Pain

Simo Knuuttila

University of Helsinki, Helsinki, Finland

Abstract

The Latin word *dolor*, as it is used in medieval philosophy, can refer to simple physical pain or to an emotion of the sensory soul. According to Thomas Aquinas, physical pain is an unpleasant experience of something repugnant to the body; emotional pain of the sensory part of the soul is a reaction to an experience of something taking place against sensory appetite. This analysis was introduced by Plato and was often repeated in ancient sources of medieval philosophy. While medieval thinkers usually regarded physical pain as supervenient on immediate bodily sensations, some of them followed Avicenna in arguing that physical pleasure and pain are also felt directly and should be added to the touch qualities. Avicenna distinguished between 15 sorts of bodily pain. Latin authors usually located the experience of physical pleasure and pain in the sensory moving power which was also the seat of the emotions. This was in line with the Aristotelian view that nature had provided all animals with the sense of touch in order to keep them away from what is harmful – pain immediately triggered avoidance.

The most common Latin word for physical pain in medieval philosophy is *dolor*. This term, like the corresponding Greek word (*lupē*), can refer to simple physical pain or to an emotion of the sensory soul. Thomas Aquinas (*Summa theologiae* II-1, 35.7) describes external physical pain and internal emotional pain as follows: external pain is caused by something repugnant to the body and internal pain is caused by what is repugnant to sensory appetite. External pain follows an external perception, particularly that of touch, and internal pain follows an act of imagination or reason.

The distinction between physical and emotional pain was traditional. It was introduced by Plato, who argued that there are bodily motions which are not perceived and others that are; of the latter some are perceived neutrally, some are perceived as pleasant, and others as unpleasant. Pleasures and distresses which do not simply arise from the body and are associated with desires and evaluations form the feeling component of all emotions (*Phil.* 33d, 43b-c, 47d-e; *Tim.* 64d). There are similar distinctions in Aristotle and in the Stoics, who taught the extirpation of emotions as misguided judgments but separated these from bodily feelings. The central idea of the traditional analysis is the distinction between pain as an unpleasant experience of a noxious state of some part of the body and this state as the cause and the object of the experience. While the experience takes place in the soul, this involves a bodily localization of

where it hurts. This distinction is formulated in a famous passage from the Peripatetic Strato of Lampsacus: “It is not in the foot that we feel hurt when we stub it, nor in the head when we crack it, nor in the finger when we cut it . . . we suppose the hurt from the wound is not where it is sensed, but where it originated, as the soul is drawn toward the place where suffering occurred” (frag. 111 in Wehrli). A similar account was known to medieval authors through Nemesius of Emesa’s *De natura hominis* (8, 64.1–15).

According to Avicenna, physical pleasure and pain are often felt as concomitants to perceptions of particular qualities, usually those pertaining to touch, but there are also acts of touch which are experiences of bodily pleasure or pain without involving another underlying sensation (*Liber de anima* II.3, 137–8). While medieval authors usually regarded pain as supervenient on immediate sensations, some of them, such as Pietro d’Abano, argued in an Avicennian manner that physical pleasure and pain are also felt directly and should be added to the touch qualities (*Conciliator differentiarum* 77).

Latin authors usually located the experience of physical pleasure and pain in the sensory moving power which was also the seat of the emotions. (See, for example, Thomas Aquinas, (*Summa theologiae* II-1, 35.7; John Duns Scotus, *Ordinatio* III.15, 43.) This was in line with the Aristotelian view that nature had provided all animals with the sense of touch in order to keep them away from what is harmful. Pain immediately triggered avoidance. Whether physical pain was an occurrent sensory quality or a cause of emotional sadness, may authors referred in this connection to compassion between body and soul.

Physical pain was discussed in medicine and in theological questions of eternal punishment and Christ’s suffering. It was not a central philosophical issue in itself. Peter John Olivi was one of the Latin authors who were interested in its varieties – material was abundantly offered by Avicenna’s distinction between 15 sorts of bodily pain (*Canon* I.2.2.20).

Parisian Condemnation of 1277

David Piché
Département de Philosophie, Université de
Montréal, Montréal, QC, Canada

Abstract

The act of censorship issued by the Bishop of Paris, Stephen Tempier, on March 7, 1277, constitutes one of the most significant events of thirteenth century intellectual history. Brandishing the threat of excommunication to prevent their circulation, Bishop Tempier condemned 219 philosophical and theological theses that he judged heterodoxical. In so doing, he was explicitly attacking the teaching of certain members of the Parisian Arts Faculty. Beyond the confrontation between orthodox ideas and contentious doctrines, the Parisian condemnation of 1277 allows us to observe a clash between divergent views of the status of philosophy and speaks to us of concurrent modes of existence. Consequently, it is not only a question of theoretical conflicts but also of epistemological and ethical issues that assume critical significance in the history of western thought.

If one tells the truth, one is sure, sooner or later, to be found out.
Oscar Wilde

The Protagonists and the Circumstances

On January 18, 1277, Pope John XXI, to whom suspicious ideas circulating in the Parisian schools were reported, mandated the Bishop of Paris, Stephen Tempier, to conduct an investigation into these allegations. Bolstered by a commission of 16 theologians, including the eminent secular Master Henry of Ghent, Bishop Tempier accomplished this investigative task, assigned to

him by the Pope, with great diligence. He drew up a list of 219 articles that, in his eyes, were heterodoxical and, exceeding the mandate he had been granted by John XXI, on March 7, 1277, promulgated a decree condemning these articles that, in his eyes, were nothing more than “blatant and execrable errors.” The threat that henceforth hung over the heads of the masters of Christianity’s intellectual capital were serious, since Bishop Tempier had determined on the penalty of excommunication for any individual caught deliberately spreading forbidden doctrines, as well as any person who would attend such a lecture, unless the latter denounced the wrongdoing to the Chancellor of the University of Paris or the Bishop himself within a period of 7 days. As a preface to the “syllabus” containing the 219 censored theses (it is worth noting that certain manuscripts transmitting the Parisian act of censorship contain 220 articles), Stephen Tempier wrote a letter to which we must pay careful attention if we want to grasp the explicit motives for the most important doctrinal condemnation of the Middle Ages. The Bishop identifies the target of his act of censorship as certain “scholars of the Arts Faculty” (*studentes in artibus*). This expression designates the professors and students in philosophy, since, throughout the thirteenth century, the teaching of liberal arts, then required to gain access to higher studies, which were in theology, law, and medicine, had expanded to include the teaching of the Graeco-Arabic corpus of philosophy, which is, essentially, the works of Aristotle and his Arabic commentators, in the forefront of which could be found Avicenna and Averroes. It is important to be aware that, since the first half of the twelfth century, “multicultural teams” of translators, often located in Toledo, were employed to make this philosophical corpus available in Latin for western Christian scholars. That said, the episcopal letter did not name these philosophers that it accuses of teaching ideas contrary to the Catholic faith, but several medieval manuscripts show us that the philosophical movement denounced by Stephen Tempier included in its ranks the Masters Siger of Brabant and Boethius of Dacia, key figures in the Parisian Arts Faculty in the years

1260–1270. The letter-preface of Bishop Tempier went further than condemning the presumed fact that certain members of the Arts Faculty had professed or discussed in the schools a series of doctrines judged to be heterodoxical. It also reproached those who devoted themselves to such controversial teaching for having strayed beyond the boundaries of their own faculty. Thus, it demonstrates the existing tension at the time between, on one hand, the philosophy professionals of the university, whose teaching then covered all fields of knowledge, from logic to metaphysics, including physics and ethics, and, on the other hand, the theology professors, whose concern was to clearly demarcate the borders beyond which the competence of philosophers did not extend, to preserve the superiority and institutional specificity of their own discipline. The risk of a “conflict of faculties” was very real, since the comprehensive philosophical corpus that the Arts Masters of the 1270s were responsible for transmitting touched on subjects – for example, the causality of God in the natural world – traditionally reserved for doctors in theology. What could be done with these intersecting points where the knowledge of philosophers encountered that of theologians? The statutes promulgated in 1272 for the Parisian Arts Faculty attempted to offer a response to this question with three clauses: (1) it was forbidden for Arts Masters to discuss purely theological questions, that is, subjects relating directly to the work of understanding the content of the Holy Scriptures, for example, the Trinity and the Incarnation; (2) if it happened that Arts Masters encountered questions that touched upon both philosophy and the Christian faith, they absolutely had to resolve them in accordance with the teachings of the Catholic faith, under pain of being declared heretical or excluded from their faculty if they resolved them differently; and finally, (3) if the Arts Masters found themselves in the presence of philosophical doctrines contrary to the Christian faith, they had the duty to refute them or, if they felt incapable of doing so, declare them false and erroneous or even pass over them in silence. In fact, such measures placed the Arts Masters in an untenable position, as if they had to square the

circle, since it was asked of them both to never touch theology and to always take account of the imperatives of the faith in their teaching duties which, however, had to be restricted to the field of purely philosophical knowledge. This balancing act required of the philosophers of Paris could explain, among other factors, the presence of a crucial passage in the letter-prologue that Bishop Tempier wrote, in which he accuses the scholars of the Arts Faculty of having tried to conceal their adherence to heterodoxical ideas, in affirming that what is true according to philosophy is not true according to the Catholic faith, “as if there were two contrary truths,” writes the Bishop who, to avoid alienating “simple people,” rushes to condemn such a manner of speaking that historiography would refer to as the “doctrine of the double truth.” That no university philosopher of the time supported such a doctrine is no longer contested by historians of today; that Tempier interpreted the Arts Masters’ writings in this way is an archival fact which needs to be taken into account. The episcopal letter finished with a verdict condemning the *De amore* of Andreas Capellanus, a work of courtly literature dating from the twelfth century, as well as works dealing with the divinatory arts and other occult practices, Bishop Tempier judging them all as “contrary to the orthodox faith and good morals.” Thus, as was the case for the other episodes of censorship in the Christian west, a solidarity of evil was supposed between dissident thought, libertine behavior, and occult knowledge, three themes that the Bishop of Paris subjected to the same opprobrium.

The Events that Led to the 1277 Parisian Condemnation

The Parisian condemnation of 1277 did not arrive ex nihilo. On the contrary, we may consider it as the culmination of a series of crucial events marking the intellectual history of the thirteenth century. In 1210, a synod called by the Archbishop of Sens, Peter of Corbeil, ruled against the teaching in Paris, whether public or private, of Aristotle’s books of natural philosophy (*libri naturales*), as well as related commentaries.

A sentence of excommunication was pronounced against whosoever contravened this directive. In 1215, the Papal Legate, Cardinal Robert of Courçon, whom Pope Innocent III had charged with reorganizing the academic curriculum in Paris, imposed a restrictive program of studies on the Faculty of Arts. In this document, which contains the earliest university statutes known by historians, a distinction is made between compulsory (grammar and logic), optional (mathematics and ethics), and forbidden subjects. Reiterating the anti-Aristotelian measures of 1210, that were accompanied by the same sentence of excommunication, the statutes promulgated in 1215 under the auspices of the Papal Legate forbade Arts Masters from lecturing on Aristotle's natural philosophy writings (including the metaphysics), as well as the *summae* arising from these works. The institutional measures of 1210 and 1215 demonstrate beyond all doubt that, already at this time, certain members of high ecclesiastical rank perceived the peripatetic philosophical system as a threat to Christian thought as it had traditionally developed in the west since patristic times. A subtle change in orientation, with notable repercussions for subsequent decades, occurred in 1231, with the appearance of Pope Gregory IX's bull *Parens scientiarum* (the mother of sciences). Among the measures in this document, considered by historians the "basic charter" of the University of Paris, it is important to remember the following: the Pope preserved the banning of Aristotelian *libri naturales*, but he mitigated it considerably by explaining that it would only last for the period during which the contentious writings were examined in order to purge them of any errors discovered. (This undertaking of intellectual purging would never end, however.) Furthermore, for a period of 7 years, the pope abrogated the penalty of excommunication that threatened the professors who would have contravened the teaching prohibitions, and he granted university masters the right to decide themselves on the required content of their courses. In so doing, Gregory IX opened the doors of the University of Paris to peripatetic works of philosophy which had previously been prohibited. In fact, in 1255, the Faculty of Arts issued new statutes

stipulating an obligatory program of studies in which the whole of Aristotle's translated works were included, as well as apocryphal works, such as the *Book of Causes*, an adaptation of Proclus' *Elements of Theology*, which seemed to have been composed in scholarly circles in Baghdad in the ninth century of the Christian era. In this way, the Faculty of Arts became an authentic faculty of philosophy, and its professors began the vast and profound undertaking to rationally comprehend the whole of reality, an undertaking that could at any moment collide with the Christian vision of the world. Between 1267 and 1273, in a series of lectures given at the University of Paris, the great Franciscan theologian Bonaventure warned his contemporaries about the danger that certain of Aristotle's doctrines represented for the Christian faith and the peril that a pagan philosophy sought for its own sake posed for human redemption. In 1270, while another great theologian, the Dominican Thomas Aquinas, was busy using the weapons of reason to fight this supposedly Averroist doctrine that historiography, following Leibniz, would call "monopsychism," Stephen Tempier, for his part, was, for the first time, condemning the teaching of 13 philosophical theses. The content of this first doctrinal sanction issued by the Bishop of Paris prefigures in condensed form the much more developed act of censorship that he would promulgate 7 years later.

P

The Principal Doctrines Censored

Given their number and diversity, as well as the apparent disorder in which they occur, it is obviously impossible to offer here an exhaustive and detailed exposé of the 219 (or 220) articles condemned on March 7, 1277. Nonetheless, we may discern a certain number of major themes that, once brought together, comprise the basis of the doctrinal issue of the Parisian censorship. Certain prohibited theses are striking because of their excessive nature and their outrageous character in the context of the sensibility and beliefs of a thirteenth century Christian conscience. This is the case for articles 16, 152, 174, 175, and 180 that claim, respectively, "that if one says

something is heretical because it is contrary to the faith, we should not care about the faith,” “that theological discourse is based on fables,” “that there are fables and falsehoods in the Christian religion, as in other religions,” “that the Christian religion prevents one from learning,” and “that one should not pray.” Other censored theses confront head-on certain of the most essential dogmatic foundations of Catholic doctrine. This is the case, for example, of those that concern the dogma of the Holy Trinity and that seem to echo the reprimands of Stephen Tempier when he writes, in his letter-preface, that “scholars of the Arts Faculty” who profess reprehensible errors “exceed the limits of their own faculty.” Consequently, it is not surprising that the Bishop of Paris prohibited articles 1 and 2 that maintain, respectively, that “God is not triune because the trinity is incompatible with supreme simplicity (. . .)” and “that God cannot engender a being similar to himself, because something that is engendered by something has an origin upon which it depends (. . .).” On the other hand, the condemnation of a number of assertions does not seem explicable, except by presupposing an ideological bias and less than impartial attitude on the part of the Bishop of Paris and his “commission of inquiry.” The interpretation of the historical significance of the Parisian censure of 1277 must thus consider the contingency of interpretative patterns that the protagonists of this event could put into place. It is not improbable that Tempier and his coreligionists, seeking to rule against the spread of teaching that they considered perilous to the truths of the Christian faith, worked as well to promote the theses of a particular school of thought to which they were attached. This would explain the presence in the syllabus of certain articles such as the following: (92) “heavenly bodies are moved by an intrinsic principle, that is the soul, and they are moved by the soul and the appetite, like animals (. . .)”; (102) “the soul of heaven is an intelligence and the celestial orbs are not the instruments of intelligences but their organs, like the ear and the eye are organs of the sensitive power”; (126) “the possible intellect is actually nothing before understanding, because in an intelligible nature, being actually something is

being what is actually understanding”; (189) “when <heavenly> intelligence is full of forms, it imprints these forms on matter by heavenly bodies as with instruments”; and (204) “separate substances are located somewhere by means of their operation (. . .).” Moreover, Tempier’s syllabus contains theses that are surprising or striking, because they appear atypical in their historical context. This is the case for articles 20 and 148, which would please vegetarians and nutritionists, in proposing, respectively, “that a man may become numerically and individually another through means of nutrition” and “that the natural law forbids the murder of animals lacking reason, as well as that of animals with reason, though to a lesser degree” or articles 150 and 200 that Kant would not have repudiated, which stipulate, respectively, “that man must not be content with authority to be certain about a question” and “that duration and time are nothing in reality but exist only in apprehension.” We are also dumbfounded by reading about the astral theory of generation that article 188 supports: “if the power of the stars in a liquid is of a similar proportion to that found in the parents’ seed, a man may be engendered from this liquid (. . .).” Aside from these theses, a large proportion of articles censored in 1277 could be distributed over four theoretical fields where confrontation with the champions of Catholic orthodoxy was inevitable. (I) In the field of philosophical theology, numerous prohibited theses seriously undermine or actually deny God’s omnipotence or omniscience. Most of them do so in adhering to a metaphysical vision according to which the First Principle, subsisting eternally in an impenetrable folding in of itself, can only produce effects in lower strata of reality through the mediation of secondary causes emanating from itself (e.g., heavenly intelligences or heavenly bodies). In that regard, we may invoke articles 3, 43, 54, and 63 of Tempier’s decree that say, respectively, “that God knows nothing other than himself,” “that the First Principle cannot be the cause of diverse realities produced down here below, except through the mediation of other causes (. . .)” and “that the First Principle cannot immediately produce realities, since they are new effects; now a new effect requires an immediate

cause that could be other than it is,” and “that God can not produce the effect of a secondary cause without the secondary cause itself.” (II) In the area of philosophical cosmology, a number of ideas struck down by the prohibition of the Bishop of Paris claim that the world in its entirety is eternal or that one of its components has always existed and will always exist (e.g., the human species, separate substances, or elements), assertions that run counter to Catholic dogma of the creation of the world from nothing at the beginning of time (*ex nihilo ab initio temporis*). On this point, we may refer to the following articles: (5) “all separate realities are coeternal with the First Principle”; (9) “there was no first man and there will be no last one, but, on the contrary, there has always been and there will always be the generation of man by man”; (87) “for all the species contained within it, the world is eternal and time is eternal (. . .)”; and (107) “the elements are eternal, although they are the effects of something new in terms of the configuration they now possess.” (III) In the field of noetics, a number of propositions that attracted the ire of Bishop Tempier converge to support the thesis of numerical unicity and separation of the intellect (the possible or potential one, that is, the one which receives intelligible forms, as well as the agent intellect, that is, the one which produces intelligible content): this is the famous doctrine, evoked earlier, that historiography has labeled “monopsychism” and whose paternity was attributed, rightly or wrongly (that is another story), to the Arabic philosopher Averroes. We may readily understand that such a doctrine appeared scandalous in the eyes of medieval Catholic theologians. Indeed, claiming that there is only a single intellect for all men, which is metaphysically separated from any one human body, in other words that the entity who possesses the power of thought does not belong to any one human being, amounts to depriving individual man of all immortality (since if something survives the death of the body of man, it could only be his intellectual soul), and, consequently, this is equivalent to denying any possibility of retribution in the hereafter for acts committed down here. In short, “monopsychism” saps the very foundations of Christian morality. In

that regard, we may refer to articles 32, 119, and 121 that posit, respectively, “that the intellect of all men is numerically one, since even if it is separated from a given body, it is not, however, separated from all bodies,” “that the operation of the separate intellect joins to the body in the same way as the operation of something not possessing the form by which it operates (. . .),” and “that the intellect, that is, the ultimate perfection of man, is radically separated.” (IV) A final doctrinal section groups together theses that attack the possibility of human freedom by favoring one form or another of determinism: astral, emotional, or cognitive. Articles 129, 136, 159, and 162 of Tempier’s syllabus tend in this direction, in that they claim, respectively, “that, when a passion and a particular knowledge are actually present, will cannot act against them,” “that the man who acts out of passion acts out of constraint,” “that the will of man is necessitated by his cognition, like the appetite of the beast,” and “that our will is subject to the power of heavenly bodies.”

Beyond Heterodoxy: Other Issues of the Parisian Condemnation

Historians were able to trace the origin of most of the articles prohibited by Tempier to the writings of Arts Masters who worked in the years preceding the decree of March 7, 1277, notably those of Siger of Brabant and Boethius of Dacia. Still, many condemned theses remain unidentified, which may be explained by invoking the loss, indeed the destruction, of the contentious works in which they were found, or the existence of a heterodoxical oral teaching which left no trace, or perhaps the fact that there are still many texts emanating from the Faculty of Arts that were not edited and that continue to sleep in manuscript libraries. Nonetheless, the problem is that, even in the case of theses whose written sources are identified, historians have noted a discrepancy between, on the one hand, what the passages from which the censored articles were extracted really want to say and, on the other hand, what Tempier’s decree had them say by removing them from their original contexts. An assertion

advanced by an Arts Master in a qualified, nuanced, and careful mode becomes, once pinned by the Bishop, a radical and audacious thesis, claiming to be absolute truth. One example will suffice to eloquently illustrate this phenomenon of distortion. In his treatise *On the Eternity of the World*, Boethius of Dacia teaches that creation (in the strict sense, that is, a production *ex nihilo*) is impossible from the point of view of natural causality which the physician (the philosopher of nature) must adopt, since, as experience proves, all natural agents produce their effects starting from a matter or a subject that preexists. From this, to know the ultimate truth about the duration of the world, Boethius invites his readers to return to the teachings of the Catholic faith that claims that the world was created in time, since, as he firmly established in his treatise, philosophy possesses no method of demonstration that could prove definitively one of the two alternatives, either eternity or the newness of the world. In other words, confronting a question of this sort that transcends the limits of philosophy as rational knowledge drawing its principles from the natural course of things, the philosopher acknowledges his incompetence and, since he is a believer, sends his readers back to the teachings of the Christian faith that admits the supernatural causality of a God who is the Creator. This is a carefully measured position, respectful of orthodoxy. Now, reading the decree of condemnation of March 7, 1277, we are led to believe that the philosopher is professing a doctrine of double truth identical to that which Tempier is denouncing, as we recall, in his letter-preface. Indeed, when the Bishop of Paris transposes Boethian thought to the register of his list of condemned articles, he has him claiming this: (90) “the physician (naturalis philosophus) must deny without qualification (*simpliciter*) the newness of the world, because he relies on natural causes and reasons. As for the believer, he may deny the eternity of the world, because he relies on supernatural causes.” This is the position of Boethius as expressed in his treatise *On the Eternity of the World*, with the exception of one word which changes everything: “*simpliciter*” (without qualification). While the Arts Master modestly argues that the newness of

the world, that is to say, its origin in time or the fact that it began to be, cannot be conceded by the physician as such, to the extent that it exceeds his inevitably naturalist perspective, leaving to the religious authorities the task of determining the absolute truth in this matter, Bishop Tempier wrongly understood that Boethius accepted the truth of the faith only to oppose it at once with a naturalistic rationalism elevated to the level of an absolute knowledge, in the light of which the creationist thesis unequivocally had to be rejected. As a general rule, Boethius and his colleagues of the Arts Faculty never claimed “that the possible or impossible without qualification (*simpliciter*), that is, according to all modes, is the equivalent to the possible or impossible according to philosophy,” contrary to what Tempier suggests here in article 146 of his syllabus, but instead they taught that what is impossible from the limited point of view of natural reason, to which philosophy is strictly bound, is possible for the person who believes in the action of a Supreme Cause transcending the limits of nature. Behind Stephen Tempier’s manifest lack of understanding of the subtleties of the Arts Masters’ position lies what we might term “the epistemological issue” of the condemnation of March 7, 1277. In the years preceding this date, the Arts Masters, to whom devolved the task of teaching the entirety of a philosophical corpus inherited from the Greeks and the Arabs, became aware of the intrinsic value of philosophy. Consequently, they developed an epistemological theory with a twofold objective: first, circumscribing the limits of the epistemic validity of diverse scientific disciplines for which they were, according to regulations, responsible (logic, physics, mathematics, metaphysics, and ethics); secondly and correlatively, guaranteeing the autonomy of philosophy as purely rational knowledge compared to the tenets of the Catholic faith and their hermeneutic consequences, which properly concern the teaching for which Theology Masters were responsible in their own faculty. Such a position on the part of the Arts Masters was new in the history of western Christianity. The document where this is expressed most forcefully and clearly was, unquestionably, the treatise *On the Eternity of the World* written by

Boethius of Dacia. While discussing the problem which gave the book its title, the Danish scholar establishes an epistemological doctrine that can be viewed as the “charter” of professional philosophers, consisting essentially of three methodological rules for Arts Masters: (1) a specialist in a particular philosophical discipline must identify the principles on which his science is based and the legitimate area of application of these principles; (2) as well, he must draw all appropriate conclusions flowing from the principles pertaining to his science accordingly, even if some might diverge from the truths of the Catholic faith; and (3) finally, in remaining firmly within the limits of his field of knowledge, he must deny any claim or proposition contradicting or even undermining the principles on which his science is based. In the eyes of a theologian like Tempier, with a unitary and Christo-centered vision of knowledge, according to which the profane sciences have value only in as much as they serve the interests of Christian theology, such a conception of philosophy, which proclaims far and wide its epistemological independence, was absolutely inadmissible. Article 18 of the 1277 syllabus is perfectly eloquent in that respect: to the claim according to which “the future resurrection must not be conceded by the philosopher, because it is impossible that it be examined by reason,” a thesis that is totally consistent with the writings of Boethius and his Arts colleagues, the Bishop of Paris replies that “it is an error, because even the philosopher must keep his intellect captive in submission to the faith.” The Arts Masters want to build up in its entirety a philosophy that is an end in itself; Tempier and his acolytes want to bring it down to the level of a mere auxiliary to Christian wisdom. From this, we have the condemnation of article 145 that contends “that there is no question that can be rationally debated that the philosopher must not debate and determine, because rational arguments are drawn from reality and philosophy must study all of reality in its diverse parts.” There were ethical consequences to the enthusiasm for philosophy as comprehensive self-regulated knowledge that drove the Arts Masters condemned by Bishop Tempier. Indeed, prior to the decree of March 7, 1277, certain members

of the Arts Faculty conceptualized a purely philosophical ideal of life based on the acquisition of intellectual virtues and oriented to attaining joyfulness of mind through the cognitive union with divine realities. This was a rigorous ethical program that came from a tradition of thought developed by the great Arabic philosophers, from al-Fārābī to Averroes, including Avicenna, and that ultimately had its roots in Aristotle’s key texts, such as Book X of the *Nicomachean Ethics* and Book XII of the *Metaphysics*. In favoring a true philosophical asceticism that devalued the pleasures of the flesh arising from the lower powers of sensibility in favor of intellectual pleasures flowing from the exercise of man’s most noble faculty, this new way of life, a potential rival to Christian ethics, was essentially addressed to professional philosophers who, thanks to this, became aware of forming a class of elite thinkers that was superior to other social classes. Here again, it is Boethius of Dacia who offers the most complete manifesto reflecting this trend toward an autonomous practice of philosophy in which man’s intellectual essence is fully realized. In his treatise *On the Supreme Good*, after having determined that a morally good human life is that which is devoted to the knowledge of what is true, the Danish scholar concluded that the ultimate goal for human beings down here resides in the loving and joyful contemplation of the First Principle, which gives existence to all beings and at which the philosopher arrives in the end of a “journey of the mind” that traverses the ascending ladder of beings. Undoubtedly, as a consequence, Boethius and his Arts colleagues professed “that there is no more excellent status than to give oneself to philosophy,” and they let it be understood “that only philosophers are the wise men of the world,” so Bishop Tempier reports in articles 40 and 154 of the syllabus. We can well see how such propositions could appear seditious to the theologians and men of the church who formed the ruling class of medieval society. We also perceive what a threat the advancing of a system of philosophical virtues capable of competing with the order of theological values could represent for Tempier and his acolytes. Therefore, the ecclesiastical power had to condemn some theses such as

those that claim “that chastity is no greater good than perfect abstinence” (article 181) and “that charity is no greater good than perfect friendship” (article 220). The scandalous notion of man attaining salvation through philosophy started to emerge from the ethical discourse of Arts Masters, as is testified by article 157 of the Parisian decree: “if one is well ordered according to his intellect and affections, as one can be sufficiently through the intellectual virtues and other moral virtues of which the Philosopher (i.e., Aristotle) speaks in the Ethics, one is sufficiently disposed for eternal happiness.” However, with respect to what we might term the “ethical issue” of the Parisian condemnation, Tempier’s document acts as a mirror that deforms as well as reflects its object. Indeed, while the Arts Masters, as we have seen, favor an intellectual hedonism and exhort their audience to master their passions, the Bishop of Paris paints a picture of them as individuals with dissolute morals, whose life would follow such maxims as “the sin against nature, like abuse in intercourse, although contrary to the nature of the species, is not, however, contrary to the nature of the individual” (article 166) and “simple fornication, such as that of an unmarried man with an unmarried woman, is not a sin” (article 183). In doing so, Stephen Tempier’s condemnation sealed for one last time the alliance of the heretic and the libertine to better denounce the Arts Masters who, however, wanted nothing more nor less than the peaceful coexistence of the philosopher and the theologian.

Parva Naturalia, Commentaries on Aristotle's

Pieter De Leemans

De Wulf-Mansion Centre, University of Leuven,
Leuven, Belgium

Abstract

The present entry gives an overview of the reception of Aristotle's *Parva Naturalia* in the medieval West from the twelfth to the fifteenth centuries. It shows that the content of the *Parva Naturalia*, and thus of the commentaries on them, has not always been the same as in modern editions and that even in the Middle Ages it fluctuated. In a first period, most commentators focused on *De sensu*, *De memoria*, *De somno*, *De insomniis*, *De divinatione per somnum*, and *De longitudine* only, apparently because James of Venice's translations of *De iuventute*, *De respiratione*, and *De vita* were no longer at their disposal. In a second period, when new translations had been made by William of Moerbeke, commentaries could and did focus on all of the above texts as well as on *De motu animalium*. In the second half of the fourteenth as well as in the fifteenth

century, the study of the *Parva Naturalia* at the University of Paris was delimited to the same texts with which the earliest commentators had dealt. This is reflected in the composition of several fifteenth-century commentaries, most of them from Paris. In Germany and Central Europe, the *Parva Naturalia* was mostly studied on the basis of a compendium by Joannes Kronsbein. These commentaries display a typical division of *De vita* into two parts; moreover, they often add *De motu animalium* and *De mundo* and sometimes the *Physiognomonica* to the collection.

The generic title *Parva Naturalia* refers to a collection of short Aristotelian treatises that deal with the important vital functions shared by both soul and body. It is commonly accepted since Freudenthal's study (1869) that this title came into use in the second half of the thirteenth century. In reality, late-thirteenth and early-fourteenth authors, such as Giles of Rome, Peter of Auvergne, and John of Jandun, use "parvi libri naturales" instead. The use of the neutral form *Parva Naturalia* might well have become common only after 1350 – it is certainly attested in the 1366 study program of the University of Paris (see also below).

Modern editions of this collection contain the following texts:

- On Sense and Sensible Objects (Sens.)
- On Memory and Recollection (Mem.)
- On Sleep and Waking (Somn. vig.)
- On Dreams (Insomn.)
- On Prophecy in Sleep (Div. somn.)
- On Length and Shortness of Life (Long.)
- On Youth and Old Age (Iuv.)
- On Respiration (Resp.)
- On Life and Death (Vit.)

These are usually divided into two groups: the "psychological" Sens., Mem., Somn. vig., Insomn., and Div. somn. (= Parv. nat. 1) and the "physiological" Long., Iuv., Resp., and Vit. (= Parv. nat. 2). For the last three texts, there is discussion whether they are independent entities or whether they form a single treatise or perhaps two (Iuv., on the one hand, and Resp. + Vit., on

the other hand) treatises. Similarly, in the Middle Ages and sometimes thereafter, Somn. vig., Insomn., and Div. somn. were considered as parts of one work *De somno et vigilia*, consisting of two books (Somn. vig., on the one, and Insomn. and Div. somn., on the other hand).

In turn, medieval commentaries on the *Parva Naturalia* do not necessarily cover the same treatises: some texts are omitted, and others are added. The most important text to be mentioned here that was added is Aristotle's *On the Movement of Animals* (Mot. an.), whose strong link with the Parv. nat. has been underlined by modern scholarship (e.g., Morel 2002; Rashed 2004). The reasons for this instability are various, due both to circumstances and to deliberate choice.

The following pages will focus on some ascribed and anonymous Latin commentaries from c. 1200 to 1500, yet they do not aim to be exhaustive. A list of both anonymous and ascribed commentaries can be found in De Raedemaeker (1965); questions on Parv. nat. 1 have been described by Ebbesen et al. (2016), De Leemans (2000) offers an inventory of commentaries on *Mot. an.* Information on individual authors can be found in the repertories of C. H. Lohr and O. Weijers. In recent years, several texts have been critically edited, including the editions prepared in the context of the project "Representation and Reality. Historical and Contemporary Perspectives on the Aristotelian Tradition" (Thomsen Thörnqvist and Ebbesen 2013).

A distinction will be made between three periods: a first period in which the interest in Aristotle's natural philosophy started to flourish; a second period, from c. 1270 onwards, when the Aristotelian corpus had been completed and renewed by other translations; and a third period, from c. 1366 onwards, when two opposite tendencies can be distinguished, of, respectively, delimiting and reformulating the study of the *Parva Naturalia*. (In what follows, the abbreviation Parv. nat. (1/2) will be used for the "modern" collection, the full expression for the medieval one. Likewise, Somn. vig. will refer to the Aristotelian text, and *De somno* to the cluster of Somn. vig., Insomn., and Div. somn.)

The Rediscovery of the *Parva Naturalia* (Before c. 1270)

The *Parva Naturalia* was brought up for discussion mainly by Greek–Latin translations that were made from the twelfth century onwards. The first such translation (*translatio vetus*) was not the work of one author alone. Most treatises, namely, *Mem.* and *Parv. nat.* 2, were translated by James of Venice (*Jacobus Veneticus Graecus*). The remaining translations are anonymous: the twelfth-century translation of *De somno* and the translation of *Sens.*, to be dated before c. 1230 (Galle 2008a; see also Bloch 2008). Interestingly, these translations were not all equally disseminated. While *Parv. nat.* 1 and *Long.* were rather popular, only a few copies are extant of James' *Iuv.*, *Resp.*, and *Vit.* (For traces of another translation by David of Dinant, see below.)

In turn, the Arabic–Latin input was limited to translations of Averroes' *Epitome* of the *Parva Naturalia* – there are no long or middle commentaries on these texts. This *Epitome*, completed in January 1170, is entitled *On Sense and the Sensible* (*De sensu et sensibili*) and deals with *Parv. nat.* 1 and *Long.* It is divided into three treatises – the first discusses *Sens.*, the second *Mem.* and *De somno*, and the third *Long.* Both the *Epitome*'s title and division go back to an older Arabic tradition (Martino 2003). In turn, the absence of *Iuv.*, *Resp.*, and *Vit.* is due to the fact that they had not been translated into Arabic. This might also count for *Mot. an.*, which the Arabs did not possess either. On various occasions Averroes underlined that its subject was closely related to that of the *Parva Naturalia* (De Leemans 2010). The Latin world became acquainted with the *Epitome* by means of two translations. While the anonymous Parisina is preserved in one manuscript only, the *Vulgata* was more widely disseminated. It was probably made by Michael Scot in about 1230 and soon influenced various Latin commentators.

Both the Greek–Latin and Arabic–Latin transmission of the *Parv. nat.* thus neglect *Iuv.*, *Resp.*, and *Vit.* (One might get the false impression – several studies err here – that at least James'

translation of *Vit.* circulated, since several medieval pre-1270 texts mention or comment on an Aristotelian treatise *De morte et vita*; yet, this was the title under which the translation of *Long.* circulated.) The dissemination of the Greek–Latin translations of these texts might have been hindered by their absence in Averroes' popular *Epitome* or by intrinsic (such as the quality of the translation) or purely circumstantial factors. Around 1250, in any case, several authors made clear that these texts were not at their disposal (see the texts quoted by Gauthier 1985, pp. 117*–118*).

For this period, one can make a distinction between commentaries written in Oxford and those written on the continent. The introduction of Aristotelian natural philosophy in Oxford probably took place at the end of the twelfth century (Burnett 1996). The oldest surviving commentaries are those by Alfred of Sareshel (*Alfredus Anglicus*) on the *Meteorologica* and *De plantis*. Alfred probably commented also on some *Parva Naturalia*. This is at least what is suggested by the 1664 catalogue of the cathedral of Beauvais, which mentions commentaries by Alfred on *De somno et vigilia* and *De morte et vita* (= *Long.*) (Callus 1943, p. 14). Moreover, he might have read *Resp.*, since he refers to – though he does not explicitly quote – the text in his *De motu cordis*.

The first and most important extant Oxford commentary was written by Adam of Buckfield (or Bocfeld), active in Oxford in the late 1230s and/or in the 1240s, and focused on all of the known *Parva Naturalia* (*Parv. nat.* 1 and *Long.*). Several versions of these commentaries exist, yet it is unclear whether or not they should all be attributed to the same author: for one of the versions of his commentary on *De somno*, for example, the authorship of Siger of Brabant has been suggested (Dondaine and Bataillon 1966: cf. *infra*). Moreover, Buckfield's commentary on *Sens.* was used as a source for composing the so-called Oxford gloss, a corpus of marginal and interlinear notes compiled in the Oxford schools in the (middle of?) the thirteenth century (Galle 2008b, c). It is not unlikely that this also holds for

the remaining *Parva Naturalia*. One of the students attending these courses was Henry of Renham, who wrote glosses on the corpus vetustius in manuscript London, British Library, Royal 12.g.ii.

Another leading representative of early Oxford Aristotelianism is Geoffrey of Aspill (d. 1287). Contrary to Buckfield he did not write straightforward expositions on the *Parva Naturalia*, yet proceeded per modum quaestionis. We still possess questions on Sens. (descr. Ebbesen et al. 2016, pp. 66–70), *De somno* (descr. Ebbesen et al. 2016, pp. 96–98; partial ed. Ebbesen 2014; see also Thomsen Thörnqvist 2016), and Long., which may have been written no later than the early 1260s. The questions on Mem. in manuscript Oxford, New College, 285 might also be by his hand (Macrae 1968).

Less famous than the above authors is William of Clifford (d. 1306), master around 1265 and author of a commentary on the Physics. Recently, it has been convincingly argued that he is also the author of the anonymous commentaries in manuscript Cambridge, Peterhouse, 157. Among these is a *Sententia cum quaestionibus* on *De somno et vigilia*, based on the *translatio vetus* (Donati 2008).

Also noteworthy are the abbreviations of, among other works of the corpus vetustius, Parv. nat. 1 and Long. in manuscript Oxford, Bodleian Library, Tanner, 116. These were sometimes ascribed to Simon of Faversham (d. 1306) on feeble grounds. Instead, D.A. Callus noticed the resemblance with the abbreviations of the Ethics by Robert Grosseteste, though without drawing any conclusions (Callus 1943, pp. 49–52). (In turn, Simon's authorship of *Quaestiones* on the *Parva Naturalia*, based on the *translatio nova*, appears to be certain – see below.)

Finally, Adam de Wyteby wrote glosses on Sens. and perhaps also on Mem. (Gauthier 1985, p. 125*).

In Paris, Aristotle's natural science was initially considered a threat to Christian faith. In 1210, a prohibition was issued against the teaching of Aristotle in Paris, which resulted in the burning of the Quaternuli of David of Dinant. In this work, David had quoted, apart from other

works, several of the *Parva Naturalia*. (He, however, used none of the existing translations but paraphrased directly from the Greek – cf. Vuillemin-Diem 2003.) Still, this and other prohibitions, in 1215 and 1231, could not prevent the increasing popularity of the study of Aristotelian natural philosophy. This is strikingly illustrated by the presence of Aristotle's works (among which Parv. nat. 1 and Long.) in a manual for students of the Arts faculty in Paris, written in c. 1230–1240 (manuscript Barcelona, Arxiu de la Corona d'Aragó, Ripoll 109). In the 1240s Roger Bacon might have been among the first to lecture on Aristotle in Paris; his commentary on Sens. is sometimes dated to this period (ed. Steele). On March 19, 1255, the study of Aristotle at the University of Paris was officially adopted, when a new syllabus proclaimed by the Arts faculty imposed the study of all known works of Aristotle: 6 weeks were reserved for the study of Sens., 5 for *De somno*, 2 for Mem., and 1 for *De morte et vita* (= Long.).

In spite of the increasing popularity of Aristotle in this period, continental commentaries on the *Parva Naturalia* are rare. The main exception is the paraphrase of Albert the Great (c. 1200–1280), an enterprise begun around 1250, which is the most ambitious attempt to offer an interpretation of the *Parva Naturalia* in the whole of the Middle Ages (ed. Borgnet; see also Donati 2009, 2011, 2012). While other commentators limited themselves to the available texts, Albert wanted to offer a complete science of the soul. He thus completed his paraphrasing of Parv. nat. 1 and Long. – for which he heavily relied on Averroes' *Epitome* – with treatises on youth and old age (*De iuventute et senectute*), on respiration (*De spiritu et respiratione*, a paraphrase of Qusṭa ibn Lūqā's *De differentia spiritus et animae*), on the movement of animals (*De motibus animalium*), on nutrition (*De nutrimento et nutribili*; Donati 2011), and on the intellect (*De intellectu et intelligibili*). All these topics were said to pertain to the second part of the science of the soul, dealing with the functions of the soul in the body (cf. Albert, Physics). (Around 1256, Albert found a translation of Mot. an. and used it for another paraphrase, *De principiis motus processivi*. This

text was not integrated in Albert's *Parva Naturalia*; it was originally inserted in his *De animalibus* but soon extracted from it as an independent treatise – see De Leemans 2010, pp. 201–206.)

Another continental exception is the commentary on Long., by Peter of Ireland (Petrus de Hibernia), which was written in the middle of the thirteenth century and consists of a mixture of literal explanation and quaestiones (ed. Dunne 1993). In turn, Peter of Spain (1220–1277) wrote a *Tractatus de longitudine et brevitate vitae* (ed. Alonso 1952). This work, however, is not a commentary on the Aristotelian text, although it is clearly inspired by it (Dunne 2003, pp. 324–326).

Finally, some commentaries based on the *translatio vetus* have been associated with Siger of Brabant, although their authorship remains a topic of discussion. This is the case for the questions on *De somno*, probably written in the 1260s, in manuscript München, Bayerische Staatsbibl., Clm. 9559 (Van Steenberghen 1931; see also Thomsen Thörnqvist 2016; Ebbesen et al. 2016, pp. 100–101) and for the literal commentaries on *De somno* and *Long.* in manuscript Wien, ÖNB, 2330 (Dondaine and Bataillon 1966). In turn, the München manuscript also contains questions on *Iuv.*, *Resp.*, and *Vit.* that have been attributed to Siger as well (Van Steenberghen 1931); these are most likely based on Moerbeke's translation.

The “Standard” *Parva Naturalia* (c. 1270–c. 1366)

A renewed impetus to the study of the *Parva Naturalia* was given by a translation of the entire collection (*translatio nova*), made in 1260–1270, by William of Moerbeke (d. 1286). While Moerbeke appears to have made entirely new translations of *Parv. nat.* 2 (De Leemans 2012), he revised the *vetus* of *Parv. nat.* 1. The Flemish Dominican is also credited with a translation of Aristotle's *Mot. an.* and *Inc. an.* – known in the Middle Ages as *De progressu animalium* – as well as of the commentary of Alexander of

Aphrodisias on *Sens.*, which highly influenced Thomas Aquinas (Gauthier 1985).

Except for Alexander's commentary (five extant manuscripts), all these texts were soon widely disseminated. This eventually led to the reformulation of the content of the *Parva Naturalia* (as illustrated by several divisions of science of this period): not only *Parv. nat.* 1 and *Long.* but also the rediscovered *Iuv.*, *Resp.*, and *Vit.*, the newcomers *Mot. an.* and *Inc. an.*, as well as the allegedly “lost” treatises *De nutrimento et nutribili* and *De sanitate et egritudine*. (Note: *Iuv.*, *Resp.*, and *Vit.* were considered as one text, often called *De morte et vita*, which was the *vetus* title of *Long.*!) Yet, this fixed content was mainly theoretical as it seems (even if one leaves the “lost” treatises out of consideration). For example, no commentaries on *Inc. an.* in this context have been preserved, a situation which is probably due to the text's very technical nature and limited philosophical relevance (De Leemans 2006).

The most influential commentaries on the *Parva Naturalia* “new style” were written by Thomas Aquinas and Petrus de Alvernia. Aquinas wrote a commentary on *Sens.* and *Mem.* (ed. Gauthier 1985; see also Ebbesen 2017), whereas Petrus wrote *Sententiae* on *De somno*, *Long.*, *De morte et vita*, and *Mot. an.* Although it is nowhere explicitly said, it is not unlikely that, by commenting on these texts, Petrus intended to complete Thomas' commentary on the *Parva Naturalia*, just as he had completed Aquinas' commentaries on *De celo* and the *Politica* (De Leemans 2004). In any case, their commentaries are often found in the same manuscripts and have been printed together, sometimes under the name of Aquinas only, up to the middle of the seventeenth century. Moreover, Petrus wrote *Quaestiones* on *Parv. nat.* 1 (ed. White; ed. of *Mem.* Bloch 2008; see also White 1990; Thomsen Thörnqvist 2016; Ebbesen 2017) and (perhaps) on *Mot. an.* (De Leemans 2004, 2005).

Other authors whose commentaries reflect the reformulated content of the *Parva Naturalia* are, toward the end of the thirteenth century, Simon of Faversham and Radulphus Brito and, in the first half of the fourteenth century, John of Jandun, Walter Burley, and John Buridan.

Simon of Faversham (d. 1306), regent master in Oxford and Paris and Chancellor of the University of Oxford from 1304 to 1306, wrote Quaestiones on *De somno* (ed. Ebbesen; see also Thomsen Thörnqvist 2016; Ebbesen et al. 2016, p. 105), *Parv. nat.* 2 (excerpts of Long. in Ebbesen 1980), and *Mot. an.* (partial ed. Christensen), whereas Quaestiones on *Mem.* might be lost. It has been argued that his questions result from his teaching in Paris but may have been edited after his return to England (Ebbesen 2013, p. 90; Christensen 2015, p. 94).

From Paris master Radulphus Brito, who probably produced most of his works as an arts master in the 1290s, manuscript Firenze, Bibl. Nazionale Centrale, Conv. Soppr., E.1.252, contains questions on all *Parv. Nat.* (descr. of *Parv. nat.* 1 in Sens. Ebbesen et al. 2016, pp. 72–73, 89–90, 107–108; partial ed. of *Parv. nat.* 1 Ebbesen; see also Ebbesen 2017) and *Mot. An.* (ed. Costa) (on Brito's authorship, see Costa 2007, pp. 158–165). It is not impossible that his course on the *Parva Naturalia* also contained a literal exposition that has not (yet) come to us (cf. ed. Ebbesen, p. 13). In turn, manuscript Vaticano, B.A.V., Vat. lat. 3061, might well contain an adaptation of Brito's quaestiones on *Parv. nat.* 1 (partial ed. Ebbesen; descr. Ebbesen et al. 2016, pp. 73–74, 90, 108–109; Ebbesen 2017) and on *Mot. an.* (ed. in Costa; see also De Leemans 2000, pp. 339–341).

John of Jandun's (c. 1285–1328) Quaestiones on *Parv. nat.* (descr. *Parv. nat.* 1 Ebbesen et al. 2016, pp. 80–82, 93, 110–112; Ebbesen 2017) and *Mot. an.* (descr. De Leemans 2000, pp. 316–322) date from the very beginning of his career (cf. manuscript Vaticano, B.A.V., Vat. lat. 6768, fol. 145ra: *Expliciunt questiones supra librum de sompno et uigilia scripte per Johannem de Ganduno et ad hunc ordinem quem habent reducte anno Christi 1309*). They remained to be copied in the fifteenth century and were printed several times in the sixteenth century.

From about the same time date Walter Burley's (c. 1275–c. 1346) commentaries on *Parv. nat.* 1 (ed. *De somno* Thomsen Thörnqvist; see also Ebbesen et al. 2016, pp. 109–110), Long. (ed. of

the preface in Dunne 2003, pp. 333–335, of some fragments on the *humidum radicale* in Dunne 2009, pp. 137–147), and *Mot. an.* While his notes of *Mot. an.* are largely influenced by Peter of Auvergne (De Leemans 2000, p. 279; ed. Scott and Shapiro), Averroes is his guide in interpreting Long. (Dunne 2003, p. 332). In turn, the most important source for his commentary on *De somno*, which alternates exposition and questions, is Albert the Great, closely followed by Averroes (ed. Thomsen Thörnqvist, p. 384; see also Thomsen Thörnqvist 2016).

John Buridan (c. 1300–post 1358) wrote both commentaries *per modum scripti* and *per modum quaestionis* on the *Parva Naturalia*. One difference is that he wrote an exposition on *Mot. an.* (ed. Scott and Shapiro), whereas questions by his hand on this text have not been preserved. His Quaestiones (ed. Stanek; see Ebbesen et al. 2016, pp. 82–84, 94, 112–113; Ebbesen 2017) were printed for the first time in Paris in 1516.

Other commentators commented on only a few texts (or better: commentaries on only a few texts have been preserved). More or less contemporary with Petrus de Alvernia's are the relatively popular commentaries on *De somno* (partial ed. Ebbesen; see also Thomsen Thörnqvist 2016, pp. 308–310; descr. Ebbesen et al. 2016, pp. 102–104) and Long. by James of Douai (fl. 1270s), which offer an intermingling of *Sententia* and *Quaestiones*. James might have commented on *Sens.* and *Mem.* as well.

Other ascribed commentaries are (1) Henricus de Alemania's Quaestiones on *Iuv., Resp.,* and *Vit.* (c. 1310), which exhibit striking similarities with the Quaestiones of John of Jandun (Kouri and Lehtinen 2000); (2) Quaestiones on the same texts as well as on *Mot. an.* (De Leemans 2000, pp. 330–332) by the otherwise unknown Petrus de Flandria in manuscript Vaticano, B.A.V., lat. 2170 (these are preceded by questions on *Sens.*, which might or might not be by the same author) (descr. Ebbesen et al. 2016, pp. 76–77; partial ed. Ebbesen; Ebbesen 2017); (3) Jacobus de Blanchis de Alexandria's *Compilatio super totam philosophiam naturalem et moralem*, which deals with *Parv. nat.* 1 only; (4) Raimundus

de Biterris' (fl. 1310) commentary on Long.; (5) John Felmingham's (?) commentary on Sens. (the ascription is based on the fact that the manuscript contains Felmingham's exposition of the *Meteorologica*) (descr. Ebbesen et al. 2016, pp. 74–76; Ebbesen 2017); and (6) the above-mentioned *Quaestiones* on Iuv., Resp., and Vit., ascribed to Siger of Brabant. In turn, Boethius of Dacia's (d. c. 1284) *De somniis* is not a commentary on the Aristotelian text, although it is clearly inspired by it (ed. Pedersen; see also Fioravanti 1966–1967).

Moreover, several commentaries have been transmitted anonymously. In addition to the manuscripts discussed above in association with Radulphus Brito and Petrus de Flandria, one may mention, by means of example, the commentaries on Mem. (ed. Ebbesen) and Sens. (descr. Ebbesen et al. 2016, pp. 78–79) in MS Oxford, Oriel College, 33, which were probably collected and perhaps also composed in late thirteenth- or early fourteenth-century Oxford (ed. Ebbesen, p. 130; Ebbesen 2017) or the commentary on Sens. (descr. Ebbesen et al. 2016, pp. 74–76; Ebbesen 2017) and Mem. (ed. Ebbesen) in manuscript Paris, BnF, lat. 16,160.

Delimitation and Reformulation (c. 1366–1500)

From the second half of the fourteenth century onwards, but mainly in the fifteenth century, some authors delimited the study of the *Parva Naturalia* to a selection of texts, whereas others expanded the collection with new texts and proposed a new division of known texts. Generally speaking, the fifteenth century was a very fruitful period for the interpretation of the *Parva Naturalia*.

Delimitation

When the curriculum at the Parisian Arts faculty was fixed in 1366, only Parv. nat. 1 and Long. figured among the Aristotelian books concerning natural philosophy that were prescribed for study. The same list was to be repeated almost one

century later, in the 1452 statutes. As a result, one actually gets a copy of the pre-1260 situation when the study of the *Parva Naturalia* focused on the same texts, yet for different reasons.

This curriculum appears to be reflected for the first time in manuscript München, Bayerische Staatsbibl., Clm. 4376, written between 1365 and 1367. It contains, among other works, anonymous *Quaestiones* on Mem., *De somno*, and Long., as well as *Quaestiones* on Sens. that are attributed to Albert of Saxony. This ascription, however, is uncertain: another (Erfurt) manuscript attributes them to Nicholas Oresme, and even the name of John Buridan has been suggested (ed. Agrimi 1983; cf. Agrimi 1991; Ebbesen et al. 2016, p. 84).

All other commentaries with this composition date from the fifteenth century. Not surprisingly, they were mainly written by authors active in Paris: (1) Jacobus Faber Stapulensis (Lefèvre d'Étaples; c. 1460–1536); (2) Johannes de Caulaincourt (fl. XV²), whose commentary was printed several times under the name of Johannes de Magistris; (3) Johannes Hennon (fl. XV²); (4) Johannes le Damoisiau (fl. XV²); (5) Joannes Versor (d. after 1482), who was very influential at the University of Cologne as well as at other universities in Germany and Central Europe; (6) Georgius Bruxellensis (d. 1510), whose commentary was edited in 1482 by Thomas Bricot (d. 1516), who in turn added abbreviations of the Aristotelian texts as well as some *Quaestiones*; and (7) Petrus Tartareti (d. 1522).

Three other authors who focused on Parv. nat. 1 and Long. worked only in Germany: (1) Johannes Hulshout de Mechlinia (d. 1475) (see also below); (2) Johannes Tinctoris de Tornaco (d. 1469); and (3) Nicolaus Theoderici de Amsterdam (d. c. 1460).

These commentaries have not yet been the object of extensive analysis. An impression of what one might expect of them is given by the *Tabula quaestionum*, *dubitationum*, and *conclusionum* of the works by Johannes Hennon, Johannes le Damoisiau, and Johannes de Caulaincourt (Bakker 2005, 2006, 2007) and by the lists of questions on Parv. nat. 1 of Joannes Versor

(Ebbesen et al. 2016, pp. 86–87, 95–96, 114–115; see also Ebbesen 2017).

Reformulation

A different movement is seen in a collection of anonymous commentaries on the *Parva Naturalia* (De Leemans 2000). They were written throughout the fifteenth century and are preserved for the most part in libraries in German-speaking countries and in Central Europe. (Also among these is the commentary in manuscript Erfurt, Ampl. F. 334, which was ascribed – on feeble grounds – to Marsilius of Inghen; see also infra.) Exploratory research for Mot. an. has shown that they all have significant internal similarity. This might be a reason to assume the existence of a “proto-commentary,” used and adapted by the respective magistri for their courses.

Most remarkably, they are based on abbreviations of the Aristotelian texts by Joannes Kronsbein. Nothing is known about this author, except that he was a German Dominican who wrote compendia both on Aristotle's moral and natural philosophy and must have been active at the latest in the very beginning of the fifteenth century. It is from this compendium that the commentaries have taken over a very peculiar division of Iuv., Resp., and Vit. These are no longer considered as one, or two, or three but as four texts whose order could vary. Apart from Iuv. and Resp., Vit. is split into two independent treatises: *De morte et vita* (= 478b22–479b16) and *De motu cordis* (= 479b17–480b30). (Note that the titles cause confusion: it has been shown that *De morte et vita* is also used to denote Long. as well as the ensemble of Iuv., Resp., and Vit., whereas *De motu cordis* is also the title of works by Thomas Aquinas and Alfred of Sareshel.) Another characteristic is the fact that the content is not limited to the standard Parv. nat., but includes Mot. an. and, much more surprisingly, the pseudo-Aristotelian *De mundo*, which had also been paraphrased by Kronsbein.

Perhaps related to Kronsbein's compendium are two commentaries per modum quaestionis by Paulus de Worczyn and Nicolaus Tempelfeld de Brega, respectively. Both authors were active in Krakow in the first half of the fifteenth century.

Their Quaestiones on the *Parva Naturalia* are characterized by the division of Vit. into two independent parts. On the contrary, they do not discuss Mot. an. or *De mundo*, but add the *Physiognomonica* (which was absent in Kronsbein's compendium) to the collection; Tempelfeld's commentary on the *Physiognomonica* is clearly inspired by Paulus' (ed. Garbaczowa).

Other Commentaries

Some commentators dealt with one or a few treatises only. Thus, for Sens., we have a commentary by Peter de Rivo (d. 1499–1500), a professor at the University of Leuven (Bartocci et al. 2013). Mem. was treated by Dominicus de Carpanis as well as by Ugo Benzi (1376–1439); the latter also wrote a *Scriptum de somno et vigilia* (ed. Fioravanti and Idato 1991). Moreover, Joannes de Slupcza (1408–1488) might have written notes on all of Parv. nat. 1. In turn, Matheolus Perusinus' (d. 1470/1480) *De memoria et reminiscencia. Ars memorativa* is an original treatise, for which Aristotle served as one of the sources (Lupi 2008; ed. Levi Donati and Sacilloto).

More important are three authors who, in spite of the above tendencies, adopt a more classical content of the *Parva Naturalia*. Marsilius of Inghen (c. 1340–1396) wrote Quaestiones on Parv. nat. (descr. of Parv. nat. 1 Ebbesen et al. 2016, pp. 85, 95, 113–114; see also Ebbesen 2017) but not on Mot. an. It is, however, unclear whether these were written in Paris or in Heidelberg. The same treatises were dealt with in a literal commentary by the Spanish author Petrus de Castrovol, published in 1498 in Lerida. A special case, in which different traditions concur, is the commentary written by Jacobus Tymens de Amersfordia (d. 1493), active at the University of Cologne. He completed the commentaries on Parv. nat. 1 and Long. by the abovementioned Johannes Hulshout de Mechlinia with discussions of Iuv., Resp., Vit., as well as Mot. an. Moreover, he had his commentary on Mot. an. followed by a set of 18 dubia on the *liber de progressionibus animalium* (= Inc. an.). By doing so, he is the first Latin author ever to realize a commentary on the *Parva Naturalia* as

defined by, among others, Thomas Aquinas and Peter of Auvergne. The latter authors might have inspired this decision: although he proclaims himself to be a follower of Albert the Great, it seems, at least in his commentary on Mot. an., that Peter of Auvergne was one of his principal sources. In turn, the influence of the Kronsbein tradition can be seen in the division of Vit. into two parts.

Paul of Pergula

Stephen F. Brown
Institute of Medieval Philosophy and Theology,
Boston College, Chestnut Hill, MA, USA

Abstract

Paul of Pergula was the first to hold a chair of Philosophy at Venice. We do not know much about his life, since the chief sources of information concerning him simply indicate that he flourished from 1400 to 1454, that he studied under Paul of Venice, refused the offer to be ordained a bishop in 1448 and chose rather to administer the Church of St. John the Almoner in Venice. His most printed work, *Logica*, was published by his student and successor, Domenico Bragadino. Another of his works, *Dubia super consequentiis Strodi*, a commentary on Ralph Strode's *Consequences*, was by a statute of 1496 a required text at the University of Padua. His *Logica* went through eight editions between 1481 and 1501 and survives in ten manuscripts, including four at the Bodleian Library in Oxford.

Paul of Pergula (c.1400–1454) was the first official master of the School of Rialto in Venice and thus the first person to hold a chair of Philosophy in that city. There were a number of Pauls who taught philosophy in the Venice–Padua–Bologna area in the first half of the fifteenth century: Paul of Venice (d. 1429), Paul of Pergula (d. 1451), and Paulus Albertini (d. 1475). Often their identities became mixed. Earlier historians, such as Girolomo Tiraboschi and Giuseppe Valentinelli, tried to sort out the facts concerning these three philosophers and identified Paul of Pergula as a

student of Paulus Nicolettus, who today is known as Paul of Venice. The Paul who was the first professor of philosophy at Venice, and taught there his whole life, is now called Paul of Pergula. He taught at the School of Rialto from 1420 until his death in 1454. From the works that have come down from him, we know that he was an *artium doctor*. He has, however, also been described as a professor of theology, although we have presently no works to verify this claim. He refused the office of bishop in 1448 and in its stead he chose to administer the Venetian Church of St. John the Almoner. In 1450, he was honored by the City of Venice for his many years of teaching. He died in 1454.

Paul of Pergula wrote a number of logical works. The most often published volume was his *Logica*, an introductory text made up of six treatises that survives in eight old editions and also in a modern form. It is a very rudimentary work that in its outline follows the *Logica parva* of Paul of Venice. Paul of Pergula's six treatises are: *Summulae*, which is a general outline of terms, propositions, and arguments, which is the content likewise of Paul of Venice's first chapter in his *Logica Parva*. Paul of Pergula's opening treatise covers in a short form the logic materials of Porphyry's *Isagoge*, Aristotle's *Categories*, *Perihermeneias* and *Analytics* as digested by logicians from the time of Peter of Spain on. The titles of the other five treatises of Paul's *Logica* are identical with the chapters of Paul of Venice: (1) *On Suppositions*; (2) *On Proving Terms*; (3) *On Consequences or Inferences*; (4) *On Obligations*; and (5) *On Insolubles*, although Pergula's third and fourth treatises are an inversion of the order of Paul of Venice's chapters three and four. There is, in his first treatise, the *Summulae*, no deep theoretical discussion of terms, propositions, or arguments. The ten categories are explained in brief and there is no sign of the arguments between realists and nominalists like Walter Burley and William of Ockham over the nature of certain kinds of qualities, or any of the other categories as inhering realities. Alexander Sermoneta (d. 1486), in a question concerning Porphyry's discussion of "accident," tells us that Paul of

Pergula gives a different interpretation of “accident” according to Porphyry than does Paul of Venice. However, no such discussion is present in the *Logica* of Pergula. If there is a foundation for Sermoneta’s deeper discussion of Paul of Pergula’s position, it might well be found in another work, Paul’s unedited treatise *Universalis* found in codex 168 of the Philadelphia Free Library, where Pergula discusses the five predicables of Porphyry.

A second work, *A Treatise on the Composite and Divided Senses*, that has been joined to the modern edition of the *Logica*, is a unified portrait of the ways of avoiding the seven ways that fallacies concerning modal propositions might be committed. It was written explicitly for Petrus de Guidonibus, to be shared with others, and covers not only modal forms such as “necessary,” “possible,” “contingent,” and “impossible,” but modal propositions in a much broader sense, where they are determined by such verbs as “I doubt,” “I believe,” “I imagine,” and “I suspect.” In the *Logica parva* of Pergula’s teacher, Paul of Venice, these are treated here and there throughout the whole work and not in a unified way; in the *Logica magna* attributed to Paul of Venice, one finds, however, a special organized treatise like this work of Paul of Pergula.

The link to other logical works of Paul of Pergula quite likely goes back to Paul of Venice. Paul of Venice studied at Oxford from about 1390 to 1393 and brought back to Padua many logical works of English authors. An example of the English logic invasion can be seen by examining library catalogs, such as those of the Franciscan convent of St. Anthony in Padua. This library had no English authors in 1396. Half a century later, among the holdings, there were three copies of Walter Burley’s *On the Purity of the Art of Logic*, six copies of William of Ockham’s *Summa logicae*, a copy of Ralph Strode’s *On Consequences*, and a copy of William Heytesbury’s *Sophismata*. The focus on English logic was very much due to the dominance of Paul of Venice, a dominance criticized by Erasmus, Thomas More, and Juan Luis Vives. These works of Strode and Heytesbury were studied by many Italians,

including Paul of Pergula. From Paul’s pen we have *Dubia super consequentiis Strodi*, which was published as a companion piece in the 1477 Padua edition of Strode’s *De consequentiis* and was also reprinted with Strode’s text in the Venice editions of 1488 and 1493. This commentary of Paul of Pergula was made a required text at the University of Padua by the statutes of 1496. Paul of Pergula also commented on William Heytesbury’s *Regulae solvendi sophismata* and *Sophismata*. His *Recollecta super sophismatibus Heytesbury*, however, did not gain the same attention as his criticism of Strode’s *De consequentiis*, since Paul only dealt with seven of Heytesbury’s sophisms, whereas his contemporary, Cajetan of Thiene (d. 1465), treated all thirty. Finally, among the works attributed to Paul of Pergula is his *Commentary on the Sophismata asinina* of William Heytesbury. This work, like that of Paul’s broader treatment of Heytesbury’s *Sophismata*, is incomplete. He only deals with 9 of the 37 asinine sophisms, which gain their title from the opening words: “I wish to prove . . . that ‘you are an ass’.” Quite likely, it is because these last works of Paul of Pergula are incomplete that they did not join the ranks of required reading at the University of Padua that was accorded his *Dubia super consequentiis Strodi*.

Conclusion

Paul of Pergula was a student of Paul of Venice and is known mostly for the part he played, along with Paul of Venice and Cajetan of Thiene, in spreading the influence of English logic, especially that of Ralph Strode and William Heytesbury. *Logica* was his most often published work, but its basic character does not set it apart from similar works, such as Paul of Venice’s *Logica parva*. His commentaries on Strode’s *De consequentiis* and Heytesbury’s *Regulae solvendi sophismata* and *Sophismata* are the works that more show his distinctive positions in discussing logical issues and providing the reasons for his personal choices.

Paul of Venice

Fabrizio Amerini

Department of Philosophy, University of Parma, Parma, Italy

Department of Humanities, Social Sciences and Cultural Industries, University of Parma, Parma, Italy

Abstract

Paul of Venice has been one of the most important logicians and metaphysicians of the Late Middle Ages. His philosophical attitude can be called Realist, since Paul erected a philosophical system in which different forms of medieval Realism have been combined together in an original way. Basically, Paul's philosophy has been influenced by some relevant realistic thinkers such as John Wyclif and the late fourteenth-century Oxonian realists, John Duns Scotus and Walter Burley. From Scotus, Paul inherits his major metaphysical doctrines: the univocity of the concept of being; the real distinction among categories; the extramental foundation of universals; the technical notions of formal distinction, individual differentia, and thisness (haecceitas). Paul's basic metaphysical intuition – viz. that the extramental

world is made up of individual things, which can be construed as a cluster of universal forms, formally distinct from each other – can be traced back to Burley. Upon such metaphysics, Paul grounds his interpretation of Aristotle's epistemology and psychology, which significantly departs in many points from Averroes' interpretation. On the other hand, his eclectic and epitomizing attitude toward medieval philosophy leads Paul to be open to other traditions of thought. Thus, Paul refers to Albert of Saxony and other Parisian physicians when he has to explain natural philosophy; Thomas Aquinas plays a crucial role in Paul's account of Aristotle's metaphysics; Giles of Rome instead exerts a decisive influence on most of Paul's Aristotelian Commentaries; finally, Paul does not miss the opportunity of discussing critically, in his handbooks, the logical and philosophical doctrines of many Nominalists of the fourteenth century, from William of Ockham and Gregory of Rimini up to John Buridan and Marsilius of Inghen. This methodological attitude certainly contributes to rendering his works stimulating and historically interesting, although it enormously complicates the interpreter's attempt to single out Paul's own position. Perhaps this is the reason why Paul has been wrongly regarded as Nominalist in logic, Thomist in metaphysics, and Averroist in psychology.

Paul Nicoletti of Venice (Paulus Nicolettus Venetus) was born in Udine, Italy, in 1368–1369. Around 1383, he joined the Augustinian order in the convent of Santo Stefano in Venice. His scholastic training begins at the Studium Generale of Padua, where Paul was assigned in 1387 to study philosophy; in 1390, Paul was assigned by his Order to the Studium Generale of Oxford to follow a course of theology, which usually extended over 3 years. His career as a teacher started in Padua by 1395. Paul obtained the title of Magister in Arts and Theology by 1405 and then actually began to teach: before in Padua, then in Siena (1420–1424), in Bologna (1424), and finally in Perugia (1425–1428). Besides his

academic career, the life of Paul was characterized by some other significant facts. Among other things, in 1409 Pope Gregory XII nominated Paul General Prior of the Augustinian Order and from the same year Paul served as ambassador of the Republic of Venice; in 1415 the Council of Ten of the Republic of Venice forbade Paul from taking part in the Council of Costanza, for reasons which are not yet completely clear; in 1427 Pope Martin V called him to Rome to defend the orthodoxy of St. Bernardino of Siena. Paul of Venice died in Padua on June 15, 1429.

Paul is author of many works, both philosophical and theological. Paul's philosophical writings can be classified into two groups: (1) systematic works and (2) Aristotelian commentaries (for the complete list see Perreiah 1986; Conti 1996). To the first group there belong two handbooks of logic (the *Logica parva*, c. 1393–1395 and the *Logica magna*, c. 1396–1399); a collection of sophisms (*Sophismata aurea*, c. 1399); a treatise of metaphysics and natural philosophy (*Summa philosophiae naturalis* or *Summa naturalium*, 1408); and a question on universals (*Quaestio de universalibus*, c. 1420–1424). The second group comprises, instead, the Commentaries on the *Posterior Analytics* (1406), on the *Physics* (1409), on the *Generation and Corruption* (c. 1415–1420), on the *Soul* (c. 1415–1420), on the *Metaphysics* (c. 1420–1424), and on the *Ars Vetus* (1428), that is, on Porphyry's *Isagoge*, Aristotle's *Categories*, and Pseudo-Gilbert of Poitiers' *Liber sex principiorum*. Paul's most significant theological work instead is an abridgement of John of Ripa's *Commentary on the Sentences* (c. 1400–1401).

Paul of Venice has been one of the most important logicians and metaphysicians of the Late Middle Ages. Generally speaking, Paul can be counted among the advocates of Realism in philosophy, since he erected a philosophical system in which different forms of medieval Realism have been combined together in an original way. Basically, Paul's philosophy has been influenced by some relevant Realistic thinkers such as John Wyclif and the late fourteenth-century Oxonian Realists (Robert Alyngton, William Milverley, William Penbygull, John Sharpe, John Tarteys, Roger Whelpdale), John Duns Scotus and Walter

Burley. From Scotus, Paul inherits his major metaphysical doctrines: the univocity of the concept of being; the real distinction among categories; the extramental foundation of universals; the technical notions of formal distinction and thisness (*haecceitas*). Paul's basic metaphysical intuition – viz. that the extramental world is made up of individual things, which can be construed as a cluster of universal (both substantial and accidental) forms, formally distinct from each other – can be traced back to Burley. Upon such metaphysics, Paul grounds his interpretation of Aristotle's epistemology and psychology, which significantly departs in many points from Averroes' interpretation (in spite of a well-established tradition that regarded him as an Averroes-inspired thinker: see Momigliano 1907; Nardi 1958; Ruello 1978; Kuksewicz in Olivieri 1983).

Paul elaborated his metaphysical views especially in his Commentaries on the Metaphysics (books 4–7 and 12, on which see Galluzzo 2012), on the *Categories* (chapter 5), on Porphyry's *Isagoge* (prologue), and in the *Summa naturalium* (part 6). Paul's metaphysics is a kind of realistic ontology. Its ground is the notion of being. Following Scotus, Paul holds that the concept of being must be endowed with a univocal sense, although Paul is of opinion that the doctrine of the univocity of being is not incompatible in principle with the doctrine of analogy (Conti 1996, chapter 1). This means that when we ask whether God exists or a man exists or a color exists, we are searching for the same explanatory conditions of the existence of each of these things, although such conditions are different in each case. The concept of being, as Avicenna stated, is the first and most common concept of our mind. We can have a simple concept of being, and such a concept is intensionally empty although extensionally full. With respect to being, the categorial table expresses ten different modes of internally modulating such a concept (see Exp. Phys., I, tr. 1, chap. 2; Exp. Metaph., IV, tr. 1, chapter 1). Since Paul holds with Aquinas that being cannot be a genus, it follows that the ten categories cannot be derived from being by means of formal differentiae that are external to the concept of being. Thus, the ten categories

indicate only the modes into which being can be divided immediately and exhaustively.

The categorial table classifies any created thing, both sensible and spiritual. Like Aquinas, Paul imagines that the spiritual world is populated by entities that are composed of form (essence) and being (existence), but not of matter and form. The relationship any spiritual entity bears to God, which entails a different form of individuality for each of them, is sufficient in order to individuate and differentiate such entities from each other. Such an individuation and differentiation, though, occurs at the level of the species and not of individuals, for it is impossible to multiply numerically spiritual entities because of their lack of matter (*Summa naturalium*, part VI, chapter 5). Unlike Aquinas, though, Paul thinks that Scotus is right in arguing that being and essence are formally distinct in these spiritual beings. Only God is absolutely simple, for in Him essence and existence amount to one and the same thing. Unlike the spiritual world, the sensible world is populated by entities that are composed both of essence and existence and of matter and form. When Paul applies his categorial doctrine to the sensible world, a first consequence he draws is that substance and accidents must be treated as distinct, absolute, and *per se* entities. While criticizing one of the most important sources of his Commentary on the Metaphysics, that is, the Franciscan theologian Alexander of Alexandria (fourteenth century), Paul argues that the property of “being or inhering in something else” is not an essential property of an accident, but only a property that necessarily ensues from an accident's essence. A substance is different from an accident in that, unlike a substance, an accident has been thought of by God as an entity for which it is not logically impossible to in-exist in another entity. Thus, Paul is more inclined to portray accidents as absolute coexisting entities rather than as inhering modes of being of substances (Amerini 2008; Gili 2016). Paul thinks that this Scotus-style explanation of the Aristotelian metaphysics is the best possible way of reconciling Aristotle's philosophy with Christian theology, especially when a conflict comes about (like in the case of the Eucharist). If accidents in principle can be separated from

substances, a further consequence Paul draws is that accidents are intrinsically individuated by virtue of themselves, while they are only extrinsically individuated by virtue of the substance in which they inhere.

According to Paul, any object of our ordinary experience, like men and trees, turns out to be a complex entity, made up of an underlying subject plus a bundle of properties. An individual matter and an individual form, which are really distinct from each other, compose the subject that underlies the properties. Although really distinct from form, matter has no degree of entity and actuality in its own right, but it acquires a certain kind of being only because a form actualizes its potentiality. As a matter of fact, Paul subscribes to the view that the essence of matter is that of being purely in potency to a formed substance, although Paul does not depart completely from the Augustinian conception of forms as “seminal reasons” latently contained in prime matter (Conti 1996, chapter 2). Following Scotus, but also expanding on an intuition present in Aquinas’ writings, Paul holds that it is the substantial form that plays a chief role in explaining the unity and identity of a thing, in that the form is responsible for a thing’s being, and to be and to be one are coextensive and convertible properties (Conti 1996, chapter 5; Conti 1998); nevertheless, matter too plays a role in differentiating things sharing one and the same form. In spite of the pivotal role played by the substantial form, Paul is neat in saying that neither form nor matter alone is able to individuate anything. With respect to this, Paul distinguishes between the proximate and the remote principle of individuation of a thing. The proximate principle of individuation is *thisness* (*haecceitas*), which is grounded upon an individual differentia (*differentia individualis*), while the remote principle is matter plus form in the case of material objects and form alone in the case of spiritual beings. Obviously, remote and proximate principle are logically connected (*Summa naturalium*, VI, chapter 5; *Exp. Metaph.*, III, tr. 1, chapter 1). In particular, an individual differentia plays a role formally analogous to that played by a specific differentia: just as this latter results in a species while determining a genus, so the former

results in an individual while determining a species; so any individual differentia coincides with the act by which a specific differentia shapes an individual piece of matter (*Exp. Cat.*, chapter 5). Although the substantial form is the key factor when it comes to explaining the process of a thing’s coming into being as well as its identity and that of each of its components, nonetheless a substantial form does not exhaust the whole essence of a thing. Here Paul is close to Aquinas and Gilles of Rome. Common matter and form must be included in the essence of any sensible substance. This is a first point in which Paul departs from Averroes and Averroism (Amerini 2004; Galluzzo 2005).

Once a substantial subject is brought into existence, a host of properties can settle on it. If accidental properties are treated as really distinct from each other and from the substance, what about substantial properties? In the case of properties such as “being human” or “being animal” with respect to man, for instance, Paul’s position is that they are really identical with man in the sense that none of them can be separated from man and exist of its own (this is an anti-Platonic constraint usually endorsed by medieval Realists), nonetheless they are formally distinct from each other since they can be associated with different foundations in a man and to different operations fulfilled by a man. The fact that our mind can form different but recurrent and properly predicable simple concepts as well as definitions of an extramental thing is the sign that within the thing there must be something that directs our mind toward the formation of such concepts and definitions (Conti 1996, chapters 3–4; Conti 2007).

The picture that we have sketched up to now gives the metaphysical framework into which Paul inserts his psychology and epistemology. We have said that for Paul the substantial form is the chief item in explaining the nature and the properties of a thing. In the case of man, this role is played by the soul. Here Paul breaks with the theological tradition influenced by Augustin, in that for him (1) to be the form of a body is part of a soul’s essence (*essentia*) and not only of a soul’s function (*officium*), although (2) the soul is a special kind of form insofar as it is able to fulfill

an operation that does not need bodily organs. Paul's explanation of the nature of a human being and of his activity of cognition is quintessentially the same as Aquinas'. Firstly, Paul rejects the idea that there is in a man a plurality of substantial forms or a plurality of souls as well as the idea that one and the same soul can undergo a process of perfectioning (*Summa naturalium*, part VI, chapter 5). This is a consequence of the basic claim that a substantial form acts upon matter in an immediate and instantaneous way, by transforming it into a substance and granting it an absolute being. Secondly, Paul holds that the soul's essence is really distinct from its potencies, which are in turn formally distinct from each other. Potencies ensue from the soul's essence but are not part of it. Among the potencies of the soul, Paul significantly includes both the possible and the agent intellect. On Paul's account, Averroes as well regards the possible intellect as a faculty of the soul, although he further assumes that such a faculty is of substantial type and unique for all men. Paul thinks that Averroes' conclusion is fully in step with Aristotle's doctrine, but confesses that such a position, which in other respects seems to be logically coherent, cannot be accepted for theological reasons connected to Christian faith. Specifically, the thesis of the uniqueness of the possible intellect is incapable of safeguarding the immortality of the individual soul and any individual ethical responsibility (*Exp. De an.*, III, t.c. 11 ff.; *Exp. Metaph.*, IV, tr. 1, chapter 3; XII, tr. 1, chapter 3). Many scholars have misunderstood Paul's attitude toward Averroes. Conti (1992) has substantially rectified their judgment. It is worth noticing that Paul criticizes the supporters of the thesis of the uniqueness of the possible intellect by appealing precisely to the same arguments as Aquinas employed in his *De unitate intellectus*.

The explanation of the machinery of cognition and concept formation, which follows upon such an account of the soul, is quite standard. Once the soul receives a sensible species and obtains the phantasm, through the sophisticated machinery of sensation and imagination (Paul lists five exterior senses, but only four interior senses, in spite of the common Avicennian background), the agent intellect sheds its light on the phantasm and stimulates

the possible intellect, so as to enable it to abstract an intelligible species from the phantasm. Once formed, the intelligible species activates the process of intellectual cognition, which ends with the formation of a concept. A concept continues to be seen as a trail left on our mind by the activity of cognition once this latter is over, but Paul departs from such a Thomistic interpretation of Aristotle's psychology when he maintains that our mind can form individual alongside universal concepts (Conti 1992).

The metaphysics we have presented above also provides the basis for understanding Paul's logical and semantic theories. As to semantics, Paul argues that common substantial names ("man," for example) are shorthand for definitions (in our example, "rational animal"), but definitions are linguistic procedures, which are supposed to mirror the essence of the things defined and a thing's essence must include both matter and form; therefore common substantial names primarily signify a universal form that is composed of matter and form. Nevertheless, a name's modes of signifying do not perfectly reflect a thing's modes of being, given that we can signify a thing both in the abstract and in the concrete, and when we signify a thing in the abstract (for instance, by the name "humanity"), we exclusively refer to its formal features (*Exp. Metaph.*, VI, tr. 1; VIII, tr. 1). Such an asymmetry presupposes that one is accustomed to distinguishing between signification and reference; in observance to the tradition, Paul relates such a distinction to the distinction between a name's signification and a name's supposition. A name such as "man" signifies a universal form, but supposits for the bearer of that form. Singular names essentially work in the same manner, while names of accidents are introduced into speech to signify exclusively an accidental form.

