessing a very copious unlocking of energies by ideas in the persons of those converts to “New Thought,” “Christian Science,” “Metaphysical Healing,” or other forms of spiritual philosophy, who are so numerous among us today. The ideas here are healthy minded and optimistic; and it is quite obvious that a wave of religious activity, analogous in some respects to the spread of early Christianity, Buddhism, and Mohammedanism, is passing over our American world. The common feature of these optimistic faiths is that they all tend to the suppression of what Mr. Horace Fletcher calls “fearthought.” Fearthought he defines as the “self-suggestion of inferiority”; so that one may say that these systems all operate by the suggestion of power. And the power, small or great, comes in various shapes to the individual—power, as he will tell you, not to “mind” things that used to vex him, power to concentrate his mind, good cheer, good temper—in short, to put it mildly, a firmer, more elastic moral tone.

The most genuinely saintly person I have ever known is a friend of mine now suffering from cancer of the breast—I hope that she may pardon my citing her here as an example of what ideas can do. Her ideas have kept her a practically well woman for months after she should have given up and gone to bed. They have annulled all pain and weakness and given her a cheerful active life, unusually beneficent to others to whom she has afforded help. Her doctors, acquiescing in results they could not understand, have had the good sense to let her go her own way.

How far the mind-cure movement is destined to extend its influence, or what intellectual modifications it may yet undergo, no one can foretell. It is essentially a religious movement, and to academically nurtured minds its utterances are tasteless and often grotesque enough. It also incurs the natural enmity of medical politicians, and of the whole tradesunion wing of that profession. But no unprejudiced observer can fail to recognize its importance as a social phenomenon today, and the higher medical minds are already trying to interpret it fairly, and make its power available for their own therapeutic ends.

Dr. Thomas Hyslop, of the great West Riding Asylum in England, said last year to the British Medical Association that the best sleep-producing agent which his practice had revealed to him was *prayer*. I say this, he added (I am sorry here that I must quote from memory), purely as a medical man. The exercise of prayer, in those who habitually exert it, must be regarded by us doctors as the most adequate and normal of all the pacifiers of the mind and calmers of the nerves.

But in few of us are functions not tied up by the exercise of other functions. Relatively few medical men and scientific men, I fancy, can pray. Few can carry on any living commerce with "God." Yet many of us are well aware of how much freer and abler our lives would be were such important forms of energizing not sealed up by the critical atmosphere in which we have been reared. There are in every-one potential forms of activity that actually are shunted out from use. Part of the imperfect vitality under which we labor can thus be easily explained. One part of our mind dams up—even *damns* up!—the other parts.

Conscience makes cowards of us all. Social conventions prevent us from telling the truth after the fashion of the heroes and heroines of Bernard Shaw. We all know persons who are models of excellence, but who belong to the extreme philistine type of mind. So deadly is their intellectual respectability that we can't converse about certain subjects at all, can't let our minds play over them, can't even mention them in their presence. I have numbered among my dearest friends persons thus inhibited intellectually, with whom I would gladly have been able to talk freely about certain interests of mine, certain authors, say, as Bernard Shaw, Chesterton, Edward Carpenter, H. G. Wells, but it wouldn't do, it made them too uncomfortable, they wouldn't play, I had to be silent. An intellect thus tied down by literality and decorum makes on one the same sort of impression that an able-bodied man would who should habituate himself to do his work with only one of his fingers, locking up the rest of his organism and leaving it unused.

I trust that by this time I have said enough to convince the reader both of the truth and of the importance of my thesis. The two questions, first, that of the possible extent of our powers; and, second, that of the various avenues of approach to them, the various keys for unlocking them in diverse individuals, dominate the whole problem of individual and national education. We need a topography of the limits of human power, similar to the chart which oculists use of the field of human vision. We need also a study of the various types of human being with reference to the different ways in which their energy reserves may be appealed to and set loose. Biographies and individual experiences of every kind may be drawn upon for evidence here.

Great Men and Their Environment

remarkable parallel, which I think has never been noticed, obtains between the facts of social evolution on the one hand and of zoological evolution as expounded by Mr. Darwin on the other.

It will be best to prepare the ground for my thesis by a few very general remarks on the method of getting at scientific truth. It is a common platitude that a complete acquaintance with any one thing, however small, would require a knowledge of the entire universe. Not a sparrow falls to the ground but some of the remote conditions of his fall are to be found in the Milky Way, in our federal constitution, or in the early history of Europe. That is to say, alter the Milky Way, alter the federal Constitution, alter the facts of our barbarian ancestry, and the universe would so far be a different universe from what it now is. One fact involved in the difference might be that the particular little street boy who threw the stone which brought down the sparrow might not find himself opposite the sparrow at that particular moment; or, finding himself there, he might not be in that particular serene and disengaged mood of mind which expressed itself in throwing the stone. But, true as all this is, it would be very foolish for anyone who was inquiring the cause of the sparrow's fall to overlook the boy as too personal, proximate, and so to speak anthropomorphic an agent, and to say that the true cause is the federal Constitution, the westward migration of the Celtic race, or the structure of the Milky Way. If we proceeded on that method, we might say with perfect legitimacy that a friend of ours who had slipped on the ice upon his doorstep and cracked his skull some months after dining with thirteen at the table died because of that ominous feast. I know, in fact, one such instance; and I might, if I chose, contend with perfect logical propriety that the slip on the ice was no real accident. "There are no accidents," I might say, "for science. The whole history of the

world converged to produce that slip. If anything had been left out, the slip would not have occurred just there and then. To say it would is to deny the relations of cause and effect throughout the universe. The real cause of the death was not the slip, *but the conditions which engendered the slip*—and among them his having sat at a table, six months previous, one among thirteen. *That* is truly the reason why he died within the year.”

It will soon be seen whose arguments I am, in form, reproducing here. I would fain lay down the truth without polemics or recrimination. But unfortunately we never fully grasp the import of any true statement until we have a clear notion of what the opposite untrue statement would be. The error is needed to set off the truth, much as a dark background is required for exhibiting the brightness of a picture. And the error which I am going to use as a foil to set off what seems to me the truth of my own statements is contained in the philosophy of Mr. Herbert Spencer and his disciples. Our problem is, What are the causes that make communities change from generation to generation—that make the England of Queen Anne so different from the England of Elizabeth, the Harvard College of today so different from that of thirty years ago?

I shall reply to this problem, The difference is due to the accumulated influences of individuals, of their examples, their initiatives, and their decisions. The Spencerian school replies, The changes are irrespective of persons, and independent of individual control. They are due to the environment, to the circumstances, the physical geography, the ancestral conditions, the increasing experience of outer relations; to everything, in fact, except the Grants and the Bismarcks, the Joneses and the Smiths.

Now, I say that these theorizers are guilty of precisely the same fallacy as he who should ascribe the death of his friend to the dinner with thirteen, or the fall of the sparrow to the Milky Way. Like the dog in the fable, who drops his real bone to snatch at its image, they drop the real causes to snatch at others, which from no possible human point of view are available or attainable. Their fallacy is a practical one. Let us see where it lies. Although I believe in free will myself, I will waive that belief in this discussion, and assume with the Spencerians the predestination of all human actions. On that assumption I gladly allow that were the intelligence investigating the man's or the sparrow's death omniscient and omnipresent, able to take in the whole of time and space at a single glance, there would not be the slightest objection to the Milky Way or the fatal feast being invoked among the sought-for causes. Such a divine in-

telligence would see instantaneously all the infinite lines of convergence towards a given result, and it would, moreover, see impartially: it would see the fatal feast to be as much a condition of the sparrow's death as of the man's; it would see the boy with the stone to be as much a condition of the man's fall as of the sparrow's.

The human mind, however, is constituted on an entirely different plan. It has no such power of universal intuition. Its finiteness obliges it to see but two or three things at a time. If it wishes to take wider sweeps it has to use "general ideas," as they are called, and in so doing to drop all concrete truths. Thus, in the present case, if we as men wish to feel the connection between the Milky Way and the boy and the dinner and the sparrow and the man's death, we can do so only by falling back on the enormous emptiness of what is called an abstract proposition. We must say, All things in the world are fatally predetermined, and hang together in the adamantine fixity of a system of natural law. But in the vagueness of this vast proposition we have lost all the concrete facts and links; and in all practical matters the concrete links are the only things of importance. The human mind is essentially partial. It can be efficient at all only by *picking out* what to attend to, and ignoring everything else—by narrowing its point of view. Otherwise, what little strength it has is dispersed, and it loses its way altogether. Man always wants his curiosity gratified for a particular purpose. If, in the case of the sparrow, the purpose is punishment, it would be idiotic to wander off from the cats, boys, and other possible agencies close by in the street to survey the early Celts and the Milky Way: the boy would meanwhile escape. And if, in the case of the unfortunate man, we lose ourselves in contemplation of the thirteen-at-table mystery, and fail to notice the ice on the step and cover it with ashes, some other poor fellow, who never dined out in his life, may slip on it in coming to the door, and fall and break his head too.

It is, then, a necessity laid upon us as human beings to limit our view. In mathematics we know how this method of ignoring and neglecting quantities lying outside of a certain range has been adopted in the differential calculus. The calculator throws out all the "infinitesimals" of the quantities he is considering. He treats them (under certain rules) as if they did not exist. In themselves they exist perfectly all the while; but they are as if they did not exist for the purposes of his calculation. Just so an astronomer, in dealing with the tidal movements of the ocean, takes no account of the waves made by the wind, or by the pressure of all the steamers which day and night are moving their thousands of tons upon its surface. Just so the marksman, in sighting his rifle, allows for the mo-

tion of the wind, but not for the equally real motion of the earth and solar system. Just so a businessman's punctuality may overlook an error of five minutes, while a physicist, measuring the velocity of light, must count each thousandth of a second.

There are, in short, *different cycles of operation* in nature; different departments, so to speak, relatively independent of one another, so that what goes on at any moment in one may be compatible with almost any condition of things at the same time in the next. The mold on the biscuit in the storeroom of a man-of-war vegetates in absolute indifference to the nationality of the flag, the direction of the voyage, the weather, and the human dramas that may go on on board; and a mycologist may study it in complete abstraction from all these larger details. Only by so studying it, in fact, is there any chance of the mental concentration by which alone he may hope to learn something of its nature. On the other hand, the captain who in maneuvering the vessel through a naval fight should think it necessary to bring the moldy biscuit into his calculations would very likely lose the battle by reason of the excessive "thoroughness" of his mind.

The causes which operate in these incommensurable cycles are connected with one another only *if we take the whole universe into account*. For all lesser points of view it is lawful—nay, more, it is for human wisdom necessary—to regard them as disconnected and irrelevant to one another.

And this brings us nearer to our special topic. If we look at an animal or a human being distinguished from the rest of his kind by the possession of some extraordinary peculiarity, good or bad, we shall be able to discriminate between the causes which originally *produced* the peculiarity in him and the causes that *maintain* it after it is produced; and we shall see, if the peculiarity be one that he was born with, that these two sets of causes belong to two such irrelevant cycles. It was the triumphant originality of Darwin to see this, and to act accordingly. Separating the causes of production under the title of "tendencies to spontaneous variation," and relegating them to a physiological cycle which he forthwith agreed to ignore altogether,¹ he confined his attention to the causes of preservation, and under the names of natural selection and sexual selec-

1. Darwin's theory of pangenesis is, it is true, an attempt to account (among other things) for variation. But it occupies its own separate place, and its author no more invokes the environment when he talks of the adhesions of gemmules than he invokes these adhesions when he talks of the relations of the whole animal to the environment. *Divide et impera* [Divide and conquer]!

tion studied them exclusively as functions of the cycle of the environment.

Pre-Darwinian philosophers had also tried to establish the doctrine of descent with modification; but they all committed the blunder of clumping the two cycles of causation into one. What preserves an animal with his peculiarity, if it be a useful one, they saw to be the nature of the environment to which the peculiarity was adjusted. The giraffe with his peculiar neck is preserved by the fact that there are in his environment tall trees whose leaves he can digest. But these philosophers went further, and said that the presence of the trees not only maintained an animal with a long neck to browse upon their branches but also produced him. They *made* his neck long by the constant striving they aroused in him to reach up to them. The environment, in short, was supposed by these writers to mold the animal by a kind of direct pressure, very much as a seal presses the wax into harmony with itself. Numerous instances were given of the way in which this goes on under our eyes. The exercise of the forge makes the right arm strong, the palm grows callous to the oar, the mountain air distends the chest, the chased fox grows cunning and the chased bird shy, the arctic cold stimulates the animal combustion, and so forth. Now these changes, of which many more examples might be adduced, are at present distinguished by the special name of *adaptive* changes. Their peculiarity is that that very feature in the environment to which the animal's nature grows adjusted itself produces the adjustment. The "inner relation," to use Mr. Spencer's phrase, "corresponds" with its own efficient cause.

Darwin's first achievement was to show the utter insignificance in amount of these changes produced by direct adaptation, the immensely greater mass of changes being produced by internal molecular accidents, of which we know nothing. His next achievement was to define the true problem with which we have to deal when we study the effects of the visible environment on the animal. That problem is simply this: Is the environment more likely to *preserve or to destroy him* on account of this or that peculiarity with which he may be born? In giving the name "of accidental variations" to those peculiarities with which an animal is born, Darwin does not for a moment mean to suggest that they are not the fixed outcome of natural law. If the total system of the universe be taken into account, the causes of these variations and the visible environment which preserves or destroys them undoubtedly do, in some remote and roundabout way, hang together. What Darwin means is that, since that environment is a perfectly known thing, and its relations to the

organism in the way of destruction or preservation are tangible and distinct, it would utterly confuse our finite understandings and frustrate our hopes of science to mix in with it facts from such a disparate and incommensurable cycle as that in which the variations are produced. This last cycle is that of occurrences before the animal is born. It is the cycle of influences upon ova and embryos; in which lie the causes that tip them and tilt them towards masculinity or femininity, towards strength or weakness, towards health or disease, and towards divergence from the parent type. What are the causes there?

In the first place, they are molecular and invisible—inaccessible, therefore, to direct observation of any kind. Secondly, their operations are compatible with any social, political, and physical conditions of environment. The same parents, living in the same enviroing conditions, may at one birth produce a genius, at the next an idiot or a monster. The visible external conditions are therefore not direct determinants of this cycle; and the more we consider the matter, the more we are forced to believe that two children of the same parents are made to differ from each other by causes as disproportionate to their ultimate effects as is the famous pebble on the Rocky Mountain crest, which separates two raindrops, to the Gulf of St. Lawrence and the Pacific Ocean toward which it makes them severally flow.

The great mechanical distinction between transitive forces and discharging forces is nowhere illustrated on such a scale as in physiology. Almost all causes there are forces of *detent*, which operate by simply unlocking energy already stored up. They are upsetters of unstable equilibria, and the resultant effect depends infinitely more on the nature of the materials upset than on that of the particular stimulus which joggles them down. Galvanic work, equal to unity, done on a frog's nerve will discharge from the muscle to which the nerve belongs mechanical work equal to seventy thousand; and exactly the same muscular effect will emerge if other irritants than galvanism are employed. The irritant has merely started or provoked something which then went on of itself—as a match may start a fire which consumes a whole town. And qualitatively as well as quantitatively the effect may be absolutely incommensurable with the cause. We find this condition of things in all organic matter. Chemists are distracted by the difficulties which the instability of albuminoid compounds opposes to their study. Two specimens, treated in what outwardly seem scrupulously identical conditions, behave in quite different ways. You know about the invisible factors of fermenta-

tion, and how the fate of a jar of milk—whether it turn into a sour clot or a mass of kumiss—depends on whether the lactic acid ferment or the alcoholic is introduced first and gets ahead of the other in starting the process. Now, when the result is the tendency of an ovum, itself invisible to the naked eye, to tip towards this direction or that in its further evolution—to bring forth a genius or a dunce, even as the raindrop passes east or west of the pebble—is it not obvious that the deflecting cause must lie in a region so recondite and minute, must be such a ferment of a ferment, an infinitesimal of so high an order that surmise itself may never succeed even in attempting to frame an image of it?

Such being the case, was not Darwin right to turn his back upon that region altogether, and to keep his own problem carefully free from all entanglement with matters such as these? The success of his work is a sufficiently affirmative reply.

And this brings us at last to the heart of our subject. The causes of production of great men lie in a sphere wholly inaccessible to the social philosopher. He must simply accept geniuses as data, just as Darwin accepts his spontaneous variations. For him, as for Darwin, the only problem is, these data being given, how does the environment affect them, and how do they affect the environment? Now, I affirm that the relation of the visible environment to the great man is in the main exactly what it is to the “variation” in the Darwinian philosophy. It chiefly adopts or rejects, preserves or destroys, in short *selects* him.² And whenever it adopts and preserves the great man, it becomes modified by his influence in an entirely original and peculiar way. He acts as a ferment, and changes its constitution, just as the advent of a new zoological species changes the faunal and floral equilibrium of the region in which it appears. We all recollect Mr. Darwin’s famous statement of the influence of cats on the growth of clover in their neighborhood. We all have read of the effects of the European rabbit in New Zealand, and we have many of us taken part in the controversy about the English sparrow here—whether he kills most cankerworms, or drives away most native birds. Just so the great man, whether he be an importation from without like Clive in India or Agassiz here, or whether he spring from the soil like Mohammed or Franklin, brings about a rearrangement, on a large or a small scale, of the pre-existing social relations.

2. It is true that it remodels him, also, to some degree, by its educative influence, and that this constitutes a considerable difference between the social case and the zoological case. I neglect this aspect of the relation here, for the other is the more important. At the end of the article I will return to it incidentally.

The mutations of societies, then, from generation to generation, are in the main due directly or indirectly to the acts or the example of individuals whose genius was so adapted to the receptivities of the moment or whose accidental position of authority was so critical that they became ferments, initiators of movement, setters of precedent or fashion, centers of corruption, or destroyers of other persons, whose gifts, had they had free play, would have led society in another direction.

We see this power of individual initiative exemplified on a small scale all about us, and on a large scale in the case of the leaders of history. It is only following the common-sense method of a Lyell, a Darwin, and a Whitney to interpret the unknown by the known, and reckon up cumulatively the only causes of social change we can directly observe. Societies of men are just like individuals in that both at any given moment offer ambiguous potentialities of development. Whether a young man enters business or the ministry may depend on a decision which has to be made before a certain day. He takes the place offered in the countinghouse, and is *committed*. Little by little, the habits, the knowledges, of the other career, which once lay so near, cease to be reckoned even among his possibilities. At first, he may sometimes doubt whether the self he murdered in that decisive hour might not have been the better of the two; but with the years such questions themselves expire, and the old alternative *ego*, once so vivid, fades into something less substantial than a dream. It is no otherwise with nations. They may be committed by kings and ministers to peace or war, by generals to victory or defeat, by prophets to this religion or to that, by various geniuses to fame in art, science, or industry. A war is a true point of bifurcation of future possibilities. Whether it fail or succeed, its declaration must be the starting point of new policies. Just so does a revolution, or any great civic precedent, become a deflecting influence, whose operations widen with the course of time. Communities obey their ideals; and an accidental success fixes an ideal, as an accidental failure blights it.

Would England have today the "imperial" ideal which she now has if a certain boy named Bob Clive had shot himself, as he tried to do, at Madras? Would she be the drifting raft she is now in European affairs if a Frederick the Great had inherited her throne instead of a Victoria, and if Messrs. Bentham, Mill, Cobden, and Bright had all been born in Prussia? England has, no doubt, today precisely the same intrinsic value relatively to the other nations that she ever had. There is no such fine accumulation of human material upon the globe. But in England the material has lost effective form, while in Germany it has found it. Leaders

give the form. Would England be crying forward and backward at once, as she does now, "letting I will not wait upon I would," wishing to conquer but not to fight, if her ideal had in all these years been fixed by a succession of statesmen of supremely commanding personality, working in one direction? Certainly not. She would have espoused, for better or worse, either one course or another. Had Bismarck died in his cradle, the Germans would still be satisfied with appearing to themselves as a race of spectacled *Gelehrten* [scholars] and political herbivora, and to the French as *ces bons*, or *ces naïfs*, *Allemands* [those good-hearted (or) those innocent Germans]. Bismarck's will showed them, to their own great astonishment, that they could play a far livelier game. The lesson will not be forgotten. Germany may have many vicissitudes, but they—

will never do away, I ween,
The marks of that which once hath been—

of Bismarck's initiative, namely, from 1860 to 1873.

The fermentative influence of geniuses must be admitted as, at any rate, one factor in the changes that constitute social evolution. The community *may* evolve in many ways. The accidental presence of this or that ferment decides in which way it *shall* evolve. Why, the very birds of the forest, the parrot, the myna, have the power of human speech, but never develop it of themselves; someone must be there to teach them. So with us individuals. Rembrandt must teach us to enjoy the struggle of light with darkness, Wagner to enjoy peculiar musical effects; Dickens gives a twist to our sentimentality, Artemus Ward to our humor; Emerson kindles a new moral light within us. But it is like Columbus' egg. "All can raise the flowers now, for all have got the seed." But if this be true of the individuals in the community, how can it be false of the community as a whole? If shown a certain way, a community may take it; if not, it will never find it. And the ways are to a large extent indeterminate in advance. A nation may obey either of many alternative impulses given by different men of genius and still live and be prosperous, just as a man may enter either of many businesses. Only, the prosperities may differ in their type.

But the indeterminism is not absolute. Not every "man" fits every "hour." Some incompatibilities there are. A given genius may come either too early or too late. Peter the Hermit would now be sent to a lunatic asylum. John Mill in the tenth century would have lived and died unknown. Cromwell and Napoleon need their revolutions, Grant his civil war. An Ajax gets no fame in the day of telescopic-sighted rifles; and, to

express differently an instance which Spencer uses, what could a Watt have effected in a tribe which no precursive genius had taught to smelt iron or to turn a lathe?

Now, the important thing to notice is that what makes a certain genius now incompatible with his surroundings is usually the fact that some previous genius of a different strain has warped the community away from the sphere of his possible effectiveness. After Voltaire, no Peter the Hermit; after Charles IX and Louis XIV, no general protestantization of France; after a Manchester school, a Beaconsfield's success is transient; after a Philip II, a Castelar makes little headway; and so on. Each bifurcation cuts off certain sides of the field altogether, and limits the future possible angles of deflection. A community is a living thing, and in words which I can do no better than quote from Professor Clifford,³ "It is the peculiarity of living things not merely that they change under the influence of surrounding circumstances, but that any change which takes place in them is not lost but retained, and as it were built into the organism to serve as the foundation for future actions. If you cause any distortion in the growth of a tree and make it crooked, whatever you may do afterwards to make the tree straight the mark of your distortion is there; it is absolutely indelible; it has become part of the tree's nature. . . . Suppose, however, that you take a lump of gold, melt it, and let it cool. . . . No one can tell by examining a piece of gold how often it has been melted and cooled in geologic ages, or even in the last year by the hand of man. Anyone who cuts down an oak can tell by the rings in its trunk how many times winter has frozen it into widowhood, and how many times summer has warmed it into life. A living being must always contain within itself the history, not merely of its own existence, but of all its ancestors."

Every painter can tell us how each added line deflects his picture in a certain sense. Whatever lines follow must be built on those first laid down. Every author who starts to rewrite a piece of work knows how impossible it becomes to use any of the first-written pages again. The new beginning has already excluded the possibility of those earlier phrases and transitions, while it has at the same time created the possibility of an indefinite set of new ones, no one of which, however, is completely determined in advance. Just so the social surroundings of the past and present hour exclude the possibility of accepting certain contributions from individuals; but they do not positively define what contributions

3. *Lectures and Essays*, i. 82.

shall be accepted, for in themselves they are powerless to fix what the nature of the individual offerings shall be.⁴

Thus social evolution is a resultant of the interaction of two wholly distinct factors—the individual, deriving his peculiar gifts from the play of physiological and infrasocial forces, but bearing all the power of initiative and origination in his hands; and, second, the social environment, with its power of adopting or rejecting both him and his gifts. Both factors are essential to change. The community stagnates without the impulse of the individual. The impulse dies away without the sympathy of the community.

All this seems nothing more than common sense. All who wish to see it developed by a man of genius should read that golden little work, Bagehot's *Physics and Politics*, in which (it seems to me) the complete sense of the way in which concrete things grow and change is as livingly present as the straining after a pseudo philosophy of evolution is livingly absent. But there are never wanting minds to whom such views seem personal and contracted, and allied to an anthropomorphism long exploded in other fields of knowledge. "The individual withers, and the world is more and more," to these writers; and in a Buckle, a Draper, and a Taine we all know how much the "world" has come to be almost synonymous with the *climate*. We all know, too, how the controversy has been kept up between the partisans of a "science of history" and those who deny the existence of anything like necessary "laws" where human societies are concerned. Mr. Spencer, at the opening of his *Study of Sociology*, makes an onslaught on the "great-man theory" of history, from which a few passages may be quoted:

The genesis of societies by the action of great men may be comfortably believed so long as, resting in general notions, you do not ask for particulars. But now, if, dissatisfied with vagueness, we demand that our ideas shall be brought into focus and exactly defined, we discover the hypothesis to be utterly incoherent. If, not stopping at the explanation of social progress as due to the great man, we go back a step, and ask, Whence comes the great man? we find that the theory breaks down completely. The question has two conceivable answers: his origin is supernatural, or it is natural. Is his origin supernatural? Then he is a deputy god, and we have theocracy once removed—or, rather, not removed at all. . . . Is

4. Mr. Grant Allen himself, in an article from which I shall presently quote, admits that a set of people who, if they had been exposed ages ago to the geographical agencies of Timbuktu would have developed into Negroes might now, after a protracted exposure to the conditions of Hamburg, never become Negroes if transplanted to Timbuktu.

this an unacceptable solution? Then the origin of the great man is natural; and immediately this is recognized, he must be classed with all other phenomena in the society that gave him birth as a product of its antecedents. Along with the whole generation of which he forms a minute part, along with its institutions, language, knowledge, manners, and its multitudinous arts and appliances, he is a *resultant*. . . . You must admit that the genesis of the great man depends on the long series of complex influences which has produced the race in which he appears, and the social state into which that race has slowly grown. . . . Before he can remake his society, his society must make him. All those changes of which he is the proximate initiator have their chief causes in the generations he descended from. If there is to be anything like a real explanation of those changes, it must be sought in that aggregate of conditions out of which both he and they have arisen.