Such semantic distinction is also connected by Paul to the distinction between formal (or primary) and material (or secondary) signification, and it applies both to names and to propositions (formal predication vs. identical predication). The main source of Paul's semantics of propositions is Gregory of Rimini. Paul's treatment of propositions follows upon the basic assumption that predication is first of all a

metaphysical relation (Question on Universals), so that logical predication only confines itself to mirroring the metaphysical predication. Accordingly, a proposition such as “man is animal,” for Paul, signifies a thing in a complex way (*complexe significabile*) insofar as it makes explicit the inner stratified structure of the thing to which the subject-term refers (Pagallo 1960; Nuchelmans 1973; Conti 2004). Rather than a state-of-affairs, a proposition formally signifies the complexity of a thing according to the way in which that thing is replicated in the mind (i.e., *qua* existing in an objective way), while materially it signifies the extramental thing itself (i.e., *qua* existing in a subjective way). The distinction between the mode of objective or mind-dependent inexistence and the mode of subjective or mind-independent existence of a proposition’s signification enables Paul to handle more easily all the complications following from the different semantic attitudes of false and true sentences. On this last point, however, Paul shows to have had some hesitations throughout his career (*Logica magna*, II, 10–11; *Exp. Cat.*, chapter 5).

As to philosophical theology, Paul of Venice must be remembered especially for his contribution to the debate on divine ideas, with which Paul deals in his *Commentary on the Metaphysics* (book 7) and in the *Question on Universals* (Conti 2003). The core of his view about divine ideas is the Augustinian conviction that divine ideas serve the function of formal paradigms for any created thing. God brings into existence a creature by thinking of it by means of an exemplar. Since God’s act of thinking of a creature logically precedes God’s act of creating that creature, it follows that in God’s mind there must be a multiplicity of ideas that are different in kind and universal in character. Especially in his *Commentary on the Metaphysics*, Paul is explicit in denying that in God’s mind there can be present ideas of genera, of individuals, and of prime matter. Moreover, Paul assumes that divine ideas cannot be self-subsisting entities (as Plato believed), in that they are merely the results of the acts of God’s thinking and so they exist subjectively in God’s mind. Theologically speaking, though, divine ideas must be placed

within the Divine Word. Accordingly, divine ideas eternally coexist with God, but unlike the Divine Word, they are not co-substantial with God. In brief, divine ideas are called to play a threefold role: first, they are the counterpart of the essence of the creatures in God’s mind; second, they are God’s instruments of cognition; third, they are efficient and exemplary patterns for God’s creation of the world. Thus, divine ideas are seen as the explanatory principle of the intelligibility of reality. Most of this account of divine ideas depends upon Wyclif’s, who described divine ideas as really identical with the divine essence but formally distinct from it, insofar as each idea plays a formally different role *qua* co-cause in the process of creation. Paul is aware that Wyclif’s account was charged with heresy because of its consequences (especially divine necessitarianism and restriction of divine omnipotence). As a final step, Paul is careful to avoid such consequences by distinguishing between ideas of actually realized things, which are finite in number, and ideas of possible but not realized things, which instead are infinite in number. This distinction preserves God’s freedom, since the created world turns out to be just one of the possible worlds God can think of.

Peter Abelard

Ian Wilks

Department of Philosophy, Acadia University,
Wolfville, NS, Canada

Abstract

The characteristic doctrines of Peter Abelard (1079–1142) can be arranged under the headings of logic, metaphysics, and ethics.

Abelard rejects the position that logical theory deals with universals taken as things (*res*). It deals with words, whose signification is explained by their association with thoughts stripped of individuating detail. His account of propositions is shaped by his distinction between propositional force and propositional content, and by his notion of the *dictum*, the causally efficacious non-thing which is what a proposition says. His account of inference is especially focused on the nature of conditionals and the sorts of relationships between terms that can be used to verify them.

Abelard's most characteristic metaphysical view is that the only things which exist are individuals. Forms exist as individual to the things they inhabit, not as shared between things. Material objects are indeed matter/form composites, but their forms are simply arrangements of underlying matter; material objects are thus usefully subject to mereological analysis (i.e., analysis in terms of part/whole relations). Humans, but not

animals, have immaterial souls, and are capable of freedom. By contrast God is not free; he can only do the things he does.

Abelard's most characteristic ethical view is that it is the consent, not the action, that is to be judged as sinful or meritorious. A sinful consent is marked by contempt for God, and is formed explicitly in violation of God's law. Law is itself revealed both in the Old and New Testament – yielding Old and New Law, respectively – but is also innately present to humans in the form of natural law. Meritorious consent is marked by love of God – in other words, by charity. Charity is the theological equivalent of justice, which itself holds central place among the cardinal virtues. Justice and charity both enjoin regard for the interests of others, but charity additionally does this as a product of the love of God, and for that reason counts as a more fundamental virtue than justice.

Peter Abelard was a colossus of twelfth-century culture. He is widely known through his popular writings: letters, an autobiography, sermons, and hymns. But his greatness as a thinker stems chiefly from a series of technical writings in philosophy and theology.

He was born in 1079 near Nantes in Brittany. As a young man, he studied under two of the most eminent philosophical minds of the time, Roscelin of Compiègne and William of Champeaux. After conflict with the latter, he established various schools of his own – in Melun, Corbeil, and Mont Ste. Geneviève – before becoming master of the cathedral school of Notre Dame. By 1117, he had vacated this choice position following the scandal of his romance with Heloise. Removal to various monastic settings increased his literary productivity, and progressively channeled his interests toward theology and ethics. Open conflict with elements of the church hierarchy led to a condemnation of his work in 1121 at the Council of Soissons. In 1122, he established a flourishing school at Quincy, and in 1127 he took the position of abbot in a monastery in Brittany. After several tumultuous years in that situation, he resumed

teaching in Paris in 1132. His work was publicly condemned again at the Council of Sens in 1141, and he was excommunicated at that time. This sentence was lifted in 1142, just prior to his death (Clanchy 1997).

Abelard inherited (via Boethius) the Stoic division of philosophy's subject-matter into logic, physics, and ethics. The preponderance of his philosophical work may be gathered under those headings, which will appear in the following summary, except that "metaphysics" replaces "physics" as being a better fit with current usage.

Logic

By far, the most important source for Abelard's logical theory is Aristotle's own work in this area, as conveyed in the *De interpretatione* and to a lesser extent the *Categories*, and as commented on in exegetical works by Boethius. He is also much influenced by theoretical writings in the area of grammar, particularly Priscian's *Institutiones grammaticae* and its medieval commentators.

Abelard employs a *linguistic* interpretation of logic's subject matter; logic is about language, not metaphysical objects like universals. Logicians should primarily approach a proposition like "Every human is an animal" as involving a relationship between its component words, not a relationship between humanity and animality. On the other hand, the logician studies words taken not as mere sounds but as sounds invested with semantic content. A *vox* is a mere sound. A *vox* invested with semantic content is a *sermo*. The *sermo* relates to the *vox*, Abelard argues, as a statue relates to the stone from which it is formed; in some sense, the statue and stone are the same thing, but nonetheless there are properties they do not share. An example is the property of being human-made, which the statue has but not the stone. A property often achieved by the *sermo*, but not the *vox*, is that of being predicable of many – in other words, having generality of meaning. How does "human" manage to apply generally to humans? The linguistic approach to logic rules out an answer which appeals to a

universal – humanity – as a way to answer the question. Abelard instead provides a purely semantic account of generality, the main work of which is done by his account of the thought or understanding (*intellectus*) which a word generates in the mind of the hearer. An *intellectus* is capable of recording more or less detail from the things it represents, and therefore of being a more or less general representation of those things. “Human” achieves generality of application to humans by generating an *intellectus* stripped of individuating detail; it pertains to no particular human, and therefore pertains to all humans. Hence arises the word’s generality (Abelard 1933; Tweedale 1976; Jacobi 2004).

At the next stage of logical analysis, attention is directed to the process of fusing words into propositions. Key to this process is the function of the verb. Abelard follows Aristotle in defining a verb as a sign of something’s being said of something else. As such it confers a completeness upon a whole proposition not possessed by any of its constituent words or phrases. Abelard develops this point into a distinction between propositional force and propositional content. The same propositional content can be said assertively (“Socrates runs”), interrogatively (“Does Socrates run?”), imperatively (“I command that Socrates run”), and so on, depending on the particular mode of signification attaching to the verb. It is the *same* content that undergoes this diverse treatment, and Abelard recognizes the utility of isolating it as a distinct semantic component of the proposition. He calls it the *dictum* of the proposition (Abelard 1970, 2010; Nuchelmans 1973).

This notion of a *dictum* remains a work in progress. Abelard recognizes the importance of having such a notion but never quite achieves a perspicuous account of it. He describes it negatively as not being any sort of *intellectus* associated with the proposition, or any of the things denoted by the terms of the proposition. The *dictum* is itself, in fact, not a thing at all – on that point Abelard is adamant. He describes it positively as the cause of key semantic features of the proposition: its truth or falsity, its necessity or possibility, and its oppositeness (contradictoriness, contrarity) to other propositions. A *dictum*

is what an assertive proposition says, and if that proposition is true the *dictum* is what makes it so (Abelard 1970, 2010; Guilfooy 2002). What Abelard has in mind here seems to approximate contemporary notions like “fact” or “state of affairs,” especially if these are taken as causally efficacious non-things.

This analysis of propositional content prompts further insights (Abelard 1970, 2010; Wilks 2008). (a) Abelard is able to rethink the grammar of impersonal constructions, such as “It is possible...,” “It is true...,” and “It is good...,” where the blank is to be filled in each case by a clause expressing a *dictum* (e.g., “that Socrates runs”). At first sight, it seems as if that *dictum*-expressing clause is the subject term in these cases, with “possible,” “true,” and “good” serving as predicate terms; but since, as noted, the *dictum* is not a thing, the clause cannot serve in that capacity. So Abelard is at pains to find new analyses of impersonal constructions which identify appropriate subject and predicate terms. (b) The clarifying insight that negation applies to the proposition as a whole and not just to the predicate is facilitated by analyzing the proposition into a content to which an assertive force is applied. The negation is then construed as applying to the assertive force, not to any part of the content. Abelard is thus able to distinguish between “It is not the case that S is P” and “S is not P.” He rightly regards the former as the proper form of negation. (c) Modal propositions can be expressed as impersonal constructions (“It is possible that...” and “It is necessary that...”). But when so expressed, they appear to lack proper subject terms, and therefore seem to require reformulation. “It is possible that S is P” can in fact be easily reformulated as “S is possibly P”; this latter expression yields what is clearly a *de re* modality, as opposed to the former expression, which yields a *de sensu* (that is, *de dicto*) one. Abelard’s approach to impersonals generally makes him sensitive to the great importance of this modal distinction, a sensitivity that enlightens his entire approach to modal theory.

The final stage of logical analysis involves study of inference patterns themselves. While Abelard’s treatment of syllogistic logic presents

smaller-scale insights and novelties of formulation, we find marked innovation in his handling of conditionals (that is, statements of “if . . . then” form). He argues that the entailment present in these is as demonstrable as the entailment present in standard syllogisms. In syllogisms, the entailment of conclusion by premises stems from the fact that the content of the conclusion is already present in the premises; likewise, in conditionals, the entailment of antecedent by consequent stems from the fact that the content of the consequent is already present in the antecedent. In syllogisms, the entailment is demonstrated by appealing to the formal properties of the propositions themselves. In conditionals, it is demonstrated by appealing to the relationship between terms in antecedent and consequent, and identifying it as being the sort of relationship which grounds an entailment. “If it is a man then it is an animal” exemplifies such an entailment. The fact that the content of the consequent is present in the antecedent is evident in the relationship between man and animal; this is a relationship of species, man being a species of animal. Identifying this relationship suffices to demonstrate that entailment exists. Abelard attempts to identify other sorts of relationships between terms – referred to as “topics” (*loci*) – which likewise demonstrate that entailment exists. His attempt to codify these topics into systematic theory is one of the most elaborate philosophical exercises of any that he undertakes (Abelard 1970; Martin 1987, 2004).

Metaphysics

Abelard’s work in metaphysics is heavily influenced by Aristotle’s *Categories*, especially as commented on in exegetical works by Boethius, and in Porphyry’s *Isagoge*; and of course the influence of Christian theism is pervasive.

Nonetheless, his most characteristic metaphysical view derives from none of those sources. That view – generally referred to as “nominalism” – emphasizes the individuality of *all* things that exist, and opposes any theoretical approach to the contrary.

Abelard’s nominalism arises in the context of a position now known as “Material Essence Realism,” which radically de-emphasizes the individuality of things. Adherents of this position do not adopt a purely linguistic reading of Aristotle’s logical writings, instead interpreting the universal terms appearing in a statement like “Every human is an animal” as universal things: humanity and animality. Boethius says of these universals that they are present as a whole in many individuals, and constitute the nature of each. So the same animality is shared by many animals, which are differentiated from one another only by the different accidents they possess. A pivotal event in Abelard’s career is his sustained attack on this theory. Individual animals cannot properly be differentiated from each other, he argues, if at base they are all the same animal – which they would be if animality were a universal in the Boethian sense. And if accidents did indeed differentiate substances from each other, then they would be metaphysically prior to those substances, which make no sense given how accidents are understood to relate to substances. So, material essence realism is rejected whole cloth (Abelard 1933; King 2004).

We have already seen what universal terms are for Abelard. They are just words. And we have seen how they work. They denote classes because of the applicability of an abstracted *intellectus* to all members of a class. There need to be no appeal to a single form simultaneously shared by all members. What animals have in common is not animality, the universal thing, but just this: being an animal, which Abelard refers to as a *status*, by which he seems to mean the condition or state that things are in (Abelard 1933; Tweedale 1976). Other than to emphasize that it is not a thing, he gives little detail about what a *status* is, and so the word proves difficult to translate. The point of the notion seems to be that things are comparable without having in common a shared form, and that this comparability is what allows the same abstracted *intellectus* to be applicable to a plurality of things.

Abelard considerably simplifies the understanding of form on this account. In fact, in speaking of material things, he describes forms as being nothing more than the arrangement or composition

of the matter in which they are present (Abelard 1919; Arlig 2012). His corresponding discussion of matter proceeds along the lines of the *vox/sermo* distinction noted earlier. The matter alone of a physical object is numerically the same as the composite object arising when that matter is imbued with form. But the composite has properties that the matter alone does not, just as an image has properties that its component material does not. So the matter and the resulting composite are not the same in property, even though they are the same in number. There is obviously a complex account of sameness and difference at work here; the provenance of this account is Abelard's discussion of the Trinity, and his ongoing endeavor to clarify how its members are in one sense the same, and in another sense different (Abelard 1969b, 1987a; Brower 2004; King 2004; Marenbon 2007; Arlig 2012). Abelard also gives us a complex analysis of part/whole relations to account for material containment and aggregation. Continuous wholes – where there are no intervals among parts – are the limiting case of individual physical objects. More complicated are discrete wholes. Some of these are mere pluralities, whose parts are spatially scattered. Some, like flocks of birds, have parts that are spatially proximate but unarranged. Others, like houses, have parts that are spatially proximate and arranged. A key point for Abelard is to define the distinct parts of this third kind of discrete whole; his claim is that they are the parts whose placement in the arrangement will have the immediate effect of bringing the whole into existence (Abelard 1970; King 2004).

Various other features of the material world are canvassed in Abelard's work, largely in response to the content of Aristotle's *Categories*: the nature of relations, space, time, change, and so on (King 2004). But as a Christian theist, he focuses his attention on two immaterial entities as well: the human soul and God. The souls of animals are material and thus perish when the animals die. The souls of humans are not material. Neither are they forms, since, Abelard argues, it makes no sense to say of a form that it has insanity, anger, or knowledge, although it makes perfect sense to say of a soul that it has those qualities. Indeed, if a

soul were a form in a form/matter composite, then it would be like other forms in such composites in having a purely material basis. Human souls are metaphysically distinct from the material order of the world, and hence can sustain thought independently of a physical body (Abelard 1921). Thus is a theological account of the special dispensation for human beings brought alongside a relentlessly materialist account of the properties of the world.

Abelard's view of God is strikingly deterministic: God can only do the things he does, and only when and how he does them, and is likewise constrained in what he omits. This is presented as a consequence of God's goodness. Divine acts and omissions are always the best among alternatives, none of which are better than, or even as good as, the acts and omissions themselves. In fact, God never even has to choose between equally good alternatives because none such ever arise for him. Presumably, this is because his goodness never allows him down a path where equally good alternatives would even be encountered; the path he is drawn to is without moral forks, where every good encountered is the decisively best one when set against alternatives. This means, in the end, that there is a reason for everything God does or omits, and that the world, which is the product of these absolutely reasoned acts and omissions, is a deterministic one. There is, of course, allowance for human freedom in this world, since the human soul is set apart by its immateriality. Humans can actually be free, even though God is not. Does this non-freedom compromise the dignity of God? Not at all, says Abelard. Being free is like eating, walking, or sinning – not properties we should expect to find in a divine being anyway and, therefore, not properties whose absence compromises the divinity of God (Abelard 1969b, 1987a; Marenbon 1997, 2013).

Ethics

Abelard works in the tradition of Augustinian theological ethics, but is also influenced by Stoic theory, primarily through Cicero's *On Invention* (*De inventione*).

Emphasis on the believer's interior life, and the importance of the very quality of the thoughts themselves that underlie actions, is typical of the Augustinian tradition. Pagans have been able to act in an exemplary fashion just as Christians have; how the groups differ morally must therefore be a product not of action itself but of the thought process giving rise to it. This is the widespread presumption that precedes Abelard, and he develops it uncompromisingly by insisting that moral relevance attaches only to the consent (intention) from which action flows. The physical action itself makes no moral difference. Neither does any state of desire or aversion involved in the action, or even any virtue or vice. We may legitimately call an action sinful or meritorious, but only in the derivative sense that it arises from a sinful or meritorious consent (Abelard 1971; King 1995; Marenbon 1997).

If we are to judge the action based on the consent, how then are we to judge the consent? Abelard has seemed to some commentators to be left with no objective reference point for determining sinful consents. But in fact he does address this concern: a consent is sinful when it constitutes an attitude of contempt (*contemptus*) for God. It does so when it is formed explicitly in violation of one of God's laws. To consent in this way, of course, one must actually know what God's laws are in the first place, and this requirement might seem to sit uncomfortably with the fact that those in pagan cultures are in no position to be apprised of Christian revelation. But Abelard has a broad conception of God's law. It includes the superseded Old Law of the Old Testament, and the now applicable New Law of the New Testament, but, preceding both of these in time, it also includes many self-evident precepts of natural law, such as the edicts against murder, mendacity, adultery, and so on. These precepts are available as items of Old Law or New Law, but they are also available in natural law independently of the content of Christian revelation. Pagan thinkers clearly had some grasp of precepts like these, as attested in their writings. But indeed, it does not require special intellectual gifts to achieve this understanding. The general run of adults, so long as they are sound of mind, achieve it by virtue of

having a conscience (*conscientia*), which bestows insight into self-evident truths of natural law. Because they have this understanding, their consents in violation of natural law are able to be instances of contempt for God. That is why those consents are sins. Those humans who have benefited from revelation – formerly the Old Law, now the New Law – have all the more capacity to recognize consents which manifest such contempt (Abelard 2001; Marenbon 1997).

The capstone of Abelard's ethical system is his account of charity (*caritas*), which is defined as the love of God for his own sake or the love of one's neighbors for the sake of God. As a settled disposition of the soul, it counts as a virtue. Indeed, it is the central virtue. Since sin is contempt for God, habitually referencing actions to one's love for God will offer a guard against sin. Besides this theological virtue (as well as faith and hope, the two other key theological virtues), there is also a role in Abelard's theory for the traditional cardinal virtues of prudence, temperance, courage, and justice. In Stoic fashion, he argues that other nontheological virtues are reducible to these, and that among them justice holds central place as being subserved by the others. But in Augustinian fashion, he also argues that justice is a dim reflection of charity, enjoining a concern for the well-being of others, but not motivating that concern through love of God. Charity thus emerges as the theologically informed counterpart of the highest of the non-theological virtues. As such, it is the chief means of meritorious consents, but more importantly the attitude of love it implies is the chief end of human striving, the highest good for human beings. The reward of heaven is the protracted exercise of this love in the form of a beatific vision. It might seem intuitive to distinguish meritorious consents from the heavenly reward to which they lead, but on Abelard's view the consents and reward both reduce to the same thing: the love of God (just as sinful consents and hell both reduce to the same thing: the hatred of God). Heaven is not, properly speaking, even a reward, he maintains. It is an extension of the inner life of charity that leads to it (Abelard 1987a, 2001; Marenbon 2007).

Peter Auriol

Christopher Schabel
Department of History and Archaeology,
University of Cyprus, Nicosia, Cyprus

Abstract

The French Franciscan Peter Auriol (c. 1280–1322) taught at Bologna, Toulouse, and finally Paris, where he lectured on the *Sentences* in 1317–1318 and remained as master until 1321, when he was made archbishop of Aix-en-Provence shortly before his death. Auriol composed popular treatises on poverty, natural philosophy, and the Immaculate Conception, various sets of questions on the *Sentences*, an important *Quodlibet*, and a significant Bible commentary. In his *Sentences* questions and *Quodlibet* – especially his great *Scriptum* on I *Sentences* – his explicit attacks on Thomas Aquinas, John Duns Scotus, and other giants, his proud independence, his provocative originality, and his general brilliance

made Auriol perhaps the most influential Parisian theologian in the period after Scotus, although this influence was often negative. Auriol had a broad readership into the seventeenth century, and his works were printed frequently from the 1470s to 1695. Auriol is best known for his positions on universals, cognition, divine foreknowledge, grace, and predestination. His systematic approach allows us to trace common threads in his doctrine: conceptualism and the rejection of realism, a strong emphasis on contingency and a thorough denial of determinism, and a strict interpretation of divine simplicity and necessity. His appeal to creative devices and terms to construct his theories, among them “apparent being,” “indistance,” and “indistinction,” make his opinions immediately recognizable in the works of his successors, who more often than not argued against him.

Peter Auriol (Aureoli, Aureolus, Aureolo, Aureole, Aureol, Oriel, Oriol, Oriole), the *Doctor Facundus*, was born c. 1280 or slightly earlier, near Gourdan, about 30 km north of Cahors in southwest France. Most likely before 1300, Auriol joined the Friars Minor in the Franciscan province of Aquitaine and probably began his higher studies at the province's main *studium* in Toulouse, where he seems to have met Jacques Deuze, the future Pope John XXII. In an early work, Auriol mentions that he was present at Paris at a theological lecture, so presumably he studied theology in his order's Parisian convent in the first decade of the fourteenth century, before being sent to teach theology at Minorite *studia* elsewhere, as was customary. We find him as *lector* at the order's Bologna *studium* in 1312, according to one manuscript of his only purely philosophical work, the *Tractatus de principiis philosophicis* (or *physicis* or *naturae*). Another early work, *De paupertate*, was composed in late 1311 or early 1312, perhaps also at Bologna. Afterward Auriol taught at the Franciscans' Toulouse *studium*, writing two treatises on Mary's Immaculate Conception by May 1315 in the wake of a disputation from December 1314,

during a first year of lecturing on Peter Lombard's *Sentences*. He was termed *lector* in Toulouse in early 1316, probably still reading the *Sentences*, but on May 31 of that year, the Franciscan General Chapter in Naples assigned him to lecture on the *Sentences* at Paris. By then Auriol had written much of his largest and most important work, the *Scriptum* on the first book of the *Sentences*, which he may have completed going to Paris, since a beautiful presentation copy (Vatican, Borghese 329) was finished for Pope John XXII on May 19, 1317. It is probable that some of the surviving *reportatio* material (i.e., transcripts done by students or secretaries) from Auriol's various lectures on the *Sentences* also derives from his Toulouse years.

By the time Auriol began teaching at Paris, he was already well known. Throughout the fourteenth century, bachelor lectures on the *Sentences* at Paris were delivered over one academic year, and colophons from Auriol's manuscripts indicate that he read the *Sentences* in 1317–1318, and not 1316–1318 as was once thought. Various *reportationes* of these lectures circulated, some of them revised by Auriol himself. After Auriol's lectures, on July 14, 1318, Pope John asked ("partly because of [personal] experience") the chancellor of the University of Paris to promote Auriol to master, and Auriol was regent master the following academic year, mentioned as such on November 13, 1318. Either as a formed bachelor or new master Auriol engaged in disputations with masters of the faculty of theology, notably Thomas Wylton and Hervaeus Natalis, from which some questions survive. During his term as regent master, Auriol composed his extremely popular and influential Bible commentary, the *Compendium sensus litteralis totius divinae Scripturae*. Various other scriptural texts have also been ascribed to Auriol, not all of them convincingly. During his regency, he published the 16 questions of his *Quodlibet* in 1320, ostensibly from a public disputation that took place during Lent or Advent, but surely based at least in part on earlier debates. In late 1320, Auriol was made Franciscan provincial minister of Aquitaine, but he was still active in Paris when he was appointed archbishop of Aix-en-Provence on February

27, 1321. In the late spring of 1321, Pope John XXII himself consecrated Auriol in Avignon, where Auriol died before January 23, 1322, probably on January 10. He was apparently never made cardinal, despite a myth that originated much later, confusing him with his predecessor as archbishop of Aix-en-Provence, also named Peter.

In an era of towering figures, Peter Auriol was outstanding. His works were immediately popular and remained so: the *De paupertate* was printed in 1511 and 1513, while the treatises on the Immaculate Conception were printed at least four times between 1490 and 1695, before the modern edition of 1904 (about a dozen manuscripts preserve the first tract, half of them also containing the second). Most popular of all was Auriol's Bible commentary: besides the many manuscripts, it was printed some 13 times from the 1470s to 1649. The modern edition of 1896 takes up 555 pages of text. His early *De principiis* was left incomplete and was never printed, but it still survives in six manuscripts plus fragments, and when the critical edition is complete, it will constitute a sizeable volume. Stray questions from Parisian disputations, notably in MS Oxford, Balliol 63, also survive, and some have been published. Auriol's most important works for philosophical content are his *Sentences* questions and *Quodlibet*: roughly 50 codices preserve parts of the various versions of Auriol's *Sentences* questions, and a dozen or so witnesses contain the *Quodlibet*. In 1596, the *Scriptum* on book I was printed in a huge volume, equivalent to some 2500 pages in a critical edition, and in 1605, another large tome was published including the *Quodlibet* and versions of books II–IV. The 1596 edition followed a faulty exemplar, so in 1952–1956 an improved diplomatic edition (based on Vatican, Borghese 329) of the *Scriptum*'s prologue and distinctions 1–8 was published by E.M. Buytaert in two volumes, and more of the *Scriptum* has been published on the *Peter Auriol Homepage*. In the 1605 edition, again, the manuscripts followed were often poor and the redactions themselves mixed. In the confusing case of book III, the edition combines three different versions. On the basis of a systematic

analysis of the surviving manuscripts – among them a codex containing two copies of book III that turned up in a Vermont bookshop – an international group is working to disentangle the unprinted redactions of book I and all the versions of books II–IV, eventually to publish critical editions of all redactions and the *Quodlibet*.

Peter Auriol's works were popular because of his innovative procedure and his combative independence vis-à-vis earlier theologians. He approached questions by first presenting the most important prevailing opinions of the day, and he was a pioneer in the practice of naming names. His *Scriptum* on book I of the *Sentences* abounds in over 500 explicit and often detailed citations of scholastic theologians active after 1250, especially John Duns Scotus, OFM (133), Thomas Aquinas, OP (122), Henry of Ghent (54), Hervaeus Natalis, OP (51), Durand of Saint-Pourçain, OP (47), and William of Ware, OFM (26). Several of these theologians were still alive and active in the Parisian Faculty of Theology, such as Hervaeus and Thomas Wylton. (Caution: in about 100 instances, the 1596 edition has the citation wrong.) Auriol's habit of summarizing previous positions made his *Scriptum* a reference work for those who came after him. His contemporary and confrere Francis of Meyronnes explicitly advised his readers that, if they wanted to know who thought what, they should look at Peter Auriol. Twenty-five years later, this was still the case for the great Augustinian Gregory of Rimini, who sometimes tacitly quoted earlier figures via Auriol. A more striking example comes from a century after Auriol's death, when John Capreolus, in his defense of Thomas Aquinas against the latter's attackers, commonly cited those opponents through Auriol's text.

After reviewing earlier and contemporary opinions Auriol invariably found something wrong in all of them, small or large, and then presented his own view. "Quid dicendum secundum veritatem," he would begin, emphasizing that his opinion was both different and better. A couple of anonymous abbreviations and paraphrases of Auriol's *Sentences* commentary and *Quodlibet* demonstrate that Auriol did have a following. On account of his attacks on earlier

views, however, Auriol himself became a target for almost every major theologian active afterward down to the Black Death. Whether they were Thomists, like the Dominican Bernard Lombardi, or Scotists, like the Franciscan Landolfo Caracciolo, or more independent, like the Franciscan Gerald Odonis, it was impossible for them to avoid dealing with Auriol's theories. Simple bean counting shows how preoccupied they were for more than 30 years after his Parisian *Sentences* lectures: Auriol is the main opponent – or at least the most commonly cited theologian after Scotus – in the works of virtually every Parisian Franciscan for the next quarter century. At Oxford, only the local boy William of Ockham outranks Auriol in the *Sentences* questions of the Franciscans Walter Chatton, Adam Wodeham, and John of Rodington. Among the Parisian Dominicans, Hervaeus Natalis battled Auriol directly, Raymond Bequini actually composed a polemical work against Auriol, and Bequini's and Bernard Lombardi's *Quodlibeta* are primarily directed at Auriol. To varying degrees, this is also true of the Augustinians Gerard of Siena, James of Pamiers, Michael of Massa, and probably Thomas of Strasbourg. Auriol is second only to Scotus in the amount of attention he received from the Carmelite John Baconthorpe. This continued into the 1340s: for the Augustinians Alphonsus Vargas of Toledo and Gregory of Rimini, Auriol was a close second behind Scotus, although Gregory of Rimini cited Ockham as often as Auriol. The Carmelite Paul of Perugia cited Auriol more than any other theologian of the thirteenth and fourteenth centuries. After the Black Death, this focus on Auriol faded to an extent, but even in the fifteenth century, the Thomist John Capreolus and the Scotist Peter of Nugent considered Auriol the main threat to their champions. Auriol remained an important thinker down to the Protestant Reformation and well into the seventeenth century.

Auriol was systematic and brilliant, and driving him was a search for simplicity in metaphysics, theology, natural philosophy, and even logic. Indeed, sometimes his desire for simplicity forced him to appeal to vague negative concepts, "indistance," "indistinction," and "imprecision"

being examples. At other times, the data of revelation required uncomfortable modifications. In general, however, he was very successful, "ahead" of his time even, in that some of his ideas would today seem common sense. For example, take Auriol's doctrine of place, a scientific context where his ideas are well known. The Aristotelian notion of place is the immobile inner surface of the containing body, so the place of wine in a bottle of wine is the inner surface of the bottle. Auriol rejects this in his questions on II *Sentences*, instead defending a "vulgar" (common sense?) notion of place as position in the universe, such that he is able to contemplate the concept of absolute space. Auriol's view was rejected by his successors, but it provoked innovative alternatives and was still discussed in the late sixteenth century, before his text was printed in 1605, and one wonders whether it played an indirect role afterward in the development of Newtonian cosmology.

Interest in Auriol's thought has steadily grown since the beginning of the twentieth century, and over the past three decades, his ideas have finally begun to receive the attention they deserve. Auriol is known in particular for his views on ontology and cognition, on the one hand, and God's connection with humans with respect to foreknowledge, grace, and predestination, on the other. Several excellent surveys of Auriol's thought have been published, and so here some of Auriol's ideas will be approached in part through the prism of the Cretan Greek Peter of Candia, a fellow Franciscan active c. 1380 who was elected Pope Alexander V at the Council of Pisa in 1409. Candia authored one of the most widely read sets of questions on the *Sentences* of the latter half of the fourteenth century, and he cited Auriol more often than anyone except the other Franciscans Scotus, John of Ripa, and Ockham. Writing at the distance of one lifetime, Candia chose the salient points of Auriol's doctrine and attempted to explain them as clearly as possible, without coloring his presentation with his own evaluation.

It is well known that Auriol was a conceptualist. Along with contemporary thinkers like Durand of Saint-Pourçain and William of

Ockham, Auriol holds that only particulars have extramental existence of any kind and, correspondingly, all universality and generality are products of mental activity. As a good Aristotelian for whom "nothing is in the intellect that was not first in the senses," Auriol grounds all human knowledge in sensory perception. Nevertheless, Auriol argues strenuously for the active nature of both the senses and the intellect, asserting that all cognitive powers mold data in one way or another. In reaching this conclusion, Auriol begins with his famous examples of "erroneous" sensory perception. Taking vision as his example, Auriol presents eight visual "experiences" where what we see is not a reflection of "reality" per se. One is the classic example of a person watching the shore from a moving ship: it appears that the objects on shore move. Another is that a stick partially submerged in water seems to be broken. Auriol claims that, when we have visual sensory experiences like these, we are having intuitive cognitions; for Auriol, then, unlike for John Duns Scotus, for example, whether a cognition is intuitive or abstractive has to do with how that cognition appears to us (a phenomenological criterion) as opposed to whether the object is actually present and existent (an ontological criterion): if the object appears to us to be directly present (whether it is in fact present or not), then for Auriol we are having an intuitive cognition and not an abstractive cognition. The sense of sight, for Auriol, always delivers intuitive cognition, even when we are experiencing sensory illusions. More importantly, Auriol claims on the basis of these experiences that the senses are fundamentally active. The stick in the water is not broken; it just appears to be broken. According to Auriol, the fact that we have a broken stick as the object of our sense cognition, when in fact there is no broken stick in extramental reality, proves that the senses actively create something upon perceptual acquaintance. Specifically, according to Auriol, the senses place the extramental object of cognition into what he calls "apparent being" (*esse apparens*, but he also calls it "objective being" and "intentional being"). The activity of the senses is the only way of explaining how we see a broken stick when there is no broken stick.

Moreover, for Auriol these cases of nonveridical sensory perception show us how the senses work in general: even in veridical sensory perception, the senses are fundamentally active for Auriol, putting the perceived object into apparent being, which itself is the term or object of the sensory act. When the *esse apparens* – what appears – matches the external object, the perception is accurate, and when it does not, the perception is erroneous. Auriol was not a skeptic: he had confidence that most of the time we are not fooled and he did not worry about the negative ramifications for certitude that his theory posed. Nevertheless, he was attacked on this point immediately.

What is *esse apparens*? Auriol claims that it is the object of cognition itself but put into another mode of being by the activity of the senses. When he says this, he means it literally: the extramental object of cognition and the *esse apparens* by which we perceive it are identical according to strict numerical identity. Thus, an extramental thing in *esse apparens* is just that object as perceived, that is, as the object of a cognitive power. If this were not the case, according to Auriol, then a type of veil of perception would fall between our cognitive powers and the extramental world. When we perceive something, we are literally perceiving that thing, not that thing as it exists extramentally, but rather that thing as it exists as an object of cognition. These are two different modes or ways that numerically the same thing exists. This is as true for intellectual cognition as for sensory cognition. For Auriol, when we form a concept of something, our intellectual faculties put that something into *esse apparens*. Yet that concept is nothing other than that something as conceived, not a separate entity with its own real existence. According to Auriol, then, every particular thing that exists has two modes of being: real being in extramental reality and apparent being, but the latter can only be actualized by someone cognizing the thing.

As mentioned above, for Auriol the world is made up exclusively of individuals. Nevertheless, individuals can have extremely similar characteristics. For Auriol, these characteristics (*rationes*) are the extramental foundation of our universal concepts, since each of these characteristics is

able to lead us to form a different concept, and since the extreme similarity of these characteristics leads an intellect to form precisely the same universal concept about several individuals belonging to what we would call a natural kind. So Auriol grounds our universal concepts in extramental reality (and hence in sense cognition), while maintaining that actual universality or generality is merely conceptual (since the characteristics are proper to one and only one individual, being merely extremely similar to the proper characteristics of another individual of the same natural kind). Moreover, the universal concepts that we form of any individual simply are that individual put into apparent being (as we saw above). On the basis of perceptual acquaintance with Socrates, for example, I can form the concepts “Socrates,” “man,” and “animal,” and all of these concepts are (by strict numerical identity) Socrates. The universal concept “animal” is all animals, but this does not entail that there is an extramental “animality” separate from these individuals.

Because Auriol asserts that, on the most basic level, everything that exists outside the mind is an individual, he not only rejects the realism of the major scholastics of the thirteenth and early fourteenth centuries, parallel to what Ockham would soon do at Oxford, but he insists that the search for a principle of individuation, something that makes an individual an individual, is a waste of time. External reality is made up exclusively of individuals, and any attempt to explain how these individuals are in fact individual will simply generate the same question about the purported principle of individuation (why is that individuated?), and so on ad infinitum. Accordingly, his understanding of Aristotelian hylomorphism includes the denial that prime matter can be understood as existing separately from form. In this way, he rejects the predominant position of the Franciscan philosophical tradition, which attributed to prime matter some minimal actuality. Rather, matter is always understood as existing with form in a sensible substance. The same applies to accidental forms. Therefore, there is no reason to multiply separately existing entities: that a particular individual man is tall, fat, and pale, does not mean that

these forms have any separate being apart from the substance. (The one possible exception to this claim is the rational soul, which Auriol often discusses as though it is a form different from other forms inasmuch as it is able to have continued existence without the matter in which it inheres; this might make Auriol a type of pluralist when it comes to human substantial forms, but Auriol is rarely, if ever, explicit on this topic.) Not all of the nine Aristotelian categories of accidents have even this sort of real being in a substance, but only quality, quantity, action, and passion. Relation, place, time, position, and state/habit have no existence outside the mind, not even in substances.

Fixed as he was in a generally Aristotelian intellectual world, however, it took ingenuity for Auriol to come up with an intelligible explanation of qualitative and quantitative change that saved the phenomena. Auriol's solution will bring us to his theory of God's connection with humans, since his main treatment of qualitative change is in the context of the increase or decrease of grace, a form, in the soul, a substance. Peter of Candia (*I Sentences*, q. 5, a. 3) fixes on Auriol's own words and then lists the main elements. The problem is, what happens when grace increases, or more precisely, what exactly is added to the existing grace and how?

Lord Peter Auriol imagines that that reality according to which the smaller [existing] grace is made more intense cannot be a whole grace that is distinctly discrete, participating in the reality or specific nature [of that grace] as if it were one separate piece of grace, but rather it participates in the reality and nature of grace through a certain reduction, so that it could be called 'con-grace'. But this reality is completely inseparable (*impraecisibilis*) in reality and in the intellect. Thus is it not per se able to be made, even by divine power, such that it would receive separate and demonstrated being. Nor is it per se intuitively intelligible, but only 'co-intelligible', so that an angelic intellect could not intuitively divide the augmented grace into two parts of grace. Rather the increased grace always occurs to that intellect as something to which 'something of grace' has been added, and not grace. And one must imagine in a similar way concerning *all other qualitative or quantitative forms*... On this basis three propositions are inferred: first, what is added in the increase of grace is not properly grace; second, what is added

cannot come about by itself without that to which it is added, because in its own nature it is unseparated (*impraecisa*) reality; third, this reality is not separately conceivable without the prior reality. And this is his intention on this matter, via which, as he says, one saves the numeric unity of a form and its simplicity, and the actual infinity of things is avoided, and similarly one saves the continuity of motion, and briefly everything required for the increase in intensity of forms is beautifully preserved in this way.

Grace is of course linked to salvation, predestination, and divine foreknowledge of future contingents, perhaps the context that best demonstrates the depth and extent of Auriol's impact and the one in which the reception of Auriol's theories has been investigated most fully. Auriol argues at length in rejecting the prevailing views, those of Aquinas and Scotus. Auriol approaches the general problem from two directions, the first from the perspective of God. We can again do no better than quote Peter of Candia's succinct summary (*I Sentences*, q. 6, a. 2):

Because God is eternity, and consequently excludes every temporal characteristic, while every creature is temporal and consequently formally excludes every characteristic of a being of eternity, therefore strictly speaking there is no priority, posteriority, or simultaneity between God and creature. Thus He can neither be said to be distant from that creature by duration nor be at the same time with it, because this would either be on the basis of eternity or on the basis of temporality. But it cannot be by either of these, since neither is common to the other. And so truly and strictly speaking, God's knowledge attains the 'actuality' of a contingently future creature via some sort of negative *indistance*. From this it appears that His knowledge of the actuality of a future contingent does not make a proposition about the future true or false, but leaves it neutral, since with respect to that future contingent He does not have 'expecting' knowledge. This is because He would then be distant from such a future, which is not true, unless the line of [temporal] succession were applied to Him. But that is false, because such a line is repugnant to the nature of eternity.

Approaching from another direction, Auriol centers his argument on the contingency or "freedom" of human actions, at least with respect to sin. Auriol holds that any metaphysical or logical predetermination with respect to future events would entail that they occur of necessity. Having denied that God's knowledge precedes the future

or makes propositions about the future true or false, he argues more generally as follows: if every proposition about the future is either true or false, the future happens necessarily. Since it appears that not all things are determined beforehand, and indeed human free will and divine justice require that at least some things come about contingently and not necessarily, propositions about the contingent future are neither true nor false, but neutral. Auriol – and some other major scholastics – claims that this was Aristotle’s opinion as well.

Auriol’s stress on the contingency of human action entailed modifications not only in his theory of propositional truth but also in his view of salvation. The standard view was that the only cause of the elects’ predestination is God’s mercy, whereas the reprobates are justly damned for their faults. A recent minority, represented by Henry of Ghent and Thomas Wylton, maintained that human free will was somehow involved in both predestination and reprobation. Trying both to avoid Pelagianism and to preserve the transcendence of divine predestination, Auriol asserts that humans who will be saved are a quasi-privative, negative, or passive cause of their predestination in that they do not place an obstacle or impediment in the path of grace. Auriol suggests that God freely sends out His salvific grace to everyone; those who do not place an obstacle are saved; those who place an obstacle thereby block this grace and are justly damned. For Auriol, this scenario better balances human “freedom” and God’s omnipotence and transcendence.

The view had the added advantage of safeguarding divine simplicity and necessity. For Auriol, immutability and necessity are the same thing. To the extent that something is immutable, it is necessary. Since God is both immutable and eternal, God is necessary to the highest degree, absolutely, such that He cannot be otherwise. If God foreknew something or actively predestined someone, this would entail the absolute necessity of the outcome. The only difficulty is that God does act. This forces Auriol to make a distinction between God’s intrinsic and extrinsic will: the intrinsic will is identical to God – atemporal, immutable, and absolutely necessary – and

cannot be the source of activity and change; the extrinsic will is that by which, for example, God creates. Auriol refers to the first as the “will of complacency” and the second as the “will of operation.” Further, in order to preserve divine freedom, Auriol has to tailor his notion of freedom to include complacency or pleasure: what is done complacently or with pleasure is done freely, but not in an everyday nonphilosophical sense of “freedom”:

The defining note of freedom belongs to a power through its having an act of experiencing pleasure (*complacentia*) and delight. For the act of taking pleasure (*complacentia*) is formally free. A power is called free that does whatever it does because it takes pleasure in it (*ex complacentia*). Nothing else is required for the notion of freedom. (*Scriptum* I, d. 1, q. 8, trans. Hoffmann [2015], p. 69)

Auriol connects divine necessity, complacency, and intrinsic acts of the will and intellect in his related doctrine of the necessity of grace. Once again, Peter of Candia provides an overview (*I Sentences*, q. 5, a. 2), nicely linking the issue back to Auriol’s theory of intuitive cognition, where we began:

Every created grace (*caritas*) is intrinsically grace, such that it includes a contradiction for it to exist and not to be love (*dilectio*), just as whiteness is intrinsically whiteness and it is a contradiction for it to exist and not to be color. And consequently, just as it is impossible for whiteness to be subjectively in something that does not designate that it is formally white, it is also impossible for grace to exist in something that is not dear (*carum*) to God. Thus this form falls *necessarily* under God’s complacency, such that when it is posited in a soul, it necessarily follows that that soul is dear (*grata*) to God. And just as being white is the formal effect of whiteness, so being dear (*carum*) is the formal effect of grace. Therefore it is just as impossible for something to be white without whiteness as it is for something to be called dear (*carum*) without grace. And so being dear does not stem effectively from divine acceptance, just as being white does not stem from whitewashing. But this form cannot be produced effectively except by God. And through this the definition of grace according to [Auriol] is apparent: grace is the habitual love of God infused immediately by Him in the rational appetite, over which divine complacency passes immutably and from eternity, from which complacency it does not flow effectively. And this doctor speaks about grace

just as he speaks generally about *all acts of intellect and will* that are intrinsically such. Thus for him intuitive cognition (*notitia*) is a certain absolute quality that is intrinsically such, and so he maintains that it can exist without the presence of the object.

Aspects of Auriol's views on divine simplicity received a sympathetic hearing, and William of Ockham, Gerald Odonis, and Thomas of Strasbourg put forth theories of predestination that resembled Auriol's in some way. Generally, however, Auriol's positions on predestination and, especially, divine foreknowledge provoked a vehemently negative reaction over the next century and a half. Auriol's way of distinguishing between different modes of divine willing was subject to ridicule, as was his notion of complacency, but the attempts to dissolve Auriol's arguments against previous positions were rather feeble. Although Peter of Candia presented Auriol's opinion at great length and in neutral fashion, as was his practice, Auriol's only vocal follower was Peter de Rivo at the University of Louvain after 1465, and Rivo's view met with papal condemnation in 1474. Still, it is possible that Auriol had an impact on his great Jewish contemporary Gersonides on this issue, and even after Pope Sixtus IV's condemnation, Auriol gained an important follower in the early sixteenth century in Pietro Pomponazzi and he may have influenced Martin Luther himself. Auriol's view was still widely debated in the seventeenth century. This may be true for many other philosophical issues as well, but we have yet to take most of their histories beyond the Black Death.

Peter Damian

Toivo J. Holopainen
Faculty of Theology, University of Helsinki,
Helsinki, Finland

Abstract

Peter Damian (c. 1007–1072), an Italian cardinal and religious leader, has a modest place in the history of philosophy because of his little treatise *De divina omnipotentia* (*On Divine Omnipotence*). Damian is often depicted as a thinker who, in his attempt to defend divine omnipotence, denied the universal validity of the principle of contradiction and affirmed that God can change the past. Such a view is based on a misinterpretation of Damian's statements. He actually held that the past cannot be changed, but he did not see this as a limitation of divine omnipotence but as an expression of God's power. Damian's treatise reflects an early phase in the scholastic deliberation on philosophical theology.

Peter Damian (Petrus Damianus or Petrus Damiani) was born c. 1007 in Ravenna, Italy. He acquired the name Damianus or Damiani after his elder brother Damianus, who cared for him in his youth. He studied liberal arts and law in Ravenna, Faenza, and Parma, and then became a teacher of rhetoric. In 1035, he experienced a religious conversion and entered the Benedictine monastery at Fonte Avellana. He became prior of Fonte Avellana

in 1043. Damian was actively involved in monastic reform and the reform of the Church. He was nominated cardinal in 1057 and died in 1072.

Damian was a voluminous writer. The most important part of his production is his letters, some of which are actually lengthy treatises. Of the surviving 180 letters, the most significant philosophically is Letter 119, known as *De divina omnipotentia*. Damian sent this letter c. 1065 to Abbot Didier (or Desiderius) of Monte Cassino and his monks. The letter is related to a live discussion which had taken place during Damian's recent visit to the monastery. It is highly rhetorical in both style and structure, which makes it liable to misunderstanding.

In the live discussion at Monte Cassino, Damian had affirmed that God in his omnipotence is capable of everything. Some of those present then asked him whether God can bring it about that what has happened has not happened. For example, can God bring it about that Rome was never founded? Damian does not tell us how the debate continued. In *De divina omnipotentia*, he strives to show that divine omnipotence remains intact even though the past cannot be changed. However, he never actually utters the statement "God cannot change the past" while he does this. Damian thinks that an alarming claim like this is better left unsaid when talking to a wider audience. (Damian's letters were circulated among a larger audience than the addressees.)

An important part of Damian's strategy in *De divina omnipotentia* is to argue that the past is not so different from the present or the future when it comes to divine power. To begin with, Damian connects the query of his opponents to a disputed question within contemporary logic, referred to as "the question about the consequence of necessity and impossibility." This question, inspired by the Aristotelian problem of future contingents, is concerned with statements like "What has been, necessarily has been, and it is impossible that it has not been," "What is, necessarily is, as long as it is, and it is impossible that it is not," and "What will be, necessarily will be, and it is impossible that it will not be." Damian lets us understand, rightly or wrongly, that the consequence of necessity and impossibility is the reason why the opponents have presented their query. Damian retorts

that a similar problem arises with the present and the future. If God has no power over the past because of the consequence of necessity, then he has no power over the present or the future either. Stating this does not solve the problem at hand but it does put the matter in a different perspective.

Damian continues by focusing on God's eternity and the immutable presence of the created history in the divine sphere. The past is past for us, but it enjoys a permanent existence in the divine providential plan. The day when God created the world still exists there and so does any other day. Damian also draws attention to the divine will as the cause of the created existence. There are things because God has chosen them, and he gives to them whatever existence they have. What God wills to be cannot but be. The efficiency of God's will brings it about that there is no room for contradiction in his creation. The principle of contradiction is valid for the created history because God gives being in an unequivocal manner. For the same reason, the consequence of necessity and impossibility is valid. What has been, necessarily has been, because the past thing cannot lose the status that God has given to it. The past cannot be changed, but this is not a limitation of God's power but a consequence of his insuperable command.

Another question treated in *De divina omnipotentia* is the following: Can God restore virginity to a woman who has lost it? It is important to note that Damian views this as a separate query which is not to be confused with that about changing the past. He emphatically affirms that God can restore virginity to a woman who has lost it, but the restoration that he thinks of does not include removing some events in the past. Damian singles out two senses in which virginity can be restored. First, God can restore virginity "according to the fullness of merits." This kind of restoration concerns the moral status of the individual before God. Second, God can restore virginity "according to the integrity of the flesh" (*iuxta carnis integritatem*). This restoration concerns the physical state of the female sexual apparatus. To support his judgment that God can restore virginity in the latter sense, Damian offers a discussion of miracles and God's power over the laws of nature. The restoration of virginity that

Damian affirms as possible does not change the fact that the virginity was lost, as the restoration of life to Lazarus (John 11: 1–43) did not change the fact that Lazarus had really died.

The background of Damian's views in *De divina omnipotentia* is to be sought in the works of Augustine and Boethius. Augustine discussed themes like eternity, providence, foreknowledge, and necessity in a number of works, for example, *The City of God* and *On Free Choice*. Boethius developed a different approach in *The Consolation of Philosophy* and his two commentaries on Aristotle's *De interpretatione* (the problem of future contingents). These works of Augustine and Boethius also contain remarks on divine omnipotence. Peter Damian was familiar with these late antique texts. However, the immediate backdrop of Damian's views is in the eleventh-century school discussions based on the sources just mentioned. Damian knew well the developments in the Italian town schools due to his secular teaching career in the 1020s and 1030s, and *De divina omnipotentia* is one of our main witnesses to this early phase of scholastic deliberation. Another author with the same kind of schooling is Anselm of Canterbury, who received an Italian education before he left his home country in 1056. Damian's *De divina omnipotentia* can serve as a useful point of comparison for many aspects of Anselm's thought.

theology, and served three times as rector of the university. He was a canon of Mechelen and *plebanus* of Saint Peter in Louvain. He wrote a series of commentaries on Aristotle, a Gospel Harmony, and treatises on the dating of Easter and calendar reform, some of which stemming from a quarrel with Paul of Middelburg. He is best known as the leading protagonist in the so-called Quarrel over future contingents against the Louvain theologian Henry of Zomerem. The dispute between the two goes back before 1450, but really erupted in 1465. Until Henry's death in 1472, Rivo defended the position of Peter Auriol on the subject of divine foreknowledge of future contingents, maintaining that propositions about the contingent future are neither true nor false, but neutral. Henry countered by accusing Rivo of heresy. The long dispute involved the Faculties of Arts and Theology at Louvain, the Faculties of Theology at Paris and Cologne, the bishop of Tournai, the duke of Burgundy, the Greek Cardinal Bessarion, and Pope Paul II. A number of treatises were composed in the quarrel by Rivo, Henry, and several members of Bessarion circle. One of the latter group, the Franciscan Francesco della Rovere, was elected Pope Sixtus IV in 1471 and in 1474 officially condemned Rivo's doctrine, and by extension Auriol's.

Peter de Rivo

Abstract

Peter de Rivo (c. 1420–1499) was a controversial scholar active at the early University of Louvain. He was professor of philosophy and rhetoric in the Faculty of Arts, professor of

The long life of Peter de Rivo, alias Pieter van der Beken, was intertwined with the development of the University of Louvain. Founded in 1425, the university quickly became one of the most vibrant in Europe. Rivo had a long career in teaching and administration and was personally involved in two controversies that raged in the university's early history: the first is the so-called Quarrel over future contingents; the second dealt with the dating of Easter. Born in the early 1420s in Aalst, a city of the County of Flanders belonging to the diocese of Cambrai, Rivo enrolled in the university in 1437, became arts master in 1442, and was named professor of philosophy at the College of the Castle in 1443. Already a canon in the cathedral of Saint Rumbold in Mechelen

(from 1442), in 1460 he received the canonry in the collegiate church of Saint Peter in Louvain that provided the salary for the chair of rhetoric, which he held until 1470. Rivo started his studies in theology right after obtaining the title of master of arts. He lectured on the *Sentences* in 1448–1449, but after that date his theological career appears to have slowed down, since he remained for decades a simple *baccalaureus formatus* and was not made doctor until 1477. He next became ordinary professor, obtaining the chair of theology connected to the plebany of Saint Peter, which had belonged to his old teacher Johannes Varenacker (d. 1475). Besides his teaching activity, Rivo served as the official letter writer of the university in 1456 and was appointed rector three times, in 1457, 1477, and 1478. He was also involved in the social and political life of Louvain. During the series of riots that shook the Burgundian Low Countries after the death of Charles the Bold (5 January 1477), the succession of Mary of Burgundy, and her marriage with the Archduke Maximilian of Habsburg, Rivo was among those city notables who tried to temper the urban revolt in Louvain, mediating first between the internal factions, and then between the city and Maximilian. In August 1477, as rector and renowned rhetorician, Rivo was also in charge of pronouncing the official speech for the first entry of the archduke into Louvain. The text of this panegyric, the *Relatio seu propositio coram Maximiliano Lovanii reserata in primo introitu terrarum sponse sue*, is preserved in two manuscript copies dating to the fifteenth and seventeenth century (Glasgow, University Library, Sp Coll Hunterian Bf.3.15, handwritten on the blank verso of k8 and continuing onto the recto and verso of an inserted vellum leaf; Brussels, KBR, MS. 17320–17330). He died on 26 January 1499.

As a professor at the College of the Castle, Rivo lectured on some of the texts in logic and natural philosophy that constituted the basis of education in arts at that time. His lectures survive in written form in four manuscripts: Greifswald, Bibliothek des Geistlichen Ministeriums, 34.D. IX; Berlin, Staatsbibliothek – Preußischer Kulturbesitz, Magdeburg 201, 220, and 227. These manuscripts were copied and read in

Dominican convents of the province of Saxony between the 1460s and the 1480s and contain Rivo's commentaries on Porphyry's *Isagoge* (one copy), along with Aristotle's *Categories* (one copy), *On Interpretation* (one copy), *Prior Analytics* (one copy), *Posterior Analytics* (two copies), *Topics* (two copies), *Physics* (three copies), *On the Heavens* (two copies), *On Generation and Corruption* (one copy), *Meteorology* (two copies), *On the Soul* (three copies), and *On Sense and the Sensible* (two copies). A copy of his now lost commentary on the *Metaphysics* was preserved, together with an extra copy of all his commentaries on the *Organon*, in a codex in the Magdeburg Dom Gymnasium (MS. 165) until its destruction in World War II. Rivo also composed a philosophical treatise on the will that can be found in only one partial witness, copied and annotated in the margins by Adrian of Utrecht (later Pope Adrian VI), who studied at the Faculty of Arts of Louvain beginning in 1476 (Louvain, Maurits Sabbe Library [GBIB], Cod. 17). Most of these texts are still unedited; provisional editions of a number of Rivo's commentaries are available online. From a first general survey and selected case studies, Rivo seems to have pursued the path of the *via antiqua*, abiding by the directives prescribed by the early statutes of the Louvain Faculty of Arts, which forbade the teaching of John Buridan, Marsilius of Inghen, and William of Ockham, and listed instead Albert the Great, Thomas Aquinas, Giles of Rome, and Averroes as "truthful commentators" of Aristotle. In particular, Rivo seems to have shown a preference for Albert, although this tendency is not a slavish or explicit dependence.

Rivo is best known for his role in the quarrel over future contingents at Louvain. Ironically, until recently he was more famous in this regard than the scholastic whose theory he resurrected: the Franciscan Peter Auriol (d. 1322). Peter de Rivo entitled his collective works on the subject *A Defense of the Doctrine of Lord Peter Auriol in the Matter of Future Contingents*. In late 1446, the arts faculty asked him and the dean to investigate the suspect doctrines of a group of arts masters led by Henry of Zomerem (c. 1417–1482). With the approval of the Faculty of Theology, in mid-1447

the Arts Faculty published a statute proscribing 11 propositions, including that “determinately one part of a contradiction in future contingents is true and the other false, just as in present and past contingents” – in fact, this and two of the others “must be totally suppressed.” Prima facie the poorly worded statute supports Peter Auriol’s opinion. Among authors whose works are preserved, however, Auriol’s stance had been almost universally attacked in the 130 years since its first expression. For his part, Henry of Zomerem claimed that the propositions censured were based on the teachings of Scotus.

Henry was in Paris for much of the 1450s, becoming master of theology there in 1462. Back in Louvain he was given the prestigious chair of theology that Heymeric of Camp had left vacant at his death, so Henry could now set things right. In a quodlibetal disputation in the Arts Faculty in Advent, 1465, Rivo defended Auriol’s doctrine. The debate continued the following year at the same venue. After a hiatus, in November 1469, Henry spoke out against what he considered the heretical position that Rivo had defended. When the Advent quodlibetal session opened, Rivo resumed the debate on 18 December. Henry responded 2 days later, again calling Rivo’s opinion heresy. The next day Rivo replied and the Arts Faculty asked the university to force Henry to abide by the statute of 1447. Despite the university’s repeated efforts to silence both sides, the quarrel escalated, coming even to physical violence among the supporters. Both Rivo and Henry composed treatises, several in the case of Rivo who, as professor of rhetoric, used his skills to the fullest extent to gain supporters that he would otherwise probably not have had. To this day, six manuscripts preserving the texts that Rivo composed for the quarrel are known to survive: four in the BnF in Paris (Lat. 3169, 4152, 12390 and Nouv. Acquis. 1179), one in the Vatican Library (Vat. lat. 4865), and one in the University Library of Basel (A VI 12).

Rivo adopted Auriol’s defense of Aristotle’s “demonstration” in chapter 9 of *De interpretatione* that propositions about future contingents are neither true nor false, but neutral.

Furthermore, for Auriol and Rivo, not even God’s knowledge makes such propositions true or false, because divine knowledge of what is future to us does not precede the future’s coming about, otherwise everything would happen necessarily. Following Auriol, Rivo claimed that God’s atemporal knowledge of future contingents cannot be expressed properly by any proposition, so denying truth to future contingent propositions does not affect His knowledge.

Rivo’s main innovation is his articulation of various ways to take “truth.” If we tell the editor on 14 July 2017, “We will submit this on 14 February 2018,” this proposition is true, but only in the “popular” sense that the editor knows we are trustworthy and we intend to follow up. In the Aristotelian sense, however, by the “rigor of logic” and with truth “inhering” in it, our proposition is not true. We may have our entry ready and intend to submit, and then be punished with sudden administrative tasks. Rivo’s example is this: if Plato, whom Aristotle trusts, says to Aristotle, “I will have lunch with you tomorrow,” Aristotle will believe it faithfully, and say that it is true, but he will not maintain that the truth inheres in Plato’s assertion. The main problem with this is prophecy. Here Rivo agrees with Auriol that prophetic propositions signify divine knowledge by the “intention” of the prophets. In Rivo’s terminology, although they are not true in Aristotle’s sense, by the rigor of logic and with the truth inhering in them, they are nevertheless true by the “Uncreated Truth” that the prophet makes them signify. And if we can believe Plato’s promise about lunch, then we can believe God’s prophecies so much more, without maintaining that truth actually inheres in them.

For Rivo, when a proposition about the future is strictly speaking true, this truth is “unimpedible.” It simply cannot be true now in the Aristotelian sense that “We will submit this on 14 February” and yet still be possible for us not to submit. This also applies to prophetic and other propositions that express God’s foreknowledge: “If true propositions about future contingents are required to express divine foreknowledge, one asks of my adversary, by what truth must they be true, unimpedible truth or impeded truth? If by

unimpedible truth, it follows that all futures will come about unimpedibly. If by impedible truth, it follows first that God's foreknowledge can be maintained along with the said opinion of Aristotle, by which he only denies unimpedible truth in propositions about future contingents."

Rivo also rejects, with some ridicule, the traditional logical devices used to reconcile divine foreknowledge and the contingency of the future. The common solution to the problem of the consequence "God foreknows that we will submit, therefore we will submit necessarily" is to appeal to the composite and divided senses of the proposition, and the distinction between absolute and conditional necessity. Rivo remarks, in a way that Auriol had and Martin Luther would later: "I have been astonished at some people who explored the greatest causes with the utmost subtlety, so that they scarcely left a particle undiscussed, and yet they are satisfied with these solutions."

Lacking the university's support, Henry denounced Rivo and his cohort to Pope Paul II and called on his allies for assistance: the duke of Burgundy, his alma mater the Faculty of Theology at Paris, and the powerful Greek Cardinal Bessarion in Rome. Rivo counterattacked, accusing Henry of the determinist heresy of Wyclif, and the university appealed to the Faculty of Theology of Cologne. Pope Paul ordered the bishop of Tournai to investigate, while Bessarion held a philosophical inquiry, soliciting tracts from Fernando de Cordoba, Guillaume Baudin, the Dominican Giovanni Gatti, and the Franciscans Giorgio Benigno Salviati and Francesco della Rovere, the latter about to be elected Pope Sixtus IV in August 1471. Rivo wrote a commentary on della Rovere's treatise and refutations of Baudin's and Henry's own works. In the end, Sixtus held an inquiry and, after Henry of Zomerens and Bessarion's deaths in 1472, Rivo was forced to retract his position in 1473. When he tried to interpret his retraction in a benign manner, he was investigated for backsliding. New light on this final phase of the quarrel is shed by a series of texts contained in MS. Leuven, Universiteitsbibliotheek, 1635, composed between 1473 and 1476 in opposition to Rivo's doctrines by an anonymous Thomist

theologian active in Louvain at the time. Meanwhile, in 1474, Pope Sixtus IV published the bull *Ad Christi vicari* formally condemning the opinion of Peter de Rivo and, therefore, Peter Auriol. Rivo signed a new retraction in 1476 and he was allowed to resume his activities in 1477, when he was finally promoted to doctor and professor of theology. In his last will and testament, however, he seemed to have professed again his old belief, stipulating that his beneficiaries "should conform in their teaching to the statute drawn up by the Faculty of Theology at the request of the Faculty of Arts," that is, the same statute that during the quarrel he advocated as defending his own position in the matter of future contingents.

The memory of the quarrel and of Rivo's "heresy" lingered among the historiographers of Brabant from the end of the fifteenth to the twentieth century. Petrus Impens (d. 1523), prior of Bethlehem in Herent, recorded a short report on the events in his *Chronicon Bethlemiticum*. Texts related to the debate, including some preserved in MS. Leuven 1635, were still circulating in Louvain at the beginning of the seventeenth century, as witnessed by the Jesuit Cardinal Juan de Lugo (1583–1660), who discussed them in his *Disputationes de mysterio incarnationis* (1633). One century later, they were also mentioned in Martin Ortiz's *Caduceus theologicus et crisis pacifica de examine thomistico in tres partes divisa* (1733). The editing of the *corpus* of treatises and documents connected to the quarrel began with the works of the Louvain historian Valerius Andreas (1588–1655) and of the theologian Charles du Plessis d'Argentré (1637–1740), and it is still in progress.

Despite the papal condemnation for heresy, Peter de Rivo spent the last 25 years of his life as a well-respected theologian and member of the city élite. Among the texts that he wrote at this stage, works related to chronology take pride of place. Rivo had an interest in matters concerning the dating of Christ's life and the calendar at least since 1449. In 1471 he composed the *Dialogus de temporibus Christi*, which imagines a discussion between a Jew, Gamaliel, and a Christian, Paul, concerning the conflicting theories on the day and hour of the birth and the passion of Christ, by examining issues such as historical and

computistical methods and a proposal for the reform of the calendar (New York, Columbia University, Rare Book & Manuscript Library, Western MS. 31). Later in his life, Rivo specifically dedicated a short treatise to calendar reform, the *Reformatio kalendarii*; this text was considered lost until it was discovered bound in an incunabulum of the Cambridge University Library (Inc 3. F.2.9 [3294]).

Another example of his interest in establishing chronologies is the *Monotesseron*, a harmony of the Gospels echoing in the title the more famous work by Jean Gerson. Its purpose was to provide a coherent account of the life of Christ, putting in order the texts of the four Gospels and trying to resolve their discrepancies. Through this work, the reader would then be able to get an overview of the events in their correct historical order and to memorize their sequence using the system of rubrics, tables, and mnemonic verses that accompanied the text of the Vulgate. In the prefatory dialogue Rivo explains the criteria he followed for establishing the order among the four narrations (he takes Luke as the leading evangelist) and describes this complex system of paratexts. The *Monotesseron* is transmitted in two versions: a synopsis, authored by Rivo and partly accompanied by a commentary, and a unified harmony, which is probably an anonymous reworking. It is preserved in five manuscripts, in which the layout of Rivo's work is differently reshaped according to the needs of his readership – in particular, those of the Brabantine priories of Augustinian canons affiliated with the Congregation of Windesheim, where the liturgical calendar was central to devotional life (MSS. Brussels, KBR, 129–130, 5570, 11750–11751; Paris, Bibliothèque Mazarine, 300/1; and Wien, Österreichische Nationalbibliothek, Cod. Ser. n. 12890).

Rivo's most famous contributions in this domain, however, are the computistical works he wrote against Paul of Middleburg (1445–1533), former student of theology and medicine in Louvain, then doctor of medicine and professor of astrology at the University of Padua, as well as personal astrologer and physician of the dukes of Urbino. The occasion was a dispute on the dating of Easter, initiated by Paul in 1487, when he

proposed in an *Epistola* addressed to the University of Louvain that the traditional opinion according to which Jesus died on Friday 25 March and was resurrected on the following Sunday failed to harmonize the events described in the Gospels with the astronomical calculations. According to Paul's estimate, Christ died instead on Monday 22 March and was resurrected on the following Thursday. Peter de Rivo reacted in defense of the traditional dating by publishing in 1487 the *Opus responsivum ad epistolam apologeticam Magistri Pauli de Middelburgo de anno, die et feria dominicae passionis*, followed, 4 years later, by the *Tertius tractatus de anno, die et feria dominicae passionis atque resurrectionis*, probably in response to other letters addressed to him by Paul of Middelburg. The controversy probably went cold shortly after 1492.

Among the writings by Rivo that have come down to us, one should finally mention three short texts: a dialogue in verses, an example of biblical exegesis, and a case of pastoral theology. The first was published in Leiden in 1509 with the title *Libellus quo modo omnia in meliorem partem sunt interpretanda* and consists of a dialogue between Man and Reason about how the dramatic events of the history of salvation should be considered as a path to the greater good. The second is a brief explanation of Ambrose of Milan's commentary on Ps. 118:154 "Judge my judgment and redeem me: quicken thou me for thy word's sake" (*Explanatio verborum Ambrosii in versiculo secundo vicesimi octonarii psalmi CXVIII*), presented as an appendix to Ambrose's text in a manuscript in the Bibliothèque Mazarine in Paris (MS. 567). The last is a letter to an anonymous friend, *frater professus* of the priory of Augustinian canons of Groenendaal, in which Rivo addresses three doubts in matters of confession; the text is followed by Rivo's epitaph (Stuttgart, Württembergische Landesbibliothek, Cod. HB I 10).

Peter Helias

C. H. Kneepkens
Faculty of Arts, University of Groningen,
Groningen, The Netherlands

Abstract

Peter (Petrus) Helias (c. 1100 – after 1166) (PH). A student of Thierry of Chartres in the 1130s, he was an influential and renowned grammarian and rhetorician at Paris. About 1155, PH became a canon at Poitiers.

PH's major work is his *Summa* on Priscian's *Institutiones grammaticae*. Being both a commentary and a well-structured textbook, it is the starting point of a new current in grammar teaching. Doctrinally, PH is deeply indebted to the anonymous grammarians of the *Glosulae* tradition, William of Conches, and the moderate Boethian–Neoplatonistic teaching of the philosopher and theologian Thierry of Chartres. Adopting the *summa* model gives him the opportunity to rephrase and expound Priscian's text and to systematically focus on major linguistic problems, for example, the explanatory principles or causes of invention, the semantic well-formedness of a sentence, the Boethian three-pronged interpretation of “substance,” the distinction between the *nomen complexivum* and *collectivum* in the discussion on equivocal nouns, the division of the grammatical *accidentia* into *secundariae significationes* and *proprietas communes*, the distinction between construction at word level and a construed sentence, and the assessment

of the syntactic aspect of (grammatical) government against the traditional view that emphasized its semantic character.

The first part of his *Summa* (on Priscian, I–XVI) was widely spread during the Middle Ages, but the part on Priscian, XVII–XVIII, on syntax, was soon replaced by the *summa Absoluta cuiuslibet* often incorrectly attributed to him, for example, by Robert Kilwardby. In the later Middle Ages, his fame continued and several grammatical commentaries and metrical treatises were published under his name.

In rhetoric, PH composed a commentary on Cicero's *De inventione* (not published); there, he followed a well-established tradition and appeared to be strongly influenced by Thierry. Other works traditionally attributed to him, are inter alia a commentary on the *Auctor ad Herennium* and Boethius' *De trinitate* are spurious.

a major influence on well-known Franciscan thinkers of the time. In social philosophy, he was an active participant in the influential debates concerning the Franciscan ideal of absolute poverty. From more theoretical perspectives, freedom of the will and the activity of the soul in respect to the corporeal world are the most important tenets of Olivi’s thought, and it was in this area that he had the most lasting influence on the western intellectual heritage. Olivi laid the ground for distinctively modern habits of thought. His thought centered around self-reflexive and free human subjectivity, and its place in the corporeal, mechanical world on the one hand, and in the social-political order on the other.

Biography

Peter John Olivi (1248–1298) entered the Franciscan order at the age of 12 in 1261, and within the order got as good an education as one could at the time get. From 1267 to 1272, he studied in Paris with St. Bonaventure and other famous thinkers. He did not receive a doctorate, possibly because of his controversial opinions. Nevertheless, he taught at Franciscan schools in southern France until 1283, when some of his views were condemned. He was rehabilitated in 1288 with the help of his former teacher, Cardinal Matthew of Aquasparta, and moved on to teach for 2 years at Florence. Then he returned to France, to Montpellier, and to Narbonne, where he died on March 14, 1298.

Abstract

Peter John Olivi (1248–1298) was in his time well known as social reformist, but in histories of philosophy, he has often been ignored. He was, however, a very original thinker who had

Precursor of Modern Thought

Although Olivi has not always been recognized even by medieval scholars, he was one of the most original thinkers of the age, and he also had a major influence on the development of intellectual history. His ideas are clearly present in writings by well-known Franciscan philosophers like John Duns Scotus, Peter Auriol, and William of Ockham, who nevertheless rarely cite Olivi by name. The silence is partly due to the dubious reputation

Olivi had as the leader of a social reformist movement and the recurring doctrinal suspicions against him. Some of his views were condemned by the Council of Vienne (1311–1312) and in 1326 by Pope John XXII. Most of his works have survived in the Vatican library but remain in obscurity. As research has shown beyond doubt, Olivi's ideas on the philosophy of history, on Aristotelian metaphysics and especially on human freedom were highly original but gained currency through discussions by these well-known thinkers. In fact, Olivi turns out to be a central innovator in respect of distinctively modern views developed in the later Middle Ages.

Olivi's modernity is obvious from the style of his writing. He composed works that fit the standard medieval genres of academic writing: commentaries on Peter Lombard's *Sentences* and the Bible, quodlibetal questions, etc. However, he writes with a personal tone that seems to spring from an intimate experiential touch of his philosophical thinking. He clearly has a liking for arguments, and often puts forward positions only to later reject them. In many cases, he states the common view, shows its problems and puts a new, innovative view against it, but ultimately refrains from taking a formal stance on the issue. This is not because of general hesitation, since in many cases he does not hesitate to take a strong, controversial, view. Rather, it seems that Olivi enjoyed philosophical reasoning even in matters that he himself thought to be of limited real significance and thus could be left open. In general, his writings do not have the abstract, universalizing overtones that are so typical for the Scholastics.

Social Philosophy

In his commentary on the Apocalypse and in his *Questions on Evangelical Perfection*, Olivi discusses the Franciscan ideal of absolute poverty and articulates in his own way, how using the necessities of life is possible without claiming property of them (*usus pauper*). Olivi was an early leader of the "Spiritual" reform movement, and indeed it seems that to some extent the

doctrinal condemnations against him seem to be connected with the reactions against this radical reform movement. Nevertheless, such major thinkers as John Duns Scotus and William of Ockham follow Olivi in some central features of their own theories of ideal poverty. These discussions led to the idea of subjective rights that got a very central position in modern social philosophy. In Olivi's view, rights must be constituted by an act of free will, and thus the natural order does not imply any rights. This view is stated clearly in his theory of property acquisition and of political power.

As Olivi formulates it theoretically, Franciscan poverty is based on giving up one's freedom, the most valuable thing any person has and the very foundation of personhood. In giving up one's freedom, the Franciscan brother accepts absolute obedience to God and gives up all kinds of property rights, private as well as common. This did not mean absolute obedience to any authority of the church, but rather made the issue of obedience an issue of conscience. Olivi is known as an apocalyptic thinker who thought the Antichrist would be a Pope. Indeed, he saw a widespread decay of the Church: "the whole Church is infected from head to toe, confused, and turned into a new Babylon as it were." He saw the Franciscan movement as having brought a new age to the Church, emphasizing the role of the Holy Spirit in this new historical era.

Human Freedom

Free will is one the most central philosophical topics in Olivi's writings and clearly something that he thought was crucial. This is a topic where he did not hesitate to claim what he thought the truth was, and his fiercest opposition to "worshippers of Aristotle" concerns denials of the absolute freedom of the human will. As Olivi argues, our main social practices like political power and judicial punishment, and emotions like love, hatred, shame, and gratitude, are all based on the assumption that people act freely. Even personhood depends on taking oneself to be free. Such a fundamental assumption shared by all humans

cannot be wrong, Olivi argues. He has also some more metaphysical arguments to prove human freedom, but they are interesting primarily in showing how he understood the freedom at issue.

As Olivi saw it, the freedom of the human will is based on the capacity to control one's will oneself so that the will is a self-mover. This is not to be understood in the sense that the will could not be moved from the outside. Rather, Olivi claims that normal healthy adult humans have a will that is able to move itself independently of external influences. That is, he admitted that the will in children, madmen, and drunkards can be and often is moved by external forces. A strong emotion may force a madman do something, but a mentally healthy adult person is able to control himself even in the face of a strong emotion. Freedom is, thus, a self-reflexive capacity where a person takes, with a second-order act, control over the first-order acts of the will directed at external objects. That is, people make genuinely free choices when and only when they make the choices consciously as their own choices. Olivi did not think that the will would be constantly active in making free choices, though he did think that all humans have the potential for free self-control. People do not always think about what they are doing, but they are always free to take control of themselves.

Olivi rejected the Aristotelian assumption that given the premises of a practical syllogism, the action follows as a necessary conclusion. A free person may choose otherwise, he says, though admitting that people do often consider rationally what would be the best course of action for a certain end. But people are free to follow the best course of action or not, even without giving up the end. Positing the end is also dependent on the will, even in the case of the ultimate end that is sought for no other further end. In Olivi's example, if you hate your enemy and find by reasoning the best way to harm the person, this reasoning does not bind you to an action. You are free not to harm the person you hate, and you are even free to begin loving the person for his or her own sake.

Olivi uses the idiom "intellectual beast" to describe what a human being without freedom would be. Personhood is grounded on freedom,

and Olivi thinks that free will is the ground for human dignity. He claims that if given the choice to continue life without freedom, anyone would prefer nonexistence.

Mind–Body Dualism

Corporeal entities are not capable of the kind of reflexivity required for freedom, Olivi argues. In intentionality, there is a distinction between the subject and the object, and in divisible matter this makes the subject and the object necessarily distinct things, whereas in self-reflexivity the subject and the object are the same. Thus, the free, intellectual soul must be incorporeal. Olivi does not, however, give up the Aristotelian universality of the form–matter distinction. He accepts that all individuals consist of matter and form, but claims that the human soul informs two distinct kinds of matter: the corporeal and the spiritual. As the intellectual part of the soul does not inform any corporeal matter, the human soul is the form of the body only in respect to its sensitive part. The intellectual soul informing spiritual matter becomes, thus, a full-fledged individual capable of existence and its own kinds of action even in separation from the body.

Some authorities within the church saw Olivi's view as denying the true doctrine that the soul is the form of the body, and condemned the view. However, many important later thinkers, for example, William of Ockham, followed Olivi in affirming that the intellectual soul is genuinely independent from the body and capable of existing by itself as an individual. As the idea of spiritual matter was given up, Olivi's theory can be seen as a direct predecessor of René Descartes' seventeenth-century dualism.

Olivi held strongly to the view that the mind is active and that corporeal bodies are passive. He describes sensory perception in terms of an intentional relation where the mind comports to the world, thus rejecting the standard Aristotelian model where corporeal things act upon the sensory and cognitive systems. In vision, for example, one ought not to say that the object causally produces an act of seeing, but that the soul

actively produces a visual act where the object is merely a “terminative cause.” Looked at as a theory of attention, Olivi’s discussion contains interesting philosophical insights.

Self-Reflexivity

Olivi’s questions on Peter Lombard’s *Sentences* contain a comprehensive philosophical psychology developed within the general context of the Aristotelian faculty psychology dominant at the time. In building this system, Olivi rarely puts forward strong claims. It is interesting to see, however, that he did not think of consciousness as a distinctive human capacity despite the strong claim that the strong kind of self-reflexivity needed for freedom is strictly limited to humans in distinction to other animals.

A certain kind of self-reflexivity is to be found already at the level of touch, the most basic of all the senses. Touch, as Olivi tentatively defines it, is a sense by which an animal feels its own body in relation to health, welfare, and success in action. It is not, thus, a sense defined through proper sensibles like heat and hardness. In a way, even the simplest animals thus have the capacity for reflexive perception of themselves as bodily entities. Olivi also mentions the Classical Stoic example of a dog sacrificing its leg to save the head, thus showing awareness of the respective values of the different parts of the body.

Animals are not, however, capable of self-reflection in the spiritual manner typical for humans. Olivi appears to think that an animal has an image of its own body, a kind of self-image, but it cannot understand itself as the perceiver of this image. This is limited to humans. Olivi seems to accept, but not emphasize, the traditional Aristotelian idea that humans differ from other animals through the power of understanding universally. Rather, Olivi’s understanding of the human distinction emphasizes self-reflexivity and free self-control. This distinction is, for him, the distinctive human capacity, and the foundation of human dignity.

Peter Lombard

John T. Slotemaker

Department of Theology, Boston College,
Chestnut Hill, MA, USA

Abstract

Peter Lombard was a theologian and bishop of Paris who wrote Glosses on select books of the Bible and a theological textbook called the *Book of Sentences*. He had a significant impact on the development of medieval theology through his *Sentences*, as this work became the central textbook of theology from the early thirteenth century until the sixteenth century. Most of the philosophers and theologians of the later Middle Ages wrote commentaries on the *Sentences*. Through his systematic ordering of Christian theology, Peter Lombard deeply influenced the development of medieval philosophy and theology.

Peter Lombard (b. c. 1095/1100 – d. 1160), theologian, and later bishop of Paris, was born near Novara in Lombardy and died in Paris on August 21. He studied under Bernard of Clairvaux for a brief period at Reims, and it was Bernard who recommended Peter to Gilduin, the prior of St. Victor in Paris, for further theological studies. Peter arrived in Paris in 1136 to study with Hugh of St. Victor around the time that Hugh was completing his *De sacramentis* (1137). Besides attending the lectures of Hugh, Peter Lombard probably also sought out Peter Abelard who was lecturing in Paris and whose works he came to know well.

Peter Lombard began teaching at the cathedral school of Notre Dame around 1145. He became a canon in 1145, subdeacon in 1147, and subsequently deacon and archdeacon, eventually being consecrated bishop of Paris on July 28, 1159. During this period, he was also consulted on various theological issues by Pope Eugene III; for example, Peter was called to the

consistory in Paris in 1147 to discuss the trinitarian theology of Gilbert de la Porrée, Bishop of Poitiers. Gilbert's trinitarian theology was revisited by Peter Lombard, Bernard of Clairvaux and abbot Suger of St. Denis at the council of Reims in 1148. The works of Peter Lombard include his *Gloss on the Psalter* (1536), *Gloss on the Pauline Epistles* (1148–1159), and his *Book of Sentences* (1155–1157).

Biblical Commentaries

Peter Lombard's *Gloss on the Psalter* is a revision of Anselm of Laon's *Gloss on the Psalter*. The work was edited and defended by Peter's student, Herbert of Bosham, after Gerhoch of Reichersberg charged Peter with Christological-Nihilism (claiming that Jesus in his humanity *non est aliquid*/is not a something; see below). The work offers a figurative interpretation of the *Psalms*, and does not engage in sustained doctrinal or theological discussion. Despite this fact, the work was important to subsequent tradition for its comprehensive treatment of the Psalter and its detailed introduction (*accessus*) to the work.

The Gloss on the Pauline Epistles, known to subsequent generations as the *Collectanea* or *Magna glossatura*, is a collection of Peter Lombard's notes and lectures on the Pauline Epistles. The work was under continual revision until Peter was elected Bishop of Paris in 1159. This commentary, in comparison with his earlier work, relies on a broader range of patristic and medieval sources and continues the *accessus* method of organization. Peter's two Glosses served as primers for his *Book of Sentences* as he continued to develop his distinctive methodological approach to the Scriptures and Christian doctrine.

The Systematization of Theology

The *Sentences* of Peter Lombard became the standard doctrinal textbook between the mid-thirteenth century and the sixteenth century in western Europe. The gradual systematization of

theology that took place in the long twelfth century (1050–1215) had its roots in the early theological works of Anselm of Canterbury and continued through the works of Peter Abelard, Hugh of St. Victor, Robert of Melun, and Odo of Lucca's *Summa sententiarum*. The process of accumulation is already evident in Robert of Melun's amalgamation of Hugh of St. Victor and Peter Abelard and in Odo of Lucca's reliance on Hugh of St. Victor and Anselm of Laon. But, of the various sentence compilations that were composed during the mid-twelfth century, it was the *Sentences* of Peter Lombard that became the standard.

Like the other high medieval sentence compilations, the *Sentences* of Peter Lombard are primarily a collection of patristic citations from Saints Ambrose, Hilary of Poitiers, and Augustine. For his sources, Peter relied heavily on his previous *Glosses on the Psalter* and the *Pauline Epistles* as well as his medieval predecessors. When compared to contemporary theological systems, such as Hugh of St. Victor's *De sacramentis*, it is clear that Peter abandoned earlier attempts to construct a historical or chronological interpretation of Christian doctrine. Peter's theological work is a more systematic project grounded in Augustine's *De doctrina Christiana* and employs Augustine's distinction between things (*res*) and signs (*signa*). For the bishop of Hippo all of Christian doctrine is of things or of signs (*omnis doctrina vel rerum est vel signorum*). Certain things (Trinity) do not signify anything, but signs do; all signs are also things, but not all things are signs. Further, the distinction between things and signs is coupled with the distinction between things to be enjoyed (*frui*), things to be used (*uti*), and things that are both used and enjoyed. This latter distinction between things to be enjoyed and things to be used is between: (1) things enjoyed (*frui*) in the sense of delighting in the thing for its own sake (not for the sake of something else), and (2) things used (*uti*) as a sign for, or as a means of arriving at, something else.

Employing Augustine's analysis Peter divides the four books of the *Sentences* into: book I, Trinity (thing/s to be enjoyed); book II, creation, angels, the fall and grace (things to be used);

book III, the Incarnation of the Word and the virtues (things that are objects of enjoyment and use); book IV, the sacraments and last things (signs). The above distinctions are developed in the introductory sections of book I and book IV of the *Sentences* (I *Sent.*, dist. 1; IV *Sent.*, dist. 1 (prol.)). Peter argues that the Triune God is the only proper object of enjoyment. Everything else in the cosmos is a thing (including the sacraments as signs) to be either used and enjoyed or simply used. Peter's Augustinian ordering of Christian doctrine and theology is a rational structure that eventually replaced the historical or chronological approaches to Christian doctrine that antedated his own work.

The success of Lombard's *Sentences* is due primarily to his balanced approach to the opinions of the Fathers and the Masters. His work often achieves a *via media* between contradictory opinions. But, despite Peter's attempt to reconcile various opinions, certain positions held in the *Sentences* became the object of heated debate in the schools. Two examples are Lombard's discussion of the Holy Spirit as charity (I *Sent.*, dist. 17); and his analysis of the hypostatic union in which he argues that Christ, in his human nature (*qua human*), is nothing (*nec aliquid*; III *Sent.*, dist. 10). Lombard's claim in book III, distinction 10 is not a variant of docetism, but argues that since Jesus' human nature did not have an independent human hypostasis, it was not, strictly speaking, a human thing. Both of these distinctions attracted the attention of theologians from the mid-twelfth century up through the time of Johannes von Staupitz and Martin Luther; two sixteenth-century theologians who were sympathetic to Lombard's analysis of the Holy Spirit in distinction 17 of book I.

Alexander of Hales made the *Sentences* of Peter Lombard his doctrinal textbook for the study of theology at the University of Paris around 1222. The introduction of the *Sentences* was to compliment the study and interpretation of Scripture that was dominant at Paris in the twelfth and early thirteenth century. This decision was followed by Richard Fishacre at Oxford (c. 1245), despite opposition from Robert Grosseteste and Richard Rufus who wanted to maintain the centrality and sufficiency of the

Scriptures for theological study. Regardless of such critiques, the *Sentences* of Peter Lombard became the standard theological textbook in western Europe up until the sixteenth century. Commentaries on the *Sentences* became the chief method, along with commentaries on the Bible and Peter Comestor's *Historia scholastica*, of attaining the level of Master of Theology.

The initial commentaries on the *Sentences* were balanced works that functioned as instruments for learning the entire breadth of scholastic theology. Early commentators such as Alexander of Hales and Albert the Great commented on (glossed) all four books of the *Sentences*, a practice that was continued by their respective students in the mid-thirteenth century: Bonaventure and Thomas Aquinas. Both Bonaventure and Thomas commented on all four books of the *Sentences* distinction by distinction, thus following closely the logical ordering of Lombard's work. Later, by the late thirteenth and early fourteenth centuries, the commentaries became topical treatises that addressed the most important philosophical and theological questions of the day. This is evident in Scotus' *Ordinatio* where he considers fewer questions within each distinction and omits (or collapses into each other) certain distinctions all together. Both as a representative of the twelfth-century *Sentences* collections, and throughout the various subsequent genres of *Sentence* commentaries, the *Sentences* of Peter Lombard were the single most important theological work of the Middle Ages.

Peter of Abano

Henrik Lagerlund

Department of Philosophy, Stockholm University,
Stockholm, Sweden

Abstract

Peter of Abano (c. 1250–1316) was a very influential medical thinker from the fourteenth century. He also had an influence on fourteenth-century philosophy in Paris and Padua.

Peter of Abano was Italian by birth and received his basic education in Padua. At some point in his life (unclear when), he traveled to Constantinople where he is said to have learned Greek. Toward the end of the thirteenth century, he moved to Paris. In Paris, he soon got into serious trouble with the inquisition. He was, for example, accused of having held the position that the intellectual soul is derived from the potentiality of matter. He was, however, never convicted and left Paris in the early fourteenth century (c. 1306) to return to Padua. In Padua, he got into trouble again with the inquisition, but died before he was charged with anything. Apparently, his bones were later burned in Padua as a sign of his heresy (Hasse 2001, p. 636).

Peter's most famous work is the *Conciliator differentiarum philosophorum et praecipue medicorum*. Presumably, it was written during his time in Paris and then perhaps revised later on in Padua. Its possible influence on fourteenth-century philosophy has been very little studied (it is in general very little studied), but it later

became a standard text in medicine and was printed numerous times in the late fifteenth and early sixteenth centuries (see Siraisi 1987, 2001; Nardi 1958).

Peter also wrote another work that was perhaps not as influential as the *Conciliator*, but which was also printed numerous times in the late fifteenth and early sixteenth centuries, namely an *Expositio problematum Aristotelis*. It seems also to have been written during his Paris period and then revised in Padua. It was often circulated later in the fourteenth century in a shortened version by John of Jandun.

Peter of Ailly

Joël Biard

Centre d'Etudes Supérieures de la Renaissance,
Université de Tours, Tours, France

Abstract

Peter of Ailly was one of the most important thinkers and philosophers of the later fourteenth and the early fifteenth century. He was deeply involved with the Papal politics of his time and wrote several philosophical works that remained influential well into the sixteenth century.

Peter of Ailly was born in 1350 in Compiègne. His philosophical background was formed from 1364 onward at the College of Navarre. He obtained his Arts degree in 1368, and joined the Faculty of Theology from which he graduated in 1381. He then became Regent Master. He was appointed Grand Master of the College of Navarre in 1384 and then Chancellor of Paris University in 1389.

From this time on Peter of Ailly was involved in the struggles surrounding the Great Western Schism, which divided Europe between 1378 and 1414. After the return of Gregory IX to Rome, the College of Cardinals, reduced in number, convened to elect a Pope. But later it was argued that it had acted under pressure and another Pope was elected. From that time on there existed two opposed series of Popes, one in Rome and another in Avignon. It was only with the Council of Constance in 1414–1418 that the schism ended.

In 1381, Peter of Ailly became the voice of a group of students who demanded a council to put an end to the schism. After having published a pamphlet (*Epistola Leviathan*), he was forced to flee to Noyon, but then returned to Paris in 1384. He is involved in fights against the Chancellor of the university, which was forced to resign in 1385, and against the Dominicans. He became the Chaplain of King Charles VI. He then argued in support of the Popes of Avignon. He became Bishop of Le Puy in 1395, and then Bishop of Cambrai in 1397. He experienced both good times as the time when he in 1403 was the ambassador of the King to Benedict XIII in Avignon, and moments of difficulty during which he devoted himself to his diocese, as for example when he in 1408 had to take refuge in Cambrai. Peter of Ailly was appointed Cardinal in 1411 and Papal legate in Avignon of Pope John XXIII in 1413. He participated in the Council of Constance that marked the end of the schism with the election of Martin V, and the resignation of the Pope of Rome and the deposing of others. During this same council, he took an active part in the conviction of John Huss. He spent the remaining years of his life in Avignon, where he died in 1420.

Peter of Ailly was a great scholar. He possessed a very extensive library, and was associated with early French humanists. He wrote a considerable number of books (about 170 are known). His philosophical works include a *Tractatus de anima*, written between 1377 and 1381, and a *Tractatus de consolatione philosophiae Boethii*, dating from the same period. He also wrote the *Conceptus*, which gives an exposition of the different kinds of conceptual terms and their organization in the early 1370s, and a treatise on the *Insolubilia* (between 1372 and 1375) dealing with the truth and falsity of propositions in general, and self-reflexive propositions in particular. There is also a *Tractatus exponibilium*, in six chapters, written between 1384 and 1388, outlining, in a systematic fashion, propositions with adverbial or syncategorematic terms in such a way that they should be explicitly explained by several underlying propositions. The authenticity of the treatise *De destructione modorum significandi* has been

challenged but is now accepted. It was written before 1388. His *Questions on the Books of the Sentences* (read in 1377–1378) manifests the trend of the fourteenth century to reduce the number of issues dealt with, then to amplify them and insert many strictly philosophical developments. All these works were widely circulated up until the early sixteenth century.

His *Imago mundi*, a geography text, is still famous because Christopher Columbus owned a copy of it. But this is mostly a compilation made from ancient authors, in particular Ptolemy. He also composed a dozen other cosmographic, astronomical, and astrological works. In the latter, he defends the validity of astrology as a study of the influence of the stars on the course of human history.

Among his ecclesiological and political works, two works from his mature period should be mentioned, namely the *Tractatus de materia concilii generalis* (1402–1403) and the *Tractatus de ecclesiastica potestate* (1416), as well as a small compendium written for the Council of Constance, *Tractatus de reformatione Ecclesie*. He is also the author of many sermons in both Latin and French.

In logic and philosophy of language, Peter of Ailly manifests the influence of Ockham's philosophy in Paris. He gives all his attention to the theory of mental language. William of Ockham represents a major turning point in treating the domain of concepts as a true language, subject to a principle of compositionality, governed by syntax, and bearing semantic properties. According to Peter of Ailly, the level of concepts, organized into a language, is the major area, if not the only, of all logical, semantic, and epistemological analysis. The division and classification of the types of terms, by which logic usually begins, becomes a classification of concepts, that is, into simple or complex, absolute or connotative, but also into categorematic or syncategorematic, nominal or verbal, adjectives or substantives, etc. All logical and grammatical differences within spoken language are dependent on differences in mental language. This is why Peter of Ailly, in the *Conceptus*, and in the *Destructio modorum significandi*, denies that there are principles of

construction of spoken language, which was the function performed by the "modes of signifying" of speculative grammar. The construction or the grammatical "regimen" results from the conventional subordination of spoken terms to concepts, which are by themselves ordered in a certain way. But we have to make a distinction, which Peter of Ailly picks up from Gregory of Rimini, between mental language improperly speaking, which is only the mental image of the spoken language, and is as such conventional, and mental language properly speaking, which is the determining structure of the semantic properties and the epistemological significance of language. A simple apprehensive cognition is the mental term itself, which is a concept and which naturally signifies something.

In this context, there is no room for the idea, developed in Oxford in the late 1320s and made famous in Paris by Gregory of Rimini in the 1340s, of the "proper and adequate significate of the proposition." In the *Commentary on the Sentences* (Book I, Dist. 35, q. 1), this issue is discussed regarding the compatibility between the divine science and the contingency of the future. Paradoxically, as often, the general framework is dependent on Gregory of Rimini's commentary. Some future contingents are *incomplexe significabilia*, that is, they are possible entities, which will possibly be expressed in the future. But are the complex enunciabiles that can be expressed in the present about the future, *complexe significabilia* as some believe? Peter states that they are rather *complexe significantia*. The whole complexity is then located in the significant complex expressions and not in the significates. He then deviates from Gregory and returns to a Buridanian position in which only individual things are signified, and in which these are signified either in a simple or in a complex manner. The only other difference that we find in the *Conceptus* is that terms are also signifying *aliquiditer*, in a certain way. In fact, according to an expression that we shall find again, for example, in the early sixteenth century in John Mair, concepts signify "*aliquid vel aliqua vel aliquiditer*." They can signify one thing or several things or in a certain way, somehow, in the case of syncategorematic terms,

given that there are mental syncategorematic terms. This kind of signification is not only a modification of the signification of categorematic terms, of the direct reference to some entitates, not just a way of signifying, but it is the adverbial signification of mental syncategorematic terms. In the *Insolubilia*, Peter of Ailly is very harsh on the theory of complexe significabilia that he considers to be “irrational and unintelligible.” He rehashes a Buridianian argument, namely that all that there is, is either one thing or nothing, either a substance or an accident, either God or the creation, and the complexe significabile can in no way be situated in this scheme. In the same treatise, Peter of Ailly admits that some propositions, since they are self-reflective, signify something about themselves, for example, they signify that they are false. He refuses, however, the generalization proposed by Thomas Bradwardine in his own *Insolubilia* that any proposition implicitly signifies its own truth or falsity.

The relation of a cognitive power to an object is called a notitia. The different kinds of cognitions are discussed in the *Tractatus de anima*. A notitia can be both sensitive and intellective. That which is known or knowable is called an obiectum. But the object is not an intentional being distinct from the thing. It is the thing itself as it is in front of the cognitive power. Every thing is not ipso facto an object, but it is as far as it is directed to a cognitive power, at least in the case of a present thing. In the case of past or future things, or things simply absent from my field of apprehension, it is an image, a species, which takes the place of the object so that the cognitive power can perform its function. The concepts or notitiae are acts of the intellect, characterized as immutatio vitalis, vital actions or changes. In the *Commentary on the Sentences*, we find as a general definition: “a cognition is an act representing something in a vitally perceptive power.” Speaking of acts implies refusing any idea of a concept as mental content. This is why the model here is that of a direct relationship, not that of mediation by a representation.

The question of the intermediate, however, reappears together with the distinction between intuitive and abstractive cognition. In his

Commentary on the Sentences (Book I, q. 3), Peter of Ailly defines first of all an abstractive cognition as one that abstracts from the existence or nonexistence of the thing, while an intuitive cognition cognizes it as present, according to its actual existence. Furthermore, he insists on the fact that an abstractive cognition gives us the object “in a thing which represents it.” Agreeing with the definitions of Gregory of Rimini, which is close to Scotus, Peter of Ailly outlines, in the *Commentary on the Sentences* and in the *Treatise on the Soul*, intuitive cognition as that by which something is known formally in itself, whereas abstractive cognition is that by which something is known through a representation.

This idea leads (especially in the *Insolubilia*) to a distinction between formal and objective signification. The first is that by which a concept refers itself to the thing it signifies, the second explicates the mediation through which a cognition or a concept refers to something. This intermediate being is like an image (species) or a spoken sign. This duality between formal and objective signification will later be crossed with the idea of an objective or intentional being. Then it will be found in the theory of formal and objective concepts at the end of the sixteenth century.

The *Commentary on the Sentences* is also famous for strictly theological reasons, particularly regarding its doctrines of predestination and justification, which are known until the sixteenth century. The absolute simplicity of the divine being prohibits all distinctions within it, whether it be that of faculties or ideas. The order of established secondary causes is contingent. It is the level of ordained power. But by his absolute power, God can directly do what he ordinarily does by the secondary causes. This applies to the sacraments as well as to grace. In the established order, the habit of created charity, freely given by God, is necessary to avoid sin, although de potentia absoluta the one does not imply the other. Prescience of merits is not the cause of justification, because justification is unmotivated. But in the established order, sin is the cause of reprobation. Our concept of God is obtained by an abstractive cognition from what is created. If we cannot have an evident cognition of God we

have, however, a probable (*probabilis*) cognition of him.

In the first question on Book I of the *Sentences*, about the evident knowledge of theological truths, Peter of Ailly exposes his theory of evidence and certitude. The contingent propositions about truths of experience can only be the object of a conditioned evidence, though doubting of them would not be reasonable. Only the evidence or propositions such as “I know that I am, that I live” is possible for men down here. More generally, in his *Questions on Sentences*, Peter of Ailly, following John of Mirecourt, develops a theory of probable knowledge which broadens the field of the probable. Most of theological propositions must be sustained *probabiliter*. They are not evident but can be based on arguments having a certain force of persuasion.

Peter of Ailly’s probabilism does not lead to fideism, and a fortiori certainly not to skepticism. Absolute evidence is limited to the non-contradictory and (according to the ordained power) to the intuition of what exists, but reason gives us relative certainty and conditional evidence in the natural order of ordained power, in which causal relationships, such as the commandments, are contingent, and the same hold in matters of Trinitarian theology.

The Treatise on the Consolation of Philosophy of Boethius is presented as a work of moral philosophy. It includes a eulogy of philosophy in the beginning, and ends with a part on future contingents. But the main problem is that of happiness. Peter wonders if a philosopher can attain true happiness through natural means. He develops a purely philosophical approach. However, the philosopher reaches only a probable cognition. Peter of Ailly does not adopt, even as a relative truth, the doctrine of intellectual happiness, and he has reservations about the Aristotelian theory formulated in the *Nicomachean Ethics*. At the same time, he revisits the position of Scotus, accentuated by Ockham, that faith is required for understanding the true good. Peter admits the existence of a human tendency toward the ultimate good, a *summum bonum*. And he even recognizes, through a convincing argument, that God is the *summum bonum*. However, the supreme good

cannot be attained by a human being in this life, since only God gives happiness through the beatific vision.

Peter of Ailly does not develop a real political philosophy, but political theories are present in his ecclesiological work. These are marked by the context of the Great Schism, and his position in favor of a council to resolve the crisis. He supports the distinction of civilian and spiritual power whose purposes are different. The spiritual power is superior in dignity but does not exercise the prerogative upon civil power. It is the universal Church, not the Pope, that has the “fullness of power.” He often takes on the ideas of John of Paris, and he applies the Aristotelian analysis of the ends of the government to the Church. The political authority must ensure the good of the community as a whole. The Council does not have to judge the Pope, but if the survival and unity of the Church is no longer secured with the Pope, the General Council becomes the representative of the Church. The source of authority is the consent of the community.

The most famous pupil of Peter of Ailly was John Gerson, but Peter exerted a widespread influence for two centuries in philosophy of language, theology, and political ecclesiology. He was for a long time viewed negatively, but his ideas are now revalued thanks to a better understanding of what absolute power means as well as a more measured assessment of his doctrines of grace and justification. His works are seen as important sources for understanding the logic and the epistemology of his century.

Peter was strongly influenced by Thomas Aquinas' interpretations of Aristotle. However, his own interpretations should be understood not only as expanding or continuing Thomas' commentaries but as adding a particular accent of his own (Flüeler, *Rezeption und Interpretation der Aristotelischen "Politica" im späten Mittelalter*. Grüner, Amsterdam, 1992; Galle, *Questions on Aristotle's "De caelo": a critical edition with an interpretative essay*. Leuven University Press, Leuven, 2003; Toste *Virtue and the city: the virtues of the ruler and the citizen in the medieval reception of the "Politics."* In: Bejczy IP, Nederman CJ (eds) *Princely virtues in the Middle Ages, 1200–1500*. Brepols, Turnhout, pp 75–100, 2007). After more than two decades as a teacher in the Faculty of Arts, Peter secured a chair at the theological faculty. In the years that followed, his teaching duties led to the production of six *Quodlibeta*, which also found a wide audience.

Peter of Auvergne

Christoph Flüeler

Historische Hilfswissenschaften und Mittellatein,
Universität de Fribourg, Fribourg, Switzerland

Abstract

Peter of Auvergne was both master of the Faculty of Arts and of the Faculty of Theology at the University of Paris in the last three decades of the thirteenth century. He is one of the major promoters of medieval Aristotelianism and the most productive commentator from the Faculty of Arts at that time. His substantial body of work consists mainly of Aristotelian commentaries pertaining to nearly all books taught at the Paris Faculty of Arts. His interpretations on natural philosophy and especially his groundbreaking commentary on the *Politics*, shaped later readings of this text. Like all of the Paris scholars of arts in the late thirteenth century,

Biography

Peter of Auvergne (Petrus de Alvernia, less often Peter de Croco) was a master at the Paris Faculty of Arts during the 1270s, 1280s, and 1290s. Although Peter is among the few masters of this period who are known by name, we have practically no biographical information about him (Hocedez 1933). In 1296, he was promoted to *doctor theologiae*, then appointed bishop of Clermont by Pope Boniface VIII on January 21, 1302. He held this office until his death on September 25, 1304. It is possible, though not certain, that this same Petrus de Alvernia was rector of the University of Paris in 1275.

Works

The surviving works of Peter of Auvergne are all directly or indirectly connected with his teaching duties at the University of Paris. What is unusual about the surviving body of his work is the fact

that it includes commentaries on most of Aristotle's works that were in the curriculum of the Faculty of Arts at the time. The breadth and intensity of this engagement with Aristotelian philosophy marks Peter as one of the most influential commentators on Aristotle during the Middle Ages. The commentaries can be formally classified as commentaries in question form and literal commentaries. The literary form of the question commentaries – influenced by the instructional techniques used in the other faculties – is, in the case of Peter as well as of all the other masters, determined by strictly regulated discussion practices used at the university and results from the use of various techniques for recording these disputations. Peter's commentaries in question form are as a rule made up of a list of central questions, presented together with some counterarguments built on Aristotelian assertions, and concluded with an answer. As these *quaestiones*, or question commentary texts, were obviously based on transcripts or notes (with the possible exception of the *quaestiones* about the *Metaphysics*), we can assume that they were composed during the time when Peter taught at the Faculty of Arts. The structure of the literal commentaries is different, in that each one carefully subdivides and structures the content of an Aristotelian work, then provides a sentence by sentence interpretation. Like other commentators of his time, Peter follows the practice of commenting on variant readings in different manuscript copies of the same Aristotelian text. The production and dissemination of Peter's literal commentaries are markedly different from those of his commentaries in question form (again with the possible exception of the questions on the *Metaphysics*). They are obviously not notes taken by a listener, but rather complete written texts, indicating that they could only have come from the period when Peter taught at the theological faculty. This later date of composition is indicated by, among other factors, the method of dissemination, as these and other Aristotelian commentaries by well-known theologians (Albert the Great, Thomas Aquinas, Aegidius Romanus) were copied using the so-called *pecia* system.

On the *Logica vetus*, only commentaries in question form have survived, and the questions on the works in the *Logica nova* ascribed to him are of questionable origin. In addition, a series of *sophismata* address logical questions. These commentaries highlight similarities to some of the modists. His particular interest in posing questions of metaphysics and natural philosophy is apparent not only in the commentaries on Aristotelian natural philosophy and metaphysics, but also in the known works on practical philosophy and the theological *quodlibeta*, which treat such questions in exhaustive detail (e.g., in *Quodlibet IV*, q.8: “*Utrum potentia in materia et forma ad quam est, sint idem secundum rem*”). The two commentaries on the *Politics* may be considered prime examples of practical philosophy. The so far unedited commentary in question form (the most important exemplar of this text is Paris, BnF, lat. 16089) contains a total of 126 questions about the first seven books. It is the oldest surviving commentary on the *Politics* of Aristotle produced at the University of Paris, a work that directly or indirectly influenced all later question commentaries on the *Politics*. This commentary not only advances the necessity of a political philosophy as a subdiscipline of practical philosophy, but also endeavors to establish this separate field of study on the basis of a set of central questions. In order to demonstrate the status of political philosophy as a valid scholarly field, the commentator makes a thorough exploration of concepts from metaphysics and natural philosophy. This commentary was used by, among others, Marsilius of Padua in *Defensor pacis* (Dictio 1, c. 16), who obviously regarded it as an important transmission of political Aristotelianism (Flüeler 1992, I: 120–131). Peter also wrote a literal commentary on the *Politics*, the so-called *Scriptum* as a continuation of a commentary left unfinished by Thomas Aquinas, incorporating Books III–VIII.

As a bachelor of theology, Peter had also read the *Sentences* of Peter Lombard, though only one group of questions on this work has survived in a single manuscript. Chief among the theological works are the six *Quodlibeta*, which he disputed after earning the title of master (1296), continuing

the series year after year during Advent until 1301 (Schabel 2007). There are 108 questions in all (in 19 surviving manuscripts), treating completely different questions, of which the one concerning Peter's understanding of the "*verbum mentis*" was the most often quoted among theologians of the fourteenth century (Cannizzo 1961).

Peter influenced the reception of individual Aristotelian works until early modernity through the broad dissemination of his commentaries. This enduring influence in the fifteenth and sixteenth centuries could be related to the fact that Peter continued two commentaries on Aristotle left incomplete by Thomas Aquinas (*De caelo*, *Politica*) as well as to the fact that his other literal commentaries on Aristotelian natural philosophy (*Meteorologica*, *Parva naturalia*) were often copied, and later even printed, together with the commentaries of Thomas Aquinas.

Peter of Candia

Christopher Schabel
Department of History and Archaeology,
University of Cyprus, Nicosia, Cyprus

Abstract

The Greek Franciscan Peter of Candia (c. 1340–1410) was a towering figure in intellectual and ecclesiastical affairs during the Great Schism. His education and early teaching took him all over Europe until he began lecturing on the *Sentences* at Paris just as the Schism began. Afterward he was active in northern Italy in the service of the future duke of Milan and as a prelate, rising to archbishop of Milan and cardinal. He was also associated with leading humanists and the Palaiologan dynasty. Joining the conciliar movement, he was elected Pope Alexander V at the Council of Pisa in 1409, but he died the following year. His election no doubt helped make his main writing, his questions on the *Sentences*, a best-seller in his day. In this work, Peter provides a history of many of the main philosophical and theological developments of the fourteenth century, presenting with exceptional clarity and in unbiased fashion the views of many leading thinkers from earlier in the 1300s, especially John Duns Scotus, Peter Auriol, William of Ockham, Gregory of Rimini, Thomas Bradwardine, and John of Ripa. He also offered the main criticisms of these views from a variety of perspectives. He did not attempt an original synthesis, but his perceptive observations constitute a useful tool for understanding scholasticism in the fourteenth century.

Peter of Candia, modern Herakleion, was born to Greek parents on Crete c. 1340, during the island's long period of Venetian rule (1211–1669). Peter – a.k.a. Petros/us Ph/Filargis/

o/us, Philaretus, and Cretensis – was orphaned during the Black Death and raised by local Franciscans, who recognized his intelligence. Around 1357, Peter joined the order and embarked on a career reflecting the Franciscan school network, studying at Minorite *studia* in Padua, Norwich, and Oxford, where he attended theological lectures. Peter claimed to have heard the Franciscan William of Cremona lecture on the *Sentences*, which he is said to have done at Paris in 1365–1366, and in Bologna 2 years later, so Peter probably studied at one of those *studia* as well, most likely at Paris. He was then sent to teach in convents in Russia, Bohemia, and Poland. His superiors rewarded him by assigning him to lecture on the *Sentences* at Paris as bachelor of theology, which he did in the 1378–1379 academic year, and not over the 2-year period 1378–1380, as was previously thought. (Colophons stating otherwise must refer to the completion of the edited version in 1380 or 1381.) Peter began with his first *principium* on September 24, 1378, 4 days after the outbreak of the Great Schism. He was licensed at the end of 1381 and incepted as master of theology in early 1382.

By 1384, Peter had moved to Italy, where he helped develop the University of Pavia. There Peter joined Giangaleazzo Visconti's service. Recognized as the most illustrious member of a court that included Baldus de Ubaldis and Manuel Chrysoloras, Peter became deeply involved in humanist circles, associating closely with Umberto Decembrio, Pier Candido Decembrio, and Coluccio Salutati. Peter's principal sermons delivered before his lectures on each book of the *Sentences* already revealed that he was a master Latinist, but he did not forget his Greek. Considering Plato and Aristotle his compatriots, Peter retained links to the Palaiologans in Constantinople and the Morea and translated some of St Jerome into Greek. Thus, he represents an early bridge between the Latin and Greek phases of the Italian Renaissance.

In late 1386, the Roman Pope Urban VI appointed Peter bishop of Piacenza. He was then transferred to Vicenza (early 1388) and Novara

(mid-1389). Still active as Giangaleazzo's ambassador on various missions, Peter obtained for his master the title "Duke of Milan" from Emperor Wenceslas in 1394, and when the see became vacant, Peter was made archbishop of Milan on May 17, 1402. The duke died 4 months later, but Peter continued his professional ascent: in 1405, the Roman Pope Innocent VII named Peter cardinal-priest of the Church of the Twelve Apostles. When the rival popes refused to take steps to end the Great Schism, Peter joined the conciliar movement, giving the sermon to open the Council of Pisa on March 26, 1409. The council deposed Popes Gregory XII and Benedict XIII and, on June 26, elected Peter of Candia pope as Alexander V, the only Greek pope after the eighth century. The election effectively created three popes, although Alexander won the support of most of Catholic Christendom. Unfortunately for Alexander and his legacy, his eventful papacy lasted only 10 months and he died in Bologna on May 3, 1410. Thus, the Schism continued and much later Alexander V was labeled an "anti-pope."

Among Peter of Candia's philosophical writings are the logic treatises *De consequentiis*, published by Maria Bertagna, and *De obligationibus*, edited but not yet published by Stephen F. Brown. Peter also wrote the theological tract *De divinis nominibus*, printed in early modern editions of Francis of Meyronnes' works. Peter's most important work is his questions on the *Sentences* of Peter Lombard, parts of which survive in at least 50 manuscripts, making it one of the two or three most popular examples of the genre in the latter half of the fourteenth century. Editors have privileged Vat. lat. 1081 as allegedly the best manuscript, but it is not without flaws, including omissions *per homoeoteleuton*, and any critical edition should also employ the half dozen or so other good witnesses. Peter's text – principal sermons and questions plus a mere 11 questions (6, 3, 1, and 1 for the four books) divided into 33 articles – would occupy roughly 2,000 pages in a critical edition and is being published online. The work's greatest merit is that it serves as a virtual history of fourteenth-century thought on many issues. For

this reason, Cardinal Ehrle's seminal book on the era, from 1925, takes Peter's questions on the *Sentences* as its focal point. Peter summarizes clearly, succinctly, and in his own words the opinions of the giants from earlier in the century. Of Peter's over 350 explicit citations of 32 university scholastics, only 42 refer to a mere eight thirteenth-century authors, including 17 for Thomas Aquinas and eight for Bonaventure. By contrast, the 24 fourteenth-century theologians cited receive over 300 mentions, with roughly 92 for John Duns Scotus (four for Scotists), 58 for John of Ripa, 54 for William of Ockham (11 for Ockhamists), 34 for Peter Auriol, and 13 for Gregory of Rimini, with fewer for Francis of Meyronnes, Landolfo Caracciolo, Adam Wodeham, Thomas Bradwardine, Richard Brinkley, Francis of Marchia, and many others, including several of Peter's contemporaries.

These numbers underestimate Peter's "historical" tendencies, because whole sections are devoted to expounding the thought of Bradwardine or Auriol, for example, on certain issues, after introducing them only once. Peter was so talented at this that, concerning his portrayal of Auriol's doctrine of divine foreknowledge, in 1470 Peter de Rivo would remark that "Peter of Candia explained his opinion with clearer words" than had Auriol himself. Not only would Peter survey these earlier opinions, but he would usually give a succinct abstract afterward, summarizing his survey by beginning like this: "Therefore this doctor's view, as I see it, consists in the following..." Because of Peter's objectivity, his abstracts are a wonderful tool for understanding fourteenth-century thinkers. The following typical statement is characteristic of his unbiased approach, in this case concerning a position of Auriol: "I don't care whether it's true or not, because right now I am not reciting it to adhere to it, but just to make clearer the truth of what will be said later." Thus, the opening question to Peter's Prologue to the *Sentences* has been aptly called his "Hundred Year 'History' of the Theologian's Role."

Peter of Candia also offers an independent appraisal of earlier scholars' theories, criticizing and approving where he thinks best, often with

a touch of humor. For example: “Thus appears the solution to the arguments of the Subtle Doctor, which in truth include many things that are not proven demonstratively, such as that God understands outside Himself, that He has an infinite intellect, and that He wills, so almost every argument includes something that is believed or only probable.” And elsewhere: “But although these things appear beautifully said, they generate no melody in Ockham’s ears.” Concerning Ockham: “Although one can maintain this position, because it would be hard to disprove it, in truth, if one pays close attention, it does not fish as deeply as the previous two.” In another context: “I once heard this response from Master William of Cremona, when he was lecturing on the *Sentences*, but with all due respect, he did not then have the mind of a doctor.” Peter often speaks “with all due respect,” and sometimes “for the sake of argument.”

It has been suggested that Peter was not a brilliant theologian in the sense of having an original system. Looking back over the long university debates over the previous 180 years and the thousands of treatises produced in that era, perhaps Peter realized the futility of trying to be absolute and yet consistent. In book II, question 3, article 2, when Peter saw that what he was saying on the issue of the univocity of being was contradictory to what he had said before, he quipped: “I upheld this position in my second *principium*, against Master Gerard Calcar, and now I am holding the opposite here – not that I consider one position to be truer than the other, but in order to illustrate several ways of conceiving the problem, for the pleasure of those who sometimes want to eat bread and sometimes cheese.” In book I, question 6, article 2, on divine foreknowledge of future contingents, Peter presents objectively and at length the opinions of Auriol, John of Ripa, and Scotus. He finds them all wanting and offers a rather vague “safer way.” In conclusion, he lists six possible solutions, all with their own problems, and ends by declaring: “I, like a little dog, have started the hare for you. Capture it through whatever path of the aforesaid ways you wish.” In book I, question 1, article 1, on the nature of theology, Peter presents the positions of Auriol and Gregory of Rimini,

respectively, that theology is merely declarative, helping the theologian to better understand what he believes, and that it is instead deductive, taking the truths of Scripture and deducing further truths. Peter of Candia studied these positions and the reactions of other theologians, coming up with his own evaluation. He criticized certain aspects of each side and appreciated their merits, adopting finally a middle course, following Scotus and Ockham, he claimed.

Given the nature of Peter of Candia’s major writing, perhaps it is best to finish in his own words: “But because I have written enough, and visibly, I believe the school has been oppressed enough with listening to me, I will refrain.” Or better, Peter’s last words in his entire work: “I was prepared to make a long discussion of this material, but God wants me to rest from my labors.”

Abstract

Petrus Peregrinus de Maharncuria (Peter of Maricourt, Pierre Peregrin, or Pierre de Maricourt) was a French scientist, the author of a *Letter on the Magnet* (*Epistula de magnete ad Sigerium de Foucaucourt*), a short, systematic treatise on the properties and uses of lodestone (magnetite), and a *New Construction of a Peculiar Astrolabe* (*Nova compositio astrolabii particularis*). *De magnete* includes a reference to an apparently lost treatise *On the Properties of Mirrors* (*De operibus speculorum*, cf. *De magnete* II.2, 353). Due to the precision of his work, Maricourt may be considered one of the earliest scientists in the Latin West.

The only certain information we have concerning Pierre de Maricourt is that he was at the siege of Lucera, perhaps for the army of Charles I of Anjou, where the *Letter on the Magnet* was signed on August 8, 1269 (*De magnete* II.3, 397–8). The rest of our (conjectural) information depends on identifying the author of the *Letter* with a certain “Magister Petrus” mentioned in the works of Roger Bacon (*Opus majus* IV.2: Bridges I.116; *Opus tertium* 11, Brewer 35; 13, Brewer 43ff). However, Maricourt's full name occurs only as an addition in some manuscripts of the *Opus tertium* (Schlund 1911a, pp. 445–449, 455), and even if the identification is true the information is very limited: Bacon states that he was a Picard; from his surname (“Peregrinus”) we may conjecture that he was a crusader (see Schlund 1911a, pp. 453–454); and from the dates we may infer that he probably studied at Paris in the 1250s (cf. Arnold and Potamian 1904: x). The estimated date of the *Nova compositio* (after 1263; cf. Sturlese and Thomson 1995: 113) and Bacon's

Opus majus and *tertium* (written before 1267) is a good argument to identify Pierre de Maricourt with Bacon's "Magister Petrus." In any event, Bacon praises "Magister Petrus," for his emphasis on the use of mathematics and experimentation in physics, as opposed to the dialectical methods and the commentary tradition dominant at Paris. These traits are confirmed in the texts of the *Epistula* and the *Compositio*.

De magnete is his most famous work, the main treatise on magnetism in Europe until William Gilbert's *De magnete* (1600). The letter is divided in two parts: the first one discusses the properties of magnets, and the second proposes the construction of some devices based on these properties. Maricourt calls the parts of lodestones "poles," as a reference to geographical poles (*De magnete* I.4, 73–77), provides a method to determine the poles of the magnet (I.4–5, 90–118), and describes magnetic fields (I.4, 78–89). He states the basic laws of attraction (I.6, 120–143), the magnetization of iron (I.7, 150–161), and the change of polarity by a stronger magnetic field (I.8, 163–177). Based on his observations, Maricourt concluded that the orientation of the magnet depends on the arrangement of the skies (I.10, 260–265).

Maricourt's preamble to the letter describes the qualifications of the natural philosopher. He states that the construction of the instruments is necessary to understand the properties of the magnet (cf. I.1, 32–34), and that implies "to be proficient in manual works" (I.1, 43–44). Moreover, Maricourt appeals to the "evidence of experiment" (I.6, 147), the "truth proved by experience" (I.7, 160–161), and the "experienced truth" (I.9, 220) as support for his conclusions. These features anticipate the approach of scientists beginning in the seventeenth century, so Bacon's praise would be rightly deserved. However, sometimes Maricourt's vocabulary reveals his scholastic training in Aristotle's *Physics*, appealing, for instance, to "agents" and "patients" (cf. I.9, 180–185) and to "natural desires" (cf. I.9, 202) to explain magnetic attraction.

Maricourt's own proficiency as an engineer is reflected in his description of the construction of two compasses (floating and dry) and an alleged

perpetual motion machine, both in the second part of *De magnete*, and in his *Constructio astrolabii particularis*.

Maricourt's compasses are relatively standard, but his perpetual motion machine is peculiarly based on the properties of the magnet: a silver cylinder with iron nails around the borders and a fixed silver rod with a lodestone near the iron nails. The idea is that the lodestone should pull the iron nails upward because of the laws of attraction ruling the magnet. To improve the performance of the device, small beans of silver or brass (to prevent magnetizing them) may run between the nails and the borders of the cylinder, adding speed as the beans pull the capsule downward on the right side and the magnet pulls upward on the left (Fig. 1). Regardless of the feasibility of such a device, it is noticeable that Maricourt's machine appealed to two fundamental interactions of physics: electromagnetism and gravitation.

Peter of Maricourt, Fig. 1 A model of Maricourt's perpetual motion machine. The arrow (blue in the online version of this Encyclopedia) indicates the direction of the movement of the wheel; the lodestone is the egg on the left of the fixed silver rod, pulling upward the iron nails (here as slanted black lines on the borders of the wheel), while the (silver or brass green and red) bullets fall on the right side, allegedly to improve performance. (Reproduced with kind permission from Kleinert 2003, p. 168, 2005, p. 33)

Peter of Maricourt, Fig. 2 A partial view of one plate of Maricourt's astrolabe. (Reproduced with kind permission from Maricourt 1995, p. 126)

Maricourt's astrolabe (Fig. 2) is also "peculiar" on its own: he tried to combine the features of the classical astrolabe in Ptolemy's tradition, mapping the skies above the Tropic of Cancer but requiring a plate for each latitude at which it was used, and the more general astrolabe by al-Zarqālī, projecting the eastern and western

halves of the heavens from the pole to the equator. Maricourt chose to map each half of the northern and southern hemispheres onto a plane through or parallel to the equator, chosen as the limit of projection. In spite of its ingenuity, this device never seemed to be very popular, and the text of the *Nova compositio* survives

only in four manuscripts, without much evidence as to determine the stemma (Sturlese and Thomson 1995, pp. 116–117).

Peter of Spain

Henrik Lagerlund

Department of Philosophy, Stockholm University, Stockholm, Sweden

Abstract

The identity of the author known as Peter of Spain is disputed, but what is clear is that he wrote two works on logic, the famous *Tractatus* or *Summule logicales magistri Petri Hispani* and a *Syncategoremata*. The *Tractatus* was the most influential logic work of the Middle Ages, and it was standard, reading well into the seventeenth century.

Life and Works

There are two works attributed to the author known as Peter of Spain. The first one is the enormously influential *Tractatus* or according to the manuscripts *Summule logicales magistri Petri Hispani*. It is one of the most influential logic works of the Middle Ages and was standard, reading well into the seventeenth century. It was famously commented on by John Buridan in the fourteenth century. The other work is a *Syncategoremata*. In almost all of the manuscripts of this work, it follows the *Tractatus*, and this, together with doctrinal similarities, has led to the assumption that it is by the same author as the *Tractatus*. Other works have traditionally been ascribed to the author of the *Tractatus*, for example, a treatise on the soul and also commentaries on Aristotle's *De anima*, but it seems unlikely that they are by the same author.

There have been many theories as to who Peter of Spain actually was. The most known is that he was Portuguese and became Pope in 1276 under the name John XXI. Another theory is that he was Spanish and a Dominican. A third view, which has been around since the fifteenth century, is that he was Petrus Ferrandi Hispanus (d. between 1254 and 1259). There are other theories as well, but

there is no way to know which one is correct and even whether any of them are correct. Both works mentioned above are from the early part of the thirteenth century, however, and the content is closely related to other logic textbooks of the same time.

The *Tractatus*

The *Tractatus* is divided into 12 treatises; they are:

1. On propositions (or statements)
2. On predicables
3. On categories
4. On syllogisms
5. On topics or loci
6. On supposition
7. On fallacies
8. On relatives
9. On ampliation
10. On appellation
11. On restriction
12. On distribution

The *Tractatus* is a summary of logic covering both the so-called *logica antiquorum* and the *logica modernorum*.

The first treatise is an introduction dealing with the subject matter of dialectics (or logic) and the different kinds of propositions dealt with in logic. He defines dialectics in the following way:

Dialectics is the art that holds the road to the principles of all methods, and therefore dialectics should be first in the acquisition of all the sciences. (I.1, 4–6)

This definition reflects the absolute fundamental aspect of logic for the scholastics. Logic is a tool or an art that, according to scholastics, is presupposed in all science. All study must start with logic.

Dialectics or argumentation presupposes discourse (*sermone*), and discourse presupposes utterance (*vox*), which in turn is sound (*sono*) of a special kind. A sound is either an utterance or not. If it is not an utterance, then it is not of interest

to logic. An utterance is either significative or not. An utterance that is significative is a sound, which represents something, for example, “human being.” A non-significative utterance does not represent anything. A significative utterance is either a name (*nomine*) or a verb (*verbo*). It is a name if it signifies conventionally something without a time, while a verb signifies conventionally (*ad placitum*) something with a time. The difference is simply that since a verb signifies a doing of something, it requires time in which the doing takes place, but a name is atemporal; it does not require time for naming something.

An expression (*oratio*) is a complex significative utterance, that is, it is a sentence such as “The human being is white.” There are also two kinds of expressions, namely, perfect or proper expressions and imperfect or improper expressions. An improper expression is, for example, “white human being.” It is improper since it does not contain both a name and a verb. There are, of course, different kinds of expressions according to the different grammatical modes, such as indicative, imperative, perfect, etc., but only indicative expressions are called proposition, and hence only they are important for logic.

A proposition is hence a perfect or proper expression in the indicative mode, which is either true or false. There are furthermore two kinds of propositions, namely, categorical and hypothetical. The two kinds of propositions also divide into two kinds of logics; one for categorical propositions and the other for hypothetical.

A categorical proposition is a proposition that has a subject and a predicate as its principle parts. In the proposition “A human being runs” (“*homo currit*”), “human being” and “runs” are, respectively, the subject and the predicate. The logical form of this proposition is not “A human being runs,” however, since there is a copula or something binding the subject and predicate (or verb) assumed in between them. The logical form is therefore “A human being is running.”

There are three kinds of hypothetical propositions, namely, conditional, copulative, and disjunctive. A conditional proposition is made up of

categorical propositions conjoined with the words “If . . . then.” A conjunctive proposition conjoins two categorical propositions with “and,” and a disjunctive proposition does the same thing with “or.” It is also common to state the conditions under which these hypothetical propositions are true. A conditional proposition is true, if, given the truth of the antecedent, the consequent is also true. A copulative proposition is true if both conjuncts are true, and a disjunctive proposition is true, if at least one of the disjuncts is true.

After having outlined the different distinctions between various propositions, the *Tractatus* returns to the traditional order, which means that the next part of it deals with the predicables, that is, the topic of Porphyry’s *Isagoge*. The predicables are universals, which means that they are what can be predicated in the most general sense. The division is the traditional one, namely, between genus, *differentia*, species, property (*proprium*), and accident.

The treatment of the theory syllogisms in the fourth treatise of the *Tractatus* is traditional. It does not include a discussion of modal syllogisms. There is no discussion of demonstrative syllogisms in the *Tractatus*.

Peter’s discussion of dialectical arguments in treatise five is also traditional. The treatment of the *loci* (or *topoi*) deals with the same issues as Aristotle dealt with in the *Topics*, but the medieval discussions of the *Topics* had changed quite a lot, however, and it was Boethius that set the subject matter of this part of logic for the Middle Ages. Peter’s discussion of *loci* is hence based on Boethius’ discussion in *De differentiis topicis*.

The properties of terms are part of the so-called *logica modernorum* and are dealt with by Peter in treatises VI, IX, X, XI, and XII, which contain discussion about signification, supposition, copulation, appellation, ampliation, restriction, and distribution. To draw the distinction between signification and supposition, Peter notes that some things are said with construction, such as “A human being runs” or “a white human being,” and things said without construction, such as “animal.” Unconstructed terms have signification, and they signify something in one of the ten categories.

Supposition is defined by Peter as the acceptance of a substantive term for something. Signification is prior to supposition in the sense that signification is what a term has all by itself, while supposition is what a term has in a composition. The division of supposition differs a little bit between the textbook authors, but it is foremost only a difference in terminology.

Supposition is either common or discrete, according to Peter. Common supposition is what common terms such as “human being” have, while discrete supposition is what discrete terms such as “Socrates” and “this human being” have. Common supposition is divided into natural and accidental supposition. The natural supposition of “human being” includes all that is naturally apt to stand for, that is, all humans that have been, are, and will be. Accidental supposition is the supposition of a term such as “human being” has in conjunction with something else such as “a human being exists.” In that case, “human being” stands for presently existing humans.

Accidental supposition is divided into simple and personal supposition. A common term has simple supposition when it stands for a universal, like in “human being is a species.” Personal supposition is the acceptance of a common term for its inferiors. It is divided into determinate and confused supposition. A common term has determinate supposition if it is taken indefinitely or with a particular sign; for example, in “a human being runs” or “Some human being is running.” Confused supposition is the acceptance of a common term for several things by means of a universal sign. In “Every human being is running,” “human being” has confused supposition.

Peter makes a further division of confused supposition. There is confused supposition by the necessity of the mode or sign (*necessitate signi vel modi*) and confused supposition by the necessity of the thing (*necessitate rei*). In “Every human being is an animal,” “human being” is by the necessity of the mode taken confusedly and distributively for all its supposita. Given that all humans have their own essence, the copula “is” is taken by the necessity of the thing for all essences that “human being” supposits for, and therefore, “animal” is taken by the necessity of the thing for

all animality in each human being. By this reasoning, “human being” is said to supposit confusedly, mobilely, and distributively. It supposits confusedly and distributively because it holds for all humans, and it supposits mobilely because descent can be made from it to any of its supposita. “Animal” is said to supposit confusedly and immobilely, since descent is not allowed.

In relation to supposition, Peter also discussed notions such as ampliation, appellation, restriction, and distribution. Ampliation and restriction are a division of personal supposition. Restriction is the narrowing of a common term from a larger to a smaller supposition. In “A white human being is running,” “white” has a narrowing effect on the supposition of “human being.” Ampliation is the opposite, that is, the broadening of the supposition of a common term. In the proposition “A human being can be the Antichrist,” the term “can” extends the supposition of “human being” to future things. Tensed or modal proposition tends to have amplified supposition.

Appellation is related to these two notions. Appellation is the acceptance of a term for an existing thing. It is distinct from signification and supposition, since it only concerns existing things, while signification and supposition are wider than that and include also nonexistence. The appellata of a term are the existing things it stands for. Distribution, which has already been mentioned, is the multiplication of a common term by a universal sign. In “Every human being,” “human being” is distributed for all humans.

The discussion of fallacies is by far the largest part of the *Tractatus*. His discussion begins by a treatment of disputations. A disputation is an activity of one person “syllogizing” with another to reach a conclusion. Peter explains that five things are needed for a disputation: the originator or the opponent, a respondent, a disputed proposition, the act of disputing, and the instruments of the disputation.

There are four kinds of disputations, namely, didactic (doctrinal), dialectical, probative (temptative), and sophistical. The didactic disputation comes to its conclusions from premises peculiar to each discipline and not from what

seems true to the respondent. The instruments of such a disputation are demonstrative syllogisms. A dialectical disputation draws contradictions from probable premises. Its instruments are the dialectical syllogisms. Probative disputations argue from what seems true to the respondent. Sophistical disputations argue from what seems probable but is not. The difference between the last two is that the first disputation from what seems true or probable to what is true, but the latter from what seems true or probable but is not.

There are five kinds of sophistical disputations, which derive from the five goals of such disputations, namely, refutation (*redargutio*), falsity (*falsum*), paradox (*inopinabile*), babbling (*nugatio*), and solecism (*soloecismus*). Refutation is the denying of what was previously granted or granting what was previously denied. Falsity occurs in the case when a proposition does not conform to reality. A paradoxical disputation is when the conclusion is contrary to the opinion of the many or the wise. Babbling is simply the repetition of the same thing, and finally, solecism is a disputation developing a discourse contrary to grammar.

The presentation of logic in the *Tractatus* became standard and all discussions started on the foundation presented there. Buridan chose to base his own view on Peter’s not because he thought it was the best of clearest presentation, but because it was most influential.

The Syncategoremata

Peter’s treatise on syncategorematic words is part of a genre that developed in the early thirteenth century. The term itself comes from Prician, and it is used to capture words that do not have a meaning, or signification, on their own, but only in combination with the so-called categorematic words. Peter’s treatise is divided into ten chapters. They are as follows:

1. On composition
2. On negation
3. On exclusive words
4. On exceptive words

5. On consecutive words
6. On the verbs “begins” and “ceases”
7. On the words “necessary” and “contingent”
8. On conjunction
9. On “how much,” “than,” and “whatever”
10. On answers

Composition is about “is,” and negation is about “not.” With exclusive words, Peter means words such as “only” and “alone.” Exceptive words are “except” and “unless.” Consecutive words are words such as “if” or “if not.” The conjunctive words he discusses are “or,” “and,” “unless,” “in that,” and “that not.”

There are two kinds of compositions, Peter claims, namely, (a) composition of things and (b) composition of modes of signification. He further divides (a) in five kinds. There are compositions of (1) form and matter, (2) accident with a subject, (3) power or faculties with that which they belong to, (4) integral parts with a whole, and (5) a difference with a genus to make a species. There are also two different compositions of modes of signifying. The first composition is a quality with a substance, and the second is an act with a substance. The first composition is signified by a noun, Peter claims. For example, “human” signifies “a thing that has humanity,” and if you break this apart, then there is a thing, which is a substance, and humanity, which is a quality. He is careful to say that there really are only two things, a substance and a quality, but formally, he notes, there are three things, namely, a composition of the two as well. The composition cannot be a real thing though because then there would need to be a composition of the substance with the composition and this would lead to an infinite regress. The second kind of composition is exemplified by a participle. It is interesting how he thinks word kinds can be shown to correspond to real things.

Modal propositions are treated a little differently in the *Syncategoremata* than in the *Tractatus*. The first distinction drawn is between the necessity of mode and the necessity of things. This is a rather uninteresting distinction simply noting that there is a difference between a proposition which explicitly includes a modal term and one which does not although it is necessary. The

example he uses is “Socrates is necessarily running” and “A man is an animal.” The first is a modal proposition with the mode “necessarily” in it, although it is contingently true, and the second is an assertoric or *de inesse* proposition, although it is necessarily true. “Things” is ambiguous he also notes. It can cover intentions such as “genus” and “species,” and it can cover the things that the intentions concern. As we shall see, it is the necessity of things that is important.

The distinctions of contingency Peter presents are standard to the thirteenth century. First of all, contingency is divided into that which can both be the case and not be the case, that is, traditional contingency, and into that which is predicated of both necessity and contingency, that is, traditional possibility. It always generated confusions calling both these contingency, but it was standard in the thirteenth century and ultimately derives from Aristotle.

Contingency in the first sense is also divided into three, namely, contingency that naturally occurs (*contingens natum*), contingency that regards either of two outcomes (*contingens ad utrumlibet*), and contingency that rarely occurs (*contingens in paucioribus*). This notion is based on some kind of statistical view of contingency where the frequency of its occurrence is important for how to classify something as contingent. It is natural that men grow old and gray, and hence although contingent it is close to a necessity. Other things may occur rarely and are hence closer to what is impossible. There is then also a space in between where there is a 50-50 chance of something occurring, and thus it is statistically indeterminate, hence the term “*ad utrumlibet*.”

The notion of the necessity of things is greatly expanded under the question whether necessity and contingency determine the compositions of subject and predicate. Necessity and contingency is found in things, he emphasizes. He writes that “it is because a composition found in a proposition is necessary only because of the necessary relationship between the subject and the predicate, and therefore necessity primarily occurs in the thing that is the subject and the thing that is the predicate and secondarily in the composition.” The necessity expressed here is twofold he notes. It is the necessity of substances and the

necessity of acts. He explicates it by saying that “one sign of necessity is that which signifies necessity as a disposition of a substance, that is, the name (noun) ‘necessary’. In another way a sign of necessity is that which signifies necessity as the disposition of an act, that is, the adverb ‘necessarily’.”

He also develops a different view of ampliation in the *Syncategoremata*. Almost all logicians of the thirteenth century argued that necessity propositions do not amplify their terms, but are only about actually existing things. Peter on the other hand argues that necessity propositions are amplified. This might have had an influence on Buridan.

Peter of Trabibus

Russell L. Friedman

Institute of Philosophy, De Wulf-Mansion Centre for Ancient, Medieval and Renaissance Philosophy, Katholieke Universiteit Leuven, Leuven, Belgium

Abstract

Peter of Trabibus was a Franciscan theologian who worked in the 1290s probably at Santa Croce, the Franciscan convent in Florence. Peter’s thought fits roughly into the post-Bonaventurean Franciscan current that also

includes Matthew of Aquasparta, John Pecham, and Roger Marston, but he is best known as having held views clearly influenced by Peter John Olivi.

Peter of Trabibus was a Franciscan theologian, probably from Italy, and active during the last decade of the thirteenth century. We have from his hand a large commentary on books I, II, and IV Sentences that survive in, respectively, 1, 3, and 2 manuscripts (Huning 1964: 208–213; Friedman [forthcoming](#)); these are clearly “ordinationes,” works carefully revised for publication by the author, and they are quite substantial (in total some 1.2 million words distributed over more than 1300 quaestiones). In addition, very strong arguments can be made for Peter’s having authored several anonymous texts found in one Florentine manuscript, including commentaries on II Sentences (a version earlier than the *ordinatio*) and III Sentences, two sets of *quodlibetal* questions, and a set of disputed questions. These latter works place Peter’s activity in Florence, undoubtedly at the Franciscan convent there, Santa Croce, and they can be rather precisely dated to 1294–1296 (Huning 1964: 213–223; Piron 2006: 409–410, 2008: 80–82). Peter John Olivi, who in the areas studied to date is the single most important (if unacknowledged) influence on Peter of Trabibus’ thought, taught at the same convent in the years 1287–1289, and thus Olivi may have had a personal impact on Peter of Trabibus (Piron 2008: 78, 83–86).

In general, Peter can be counted among a group of Franciscan authors from the later thirteenth century who took many of their doctrinal cues from Bonaventure, while taking Thomas Aquinas as their usual doctrinal target. This group includes such figures as Matthew of Aquasparta, John Pecham, Roger Marston, and Olivi and it has often been characterized with some justification as an “Augustinian” current. While Augustine and numerous Augustinian doctrines do play an enormous role in the thought of these Franciscans, Peter of Trabibus, like the other members of this group, is highly conversant with Aristotle, Avicenna, and Averroes, citing them often and using

their ideas in nuanced ways (Huning 1965: 20–26). In his epistemology, it appears we can trace an evolution in Peter’s thinking concerning divine illumination: from a disputed question in which he accepts the doctrine but is aware of Olivi’s criticisms of it, to his *Ordinatio Sentences* commentary in which under the influence of Olivi’s critique he rejects it (Huning 1964: 216; Piron 2008: 82). In his cognitive theory, Peter takes an explicitly Augustinian line, arguing that the intellect is a purely active power, the object of intellection serves merely as a trigger for the intellect to act; in line with this, Peter denies any distinction between the possible and agent intellect, since the agent intellect just is the intellect insofar as it elicits its act (Longpré 1922: esp. 280–285). Whenever we understand – even in the beatific vision – the intellect produces a “species” (di Noto 1963: 86–87), and by “species” Peter means here nothing other than the intellect’s act, i.e., the concept (Pelster 1938: 397). Peter supports both the plurality of substantial forms and the existence of spiritual matter, saying that one human being is a composite of a body with its own corporeal form and a rational soul, which is itself an aggregate of a number of forms or formal parts all rooted in the same spiritual matter (Huning 1968a). He claims explicitly that while all the powers of the soul are *essentially* united to the body, not all are *formally* united to it (i.e., united to it as its form and actuality), thus making room for a libertarian freedom of the will that Peter maintains is incompatible with a direct, formal union of the will with the body; the essential link between the will and the bodily powers nevertheless sometimes leaves the will unable to exercise its native freedom (Simoncioli 1956: 164–175, esp. 224–226). When discussing the formal parts of the soul as well as the distinction between the divine attributes, Peter uses the notion of a “formal” distinction in a way reminiscent of John Duns Scotus’ later use (Huning 1968b); Peter also has a sophisticated discussion of transcendental unity, which he holds is an objective feature of existing things arising from their form (Houser 1979). In line with his Franciscan contemporaries, Peter rejects the real distinction between essence and existence saying that they differ only

according to a mode of signifying (Pelster 1938: 387–388) and he argues that the world cannot possibly be eternal since that would involve a contradiction (Ledoux 1931). One area in which Peter does not seem to have been appreciably influenced by Peter Olivi is in his attitude toward the Church and the Franciscan order, where Peter of Trabibus is a measured voice in comparison to Olivi's rather radical defense of Franciscan poverty (Huning 1964: 222–223, 1965: 41–43; Piron 2008: 84; Lambertini forthcoming).

How much impact Peter of Trabibus had on later thinkers is still a matter for investigation. In the early years of the fourteenth century, James of Trisanto explicitly acknowledged his use of passages from Peter of Trabibus' *Ordinatio* on II Sentences (Huning 1964: 197, 205–206; Piron 2008: 79). Evidence can also be given of Peter's influence on his obscure contemporary John of Erfurt (Piron 2008: 81–82). More speculatively, Sylvain Piron has argued that Dante may have taken part in Peter's first quodlibetal disputation when the two men overlapped in Florence (Piron 2006: 434–435, 2008). Only more editing and study of Peter's work will allow us to trace in more detail any further impact he may have had.

Petrarch

Andreas Kamp

Institut für Politische Wissenschaft, Universität zu Köln, Cologne, Germany

Abstract

Petrarch made vital contributions to several fields that are intrinsically interconnected. The intellectual center of gravity unifying these topics was his consistent orientation towards Roman antiquity.

He thoroughly and categorically excoriated the dominant Aristotelian scholastic philosophy and theology. He accused the scholastics of verbal ineptitude, scientific irrelevance, practical inefficiency, and a metaphysical and religious misorientation. He countered their approach by developing a radically innovative philosophical program, which was thematically focused on topics concerning man, while formulating as principal goals the restitution of a sophisticated Latin style, the establishment of a practically effective moral philosophy, and a return to simple faith. His models were the great authors of Roman antiquity, including both pagan writers and Church Fathers, first and foremost among them, St. Augustine, followed by Cicero, Seneca, and St. Ambrose.

Petrarch was distinctly dissatisfied with his own times, both with the political state of affairs and with the intellectual status quo. His broad knowledge of classical Roman literature led to an innovative structuring of history. He divided history into antiquity, the long-running “middle” period, and a future age which he hoped was soon to unfold. In its core, he thus anticipated the well-known division still used today by all disciplines working in the field of history: antiquity, the middle ages, and modern times. Petrarch also organized these eras hierarchically. Roman antiquity was the shining paradigm; the middle ages were “dark”; and, if his philosophical and political program was put into action, the future era would shine more brightly than the middle ages, approaching the level of antiquity.

Finally, Petrarch also developed an innovative project concerning the political state of Italy, one intended to guide its future, while also equally inspired by ancient Rome. Petrarch’s two complimentary goals consisted of freeing Italy from foreign rule and establishing a “nationwide” unity.

Biography

Francesco Petrarca, known in English as Petrarch, was born on July 20, 1304 at Arezzo. His father

was a notary and the family, who had been banished from Florence 2 years previously, lived in modest circumstances. In 1312, they moved to Carpentras, a small village in the vicinity of the papal seat at Avignon. Here Petrarch was educated in Latin grammar and rhetoric. He quickly developed a deep love of the Latin “classics,” especially of one author whom he was to favor throughout his life: Cicero.

In 1316, following his father’s wishes, Petrarch began to study law at near-by Montpellier. Immediately after his father’s death in 1326, however, he abandoned his studies without graduating. During this decade wasted on a topic he deeply disliked, Petrarch began writing poems in the Italian vernacular. But most of all he spent his time devouring Latin poetry, philosophy, and historiography – anything he could get his hands on. The works of St. Augustine, which he got to know in 1325 at the latest, left a vital impact on Petrarch’s sense of self and of the world, as can be traced in his *Secretum*, completed in 1353. The influence exerted by Augustine exceeded even that of Cicero.

Having taken minor orders, in 1330 Petrarch entered into the service of the Colonna family in Avignon as chaplain. In the following years Petrarch, who was financially well cared-for, traveled extensively, further developed his Italian poems and started on several large-scale works in Latin. His renown grew constantly. In 1341, he was crowned *poeta laureatus* in Rome. From then on, he was officially recognized as the supreme poet of his day, a distinction he holds even now.

In 1353, Petrarch finally left Provence and returned to Italy. He lived at the court of the Visconti in Milan until 1361, then with the Carrara in Padua, spent some time in Venice and Pavia, again lived with the Carrara, and from 1368 onwards stayed primarily in his country estate in Arquà near Padua. These years were filled with diplomatic missions, traveling at the behest of his patrons, but mostly he was occupied with studying, reading, and writing. Thus, in the seclusion of Arquà, in 1370 he not only wrote the extremely valuable autobiographical sketch *Epistola posteritati* (“Letter to Posterity”) but also his programmatic philosophical work, *De sui ipsius et*

multorum ignorantia ("On His Own Ignorance and That of Many Others").

In the night of July 18, 1374, Petrarch passed away in his country house – according to legend, with his head bent over a book.

Philosophical Program

Petrarch was not a professional philosopher. And yet, he was to influence the further development of the history of philosophy, since in his mature work *De sui ipsius et multorum ignorantia* he presented a revolutionary program. It consists of two complimentary elements. On the one hand, Petrarch broadly and drastically criticized the intellectual status quo, and, on the other hand, he voiced the principles of a radical paradigm change.

Petrarch identified two characteristic features of the status quo: depressingly low standards and an intellectual misorientation caused by the "insane and clamoring hordes of scholastics" (*De ignorantia*, 1114). Since they lacked creativity but had an overwhelming urge to write, they simply used other people's thoughts and transformed them into their own, noisily advertising them as original ideas and overstocking the world with a flood of commentaries on the *Sententiae* ("Sentences") of Peter Lombard or the works of Aristotle (*De ignorantia*, 1112/1114). These professional commentators, who gave themselves the airs of theologians or philosophers, had managed to replace originality with sterile exegesis, attaining control over the "market of opinions." But there was more: their countless treatises were written in execrable Latin, lacking any stylistic artistry whatever (*De ignorantia*, 1032/1034).

Petrarch was especially resentful of the multitude of Aristotelian exegetes, who were active everywhere, but especially dominant in the universities of France and Italy (*De ignorantia*, 1106). They had ludicrously made Aristotle their God, replacing the *lex christiana* ("Christian law") with the *lex aristotelica* ("Aristotelian law") (*De ignorantia*, 1040, 1048)! In their blind enslavement to Aristotle, they had committed

three fundamental mistakes. First, they concentrated on amassing heaps of insights taken from the field of natural philosophy, which were often unproven and often unprovable or even faulty. These insights were completely irrelevant, since they did not even touch on the central questions concerning man's nature, origins, and destination (*De ignorantia*, 1038/1040, 1062, 1066). Second, they offered theoretically unsatisfactory and practically ineffective ramblings on essential topics such as morals or felicity (*De ignorantia*, 1062/1064, 1104/1106). Third, while it would have been best to avoid Aristotle in the field of metaphysics, his followers daringly spread their master's theories, which were profoundly wrong and highly dangerous (*De ignorantia*, 1090/1092, 1098, 1102).

In short, Petrarch scathingly criticized the entire habitus, contents, and verbal presentation of the "scholastic" philosophy and theology which had developed since the mid-twelfth century.

But his overall attack was not only directed at the "scholastics"; it basically aimed at their *spiritus rector* ("guiding spirit"), Aristotle himself. To start with, Petrarch was very critical of his style (*De ignorantia*, 1104). Then, Aristotle was the founder of natural philosophy, the results of which were not only highly questionable but also completely superfluous, as they lacked solutions for the existential problems of mankind (*De ignorantia*, 1038/1040, 1062). Furthermore, Aristotle had also failed in the field of moral philosophy. On the one hand, he had spoken extensively about felicity, although he had an inadequate idea of it since his thoughts were not founded on the Christian faith (*De ignorantia*, 1062/1064). On the other hand, while educating his readers on the nature of virtue, he did not achieve any practical effects since he was unable to inspire either a love of virtue or a hatred of sinful behavior (*De ignorantia*, 1106/1108). That is why he was not, on any account, to be listed among the canon of "true moral philosophers and helpful teachers of virtue" (*De ignorantia*, 1108/1110). But most of all, Aristotelian metaphysics was to be avoided (*De ignorantia*, 1102) since the thesis of the eternity of the world, in particular,

stood in stark opposition to both the truth and the Christian faith (*De ignorantia*, 1092, 1098–1104).

Accordingly, Petrarch's overall judgment was entirely negative: Aristotle had occupied himself extensively with minor matters while misperceiving the decisive truths about both human and divine nature (*De ignorantia*, 1062, 1068, 1102). As such, his philosophy was dangerous and had already led many "into the depths of delusion" (*De ignorantia*, 1066).

Petrarch's revolt against the reigning spirit of his time, which was based on Aristotle and supported by "the scholastics", rested on four leitmotifs: style and rhetoric; moral philosophy; metaphysics; and Christianity. In each of these domains, Petrarch proposed a general change of paradigm.

In the domain of style and rhetoric, Petrarch was an energetic advocate of using Cicero as a model. Since his adolescence Petrarch had admired the eloquence of Cicero, who to him surpassed every other author in this field of whatever origin (*De ignorantia*, 1068, 1082, 1122). This orientation, however, should not lead to losing one's own creative voice; so, while concisely defining his own position as "*Ciceronianus sum*" ("I am a Ciceronian"), Petrarch simultaneously and explicitly warned against slipping into a blind, unreflective *imitatio* ("imitation") of the model (*De ignorantia*, 1122).

In the field of moral philosophy, Petrarch presented luminaries whom he referred to as "ours" (*De ignorantia*, 1106), especially Cicero and Seneca, as well as Horace (*De ignorantia*, 1106). These three were all "true moral philosophers," since they had not only educated the minds of their readers through the force of their words but had also correctly formed their willpower (*voluntas*) by instilling in them a love of virtue and a hatred of sin, which then led to good actions and a virtuous life (*De ignorantia*, 1106–1110); and goodwill was a more dependable basis for moral action than intellect, however well developed it might be (*De ignorantia*, 1110).

In metaphysics, Petrarch wanted Plato to replace Aristotle. Plato, in his view, was the true *princeps philosophiae* ("prince of philosophers"), since among all philosophers he had come closest to truth in matters of religion (*De ignorantia*,

1104, 1112, 1118). On the one hand, his *Timaeus* had presented a theory of divine creation of the world that was compatible with the Christian faith, and, on the other hand, he had developed the theory of ideas (*De ignorantia*, 1092, 1118).

In matters of religion, Petrarch believed in the need for a simple humble faith, the "*fides humilis*" (*De ignorantia*, 1046/1048, 1064/1046). Faith to him constituted the "highest, most certain, and finally also the most felicitous of all sciences" (*De ignorantia*, 1126). It meant following the examples of the Church Fathers St. Jerome, St. Ambrose, and, first and foremost, the "great St. Augustine" (*De ignorantia*, 1064, 1100, 1114, 1124/1126).

But the paramount position of highest religious authority was not the only role that Augustine played for Petrarch. Augustine also functioned as the guiding light in Petrarch's entire spiritual universe. It was on his authority that Plato replaced Aristotle as the new "prince of philosophers" (*De ignorantia*, 1112/1124, 1118); he had successfully rebuffed Aristotle's envious attack on Plato's theory of ideas (*De ignorantia*, 1118); he sanctioned the turn to new models in the field of moral philosophy such as Cicero or Seneca (*De ignorantia*, 1106/1108, 1122); he legitimized raising the status of Cicero to a paradigm of style and rhetoric (*De ignorantia*, 1122); he endorsed the moral philosophical relevance of eloquence (*De ignorantia*, 1108); and, finally, he consolidated Petrarch's conviction that both Plato and Cicero, had they lived later in time, would have been true and proper Christians, which he considered them to be in spirit (*De ignorantia*, 1122/1124).

To sum up, *De ignorantia* presented the following key positions:

1. The wretched Latin of the "scholastics," which entirely lacked style and eloquence, was to be replaced by a return to "classical" Latin as exemplified by Cicero.
2. Natural philosophy, which had been followed with expansive effort by Aristotle and his followers, had produced a wealth of unproven, unprovable, or faulty results and had distracted mankind from the basic essentials. It was, therefore, not only useless but exceedingly

dangerous and should therefore be definitively abandoned.

3. Scholars should concentrate on specifically human issues. To this end, a practically effective moral philosophy was required, sweeping away the dominant intellectualistic Aristotelian approach and replacing it with an orientation based on Roman models such as Cicero and Seneca.
4. In metaphysics, the predominance of the dangerous Aristotelian theories was to be abolished once and for all. It was to be replaced by Platonic philosophy, which was much more in harmony with the Christian faith.
5. In religion, the *Summae* and the innumerable commentaries on the *Sententiae* were to be abandoned. In their place, a simple faith and a return to the thoughts of the eminent Church Fathers, especially St. Augustine, was to be promulgated.
6. Irrespective of whether it concerned matters of style and rhetoric, moral philosophy, metaphysics, or religion, only "classical" authors were to be regarded as worthy models. To counter "scholasticism," based on Aristotle, an entirely new canon of authors was to be promoted. With the exception of Plato, who was introduced in the canon on account of Augustine's praise, this new canon consisted exclusively of Roman authors, whose luminaries were Cicero and, above all, St. Augustine.
7. A certain basic attitude was to be taken in the face of the Roman models. Irrespective of admiration and enthusiasm, one was to be attentive not to drop into sterile imitation. Rather, the goal was to develop a creative appropriation of the "classical" heritage.
8. With pride, Petrarch referred to Roman authors as "ours" and thus created a "national" tradition in the field of intellectual history, paving the way for the construction of a specifically Italian identity.

There were, however, two important aspects of the *studia humanitatis*, that is, the range of disciplines we now refer to as "the humanities," which Petrarch did not mention in *De ignorantia*: history and politics. Yet he did, in fact, make important contributions to both.

Structuring History

A recurring constant in the intellectual biography of Petrarch was his keen interest in history. It is no coincidence that already in the 1320s he had copied the entire text of Livy obtainable at the time. Furthermore, Petrarch himself had been an active historiographer since the 1330s, when he started writing *De viris illustribus* ("On Famous Men").

Petrarch's relevance for historiography was not, however, founded on unveiling some detail about one or the other odd battle, consul, or emperor. It lay in his radical reappraisal and reorganization of history as such.

Since his youth, Petrarch had felt a thorough dislike for his own era ("*ista aetas*") (*Epistola posteritati*, 262). This is why he soon engaged in intensive reading of historians, trying to gain knowledge of another era, that of antiquity ("*vetustas*") (*Epistola posteritati*, 262). Thus, Petrarch established two fundamentally divergent epochs of history: his own and antiquity. The difference between them was one of quality: antiquity, which to Petrarch primarily meant the long period of Roman dominance, was an era of peace, justice, and virtue (*Al popolo romano*, 182), and, as indicated in *De ignorantia*, the age of intellectual greats spanning from Cicero via Seneca through to Ambrose and Augustine. In other words, antiquity was presented as the "good old days." In contrast, his own era, which had already lasted for several centuries and which Petrarch at one point referred to as the middle ("medium") age (*Ad Franciscum priorem Sanctorum Apostolorum de Florentia*, 322), was an epoch of extensive "darkness" ("*tenebrae*") (*Ad Agapitum de Columna*, 29). In order to overcome this darkness, both morally and intellectually, Petrarch mapped out a new direction with his *De ignorantia*. If this new path was adhered to, there was hope of the dawning of a third, more felicitous age ("*felicius aevum*") (*Ad Franciscum priorem*, 322).

Petrarch was thus the first to ever formulate a clear apprehension of the existence of epochs – both in intellectual and in real history. These eras extended over a long time period, encompassing several centuries, and were constituted by a

coherent set of specific characteristics that influenced every sphere of life. Petrarch defined three different eras: antiquity, the ongoing “middle” age, and an era that he hoped would dawn in the near future. Basically, Petrarch thus anticipated the chronological classification of epochs into Antiquity, the Middle Ages, and Modern Age that is still in use today. Petrarch also introduced a definite hierarchy between these three eras: the zenith was the luminous period of antiquity, the nadir his own gloomy “middle” age, with the hope of a third epoch in the future, when, by basing itself on Roman models, humanity would be released from the contemporary darkness and return to a relatively high level. In other words, Petrarch envisioned the course of history neither as permanent degeneration nor as continuing progress, but rather as an up and down journey driven by humanity itself.

Both Petrarch’s high esteem for antiquity and his disparaging of the middle ages as a “dark” era turned out to be extremely influential during the following centuries.

Political Visions

The second vital motif in Petrarch’s dislike for his own era was the political situation of his native land. Italy was politically fragmented. Alongside the kingdoms of Sicily and Naples, which were under Spanish and French rule, the Papal States, the mighty seafaring republics of Venice, Genoa, and Pisa, as well as regional centers of power such as Milan and Florence, there were also dozens of autonomous city states in central and northern Italy. Armed conflicts and skirmishes between the innumerable political organisms were the order of the day. What is more, they were internally rekindled by endless factional controversies, rebellions, expulsions, and forceful attempts at repatriation.

From early on, Petrarch was acquainted with this pitiful reality through the fate of his own family. Accordingly, his diagnosis was as outspoken as it was harsh: “In our times, Italy groans like a slave” (*Sine nomine*, 102). The much-needed remedy was accordingly radical: even in politics,

ancient Rome and its extraordinary greatness were exemplary, since in the Roman world there had been peace and tranquility, and justice and virtue had thrived to the full. This meant that the fragmentary state of Italy had to be overcome and the unity of Italy, which in antiquity had been imposed by Rome, had to be restored. Also, foreign rule must be abolished and the old autonomy regained.

To reach the first goal, Petrarch set his hopes on Charles IV, who in 1347 became King of Bohemia and in 1355 Holy Roman Emperor. Alluding to the example of Julius Caesar, Petrarch beseeched Charles to fulfill his “highest and most holy duty” by uniting Italy in peace and tranquility (*Ad Carolum quartum*, 374/376). Drawing on all his Ciceronian eloquence and a wide repertoire of classical Roman literature (e.g., *Ad Carolum quartum*, 488–500), from 1351 onward Petrarch entreated Charles again and again for an entire decade, but to no avail.

Petrarch could not expect a monarch from the House of Luxemburg to help him realize the second goal, since Charles was merely another foreign prince (“*princeps externus*”) (*Ad Carolum quartum*, 374). A few years previously Petrarch’s hopes had been raised on the occasion of a rebellion organized by Cola di Rienzo, who, in 1347, freed the city of Rome, the “capital of Italy”, from the rule of foreigners coming from “some despicable corner of the world” (*A Cola di Rienzo e al popolo romano*, 76/78, 90). An enthusiastically supporter of Cola, Petrarch was quite confident that this event would set an example and that Italy, which was currently wasting away, would rise up and end its servitude (*A Cola di Rienzo e al popolo romano*, 76, 90). But in the very same year, Cola’s rule collapsed miserably, crushing Petrarch’s hopes along with it.

Petrarch did not manage to make a direct improvement to the political situation in Italy. He was, however, the first to develop the political project of freeing his native land and building national unity, an aim that was only to be realized much later, in the mid-nineteenth century. But his aspirations remained constantly present in the “collective mind” of Italy. It does not come as a surprise, therefore, that Machiavelli’s *Principe*,

proposing the same political program to the sovereign of Florence, Lorenzo di Piero de' Medici, ends with a quotation from Petrarch.

Philip the Chancellor

Rollen Edward Houser
Center for Thomistic Studies, University of
St. Thomas, Houston, TX, USA

Abstract

Philip the Chancellor's *Summa de bono* (1225–1228) was developed around a central controlling analogy. Just as creatures are good in three ways (transcendentally, in their natural species or kinds, and in their perfective acts), so also are human acts morally good in three ways (through “generic goodness,” the goodness of moral species, and meritorious goodness). Philip focused his account of goodness in creatures on the transcendentals and his account of moral goodness on the theological and cardinal virtues.