Now, it seems to me that there is something which one might almost call impudent in the attempt which Mr. Spencer makes, in the first sentence of this extract, to pin the reproach of vagueness upon those who believe in the power of initiative of the great man.

Suppose I say that the singular moderation which now distinguishes social, political, and religious discussion in England, and contrasts so strongly with the bigotry and dogmatism of sixty years ago, is largely due to J. S. Mill's example. I may possibly be wrong about the facts; but I am, at any rate, "asking for particulars," and not "resting in general notions." And if Mr. Spencer should tell me it started from no personal influence whatever, but from the "aggregate of conditions," the "generations," Mill and all his contemporaries "descended from," the whole past order of nature in short, surely he, not I, would be the person "satisfied with vagueness."

The fact is that Mr. Spencer's sociological method is identical with that of one who would invoke the zodiac to account for the fall of the sparrow, and the thirteen at table to explain the gentleman's death. It is of little more scientific value than the oriental method of replying to whatever question arises by the unimpeachable truism, "God is great." *Not* to fall back on the gods, where a proximate principle may be found, has with us Westerners long since become the sign of an efficient as distinguished from an inefficient intellect.

To believe that the cause of everything is to be found in its antecedents is the starting point, the initial postulate, not the goal and consummation, of science. If she is simply to lead us out of the labyrinth by the same hole we went in by three or four thousand years ago, it seems hardly worthwhile to have followed her through the darkness at all. If anything

is humanly certain it is that the great man's society, properly so called, does *not* make him before he can remake it. Physiological forces, with which the social, political, geographical, and to a great extent anthropological conditions have just as much and just as little to do as the condition of the crater of Vesuvius has to do with the flickering of this gas by which I write, are what make him. Can it be that Mr. Spencer holds the convergence of sociological pressures to have so impinged on Stratford-upon-Avon about the 26th of April, 1564, that a W. Shakespeare, with all his mental peculiarities, had to be born there—as the pressure of water outside a certain boat will cause a stream of a certain form to ooze into a particular leak? And does he mean to say that if the aforesaid W. Shakespeare had died of cholera infantum, another mother at Stratford-upon-Avon would needs have engendered a duplicate copy of him to restore the sociologic equilibrium—just as the same stream of water will reappear, no matter how often you pass a sponge over the leak, so long as the outside level remains unchanged? Or might the substitute arise at “Stratford-atte-Bowe”? Here, as elsewhere, it is very hard, in the midst of Mr. Spencer's vagueness, to tell what he does mean at all.

We have, however, in his disciple, Mr. Grant Allen, one who leaves us in no doubt whatever of his precise meaning. This widely informed, suggestive, and brilliant writer published last year a couple of articles in the *Gentleman's Magazine*, in which he maintained that individuals have no initiative in determining social change.

The differences between one nation and another, whether in intellect, commerce, art, morals, or general temperament, ultimately depend, not upon any mysterious properties of race, nationality, or any other unknown and unintelligible abstractions, but simply and solely upon the physical circumstances to which they are exposed. If it be a fact, as we know it to be, that the French nation differs recognizably from the Chinese, and the people of Hamburg differ recognizably from the people of Timbaktu, then the notorious and conspicuous differences between them are wholly due to the geographical position of the various races. If the people who went to Hamburg had gone to Timbaktu, they would now be indistinguishable from the semibarbarian Negroes who inhabit that central African metropolis;⁵ and if the people who went to Timbaktu

5. No! not even though they were bodily brothers! The geographical factor utterly vanishes before the ancestral factor. The difference between Hamburg and Timbaktu as a cause of ultimate divergence of two races is as nothing to the difference of constitution of the ancestors of the two races, even though as in twin brothers, this difference might be invisible to the naked eye. No two couples of the most homogeneous race could possibly be found so identical as, if set in identical environments, to give rise to two identical lineages. The minute divergence at the start grows broader with each generation, and ends with entirely dissimilar breeds.

had gone to Hamburg, they would now have been white-skinned merchants driving a roaring trade in imitation sherry and indigestible port. . . . The differentiating agency must be sought in the great permanent geographical features of land and sea; . . . these have necessarily and inevitably molded the characters and histories of every nation upon the earth. . . . We cannot regard any nation as an active agent in differentiating itself. Only the surrounding circumstances can have any effect in such a direction. [These two sentences dogmatically deny the existence of the relatively independent physiological cycle of causation.] To suppose otherwise is to suppose that the mind of man is exempt from the universal law of causation. There is no caprice, no spontaneous impulse, in human endeavors. Even tastes and inclinations *must* themselves be the result of surrounding causes.

Elsewhere Mr. Allen, writing of the Greek culture, says:

It was absolutely and unreservedly the product of the geographical Hellas, acting upon the given factor of the undifferentiated Aryan brain To me it seems a self-evident proposition that nothing whatsoever can differentiate one body of men from another, except the physical conditions in which they are set—including, of course, under the term *physical conditions* the relations of place and time in which they stand with regard to other bodies of men. To suppose otherwise is to deny the primordial law of causation. To imagine that the mind can differentiate itself is to imagine that it can be differentiated without a cause.

This outcry about the law of universal causation being undone, the moment we refuse to invest in the kind of causation which is peddled round by a particular school, makes one impatient. These writers have no imagination of alternatives. With them there is no *tertium quid* between outward environment and miracle. *Aut Caesar, aut nullus* [Either Caesar or no one]! *Aut* Spencerism, *aut* catechism!

If by “physical conditions” Mr. Allen means what he does mean, the outward cycle of visible nature and man, his assertion is simply physiologically false. For a national mind differentiates “itself” whenever a genius is born in its midst by causes acting in the invisible and molecular cycle. But if Mr. Allen means by “physical conditions” the whole of nature, his assertion, though true, forms but the vague Asiatic profession of belief in an all-enveloping fate, which certainly need not plume itself on any specially advanced or scientific character.

And how can a thinker so clever as Mr. Allen fail to have distinguished in these matters between *necessary* conditions and *sufficient* conditions of a given result? The French say that to have an omelet we must break

our eggs; that is, the breaking of eggs is a necessary condition of the omelet. But is it a sufficient condition? Does an omelet appear whenever three eggs are broken? So of the Greek mind. To get such versatile intelligence it may be that such commercial dealings with the world as the geographical Hellas afforded are a necessary condition. But if they are a sufficient condition, why did not the Phoenicians outstrip the Greeks in intelligence? No geographical environment can produce a given type of mind. It can only foster and further certain types fortuitously produced, and thwart and frustrate others. Once again, its function is simply selective, and determines what shall actually be only by destroying what is positively incompatible. An Arctic environment is incompatible with improvident habits in its denizens; but whether the inhabitants of such a region shall unite with their thrift the peacefulness of the Eskimo or the pugnacity of the Norseman is, so far as the climate is concerned, an accident. Evolutionists should not forget that we all have five fingers not because four or six would not do just as well, but merely because the first vertebrate above the fishes *happened* to have that number. He owed his prodigious success in founding a line of descent to some entirely other quality—we know not which—but the inessential five fingers were taken in tow and preserved to the present day. So of most social peculiarities. Which of them shall be taken in tow by the few qualities which the environment necessarily exacts is a matter of what physiological accidents shall happen among individuals. Mr. Allen promises to prove his thesis in detail by the examples of China, India, England, Rome, etc. I have not the smallest hesitation in predicting that he will do no more with these examples than he has done with Hellas. He will appear upon the scene after the fact, and show that the quality developed by each race was, naturally enough, not incompatible with its habitat. But he will utterly fail to show that the particular form of compatibility fallen into in each case was the one necessary and only possible form.

Naturalists know well enough how indeterminate the harmonies between a fauna and its environment are. An animal may better his chances of existence in either of many ways—growing aquatic, arboreal, or subterranean; small and swift, or massive and bulky; spiny, horny, slimy, or venomous; more timid or more pugnacious; more cunning or more fertile of offspring; more gregarious or more solitary; or in other ways besides—and any one of these ways may suit him to many widely different environments.

Readers of Mr. A. R. Wallace will well remember the striking illustrations of this in his *Malay Archipelago*:

Borneo closely resembles New Guinea not only in its vast size and its freedom from volcanoes, but in its variety of geological structure, its uniformity of climate, and the general aspect of the forest vegetation that clothes its surface; the Moluccas are the counterpart of the Philippines in their volcanic structure, their extreme fertility, their luxuriant forests, and their frequent earthquakes; and Bali, with the east end of Java, has a climate almost as dry and a soil almost as arid as that of Timor. Yet between these corresponding groups of islands, constructed, as it were, after the same pattern, subjected to the same climate, and bathed by the same oceans, there exists the greatest possible contrast when we compare their animal productions. Nowhere does the ancient doctrine that differences or similarities in the various forms of life that inhabit different countries are due to corresponding physical differences or similarities in the countries themselves meet with so direct and palpable a contradiction. Borneo and New Guinea, as alike physically as two distinct countries can be, are zoologically wide as the poles asunder; while Australia, with its dry winds, its open plains, its stony deserts, and its temperate climate, yet produces birds and quadrupeds which are closely related to those inhabiting the hot, damp, luxuriant forests which everywhere clothe the plains and mountains of New Guinea.

Here we have similar physical-geography environments harmonizing with widely differing animal lives, and similar animal lives harmonizing with widely differing geographical environments. A singularly accomplished writer, E. Gryzanovski, in the *North American Review*, uses the instances of Sardinia and Corsica in support of this thesis with great effect. He says:

These sister islands, lying in the very centre of the Mediterranean, at almost equal distances from the centres of Latin and Neo-Latin civilization, within easy reach of the Phoenician, the Greek, and the Saracen, with a coastline of more than a thousand miles, endowed with obvious and tempting advantages, and hiding untold sources of agricultural and mineral wealth, have nevertheless remained unknown, unheeded, and certainly uncared for during the thirty centuries of European history These islands have dialects, but no language; records of battles, but no history. They have customs, but no laws; the *vendetta*, but no justice. They have wants and wealth, but no commerce; timber and ports, but no shipping. They have legends, but no poetry; beauty, but no art; and twenty years ago it could still be said that they had universities, but no students. . . . That Sardinia, with all her emotional and picturesque barbarism, has never produced a single artist is almost as strange as her barbarism itself. . . . Near the focus of European civilization, in the very spot which an *à priori* geographer would point out as the most favorable

place for material and intellectual, commercial, and political development, these strange sister islands have slept their secular sleep, like *nodes* on the sounding-board of history.

This writer then goes on to compare Sardinia and Sicily with some detail. All the material advantages are in favor of Sardinia, "and the Sardinian population, being of an ancestry more mixed than that of the English race, would justify far higher expectations than that of Sicily." Yet Sicily's past history has been brilliant in the extreme, and her commerce today is great. Dr. Gryzanovski has his own theory of the historic torpor of these favored isles. He thinks they stagnated because they never gained political autonomy, being always owned by some Continental power. I will not dispute the theory; but I will ask, Why did they not gain it? and answer immediately: Simply because no individuals were born there with patriotism and ability enough to inflame their countrymen with national pride, ambition, and thirst for independent life. Corsicans and Sardinians are probably as good stuff as any of their neighbors. But the best woodpile will not blaze till a torch is applied, and the appropriate torches seem to have been wanting.⁶

6. I am well aware that in much that follows (though in nothing that precedes) I seem to be crossing the heavily shotted bows of Mr. Galton, for whose laborious investigations into the heredity of genius I have the greatest respect. Mr. Galton inclines to think that genius of intellect and passion is bound to express itself, whatever the outward opportunity, and that within any given race an equal number of geniuses of each grade must needs be born in every equal period of time; a subordinate race cannot possibly engender a large number of high-class geniuses, etc. He would, I suspect, infer the suppositions I go on to make—of great men fortuitously assembling around a given epoch and making it great, and of their being fortuitously absent from certain places and times (from Sardinia, from Boston now, etc.)—to be radically vicious. I hardly think, however, that he does justice to the great complexity of the conditions of *effective* greatness, and to the way in which the physiological averages of production may be masked entirely during long periods, either by the accidental mortality of geniuses in infancy, or by the fact that the particular geniuses born happened not to find tasks. I doubt the truth of his assertion that *intellectual* genius, like murder, "will out." It is true that certain types are irrepressible. Voltaire, Shelley, Carlyle can hardly be conceived leading a dumb and vegetative life in any epoch. But take Mr. Galton himself, take his cousin Mr. Darwin, and take Mr. Spencer: nothing is to me more conceivable than that at another epoch all three of these men might have died "with all their music in them," known only to their friends as persons of strong and original character and judgment. What has started them on their career of effective greatness is simply the accident of each stumbling upon a task vast, brilliant, and congenial enough to call out the convergence of all his passions and powers. I see no more reason why, in case they had not fallen in with their several hobbies at propitious periods in their life, they need necessarily have hit upon other hobbies, and made themselves equally great. Their case seems similar to that of the Washingtons, Cromwells, and Grants, who simply rose to their occasions. But apart from these causes of fallacy, I am strongly disposed to think that where transcendent geniuses are concerned the numbers anyhow are so small that their

Sporadic great men come everywhere. But for a community to get vibrating through and through with intensely active life, many geniuses coming together and in rapid succession are required. This is why great epochs are so rare—why the sudden bloom of a Greece, an early Rome, a Renaissance is such a mystery. Blow must follow blow so fast that no cooling can occur in the intervals. Then the mass of the nation grows incandescent, and may continue to glow by pure inertia long after the originators of its internal movement have passed away. We often hear surprise expressed that in these high tides of human affairs not only the people should be filled with stronger life but that individual geniuses should seem so exceptionally abundant. This mystery is just about as deep as the time-honored conundrum as to why great rivers flow by great towns. It is true that great public fermentations awaken and adopt many geniuses who in more torpid times would have had no chance to work. But over and above this there must be an exceptional concourse of genius about a time to make the fermentation begin at all. The unlikeliness of the concourse is far greater than the unlikeliness of any particular genius; hence the rarity of these periods and the exceptional aspect which they always wear.

It is folly, then, to speak of the “laws of history” as of something inevitable, which science has only to discover, and whose consequences anyone can then foretell but do nothing to alter or avert. Why, the very laws of physics are conditional, and deal with *ifs*. The physicist does not say, “The water will boil anyhow;” he only says it will boil if a fire be kindled beneath it. And so the utmost the student of sociology can ever predict is that *if* a genius of a certain sort shows the way, society will be sure to follow. It might long ago have been predicted with great confidence that both Italy and Germany would reach a stable unity if someone could but succeed in starting the process. It could not have been predicted, however, that the *modus operandi* in each case would be subordination to a paramount state rather than federation, because no historian could have calculated the freaks of birth and fortune which gave at the same moment such positions of authority to three such peculiar individuals as Napoleon III, Bismarck, and Cavour. So of our own politics. It is certain now that the movement of the independents, reformers, or whatever one please to call them, will triumph. But whether it do so

appearance will not fit into any scheme of averages. That is, two or three might appear together, just as the two or three balls nearest the target center might be fired consecutively. Take longer epochs and more firing, and the great geniuses and near balls would on the whole be more spread out.

by converting the Republican party to its ends, or by rearing a new party on the ruins of both our present factions, the historian cannot say. There can be no doubt that the reform movement would make more progress in one year with an adequate personal leader than as now in ten without one. Were there a great citizen, splendid with every civic gift, to be its candidate, who can doubt that he would lead us to victory? But, at present, we, his environment, who sigh for him and would so gladly preserve and adopt him if he came, can neither move without him, nor yet do anything to bring him forth.⁷

To conclude: The evolutionary view of history, when it denies the vital importance of individual initiative, is, then, an utterly vague and unscientific conception, a lapse from modern scientific determinism into the most ancient oriental fatalism. The lesson of the analysis that we have made (even on the completely deterministic hypothesis with which we started) forms an appeal of the most stimulating sort to the energy of the individual. Even the dogged resistance of the reactionary conservative to changes which he cannot hope entirely to defeat is justified and shown to be effective. He retards the movement; deflects it a little by the concessions he extracts; gives it a resultant momentum, compounded of his inertia and his adversaries' speed; and keeps up, in short, a constant lateral pressure, which, to be sure, never heads it round about, but brings it up at last at a goal far to the right or left of that to which it would have drifted had he allowed it to drift alone.

I now pass to the last division of my subject, the function of the environment in *mental* evolution. After what I have already said, I may be quite concise. Here, if anywhere, it would seem at first sight as if that school must be right which makes the mind passively plastic, and the environment actively productive of the form and order of its conceptions; which, in a word, thinks that all mental progress must result from a series of adaptive changes, in the sense already defined of that word. We know what a vast part of our mental furniture consists of purely remembered, not reasoned, experience. The entire field of our habits and associations by contiguity belongs here. The entire field of those abstract conceptions which were taught us with the language into which we were born belongs here also. And, more than this, there is reason to think that the order of "outer relations" experienced by the individual may itself determine the order in which the general characters

7. Since this paper was written, President Cleveland has to a certain extent met the need. But who can doubt that if he had certain other qualities which he has not yet shown, his influence would have been still more decisive? (1896.)

imbedded therein shall be noticed and extracted by his mind.⁸ The pleasures and benefits, moreover, which certain parts of the environment yield, and the pains and hurts which other parts inflict, determine the direction of our interest and our attention, and so decide at which points the accumulation of mental experiences shall begin. It might, accordingly, seem as if there were no room for any other agency than this; as if the distinction we have found so useful between “spontaneous variation,” as the producer of changed forms, and the environment, as their preserver and destroyer, did not hold in the case of mental progress; as if, in a word, the parallel with Darwinism might no longer obtain, and Spencer might be quite right with his fundamental law of intelligence, which says, “The cohesion between psychical states is proportionate to the frequency with which the relation between the answering external phenomena has been repeated in experience.”

But, in spite of all these facts, I have no hesitation whatever in holding firm to the Darwinian distinction even here. I maintain that the facts in question are all drawn from the lower strata of the mind, so to speak—from the sphere of its least evolved functions, from the region of intelligence which man possesses in common with the brutes. And I can easily show that throughout the whole extent of those mental departments which are highest, which are most characteristically human, Spencer’s law is violated at every step; and that as a matter of fact the new conceptions, emotions, and active tendencies which evolve are originally produced in the shape of random images, fancies, accidental outbirths of spontaneous variation in the functional activity of the excessively instable human brain, which the outer environment simply confirms or refutes, adopts or rejects, preserves or destroys—selects, in short, just as it selects morphological and social variations due to molecular accidents of an analogous sort.

It is one of the tritest of truisms that human intelligences of a simple order are very literal. They are slaves of habit, doing what they have been taught without variation; dry, prosaic, and matter-of-fact in their remarks; devoid of humor, except of the coarse physical kind which rejoices in a practical joke; taking the world for granted; and possessing in their faithfulness and honesty the single gift by which they are sometimes able to warm us into admiration. But even this faithfulness seems to have a sort of inorganic ring, and to remind us more of the im-

8. That is, if a certain general character be rapidly repeated in our outer experience with a number of strongly contrasted concomitants, it will be sooner abstracted than if its associates are invariable or monotonous.

mutable properties of a piece of inanimate matter than of the steadfastness of a human will capable of alternative choice. When we descend to the brutes, all these peculiarities are intensified. No reader of Schopenhauer can forget his frequent allusions to the *trockener ernst* [dull earnestness] of dogs and horses, nor to their *ehrlichkeit* [honesty]. And every noticer of their ways must receive a deep impression of the fatally literal character of the few, simple, and treadmill-like operations of their minds.

But turn to the highest order of minds, and what a change! Instead of thoughts of concrete things patiently following one another in a beaten track of habitual suggestion, we have the most abrupt crosscuts and transitions from one idea to another, the most rarefied abstractions and discriminations, the most unheard-of combinations of elements, the subtlest associations of analogy; in a word, we seem suddenly introduced into a seething caldron of ideas, where everything is fizzling and bobbing about in a state of bewildering activity, where partnerships can be joined or loosened in an instant, treadmill routine is unknown, and the unexpected seems the only law. According to the idiosyncrasy of the individual, the scintillations will have one character or another. They will be sallies of wit and humor; they will be flashes of poetry and eloquence; they will be constructions of dramatic fiction or of mechanical device, logical or philosophic abstractions, business projects, or scientific hypotheses, with trains of experimental consequences based thereon; they will be musical sounds, or images of plastic beauty or picturesqueness, or visions of moral harmony. But, whatever their differences may be, they will all agree in this—that their genesis is sudden and, as it were, spontaneous. That is to say, the same premises would not, in the mind of another individual, have engendered just that conclusion; although, when the conclusion is offered to the other individual, he may thoroughly accept and enjoy it, and envy the brilliancy of him to whom it first occurred.

To Professor Jevons is due the great credit of having emphatically pointed out how the genius of discovery depends altogether on the number of these random notions and guesses which visit the investigator's mind. To be fertile in hypotheses is the first requisite, and to be willing to throw them away the moment experience contradicts them is the next. The Baconian method of collating tables of instances may be a useful aid at certain times. But one might as well expect a chemist's notebook to write down the name of the body analyzed, or a weather table to sum itself up into a prediction of probabilities of its own accord, as to hope

that the mere fact of mental confrontation with a certain series of facts will be sufficient to make *any* brain conceive their law. The conceiving of the law is a spontaneous variation in the strictest sense of the term. It flashes out of one brain, and no other, because the instability of that brain is such as to tip and upset itself in just that particular direction. But the important thing to notice is that the good flashes and the bad flashes, the triumphant hypotheses and the absurd conceits, are on an exact equality in respect of their origin. Aristotle's absurd Physics and his immortal Logic flow from one source: the forces that produce the one produce the other. When walking along the street, thinking of the blue sky or the fine spring weather, I may either smile at some grotesque whim which occurs to me, or I may suddenly catch an intuition of the solution of a long-unsolved problem, which at that moment was far from my thoughts. Both notions are shaken out of the same reservoir—the reservoir of a brain in which the reproduction of images in the relations of their outward persistence or frequency has long ceased to be the dominant law. But to the thought, when it is once engendered, the consecration of agreement with outward relations may come. The conceit perishes in a moment, and is forgotten. The scientific hypothesis arouses in me a fever of desire for verification. I read, write, experiment, consult experts. Everything corroborates my notion, which being then published in a book spreads from review to review and from mouth to mouth, till at last there is no doubt I am enshrined in the Pantheon of the great diviners of nature's ways. The environment *preserves* the conception which it was unable to *produce* in any brain less idiosyncratic than my own.

Now, the spontaneous upsettings of brains this way and that at particular moments into particular ideas and combinations are matched by their equally spontaneous permanent tiltings or saggings towards determinate directions. The humorous bent is quite characteristic; the sentimental one equally so. And the personal tone of each mind, which makes it more alive to certain classes of experience than others, more attentive to certain impressions, more open to certain reasons, is equally the result of that invisible and unimaginable play of the forces of growth within the nervous system which, irresponsibly to the environment, makes the brain peculiarly apt to function in a certain way. Here again the selection goes on. The products of the mind with the determined aesthetic bent please or displease the community. We adopt Wordsworth, and grow unsentimental and serene. We are fascinated by Schopenhauer, and learn from him the true luxury of woe. The adopted bent becomes a ferment in the community, and alters its tone. The alteration may be a

benefit or a misfortune, for it is (*pace* Mr. Allen) a differentiation from within, which has to run the gauntlet of the larger environment's selective power. Civilized Languedoc, taking the tone of its scholars, poets, princes, and theologians, fell a prey to its rude Catholic environment in the Albigensian crusade. France in 1792, taking the tone of its Saint-Justs and Marats, plunged into its long career of unstable outward relations. Prussia in 1806, taking the tone of its Humboldts and its Steins, proved itself in the most signal way "adjusted" to its environment in 1872.

Mr. Spencer, in one of the strangest chapters of his *Psychology*, tries to show the necessary order in which the development of conceptions in the human race occurs. No abstract conception can be developed, according to him, until the outward experiences have reached a certain degree of heterogeneity, definiteness, coherence, and so forth.