Biography

Philip the Chancellor (b. 1165–1185, d. December 23, 1236) was a “renaissance” man: poet, preacher, theologian, and ecclesiastical politician. He was made Archdeacon of Noyon in 1202 by

one noble cousin and Chancellor of Notre-Dame de Paris in 1217 by another, and his right to confer the *licentia docendi* placed Philip amidst controversies at the University of Paris. Friend to the friars, under him the Dominicans attained two chairs in theology, the Franciscans one.

Thought

The *Summa* begins with a scriptural conundrum. God found all creation “very good” (*Genesis* 1.31), but when called a “good teacher,” Jesus replied: “Why do you call me good? No one is good but God alone” (*Luke* 18.19). Philip answered with a distinction: goodness “is said commonly of all things” but is also “appropriated” to God; divine goodness is “absolute,” that of creatures “relative.” The *Summa* concentrates on creatures: first on the “good of nature” and secondly on the “good of grace” found in moral actions. Philip began each half of his work with a preface laying down philosophical principles useful for theology.

Transcendentals

The transcendentals (*comunissima*) are taken from “the philosophers,” especially Avicenna, who is unnamed. An individual creature is intelligible at two levels of universality. Its essential features fall within Aristotle's ten categories, but it has even more universal features that stand to its categorical attributes as higher genera stand to species. These are the four transcendentals: “a being (*ens*), one, true, and good.”

Since it is the “first” notion, “a being” cannot be defined using a higher genus. But since the transcendentals are “convertible,” they can be described through each other, and also through their subdivisions. “A being (*ens*)” is divided into substance and accident, but Philip uses a second distinction to explain his metaphysical doctrine of creation. “Every creature differs in this way from the first essence, because in it being (*esse*) and what is (*quod est*) differ.” Here “being” refers to the creature's “essence

(*essentia*)” and “what is” refers to its individuality. The hallmark of the creature is unity achieved through ontological composition.

To describe the other three transcendentals, Philip turned to Aristotle’s description of unity: “the one is undivided in itself and divided off from others.” About truth, Philip recognized Aristotle’s notion of truth in the mind, but he preferred the Avicennian notion of ontological truth. The true is “what has *indivision* of being (*esse*) and that which is (*quod est*).” A creature is true to the extent it realizes its own essence. Philip noted the Aristotelian description of the good as “what is desired by all things” and also the neo-platonic conception that “the good is diffusive or communicative of being,” but moved beyond both: “The primary definition of the good is not given causally, but through a ‘difference’ that consists in a negation.” So the good is “what has indivision of act from potency.” This definition provides the metaphysical foundation for distinguishing goods of “nature” and “grace.” A creature is good primarily through a first act that gives it an actual essence; moral goodness is achieved through a second act – human action.

The Good of Nature

Creatures are divided into three kinds of goods. First is “the intellectual creature” or angel. An angel is “intellectual” by having a “simple essence” devoid of matter and is a “creature” having been composed from two metaphysical principles “being and what is,” or essence and the individuality of a spiritual person.

Second come the inanimate things, plants, and animals recounted in the *Genesis* creation story, “the good which is a corporeal creature.” They are composed in several ways: substance and accident, substantial form and matter, substance whose form is a soul.

Finally, Philip turns to “the human,” who is a “conjunction of corporeal and incorporeal substance” or “body and soul.” The soul “perfects the body,” but Philip’s three definitions of the human soul all emphasize it as “an intellectual spirit ordained... to beatitude” (Seneca). As both perfection of the body and intellectual spirit,

the soul is itself composed substantially, not of form and matter but of essence and individuality, “in the manner of an intelligence.” The multiplicity of psychic powers – vegetative, sensory, and the trinity of concupiscible, irascible, and rational powers – then bring the spiritual soul close to the body.

Moral Goodness

The moral half of the *Summa* begins with three senses of moral goodness: “a certain action is called ‘good generically (*bona genere*),’ for example, feeding the hungry; it is also called ‘good from its circumstances,’ for example, giving to this indigent as much as suffices for him or to the extent that he is poor; and finally it is called good from the infusion of grace and from having the required intention.” Since actual grace produces the highest sort of virtue, the study of human morality becomes the study of virtue.

Theological Virtues

Love is the basis for distinguishing generic and specific theological virtues. “Charity is called *general* love, which is not some determinate virtue, but is the reason and cause of each virtue.” And “*specific charity* is different from *general charity*, because specific love has the same thing for its matter and for its end, since it loves the highest good for its own sake.” General charity has God as its end, but not as its object or matter. Specific charity has God for both. The other two theological virtues have God as their end, but not as their “matter.” God as “first truth” is the “matter” of faith, while hope has the “certain expectation of future glory” as its matter. Though all three theological virtues lead to eternal life, “merit absolutely pertains to charity, to the other virtues only relatively.”

Cardinal Virtues

The cardinal virtues also “can be taken in two ways.” “For the existence of virtue four things

are required: to know, to will, to persevere amid difficulties, and to attain the mean between excess and deficiency.” These general or “universal conditions” of all virtue respectively “come from” prudence, justice, courage, and temperance. It follows that for the cardinal virtues, considered generically, “whoever has one virtue has all.”

Taken in a second way, however, a cardinal virtue is considered “according to the act of its proper *power* and concerning the proper *matter* of that power.” For the specific cardinal virtues, “it is *not* necessary that when one has one virtue one has all.” Courage resides in the soul’s irascible power; its object is “the difficult in the realm of exterior passions impressed by another,” such as fear and confidence. Temperance resides in the concupiscible power; its objects are “passions generated within us,” such as desire and aversion, and especially “desire of corporeal pleasures.” Both prudence and justice reside in the power of reason. Their objects, while different, range wider than those of courage and temperance. Prudence “does not have its own proper and limited matter” because it is concerned with the objects of all the virtues. And the object of justice is also wide: “to order all these (moral acts) to our proximate end.”

Since the cardinal virtues are “universal conditions,” there are “other virtues *reduced* to these [cardinal] virtues either as parts or as species or as their dispositions.” The parts of courage are patience and perseverance; the parts of temperance are modesty, sobriety, continence, virginity, and the “golden crown” awarded an outstanding Christian life. The parts of justice are “worship” owed to God, “reverence” owed to prelates, and “obedience” owed to both. Prudence has no parts.

The Good of Grace

The third sense of moral goodness comes “from the infusion of grace and from having the required intention” of not just “leading up to our end (*ad finem*)” but “into our end (*in finem*),” God. Virtues in this highest sense add “meriting eternal life” to the content of the theological and cardinal virtues.

In addition to a title, Philip’s *Summa* offered later scholastics the transcendentals and the seven principal virtues, expanded to include

acquired as well as infused cardinal virtues, a patrimony they would embrace.

Philoponus, Arabic

Elias Giannakis

Department of History and Archaeology,
University of Ioannina, Ioannina, Greece

Abstract

Yahyā al-Naḥwī, that is, John the Grammarian, is the Arabic name for John Philoponus (c. CE 490–575) in the medieval Arabic literature. His image in the Arabic sources, though embellished with legendary details, is not far from reality. He was a pupil of the Neoplatonist Ammonius in Alexandria of Egypt and a commentator of Aristotle and Galen. He wrote independent philosophical treatises against Proclus and Aristotle. Being a Christian, he

also wrote theological treatises in which he expounded his views about the Trinity and his anti-Chalcedonian tenets in the disputes of his age. Above all, he became famous for his arguments against the eternity of the world, which formed the basis of argumentation not only in the Syro-Arabic Christian theology but also in Arabic-Islamic (al-Ġazālī) and Arabic-Jewish theology on the creation of the world (Maimonides).

Sources

The main sources about Philoponus' life and writings in the medieval Arab world are three bio-bibliographical works: First, the *Fihrist* of Ibn al-Nadīm (d. 995) written in CE 987; second, the *History of Wise Men* of Ibn al-Qifṭī (d. CE 1248), who quotes Ibn al-Nadīm but with further additions and embellishments; and third, a collection of biographies of a number of physicians and authors of medical writings composed by Ibn Abī Uṣaybi'a (d. CE 1270). Some further references to Philoponus are also found in Ḥaḥīr al-Dīn al-Bayhaqī (d. CE 1170), while minor ones occur here and there in various other works.

Life

According to Ibn al-Nadīm, Yaḥyā al-Naḥwī lived in Alexandria of Egypt in the first half of the seventh century. He supports this incorrect claim by an observation he makes on the basis of a statement in John Philoponus' commentary on Aristotle's *Physics*, saying: "like this year of ours, which is the three hundred and forty third Coptic year of Diocletian" (Ibn al-Nadīm, *K. al-Fihrist*, vol. 1, p. 255). This date suggests that he was writing in CE 627. But this mistake is already found in some Greek manuscripts. Based on this date, Ibn al-Nadīm adds that Yaḥyā al-Naḥwī lived in the time of 'Amr ibn al-ʿĀṣ, the commander of the Arab armies, who invaded and conquered Egypt from CE 639 onward. He also

says that the two men met and 'Amr ibn al-ʿĀṣ held him in high esteem. Ibn al-Qifṭī adds that 'Amr ibn al-ʿĀṣ heard with admiration Yaḥyā al-Naḥwī's arguments against the Trinity and the eternity of the world. Further, Ibn al-Qifṭī alone presents a legendary story in the form of a dialogue between Yaḥyā al-Naḥwī and 'Amr ibn al-ʿĀṣ regarding the books in the Ptolemaic Library in Alexandria and the burning of them at the command of the Caliph 'Umar (r. 634–644). Again, Ibn al-Qifṭī and Ibn Abī Uṣaybi'a (both quoting 'Ubayd Allāh b. Jibrīl), cite a curious story that Yaḥyā al-Naḥwī in his youth was a ferryman carrying to the "House of Sciences" the eminent men who taught there. By their contact, he became eager for acquiring knowledge, so he sold his boat and began his studies with patience and perseverance. Quoting Abū Sulaymān al-Sijistānī (d. c. 1001), Ibn Abī Uṣaybi'a states that Yaḥyā al-Naḥwī was competent in grammar, logic, and philosophy. He also adds that he was a pupil of Ammonius who in turn was a pupil of Proclus and that he was a Christian of the Alexandrian Church. Ibn al-Nadīm says that Yaḥyā al-Naḥwī was a pupil of Severus and a Jacobite Christian. He also incorrectly claims that Yaḥyā al-Naḥwī was a bishop in Egypt (in Alexandria, according to Ibn al-Qifṭī), but later deposed, because he insisted in professing tritheism; but when 'Amr ibn al-ʿĀṣ met Yaḥyā al-Naḥwī, he "honored him and found a position for him." Citing some Christian chronicles, Ibn Abī Uṣaybi'a offers another story involving Philoponus' refutation of Eutyches' teachings in the Christological disputes in the Council of Chalcedon.

Works

Our three bio-bibliographers list a number of Arabic translations of works attributed to Yaḥyā al-Naḥwī. First, they list Arabic translations of commentaries on Aristotle's *Categories*, *De interpretatione*, *Prior Analytics* (partial), *Posterior Analytics*, *Topics*, *Physics*, and *De*

generatione et corruptione. The work entitled *Commentary on Aristotle's "mā bāla,"* as Steinschneider suggested, probably was a commentary on a collection of *Physical questions* beginning with the phrase *mā bāla*. Then, they list Arabic translations of a commentary on Porphyry's *Isagoge* and a commentary on Galen's *De usu partium*. Apart from the commentaries, Arabic translations of the following separate treatises are attributed to him: *Refutation of Proclus on the Eternity of the World*, in 18 books, *Refutation of Aristotle*, in six books, *That the Force of Every Finite Body is Finite*, in one book, *Refutation of Nestorius*, in one book, and two other unidentified works against the doctrines of some other people. Furthermore, a history of medicine and 20 other medical treatises have also been attributed to "Yaḥyā," but Meyerhof has argued against their attribution and authenticity. None of Philoponus' genuine works translated into Arabic survives in full. What has turned up so far are long extracts in a summary form from his *Commentary on Aristotle's Physics*, a summary of his *Book on the Proof for the Temporal Creation of the World*, few quotations from his book *Contra Aristotelem* and from his book *De aeternitate mundi contra Proclum*, and some other reworked extracts from the same work.

Thought and Influence

Philoponus' thought in the Arabic tradition must be examined and assessed on the basis of works that survive in Arabic as well as on the basis of explicit references to his doctrines by Muslim authors. So the extracts from his *Commentary on Aristotle's Physics* that are found in the Leiden codex (written in 1129–1130) of the so-called "Baghdad Physics" contain some of his major points of disagreement with Aristotle, namely: (1) on place as being a three-dimensional extension; (2) on vacuum as logically possible, though it never becomes actual in nature; (3) on the motion of projectiles, which move on account of the force imparted to them by the mover, while

this force exhausts itself in the course of the movement (*impetus* theory); (4) on time, that it has a beginning, since a temporal instant need not bound a preceding as well as a following period; (5) on the impossibility of an actual and traversed infinity, so that Socrates cannot have an infinite number of ancestors. Both Yaḥyā b. 'Adī (d. 974) and Ibn al-Samḥ (d. 1027) object to Philoponus by adding fatuous remarks here and there in the "Baghdad Physics." Next, the arguments against actual infinity were used by Philoponus in order to build his proofs against Aristotle's and Proclus' tenet of the eternity of the world. Similar arguments are found in the surviving summary of the *Book on the Proof for the Temporal Creation of the World*, which, as Pines suggested, may well derive from a lost work of Philoponus, different from the polemical ones against Proclus and Aristotle. This summary work consists of three treatises: In the first treatise, it is argued that the world cannot be eternal, for the Universe, being a corporeal object, contains only finite force. This treatise seems to be identical with the work *That the Force of Every Finite Body is Finite* mentioned by the Arab bio-bibliographers. Again, Ibn Suwār (d. after 1017), probably refers to the same work, since he reports that Philoponus' proof for the creation of the world is based on the finiteness of the force of all bodies. In the second treatise, it is argued that in order to obtain an infinite past time, one has to suppose that the number of individuals was infinite, but the sum of the finite life duration of a finite number of individuals can only be finite. This argument is connected with that of the third treatise, in which it is said that the eternity of the world involves the eternity of mankind. This thesis entails the consequence that Socrates was preceded by an infinite number of ancestors. But this is impossible because of the impossibility of an actual and traversed infinity. Now, although the work *Contra Aristotelem* does not survive in Arabic, some of the arguments are quoted and criticized in a treatise of al-Fārābī (d. 950) against John Philoponus. Al-Fārābī's opposition to Philoponus is followed by Ibn Sīnā (Avicenna) (d. 1037), Ibn Bājja (Avempace) (d. 1139) and

Ibn Rushd (Averroes) (d. 1198). None of them acknowledges any debt to Philoponus, although they follow some of his arguments, especially those relevant to the impetus theory. All of them sided with Aristotle on the issue of the eternity of the world. Again, some of the Christian philosophers of the School of Baghdad opposed Philoponus probably for religious reasons. As Davidson has shown, Philoponus' arguments were the source for medieval Islamic and Jewish proofs for the creation of the world. For example, the Muslim philosopher al-Kindī (d. 870) and the Jewish writer Saadia (d. 942) draw upon Philoponus' arguments without mentioning him by name or quoting him directly. The case is similar with other Muslim writers, as for instance, the Mu'tazilite al-Khayyāṭ (d. 913), the Ash'arite al-Ġazālī (d. 1111), or al-Shahrastānī (d. 1153). As for al-Ġazālī, Bayhaqī in his biographical work on learned men of Islam reports that Ibn Sīnā had claimed that what al-Ġazālī had written in his *Tahāfut al-falāsifa* was a rearrangement of the words of Yaḥyā al-Naḥwī. However, Christian and Muslim writers knew Philoponus' celebrated arguments against the philosophers' tenet of the eternity of the world, as Ibn Suwār and al-Bīrūnī (d. 1050) clearly testify. In the end, the fact remains that Philoponus' influence was profound and his views and arguments were transmitted from the Arabs to the Latin West, as Zimmermann has shown in the case of the impetus theory.

Philosophical Psychology, Byzantine

Jozef Matula

Department of Philosophy, Center for Medieval and Renaissance Philosophy, Palacky University, Olomouc, Czech Republic

Abstract

Byzantine psychology can be characterized as a complex of problems connected with the relation between the soul and the body, divisions of the soul (tripartite division), the immortality of the soul, internal senses (imagination, memory), the theory of pneuma, passions, emotions, dreams, etc. A specific feature of Byzantine psychological thought is the continuity with the ancient theories on the soul, mainly of Aristotle. Some of the sources of Byzantine psychology were Aristotle's *De anima*, Galen's works, late commentaries on the *De anima* (Simplicius, Philoponos, Stephanus), and Patristic texts. The most influential ideas about psychology in early Byzantine period come from Nemesius, Gregory of Nyssa, Gregory of Nazianzus, Maximus the Confessor, and John of Damascus. The Byzantine scholars who were interested in such issues were Michael Psellos, Michael of Ephesus, Nikephoros Blemmydes, Sophonias, Nikephoros Choumnos, Theodore Metochites, Nikephoros Gregoras, Gregory Palamas, George Gemistos Plethon, and Gennadios Scholarios.

Byzantine Psychology

Psychological theories derive from anthropology. The classical Byzantine definition of man springs from the Greek philosophical tradition and is common to theologians, philosophers, and even elementary school textbooks. In general, man is a rational, mortal being, or corporeal essence, endowed with speech and thought, capable of reason and knowledge (Michael Psellos, Nikephoros

Blemmydes). Man, a being that unites two natures in one person, was already the favorite model for hypostatic union from the sixth century. In this context the soul or spirit of man is contrasted to the body in negative terms (in-corporeal, immortal, incorruptible), and man is perceived as a simultaneous synthesis of opposites: as a being of different essences united ineffably and simultaneously (Anastasios of Sinai), or as a mixture of opposites (Maximus the Confessor). Man is not his soul, but a substantial composite, a hypostatic unity of two independent substances – the soul and the body. The nature of the soul is a self-moving incorporeal substance, therefore immortal and incorruptible (Leontius of Byzance). The human being is a perfect creature between the corporeal and incorporeal worlds, a microcosm (*mikros kosmos*, “little universe”) – man possesses in himself all the elements of the macrocosm (Nemesios of Emesa). He is conceived as the essence “lying on the borders” (*methorion*) between the spiritual and the material, and serves as the mediator of a natural synthesis (Maximos the Confessor Gregory of Nyssa), as “the bond (*syndesmos*) of the entire creation” (Kosmas Indikopleustes). Created by God, man is like the world, “a miniature world within the larger one” (John of Damascus); he is composed of two natures (divine and bestial) and occupies an intermediate place (Gemistos Plethon).

The ideas and notions of man (a single animal, mortal, and immortal, visible and invisible) as a king (*basileus*) of the created world are adopted from the Church Fathers (Gregory of Nazianzus, Makarios of Egypt). The concept of man as animal derives from ancient Greek philosophy and early Patristic thought, where a rational animal (*zoon logikon*) is a standard definition of man (Athanasios, Nemesios of Emesa). While some Christian writers seem to have conceived of the human person as a simple dichotomy of body and soul, threefold definition of man is characteristic of Byzantine patristic, monastic, and philosophical literature. This arrangement is found in ancient Platonism and Neoplatonism, as well as in the Biblical notions of man, which refer to body, soul, and spirit (Epistles of Saint Paul).

The Byzantine thinkers were concerned with psychological phenomena such as dreams, passions, emotions, humoral imbalances, mental disorders as melancholy, mania, and epilepsy. The Byzantine physicians followed the Hippocratic tradition and, in particular, Galen in attributing mental disorder to humoral imbalance. The humoral account was often supplemented by another tradition in which different disorders were often linked to different areas of the brain. The mental disorders were often associated with disturbances of function in one or more of the cerebral ventricles. The central issue of Byzantine psychology is characterized by the attempt to ascribe a certain set of mental powers or “faculties” to defined localizations within the brain and particularly its ventricles. Brain functions were carried out in the cerebral ventricles by the psychic pneuma, or animal spirit endowed with the power to perform sensitive and mental activities. Although opinions differed as to which specific function belonged to each of the ventricles, the idea of ventricular localization was accepted until the end of Byzantium. The internal senses were assumed to be located in the ventricles of the brain. These ventricles were supposed to be sense organs performing functions such as remembering or imagining. The theory was created by assigning the various perceptual and cognitive faculties identified by Aristotle in his *De anima* to the spirit-filled cerebral ventricles described by Galen in his discussion of the anatomy of the brain. The description of processes of the inner sense (especially, *phantasia*) was important for the explanation of the various psychological phenomena connected with dreams, visions, or demonology.

Writings

A vivid interest in the problems of the soul is demonstrated in the writings of Byzantine philosophers such as Michael Psellos, Nikephoros Blemmydes, Sophonias, Michael of Ephesus, Nikephoros Choumnos, and Gennadios Scholarios. A large number of short treatises discussing particular philosophical issues on the

unity of the soul and the body, and the faculties of the soul appear in Byzantine thought. There were also various texts in which psychological issues were dealt with – such as theological treatises on the soul (Nicetas Stethatos) or medical works (Symeon Seth).

Most Byzantine philosophers wrote compendia, paraphrases, and commentaries on the classical authors, and Byzantine thought was influenced by the rigorous revival of the interest in commentaries on Aristotle from the earlier period (sixth century). Especially Philoponos' commentary was extremely influential in Byzantium and most Byzantine thinkers adapted his commentary on the *De anima* to their anthropological treatises (Michael Psellos, the work *Doxai peri psyches* falsely attributed to Michael Psellos, John Italos, Nikephoros Blemmydes, Sophonias, Theodoros Metochites, and Gennadios Scholarios). Philoponos held that Aristotle agreed with Plato about the three kinds of soul – the vegetative soul, which is inseparable from the body, the irrational soul which is separable from the body but inseparable from the pneuma, and the rational soul which is the substance which transcends all body (separable and immortal).

Authors like Gennadios Scholarios relied not only on the ancient philosophers but also on Latin philosophers (Albert the Great, Thomas Aquinas).

Ancient and Patristic Sources

Byzantine psychology represents a fusion of Galenic physiology and anatomy with Aristotelian psychology. In Byzantine anthropologies we find various concepts deriving from Ancient Greek philosophy and medicine side by side with significant commentators of Aristotle and the anthropological concepts of the Church Fathers. In general, the most important source was Aristotle, whose psychological thinking is contained principally in his work *De anima*, although some specific aspects of psychology, relating to sensation (*De sensu*), memory (*De memoria et reminiscentia*), and sleeping and dreaming (*De somno*, commented by Theodore Metochites) are contained in *Parva naturalia* (commentaries by Michael of Ephesus,

Sophonias). For instance, in the thirteenth and fourteenth centuries, Sophonias' paraphrase of Aristotle's *De anima* or Nikephoros Blemmydes' *De anima* draws on John Philoponos' lost commentary on book 3 of the *De anima*. Later Gennadios claimed that even Thomas Aquinas' commentary on Aristotle's *De anima* was dependent on Philoponos.

An important figure in terms of psychology in Byzantium is Galen, especially his adaptations of the Hippocratic four humors, his use of Plato, Aristotle, and the Stoics in creating an all encompassing medical theory. He was a significant source for the learned Byzantine physicians and philosophers. By the thirteenth and fourteenth centuries, Galen was regarded by the Byzantines to be the greatest medical authority they inherited from the time of the early Roman Empire. As a proof of that are the Byzantine transcriptions of Galen's works which survive in large numbers. Galen adopted Aristotle's basic threefold classification of the internal senses (imagination, cognition, and memory) and he specified the localization of these faculties in the anterior, middle, and posterior ventricles of the brain. The head was the centre of psychic life, and mental faculties were localized in the ventricles of the brain. The Byzantines accepted the Galenic notion of the brain as the organ responsible for the conversion of vital into animal spirits. The so-called cell doctrine remained almost unaltered during the whole of Byzantine thought.

A more coherent account of the soul is presented in the work *On Human Nature* by Nemesius of Emesa; it is a systematic attempt to harmonize medical philosophy and Christian anthropology. This treatise is a distillation of classical learning and attracted the attention of Early Byzantine thinkers (Maximus the Confessor, John of Damascus); through them it influenced later Byzantine thinkers such as Meletios the Monk, whose synopsis of Christian and pagan ideas on the human constitution is composed almost entirely of excerpts from earlier authors. Through the works of Nemesius of Emesa and John of Damascus, Byzantine authors were also acquainted with a classification of emotions (pleasure, distress, fear, and anger).

The Relation of Body and Soul

Most Byzantines accepted the Aristotelian view which defines man as a composite of body and soul. Thinkers mostly influenced by Aristotle accepted the definition of soul as the vital principle and energy that gives existence and form to body. The soul is the primary principle of nourishment, sensation, movement, and understanding. Aristotle's definition of the soul as "the actuality of a natural body which potentially has life" presented a formidable challenge to Byzantine thinkers (Nikephoros Blemmydes, Gennadios Scholarios).

The soul is the vital life principle. Some early Byzantines perceived the soul in physical terms, as breath (Didymos the Blind) or blood (this notion was criticized by Nemesios), but later Gregory of Nyssa insisted on a purely intellectual definition of it as *ousia noera* (intelligent substance of the rational soul). The soul unceasingly kindles the body to life, and suitably endows it with life and is defined as everlasting, ever-living, immortal, and eternal. The soul was considered as a guide for the body, giving it life and movement and causing its growth. The soul is not harmony, temperament, or any other quality, but it is an incorporeal being that is immortal but usually united with the body (Nemesius of Emesa). The soul is divided into three parts, the rational (*to noeron*), the spirited (*to thymikon*), and the appetitive (*to epithymetikon*). This terminology proves the Neoplatonic influence. Despite the apparent affinities between the Christian and the Neoplatonic tradition, however, important differences were continuously stressed by Byzantine thinkers. In general, late Byzantine philosophers rejected Neoplatonic theories on the preexistence of the soul. Some systematic criticism of Proclus' (Anonymous (eleventh century), Nicholas of Methone) or Plotinus' concept of the soul appeared (Nikephoros Choumnos). The soul and the body are created simultaneously and their coexistence is definite from the embryo (Gregory of Nyssa, Arethas, Nikephoros Choumnos). The soul cannot exist before its body, nor does it in ecstasy depart from its own nature into the nature of God. The soul does not have the attributes of

the sperm or of the father of the rational being but of God, because it is produced by God and entered in the creature (Arethas). After death the soul retains its identity and is linked to its former body, which it recovers at the future resurrection (John of Damascus, Nikephoros Blemmydes).

Although the soul is united with the body, it is itself immaterial and does not consist of any of the four material elements (earth, water, air, fire) or a combination of them. Unlike the soul, the body is construed as three-dimensional, visible, and corruptible (mortal). It consists of the four elements and has four humors (black bile, phlegm, blood, yellow bile). The Byzantines rejected the image of the body as the cage or prison of the soul (Plato, Stoics) or as the embodiment of evil (dualistic heresies, Manicheism).

The body, created by God himself, was conceived of as ethically neutral, an instrument through which the soul could sin. The soul is moved by free choice, it acts by means of the body, whereas the body is changeable by nature and it does not have its own motion. Byzantine thinkers were concerned to retain an important place for free will in their psychologies and to deny deterministic accounts of behavior (contra-astrology). But there were attempts at a reconciliation between the belief in astral influence over the natural world and the Christian doctrines of divine providence and human free will (Nikephoros Gregoras). However, some thinkers, being influenced by Neoplatonism, insisted that the astral bodies were vehicles to transfer false images, fantasies, and hallucinations, and to deceive man in which phantasia played an important role (Michael Psellos).

Immortality of the Soul

Late Byzantine philosophical writings show the difficulties of the interpretation of Aristotle's account of the soul, whether he thinks that the soul is immortal or not (Theodore Metochites). Some Early Byzantine authors claimed that Aristotle believed the soul to be mortal, and they condemned him for it (Ps.-Justin Martyr, Gregory of Nyssa). Some other thinkers claimed that

Aristotle defined the soul as immortal and assigned to it an incorporeal mode of being (Michael of Ephesus). Through the interpretative tradition of the Neoplatonic commentators (Philoponus and Ps.-Simplicius) the Byzantine thinkers defended Aristotle's position that the rational soul alone is immortal (John Italos, Sophonias). They referred to Aristotle's texts (*De anima*, *Physics* 7–8) in which he considers the intellect as functioning separately and possessing an activity which does not require the body. Aristotle's comparison of the intellect in the body to the pilot of a ship was used to show that he thought the rational soul was separable and immortal (Nikephoros Blemmydes, Theodore Metochites).

Throughout the long era of Christian Byzantium, as with other branches of knowledge, Byzantine psychology shows the vitality of ancient Greek philosophy. Apart from continuity with the ancient Greek philosophical tradition and Greek Patristic sources, Byzantine psychology is characterized by an absence of Arabic philosophical-medical tradition (Avicenna, Averroes). Moreover, the relationship between the Byzantine and Latin West is of interest in connection with philosophical approaches to Aristotle's philosophy. The existence of numerous translations of Latin works (mostly by Thomas Aquinas) in Byzantium opened more gates to western scholasticism (Gennadios Scholarios). The discussion between Platonic and Aristotelian accounts of the soul continued in the background of the dispute between Gemistos Plethon and Gennadios Scholarios, and the debate continued after the fall of Constantinople 1453 mainly in Italy (Bessarion, Theodore Gazes, John Argyropoulos, George Trapezountios).

Philosophical Psychology, Jewish Tradition

James T. Robinson

The Divinity School, University of Chicago,
Chicago, IL, USA

Abstract

During the Middle Ages (especially c. 900–1500) the Jews developed a rich and varied tradition of philosophical psychology, ranging from the stoically-inspired theories of Saadia Gaon to the Neoplatonism of Isaac Israeli, from the Aristotelianism of Maimonides and Gersonides to the anti-Aristotelianism of their sharpest critic, Hasdai Crescas. Jews made original contributions to the technical discussion of the soul, in discursive treatises and commentaries on philosophical texts. They also discussed the soul in traditional texts and genres – commentaries on Bible and rabbinic literature, sermons, and liturgical poetry – thus introducing “foreign” ideas into the very heart of classical Judaism.

This brief survey of Jewish psychological writings during the Middle Ages will focus on major figures and systematic works of philosophy and theology; it will make only occasional reference to the exegetical, homiletical, and liturgical material. The major developments will be presented chronologically, beginning with Judaeo-Arabic writings from the Islamic world, then turning to Hebrew texts from Christian Europe.

Saadia Gaon (882–942)

One of the first rabbinic Jews to write systematically about the soul, or about any other philosophical-theological subject, was Saadia Gaon, rabbinic leader and controversialist in Iraq during the early tenth century. Saadia discusses the soul in his biblical commentaries and commentary on *Sefer Yetsirah*. The fullest discussion,

however, is found in his theological summa *The Book of Beliefs and Opinions*.

In Book 6 of *The Book of Beliefs and Opinions* Saadia surveys and rejects six definitions of the soul – as accident, air, fire, a duality (soul and spirit), two kinds of air, and the blood – before presenting his own view: that the soul is a luminous substance akin to, but even finer than the substance of the celestial spheres. It has its seat in the heart, works in the body through the veins and nerves, and possesses in general three faculties, which he associates with three biblical terms: *nefesh* refers to the appetitive faculty of the soul; *ruah* to the irascible or passionate; and *neshamah* to the rational. The soul, he maintains, is created in the heart when the body is fully formed, lives with the body a fixed duration of time, then separates after death, remaining apart till body and soul are reunited during the time of resurrection. Only then is the single composite existence that is human being – body and soul together – judged and given reward or punishment.

Already in Book 6 Saadia shows his primary concern to be not with abstract theories of the soul per se but with divine reward and punishment. In Books 7 through 9 this becomes the primary focus, as he presents a detailed explication of his eschatological theories. In general these sections draw much more from biblical texts than rational inquiry. Nevertheless, some philosophical and theological ideas are worthy of note. For example, his discussion of resurrection confronts a basic problem of individuation found already in earlier Christian theology: What body exactly is reconstituted and in what state? Old or young? Sick or healthy? The problem also of how flesh is reconstituted when combined with other things is raised. Thus to cite one famous example: A man is eaten by a lion, the lion drowns and is eaten by a fish, the fish is caught and consumed by a fisherman, who is subsequently burned to ashes. How can the flesh of the original man be reconstituted once digested and incorporated physiologically into another being?

These types of paradoxes are characteristic of Saadia's treatment of resurrection and redemption. Although they are not directly related to

psychology, they are worthy of consideration in the history of the problem of individuation.

Isaac Israeli (c. 855–955)

Saadia was not the only Jew engaged in philosophy during the late ninth and early tenth century. He was rivaled by his near contemporary Isaac Israeli – philosopher and physician in Kairouan – who produced a very different literary corpus with strong ties not to Stoicism and Muʿtazilite *kalām* but to Neoplatonism. Each of Israeli's surviving philosophical works includes discussions of the soul; a brief discussion of them will be given here.

Israeli's *Book of Definitions* is Neoplatonic in form as well as content. Following the Alexandrian school tradition (and more directly its Arabic epigone al-Kindī), it presents a list of some 57 philosophical terms which are organized not alphabetically but conceptually. Following the definitions and descriptions of “philosophy” itself, he presents terms from above to below, according to their place within the cosmos: wisdom, intellect, soul, celestial sphere, sublunar, and celestial body.

The definitions given by Israeli are strongly metaphysical and generally fit into standard Neoplatonic emanationist cosmologies. Intellect is the first emanation or hypostasis, the specificity of all things and genus of genera; it knows itself and through knowing itself knows all other things; it is, however, of three types or stages: actual intellect; potential intellect; and a “second intellect” – which refers to the process of acquiring possible knowledge through sensation and experience, which can then be transformed into actual knowledge. Soul is second to intellect; it is a substance that perfects the body that possesses life potentially (according to Aristotle), or a substance connected with the celestial body (according to Plato).

After harmonizing these two views (following the standard Neoplatonic practice of harmonizing Plato and Aristotle), Israeli provides more detailed information about the different souls or types of soul, set in emanative order: The rational emanates from the intellect; it is highest in rank, is

responsible for learning and knowledge in both the theoretical and practical spheres; it is because of the rational soul that one can receive reward or punishment. The animal soul is lower than the rational, from whose shadow it emanates; it is possessed by animals, is concerned primarily with sensation and movement, rather than reason and understanding; because animals cannot reason, they are not subject to reward and punishment. The lowest soul is the vegetative, which emanates from the shadow of the animal; it is concerned primarily with desire and governs the functions of nutrition, reproduction, growth, and decay. Contrary to humans and animals, vegetables are not in possession of reason, movement, or sensation.

The emanative scheme presented in *The Book of Definitions* is reproduced, with some variations, in *The Book of Substances*, *The Chapter on the Elements*, and *The Book on Spirit and Soul*. In these treatises Israeli's ideas about soul and spirit are also sometimes explained in light of biblical terms and expressions. It is in his work where I Samuel 25:9 – “The soul of my Lord shall be bound in the bundle of life with the Lord thy God; and the souls of thine enemies, them shall he sling out, as from the hollow of a sling” – emerged as a popular biblical proof-text of both eternal reward and punishment for the soul, and where a Jewish eschatology is first developed out of Neoplatonic ideas and images. Like Saadia, Israeli combines biblical and rabbinic images with philosophy – in this case Neoplatonic philosophy – to create a striking image of the hereafter. For him, the soul is purified through good acts which correspond with reason, and is sullied by bad acts which are governed by the appetites of the animal soul. The pure soul is released into the spiritual realm, whereas the dark turbid soul remains below, caught in the cosmological sphere of fire, revolving eternally in this literal hell-fire.

Moses Maimonides (1138–1204)

In the two centuries following Saadia and Israeli, Jewish thought was largely under the influence of Muʿtazilite *kalām* and Neoplatonism. This is

especially the case in Islamic Spain, where Israeli inspired a long line of Jewish Neoplatonists. In the twelfth century, however, *kalām* and Neoplatonism gave way to Aristotelianism, which would come to dominate Jewish philosophical discussion about the soul for the remainder of the Middle Ages.

The most important and influential of the Jewish Aristotelians was Moses Maimonides, legal scholar, communal leader, physician, and philosopher in Egypt. To be sure, Maimonides does not fit neatly into any school tradition of Aristotelianism, nor did he write systematically on the soul (or any other philosophical subject). Yet his nonsystematic eclectic discourses and his enigmatic judgments did much to stimulate Jewish thought for several centuries to come. A brief description of his most fruitful discussions of the soul will be given here.

Maimonides' early commentary on the Mishnah, like all his writings, was novel in many ways. It is comprehensive, providing explanation of all Mishnaic tractates, including those without Talmudic explication; and it includes three systematic prefaces, two of which relate to the soul. As introduction to tractate *Avot*, a collection of Tannaitic wisdom sayings, Maimonides provides a synthetic primer in Aristotelian ethics, which would become the standard textbook in philosophical ethics used by Jews throughout the later Middle Ages. In the first few chapters, as introduction to the doctrine of the mean, he presents a brief discourse on the soul and its faculties. Borrowing from al-Fārābī's *Select Aphorisms* (sometimes word-for-word), he defends the unity of the soul, the uniqueness of the human soul (which is essentially different than animal and plant souls), and describes the soul's faculties and their functions: nutrition, sensation, appetite, imagination, and reason – both practical and theoretical. By knowing the soul the physician of the soul, that is, the ethicist, can diagnose, treat, and cure the soul's sicknesses, leading it from extreme behavior to the mean and from a life of vice to a life of virtue. Yet the question remains: how does one determine what the mean is? Here Maimonides diverges from al-Fārābī (and Aristotle), identifying knowledge of God as the orienting ethical principle toward which all actions should lead.

The other introduction relating to psychic matters prefaces an earlier chapter of the Mishnah, Chapter. 10 ("Heleq") of *Sanhedrin*. Working off the qualified first sentence of this chapter – all Jews have a share (*heleq*) in the world to come, except . . . – Maimonides presents a survey of different conceptions of the "world to come." He counts five: the garden of Eden and Gehinnom construed as places of corporeal pleasure or pain; the messianic age, governed by an eternal king who rules an elite population of immortal giants; the time of resurrection, when all deserving souls are reconstituted with their bodies and live forever in peace; a this-worldly "world to come," characterized by universal health, wealth, peace, and security; the final view, according to Maimonides, combines all the others: a messianic age, when the dead are resurrected, experience infinite pleasure in the garden of Eden, and live forever in peace and security. Following a brief excursus on education and exegesis, in which the primarily rhetorical and heuristic character of any doctrine of reward is exposed, he presents his own purely spiritualistic view: that knowledge of God is the highest goal and contemplation of God the greatest reward; this alone is true delight; it has no share whatsoever in anything material.

Maimonides' ethics and eschatology are repeated in his comprehensive code of law, the *Mishneh Torah*. In the "*Laws of Ethical Dispositions*" Maimonides presents a complete ethical theory – in Jewish legal context – governed by the principles of Aristotle's doctrine of the mean (although there is constant tension between ethical moderation and intellectual extremism). In the "*Laws of Repentance*" the spiritualistic intellectualistic orientation of the Introduction to Heleq is reproduced in striking form: true love of God results from knowledge of God ("according to the knowledge, will be the love"), as exemplified by the single-minded passion of the lover in Song of Songs, who seeks conjunction with her beloved active intellect, or the rabbinic ideal in *Berakhot*: "In the world to come, there is no eating, drinking, or sexual relations, but rather the righteous sit with their crowns on their heads enjoying the radiance of the divine presence."

The Guide of the Perplexed – Maimonides' philosophical-theological magnum opus – also includes significant material about the soul and intellect, although generally it is difficult to determine what his true opinion might have been on any particular subject. The text itself is framed by the noetic nature of man – created in the (intellectual) image of God (*Guide* 1:1), and directed toward intellectual perfection as his final end (*Guide* 3:54) – and has discussions of soul and intellect throughout. For example, in *Guide* 1:72 and 2:6–7 Maimonides presents a fairly standard Neoplatonized-Aristotelian emanationist cosmology, with the active intellect – the last of the celestial intelligences – construed as the cause of existence and final aim of knowledge. In *Guide* 1:40–42 he lists various definitions – philosophical and nonphilosophical alike – of the equivocal terms “soul,” “spirit,” “life,” and “death.” And in *Guide* 1:68 he presents a summary of the Aristotelian doctrine of the identity of knower and thing known. Many of the traditional theological doctrines in the *Guide* are understood with the help of the theory of the active intellect. Both prophecy and providence are explained as resulting from a divine overflow through the active intellect to individuals with properly prepared intellects.

There are other chapters in the *Guide*, however, which complicate matters, suggesting that cognition, for Maimonides, is far more difficult than it might first appear. In contemporary Maimonidean scholarship these chapters have led to a series of studies and counter-studies, arguing that Maimonides, who seems to place such great emphasis on intellectual perfection, conjunction, and knowledge of God, in fact believed that these designated goals could not possibly be achieved by any human being (except, perhaps, by Moses). Based on remarks about the limitations of the human intellect – incapable of apprehending even the celestial world, let alone God – recent scholars have suggested that Maimonides was a metaphysical critic (akin to Kant) or even a skeptic.

In Maimonides' own time, in contrast, he was accused of exactly the opposite: being far too enamored with the intellectual life. Based mainly

on his commentary on the Mishnah and *Mishneh Torah*, he was charged with denying the religious doctrine of resurrection, and of promoting a purely elitist noetic doctrine of eternal reward, based solely on intellectual accomplishment. In response to these accusations, he wrote his “*Letter on Resurrection*,” an apologetic tract, which might be considered his last philosophical-theological writing. Resurrection, he writes there, is rabbinic dogma, and he accepts it, just as others should; he does not deny it or explain it metaphorically. On the contrary, precisely because it is dogma and cannot be proved rationally it should simply be accepted on faith; and moreover denying it affects belief in other related subjects, such as miracles. Nevertheless, he reaffirms what he stated in earlier works: that the final reward, beyond any other reward, the “world to come” where one reaches true life without death, is incorporeal – made up of “souls without bodies, like angels.”

Levi b. Gershom, Gersonides (1288–1344)

The thirteenth century was largely a time of transition in the history of Judaism, as the centers of Jewish thought moved from the Islamic world to Christian Europe. Dozens of translations of philosophical writings from Arabic to Hebrew, along with Hebrew encyclopedias, summaries, glossaries and other reference works, laid the foundations for the emergence of a tradition of philosophy in Hebrew. Although the thirteenth century produced some creative and original thinkers, it was not till the fourteenth that the hard work of the translators produced a mature philosophical culture. This is represented most fully by Gersonides, generally considered the most original Jewish philosopher in the later Middle Ages.

Among the many subjects that preoccupied Gersonides during his productive career are the soul, the intellect, and the possibility of conjunction with the agent intellect. He discusses these in his commentary on Averroes' *De anima*, in his commentaries on the Bible, and most

systematically in Book 1 of his theological summa, *The Wars of the Lord*. The latter will be our focus here.

Gersonides' discussion of intellect and immortality in the *Wars* is framed by Aristotle's *De anima*, especially the notoriously ambiguous text at 3:5. There Aristotle introduced the notion of a passive (or potential or material) intellect, which can "become all things," and an active intellect, which causes or "makes" all things; the latter is "separate, impassible, unmixed . . . it alone is immortal and eternal." Gersonides does not engage Aristotle directly. For him the study of Aristotle means the study of the commentators (Alexander, Themistius, al-Fārābī, Averroes), who developed different and incompatible interpretations of Aristotle and inconsistent theories of intellect and intellection. Gersonides' aim in the *Wars* is to explain clearly the different views, show their weaknesses, and develop his own position out of and in contradistinction to theirs. His opinion, he claims, will emerge as superior in terms of philosophical argumentation. It will also help support the traditional doctrine of individual immortality – at least in some degree.

The discussion of the different views, leading to his own original hypothesis, can be summarized as follows:

According to Alexander of Aphrodisias (as Gersonides construes his position), the material or potential or human intellect is a disposition in the soul which comes to be with the body; it is the capacity to know, and nothing more. It knows through a process of abstraction: the senses provide material forms to the imagination, and the imagination intelligible forms to the intellect, which can see them with the help of an agent or active intellect – an external celestial incorporeal cause of thinking, which shines light (as it were) on a potentially intelligible substance, in the same way that the sun shines light on a potentially sensible substance. When the intellect is thinking an intelligible, it is actually thinking; when it is thinking an intelligible substance completely separate from matter, it can become one with this separate intelligible and survive eternally through it. The sum total of its thoughts is called acquired intellect; when these acquired thoughts are

separate intelligibles, they survive, having achieved some sort of union with the eternal thoughts the mind is thinking.

Themistius, according to Gersonides, defends a completely contrary – largely Platonizing – reading of Aristotle, a view which Averroes then develops in detail (as Gersonides understands him). According to this view, the material or potential or human intellect is not a disposition that comes to be with the body, but rather a separate substance, which is an incorporeal one, and eternal by nature. It itself possesses universal knowledge; in contrast, it can know individual particular things only through the individual body or soul. As with Alexander, Themistius (as developed by Averroes) considers the agent or active intellect an external cosmic intelligence, but it is identical with the material intellect. In other words, the potential or material or human intellect is an individual instantiation of the universal active intellect. Although the material intellect can acquire particular knowledge with the help of sense and imagination, this knowledge does not perdure. Only the material intellect, with the death of the body, when it returns, as it were, to its original state in the active intellect, survives the destruction of the body.

In Gersonides' opinion all of these views are deficient in some way, and through his criticism of them he develops his own view, which for him answers all the problems of the others. To sum up his criticism, in Gersonides' opinion Alexander can account for particular knowledge – through abstraction – but seems incapable of explaining universal knowledge; for if the material intellect comes to be with the body, it is also subject to destruction (following a basic principle of Aristotelian science), yet universal knowledge, in Alexander's acquired intellect, is eternal. Themistius, for his part, cannot account for particular knowledge, for the only way a separate intellect can know individuals is by mixing with the body, but if it mixes with the body, it is no longer separate. That the material and active intellects are one in essence, different in accident, is given the lengthiest discussion by Gersonides. He focuses on problems of individuation: if the active intellect is really one, then the material intellect in

all humans should be one, but there is a manifest difference between individuals; and if the material intellect, on the other hand, is many, then one would conclude that a single thing is both one and many at the same time.

What then is Gersonides' own view? For him, the material intellect is a disposition or capacity created in the imagination. It is created, but can become eternal – for the principle that nothing that comes to be can become eternal is false (he argues this in Book 5). Here, for the most part, he agrees with Alexander, and rejects the view of Themistius and Averroes. With the active intellect, however, Gersonides begins to break new ground. He agrees that the active intellect is a separate external incorporeal cosmic intelligence, which is a cause of existence and knowledge, but the way he defines it is different. For Gersonides, this active intellect is the cause of all existence in the lower world, insofar as it possesses all forms that prime matter is capable of receiving, and in their myriad relations. And, for the same reason, it is the cause of thought, since in it are all the possible intelligible forms, in all their myriad relations – it provides the grounds, as it were, for all thinking. In this sense the active intellect is – to use Gersonides' terminology – the order, justice, pattern, or “*nomos*” of the sublunar world.

One question remains: If the active intellect is the pattern of the world, can an individual human intellect know it completely and conjoin with it, and what would conjunction mean? For Gersonides, all knowledge comes through experience of the world; all knowledge is scientific or inductive; it is always the result of learning. In his opinion, there is no innate knowledge or illumination from above; even first principles are learned. Therefore any sort of complete cognition or union with the active intellect is impossible; human beings, through rational study, cannot possibly acquire complete understanding of all forms in the world in all their complex relations; they cannot possibly see the world from the perspective of the active intellect. Yet precisely because the active intellect is the pattern of the world, and the world is a reflection of it, the knowledge

gained through empirical study provides some share in or taste of this universal pattern.

It is this combination of ideas, perhaps born of Gersonides' own inclination toward the empirical that led him to a remarkable conclusion: that immortality consists in the little knowledge one acquires through the rational scientific empirical investigation of the world, and this little knowledge is different – and unique – for each individual intellect. In this way does Gersonides – the staunch Aristotelian, the sturdy empiricist – defend the doctrine of an individual immortality.

Hasdai Crescas (c. 1340–1410/1411)

Although Gersonides was critical of his Aristotelian forebears, and often worked hard to undermine their theories, he was nevertheless committed to constructing a positive scientific understanding of the world. Hasdai Crescas, in contrast – chief rabbi of the Jews of Aragon, legal scholar, polemicist, and theologian – mastered Aristotelianism for a different reason: to topple it from within. Through his careful study of the massive corpus of philosophical texts available in Hebrew, he set out, in his *Light of the Lord*, to free Judaism from the doctrines of Aristotle and his Jewish epigones. In particular, he focused his attention on philosophical proofs for the existence, unity, and incorporeality of God (and the Aristotelian principles upon which they were based), philosophical ideas about the origin of the world, divine knowledge of individuals, prophecy as a natural perfection, providence as consequent upon the intellect, and – most important for our purposes – the noetic doctrine of immortality, achieved through conjunction with the active intellect.

The main discussion of intellect and immortality in *Light of the Lord* is found in Book 2, Part 6, where Crescas first presents a summary of the Aristotelian theory of knowledge and conjunction – based mainly on Jewish adaptations – followed by a refutation of it. The ideas of the philosophers, as Crescas understands them, are as

follows: through the acquiring of true knowledge, the human or potential or material intellect can become constituted as an incorporeal substance, called the “acquired intellect,” which will exist forever. This state of existence, this achieving of knowledge, is considered by them the final aim of human existence; and the intellect’s eternal contemplation of universal truths after death is what it means to be truly happy: it brings with it true beatitude and leads to the highest form of pleasure.

How one can achieve this state of intellectual bliss, however, is not entirely clear. For Crescas, there are two different ways of understanding it. First, the view that knowledge of any truth whatsoever will lead to some degree of acquired intellect and some level of immortality. This idea, which Crescas seems to draw from Gersonides, is dependent on the view that intelligible forms in the sublunar world are part of the plan or order or “nomos” in the active intellect, thus to know any part of the plan is to know a part of the active intellect. According to this opinion, the more knowledge one attains the greater one’s pleasure and larger one’s share in eternal bliss. The second view – which Crescas seems to draw from Maimonides – is that the intellect can become constituted as an incorporeal eternal substance only when it contemplates an incorporeal separate intelligence, such as God, the angels, or the active intellect; conjunction requires knowledge of the intelligence itself, not any part or instantiation of it.

The philosophical theory of conjunction – no matter which way it is construed – is, for Crescas, not only incoherent but also dangerous. First, if one achieves some share in immortality simply by knowing any rational truth, then anyone can attain it. Reason and philosophy, moreover, would seem to be superior to revelation and law, for it is through thinking, not through acting and obeying, that final reward is achieved. The second theory is no less problematic – on different grounds. The problem is that, according to Maimonides, knowledge of God (and apparently all incorporeal substances) is possible only through negation, and

negative knowledge, knowing what God, the angels, or the active intellect is not, cannot lead to any positive identification between knower and known. By knowing what is not the active intellect one is not led to any union with the active intellect. If conjunction with the active intellect requires complete and positive knowledge of the active intellect, and knowledge of the active intellect is impossible, then conjunction is impossible. Or, to modify slightly an infamous conclusion attributed to al-Fārābī: immortality of the soul is nothing but an old wives’ tale.

Crescas has another argument as well, which is more creative, and which, in many ways, leads more directly to his own opinion on the subject. If the final aim of human existence, he argues, is knowledge and intellectual cognition, which constitutes the intellect as a separate incorporeal substance, then the final aim of man is to become not-man. That is, the final aim of man as composite of form and matter is to become pure intellect, completely separate from matter. Not only is this incoherent, he concludes, but it is in violation of divine justice, for how can the intellect alone, existing eternally, joyfully contemplating universal truths, receive this reward for what was accomplished by the human being during life, as body and soul.

What then is the final aim of human existence, according to Crescas? And if immortality is possible, and not trivial, what is it and how is it achieved? Here Crescas draws more from Scripture and tradition to present a theory contrary to that of the philosophers. For him the soul is a self-subsisting spiritual substance disposed toward thinking. That is, the soul is not a substrate, which serves and is subordinate to intellect; rather thinking or intellectual cognition is just one of several things that contribute to the happiness of the soul – which is the final perfection. In fact, thinking is itself subordinate to action, to obedience to the law and observance of the commandments, by which love – the highest ideal and truest happiness, is achieved. As the Rabbis say: “Which is better, study or action? Study, because it leads to action.” This is why eternal reward is

achieved even by the minor child who does nothing more than say amen after the communal prayers.

Crescas' critique of the Aristotelian ideas of acquired intellect and conjunction with the active intellect had varying success. It was used, borrowed, modified, and developed by a host of students and followers during the fifteenth century, including Joseph Albo; and it was rejected by others, such as Abraham Shalom, who attempted to defend Maimonides and Gersonides against Crescas' attacks. As in other areas of Crescas' philosophy, perhaps here also it was only in Renaissance and early modern times when his ideas were fully appreciated – for example, in the philosophy of love of Judah Abarbanel or the intellectual love of God of Spinoza.

Philosophical Theology, Byzantine

George Arabatzis

Research Centre on Greek Philosophy, Academy of Athens, Athens, Greece

Abstract

The history of Byzantine philosophical theology balances between doctrinal elaboration and a distinctive mystical tendency. Its study may be either of a theological or of a rationalist approach. The first asserts firmly the special weight of the works of theologians like John of Damascus, Maximus the Confessor, Photios, Gregory Palamas, and others. The second approach focuses on the decisive part that ancient Greek philosophy played in Byzantine theology. Although the history of this latter offers a series of charismatic individuals, the concluding phase of Byzantium presents two ideal-types of philosopher theologians' personalities: Gregory Palamas, who maintained the traditional articulation and hierarchy of the outward (Greek) *Paideia* and the inward (Christian) *Paideia* and George Gemistos Plethon, who transcended this model in favor of Greek philosophy. Mysticism and the relation to the Latin Church are the other main issues that occupied the intellectual activity of the late Byzantine philosophico-theological thought, but the general trends do not succeed to account for all the individual positions of the Byzantine intellectuals who by their theories and activities challenged the purity of the relevant classifications.

Byzantine philosophical theology covers a thousand years of history, a period that corresponds to the evolution of a state that was simultaneously a successor to the Roman Empire, a Christian kingdom and a home for Hellenism. Byzantine theology was shaped through a series of philosophico-theological debates in which the ancient Greek philosophical heritage was at the same time

rejected and presupposed by the intellectuals of the new faith. The struggle against heresies like *monophysitism* created the need for the formulation of dogmas at a time when doctrinal matters were the subject of popular discussion. Following a period of anti-philosophical apologetics, a distinction was inaugurated between inward *paideia* (Christianity) and outward (Greek) *paideia*. The Cappadocian Fathers, Gregory Nazianzus, Gregory of Nyssa, and Basil the Great, together with John Chrysostom (fourth century) became the key figures in the Byzantine synthesis of Greek philosophy and Christianity. Maximus the Confessor (580–662) transmuted the negative theology of Pseudo-Dionysius Areopagita, that was largely based on Neoplatonism, together with the legacy of Origen into a new Christian philosophy; the negative or apophatic theology became the special characteristic of the eastern Christian tradition.

The Iconoclastic crisis, from 730 to 843, that concerned the acceptance or not of the cult of the icons, generated a discussion about the degree of abstraction and representation that could be theologically admitted. John of Damascus (Mansur ibn Sarjun to his real name, c. 665–749), a great personality of Byzantine theology, although living and working beyond the Byzantine borders in Syria defended philosophically the cause of the icons and contributed significantly to the Byzantine philosophical theology with his work *The Source of Knowledge*, a *summa* of theological and philosophical knowledge. When the Iconoclastic crisis was over, the ecclesiastical men felt stronger to assume a humanistic role regarding the Greek letters while the dogmatic argument progressively became less inspired and constantly referring to the classical intellectual syntheses of the Fathers of the Church.

The Schism with the Church of Rome demanded for a large amount of polemical rhetoric and an imposing Patriarch like Photios (c. 820–893), a great humanist himself, is exemplary as to the evolution regarding an ecclesiastical man's use of philosophy. The tenth/eleventh centuries were marked by the powerful mystical writer Symeon the New Theologian; but a little later we witness a strong philosophical fermentation that created a tension between the

philosophers and the Church. The most controversial of them, John Italos, possibly experimented in a new synthesis between reason and faith. The threatening rise of the power of the Ottomans made some men of the state and some intellectuals consider the union with the Latin Church as a solution to the problem, but in the meanwhile the Byzantine Orthodoxy had acquired a national character; the people and the monks were strongly opposed to the idea of a possible union of the two Churches.

In the Hesychast crisis (fourteenth century), it was Gregory Palamas (1296–1359) the defender of the mystical method of the hesychast-quietist monks – named by their contemptuous opponents the “*omphalosopes*/navel gazers” – who triumphed by insisting on the tradition of the orthodox spirituality and mysticism, while using no less of philosophically grounded arguments. Among his adversaries, a Latinophile party led notably by Demetrios Kydones who translated and was influenced by the works of Thomas Aquinas. The last great philosopher of Byzantium, George Gemistos Plethon (c. 1355–1452), a neo-pagan philosopher, believed that the rescue of the state could be achieved, between other things, by the adoption of a state religion inspired by the Hellenic twelve-gods paganism, but this idea found no echo in the Greek nation who could not be regarded as distinguished from Orthodoxy. Only a limited number of Byzantine intellectuals who fled the Turks mainly to Italy were converted to Catholicism. The passage to the West was not so successful for many of them and the reason for this “failure” is likely to be found in the disillusionment of the Greeks with Renaissance humanism; their Byzantine identity found again comfort in the Orthodox spirituality and the Hellenic tradition.

The study of Byzantine theology is a historical science not to be confused with Orthodox theology although the two domains are often intermingling (see Hans-Georg Beck, 7 ff.). Two issues are thus open to the study of the Byzantine philosophical theology: (a) the perception of Byzantine theology as philosophically meaningful, with the most important personalities being theologians like John of Damascus, Maximus the

Confessor, Photios, Gregory Palamas; (b) the categorization of the Byzantine philosophical theology into philosophical problems that were historically dealt within the Greek philosophical tradition. There lies the difference between a theologian's and a historian's of philosophy approach. The first historian of Byzantine philosophy, Basil Tatakis (Tatakis 1969), combined the demands for a value-neutral history of philosophy and a respect for the Orthodox tradition. The example of two distinctive Byzantine theologians can illustrate the difficulties of the above classification: John of Damascus' *The Source of Knowledge* is divided into three parts: *Dialectica* – a Defense of Orthodoxy – a Catalogue of Heresies. The *Dialectica* was influenced by Aristotelian Logic and for that the writer has been regarded as a forerunner of Scholasticism. Although the influence of John of Damascus was great, it did not exhaust all the philosophico-theological possibilities and so Patriarch Photios represents a genuine Byzantine spirit of another type; he was a very distinctive Byzantine, a combination of an Orthodox, a Hellenist, and a philosopher. Yet, the blend was quite different from that of John of Damascus mainly because the part of the Hellenist *littérateur* in him was of greater importance. In a way, the move from John of Damascus to Photios and what followed in the intellectual life is a measure of the evolution of the Byzantine thought. The general process leads from Christian philosophy to the beginnings of Humanism.

There is no doubt that the history of philosophical theology in Byzantium is a history of personalities as well as a history of ideas. In the face of historical challenges, the reactions of the scholars had often a distinctive individualistic character that facilitated the formation of factions. The Byzantine eleventh century is a real turning point that marked not only the beginning of a new cultural development but also the start of a fatal political decline. The final phase of Byzantium offers two ideal-types concerning philosophical theology: Plethon, the Hellenocentric, and Gregory Palamas, the man of the Orthodox tradition. Three problems were central to the Byzantine philosophical theology: (a) First, how much could a Byzantine advance in the study of ancient

philosophy without endangering his Christian faith? As we have seen, a limit was adopted between outward and inward *paideia* that should never get crossed. While, the declarations of distancing oneself from Greek philosophy were numerous, they often meant little as to the acknowledgment of the value of Greek philosophy. The only intellectual that crossed definitely the limit in favor of paganism was Plethon. (b) Another important problem concerned the relation with the Latin Church. Progressively, the Byzantines became conscious of the development of western Scholasticism. The formation of a Latinophile party and the translation of Thomas Aquinas' works testify to this evolution, but the anti-Latin tendency that expressed the convictions of common people was to prevail. (c) The final problem was that of Byzantine mysticism. Any excess of mysticism was always dealt by an unstated but nonetheless real common sense principle.

Even within these distinctions, the categorization of individual cases is not easy and the classification of the various tendencies is extremely difficult. Gregory Palamas' ideas were contested by Barlaam of Calabria, an Orthodox at the start but later a Catholic, by Demetrios Kydones, a later convert to the Latin rite but initially a friend of Palamas' supporter John Kantakuzenos, and also by Nikephoros Gregoras who was equally hostile to Palamas and to Rome. Men interested in Latin theology were otherwise pious Orthodox like Joseph Bryennios. George Gennadios Scholarios, the adversary of Plethon, was an anti-unionist but interested in Scholastic theology. The hellenocentric Plethon was opposed to the Union of the Churches; his pupil Bessarion supported the effort for the Union and later became a cardinal and renown humanist. Yet, the modern use of the word "*hellene*" seems to have its origin in the Orthodox-Hesychast milieu by the theologian Nilus Kabasilas. The various philosophical oppositions were formed more easily because in Byzantium there was traditionally a distinctive permeability between lay and clerical intellectuals. Still, religion persisted as a unifying factor on the basis of the Byzantine's profound sense of *eusebeia* (piety) that related the earthly to the celestial world.

Philosophical Theology, Jewish

Tamar Rudavsky

Department of Philosophy, The Ohio State University, Columbus, OH, USA

Abstract

Medieval Jewish philosophers, like their Islamic and Christian contemporaries, were concerned to harmonize the tenets of Judaism with ancient Greek philosophic teachings that held sway at successive periods of Jewish history. Confronting problems in which there seemed to be a conflict between philosophical speculation (*iyyun*) and acceptance of dogmas of the Judaic faith (*emunah*), the goal of the Jewish philosopher was not only to buttress faith with understanding, but to reconcile two distinct bodies of knowledge. We shall focus upon the attempts of several major medieval Jewish figures, including Saadia Gaon (882–942), Maimonides (1135–1204), Gersonides (1288–1344), and Crescas (c. 1340–1410/1411), to reconcile the strictures of faith and reason in the context of the following issues: divine predication, creation, and theodicy.

P

Divine Predication

Do the different attributes of God constitute distinct aspects or persons in the Divine essence? Jewish philosophers were divided on this question, as were medieval thinkers in general. Saadia Gaon, a tenth-century Jewish philosopher whose works reflected the influence of the Islamic Mu'tazilite, set the stage for subsequent Jewish discussions. In his major philosophical work *The Book of Doctrines and Beliefs*, Saadia followed the tradition of Philo and the *kalām* thinkers in denying multiplicity to God: the three attributes of Life, Power, and Wisdom are implied in the very notion of God. It is due to the deficiency of human

language that they cannot be expressed in one single term.

Maimonides' *Guide of the Perplexed* is the most important work of medieval Jewish philosophy and exercised a profound influence upon all subsequent Jewish thought, as well as upon Christian scholasticism. His theory of divine predication followed the Neoplatonic tradition and was built primarily upon the distinction found in al-Fārābī and Avicenna between essence and existence. This distinction implied that in the case of contingent beings existence is accidental to essence, whereas in God essence and existence are one. Hence God's nature is totally unlike ours, and terms used to describe God must be used either in a homonymous way or as negative predicates. The four essential attributes of God – life, power, wisdom, and will – are of one simple essence; all other attributes are to be conceived either as descriptive of divine action, or as negative attributes. However, even these four attributes, when predicated of God, are used in a homonymous, or equivocal, sense (Maimonides 1963, 1.56.131). The difference between human and divine predicates is qualitative: since the terms are applied by way of perfect homonymity, they admit of no comparison between God and His creatures.

In chapters 1.58–60 of the *Guide*, Maimonides develops his celebrated theory of negative predication, arguing that ultimately negative predication alone brings the human mind closer to an understanding of God: "Know that the description of God, may he be cherished and exalted, by means of negations is the correct description" (Maimonides 1963, 1:58:136). This third piece of Maimonides' theory of divine predication represents the logical culmination of his theory of language. Maimonides' point in these chapters is that because every affirmation about God is to be understood as a negation, not as a privation, it follows that the negation of a weakness does not imply that its opposite power is indirectly attributed to God. Rather it implies that the term or its opposite does not apply to God at all. So God is said to be neither weak nor powerful, just as a wall is neither seeing nor blind. The term "power" is

inapplicable to God; so are all other terms. God is simply the sort of being who neither has or fails to have any predicate we might to apply. To apply either privations or affirmative predicates of God is to be guilty of a category error. Maimonides presents an epistemological taxonomy according to which "with every increase in the negations regarding Him...you come nearer to that apprehension than he who does not negate with regard to Him that which, according to what has been demonstrated to you, must be negated" (Maimonides 1963, 1:59:138). In other words, the individual who describes God in glowing, flowery language is epistemologically further away from God than the individual who recognizes that God cannot be described at all. Maimonides is explicit on this point: whenever a person affirms of God positive predicates, the said person recedes from God's true reality. The implications of this doctrine with respect to prayer are striking. Ultimately silence is the only appropriate linguistic response to divine predication: "silence with regard to You is praise" (Maimonides 1963, 1:59:139).

Gersonides, on the other hand, disagreed with Maimonides' theory of negative theology. In his major work *The Wars of the Lord*, a sustained examination of the major philosophical issues of the day, Gersonides subjects Maimonides' theory to critique. He sides with Averroes who, rejecting the Avicennan distinction between essence and existence, argued that existence is not an accident of Being. In following Averroes, Gersonides paves the way for a positive theology, which permits of positive attributive ascription. Gersonides disagrees with Maimonides, claiming that divine predicates are to be understood as *pros hen* equivocals, or derivative equivocals, rather than absolute equivocals (as Maimonides had argued). That is, according to Gersonides, predicates applied to God represent the prime instance or meaning of the term, whereas human predicates are derivative or inferior instances. So, for example, knowledge when applied to God is perfect knowledge and constitutes the standard for human knowledge, which is less perfect than divine knowledge (Gersonides 1987, III.4: 107–115). The

implications of this discussion will become apparent when we turn shortly to the predicate of divine omniscience.

Creation

The problem of creation is a good example of the attempted synthesis between philosophy and Jewish tenets rooted in Scripture. Working within a framework which upheld the infinity of time, Aristotle posited an eternal universe which had no temporal beginning. Jewish thinkers as far back as Philo had already grappled with reconciling this framework with the Biblical account of creation. Saadia, for example, argued that both the Platonic and Aristotelian theories of eternity and uncreatedness of the universe are incompatible with the Jewish view of creation *ex nihilo* (from nothing). After examining and rejecting the current philosophical views of creation, he stressed the philosophical significance of the Biblical viewpoint. Subsequent thinkers were equally committed to a cosmology in which the deity willed the universe to exist.

Maimonides' discussion of creation is fraught with interpretative difficulties. Warning (in the introduction to the *Guide*) of the dangers of expounding upon creation, he asserts that this topic must not be taught even to one individual. In light of this warning, Maimonides' analysis of the doctrine of creation has been interpreted as a highly nuanced presentation. In *Guide* II.13 Maimonides summarizes what he considers to be the three standard views on creation as the Scriptural, Platonic, and Aristotelian views. The main elements of each theory, as depicted by Maimonides, can be summarized briefly as follows. The view of Scripture (1) is that the universe was brought into existence by God after "having been purely and absolutely non-existent;" through His will and His volition, God brought into "existence out of nothing all the beings as they are, time itself being one of the created things." (Maimonides 1963, II.13: 281) The Platonic view (2) states that inasmuch as even God cannot create matter and form out of absolute non-existence, there "exists a certain

matter that is eternal as the deity is eternal. . . He is the cause of its existence. . . and that He creates in it whatever He wishes" (Maimonides 1963, II.13: 283). According to Maimonides, the view of Aristotle (3) agrees with (2) in that matter cannot be created from absolute non-existence, but concludes that the heaven is not subject to generation/corruption; that "time and motion are perpetual and everlasting and not subject to generation and passing-away" (Maimonides 1963, II.13: 284).

Which of these three views is espoused by Maimonides himself? Ostensibly, at least, Maimonides supports (1). Having dismissed (2) as a weaker version of (3), he argues that (1) is no more flawed than is (3). Then, pointing to the possibility of (1), coupled with its Mosaic (and Abrahamic) sanction, Maimonides argues that the very plausibility of (1) suggests the non-necessity of (3). Why does Maimonides not accept (2)? The main reason, as he tells us, is that the Platonic view has not been demonstrated (*Guide* II.25: 329). If we take Maimonides at his word, then, it is clear that (1), creation in time of the universe out of absolute non-existence, is his view. Some scholars, however, reading an esoteric subtext into the *Guide*, have dismissed his espousal of (1) as an exoteric stance and have searched for the underlying, or concealed, interpretation which is Maimonides' real view of creation. And as commentators working through the text have demonstrated, there is certainly ample evidence to support either (2) or (3) as his esoteric view. In fact, there is so much conflicting evidence, all of which can be supported with plausible argument, that some recent scholars have suggested that ultimately Maimonides upheld a skeptical stance in light of the evidence and did not take to heart any of the three positions. Although such a skeptical view would not be quite as heretical as espousing either (2) or (3), it still constitutes a provisional rejection of (1), which is tantamount to a rejection of the Mosaic theory.

Gersonides' discussion of time and creation is contained primarily in *Wars* VI.1. Like Maimonides, he is concerned with whether time is finite or infinite, as well as with whether the creation of the

world can be said to have occurred at an instant. In order to uphold the finitude of time, Gersonides refutes the Aristotelian arguments by attempting to demonstrate that time must have been generated. He will argue that just as quantity is finite, so too is time, since time is contained in the category of quantity (Gersonides 1999: 270). Having posited that the world was created at an initial instant of time by a freely willing agent, Gersonides must decide whether the world was engendered out of absolute nothing or out of a pre-existent matter. Arguing that creation out of nothing is incompatible with the facts of physical reality, he adopts a Platonic model of matter drawn ultimately from the *Timaeus*. The opening verses of Genesis 1 are used to distinguish two types of material reality: *geshem* and *homer rishon* (Gersonides 1999: 330–331). Totally devoid of form, *geshem* is the primordial matter out of which the universe was created. Since it is not informed, it is not capable of motion or rest; and since it is characterized by negation, *geshem* is inert and chaotic (Gersonides 1999: 330–331). This primordial matter is identified with the “primeval waters” described in Genesis 1:2. However, Gersonides points out that *geshem* does not itself exemplify absolute non-being, but rather is an intermediary between being and non-being (Gersonides 1999: 334–344).

Divine Providence

We turn now to one of the most intractable problems in medieval Jewish thought, namely that of divine providence, and its implications for the presence of evil in the world. Medieval philosophers, concerned with safeguarding the freedom of human action, worried whether God’s foreknowledge of future contingent events entailed the necessary occurrence of these events. That the force of God’s knowledge need not be causal was already claimed by Saadia Gaon. In answer to the apparent paradox that God’s foreknowledge necessitates the objects of his knowledge, Saadia’s response is that “he who makes this assertion has no proof that the knowledge of the Creator concerning things is the cause of their existence” (Saadia Gaon 1948: 186). What concerned medieval philosophers in general,

and Jewish philosophers in particular, was the fact that if God is infallible, then the objects of his knowledge cannot fail to be what God already knows them to be. How to account for the ability of humans to contravene the prior infallible knowledge which God has of their actions became of paramount importance to later Jewish philosophers.

Under what conditions does God know unactualized particulars? Maimonides emphasizes that the term knowledge is predicated equivocally of God and humans, maintaining that God is in no way affected by what He knows. God remains one even though His objects constitute a plurality, and He remains unchanged even though the objects of His knowledge are mutable. These points are reflected in two brief assertions: first, that God’s knowledge does not contain plurality, and second, that God cannot acquire at a certain time knowledge He did not possess previously. Since the divine knowledge is *a priori*, it is not affected by the ontological status of objects which result from this knowledge. Hence Maimonides argues that since the objects of God’s knowledge do not causally act upon His knowledge, His essence is unaffected by their multiplicity. The second claim, that God’s knowledge is unaffected by any change in its objects, is supported in the context of a distinction between absolute and relative non-existence. Absolute non-existence is never an object of God’s knowledge (Maimonides 1963, III.20: 480). Relative non-existents, or future contingents, are possible objects of God’s knowledge. It is not impossible, Maimonides claims, that God’s knowledge has as its object those “non-existent things about whose being brought into existence we knew beforehand” (Maimonides 1963, III.20: 481). Like Averroes, Maimonides asserts that God’s knowledge of future possibles does not change their nature; neither is His nature altered by a change in the objects of His knowledge.

Gersonides is one of the only Jewish philosophers who upheld a form of indeterminism as a solution to the paradox of divine omniscience. Although intimated in a number of texts, this position is developed most fully in treatise III of *Wars*, wherein he develops his main argument that

an omniscient, immutable deity cannot know changing particulars. The underlying premise in this argument is that all future particular objects are in fact mutable: that is, they change from a state of non-existence to one of existence. Gersonides claims that an immutable deity cannot be omniscient, if omniscience entails knowing objects which undergo change. But does it follow from God's knowing a future contingent that it is necessary? In contradistinction to Maimonides, who claims that God's knowledge does not render the objects of his knowledge necessary, Gersonides will want to maintain that divine foreknowledge and contingency are incompatible.

Arguing that divine omniscience severely compromises the contingency of the objects of God's knowledge, Gersonides dismisses Maimonides' form of compatibilism. Having rejected Maimonides' attempts to harmonize foreknowledge and contingency, and having upheld the existence of contingency in the universe, Gersonides adopts the one option left to him, namely that God does not know future contingents. According to Gersonides, God knows that certain states of affairs may or may not be actualized. But in so far as they are contingent states, he does not know which of the two alternatives will in fact be actualized. For if God did know future contingents prior to their actualization, there could be no contingency in the world (Gersonides 1987, III.4: 116ff). Gersonides claims that God's inability to foreknow future contingents is not a defect in his knowledge (Gersonides 1987, III.4: 235–236). With respect to future contingents, God knows their ordered nature or essence, and he knows that they are contingent, but he does not know which alternative will become actualized. But has Gersonides in fact solved the problem of divine omniscience? Despite his admonition to the contrary, I have argued in other works that ultimately Gersonides' theory of divine omniscience does not fully account for other theological concerns, for example prophecy (Rudavsky 2000).

Hasdai ben Judah Crescas is the last outstanding original Jewish philosopher in the late medieval period. His major work *Sefer Or Adonai* (*The Book of the Light of the Lord*, 1405–1410),

finished several months before his death, was written as a polemic against his two Aristotelian predecessors Maimonides and Gersonides. In this work, Crescas sought to undermine the Aristotelian cosmology and physics that pervaded the works of his predecessors. Crescas rejects the views of both Maimonides and Gersonides, arguing that God acts toward the world with goodness, love, and grace. Against Gersonides, for example, Crescas affirms God's knowledge of future contingents, even those determined by human choice. He then argues that human freedom is only apparent and not genuine: humans think they are free because they are ignorant of the causes of their choices. Human responsibility for action lies not in the actual performance of the action, but rather in the agent's acceptance of an action as its own. The feeling of joy an agent feels at acquiescing to certain actions, for example, fulfilling the commandments, is the reward for that action. So too, God experiences joy in giving of himself to the world (Crescas 1990: 123–205).

Theodicy

In this last section, we shall focus upon the problem of evil as portrayed by Maimonides in *Guide* II: 10–13. Maimonides' discussion represents a model attempt to explain how it is that an omniscient, omnipotent, and benevolent deity permits the existence of evil in general, and the suffering of innocents in particular. Many Jewish thinkers took into consideration *The Book of Job*, and Maimonides is no exception; his discussions of evil and divine omniscience are applied to the travails of Job. In chapters II.11 and 12, Maimonides undertakes a classical theodicy, drawn on conventional distinctions. Maimonides claims that the preponderance of moral evils (those that occur between humans) are the result of ignorance, or the privation of knowledge. Reflecting the platonic maxim that to know the good is to do the good, Maimonides suggests that it is as a result of ignorance that we inflict harm upon ourselves and upon others. It is only because we view the universe from our limited perspective that we perceive matters as worse than in fact they are;

were we to adopt a more holistic view, we would realize that humans are but a speck of sand, and that our travails represent but a minor chord in the vast orchestra of the universe.

Nevertheless, Maimonides realizes that this response is not in itself satisfying for the vast number of individuals who are unable to attain this intellectually detached perspective. He therefore introduces a straightforward typology, distinguishing between metaphysical, natural, and moral evil. The first type of evil refers back to the ontological make-up of matter itself: it is because we are endowed with matter that we suffer the material infirmities we deem evil. Laying the groundwork for his subsequent discussion of divine omnipotence, Maimonides dismisses the obvious objection of why could not God have created “coming to be” without “passing away” with an *ad hominem*:

He who wishes to be endowed with flesh and bones and at the same time not be subject to impressions and not to be attained by any of the concomitants of matter merely wishes, without being awareness of it, to combine two contraries, namely, to be subject to impressions, and not to be subject to them (Maimonides 1963, III.12: 443).

In other words, the very nature of “being a human being” requires essentially that we be subject to generation and corruption, and the latter carries with it all the pains and imperfections we associate with human life. Maimonides adumbrates the strain to be popularized by Leibniz, namely that this is the best of all possible worlds. God could not have created a matter with a more perfect nature: material stuff “is generated in the most possible way in which it is possible to be generated out of that specific matter” (Maimonides 1963, III.12: 444). Maimonides’ second category of evils we may term “social evils,” namely those pertaining to political upheaval or moral behavior. These two are relatively rare, in Maimonides’ mind.

It is the third category of evil, what we may call personal evils, that most concern Maimonides. Here we hear echoes of Maimonides the physician, admonishing his flock not to overindulge in eating, drinking, sexual licentiousness, etc., resulting in personal harm. Maimonides divides personal evils into evils we bring upon ourselves

physically (diseases of the body), and those we introduce psychically (diseases of the mind). With respect to the first, it is clearly overindulgence that is to blame: reminiscent of Socrates’ exhortation in the *Phaedo* not to indulge in bodily pursuits, Maimonides reminds us that vice with respect to eating, drinking, and copulation are due to “excess in regard to quantity or irregularly or when the quality of the foodstuffs is bad” (Maimonides 1963, III.12: 445).

Diseases of the soul are a bit more complex. In the first place, overindulgence on the bodily side cannot help but affect our moral temperament, and so that is reason enough to exercise physical restraint. Furthermore, as a result of physical overindulgence, we tend to lust after items that will satisfy these physical desires: unlike the pursuit of items necessary to human survival, the desire for superfluous possessions is endless and leads to infinite desire, lust, and avarice. Interestingly enough, the “necessaries” such as air, water, and food, tend to be more accessible and cheaper, while the less necessary luxuries tend to be less accessible and hence more expensive. Were we to eliminate our desires for these luxuries, our soul would cease to suffer needless anxiety and the concomitant evils that accrue upon their pursuit. Hence, it is human will that introduces this third variety of evil.

But evil must be understood against the backdrop of divine providence, for it might be argued that a benevolent, omniscient, and omnipotent deity should and would be able subvert evil and suffering. Maimonides presents in chapters III: 15–22 a theory of divine providence according to which the Active Intellect watches over humans in the sublunar world as a result of a divine overflow with which human intellect is united. That a ship goes down at sea is the result of chance, but “the fact that the people in the ship went on board. . . is, according to our opinion, not due to chance, but to divine will in accordance with the deserts of those people as determined in his judgments” (Maimonides 1963, III.17: 472). In other words, providence is consequent upon the perfection of human intellect and reflects the causal and ontological grid whereby God orders reality: in order for God to permit a causal nexus according to which certain people board the ship and others

not, God must know, as it were, whether or not they are deserving of providence.

Already commentators in Maimonides' own time were aware of the apparent discrepancy in Maimonides' position. Maimonides too was not unaware of the difficulties inherent in this position, as evidenced by his attempt once more at the end of the *Guide* to explain why it is that often the righteous (who ostensibly should be most firmly united with the divine overflow) nevertheless suffer. Claiming that divine providence is constantly watching over those who have obtained the intellectual overflow from God, Maimonides argues in *Guide* III.51 that evil attends to those who withdraw their attentions from God: "providence withdraws from him during the time when he is occupied with something else" (Maimonides 1963, III.51: 625). Prophets or excellent persons suffer evil only during times of distraction, the "greatness of the calamity being proportionate to the duration of the period of distraction or to the vileness of the matter with which he was occupied" (Ibid).