Thus the belief in an unchanging order, the belief in *law*, is a belief of which the primitive man is absolutely incapable. . . . Experiences such as he receives furnish but few data for the conception of uniformity, whether as displayed in things or in relations. . . . The daily impressions which the savage gets yield the notion very imperfectly, and in but few cases. Of all the objects around—trees, stones, hills, pieces of water, clouds, and so forth,—most differ widely, . . . and few approach complete likeness so nearly as to make discrimination difficult. Even between animals of the same species it rarely happens that, whether alive or dead, they are presented in just the same attitudes. . . . It is only along with a gradual development of the arts . . . that there come frequent experiences of perfectly straight lines admitting of complete apposition, bringing the perceptions of equality and inequality. Still more devoid is savage life of the experiences which generate the conception of the uniformity of succession. The sequences observed from hour to hour and day to day seem anything but uniform; difference is a far more conspicuous trait among them. . . . So that if we contemplate primitive human life as a whole, we see that multiformity of sequence, rather than uniformity, is the notion which it tends to generate. . . . Only as fast as the practice of the arts develops the idea of measure can the consciousness of uniformity become clear. . . . Those conditions furnished by advancing civilization which make possible the notion of uniformity simultaneously make possible the notion of *exactness*. . . . Hence the primitive man has little experience which cultivates the consciousness of what we call *truth*. How closely allied this is to the consciousness which the practice of the arts cultivates is implied even in language. We speak of a true surface as well as a true statement. Exactness describes perfection in a mechanical fit, as well as perfect agreement between the results of calculations.

The whole burden of Mr. Spencer's book is to show the fatal way in which the mind, supposed passive, is molded by its experiences of "outer relations." In this chapter the yardstick, the balance, the chronometer, and other machines and instruments come to figure among the "relations" external to the mind. Surely they are so after they have been manufactured, but only because of the preservative power of the social environment. Originally all these things and all other institutions were flashes of genius in an individual head, of which the outer environment showed no sign. Adopted by the race and become its heritage, they then supply instigations to new geniuses whom they environ to make new inventions and discoveries; and so the ball of progress rolls. But take out the geniuses, or alter their idiosyncrasies, and what increasing uniformities will the environment show? We defy Mr. Spencer or anyone else to reply.

The plain truth is that the "philosophy" of evolution (as distinguished from our special information about particular cases of change) is a metaphysical creed, and nothing else. It is a mood of contemplation, an emotional attitude, rather than a system of thought—a mood which is old as the world, and which no refutation of any one incarnation of it (such as the Spencerian philosophy) will dispel; the mood of fatalistic pantheism, with its intuition of the One and All, which was, and is, and ever shall be, and from whose womb each single thing proceeds. Far be it from us to speak slightly here of so hoary and mighty a style of looking on the world as this. What we at present call scientific discoveries had nothing to do with bringing it to birth, nor can one easily conceive that they should ever give it its *quietus*, no matter how logically incompatible with its spirit the ultimate phenomenal distinctions which science accumulates should turn out to be. It can laugh at the phenomenal distinctions on which science is based, for it draws its vital breath from a region which—whether above or below—is at least altogether different from that in which science dwells. A critic, however, who cannot disprove the truth of the metaphysic creed, can at least raise his voice in protest against its disguising itself in "scientific" plumes. I think that all who have had the patience to follow me thus far will agree that the Spencerian "philosophy" of social and intellectual progress is an obsolete anachronism, reverting to a pre-darwinian type of thought, just as the Spencerian philosophy of "Force," effacing all the previous distinctions between actual and potential energy, momentum, work, force, mass, etc., which physicists have with so much agony achieved, carries us back to a pre-Galilean age.

Arthur Schopenhauer ¹

1788–1860

The controversy over education is almost as ancient as philosophy itself. It begins with Plato and Aristotle. Plato's most famous dialogue, *The Republic*,² is in large part an attempt to outline an ideal educational program. Book VIII of Aristotle's *Politics*³ is a criticism of Plato's program and a presentation of Aristotle's own plan for education. From this beginning, the debate on education continues throughout the history of philosophy. It eventually involves (among many others) Montaigne, Descartes, Rousseau, Kant, Schopenhauer, and John Dewey.

Though the education controversy is centuries old, it has never before raged so fiercely as it has in the United States in the twentieth century. During this period, we have witnessed clashes between *progressivists* and *classicists*, between those who favor courses in social adjustment and those who think that all such courses should be eliminated, between those who think that children should learn "at their own pace" and those who want children to be "challenged," between those who favor indoctrination and those who think that children should be given complete intellectual freedom, and so on. A listing of all of the various grounds of dispute would require several pages.

Are Schopenhauer's views on education relevant to any of these controversies? Indeed they are, but partisans of either "traditional" or "modern" education will be disappointed to find that he cannot definitely be aligned on either side of the argument. When he says that "the branches of knowledge which are to be studied at any

¹ For a biography of Schopenhauer, see Vol. 5, pp. 120–122, in this set.

² See *Great Books of the Western World*.

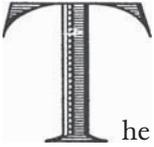

³ See *Great Books of the Western World*.

period of life should be such as the mind is equal to at that period and can perfectly understand," he might appear to be on the side of the modernist. But when he insists that "the memory should be specially taxed in youth," he approaches the traditionalist side.

Schopenhauer's main concern is that the method of education should be as *natural* as possible. In other words, the advance of education should be from the observation of particular facts to the formulation of general principles—not vice versa. If general principles are taught first, says Schopenhauer, they soon become *prejudices* which hinder the individual from seeing the world as it really is. When this occurs (and according to Schopenhauer, it usually does), the individual often must spend most of his adult life *unlearning* his childhood prejudices.

Schopenhauer is one of the most independent thinkers who ever lived. He is almost completely free of the illusions that we tend to associate with thought in the nineteenth century. Reading him today is like reading a contemporary. In fact, in parts of his essay *On Education*, Schopenhauer seems to be in advance of contemporary thinkers.

On Education

he human intellect is said to be so constituted that general ideas arise by abstraction from particular observations, and therefore come after them in point of time. If this is what actually occurs, as happens in the case of a man who has to depend solely upon his own experience for what he learns—who has no teacher and no book—such a man knows quite well which of his particular observations belong to and are represented by each of his general ideas. He has a perfect acquaintance with both sides of his experience, and accordingly he treats everything that comes in his way from a right standpoint. This might be called the natural method of education.

Contrarily, the artificial method is to hear what other people say, to learn and to read, and so to get your head crammed full of general ideas before you have any sort of extended acquaintance with the world as it is, and as you may see it for yourself. You will be told that the particular observations which go to make these general ideas will come to you later on in the course of experience; but until that time arrives you apply your general ideas wrongly, you judge men and things from a wrong standpoint, you see them in a wrong light, and treat them in a wrong way. So it is that education perverts the mind.

This explains why it so frequently happens that, after a long course of learning and reading, we enter upon the world in our youth, partly with an artless ignorance of things, partly with wrong notions about them; so that our demeanor savors at one moment of a nervous anxiety, at another of a mistaken confidence. The reason of this is simply that our head is full of general ideas which we are now trying to turn to some use, but which we hardly ever apply rightly. This is the result of acting in direct opposition to the natural development of the mind by obtaining general ideas first, and particular observations last: it is putting the cart before the horse. Instead of developing the child's own faculties of dis-

cernment, and teaching it to judge and think for itself, the teacher uses all his energies to stuff its head full of the ready-made thoughts of other people. The mistaken views of life, which spring from a false application of general ideas, have afterwards to be corrected by long years of experience; and it is seldom that they are wholly corrected. This is why so few men of learning are possessed of common sense, such as is often to be met with in people who have had no instruction at all.

To acquire a knowledge of the world might be defined as the aim of all education; and it follows from what I have said that special stress should be laid upon beginning to acquire this knowledge at the right end. As I have shown, this means, in the main, that the particular observation of a thing shall precede the general idea of it; further, that narrow and circumscribed ideas shall come before ideas of a wide range. It means, therefore, that the whole system of education shall follow in the steps that must have been taken by the ideas themselves in the course of their formation. But whenever any of these steps are skipped or left out the instruction is defective, and the ideas obtained are false; and finally a distorted view of the world arises, peculiar to the individual himself—a view such as almost everyone entertains for some time, and most men for as long as they live. No one can look into his own mind without seeing that it was only after reaching a very mature age, and in some cases when he least expected it, that he came to a right understanding or a clear view of many matters in his life that, after all, were not very difficult or complicated. Up till then they were points in his knowledge of the world which were still obscure, due to his having skipped some particular lesson in those early days of his education, whatever it may have been like—whether artificial and conventional, or of that natural kind which is based upon individual experience.

It follows that an attempt should be made to find out the strictly natural course of knowledge, so that education may proceed methodically by keeping to it; and that children may become acquainted with the ways of the world without getting wrong ideas into their heads, which very often cannot be got out again. If this plan were adopted, special care would have to be taken to prevent children from using words without clearly understanding their meaning and application. The fatal tendency to be satisfied with words instead of trying to understand things—to learn phrases by heart, so that they may prove a refuge in time of need—exists, as a rule, even in children; and the tendency lasts on into manhood, making the knowledge of many learned persons to consist in mere verbiage.

However, the main endeavor must always be to let particular observations precede general ideas, and not vice versa, as is usually and unfortunately the case; as though a child should come feet foremost into the world, or a verse be begun by writing down the rhyme! The ordinary method is to imprint ideas and opinions, in the strict sense of the world, prejudices, on the mind of the child before it has had any but a very few particular observations. It is thus that he afterwards comes to view the world and gather experience through the medium of those ready-made ideas, rather than to let his ideas be formed for him out of his own experience of life, as they ought to be.

A man sees a great many things when he looks at the world for himself, and he sees them from many sides; but this method of learning is not nearly so short or so quick as the method which employs abstract ideas and makes hasty generalizations about everything. Experience, therefore, will be a long time in correcting preconceived ideas, or perhaps never bring its task to an end; for, wherever a man finds that the aspect of things seems to contradict the general ideas he has formed, he will begin by rejecting the evidence it offers as partial and one sided; nay, he will shut his eyes to it altogether and deny that it stands in any contradiction at all with his preconceived notions, in order that he may thus preserve them uninjured. So it is that many a man carries about a burden of wrong notions all his life long—crotchets, whims, fancies, prejudices, which at last become fixed ideas. The fact is that he has never tried to form his fundamental ideas for himself out of his own experience of life, his own way of looking at the world, because he has taken over his ideas ready made from other people; and this it is that makes him—as it makes how many others!—so shallow and superficial.

Instead of that method of instruction care should be taken to educate children on the natural lines. No idea should ever be established in a child's mind otherwise than by what the child can see for itself, or at any rate it should be verified by the same means; and the result of this would be that the child's ideas, if few, would be well grounded and accurate. It would learn how to measure things by its own standard rather than by another's; and so it would escape a thousand strange fancies and prejudices, and not need to have them eradicated by the lessons it will subsequently be taught in the school of life. The child would, in this way, have its mind once for all habituated to clear views and thoroughgoing knowledge: it would use its own judgment and take an unbiased estimate of things.

And, in general, children should not form their notions of what life is

like from the copy before they have learned it from the original, to whatever aspect of it their attention may be directed. Instead, therefore, of hastening to place books, and books alone, in their hands, let them be made acquainted, step by step, with things—with the actual circumstances of human life. And above all let care be taken to bring them to a clear and objective view of the world as it is, to educate them always to derive their ideas directly from real life, and to shape them in conformity with it—not to fetch them from other sources, such as books, fairy tales, or what people say, and then apply them ready made to real life. For this will mean that their heads are full of wrong notions, and that they will either see things in a false light or try in vain to remodel the world to suit their views, and so enter upon false paths; and that, too, whether they are only constructing theories of life or engaged in the actual business of it. It is incredible how much harm is done when the seeds of wrong notions are laid in the mind in those early years, later on to bear a crop of prejudice; for the subsequent lessons which are learned from real life in the world have to be devoted mainly to their extirpation. To unlearn the evil was the answer which, according to Diogenes Laërtius, Antisthenes gave when he was asked what branch of knowledge was most necessary; and we can see what he meant.

No child under the age of fifteen should receive instruction in subjects which may possibly be the vehicle of serious error, such as philosophy, religion, or any other branch of knowledge where it is necessary to take large views; because wrong notions imbibed early can seldom be rooted out, and of all the intellectual faculties judgment is the last to arrive at maturity. The child should give its attention either to subjects where no error is possible at all, such as mathematics, or to those in which there is no particular danger in making a mistake, such as languages, natural science, history, and so on. And in general, the branches of knowledge which are to be studied at any period of life should be such as the mind is equal to at that period and can perfectly understand. Childhood and youth form the time for collecting materials, for getting a special and thorough knowledge of individual and particular things. In those years it is too early to form views on a large scale; and ultimate explanations must be put off to a later date. The faculty of judgment, which cannot come into play without mature experience, should be left to itself; and care should be taken not to anticipate its action by inculcating prejudice, which will paralyze it forever.

On the other hand, the memory should be specially taxed in youth, since it is then that it is strongest and most tenacious. But in choosing

the things that should be committed to memory the utmost care and forethought must be exercised, as lessons well learned in youth are never forgotten. This precious soil must therefore be cultivated so as to bear as much fruit as possible. If you think how deeply rooted in your memory are those persons whom you knew in the first twelve years of your life, how indelible the impression made upon you by the events of those years, how clear your recollection of most of the things that happened to you then, most of what was told or taught you, it will seem a natural thing to take the susceptibility and tenacity of the mind at that period as the groundwork of education. This may be done by a strict observance of method, and a systematic regulation of the impressions which the mind is to receive.

But the years of youth allotted to man are short, and memory is, in general, bound within narrow limits; still more so the memory of any one individual. Since this is the case, it is all important to fill the memory with what is essential and material in any branch of knowledge, to the exclusion of everything else. The decision as to what is essential and material should rest with the masterminds in every department of thought; their choice should be made after the most mature deliberation, and the outcome of it fixed and determined. Such a choice would have to proceed by shifting the things which it is necessary and important for a man to know in general, and then necessary and important for him to know in any particular business or calling. Knowledge of the first kind would have to be classified, after an encyclopaedic fashion, in graduated courses, adapted to the degree of general culture which a man may be expected to have in the circumstances in which he is placed; beginning with a course limited to the necessary requirements of primary education, and extending upwards to the subjects treated of in all the branches of philosophical thought. The regulation of the second kind of knowledge would be left to those who had shown genuine mastery in the several departments into which it is divided; and the whole system would provide an elaborate rule or canon for intellectual education, which would, of course, have to be revised every ten years. Some such arrangement as this would employ the youthful power of the memory to best advantage, and supply excellent working material to the faculty of judgment, when it made its appearance later on.

A man's knowledge may be said to be mature, in other words, to have reached the most complete state of perfection to which he, as an individual, is capable of bringing it, when an exact correspondence is established between the whole of his abstract ideas and the things he has

actually perceived for himself. This will mean that each of his abstract ideas rests, directly or indirectly, upon a basis of observation, which alone endows it with any real value; and also that he is able to place every observation he makes under the right abstract idea which belongs to it. Maturity is the work of experience alone; and therefore it requires time. The knowledge we derive from our own observation is usually distinct from that which we acquire through the medium of abstract ideas; the one coming to us in the natural way, the other by what people tell us, and the course of instruction we receive, whether it is good or bad. The result is that in youth there is generally very little agreement or correspondence between our abstract ideas, which are merely phrases fixed in the mind, and that real knowledge which we have obtained by our own observation. It is only later on that a gradual approach takes place between these two kinds of knowledge, accompanied by a mutual correction of error; and knowledge is not mature until this coalition is accomplished. This maturity or perfection of knowledge is something quite independent of another kind of perfection, which may be of a high or a low order—the perfection, I mean, to which a man may bring his own individual faculties; which is measured, not by any correspondence between the two kinds of knowledge, but by the degree of intensity which each kind attains.

For the practical man the most needful thing is to acquire an accurate and profound knowledge of the ways of the world. But this, though the most needful, is also the most wearisome of all studies, as a man may reach a great age without coming to the end of his task; whereas, in the domain of the sciences, he masters the more important facts when he is still young. In acquiring that knowledge of the world, it is while he is a novice, namely, in boyhood and in youth, that the first and hardest lessons are put before him; but it often happens that even in later years there is still a great deal to be learned.

The study is difficult enough in itself; but the difficulty is doubled by novels, which represent a state of things in life and the world such as, in fact, does not exist. Youth is credulous, and accepts these views of life, which then become part and parcel of the mind; so that, instead of a merely negative condition of ignorance, you have positive error—a whole tissue of false notions to start with; and at a later date these actually spoil the schooling of experience, and put a wrong construction on the lessons it teaches. If, before this, the youth had no light at all to guide him, he is now misled by a will-o'-the-wisp; still more often is this the case with a girl. They have both had a false view of things foisted onto them

by reading novels; and expectations have been aroused which can never be fulfilled. This generally exercises a baneful influence on their whole life. In this respect those whose youth has allowed them no time or opportunity for reading novels—those who work with their hands and the like—are in a position of decided advantage. There are a few novels to which this reproach cannot be addressed—nay, which have an effect the contrary of bad. First and foremost, to give an example, *Gil Bias*, and the other works of Le Sage (or rather their Spanish originals); further, *The Vicar of Wakefield*, and, to some extent, Sir Walter Scott's novels. *Don Quixote* may be regarded as a satirical exhibition of the error to which I am referring.

The foregoing is from Schopenhauer's
STUDIES IN PESSIMISM.

Michael Faraday

1791–1867

Michael Faraday, one of the great men of science, was born in 1791 in a small village near London, England. His family was very poor, and it was necessary for him to begin working at an early age. When he was twelve, he became an errand boy for a bookseller and bookbinder. He made such an excellent impression upon his employer that a year later he was accepted as an apprentice bookbinder without fee.

Michael had little formal schooling, and the most important part of his early education was obtained from the books he came across in his work. He was particularly interested in works on chemistry and in the electrical treatises in *Encyclopædia Britannica*. When he was twenty, he attended a series of lectures on science by Sir Humphry Davy at the Royal Institution. He made careful notes of the lectures, bound them in a book, and sent them to Davy along with a request for employment at the Royal Institution. Davy at first attempted to discourage him from giving up the trade of bookbinding, but a few months later he offered Faraday the post of laboratory assistant. Faraday accepted, and from that time until his death he was closely associated with the Royal Institution.

As Davy's assistant, Faraday was engaged in many different types of scientific research, including studies of chlorine, glass, and the

Notes from the artist: "A design based on the equipment used in his experiments on the induction of currents forms the background for the portrait of Faraday. The pose was adapted from a portrait taken by C. L. Dodgson, better known as Lewis Carroll."

Michael
Faraday

liquefaction of gases. In 1821 he began work in the field in which he was to make his most important contributions: electromagnetism. The scientific world had been stirred the previous year by the researches of a Danish scientist, H. C. Oersted, which indicated a relationship between electricity and magnetism. Faraday was fascinated with the subject, but he was unable to turn his full attention to it for almost a decade. Then, through a series of experiments made in 1831, he discovered that an electric current could be induced in a coil of wire by the movement of a magnet in its vicinity. He also observed that the same effect could be achieved if the coil was moved while the magnet remained stationary. Later he discovered that an electric current in one wire caused induction in a neighboring wire. These fundamental discoveries led directly to the dynamo and the transformer, and they formed the basis of all subsequent developments in electricity.

Faraday continued his electrical research for many years, keeping a careful record of his observations. He published his findings under the general title *Experimental Researches in Electricity*.¹ The greatness of this work was quickly recognized, and it has long been considered a scientific classic. During his long life, Faraday received almost every important honor which could be bestowed upon a man of science. After a long period of ill health, he died in 1867.

At the time Faraday composed his lecture *Observations on Mental Education*, there was considerable clamor in England about "spiritualism." The air was filled with reports of seances, in which the dead communicated with the living. In a typical seance, a group of persons desiring to communicate with the dead sat around a heavy table in a dimly lit room. If the table moved, it indicated the presence of the dead. Many stories were told of tables rising several feet in the air or moving across a room unassisted.

Faraday was particularly interested in spiritualistic phenomena because many people had attempted to explain them in terms of electricity and magnetism. Always an open-minded man, he refused to pass judgment on such theories until he had personally observed a seance. His observations convinced him that the claims of the spiritualists were completely without substance. He was very dis-

¹ See *Great Books of the Western World*.

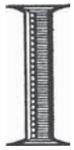

turbed by what he learned about his fellow men through this experience. In a letter written to a friend at the time, he said, "What a weak, credulous, incredulous, unbelieving, superstitious, bold, frightened—what a ridiculous world ours is, as far as concerns the mind of men. How full of inconsistencies, contradictions, and absurdities it is!" He refers to his dealings with the table-movers several times in *Observations on Mental Education*, and the general theme of the lecture seems to have been directly inspired by them.

In his lecture Faraday argues that the greatest intellectual weakness of men is deficiency of judgment. By this he means primarily the tendency of men to draw sweeping conclusions from little or no evidence or to draw conclusions hastily without taking into account all the factors involved. Though he believes that the judgment can be partly trained through formal education, Faraday insists that it can be improved only if the individual is willing to make a strong personal effort. He describes in detail a series of steps by which the judgment can be self-educated.

Each of us is willing to admit that the judgments of others are often faulty, but we are inclined to assume that our own judgment is quite sound and dependable. Nevertheless, it is very unlikely that anyone can read *Observations on Mental Education* without discovering that he is guilty of one or more of the errors of judgment specified by Faraday. It is equally unlikely that the reader will fail to profit from Faraday's advice on how to improve his judgment.

The remarks at the beginning of this lecture are addressed to Prince Albert, who was present in the audience.

Observations on Mental Education

I take courage, Sir, from your presence here this day, to speak boldly that which is upon my mind. I feared that it might be unpleasant to some of my audience, but as I know that your Royal Highness is a champion for and desires the truth, I will believe that all here are united in the same cause, and therefore will give utterance, without hesitation, to what I have to say regarding the present condition of mental education.

If the term education may be understood in so large a sense as to include all that belongs to the improvement of the mind, either by the acquisition of the knowledge of others, or by increase of it through its own exertions, then I may hope to be justified for bringing forward a few desultory observations respecting the exercise of the mental powers in a particular direction, which otherwise might seem out of place. The points I have in view are general, but they are manifest in a striking manner, among the physical matters which have occupied my life; and as the latter afford a field for exercise in which cogitations and conclusions can be subjected to the rigid tests of fact and experiment—as all classes employ themselves more or less in the consideration of physical matters, and may do so with great advantage, if inclined in the least degree to profit by educational practices, so I hope that what I may say will find its application in every condition of life.

Before entering upon the subject, I must take one distinction which, however it may appear to others, is to me of the utmost importance. High as man is placed above the creatures around him, there is a higher and far more exalted position within his view; and the ways are infinite in which he occupies his thoughts about the fears, or hopes, or expectations of a future life. I believe that the truth of that future cannot be brought to his knowledge by any exertion of his mental powers, however exalted

they may be; that it is made known to him by other teaching than his own, and is received through simple belief of the testimony given. Let no one suppose for a moment that the self-education I am about to commend in respect of the things of this life, extends to any considerations of the hope set before us, as if man by reasoning could find out God. It would be improper here to enter upon this subject further than to claim an absolute distinction between religious and ordinary belief. I shall be reproached with the weakness of refusing to apply those mental operations which I think good in respect of high things to the very highest. I am content to bear the reproach. Yet, even in earthly matters, I believe that the invisible things of Him from the creation of the world are clearly seen, being understood by the things that are made, even His eternal power and Godhead; and I have never seen anything incompatible between those things of man which can be known by the spirit of man which is within him, and those higher things concerning his future which he cannot know by that spirit.

Claiming, then, the use of the ordinary faculties of the mind in ordinary things, let me next endeavour to point out what appears to me to be a great deficiency in the exercise of the mental powers in every direction; three words will express this great want, deficiency of judgment. I do not wish to make any startling assertion, but I know that in physical matters multitudes are ready to draw conclusions who have little or no power of judgment in the cases; that the same is true of other departments of knowledge; and that, generally, mankind is willing to leave the faculties which relate to judgment almost entirely uneducated, and their decisions at the mercy of ignorance, prepossessions, the passions, or even accident.

Do not suppose, because I stand here and speak thus, making no exceptions, that I except myself. I have learned to know that I fall infinitely short of that efficacious exercise of the judgment which may be attained. There are exceptions to my general conclusion, numerous and high; but if we desire to know how far education is required, we do not consider the few who need it not, but the many who have it not; and in respect of judgment, the number of the latter is almost infinite. I am moreover persuaded, that the clear and powerful minds which have realized in some degree the intellectual preparation I am about to refer to, will admit its importance, and indeed its necessity; and that they will not except themselves, nor think that I have made my statement too extensive.