Conclusion

We have seen that Jewish philosophy arises out of a clash of two worldviews: the tenets of Jewish faith and belief on the one hand, and the strictures of philosophy on the other. This clash permeated much of Jewish philosophical debate in the Middle Ages. Discussions pertaining to divine predication, creation, divine omniscience, and theodicy have reflected this tension. In short, both these philosophers reflect the medieval Jewish attempt to reconcile traditional Jewish beliefs with what they feel are the strongest points in Greek philosophy, be it Plato, Aristotle, or Neoplatonism; although a synthesis of these systems is their ultimate goal, the strictures of philosophy often win out at the expense of theology.

Abstract

In Islam, the revealed text reminds human beings of their need to know (Qurʾān, XVI, 78). Muslims embarked on an intellectual task, which was expressed in different discourses: theology, jurisprudence, mysticism,

linguistics, history, and philosophy. The latter took shape when Islamic thought came into contact with Greek philosophy, giving rise to a movement called *falsafa*: philosophy. This movement continued and recreated Greek philosophical thought in the Islamic world. The great issues that interested philosophers were the relationship between philosophy and religion, the explanation for and conception of the universe and its origin, and human beings and their social and political conduct. *Falsafa* enjoyed productive expansion and diffusion throughout the Islamic world, first in the East and later in the West, where it exerted a powerful influence on the thought of Latinized areas: it contributed to the transmission of Greek philosophy to Europe and to new developments in the medieval philosophy of the Latin world.

Islamic thought was grounded in the hermeneutic situations Muslims found in their religious sources. The first part of the profession of faith, "There is no god but God," began a process of knowledge, which generated a kind of philosophy built on the divine unity of the First Principle as opposed to the multiplicity of the universe. The second part, "Muḥammad is the messenger of God," reveals another aspect of Islam, in which it defines itself as founded on prophecy. This called for a doctrine that was able to explain divine revelation and prophethood.

Many different thinkers took up the task, and among these were the philosophers. They attempted to find a rational justification for prophethood, affirming that the ability to have visions and the special relationship prophets maintain with the Active Intellect, as well as the special enlightenment they receive, were all part of human nature.

Was this a "prophetic philosophy?" There was certainly a strain of philosophy that developed in this direction, produced by the party of 'Alī, the *Shī'a*. They focused their thought on prophecy and originated a prophetic brand of philosophy, in which there can be seen considerable Gnostic and Zoroastrian influences from the Persian

world. The central idea of their philosophy lies in reaching the hidden meaning of divine revelation. On this depends the truth of human existence: the meaning of humankind's origin and destiny. The resulting esoteric and Gnostic thought revealed a cognitive and scientific universe applied to the exegesis of revelation, in which the sciences of the Hermetic-Pythagoric tradition had their place. This is what can be inferred from the *Epistles*, written by the Ikhwān al-Ṣafā', the Brethren of Purity, or Brethren of Sincerity. Their philosophical system is a mixture of religion and Pythagoric, Platonic, and Neoplatonic doctrines. The central idea is the hierarchy running downward from the One, according to Pythagoric numeric combinations. It concludes with the exposition of the return of Unity.

But philosophy in the Islamic world was also something else. It has been maintained that philosophy comprised the different aspects and forms taken by Islamic thought, by virtue of the eastern idea of *ḥikma*, wisdom, which implies a broad conception in which the divine and the human, the mundane and the religious, are two facets of the same reality. However, more detailed study of the uses of the terms *ḥikma* and *falsafa*, identified in many classical Arabic texts (Aristotle was called the "wise" and the "philosopher"), reveals that not all of the disciplines making up Muslim thought should form part of something as specific as *falsafa*. The latter emerged as a form of learning independent from, although linked to, other expressions of Muslim thought.

This is the conception that can be inferred from some writers. Ibn Qutayba (d. 889) held that the training of wise men and religious authorities should be based on several sciences: religion, philology, ethics, and also Greek philosophy, in order to be able to refute it. 'Umar Khayyām (d. 1131) maintained in his *Epistle on Existence* that among the categories of thinkers there are Greek-influenced philosophers who use rational arguments, endeavor to know the laws of logic, and are not content with mere arguments from personal conviction. For al-Ġazālī (d. 1111), the philosophers are a group of researchers characterized by the use of logic and deductive reasoning. Ibn Khaldūn (d. 1406) states that the intellectual

sciences differ from traditional sciences in that the former are innate in humans and may be grasped through rational and reflective ability and therefore may also be called philosophical sciences.

Philosophical thought was therefore an expression of Islamic thought with its own specific characteristics. Philosophers were able to adopt and adapt Greek philosophy to find answers to theoretical and experiential problems. Due to its evolutionary maturity, philosophy was able to find ways around obstacles that emerged and hindered the development of ideas. Arabic philosophy was not external to the context in which it emerged; its existence was possible because the thought structured around the ideas of the Qurʾān and the *ḥadīth* had already reached maturity. Philosophy could be seen as a set of doctrines that attempted to interpret Islam from outside Muslim thought using non-Muslim tools; but also as a new way to finding a meaning in the law of God using very different means from those used up to that point. Philosophers explain and interpret the meaning of Qurʾānic *āyāt* in the light of new methodological principles. This philosophy was religious and is inseparable from other aspects of the culture in which it was born. Its originality lay in the discovery that human reason was capable of leading humankind to the understanding of Truth.

The reading of Platonic, Aristotelian, and Neoplatonic texts gave it an eclectic character. The synthesis that structured philosophical thought was a mixture of Neoplatonism and Aristotelianism, until Ibn Rushd. The link maintained by this philosophy with science was another of its characteristics, because Greek knowledge was seen as being the unifying intellectual element. Practical knowledge helped to complete the education of the perfect human, able to master nature, and understand all its secrets. The assimilation, use, and transformation of this material from outside Islamic culture resulted in doctrines dealing with issues such as the relationship between philosophy, revelation, and the rational justification of prophethood; the explanation of the Oneness of God, the First Being, and the formation of the universe, as well as the relationship between the affirmation of the individual and social reality of humans, and the political implications of

membership of the Muslim community. The basic doctrines of Islamic philosophy were articulated around these three main issues and their most important exponents were al-Kindī (d. c. 873), al-Fārābī (d. 950), and Ibn Sīnā (d. 1037), in the East; Ibn Bājjā (d. c. 1138), Ibn Ṭufayl (d. 1185), and Ibn Rushd (d. 1198), in al-Andalus.

The first of these issues to be raised was the explanation of the relationship between philosophy and religion. Aristotelian texts had made clear the existence of Reason, by means of which humans can reach Truth. Conceived as a tool providing rules applicable to human knowledge and endeavor in order to avoid error, the Arabic term for logic was *al-mantiq*. The term derives from the root *n-t-q*, whose verbal noun, *nutq*, originally meant “articulated, uttered, pronounced word”; from this, it came to mean “reason,” because only someone equipped with reason can articulate words with meaning. Therefore, logic in Arabic meant “the place of reason” or, rather, “the place of rational words.” But Islam, as a religion, already had another word: the word of God as expressed in the Qurʾān, which is God’s revealed word given to human beings; and as such, non-logical, nonrational word. What is the relationship between these two words? Do they contradict or complement each other? Are they mutually exclusive or integrable? The problem was therefore posed between faith in the given word and a word-creating reason; between religion as the Word of God and philosophy as the word of humankind. It has been said that this problem was raised to reconcile philosophy and religion and bring them into line with each other; some have seen it as a rejection of religion by philosophy; others as the concealment of philosophy under a blanket of religion. However, the dichotomy only makes sense when seen simply as two different paths converging on the same Truth.

Al-Kindī recognized that philosophy is the search for truth, a long road on which traveling requires effort, as it demands that the traveler integrates previous contributions. Truth can be attained through reason, provided it has the support of those dedicated to it, through the contribution made by each of their efforts. The path of

philosophy is made up of different levels, the highest of which is that relating to knowledge of the First Truth or knowledge of the divine nature and the oneness of God, of the virtues to be espoused, and the evil that must be avoided. According to al-Kindī, this is the same goal announced by the prophets, who have obtained the same knowledge via a different route from that used by the philosophers: they did not need effort, dedication, or time, nor did they have to resort to the discursive reasoning of logic and mathematics; rather they attained it with the aid of divine Will, which inspired the prophets and revealed the truth to them in an instant. There is agreement as to the goal of philosophy and religion. Both propound the truth; there is no disparity between their contents. But there is a difference in the method used; one rational, the other revealed. They are two different paths leading to the same destination.

Al-Fārābī deepened this approach and pointed to the superiority of philosophy over religion; the former has its origin in reason and the latter is fruit of the imagination. Philosophy is concept; religion is representation. In philosophy, truth can be discovered by humans intellectually whereas in religion, the prophet must translate it into symbols that the rest of humankind is able to understand. Neither is there any distinction between them regarding their origin and purpose: both come from the enlightenment of God through the Active Intellect, the last of the realities emanating from the first Being in the intelligible order. The result will either be philosophy or religion, depending on the individual faculty of the person that is enlightened in this way. If the emanation of forms that flows from the Active Intellect activates the intellect, then humans acquire intelligible truths, and become philosophers; but if that enlightenment activates the imagination, the prophet, i.e., the only human being able to receive this enlightenment in all its perfection, reproduces the intelligible truths in the form of images, and communicates them to humankind. For this reason, there is only one philosophy, one thought structure that is valid for all of humanity, while there are many religions, because of the different languages used as vehicles for the symbols.

Although Ibn Sīnā did not raise this problem directly in the same terms, it seems that he was inclined toward a solution that gave more weight to religion, which was of great importance in his thought. But he also clearly stated that the existence of the prophet is compatible with reason, and proposed a rational explanation for prophecy as something innate in human beings. On the other hand, all of his work is an account of reality following the strictest rules of reason. He did not reject the approach of his two predecessors and was attacked fiercely by al-Ġazālī for supporting doctrines that were incompatible with religion.

In al-Andalus, Ibn al-Sīd al-Baṭalyūsī (d. 1127) pointed to the possibility and need to bring reason and revelation together, as both search for and teach one single truth. He said this while defending a poet accused of *kufṛ* (infidelity or unbelief).

Ibn Bājja did not raise the issue explicitly either, but his affirmation of the superiority of the intellectual and contemplative life could be taken as a statement in favor of philosophy. The idea of the recluse dedicated to knowledge, the only one who can attain total and complete happiness by cultivating rational faculties, appears to suggest the idea of the superiority of reason over that given in revelation.

In *Ḥayy ibn Yaqzān*, also called *Philosophus autodidactus*, Ibn Ṭufayl develops the theme of the recluse who attains the pinnacle of knowledge. This text has been interpreted mystically, but in it the author clearly puts forward the idea that what the recluse attains through the use of reason does not contradict what is propounded by religious teaching: the recluse can build a philosophical system with his own rational faculties, an interpretation of the universe that allows the ultimate and radical principle that underlies all reality to be attained from the most mundane. Contemplation is the supreme aim to which all humans must aspire, because knowledge, perfection, and happiness are attained using the intellect, in accordance with human nature.

Ibn Rushd maintained that philosophy is nothing more than the reflective study of the universe, a task to which believers are invited by revelation, because the rational consideration of the

universe cannot lead at any conclusion that runs contrary to revelation: there is only one truth and, consequently, philosophical truth, rational truth, cannot contradict the truth of religion. There are diverse paths taking humans to this truth. The author recognizes the superiority of philosophy when he maintains that the rational path is that which leads to science through the use of demonstrative argument. The other paths provide valid, but insufficient, arguments for accessing the truth.

Another issue was that related to the explanation of the entire universe by having recourse to a unique First Principle. From a religious perspective, this could be couched as the problem of creation by God. In Islam, the problem of God's relationship with the universe and whether this was eternal or had a beginning was raised. If one recognizes God and the world's eternity, then the relationship between them must also be eternal, as eternity and necessity imply, according to the Aristotelian doctrine, that an eternal relationship would be limited by necessity. As necessity excludes volition, the eternity of the universe would imply that God lacks volition and is subjected to necessity. But if the universe has been created, will and freedom can be attributed to God, because from this will originates the action that created the universe.

Theologians affirmed the radical temporality of the universe: to deny the creation of the world meant unbelief. The opposite opinion was held by philosophers, with the exception of al-Kindī, who was influenced by the theological roots from which his thought evolved. He devoted part of his writings to showing the finite, transitory, and multiple character of the universe and proving the need for an infinite, eternal, and truly unique Creator, the cause of the unity that underlies all multiplicity. Creation depended on divine will: God simply wants things to be and they are, as stated in Qur'anic passages, of which he gives a philosophical explanation, based on the idea that being originated out of non-being.

The philosophies of al-Fārābī and Ibn Sīnā, developed from Aristotelian and Neoplatonic teachings, affirmed the eternity of the universe, and offered an explanation articulated around a

process of emanation, the affirmation of the theory of causality, and the necessary nature of the universe. Al-Fārābī proposed the distinction between necessary being and possible being. A necessary being is one that cannot be not existent. Possible beings are those whose existence can be denied without being contradictory or absurd, and whose existence depends on another. The Necessary Being of al-Fārābī endorses the features of a combination of Plotinus' One and, at the same time, those of the First Unmoved Mover of Aristotle's *Physics* and *Metaphysics*. It is the absolute One; the perfect, self-sufficient, eternal, uncaused, immaterial, and without opposite being, that moves as an intelligible and benign principle. Because it is an intellect, it is able to think about itself. Its superabundance gives rise to a process of emanation that causes multiplicity to appear. This process is purely a consequence of its existence, without volition or choice; it generates a first intellect in which is present the duality of the subject that thinks and the object that is thought about. This first emanated being, through its thinking about the First Being from which it originated, generates a new intellect; on thinking about itself, it generates the first heaven. The second intellect, in turn and by the same process, causes a second intellect and a third heaven, that of the fixed stars. In this way, successive intellects are generated, until the tenth, along with the spheres of Saturn, Jupiter, Mars, the Sun, Venus, Mercury, and the Moon. The tenth intellect, identified with the Active Intellect of the Aristotelian tradition, generates the Earth, the world of generation and corruption. The universe is conceived according to an ontological hierarchy, based on six principles: the First Being, the separate intellects or second causes, the Active Intellect, the soul, form, and matter. The first three are not bodies nor are they in bodies; the last three are not bodies either, but they are joined to bodies. Matter and form are the most imperfect principles. The union of matter and form creates the physical bodies, which are subject to generation and corruption. The soul is the principle of movement, because in each being it produces a tendency, that in human beings culminates in the desire to know the cause that originated it and their first cause, the

First Being; this implies that the human being is able to trace the universe back to its origin.

Ibn Sīnā accepted this framework, although he perfected some of al-Fārābī's metaphysical concepts. He developed the idea of being as a primary concept perceived by direct intuition. He broadened the study of necessary being and possible being: that which is absolute unity, and cannot therefore have an essence–existence composition, in so far as it has no genus or difference, is indefinable and indemonstrable. In relation to possible beings, he established a distinction between those that were possible in themselves and those that were necessary, once they had received existence from the necessary being. Using this distinction, he was able to modify the emanation process, explaining it in the following way: the Necessary or First Being brings into existence, when it thinks, the first intellect. The first intellect carries out a double act of thought from which emanate three entities: this thought exists purely because it has received its existence from the First, and generates the soul that moves the first heaven; it thinks of itself as possible and generates the body of this first heaven; it thinks of the First Being, which is its cause, and brings another intellect into being. This process is repeated until the active or tenth intellect. In this process, it is the necessity of the universe that determines its eternity.

The controversy over the universe and its origin was resolved by Ibn Ṭufayl using empirical observation to examine the phenomena that surrounded him. The recluse discovers the answers to the questions formulated in his daily existence and he progresses in knowledge through experiments. He studies nature and the multiplicity of beings existing in it, reaching the conclusion of the unity of the species. He works his way up from the lowest levels of being to the highest and discovers that everything that exists has an efficient cause. Concerning the problem of the eternity or creation of the universe, he concludes that it is necessary to admit the existence of a maker from which everything emanates, whose essence is unique and whose being is similar to sunlight, which is the unmoved mover and final cause of the universe.

Ibn Rushd sets out several theories advanced on the origin of the universe. He maintains that Aristotle's theory is the most congruous with the nature of being: the agent does not produce anything, but simply unites two things that already exist, matter and form, to actualize that which is potential. For him, all creation, production, or generation is a deduction of the forms which exist in matter. In wanting to reject the Platonism of his predecessors, he had to put form within matter, as they do not exist separately. In so far as they are present in matter simply as potentiality, deduction, or extraction implies actualization. Matter is the necessary prerequisite for all production, for all creation. But it is not matter that deduces, or causes the forms potentially contained within it to come out, because its potentiality is purely passive. It requires the action of the agent, which Ibn Rushd, in several passages of his works, identifies with God. Matter is therefore unable to transform itself. The consequence of this was the affirmation of the eternity of the world.

The third issue deals with the reality of human beings, as individuals and at the political and social level, as members of a community. The philosophers extensively developed the idea of the human as a summary of the cosmos, a microcosm that reflects its reality onto the structure of the universe; with a body, a soul, and an intellect. Their intention was to follow Aristotle's *De anima* and its conception of humans, but it was the Neoplatonic vision that left its mark on their theories. The human was seen as a soul joined to a body, which, according to Ibn Sīnā, constitutes the self, the true nature of human beings. The soul, as substantial form and beginning of life, is a fundamental reality, unique and single, known by its many manifestations. These correspond to the different functions undertaken by humans and which follow Aristotle's thinking: vegetative, sensitive, appetitive, imaginative, and rational. These faculties are actualized through bodily organs, except the latter, which does not require any organ to manifest itself, due to its immaterial nature. The Arabic philosophers recognize the interdependence that exists between the body and the soul. The analysis of the soul is usually

limited to the study of knowledge processes. They speak of sense perception, which is produced when humans grasp objects that can be sensed using the sensory organs. They give great importance to the imagination as a faculty. For them the functions of imagination are not restricted to those relating to the perception of individual sense images in the absence of an observable sense object, on one hand, or the creation and composition of new sense forms based on those already perceived or on the decomposition of known images, on the other. Al-Fārābī granted imagination a new function: imitation, by virtue of which intelligible truths can be imitated, and in this way are transformed into symbols and images, implying imperfect knowledge of the intelligible truths. This provides a natural explanation for the reality of the prophetic faculties of some men, the prophets, who receive divine revelation via the enlightenment of their imagination by the Active Intellect. Finally, intellect is the faculty that is studied in depth, because it is intellect that perfects the soul and allows us to attain happiness. Following Aristotle's text, the philosophers recognize its different levels: from its initial state of pure potentiality to the level at which it acquires the intelligible forms, which is after the intermediate level where intellect obtains the first principles of science, which are the basis of the different forms of knowledge; and finally to practical life, where intellect is the faculty that allows the distinction between good and evil. The knowledge process is explained by the intervention of the Active Intellect, identified with the tenth separate intellect, that of the intelligible forms, which are conferred upon human intellect by enlightenment. This intellect is called "Giver of forms."

Humans cannot survive nor develop, unless they can associate with other human beings. Humanity will find plenitude in association. Ibn Sīnā dealt with this problem, but it was al-Fārābī who produced a theory on the social and political character of humankind. Society is necessary for happiness to be attained. There are imperfect and perfect societies, and it is only in the latter that supreme good and ultimate perfection is achieved, the real definition of true happiness. These should be states ruled by political science and organized

according to the hierarchy of the human soul. The Head of the State is Plato's philosopher-king, who must master political science. Juxtaposed to the perfect society and the virtuous city are the states whose motivations are not found in true virtue and happiness, but in the pursuit of worldly goods, which only give the appearance of goodness. These states are those of the ignorant, corrupted, disordered, lost city; those that set their ultimate goal as subsistence, honor, wealth, or pleasure; their rulers and citizens hold false conceptions of what should be the basis of the state, because they have substituted the principles of the virtuous city for others; also, it is possible that their conceptions are just, but their actions are not. All lack political science, which is the true architectural science.

Ibn Rushd maintains that, due to its independence from the body, there is only one material intellect for all individuals. He arrived at this opinion after revising his initial doctrine. At first, Ibn Rushd maintained that the material intellect was an aptitude that existed in humanity to enable the reception of intelligible forms. Later on, he maintained that this intellect was generated every time the Active Intellect acted upon an individual. In the final version, found in his *Middle Commentary on Aristotle's De Anima*, the material intellect is a single and eternal substance, shared by all humankind. This affirmation is part of an argument he had with Alexander of Aphrodisias, who, having conceived the possible intellect as individualized matter in each person, understood it as something transitory and divisible. According to Ibn Rushd, this implied that human beings did not possess their own actions, other than the purely passive action of being informed by the Active Intellect. Because Ibn Rushd maintained the oneness of the material intellect, which has the potentiality to receive all that is intelligible, he was able to provide an account of how humans can know the universals through the action of the Active Intellect.

Ibn Rushd, who dealt extensively with politics, was convinced that supreme good, ultimate perfection, and happiness could only be attained in the Perfect City, identifiable with the ideal caliphate of the first four caliphs. He develops the theory

of eudemony as fundamentally social – not merely individual – happiness, and points out the importance of political discourse for the community, since language should give rise to virtuous and just actions as an essential condition for an honest and reasonable human life. He states that rhetoric is composed of the arts of discourse and ethics; that is, of politics. He differentiates between the object of practical or political science and that of the theoretical sciences, because its purpose consists of acts that belong to volition, based on free will and choice. Although it belongs to the practical sciences as for the nature of its object, its principles and its purpose, two parts can be identified within it: the first, that is general or theoretical, dealing with the ways and habits of the soul, and the second, that is strictly practical, showing how these ways and habits are established in the soul and their organization within social groups. He insists that the main purpose of ethical discourse is the governance of the city and, more specifically, the good that that government must strive for. The central point here is the noble art of city governance. For him, the theoretical part of politics should teach to the political government how to proceed toward the happiness of citizens, and should contain all general principles relating to that happiness. Ibn Rushd moves away from al-Fārābī in that he does not succumb to purely theoretical speculation, rather he makes continual reference to Islamic history and the politics of his era, which allow us to better situate his view on Islamic society.

to stretch from Saadia Gaon (882–942) to Isaac Abravanel (1437–1508). In between these two bookends exist a handful of "Neoplatonists" (e.g., Solomon ibn Gabirol, Abraham ibn Ezra), their critics (e.g., Judah Halevi), the towering Aristotelian synthesis of Maimonides (1138–1204), followed by a series of epigonic thinkers (e.g., Samuel ibn Tibbon, Joseph Kaspi), and several more original thinkers (e.g., Gersonides and Hasdai Crescas).

Such is the master narrative of medieval Jewish philosophy. In what follows I subscribe, for the sake of convenience, to this narrative; however, it is important to be aware that too strict an adherence to it potentially prevents us from including individuals traditionally left out of this canon (e.g., Judah al-Harizi, Isaac Polleqar), movements (e.g., rabbinic thought, kabbalah), or issues (e.g., animals, literature, genres). With this in mind, what follows presents the general contours of medieval Jewish philosophy and, even though it mentions specific individuals, this entry works on the assumption that more details concerning many of these thinkers will be dealt with more exhaustively in cognate entries.

Problematics

Medieval Jewish philosophy, like all religious philosophies, is the attempt to reconcile the potentially irreconcilable: rationalism under the guise of Greek philosophy and faith as taught by religious scripture. For some, let us call them "religious philosophers," reason and faith naturally went together *at least when properly interpreted*. For most, however, the two worldviews could never coexist because they represented two completely different modalities and thus two mutually exclusive sets of authority. If reason was based on the free exercise of the rational faculty, religion was dependent upon a series of commandments derived, not from reason, but from revelation. Whereas the majority of philosophical speculation was, for example, predicated on the eternity of the universe (as Aristotelian

Philosophy, Jewish

Abstract

Although "medieval Jewish philosophy" as a concept and field of study was not coined until the modern period, the term nonetheless denotes a series of features and concerns shared by a number of individuals between the tenth and sixteenth centuries. The tendency however has been to draw a fairly circumscribed line defining *the* "canon" of medieval Jewish philosophy that is perceived

physics presupposed), religion needed an omnipotent and omniscient deity who created the world *ex nihilo*.

We witness all of these tensions, and others, in medieval Jewish philosophy. The Bible presents a God who creates the universe from nothing, who is described using anthropomorphic and anthropopathic language, who chooses one people (i.e., the Jews) over others, and who will redeem the world at the end of times. On the human side, Jews possess a series of commandments – many of which, on first blush, appear to be irrational (e.g., the mixing of various substances) – that govern every aspect of their life (from circumcision to diet to death) and whose performance is connected to religious, if not necessarily intellectual, perfection.

The reconciliation of faith and reason, religious practice and intellectual speculation, becomes the goal of Jewish philosophy. As a result, medieval Jewish philosophers engaged in the interpretation of each one of these apparently contradictory activities in terms of the other. If the first chapter of Genesis, for example, claims that God created the world *ex nihilo*, then how might this act of creation be compatible with Neoplatonic or Aristotelian metaphysics? If the commandments dictate that Jewish males must be circumcised on the eighth day after birth or that Jews must refrain from mixing meat and dairy, how can such practices be reconcilable with larger and more universal sets of ethical claims?

This reconciliation was facilitated by a series of readings that included a number of hermeneutical strategies, the most important of which was allegory. Beginning as early as Philo of Alexandria (20 BCE–50 CE), Jewish philosophers engaged in the practice of using allegory to show that when the biblical text says something that *apparently* does not coincide with the dictates of reason, it is not the case that the Bible is wrong, only that our understanding of it is. The result is that the literal level of the Bible must be reinterpreted – critics would say interpreted away – so that it may now be seen to coincide with reason. This use of allegory would subsequently be employed by virtually every medieval Jewish philosopher as a way to smooth over the

potential roadblocks that prevented the smooth harmonization of philosophy and religion. If the philosophers thought that they had succeeded in this, their critics accused them of perfidy and of making a mockery of religious texts and the commandments derived therefrom.

Canons

As should be apparent from the above, the canons of Jewish philosophy are twofold: Jewish and non-Jewish. As for the former, all Jewish philosophy can be understood, at least phenomenologically, as the attempt to explain rationally the traditional sources of Judaism (e.g., Torah, Talmud). As for the latter, all Jewish philosophy is the explanation of these concepts using the interpretive grids supplied by non-Jewish philosophical schools (e.g., Neoplatonism, Scholasticism, Humanism).

There exists, with one or two possible exceptions, virtually no works written by Jews devoted solely to the topic of philosophy. There is, for example, no “Jewish” Averroes i.e., someone who was interested solely in interpreting Aristotle and who had very little concern for religion or religious ideas. This led Leo Strauss to make his famous (or perhaps infamous) proclamation that the most famous and important work of Jewish philosophy, Maimonides’ *Guide of the Perplexed*, “is not a philosophic book – a book written by a philosopher for a philosopher – but a Jewish book: a book written by a Jew for Jews” (1963: xv). This signals that Jewish philosophy, while certainly a speculative enterprise, is first and foremost an exegetical endeavor, the attempt to read philosophy into the Torah and *vice versa*. If we want to find “pure” philosophical treatises, devoid of religious concerns, we often search in vain.

Despite the fact that there exist very few pure philosophical treatises, nineteenth-century German-Jewish scholars associated with the movement *Wissenschaft des Judentums* (“The Science of Judaism”) nevertheless had no problems in defining an object of study that they labeled as medieval Jewish philosophy. They subsequently created a canon of thinkers, and

treatises, that they believed adequately contributed to such a field of study. Like all such canons created in the nineteenth century, it put pride of place on great men and original works, and tended to marginalize others – especially those who wrote commentaries to these earlier works – as epigonic and unoriginal. Perhaps because of the apparent freedom that Jews enjoyed under eleventh- and twelfth-century Muslim rule and the concomitant desire for equality in Germany, these *Wissenschaft* scholars tended to focus on the philosophers from Muslim Spain (al-Andalus). They identified these medieval Andalusi Jewish thinkers with a classical “golden age” and viewed the period between this golden age and their own as one of gradual decline. In their quest to revivify Jewish life they created, what Shmuel Feiner calls, a “pantheon of historical heroes” (2002: 50–65) and, in many ways, they shaped this pantheon in their own image.

In their desire to make Judaism a religion of reason, to use the phrase of Hermann Cohen, all that did not fit within a rather strict definition of “rationality” was excluded and often ridiculed as obscurantist. In other words, “Jewish philosophy” was artificially extracted from “Jewish mysticism” (kabbalah) or “Talmudism” when in fact the boundaries between them were often quite porous. The end result is that “medieval Jewish philosophy” was developed – and a canon of thinkers and works imagined – as a way to correct perceived excesses and lacunae in modern Judaism.

This is certainly not to claim that medieval Jewish philosophy was simply an invention of nineteenth-century German-Jewish scholars, however. What it does signal is that we must be aware of the potential artificiality of the enterprise and thereby realize that their definition of Jewish philosophy may in fact be too narrow or too ideological. Moreover, we should not let received opinion about medieval Jewish philosophy shackle the way we imagine it, the various relationships configured between philosophers and its discontents, in the future.

A case in point that tests the potential artificiality of “medieval Jewish philosophy” is the curious work of Solomon ibn Gabirol (1021–c. 1058)

entitled *The Fountain of Life*, which, although written in Arabic, survived only in a Latin translation known as the *Fons vitae*. This treatise is a purely metaphysical work and – with the possible exception of one quotation (from the mystical *Sefer Yetzira*, and not the Bible) – makes no mention of Judaism whatsoever. We thus have no idea how Ibn Gabirol either extracted his ideas from scripture or read them into it. As a result, subsequent Jewish philosophers largely ignored the work, although it would come to play an important role in Christian scholasticism, where its author was assumed to be a Muslim (the so-called “Avicebrol”). It was not until the nineteenth century that Solomon Munk found Hebrew excerpts of the work and proved their identity with the *Fons vitae* that the text finally became associated with Ibn Gabirol. So what do we do with Ibn Gabirol? Is his *Fons vitae* a work of Jewish philosophy just because its author was Jewish? The tendency is to focus less on his *Fons vitae* and more on his “Jewish” works such as his philosophical poem *Keter Malkhut* that explicitly addresses Jewish themes and is replete with biblical prooftexts.

Schools

In the opening line of his *Die Philosophie des Judentums*, Julius Guttmann writes: “The Jewish people did not begin to philosophize because of any irresistible urge to do so. They received philosophy from outside sources, and the history of Jewish philosophy is a history of the successive absorptions of foreign ideas which were then transformed and adapted according to specific Jewish points of view” (1964: 3). Although the particular datum of Jewish philosophy has not changed, the philosophical lenses used to interpret this datum have largely been contingent upon the larger intellectual worlds in which Jews lived. In the period under discussion there were primarily three such philosophical schools: Neoplatonism, Aristotelianism, and Humanism.

After the thought of Philo who, *pace* Harry Wolfson’s formulation, had very little influence on subsequent Jewish philosophical speculation,

rationalism reenters Judaism in the Islamic period, initially under the guise of rational theology (*kalām*). One of the earliest Jewish rationalists was Saadia Gaon (882–942), whose main work, *The Book of Opinions and Beliefs*, was an attempt to integrate Jewish theological speculation with Greek thought as mediated by Muslim rationalist theologians. In this, he largely sets the stage for the majority of Jewish philosophical speculation in the Islamic world for the next three centuries. For example, Saadia held that Torah and philosophy mutually reinforced one another and that scientific speculation could be invoked to defend traditional Jewish beliefs such as God's unity and the creation of the world.

Although Saadia was primarily a theologian, albeit with a rationalist temperament, "Jewish philosophy" would begin in earnest in the generations after him. In this regard, Neoplatonism became the dominant philosophical worldview between the ninth and twelfth centuries. Although largely the product of Plotinus and Proclus, Neoplatonic ideas tended to circulate in the name of Aristotle (e.g., *The Theology of Aristotle*, *The Book of the Apple*). Two ideas central to Neoplatonism in all of its many guises were the doctrine of the emanation and the myth of the soul. Based on Aristotle's obscure discussion in *De anima*, and later comments on it by the likes of Alexander of Aphrodisias and Themistius, emanation sought to solve the problem of how multiplicity arises from unity. As it came to be worked out, the self-reflection or self-intellection of the One entails the emergence of a pure Intellect. By contemplating itself and its source, this pure Intellect gives rise to a second intellect and the outermost sphere of the heavens. The subsequent sequence of intellects and spheres carries down to the tenth and lowest of the supernal or heavenly intellects, the Active Intellect, and the nethermost celestial sphere, that of the moon. As developed by later Aristotelians, the Active Intellect is responsible for the projection of universal forms or archetypes onto matter, and for actualization of human intellect.

The myth of the soul conceives of the human soul as ontically related to the universal Soul, whence it departs to live in a human body. Trapped in the body, the soul can either aspire to

reascend to its celestial home or become mired in the filth of matter. The way for the soul to reascend is by means of the study of philosophy. Typical Jewish Neoplatonists include Isaac Israeli (850–c. 932), Bahya ibn Paquda (fl. first half of the eleventh century), Solomon ibn Gabirol (1021–c. 1058), Abraham bar Hiyya (d. c. 1136), Joseph ibn Zaddik (d. 1149), and Abraham ibn Ezra (1089–1164).

In the late twelfth century, Aristotelianism largely displaced Neoplatonism as the regnant discourse among Jewish intellectuals. It was certainly not a clean break: If Neoplatonism had absorbed many Aristotelian elements, the opposite also held true. As a result, Aristotle's metaphysical structures were altered by the adoption of the doctrine of emanation, and the purpose of knowledge took on religious connotations since its ultimate goal was perceived to be the apprehension of the metaphysical world. However, the monism of Neoplatonism was gradually replaced by the dualism of form and matter, and the human soul – no longer regarded as an emanation from the universal Soul – became defined as the form of the body. The Neoplatonic theory of knowledge as recollection or remembrance gave way to the Aristotelian theory of observation and abstraction from sensual phenomena. Finally, Aristotelian ethics lacked the religious character of Neoplatonic ethics that enjoined humans to liberate themselves from the bonds of matter and to elevate themselves to the celestial home by means of spiritual perfection. Important early Jewish Aristotelians include Abraham ibn Daud (1110–1180) and Moses Maimonides (1138–1204).

Perhaps owing to both the novelty and the potential for misunderstanding, early Aristotelians such as Ibn Daud and Maimonides tended to write esoterically, only hinting at implicit connections between Judaism and philosophy. In the post-Maimonidean era, however, many of those who commented on Maimonides' work were not as concerned with maintaining the same level of secrecy. The result is that Maimonides was translated, both literally and linguistically, into other conceptual idioms, revealing his secrets, as it were. Samuel ibn Tibbon (c. 1165–1232) who lived in Provence, for instance, translated the

Guide and many other philosophical works produced by Jews and Muslims (e.g., Avicenna, al-Fārābī) into Hebrew.

Samuel ibn Tibbon also wrote two original treatises: A commentary on Ecclesiastes and a philosophical-exegetical monograph by the name of *Ma'amar Yiqqawu ha-Mayim* (Treatise on *Let the Waters be Gathered* [i.e., *Gen 1:9*]). Both treatises discuss philosophical ideas in the form of biblical exegesis; and they both borrow and apply methods developed by Maimonides in his *Guide*. Ibn Tibbon, as well as other members of his family – for example, his son-in-law, Jacob Anatoli (c. 1194–1256) and his son, Moses ibn Tibbon (fl. 1240–1283) – was responsible for helping the thought of Averroes make further inroads into Jewish philosophy. Anatoli is noteworthy because he was one of the first Jewish philosophers that had direct contact with Christian Scholastics, including the famous scholar Michael Scott, when he was the court physician to Emperor Frederick II Hohenstaufen at Naples. The thirteenth century, to quote Colette Sirat, was “a century of translations and encyclopedias” (1985: 231). Both of these were ultimately responsible for the dissemination of philosophy and science to a growing class of upwardly mobile Jewish court bureaucrats (Tirosh-Samuelson 2003: 251–252).

In many ways we can consider Samuel ibn Tibbon as the founder of Maimonideanism, a philosophical-exegetical movement that radicalized Maimonides and that would continue for centuries. This new movement however did certainly not go unchecked or uncriticized. The rise of Maimonideanism gave way to series of intra-communal tensions usually referred to as the “Maimonidean Controversies,” which revolved around the reception, role, and function of Maimonides’ writings. These controversies were not simply a matter of academic debate, but were a series of acrimonious personal and communal conflicts about the direction of Jewish culture, including the age-old struggle religion and philosophy.

The goal of philosophy in this period was to inculcate the values of philosophy in as large an audience as possible as opposed to working out

technical philosophical problems in obscure treatises. The main way that philosophy was produced in this period was, as mentioned, through encyclopedias and commentaries, in addition to sermons, dialogues, and poetry (Hughes 2008: 53–106). Major thinkers in these debates included philosophical popularizers such as Shem Tov ibn Falaquera (c. 1225–c. 1295). In its most radical form, Maimonideans – as articulated in such individuals as Joseph ibn Kaspi (1280–after 1332) – claimed that philosophy represented the inner, hidden meaning of the Torah. Whereas Maimonides had tried to keep philosophy and religion in creative counterpoint, such individuals held that the plain meaning of the Torah, and thus all the teachings and practices of Judaism, were simply the means to a higher, intellectual end.

In the fourteenth and fifteenth centuries, Jewish philosophy continued to be written and disseminated primarily in the form of commentary. It is, of course, important to be aware that although the genre of commentary outwardly appears conservative, upon closer inspection much original thinking goes on in it, as commentators propound new and often highly original ideas in the guise of earlier thinkers. In this period it is difficult to determine to just what extent Jewish philosophers were familiar with developments in scholastic philosophy. Many of the major Provencal philosophers – e.g., Gersonides (1288–1344), Moses Narboni (d. c. 1362) – reveal little signs of such influence, and the major thinker that they seem to struggle with is Averroes. In contrast, philosophers who flourish in the late fourteenth century and early fifteenth – e.g., Profiat Duran (c. 1350–c. 1415), Joseph Albo (c. 1380–1444), Abraham Bibago (c. 1446–c. 1489) – are much more conservative and their main task, in the aftermath of strong persecution and proselytizing efforts on the Iberian Peninsula, was to combat what they perceived to be the pernicious influence of Averroism on Spanish Jewry.

If Maimonides was the most important Jewish thinker in the medieval period, second place must surely go to Gersonides. He wrote philosophical commentaries on virtually all of the books of the Bible, in addition to composing an original treatise, *Wars of the Lord*. Although Gersonides lived

in a larger intellectual environment permeated by scholasticism, his philosophical world was that of Muslim Spain, despite the fact that he could not read Arabic. Gersonides' thought is largely concerned with reconciling the Aristotelianism of Averroes with the theology of Maimonides.

Increasingly in the fifteenth century, we begin to witness the absorption and systematization of Christian thought and philosophy, including the different currents of Scholasticism (Thomism, Scotism, Nominalism) in Jewish philosophy. This may well be the result of better knowledge among Jewish elites, possible Jewish attendance at Christian schools and academies, and perhaps even the existence of similar Jewish institutions. As a consequence we begin to see the employment of Scholastic methods, especially by Iberian thinkers, and even explicit references to Latin Scholastic authors by so-called "Jewish Averroists" (Zonta 14–15). Such thinkers include Abraham Bibago (c. 1446–c. 1489), Abraham Shalom (d. 1492), Isaac Arama (c. 1420–1494), and Isaac Abravanel (1437–1508).

Some have argued that Hebrew Scholasticism in Iberia is part of the attempt to defend Judaism from its two main intellectual opponents at this time: Christianity and radical Averroism (Tirosh-Samuelson 2003: 504–505). Others, however, claim that the absorption of Scholasticism was primarily for philosophical reasons (Zonta 2006: 22). Hebrew Scholasticism was also popular in Italy, where individuals included Judah Messer Leon (c. 1470–c. 1526) and his disciples Abraham Farissol (1451–1525); the last major Jewish Averroist and one with Scholastic leanings was Elijah del Medigo (c. 1458–c. 1493).

Jewish philosophy in fifteenth-century Italy was also heavily influenced by parallel developments of Humanism in Christian thought. The recovery of Greek texts and the revival of Platonism and Neoplatonism in the middle of the fifteenth century coincided with a parallel movement in Jewish thinkers. One of the earliest Jewish thinkers to absorb these Humanistic trends was the aforementioned Judah Messer Leon, whose *Book of the Honeycomb's Flow* attempted to show how the rhetorical and aesthetical innovations actually derived from the biblical

narrative (Hughes 2010). For Messer Leon, it was the Torah, as opposed to the ancient orators, that exemplifies perfect speech. Perhaps the best example of humanism in Jewish garb is the enigmatic Judah Abravanel (c. 1465–after 1521). His *Dialoghi d'Amore* represents one of the first treatises in Jewish philosophy written in Italian, and it shows the influence of Ficino's interest in pagan ancient wisdom and its compatibility with Judaism.

Critics

The rationalist agenda in Judaism was certainly not without its critics. Although we have already witnessed this criticism of Maimonides during the so-called Maimonidean Controversies, there also exist several important individuals who tried to offer alternatives to philosophy. Although often trained in philosophy, their goal was to undermine the philosophical enterprise from within. In this regard, perhaps the best known is the pre-Maimonidean Judah Halevi (c. 1075–1141). At the age of 50, so the legend goes, Halevi turned his back on what he perceived to be the inauthenticity of Judeo-Arabic cultural forms. Disillusioned with the inter-confessional Neoplatonism of his day, he was especially critical of how it ignored the particularities of the historical record, especially when it came to Judaism. In his *Kuzari*, a dialogue, the rabbinic protagonist responds to the philosopher's articulation of the "God of Aristotle" with the credo that "I believe in the God of Abraham, Isaac, and Jacob." With this claim he signals the importance of experience over intellection, and that without the proper actions belief is ultimately unimportant. He also faults the philosophers for their improbable speculation about divine intellects (e.g., why should there be only ten) and about causation.

Like Halevi, Hasdai Crescas (1340–1410) attempted to undermine the dominant philosophical system of his age, now the Aristotelianism of Maimonides and Averroes. He did this primarily by trying to disprove Aristotle's physics. In so doing, he rejected Aristotle's conception of a self-contained universe wherein everything

moves toward its natural place. He further rejected the Aristotelian account that ruled out an actual infinite series of causes. Crescas argued, on the contrary, that infinite time, infinite space, and an infinite series of causes was indeed possible. This infinite universe, in turn, was held together by infinite divine love that regulated both cosmic and human affairs. Crescas also sought to undermine the Maimonidean *summum bonum* of intellectual perfection and the conjunction between the human and Active intellects. Rather, he argued that human perfection was based on the love of God actualized through the performance of the divine commandments as revealed in the Torah.

Isaac Abravanel (1437–1508) – father of Judah Abravanel – was highly critical of Maimonides. He faults Maimonides, and his later followers, for defining Judaism in accord with the foreign fashion of other nations. For Abravanel, however, Judaism has nothing in common with foreign sciences because the teachings of the Torah are revelations from God. He particularly faulted Maimonides' attempts to define the principles or articles of faith of Judaism. Such a task, according to Abravanel, was impossible because all the commandments are of equal value. He is also highly critical of Maimonides' conception that prophetic visions were creations of the imaginative faculty and thus susceptible to rational description. On the contrary, Abravanel argued that they were miraculous occurrences and he thus defends the irrationality of miracles and their importance for Judaism.

Themes

Since Aristotelian cosmology and all of the sciences that followed in its wake were predicated on the eternality of the universe, this seemed, at first blush, to contradict the biblical account of creation *ex nihilo*. The creation of the universe from nothing implied an omnipotent and omniscient God that could work freely in the universe, and subsequently make other facets of Judaism (e.g., revelation, redemption, miracles) possible. Some Jewish philosophers contended that God did in fact create the world out of nothing (e.g., Saadia

Gaon); others contended that the world was created but that it would exist without end (e.g., Gersonides); other that the universe was eternal (e.g., Moses Narboni); and still others (e.g., Crescas) that the world is eternally emanated from God by means of the eternal divine will. The biggest debate in medieval Jewish philosophy concerns the opinion of Maimonides on the status of the universe (Seeskin 2005: 6–34). Because he nowhere specifies his opinion clearly, later (and modern) commentators have ascribed to him both the opinions of creation *ex nihilo* and eternality, in addition to the Platonic belief that the world was created out of preexistent matter.

Another issue of concern to medieval Jewish philosophers was prophecy. Because biblical books tended to be full of various anthropomorphisms and anthropopathisms, these were often difficult to reconcile with the rational teachings of philosophy. The fullest discussion of prophecy occurs in Maimonides' *Guide of the Perplexed*, wherein he argues that revelation is the product of the prophet's imaginative faculty. This permits prophets to take rational truths and enwrap them in poetic and rhetorical flourishes so as to communicate philosophical truths to nonphilosophers. It is up to the philosopher, however, to retranslate, as it were, these highly literary and figurative images back into the language of philosophy (Hughes 2010). Indeed, as mentioned, this is in many ways the *raison d'être* of the medieval Jewish philosophical program.

The problem of immortality also concerned medieval Jewish philosophers. Virtually all agreed that there existed some part of the individual, that which constitutes the essence of humans *qua* humans, that survives the death of the body. For them, this essence was the intellect or rational soul. Whereas traditional Judaism and more conservative thinkers would argue that immortality is derived from the proper relationship that the individual has with God through the observance of the commandments, the philosophers tend to locate immortality in the acquisition and mastery of the secular sciences. There is also some debate as to whether immortality is personal or impersonal. Most seem to imply that it is the latter since only the perfected intellect can become immortal, with

the corporal and hence individualizing aspects departing with the death of the body.

Another central feature of medieval Jewish philosophy was the status of divine attributes. Ontologically, how are we to assign attributes to God (e.g., might, justice) without jeopardizing his unity? If God does possess attributes, in what way can they be said to exist? When the Bible speaks of God's strength or God's speech, how does it employ such terms? Are they symbols, metaphors, or analogies? Most of the Jewish philosophers stress the absolute unity and unfathomability of the divine essence, while at the same time claiming that we can know something of God's attributes of action (e.g., righteousness, lovingkindness). Saadia, for example, denies the existence of separate divine attributes and instead insists on the perfect unity of God with His knowledge, wisdom, life, and so on. Maimonides, on the other hand, argues that all of the attributes that are applicable to God are "negative," that is, they are attributes whose opposites are to be negated of God. To say that God possesses life, for example, means that we negate of God the trait of death. In an attempt to preserve divine unity, however, Gersonides argued that attributes are predicated of God primarily and only predicated of creatures in a secondary manner. So although God and his creatures may appear to be similar, they are in fact only analogous and no relation between the two need be implied.

Increasingly in the post-Maimonidean period, the issue and status of belief became central to Jewish philosophy. In the twelfth century, belief (*emunah*; Ar. *I'tiqād*) referred primarily to a "belief" or a "conviction," which led those like Maimonides to distinguish between rational and traditional beliefs. Maimonides' cognitive approach made certain beliefs obligatory (e.g., creation, prophecy, messiah) and this required Jews to be instructed in the dogmas of the tradition. Increasingly in the thirteenth and fourteenth centuries, influenced by the Averroist tradition, Jewish philosophers began to distinguish between knowledge and true opinion. Only the former, according to the likes of Gersonides and Moses Narboni, are a sufficient condition for human

happiness and immortality. In the fifteenth centuries, Jewish philosophers such as Isaac Abravanel argued that beliefs, as principles that derive from a strong and certain conviction as opposed to demonstration, are in fact superior to rational knowledge.

Conclusions

In sum, medieval Jewish philosophy is essentially a series of reading strategies provided by rationalist Jews to philosophize about Judaism. Influenced by Islamic legal speculation, Neoplatonism, Aristotelianism, and Humanism these individuals reflected upon the central tenets of Judaism (e.g., God, Torah, prophecy) and attempted to show how they were compatible with the teachings of philosophy. In all of their endeavors, Jewish philosophers sought to mediate the series of tensions – both real and perceived – between rationalism and religion. Although their intellectualist program did not go unchecked or uncriticized, they nevertheless succeeded in changing the contours of Judaism by redefining traditional terms and concepts.

Photios of Constantinople

Jozef Matula

Department of Philosophy, Center for Medieval and Renaissance Philosophy, Palacky University, Olomouc, Czech Republic

Abstract

Photios, together with Arethas and Leo the Mathematician, is a representative of the “first Byzantine Renaissance” and a major figure in the transitional period of Byzantine intellectual history in the ninth and tenth centuries. He revived classical education in Byzantium, and through his activities humanism became a constitutive element of Byzantine thought.

Photios' *Amphilochia* (composed between 867 and 877) is one of the most important Byzantine philosophical documents, in which he deals with philosophical and theological topics. It contains the first known commentary on Aristotle's *Categories* of the ninth century (qu. 137–147), in which he discusses various topics of Aristotle's philosophy (theory of predication, the concept of substance, species and genera, categories).

Biography

Photios (810/820–891/893), patriarch of Constantinople (858–867, 877–886), was one of the dominant figures in the Byzantine religious, social, and political life of the ninth century. He was also one of the most prominent members of the Court of Constantinople and a protagonist in the controversy over the *filioque* clause (Dvornik 1948). His religious career is related to theological disputes, the restoration of icons, and political activities connected with missions to the Slavs. He laid the foundations of education, which made him one of the most famous scholars of the Byzantine Empire. He was interested in theological issues, grammar, poetry, rhetoric, philosophy, medicine, and law. His works are significant as evidence of the philosophical activities of the first half of the ninth century (Tatakis 1949; Lemerle 1971).

Most important for the history of philosophy is Photios' *Bibliotheca* (sometimes called *Myriobiblon*), composed around 837/838, which is a collection of extracts of 280 volumes of classical authors, the originals of which are now to a great extent lost. In this work, he devoted several pages to preserve various ancient philosophical theories on free will and predestination (codices 214 and 251), skepticism (codex 212), and number symbolism (codex 187). He also compiled the *Lexikon*, a list of notable words, expressions, and references to facilitate the reading of sacred and secular authors, which was published later than the *Bibliotheca*. His most important work is the *Amphilochia*, a collection of some 300 questions

and answers on difficult points in the Scripture, addressed to Amphilochius, the archbishop of Cyzicus. *Amphilochia* supplements the picture of Photios' reading of classical philosophy, treating both theological problems and secular questions.

In *Mystagogy of the Holy Spirit*, Photios developed dialectical arguments against the Latin doctrine of the *filioque*. He remains faithful to the Orthodox dogma and always in agreement with traditional patristic and conciliar positions. He also wrote a treatise against the Paulicians, based on a similar work by Peter of Sicily, and his homilies contain abundant material for Byzantine political history and art. His many letters are addressed to popes, rulers, as well as military, civil, and church leaders.

Thought

Photios did not write any comprehensive philosophical treatise, and he did not create an independent system of thought. As a philosopher, he cannot be separated from his theological thought, which has its origins in the Scripture, the Church Fathers, and Church Councils. His main interest in philosophy is logic and dialectic (Kustas 1973). He considered secular learning and logical methods to be a special preparation for theological matters. Philosophical thinking is, according to him, a process of understanding notions that are then compared to religious truths, and through this process they are denied or accepted.

Photios, versed in ancient literature, revived the interest in antiquity in Constantinople (Tatakis 1949; Lemerle 1971; Hägg 1975). An important place is given to Plato, Aristotle, the Stoics, the Neoplatonists (Proclus, Porphyry), and the commentators (Ammonius, Simplicius, Philoponus, Olympiodorus). In *Bibliotheca*, he quotes from the lost writings of the skeptic Aenesidemus, the Neoplatonist Hierocles, Aristides, and from an anonymous biography of Pythagoras.

Photios understands Plato and Aristotle as the successors of Pythagoras (codex 249), and both thinkers are, in his view, fundamentally in

agreement as far as the notions of providence and the immortality of the soul are concerned. He is familiar with Plato's works, though his knowledge seems to have come chiefly from intermediary sources. Photios often mentions Plato, but he nowhere undertakes an analysis of a Platonic dialogue (unless such an analysis is lost). Plato is a great stylist, but Photios faults him for his attack of rhetoric and poetry. He analyzes the concepts of genera and species and argues against the theory of Ideas (*Amphilochia*, q. 77). He finds the Platonic doctrine of Ideas unacceptable, because the Ideas cannot function as genuine predicates in the sensible world, which is God's creation, and God's creative power needs no assistance of them.

From all the ancient philosophers, Photios finds the greatest affiliation with Aristotle. He is interested in Aristotelian logic, and he comments on the *Categories*. Questions 137–147 of the *Amphilochia* form a small Aristotelian treatise, where he explains the ten categories. The main philosophical problems related to Aristotle's *Categories* are connected with the ontological status of species and genera. He seems to follow the interpretative approach of Porphyry, Ammonius, and John Damascene (Anton 1994a; Benakis 1978–9; Schamp 1996b). The intention of Photios' comments is to make corrections to Aristotle's theory before he can use them to clarify the doctrine of being, the concept of God, the Trinity, and the angels.

These comments on the *Categories* probably come from a full-length commentary on Aristotle's work. In contrast to Aristotle's text in the *Categories*, Photios stresses that his account of the last six categories is more detailed than Aristotle's and in better balance with the treatment of the first four (qu. 142–143). He suggests that the last six categories are not composite, because each one of them is the result of combining two categories, but in such a way that something new emerges. He uses the analogy of friendship and rulership to illustrate this theory. Friendship is constituted by the union of two friends but cannot be identified with either of them, nor can it be said to be composed of the two as parts. Similarly, in the case of the category

of “where,” although we combine two categories, a new category emerges that cannot be identified either with substance or with quality, nor can it be said to be composed of them as parts (Ierodiakonou 2005).

The centerpiece of the *Amphilochia* is a theory of substance (*ousia*), which Photios claims to be his own (qu. 138). Photios uses Aristotle's *Categories* as a basis but he proceeds to examine substance independently of Aristotle. He disagrees with Aristotle that the distinction between first and second substance is limited to individual substance versus universal substance. The individual (first substance) and the universal (second substance) cannot be predicated synonymously either with regard to themselves or with regard to substance. The individual and the universal, although they share the name substance, each calls for a different determination, as what determines first substance is totally different from what determines second substance. According to Photios, substance has many meanings (*pollachos legomenon*) and refers to matter, form, the efficient agent that gives form to matter, or in a metaphorical sense it indicates possessions and money. The substance is the existence of each being, the opposite of which is nonbeing or substance as *hyperousia* and productive of all beings (Anton 1994a). He distinguishes between first substances consisting of form and matter, and self-subsisting beings consisting of what are only analogues of form and matter. The latter make up a distinct class, the realm of angels and of immaterial reason. His aim is to revise the understanding of substance – he added two meanings of it: divine substance as transcendent substance (*ousia hyperousios*) and the angels as bodiless substance (*asomatos ousia*).

Photios' interest in ancient philosophy derives from his interest in theological issues (*filioque*, apology of icons). His use of Aristotle's teachings (on substance, genera, and species) serves to underscore theological dogmas and prevent aberrations of religious discourse (Arianism). Photios' devotion to religious questions is thus connected with his attempt to combine ancient wisdom and revealed theology.

Pierre Ceffons

Christopher Schabel

Department of History and Archaeology,
University of Cyprus, Nicosia, Cyprus

Abstract

Certain late medieval figures are atypical, challenging our conceptions of the mentalité of the period. Within the seemingly traditional context of scholasticism, the Cistercian Pierre Ceffons is one such figure. Born near Troyes, Ceffons became a monk at Clairvaux and eventually took his turn as his order's bachelor of the *Sentences* at the University of Paris in the academic year 1348–1349, the time of the Black Death. From these lectures we have his main work in philosophy, his lengthy but unfinished questions on the *Sentences* of Peter Lombard, put in written form around 1353, composed at the same time he authored his other known writings. Ceffons was a fascinating thinker, both as a bold philosopher in his own right and as an informative witness to the intellectual trends of his day. Ceffons certainly illustrates the critical attitude of the brightest minds of the era, variously described as fideistic, skeptical, destructive, or simply rigorous, depending on one's perspective.

Pierre Ceffons was the Cistercian bachelor of the *Sentences* at the University of Paris in the academic year 1348–1349, during which he experienced, lectured on, and tried to explain in naturalistic terms the Black Death. From Ceffons, a village just a few hours' walk from Troyes and Clairvaux, where he became a monk, Pierre was also called Pierre de Clairvaux, although, contrary to an old tradition, he was never abbot. According to a note in a Troyes manuscript (Médiathèque du Grand Troyes 1785, f. 285vb) containing Thomas of Ireland's *Manipulus florum*, a codex completed in Paris on 11 April 1313 (new style), Brother Pierre Ceffons had it copied while studying there. The original

name has been erased, however, and “Petri de Ceffons” written in its place in a different hand. Instead of being a student at Paris in 1313, therefore, Ceffons was probably born around then or slightly later, since bachelors of the *Sentences* were usually 30–35 years old. A possible reference to his own *Quodlibeta* and a remark that Ceffons “disputed” something in 1352 or early 1353 suggest that he may have become a Master of Theology, but he disappears from view after 1353.

One of Ceffons’ works was very widely disseminated, his brief and satirical *Letter from Lucifer to the Prelates*, extant in hundreds of manuscripts and printings. Two manuscripts in Troyes (859 and 930) and one each in Paris (Bibliothèque nationale de France, lat. 3315), London (British Library, Harley 2667), and Liège (Université, Bibliothèque Générale de Philosophie et Lettres 185) contain Ceffons’ *Opera Minora*, which are being critically edited. Ceffons’ lengthy *Centilogium* (i.e., the *Letter from Jesus Christ to the Prelates*) and the *Letter from Lucifer* are in all five, while the *Little Decretum on the Power of St. Peter* (against Marsilius of Padua, John of Jandun, and William of Ockham) is found in Troyes 859 and 930 and in Paris 3315. Troyes 930 also contains the *Sermon in the Chapter General*, *Pierre’s Confessional*, the *Flowers of Boethius’ De consolatione*, and the *Flowers of Diverse Authors and Philosophers*. Finally, along with abbreviated versions of the *Sermon in the Chapter General* and *Pierre’s Confessional*, Harley 2667 preserves some of Ceffons’ correspondence.

Pierre’s Confessional (also called the *Dream/Soliloquies/Meditations on a Certain Definition*), a long treatise related to the controversy over the mendicants’ right to hear confessions, attacks a ruling of the Cistercian chapter general from mid-September 1348 requiring monks to confess to their abbot annually even if they have already done so to another confessor. Completed on 6 February 1349, *Pierre’s Confessional* was quoted at length by the Cistercian Conrad of Ebrach and the Augustinian Dionigi de Modena. The *Letter from Lucifer* was written in early 1352, then the *Little Decretum* before 24 March 1353, while the

Centilogium was completed on 13 April 1353, and the *Sermon in the Chapter General*, dated 15 September, is from 1351, 1352, or 1353. The *Little Decretum* also constitutes distinction 18 of book IV of Ceffons’ questions on the *Sentences* in Troyes 62, but the bulk of Ceffons’ questions ultimately derives from his *Sentences* lectures in 1348–1349, from which we also have a couple of sermons in Troyes 930.

Once thought to be an autograph, Troyes 62 is by a professional scribe working from Ceffons’ notes. Ceffons admits that his handwriting is horrible and that he hurried to make his written version (*Scriptum* or *Ordinatio*), at the request of others, without even reading it all, let alone correcting it. A complicating matter is Ceffons’ proto-humanism, striving to be eloquent and quoting numerous classical authors. As a result, this beautiful manuscript, containing his main philosophical work, is often incomplete and frequently corrupt, as shown by the critical edition of the *Parvum Decretum*, the only section surviving in other witnesses. Thus, aside from the *Introductory Letter* and a fragment that Damasus Trapp printed in a pioneering article in 1957, nothing of Ceffons’ *Sentences* was published until after 2010. Recently, however, a number of scholars have undertaken to edit substantial portions, including forthcoming volumes with the *Principia*, the *Prologue*, and distinctions 35–48 of book I, a number of stray questions, and the *Final Sermon* ending Ceffons’ lectures. Although books III and IV are brief, Ceffons’ *Sentences* is in some ways the most complete of the Middle Ages and would require around 3000 modern pages to print.

What is emerging is a bold philosopher and defender of academic freedom, abreast of all the latest trends and works from both Paris and Oxford, who loved to impress his audience with classical references and to annoy them with constant demands for evidence. Ceffons caused trouble from the first letter of his text, literally. Rather than choose an entire biblical phrase for the theme of his first principal sermon opening his lectures on the *Sentences*, Ceffons opted for “O,” which expressed his awe before the task that lay ahead as well as his mischievous approach. Ceffons

remarks elsewhere that he was criticized for his thema, using a mere letter or syllable being unacceptable. Ceffons retained his “O” thema in all four principal sermons and in his *Sermo finalis* or *Final Sermon*, delivered on the last day of classes, introducing the next Cistercian bachelor of the *Sentences* – a rare survival of the approximately one thousand such final speeches delivered by *sententiarii* at Paris in the fourteenth century.

Bachelors of the *Sentences* in the fourteenth century inaugurated the academic year in late September and early October with *principia*. On each day a separate bachelor would deliver a sermon related to Peter Lombard’s *Sentences* and then defend a philosophical or theological thesis, attacking one or more theses of other bachelors. In January, March, and May, the bachelors would give their second, third, and fourth principal sermons and questions in an ongoing debate that concluded in the final lecture in late June. Ceffons defended the thesis that everything happens of absolute necessity, not, he said, because he actually believed that, but for the sake of debate, in order to see whether his fellow bachelors could prove logically that anything at all happens contingently. Ceffons himself thought that the existence of contingency could not be proven, that using reason alone the deterministic position appears more likely, and that merely on faith do we accept that things can happen otherwise. Throughout his four *principia*, occupying perhaps 300 modern pages in total, Ceffons defends absolute determinism on the basis of the truth value of propositions about the future, of the necessary chain of efficient causation in the natural world, of our will’s pursuing only what appears to be beneficial and our mind’s accepting only what appears to be true, and of divine foreknowledge and predestination. Ceffons’ arguments for logical, physical, psychological, and metaphysical or theological determinism provoked all nine of his fellow bachelors that year, his *socii*, to attack his thesis from one angle or another, usually failing because they made presuppositions that Ceffons considered unwarranted.

Ceffons’ lengthy verbatim quotations from his *socii* are valuable historically, since, with the exception of the Augustinian Hugolino of

Orvieto, nothing seems to have come down to us from their *Sentences* lectures. One of Ceffons’ colleagues tried to refute his thesis on the basis of Church authority, since the infallible Church holds that not everything happens of necessity. Rather than simply reply that this refutation is based on faith and not evidence, Ceffons instead argued at length that, no matter how one defines “the Church,” the Church is prone to error, unless one gives a tautological definition: “The Church is whoever cannot err.” Popes, cardinals, councils, and whole bodies of the faithful have made and do make mistakes.

Hugolino critiqued Ceffons using the newly imported Oxonian device of the *complexe significabile*, which Adam Wodeham employed to describe a state of affairs signified by a proposition. Ceffons rejected Hugolino’s rebuttal as beside the point, but the exchange highlights another aspect of Ceffons’ writing: his questions on the *Sentences* are a witness to the innovative ideas of the time, about which there was frequent disagreement over definitions and sometimes controversy. Related to this are Ceffons’ many complaints about recent censorship and condemnation at Paris. Unlike in Oxford, Ceffons often remarked sarcastically, one had to tread carefully in Paris. Most notably, Ceffons’ senior Cistercian confrère Jean de Mirecourt, later abbot of Royaumont, introduced “ill-sounding” English ideas and, Ceffons quipped, was censured by a commission of “three old witches” in 1347. Historians disagree about whether Gregory of Rimini was on this tribunal, with good arguments supporting either side.

Ceffons’ questions on the *Sentences* abound with lengthy passages on recent logical, mathematical, geometrical, physical, and metaphysical theories. Ceffons helped introduce into the Parisian milieu the philosophical writings of the likes of William of Heytesbury and the Oxford Calculators, quoting extensively from Thomas Bradwardine’s *De proportionibus*, for example. Ceffons was also one of the first Parisians to deal in depth with the archbishop of Canterbury’s recent *De causa Dei* of 1344. While admiring Bradwardine’s theological determinism, Ceffons argued that Bradwardine’s opposition to astrology

was overblown. The Parisian Nicole Oresme, more famous as an opponent of astrology, was another important source for Ceffons, as Konstanty Michalski noted decades before Trapp's fundamental article. Ceffons knew several of Oresme's writings, even ones that did not circulate widely. Ceffons defended astrology against the likes of Oresme, but Ceffons also borrowed Oresme's famous discussion of the possible rotation of the Earth, perhaps being even more sympathetic to the idea than Oresme himself was.

Always careful to distinguish between demonstration and opinion, knowledge and belief, Ceffons doubted as a philosopher what he believed as a theologian. As a philosopher, he utilized such concepts as instants of time, geometrical points, universals, or hylomorphism, while asserting that they could very well simply be devices of convenience. Ceffons was acutely aware of human epistemological limitations, remarking on the question of other possible worlds, for example, that we are like moles living underground, blind and confined, unable to assess our own ignorance. Nevertheless, Ceffons supported the scientific imagination and even our capacity to discover new knowledge. All told, Pierre Ceffons was one of the most interesting authors of the fourteenth century, one whose complete works deserve to be published, despite the complexity of the task.

Plato, Arabic

Rüdiger Arnzen
Thomas Institut, Universität zu Köln, Cologne,
Germany

Abstract

There is yet no comprehensive and systematic study of the Arabic transmission of Plato's works and the knowledge about Plato's philosophy in the medieval Islamic civilizations.

From the tenth to the thirteenth centuries, biographers and philosophers writing in Arabic composed various biographies and bibliographies on Plato, which trace back to different Greek sources such as Thrasyllus and Theon of Smyrna. The reception of Plato's works was primarily restricted to paraphrases and summaries, among which Galen's *Synopsis* of the Platonic corpus played a major role. None of Plato's works has been preserved in a complete Arabic translation, and it is a matter of doubt whether there were ever such translations. Apart from this rather fragmentary transmission, a number of Greek commentaries on at least four Platonic dialogues were known in the Arabic-speaking world. The major topics of Arabic Platonism are the temporal creation of the world, Plato's theory of the state, the concept of love (both in terms of its metaphysical as well as its medical implications), the theories of the intellect and the tripartite soul, and the concept of Platonic Forms and its ontological counterpart, the Two-World Theory. More influential than the authentic Plato was the vulgarized Plato of gnomological and doxographical anthologies and popular wisdom literature, and the pseudepigraphic Plato of gnostic, occult, and Neoplatonic writings. The conflation of these traditions during the twelfth and thirteenth centuries initiated a new Arabic Platonism without Plato.

Introduction

The medieval Arabic-Islamic world speaks of Plato as a divine philosopher and sage. Yet his heritage is located largely outside the properly philosophical tradition in Arabic. The philosopher Plato and his dialogues exerted a less intense and lasting influence than the vulgarized Plato of late antique gnomological and doxographical anthologies, the invented Plato of gnostic, occult and neo-Pythagorean traditions, and the pseudepigraphic Plato of Neoplatonic writings and their Arabic transmission (cf. Rosenthal 1940, 1941a, b; Endress 1997:49–52; Walbridge 2000:83–103; Jeck 2004:59–142).

Arabic *Vitae* of Plato

Details about the life of Plato, whose Arabicized name is Aflātūn, were known through translations of Greek sources based on the reports by Theon of Smyrna, Pseudo-Plutarch, Porphyry's *History of Philosophy*, and other, unidentified biographical sources (cf. Walzer 1960:235; Peters 1979:31). Most of these Arabic *vitae*, dating from the tenth to the thirteenth centuries, emphasize the (allegedly) symbolic-allegorical or even cryptic style of Plato's writings. Among the teachers of Plato, Socrates, Timaeus, the Athenian stranger of the *Laws* and the Eleatic stranger of the *Sophist* are mentioned. According to the philosopher al-ʿĀmirī, Plato excelled Socrates and Pythagoras in his knowledge of mathematics and natural science (cf. Rowson 1988:72–75, 203–213). In al-Mubashshir b. Fātik's *Mukhtār al-ḥikam wa-maḥāsīn al-kalīm* and al-Shahrastānī's *Kitāb al-milāl wa-l-niḥāl*, Plato is portrayed as a descendant of the mythological Asclepius. Other prominent biographical topics are Plato's journeys to Sicily and Egypt, his foundation of the Platonic Academy, and his intellectual relationship with Pythagoras and Aristotle. Apart from the sources already mentioned, the most detailed accounts of Plato's life are found in (Pseudo-)Ḥunayn b. Ishāq's *Nawādir al-falāsifa*, Ibn al-Nadīm's *Fihrist*, al-Shahrastānī's *Nuzhat al-arwāḥ wa-rawḍat al-afrāḥ*, Ibn al-Qifṭī's *Taʾrīkh al-ḥukamāʾ*, Ibn Abī Uṣaybiʿa's *ʿUyūn al-anbāʾ fī ṭabaqāt al-aʿtibāʾ*, and the anonymous *Muntakhab Ṣiwān al-ḥikma* (for translations and studies, cf. Gutas forthcoming).

Arabic Bibliographies of Plato's Oeuvre

All works mentioned in the "classical" Greek reports on Plato's oeuvre, such as those by Thrasyllus, Albinus, and Galen, were known by title to the Arabic-writing bibliographers and historians. The earliest and most comprehensive Arabic discussion of the Platonic corpus is found in a treatise entitled *The Philosophy of Plato* (ed. Rosenthal and Walzer 1943). This treatise, which is usually ascribed to the philosopher

al-Fārābī, describes Plato's works in a non-tetralogical arrangement reflecting the supposed development of Plato's thought. It certainly draws on Greek sources, presumably Galen or other closely related Middle Platonic sources (cf. Tarrant 1993:32–38). Another *pinax*, preserved in Ibn al-Nadīm's *Fihrist*, is based on at least two other sources. The first source Ibn al-Nadīm is referring to is the tetralogical arrangement of Plato's dialogues provided by the mathematician Theon of Smyrna, while it is not quite clear whether Ibn al-Nadīm indeed follows strictly Theon's system of division (cf. Lippert 1894:39–50; Tarrant 1993:58–68). Second, Ibn al-Nadīm's account is at least partly indebted to the catalogue of philosophical and scientific books prepared by one of his contemporaries, the philosopher Yaḥyā ibn ʿAdī. This catalogue must have drawn on further sources, as the dialogue *Critias* is referred to under the title *Atlantiscus*, which corresponds with Thrasyllus (as reported by Diogenes Laertius), but not with Theon. While the bibliography in Ibn al-Qifṭī's *Taʾrīkh al-ḥukamāʾ* is heavily indebted to Ibn al-Nadīm's *Fihrist*, Ibn Abī Uṣaybiʿa must have had access to additional sources. He not only mentions dialogues omitted in the lists of Ibn al-Nadīm and Ibn al-Qifṭī (such as *Epinomis*, *Lysis*, and *Politicus*), but also refers by transliterations of the Greek titles to some dialogues mentioned in the earlier bibliographies by Arabicized titles or descriptions only (cf. Gutas forthcoming). With the exception of al-Fārābī, all bibliographers mention also *spuria* that cannot be related to any Greek *pinax* of Platonic works. They also sometimes include the same work twice which points to the fact that the bibliographers used more than one Graeco-Arabic source, without being able to identify different references to one and the same work.

Translations, Summaries, and Commentaries

The Arabic transmission of Plato's works is sporadic, complicated, and as yet not systematically researched (for the history of research on the Arabic Plato, cf. Gutas forthcoming, first section;

a collection of authentic fragments and pseudo-*Platonica* in Arabic has been edited by Badawī (1974). None of the works has been preserved in a complete translation; indeed, it is a matter of doubt whether there were ever any complete translations into Arabic (cf. Rosenthal 1940:393; Reisman 2004:264). The medieval bibliographers report the following translations: (1) *Leges*, translated by Ḥunayn b. Ishāq and by Yaḥyā b. ‘Adī; (2) *Respublica*, translated or paraphrased by Ḥunayn b. Ishāq; (3) *Sophistes*, translated by Ishāq b. Ḥunayn together with the Commentary by Olympiodorus; and (4) *Timaeus*, translated by Yaḥyā b. al-Biṭrīq and corrected by Yaḥyā b. ‘Adī. Of the following dialogues, Arabic fragments of varying length and often of a paraphrastic nature have come down to us: *Crito*, *Leges*, *Meno*, *Phaedo*, *Respublica*, *Symposium*, *Timaeus* (for editions and studies cf. Daiber 1999, vol 2, 434–439; Gutas forthcoming).

From Ḥunayn b. Ishāq’s own report, we know that he and his pupils translated Galen’s Summaries (lost in Greek) of the following eight works: *Cratylus*, *Euthydemus*, *Leges*, *Politicus*, *Parmenides*, *Respublica*, *Sophistes*, and *Timaeus* (cf. Bergsträsser 1925; Boudon-Millet 2000: 455–460). Of these translations, only the Arabic version of Galen’s *Synopsis* of the *Timaeus* is extant today (ed. Kraus and Walzer 1951; cf. Festugière and Tonneau 1952).

In addition to these translations and summaries, a number of Greek exegetical works were known to the Arabs: (1) Galen’s Commentary on the medical contents of the *Timaeus* (cf. Schröder and Kahle 1934; Boudon-Millet 2000:459); (2) excerpts of Proclus’ Commentaries on *Phaedo*, *Respublica*, bk. X, and *Timaeus* (cf. Schmutte and Pfaff 1941; Endress 1973, 28 f.; Rowson 1988); (3) a certain “Exposition” of the *Timaeus* by Plutarch (of Chaeronea?, cf. Pines 1936:90); and (4) Olympiodorus’ Commentary on the *Sophistes* (cf. above).

Furthermore, philosophers writing in Arabic themselves composed works discussing, summarizing, or commenting on the Platonic sources available to them. For example, al-Kindī dealt with the theories of numbers, solids, and harmonic proportions provided in *Respublica* and *Timaeus*

(cf. Rescher 1967; Adamson 2007:160–180); al-Fārābī and Ibn al-Tayyib composed expositions of the *Leges*; Abū Bakr al-Rāzī commented upon Plutarch’s Exposition of the *Timaeus*; Thābit b. Qurra dealt with geometrical problems of the *Meno* and the *Respublica*; and Ibn Rushd (Averroes) wrote a paraphrase of the *Respublica* (cf. Gutas forthcoming).

Elements of Arabic Platonism

Future research is still required to determine the relation between the fragmentary transmission of Platonic works and the doctrines ascribed to Plato in the Arabic tradition. However, there can be little doubt that even the most fundamental doctrines were taken into consideration not as coherent elements of a comprehensive systematic philosophy, but rather as *disiecta membra* which could be fitted together only by means of Aristotelian, Neoplatonic, or genuinely Islamic conceptions. From the very beginning of the Arabic reception up to the seventeenth-century philosophical schools of Shiraz and Isfahan, the topos of the harmony between the doctrines of Plato and Aristotle formed a major motif of the varying forms of Arabic Platonism (cf. Endress 1991; D’Ancona 2006).

Al-Kindī, the first philosopher of the Arabic tradition, tried to reconcile various theories propounded by Plato and Aristotle, in particular their doctrines of the first cause as well as of the intellect and the soul (Endress 1991; Adamson 2007). Plato’s theory of the state, or what was known about it, heavily influenced the political theories of Abū Bakr al-Rāzī, al-Fārābī, the Ikhwān al-Ṣafā’, and others (cf. Walzer 1985:8–18, 424–490; Baffioni 1994, 2004; Daiber 1996). The *Timaeus* could be used to support the doctrines of the creation of the world in time and of divine providence, which appealed to many philosophers writing in Arabic (cf. D’Ancona 2003). Al-Kindī, al-Daylamī, Miskawayh, and others adopted and modified (by means of Neoplatonic concepts) Plato’s thoughts on love (cf. Rosenthal 1940; Walzer 1957). The theory of the tripartite soul expounded in *Respublica* and *Timaeus*, as

well as the separation of body and soul in the *Phaedo* exerted an enormous influence on Islamic theories of the soul, its immortality, and its virtues (cf. Rosenthal 1940; Peeters 1979; for the *Phaedo* see especially Bürgel 1971; Bielawski 1974; Biesterfeldt 1991). The philosophy of Shihāb al-Dīn al-Suhrawardī initiated a long-lasting debate about Platonic Forms and Paradigms that were discussed in connection with various Two- or Three-World Theories (cf. Arnzen 2009a, 442 f.).

Gnomologies and Doxographies

Plato is one of the most prominent figures in medieval Arabic gnomologies, doxographies, and anthologies of (alleged) quotations (cf. Rosenthal 1940, 1941a). Most gnomological collections, which ultimately depend on a Greek corpus dating from late antiquity, transmit wise sayings from various authorities, but there are also collections focusing solely on Plato (cf. Gutas 1975; Arnzen 2009b). While the early Arabic doxographies include mostly authentic materials, those of the later period by and large tend to incorporate materials taken from pseudepigrapha and inauthentic gnomologies. Furthermore, we know works of a hybrid genre, which include authentic quotations from Platonic works and Galen's *Summaries* together with pseudepigraphic doxographical and gnomological materials (cf. Arnzen 2009b).

Pseudepigrapha

The vast genre of Arabic pseudo-*Platonica* comprises three main corpora. The first and most remote group in terms of authenticity is formed by treatises on occult and hermetic sciences. Prominent examples of alchemical works are the so-called *Summa Platonis*, the *Book of Tetralogies* (*Kitāb al-Rawābīʿ*) in dialogue form, and the *Kitāb Muṣaḥḥahāt Aflātūn*, which forms part of the *Corpus Jabirianum* and introduces a certain Timaeus into the secrets of alchemy (cf. Singer 1946; Ullmann 1972, 155 f.; Thillet 2005). Other

works of this corpus deal with astrology, occult practices performed on living and dead animals, or magic art based on symbolisms of numbers and letters or spells (cf. Ullmann 1972:287, 365, 452; Pingree 1993). Many of these treatises were translated into Latin during the Middle Ages (cf. Hasse 2002).

A second group of pseudo-*Platonica* is constituted by works aiming at moral refinement and political education, for example, a number of *Platonic Testaments*, various epistles, and the so-called *Exhortation Concerning the Education of Young Men*, which adopts neo-Pythagorean concepts of economics, pedagogy, and politics (cf. Rosenthal 1941b). Another influential work of this group is the *Book of the Laws* (*Kitāb al-Nawāmīs*, obviously alluding to Plato's *Leges*) which treats the relationship between religion, philosophy, and sociopolitical issues (cf. Tamer 2005).

Finally, there is the rather disparate group of extracts from the Arabic *Plotiniana* and *Procliana*. Sections falsely attributed to Plato include excerpts of the *Liber de Causis*, an Arabic adaptation based primarily on Proclus' *Elementatio theologica*, as well as excerpts of the Arabic adaptations of Plotinus' *Enneads* IV–VI (cf. D'Ancona and Taylor 2003; D'Ancona 2004). This group of pseudo-*Platonica* forms the main source of inspiration for the post-Suhrawardian Arabic Platonism without Plato.

Platonism

Stephen Gersh

The Medieval Institute, University of Notre Dame, Notre Dame, IN, USA

Abstract

This entry provides a survey of the medieval phase of the history of Platonism. Spanning the period from the ninth to the fourteenth century, the medieval phase represents a direct tradition of Platonism to the extent that it is based on the reading of Plato's *Timaeus* and an indirect tradition to the extent that it depends on non-Christian and Christian authors of late antiquity. Medieval Platonism is also characterized by its close relation to the medieval curriculum of the Trivium (verbal arts) and Quadrivium (numerical arts) and by its dependence on sources written originally in or translated into Latin. Moving in chronological sequence, the entry focuses on arguably the three most important groups of thinkers within the medieval Platonic tradition from the threefold angle of their use of textual authorities, their modes of reasoning, and their doctrinal positions. Thus, (1) John Scottus

Eriugena (early to middle ninth century) represents a Platonism, which might be termed “Patristic”; (2) Thierry of Chartres and Bernard Silvestris (early twelfth century) represent a Platonism exhibiting a blend of “Humanistic” and “Encyclopedic” tendencies; and (3) Dietrich of Freiberg and Berthold of Moosburg (late thirteenth to early fourteenth centuries) represent a Platonism that might be labeled “Scholastic.”

Medieval Platonism can be understood, to a large extent, as a complicated and evolving response to Plato’s *Timaeus*. The most important part of this dialogue (to 53c) was translated into Latin and equipped with a commentary by Calcidius during the early fourth century. Complete Latin translations of Plato’s *Meno* and *Phaedo* by Aristippus of Catania and a partial Latin translation of the *Parmenides* – attached to Proclus’ incomplete commentary on the dialogue – by William Moerbeke acquired a limited circulation from the thirteenth century onward. However, the translation and commentary of Calcidius represented not only the definitive presentation of Plato’s own doctrine during the Middle Ages but also the nucleus around which various further “Platonic” doctrines could be configured. These additional teachings were derived either from non-Christian authors of late antiquity or from the Church Fathers, in the latter case acquiring indirectly the superior doctrinal authority of their biblical source.