As I believe that a very large proportion of the errors we make in judgment is a simple and direct result of our perfectly unconscious state, and think that a demonstration of the liabilities we are subject to would aid

greatly in providing a remedy, I will proceed first to a few illustrations of a physical nature. Nothing can better supply them than the intimations we derive from our senses; to them we trust directly; by them we become acquainted with external things, and gain the power of increasing and varying facts upon which we entirely depend. Our sense perceptions are wonderful. Even in the observant, but unreflective, infant they soon produce a result which looks like intuition because of its perfection. Coming to the mind as so many data, they are stored up and, without our being conscious of it, are ever after used in like circumstances in forming our judgment; and it is not wonderful that man is accustomed to trust them without examination. Nevertheless, the result is the effect of education: the mind has to be instructed with regard to the senses and their intimations through every step of life; and where the instruction is imperfect, it is astonishing how soon and how much their evidence fails us. Yet, in the latter years of life we do not consider this matter, but, having obtained the ordinary teaching sufficient for ordinary purposes, we venture to judge of things which are extraordinary for the time, and almost always with the more assurance as our powers of observation are less educated. Consider the following case of a physical impression, derived from the sense of touch, which can be examined and verified at pleasure: If the hands be brought towards each other so that the tips of the corresponding fingers touch, the end of any finger may be considered as an object to be felt by the opposed finger, thus the two middle fingers may for the present be so viewed. If the attention be directed to them, no difficulty will be experienced in moving each lightly in a circle round the tip of the other, so that they shall each feel the opposite, and the motion may be either in one direction or the other—looking at the fingers, or with eyes employed elsewhere—or with the remaining fingers touching quiescently, or moving in a like direction; all is easy, because each finger is employed in the ordinary or educated manner whilst obeying the will, and whilst communicating through the sentient organ with the brain. But turn the hands half way round, so that their backs shall be towards each other, and then, crossing them at the wrists, again bring the like fingers into contact at the tips. If it be now desired to move the extremities of the middle fingers round each other, or to follow the contour of one finger by the tip of the opposed one, all sorts of confusion in the motion will ensue; and as the finger of one hand tries, under the instruction of the will, to move in one course, the touched finger will convey an intimation that it is moving in another. If all the fingers move at once, all will be in confusion, the ease and simplicity of the first case having entirely disappeared. If, after some

considerable trial, familiarity with the new circumstances have removed part of the uncertainty, then, crossing the hands at the opposite sides of the wrists will renew it. These contrary results are dependent not on any change in the nature of the sentient indication, or of the surfaces or substances which the sense has to deal with, but upon the trifling circumstance of a little variation from the direction in which the sentient organs of these parts are usually exerted, and they show to what an extraordinary extent our interpretations of the sense impressions depend upon the experience, *i.e.*, the education which they have previously received, and their great inability to aid us at once in circumstances which are entirely new.

At other times they fail us because we cannot keep a true remembrance of former impressions. Thus, on the evening of the eleventh of March last, I and many others were persuaded that at one period the moon had a real green colour, and though I knew that the prevailing red tints of the general sky were competent to produce an effect of such a kind, yet there was so little of that in the neighbourhood of the planet, that I was doubtful whether the green tint was not produced on the moon by some aerial medium spread before it, until, by holding up white cards in a proper position, and comparing them with our satellite, I had determined experimentally that the effect was only one of contrast. In the midst of the surrounding tints, my memory could not recall the true sentient impression which the white of the moon most surely had before made upon the eye.

At other times the failure is because one impression is overpowered by another; for as the morning star disappears when the sun is risen, though still above the horizon and shining brightly as ever, so do stronger phenomena obscure weaker, even when both are of the same kind; till an uneducated person is apt to pass the weaker unobserved, and even deny their existence.

So, error results occasionally from believing our senses: it ought to be considered, rather, as an error of the judgment than of the sense, for the latter has performed its duty; the indication is always correct, and in harmony with the great truth of nature. Where, then, is the mistake? Almost entirely with our judgment. We have not had that sufficient instruction by the senses which would justify our making a conclusion; we have to contrive extra and special means, by which their first impressions shall be corrected, or rather enlarged; and it is because our procedure was hasty, our data too few, and our judgment untaught, that we fell into mistake; not because the data were wrong. How frequently may each one of us perceive, in our neighbours, at least, that a result like this derived from the

observation of physical things, happens in the ordinary affairs of common life.

When I become convicted of such haste, which is not unfrequently the case, I look back upon the error as one of “presumptuous judgment.” Under that form it is easily presentable to the mind, and has a useful corrective action. I do not think the expression too strong; for if we are led, either by simplicity or vanity, to give an opinion upon matters respecting which we are not instructed, either by the knowledge of others, or our own intimate observation; if we are induced to ascribe an effect to one force, or deny its relation to another, knowing little or nothing of the laws of the forces, or the necessary conditions of the effect to be considered; surely our judgment must be qualified as “presumptuous.”

There are multitudes who think themselves competent to decide, after the most cursory observation, upon the cause of this or that event (and they may be really very acute and correct in things familiar to them)—a not unusual phrase with them is that “it stands to reason,” that the effect they expect should result from the cause they assign to it, and yet it is very difficult, in numerous cases that appear plain, to show this reason, or to deduce the true and only rational relation of cause and effect. In matters connected with natural philosophy, we have wonderful aid in the progress and assurance in the character, of our final judgment, afforded us by the facts which supply our data, and the experience which multiplies their number and varies their testimony. A fundamental fact, like an elementary principle, never fails us, its evidence is always true; but, on the other hand, we frequently have to ask, “What is the fact?”—often fail in distinguishing it, often fail in the very statement of it, and mostly overpass or come short of its true recognition.

If we are subject to mistake in the interpretation of our mere sense impressions, we are much more liable to error when we proceed to deduce from these impressions (as supplied to us by our ordinary experience), the relation of cause and effect; and the accuracy of our judgment, consequently, is more endangered. Then our dependence should be upon carefully observed facts and the laws of nature; and I shall proceed to a further illustration of the mental deficiency I speak of, by a brief reference to one of these.

The laws of nature, as we understand them, are the foundation of our knowledge in natural things. So much as we know of them has been developed by the successive energies of the highest intellects, exerted through many ages. After a most rigid and scrutinizing examination upon principle and trial, a definite expression has been given to them; they have

become, as it were, our belief or trust. From day to day we still examine and test our expressions of them. We have no interest in their retention if erroneous; on the contrary, the greatest discovery a man could make would be to prove that one of these accepted laws was erroneous, and his greatest honour would be the discovery. Neither would there be any desire to retain the former expression—for we know that the new or the amended law would be far more productive in results, would greatly increase our intellectual acquisitions, and would prove an abundant source of fresh delight to the mind.

These laws are numerous, and are more or less comprehensive. They are also precise; for a law may present an apparent exception, and yet not be less a law to us, when the exception is included in the expression. Thus, that elevation of temperature expands all bodies is a well-defined law, though there be an exception in water for a limited temperature; because we are careful, whilst stating the law, to state the exception and its limits. Pre-eminent among these laws, because of its simplicity, its universality, and its undeviating truth, stands that enunciated by Newton (commonly called the law of gravitation), that matter attracts matter with a force inversely as the square of the distance. Newton showed that, by this law, the general condition of things on the surface of the earth is governed; and the globe itself, with all upon it, kept together as a whole. He demonstrated that the motions of the planets round the sun, and of the satellites about the planets, were subject to it. During and since his time, certain variations in the movements of the planets, which were called irregularities, and might, for aught that was then known, be due to some cause other than the attraction of gravitation, were found to be its necessary consequences. By the close and scrutinizing attention of minds the most persevering and careful, it was ascertained that even the distant stars were subject to this law; and, at last, to place as it were the seal of assurance to its never-failing truth, it became, in the minds of Leverrier and Addams (1845), the foreteller and the discoverer of an orb rolling in the depths of space, so large as to equal nearly sixty earths, yet so far away as to be invisible to the unassisted eye. What truth, beneath that of revelation, can have an assurance stronger than this!

Yet this law is often cast aside as of no value or authority, because of the unconscious ignorance amidst which we dwell. You hear at the present day, that some persons can place their fingers on a table, and then elevating their hands, the table will rise up and follow them; that the piece of furniture, though heavy, will ascend, and that their hands bear no weight, or are not drawn down to the wood; you do not hear of this as a

conjuring manoeuvre, to be shown for your amusement, but are expected seriously to believe it; and are told that it is an important fact, a great discovery amongst the truths of nature. Your neighbour, a well-meaning, conscientious person, believes it; and the assertion finds acceptance in every rank of society, and amongst classes which are esteemed to be educated. Now, what can this imply but that society, speaking generally, is not only ignorant as respects education of the judgment, but is also ignorant of its ignorance. The parties who are thus persuaded, and those who are inclined to think and to hope that they are right, throw up Newton's law at once, and that in a case which of all others is fitted to be tested by it; or if the law be erroneous, to test the law. I will not say they oppose the law, though I have heard the supposed fact quoted triumphantly against it; but as far as my observation has gone, they will not apply it. The law affords the simplest means of testing the fact, and if there be, indeed, anything in the latter new to our knowledge (and who shall say that new matter is not presented to us daily, passing away unrecognized), it also affords the means of placing that before us separately in its simplicity and truth. Then why not consent to apply the knowledge we have to that which is under development? Shall we educate ourselves in what is known, and then casting away all we have acquired, turn to our ignorance for aid to guide us among the unknown? If so, instruct a man to write, but employ one who is unacquainted with letters to read that which is written; the end will be just as unsatisfactory, though not so injurious, for the book of nature, which we have to read, is written by the finger of God. Why should not one who can thus lift a table, proceed to verify and simplify his fact, and bring it into relation with the law of Newton? Why should he not take the top of his table (it may be a small one), and placing it in a balance, or on a lever, proceed to ascertain how much weight he can raise by the draught of his fingers upwards; and of this weight, so ascertained, how much is unrepresented by any pull upon the fingers downward? He will then be able to investigate the further question, whether electricity, or any new force of matter, is made manifest in his operations; or whether action and reaction being unequal, he has at his command the source of a perpetual motion. Such a man, furnished with a nicely constructed carriage on a railway, ought to travel by the mere draught of his own fingers. A far less prize than this would gain him the attention of the whole scientific and commercial world; and he may rest assured, that if he can make the most delicate balance incline or decline by attraction, though it be only with the force of an ounce, or even a

grain, he will not fail to gain universal respect and most honourable reward.

When we think of the laws of nature (which by continued observation have become known to us), as the proper tests to which any new fact or our theoretical representation of it should, in the first place, be subjected, let us contemplate their assured and large character. Let us go out into the field and look at the heavens with their solar, starry, and planetary glories; the sky with its clouds; the waters descending from above or wandering at our feet; the animals, the trees, the plants; and consider the permanency of their actions and conditions under the government of these laws. The most delicate flower, the tenderest insect, continues in its species through countless years; always varying, yet ever the same. When we think we have discovered a departure, as in the *Aphides*, *Medusae*, *Distomae*, etc.,¹ the law concerned is itself the best means of instituting an investigation, and hitherto we have always found the witness to return to its original testimony. These frail things are never ceasing, never changing, evidence of the law's immutability. It would be well for a man who has an anomalous case before him to contemplate a blade of grass, and when he has considered the numerous ceaseless, yet certain, actions there located, and his inability to change the character of the least among them, to recur to his new subject; and, in place of accepting unwatched and unchecked results, to search for a like certainty and recurrence in the appearances and actions which belong to it.

Perhaps it may be said, the delusion of table-moving is past, and need not be recalled before an audience like the present²—even granting this, let us endeavour to make the subject leave one useful result; let it serve for an example, not to pass into forgetfulness. It is so recent, and was received by the public in a manner so strange, as to justify a reference to it, in proof of the uneducated condition of the general mind. I do not object

1. See Claparède's *Account of Alternating Generation and the Metamorphoses of Inferior Animals*.

2. As an illustration of the present state of the subject, I will quote one letter from among many like it which I have received—M. F.

“April 5, 1854.

SIR, I am one of the clergymen of this parish, and have had the subject of table-turning brought under my notice by some of my younger parishioners; I gave your solution of it as a sufficient answer to the mystery. The reply was made, that you had since seen reason to alter your opinion. Would you have the politeness to inform me if you have done so? With many apologies for troubling you,

I am, your obedient servant,
_____.”

to table-moving, for *itself*; for being once stated it becomes a fit, though a very unpromising subject for experiment; but I am opposed to the unwillingness of its advocates to investigate; their boldness to assert; the credulity of the lookers-on; their desire that the reserved and cautious objector should be in error; and I wish, by calling attention to these things, to make the general want of mental discipline and education manifest.

Having endeavoured to point out this great deficiency in the exercise of the intellect, I will offer a few remarks upon the means of subjecting it to the improving processes of instruction. Perhaps many who watch over the interests of the community, and are anxious for its welfare, will conclude that the development of the judgment cannot properly be included in the general idea of education; that as the education proposed must, to a very large degree, be of *self*, it is so far incommunicable; that the master and the scholar merge into one, and both disappear; that the instructor is no wiser than the one to be instructed, and thus the usual relations of the two lose their power. Still, I believe that the judgment may be educated to a very large extent, and might refer to the fine arts, as giving proof in the affirmative; and though, as respects the community and its improvement in relation to common things, any useful education must be of *self*, I think that society, as a body, may act powerfully in the cause. Or it may still be objected that my experience is imperfect, is chiefly derived from exercise of the mind within the precincts of natural philosophy, and has not that generality of application which can make it of any value to society at large. I can only repeat my conviction, that society occupies itself now-days about physical matters, and judges them as common things. Failing in relation to them, it is equally liable to carry such failures into other matters of life. The proof of deficient judgment in one department shows the habit of mind, and the general want, in relation to others. I am persuaded that all persons may find in natural things an admirable school for self-instruction, and a field for the necessary mental exercise; that they may easily apply their habits of thought, thus formed, to a social use; and that they ought to do this, as a duty to themselves and their generation.

Let me first try to illustrate the former part of the case, and at the same time state what I think a man may and ought to do for himself.

The *self-education* to which he should be stimulated by the desire to improve his judgment, requires no blind dependence upon the dogmas of others, but is commended to him by the suggestions and dictates of his own common sense. The first part of it is founded in mental discipline: happily it requires no unpleasant avowals; appearances are preserved,

and vanity remains unhurt; but it is necessary that a man examine himself, and that not carelessly. On the contrary, as he advances, he should become more and more strict, till he ultimately prove a sharper critic to himself than any one else can be; and he ought to intend this, for, so far as he consciously falls short of it, he acknowledges that others may have reason on their side when they criticize him. A first result of this habit of mind will be an internal conviction of ignorance in many things respecting which his neighbours are taught, and, that his opinions and conclusions on such matters ought to be advanced with reservation. A mind so disciplined will be open to correction upon good grounds in all things, even in those it is best acquainted with; and should familiarize itself with the idea of such being the case: for though it sees no reason to suppose itself in error, yet the possibility exists. The mind is not enfeebled by this internal admission, but strengthened; for, if it cannot distinguish proportionately between the probable right and wrong of things known imperfectly, it will tend either to be rash or to hesitate; whilst that which admits the due amount of probability is likely to be justified in the end. It is right that we should stand by and act on our principles; but not right to hold them in obstinate blindness, or retain them when proved to be erroneous. I remember the time when I believed a spark was produced between voltaic metals as they approached to contact (and the reasons why it might be possible yet remain); but others doubted the fact and denied the proofs, and on re-examination I found reason to admit their corrections were well founded. Years ago I believed that electrolytes could conduct electricity by a conduction proper; that has also been denied by many through long time: though I believed myself right, yet circumstances have induced me to pay that respect to criticism as to reinvestigate the subject, and I have the pleasure of thinking that nature confirms my original conclusions. So though evidence may appear to preponderate extremely in favour of a certain decision, it is wise and proper to hear a counter-statement. You can have no idea how often and how much, under such an impression, I have desired that the marvellous descriptions which have reached me might prove, in some points, correct; and how frequently I have submitted myself to hot fires, to friction with magnets, to the passes of hands, etc., lest I should be shutting out discovery—encouraging the strong desire that something might be true, and that I might aid in the development of a new force of nature.

Among those points of self-education which take up the form of mental discipline, there is one of great importance, and, moreover, difficult to deal with, because it involves an internal conflict, and equally touches our

vanity and our ease. It consists in the tendency to deceive ourselves regarding all we wish for, and the necessity of resistance to these desires. It is impossible for any one who has not been constrained, by the course of his occupation and thoughts, to a habit of continual self-correction to be aware of the amount of error in relation to judgment arising from this tendency. The force of the temptation which urges us to seek for such evidence and appearances as are in favour of our desires, and to disregard those which oppose them, is wonderfully great. In this respect we are all, more or less, active promoters of error. In place of practising wholesome self-abnegation, we ever make the wish the father to the thought: we receive as friendly that which agrees with, we resist with dislike that which opposes us; whereas the very reverse is required by every dictate of common sense. Let me illustrate my meaning by a case where the proof being easy, the rejection of it under the temptation is the more striking. In old times a ring or a button would be tied by a boy to one end of a long piece of thread, which he would then hold at the other end, letting the button hang within a glass, or over a piece of slate-pencil, or sealing-wax, or a nail; he would wait and observe whether the button swung, and whether in swinging it tapped the glass as many times as the clock struck last, or moved along or across the slate-pencil, or in a circle or oval. In late times parties in all ranks of life have renewed and repeated the boy's experiment. They have sought to ascertain a very simple fact—namely, whether the effect was as reported; but how many were unable to do this? They were sure they could keep their hands immovable—were sure they could do so whilst watching the result—were sure that accordance of swing with an expected direction was not the result of their desires or involuntary motions. How easily all these points could be put to the proof by not looking at the objects, yet how difficult for the experimenter to deny himself that privilege. I have rarely found one who would freely permit the substance experimented with to be screened from his sight, and then its position changed.

When engaged in the investigation of table-turning, I constructed a very simple apparatus, serving as an index, to show the unconscious motions of the hands upon the table. The results were either that the index moved before the table, or that neither index nor table moved; and in numerous cases all moving power was annihilated. A universal objection was made to it by the table-turners. It was said to paralyze the powers of the mind—but the experimenters need not see the index; they may leave their friends to watch that, and their minds may revel in any power that their expectation or their imagination can confer. So restrained, a *dislike*

to the trial arises; but what is that except a proof that whilst they trust themselves they doubt themselves, and are not willing to proceed to the decision, lest the trust which they like should fail them, and the doubt which they dislike rise to the authority of truth.

Again, in respect of the action of magnets on the body, it is almost impossible for an uninstructed person to enter profitably upon such an inquiry. He may observe *any* symptom which his expectation has been accidentally directed to—yet be unconscious of any, if unaware of his subjection to the magnetic force or of the conditions and manner of its application.

As a proof of the extent of this influence, even on the minds of those well aware of its force, and desirous under every circumstance to escape from it, I will mention the practice of the chemist, who, dealing with the balance, that impartial decider which never fails in its indication but offers its evidence with all simplicity, durability, and truth, still remembers he should doubt himself; and, with the desire of rendering himself inaccessible to temptation, takes a counterpoised but unknown quantity of the substance for analysis, that he may remain ignorant of the proportions which he ought to obtain, and only at last compares the sum of his products with his counterpoise.

The inclination we exhibit in respect of any report or opinion that harmonizes with our preconceived notions, can only be compared in degree with the incredulity we entertain towards everything that opposes them; and these opposite and apparently incompatible, or at least inconsistent, conditions are accepted simultaneously in the most extraordinary manner. At one moment a departure from the laws of nature is admitted without the pretence of a careful examination of the proof; and at the next, the whole force of these laws, acting undeviatingly through all time, is denied, because the testimony they give is disliked.

It is my firm persuasion that no man can examine himself in the most common things, having any reference to him personally, or to any person, thought, or matter related to him, without being soon made aware of the temptation and the difficulty of opposing it. I could give you many illustrations personal to myself, about atmospheric magnetism, lines of force, attraction, repulsion, unity of power, nature of matter, etc.; or in things more general to our common nature, about likes and dislikes, wishes, hopes, and fears; but it would be unsuitable and also unnecessary, for each must be conscious of a large field sadly uncultivated in this respect. *I will simply express my strong belief that that point of self-education which consists in teaching the mind to resist its desires and inclinations,*

until they are proved to be right, is the most important of all, not only in things of natural philosophy, but in every department of daily life.

There are numerous precepts resulting more or less from the principles of mental discipline already insisted on as essential, which are very useful in forming a judgment about matters of fact, whether among natural things or between man and man. Such a precept, and one that should recur to the mind early in every new case, is to know the conditions of the matter, respecting which we are called upon to make a judgment. To suppose that any would judge before they professed to know the conditions would seem to be absurd; on the other hand, to assume that the community does wait to know the conditions before it judges is an assumption so large that I cannot accept it. Very few search out the conditions; most are anxious to sink those which oppose their preconceptions; yet none can be left out if a right judgment is to be formed. It is true that many conditions must ever remain unknown to us even in regard to the simplest things in nature: thus as to the wonderful action of gravity, whose law never fails us, we cannot say whether the bodies are acting truly at a distance, or by a physical line of force as a connecting link between them. The great majority think the former is the case; Newton's judgment is for the latter. But of the conditions which are within our reach we should search out all; for in relation to those which remain unknown or unsuspected, we are in that very ignorance (regarding judgment) which it is our present object, first to make manifest, and then to remove.

One exercise of the mind, which largely influences the power and character of the judgment, is the habit of forming clear and precise ideas. If, after considering a subject in our ordinary manner, we return upon it with the special purpose of noticing the condition of our thoughts, we shall be astonished to find how little precise they remain. On recalling the phenomena relating to a matter of fact, the circumstances modifying them, the kind and amount of action presented, the real or probable result, we shall find that the first impressions are scarcely fit for the foundation of a judgment, and that the second thoughts will be best. For the acquirement of a good condition of mind in this respect, the thoughts should be trained to a habit of clear and precise formation, so that vivid and distinct impressions of the matter in hand, its circumstances and consequences, may remain.

Before we proceed to consider any question involving physical principles, we should set out with clear ideas of the naturally possible and impossible. There are many subjects uniting more or less of the most sure

and valuable investigations of science with the most imaginary and unprofitable speculation, that are continually passing through their various phases of intellectual, experimental, or commercial development: some to be established, some to disappear, and some to recur again and again, like ill weeds that cannot be extirpated, yet can be cultivated to no result as wholesome food for the mind. Such, for instance, in different degrees, are the caloric engine, the electric light, the Pasilalinic sympathetic compass, mesmerism, homeopathy, odyalism, the magneto-electric engine, the perpetual motion, etc.: all hear and talk of these things; all use their judgment more or less upon them, and all might do that effectively if they were to instruct themselves to the extent which is within their reach. I am persuaded that natural things offer an admirable school for self-instruction, a most varied field for the necessary mental practice, and that those who exercise themselves therein may easily apply the habits of thought thus formed to a social use. As a first step in such practice, clear ideas should be obtained of what is possible and what is impossible. Thus, it is impossible to *create* force. We may employ it; we may evoke it in one form by its consumption in another; we may hide it for a period; but we can neither create nor destroy it. We may cast it away; but where we dismiss it, there it will do its work. If, therefore, we desire to consider a proposition respecting the employment or evolution of power, let us carry our judgment, educated on this point, with us. If the proposal include the double use of a force with only one excitement, it implies a creation of power, and that cannot be. If we could by the fingers draw a heavy piece of wood or stone upward without effort, and then, letting it sink, could produce by its gravity an effort equal to its weight, that would be a creation of power, and cannot be.

So again we cannot annihilate matter, nor can we create it. But if we are satisfied to rest upon that dogma, what are we to think of table-lifting? If we could make the table to cease from acting by gravity upon the earth beneath it, or by reaction upon the hand supposed to draw it upwards, we should annihilate it, in respect of that very property which characterizes it as matter.

Considerations of this nature are very important aids to the judgment; and when a statement is made claiming our assent, we should endeavour to reduce it to some consequence which can be immediately compared with, and tried by, these or like compact and never failing truths. If incompatibility appears, then we have reason to suspend our conclusion, however attractive to the imagination the proposition may be, and pursue the inquiry further, until accordance is obtained; it must be a most un-

educated and presumptuous mind that can at once consent to cast off the tried truth and accept in its place the mere loud assertion. We should endeavour to separate the points before us, and concentrate each, so as to evolve a clear type idea of the ruling fact and its consequences; looking at the matter on every side, with the great purpose of distinguishing the constituent reality, and recognizing it under every variety of aspect.

In like manner we should accustom ourselves to clear and definite language, especially in physical matters, giving to a word its true and full, but measured, meaning, that we may be able to convey our ideas clearly to the minds of others. Two persons cannot mutually impart their knowledge, or compare and rectify their conclusions, unless both attend to the true intent and force of language. If by such words as attraction, electricity, polarity, or atom, they imply different things, they may discuss facts, deny results, and doubt consequences for an indefinite time without any advantageous progress. I hold it as a great point in self-education that the student should be continually engaged in forming exact ideas, and in expressing them clearly by language. Such practice insensibly opposes any tendency to exaggeration or mistake, and increases the sense and love of truth in every part of life.

I should be sorry, however, if what I have said were understood as meaning that education for the improvement and strengthening of the judgment is to be altogether repressive of the imagination, or confine the exercise of the mind to processes of a mathematical or mechanical character. I believe that, in the pursuit of physical science, the imagination should be taught to present the subject investigated in all possible, and even in impossible views; to search for analogies of likeness and (if I may say so) of opposition—inverse or contrasted analogies; to present the fundamental idea in every form, proportion, and condition; to clothe it with suppositions and probabilities, that all cases may pass in review, and be touched, if needful, by the Ithuriel spear of experiment. But all this must be under government, and the result must not be given to society until the judgment, educated by the process itself, has been exercised upon it. Let us construct our hypotheses for an hour, or a day, or for years; they are of the utmost value in the elimination of truth, “which is evolved more freely from error than from confusion”; but, above all things, let us not cease to be aware of the temptation they offer, or, because they gradually become familiar to us, accept them as established. We could not reason about electricity without thinking of it as a fluid, or a vibration, or some other existent state or form. We should give up half our advantage in the consideration of heat if we refused to con-

sider it as a principle, or a state of motion. We could scarcely touch such subjects by experiment, and we should make no progress in their practical application, without hypothesis; still it is absolutely necessary that we should learn to doubt the conditions we assume, and acknowledge we are uncertain, whether heat and electricity are vibrations or substances, or either.