Two general features of this *Timaeus*-influenced tradition may be distinguished. First, medieval Platonism was elaborated on the basis of the Trivium and Quadrivium. In line with the philosophical preoccupations of the *Timaeus* itself, medieval thinkers tended to emphasize grammar and rhetoric over dialectic among the verbal arts and arithmetic, astronomy, and music over geometry among the numerical arts. Although the sevenfold curriculum was modified in the twelfth century with the introduction of further arts and again in the thirteenth century under the influence of the Aristotelian university curriculum, the general interpretation of Platonism in terms of the liberal arts remained

paramount. Secondly, medieval Platonism was developed in the context of the Latin language. Given that the study of Greek language and literature was never part of the medieval curriculum, the various non-Christian and Christian texts used to supplement the “Platonism” of the *Timaeus* and the other dialogues were exclusively those written by Latin authors.

In this entry, the period of “medieval Platonism” will be defined as beginning in the ninth century, where an intellectual phenomenon that is both authentically medieval and genuinely philosophical appears for the first time, and as ending in the fourteenth century, after which the “Platonic” philosophy is sufficiently influenced by humanistic approaches to be considered as postmedieval. Even when considered within these chronological limits, however, “medieval Platonism” emerges as a very complex historical and philosophical notion. In order to provide an adequate description within a brief compass, it will perhaps be most useful to proceed (a) by considering three historically distinguishable groups of thinkers in chronological order and (b) by examining separately the authoritative texts, the methods of reasoning, and the doctrinal assumptions of each group.

The literary activity of John Scottus Eriugena, a scholar of Irish origin working in northern France, can be placed in the early to middle ninth century. Although he can also be considered a typical representative of the powerful grammatical and logical tradition established by Alcuin of York in the previous century, Eriugena was absolutely unique in developing a comprehensive philosophical system from these and other elements and expounded it at length in his treatise entitled *On Natures*. He is the first writer of the medieval period whom it would be reasonable to describe as a Platonic philosopher, although he probably did not grasp the extent to which he was a follower of that tradition. In fact, he combines overt criticism of certain doctrines explicitly held by “the Platonists” with a less emphatic dependence on many other Platonic teachings, for example, by attacking the transmigration of souls in his early *Glosses on Martianus Capella* but introducing the world soul into the fourth book of *On Natures*.

This twofold approach to the Platonic tradition broadly follows a pattern established by certain writers of late antiquity in seeing the Platonists as the ancient thinkers who had a partial illumination of Christian truth.

From the textual viewpoint, the Platonism of Eriugena might best be characterized as “Patristic.” The writer’s dependence primarily upon Augustine among the Latin Church Fathers is apparent in his early treatise *On Predestination* – which starts from a dispute over the correct interpretation of Augustine on this topic – and continues in the later *On Natures*. His dependence on (Pseudo-)Dionysius the Areopagite among the Greek Church Fathers, a literary relation made possible by his own previous achievement of translating the complete works of this pseudonymous writer into Latin, is the most obvious hermeneutic feature of *On Natures* as a whole. Beginning in his earliest works, Eriugena further combines the textual authority of Boethius with that of Augustine and Dionysius. Boethius’ writings can be seen as having provided him with a unique paradigm for the conceptual assimilation of Platonic thought, since they presented simultaneously an explicit Platonism in *On the Consolation of Philosophy* and three kinds of implicit doctrine: the Platonism of Augustine’s scriptural exegesis in Boethius’ *On the Trinity*, a Neo-Pythagorean variant of the same tradition in his *On Arithmetic* and *On Music*, and the Platonism of Greek Aristotelian Commentary in Boethius’ two commentaries *On Porphyry’s Introduction*.

From the methodological viewpoint, Eriugena’s Platonism is grammatical and dialectical in character. It is “grammatical” to the extent that (1) its philosophical doctrines are developed from a movement between the linguistic signifier and a linguistic signified, especially in the form of etymologies, and from a movement between one linguistic signified and another, particularly in the form of the (pagan) allegory or the (Christian) spiritual sense, and also to the extent that (2) these developments of philosophical doctrine occur in the context of reading, the decoding of hidden meanings, rather than writing, the encoding of hidden meanings. Among examples of etymologies yielding Platonic meaning, one

might mention from the *Glosses on Martianus Capella*, the interpretation of Calcidius’ term *entelechia* applied to the world soul as “interior eternity” and also the interpretation of Martianus Capella’s *an(o)ia* applied to divination as “super-intelligence.” Among examples of allegories yielding Platonic meaning, one might mention from the third book of *On Natures* the interpretation of the first 3 days of creation as signifying the emanative power of God, the distinction between the higher and the lower worlds, and the Forms of the four elements, respectively. Eriugena’s Platonism is “dialectical” to the extent that its philosophical doctrines are developed from the movement among linguistic signifieds of such specific logical types as terms, propositions, and syllogisms.

In order to make its relations with the later tradition clear, we might summarize the content of Eriugena’s Platonism under the headings of theology, cosmology, and psychology, these terms not being applied in exactly this way by the original authors. In connection with the theological domain, several important doctrines may be distinguished. On the one hand, there is the teaching that affirmative language applied to God, for example, saying that “God is living,” actually signifies God’s immanence in the creature and represents a metaphorical usage with respect to God himself but that negative language, for example, saying that “God is not living,” actually refers to God’s transcendence of the creature and represents a literal usage with respect to God himself. This doctrine is adapted from Pseudo-Dionysius. Another important doctrine in connection with the theological domain is the notion that Aristotelian categories like substance, quality, and quantity can provide a framework for affirmative language applied to God, for example, in saying that “God is existent,” “God is good,” and “God is great,” but that the accidental categories must be converted into substantial form, for example, by understanding “God is good” to mean “God is goodness,” etc. Here, the source is Augustine together with Boethius. With respect to the cosmological sphere, several important doctrines may be distinguished. First, there is the notion – derived from the dialectical tradition – that God or

Nature comprises four species: the “Not-Created and Creating” or God as beginning, the “Created and Creating” or the causes of spatial and temporal effects, the “Created and Not-Creating” or the effects of the nonspatial and nontemporal causes, and the “Not-Created and Not-Creating” or God as end. Given that the relations between the first and fourth species, between the second and third, and between the two pairs are said to exhibit various degrees of mind-dependence with respect not only to the divine but also to the human mind, the articulation of this complex structure reveals the extent to which the emanative relation between cause and effect typical of ancient Platonism has been shifted from the realist into the idealist register. A second important doctrine with respect to the cosmological sphere – derived from the patristic tradition – is the notion that the 6 biblical days of creation represent not God’s separate acts of producing various things in a sequence of temporal phases but a set of relations between God and different things linking the non-temporal and temporal spheres themselves. In connection with the psychological domain, there is one doctrine that reflects the first doctrine mentioned in connection with the theological domain. Just as with respect to God an affirmative statement saying that “God is living” refers to God’s immanence in the creature in general and a negative statement saying that “God is not living” refers to his transcendence of the creature in general, so with respect to Man, an affirmative statement saying that “Man is animal” refers to his immanence in the lower creature and a negative statement saying that “Man is not animal” refers to his transcendence of the lower creature. This extrapolation from Pseudo-Dionysius is highly original.

Thierry of Chartres, whose more usual medieval name Thierry “the Breton” (Britto) shows his national origin, and Bernard of Tours, who acquired the nickname Bernard “Silvestris” from the prominent role of *silva* (“matter”) in his writing, were the two leading members of a proto-humanistic circle of scholars working in northern France during the first half of the twelfth century, which is usually albeit controversially labeled “The School of Chartres.” That these writers

thought of themselves as followers of the Platonic tradition is indicated by Bernard’s dedication of a work to his teacher Thierry in which – repeating a formula that Augustine once applied to Plotinus – the pupil describes the master as the reincarnation of Plato. The Platonism of Thierry emerges most clearly in his three commentaries on Boethius’ *On the Trinity* and in the summary of a lecture-course covering Boethius’ *On the Trinity*, *On the Hebdomads*, and *Against Eutyches and Nestorius*, and that of Bernard in his commentaries on Virgil’s *Aeneid*, books I–VI, and on Martianus Capella’s *On the Marriage of Philology and Mercury*, and in his poetical and philosophical work *Cosmography*.

From the textual viewpoint, the Platonism of Thierry of Chartres and Bernard Silvestris might best be characterized as a mixture of the “Humanistic” and the “Encyclopedic,” the former term indicating their preoccupation with ancient Latin writers and the latter term the compiling style of the ancient Latin writers with whom they were preoccupied. Among these ancient writers, Apuleius was the author of a treatise *On Plato and his Doctrine*, which supplied a biography of the philosopher and an account of some of his theories. Calcidius translated and commented on Plato’s *Timaeus*, demonstrating the possibility of combining “Middle Platonic” and “Neoplatonic” doctrines of first principles. The work entitled *Asclepius* and attributed to the quasi-mythical writer “Thrice-Great” Hermes – whose authority for Christian readers had been established by Lactantius – served as a kind of parallel witness to the Pseudo-Dionysian theology. Macrobius commented on Cicero’s *Dream of Scipio*, providing the only summary of the “Neoplatonic” doctrine of the three first principles or hypostases available to the medieval reader. Martianus Capella was the author of a treatise *On the Marriage of Philology and Mercury*, which explained the structural relation among the seven liberal arts in Platonic or Pythagorean terms.

From the methodological viewpoint, Thierry of Chartres’ and Bernard Silvestris’ Platonism is grammatical and dialectical in the manner defined earlier. However, Bernard’s philosophy – at least in the case of his *Cosmography* – is also rhetorical

in character. It is “rhetorical” to the extent that (1) its philosophical doctrines are developed from a movement between the linguistic signifier and a linguistic signified, especially in the form of etymologies, and from a movement between one linguistic signified and another, particularly in the form of the (pagan) allegory or the (Christian) spiritual sense, and also to the extent that (2) these developments of philosophical doctrine occur in the context of writing, the encoding of hidden meanings, rather than of reading, the decoding of hidden meanings. Bernard’s rhetorical practice adapts to Platonic purposes a number of semantic distinctions that have been explained in his commentaries. Within the sphere of allegory, Bernard distinguishes between single terms (nouns) having primary and secondary meanings, for example, the Sun signifying the heavenly body and the Form of the Good, and combined terms (nouns + verbs) having primary and secondary meanings, for example, the fabrication of the world soul signifying a mythical craftsman’s activity and the dynamic structure of nature. Within the allegorical sphere, Bernard also distinguishes between single terms having a plurality of (primary and secondary) meanings, for example, the goddess Juno signifying both the element of air and the practical life, and pluralities of terms having a single (or primary) meaning, for example, both the god Jupiter and the man Anchises signifying the Christian God.

The content of Thierry of Chartres’ and Bernard Silvestris’ Platonism might be summarized under the headings of cosmology and psychology, theology being somewhat absorbed into cosmology in this system. The cosmological doctrine includes at least four points of interest. First, there is what might be termed the theory of four considerations. According to Thierry, the universe can be considered in four ways: in “absolute necessity” or where the Forms of things exist in a transcendently enfolded state in God, in “necessity of complication” or where the Forms are unfolded above individual things, in “determinate possibility” or where the Forms are unfolded within individual things, and in “absolute possibility” or where the Forms of things exist in an immanently enfolded state in Matter. Although

the fourfold consideration of the universe was probably derived from Augustine and the creative process of enfolding and unfolding probably from Boethius’ *On the Consolation of Philosophy*, the combination of these ideas to produce an emphatically idealist sense of divine causality seems to be Thierry’s innovation. A second important feature of this twelfth-century cosmology is the preoccupation with arithmetic. In dependence upon the Pythagorean tradition represented in the Latin-speaking world by Boethius’ *On Arithmetic* and according to which the transcendent Forms are equivalent to numbers, Thierry can argue dialectically that equality and inequality are inseparable determinations of divine power, that the generation of persons within the Trinity involves equality whereas the production of the creature outside the Trinity involves inequality, that the generation of persons within the Trinity can be expressed by the formula $1 \times 1 = 1$, and that the production of the creature outside the Trinity represents the multiplication of 1×2 , 1×3 , 1×4 , etc. Thirdly, there is what might be termed the theory of four causes. According to Thierry, there are four causes of the world’s substance: the efficient cause, which is the Being of God; the formal cause, which is the Wisdom of God; the final cause, which is the Goodness of God; and the material cause, which is the four elements; it being necessary to posit such an efficient cause because the world is mutable, such a formal cause because the world is orderly, such a final cause because the world is not self-sufficient, and such a material cause because the world must proceed from disorder. The originally Aristotelian theory of the four causes was probably derived from Macrobius’ *Commentary on the Dream of Scipio*, and the identification of God with the Platonic transcendent Form probably from Boethius, although the emphatically immanent sense of divine causality produced by the combination of the two doctrines seems to be Thierry’s innovation. A fourth important feature of this twelfth-century cosmology is the preoccupation with music. Following the Pythagorean doctrine made available to Latin readers through Calcidius’ *Commentary on the Timaeus* and according to which immanent forms are connected by proportions, Bernard can

describe allegorically the absence of proportions in Matter and the introduction of such proportions by Form; the separation of the elements according to their properties of hotness, coldness, dryness, and wetness; and the consequent perfecting of the world's body.

It is in connection with the psychological doctrine of Thierry of Chartres and Bernard Silvestris that the problems of assimilating Platonic philosophy become more evident. By the ninth century, the relation of derivation between the world soul and individual souls – suggested by the Artificer's production of soul in the *Timaeus* – was viewed as problematic because of the Christian emphasis on the autonomy of individual moral responsibility. Eriugena's response to the problem had been to separate the problematic horizons of the universal and individual souls entirely by identifying the universal soul with the form of Life in which individual living things participate and to treat individual souls – together with their idealized bodies – as constituents of something called the “plenitude of humanity.” In the twelfth century, the world soul had again become the focus of debate. Now the relation of identity between universal soul as third hypostasis and Holy Spirit as third person – suggested by combining the Christian Trinity with the Neoplatonic hypostases – was seen as problematic because of the Christian dogma of consubstantiality in the Trinity. Thierry of Chartres attempts to solve the problem by distinguishing between the “supreme Trinity” and the “trinity of perpetual things” and treating the latter as an external reflection of the former. Thus, the three persons of the supreme Trinity can have a non-subordinating relation among themselves, whereas the three members of the trinity of perpetual things may have a subordinating relation. Moreover, the third member of the latter trinity can be identified not only with the world soul of the *Timaeus* but also with the “Nature” mentioned in Cicero's dialogues and the “Spirit” mentioned in the Hermetic *Asclepius*. Bernard Silvestris seems to have followed this solution in identifying the relation of external reflection between the supreme Trinity and the trinity of perpetual things with a relation of allegorical expression. Concerning the problem of the

relation between the universal soul and the individual soul, it is worth noting that, whereas this problem had been solved in the early medieval period by considering the universal soul primarily in terms of its lower phase of life and then identifying the latter with God – as form of life – the same problem will be solved in the later medieval period by considering the universal soul primarily in terms of its higher phase of intellect and then identifying the latter with God, as agent intellect.

Dietrich of Freiberg and Berthold of Moosburg are two of the most distinguished members of the late thirteenth- and early fourteenth-century German philosophical tradition founded by Albert the Great. Dietrich held many of the most important academic and administrative positions of the Dominican order both in Paris and in Germany, while Berthold held more minor positions of the same order at least in Germany. Both can be considered Platonists to the extent that they start from Albert's position that Plato and Aristotle are fundamentally in agreement and that they specialize in the interpretation of intensely Platonic sources, although Berthold begins to emphasize certain differences between Plato and Aristotle, which indicate the superiority of the former. With respect to their exposition of Platonism, the most important of Dietrich's numerous works are perhaps *On the Beatific Vision*, *On the Intellect and the Intelligible*, and *On Being and Essence*, while Berthold is represented by his single enormous work entitled *Exposition of Proclus' Elements of Theology*.

From the textual viewpoint, the Platonism of Dietrich of Freiburg and Berthold of Moosburg might best be characterized as “Scholastic.” Within the largest repertoire of philosophical texts assembled during the Middle Ages, the earlier Greek writings most often studied by these Scholastic Platonists were undoubtedly the works of Aristotle and Proclus' *Elements of Theology*. The former represented an authority to be overtly challenged or subtly undermined, whereas the latter furnished a paradigm of the systematic organization of Platonic thought through dialectical exposition. Various works of a decidedly Platonic character were drawn from different cultural milieus: from the Arabic world, the anonymous

Book of Causes, which provided a summary of Neoplatonic emanation theory; from Jewish literature, the Fountain of Life by Avicbron, with its influential theory of the universal relation between form and matter; and from the Byzantine world, Eustratios' Commentary on Aristotle's Nicomachean Ethics, which provided a defense of the theory of Forms. The earlier Latin writings most often studied by the Scholastic Platonists were perhaps the works of Anselm of Canterbury and the Physical Key of "Theodorus." The former was celebrated for proving the existence of God through his definition, whereas the latter provided a summary of Eriugena's doctrine detached from its author's controversial name.

From the methodological viewpoint, the most decisive change in the medieval approach to Platonism occurs in the work of Dietrich of Freiburg and Berthold of Moosburg. Whereas between the ninth and twelfth centuries, the grammatical method of decoding hidden meanings in the form of etymologies and allegories or the rhetorical method of encoding hidden meanings in the form of etymologies and allegories had been as prominent as the dialectical methods of constructing propositions and syllogisms among thinkers with Platonic leanings; during the thirteenth and fourteenth centuries, the dialectical methods come to the forefront. Berthold of Moosburg provides dramatic evidence of this shift in his voluminous Exposition of Proclus' Elements of Theology. The preface to this work includes some remarks about the history of philosophy in which the commentator explains that Plato had originally expressed his thought in concealed teachings, that Plotinus' contribution was to remove the coverings, and that Proclus finally organized the thought into propositional form. In the main body of the work, each of the 211 propositions that make up the Elements of Theology receives a separate treatment divided into (A) discussion of Proclus' proposition subdivided into (1) analysis of earlier propositions presupposed by the current proposition and (2) analysis of the proposition itself and (B) discussion of Proclus' proof.

The shift toward dialectic in these late medieval thinkers is reinforced by their shift toward

idealism. It had been a feature of Christian Platonism since Augustine's time to view the derivation of first principles less as an emanative process completed by intellection – that is, where the One is followed by intellect – than as an emanative process commenced by intellection, that is, where God is coextensive with intellect. This position was assumed in Eriugena's doctrine of the four species of Nature and Thierry of Chartres' doctrine of the four considerations, given that in both cases a dialectical process within the divine intellect underlay the corresponding dialectical process in the human intellect. Now toward the end of the thirteenth century, Dietrich of Freiberg continues this approach but also radicalizes it by introducing the ontological category of "conceptional being." This latter represents neither a self-thinking subject – as was generally the case with the earlier idealisms – nor a mere being of reason but rather the self-knowing, which knows itself in a subject's thinking of its object, the subject being the various created intellects and the object Being qua Being. Dietrich's doctrine of conceptional being is certainly a novelty in medieval thought although it is anticipated in certain respects by Plotinus' notion of authentic being in *Enneads* VI. 4–5.

In order to make its relations with the earlier tradition clear, we might again summarize the content of Dietrich of Freiberg's and Berthold of Moosburg's Platonism under the headings of theology, cosmology, and psychology. Among the more important doctrines within the theological domain, there is one in which the rejection of Aristotle in favor of Plato comes into focus. Berthold's Exposition of Proclus' Elements of Theology begins by noting that, although these philosophers agree that multiplicity is a distinction of things or reasons, they disagree about the basis for this distinction. For Aristotle, unity is a "transcendental," since the opposition of being and nonbeing – which is transcendental – is the basis of the distinction between unity and multiplicity. But Plato is more correct in saying that unity – that is, the "One" – is above being and nonbeing and that the basis of the distinction between unity and multiplicity is degree of power. This discussion is explicitly based on

Aristotle's *Metaphysics* and Eustratios' *Commentary on Aristotle's Nicomachean Ethics* but also assumes the teaching of Dietrich of Freiberg. Toward the end of his treatise *On Intellect and the Intelligible*, Dietrich turns to considering the highest objects of intellect – including terms like unity and being – and explains that these constitute “reasons” that are identical with God. Although one can distinguish within the cognitive process in each case a reason in God, in the agent intellect, and in the possible intellect, and also a determinate phantasm accompanying each intelligible object, there is ultimately no plurality of reasons in the activity of intellection. This decidedly Platonic conclusion to Dietrich's discussion of intellect and the intelligible closely follows Augustine's account of angelic knowledge. Among the doctrines utilized by Dietrich and Berthold within the domain of cosmology, the notion of “essential cause” is particularly important. As derived explicitly from Proclus' *Elements of Theology*, this idea replaces the notion of horizontal causal relations between two individual things on the same level of reality with vertical causal relations between a more universal thing on one level and a more particular thing on another. Strictly speaking, an essential cause is that which pre-contains its effect in a higher mode than that in which the latter itself exists and therefore causes the latter through its own essence as an intellectual principle. The cosmological structure of the four “manners” unfolds according to this principle of essential causality. Thus, Dietrich and Berthold also derive from Proclus' treatise a basic analysis of reality in terms of the four levels of body, soul, intellect, and unity – each level having special characteristics marking it off from other levels – although the medieval thinkers deviate from their ancient predecessor in emphasizing that body, soul, and intellect are simultaneously multiplicities of “real” beings and unities of “conceptual beings.” Another doctrine utilized by Dietrich and Berthold within the domain of cosmology and having particular importance is that of being and essence. With something of a departure from the *Elements of Theology*, this doctrine combines the notion of a cause pre-containing its effect in a higher mode than that in which the latter itself

exists with a new understanding of emanative causality. According to the latter, the sameness constituting one side of the relation between cause and effect is associated strictly with the essence, whereas the difference constituting the other side of that relation is associated strictly with being. Finally, among the more important doctrines in the psychological domain, there is one in which it is less a question of rejecting Aristotle in favor of Plato than of reading Aristotle through Plato. Dietrich's *On the Blessed Vision* provides a detailed account of both the agent intellect and possible intellect of Aristotle in order to show that the beatific vision must occur in the former. The relation between the agent intellect, which knows itself and its object internally and essentially, and the possible intellect, which knows itself and its object externally and accidentally, clearly involves essential causality and emanation. By identifying it with the relation between the hidden mind and exterior thought described in Augustine's *On the Trinity*, Dietrich can show that “the Philosopher” agrees with theology.

This entry has attempted to argue briefly that, behind the bewildering multiplicity of methodological and doctrinal forms, “medieval Platonism” has a conceptual unity and a definite structure. However, it has not been possible to discuss all the significant figures here. A complete list would have to include in the twelfth century Adelard of Bath who combined the study of Plato with an interest in Arabic science; Bernard of Chartres who is responsible for the earliest glosses on the *Timaeus*, which can be associated with a named author; and William of Conches who commented on Plato, Macrobius, and other Platonists. In the thirteenth century, the contributions of Ulrich of Strasbourg who codified the Albertist synthesis of Platonism and Aristotelianism and of Meister Eckhart who presented a powerful new rhetorical expression of Platonism in his vernacular *Sermons* would also have to be acknowledged.

Platonism, Renaissance

Stephen Gersh

The Medieval Institute, University of Notre Dame, Notre Dame, IN, USA

Abstract

This entry provides a survey of the Renaissance phase in the history of Platonism and covers the period roughly 1440–1500. Renaissance Platonism is distinguished from medieval Platonism on account of its access to Greek texts and Latin translations of works by Plato himself and by his ancient commentators which had been unavailable earlier. The brief initial phase of Renaissance Platonism is represented by the work of humanist translators of Plato for whom the ethical aspects of Plato's early dialogues were the primary concern. A much longer second phase was initiated by Marsilio Ficino, for whom the cosmological and theological elements in the dialogues of Plato's middle and later periods and the "Platonism" (really Neoplatonism) of late antique thinkers became the main focus. With respect to the latter phase, this entry discusses (1) four main tendencies in Renaissance philosophy: a new understanding of human subjectivity, exploration of the relations between rhetoric and magic, a new understanding of the role of mathematics, and the elaborate historiography of philosophy and (2) three major Platonic philosophers in whom the interplay of these tendencies can be traced: Nicholas of Cusa, Marsilio Ficino, and Giovanni Pico della Mirandola.

The Platonism of the Renaissance is distinguished from the medieval phase of the same tradition by its increased access to serviceable Latin translations and in certain cases also to original Greek texts of Plato's and the ancient Platonists' writings. This new situation resulted primarily from the activity of collectors bringing Greek manuscripts from Byzantium to Italy in the decades before 1453 and of humanists wishing to promote a general pedagogy based on the study of ancient literature.

A first phase of Platonic translation and study can be associated for the most part with the humanists themselves. In the early 1400s, Uberto and Pier Candido Decembrio – with the assistance of a Byzantine *émigré* named Manuel Chrysoloras – produced a translation of Plato's *Republic*. In the 1440s another version of the *Republic* and versions of the pseudo-Platonic *Axiochus* and *Eryxias* were composed by Antonio Cassarino. Before 1427 Leonardo Bruni produced translations of the *Apology*, *Crito*, and *Phaedo*, of the first part of the *Phaedrus*, of the *Gorgias*, and of several *Letters*. Among humanists of later decades, Cencio de' Rustici translated the *Axiochus* and *De virtute*; Lorenzo Lippi the *Ion*; Rinuccio Aretino the *Crito*, *Axiochus*, and *Euthyphro*; Francesco Filelfo three *Letters*; and Angelo Poliziano a section of the *Charmides*. With this group may be associated the Aristotelian George of Trebizond – a Byzantine convert to Catholicism – who translated the *Laws*, *Epinomis*, and *Parmenides* in the 1450s.

Typical of the humanist approach to Plato is a preoccupation with the literary, pedagogic, and ethical issues raised by the early "Socratic" dialogues and especially with the analysis of different political institutions in the *Republic*. This interpretation does not make use of the ancient commentary tradition with respect to Plato. In stark contrast to this stands the work of Ficino. His approach to Plato may be characterized by its emphasis on the theological, cosmological, and eschatological doctrines of the middle and later dialogues, together with its specific agenda of reconciling philosophy and Christianity through Platonism. In this interpretation, the ancient commentary tradition with respect to Plato acquires an overwhelming importance.

Marsilio Ficino's public career as a Platonist commenced in earnest in 1463 when he was asked to translate Cosimo de' Medici's Greek codex of Plato, and within about 2 years, he had translated ten dialogues, two of which – the *Parmenides* and the *Philebus* – he read aloud to Cosimo on the latter's deathbed. The complete *Platonis Opera omnia* together with Ficino's important introductory notes – the *argumenta* – was printed in 1484, although provisional manuscript versions of many of the dialogues were obviously being used by Ficino and circulated among his associates before that date. Also in 1484, Ficino's commentary on the *Symposium*, also known as *De amore* and itself written in dialogue form, was printed for the first time. Ficino's extended commentaries on the *Phaedrus*, *Sophist*, *Philebus*, *Timaeus*, *Parmenides*, and an extract of *Republic VIII* (dealing with the so-called nuptial number) were published in the collected volume *Commentarium in Platonem* in 1496, although some of the commentaries were still unfinished at that point.

The Renaissance interpretation of Platonism depends, in the first instance, on sources not exploited within the medieval philosophical curriculum. Among the late ancient Greek works beginning to have an impact at this time were the *Hermetic Corpus*, Plotinus' *Enneads*, and Iamblichus' *On the Mysteries of the Egyptians*, of which Ficino's translations were published in 1471, 1492, and 1497, respectively. Together with this group may be considered Proclus' *Platonic Theology*, of which the translation by Pietro Balbi was circulating in manuscript from 1462. The Greek text of Syrianus' *Commentary on Aristotle's Metaphysics* was studied during the last decades of the fifteenth century and that of Damascius' *On First Principles* after the middle of the sixteenth, although neither work had been translated. Ancient Greek sources were occasionally supplemented by Byzantine works, for example, Michael Psellus' *On the Operation of Demons*, Nicholas of Methone's *Refutation of Proclus' Elements of Theology*, and George Gemistos Plethon's *Commentary on the Zoroastrian Oracles*, and on at least one occasion by an Arabic work, the so-called *Theology of Aristotle* of which a translation appeared in 1519.

The Renaissance interpretation of Platonism also depends on sources which had been utilized within the medieval philosophical curriculum, although it expands the reading of those sources by presenting them in new combinations with one another and with Greek writings. For the writers of the fifteenth and sixteenth centuries as for their medieval predecessors, Augustine and Pseudo-Dionysius the Areopagite provide the fundamental rationale for the study of Platonism within a Christian context. Medieval translations of ancient Greek works such as Proclus' *Elements of Theology*, *Three Minor Treatises*, and *Commentary on the Parmenides* – completed by William of Moerbeke in 1268, 1280, and 1286, respectively – continue to be used and indeed become more widely known. Arabic works in medieval translations, including the treatise known as *On Causes*, which was ultimately derived from Proclus' *Elements of Theology*, remain in circulation. Medieval writers such as Anselm of Canterbury, William of Conches, Thierry of Chartres, Thomas Aquinas, Henry of Ghent, and Giles of Rome provide further useful models for theorizing in the Christian Platonic manner. Among medieval writers, Ramon Llull exercised more influence over philosophers of the fifteenth and sixteenth centuries than he did over any nearer his own time.

That Platonic philosophy was not universally welcomed during the Renaissance is shown by the outbreak of two controversies which were deliberately linked for polemical reasons. The first concerned the compatibility between Platonic doctrine and Christian morality and was raised by the theory of the community of wives in the *Republic*, the frequent homosexual suggestions in dialogues like the *Charmides* and *Symposium*, and the references to Socrates' daemon in the *Apology*. The second concerned the relative merits of Plato and Aristotle and was material to the encounter between Byzantine theologians and Latin scholastics at the Councils of Ferrara and Florence (1438–1439), called to debate union between the Orthodox and Catholic churches. The development of both controversies is perhaps best documented by the extensive treatise *Against the Calumniator of Plato* of Cardinal Bessarion

(1469), directed at George of Trebizond. That Platonic philosophy was not universally welcomed during the Renaissance is also indicated by the fact that university education in Italy continued to be dominated by Aristotelian studies. Although the important Platonic philosophers of the fifteenth and sixteenth centuries had all studied in major European universities – for example, Nicholas of Cusa, Marsilio Ficino, and Giovanni Pico della Mirandola – it is a notable fact that they pursued their professional careers almost exclusively outside such an environment.

The use of a term like “Renaissance Platonism” as suggesting a unitary intellectual phenomenon is perhaps somewhat questionable in a situation, such as that obtaining during the fifteenth century, where the works of various independent thinkers rather than the collective activity of an institution are at issue. Nevertheless, since there are certain common features bringing the fifteenth-century thinkers into a group and distinguishing their Platonism from medieval Platonic or Aristotelian philosophy, we will retain the term “Renaissance Platonism” at least as a convenient shorthand expression.

In comparison to its medieval forerunner, the Platonism of the fifteenth century is characterized especially by its greater emphasis on the problems of practical philosophy. This emerges in the sphere of ethics with the debate over homosexual and heterosexual love occasioned by the reading of Plato's dialogues in Bessarion and Ficino and in the sphere of politics with the attempts of Nicholas of Cusa to apply Platonism to the agenda of religious concord. In fact, the Platonism of the fifteenth century is characterized by a tendency to elevate practical philosophy to the level of theoretical philosophy and sometimes even to undermine the distinction between the two types of philosophy. These developments can be studied in the context of several related phenomena: a new understanding of human subjectivity, exploration of the hidden relations between magic and rhetoric, a new approach to mathematical thinking, and a greater awareness of the historical foundation of philosophy itself.

The new understanding of human subjectivity is revealed in certain tendencies toward

individualism and relativism. Whereas the human subject of medieval thinking was assimilated to a framework of generic and absolute qualities – except to the extent that the Christian doctrine of salvation depended on the notion of individuality in the moral domain – the human subject of fifteenth-century speculation played a more practical role in the constitution of itself and its world. This new approach can be seen in Nicholas of Cusa's epistemology, where the human being is in a certain sense liberated by its own limitation. For Nicholas, since the relations existing between a finite human being and another finite human being and between all finite human beings and the infinite divine truth are incommensurable, the human subject is forced to define itself epistemologically with respect to these two spheres through a creative process of "conjecture" (*coniectura*).

There is what might be called a magical element recalling the contrast between the manipulation of internal or mental images called "cabala" by Pico della Mirandola and the manipulation of external or sensory images called "magic" by the same author.

The new understanding of the role of mathematics takes the form of a shift from theologically orientated arithmetic to physically orientated geometry. Medieval thinking assumed a descending hierarchy of metaphysics, mathematics, and physics in which a mathematics rooted in metaphysics was applied to the physical sphere and in which that mathematics involved the semantic properties of number studied hermeneutically. In the fifteenth- and sixteenth-century speculation, we see the beginning of a shift to a similar descending hierarchy in which a mathematics rooted in physics is applied to the metaphysical sphere and in which that mathematics involves the spatial properties of number studied logically. Pico della Mirandola's deduction of the properties of metaphysical principles from the arithmetical equivalences of Hebrew names may be considered an example of speculation in the former mode.

Fifteenth-century Platonism is also distinguished from earlier Platonism by its conscious reference to a complicated historiography of

philosophy pioneered by Ficino. Here, we find separately or in combination:

- (1) A systematic interpretation of the development of philosophy before Plato – including the notion of a tradition of "ancient theology" (*prisca theologia*) stemming from Zoroaster or Hermes Trismegistus – an increasing emphasis on arithmetical and geometrical thinking allegedly derived from Pythagoras, a renewed interest in the cosmological thinking found in the fragmentary remains of Empedocles and Anaxagoras, and a systematic presentation of the different Platonisms of late antiquity – including the distinction between the six "Academies" (*Academiae*) and the contrast between the "Roman" and the "Lycian" schools.
- (2) Various attempts to reconcile the philosophies of Plato and Aristotle, for instance, Nicholas of Cusa's idea of a coincidence of opposites between the two.
- (3) A development of the thesis that Dionysius the Areopagite – the "pinnacle" (*culmen*) of Platonic discipline and the "column" (*columna*) of Christian theology – wrote during the apostolic period, that his writings were then deliberately concealed through the jealousy of the later non-Christian Platonists, that certain thinkers like Philo Judaeus, Origen, and Ammonius Saccas had intimations of their content, and that the philosophy of Plotinus and Augustine's reading of the *Books of the Platonists* (*libri Platoniorum*) amounted to the definitive rediscovery of the original Dionysian teachings.
- (4) The beginnings of a distinction between the doctrines of Plato himself and of later Platonists, for example, Pico della Mirandola's idea that it was the later followers of Plato who altered the master's doctrine in order to elevate the "good" or the "one" dogmatically as a first principle before being itself.

In order to understand the philosophical issues of Renaissance Platonism in greater depth, we must now turn to the contributions of its most important individual thinkers. In chronological

order, these are Nicholas of Cusa, Marsilio Ficino, and Giovanni Pico della Mirandola.

With Nicholas of Cusa (1401–1464), the question of human subjectivity is developed into a methodologically rigorous form of idealism. The notion typical of any idealistic system that real objects are to some extent mind-dependent is elaborated in Nicholas' *On Learned Ignorance* and *Apology for Learned Ignorance* specifically under the influence of two earlier doctrines. These are the reinterpretations of the separately subsisting Platonic Forms as either thoughts of God or attributes of the divine by Pseudo-Dionysius and the derivation of the plurality of the Platonic forms from the inherently multiple human mind's attempts to grasp the unity of the divine substance by a certain commentator on Boethius whose name is not known to Nicholas himself. We can identify this commentator as Thierry of Chartres.

Nicholas views ultimate reality, which must be understood philosophically as God reflected in the created universe or as the created universe reflecting God, in terms of a complicated structural harmony. When considered from the most exalted viewpoint, reality emerges as the "coincidence of opposites" (*coincidentia oppositorum*) seemingly advocated by Dionysius. This coincidence represents a dialectical relation between terms which are logically opposed sometimes on the same metaphysical level, for example, "rest" and "motion," sometimes on different levels, for example, "absolute" and "contracted" or "learned" and "ignorant," and sometimes in both these senses, for example, "maximum" and "minimum." Since these terms are predicated at the same time and in the same respect of a single subject, a suspension of the principle of non-contradiction fundamental to Aristotelian thinking is clearly intended. Nicholas can argue in *On the Beryl* that it was because of his mistaken belief in the universal applicability of this law that Aristotle was unable to resolve fundamental metaphysical problems concerning the nature of physical change and the nature of substance in a successful manner. When considered from a less elevated viewpoint, reality appears as a structure of mediation which exemplifies the principle of "everything in everything" (*quodlibet in*

quodlibet) probably derived from Proclus. This structure may consist of three terms – such as the "absolute maximum" or God, the "contracted maximum" or the universe, and the "absolute and contracted maximum" or Christ on which the structure of the treatise *On Learned Ignorance* is based – where there is a single mediation. Alternatively, it may consist of four terms – such as the first oneness or "God," the second oneness or "intellect," the third oneness or "soul," and the fourth oneness or "body" around which the main discussion of *On Conjectures*, Book I, is organized – where a double mediation is implied. For Nicholas, the coincidence of opposites is related to the mediated structure in the same manner as the nondiscursive enfolding of concepts is related to the discursive unfolding of those same concepts.

But real objects are only mind-dependent to some extent because such objects are ultimately unknowable. In Nicholas' philosophy, the disjunction between the mind and its object is expressed mathematically as a disproportion between the finite and the infinite, and a means of overcoming this disjunction is then provided by mathematical symbolism. Two kinds of argument are developed at length in *On Learned Ignorance*, Book I. First, a finite geometrical term such as a line, a triangle, or a circle can be rendered infinite conceptually and then applied symbolically to a corresponding object: here Maximum, Trinity, and Unity, respectively. Secondly, the line, when rendered infinite, can be equated with the triangle and the triangle, when rendered infinite, with the circle. Nicholas claims to derive this application of the coincidence of opposites from Pythagoras.

Augustine is perhaps the decisive influence on the philosophy of Marsilio Ficino (1433–1499). This fact can be shown by comparing Augustine's interpretation of the Mosaic account of creation – of which the applications of an alternation of revealing and concealing and of a structure based on the number six to angelic thinking are the salient features – with Ficino's account of the history of philosophy. Ficino here introduces a general historical schema. This envisages the secular and the sacred histories as two parallel sequences both of which are bisected by the

coming of Christ. The segment of the secular history corresponding chronologically to the Old Law contains a phase of revelation from the beginnings of philosophy until Plato and a phase of concealment after the time of Plato. The segment of secular history corresponding chronologically to the New Dispensation contains a phase of revelation in Pseudo-Dionysius' presentation of Platonism, a phase of concealment when the Dionysian writings were hidden, a further phase of revelation in Plotinus' and Augustine's rediscovery of the elements of Platonism compatible with Christianity, and a further phase of concealment when the Plotinian-Augustinian tradition was replaced by Scholasticism. Ficino also introduces several more specific historical schemata. According to one schema, philosophy is identified with certain ancient mysteries which were progressively revealed by Hermes Trismegistus, Orpheus, Aglaophamus, Pythagoras, Philolaus, and Plato. In sometimes removing Philolaus at the same time as adding Zoroaster to this list, Ficino seems to be intent on retaining exactly six phases of revelation. According to another schema, the true Platonic philosophy is understood to have been concealed by Xenocrates, Arcesilaus, and Carneades but then revealed by Ammonius Saccas, Plotinus, and Proclus. In explicitly contrasting three Greek and three non-Greek "Academies," Ficino seems again to be preoccupied with the association between revelation and the number 6.

Such original interpretations of Augustine's doctrine provide Ficino with the best context for assimilating various Plotinian ideas new to the Latin world. An example of such an assimilation is the fundamental doctrine of the "hypostases," which is subtly transformed in Ficino's *Platonic Theology*. According to Ficino, there are five primary levels of being – "God" (*deus*), "Angel" (*angelus*), "Soul" (*anima*), "Quality" (*qualitas*), and "Body" (*corpus*) – rather than three as in Plotinus. These hypostases are distinguished from one another according to the presence or absence of specific characteristics such as activity and passivity, motion and rest, and unity and multiplicity – a feature more Augustinian than

Plotinian. Ficino further deviates from Plotinus' theory of the hypostases by emphasizing the mediating position of self-moving Soul between the immobile Angel and the mobile Quality and also by interpreting each of the hypostases Angel, Soul, and Quality as a species "primal in a certain genus" (*primum in aliquo genere*) rather than as a genus. Also according to Ficino, the first hypostasis as well as the second hypostasis is fundamentally intellectual in nature – another feature more Augustinian than Plotinian. Finally, each of the five primary levels of being is interpreted as furnishing the speculative limit for a different earlier philosopher, that is, God for Plato, Angel for Anaxagoras, Soul for Heraclitus, Quality for the Stoics, and Body for Democritus.

Ficino employs his revised version of Plotinus' doctrine of hypostases in order to interpret Plato's thought in two important areas. When writing as theorist of the theological in his *Platonic Theology* and *Commentary on the Phaedrus*, Ficino identifies both the abstract categories of Plato's *Parmenides* and the Olympian deities of Plato's *Phaedrus* with hypostatic levels. In the former case, the "One" becomes God, the "One-Many" becomes Angel, and the "One and Many" becomes Soul, whereas in the latter, Jupiter and the other deities can become different intellects, different Ideas within Intellect, or intellectual modalities according to context. When writing as theorist of the erotic in his dialogue *De amore*, Ficino identifies the "heavenly Venus" and the "earthly Venus" of the *Symposium* with intellectual or psychic modalities. The former becomes an angel's ascending movement toward God or a soul's ascending movement toward an angel, the latter the soul's descending movement toward procreation.

Although the work of Giovanni Pico della Mirandola (1463–1494) has given rise to many divergent interpretations on the part of modern scholars, a sufficiently careful reading of his main texts makes his relation to the fifteenth-century Platonic tradition reasonably clear. We may start from the famous *Nine Hundred Conclusions* – which represent not a conventional written treatise on philosophy but a collection of

philosophical propositions to be debated orally – and from the *Oration* (later subtitled *On the Dignity of Man*) designed to introduce that disputation. Here, the importance of understanding reality as a coincidence of opposites is indicated by Pico's labeling of a methodologically important section of the *Conclusions* "paradoxical conclusions according to my own opinion introducing new doctrines of philosophy" and that of understanding reality as a structure of mediation is indicated by Pico's constant use of the verbal expression "just as...so also" (*sicut...ita*) within the formulation of the different propositions. Both the coincidence of opposites and the structure of mediation are connected to the notion that man – and an *individual* human being as well as the collectivity is clearly understood here – can bring all levels of reality into union because he uniquely has no properties of his own.

It is important to understand the novel treatment of the relation between practical and theoretical philosophy by Pico, in which the former is elevated to the level of the latter and indeed is combined with it in a subtle manner. For Pico, the mediating structure of reality is not only something to be discovered theoretically but also something to be manipulated in a practical sense, this same operation being called "cabala" (*cabala*) when it takes place within the soul itself but "magic" (*magia*) when it takes place in respect of bodily things. In the *Oration* and the *Nine Hundred Conclusions*, Pico describes the essential features of the cabala which he has been studying with the assistance of Jewish scholars such as Flavius Mithridates. He notes that it is an oral teaching revealed to Moses alongside the written law that was transmitted as an esoteric method of interpreting that written law through the manipulation of the numerical properties of the Hebrew alphabet; and he maintains that it confirms the doctrines of the greatest philosophy and, more importantly, the essential teachings of Christianity. For Pico, Cabalism is not simply another philosophical component within the syncretistic system of "ancient theology" but a general hermeneutical technique which can be practiced in relation to all other forms of

philosophy. To the extent that it depends on a manipulation of the mediating structure of reality both within the soul itself and with respect to bodily things, this process of "making marriage in the world" (*maritare mundum*) is also identified with the theurgy of such ancient thinkers as Iamblichus and Proclus.

Pico's relation to the fifteenth-century Platonic tradition is indicated most clearly in his treatise *On Being and Unity* (*De ente et uno*). This essay seems to be the only completed section of a projected larger work in which he would explain, according to the *Oratio*, the "harmony of Plato and Aristotle" (*Platonis Aristotelisque concordia*) proposed by many earlier thinkers, but not demonstrated hitherto. In fact, *On Being and Unity* actually illuminates the relations both between Plato and Aristotle and between Plato and the "Platonists." On the first question, Pico shows that the agreement between the two ancient thinkers is to be sought neither in asserting that Plato speaks the truth concerning divine things and Aristotle the truth regarding the natural world nor in distinguishing an exoteric Aristotle who rejects Plato from an esoteric Aristotle who agrees with him but in emphasizing the irreducible polysemy of the term "Being" which the two philosophers explore from different viewpoints. On the second question, Pico argues that the doctrine of certain "Platonists" that the One is to be placed unequivocally as a hypostasis above Being, which they believe to be the central teaching in Plato's *Parmenides*, and opposed to the Aristotelian doctrine of the convertibility of Being and Unity fails to appreciate a text whose essential message is the necessity of hermeneutical suspension before the highest Truth.

Plethon, George Gemistos

George Karamanolis

Department of Philosophy, University of Vienna,
Vienna, Austria

Abstract

George Gemistos Plethon was a significant philosopher during the last years of Byzantium (c. 1360–1454). His adopted surname Plethon was deliberately chosen as an allusion to Plato. Born in Constantinople, Plethon later moved to Mystras in Peloponnese and took part in the Byzantine delegation to the council of Ferrara-Florence in 1438–1439, where the issue of the Church union was discussed. Plethon was a Platonist, inspired in his interpretation of Plato by several ancient Platonists including Neoplatonists. His most comprehensive philosophical work is the *Book of Laws*, modeled on Plato's homonymous work, which was condemned posthumously by the Orthodox Church on allegations of the paganism of its author. His most famous treatise *On the Differences Between Plato and Aristotle* launched a long debate among Byzantines and Italian Humanists regarding the merits of the two classical philosophers.

Life

Little is known about the descent and the early years of Plethon, originally named George Gemistos, and almost nothing is certain of his life until 1407. Presumably, he was born sometime between 1355 and 1360, given the testimony of George Trapezountios (*Comparationes*

philosophorum Aristotelis et Platonis, Chap. 3) that at his death in 1454, Plethon was almost 100 years old (Woodhouse 1986, p. 5). References to members of the Gemistos family in documents of the church in the thirteenth and fourteenth centuries suggest that he was Constantinopolitan with close ties to the church (Woodhouse 1986, pp. 17–18). The only testimony regarding the early education of Plethon comes from a possibly biased source, his later adversary, George Scholarios. He suggests that Plethon was educated by a certain Elissaeus, a Jew, otherwise unknown (Scholarios, *Letter to the Princess of Peloponnese*, *Opera* IV.152–153, *Letter to Exarch Joseph*, *Opera* IV.162; Woodhouse 1986, pp. 23–25). Scholarios' report, written after Plethon's death, raises suspicions, because it aims to substantiate the polemical claim that Plethon entertained heretical beliefs. The practice of associating alleged heretics with Jews was common among Byzantines.

Plethon must have taught at Constantinople from the late 1390s to 1409. One of his students from this period was Markos Eugenikos, the future bishop of Ephesus and later the main opponent to Church union at the council of Florence. While in Constantinople, Plethon must have been in contact with Demetrios Kydones, as can be inferred from a letter of Plethon to Bessarion (Mohler 1942:III.467.18). Gemistos left the capital of Byzantium for Mystras in 1409. Scholarios (*Letter to the Princess of Peloponnese*, *Opera* IV.152–3) suggests that Plethon was sent into exile to Mystras by the emperor Manuel II, but this is almost certainly false. Most probably Plethon was sent to Mystras out of imperial favor. This is testified by a document dated in 1433 written by Theodore II, despot of Mystras, according to which Plethon was loyal to the imperial family and came to Mystras at the request of his father Manuel II (Lambros, *Palaiolegeia kai Peloponnisiaka*, 1930a, IV.106–109), presumably because the latter sent to Mystras trustworthy persons to support the regime of his son Theodore (Masai 1956, pp. 59–63). In Mystras, Plethon undertook considerable activity, educational and political. The circle of his students included the future Cardinal Bessarion and Isidore of

Monemvasia, probably the future bishop of Monemvasia, while at the same time he composed two political works, the *Address to the Emperor Manuel on Affairs in the Peloponnese* and the *Advisory Address to the Despot Theodore on the Peloponnese* (Lambros 1926a III.246–265, 1930a IV.113–135). In them, Plethon expresses deep dissatisfaction with the political situation and exhorts the imperial court to change the administrative, military, and economic policies in Peloponnese, while he argues for a social and political reformation inspired by Plato's *Republic* (see below, Philosophy). Similar contemporary political writings are Chrysoloras' exhortation to the emperor (1413/1414) and the anonymous Lucianic satire *Mazaris' Journey to Hades* (1415).

In 1426, Emperor John the VIII solicited Plethon's advice on the question of summoning a council for Church union (Woodhouse 1986, p. 111), a highly controversial issue in Byzantium, with the ultimate vision of mounting a joint military campaign against the Ottoman Turks. By autumn 1437, the emperor had accepted the Pope's invitation for a council at Ferrara. The Byzantine delegation included Plethon and two of his students, Markos Eugenikos and Bessarion. The onset of plague necessitated the change of venue to Florence, under the patronage of Cosimo de' Medici. Plethon's role in the council was not very active, although he reportedly defended Markos Eugenikos (Woodhouse 1986, p. 173), which means that he resisted the unionist position (Masai 1956, pp. 323–327). Plethon was more interested in debating with the Italian humanists, being particularly concerned with the question of how the philosophies of Plato and Aristotle compare. While in Florence, he wrote a short treatise *On the Differences Between Plato and Aristotle* (*De differentiis*) in which he advocates the view that the philosophy of Aristotle is fallacious on many counts and as such inferior to that of Plato; he claims further that this verdict was shared by ancient thinkers. He probably refers to ancient Platonists excerpted by Eusebius in his *Preparation for the Gospel*.

Plethon's work gave rise to a long controversy over the relative value of the philosophies of

Plato and Aristotle (Monfasani 1976; Karamanolis 2002). Four or 5 years after the publication of *De differentiis* in 1439, Scholarios published a long and carefully argued refutation, *Against Plethon's Objections to Aristotle*, to which Plethon replied 5 years later (i.e., 1448–1449) with a work (*Against Scholarios' Tenets*) more scholarly than the *De differentiis*. Scholarios did not reply, yet the scenery was set for a controversy which lasted after the death of Plethon. Theodore Gazes wrote against Plethon and in defense of Aristotle, to which Michael Apostoles replied, criticizing Aristotle's doctrine of substance. To this replied Gazes' cousin, Andronikos Kallistos, defending Aristotle against the criticisms of Plethon and Apostoles. The most powerful advocate of Aristotle was George Trapezountios, whose work *Comparationes philosophorum Aristotelis et Platonis*, being the first written on the subject in Latin, introduces the subject to Italian humanists. A scholarly reply to Trapezountios comes from Bessarion in his *In calumniatorem Platonis*, which highlights the merits of Plato without dismissing Aristotle, arguing that the ancients considered their philosophies as being largely in agreement, while he further argues against Plethon for the agreement between Platonic philosophy and Christianity.

Plethon was particularly active in the last 14 years of his life. The majority of the surviving autographs of his were written at this time (Diller 1956, pp. 28–29). Plethon must have been engaged especially with the writing of his magnum opus, the *Book of Laws*. The work survives in part, since Scholarios, after becoming the first Ottoman-era patriarch of Constantinople in 1454, ordered the burning of all copies posthumously, on the grounds that it propagates paganism (*Letter to Exarch Joseph*, Scholarios *Opera* IV.155–172; Woodhouse 1986, pp. 356–360; Monfasani 1992, pp. 49–50). Plethon died most probably in 1454 in Mystras (Monfasani 1976, pp. 206–214). In 1464, his admirer Sigismondo Malatesta transferred Plethon's remains and reburied them in his neo-pagan temple in Rimini (Woodhouse 1986, pp. 374–375).

Philosophy

Plethon is a Platonist, inspired in his interpretation of Plato mainly by Plutarch (first-century CE), Numenius, Atticus (second century CE), Plotinus (third century), and Proclus (fifth-century). Plethon maintains the agreement of Zoroastrian, Pythagorean, and Platonic philosophy (*Book of Laws* III.43, 252–256), which is reminiscent of Numenius' claim about the diffusion of truth to ancient sages (fr. 1 *Des Places*; cf. *Laws* III.43, 253–256), and considers the Persian Magi to be disciples of Zoroaster and interpreters of his thought in the *Chaldean Oracles*, which explains his fascination with them (Athanasiasiadi 2002). Like Numenius and Plotinus, Plethon maintains the hierarchical structure of intelligible reality, while he also relates metaphysical principles with pagan gods and shows a tendency for religious prescriptions, which is characteristic of Proclus.

Plethon's most important philosophical works are the *De differentiis* and the *Book of Laws*. More comprehensive is the *Book of Laws*, which must have been written over a long period of Plethon's life. It is a loose and repetitive composition divided into three books, none of which focuses on a single theme; chapters on ethics and politics appear in books I and III and chapters on metaphysics occur in books I and II, while some chapters such as II and VI, on fate, were probably independent treatises (Hladky 2007: 198–209). In the first chapter, Plethon argues that his work aims to present the laws and the best constitution according to which intelligent people should live in order to achieve happiness (*Laws* III.43, 248). Plethon maintains that human happiness cannot be determined unless one inquires first into the nature of human beings and the nature of the universe, where man lives (*Book of Laws* I.1, 22), a view he also defends in his treatise *On Virtues* (A2, p. 3 Tambrun-Krasker). Accordingly, Plethon suggests that ethics depends on physics, and physics depends on theology.

Plethon maintains the Platonist division of reality into intelligible and sensible realms and argues for its hierarchical order. He adopts a

Pythagorean and Platonist distinction of three kinds of essences. The first is the father or originator of everything else (*Laws* III.15, 96), which Plethon identifies with Zeus (*Laws* III.15, 96) and apparently also with the Form of the Good (III.35, 222) which is beyond being (*Republic* 509b), as can be inferred from his description according to which the first god is supremely one and simple (*Laws* III.15, 100), pre-eternal (*propatôr*, *Book of Laws* III.35, 204), being itself (*autoôn*; III.34, 132), good itself (*autoagathos*; *Book of Laws* III.34, 132), and beyond being (*hyperousios*; I.5, 46). Noticeably, Plethon uses vocabulary found in Numenius (frs. 16, 17, 21 Des Places) and the *Chaldean Oracles* (XXXI-II). Like Numenius and Plotinus, Plethon maintains that the first god brings about a second entity, an image of himself (*Book of Laws* III.15, 96–98), through whom the first god creates the universe (*De differentiis* X.336.20–23). This is the realm of the intelligible Forms, which is characterized by multiplicity (*De differentiis* X.337.7–13; *Book of Laws* I.5, 56). The Forms are the immediate causes of the things in the sensible world (*De differentiis* X.341.39–342.1), yet God or Zeus is the ultimate cause of everything (*Book of Laws* III.15, 102). Plethon identifies the Forms with the supra-celestial gods, who are divided into two kinds, the Olympian and the Titans (*Book of Laws* I.5, 46–52). The final kind of essence is the soul, which is identified with the subcelestial gods (*Book of Laws* I.5, 52–54). Each kind of essence generates an ontologically inferior entity (*Book of Laws* III.15, 94–96, 102): the first god generates the intellect and the Forms, identifiable with a certain class of gods, they in turn generate lower gods until we reach the realm of demons and that of the mortal beings (*Book of Laws* I.5, 52).

Plethon is a determinist, maintaining two axioms that “whatever occurs must necessarily do so from some cause” and that “every cause must produce whatever effect it may have in both a necessary and a determinate way” (*De differentiis* VIII, 332.24–334.4). Plethon relates the effect of the causes with the activity of the gods, arguing that the gods are the causes of everything that happens (*Book of Laws* II.6,

64–66), with the first god, Zeus, in particular to be the source of necessity, as he is unchangeable (*Book of Laws* II.6, 67). Plethon claims that the rejection of determinism leads to atheism (*Book of Laws* II.6, 66), of which he accuses Aristotle (*De differentiis* VIII). Being confronted with the question of human freedom that his position entails, Plethon takes a view similar to that of the Stoics (Siniosoglou 2011, 316), arguing that man is free in his most rational part, yet this does not mean absence of necessity. This is imposed by the gods and the first god in particular, but it is always for the good since the first god is absolute goodness; man, being rational, can always decide to side with the divine necessity and live a good life, or not and be miserable (*Book of Laws* II.6, 67, 72–74; *Letter to Bessarion*, Mohler 1942:I.462; Bargeliotes 1975; Hladky 2007, pp. 117–120). Accused by Bessarion that this is a Stoic view (*Letter to Plethon II*, Mohler 1942:III.464), Plethon refers to the role of the soul in *Epinomis* (*Letter to Bessarion II*, Mohler 1942:III.466).

Regarding cognition, Plethon argues that reason is the best and most divine criterion by means of which we, humans, can attain truth and achieve happiness (*Book of Laws* I.2, 34). Also divine are the common notions by means of which we think, which Plethon apparently identified with the intelligible Forms, as can be inferred from the fact that in *De differentiis* X, he argues that the Forms solve the problem of how man cognizes the essences of things. These forms or common notions are sown into the souls by the divine intellect, and this is how each soul has acquired reasons of things (*Magian Oracles* XVI; Hladky 2007, p. 45).

As a Platonist, Plethon defends the immortality of the soul and criticizes Aristotle for rejecting the Platonist position (*De differentiis* IX–X). Plethon adopts the Platonic view that human soul consists in a mortal and in an immortal part, which correspond to our animal and divine nature (*Book of Laws* III.43, 246–8), and argues that man is the bond between the mortal and the immortal part of the universe (*Book of Laws* III.43, 246, *Summary of the Doctrines of Zoroaster and Plato*, Alexandre *Traité des Lois*, 1858, 267). He argues that the soul uses an ethereal body as a means for

moving into an actual body (*Reply to Scholarios* XXIX.474.25–30, *Magian Oracles* XV), a doctrine that he found in Neoplatonists. Plethon adds some new arguments in support of the Platonic thesis regarding the immortal nature of the soul in his two funeral orations on the empresses Cleope and Helen. He points out that this is an ancient belief widely accepted (*On Cleope* 171.7–172.8; Lambros 1930b) and also claims that the desire on the part of humans for immortality suggests that this can be satisfied. Plethon further argues that humans would not be prepared to kill themselves, unless the human soul would survive, because no animal seeks its own destruction (*On Cleope* 173.9–174.4; Lambros 1930b). Being the boundary (*methorion*) between the mortal and immortal world, man connects the two and contributes to the universal harmony (*Book of Laws* III.43, 258–60; Hladky 2007, p. 109).

Plethon's view that man is composite of a mortal and an immortal part shapes also his ethics. Assuming that man is a creature of god and akin to its creator by virtue of reason (*Book of Laws* III.34, 148), he claims that man can become like god, who is perfectly good (*On Virtues* A2:3), defending the view of the *Theaetetus* 176b that happiness consists in attaining assimilation to god (*On Virtues* A1, *Laws* II.6, 74, III.34, 144). Virtue is defined as "the disposition (*hexis*) according to which we are good" (*On Virtues* A1:1). Like Plotinus and later Neoplatonists, Plethon appears to distinguish between civic virtues, which benefit society (A11:12), and dianoetic virtues, pertaining to man's immortal part. In the first category, he distinguishes four cardinal virtues in hierarchical order, prudence, justice, courage, and temperance. In order to acquire virtue, we must have a perfect understanding of it as well as practice and training (A14:14). Yet in his view the most eminent activity by means of which man comes close to the divine is contemplation (*Book of Laws* III.43, 246–248).

Plethon's political views are outlined in the *Book of Laws* and in his advisory orations to the emperor Manuel and the Despot of Mystras, Theodore. In the political orations and in his two funeral orations on the empresses Cleope and Helen, Plethon uses historical and mythological

examples and talks about the Byzantines in a historical perspective, linking them with the Romans and the ancient Greeks. In his addresses to the imperial court, Plethon proposed economic, administrative, and military reforms in the organization of Peloponnese. Inspired by the *Republic*, Plethon argues for a three-tiered social structure, the ruling class (the imperial court), the service providers (e.g., merchants, retailers), and the laborers (e.g., farmers), while in his oration to Theodore, Plethon distinguishes three kinds of constitution, monarchy, oligarchy, and democracy, himself leaning toward an enlightened monarchy, that is, a ruler assisted with good counselors and relying on good laws (Siniosoglou 2011, 330–388). This appears to be at odds with the ideal constitution of the *Republic*, but perhaps Plethon considered the ruler and his advisors as the ruling class (Hladky 2007, pp. 10–12).

Plethon also had scientific, historical, and theological interests; he was the author of a geographical treatise (Diller 1937), of an astronomical manual (Tihon-Mercier), of a historical work on the aftermath of the battle of Mantinea (Maltese 1989), and of a theological treatise about the procession of the Holy Spirit, in which he defended the Byzantine position (Alexandre *Traité des Lois* 300–311). Scholarios' accusations of Plethon for attachment to Proclus (*Letter to the Exarch Joseph*, Scholarios, *Opera* IV.153.23–24) and commitment to and diffusion of paganism distort the profile of the complex thinker and should be resisted (Monfasani 1992, against Masai 1956; Woodhouse 1986). Plethon had an impact on Byzantines and Italian humanists. He probably introduced to Italy Strabo's *Geography*, studied also by Christopher Columbus (Woodhouse 1986, p. 183), and was responsible for the diffusion of the *Chaldean Oracles* to Ficino's circle (Wilson 1992, pp. 91–92; Tambrun-Krasker 2006, pp. 9–33), who mentions Plethon in the preface of his translation of Plotinus' *Enneads*.

Plotinus, Arabic

Cristina D'Ancona

Dipartimento di Filosofia, Università di Pisa, Pisa, Italy

Abstract

One of the most influential among the works translated into Arabic, the *Enneads* IV–VI circulated in the Arabic-speaking world under Aristotle's name. The Arabic version belongs to the set of translations done by the scholars gathered around al-Kindī (Endress 1973, 1997). This early translation gave rise to three texts: the so-called *Theology of Aristotle*, an *Epistle on the Divine Science* falsely attributed to al-Fārābī, and a collection of sayings attributed to a “Greek Sage” (*al-Shaykh al-Yūnānī*). To the Plotinian doctrines assimilated and adapted within the Kindī's circle an extraordinary impact was granted by Aristotle's alleged authorship, and this in almost all the fields of Arabic philosophy outside logic and physics. No matter what solutions the *falāsifa* espoused, their agenda of problems was significantly influenced by the Arabic Plotinus in metaphysics and cosmology (the separatedness and absolute simplicity of the First Principle, its universal causality through the mediation of the first Intellect, the separate substances and cosmic Soul) as well as in psychology (the spirituality and immortality of the human soul, the union of soul with the separate Intellect).

The *Enneads* and Their Arabic Translation

Even though his importance for Arabic philosophy equals only Aristotle's, the name of Plotinus is almost unknown in Arabic philosophical literature, as highlighted by Rosenthal's telling formula “Plotinus: the power of anonymity” (Rosenthal 1974). This anonymity was by no means a neutral one. It is not the case that Plotinus' writings in Arabic bear no name or a misspelled one; indeed, most of them circulated under Aristotle's own name, thereby generating one of the most decisive features of Arabic–Islamic philosophy: the intermingling of Aristotelian and Neoplatonic tenets, apparent not only in eastern Arabic–Islamic philosophy up to Avicenna and later, but also in the West of the Muslim world, including Averroes – at least in the sense that such an intermingling settled the agenda of the problems the latter had to solve. The main Plotinian text in Arabic is the so-called *Theology of Aristotle*, a treatise in ten chapters where the attribution to Aristotle of materials taken from *Enneads* IV–VI is explicit from the outset. At the beginning of the Arabic text, we are told that this book is the *Uthūlūjīyā* (a loan word for θεολογία) of the philosopher Aristotle, the meaning of the Greek term being *rūbūbiyya*, that is, divine sovereignty; Aristotle's *Uthūlūjīyā*, according to the Arabic text, is commented upon by Porphyry. In fact, what follows this premise is a series of extracts from *Enneads* IV–VI.

How did Plotinus' writings reach the Arabic-speaking world, and under what circumstances did they turn out to be “Aristotle's” work? While there is no scholarly consensus about the latter question, as for the former some conclusions are firmly established nowadays. The first and most important one is that the Arabic version was done on the basis of the *Enneads*, that is, Porphyry's edition of Plotinus' writings, and not – as maintained in past scholarship – on the basis of some alternative way of circulation of them. The hypothesis that the Arabic translation was issued from some form of circulation of Plotinus' teaching other than the *Enneads* was suggested by (1) the difference between the Greek text and the Arabic version, both in structure and contents, and

(2) the testimonies about the existence of non-Enneadic versions of Plotinus' writings. Conflating (1) and (2), some scholars – including no less a specialist than Paul Henry, the coeditor of the *Enneads* – advanced the idea that what was lying in the background of the Arabic Plotinus was one or another of these non-Enneadic versions of his writings. None of them has come down to us, but Porphyry's witness in the *Vita Plotini* about the early circulation of some treatises as well as about the existence of notes taken from Plotinus' lectures, plus some facts in the literary tradition both direct (a marginal scholium) and indirect (extensive quotations by other writers, e.g., Eusebius), suggested that some of Plotinus' writings were available even before the production of the *Enneads* by Porphyry, some 30 years after Plotinus' death. If one takes into account that the structure of the *Theology of Aristotle* is completely different from that of the *Enneads*, it comes as no surprise that in the eyes of the first generation of scholars who studied comparatively the Greek and Arabic texts the latter was likely to derive not from Porphyry's edition – the *Enneads* – but from one or another of these non-Enneadic versions (Henry 1937, 1938:xiv, followed by Cruz Hernández (1974, 1981:55). Since at the end of the *Vita Plotini*, which is put at the beginning of the *Enneads*, Porphyry informs us that he added some complements to Plotinus' writings ("commentaries," "headings," and "summaries"), and since the beginning of the Arabic text says that this book is the *Theology* of Aristotle commented by Porphyry, the prevailing opinion was that the work translated into Arabic was one of these Porphyrian complements, the favorite one being the "commentaries" (Dieterici 1883; Paret 1959–1960; Pines 1971; Thillet 1971); this opinion has been challenged by Zimmermann (1986). However, decisive proofs that the Arabic version was made out of an exemplar of the *Enneads* have been provided by Schwyzler (1941); later on, Henry changed his mind on this point (Henry 1982). So, the first question raised above – how did Arabic-speaking scholars get in touch with Plotinus' writings? – can safely be answered as follows: a manuscript of the *Enneads* reached

Baghdad within the first decennia of the ninth century, and was translated into Arabic there. This conclusion is grounded on the data given at the beginning of the Arabic *Theology*, where three names are mentioned that locate the translation in space and time: the Christian 'Abd al-Masīḥ ibn Nā'ima al-Ḥimsī (i.e., from Emesa, Syria), as the translator of the *Uthūlūjiyā* into Arabic; al-Kindī, as the revisor of the translation, and Aḥmad the son of the caliph al-Mu'taṣim, to whom al-Kindī was appointed as a tutor, as the addressee of the revision. Since al-Kindī is mentioned as the revisor, his circle and the Baghdad caliphal court are the milieu where the translation was done; since al-Mu'taṣim reigned between 833 and 842, this is the span of time in which it was produced. Although incomplete – since, as we have seen before, only treatises belonging to *Enneads* IV–VI feature in the Arabic corpus – the Arabic Plotinus provides important information on the lost Greek manuscript that served as the basis for the translation. A considerable part of treatise IV 7 [2] is lost in the Greek direct tradition (the lacuna was recognized and the loss was made good thanks to the extensive quotations of IV 7 [2] made by Eusebius); now, this part is extant in Arabic: the obvious implication is that the Greek MS out of which the translation was done was not affected by the lacuna. This licenses two conclusions: (1) the missing part did belong in the *Enneads* as they were edited by Porphyry, against the hypothesis that the complete text that features in Eusebius' quotation counts as the witness of a non-Enneadic version of Plotinus' writings (Kraus 1936); (2) the Greek manuscript that served as the basis for the Arabic translation, although lost, can be safely said to be independent of the entire Greek direct tradition, since it did not share in the conjunctive error common to all the Greek MSS, that is, the lacuna mentioned above (D'Ancona 2006). We have just seen that the translation was done within the forties of the ninth century; this means that the Greek MS out of which it was produced anteceded the archetype of the Greek tradition, because the latter can be traced back to the *end* of the ninth century (as a matter of fact, some features of the Greek MSS of the *Enneads* show that the archetype belonged in

the so-called *Collection philosophique*, a group of MSS produced in Byzantium in the last quarter of the ninth century). All in all, one can say that a Greek MS of the *Enneads* reached Baghdad, where it served as the basis of the Arabic version; later on, another MS of the *Enneads* affected by the lacuna gave rise in Byzantium to the entire direct tradition. The implication is that one can have recourse to the Arabic text as to the indirect witness of a MS of the *Enneads* that is not only independent of the archetype, but also earlier than it.

Another issue that seems to be settled is that of the so-called Syriac *Vorlage*. One of the most apparent doctrinal changes in the Arabic with respect to the Greek text consists in the transformation of Plotinus' One into God Almighty, and of its emanative power into creation out of nothing. Although fitting perfectly with Islam, this adaptation was traced back by past scholarship to the Christian Syriac milieu of the sixth century. The reason for this lies in that scholars were working with the assumption that a Greek text based on Plotinus' teaching was reworked in order to fit with a monotheistic and creationist context well before its translation into Arabic. Since there are some traces of Syriac in the *Theology* – the most evident example being the term for “chapter,” that is, “mīmar,” a term of Syriac origin – the conclusion was drawn that the monotheistic adaptations took place along with the translation into Syriac, so producing a text, already in a Semitic language, out of which the Arabic version was allegedly made (Baumstark 1902; Kraus 1940–1941; Anawati 1974). Doubts about the existence of this alleged Syriac adapted version of Plotinus have been raised by Zimmermann (1986), and a fresh reexamination of the available evidence has led Brock (2007) to conclude that it is highly improbable that such a text did exist. On the other hand, Brock points to the Neoplatonic influence on the Syriac Christian milieu in which Ibn Nāʿima al-Ḥimsī was educated.

From the Arabic Plotinus to the *Theology of Aristotle*

Doubts about the Aristotelian authorship of the *Theology* are as early as the sixteenth century.

There was no medieval Latin translation of the *Theology of Aristotle*, but in 1519 a Latin version was published in Rome (the version was done by Pietro Nicola Castellani on the basis of the previous translation, now lost, done by Moses Rovas in Cyprus), and another version was published in 1571 by Jacques Charpentier (see Fenton 1986; Kraye 1986; Aouad 1989:565). The Latin text is based on the so-called Longer Version of the *Theology*, in 14 chapters, whose Arabic antecedent is only fragmentarily extant (on the “Longer Version” see Fenton 1986, the survey of previous literature in Aouad 1989:564–570, and Treiger 2007). Soon after, Francesco Patrizi, who published the Latin version as an appendix to his *Nova de universis philosophia*, was struck by the difference between Aristotle's usual position and the blatant Platonism of “his” *Theology*: the explanation he advanced was that the *Theology* contained the exoteric doctrine heard by Aristotle from Plato's lips, as shown not only from Patrizi's remarks, but also by the very title given to this appendix, *Mystica Aegyptiorum et Chaldaeorum a Platone voce tradita, ab Aristotele excepta et conscripta philosophia*. The solution devised by Patrizi clearly indicates his awareness that the *Theology* gave a non-Aristotelian ring – an awareness that increased during the seventeenth century in Europe (see Kraye 1986). In the *Bibliotheca Graeca* (1716, III:162–164) Fabricius remarks that the doctrines of the *Theology*, far from being Aristotelian, are akin to those of the Hermetic *Poimandres*, “ut Platicum potius aliquem quam Aristotelem auctorem esse res ipsa clamat.” However, Fabricius did not identify the “Platonic” source: this move was done by Th. Taylor at the beginning of the nineteenth century (Taylor 1812, III:403–413; see also Taylor 1816). Later on, towards the end of the century, the Orientalist F. Dieterici provided the *editio princeps* of the Arabic text (Dieterici 1882) and its German translation (Dieterici 1883). On the basis of this translation, V. Rose, the specialist of the *Aristoteles pseudepigraphus*, identified more systematically than Taylor had done the Plotinian treatises that count as a source for the various chapters of the *Theology* (Rose 1883). The next decisive steps in the literary history of the Arabic Plotinus belong to the twentieth century. In 1940 another

Orientalist, P. Kraus, discovered in a Cairene MS an *Epistle on the Divine Science* attributed to al-Fārābī, which he identified as the Arabic abridged version of four treatises of the fifth *Ennead* (Kraus 1940–1941). These four treatises are different from those lying in the background of the *Theology*, but share with the latter several monotheistic adaptations: this gave a hint towards the existence of an original translation of materials drawn from the *Enneads*, lying in the background of the two complementary texts, the *Theology* and the *Epistle*. A third Orientalist, F. Rosenthal, discovered that the “sayings” attributed in various doxographies and in a MS of the Bodleian Library to the so-called *al-Shaykh al-Yūnānī* (“*The Greek Sage*”) were nothing if not other parts of the Arabic Plotinus (Rosenthal 1952–1955). The doxographies that include passages taken from Plotinus and attributed to the “*Greek Sage*” are, chronologically arranged, the following: (1) the *Muntakhab Šiwān al-ḥikma* derived from the lost *Šiwān al-ḥikma* attributed to al-Sijistānī, (2) al-Shahrastānī’s *Kitāb al-milal wa-l-niḥal*, and (3) al-Shahrastānī’s *Rawḍat al-afrāḥ* (see the relevant entries in this volume). In all likelihood, the three doxographies and the sayings of the Bodleian MS depend upon one and the same source, the lost *Šiwān al-ḥikma*, a compilation of earlier sources that can be traced back to the beginning of the eleventh century. At variance with what happens in the case of the *Theology* and the *Epistle*, the Plotinian passages attributed to the “*Greek Sage*” and the *Theology* do overlap here and there. The three texts – the *Theology*, the *Epistle on the Divine Science*, and the “*Sayings of the Greek Sage*” – share in the same linguistic features and doctrinal adaptations, so that Rosenthal’s conclusion imposes itself: they derive from one and the same “Arabic Plotinus Source.” When G. Endress published in 1973 his *Proclus Arabus* (see the entry on Proclus, Arabic in this volume), the systematic analysis of the syntax, terminology, and doctrinal adaptations that he extended also to the Arabic version of Proclus’ *Elements of Theology* and to the *Liber de causis* allowed him to conclude that the “Arabic Plotinus Source,” together with the *Elements of Theology*, with their offspring known as the *Liber de causis*, and with some Alexander of Aphrodisias, were

translated and adapted within one and the same circle of scholars: the “Kindī’s circle” (Endress 1973, 1997). On this ground, and on the basis of a reexamination of the entire dossier, Zimmermann (1986) has advanced the hypothesis that the works by Plotinus, Proclus, and Alexander of Aphrodisias were meant to fulfil the demand for a theological complement to Aristotle’s *Metaphysics*. In the eyes of the scholars of this circle, and mostly of its “spiritus rector” al-Kindī (Endress 1997), a more detailed account of the causality of the Immobile Mover sketched in Book *Lambda* was needed, in order to show that Greek philosophy reached the same truth as the Qur’ān about God and his creation. Such an account could be found in a set of post-Aristotelian authors – Alexander, Plotinus, Proclus – who stressed both the separatedness and the causality of a unique and transcendent First Principle.

There is no scholarly consensus about the details of the transformation of the “Arabic Plotinus source” into the *Theology of Aristotle* – in particular, about the two related issues of (1) the chaos versus intentional structure of the *Theology*, and (2) the purposiveness versus mistaken nature of the attribution to Aristotle – but the origins of the text within the Kindī’s circle and its role in building the Arabic Aristotle are established on firm grounds.

Doctrine

Taken as a whole, the Arabic Plotinus contains a full account of the main tenets of Plotinian metaphysics and psychology: the spirituality and immortality of the human soul; the existence of a cosmic Soul; the existence and causality of the intelligible realm, that is, a level of reality that can be grasped only by intellect and escapes sense perception; its identity with the divine Intellect, that is, a separate intellectual principle that inherits both from Plato’s Demiurge and Aristotle’s “thinking of thinking”; the existence, beyond Intellect, of another principle higher than it and perfectly simple, the One, which in turn inherits from the Idea of Good “beyond Being” of Plato’s *Republic*. The three principles – the

One, Intellect, and Soul – that form the core of Plotinus’ metaphysics are omnipresent in the various texts derived from the “Arabic Plotinus Source.”

More in detail, the *Theology* begins with an account of the descent of the human soul into the world of coming-to-be and passing away (the source is the final part of Plotinus’ treatise *On the Immortality of the Soul*, IV 7[2]); to this, a famous passage is appended, taken from Plotinus’ treatise IV 8[6], where the ascent of the human soul to the intelligible realm is described. Quite emphatically introduced by the words “A speech by him, *kalām lahu*” – that is, by the author of the *Uthūlūjīyā* – the passage where Plotinus, speaking in the first person, describes his experience of contemplation of the intelligible realm has been put into Aristotle’s own mouth. In the Arabic version, “Aristotle’s” ascent culminates in an instant vision of the First Principle beyond the intelligible realm. But a human soul cannot stand such a vision, and in returning to its usual mode of cognition, that is, discursive reason, wonders about the reason why a spiritual entity capable of seeing the intelligible realm and the First Principle is linked to the body. Chapter I of the *Theology* ends with Plotinus’ response to this question: Plato has taught that a wise and good Creator has sent the souls to the world of coming-to-be and passing away. A wide passage with no correspondence in the Greek text adds to this Plotinian idea something new: an account of Plato’s philosophy, praised by the author of the *Theology* (i.e., “Aristotle”) for having taught the existence of the intelligible realm, of God Almighty beyond it, and his creation out of nothing both of the intelligible and the visible worlds (Dieterici p. 4.12–14.9 = Badawī p. 18.11–28.3). Chapter II, based on Plotinus’ IV 4[28] and IV 3[27], is devoted to the question of the memory that the soul can have of its stay in the intelligible realm, once descended in the world of coming-to-be and passing away (Dieterici p. 14.10–32.6 = Badawī p. 29.1–44.18). Chapter III contains the main part of Plotinus’ treatise *On the Immortality of the Soul*, IV 7[2], and deals with the proofs of the spirituality and immortality of our souls (Dieterici p. 32.8–43.19 = Badawī

p. 45.1–55.19). Chapter IV is taken from the beginning of Plotinus’ treatise V 8[31], *On the Intelligible Beauty*, and deals with the nobility of the intelligible realm and its superiority to the visible world (Dieterici p. 44.1–54.2 = Badawī p. 56.1–64.5). Chapter V is based on the beginning of treatise VI 7[38], where Plotinus explains how to account for the “reasoning” of the Demiurge in the *Timaeus*: the title of the Arabic chapter shows by itself the adaptations mentioned above, “Account of the Creator, his creation of what he has created and the status of the things in him” (Dieterici p. 54.3–63.16 = Badawī p. 65.1–73.16). Chapter VI depends upon the central part of Plotinus’ IV 4[28] and endorses its criticism of astrology and magic: stars do not produce events in the sublunar world, at the most they provide hints to the events to come (Dieterici p. 64.1–75.5 = Badawī p. 74.1–83.17). Chapter VII, issued from the final part of Plotinus’ IV 8[6], *On the Descent of Soul into the Bodies*, accounts for the reasons of the descent of the soul into the world of coming-to-be and passing away, and for the conditions for its return to the intelligible realm it comes from (Dieterici p. 75.16–85.6 = Badawī p. 84.1–91.21), so creating a long-lasting topic of Arabic–Islamic philosophy, that of the “*Provenance and Return*,” as runs the title of a treatise by Avicenna (*K. al-Mabda’ wa-l-ma’ād*, ed. Nūrānī 1984). Chapter VIII derives from a variety of sources, VI 7[38], IV 4[28], V 1[10], and V 8[31], and deals with the intelligible realm, the pure intellects and souls dwelling in it, the generation of Intellect from the One, and the union of the human soul with Intellect (Dieterici p. 85.7–125.3 = Badawī p. 92.1–120.18). Chapter IX, issued from the first two chapters of IV 7[2] and the last two of V 1 [10], is devoted to the presence in human souls of a part or faculty that remains constantly united with Intellect and the intelligible world (Dieterici p. 125.4–135.11 = Badawī p. 121.1–133.3). Finally, Chap. X, based on V 2[11], VI 7[38], and V 8[31], deals with the causality of the First Principle, the True One: this principle creates Intellect with no intermediary, be it the “thought” (or decision) of creating it. Indeed, the First Principle creates solely by its being, *bi-anniyatihi*

faqat, with no instruments or movement whatsoever. This means that the *Theology* endorses Plotinus' model of the causality of intelligible principles that produce their effects with no alteration whatsoever, the example being the emanation of heat from fire or cold from snow: two effects that are given by the very fact that their principle exists. Another source of the topic of creation *bi-anniyati faqat* is Plotinus' exegesis of the Platonic Demiurge, whose "reasoning" (λογισμός) in the *Timaeus* is interpreted in treatise VI 7[38] – widely taken up in the *Theology* – as showing the intrinsic rationality of the visible world: Plotinus' exegesis is meant to exclude the literal interpretation of such a "reasoning" as a deliberation about what should be done. The immobile and spontaneous causality of the Plotinian divine Intellect becomes in the *Theology* the prominent feature of creation, that is, the production of being out of nothing, done by a principle that is said to be "pure Being" and creates "solely by its Being." In defining the First Principle as the highest and purest instance of "Being" the *Theology* parts company with Plotinus, who had located the One beyond Being. At variance with the Greek Plotinus, in the Arabic version the True One, also named "Pure Being," "First Agent," and "God Almighty," creates the Intellect. The latter is created directly, with no intermediary, whereas the lower levels of being (the cosmic Soul, the celestial spheres, and the sublunar world) are created by God through the mediation of Intellect. This recasting of the doctrine of the three principles One, Intellect, and Soul is the hallmark of the Arabic Plotinus and features also in the *Liber de causis*, even though the latter derives from Proclus' *Elements of Theology*, where Intellect does not play the prominent role it had in Plotinus. This fact, together with other elements of the Arabic Plotinus that feature in it, licenses the conclusion that the *Liber de causis* is the work of an author who has conflated the Arabic Proclus and the Arabic Plotinus, and it has been advanced that this author was al-Kindī himself. The *Theology of Aristotle* remained unknown to Latin Middle Ages, but the Latin translation of *Liber de causis* granted a considerable influence on Latin medieval philosophy to the most typical tenet of the

Arabic Plotinus, known through the axiom "Causa prima creavit esse animae mediante intelligentia" (*Liber de causis*, Prop. 3).