When the different data required are in our possession, and we have succeeded in forming a clear idea of each, the mind should be instructed to balance them one against another, and not suffered carelessly to hasten to a conclusion. This reserve is most essential; and it is especially needful that the reasons which are adverse to our expectations or our desires should be carefully attended to. We often receive truth from unpleasant sources; we often have reason to accept unpalatable truths. We are never freely willing to admit information having this unpleasant character, and it requires much self-control in this respect, to preserve us even in a moderate degree from errors. I suppose there is scarcely one investigator in original research who has not felt the temptation to disregard the reasons and results which are against his views. I acknowledge that I have experienced it very often, and will not pretend to say that I have yet learned on all occasions to avoid the error. When a bar of bismuth or phosphorus is placed between the poles of a powerful magnet, it is drawn into a position across the line joining the poles; when only one pole is near the bar, the latter recedes; this and the former effect is due to repulsion, and is strikingly in contrast with the attraction shown by iron. To account for it, I at one time suggested the idea that a polarity was induced in the phosphorus or bismuth the reverse of the polarity induced in iron, and that opinion is still sustained by eminent philosophers. But observe a necessary result of such a supposition, which appears to follow when the phenomena are referred to elementary principles. Time is shown, by every result bearing on the subject, to be concerned in the coming on and passing away of the inductive condition produced by magnetic force, and the consequence, as Thomson pointed out, is, that if a ball of bismuth could be suspended between the poles of a magnet, so as to encounter no resistance from the surrounding medium, or from friction or torsion, and were once put in motion round a vertical axis, it would, because of the assumed polar state, go on for ever revolving, the parts which at any moment are axial moving like the bar, so as to become the next moment equatorial. Now, as we believe the mechanical forces of nature tend to bring things into a stable, and not into an unstable condition; as we believe that a perpetual motion is impossible; so because both these points

are involved in the notion of the reverse polarity, which itself is not supposed to be dependant on any consumption of power, I feel bound to hold the judgment balanced, and therefore hesitate to accept a conclusion founded on such a notion of the physical action; the more especially as the peculiar test facts³ which prove the polarity of iron are not reproduced in the case of diamagnetic bodies.

As a result of this wholesome mental condition, we should be able to form a proportionate judgment. The mind naturally desires to settle upon one thing or another; to rest upon an affirmative or a negative; and that with a degree of absolutism which is irrational and improper. In drawing a conclusion it is very difficult, but not the less necessary, to make it proportionate to the evidence: except where certainty exists (a case of rare occurrence), we should consider our decisions as probable only. The probability may appear very great, so that in affairs of the world we often accept such as certainty, and trust our welfare or our lives upon it. Still, only an uneducated mind will confound probability with certainty, especially when it encounters a contrary conclusion drawn by another from like data. This suspension in degree of judgment will not make a man less active in life, or his conclusions less certain as truths; on the contrary, I believe him to be the more ready for the right amount and direction of action on any emergency; and am sure his conclusions and statements will carry more weight in the world than those of the incautious man.

When I was young, I received from one well able to aid a learner in his endeavours toward self-improvement, a curious lesson in the mode of estimating the amount of belief one might be induced to attach to our conclusions. The person was Dr. Wollaston, who, upon a given point, was induced to offer me a wager of two to one on the affirmative. I rather impertinently quoted Butler's well-known lines⁴ about the kind of persons who use wagers for argument, and he gently explained to me, that he considered such a wager not as a thoughtless thing, but as an expression of the amount of belief in the mind of the person offering it; combining this curious application of the wager, as a meter, with the necessity that ever existed of drawing conclusions, not absolute but proportionate to the evidence.

Occasionally and frequently the exercise of the judgment ought to end

3. *Experimental Researches in Electricity*, paragraphs 2657–2681. See *Great Books of the Western World*.

4. "Quoth she, 'I've heard old cunning stagers,
Say fools for arguments use wagers.'"

in absolute reservation. It may be very distasteful, and great fatigue, to suspend a conclusion, but as we are not infallible, so we ought to be cautious; we shall eventually find our advantage, for the man who rests in his position is not so far from right as he who, proceeding in a wrong direction, is ever increasing his distance. In the year 1824, Arago discovered that copper and other bodies placed in the vicinity of a magnet, and having no direct action of attraction or repulsion upon it, did affect it when moved, and was affected by it. A copper plate revolving near a magnet carried the magnet with it; or if the magnet revolved, and not the copper, it carried the copper with it. A magnetic needle vibrating freely over a disc of glass or wood, was exceedingly retarded in its motion when these were replaced by a disc of copper. Arago stated most clearly all the conditions, and resolved the forces into three directions, but not perceiving the physical cause of the action, exercised a most wise and instructive reservation as to his conclusion. Others, as Haldat, considered it as the proof of the universality of a magnetism of the ordinary kind, and held to that notion though it was contradicted by the further facts; and it was only at a future period that the true physical cause, namely, magneto-electric currents induced in the copper, became known to us. What an education Arago's mind must have received in relation to philosophical reservation; what an antithesis he forms with the mass of table-turners; and what a fine example he has left us of that condition of judgment to which we should strive to attain!

If I may give another illustration of the needful reservation of judgment, I will quote the case of oxygen and hydrogen gases, which, being mixed, will remain together uncombined for years in contact with glass, but in contact with spongy platinum combine at once. We have the same fact in many forms, and many suggestions have been made as to the mode of action, but as yet we do not know clearly how the result comes to pass. We cannot tell whether electricity acts or not. Then we should suspend our conclusions. Our knowledge of the fact itself, and the many varieties of it, is not the less abundant or sure; and when the truth shall hereafter emerge from the mist, we ought to have no opposing prejudice, but be prepared to receive it.

The education which I advocate will require patience and labour of thought in every exercise tending to improve the judgment. It matters not on what subject a person's mind is occupied, he should engage in it with the conviction that it will require mental labour. A powerful mind will be able to draw a conclusion more readily and more correctly than one of moderate character, but both will surpass themselves if they make an

earnest, careful investigation, instead of a careless or prejudiced one; and education for this purpose is the more necessary for the latter, because the man of less ability may, through it, raise his rank and amend his position. I earnestly urge this point of self-education, for I believe it to be more or less in the power of every man greatly to improve his judgment. I do not think that one has the complete capacity for judgment which another is naturally without. I am of opinion that all may judge, and that we only need to declare on every side the conviction that mental education is wanting, and lead men to see that through it they hold, in a large degree, their welfare and their character in their own hands, to cause in future years an abundant development of right judgment in every class.

This education has for its first and its last step *humility*. It can commence only because of a conviction of deficiency; and if we are not disheartened under the growing revelations which it will make, that conviction will become stronger unto the end. But the humility will be founded, not on comparison of ourselves with the imperfect standards around us, but on the increase of that internal knowledge which alone can make us aware of our internal wants. The first step in correction is to learn our deficiencies, and having learned them, the next step is almost complete: for no man who has discovered that his judgment is hasty, or illogical, or imperfect would go on with the same degree of haste, or irrationality, or presumption as before. I do not mean that all would at once be cured of bad mental habits, but I think better of human nature than to believe, that a man in any rank of life, who has arrived at the consciousness of such a condition, would deny his common sense, and still judge and act as before. And though such self-schooling must continue to the end of life to supply an experience of deficiency rather than of attainment, still there is abundant stimulus to excite any man to perseverance. What he has lost are things imaginary, not real; what he gains are riches before unknown to him, yet invaluable; and though he may think more humbly of his own character, he will find himself at every step of his progress more sought for than before, more trusted with responsibility and held in pre-eminence by his equals, and more highly valued by those whom he himself will esteem worthy of approbation.

And now a few words upon the mutual relation of two classes, namely, those who decline to educate their judgments in regard to the matters on which they decide, and those who, by self-education, have endeavoured to improve themselves; and upon the remarkable and somewhat unreasonable manner in which the latter are called upon, and occasionally

taunted, by the former. A man who makes assertions, or draws conclusions, regarding any given case, ought to be competent to investigate it. He has no right to throw the onus on others, declaring it their duty to prove him right or wrong. His duty is to demonstrate the truth of that which he asserts, or to cease from asserting. The men he calls upon to consider and judge have enough to do with themselves, in the examination, correction, or verification of their own views. The world little knows how many of the thoughts and theories which have passed through the mind of a scientific investigator have been crushed in silence and secrecy by his own severe criticism and adverse examination; that in the most successful instances, not a tenth of the suggestions, the hopes, the wishes, the preliminary conclusions have been realised. And is a man so occupied to be taken from his search after truth in the path he hopes may lead to its attainment, and occupied in vain upon nothing but a broad assertion?

Neither has the assertor of any new thing a right to claim an answer in the form of Yes or No; or think, because none is forthcoming, that he is to be considered as having established his assertion. So much is unknown to the wisest man, that he may often be without an answer: as frequently he is so, because the subject is in the region of hypothesis, and not of facts. In either case he has the right to refuse to speak. I cannot tell whether there are two fluids of electricity or any fluid at all. I am not bound to explain how a table tilts any more than to indicate how, under the conjurer's hands, a pudding appears in a hat. The means are not known to me. I am persuaded that the results, however strange they may appear, are in accordance with that which is truly known, and if carefully investigated would justify the well-tried laws of nature; but, as life is limited, I am not disposed to occupy the time it is made of in the investigation of matters which, in what is known to me of them, offer no reasonable prospect of any useful progress, or anything but negative results. We deny the right of those who call upon us to answer their speculations "if we can," whilst we have so many of our own to develop and correct; and claim the right for ourselves of withholding either our conclusions or the reasons for them, without in the least degree admitting that their affirmations are unanswerable. We are not even called upon to give an answer to the best of our belief: nor bound to admit a bold assertion because we do not know to the contrary. No one is justified in claiming our assent to the spontaneous generation of insects, because we cannot circumstantially explain how a mite or the egg of a mite has entered into a particular bottle. Let those who affirm the exception to the

general law of nature, or those others who upon the affirmation accept the result, work out the experimental proof. It has been done in this case by Schulze, and is in the negative; but how few among the many who make, or repeat, the assertion, would have the requisite self-abnegation, the subjected judgment, the perseverance, and the precision which has been displayed in that research.

When men, more or less marked by their advance, are led by circumstances to give an opinion adverse to any popular notion, or to the assertions of any sanguine inventor, nothing is more usual than the attempt to neutralize the force of such an opinion by reference to the mistakes which like educated men have made; and their occasional misjudgments and erroneous conclusions are quoted, as if they were less competent than others to give an opinion, being even disabled from judging like matters to those which are included in their pursuits by the very exercise of their minds upon them. How frequently has the reported judgment of Davy, upon the impossibility of gas-lighting on a large scale, been quoted by speculators engaged in tempting monied men into companies, or in the pages of journals occupied with the popular fancies of the day; as if an argument were derivable from that in favour of some special object to be commended. Why should not men taught in the matter of judgment far beyond their neighbours, be expected to err sometimes, since the very education in which they are advanced can only terminate with their lives? What is there about them, derived from this education, which sets up the shadow of a pretence to perfection? Such men cannot learn all things, and may often be ignorant. The very progress which science makes amongst them as a body is a continual correction of ignorance—*i.e.*, of a state which is ignorance in relation to the future, though wisdom and knowledge in relation to the past. In 1823 Wollaston discovered that beautiful substance which he called titanium, believing it to be a simple metal: and it was so accepted by all philosophers. Yet this was a mistake, for Wöhler, in 1850, showed the substance was a very compound body. This is no reproach to Wollaston or to those who trusted in him; he made a step in metallurgy which advanced knowledge, and perhaps we may hereafter, through it, learn to know that metals are compound bodies. Who, then, has a right to quote his mistake as a reproach against him? Who could correct him but men intellectually educated as he himself was? Who does not feel that the investigation remains a bright gem in the circlet that memory offers to his honour?

If we are to estimate the utility of an educated judgment, do not let us hear merely of the errors of scientific men, which have been corrected

by others taught in the same careful school; but let us see what, as a body, they have produced, compared with that supplied by their reproachers. Where are the established truths and triumphs of ring-swingers, table-turners, table-speakers? What one result in the numerous divisions of science or its applications can be traced to their exertions? Where is the investigation completed, so that, as in gas-lighting, all may admit that the principles are established and a good end obtained, without the shadow of a doubt?

If we look to electricity, it, in the hands of the careful investigator, has advanced to the most extraordinary results: it approaches at the motion of his hand; bursts from the metal; descends from the atmosphere; surrounds the globe: it talks, it writes, it records, it appears to him (cautious as he has learned to become) as a universal spirit in nature. If we look to photography, whose origin is of our own day, and see what it has become in the hands of its discoverers and their successors, how wonderful are the results! The light is made to yield impressions upon the dead silver or the coarse paper, beautiful as those it produced upon the living and sentient retina: its most transient impression is rendered durable for years; it is made to leave a visible or an invisible trace; to give a result to be seen now or a year hence; made to paint all natural forms and even colours; it serves the offices of war, of peace, of art, science, and economy: it replaces even the mind of the human being in some of its lower services; for a little camphine lamp is set down and left to itself, to perform the duty of watching the changes of magnetism, heat, and other forces of nature, and to record the results, in pictorial curves, which supply an enduring record of their most transitory actions.

What has clairvoyance, or mesmerism, or table-rapping done in comparison with results like these? What have the snails at Paris told us from the snails at New York? What have any of these intelligences done in aiding such developments? Why did they not inform us of the possibility of photography? Or when that became known, why did they not favour us with some instructions for its improvement? They all profess to deal with agencies far more exalted in character than an electric current or a ray of light: they also deal with mechanical forces; they employ both the bodily organs and the mental; they profess to lift a table, to turn a hat, to see into a box, or into the next room, or a town—why should they not move a balance, and so give us the element of a new mechanical power? Take cognizance of a bottle and its contents, and tell us how they will act upon those of a neighbouring bottle? Either see or feel into a crystal, and inform us of what it is composed? Why have they not added one

metal to the fifty known to mankind, or one planet to the number daily increasing under the observant eye of the astronomer? Why have they not corrected one of the mistakes of the philosophers? There are no doubt very many that require it. There has been plenty of time for the development and maturation of some of the numerous public pretences that have risen up in connexion with these supposed agencies; how is it that not one new power has been added to the means of investigation employed by the philosophers, or one valuable utilitarian application presented to society?

In conclusion, I will freely acknowledge that all I have said regarding the great want of judgment manifested by society as a body, and the high value of any means which would tend to supply the deficiency, have been developed and declared on numerous occasions, by authority far above any I possess. The deficiency is known hypothetically, but I doubt if in reality; the individual acknowledges the state in respect of others, but is unconscious of it in regard to himself. As to the world at large, the condition is accepted as a necessary fact; and so it is left untouched, almost ignored. I think that education in a large sense should be applied to this state of the subject, and that society, though it can do little in the way of communicated experience, can do much, by a declaration of the evil that exists and of its remediable character; by keeping alive a sense of the deficiency to be supplied; and by directing the minds of men to the practice and enlargement of that self-education which every one pursues more or less, but which under conviction and method would produce a tenfold amount of good. I know that the multitude will always be behindhand in this education, and to a far greater extent than in respect of the education which is founded on book learning. Whatever advance books make, they retain; but each new being comes on to the stage of life, with the same average amount of conceit, desires, and passions, as his predecessors, and in respect of self-education has all to learn. Does the circumstance that we can do little more than proclaim the necessity of instruction justify the ignorance? Or our silence? Or make the plea for this education less strong? Should it not, on the contrary, gain its strength from the fact that all are wanting more or less? I desire we should admit that, as a body, we are universally deficient in judgment. I do not mean that we are utterly ignorant, but that we have advanced only a little way in the requisite education, compared with what is within our power.

If the necessity of the education of the judgment were a familiar and habitual idea with the public, it would often afford a sufficient answer to

the statement of an ill-informed or incompetent person; if quoted to recall to his remembrance the necessity of a mind instructed in a matter, and accustomed to balance evidence, it might frequently be an answer to the individual himself. Adverse influence might, and would, arise from the careless, the confident, the presumptuous, the hasty, and the dilatory man, perhaps extreme opposition; but I believe that the mere acknowledgment and proclamation of the ignorance, by society at large, would, through its moral influence, destroy the opposition, and be a great means to the attainment of the good end desired: for if no more be done than to lead such to turn their thoughts inwards, a step in education is gained: if they are convinced in any degree, an important advance is made; if they learn only to suspend their judgment, the improvement will be one above price.

It is an extraordinary thing that man, with a mind so wonderful that there is nothing to compare with it elsewhere in the known creation, should leave it to run wild in respect of its highest elements and qualities. He has a power of comparison and judgment, by which his final resolves, and all those acts of his material system which distinguish him from the brutes, are guided—shall he omit to educate and improve them when education can do much? Is it towards the very principles and privileges that distinguish him above other creatures, he should feel indifference? Because the education is internal, it is not the less needful; nor is it more the duty of a man that he should cause his child to be taught than that he should teach himself. Indolence may tempt him to neglect the self-examination and experience which form his school, and weariness may induce the evasion of the necessary practices; but surely a thought of the prize should suffice to stimulate him to the requisite exertion: and to those who reflect upon the many hours and days, devoted by a lover of sweet sounds, to gain a moderate facility upon a mere mechanical instrument, it ought to bring a correcting blush of shame, if they feel convicted of neglecting the beautiful living instrument, wherein play all the powers of the mind.

I will conclude this subject—believe me when I say I have been speaking from self-conviction. I did not think this an occasion on which I ought to seek for flattering words regarding our common nature; if so, I should have felt unfaithful to the trust I had taken up; so I have spoken from experience. In thought I hear the voice, which judges me by the precepts I have uttered. I know that I fail frequently in that very exercise of judgment to which I call others; and have abundant reason to believe that much more frequently I stand manifest to those around me, as one

who errs, without being corrected by knowing it. I would willingly have evaded appearing before you on this subject, for I shall probably do but little good, and may well think it was an error of judgment to consent: having consented, my thoughts would flow back amongst the events and reflections of my past life, until I found nothing present itself but an open declaration, almost a confession, as the means of performing the duty due to the subject and to you.

LECTURES ON EDUCATION.

Edmund Burke

1729–1797

Edmund Burke was born in Dublin. January 12, 1729, is the most probable date. His father, a well-to-do lawyer, was a Protestant, his mother a Roman Catholic. Burke took his B.A. at Trinity College, Dublin. In 1750 he began to read law at the Middle Temple, London. He soon turned to writing. His first two books appeared in 1756. The same year he married the daughter of a Dr. Nugent, of Bath.

In 1761 he went back to Dublin for a while in the household of the Secretary for Ireland. When Rockingham became British Prime Minister in 1765, he hired Burke as his secretary. Burke went into Parliament as a member for Wendover. Two speeches on the American problem made his reputation. About this time he joined “The Club,” whose members, then or later, included Dr. Johnson, Gibbon, Adam Smith, Boswell, and Burke’s father-in-law, Dr. Nugent.

Burke fought hard to get workable justice for the American Colonies. Out of this quarrel sprang such powerful arguments as his *Speech on Conciliation with America* and the *Letter to the Sheriffs of Bristol* (see below). Some of his most famous speeches were delivered during his fourteen-year prosecution of Warren Hastings for high crimes in India. Hastings was acquitted.

In 1790 Burke’s *Reflections on the Revolution in France* became the manifesto of conservative Europe. George III and Catherine of Russia praised it. It ran through eleven editions in about a year. Thomas Paine replied to it in *The Rights of Man*. Most of the other Whig leaders favored the French Revolution at first. Thus Burke was thrust more and more outside his party’s councils. In 1794 he resigned from Parliament. He was given a pension of £2,500. The Duke of Bedford and Lord Lauderdale objected to this. Burke

replied with a last great flash of eloquence in *A Letter to a Noble Lord*. He died on July 9, 1797.

In the late twentieth century we have speeches and White House press conferences on the television networks. At the same moment a whole nation may see and listen to the President, a senator, or a candidate. Burke, like Lincoln and Washington, spoke to a few hundred people. His printed words might reach a few thousand more. He held no great offices, led no armies, put his name to no important treaties. So we find it hard to imagine how he gained his tremendous reputation.

Part of the answer lies in his concentration. He was a statesman—altogether that, and nothing but that. Everything he did was done in that light. Unlike Cicero, his model as a writer and a man, he was not an effective orator. He lacked the commanding voice and presence. Nor was he a great politician. His record, as a party strategist and at the polls, is dotted with errors. Moreover, he seems to have been—a little too often—the honorable champion of lost causes. But he comes down to us, formidable still, as the great framer of issues. He was the one man in his nation and time who could fasten on some political problem, spell it out in bold letters, and place it in relation to the general ideas that influence the life of mankind.

His talent is close to its best in a *Letter to the Sheriffs of Bristol*. Here his famous style—large, firm, bold—builds a solid house of argument. When the letter was written, he was a member of Parliament from Bristol, at that time the second largest city in England. It is a “letter” in format only—in fact, like all his writings, it is a speech. He is aware that he has been criticized for “steadily pursuing the pernicious maxim of not obeying the voice of his constituents.” Here—to the sheriffs, who were important local officials, and through

Notes from the artist: “Burke is shown sitting under a quotation from Reflections on the Revolution in France. He had defended the American Revolution but attacked the French because of its excesses and what he considered to be crimes against humanity.”

Because half a dozen grasshoppers under a fern make the field ring with their importunate chink, whilst thousands of great cattle, reposed beneath the shadow of the British oak, chew the cud and are silent, pray do not imagine that those who make the noise are the only inhabitants of the field; that, of course, they are many in number, or that, after all, they are other than the, little, shrivelled, meagre, hopping, though loud and troublesome *insects* of the hour.

them to the voters—Burke gives an account of his recent service in Parliament and of the motives that led him to act as he did.

But this is only the immediate pretext for his letter. He writes in the midst of the American Revolution. He knows that many of the voters in his district are anti-American. He lays out the full force of his logic in the hope that he can persuade them to his own views. Here his political intentions and his devotion to the ruling ideas of freedom and justice merge in one powerful argument. Thoroughness, as John Morley said, was one of his great virtues. He knows what he is talking about. He does not set Englishmen against Americans, as the war has done. He speaks of both as Englishmen, and argues that what hurts one hurts the other. The partial suspension of habeas corpus is as dangerous to English liberty as it is unjust to Americans. “Bodies,” he writes, “tied together by so unnatural a bond of union as mutual hatred are only connected to their ruin.” So he pleads for a quick ending to the war in “an honourable and liberal accommodation.”

Few Englishmen listened. Burke and his friends could only wait for the muffled drums of Yorktown in 1781.

Letter to the Sheriffs of Bristol

Gentlemen—I have the honour of sending you the two last acts which have been passed with regard to the troubles in America. These acts are similar to all the rest which have been made on the same subject. They operate by the same principle, and they are derived from the very same policy. I think they complete the number of this sort of statutes to nine. It affords no matter for very pleasing reflection to observe that our subjects diminish as our laws increase.

If I have the misfortune of differing with some of my fellow-citizens on this great and arduous subject, it is no small consolation to me that I do not differ from you. With you I am perfectly united. We are heartily agreed in our detestation of a civil war. We have ever expressed the most unqualified disapprobation of all the steps which have led to it, and of all those which tend to prolong it. And I have no doubt that we feel exactly the same emotions of grief and shame on all its miserable consequences, whether they appear, on the one side or the other, in the shape of victories or defeats, of captures made from the English on the continent or from the English in these islands, of legislative regulations which subvert the liberties of our brethren or which undermine our own.

Of the first of these statutes (that for the letter of marque) I shall say little. Exceptionable as it may be, and as I think it is in some particulars, it seems the natural, perhaps necessary, result of the measures we have taken and the situation we are in. The other (for a partial suspension of the *habeas corpus*) appears to me of a much deeper malignity. During its progress through the House of Commons, it has been amended, so as to express, more distinctly than at first it did, the avowed sentiments of those who framed it; and the main ground of my exception to it is, because it does express, and does carry into execution, purposes which appear to me so contradictory to all the principles, not only of the constitutional policy

of Great Britain, but even of that species of hostile justice which no asperity of war wholly extinguishes in the minds of a civilized people.

It seems to have in view two capital objects: the first, to enable administration to confine, as long as it shall think proper, those whom that act is pleased to qualify by the name of *pirates*. Those so qualified I understand to be the commanders and mariners of such privateers and ships of war belonging to the colonies as in the course of this unhappy contest may fall into the hands of the crown. They are therefore to be detained in prison, under the criminal description of piracy, to a future trial and ignominious punishment, whenever circumstances shall make it convenient to execute vengeance on them, under the colour of that odious and infamous offence.