The *Theology of Aristotle* and Arabic Philosophy

The influence of the Arabic Plotinus, conveyed in particular by the *Theology of Aristotle*, was considerable. After al-Kindī, whose pivotal role in the production of the Arabic Plotinian corpus has been mentioned above, and who made use himself of many topics of the Arabic Plotinus (see for instance *On First Philosophy*, p. 25.4–9 and 97.8–10 Rashed-Jolivet; *Epistle on the True Agent*, p. 169.5–8 Rashed-Jolivet; *Epistle Explaining What the Soul Remembers of What it had in the World of Intellect*, German transl. Endress 1994), the *Theology* was taken into account by al-Fārābī in his *Book on the Harmony of the Two Opinions of the Two Sages, the Divine Plato and Aristotle*, p. 64.7–65.10 Martini Bonadeo (commentary, p. 199–202) p. 65.14–18 (comm., p. 203–206); p. 69.15–70.7 (comm., p. 213–216); p. 72.8–16 (comm., p. 219–220); p. 72.16–73.10 (comm., p. 221–223); p. 74.1–16 (comm. p. 225–226). The latter passage is the most important, containing as it does the extensive quotation of the account of "Aristotle's" ascent into the intelligible world. After al-Fārābī, this passage will be quoted by several other *falāsifa*, both East and West (see below). The Farabian authorship of the *Harmony* has been challenged, but the main tenets of the *Theology* form the backbone also of Fārābī's *Principles of the Views of the Citizens of the Best State*, a work whose authenticity lies beyond doubt (one may compare for instance, on the key issue of creation outside time, p. 92.8–16 Walzer with *Theology*, p. 162.14–163.8; 174.22–175.3; 177.8–10; 187.8–10 Badawī).

The pupil of a pupil of al-Kindī, al-ʿĀmirī (see the relevant entry in this volume) is heavily if tacitly indebted to the *Theology* in his *K. al-Amad ʿalā l-abad* (*Book on the Afterlife*): compare for instance Chap. V, p. 88–95 Rowson, with *Theology* I, p. 3.13–17 Dieterici = p. 6.7–11

Badawī; III, p. 38.6–10 Dieterici = p. 50.9–12 Badawī; Chap. VII, Sect. 7, p. 102–103 Rowson with Chap. VI of the *Theology* (Dieterici, p. 64.1–75.5 = Badawī, p. 74.1–83.17); and Chap. XV, Sect. 7, p. 140–141 Rowson with Chap. VII of the *Theology* (Dieterici, p. 75.16–85.6 = Badawī, p. 84.1–91.21). Other parallel passages or doctrinal influences are indicated in D’Ancona et al. (2003:95, 293–294, 293, 300, 317, and 341).

The Arabic Plotinus lies in the background also of several doctrines expounded in the *Epistles* of the Ikhwān al-Ṣafā’ (see the relevant entry in this volume); in particular, *Epistle* I, p. 138 Ġālīb contains a description of the ascent into the intelligible world, which is indebted to the passage of Chap. I of the *Theology* mentioned above (Diwald 1975:23). This passage is known also to Ibn Zur’a, one of the “Baghdad Aristotelians” (see Kraus 1940–1941:271 and Zimmermann 1986:183), and to Miskawayh (*al-Fawz al-aṣṣḡar*, p. 99.9–12 ‘Udayma); see the relevant entries in this volume. Other doctrines of the *Theology* echoed in the *Epistles* include the topics of creation outside time (*Epistle* III, 9: Diwald 1975:450–451); of creation “mediante Intelligentia” (*Epistle* III, 1: Diwald 1975:55; *Epistle* III, 4, Diwald 1975:179), and of the substantiality, and separability of the human soul from the body (*Epistle* III, 4: Diwald 1975:185).

Avicenna, who has commented upon the *Theology*, is heavily indebted to it as for several topics that structure his thought: the absolute simplicity of the First Principle, the generation of the First Intellect from the *necesse esse* (“ex uno non nisi unum”), the “provenance” of soul from and its “destination” to the intelligible world. Echoes of the *Theology* are widespread in Avicenna’s works, from the earlier ones, like the *Compendium on the Soul* (see Gutas 1988:19) and the *Provenance and Destination* (see Gutas 1988:31) to the last ones, like the *Fair Judgment* (only fragmentarily extant). The *Fair Judgment* contained Avicenna’s *Notes on the Theology*, as he himself informs in a letter to his friend Abū Ja’far Kiyā’. The *Letter to Kiyā’*, where he accounts for the structure of the *Fair Judgment* (a work already lost when he wrote the letter), contains an opinion about the *Theology*

that has been interpreted in different ways, since the moment the letter was discovered (Kraus 1940–1941): some scholars saw in Avicenna’s remark a doubt about the Aristotelian authorship (as exemplified in the translation given by Gutas (1988:63–64): “despite the fact that the *Theologia* is somewhat suspect”); others see in it a note of caution about the doctrines held in it (as exemplified in the translation given by Zimmermann (1986:184): “for all one may find to object to in the *Uthūlūjīā*”); see the dossier in Aouad (1989:583–584). Both the *Letter to Kiyā’* and the *Notes* by Avicenna on the *Theology*, which survived in part the loss of the *Fair Judgment*, are edited (Badawī 1947:37–74, the *Notes*; p. 120–122, the *Letter*) and have been translated into French (Vajda 1951). (For a survey up to 1989, see Aouad 1989:583–586; after this date, see De Smet 2001, 2002; D’Ancona et al. 2003:102–111.)

After Avicenna, the *Theology* continued to be viewed as part and parcel of Aristotle’s metaphysics and “divine science.” In his *Book on the Science of the Metaphysics*, ‘Abd al-Laṭīf al-Baġdādī included a summary of the *Theology*: see the dossier in Aouad (1989:586–587) and Martini Bonadeo, ‘*Abd al-Laṭīf al-Baġdādī On Metaphysics*’ (forthcoming). A survey on the influence of the *Theology* on the eastern post-Avicennian philosophers belonging in the so-called *Ishrāqī* (Illuminationist) tradition has been provided by Aouad (1989:587–599). This survey includes a list of extant commentaries up to the end of the seventeenth century; for an up-to-date account see also Rizvi (2007).

As for the circulation of the Arabic Plotinian corpus in the Muslim West, even though no systematic analysis has been done to the present day, it is fair to say that there are no evident proofs of a direct and extensive knowledge. However, some doctrines and typical features of the Arabic Plotinus reached al-Andalus indirectly, a possible way being the *Epistles* of the Ikhwān al-Ṣafā’ (known in al-Andalus), not to mention the works of the eastern *falāsifa* like al-Fārābī and Avicenna, who had already endorsed some typical tenets and wordings of the *Theology*. Also, at least two items of the Neoplatonic complements to

Aristotle's metaphysics produced within the circle of al-Kindī did circulate in al-Andalus: the *Liber de causis*, which was translated into Latin in Toledo by Gerard of Cremona, and the Arabic propositions of Proclus' *Elements of Theology* attributed to Alexander of Aphrodisias, which had a substantial influence on Ibn Bājja (see Altmann 1965; Endress 1973:53–54, and D'Ancona 2008). In his *Ḥayy ibn Yaqzān*, Ibn Ṭufayl reproduces, in all likelihood without any awareness of the source he is quoting from, the passage on the ascent of the soul into the intelligible world and to the First Principle beyond it (trans. Goodman p. 152). A balanced account of the Neoplatonic sources of Averroes is still to be made, but one can at least say that most problems he had to solve were settled by the tradition of the *falsafa* that he inherited, with its typical intermingling of Aristotelian and Neoplatonic doctrines. Among these, a point raised by Merlan (1963:20–21), and later on almost forgotten in the scholarship deserves attention: the ultimate source of the doctrine of the union of soul with the separate Intellect (*ittiṣāl*) is Plotinus, not Alexander of Aphrodisias. As a matter of fact, Alexander's Agent Intellect is the Immobile Mover itself, while it is in the Arabic Plotinus (*Theology*, Chaps. VIII and IX) that the soul, in ascending into the intelligible world, reaches the union with an Intellect that is a separate substance distinct from and subordinated to the First Principle. In his *Epistle On Intellect*, al-Fārābī insisted upon the fact that the Agent Intellect that the human soul strives for is by no means the First Cause (p. 32–33 Bouyges). This is the cluster of problems that forms the background of Averroes' solutions. On other crucial issues, like for instance God's knowledge of individuals, the influence of the Neoplatonism of the Kindian texts on Averroes can also be detected.

Political Aristotelianism

Christoph Flüeler

Historische Hilfswissenschaften und Mittellatein,
Universität de Fribourg, Fribourg, Switzerland

Abstract

Aristotle's *Politics* has had a long and enduring influence on political theory from the thirteenth century up to the present (Horn C and Neschke-Hentschke A, Politischer Aristotelismus. Die Rezeption der aristotelischen "Politik" von der Antike bis zum 19. Metzler, Jahrhundert,

Weimer, 2008). Medieval reception began in the sixth decade of the thirteenth century with the translation of the work from Greek into Latin by William of Moerbeke. In the period following this successful transmission of the Aristotelian text, extensive commentaries were written by well-known scholars such as Thomas Aquinas, Albert the Great, and Peter of Auvergne, demonstrating the interest of both religious schools and universities in developing political philosophy as an independent discipline and integrating it into their curricula.

Thus the discipline of political science, or political philosophy, came into existence in close conjunction with the reception of the eight books of the *Politics*. The *Politics* remained predominant in political theory in the Latin West until the fifteenth century, influencing numerous commentaries and other literary genres, notably mirrors for princes and tracts on the power of the pope, *De potestate papae* (Miethke J, De potestate papae. Die päpstliche Amtskompetenz im Widerstreit der politischen Theorie von Thomas von Aquin bis Wilhelm von Ockham. Mohr Siebeck, Tübingen, 2000). Political Aristotelianism, however, is not limited to the reception of Aristotle's *Politics*, but involves a more complex understanding of the entire body of Aristotelian works. In addition to the foundation laid for practical philosophy by the *Nicomachean Ethics*, the *Rhetoric* as well as the *Metaphysics* and Aristotelian natural philosophy have influenced medieval Aristotelian political philosophy (Lambertini R, Politische Fragen und politische Terminologie in mittelalterlichen Kommentaren zur Ethica Nicomachea. In: Kaufhold M (ed) Politische Reflexion in der Welt des späten Mittelalters/ Political thought in the age of scholasticism. Essays in Honour of Jürgen Miethke. Brill, Leiden, pp 109–127, 2004).

Reception

The reception of the *Politics* remains limited to the Latin West. The work has left barely detectable

traces in Byzantine, Arab, or Jewish philosophical works. The Byzantine philosopher Michael Ephesus (tenth century) left only some notes regarding this work, and the existence of an Aristotelian political philosophy naturally could not have remained hidden from Averroes (d. 1198), indicating that the work was not accessible in the Arab West. As a result, the Byzantines, Arabs, and Jews were more likely to base their arguments on Plato's political philosophy, especially the *Republic*, a work that was only available for direct study in the West beginning in the early Quattrocento, when it was translated by Italian humanists. William of Moerbeke tracked down the *Politics* in Greece about 1260, at the beginning of his translation efforts, and began by making an incomplete translation of Books 1 through 2.11 (1254a–1273a30). A few years later, he turned again to the *Politics* and was able to finish a complete translation of the work by about 1265. This Flemish or northern French translator used a word-for-word (*verbum de verbo*) translation method. Moerbeke markedly enriched the western vocabulary for political terminology through his introduction of numerous neologisms.

The first commentaries on this version of the *Politics* were written by the Dominican friars Thomas Aquinas and Albert the Great. In addition, the *Politics* was added to university curricula shortly after its translation. According to a statement by Pierre Dubois, Siger of Brabant is supposed to have disputed questions from Aristotle's *Politics*, including a defense of the primacy of the law above even the most virtuous of human beings in *Pol.* III.10 (1281b). The most influential commentaries at the University of Paris were the two written by Peter of Auvergne (d. 1304). His *Quaestiones super libros politicorum*, with its 126 questions on the first seven books, is without doubt a by-product of his teaching responsibilities at the Faculty of Arts. Not only did the questions prove exceptionally provocative of response over time, clearly influencing all later political commentaries in question form until the fifteenth century (Flüeler 1992), they also contain the first transmission of university debates on subjects in political science, as well as a methodological foundation for practicing the discipline. In

addition to his questions on the *Politics*, Peter wrote a literal commentary which, together with the incomplete commentary by Thomas Aquinas, shaped reception of the work through early modernity. Commentators of the fourteenth century include scholars such as Guido Vernani, Walter Burley, Nicholas Oresme, and Nicolas de Waldemonte (ps. John Buridan), among others. During the fifteenth century Donatus Acciaiolli, Guillelmus Becchius Florentinus, Henricus Toke, Henricus Totting de Oyta, Johannes Versoris, and Leonardus Bruni Aretini wrote commentaries on the *Politics*, and there are numerous anonymous works of this character. Although the *Politics* did not belong to the group of works, such as the *Nicomachean Ethics* for example, which were read year after year at arts faculties, it does appear to have been taught on a regular basis, as evidenced by the detailed lecture plans of the University of Vienna (Flüeler 2004: 135–138).

Development

On the most important points of Aristotelian political philosophy (Horn and Neschke-Hentschke 2008: 1–19) medieval commentators and authors generally follow Aristotle, though they might set new accents or pose new questions that go beyond the scope of Aristotle's position. The question of the epistemological status of the study of political science is explicitly treated, in order to distinguish this field of study from others in terms of its subject matter, goal, and intended purpose. Issues of nature and the basis of lordship are more thoroughly examined than in Aristotle's own works, with the earliest receptions in the late thirteenth and early fourteenth centuries relying more on metaphysical models (e.g., Peter of Auvergne, Thomas Aquinas, Dante). These methodological questions are based mainly on the first book of the *Politics* and discuss the general nature of lordship and servitude in connection with Aristotle's arguments concerning slavery. Monarchy is considered the best form of rule by most authors, who therefore generally misunderstand Aristotle's carefully nuanced opinions on the subject (Lambertini 2001; Ubl, in Flüeler 2002).

Aristotle's *Politics* influenced political discourse and political language far beyond the scope of the commentaries, as demonstrated by Thomas Aquinas. Not only did Aquinas treat the *Politics* explicitly in his commentary on the work (1269–1271), but his mirror for princes, *De regno* (1271–1273), written at the same time as the commentary or slightly later, also could not have been written without a knowledge of the *Politics*. The strength of the link between the tradition of mirrors of princes and the reception of the *Politics* is also demonstrated by the *De regimine principum* by Giles of Rome, which was famous for presenting the fundamentals of Aristotelian political thought in an understandable way. Even Dante still considered political science a new field of study (Mon 1.1.5). However, Dante's main point of reference is not Aristotle's *Politics*, with which he was also familiar, but rather the radical Aristotelians' theory of the Intellect and Happiness, which he attempted to translate into political theory. Marsilius of Padua also utilized contemporary political Aristotelianism (*Defensor pacis* I.16) in order to address central questions of the time that could not have been addressed by Aristotle (*Defensor pacis* I.1.3). The question of the relationship between worldly and spiritual power was never discussed by Aristotle but could still be answered in a variety of ways using an Aristotelian model.

Political Philosophy

Arthur Stephen McGrade
Professor Emeritus of Philosophy, The University
of Connecticut, Storrs, CT, USA

Abstract

This survey will be concerned almost entirely with the Latin West. Other strands of medieval political thought are discussed elsewhere in the volume in articles on Political Philosophy, Byzantine; Political Philosophy, Arabic; and Political Philosophy, Jewish. Here I consider first the sources, historical contexts, and genres of medieval political philosophy, then some major topics discussed and positions taken on them.

Sources

Medieval political philosophy continues classical reflections, with the additional influence of Christianity. (The relation of philosophy to religion here is the converse of that in Islam. Christianity entered a Graeco-Roman world that already had well-developed philosophical traditions, with the result that Christian authors often sought to justify or interpret their faith philosophically. In Islam, religion preceded philosophy, and the task of justification fell to the devotees of the latter.) A third major class of sources is law. Just as philosophy was in place when Christianity appeared, there was also a refined legal culture to be related to Christian ideas.

Philosophical Texts

The chief philosophical sources for political thought were Plato and Neoplatonism; Stoicism

and Cicero; and Aristotle (only a few of whose works were accessible to medieval thinkers before the thirteenth century).

Plato and Neoplatonism

Only one of Plato's dialogues was known in the Latin Middle Ages, but much of his thought had been assimilated by the church fathers, directly or through later Platonists. The realm of ideal being posited by Plato, more real than, and a model for, the natural world, was the background for all western philosophical thought through the twelfth century. The most important part of this position for politics was the vision of an ideal polity to which all human beings should belong. Plato's picture of the soul as a bundle of appetites, inherently unordered until constrained by a spirited element to obey reason, also exercised a pervasive influence.

Stoicism and Cicero

The Stoic idea of a cosmic rational principle (logos) was also broadly influential. The most important aspect of this for political thought was the conception of a natural law valid independently of human legislation. On this basis, personal moral integrity and devotion to one's community were championed by Cicero.

Aristotle

Although Aristotle's *Politics* arrived late in the West, its influence on political thought after 1250 was enormous. Major features of the work were its critical and comparative analysis of a wide range of political structures and its presentation of these as outcomes of deliberate human action. (It is unclear whether the *Politics* was translated in medieval Islam.)

The Bible and Its Interpreters

It is difficult to exaggerate the extent to which western political thought during the Middle Ages and through the seventeenth century is informed by the Christian Bible.

Politically Central Themes

The Scriptures are rich in social and political implications. The peculiar dynamic of political

thought in medieval Christendom is set up most directly by contrasts between scriptural passages of two kinds. On one hand are those depicting Jesus' love and humility; on the other are those proclaiming his majesty as Son of God ("the logos made flesh," Christianity's central addition to classical philosophy) and his position as judge of the world and all its inhabitants at the end of time.

The Church Fathers

The doctrine of the Incarnation was formally defined in fourth- and fifth-century councils. In particular, Jesus was held to unite in his person two natures, a divine and a human. The meek and sacrificially loving Jesus was available as a human model for living under virtually any political order. Jesus as God on earth could, however, serve as a basis for claims to divine mission and commanding authority by emperors, kings, or church leaders recognized as representing him.

Later Exegetes

When Christianity came to be embraced by lay rulers, their apologists could also appeal to Old Testament kings as a model for royal or imperial control of both religious and secular affairs. A biblically grounded contrary case was made (most vigorously from the eleventh century onward) for clerical – especially papal – jurisdiction over all of life. A controversial twelfth-century exegesis of the book of Revelation foretold a spiritual church not guided in legal fashion by popes and bishops. In a related thirteenth-century reading, also controversial, the gospels presented Christ and the apostles as legally completely poor, without any earthly rights or authority.

Legal Sources

Medieval political thinkers drew on a variety of legal sources.

Roman Law

The collections of laws promulgated in the early sixth century by the Emperor Justinian I comprised much of classical Roman law and also many laws for religion made after the Empire's official conversion to Christianity.

Medieval study and application of this body of civil law (*Corpus iuris civilis*) began in the twelfth century and was continuously refined thereafter, peaking with the civilian Commentators of the fourteenth century.

Feudal Law

The rules governing the personal relationships of fidelity and mutual obligation between superior and inferior central to feudalism were only put into writing in the twelfth century, when the institution itself was in decline. Given its principles of consent and accountability, one should be cautious about using the term "feudal" pejoratively.

Church Law

Besides defining doctrine, general (ecumenical) and regional church councils decided many disciplinary issues. After the patristic period, the most important councils in the West were those held under Charlemagne in the eighth and ninth centuries and general councils called by popes, such as the Third and Fourth Lateran Councils of 1179 and 1214. Beginning in the twelfth century, collections of conciliar rules (canons) and other authoritative texts were made. The most influential was Gratian of Bologna's *Decretum* (c. 1140). Later portions of the canon law (*Corpus iuris canonici*) consisted of papal doctrinal statements and decisions on practical matters. Each major portion of the canon law was subjected to learned commentary.

Contexts

Even the most all-embracing medieval political texts were oriented toward specific historical situations. In the course of a millennium, these contexts changed dramatically.

Imperial Disintegration (410–732)

The sack of Rome by the Visigoths in 410 was a milestone in the collapse of the western Roman Empire. The last western emperor died in 476, and although Germanic and Frankish tribal chiefs who exercised power in this period often sought formal acceptance from Byzantium, they recognized no

effective jurisdiction from the East after the early sixth century. Elsewhere, Islam arose in Arabia, came into enduring conflict with the eastern Empire, and spread across North Africa and into Spain.

During this unorganized period, two developments were significant for political thought. One was the growth of monasticism, especially in communities following the Rule of Benedict of Nursia (c. 480–550), communities which were sometimes inspiring examples of organization and endurance. The monastic program of seeking God through progress in humility also provided some counterweight to other values driving political life in medieval society.

A second development was the assertion of ecclesiastical independence from, or indeed superiority to, lay rulers. The key term in later debates about papal power, *plenitudo potestatis* (fullness of power), was used by Pope Leo I, although not with regard to clerical–lay relations. The most influential text was Pope Gelasius I's rebuke in 494 of a Byzantine emperor for intervening in current doctrinal conflicts:

There are two (*Duo sunt*) by which the world is chiefly governed: the sacred authority of bishops and the royal power. . . . Although you rule over the human race in dignity. . . . you understand that, according to the order of religion, in what concerns the receiving and correct administering of the heavenly sacraments you must be subject rather than in command.

New Europe (732–1077)

Further Muslim advance into Europe from Spain was halted by Charles Martel in 732 at the battle of Poitiers. Charles' grandson Charlemagne extended Frankish overlordship to much of present-day western Europe. Charlemagne was crowned Roman emperor by Pope Leo III in Rome on Christmas day 800. The political significance of this act came to be interpreted differently by popes and lay rulers. Carolingian and later rule during this period was theocratic, with the divinely favored emperor or king taking a leading part in church affairs. At the same time, clerical and, particularly, papal claims to superiority over the laity were elaborated.

Reformation and Renaissance (1077–1215)

In 1077, the emperor Henry IV did brief penance for resisting Pope Gregory VII's measures for church reform. Papal authority grew in both theory and practice during the eleventh and twelfth centuries. In the version of Gelasius' *Duo sunt* that entered canon law, the clause making clear that the emperor's submission to bishops referred only to sacraments was deleted, as was the clause recognizing that the emperor ruled over the human race. Indeed, Gregory VII claimed that only the pope was entitled to the imperial insignia. The concept of positive law was clearly articulated in this period, primarily in application to papal legislation. The revival of Roman law studies provided some support for imperial authority, and an anonymous Norman author defended royal authority as sacred: the king is by nature a man but by grace a *christus*, a God-man (Williams 1951), and lay political structures became more complex on their own. All this took place in the midst of economic progress and cultural achievements properly termed a Renaissance, one sometimes credited with discovering the individual.

Enlightenment (1215–1302)

The recovery of Aristotle's metaphysical, scientific, ethical, and political texts, along with further development of earlier medieval work in theology and legal studies, contributed to a thirteenth-century intellectual assurance evident in the brilliance of university masters and jurists and also in the educated individuals who advised or served the powerful in politics and religion. In politics, this century of enlightenment was a period of further development for the kingdoms of England and France and of conflict between powerful emperors and popes over the Italian peninsula (with city-republics and duchies negotiating their lives between them). In religion, Pope Innocent III convoked the Fourth Lateran Council (1215) to promote deeper Christianization of the laity. This program included required annual confession of sins to a priest, preaching and teaching by the clergy, and determined prosecution of heresy. The new mendicant orders, Dominicans and Franciscans, played key parts in these measures.

As examples of humble discipleship, the friars represented a reaction against the commercialization of traditional relationships and were accordingly preferred by many as confessors. They were also leading intellectual lights of the time and were heavily employed as agents of the papal Inquisition.

Power and Poverty, Real and Verbal (1302–1453)

Major contexts for political philosophy in the late Middle Ages can be described in contrasts drawn between the real and the fictive or merely verbal. Civil lawyers, developing an idea of Pope Innocent IV's, distinguished the fictive legal personality of a political community (a kingdom, say) from its real members when they attempted to accommodate the *de facto* independence of kingdoms such as England and France from the theoretically universal dominion of the Empire. Reasoning employed here also found application to smaller communities, old and newly formed. For example, a city that actually ran its own affairs had a case for recognition as legitimately free, a ruler to itself, a *civitas sibi princeps*.

A harsher distinction between real and verbal was made by a henchman of the king of France, addressing Pope Boniface VIII regarding his claims to supreme authority in the bull *Unam sanctam* (1302): "Your power is verbal, ours is real." A little later, different assertions of papal unreality were made by rebel Franciscans (including William of Ockham) who accused John XXII of heresy (hence of being a pseudo-pope) for denying the total legal poverty of Christ and his apostles. John in turn accused the friars themselves of practicing a merely fictive poverty. Other disputes about papal reality occurred during the schism of 1378–1417, when as many as three individuals at once claimed to be pope. The conciliar movement managed to negotiate unity in the papacy, but even with the rich resources of medieval corporation theory it remained unclear by the time of John Torquemada's *Summa de ecclesia* (1453) what, if any, authority the body of the church had with respect to its papal head.

Genres

Comprehensive Treatises

A number of medieval treatises set out a general view of the political domain: Augustine of Hippo's *City of God*, John of Salisbury's *Policraticus*, Thomas Aquinas' *On Kingship* to the King of Cyprus, Giles of Rome's *On the Rule of Princes*, Dante Alighieri's *Monarchia*, Marsilius of Padua's *Defender of Peace*, the third part of William of Ockham's *Dialogus*, John Wyclif's *De civili dominio*, and several defenses of papal power.

Mirrors for Princes

Advice books to rulers were popular in the ninth and twelfth to thirteenth centuries. Those of general significance include Bernard of Clairvaux's *On Consideration*, written to guide Bernard's former student Pope Eugenius III, and works by Aquinas and Giles of Rome mentioned above. John of Salisbury's *Policraticus* is a high-definition mirror for both rulers and courtiers.

Commentaries on Aristotle

Commentaries on the *Politics* were of two types, literal phrase-by-phrase explications, of which Thomas Aquinas' is a good example for the portion of the work covered (to 1280a6), and commentaries in question form, of which Albert the Great's is a model of philosophical engagement, posing and resolving objections to the Philosopher's views at every step. Peter of Auvergne wrote influential commentaries of both types.

Sentence Commentaries and Other Theological Treatises

Much important material for political philosophy is embedded in theological treatises, such as commentaries on Peter Lombard's *Sentences*. Discussions of the sacrament of penance could, for example, include material on business ethics. The core of Thomas Aquinas' political thought is contained in his discussion of law beginning at q. 90 of *ST IaIIae*, but his later treatments of charity, justice, prudence, and the vices opposed to them are also significant.

Disputed and Quodlibetal Questions

The standard unit of scholastic discourse, the *quaestio*, organized around arguments for and against a single proposition, lent itself to discussion of political issues, including hereditary as against elective monarchy and the rule of law as against personal rule. A dialogue between masters can sometimes be traced in their respective questions (McGrade et al. 2001).

Topics

The nature and aims of politics as recognized in medieval philosophical thought and the regimes proposed to achieve these aims are sketched below to provide guidance to fuller discussions elsewhere in this volume.

The Nature of Politics

The founding text of medieval political thought was Augustine of Hippo's *On the City of God Against the Pagans*, written to refute the charge that abandoning the old gods in favor of Christianity was responsible for the sack of Rome in 410. According to Augustine, no human being dominated any other in the state of innocence described in Genesis. The pervasive fact of such domination in later times is due to Adam's original sin of rebellion against the rightful dominance of God. On this account all politics is unnatural, for the essence of earthly empires, kingdoms, cities, and even families is the control of some by others. Relationships of dominance and subjection are a punishment but also a partial remedy for loving self more than God, since uncontrolled self-will would produce a world even worse than the one in which we find ourselves. Politics is a matter of damage control. Genuine happiness, including freedom from our own drive for domination, can come only by God's grace, through faith in Christ.

From this position, two approaches to political action were taken, both involving the church. The more familiar one, sometimes referred to as political Augustinism, was to promote the power and authority of the church, provider of the means of grace. The other approach was to minimize the

church's involvement in secular politics, relying on its ministry to individuals for whatever amelioration of civic life might be possible. Bernard of Clairvaux exemplifies both approaches and the tension between them by endorsing the principle that earthly powers should act at the pope's nod (*nutum*), while entreating the pope to avoid immersion in secular business.

Other approaches to politics, with less or in some cases no discernible emphasis on human corruption, were taken mainly in the later Middle Ages. Thomas Aquinas argued for the naturalness of politics and the possibility of nonexploitative forms of authority aimed at a genuine, albeit not ultimate, this-worldly happiness. Marsilius of Padua saw natural human desire for a "sufficient" life as the proper motive of political association and regarded contemporary papal exercise of power as an unwholesome disturbance of natural processes. For Marsilius, blessedness in the next life was indeed to be had only by following Christian teaching, but it was crucial that the clergy have no coercive power to enforce their teaching.

Natural Norms

Commitment to some form of natural law or natural rights was universal among medieval political thinkers, but conceptions varied. Natural law was seen by some as an instinct implanted by nature in humans and other animals for their own well-being. Other thinkers, including Thomas Aquinas and William of Ockham, connected natural law with the capacity to grasp what actions are intrinsically rational.

Two Latin expressions are ordinarily translated as "natural law": *lex naturalis* and *ius naturale*. *Ius* also had two other senses. As "what is right," *ius* was the object or objective of justice. In the sense of "a right," *ius* was a power of action or control inhering in a bearer or subject. The relation of this distinction to modern ideas of rights has been much discussed in recent scholarship (Tierney 1997; Brett 1997; McGrade 2006).

Justice

Many lines of thought influenced medieval discussions of justice, including Roman law,

Ciceronian civic virtue, and Aristotelian ethical and political analysis. Accepting the Roman law definition of justice as a constant and perpetual will to render each his due, Augustine of Hippo wondered how anyone could do this who did not render God his due. The conclusion was often drawn that true justice could exist only in a Christian society. Even when the legitimacy of non-Christian polities was conceded, the possibility of giving equal political recognition to Christians and non-Christians was rarely even implied, although William of Ockham suggested that since believers and unbelievers had sometimes in the past lived together in peaceful association (*societas pacifica*), a non-Christian world ruler might be acceptable in future. Francisco de Vitoria argued on scholastic grounds for the political rights of the native Americans in the context of Spanish conquests.

Peace

For Augustinians, peace, like justice, was a matter of right order, ultimately in relation to God, a “tranquillity of order” in which body, soul, and mind were subordinate each to the next, and mind to God. Augustine also recognized a useful but spiritually unquiet earthly peace based on agreement about who was to rule and who obey. The peace defended by Marsilius of Padua, though earthly, was also defined by tranquillity, one arising from the temperate functioning of all parts of a community.

Common Good

Since for Aristotle the aim of political association is not simply life but the good life, his conception of the common good could readily be used to give earthly politics a morally and culturally elevated dimension and to encourage civic virtue. The idea of the common good was carried further in the identification of God as the common good of the universe (Kempshall 1999).

Property and Poverty

Some authors held that private property, like government, was a result of sin, while others argued that property was a reasonable and in that sense

natural institution and would have arisen even without sin. In either case, issues about the use of material things needed to be addressed, and in an increasingly complex society this led to significant economic thought. Controversy about the Franciscan ideal of poverty, a life free of legal rights, involved fundamental questions about natural rights.

Coercion

Christians served in the Roman army as early as the second century, but serious discussion of the moral issues involved in warfare began with Augustine of Hippo, who was cited as an authority throughout numerous later discussions of just war. Spreading Christianity to non-Christian territories came not to be acceptable in itself as a justification for war. Defense of orthodoxy against heresy or schism was, however, especially from the twelfth century.

Regimes

Medieval thinkers discussed a variety of governmental arrangements as means for achieving the aims just outlined.

Monarchy: Papal, Imperial, Royal

Of all medieval monarchies, that of the papacy was most elaborately defended, both in the canon law and commentaries thereon and in a series of more systematic works by fourteenth- and fifteenth-century authors: Giles of Rome, James of Viterbo, Augustine of Ancona, and John Torquemada. Papal apologists – hierocrats or curialists – did not seek to abolish lay structures of government in favor of direct papal administration, but the plenitudo potestatis claimed for the pope included superiority over all human law and ultimate jurisdiction over all other rulers, clerical or lay.

The critics of unrestricted papal power defended other regimes as complements to or replacements for papal authority. The favored candidate for Dante Alighieri, Marsilius of Padua (at times), and William of Ockham was the Roman Empire. The Empire’s legitimacy at the time of Christ was important to all three of these thinkers. For Dante, the final aim of imperial

rule was fulfillment of humanity's intellectual potential in a global civilization. Marsilius and Ockham assigned more modest aims to temporal government, but for Marsilius the achievement of communal tranquillity required that all coercive power be vested in a single civil government or principate. This entailed that in a Christian community the civil ruler's ecclesiastical authority would be as great as that exercised by emperors in any earlier century. As against Marsilius' monism, Ockham presented the argument that the best regime was compatible with the existence of jurisdictions independent of the supreme secular authority.

Other critics of curialism, such as John of Paris and John Wyclif, were oriented toward royal regimes. John of Paris, like Ockham, was a dualist. Wyclif gave the civil ruler an important negative religious function, that of compelling Christian clergy to live modestly, following the example of Christ and his apostles.

Kingship was also commended by authors who believed in at least the moral subordination of civil to spiritual authority. In John of Salisbury's organic model of society, the princely head is an earthly image of the divine majesty, while yet being a minister of the priestly soul of the community. In the treatise Thomas Aquinas wrote for the king of Cyprus, kings are responsible for the moral well-being of their subjects, but for salvation it is necessary that every individual be subject to the Roman pontiff. In Giles of Rome's treatise on kingship, the king is to be the source of law and an inspiring model of personal virtue for all his subjects, but Giles' *On Ecclesiastical Power* is an emphatic declaration of papal supremacy.

Republicanism

Ptolemy of Lucca considered a "political" or republican government the only one fit for a virtuous people. Marsilius of Padua proposed discussion involving the whole citizenry as the best way to produce satisfactory laws and viable government. Constitutionalist ideas were developed with regard to the church in the conciliar movement of the late fourteenth and fifteenth centuries.

The Mixed Constitution

Serious consideration was given by late medieval Aristotelians to the mixed constitution of Politics 1297a6 (Blythe 1992). Traditional emphasis on the rule of law made by a representative body gave England a government that could be expounded by John Fortescue as both royal and political.

The Variability of Legitimate Regimes

Many authors, including Thomas Aquinas, held that different secular regimes were appropriate for different peoples and circumstances. Ptolemy of Lucca strongly favored a republican regime for a freedom-loving people but thought monarchy, which he equated with despotism, necessary in most cases. Marsilius of Padua held that the broadly participatory deliberative process mentioned above could result in the citizenry's establishing any of a number of types of government. In the circumstances of his day, he was prepared to delegate even the community's own proper function as supreme human legislator to a single individual, the Roman emperor. William of Ockham developed the position that monarchy was ordinarily the best regime for both temporal affairs and the church, but that circumstances might occasionally require other forms of government – and that although the papal headship of the church had been instituted by Christ it was nevertheless beneficial (*expediens*) for the community of the faithful to have power to change the church's government from monarchic to aristocratic, at least temporarily.

Resistance

Tyranny was regularly deplored by medieval authors and tyrannicide occasionally deemed licit. In most secular contexts, power was sufficiently diffused to allow some party to claim authority on behalf of the community to correct a faulty ruler. William of Ockham used the biblical idea of "fraternal correction" as a basis for resistance to what he regarded as heresy on the part of John XXII. There was also, however, a tradition holding that bad rulers were divine punishment for the sins of the people.

Conclusion

Past research in medieval political thought has revealed significant continuities with modern thought. Recent work on the idea of natural rights is a striking example. More such continuities will certainly be found through further study of major texts and exploration of the large body of quodlibetal and disputed questions. Much can also be learned from aspects of the Middle Ages that are less prominent today or until recently have seemed entirely archaic. For example, a study of medieval monastic rules from the perspective of political philosophy could be of scholarly and human interest. More urgently, today's "radical Islam" directs attention to issues of religion and politics that were central to the radical Christianity of twelfth- and thirteenth-century Europe – with its Crusades, popular religious movements, Inquisition, papal-imperial conflicts, and personal spirituality. A more nuanced appreciation of the struggles over such issues at that time might give a better sense of how they present themselves to many Muslims and others today. Study of medieval developments might help the search for a shared understanding of natural norms as a basis for cross-cultural peace.

Abstract

Political philosophy, the attempt to replace opinion about political affairs by knowledge, arises in the medieval Arabic–Islamic tradition of the Middle East with al-Fārābī (870–950) and ends with Averroes (1126–1198). Two important figures precede al-Fārābī – al-Kindī (Abū Yūsuf Yaʿqūb ibn Ishāq al-Kindī, died 866) and al-Razī (Abū Bakr Muḥammad ibn Zakariyyā al-Rāzī, 864–925), but neither engages in political philosophy. Al-Kindī, acclaimed “the philosopher of the Arabs,” was renowned for his excursions into Greek, Persian, and Indian wisdom and for his detailed knowledge of astronomy. Although some of his writings contain the germs of a political teaching, he is primarily interested in ethics and accepts the milieu in which we live as a fixed variable, something not worth trying to alter. Al-Razī sees the philosophic life as “making oneself similar to God. . . to the extent possible for a human being” and prescribes for human conduct with that goal in mind. He discerns that one who aspires to philosophy must focus on things such as gaining a livelihood, acquisition, expenditure, and seeking rulership, but goes no further. That is, he never investigates how ethics, household management, and political rule are related or even what they comprise and contents himself with speaking of political rule in ethical terms.

Moreover, as the following narrative reveals, Arabic political philosophy does not develop in a unilinear fashion. There is a dialogue of sorts between those who contribute to it, in that later philosophers refer to their predecessors explicitly as well as indirectly. And there is constant tension about the relationship between reason and revelation, with some thinkers almost blurring the two while others keep them firmly distinct. Finally, although there is a brief flicker of the philosophic flame coming back to life with Ibn Khaldūn (1332–1406), it is all too short-lived.

Abū Naṣr Muḥammad ibn Muḥammad ibn Ṭarkhān ibn Awzalagh al-Fārābī was born in about 870 either in Kazakhstan or Turkestan. He arrived in Baghdad after 890. Around 942, political upheavals forced him to Aleppo, then Egypt, and finally Damascus, where he died in 950. Widely acclaimed “the second teacher,” that is, second after Aristotle, al-Fārābī founded the Arabic-Islamic political philosophy insofar as the fact that he is the first to explore the challenge revealed religion presents to traditional philosophy in its claim that the creator provides for human well-being by means of an inspired prophet-legislator.

He does so by showing that the political science of Plato and Aristotle with its traditional separation between practical and theoretical knowledge no longer suffices for the radically new situation created by revealed religion. That older political science can identify the actions and ways of life needed for sound political rule to flourish, but is silent about opinions – especially the theoretical opinions set forth in religion – and thus unable to identify the kind of rulership needed now that religion holds sway. Nor can it speak about the opinions or actions addressed by the jurisprudence and theology of revealed religion. These tasks require a political science bringing theoretical and practical science together along with prudence and showing how to order them in the soul of the ruler.

Al-Fārābī’s new political science presents religious beliefs as opinions and acts of worship as actions. For him, both are prescribed for a community by a supreme ruler or prophet. His new political science views religion as centered in a political community whose supreme ruler appears

to be identical with the founder of a religion. Indeed, the goals and prescriptions of the supreme ruler are those of the prophet law-giver. Everything said or done by this supreme ruler finds justification in philosophy, and religion thus depends on theoretical as well as practical philosophy. Similarly, by presenting the art of jurisprudence as a means to identify particular details the supreme ruler failed to regulate before his death, al-Fārābī makes it depend upon practical philosophy and thus to be part of this broader political science.

His new political science offers a comprehensive view of the universe and identifies the practical acumen permitting the one who possesses this understanding, either the supreme ruler or a successor endowed with his qualities, to rule wisely. Able to explain the various ranks of all the beings, this political science also stresses the importance of religion for uniting the citizens and for helping them attain the virtues that prolong decent political life. Al-Fārābī thereby reaches to the core of revealed religion and presents it as consonant with the best understanding of the philosophy set forth by Plato and Aristotle. Politics is central to the proper human life because only in a well-ordered regime can people pursue their true end or purpose – ultimate happiness or perfection.

Abū ‘Alī al-Ḥusayn ibn Sīnā or Avicenna was born in Afshana in 980. His family soon moved to nearby Bukhārā where he began his studies. After the Qur’ān and related literature, he pursued mathematics, Islamic jurisprudence, and philosophy. Avicenna served as an administrator for the local ruler and as jurist for, and advisor to, other minor rulers. He also managed the affairs of the widows of rulers and served as physician to Shams al-Dawla, the Buyid prince of Hamadhān and Qirmisin – being named his chief minister or vizier on two occasions. Despite his engagement in politics, Avicenna composed no comprehensive treatise on the subject.

In the first chapter of the introductory volume to his famous *Healing*, Avicenna explains the general order of the whole work. After the part on logic is another part devoted to natural science. It is followed by a third part about mathematics, and the whole compendium concludes with

Avicenna's explanation of the divisions and aspects of metaphysics. He says nothing about practical philosophy or science until the very end of his discussion of metaphysics or divine science. As he puts it, his "summary of the science of ethics and of politics" is placed there "until I compose a separate, comprehensive book about them."

Avicenna's fuller teaching reveals, however, that ethical and political science belong after divine science intrinsically and not provisionally. The human manifestation of divine science and its practical proof, they testify to divine providence for humankind and thus to the truth of revelation more clearly than any of the other sciences investigated in the *Healing*. Because the correctness of what they teach can also be verified by Aristotelian or pagan reasoning processes, Avicenna elucidates the relationship he discerns between pagan philosophy and the revelation accorded the Prophet Muḥammad. His description of Plato's *Laws* as a treatise on prophetic law-giving indicates how interrelated he deems philosophy and revelation. Moreover, in elucidating the political aspects of prophecy and divine law, he addresses the most fundamental political questions: the nature of law, purpose of political community, need for sound moral life, importance of providing for divorce as well as marriage, conditions for just war, considerations that lay behind penal laws, and the end of human life. Although he is silent about the origin of private property as well as how future successors to the prophet-lawgiver might be raised so that they will have moral habits and character traits suitable to such a position, he provides the basic principles for readers to pursue these issues on their own.

Differently stated, Avicenna's political teaching provides an introduction to the fundamentals of political science, but does not make political life central to human well-being. His prophet dwells on beliefs having no immediate political relevance. Indeed, some are antipolitical or ascetic, as though the highest goal toward which thoughtful humans should strive is to weaken the ties between the soul and their body thereby achieving separation from the body. Thus, the great turn toward political philosophy initiated by al-Fārābī is ignored and even obscured by Avicenna.

After Avicenna, philosophy moves West to Andalusia. The first to come to light there is Abū Bakr Muḥammad ibn Yaḥyā ibn al-Ṣā'ig or Ibn Bājja. Born in Saragossa between 1085 and 1090, he escaped political turmoil first in Granada and then Seville, serving as chief minister or vizier to local governors loyal to the Almoravid dynasty in both cities. He died in Fez in 1139.

Ibn Bājja is highly praised by his successors for his promise, but also blamed for having allowed diversions to distract him from his writing. Important as are his treatises on music, astronomy, logic, natural science, metaphysics, and even al-Fārābī's logical writings. Of greater interest here is his focus on the solitary – the individual whose intellectual and moral qualities put him at odds with the dominant opinions in imperfect regimes. Ibn Bājja pursues the theme in his *Regimen of the Solitary*, comparing this exceptional individual to a weed in that he comes on his own to form correct opinions about the world and how to live as a human being that are in sharp contrast with the false, unsound opinions of his own city as well as of most other cities in existence at any time. He flourishes in spite of his surroundings, developing into a specimen distinct from those dominant in his own milieu.

Ibn Bājja reaches back to Plato and the *Republic* to establish the importance of the subject. He grounds his account in what al-Fārābī has said about the tensions arising for those possessed of sound opinions and character as they interact with the dominant opinions and role models. Precisely because the best solution – bringing into being a perfect city that provides education suitable for all the citizens – is not likely, perhaps not even possible, Ibn Bājja focuses on the individual who manages to arrive at a proper understanding of the universe and the goal of human beings within it. That is, he indicates what that understanding should be and suggests obliquely how it differs from the opinions and actions all too evident in actual regimes. But Ibn Bājja never indicates how the solitary individual is to be formed or governed. Suggestions about the way the universe is to be intellectually apprehended and the soul of one who arrives at such an apprehension notwithstanding, the account remains too imprecise and inconclusive to offer the

guidance for which Ibn Bājja so whets readers' appetites.

In this respect, he unwittingly contributes to the intellectual tension introduced by Avicenna. Rooted as his enterprise is in the educational task of Plato's *Republic* and of al-Fārābī's larger political teaching, Ibn Bājja's attention to the spiritual forms encourages those who would like to link philosophy – especially political philosophy – with religious and metaphysical themes. Indeed, Ibn Bājja contributes so to that nonrational perspective that his immediate successor, Ibn Ṭufayl, deems it necessary to restate the history of philosophy within Islam so as to redress the balance.

Abū Bakr Muḥammad ibn 'Abd al-Malik ibn Ṭufayl al-Qaysī was born in Guadix, not far from Granada, in 1110. Reputed for his learning in philosophy, jurisprudence, theology, and logic, as well as natural science, he gained the favor of the Almohade ruler, Abū Ya'qūb Yūsuf, whom he served for many years as a political advisor and physician. Only his philosophical novel, *Ḥayy ibn Yaqẓān* (*Alive, Son of Awake*), has survived. He died in Marrakesh in 1185.

In the philosophical introduction to that work, Ibn Ṭufayl focuses on the relationship between the rational acquisition of knowledge and the path to it pursued by those who favor mysticism or Sufism. The work itself consists of three major parts. In the introduction, Ibn Ṭufayl explains his reasons for writing a book such as this and provides a general critique of philosophy, theology, and mysticism within the Arab world at his time. It is followed by the story of Ḥayy and by a formal conclusion in which Ibn Ṭufayl returns to the main theme of the work.

The tale is a response to a request that he unfold, what he knows "of the secrets of the Oriental wisdom mentioned by the master, the chief, Abū 'Alī ibn Sīnā." Ḥayy is either self-generated from a lump of clay or comes into being as do all humans but has been put into the sea in a basket because his mother, the sister of a very proud monarch, wedded beneath her status in secret, and feared for the fruit of this union should her brother learn of Ḥayy's existence. However generated, he grows up on a deserted island, nursed by a doe until he can fend for himself. During seven periods of 7 years each, he discovers

his natural surroundings and the way they interact, ascending by a series of basic inductive reasoning to an understanding of physics and its many divisions as well as mathematics and its parts. He also gains insight into the nature of the heavenly bodies and into the character of the creator as well as of his messenger and prophet, Muḥammad.

Not until he encounters Asāl, the inhabitant of a neighboring island who is discontent with the way his fellow citizens practice religion, does Ḥayy learn to speak. The two return to Asāl's island intent upon showing people the correct path, but fail miserably. Intelligent as each is, neither has any awareness of how to speak to human beings whose primary concerns are the securing of basic needs and then the enjoyment of pleasant respite. Only Salamān, a friend of Asāl's who discerns that most people cannot appreciate the truths Ḥayy wishes them to grasp but is content to let them flounder, understands the limits of human reason. His complacent disinterest in the well-being of his fellow citizens baffles Ḥayy and Asāl, to be sure. But it also deprives them of the possibility of learning about a law-giver's and prophet's greatest skill: being able to persuade others of his vision.

The tale ends with Ḥayy and Asāl deciding to return to their desert island in order to spend their remaining days meditating about divine matters. A reader who has followed the narration through to the end may discern how important it is for those who know or are somehow inspired to be able to communicate their insights to others. Unless those who understand the way things are also have a sound grasp of rhetoric, they will never be able to help others elevate their thoughts and achieve a better political order. Through this delightful tale, then, Ibn Ṭufayl reminds the reader of al-Fārābī's account of the first ruler as prophet as well as law-giver and philosopher.

Abū l-Walīd Muḥammad ibn Aḥmad ibn Muḥammad ibn Rushd or Averroes, as he is more commonly known in the West, is renowned for his intellectual excellence and profound accomplishments in jurisprudence, medicine, poetry, philosophy, natural science, theology, and, above all, for his commentaries on Aristotle. He was born in Cordoba in 1126. The most important event in Averroes' life must be his

presentation by Ibn Ṭufayl to Abū Ya'qūb as the person most qualified to undertake the task of commenting on Aristotle's works. While engaged in those commentaries, he served as a judge, was the personal physician to Abū Ya'qūb, and composed treatises on topics of more immediate concern to fellow Muslims, most notably, the *Decisive Treatise*. Later, accused of being overly occupied with philosophy and "the sciences of the ancients," he was banished for 2 years. Shortly after returning to favor at the court in Marrakesh, he died in 1198.

In the *Decisive Treatise*, he investigates the relationship between philosophy and divine law and, more pointedly, the important role of prophecy. Central to the argument set forth there is Averroes' clear sense of the limits of reason and need to speak to people in language they understand – precisely what Ḥayy and Asāl lacked. Referring to a famous Qur'ānic passage (16:125), he notes that most scholars agree upon the need to address people with different levels of learning in ways suitable to them just as the Qur'ān recommends. It is because religion, like politics, must take the whole citizen body into account that different kinds of speech and even different kinds of practices are justified. Moreover, those who would deny that the revealed law works in such a manner put the citizenry into danger. By explaining complicated matters of faith to those not able to follow the reasoning, these would-be teachers lead the less gifted into confusion and frequently into disbelief.

For Averroes, there is a major danger in using dialectic or demonstration to address those who can comprehend only preaching or rhetoric. On the grounds that the lawgiver, that is, the prophet, is similar to a physician – the lawgiver caring for souls and the physician for bodies – Averroes draws the practical consequences. First, such misguided teachers are doing little more than telling the populace not to heed the ministrations of the physician. Indeed, such teachers drive the people away from the one individual who can help them recover the health of their soul and preserve it from future sicknesses. The goal of the lawgiver or prophet is not to make the people physicians, but to teach them the basic fundamentals with respect to the all-important health of their soul.

For such an undertaking, there is no need to fret about the intricacies of the revealed book. The surface teaching suffices. That is what Averroes seeks to safeguard through his defense of rhetoric and the surface understanding of Scripture.

This is the core teaching of the *Decisive Treatise*, a writing for which Averroes apologizes but that he felt compelled to write in order to overcome the terrible strife between the proponents of religion and those of philosophy then prevalent. It is prompted by his own broad understanding of the complexity of the human soul tempered by a peculiar sense of what is needed for sound political life. In this manner, he brings philosophy and religion together even as he reinforces the central focus of al-Fārābī's political teaching.

In sum, Arabic political philosophy is best characterized as political philosophy within the medieval Arabic-Islamic tradition. As such, its major concern is the relationship between reason and revelation – especially as it is manifested in the act of law-giving. That in turn leads to inquiry into the larger question of prophecy and of what qualifies a human being to become a law-giving prophet.

Political Philosophy, Byzantine

Ivan Christov

Faculty of Theology, University of Sofia, Sofia, Bulgaria

Abstract

Byzantine political philosophy (BPP), in general, is a reflection on the political practices and the nature of the Empire, on the divine origin of emperorship, on the hierarchical order of imperial government, civil ranks and the community of Christian states, under the guidance of the Byzantine Emperor. In a more particular sense, it is a reflection that goes further and

comments on its own foundations in Christian metaphysics, epistemology, and axiology. This second approach to the BPP is rather problematic because of the scarce textual evidence. The Byzantines felt not much need to theorize, taking for granted that their Empire is a gift from God. It was also usual in that time to impose the general theological and philosophical modes of thought on political thought, not taking into account their sophisticated interaction with facts. Thus, the BPP tended to be just a part of the imperial ideology.

The founder of BPP was admittedly Eusebius of Cesarea (c. 263–339). He adapted in Christian terms the Roman and Hellenistic idea of emperorship as an image of the kingship of Zeus and originated the Byzantine conception of the divine origin of imperial government. Eusebius' reflections laid the intellectual basis of Byzantine theocracy and due to their influence on the church fathers and historians, they gained immense importance both in the East and in the West. The later BPP was rather fragmentary and consisted mainly of advice to the emperors. It took the literary form of "Mirrors for Princes," providing samples of rhetorical speech, diplomacy, and court flattery, far from originality. The main sources we have about the BPP within this genre are the works by the deacon Agapetos; Patriarch Photios; Theophylact, Archbishop of Ochrid; Kekaumenos; Nikephoros Blemmydes; and John Apokaukos, Bishop of Naupact.

The Empire

According to the BPP, the Byzantine Empire was considered a terrestrial image of the kingdom of God, and the emperor was seen as God's vicegerent or viceroy on earth. This put the reflections on the Empire in an eschatological context and made them an essential part of a Christian Philosophy of history. The Byzantine Empire was "a chosen vessel" for the salvation of the human race and a realization of Divine Providence. It conveyed the plan of salvation, bringing to completion the highest achievements of mankind, providentially

granted to Jews, Hellenes, and Romans. Among the most important of them were *the universal form of state* and *the universal language*. It was the Roman Empire that for the first time brought the whole human race together in one unity and agreement, imposing legislation and a state constitution of more than a regional or national importance. Due to its might, it participated in the Majesty of the Kingdom of God, for it transcends, as far as an earthly realm could, every other power on earth. According to the conception of *translatio imperii*, the Byzantine Empire was considered a successor of the Roman Empire, its capital Constantinople was titled “New Rome,” and the Byzantines called themselves “Romans” (*rhōmaioi*). The Greek language of the Byzantine Empire was another gift by the Divine Providence to complete its universal nature. Greek not only expresses the spiritual and cultural heritage of Hellenes, but what is more important – this is the language of the Christian *kērugma*, the language conveying the way to salvation. Therefore, the Byzantine Empire has embodied the two great powers that came forth to civilize and unite the whole world – the monarchy of the Roman Empire and the teaching of Christ. The capital Constantinople was also called the “Queen of Cities” and the “New Jerusalem.” It was considered as both a political and religious center of the Christian world. Constantinople was hailed in hymns and stimulated the emergence of a particular literary genre of the *Laudes Constantinopolitanae*.

The Emperor

Being a reflection of the Kingdom of God on earth, the Empire should mirror the hierarchical order of heaven, stemming from one Supreme Being. It could only have one sovereign, as there is only one God. It is on these grounds that the *monarchy* was considered the best form of government. Presided by the emperor, it should ensure universal peace, justice, and unity of faith, binding in the entire human race in hierarchical order. United by the Byzantine Empire, humankind should become “one flock with one

Shepherd.” The BPP took the pagan concept of the god-emperor and transformed it into Christian terms as a “Vicar of Christ” and “Chosen of God,” both granting the divine origin of his sovereignty and opposing pagan pantheism. This is the reason behind the ambiguous stance of the emperor. On the one hand he had absolute power insofar as he was bound to be a proper image of the Almighty God, but on the other he was granted his powers not *by nature* but *by grace*. This gave a Christian nuance to the ancient conception on the chosen nature of monarchy, moderating its absolutist claims. The Byzantine Emperor could be dethroned by the persons who had formally elected him (this actually happened to 43 of the emperors) and the people of Byzantium were granted the right of mutiny against their sovereign.

The Political Practices

According to the BPP, the emperor was chosen and guided by the Logos of God. That is why he was considered the only source of order and stability in Byzantine society. The Byzantine Emperor was the source human and the mediator of divine legislation. His privileged position was expressed by the formula of the “animated law” (*nomos empsychos*). The law was personified in the institution of the emperor. It was through him that God ensured direct control over the human legislation. This on the one hand led BPP to interpretations on behalf of the thesis that he (like the Roman emperor) is above law, but on the other hand it was taken to mean that his prerogatives are just to make corrections in the otherwise inflexible law, with a view to greater humanity. The first stance put stress on the theocratic tendencies in the institution of the emperor. He was called to represent Christ in the political as well as in the mystical life of the Byzantines. There was a hierarchical order of ranks according to their proximity to the sacred person of the emperor and all of them were subjected to the custom of prostration. The Byzantine court was famous for its ceremonies, aimed at his mystical glorification. The emperor also represented Christ at many church

celebrations and customs such as to invite twelve guests to a meal on Christmas Day and to wash the feet of 12 poor men from the street. He was considered the upholder of the church law and order. Without his signature the decrees of church councils were not valid. Being the defender of the church and the canons the emperor regulated the hierarchy of the Church and defended the decrees of the councils. Yet the sacred position of the emperor did not endow him with an absolute power over the Church and society. The theological distinction of *grace* and *nature* reflected on the distinction the Byzantines made between the institution of the emperor and the emperor as a person. The divine origin of the institution remained unquestioned, while the emperor himself had to meet some spiritual, moral, and political requirements to be elected for this position. The legal right of mutiny against the emperor (admitted in western political thought much later in c. 13–14), the practice of dethroning an emperor, excommunication and even of anathemizing the emperor by the patriarch served as a warranty against the claims of the person on throne to interpret the prerogatives of his institution, given by the grace of God, in terms of natural law. That is why there was a kind of a social contract in Byzantine society as well as implicit harmony and cooperation between emperor and patriarch, between state and church.

The Community of Christian States

The conception of the universal nature of Byzantine Empire and its divine origin led to the idea that it is the sole legitimate empire on earth. The Byzantines believed that their state was chosen to fulfill Divine Providence and they never admitted the existence of another. Insofar as this contradicted the political reality, they could only recognize other states, developing the ideology of the granting of privileges and royal insignia by the Byzantine Emperor. “The Byzantine hierarchy of states” according to this theory was a hierarchically dependent community, based on the level of their kings’ kindred relation

to the Byzantine Emperor. Even the pragmatism of the late Byzantine emperors could not help them in their quest of western help against the Ottoman Turks to properly surpass the limitations of this ideology. This finally led to the fall of Byzantium and destroyed the theoretical illusions, cherished by the BPP about the empire as an almighty reflection of the majesty of the Kingdom of Christ that will remain unconquered until the final consummation.

Porphyry, Arabic

Cristina D'Ancona

Dipartimento di Filosofia, Università di Pisa, Pisa, Italy

Abstract

The author of the *Isagoge*, Porphyry was first and foremost seen as an authoritative commentator of Aristotle by his Arab readers. Following in the footsteps of Ammonius and his school in Alexandria, also in the Arabic-speaking world the *Isagoge* was placed at the beginning of the *Organon*, and has been incessantly commented upon in medieval Arabic philosophy. The Alexandrian tradition also disseminated the topic, ultimately derived from Porphyry, of the harmony between Plato and Aristotle. Some works other than the *Isagoge* were known to some extent in the Arabic-speaking world but Porphyry's name is linked first and foremost to the logical corpus of Aristotle, and only secondarily to other parts of the corpus (*Physics*, *Nicomachean Ethics*). Porphyry was also known as the “commentator” of the spurious *Theology* (in fact, Plotinus' *Enneads*).

Biobibliographical Information in the Arabic Sources

The *K. al-Fihrist* by Ibn al-Nadīm has an entry on Porphyry and refers to the entry on Aristotle for

additional information on his works; the subsequent biobibliographies depend upon the *Fihrist*, even though on one specific issue two of them include further data. The biobibliographical accounts on Porphyry in the Arabic sources have been translated into various languages by Bidez (1913: 54*–60*), (all the main sources), Smith (1993: 8–11), and Adamson (2007) (the account in the *K. al-Fihrist*), and have been analyzed time and again (Müller 1882: 24–30; Steinschneider 1889: 97–99; Gätje 1971: 76–79; Segonds 1982: 169–176), but a synopsis of the overlaps and differences among the Arabic surveys will be useful here. The main Arabic sources are the following (in chronological order): *K. al-Fihrist*, p. 253.12–18 Flügel [=F] to which the information given in the entry on Aristotle should also be added (see below); Ibn al-Qiftī's *Tarikh al-ḥukamā'*, p. 256.13–257.9 Lippert [=Q]; Ibn Abī Usaybi'a's *'Uyūn al-anbā' fī ṭabaqāt al-aṭibbā'*, p. 24 Müller [=IAU]; Barhebraeus *Ta'rīkh mukhtaṣar al-duwal*, I, p. 84 (Latin); II, p. 133 (Arabic) [=B]; Ḥajjī Khalīfa's *Kashf al-ẓunūn*, vol VII, n 7331 [=K]; to them, Casiri's *Bibliotheca*, I, pp. 185–186 [=C] can be added (on these sources, see the bibliography below; in particular on the *K. al-Fihrist*, see the entry on Translations from Greek into Arabic in this volume). It will appear from the synopsis below that the *K. al-Fihrist* forms the basis of all the subsequent accounts, even though Q and B seem to have had access to additional information, partly reflected in the much later bibliographical survey by K. As for C, he relies on Q and B, as the author himself says.

Porphry's Life and Philosophical Affiliation

According to the Arabic sources, Porphyry came from Tyre, Syria (F, Q, IAU, B, K, C); his lifetime was after Alexander (F) and Galen (F, Q) but before Ammonius (F, C). He lived under the emperor Diocletianus (B) and was a renowned and subtle commentator of Aristotle's works (F, Q, B, C). Indeed, Q (followed by K and C) expands this bit of information, describing how, in Porphyry's time, people baffled by the difficulty of Aristotle's books addressed to him the request

of commenting upon them; Porphyry replied that Aristotle's system of science was too difficult to be understood without an introduction, and he wrote the *Isagoge* in order to comply with the request; the *Isagoge* was then placed before Aristotle's writings (p. 257.3–4 Lippert), a story which is clearly reminiscent of Ammonius' commentary on the *Isagoge* (p. 22.12–23 Busse), and is repeated also in other Alexandrian commentaries (e.g., Elias; on the Neoplatonic exegesis of Aristotle's logical corpus in Alexandria, see Hadot 1987, 1991, 1992; on the influence of this tradition in the Arab world, see Hein 1985). B mentions also the name of Chrysaorius – the addressee of the *Isagoge* – as the friend who asked Porphyry to explain Aristotle's doctrines, an information coming ultimately from Ammonius, that does not appear in Q. Thus, the Arabic Porphyry is unanimously presented as a thinker of Aristotelian allegiance, indeed as a leading commentator on Aristotle, a profile which features also in the *Theology of Aristotle* (see the entry on Plotinus, Arabic in this volume), where “Porphyry from Tyre” is presented twice as the commentator of Aristotle's book on “Theology” (p. 3.6 and 8.4 Badawī), and in other sources (see below “Other Works”).

Works

As we have just seen, in the *K. al-Fihrist* Porphyry is first and foremost a commentator on Aristotle. Obviously, Ibn al-Nadīm did not create this image, but simply recorded it: Porphyry “expounded the books of Aristotle, as we have mentioned in the place where we have given an account of Aristotle” (p. 253.13–14 Flügel, trans. Dodge, p. 610); after this sentence, Porphyry's original works are listed. In what follows, the order is basically that of the entry in the *K. al-Fihrist*; also, the titles of the works are given in the form they have there.

Isagoge (*Kitāb Īsāgūjī fī l-madkhal ilā l-kutub al-manṭiqiyya*): F, Q, B, C.

Introduction to the Categorical Syllogisms (*Kitāb al-madkhal ilā al-qiyāsāt al-ḥamliyya*): F, Q, B, C.

On Intellect and the Intelligible (*Kitāb al-'aql wa-l-ma'qūl*): F.

Two Books to Anebo (*Kitābāni ilā Anābūn*): F, Q, B, C.

Refutation of Longinus (?) *On the Intellect and the Intelligible* (*Kitāb al-radd ‘alā’*) [see below on the spellings of this name] *fī l-‘aql wa-l-ma‘qūl*: F, Q, B, C.

Book of the Elements (*Kitāb al-uṣṭuqāt*): F, Q, B, C.

Accounts of the Philosophers (*Kitāb Akhbār al-falāsifa*): F, Q, B, K, C.

Book on Sleep and Awakening (*Kitāb al-nawm wa-l-yaqā’a*): F.

With the exception of *On Intellect and the Intelligible* (whose relationship with the *Refutation of Longinus* [?] on the same topic will be discussed below) and *On Sleep and Awakening* (mentioned only by Ibn al-Nadīm in the section on oneirocritics, p. 316.24 Flügel), the list of Porphyry’s original works is the same in all the bibliographical surveys; the obvious implication is that Q and K are derivative (as usual, IAU skips the bibliographical information, and C, as we have seen before, explicitly relies on Q and B). The same is true for the commentaries: F mentions, in relationship with the various items of the entry on Aristotle, Porphyry’s commentaries on the *Categories*, *De interpretatione*, *Physics* and *Ethics*, and the same titles feature in Q and K (C omits the commentary on the *Physics*); for more details on these commentaries, see below.

Porphyry’s Works in Arabic

Among the works by Porphyry known to the Arab bibliographical sources only the *Isagoge* is extant, but others have left some traces: the commentaries on the *Physics* and *Nicomachean Ethics*, the *Letter to Anebo* and the *History of Philosophy*, all of them lost or only fragmentarily extant in Greek. To this, a short Arabic writing on the soul should be added, that has been attributed to Porphyry but is unknown in Greek. Some hypotheses have been advanced in scholarship about the works whose titles were known to Ibn al-Nadīm and his followers, but did not circulate in Arabic. Finally, it has been argued that further works by Porphyry,

although unknown to bibliographical sources and not mentioned by any Arab writers, have influenced Arabic philosophy.

Extant or Attested Works

Works on Aristotle

Isagoge The Arabic version is extant and edited (al-Ahwānī et al. 1952; Badawī 1952): it was the work of Abū ‘Uthmān al-Dimashqī, one of the collaborators of Ḥunayn ibn Ishāq (see the entry on Translations from Greek into Arabic in this volume), and it was done on the basis of one of the numerous Syriac versions of the *Isagoge* (see the entry on Translations from Greek into Syriac in this volume), i.e., that of Athanasius of Balad (see Gyekye 1979: 16–17; Hugonnard-Roche 1994). However, the knowledge of Porphyry’s *Isagoge* antedates this translation: among the works of al-Kindī, an epistle on it is recorded (*Risāla al-aṣwāt al-khamisa*, lost to us, but mentioned in the *K. al-Fihrist*, p. 256.16 Flügel). Al-Kindī might have been acquainted with the contents of the *Isagoge* through the compendium of Aristotle’s logic translated or compiled by Ibn al-Muqaffā’, a work which, following in the footsteps of the Alexandrian tradition, places the *Isagoge* before the *Organon* (on the date and authorship of this work, see the entry on Translations from Greek into Arabic in this volume). Also, Ibn al-Nadīm records a certain Ayyūb ibn al-Qāsim al-Raqqī as the translator of the *Isagoge* from Syriac into Arabic (p. 244.16 Flügel). The *Isagoge* was widespread, not to say omnipresent in Arabic philosophy: according to Gyekye (1979: 17), between 850 and 1550 no less than 50 commentaries were written on it. Among them, the most important are Ibn al-Ṭayyib’s commentary (ed. Gyekye 1975), Avicenna’s paraphrasis (the *K. al-Madkhal* of the *K. al-Shifā’*, ed. al-Ahwānī et al. 1952), and two writings by Averroes: the abridgment contained in the *Ḍarūrī fī l-manṭiq*, entitled *al-Qawl fī l-ma‘ānī l-fā‘ila li-l-taṣawwur* (see Endress 1999: 343) and the *Middle Commentary* (*Talkhīs kitāb Isāgūjī*, ed. and trans. Davidson 1969a, b).

Commentary on the Physics In the *K. al-Fihrist*, p. 250.21–22 Flügel, Ibn al-Nadīm mentions in his account on Aristotle’s *Physics* the commentary by Porphyry on books I–IV, translated by Basīl, in all likelihood the same translator of the *Sayings* of the Pseudo-Menander, and the father of two other translators of the school of Ḥunayn, Tadhārī (Theodore) and Iṣṭifān. This commentary is lost in Greek, even though it has left several traces in later authors, chiefly Simplicius. The *Treatise on the Metaphysics* attributed to Abū Bakr Zakariyā’ al-Rāzī (ed. Kraus 1939) records an opinion uttered by Porphyry in the “second treatise of the *Physics*.” Hence, this passage has been included as fr. 463F in Smith’s collection of Porphyry’s fragments (see Smith 1993). Containing as it does several opinions on nature and its action (Alexander, Philoponus, Porphyry), this passage has attracted much attention in scholarship since then (see Brown 1972; Genequand 1984; Adamson 2007).

Commentary on the Nicomachean Ethics In the *K. al-Fihrist*, p. 252.2 Flügel, a commentary by Porphyry (lost in Greek) is mentioned in relationship to Aristotle’s *Ethics* (“*K. al-akhlāq, fassarahu Furfūriyyūs*, Book of Ethics, Porphyry commented upon it”), and al-Farābī refers to it in his *K. al-jam‘*, p. 56.13 Martini Bonadeo (see Martini Bonadeo 2008: 170). In the *K. al-Fihrist*, the translation of both Aristotle’s work and Porphyry’s commentary is attributed to Iṣḥāq ibn Ḥunayn. Several hypotheses have been advanced to explain the oddity that Aristotle’s *Ethics* is said to fall into 12 books, instead of the 10 of the Greek *Nicomachean Ethics*, and some of these hypotheses include a discussion also of Porphyry’s commentary: see the survey by Zonta (2003: 193–194) as for the idea that an additional book inserted in the Arabic version between books VI and VII was a Neoplatonic compilation that can be traced back to Porphyry. Citations from this commentary have been discovered by Ghorab (1972) in the *K. al-sa‘āda wa-l-is‘ād* attributed to al-‘Āmirī, and the influence of Porphyry’s commentary on Miskawayh’s *K. Tahdhīb al-akhlāq* has been argued for by Walzer (1956).

Other Works

Two Books to Anebo “Anebo,” the pseudonym of Iamblichus who was the real addressee of the lost “Letter” by Porphyry, is recorded in Arab bibliographies: the *K. al-Fihrist*, followed by Ibn al-Qifṭī, mentions two books “to Anābū.” Also, the *K. al-Fihrist* lists among the works of Abū Zakariyā’ al-Rāzī a *Refutation of the Book to Anebo by Porphyry* (p. 300.18–19 Flügel), which contained an explanation of “the Aristotelian doctrines on theology”: see the discussion in Gätje (1971: 77). In the *K. al-Milal wa-l-niḥal* by al-Shahrastānī, p. 345–347 Cureton, a passage from this writing *To Anebo* is quoted, where Porphyry’s metaphysical and cosmological doctrines are expounded (see Gabrieli 1946). It is worth noting that this account begins with Shahrastānī’s statement that Porphyry is a follower of Aristotle and is in complete agreement with him. As a proof, the *Letter to Anebo* is quoted, where Porphyry contends that Plato did not maintain the generation of the cosmos in time, but only argued that it is dependent on a principle other than it and anterior to it.

Accounts of the Philosophers Of this work, the Φιλόσοφος ιστορία only fragmentarily extant in Greek, Ibn al-Nadīm says he saw the fourth chapter in Syriac, an information repeated by Ibn al-Qifṭī. Up-to-date analysis of the Arabic testimonies, including a survey of the main problems, by Cottrell (2008). Rosenthal (1937) had detected in Mubashshir ibn Fātik’s *Choicest Maxims and best Sayings* an account of the “Life of Zeno of Elea” which he tentatively traced back to the *Accounts of the Philosophers* (Rosenthal 1937: 39), even though Porphyry is not mentioned as the source of the account on Zeno; this is considered as fr. XXX in Sodano’s edition of the fragments of Porphyry’s Φιλόσοφος ιστορία (see Sodano 1997: 144–153). Rosenthal traced back tentatively to the same source also the “Life of Solon” recorded in al-Mubashshir (=fr. 203 A Smith = fr. I of Book I Sodano; see Segonds 1982: 170–171; Sodano 1997: 38–40). Rosenthal also provided a detailed comparison between the

“Life of Pythagoras” recorded in Ibn Abī Uṣaybi‘a, p. 38–41 Müller and the *Life of Pythagoras* by Porphyry, admittedly a part of the Φιλόσοφος ἱστορία (see Rosenthal 1937: 43–56); an account on Pythagoras’ doctrine of the spheres is attributed to Porphyry also in Bīrūnī’s *India* (I, p. 43 Sachau: see Segonds 1982: 171). Also the *K. al-Milal wa-l-niḥal* by al-Shahrastānī refers to Porphyry as for Anaxagoras’ doctrines: this account is included as fr. 205F in Smith and as fr. VI of Book I in Sodano. There is no scholarly agreement about another account in Shahrastānī’s *K. al-Milal wa-l-niḥal*, that on Empedocles. Even though Porphyry is not mentioned, Altheim-Stiehl (1954) argued that Empedocles’ doctrines as recorded by al-Shahrastānī should be traced back to the Φιλόσοφος ἱστορία, a conclusion challenged by De Smet (1998), who has shown that the account in the *K. al-Milal wa-l-niḥal* depends on the Arabic doxography of the Pseudo-Ammonius edited by Rudolph (1989), a Neoplatonic reworking of a doxographical survey by Hippolytus of Rome, adapted to the Muslim theological controversies of the ninth century (on this dossier, see also Brague-Freudenthal 2005). Finally, Ibn al-Nadīm records in the section on the first philosophers Porphyry’s account about Thales as the first philosopher: this, Ibn al-Nadīm says, comes from Porphyry’s *History* (*Ta’rīkh*), a work extant in Syriac, two chapters of which have been translated into Arabic (p. 245.13–14 Flügel). According to Dunlop (1957), this translation was the work of Ibn Suwār, one of the scholars of the Aristotelian circle of Baghdad (see the entry on Ibn Suwār in this volume), and also Abū Sulaymān al-Sijistānī (another leading Aristotelian scholar of the time) was acquainted with Porphyry’s *Accounts of the Philosophers*. However, the title given in the *K. al-Fihrist* does not point to the Φιλόσοφος ἱστορία, but to the *Chronicle* (so Altheim-Stiehl 1954: 14; Segonds 1982: 169; see also Cottrell 2008, p. 528 n. 23, correcting several mistakes in previous scholarship). According to Sodano (1997: 48), nothing prevented Porphyry from speaking about Thales in the *Chronicle* and also in the Φιλόσοφος ἱστορία. A passage by Shahrastānī’s *K. al-Milal*

wa-l-niḥal where Porphyry deals with Thales (=fr. 204F Smith) is then considered by Sodano (1997: 42–43), as fr. V from Book I of the Φιλόσοφος ἱστορία. On all this, see Cottrell (2008: 546–555).

Dubia seu spuria

Kutsch (1954) discovered in the MS Istanbul, Aya Sofya 2457 a short writing on the soul which is attributed to Porphyry (*Maqāla li-Furfūriyyūs fī l-naḥs*). Not mentioned in bibliographies, this writing has been connected by Kutsch (1954: 267) with the pseudo-*Theology of Aristotle*. The literal correspondences between the *Maqāla li-Furfūriyyūs fī l-naḥs* and the *Theology* made Kutsch surmise, also on the basis of the fact that Porphyry features as the commentator of the *Theology* (see above), that the entire *Theology* was nothing if not an account of Aristotle’s theological doctrines as expounded by Porphyry. In Kutsch’s eyes, Porphyry made use by and large of his Plotinian readings to present Aristotle’s theology, and this work lay in the background of the Arabic *Theology*.

Hypotheses About Porphyry’s Works Mentioned in the Bibliographical Sources

Introduction to the Categorical Syllogisms

This work, lost in Greek but known to Boethius, who made use of it (Bodéüs 2008: 10), was translated into Arabic by Abū ‘Uthmān al-Dimashqī, according to the *K. al-Fihrist*, p. 253.15 Flügel (followed by Ibn al-Qifṭī).

On Intellect and the Intelligible

Only the *K. al-Fihrist* (p. 253.16 Flügel) lists this title, which may hint at the treatise that Porphyry himself mentions in the *Vita Plotini* 18.10–11, *That the Intelligibles Subsist Outside the Intellect* (lost in Greek). Ibn al-Nadīm mentions an “old translation” of this work, with no further details. It has been surmised that this title should be read together with the subsequent item, the *Refutation Against Longinus* (?) *On the Intellect and the Intelligible*; see the discussion in Gätje (1971: 77–78).

Refutation Against Longinus (?) On the Intellect and the Intelligible

This title features in the *K. al-Fihrist* (p. 253.16 Flügel) where the skeleton of the name is meaningless; the spelling of the name is different but not particularly helpful in other bibliographies (“Bāhyiūs,” “Pammachius,” and others); see again the discussion in Gätje (1971: 77–78). One may surmise that this title echoes two writings mentioned in the *Vita Plotini*: (a) the treatise *Against Those Who Keep the Intellect Apart from the Intelligible*, i.e., the “retractatio” that Porphyry wrote after having read the response of Plotinus’ pupil Amelius to his writing *That the Intelligibles Subsist Outside the Intellect*; and (b) a letter that he wrote to his former teacher Longinus, who had criticized Plotinus (see Gätje 1971: 78). On the circulation of the *Vita Plotini* in Arabic, see Thillet (2007); one may add that, even though there are no traces of an Arabic translation of it, the *Vita Plotini* did surely reach Baghdad in the ninth century, since this writing did not circulate separated from the *Enneads*, of which it serves as a preface (on the translation of the *Enneads*, see the entry on Plotinus, Arabic in this volume).

Book of the Elements

The *K. al-Fihrist* (p. 253.17 Flügel) lists among Porphyry’s works a *K. al-ustuqsāt* which has been tentatively translated by Dodge (1970: 610) as “Seeking an Explanation,” on the basis of the variant reading *K. al-istafsār* in one of the MSS of the *Fihrist*. However, the other bibliographies, (Ibn al-Qifī and Barhebraeus), read *K. al-ustuqsāt* (Casiri renders it as *Liber elementorum*); this work, says Ibn al-Nadīm, was in Syriac. Beutler (1953: 300) lists this work dubitatively as n. 65 in his survey of Porphyry’s writings, and suggests a writing on mathematics. However, taking into account that *ustuqsāt* is the transliteration of στοιχεῖα (compare, in the entry on Proclus, Arabic in this volume the so-called *Uṣṭukhūsiyya al-suḡrā*, the “minor *Elementatio*,” p. 252.22 Flügel), one may tentatively surmise that this title points to Porphyry’s *Sentences*, which, like Proclus’ *Elements of Theology*, is subdivided into propositions. On the possible echoes

of one of Porphyry’s *Sentences* in Arabic, see Thillet (1971: 299).