To this first purpose of the law I have no small dislike, because the act does not (as all laws and all equitable transactions ought to do) fairly describe its object. The persons who make a naval war upon us, in consequence of the present troubles, may be rebels; but to call and treat them as pirates is confounding not only the natural distinction of things, but the order of crimes—which, whether by putting them from a higher part of the scale to the lower or from the lower to the higher, is never done without dangerously disordering the whole frame of jurisprudence. Though piracy may be, in the eye of the law, a *less* offence than treason, yet, as both are, in effect, punished with the same death, the same forfeiture, and the same corruption of blood, I never would take from any fellow-creature whatever any sort of advantage which he may derive to his safety from the pity of mankind, or to his reputation from their general feelings, by degrading his offence, when I cannot soften his punishment. The general sense of mankind tells me that those offences which may possibly arise from mistaken virtue are not in the class of infamous actions. Lord Coke, the oracle of the English law, conforms to that general sense, where he says that “those things which are of the highest criminality may be of the least disgrace.” The act prepares a sort of masked proceeding, not honourable to the justice of the kingdom, and by no means necessary for its safety. I cannot enter into it. If Lord Balmerino, in the last rebellion, had driven off the cattle of twenty clans, I should have thought it would have been a scandalous and low juggle, utterly unworthy of the manliness of an English judicature, to have tried him for felony as a stealer of cows.

Besides, I must honestly tell you that I could not vote for, or countenance in any way, a statute which stigmatizes with the crime of piracy these men whom an act of Parliament had previously put out of the protection of the law. When the legislature of this kingdom had ordered all

their ships and goods, for the mere new-created offence of exercising trade, to be divided as a spoil among the seamen of the navy—to consider the necessary reprisal of an unhappy, proscribed, interdicted people, as the crime of piracy, would have appeared, in any other legislature than ours, a strain of the most insulting and most unnatural cruelty and injustice. I assure you I never remember to have heard of anything like it in any time or country.

The second professed purpose of the act is to detain in England for trial those who shall commit high treason in America.

That you may be enabled to enter into the true spirit of the present law, it is necessary, Gentlemen, to apprise you that there is an act, made so long ago as in the reign of Henry VIII, before the existence or thought of any English colonies in America, for the trial in this kingdom of treasons committed out of the realm. In the year 1769 Parliament thought proper to acquaint the crown with their construction of that act in a formal address, wherein they entreated his Majesty to cause persons charged with high treason in America to be brought into this kingdom for trial. By this act of Henry VIII, so construed and so applied, almost all that is substantial and beneficial in a trial by jury is taken away from the subject in the colonies. This is, however, saying too little; for to try a man under that act is, in effect, to condemn him unheard. A person is brought hither in the dungeon of a ship's hold; thence he is vomited into a dungeon on land, loaded with irons, unfurnished with money, unsupported by friends, three thousand miles from all means of calling upon or confronting evidence, where no one local circumstance that tends to detect perjury can possibly be judged of; such a person may be executed according to form, but he can never be tried according to justice.

I therefore could never reconcile myself to the bill I send you, which is expressly provided to remove all inconveniences from the establishment of a mode of trial which has ever appeared to me most unjust and most unconstitutional. Far from removing the difficulties which impede the execution of so mischievous a project, I would heap new difficulties upon it, if it were in my power. All the ancient, honest, juridical principles and institutions of England are so many clogs to check and retard the headlong course of violence and oppression. They were invented for this one good purpose, that what was not just should not be convenient. Convinced of this, I would leave things as I found them. The old, cool-headed, general law is as good as any deviation dictated by present heat.

I could see no fair, justifiable expedience pleaded to favour this new suspension of the liberty of the subject. If the English in the colonies can

support the independency to which they have been unfortunately driven, I suppose nobody has such a fanatical zeal for the criminal justice of Henry VIII that he will contend for executions which must be retaliated tenfold on his own friends, or who has conceived so strange an idea of English dignity as to think the defeats in America compensated by the triumphs at Tyburn. If, on the contrary, the colonies are reduced to the obedience of the crown, there must be, under that authority, tribunals in the country itself fully competent to administer justice on all offenders. But if there are not, and that we must suppose a thing so humiliating to our government as that all this vast continent should unanimously concur in thinking that no ill fortune can convert resistance to the royal authority into a criminal act, we may call the effect of our victory peace, or obedience, or what we will, but the war is not ended; the hostile mind continues in full vigour, and it continues under a worse form. If your peace be nothing more than a sullen pause from arms, if their quiet be nothing but the meditation of revenge, where smitten pride smarting from its wounds festers into new rancour, neither the act of Henry VIII nor its handmaid of this reign will answer any wise end of policy or justice. For, if the bloody fields which they saw and felt are not sufficient to subdue the reason of America, (to use the expressive phrase of a great lord in office,) it is not the judicial slaughter which is made in another hemisphere against their universal sense of justice that will ever reconcile them to the British government.

I take it for granted, Gentlemen, that we sympathize in a proper horror of all punishment further than as it serves for an example. To whom, then, does the example of an execution in England for this American rebellion apply? Remember, you are told every day, that the present is a contest between the two countries, and that we in England are at war for our own dignity against our rebellious children. Is this true? If it be, it is surely among such rebellious children that examples for disobedience should be made, to be in any degree instructive: for who ever thought of teaching parents their duty by an example from the punishment of an undutiful son? As well might the execution of a fugitive Negro in the plantations be considered as a lesson to teach masters humanity to their slaves. Such executions may, indeed satiate our revenge; they may harden our hearts, and puff us up with pride and arrogance. Alas! this is not instruction.

If anything can be drawn from such examples by a parity of the case, it is to show how deep their crime and how heavy their punishment will be, who shall at any time dare to resist a distant power actually disposing

of their property without their voice or consent to the disposition, and overturning their franchises without charge or hearing. God forbid that England should ever read this lesson written in the blood of any of her offspring!

War is at present carried on between the king's natural and foreign troops, on one side, and the English in America, on the other, upon the usual footing of other wars; and accordingly an exchange of prisoners has been regularly made from the beginning. If, notwithstanding this hitherto equal procedure, upon some prospect of ending the war with success (which, however, may be delusive) administration prepares to act against those as traitors who remain in their hands at the end of the troubles, in my opinion we shall exhibit to the world as indecent a piece of injustice as ever civil fury has produced. If the prisoners who have been exchanged have not by that exchange been virtually pardoned, the cartel (whether avowed or understood) is a cruel fraud; for you have received the life of a man, and you ought to return a life for it, or there is no parity or fairness in the transaction.

If, on the other hand, we admit that they who are actually exchanged are pardoned, but contend that you may justly reserve for vengeance those who remain unexchanged, then this unpleasant and unhandsome consequence will follow: that you judge of the delinquency of men merely by the time of their guilt, and not by the heinousness of it; and you make fortune and accidents, and not the moral qualities of human action, the rule of your justice.

These strange incongruities must ever perplex those who confound the unhappiness of civil dissension with the crime of treason. Whenever a rebellion really and truly exists, which is as easily known in fact as it is difficult to define in words, government has not entered into such military conventions, but has ever declined all intermediate treaty which should put rebels in possession of the law of nations with regard to war. Commanders would receive no benefits at their hands, because they could make no return for them. Who has ever heard of capitulation, and parole of honour, and exchange of prisoners in the late rebellions in this kingdom? The answer to all demands of that sort was, "We can engage for nothing; you are at the king's pleasure." We ought to remember, that, if our present enemies be in reality and truth rebels, the king's generals have no right to release them upon any conditions whatsoever; and they are themselves answerable to the law, and as much in want of a pardon, for doing so, as the rebels whom they release.

Lawyers, I know, cannot make the distinction for which I contend; be-

cause they have their strict rule to go by. But legislators ought to do what lawyers cannot; for they have no other rules to bind them but the great principles of reason and equity and the general sense of mankind. These they are bound to obey and follow; and rather to enlarge and enlighten law by the liberality of legislative reason than to fetter and bind their higher capacity by the narrow constructions of subordinate, artificial justice. If we had adverted to this, we never could consider the convulsions of a great empire, not disturbed by a little disseminated faction, but divided by whole communities and provinces, and entire legal representatives of a people, as fit matter of discussion under a commission of Oyer and Terminer. It is as opposite to reason and prudence as it is to humanity and justice.

This act, proceeding on these principles, that is, preparing to end the present troubles by a trial of one sort of hostility under the name of piracy, and of another by the name of treason, and executing the act of Henry VIII according to a new and unconstitutional interpretation, I have thought evil and dangerous, even though the instruments of effecting such purposes had been merely of a neutral quality.

But it really appears to me, that the means which this act employs are, at least, as exceptionable as the end. Permit me to open myself a little upon this subject, because it is of importance to me, when I am obliged to submit to the power without acquiescing in the reason of an act of legislature, that I should justify my dissent by such arguments as may be supposed to have weight with a sober man.

The main operative regulation of the act is to suspend the common law, and the statute *habeas corpus* (the sole securities either for liberty or justice), with regard to all those who have been out of the realm, or on the high seas, within a given time. The rest of the people, as I understand, are to continue as they stood before.

I confess, Gentlemen, that this appears to me as bad in the principle, and far worse in its consequence, than a universal suspension of the *Habeas Corpus* Act; and the limiting qualification, instead of taking out the sting, does in my humble opinion sharpen and envenom it to a greater degree. Liberty, if I understand it at all, is a general principle, and the clear right of all the subjects within the realm or of none. Partial freedom seems to me a most invidious mode of slavery. But, unfortunately, it is the kind of slavery the most easily admitted in times of civil discord; for parties are but too apt to forget their own future safety in their desire of sacrificing their enemies. People without much difficulty admit the entrance of that injustice of which they are not to be the immediate victims.

In times of high proceeding it is never the faction of the predominant power that is in danger; for no tyranny chastises its own instruments. It is the obnoxious and the suspected who want the protection of law; and there is nothing to bridle the partial violence of state factions but this: "that whenever an act is made for a cessation of law and justice, the whole people should be universally subjected to the same suspension of their franchises." The alarm of such a proceeding would then be universal. It would operate as a sort of call of the nation. It would become every man's immediate and instant concern to be made very sensible of the absolute necessity of this total eclipse of liberty. They would more carefully advert to every renewal, and more powerfully resist it. These great determined measures are not commonly so dangerous to freedom. They are marked with too strong lines to slide into use. No plea, nor pretence, of inconvenience or evil example (which must in their nature be daily and ordinary incidents) can be admitted as a reason for such mighty operations. But the true danger is, when liberty is nibbled away, for expedients, and by parts. The *Habeas Corpus* Act supposes, contrary to the genius of most other laws, that the lawful magistrate may see particular men with a malignant eye, and it provides for that identical case. But when men, in particular descriptions, marked out by the magistrate himself, are delivered over by Parliament to this possible malignity, it is not the *habeas corpus* that is occasionally suspended, but its spirit that is mistaken, and its principle that is subverted. Indeed nothing is security to any individual but the common interest of all.

This act, therefore, has this distinguished evil in it, that it is the first *partial* suspension of the *habeas corpus* that has been made. The precedent, which is always of very great importance, is now established. For the first time a distinction is made among the people within this realm. Before this act, every man putting his foot on English ground, every stranger owing only a local and temporary allegiance, even Negro slaves who had been sold in the colonies and under an act of Parliament, became as free as every other man who breathed the same air with them. Now a line is drawn, which may be advanced farther and farther at pleasure on the same argument of mere expedience on which it was first described. There is no equality among us; we are not fellow-citizens, if the mariner who lands on the quay does not rest on as firm legal ground as the merchant who sits in his counting-house. Other laws may injure the community, this dissolves it. As things now stand, every man in the West Indies, every one inhabitant of three unoffending provinces on the continent, every person coming from the East Indies, every gentleman who

has travelled for his health or education, every mariner who has navigated the seas, is, for no other offence, under a temporary proscription. Let any of these facts (now become presumptions of guilt) be proved against him, and the bare suspicion of the crown puts him out of the law. It is even by no means clear to me whether the negative proof does not lie upon the person apprehended on suspicion to the subversion of all justice.

I have not debated against this bill in its progress through the House, because it would have been vain to oppose and impossible to correct it. It is some time since I have been clearly convinced that in the present state of things all opposition to any measures proposed by ministers, where the name of America appears, is vain and frivolous. You may be sure that I do not speak of my opposition, which in all circumstances must be so, but that of men of the greatest wisdom and authority in the nation. Everything proposed against America is supposed of course to be in favour of Great Britain. Good and ill success are equally admitted as reasons for persevering in the present methods. Several very prudent and very well-intentioned persons were of opinion that during the prevalence of such dispositions, all struggle rather inflamed than lessened the distemper of the public councils. Finding such resistance to be considered as factious by most within doors, and by very many without, I cannot conscientiously support what is against my opinion, nor prudently contend with what I know is irresistible. Preserving my principles unshaken, I reserve my activity for rational endeavours; and I hope that my past conduct has given sufficient evidence that if I am a single day from my place, it is not owing to indolence or love of dissipation. The slightest hope of doing good is sufficient to recall me to what I quitted with regret. In declining for some time my usual strict attendance, I do not in the least condemn the spirit of those gentlemen who, with a just confidence in their abilities (in which I claim a sort of share from my love and admiration of them), were of opinion that their exertions in this desperate case might be of some service. They thought that by contracting the sphere of its application they might lessen the malignity of an evil principle. Perhaps they were in the right. But when my opinion was so very clearly to the contrary, for the reasons I have just stated, I am sure my attendance would have been ridiculous.

I must add in further explanation of my conduct that, far from softening the features of such a principle, and thereby removing any part of the popular odium or natural terrors attending it, I should be sorry that anything framed in contradiction to the spirit of our Constitution did not in-

stantly produce, in fact, the grossest of the evils with which it was pregnant in its nature. It is by lying dormant a long time, or being at first very rarely exercised, that arbitrary power steals upon a people. On the next unconstitutional act, all the fashionable world will be ready to say—Your prophecies are ridiculous, your fears are vain, you see how little of the mischiefs which you formerly foreboded are come to pass. Thus, by degrees, that artful softening of all arbitrary power, the alleged infrequency or narrow extent of its operation, will be received as a sort of aphorism—and Mr. Hume will not be singular in telling us that the felicity of mankind is no more disturbed by it than by earthquakes or thunder or the other more unusual accidents of nature.

The act of which I speak is among the fruits of the American war; a war in my humble opinion productive of many mischiefs of a kind which distinguish it from all others. Not only our policy is deranged, and our empire distracted, but our laws and our legislative spirit appear to have been totally perverted by it. We have made war on our colonies, not by arms only, but by laws. As hostility and law are not very concordant ideas, every step we have taken in this business has been made by trampling on some maxim of justice, or some capital principle of wise government. What precedents were established, and what principles overturned (I will not say of English privilege, but of general justice), in the Boston Port, the Massachusetts Charter, the Military Bill, and all that long array of hostile acts of Parliament by which the war with America has been begun and supported! Had the principles of any of these acts been first exerted on English ground they would probably have expired as soon as they touched it. But by being removed from our persons they have rooted in our laws, and the latest posterity will taste the fruits of them.

Nor is it the worst effect of this unnatural contention that our laws are corrupted. Whilst manners remain entire, they will correct the vices of law, and soften it at length to their own temper. But we have to lament that in most of the late proceedings we see very few traces of that generosity, humanity, and dignity of mind which formerly characterized this nation. War suspends the rules of moral obligation, and what is long suspended is in danger of being totally abrogated. Civil wars strike deepest of all into the manners of the people. They vitiate their politics; they corrupt their morals; they pervert even the natural taste and relish of equity and justice. By teaching us to consider our fellow-citizens in a hostile light, the whole body of our nation becomes gradually less dear to us. The very names of affection and kindred, which were the bond of charity whilst we agreed, become new incentives to hatred and rage,

when the communion of our country is dissolved. We may flatter ourselves that we shall not fall into this misfortune. But we have no charter of exemption, that I know of, from the ordinary frailties of our nature.

What but that blindness of heart which arises from the frenzy of civil contention could have made any persons conceive the present situation of the British affairs as an object of triumph to themselves, or of congratulation to their sovereign? Nothing surely could be more lamentable to those who remember the flourishing days of this kingdom than to see the insane joy of several unhappy people, amidst the sad spectacle which our affairs and conduct exhibit to the scorn of Europe. We behold (and it seems some people rejoice in beholding) our native land, which used to sit the envied arbiter of all her neighbours, reduced to a servile dependence on their mercy—acquiescing in assurances of friendship which she does not trust, complaining of hostilities which she dares not resent, deficient to her allies, lofty to her subjects, and submissive to her enemies—whilst the liberal government of this free nation is supported by the hireling sword of German boors and vassals, and three millions of the subjects of Great Britain are seeking for protection to English privileges in the arms of France!

These circumstances appear to me more like shocking prodigies than natural changes in human affairs. Men of firmer minds may see them without staggering or astonishment. Some may think them matters of congratulation and complimentary addresses; but I trust your candour will be so indulgent to my weakness as not to have the worse opinion of me for my declining to participate in this joy, and my rejecting all share whatsoever in such a triumph. I am too old, too stiff in my inveterate partialities, to be ready at all the fashionable evolutions of opinion. I scarcely know how to adapt my mind to the feelings with which the Court Gazettes mean to impress the people. It is not instantly that I can be brought to rejoice, when I hear of the slaughter and captivity of long lists of those names which have been familiar to my ears from my infancy, and to rejoice that they have fallen under the sword of strangers, whose barbarous appellations I scarcely know how to pronounce. The glory acquired at the White Plains by Colonel Rahl has no charms for me, and I fairly acknowledge that I have not yet learned to delight in finding Fort Kniphausen in the heart of the British dominions.

It might be some consolation for the loss of our old regards, if our reason were enlightened in proportion as our honest prejudices are removed. Wanting feelings for the honour of our country, we might then in

cold blood be brought to think a little of our interests as individual citizens and our private conscience as moral agents.

Indeed, our affairs are in a bad condition. I do assure those gentlemen who have prayed for war, and obtained the blessing they have sought, that they are at this instant in very great straits. The abused wealth of this country continues a little longer to feed its distemper. As yet they, and their German allies of twenty hireling states, have contended only with the unprepared strength of our own infant colonies. But America is not subdued. Not one unattacked village which was originally adverse throughout that vast continent has yet submitted from love or terror. You have the ground you encamp on, and you have no more. The cantonments of your troops and your dominions are exactly of the same extent. You spread devastation, but you do not enlarge the sphere of authority.

The events of this war are of so much greater magnitude than those who either wished or feared it ever looked for, that this alone ought to fill every considerate mind with anxiety and diffidence. Wise men often tremble at the very things which fill the thoughtless with security. For many reasons I do not choose to expose to public view all the particulars of the state in which you stood with regard to foreign powers during the whole course of the last year. Whether you are yet wholly out of danger from them is more than I know, or than your rulers can divine. But even if I were certain of my safety, I could not easily forgive those who had brought me into the most dreadful perils, because by accidents, unforeseen by them or me, I have escaped.

Believe me, Gentlemen, the way still before you is intricate, dark, and full of perplexed and treacherous mazes. Those who think they have the clue may lead us out of this labyrinth. We may trust them as amply as we think proper; but as they have most certainly a call for all the reason which their stock can furnish, why should we think it proper to disturb its operation by inflaming their passions? I may be unable to lend a helping hand to those who direct the state; but I should be ashamed to make myself one of a noisy multitude to halloo and hearten them into doubtful and dangerous courses. A conscientious man would be cautious how he dealt in blood. He would feel some apprehension at being called to a tremendous account for engaging in so deep a play without any sort of knowledge of the game. It is no excuse for presumptuous ignorance, that it is directed by insolent passion. The poorest being that crawls on earth, contending to save itself from injustice and oppression, is an object respectable in the eyes of God and man. But I cannot conceive any

existence under heaven (which in the depths of its wisdom tolerates all sorts of things) that is more truly odious and disgusting than an impotent, helpless creature, without civil wisdom or military skill, without a consciousness of any other qualification for power but his servility to it, bloated with pride and arrogance, calling for battles which he is not to fight, contending for a violent dominion which he can never exercise, and satisfied to be himself mean and miserable, in order to render others contemptible and wretched.

If you and I find our talents not of the great and ruling kind, our conduct, at least, is conformable to our faculties. No man's life pays the forfeit of our rashness. No desolate widow weeps tears of blood over our ignorance. Scrupulous and sober in a well-grounded distrust of ourselves, we would keep in the port of peace and security; and perhaps in recommending to others something of the same diffidence, we should show ourselves more charitable to their welfare than injurious to their abilities.

There are many circumstances in the zeal shown for civil war which seem to discover but little of real magnanimity. The addressers offer their own persons, and they are satisfied with hiring Germans. They promise their private fortunes, and they mortgage their country. They have all the merit of volunteers, without risk of person or charge of contribution; and when the unfeeling arm of a foreign soldiery pours out their kindred blood like water, they exult and triumph as if they themselves had performed some notable exploit. I am really ashamed of the fashionable language which has been held for some time past, which, to say the best of it, is full of levity. You know that I allude to the general cry against the cowardice of the Americans, as if we despised them for not making the king's soldiery purchase the advantage they have obtained at a dearer rate. It is not, Gentlemen, it is not to respect the dispensations of Providence, nor to provide any decent retreat in the mutability of human affairs. It leaves no medium between insolent victory and infamous defeat. It tends to alienate our minds further and further from our natural regards, and to make an eternal rent and schism in the British nation. Those who do not wish for such a separation would not dissolve that cement of reciprocal esteem and regard which can alone bind together the parts of this great fabric. It ought to be our wish, as it is our duty, not only to forbear this style of outrage ourselves, but to make every one as sensible as we can of the impropriety and unworthiness of the tempers which give rise to it, and which designing men are labouring with such malignant industry to diffuse amongst us. It is our business to counteract them, if possible—if possible, to awake our natural regards, and to revive

the old partiality to the English name. Without something of this kind I do not see how it is ever practicable really to reconcile with those whose affection, after all, must be the surest hold of our government, and which is a thousand times more worth to us than the mercenary zeal of all the circles of Germany.

I can well conceive a country completely overrun, and miserably wasted, without approaching in the least to settlement. In my apprehension, as long as English government is attempted to be supported over Englishmen by the sword alone, things will thus continue. I anticipate in my mind the moment of the final triumph of foreign military force. When that hour arrives (for it may arrive), then it is that all this mass of weakness and violence will appear in its full light. If we should be expelled from America, the delusion of the partisans of military government might still continue. They might still feed their imaginations with the possible good consequences which might have attended success. Nobody could prove the contrary by facts. But in case the sword should do all that the sword can do, the success of their arms and the defeat of their policy will be one and the same thing. You will never see any revenue from America. Some increase of the means of corruption, without ease of the public burdens, is the very best that can happen. Is it for this that we are at war—and in such a war?

As to the difficulties of laying once more the foundations of that government which, for the sake of conquering what was our own, has been voluntarily and wantonly pulled down by a court faction here, I tremble to look at them. Has any of these gentlemen who are so eager to govern all mankind shown himself possessed of the first qualification towards government, some knowledge of the object, and of the difficulties which occur in the task they have undertaken?

I assure you, that, on the most prosperous issue of your arms, you will not be where you stood when you called in war to supply the defects of your political establishment. Nor would any disorder or disobedience to government which could arise from the most abject concession on our part ever equal those which will be felt after the most triumphant violence. You have got all the intermediate evils of war into the bargain.

I think I know America—if I do not, my ignorance is incurable, for I have spared no pains to understand it—and I do most solemnly assure those of my constituents who put any sort of confidence in my industry and integrity, that everything that has been done there has arisen from a total misconception of the object: that our means of originally holding America, that our means of reconciling with it after quarrel, of recover-

ing it after separation, of keeping it after victory, did depend, and must depend, in their several stages and periods, upon a total renunciation of that unconditional submission which has taken such possession of the minds of violent men. The whole of those maxims upon which we have made and continued this war must be abandoned. Nothing, indeed (for I would not deceive you), can place us in our former situation. That hope must be laid aside. But there is a difference between bad and the worst of all. Terms relative to the cause of the war ought to be offered by the authority of Parliament. An arrangement at home promising some security for them ought to be made. By doing this, without the least impairing of our strength, we add to the credit of our moderation, which, in itself, is always strength more or less.

I know many have been taught to think that moderation in a case like this is a sort of treason, and that all arguments for it are sufficiently answered by railing at rebels and rebellion, and by charging all the present or future miseries which we may suffer on the resistance of our brethren. But I would wish them, in this grave matter, and if peace is not wholly removed from their hearts, to consider seriously, first, that to criminate and recriminate never yet was the road to reconciliation, in any difference amongst men. In the next place, it would be right to reflect that the American English (whom they may abuse, if they think it honourable to revile the absent) can, as things now stand, neither be provoked at our railing or bettered by our instruction. All communication is cut off between us. But this we know with certainty, that, though we cannot reclaim them, we may reform ourselves. If measures of peace are necessary, they must begin somewhere; and a conciliatory temper must precede and prepare every plan of reconciliation. Nor do I conceive that we suffer anything by thus regulating our own minds. We are not disarmed by being disencumbered of our passions. Declaiming on rebellion never added a bayonet or a charge of powder to your military force; but I am afraid that it has been the means of taking up many muskets against you.

This outrageous language, which has been encouraged and kept alive by every art, has already done incredible mischief. For a long time, even amidst the desolations of war, and the insults of hostile laws daily accumulated on one another, the American leaders seem to have had the greatest difficulty in bringing up their people to a declaration of total independence. But the Court Gazette accomplished what the abettors of independence had attempted in vain. When that disingenuous compilation and strange medley of railing and flattery was adduced as a proof

of the united sentiments of the people of Great Britain, there was a great change throughout all America. The tide of popular affection, which had still set towards the parent country, began immediately to turn, and to flow with great rapidity in a contrary course. Far from concealing these wild declarations of enmity, the author of the celebrated pamphlet which prepared the minds of the people for independence¹ insists largely on the multitude and the spirit of these addresses; and he draws an argument from them, which, if the fact were as he supposes, must be irresistible. For I never knew a writer on the theory of government so partial to authority as not to allow that the hostile mind of the rulers to their people did fully justify a change of government; nor can any reason whatever be given why one people should voluntarily yield any degree of pre-eminence to another but on a supposition of great affection and benevolence towards them. Unfortunately, your rulers, trusting to other things, took no notice of this great principle of connection. From the beginning of this affair, they have done all they could to alienate your minds from your own kindred; and if they could excite hatred enough in one of the parties towards the other, they seemed to be of opinion that they had gone half the way towards reconciling the quarrel.

I know it is said, that your kindness is only alienated on account of their resistance, and therefore, if the colonies surrender at discretion, all sort of regard, and even much indulgence, is meant towards them in future. But can those who are partisans for continuing a war to enforce such a surrender be responsible (after all that has passed) for such a future use of a power that is bound by no compacts and restrained by no terror? Will they tell us what they call indulgences? Do they not at this instant call the present war and all its horrors a lenient and merciful proceeding?

No conqueror that I ever heard of has professed to make a cruel, harsh, and insolent use of his conquest. No! The man of the most declared pride scarcely dares to trust his own heart with this dreadful secret of ambition. But it will appear in its time; and no man who professes to reduce another to the insolent mercy of a foreign arm ever had any sort of goodwill towards him. The profession of kindness, with that sword in his hand, and that demand of surrender, is one of the most provoking acts of his hostility. I shall be told that all this is lenient as against rebellious adversaries. But are the leaders of their faction more lenient to those who submit? Lord Howe and General Howe have powers, under an act of

1. Burke refers to Thomas Paine's *Common Sense*.

Parliament, to restore to the king's peace and to free trade any men or district which shall submit. Is this done? We have been over and over informed by the authorized gazette, that the city of New York and the countries of Staten and Long Island have submitted voluntarily and cheerfully, and that many are very full of zeal to the cause of administration. Were they instantly restored to trade? Are they yet restored to it? Is not the benignity of two commissioners, naturally most humane and generous men, some way fettered by instructions, equally against their dispositions and the spirit of Parliamentary faith, when Mr. Tryon, vaunting of the fidelity of the city in which he is governor, is obliged to apply to ministry for leave to protect the king's loyal subjects, and to grant to them, not the disputed rights and privileges of freedom, but the common rights of men, by the name of *graces*? Why do not the commissioners restore them on the spot? Were they not named as commissioners for that express purpose? But we see well enough to what the whole leads. The trade of America is to be dealt out in private indulgences and graces, that is, in jobs to recompense the incendiaries of war. They will be informed of the proper time in which to send out their merchandise. From a national, the American trade is to be turned into a personal monopoly, and one set of merchants are to be rewarded for the pretended zeal of which another set are the dupes; and thus, between craft and credulity, the voice of reason is stifled, and all the misconduct, all the calamities of the war are covered and continued.

If I had not lived long enough to be little surprised at anything, I should have been in some degree astonished at the continued rage of several gentlemen, who, not satisfied with carrying fire and sword into America, are animated nearly with the same fury against those neighbours of theirs whose only crime it is, that they have charitably and humanely wished them to entertain more reasonable sentiments, and not always to sacrifice their interest to their passion. All this rage against unresisting dissent convinces me, that, at bottom, they are far from satisfied they are in the right. For what is it they would have? A war? They certainly have at this moment the blessing of something that is very like one; and if the war they enjoy at present be not sufficiently hot and extensive, they may shortly have it as warm and as spreading as their hearts can desire. Is it the force of the kingdom they call for? They have it already; and if they choose to fight their battles in their own person, nobody prevents their setting sail to America in the next transports. Do they think that the service is stinted for want of liberal supplies? Indeed they complain without reason. The table of the House of Commons will glut them, let their appetite for expense be never so keen. And I assure them further, that

those who think with them in the House of Commons are full as easy in the control as they are liberal in the vote of these expenses. If this be not supply or confidence sufficient, let them open their own private purse-strings, and give, from what is left to them, as largely and with as little care as they think proper.

Tolerated in their passions, let them learn not to persecute the moderation of their fellow-citizens. If all the world joined them in a full cry against rebellion, and were as hotly inflamed against the whole theory and enjoyment of freedom as those who are the most factious for servitude, it could not, in my opinion, answer any one end whatsoever in this contest. The leaders of this war could not hire (to gratify their friends) one German more than they do, or inspire him with less feeling for the persons or less value for the privileges of their revolted brethren. If we all adopted their sentiments to a man, their allies, the savage Indians, could not be more ferocious than they are: they could not murder one more helpless woman or child, or with more exquisite refinements of cruelty torment to death one more of their English flesh and blood, than they do already. The public money is given to purchase this alliance; and they have their bargain.

They are continually boasting of unanimity, or calling for it. But before this unanimity can be matter either of wish or congratulation, we ought to be pretty sure that we are engaged in a rational pursuit. Frenzy does not become a slighter distemper on account of the number of those who may be infected with it. Delusion and weakness produce not one mischief the less because they are universal. I declare that I cannot discern the least advantage which could accrue to us, if we were able to persuade our colonies that they had not a single friend in Great Britain. On the contrary, if the affections and opinions of mankind be not exploded as principles of connection, I conceive it would be happy for us, if they were taught to believe that there was even a formed American party in England, to whom they could always look for support. Happy would it be for us, if, in all tempers, they might turn their eyes to the parent state, so that their very turbulence and sedition should find vent in no other place than this! I believe there is not a man (except those who prefer the interest of some paltry faction to the very being of their country) who would not wish that the Americans should from time to time carry many points, and even some of them not quite reasonable, by the aid of any denomination of men here, rather than they should be driven to seek for protection against the fury of foreign mercenaries and the waste of savages in the arms of France.

When any community is subordinately connected with another, the

great danger of the connection is the extreme pride and self-complacency of the superior, which in all matters of controversy will probably decide in its own favour. It is a powerful corrective to such a very rational cause of fear, if the inferior body can be made to believe that the party inclination or political views of several in the principal state will induce them in some degree to counteract this blind and tyrannical partiality. There is no danger that any one acquiring consideration or power in the presiding state should carry this leaning to the inferior too far. The fault of human nature is not of that sort. Power, in whatever hands, is rarely guilty of too strict limitations on itself. But one great advantage to the support of authority attends such an amicable and protecting connection: that those who have conferred favours obtain influence, and from the foresight of future events can persuade men who have received obligations sometimes to return them. Thus, by the mediation of those healing principles (call them good or evil), troublesome discussions are brought to some sort of adjustment, and every hot controversy is not a civil war.

But, if the colonies (to bring the general matter home to us) could see that in Great Britain the mass of the people is melted into its government, and that every dispute with the ministry must of necessity be always a quarrel with the nation, they can stand no longer in the equal and friendly relation of fellow-citizens to the subjects of this kingdom. Humble as this relation may appear to some, when it is once broken, a strong tie is dissolved. Other sort of connections will be sought. For there are very few in the world who will not prefer a useful ally to an insolent master.

Such discord has been the effect of the unanimity into which so many have of late been seduced or bullied, or into the appearance of which they have sunk through mere despair. They have been told that their dissent from violent measures is an encouragement to rebellion. Men of great presumption and little knowledge will hold a language which is contradicted by the whole course of history. General rebellions and revolts of a whole people never were encouraged, now or at any time. They are always provoked. But if this unheard-of doctrine of the encouragement of rebellion were true, if it were true that an assurance of the friendship of numbers in this country towards the colonies could become an encouragement to them to break off all connection with it, what is the inference? Does anybody seriously maintain, that, charged with my share of the public councils, I am obliged not to resist projects which I think mischievous, lest men who suffer should be encouraged to resist? The very tendency of such projects to produce rebellion is one of the chief reasons against them. Shall that reason not be given? Is it, then, a rule,

that no man in this nation shall open his mouth in favour of the colonies, shall defend their rights, or complain of their sufferings—or when war finally breaks out, no man shall express his desires of peace? Has this been the law of our past, or is it to be the terms of our future connection? Even looking no further than ourselves, can it be true loyalty to any government, or true patriotism towards any country, to degrade their solemn councils into servile drawing-rooms, to flatter their pride and passions rather than to enlighten their reason, and to prevent them from being cautioned against violence lest others should be encouraged to resistance? By such acquiescence great kings and mighty nations have been undone; and if any are at this day in a perilous situation from rejecting truth and listening to flattery, it would rather become them to reform the errors under which they suffer than to reproach those who forewarned them of their danger.

But the rebels looked for assistance from this country. They did so, in the beginning of this controversy, most certainly; and they sought it by earnest supplications to government, which dignity rejected, and by a suspension of commerce, which the wealth of this nation enabled you to despise. When they found that neither prayers nor menaces had any sort of weight, but that a firm resolution was taken to reduce them to unconditional obedience by a military force, they came to the last extremity. Despairing of us, they trusted in themselves. Not strong enough themselves, they sought succour in France. In proportion as all encouragement here lessened, their distance from this country increased. The encouragement is over; the alienation is complete.

In order to produce this favourite unanimity in delusion, and to prevent all possibility of a return to our ancient happy concord, arguments for our continuance in this course are drawn from the wretched situation itself into which we have been betrayed. It is said, that, being at war with the colonies, whatever our sentiments might have been before, all ties between us are now dissolved, and all the policy we have left is to strengthen the hands of government to reduce them. On the principle of this argument, the more mischiefs we suffer from any administration, the more our trust in it is to be confirmed. Let them but once get us into a war, and then their power is safe, and an act of oblivion passed for all their misconduct.

But is it really true that government is always to be strengthened with the instruments of war, but never furnished with the means of peace? In former times, ministers, I allow, have been sometimes driven by the popular voice to assert by arms the national honour against foreign pow-

ers. But the wisdom of the nation has been far more clear, when those ministers have been compelled to consult its interests by treaty. We all know that the sense of the nation obliged the court of Charles the Second to abandon the Dutch War: a war, next to the present, the most impolitic which we ever carried on. The good people of England considered Holland as a sort of dependency on this kingdom; they dreaded to drive it to the protection or subject it to the power of France by their own inconsiderate hostility. They paid but little respect to the court jargon of that day; nor were they inflamed by the pretended rivalry of the Dutch in trade—by the massacre at Amboyna, acted on the stage to provoke the public vengeance—nor by declamations against the ingratitude of the United Provinces for the benefits England had conferred upon them in their infant state. They were not moved from their evident interest by all these arts; nor was it enough to tell them, they were at war, that they must go through with it, and that the cause of the dispute was lost in the consequences. The people of England were then, as they are now, called upon to make government strong. They thought it a great deal better to make it wise and honest.

When I was amongst my constituents at the last summer assizes, I remember that men of all descriptions did then express a very strong desire for peace, and no slight hopes of attaining it from the commission sent out by my Lord Howe. And it is not a little remarkable, that, in proportion as every person showed a zeal for the court measures, he was then earnest in circulating an opinion of the extent of the supposed powers of that commission. When I told them that Lord Howe had no powers to treat, or to promise satisfaction on any point whatsoever of the controversy, I was hardly credited, so strong and general was the desire of terminating this war by the method of accommodation. As far as I could discover, this was the temper then prevalent through the kingdom. The king's forces, it must be observed, had at that time been obliged to evacuate Boston. The superiority of the former campaign rested wholly with the colonists. If such powers of treaty were to be wished whilst success was very doubtful, how came they to be less so, since his Majesty's arms have been crowned with many considerable advantages? Have these successes induced us to alter our mind, as thinking the season of victory not the time for treating with honour or advantage? Whatever changes have happened in the national character, it can scarcely be our wish that terms of accommodation never should be proposed to our enemy, except when they must be attributed solely to our fears. It has happened, let me say unfortunately, that we read of his Majesty's commission for making

peace, and his troops evacuating his last town in the Thirteen Colonies, at the same hour and in the same gazette. It was still more unfortunate that no commission went to America to settle the troubles there, until several months after an act had been passed to put the colonies out of the protection of this government, and to divide their trading property, without a possibility of restitution, as spoil among the seamen of the navy. The most abject submission on the part of the colonies could not redeem them. There was no man on that whole continent, or within three thousand miles of it, qualified by law to follow allegiance with protection or submission with pardon. A proceeding of this kind has no example in history. Independency, and independency with an enmity (which, putting ourselves out of the question, would be called natural and much provoked), was the inevitable consequence. How this came to pass the nation may be one day in a humour to inquire.

All the attempts made this session to give fuller powers of peace to the commanders in America were stifled by the fatal confidence of victory and the wild hopes of unconditional submission. There was a moment favourable to the king's arms, when, if any powers of concession had existed on the other side of the Atlantic, even after all our errors, peace in all probability might have been restored. But calamity is unhappily the usual season of reflection; and the pride of men will not often suffer reason to have any scope, until it can be no longer of service.

I have always wished, that as the dispute had its apparent origin from things done in Parliament, and as the acts passed there had provoked the war, that the foundations of peace should be laid in Parliament also. I have been astonished to find that those whose zeal for the dignity of our body was so hot as to light up the flames of civil war should even publicly declare that these delicate points ought to be wholly left to the crown. Poorly as I may be thought affected to the authority of Parliament, I shall never admit that our constitutional rights can ever become a matter of ministerial negotiation.

I am charged with being an American. If warm affection towards those over whom I claim any share of authority be a crime, I am guilty of this charge. But I do assure you (and they who know me publicly and privately will bear witness to me) that if ever one man lived more zealous than another for the supremacy of Parliament and the rights of this imperial crown, it was myself. Many others, indeed, might be more knowing in the extent of the foundation of these rights. I do not pretend to be an antiquary, a lawyer, or qualified for the chair of professor in metaphysics. I never ventured to put your solid interests upon speculative grounds. My

having constantly declined to do so has been attributed to my incapacity for such disquisitions; and I am inclined to believe it is partly the cause. I never shall be ashamed to confess, that, where I am ignorant, I am diffident. I am, indeed, not very solicitous to clear myself of this imputed incapacity; because men even less conversant than I am in this kind of subtleties, and placed in stations to which I ought not to aspire, have, by the mere force of civil discretion, often conducted the affairs of great nations with distinguished felicity and glory.

When I first came into a public trust, I found your Parliament in possession of an unlimited legislative power over the colonies. I could not open the statute-book without seeing the actual exercise of it, more or less, in all cases whatsoever. This possession passed with me for a title. It does so in all human affairs. No man examines into the defects of his title to his paternal estate or to his established government. Indeed, common sense taught me that a legislative authority not actually limited by the express terms of its foundation, or by its own subsequent acts, cannot have its powers parcelled out by argumentative distinctions, so as to enable us to say that here they can and there they cannot bind. Nobody was so obliging as to produce to me any record of such distinctions, by compact or otherwise, either at the successive formation of the several colonies or during the existence of any of them. If any gentlemen were able to see how one power could be given up (merely on abstract reasoning) without giving up the rest, I can only say that they saw further than I could. Nor did I ever presume to condemn any one for being clear-sighted when I was blind. I praise their penetration and learning, and hope that their practice has been correspondent to their theory.

I had, indeed, very earnest wishes to keep the whole body of this authority perfect and entire as I found it, and to keep it so, not for our advantage solely, but principally for the sake of those on whose account all just authority exists: I mean the people to be governed. For I thought I saw that many cases might well happen in which the exercise of every power comprehended in the broadest idea of legislature might become, in its time and circumstances, not a little expedient for the peace and union of the colonies amongst themselves, as well as for their perfect harmony with Great Britain. Thinking so (perhaps erroneously, but being honestly of that opinion), I was at the same time very sure that the authority of which I was so jealous could not, under the actual circumstances of our plantations, be at all preserved in any of its members, but by the greatest reserve in its application, particularly in those delicate points in which the feelings of mankind are the most irritable. They who

thought otherwise have found a few more difficulties in their work than (I hope) they were thoroughly aware of, when they undertook the present business. I must beg leave to observe, that it is not only the invidious branch of taxation that will be resisted, but that no other given part of legislative rights can be exercised, without regard to the general opinion of those who are to be governed. That general opinion is the vehicle and organ of legislative omnipotence. Without this, it may be a theory to entertain the mind, but it is nothing in the direction of affairs. The completeness of the legislative authority of Parliament over this kingdom is not questioned; and yet many things indubitably included in the abstract idea of that power, and which carry no absolute injustice in themselves, yet being contrary to the opinions and feelings of the people, can as little be exercised as if Parliament in that case had been possessed of no right at all. I see no abstract reason, which can be given, why the same power which made and repealed the High Commission Court and the Star-chamber might not revive them again; and these courts, warned by their former fate, might possibly exercise their powers with some degree of justice. But the madness would be as unquestionable as the competence of that Parliament which should attempt such things. If anything can be supposed out of the power of human legislature, it is religion; I admit, however, that the established religion of this country has been three or four times altered by act of Parliament, and therefore that a statute binds even in that case. But we may very safely affirm, that, notwithstanding this apparent omnipotence, it would be now found as impossible for King and Parliament to alter the established religion of this country as it was to King James alone, when he attempted to make such an alteration without a Parliament. In effect, to follow, not to force, the public inclination, to give a direction, a form, a technical dress, and a specific sanction, to the general sense of the community, is the true end of legislature.

It is so with regard to the exercise of all the powers which our Constitution knows in any of its parts, and indeed to the substantial existence of any of the parts themselves. The king's negative to bills is one of the most indisputed of the royal prerogatives; and it extends to all cases whatsoever. I am far from certain, that if several laws, which I know, had fallen under the stroke of that sceptre, that the public would have had a very heavy loss. But it is not the propriety of the exercise which is in question. The exercise itself is wisely forborne. Its repose may be the preservation of its existence; and its existence may be the means of saving the Constitution itself, on an occasion worthy of bringing it forth.

As the disputants whose accurate and logical reasonings have brought

us into our present condition think it absurd that powers or members of any constitution should exist, rarely, if ever, to be exercised, I hope I shall be excused in mentioning another instance that is material. We know that the Convocation of the Clergy had formerly been called, and sat with nearly as much regularity to business as Parliament itself. It is now called for form only. It sits for the purpose of making some polite ecclesiastical compliments to the king, and, when that grace is said, retires and is heard of no more. It is, however, a part of the Constitution, and may be called out into act and energy, whenever there is occasion, and whenever those who conjure up that spirit will choose to abide the consequences. It is wise to permit its legal existence: it is much wiser to continue it a legal existence only. So truly has prudence (constituted as the god of this lower world) the entire dominion over every exercise of power committed into its hands! And yet I have lived to see prudence and conformity to circumstances wholly set at nought in our late controversies, and treated as if they were the most contemptible and irrational of all things. I have heard it a hundred times very gravely alleged, that, in order to keep power in wind, it was necessary, by preference, to exert it in those very points in which it was most likely to be resisted and the least likely to be productive of any advantage.

These were the considerations, Gentlemen, which led me early to think, that, in the comprehensive dominion which the Divine Providence had put into our hands, instead of troubling our understandings with speculations concerning the unity of empire and the identity or distinction of legislative powers, and inflaming our passions with the heat and pride of controversy, it was our duty, in all soberness, to conform our government to the character and circumstances of the several people who composed this mighty and strangely diversified mass. I never was wild enough to conceive that one method would serve for the whole, that the natives of Hindostan and those of Virginia could be ordered in the same manner, or that the cutchery court and the grand jury of Salem could be regulated on a similar plan. I was persuaded that government was a practical thing, made for the happiness of mankind, and not to furnish out a spectacle of uniformity to gratify the schemes of visionary politicians. Our business was to rule, not to wrangle; and it would have been a poor compensation that we had triumphed in a dispute, whilst we lost an empire.

If there be one fact in the world perfectly clear, it is this, “that the disposition of the people of America is wholly averse to any other than a free government”; and this is indication enough to any honest statesman how

he ought to adapt whatever power he finds in his hands to their case. If any ask me what a free government is, I answer, that, for any practical purpose, it is what the people think so, and that they, and not I, are the natural, lawful, and competent judges of this matter. If they practically allow me a greater degree of authority over them than is consistent with any correct ideas of perfect freedom, I ought to thank them for so great a trust, and not to endeavour to prove from thence that they have reasoned amiss, and that, having gone so far, by analogy they must hereafter have no enjoyment but by my pleasure.

If we had seen this done by any others, we should have concluded them far gone in madness. It is melancholy, as well as ridiculous, to observe the kind of reasoning with which the public has been amused, in order to divert our minds from the common sense of our American policy. There are people who have split and anatomized the doctrine of free government, as if it were an abstract question concerning metaphysical liberty and necessity, and not a matter of moral prudence and natural feeling. They have disputed whether liberty be a positive or a negative idea; whether it does not consist in being governed by laws, without considering what are the laws, or who are the makers; whether man has any rights by Nature; and whether all the property he enjoys be not the alms of his government, and his life itself their favour and indulgence. Others, corrupting religion as these have perverted philosophy, contend that Christians are redeemed into captivity, and the blood of the Saviour of mankind has been shed to make them the slaves of a few proud and insolent sinners. These shocking extremes provoking to extremes of another kind, speculations are let loose as destructive to all authority as the former are to all freedom; and every government is called tyranny and usurpation which is not formed on their fancies. In this manner the stirrers-up of this contention, not satisfied with distracting our dependencies and filling them with blood and slaughter, are corrupting our understandings: they are endeavouring to tear up, along with practical liberty, all the foundations of human society, all equity and justice, religion and order.

Civil freedom, Gentlemen, is not, as many have endeavoured to persuade you, a thing that lies hid in the depth of abstruse science. It is a blessing and a benefit, not an abstract speculation; and all the just reasoning that can be upon it is of so coarse a texture as perfectly to suit the ordinary capacities of those who are to enjoy, and of those who are to defend it. Far from any resemblance to those propositions in geometry and metaphysics which admit no medium, but must be true or false in all

their latitude, social and civil freedom, like all other things in common life, are variously mixed and modified, enjoyed in very different degrees, and shaped into an infinite diversity of forms, according to the temper and circumstances of every community. The extreme of liberty (which is its abstract perfection, but its real fault) obtains nowhere, nor ought to obtain anywhere; because extremes, as we all know, in every point which relates either to our duties or satisfactions in life, are destructive both to virtue and enjoyment. Liberty, too, must be limited in order to be possessed. The degree of restraint it is impossible in any case to settle precisely. But it ought to be the constant aim of every wise public counsel to find out by cautious experiments, and rational, cool endeavours, with how little, not how much, of this restraint the community can subsist: for liberty is a good to be improved, and not an evil to be lessened. It is not only a private blessing of the first order, but the vital spring and energy of the state itself, which has just so much life and vigour as there is liberty in it. But whether liberty be advantageous or not (for I know it is a fashion to decry the very principle), none will dispute that peace is a blessing; and peace must, in the course of human affairs, be frequently bought by some indulgence and toleration at least to liberty: for, as the Sabbath (though of divine institution) was made for man, not man for the Sabbath, government, which can claim no higher origin or authority, in its exercise at least, ought to conform to the exigencies of the time, and the temper and character of the people with whom it is concerned, and not always to attempt violently to bend the people to their theories of subjection. The bulk of mankind, on their part, are not excessively curious concerning any theories whilst they are really happy; and one sure symptom of an ill-conducted state is the propensity of the people to resort to them.

But when subjects, by a long course of such ill conduct, are once thoroughly inflamed, and the state itself violently distempered, the people must have some satisfaction to their feelings more solid than a sophistical speculation on law and government. Such was our situation: and such a satisfaction was necessary to prevent recourse to arms; it was necessary towards laying them down; it will be necessary to prevent the taking them up again and again. Of what nature this satisfaction ought to be I wish it had been the disposition of Parliament seriously to consider. It was certainly a deliberation that called for the exertion of all their wisdom.

I am, and ever have been, deeply sensible of the difficulty of reconciling the strong presiding power, that is so useful towards the conservation of

a vast, disconnected, infinitely diversified empire, with that liberty and safety of the provinces which they must enjoy (in opinion and practice at least), or they will not be provinces at all. I know, and have long felt, the difficulty of reconciling the unwieldy haughtiness of a great ruling nation, habituated to command, pampered by enormous wealth, and confident from a long course of prosperity and victory, to the high spirit of free dependencies, animated with the first glow and activity of juvenile heat, and assuming to themselves, as their birthright, some part of that very pride which oppresses them. They who perceive no difficulty in reconciling these tempers (which, however, to make peace, must some way or other be reconciled) are much above my capacity, or much below the magnitude of the business. Of one thing I am perfectly clear: that it is not by deciding the suit, but by compromising the difference, that peace can be restored or kept. They who would put an end to such quarrels by declaring roundly in favour of the whole demands of either party have mistaken, in my humble opinion, the office of a mediator.

The war is now of full two years' standing: the controversy of many more. In different periods of the dispute, different methods of reconciliation were to be pursued. I mean to trouble you with a short state of things at the most important of these periods, in order to give you a more distinct idea of our policy with regard to this most delicate of all objects. The colonies were from the beginning subject to the legislature of Great Britain on principles which they never examined; and we permitted to them many local privileges, without asking how they agreed with that legislative authority. Modes of administration were formed in an insensible and very unsystematic manner. But they gradually adapted themselves to the varying condition of things. What was first a single kingdom stretched into an empire; and an imperial superintendency, of some kind or other, became necessary. Parliament, from a mere representative of the people, and a guardian of popular privileges for its own immediate constituents, grew into a mighty sovereign. Instead of being a control on the crown on its own behalf, it communicated a sort of strength to the royal authority, which was wanted for the conservation of a new object, but which could not be safely trusted to the crown alone. On the other hand, the colonies, advancing by equal steps, and governed by the same necessity, had formed within themselves, either by royal instruction or royal charter, assemblies so exceedingly resembling a parliament, in all their forms, functions, and powers, that it was impossible they should not imbibe some opinion of a similar authority.

At the first designation of these assemblies, they were probably not

intended for anything more (nor perhaps did they think themselves much higher) than the municipal corporations within this island, to which some at present love to compare them. But nothing in progression can rest on its original plan. We may as well think of rocking a grown man in the cradle of an infant. Therefore, as the colonies prospered and increased to a numerous and mighty people, spreading over a very great tract of the globe, it was natural that they should attribute to assemblies so respectable in their formal constitution some part of the dignity of the great nations which they represented. No longer tied to by-laws, these assemblies made acts of all sorts and in all cases whatsoever. They levied money, not for parochial purposes, but upon regular grants to the crown, following all the rules and principles of a parliament, to which they approached every day more and more nearly. Those who think themselves wiser than Providence and stronger than the course of Nature may complain of all this variation, on the one side or the other, as their several humours and prejudices may lead them. But things could not be otherwise; and English colonies must be had on these terms, or not had at all. In the mean time neither party felt any inconvenience from this double legislature, to which they had been formed by imperceptible habits, and old custom, the great support of all the governments in the world. Though these two legislatures were sometimes found perhaps performing the very same functions, they did not very grossly or systematically clash. In all likelihood this arose from mere neglect, possibly from the natural operation of things, which, left to themselves, generally fall into their proper order. But whatever was the cause, it is certain that a regular revenue, by the authority of Parliament, for the support of civil and military establishments, seems not to have been thought of until the colonies were too proud to submit, too strong to be forced, too enlightened not to see all the consequences which must arise from such a system.

If ever this scheme of taxation was to be pushed against the inclinations of the people, it was evident that discussions must arise, which would let loose all the elements that composed this double constitution, would show how much each of their members had departed from its original principles, and would discover contradictions in each legislature, as well to its own first principles as to its relation to the other, very difficult, if not absolutely impossible, to be reconciled.

Therefore, at the first fatal opening of this contest, the wisest course seemed to be to put an end as soon as possible to the immediate causes of the dispute, and to quiet a discussion, not easily settled upon clear principles, and arising from claims which pride would permit neither

party to abandon, by resorting as nearly as possible to the old, successful course. A mere repeal of the obnoxious tax, with a declaration of the legislative authority of this kingdom, was then fully sufficient to procure peace to both sides. Man is a creature of habit, and, the first breach being of very short continuance, the colonies fell back exactly into their ancient state. The Congress has used an expression with regard to this pacification which appears to me truly significant. After the repeal of the Stamp Act, "the colonies fell," says this assembly, "into their ancient state of unsuspecting confidence in the mother country." This unsuspecting confidence is the true centre of gravity amongst mankind, about which all the parts are at rest. It is this unsuspecting confidence that removes all difficulties, and reconciles all the contradictions which occur in the complexity of all ancient puzzled political establishments. Happy are the rulers which have the secret of preserving it!

The whole empire has reason to remember with eternal gratitude the wisdom and temper of that man and his excellent associates, who, to recover this confidence, formed a plan of pacification in 1766. That plan, being built upon the nature of man, and the circumstances and habits of the two countries, and not on any visionary speculations, perfectly answered its end, as long as it was thought proper to adhere to it. Without giving a rude shock to the dignity (well or ill understood) of this Parliament, they gave perfect content to our dependencies. Had it not been for the mediatorial spirit and talents of that great man between such clashing pretensions and passions, we should then have rushed headlong (I know what I say) into the calamities of that civil war in which, by departing from his system, we are at length involved; and we should have been precipitated into that war at a time when circumstances both at home and abroad were far, very far, more unfavourable unto us than they were at the breaking out of the present troubles.

I had the happiness of giving my first votes in Parliament for that pacification. I was one of those almost unanimous members who, in the necessary concessions of Parliament, would as much as possible have preserved its authority and respected its honour. I could not at once tear from my heart prejudices which were dear to me, and which bore a resemblance to virtue. I had then, and I have still, my partialities. What Parliament gave up I wished to be given as of grace and favour and affection, and not as a restitution of stolen goods. High dignity relented as it was soothed; and a benignity from old acknowledged greatness had its full effect on our dependencies. Our unlimited declaration of legislative authority produced not a single murmur. If this undefined power has be-

come odious since that time, and full of horror to the colonies, it is because the unsuspecting confidence is lost, and the parental affection, in the bosom of whose boundless authority they reposed their privileges, is become estranged and hostile.

It will be asked, if such was then my opinion of the mode of pacification, how I came to be the very person who moved, not only for a repeal of all the late coercive statutes, but for mutilating, by a positive law, the entireness of the legislative power of Parliament, and cutting off from it the whole right of taxation. I answer, Because a different state of things requires a different conduct. When the dispute had gone to these last extremities (which no man laboured more to prevent than I did), the concessions which had satisfied in the beginning could satisfy no longer; because the violation of tacit faith required explicit security. The same cause which has introduced all formal compacts and covenants among men made it necessary: I mean habits of soreness, jealousy, and distrust. I parted with it as with a limb, but as a limb to save the body: and I would have parted with more, if more had been necessary; anything rather than a fruitless, hopeless, unnatural civil war. This mode of yielding would, it is said, give way to independency without a war. I am persuaded, from the nature of things, and from every information, that it would have had a directly contrary effect. But if it had this effect, I confess that I should prefer independency without war to independency with it; and I have so much trust in the inclinations and prejudices of mankind, and so little in anything else, that I should expect ten times more benefit to this kingdom from the affection of America, though under a separate establishment, than from her perfect submission to the crown and Parliament, accompanied with her terror, disgust, and abhorrence. Bodies tied together by so unnatural a bond of union as mutual hatred are only connected to their ruin.

One hundred and ten respectable members of Parliament voted for that concession. Many not present when the motion was made were of the sentiments of those who voted. I knew it would then have made peace. I am not without hopes that it would do so at present, if it were adopted. No benefit, no revenue, could be lost by it; something might possibly be gained by its consequences. For be fully assured, that, of all the phantoms that ever deluded the fond hopes of a credulous world, a Parliamentary revenue in the colonies is the most perfectly chimerical. Your breaking them to any subjection, far from relieving your burdens (the pretext for this war), will never pay that military force which will be kept up to the destruction of their liberties and yours. I risk nothing in this prophecy.

Gentlemen, you have my opinions on the present state of public affairs. Mean as they may be in themselves, your partiality has made them of some importance. Without troubling myself to inquire whether I am under a formal obligation to it, I have a pleasure in accounting for my conduct to my constituents. I feel warmly on this subject, and I express myself as I feel. If I presume to blame any public proceeding, I cannot be supposed to be personal. Would to God I could be suspected of it! My fault might be greater, but the public calamity would be less extensive. If my conduct has not been able to make any impression on the warm part of that ancient and powerful party with whose support I was not honoured at my election, on my side, my respect, regard, and duty to them is not at all lessened. I owe the gentlemen who compose it my most humble service in everything. I hope that whenever any of them were pleased to command me, that they found me perfectly equal in my obedience. But flattery and friendship are very different things; and to mislead is not to serve them. I cannot purchase the favour of any man by concealing from him what I think his ruin.

By the favour of my fellow-citizens, I am the representative of an honest, well-ordered, virtuous city, of a people who preserve more of the original English simplicity and purity of manners than perhaps any other. You possess among you several men and magistrates of large and cultivated understandings, fit for any employment in any sphere. I do, to the best of my power, act so as to make myself worthy of so honourable a choice. If I were ready, on any call of my own vanity or interest, or to answer any election purpose, to forsake principles (whatever they are) which I had formed at a mature age, on full reflection, and which had been confirmed by long experience, I should forfeit the only thing which makes you pardon so many errors and imperfections in me.

Not that I think it fit for any one to rely too much on his own understanding, or to be filled with a presumption not becoming a Christian man in his own personal stability and rectitude. I hope I am far from that vain confidence which almost always fails in trial. I know my weakness in all respects, as much at least as any enemy I have; and I attempt to take security against it. The only method which has ever been found effectual to preserve any man against the corruption of nature and example is a habit of life and communication of councils with the most virtuous and public-spirited men of the age you live in. Such a society cannot be kept without advantage, or deserted without shame. For this rule of conduct I may be called in reproach a party man; but I am little affected with such aspersions. In the way which they call party I worship the Constitution of your fathers; and I shall never blush for my political com-

pany. All reverence to honour, all idea of what it is, will be lost out of the world, before it can be imputed as a fault to any man, that he has been closely connected with those incomparable persons, living and dead, with whom for eleven years I have constantly thought and acted. If I have wandered out of the paths of rectitude into those of interested faction, it was in company with the Saviles, the Dowdeswells, the Wentworths, the Bentincks; with the Lenoxes, the Manchesters, the Keppels, the Saunderses; with the temperate, permanent, hereditary virtue of the whole house of Cavendish: names, among which, some have extended your fame and empire in arms, and all have fought the battle of your liberties in fields not less glorious. These, and many more like these, grafting public principles on private honour, have redeemed the present age, and would have adorned the most splendid period in your history. Where could any man, conscious of his own inability to act alone, and willing to act as he ought to do, have arranged himself better? If any one thinks this kind of society to be taken up as the best method of gratifying low personal pride or ambitious interest, he is mistaken, and knows nothing of the world.

Preferring this connection, I do not mean to detract in the slightest degree from others. There are some of those whom I admire at something of a greater distance, with whom I have had the happiness also perfectly to agree, in almost all the particulars in which I have differed with some successive administrations; and they are such as it never can be reputable to any government to reckon among its enemies.

I hope there are none of you corrupted with the doctrine taught by wicked men for the worst purposes, and received by the malignant credulity of envy and ignorance, which is, that the men who act upon the public stage are all alike, all equally corrupt, all influenced by no other views than the sordid lure of salary and pension. The thing I know by experience to be false. Never expecting to find perfection in men, and not looking for divine attributes in created beings, in my commerce with my contemporaries I have found much human virtue. I have seen not a little public spirit, a real subordination of interest to duty, and a decent and regulated sensibility to honest fame and reputation. The age unquestionably produces (whether in a greater or less number than former times I know not) daring profligates and insidious hypocrites. What then? Am I not to avail myself of whatever good is to be found in the world, because of the mixture of evil that will always be in it? The smallness of the quantity in currency only heightens the value. They who raise suspicions on the good on account of the behaviour of ill men are of the party

of the latter. The common cant is no justification for taking this party. I have been deceived, say they, by Titius and Maevius; I have been the dupe of this pretender or of that mountebank; and I can trust appearances no longer. But my credulity and want of discernment cannot, as I conceive, amount to a fair presumption against any man's integrity. A conscientious person would rather doubt his own judgment than condemn his species. He would say, "I have observed without attention, or judged upon erroneous maxims; I trusted to profession, when I ought to have attended to conduct." Such a man will grow wise, not malignant, by his acquaintance with the world. But he that accuses all mankind of corruption ought to remember that he is sure to convict only one. In truth, I should much rather admit those whom at any time I have disrelished the most to be patterns of perfection than seek a consolation to my own unworthiness in a general communion of depravity with all about me.

That this ill-natured doctrine should be preached by the missionaries of a court I do not wonder. It answers their purpose. But that it should be heard among those who pretend to be strong assertors of liberty is not only surprising, but hardly natural. This moral levelling is a servile principle. It leads to practical passive obedience far better than all the doctrines which the pliant accommodation of theology to power has ever produced. It cuts up by the roots, not only all idea of forcible resistance, but even of civil opposition. It disposes men to an abject submission, not by opinion, which may be shaken by argument or altered by passion, but by the strong ties of public and private interest. For, if all men who act in a public situation are equally selfish, corrupt, and venal, what reason can be given for desiring any sort of change, which, besides the evils which must attend all changes, can be productive of no possible advantage? The active men in the state are true samples of the mass. If they are universally depraved, the commonwealth itself is not sound. We may amuse ourselves with talking as much as we please of the virtue of middle or humble life; that is, we may place our confidence in the virtue of those who have never been tried. But if the persons who are continually emerging out of that sphere be no better than those whom birth has placed above it, what hopes are there in the remainder of the body which is to furnish the perpetual succession of the state? All who have ever written on government are unanimous, that among a people generally corrupt liberty cannot long exist. And, indeed, how is it possible, when those who are to make the laws, to guard, to enforce, or to obey them, are, by a tacit confederacy of manners, indisposed to the spirit of all generous and noble institutions?

I am aware that the age is not what we all wish. But I am sure that the only means of checking its precipitate degeneracy is heartily to concur with whatever is the best in our time, and to have some more correct standard of judging what that best is than the transient and uncertain favour of a court. If once we are able to find, and can prevail on ourselves to strengthen a union of such men, whatever accidentally becomes indisposed to ill-exercised power, even by the ordinary operation of human passions, must join with that society, and cannot long be joined without in some degree assimilating to it. Virtue will catch as well as vice by contact; and the public stock of honest, manly principle will daily accumulate. We are not too nicely to scrutinize motives as long as action is irreproachable. It is enough (and for a worthy man perhaps too much) to deal out its infamy to convicted guilt and declared apostasy.

This, Gentlemen, has been from the beginning the rule of my conduct; and I mean to continue it, as long as such a body as I have described can by any possibility be kept together; for I should think it the most dreadful of all offences, not only towards the present generation, but to all the future, if I were to do anything which could make the minutest breach in this great conservatory of free principles. Those who perhaps have the same intentions, but are separated by some little political animosities, will, I hope, discern at last how little conducive it is to any rational purpose to lower its reputation. For my part, Gentlemen, from much experience, from no little thinking, and from comparing a great variety of things, I am thoroughly persuaded that the last hopes of preserving the spirit of the English Constitution, or of reuniting the dissipated members of the English race upon a common plan of tranquillity and liberty, does entirely depend on their firm and lasting union, and above all on their keeping themselves from that despair which is so very apt to fall on those whom a violence of character and a mixture of ambitious views do not support through a long, painful, and unsuccessful struggle.

There never, Gentlemen, was a period in which the steadfastness of some men has been put to so sore a trial. It is not very difficult for well-formed minds to abandon their interest; but the separation of fame and virtue is a harsh divorce. Liberty is in danger of being made unpopular to Englishmen. Contending for an imaginary power, we begin to acquire the spirit of domination, and to lose the relish of honest equality. The principles of our forefathers become suspected to us, because we see them animating the present opposition of our children. The faults which grow out of the luxuriance of freedom appear much more shocking to us than the base vices which are generated from the rankness of servitude.

Accordingly, the least resistance to power appears more inexcusable in our eyes than the greatest abuses of authority. All dread of a standing military force is looked upon as a superstitious panic. All shame of calling in foreigners and savages in a civil contest is worn off. We grow indifferent to the consequences inevitable to ourselves from the plan of ruling half the empire by a mercenary sword. We are taught to believe that a desire of domineering over our countrymen is love to our country, that those who hate civil war abet rebellion, and that the amiable and conciliatory virtues of lenity, moderation, and tenderness to the privileges of those who depend on this kingdom are a sort of treason to the state.

It is impossible that we should remain long in a situation which breeds such notions and dispositions without some great alteration in the national character. Those ingenuous and feeling minds who are so fortified against all other things, and so unarmed to whatever approaches in the shape of disgrace, finding these principles, which they considered as sure means of honour, to be grown into disrepute, will retire disheartened and disgusted. Those of a more robust make, the bold, able, ambitious men, who pay some of their court to power through the people, and substitute the voice of transient opinion in the place of true glory, will give into the general mode; and those superior understandings which ought to correct vulgar prejudice will confirm and aggravate its errors. Many things have been long operating towards a gradual change in our principles; but this American war has done more in a very few years than all the other causes could have effected in a century. It is therefore not on its own separate account, but because of its attendant circumstances, that I consider its continuance, or its ending in any way but that of an honourable and liberal accommodation, as the greatest evils which can befall us. For that reason I have troubled you with this long letter. For that reason I entreat you, again and again, neither to be persuaded, shamed, or frightened out of the principles that have hitherto led so many of you to abhor the war, its cause, and its consequences. Let us not be amongst the first who renounce the maxims of our forefathers.

I have the honour to be,

Gentlemen,

Your most obedient and faithful humble servant,

EDMUND BURKE.

Beaconsfield, April 3, 1777.

P. S. You may communicate this letter in any manner you think proper to my constituents.

John C. Calhoun

1782–1850

Few American statesmen have had so illustrious a career as John C. Calhoun. From 1807 to 1850 he was (in succession) a state legislator, a United States Congressman, Secretary of War, Vice-President, Senator, Presidential candidate, and Secretary of State. He was also an astute political thinker. Some of his speeches and essays are generally considered to be the classic statements of the political position of the South prior to the Civil War.

Calhoun was born in the Abbeville district of South Carolina in 1782. Because he had little opportunity for education there, he was sent to live with his brother-in-law, a Presbyterian minister. In 1802 he entered Yale College as a junior. After being graduated from Yale, he went to the Litchfield Law School, in Connecticut, and by 1807 was a licensed lawyer. In 1808 he became a member of the South Carolina legislature.

Calhoun's national political career began in 1811, when he was elected to the U.S. House of Representatives. At first he was a fervent nationalist, but as the years passed he became more and more concerned about preserving the institutions of the South. Though he always insisted that his primary aim was to save the Union, he gradually came to be thought of as a sectionalist.

Calhoun was Secretary of War from 1817 to 1825, and he served

Notes from the artist: “. . . a stern portrait of Calhoun with a war hawk on his shoulder, symbolizing the militancy of his position on states' rights. At the left, Andrew Jackson, Calhoun's antagonist in the federal-state argument. Jackson once admitted that his only regret was not having hanged Calhoun.”

as Vice-President under two Presidents, John Quincy Adams and Andrew Jackson. He resigned the Vice-Presidency in 1832 (the only man ever to do so) because of his opposition to certain government policies, particularly tariff policies.

In 1824 and 1828 Congress had passed tariff laws which were designed to protect northern industries but which proved to be harmful to the South. Calhoun maintained that the southern states had the right to declare those laws unconstitutional. He argued that since the states had entered into the federal union to secure certain benefits, they had the right to “nullify” those federal laws which were harmful to their interests. In advancing this argument, he advocated the “strict construction” of the Constitution. (According to the strict constitution theory, the federal government has only those powers *explicitly* granted to it by the Constitution.)

Shortly after his resignation from the Vice-Presidency, Calhoun was elected to the Senate from South Carolina. There he engaged in a debate on nullification with Daniel Webster. Webster’s views eventually triumphed, and the nullification theory was rejected. During the remainder of his Senate career, Calhoun did his best to defend states’ rights and the slavery system, but the movement of history was against him. In the election of 1844 he was temporarily a presidential candidate. He withdrew from the race and was appointed Secretary of State. In 1845 he was re-elected to the Senate, where he remained until a few days before his death in 1850.

Since the appearance of John Stuart Mill’s essay *On Liberty*,¹ the phrase “tyranny of the majority” has become part of the common language of political discussion. But Mill was by no means the first to realize that the majority in a society might use its power to oppress the minority. John C. Calhoun had recognized this danger almost a generation earlier, and he had offered his remedy for it in “The Concurrent Majority.”

Calhoun begins by attempting to prove, through an analysis of human nature, the necessity of government. He maintains that each individual’s feeling for himself is stronger than his feeling for others, and that each individual is ready to sacrifice the interests of others in order to further his own. Government is necessary, therefore, to protect men from exploitation and oppression by others.

¹ See *Great Books of the Western World*.

Following this preliminary analysis, Calhoun turns to the central question of his essay: if men pursue their own interests at the expense of others, and if governments are composed of men, how can we guarantee that the men who control the government will not use their power to oppress the governed? Calhoun thinks that the answer is some form of representative government—that is, a government whose leaders are chosen by the governed. But, according to Calhoun, representative government based upon a simple *numerical* majority is not a sufficient guarantee against oppression.

It is true that the ultimate power of government has been transferred from the government itself to the people who are governed, and that a government which acts against the interests of the majority cannot long survive. But what is to prevent a majority of the people from using the government to oppress a minority? Calhoun insists that there is nothing to prevent it, and that it can be prevented only by introducing the principle of the *concurrent* majority.

Calhoun's thinking was undoubtedly influenced by his conviction that the interests of the South were slowly being undermined by a government controlled by the North and the West. The adoption of the principle of the concurrent majority, which in effect gives veto power to minorities, would have protected the South—at least temporarily. Whether such protection was desirable is still very much a disputed matter. But whatever our views concerning the Old South and its institutions, we must not underestimate the importance of the issue raised by Calhoun. How are we to prevent a representative democracy from turning into a “tyranny of the majority”? Perhaps, as Calhoun says, it can be prevented only by the application of some form of the principle of the concurrent majority.

The Concurrent Majority

from *A Disquisition on Government*

In order to have a clear and just conception of the nature and object of government, it is indispensable to understand correctly what that constitution or law of our nature is in which government originates; or, to express it more fully and accurately, that law without which government would not, and with which it must necessarily, exist. Without this, it is as impossible to lay any solid foundation for the science of government as it would be to lay one for that of astronomy without a like understanding of that constitution or law of the material world according to which the several bodies composing the solar system mutually act on each other and by which they are kept in their respective spheres. The first question, accordingly, to be considered is: What is that constitution or law of our nature without which government would not exist and with which its existence is necessary?

In considering this, I assume, as an incontestable fact, that man is so constituted as to be a social being. His inclinations and wants, physical and moral, irresistibly impel him to associate with his kind; and he has, accordingly, never been found, in any age or country, in any state other than the social. In no other, indeed, could he exist; and in no other—were it possible for him to exist—could he attain to a full development of his moral and intellectual faculties or raise himself, in the scale of being, much above the level of the brute creation.

I next assume, also, as a fact not less incontestable, that, while man is so constituted as to make the social state necessary to his existence and the full development of his faculties, this state itself cannot exist without government. The assumption rests on universal experience. In no age or country has any society or community ever been found, whether enlightened or savage, without government of some description.

Having assumed these, as unquestionable phenomena of our nature, I

shall, without further remark, proceed to the investigation of the primary and important question: What is that constitution of our nature which, while it impels man to associate with his kind, renders it impossible for society to exist without government?

The answer will be found in the fact (not less incontestable than either of the others) that, while man is created for the social state, and is accordingly so formed as to feel what affects others as well as what affects himself, he is, at the same time, so constituted as to feel more intensely what affects him directly than what affects him indirectly through others; or, to express it differently, he is so constituted that his direct or individual affections are stronger than his sympathetic or social feelings. I intentionally avoid the expression "*selfish* feelings" as applicable to the former, because, as commonly used, it implies an unusual excess of the individual over the social feelings in the person to whom it is applied, and, consequently, something depraved and vicious. My object is to exclude such inference and to restrict the inquiry exclusively to facts in their bearings on the subject under consideration, viewed as mere phenomena appertaining to our nature—constituted as it is—and which are as unquestionable as is that of gravitation or any other phenomenon of the material world.

In asserting that our individual are stronger than our social feelings, it is not intended to deny that there are instances, growing out of peculiar relations—as that of a mother and her infant—or resulting from the force of education and habit over peculiar constitutions, in which the latter have overpowered the former; but these instances are few and always regarded as something extraordinary. The deep impression they make, whenever they occur, is the strongest proof that they are regarded as exceptions to some general and well-understood law of our nature, just as some of the minor powers of the material world are apparently to gravitation.

I might go further and assert this to be a phenomenon, not of our nature only, but of all animated existence, throughout its entire range, so far as our knowledge extends. It would, indeed, seem to be essentially connected with the great law of self-preservation which pervades all that feels, from man down to the lowest and most insignificant reptile or insect. In none is it stronger than in man. His social feelings may, indeed, in a state of safety and abundance, combined with high intellectual and moral culture, acquire great expansion and force; but not so great as to overpower this all-pervading and essential law of animated existence.

But that constitution of our nature which makes us feel more intensely

what affects us directly than what affects us indirectly through others necessarily leads to conflict between individuals. Each, in consequence, has a greater regard for his own safety or happiness than for the safety or happiness of others and, where these come in opposition, is ready to sacrifice the interests of others to his own. And, hence, the tendency to a universal state of conflict between individual and individual, accompanied by the connected passions of suspicion, jealousy, anger, and revenge—followed by insolence, fraud, and cruelty—and, if not prevented by some controlling power, ending in a state of universal discord and confusion, destructive of the social state and the ends for which it is ordained. This controlling power, wherever vested, or by whomsoever exercised, is GOVERNMENT.