Hypotheses About Works Other Than Those Mentioned in the Bibliographical Sources

Walzer (1965) strongly argued in favor of the influence on Arabic philosophy of Greek works whose Arabic translation has not been found. This was especially true, in Walzer’s eyes, for Porphyry. He did point to the Commentary to the Myth of Er included in Porphyry’s lost commentary to Plato’s *Republic*, to the lost commentary on the *De interpretatione* – which he thought was known to al-Fārābī – and mostly to the lost writing on the “Harmony between Plato and Aristotle.” This writing is unknown in Arabic and to bibliographers, but counted for Walzer as one of the main sources of inspiration for several Arab philosophers: not only and predictably al-Fārābī, whose *K. al-jam’* echoed Porphyry even in the title, but also al-‘Āmirī (to whom Walzer attributed the *K. al-sa’āda wa-l-is’ad*) and Miskawayh, whose *Tahdhīb al-akhlāq* could be used to “get a fuller picture of what this book may have been like” (Walzer 1965: 286). Walzer was confident that the *K. al-sa’āda wa-l-is’ad* did make it “almost certain” that the Arabs knew Porphyry’s lost *Harmony*, which could be reconstructed as being a collection of quotations, mainly from Plato and Aristotle, about ethical and political topics. Also, Walzer thought that in Miskawayh this harmony was reached, following Porphyry’s lead, in the sense that Aristotle counted as the appropriate guide for this world, and Plato for the world-to-come. For an up-to date discussion, see Martini Bonadeo (2008: 1–14).

Finally, Porphyry’s role in the pseudo-*Theology of Aristotle* should be mentioned. A survey of the past scholarship that saw in the *Theology of Aristotle* a reworking by Porphyry of Plotinus’ writings “which an unknown late Greek or Syriac writer came to attribute to Aristotle” (Walzer 1965: 283) has been provided by Aouad (1989: 553–555). This reconstruction implies, to say it in Walzer’s words, that “the essential features of Porphyry’s paraphrase of a number of Plotinus’ essays may be recovered through a thorough analysis of the Arabic *Theology of Aristotle*,

rearranged in its original order and freed from later additions” (Walzer 1965: 285). Pines (1971) and Thillet (1971) side with Walzer; this reconstruction has been challenged by Zimmermann (1986).

Posterior Analytics, Commentaries on Aristotle's

John L. Longeway

Department of Philosophy, University of
Wisconsin, Kenosha, WI, USA

Abstract

Beginning with the translation of Aristotle's *Posterior Analytics* into Latin in the course of the twelfth century, the Latin authors of the Middle Ages presented a theory of demonstration – an argument that produces scientific knowledge by presenting the cause of the truth of the conclusion – based on that work, and largely explicated in connection with commentaries on it. Different versions of the theory were developed with different metaphysical commitments. Robert Grosseteste wrote the first widely circulated commentary, developing an Augustinian version of the theory. Then two different versions were developed by the Aristotelians, Albert the Great and Thomas Aquinas. William of Ockham developed a fourth version within his nominalist

metaphysics. In all these versions, demonstration of natural causal knowledge was accommodated as well as demonstrations in mathematics. It was supposed by all that demonstrative knowledge is produced by the operation of human faculties within the environment of the natural world, but Augustinian thinkers presupposed the illumination of natural essences by the divine light in some way, consistent with their supposition that natural things enjoyed their essences through participation in forms in the mind of God, so that their functioning could only be understood through those forms. Thomists assumed that the natural essences of particulars had a causal force of their own, considered as universals, that was reflected in demonstrations in natural science, since it was responsible for the causal propensities of particulars. Following an Averroist line, Albert the Great (and his follower, Giles of Rome) and Ockham assumed that the causal connections underlying demonstrative knowledge are entirely between natural particulars.

In the Middle Ages, the theory of demonstration expounded in Aristotle's *Posterior Analytics* was considered the culmination of logical studies. Elaborated in commentaries, logical treatises, and opuscula on specific problems, it corresponds to modern Philosophy of Science exploring how we come to know necessary causal regularities, how scientific knowledge differs from other sorts of cognition, how mathematics differs from the other sciences, and why it is more certain.

An Aristotelian demonstration is a syllogism that produces scientific knowledge, knowledge not simply that something is the case, but why it is the case. One may have cognition that is quite certain without scientific knowledge (including our understanding of the first principles of demonstration, which are not themselves demonstrated), and Aristotle's *Posterior Analytics* is not a treatise on general epistemology. To produce and transmit scientific understanding, Aristotle thought we had to duplicate, in the deductive order of the science, the order of causes found in reality, though the causes need not be efficient

causes. He takes mathematics to be the paradigmatic science.

A demonstrative science requires that we know the meaning of the terms entering into it; have knowledge of certain axioms applicable to many sciences; knowledge of its own immediate, indemonstrable first principles; and knowledge of real definitions of the subject of the science and its various species and attributes. The principles of a demonstration must be true, provide the reason for the truth of the conclusion, be necessary and per se. Aristotle lays down no rules for discovering the first principles from which a science begins, though he points out that one needs experience of the subject, and that the first principles will explain why the subject has the attributes it does. Statements are per se in two ways: if the subject term includes the predicate explicitly within its definition, so that "A human being is rational" is per se, and if the predicate includes the subject implicitly in its definition as the proper subject for that sort of accident, so that "A human being is able to laugh" is per se. The middle term of a demonstration expresses the cause why the predicate of the conclusion belongs to its subject. The predicate of the conclusion, the "attribute," does not follow logically from the essence of the subject.

Aristotle allowed that less ideal demonstrations might not give a full explanation of the cause why the fact is true. These are demonstrations that it is the case (quia) as opposed to demonstrations why it is the case (propter quid). So one might argue from effect to cause rather than cause to effect, as does the demonstration that stars, unlike the planets, are far away because they twinkle. Or, principles might be imported from another science. If one proves that circular wounds heal more slowly because they have a large ratio of area to circumference, one must borrow, in medicine, a principle provable only in geometry. Since the physician relies on the authority of the geometer here, the demonstration (but not the whole science of medicine) is said by medieval authors to be "subalternate" to geometry.

The *Posterior Analytics* entered the West through the translation of James of Venice

between 1125 and 1150. The commentarial tradition of the Arabs and Greeks became known chiefly due to Albert the Great, who reported in his commentary the content of Themistius, and a lost work by al-Farabi on demonstration, or perhaps Averroes's critical remarks on that work, as well as the work on demonstration of Averroes himself, which was not otherwise widely known until the fifteenth century. James of Venice also translated the commentary of Alexander of Aphrodisias, or possibly that of Philoponus, which is close to that of Alexander, and though it quickly dropped from circulation, much survived in marginal glosses.

Despite James's twelfth-century translation, and earlier discussions such as that of Richard Rufus (See Wood 1996), the founding commentary in the Western tradition is that of Robert Grosseteste, written around 1230. Grosseteste presents a demonstrative science of demonstration. He argues that Aristotle first gives a definition of demonstration as a syllogism producing scientific knowledge, then a definition of scientific knowledge, and then, in a series of syllogisms, deduces the properties that a demonstration must have, considered in itself as a free-standing syllogism, in relation to other demonstrations and as part of a science. The second book, he claims, discusses the art of definition as the way to discover demonstrations, and how it is that definition occurs as middle term causing the truth of the conclusion.

Grosseteste reconciled Aristotle's work with Platonism by treating demonstration as the means by which a fallen humanity must come to knowledge of the world. The mind unaffected by the fall would see in God the exemplary forms of all things. But as it is, such knowledge is impossible, though the light of God illumines the forms of the natural things we encounter, so we come to know them. Such forms are universal and unchanging, and ground necessary truths. But knowledge of a real definition of a substance does not impart knowledge of its causal powers. This requires experience of its causal activity.

Such experience gives us knowledge as to what a given agent will do by nature if unimpeded, but it may not do it most of the time, or even very

often, because it is usually prevented. Such knowledge occurs through the knowledge of "material definitions" that depend on prior, "formal definitions." The formal definition of a thing specifies the exemplary form as a final cause, while its material definition specifies how it must be realized in matter to perform that function, that is, to be an efficient cause of certain effects. (The distinction between formal and material definition relies on an interpolation from Alexander/Philoponus's commentary in the text of James's translation. From Aquinas on, people were aware of this error.) Efficient and final causes do not occur in mathematics, and we can see triangles as they really are in themselves by direct mental view. Thus mathematical demonstrations are higher (*potior*) than natural demonstrations, since what they show is always the case, and more easily known. These two sorts of demonstration Grosseteste identifies as demonstrations of the highest sort (*potissimae*).

One science can be subalternate to another, according to Grosseteste, in several ways. So music, the science of audible proportion, falls under the science of proportion "univocally," he says, but is not a part of it, since audibility is an accident of proportion, not a difference that establishes some species of it. Music, like all natural things, is an accidental unity held together only by its relation to its higher form or purpose, and proportion is a necessary part of the real nature of music, given its defining end, which is to present proportions to the hearing. Grosseteste does not consider the case of the circular wound as subalternation at all, for circularity in no way constitutes the function of a wound.

In a second sort of subalternation, Grosseteste holds, the science of the parts of a thing, which realize its functioning, must be brought into play. So the science of harmony is subalternate to the science of numbers, "almost univocally," since numbers are essential parts of proportions, and must be known if proportions are to be known.

This account was intimately connected with Grosseteste metaphysics. He thought the material world arose from light, in itself a simple form without parts, the whole form present at each point in space. Matter can only be understood as

arising from light in accord with geometrical laws as light propagates itself through space. Thus all of natural science is subalternate to mathematics, for though mathematics does not bear on light considered in itself, it governs the way in which light realizes itself in space.

The next important commentary after Grosseteste's was Albert the Great's, written between 1245 and 1260. The Aristotelian Albert objected to Grosseteste's metaphysical views, and so rejected his account of subalternation and the role of mathematics in the natural sciences. Albert neither treated a substantial form as an exemplar to preexisting matter nor accepted the development of lower forms of individuals from higher forms in the mind of God. For Albert the unity of a particular thing does not arise as an expression of a higher unity, nor can knowledge of particular natures in themselves be obtained through reflection on higher forms. Each science must stand on its own.

Consider the science of harmony. Sounds do have mathematically expressible accidents, but the science of proportions does not establish the nature of sounds. The subject of harmony is a certain kind of sound, not a certain kind of proportion. Nature operates by its own principles, and it accomplishes the aims of a higher form only because God created it from nothing so that it would accomplish those aims of itself. It did not evolve from a higher form striving to realize itself in matter.

Thomas Aquinas agrees with this in his literal commentary on the *Posterior Analytics* (1269–1272). But he disagrees on other things. Albert does not allow that the nature of a thing can cause it to have properties not part of its essence. He thinks every accident in a thing is to be traced to another accident, in the thing or outside it, which brings it about that the first accident inheres in it. No accident, not even an attribute, a proper accident necessarily belonging to that sort of thing, is caused in it by its essence, for this would mean that the nature of a thing, considered in itself, not insofar as it is a particular in particular circumstances, efficiently causes something, and that universals as such are realities playing a causal role in the world. On the contrary, Thomas argues

that a thing's nature efficiently causes its primary attribute necessarily and without exception.

Thomas takes it that first principles in the highest sort of demonstration must be strictly necessary, universally true in every case at every time. Albert thinks the necessity involved is of another sort, a conditional necessity, so that the attribute belongs to its subject necessarily, if nothing prevents it. Aquinas argued that the middle term of the highest sort of demonstration is the real definition of the subject. This led him to claim that the minor premise is per se in the fourth way listed in *Posterior Analytics* I 4, since the fourth way indicates an efficient causal connection, and the minor premise will be true because of the efficient causal connection between the essence of the subject and the attribute proven of it. (Aristotle had allowed only the first two ways of being per se to be relevant to demonstration, introducing the third and fourth ways only to complete the list.)

Albert argued that a demonstration of the highest sort has the "causal definition" of the attribute as its middle term. An attribute is an accident, and so has no proper real definition, indicating what it is entirely in itself, since what it involves its belonging to an appropriate subject really distinct from it, and it actually belongs to such a subject only under favorable conditions. So a "real" definition for the attribute expresses things extrinsic to the attribute, its subject and that which brings it to actuality in the subject. For this reason, Ockham insists that the definition of an attribute is a nominal definition, identifying an accidental unity, not a real one. Albert's preference for the definition of the attribute as the middle term follows Averroës's opinion that the highest sort of demonstration should demonstrate not a mere potentiality, but an actual state of affairs. Aquinas granted that on his view, a demonstrable attribute in a natural thing would have to be a potentiality, though an actuality could be demonstrated in a mathematical demonstration.

Giles of Rome later defended Albert's position. Thomas had argued that Albert's candidate for the highest sort of demonstration assumed as its major premise that the definition of the attribute belongs

to the subject. But this is demonstrable, and not a first principle, for the definition of the attribute belongs to the subject only because of the subject's essential nature, and the highest sort of demonstration is from demonstrative first principles. Giles objected that the major premise in Thomas's demonstration is trivial, there being no real distinction between the subject and its essence, and so the purported demonstration begs the question. The argument had been made against Albert that the definition of the attribute and the attribute itself were identical, so that his candidate for demonstration of the highest sort begged the question, but Giles (and Ockham after him) pointed out that the definition of the attribute, being a causal definition of something whose existence depends on other things, refers obliquely to things other than the attribute itself, and so is not in fact really identical with it. The same point cannot be made in defense of the affirmation of the real definition of the subject, and so Giles turned the tables on his opponents.

In reply, John of Cornwall and Walter Burley claimed there are two sorts of concepts of a substance, quidditative concepts, captured in real definition, and concepts that express the quiddity only confusedly. Someone who does not know what the quiddity of a lion is may nonetheless have a non-quidditative concept of the lion if he has encountered lions. To avoid begging the question in a demonstration of the highest sort, one must assert the quidditative concept of the non-quidditative concept, for instance, one must assert the essence of lions of the kind exemplified by these creatures from Africa that one has seen in the zoo. Giles replies that the non-quidditative concept refers to the same reality the real definition describes, even if it does so confusedly, so that asserting the real definition of the confused concept simply asserts that the reality is itself, and is a triviality after all.

Ockham agreed with Scotus and Aquinas that the definition of the subject is the middle term in a demonstration of the highest sort, but he denies that the subject efficiently causes an attribute in itself. He insists that what follows demonstratively follows on some real structure of really

distinct parts within the subject. A genus-difference definition of a thing that does not identify really distinct parts in it cannot serve as a demonstrative middle term. Moreover, since God is perfectly simple, no demonstration concerning God can be constructed. But some definitions do identify real parts of the defined. This happens, most notably, in mathematics, where the definition of a subject obliquely conveys parts of the subject, for instance, as in the definition of a triangle, which is something composed from lines. This, clearly related to Grosseteste's demonstration in a sub-alternate science that is "almost univocal," is the only possibility for the highest sort of demonstration. It alone meets Thomas's criterion for such a demonstration, showing the attribute to belong actually to the subject necessarily and in every case, Albert's demand that the attribute be occurrent and not merely a capacity, and Giles' requirement that the attribute be really distinct from the subject.

For Ockham, a demonstration arising from natural efficient causes takes the following pattern: "When nothing opaque is between the moon and the sun, the moon is illuminated by the sun, when the moon is in such a place, there is nothing opaque between, therefore the moon is then illuminated." Hence, the attribute "illuminable," predicated of its subject without further determination, is indemonstrable, but the attribute "illuminated when in such a place," predicated of its subject with a further determination, can be demonstrated. This agrees closely with the highest form of demonstration in Albert and Giles of Rome, but Ockham does not regard it as demonstration of the highest sort, since its conclusion is hypothetical rather than categorical.

In the sixteenth century, controversy arose over the application of the "Science of Demonstration" to mathematics, and how we discover a demonstration through "analysis and synthesis." In the seventeenth and eighteenth centuries, with the new Platonisms and the anti-Aristotelian bias of the new science, the theory of demonstration came to be ignored in mainstream philosophy, though the strong empiricist tendencies in the tradition

outside Thomism may have influenced the later development of Empiricism.

Poverty

Virpi Mäkinen

Department of Systematic Theology, University of Helsinki, Helsinki, Finland

Abstract

Poverty was a relative matter in the Middle Ages, as it is nowadays. There were different modes of poverty: voluntary poverty for the religious, the simulated poverty of hypocrites, and the involuntary poverty of mendicants forced to beg in order to survive. Since mendicancy was a serious problem throughout the Middle Ages, church and, later on, society were forced to create and develop forms of poor relief. The church recommended benevolence toward the poor, who did not have means of sustenance, mainly encouraging people to give alms. The common opinion was that one should give alms from one's surplus and take care of oneself and those closest to one first. The recipient should be in need. However, two natural law principles, the maxims of *necessitas non habet legem* and of *communis omnium possessio* founded on canon law, ordered the almsgiving. From the thirteenth century onward, scholastics emphasized that property was necessary for functioning in the public sphere, both in the state and in the church. They promoted the idea of limited wealth needed to support life and that a person's moral responsibility involved having property. The Franciscan ideal of poverty as the renunciation of all modes of rights was criticized as being against the natural duty of subsistence. There was also an important discussion on individual rights and actions, which led to the doctrine of natural rights in the late Middle Ages. Poverty was also seen as one central theme in late medieval political theory concerning the relationship between ownership and political rule. Various concepts marked a contrast between the inferiority of the pauper and the superiority of the person who possessed

power (*potestas*) or civic liberty (*civis, burgensis*), or wealth (*dives*).

In the Middle Ages, as nowadays, since poverty (*paupertas*) was a relative matter, it was quite broadly defined. A pauper (*pauper*) was “a person who permanently or temporarily found her- or himself in a situation of weakness, dependence, or humiliation, characterized by privation of the means to achieve power and social esteem (which means varied with period and place): these included money, relations, influence, power, knowledge, skill, nobility of birth, physical strength, intellectual capacity, and personal freedom, rights, and dignity” (Mollat 1978). Absolute poverty was deemed a miserable state, lacking the necessities of daily life (food, clothing, housing, and health), which might lead to the state of extreme necessity.

Etymologically the words “poverty” and “poor” came from the Latin *pauper*, “poor,” which originally came from *pau* and the root of *pario*, “giving birth to not much” and referred to unproductive farmland or livestock. The words used to denote poverty in the Middle Ages also describe the causes and effects of poverty, as well as the attitudes toward the poor. There were words referring to impecuniousness and destitution in general, such as *egens*, *egenus*, *indigens*, *inops*, *insufficiens*, *mendicus*, and *miser*; shortage of food (*esuriens*, *famelicus*) or clothing (*nudus*), physical defects (*caecus*, *claudus*, *contractus*); infirmity in general (*infirmus*), mental deficiency (*isiotus*, *imbellicis*, *simplex*); situations of adversity such as those involving the loss of one's nearest relations (*orphanus*, *vidua*) or loss of liberty (*captivus*), and finally, punishment and exile (*bannus*, *exiliatus*). There were also some words which referred to a feeling of compassion (*miserabilis*, *miserabilis persona*). In medieval canon law, the concept of *miserabiles personae* including widows, orphans, the sick, and the old referred to the poor (see Mollat 1978).

Individual thinkers used different words when writing about poverty. A Cistercian monk and theologian, Bernard of Clairvaux (1090–1153), for example, used at least three different words

with specific and different meanings when speaking about poverty. *Pauperes* referred to a group of the wretched for whom material assistance was required as a matter of justice. *Egenus* referred to a category composed of needy individuals, orphans, widows, and pilgrims. *Indigentes* referred to a deficiency of an accidental nature.

Certain word associations and contrasts shed further light on the condition of the poor in the Middle Ages. The frequent association of *pauper* with *agricola* or *laborator* tells us a great deal about the origins of poverty, many of the poor being drawn from the ranks of men who worked the earth with their hands to eke out a meager subsistence. Prior to the eleventh century, people lived in precarious conditions, and the number of peasants was large. Words illuminating the struggle for daily bread and suggesting uncertainty about the future and susceptibility to disaster, evoking anxiety and distress (*anxietas*, *angustia*) as well as lack of necessary resources (*carentia*, *penuria*), were used.

Mendicancy was a serious problem throughout the Middle Ages. Several studies deal with the difficult question of estimating the amount of poverty or pauperism in the Middle Ages. Some economic historians have argued that between the thirteenth and the fifteenth centuries there was no such grinding and hopeless poverty, no such chronic semi-starvation in any class as exists today among large classes in the great cities. The proportion of medieval people who lived without adequate food and clothing for long periods of time was probably smaller than nowadays.

The reduction of poverty was not regarded as a social goal in medieval society or even in the church, as both the lack of systematic poor relief and of legislation proved. Poverty was mainly taken as a matter of course and no efficient efforts were made to discover the reasons for it.

The church, however, recommended benevolence toward the poor who did not have means of sustenance, encouraging people mainly to give alms. The influential canon law collection, Gratian's *Decretum* (c. 1140), contained the patristic citations, which maintained duty-oriented charity toward neighbors, stating, for

example, "Feed the poor. If you do not feed them you kill them" (D. 86 c. 21) or "The one who keeps more for oneself than he or she needs is guilty of theft" (D. 42 c. 1). Two important natural law principles governed benevolence toward the poor founded on the *Ordinary Gloss* to the *Decretum*. First, the maxim *necessitas non habet legem* (D. 5 c. 26), which meant that a person in extreme need had a duty, or even a right, to subsistence and might, therefore, rightfully take the property of others to sustain their own life. An Italian canonist, Hostiensis (d.c. 1287), for example, wrote that "One who suffers the need of hunger seems to use his right (*ius suum*) rather than to plan a theft." Second, the natural law maxim *communis omnium possessio* (D. 1 c. 7) held that everything created by God for mankind was held and used in common to take what is needed to sustain life. The Italian canonist Huguccio (c. 1140–1210), for example, stated that by natural law we should keep what is necessary and distribute what is left to the needy. Rufinus wrote referring to Ambrose that "No one may call his own what is common, of which if he takes more than he needs, it is taken with violence." In that both maxims were a commonplace of medieval moral theology and church law, human law cannot altogether eliminate the original commonness of things under natural law. Thus property owners must help the poor from their surplus or a person in extreme need could even take another's property in order to save his life.

The responsibility for organizing poor relief belonged to dioceses, which collected money, especially in the form of tithes. Taxes were requested to be given to the poor. The first declaration of the church's responsibility to give legal aid to the poor (including widows and orphans) was made at the Council of Chalcedon in 451. Monasteries and other religious institutions took care of the poor; the Franciscan Order, which was established in the 1220s, took as its main task the care of urban poor living outside the city walls. The confraternity, one of the most popular forms of lay association throughout late medieval Europe, made a significant contribution to the relief of the poor in the medieval city.

Beginning from the fourteenth century, the relationship between religion, society, and charity both in private and public life found new forms.

The large number of mendicants necessitated criteria for determining who were poor enough to receive alms. For Pope Innocent III (1198–1216), almsgiving required “heart, mouth and act”: from the heart arises sympathy for the poor, from the mouth arises a request and encouragement, and from the acts generosity. Augustine (354–430) already had distinguished between two kinds of almsgivers: those who give from their heart and those who give from their property. According to Innocent, four regulations had to be taken into account in the poor relief: reasons, consequences, means, and order. The sudden need had to be met with love of one’s neighbor. The consequences of helping the poor should be blessed for every party, the means of helping being alms. The order of helping meant that almsgiving should be regular, the most important aspect being *benevolentia*, the helper’s intention. If a giver did what was in accordance with his obligation, he performed a good act, since where an act was connected with loving one’s neighbor and right intention, *benevolentia*, it was meritorious. Helping the poor regardless of one’s own penury was a meritorious act but no one was obliged to help anybody in such circumstances. Thomas Aquinas (1224–1274), for example, defined alms as being “a deed whereby something is given to the needy, out of compassion and for God’s sake,” which motive belonged to mercy, so that almsgiving was an act of mercy. The Greek word for almsgiving, *eleemosyne*, was derived from having mercy, *eleein*, as well as the Latin *miseratio*. Since mercy was an effect of charity, it follows that almsgiving was an act of charity through the medium of mercy (*Summa theologiae*, 2a 2ae, q. 32, a. 1).

A French secular theologian, William of Saint-Amour (c. 1200–1272) maintained that the measure of mercy was to be proportional to the human condition. Those having only one tunic should not be compelled to divide it with others, for then both would remain unclothed. Zacheus, who gave half of his possessions to the poor while retaining enough for his own sustenance,

was for William an example of proper almsgiving. William also used Zacheus to argue that private property should not be denied, but limited so that no one should appropriate more than suffices for one’s own needs (*De periculis*, 58).

Thomas Aquinas also dealt with the various requirements of helping the poor, which he distinguished as time, place, and matter. The order of love (*ordo caritatis*) required that one should preferably help those who were more closely associated with the giver. However, when someone was in extreme necessity one should “succor a stranger. . . rather than one’s own father, if he is not in such urgent need” (a. 3). Almsgiving was therefore never limited regarding its recipient since one had to give alms without limitation both to good and bad, pious and unbelievers, friends and enemies if they were in need. The giver should give of his surplus, because one must first of all look after oneself and then after those over whom one has charge, and then relieve the needs of others with what remains. On the part of the recipient, it is requisite that one should be in need. However, since it is not possible for one individual to relieve the needs of all, one was not bound to relieve all who are in need, but only those who could not be succored if someone did not help them (*Sth* q. 32, a. 5). Scholars also discussed the amount of alms. The common opinion was that to relieve someone’s need more than sufficiently was not praiseworthy, it being better to give to several who are in need. Thomas Aquinas, for instance, stated that one should give alms so that the recipient may have relief, not an easy life, that is, not to have dainties, finer food, and clothing (*Sth*, 2a 2ae, q. 31, a. 1) and referred to Ambrose (338–397): “When you give alms to a man, you should take into consideration his age and his weakness; and sometimes the shame which proclaims his good birth; and again that perhaps he has fallen from riches to indigence through no fault of his own” (*De officiis* I, 30).

The ideas of charity toward the poor of the most influential medieval Jewish philosopher, Moses Maimonides (1135–1204) differed from those of the Christian philosophers. Maimonides pointed out that charity in which the donor did not know the recipient or the recipient the donor

was more meritorious than types of giving in which the donor could take satisfaction from the appreciation of the recipient. Giving before being asked was also preferable to giving after being asked.

However, the scholastics added that if someone omits to give alms, it is a mortal sin; on the part of the recipient, when one sees that his need is evident and urgent, and that he is not likely to be succored otherwise, and on the part of the giver, when he has superfluous goods which he does not need for the time being as far as he can judge with probability. Nor need he consider every case that may possibly occur in the future, for this would be to think about the morrow, which our Lord forbade us to do (Matt. 6:34), but he should judge what is superfluous and what is necessary accordingly, as things probably and generally occur.

Theologians also made several interesting comments on probability regarding the future, which was connected with wealth. For instance, when one is attempting to resolve the question of whether it is lawful to beg or not, one has to proceed on the grounds of probable predictions such as whether it is more likely that one can provide the necessities of life by begging or by doing something else. A notable scholastic theologian and philosopher, Henry of Ghent (c. 1217–1293), for instance, ended the reflection by stating that begging is more likely to assure the sustenance of one's life and cause less solicitude if one is able to give something in return, for example, by teaching, by praying, or by offering some other spiritual remuneration. Such calculations of probability concerning the future on the ground of our quasi-statistical knowledge of regularities in the world were quite common in the thirteenth century.

These kinds of theological and moral philosophical statements regarding almsgiving implied the idea that the poor were somehow "a useful object" for salvation by good works. Despite the main purpose of medieval scholars being to encourage people to give alms, such implications also hindered the development of poor relief.

In medieval Christianity, poverty was also a religious ideal for those living in monasteries

and other religious orders. There were various words referring to religious poverty: voluntary poverty (*paupertas spontanea*), evangelical poverty (*paupertas evangelica*), and spiritual poverty (*paupertas spiritus*). Poverty was one of the monastic vows or evangelical counsels (with chastity and obedience) from the very beginning of monastic life. Religious poverty involved a twofold obligation: first, self-denial in order to place oneself at the service of God and others. In this sense, poverty concerned purification of one's own soul (especially the will) from all worldly matters (*concupiscentia*) to aid in imitating Christ in his material poverty (*imitatio Christi*). Second, religious poverty involved giving up all personal property to live with common possessions (Matt. 19:21–31 and Acts 4:32). The monastery itself may possess both goods and money.

Voluntary poverty was understood as a benefit to the individual, a form of self-discipline. Since spiritual life was highly valued in the medieval church, a poor monk or nun was seen as the image of Christ himself, an ideal manifested in Christian mysticism. The medieval church sanctioned poverty and this was also included in the interpretation of the real poor, not only those who were dedicated to it for spiritual reasons. The figure of poor Christ as reflected in the poor can also be seen in the extended use of the expression *pauper Christi*, not only limited to a religious life of voluntary poverty for love of God.

The Franciscan Order has traditionally forgone all individual and common forms of ownership and even of using money. The Franciscan rule of poverty in the *Regula Bullata* of 1223 ("Let the Friars appropriate nothing for themselves, neither a house, nor a place, nor anything else") was interpreted in the thirteenth century in terms of the concept of use of fact (*usus facti*) as opposed to all property rights (*dominium, ius*). The notion of *factum* as opposed to *ius* indicates the nonlegal status of the Franciscans, since their activity was legally indifferent. The use of fact concerned only things necessary for sustenance without any rights over them. The Franciscan doctrine of absolute poverty responded to the

challenge presented by the early thirteenth-century economic and social changes. The “poor friars” were willing to combat “the ills of the new society,” but they were themselves inevitably its product as well.

The Franciscan ideal of poverty already had its opponents in the mid-thirteenth century. Since some rigorous Franciscans had given all their property as alms to the poor at once and lived in extreme poverty, some theologians raised the question of the moral justification of voluntary poverty. William of Saint-Amour, who led the opposition to the mendicants at the University of Paris in the mid-thirteenth century, stated that the act of relinquishing all temporal possessions without caring for the future exposes one to the danger of several sins, such as flattery, lying, stealing, perjury, and homicide, since one is required to beg for sustenance. If one gives all one’s possessions to the poor at once, it only lessens their misery for a short period, because one can no longer provide sustenance for oneself and continue to give alms. Thus, the suffering of the poor continues and perhaps leads to death. Furthermore, extensive almsgiving and poverty subject one to the danger of starvation. One who risks starvation attempts suicide, which was contrary to the precepts of the Decalogue. William observed that one could easily avoid such dangers and sins if one retained some temporal possessions (*De periculis*, 55–57).

Secular theologians also criticized the absolute poverty of the Franciscans as being opposed to Aristotelian virtue ethics. Aristotle’s *Nicomachean Ethics* influenced the notions of social and political benefits provided by wealth. Another source used along with Aristotle was the *Consolation of Philosophy* of Boethius (480–524/525), a Christian philosopher who stated that the good life depends on external goods acquired in a proper way. A French secular theologian at the University of Paris, Gerard of Abbeville (d. 1272), maintained that living either in absolute poverty or in luxury were both vices, since according to Aristotle, perfect virtue was a medium between two extremes. However, he also pointed out that wasting one’s possessions is in some way self-destructive, because life

always involves some amount of possessions. Temporal goods were not only a necessary condition for the good life, but also contributed to it. Citing Aristotle’s *Politics* (translated into Latin c. 1260), the French philosopher and theologian Godfrey of Fontaines (c. 1250–1309) declared that the amount of wealth is not important for human perfection; more important is the attitude one has toward property – the idea of moderation, which was a descendant of Aristotle’s doctrine. Another danger in voluntary poverty, in which a person gave up all property rights and lived in absolute poverty, was, according to Gerard of Abbeville, that such a situation involves one’s own life depending on another’s will (*ex alterius voluntate dependeat*). This also seems to hark back to Aristotle’s doctrine of self-sufficiency (*autarchia*).

William of Saint-Amour’s and Gerard of Abbeville’s polemical works provoked responses from the other side. The Dominican Thomas Aquinas composed a direct challenge to William’s *De periculis*. The title of Aquinas’ work is *Contra impugnantes Dei cultum et religionem* (“Against Those Who Attack the Religious Profession,” 1256/1257). In his response, Aquinas stated that voluntary poverty belongs to Christian perfection itself. Therefore, it was impossible to be perfect without being poor. However, in his later work, *Summa theologiae*, Aquinas’ opinion has changed and he saw poverty as only an instrument of perfection, which one is free to use or not.

As a Franciscan reply to the attack of Gerard’s *Contra adversarium*, Bonaventure wrote his *Apologia pauperum contra calumniatorem* (“Defence of Poverty Against the Slanderer”) at the end of 1269. For Bonaventure, the meaning of poverty in its Franciscan mode consisted in the imitation of poor Christ, which was characterized by a prohibition of the use of money, the right to live by begging, and the renunciation of all property rights both individually and collectively. The most remarkable idea in Bonaventure’s defense was that he introduced a juridical discussion into the interpretation of poverty. The friars’ poverty included only a simple use (*simplex usus*) of utensils

without any kind of *dominium*, understood in the meaning of *iura in re*.

The Franciscan ideal of the renunciation of all property rights and of all rights whatsoever posed another kind of question concerning the natural rights of human beings. In the late thirteenth and early fourteenth century, there was a turn to the moral subject and his capacity for right action, that is, to subjective capacity and individual rights; the emphasis on the active individual who had control over the moral and physical environment. Godfrey of Fontaines, for example, asked whether it was licit to give up all modes of rights maintaining that each person has a God-given natural obligation of self-preservation and, following from this duty, one had certain rights that were inalienable and could not lawfully be renounced, the most important being the fundamental right to subsistence, that is, the right to life. For Godfrey, the right to subsistence not being a universal, natural right obliged each person only in the situation of extreme necessity. However, such ideas were later developed as individual natural rights in the early modern period.

William of Saint-Amour also pointed out the “merits of wealth” in contrast to religious poverty. In his *De periculis novissimorum temporum* (1255), written against the mendicant orders, he maintained that Scripture emphasizes the duty of taking care of others and ourselves. Christians, therefore, needed a certain number of possessions to fulfill this duty of charity. William’s way of connecting wealth with morality was common to theologians from the thirteenth century onward and shows changing attitudes toward poverty. His ideas of the certain merits of wealth implied a notion of social and even individual benefit provided by wealth – a point that the humanists later maintained in their support of secular values against ascetic monks and begging friars.

Most medieval scholars assumed that the institution of private property was normal and right and that property should thus be respected. Despite the institution of private property being understood as the consequence of the fall, it was taken as a necessary condition to protect

a peaceful community in accordance with the Aristotelian idea of common good. A Franciscan theologian, Alexander of Hales (c. 1200–1245), argued that natural law prescribes community for the state of innocence and respect for property for the fallen state. For another Franciscan philosopher and theologian, William of Ockham (c. 1288–1347), “common possession of all things” belonged to the natural law in the state of innocence, but the “acquisition of what is taken from air, land, and sea, the restitution of a thing or money left for safekeeping” belonged to natural law “on supposition,” supposing Adam’s sin and, supposing that because human law has since made a division of property, it is a requirement of natural law to respect another’s property.

Whereas earlier scholastics had condemned riches both as hindering the soul’s progress toward sanctity and for the purpose of obtaining a higher social position for oneself, the late fourteenth- and fifteenth-century scholastics began to point out that affluence also confers certain social and political benefits upon communities. They also saw a connection between wealth and morality, in that riches may contribute to human being’s moral growth. The late thirteenth-century theologians had noted the social and political benefits of property and the importance of a working and thrifty population in obtaining it. Thomas Aquinas, for example, accepted trade, which maintains the family, relieves the needy, and contributes to the public benefit. Common opinion also held that one should save in anticipation of accidents to oneself and for the needs of the poor.

In the fourteenth-century Florence, it was already a generally accepted notion that the relief of the poor and other caring and helping systems should be under the support and control of the city. A Renaissance humanist, Leonardo Bruni (c. 1370–1444), for example, stated that the “upper class is protected by property, the lower class by the state.” From the fifteenth and sixteenth centuries onward, almsgiving moved from individual alms and mercy to more institutionalized public assistance. At the same time, negative attitudes toward the poor intensified and

drive toward separation in society. Begging came to be seen as shameful and dishonorable. The term *pauper* retained its religious connotation, and words associated with begging began to assume idleness on the beggar's part. Poverty was considered a form of social parasitism or even (as in the case of beggary) a crime. A Dutch humanist and theologian, Erasmus of Rotterdam (1466–1536), for instance, wrote about the poor: "perhaps nature made those people vagabonds."

Already in the late Middle Ages, labor came to correspond to a person's social status, but also determined the pauper's character, as worthiness to receive aid from others depended on whether one was unfit for work, unable to find work, or unwilling to engage in work. Distinctions were thus drawn between the "true pauper" (deserving poor) and the "sturdy beggar" (undeserving poor). The attitudes toward mendicant orders also came to change. New types of the poor were those who worked hard but still did not earn enough to support their families. Economic crisis recruited new people into the ranks of the paupers as well.

The tendency of policing the poor in cities also started by the late Middle Ages. The idea of police was, however, to regulate the community's life, not to organize poor relief. The regulations concerned mendicancy, security, criminality, health, and cleanliness. Mendicancy came to be punishable. This tendency was seen in the *De subventionem pauperum sive de humanis necessitatibus* (1526) of a Spanish humanist, Juan Luis Vivès (1492–1540), who criticized individual alms and praised institutional public relief. Vivès' tract has been called the first systematic work of social thinking and institutional reform that focused on the public exercise of compassion through a government-organized, means-tested scheme directed to the poor. The tract has also been described as pioneering the welfare state in maintaining that municipal government should be given the responsibility of securing a subsistence minimum for all its residents, not on the grounds of justice but for the sake of more effective exercise of a morally required charity. According to Vivès, the assistance scheme would be closely targeted to the

poor. He also asserted a general obligation to be willing to work: "If the poor cannot be parasites, why could the rich?" Despite the difficulties and doubts aroused by policing the poor, public assistance came to be an essential function of government from the sixteenth century onward.

Poverty was also seen as a central theme in late medieval political theory, concerning the relationship between ownership and political rule. Various antonyms established a contrast between the inferiority of the pauper and the superiority of the person who possessed power (*potestas*) or civic liberty (*civis*, *burgensis*), or wealth (*dives*), which corresponds to a different stage in the evolution of the notion of medieval poverty. Traditionally, a ruler adjudicates on property as supreme owner. According to *De potestate regali et papali* (1332) by John of Paris (d. 1306), a Dominican theologian and controversialist, a community (i.e., a state, church, or particular communities) acquired property only from individuals, and the head of the community is only an administrator of the community's property, not its owner. For John, this also applied the pope, who does not have unrestricted power over church property, still less over the properties of lay people. John's assumption that original appropriation is by individuals and his remark that individuals acquire property by "labor and industry" have led to suggestions that he anticipated Locke's theory of property. John, however, indicated that individuals acquire property under human law, which was the traditional view among medieval theologians following Augustine. Property was acquired under human law, but it was acquired by individuals, not directly by rulers.

An Italian physician and theologian, Marsilius of Padua (c. 1270–1342), opposed Pope John XXII (1316–1330) in his *Defensor pacis* (1324). The pope rejected the Franciscan doctrine that the highest form of religious poverty was to reject all kinds of property rights, both individual and common. According to the pope, no one can justly use consumables (such as food or clothes) without owning what they use – one had to have at least the right to use them. Concerning the question of property, Marsilius represented the

Franciscan ideal as being that it was not only legitimate for the religious to live without ownership of property, but it was what Christ intended for all the clergy. Therefore, Marsilius pointed out, the pope and clergy should have no lordship (*dominium*) at all, either in the sense of coercive jurisdiction or in the sense of ownership of property. Marsilius defined the poor as powerless – and demanded that the pope should be poor.

Presocratics in the Arab World

Carmela Baffioni

Mediterraneo, Università degli Studi di Napoli

L'Orientale, Naples, Italy

Abstract

Aristotle is the main source for the so-called Presocratics in the Arab world; other important references can be found in biographers and bibliographers. In general, only the Presocratics whose doctrines can be reconciled with Muslim theology are considered by the Arabs. The names of the Presocratics are variously transcribed in Arabic; their chronologies are uncertain, and sources say nothing about their education, philosophical activity or disciples, their physical appearance or the titles of their writings. The Presocratics approach nature from an eternalistic perspective; in spite of this, the Muslims chose some of these thinkers with a view to seeing in their doctrines a prefiguration of their own philosophical views: for example, the water of Thales becomes the water on which the throne of God is placed. Pythagoras is said to be “a monotheist from Ḥarrān.” Heraclitus is mainly

known as the author of a cyclical ontological system beginning and ending with God. Anaxagoras' doctrine of *panta homou* is developed into the theory of *kumūn* and *zuhūr* – of “latency and appearance,” which proposes a creation of all things together that are destined to evolve from one form to another. Atomism is a view shared in Islam in a strictly scientific perspective, for example, by Abū Bakr al-Rāzī (d. c. 925) and by orthodox theologians, to assert the absolute freedom and will of God against the Aristotelian theory of secondary causality.

Biographical Information

Aristotle is the main source for the so-called Presocratics in the Arab world. Other than Aristotle, sources for them include biographers, bibliographers, and doxographers, as well as works on history, literature, heresiography, and philosophers. The former are the most reliable because of their antiquity, while Muslim historians and philosophers usually adapt the data on ancient thought to their own purposes or place ancient thinkers in theoretical frameworks. The amount of data at our disposal is less than what might appear, however, because the sources rely on one another.

Only Presocratics whose doctrines can be reconciled with Muslim theology are considered: Parmenides, for example, is seldom quoted, probably because his conception of “being” (*to on*) as an absolute but impersonal entity was at odds with the Qur'ānic idea of God. This entry deals with Thales, Anaximander, Anaximenes, Heraclitus, Empedocles, Pythagoras, Anaxagoras, and Democritus. The eleventh century heresiographer al-Shahrastānī selected “the seven wise men” of antiquity that had been “illuminated from the lamp of prophecy.” Šā'id al-Andalusī (d. 1070) in his *Genealogy of Nations* names Thales, Empedocles, Pythagoras, Anaxagoras, and Democritus as the “five philosophers par excellence.”

The names of the Presocratics are variously transcribed in Arabic; their chronologies are uncertain, often as a result of confusion: Zeno of

Elea is confused with Zeno of Cyzicus for example, and sometimes anecdotes refer to persons with the same name.

Sources say little about their education, philosophical activity, disciples, physical appearance, or the titles of their writings. Al-Shahrastānī introduces Empedocles as a contemporary of the prophets David and Luqmān. Anaxagoras is among the most quoted Presocratic thinkers, though the dates and places of origin proposed for him are diverse: some sources place him immediately after Anaximenes – hence al-Shahrastānī links him with the Milesian school, not the town of Clazomenes – but others consider him a contemporary of Zeno of Elea, of Democritus, or of Aristotle; sometimes he is quoted together with Pythagoras, Democritus, and Diogenes the Cynic. According to the eleventh century Egyptian historian and savant Mubashshir b. Fātik and to the thirteenth century Illuminationist philosopher al-Shahrāzūrī, his works were burnt at the time of Galen. Democritus is often introduced as a contemporary of the Persian king Artaxerxes I. He is by far the most quoted Presocratic, though not always with reference to atomism or to his moral statements (cf. the Greek *Democrates*). Ibn al-Nadīm, the tenth century author of the famous *al-Fihrist* (“*The Index*”) of names of authors and works in different fields of knowledge, places Democritus among the “makers of gold and silver,” perhaps because of confusion between Democritus of Abdera and Bolos of Mendes, the Hellenistic author of *Geoponika* in the fourth century to third century BCE, also called Bolos Democritus. Unlike the other Greek supporters of atomism – Leucippus, Epicurus, and Metrodorus of Chios – Democritus is associated with various names; some generic titles are attributed to him, as is a book on animals showing what they have in common with humans.

Doctrine

The name “Presocratics” comes from the object of their speculations – nature – rather than from their chronology, whereas Socrates and the Sophists were interested in the human being and the

formation of thought and morals. The Presocratics approach nature from an eternalistic perspective according to the principle that “nothing comes out from nothing,” considered by Muslims to be a negation of the existence of God and of creation, their basic theological tenet. This may explain the scarcity of data on these thinkers and why not all of them are addressed in Muslim sources.

Different views on issues such as astronomy, meteorology, cosmology, psychology, physics, anatomy, physiology, and zoology are ascribed to Anaximander, Anaximenes, and Anaxagoras; various gnomic sayings are attributed to Anaximenes, Anaxagoras, and Democritus. Views on metaphysics and on the theory of vision are related to Democritus.

The Muslims chose some of these thinkers with a view to presenting their doctrines as precursors of their own philosophical views. The Arabic sources therefore tend to ascribe to most of these thinkers the embryonic idea of an eternal and unique God, the principle of all things; but they are also reproached for ignoring or expressing badly the related function of an active cause. This last charge may have been inspired by the perplexities expressed regarding the Anaxagorean doctrine of the *nous* in Plato’s *Phaedo*, a work that was well known to the Arabs.

The “principle” – or “principles” – the various authors place at the basis of their thought are in general exactly indicated (water for Thales, the infinite for Anaximander, air for Anaximenes, numbers for Pythagoras, homeomerics for Anaxagoras, the four “roots” for Empedocles, atoms for Democritus), but their doctrines are adapted to the new theological perspective, just as when the Christian Church Fathers quoted the same doctrines; when some tenets contradict this perspective, the authors are strongly criticized. Thus, the water of Thales becomes the water on which the throne of God is placed; the “matter” in Anaximenes is equated with the divine Pen that wrote the heavenly Qur’ān, and his “air” coincides with the Tablet on which this Qur’ān was written, because air is seen as capable of receiving forms.

Pythagoras, according to some sources a pupil of Anaximander, is said to be “a monotheist from Harrān.” The Ikhwān al-Ṣafā’ adopted a

numerological approach to reality on the basis of the Pythagorean tenet that “existing beings correspond to the nature of number.” So the Pythagorean idea of the number 1 as the principle of numbers, and not as a number itself, explains that God is the origin of beings and not a being Himself. If God is like the number 1, the Active Intellect is compared to the number 2, the Universal Soul to the number 3, and Nature or Matter to the number 4. Number is considered the best way to clarify the nature of God and His relationship with created beings, emphasizing His absolute distinction from other beings and presenting Him as the sole cause of everything else. The doctrine that considered soul as a fallen divinity imprisoned in the body as in a “tomb” can play no role in Islam, but Pythagoras is considered one of the greatest representatives of the theory of the immortality of soul, from a reinterpretation of one of his *Golden Sayings*. Pythagoras is the main source for mathematical and musical theories in Islam, often associated with Nicomachus of Gerasa, who is sometimes confused with Aristotle’s father.

Tradition attributed to Heraclitus strong links with the East; skeptical doctrines were inspired by him, even though attributed to the Sophists. However, the Arabs knew him mainly as the author of a cyclical ontological system, beginning with God (conceived in terms of light and unknowable to humans). From him, Love is produced, as a pure light that rules a multiplicity of intelligible worlds, inhabited by spiritual substances. Then, without any explanation, Struggle appears, that produces the sublunar world in continuous opposition, whose natural condition is then war. The souls crave to return to the realm of Love and, in order to help them, God sends a Messiah in every era. Complete salvation will be achieved only when the Saviour will come at the end of times (Rudolph 1989: 67–69).

Al-Shahrastānī links a vision of God similar to that of Qur’ān with Empedocles, and hints at an ontological succession of Neoplatonic inspiration. The theories of the Arab Empedocles about the soul and the hierarchy of beings have recently been connected with the thought of a controversial eleventh century Spanish author, Ibn Masarra (De Smet 1998). In Empedocles, we meet one of

the typical cases of transformation of an ancient doctrine for philological rather than ideological reasons. *Neikos* – Hatred – one of the two opposite powers that combine the four roots and give rise to the generation and corruption of all existing beings, becomes in Arabic *ḡalaba*, “Victory,” as a result of iotacization – the tendency in Byzantine Greek to use iota (ι) rather than the diphthong epsilon/iota (ει), thus reading *nikos* rather than *neikos*.

In the Muslim accounts, the homeomerics of Anaxagoras are moved by the Intellect, which is assimilated in a God who disposes or even creates them, hence determining generation according to fixed proportions. Anaxagoras’ doctrine of *panta homou* is developed into the theory of *kumūn* and *zuhūr* – of “latency and appearance.” This theory, which is mixed with the Aristotelian doctrine of potential and actual being, proposes a sort of creation of all things together that are destined to evolve from one form into another, as a spike develops from a grain, a bird from an egg, and a man from the sperm. The only difference with Aristotle would be that for Anaxagoras infinite homeomerics exist in actuality.

Doctrines influenced by the *kalām* vision of divine attributes were also referred to Anaxagoras. According to these, the will of the Creator differs neither from that which is willed nor from Him who wills; and an act is not different from Him who acts or from the object of the action; in fact, will and action have no essential form: they subsist either in the actor or in the object acted upon.

In spite of the uncertainties and misunderstandings about the founder of the doctrine, atomism is a view shared in Islam by thinkers of different persuasions. Arabic sources speak of infinite atoms of various forms, indivisible, and in necessary and casual movement. This led to a strict scientific Islamic atomism affirmed by the physician and philosopher Abū Bakr al-Rāzī (d. c. 925), who denied prophethood and admitted five eternal principles: God, soul, space, time, and matter conceived as a composition of atoms and void. Accounts of his atomism by his Ismāʿīlī adversaries show clear similarities with the original doctrines. On the other hand, atomism was supported by orthodox theologians, who adopted an

atomistic occasionalism to enhance the absolute freedom and will of God and his constant power over and link with creation. In their opposition to the Aristotelian theory of causality, these theologians subsumed into their beliefs the doctrines of the author, who was sharply criticized by Aristotle.

Prochoros Kydones

Ivan Christov

Faculty of Theology, University of Sofia, Sofia, Bulgaria

Abstract

Prochoros Kydones (c. 1333 Thessaloniki to c. 1370 Constantinople) (also spelled Prochorus Cydones), is a key figure in the spiritual and intellectual history of Byzantium in the

fourteenth century. It was to a great extent due to him and his brother Demetrios Kydones that Thomism spread to the Christian East. Translating main works of Thomas Aquinas and becoming proponents of his ideas, the two brothers stimulated intense theological controversy, in the course of which Byzantine thought contended its identity against western Scholasticism. Prochoros is by no means an original thinker. His significance lies in the fact that he applies the concepts and principles of Thomistic philosophy to the context of the Palamite controversy. He opposed the Christian Aristotelianism of Thomas Aquinas and the Scholastic method of distinctions to the Neoplatonic aspects of Palamas' thought. Following Thomas Aquinas, Prochoros identifies Being, Essence, and Energies in God. Thus, the Divine energies do not constitute anything different from the Divine essence. From this point of view Palamas is ambiguous claiming both the nonhypostatic nature of the energies and their particular ontological status between God and creation; emanating from the essence, they constitute the Divine Wisdom (Intellect), which is Divine but not God, and is also non-created. Opposing these trends of thought, Prochoros formulated a conception of logic and rational discourse, which was unacceptable for Palamite theology.

Life

The biographical information we have about Prochoros is scarce and mainly based on the letters of his brother Demetrios Kydones, defending him against the attacks of his opponents.

Born into a noble family in Thessaloniki, which after the death of his father suffered misery, Prochoros chose the monastic life and entered the brotherhood of Megisti Lavra monastery on Mount Athos (c. 1333). In c. 1363, he was ordained a priest-monk and originally held in high respect by the abbot Jacob Trikanas because of his theological erudition and literary skills. Under the influence of his brother Demetrios during the 1360s Prochoros translated from Latin

about 20 theological and philosophical texts, among them are the following: *De differentiis topicis*, lib. 1–2 by Boethius; *De vera religion* (lib. II), *De beata vita*, *De libero arbitrio*, and *Enchiridion and Eight Epistulae* by Augustine; *De mundi aeternitate*, *In Metaphysicam* (proemium), *Summa theologiae*, III (82 articuli), *Quaestio de potentia*, and *Quaestio de spiritualibus creaturis* by Thomas Aquinas; and parts of *In quattuor libros Sententiarum commentaria* by Hervaeus Natalis. His interest in the Latin tradition came along with a rising dissatisfaction with Palamite Theology. This urged him to expound his position in treatises he never finished because of his premature death. His main work *On Essence and Energies of God* (*De essentia et operatione Dei*), wrongly attributed to Gregory Akyndinos, is largely based on Scholastic theology and most of all on Thomistic texts to refute the Palamite distinction of Divine essence and energies.

Prochoros' anti-Palamite stance gradually brought him into conflict with the brotherhood in the monastery and Philotheos Kokkinos, who regained his position as a patriarch in 1364. It was in his defense that Prochoros wrote *An Answer to the Atonic Palamites*, supporting the doctrines of his inclination that had been anathematized in the Tomos of 1351. Shortly afterward (in the middle of 1367 or the beginning of 1368) he wrote *On Cataphatic and Apophatic Method of Proof in Theology and Contemplation of God by Sight* as well as a text defending the theological significance of syllogism. A series of letters, pleading his cause with the patriarch and the abbot of the monastery, date back from this period. After June 1367, Prochoros left for Constantinople where a Church Council, chaired by the patriarch, led to his condemnation in April 1368. Soon afterward, in 1370/1371, he died in Constantinople.

Thought

Prochoros could hardly be regarded as an original thinker. What he actually did was to apply the Thomistic doctrine to the Palamite debates. The

teaching of transcendentals played a particular role in his anti-Palamite views. A series of identifications that Prochoros did have followed from it: of essence and being, essence and energies, essence and potency, essence and wisdom, and essence and truth. These identifications led to his condemnation and were included in the Tomos of 1368. Provided that the transcendental of being is associated with essence, it follows that the concepts which unfold being in Aristotelian metaphysics are also identified with it – potency, act, and truth. Following the Scholastic method of distinctions, the identification of essence with being is reached in the way of distinguishing the various kinds of potency and act, and consequentially excluding those of them, which presuppose complete or partial nonidentity of the being of God with his essence. The Christian nuances of this view do not conceal the Aristotelian background. The teaching of Palamas, against which these arguments are aimed, is articulated in the language of Neoplatonic philosophy, connecting potency and act with the concept of emanation. This led him to a certain ambiguity as to the status of the Divine energies. In his doctrine, they are both nonhypostatic and nonseparated from the essence of God and on the other hand are Divine but not God Himself.

The Aristotelian basis of Kydones' views (opposed to the Neoplatonism of Palamitic doctrine) was the reason for his views about the use of syllogism to be condemned, though at first glance they concurred with that of Palamas'. Unlike the other anti-Palamites, Prochoros allows for the application of syllogism in Theology. In the Tomos of 1368, four of his arguments, in favor of the use of syllogisms and proofs, are quoted: (1) truth is inseparable from syllogism being either its principle or identical with it; (2) (connected with the first) all true discourse is in syllogistic form; (3) rational knowledge is in harmony with Revelation; (4) in the present human state syllogism is the only available instrument for finding the truth. The Tomos does not analyze these statements, taking their heterodoxy for granted. This refers at least to 1, 2, and 4. Firstly, the principle of syllogism is according to Palamas not truth itself, but its manifestation –

the energies that constitute the Divine intellect or Wisdom. On the contrary, according to Thomas the basis of syllogism and of any knowledge are transcendental attributes that constitute the Divine essence and truth is one of them. Secondly, the discourse in syllogistic form does not surpass the metaphor and the symbol. These are different ways to articulate in speech the experience of Divine energies; in the first case – their presence in nature and natural intellect, in the second – the touch of their transcendence. However the highest achievement of truth, according to Palamas (like in Neoplatonism), is not in the speech but rather in silence. This was an essential point in his theological substantiation of the monastic practice of *hesychia*.

The condemnation of Prochoros involved his brother Demetrios Kydones in the Palamite controversy and was among the factors of even more radical differentiation of conceptual patterns of eastern and western theology.

Proclus, Arabic

Elvira Wakelnig

Department of Near Eastern Studies, University of Vienna, Vienna, Austria

Abstract

The name of the Greek philosopher Proclus figures quite prominently in the Arabic philosophical literature. However, his doctrines are

often changed beyond recognition. Fourteen Proclean works were allegedly translated into Arabic and Syriac, but today none of these translations are known to be extant in its entirety. Among them, his *Proofs that the World is Eternal* and his *Elements of Theology* were the most influential ones. The latter was reworked in several recensions and became a main source for Neoplatonic thought in Arabic: the One identified with pure Being was established as the first principle and the cause of everything else; the concept of emanation and *creatio mediante intelligentia* was expounded; the hierarchy of being was arranged in the scheme One – Intellect – Soul – Nature, and the dichotomy between spiritual and corporeal world was stressed.

Biographical and Bibliographical Information

The name of the late antique Neoplatonist Proclus (rendered into Arabic mostly as Buruqlus but also by variations like Ubruqlus, Ubruqlīs, and Furuqlīs) was well known in the Arabic–Islamic world since the early days of the transmission of Greek philosophy into Arabic. However, while philosophical doctrines presented in his name, often in doxographical sources, are not always genuine, some of his original teaching was attributed to Aristotle. The question of the eternity of the world was frequently linked to Proclus, although he was not always pictured correctly as an eternalist whose arguments were refuted by Philoponus (the correct depiction occurs, e.g., in the most famous Arabic biobibliography of the tenth century composed by Ibn al-Nadīm, the *Fihrist*, and in Ibn al-Qifī’s *History of Learned Men*, as well as in al-‘Āmirī’s *On the Afterlife*). Sometimes he was also said to have been opposed to the doctrine of the world’s eternity (in al-Kaskarī’s treatise *On the Unity and Trinity of God*) but purposefully misinterpreted by his adversaries (according to the doxography of the Ps.-Ammonius; see also al-Shahrastānī, who seems to have had access to Ps.-Ammonius when composing his *Book of Religions and Sects*).

Arabic sources preserve hardly any information about Proclus' life or his school. His birthplace and lifetime are given erroneously in the *Fihrist* and by Ibn al-Qiftī.

The *Fihrist* lists 14 Proclean writings, which were translated into Arabic and/or Syriac (three of them are said to have been extant only in Syriac, two of them are unidentifiable, and different titles may actually refer to one and the same work). So far, none of these translations are known to have survived in its entirety.

The title *Eighteen Issues Which John the Grammarian Refuted* refers to Proclus' *Proofs that the World Is Eternal*, lost in Greek but translated into Arabic twice. None of these translations are known to have been preserved completely. The older one of them may go back to the very early days of translating Greek philosophical works into Arabic. It survives in at least two rather recent Turkish manuscripts that contain only the first eight arguments. The second and better translation was done by Ishāq b. Ḥunayn (presumably in the second half of the ninth century), but only the first nine arguments are known to be extant today.

One or the other of these translations of Proclus' work and/or John Philoponus' refutation of it (not known to be extant in Arabic but attested in al-Isfīzārī and Ibn al-Faḍl al-Anṭākī) was known to and used by, for example, Abū Bakr al-Rāzī, Ibn Sīnā, al-Bīrūnī, al-Ġazālī, and al-Shahrastānī. The latter refers to the Proclean proofs 1, 3–6, 8, 10, and 13 with possible traces of 12 and 16 in his *Book of Religions and Sects*.

Another quite influential Proclean text in Arabic is the *Elements of Theology*. Up to now it is not clear whether a complete Arabic translation ever existed or whether only parts of the work, maybe in the form of some late antique reworking, were rendered into Arabic. The *Fihrist* lists two titles, which may refer to an Arabic version of the *Elements of Theology*, a "Theology" (which could also indicate a translation or partial translation of the *Platonic Theology*, although that does not seem highly probable) and a *Book on the First Good*. What has been preserved are, however, relatively short treatises containing each a number of Proclean propositions and thus providing in

their entirety evidence for at least one third of the Greek text of the *Elements of Theology* in Arabic. The treatise that renders the Proclean propositions in Arabic most closely is an alleged excerpt by Alexander of Aphrodisias from Aristotle's "Theology" (which also includes five genuine texts by Alexander). It must have been translated in the circle of translators and thinkers around the ninth-century Arabic philosopher al-Kindī, most probably by Ibn al-Bīṭrīq. In the same milieu, maybe by al-Kindī himself, the *Exposition of the Pure Good* was composed. Also based on the *Elements of Theology*, it is characterized by a more severe reworking of the Proclean material with regard to language as well as to doctrine and is often attributed to Aristotle. So far two recensions of the *Exposition of the Pure Good*, apparently independent of each other and containing not exactly the same propositions, have surfaced. There is also evidence for yet another recension or for the common source of the other two recensions in al-ʿĀmirī's paraphrase of some Proclean propositions, namely, his *Chapters on the Metaphysical Topics*. One of the recensions of the *Exposition of the Pure Good* was translated into Latin under the title *Book on the Causes* (*Liber de causis*) and had a deep impact on western philosophy in the Middle Ages. An Arabic text entitled the *Book on Motion* and attributed to Aristotle also contains some propositions of the *Elements of Theology* reworked in a similar way as in the recensions of the *Exposition of the Pure Good*. However, in this *Book on Motion*, the Proclean propositions are combined with Aristotelian material and most interestingly with renderings of some propositions taken from Proclus' *Elements of Physics*.

Thus, the *Book on Motion* is so far the main textual evidence for an Arabic translation of the *Elements of Physics*. One of the two titles ascribed to Proclus in the *Fihrist* – namely, either the *Definitions of the Natural Principles* or the *Book on the Indivisible Part* – could refer to a translation of this particular Proclean work. Additionally, in his treatise *On the Continuous Bodies Being Infinitely Divisible*, Yaḥyā b. ʿAdī presents the first five propositions of the *Elements of Physics*, for which he may, however, have relied on a Syriac translation.

In his answers to the philosophical questions addressed to him by a Mosul Jew, Yaḥyā also quotes Proclus, this time by name and most probably using the latter's *Ten Doubts Concerning Providence*, whose Arabic translation seems to be mentioned in the *Fihrist* under the title *Ten Problematic Questions*.

In the Greek–Latin tradition, the *Ten Doubts Concerning Providence* is transmitted with two other treatises as the *Tria opuscula*. In the Arabic, there is some evidence for a possible translation of at least one of the remaining two treatises, namely, *On the Existence of Evils*. Miskawayh may refer to it in his *Minor Triumph*, and Abū l-Ḥasan al-Ṭabarī seems to quote from it in his *Hippocratic Treatments*.

Ibn al-Nadīm also lists a Proclean work called *Explanation of Plato's Statement that the Soul Is Immortal in Three Chapters*, which is generally taken to be a translation of the lost Greek monograph of Proclus on Plato's three proofs of immortality of the soul. Textual evidence of this writing is preserved in three short Arabic texts that are independent of each other but seem all to derive ultimately from an Arabic version of this Proclean work. These three texts are *Plato's Proofs of the Soul's Immortality*, which is preserved at the end of Ibn Sīnā's *Commentary on the Theology of Aristotle*; *Delicate Result of Plato's Syllogisms that the Soul Does Not Decay*, which is preserved as marginal gloss to a pseudo-Platonic treatise; and the sixth chapter of the second part of Miskawayh's *Minor Triumph*.

At the end of the summary of Ḥunayn's translation of Galen's *On Dispositions*, an excerpt of Proclus' *Commentary on the Timaeus* is attached. It covers a passage (89e–90c), which is dealt with in Galen's treatise. However, it is not clear whether this Proclean excerpt was already part of the Greek text containing the Galenic work or whether it has been added to the Arabic translation taken either from an Arabic version of Proclus' commentary or translated directly from the Greek by Ḥunayn. Some traces of the Proclean work may also be detected in al-Bīrūnī's *India*. However, Ibn al-Nadīm does not mention an Arabic translation of it.

What he lists in his *Fihrist* instead are the following three treatises ascribed to Proclus, for which no Greek correspondences could have been established so far:

Firstly, the *Minor Elements*, of which only an excerpt survives in the *Philosophy Reader* preserved in the Oxford Manuscript, Marsh 539.

Secondly, Proclus' *Commentary on the Pythagorean Golden Verses*, the first part of which is preserved in a recension by Ibn al-Ṭayyib. This commentary is, most probably, the work of a certain Proclus Procleius mentioned in the *Suda* and mistaken in Arabic sources for the more famous Proclus Diadochus. The last part of the abovementioned excerpt from the *Minor Elements* is very close in content to a passage in Ibn al-Ṭayyib, which may suggest that *Minor Elements* is an alternative title by which the commentary on the *Golden Verses* was also known.

Thirdly, *Ten Questions on Physical Problems*, of which only the first eight seem to have been preserved. The text is written in the tradition of the *Problemata Physica* and deals with topics such as the four elements, sleep, tickling, and hair. There is strong evidence that this text was used by Job of Edessa when composing his Syriac *Book of Treasures*. However, Job does not mention Proclus.

Doctrinal Development

Whereas most of what is preserved of the Arabic translations of Proclus' works other than the *Elements of Theology* seems to be reasonably faithful to the Greek original, all the extant textual evidence of the *Elements of Theology* has undergone considerable reworking. The 20 propositions contained in the alleged excerpt of Alexander of Aphrodisias from Aristotle's "Theology" (edited under the title *Proclus Arabus* by Gerhard Endress and enhanced by two further propositions found, by Fritz Zimmermann, in two manuscripts which contain also some of the other 20 propositions and are similar with regard to terminology and doctrinal reworking) and the propositions contained in the *Book on Motion* focus on the One as the first principle and the cause of all being. The One itself is said to be a pure Being, not beyond being as Proclus himself would claim. It is also pictured as generating the unchangeable first matter, although the Proclean concept of emanation is still present

in the text. The same holds true for the hierarchy of hypostases (henads, intellects, souls, natures), but the main distinction on the level of being with which the corpus *Proclus Arabus* operates is only threefold: One – forms – bodies.

The *Exposition of the Pure Good* in its various extant recensions, which probably all stem from what may tentatively be termed “Ur-” or “Proto-*Liber de causis*,” shares some of these characteristics but emphasizes the idea of creation far more than the propositions in the *Proclus Arabus*. It even implies the concept of a *creatio mediante intelligentia*. Likewise the Proclean hierarchy of being with its complicated details is in general suppressed and replaced by the Plotinian scheme of One – Intellect – Soul – Nature. In both cases, that is, in the case of the *Proclus Arabus* as well as in the case of the *Exposition of the Pure Good*, the textual reworking is taken to have been exerted under late antique Christian influence.

Abstract

The question whether God exists, although not in itself an issue for a faithful Muslim, Christian, or Jew, continually attracted the interest of

religious thinkers throughout the Middle Ages. Fueled by metaphysical, epistemological, and logical considerations inspired by Ancient Greek philosophy, the discussions brought to the forefront questions about being and existence, time and causal dependence, the limits of human knowledge, and the strengths and limitations of reasoning and demonstration.

Introduction

Medieval philosophical discussions of the existence of God would not, in general, concern the question whether God exists as such so much as whether God's existence can be established indubitably by an argument, and if so, how. The problems discussed were therefore intimately connected to the question of the relative significance of faith and understanding in the life of the religious person. In dealing with the subject, thinkers from the three great monotheistic religions could find ample sources of inspiration outside their own cultural spheres. Doctrines such as the trinity of God, for instance, particular to Christianity, was by most maintained to be a matter of faith, and was as a rule treated as a separate issue. By contrast, we find in all three traditions arguments to the existence of God based on the notion that God is the first cause of our universe of causes and effects.

Early attempts at proving God's existence drew inspiration primarily from Platonist philosophy. Later Aristotle came to dominate as an influence, both indirectly as a target for attacks from Christian and Islamic theologians and as a direct source among Arabic philosophers and Christian scholastics. Aristotelian philosophy enriched the discussion about how to deal philosophically with the question of God's existence in at least four important ways: (1) by confronting philosophers with a certain metaphysical framework against the background of which the concept of existence could be assessed, (2) by supplying a theory of human cognition, (3) by providing methodological discussions about the validity of arguments and what is required of scientific demonstration, and, finally, (4) by supplying, in the *Physics* and in

the *Metaphysics*, actual examples of proofs for God's existence in the form of arguments for a first mover.

The arguments for the existence of God may be seen as loosely arranging themselves around three basic ideas: first, that of the world consisting in a hierarchy of beings with respect to intrinsic value, secondly, that of God as a primary creative cause, and, thirdly, that of the universe being manifestly orderly and purposeful. These patterns of thought gave rise to arguments that are in the philosophical literature after Kant considered as falling into three classes of proof: the ontological, the cosmological, and the teleological. While this classification may serve as a rough guide, one should note that some medieval arguments draw on more than one of the three basic ideas.

Goodness and Being

The first type of arguments, those from hierarchy, took their departure from a metaphysical framework with roots in Neoplatonism. A point on which most medieval philosophers would distance themselves from the important Neoplatonic heritage, however, was the question of the existence of the Supreme Being. According to Plotinus, the One is so high on the scale of beings that the One is beyond being, and therefore, properly speaking, the One is not at all. While retaining the Platonic notion of a hierarchy of being, the medievals would hold that God occupies the top level of the order of the things there are. Proving the existence of God within this framework is essentially a matter of establishing that there is indeed a single highest entity in the hierarchy, and that this entity is identical to the monotheistic God.

Augustine puts forward an argument for God's existence in *De libero arbitrio*, book 2. The argument focuses on the supposed divine properties of eternity and immutability. If it can be shown that there exists some one thing eternal and immutable which is also superior to human reason, then God exists. Such a thing does indeed exist, Augustine argues, and this thing is truth. Some things are eternally and immutably true, namely, necessary truths such as those of mathematics. What makes

the true things true is truth itself, and since the truths made true by truth are eternally and unchangeably true, truth itself must be eternal and unchangeable. Furthermore, truth is superior to human reason. According to Augustine, truth imposes a norm on human reason by which human reason must abide, and so, metaphorically speaking, truth is the judge of reason; therefore it is better, and so higher on the hierarchy of being. There is an interesting twist to the last stage of the argument. Where one would perhaps expect Augustine simply to identify God with truth itself, Augustine hedges the question and argues that either God is truth, or if there is something higher still, then this higher thing is God.

The first argument for the existence of God in the Middle Ages proper can be found in Candidus Wizo, a student of Alcuin. In a short work titled *Dicta candidi de imagine dei*, Candidus argues, following Augustine, that all things can be divided into what exists, what lives, and what understands. The three classes of things constitute an order in terms of both power and goodness. An animal, which both lives and exists, is more powerful and also better than a stone, which merely exists. A human being, who has understanding, is better and more powerful than both. When the human being realizes that his own power has limits, he must admit there is a being who has the power to rule over the very existence of what lives and understands, and this being, Candidus adds, is God.

In the *Monologion* 1–3 Anselm of Canterbury argues from the existence of good things to the existence of a being Supreme with respect to goodness, greatness, and being. All good things are good through, or by virtue of, some one thing. There is one thing, which makes all good things good (reification of property). Moreover, this thing is itself good, indeed good to the highest degree (self-predication). Since it is the best thing it is also the greatest thing, in the sense that no other thing is equal or surpasses it in goodness. Further, all things that exist exist through something, and it cannot be the case that they exist through many separate things and there cannot be any existential cross-dependencies. Thus, there is some one thing on which all things,

including itself, depend for their existence. Dependent existence is according to Anselm a lesser form of existence than self-dependent existence, so the thing on which all other things depend, is itself existent to the highest degree.

In the *Proslogion*, Anselm puts forward his most famous and influential argument – perhaps one of the most discussed pieces of reasoning of all time. If one understands God to be that than which a greater cannot be thought, one must, according to Anselm, also accept that God is. To think that that than which a greater cannot be thought is only in the understanding (in intellectu) is to think incoherently, since it is greater for it to be both in reality (in re) and in thought.

Anselm's first critic was the contemporary Gaunilo of Marmoutiers, whose response *On Behalf of the Fool* was circulated as an appendix to the *Proslogion*, together with replies to Gaunilo by Anselm. Gaunilo raises several questions, focusing particularly on what follows from claiming that something is understood, or, as Anselm puts it, that something is in the understanding. The gist of his critique is that the existence of a thing can never be adduced from thought or concept alone. He illustrates his point by arguing that if Anselm were right, one should be able to argue from the mere thought of an island most excellent of all to the existence of that same island.

The rediscovery and dissipation of the full canon of Aristotle's *organon* and his *Metaphysics* in the mid-twelfth century onward was accompanied by an increased focus on problems of epistemology, against the background of which Anselm's argument would be viewed in new ways. Two major epistemological approaches dominated: Augustinian theories of Divine illumination, and Aristotelian theories of abstraction. According to the former, human concept formation depends at least partly on direct supernatural assistance; according to the latter, concepts (intelligible species) are the result of a cognitive process of abstraction, which depends on data supplied by the senses. On neither theory is there suggested a way for human beings to gain a concept of God by natural means alone. Most often,

scholastics following either approach would hold that it is possible for humans to know that God is, but not what He is, that is, his quiddity or essence. It seems therefore Anselm's formula "that than which a greater cannot be thought" is either not a proper concept of God, or, if it is, must have been supernaturally implanted. Defenders of Anselm's argument such as the authors of the *Summa fratris Alexandri Halensis* and Bonaventure would indeed claim that Anselm's argument is valid, but they also argue that our knowledge of God's existence is a naturally impressed disposition, or that the claim that God exists is self-evident, and thus the point of putting forward an Anselmian argument starts to look questionable. Nevertheless, Bonaventure took serious interest in Anselm's argument, and put forward several versions of it, formulated against the background of the doctrine of the transcendentals. For instance he argues, in his *Commentary on the Sentences*, that truth is a property of God, and therefore God's being (or God's "to be": his *esse*) is so true that God cannot be thought not to be (bk. 1 dist. 8, art. 1, q. 1). He also put forward a rejoinder to Gaunilo's beautiful-island argument, arguing that the notion of an island is the notion of an inherently imperfect, inherently limited, categorical being while God must be described through the transcendentals, which do not imply imperfection. The concept of a perfect island is therefore incoherent and so cannot rationally be thought of as a thing than which no greater thing can be thought. (*De mysterio trinitatis* q. 1, art. 1, ad 6).

Thomas Aquinas suggests in the *Summa theologiae* that there are five ways to prove God's existence, none of which follow Anselm's *Proslogion* argument. Aquinas' fourth way is, however, in the tradition of Anselm's strategy in the *Monologion*, starting from the observation that different things exhibit goodness, truth and being to different degrees, to the conclusion that there must be some one thing, itself the most accomplished with respect to goodness, truth, and being, which is the cause of all other, and this is God. While sympathetic to proofs based on the notion of a hierarchy, Aquinas appears to explicitly reject the *Proslogion* argument in both SCG and ST, although the exact target is perhaps not so much

Anselm as Anselm's thirteenth century advocates. According to Aquinas, God's existence is not self-evident (*per se notum*) to human beings, neither in the form of an implanted piece of knowledge nor as a conclusion drawn from self-evident premises. The latter would require knowledge about God's essence, to which man lacks access. Instead God's existence must be proved by appeal to God's effects, that is, observable facts of the sensible realm of creation.

Scotus, on the other hand, considered a "touched-up" version of Anselm's argument a valid proof for the existence of a first (i.e., highest) being in the order of eminence. According to Scotus, that than which nothing greater can be thought "without contradiction" can be readily proved to exist (e.g., *De primo principio* 4.65). However, proving the existence of such a best being is merely a part of Scotus' proof for the existence of God as an infinite being (see below).

Creation and Causation

The second family of arguments originally grew out of heated debates about whether the world has a beginning (and an end) in time. Many medievals accepted Aristotle's causal apparatus, but considered the view that the world is eternal, prevalent in ancient Greek thought, as at least problematic, and would find the related idea that matter is eternal at odds with the doctrine of creation *ex nihilo*. A key role in the history of arguments for creation is played by Alexandrian Christian John Philoponus (c. 490–570s) and his works *Contra Proclum* and *Contra Aristotelem*. In the latter work, now extant only in fragments, Philoponus argues against the eternity of the world (including the supralunar realm) by attacking Aristotle's *Physics* arguments for the eternity of time and motion.

In *Physics* 8, Aristotle had argued that it is impossible that there was ever a first motion, since every motion is the actualization of a pre-existing potentiality. On the assumption of a first motion, one must admit the existence of a thing, which, prior to the first motion, has the potentiality of being in motion. The thing in question must either have been there always, in a state of rest, or

it must have come into existence at some prior point. Now if it was at rest, there must according to Aristotle have been a cause for its state of rest, and if it came to be, there must have been a cause for its becoming. In any case, there is motion before the first motion; hence, the initial assumption of the existence of a first motion must be abandoned, and the series of motions must be eternal. Since time, moreover, is either a motion itself or a measure of motion, time too is eternal.

In his *Contra Aristotelem*, Philoponus argues that Aristotle's argument, if valid, would be a refutation not only of creation *ex nihilo*, but also of that eternal motion which Aristotle himself thought the heavens were engaged in. Since in eternal motion there is no preceding potentiality for motion, Aristotle's definition of motion as the actualization of the movable *qua* movable cannot be valid.

Philoponus puts forward a series of further counter-arguments, which trade on the theoretical unmanageability of infinities. Exploring the Aristotelian notion of the transmutation of the four (sublunar) elements of one into another, Philoponus argues that any given now existing element must be the outcome of a finite number of transformations, since an infinite series cannot be traversed. A second argument appeals to the impossibility of adding to an infinite: if current motions increase the total number of motions completed, then the past number of motions cannot be infinite, since an infinity cannot be increased. A third, similar, argument rests on the premise that an infinite cannot be multiplied. If the sphere of Saturn has completed an infinite number of revolutions, and the sphere of the planet Jupiter, for example, rotates roughly three times faster, then the number of Jupiter's revolutions should be three times infinity, which is absurd.

Similar arguments, appealing to the impossibility of adding to and multiplying infinities, can be found among the Islamic scholastics of the *kalām* tradition, and it has been argued that Philoponus was the ultimate source of these (Davidson 1969, 1987). Unlike Philoponus himself, and unlike later Arabic philosophers and Christian scholastics, who espoused various forms of hylomorphism, the majority of writers of the Mu'tazilite and Ash'arite schools advocated

a form of atomism, the so-called doctrine of accidents. The universe consists of featureless atoms, arranged into bodies or beings, the characteristics of which, such as composition and movement, are all mere accidents as opposed to being somehow dependent on internal structure, nature, or essence. According to what became the standard *kalām* proof of creation, the accidents, which are present in bodies, are subject to destruction and must, therefore, have been generated. Further, bodies cannot be free of accidents, and in particular not precede them. Now since the accidents are generated, so too must the very bodies be, and since the universe consists of only bodies and accidents, the world as a whole must have been generated.

Al-Fārābī and Avicenna rejected the *kalām* arguments for creation in time and maintained that the universe is eternal. Al-Fārābī also read Philoponus firsthand, and attacked him in at least four of his works. Instead of arguments for God based on arguments for creation, al-Fārābī appropriated the Aristotelian arguments in the *Physics* and the *Metaphysics* for a first mover (Hammond 1947: 18–22). In these arguments, Aristotle appeals to the impossibility of an infinite regress of movers, and so these latter arguments appear *prima facie* at odds with Aristotle's argument for there not being any first motion. According to Averroes and Maimonides, al-Fārābī set out to answer this problem in his work *On Changeable Beings*, now lost. In it al-Fārābī reportedly argued that although there is no first motion, and the series of motions is infinite, the motions or objects involved do not exist together, or simultaneously, and so do not taken together constitute an actual infinite. Moreover, while time is in a sense an infinite magnitude, it is neither a spatial, nor an "actual" magnitude.

Avicenna put forward an argument for the existence of God based on the distinction between what is possible of existence and what is necessary of existence. The distinction itself constitutes a challenge to the Aristotelian statistical (temporal-frequency) interpretation of possibility and necessity. While in the Aristotelian picture eternal things tend to be viewed as necessary since they exist at all times, Avicenna operated with a causal interpretation of modalities where a

possible is a thing that requires a cause for its existence (be the thing eternal or not) and a necessary is that which is uncaused. Through an *a priori* examination of the concept of existence, Avicenna aims to prove the existence of a being necessary in the sense of uncaused, a being he identifies with God. Each existing thing is either possible or necessary, and since what is sought is the necessary, the most important step in the proof is showing that the existence of an arbitrary possible entails the existence of the necessary. Any chain of causes and effects made up solely of possibles, regardless of whether it is finite or infinite, must terminate in a cause which is not itself an effect, that is, in a necessary. The total aggregate of possibles as a whole cannot be otherwise than itself a possible, and so per definition it requires a cause. In his Third Way, Aquinas argues in a similar way from the existence of contingent things. While Aquinas presents his argument as relying on sensory experience, however, Avicenna explicitly claims his proof does not rely on experience, but solely on the nature of existence (Marmura 1980: 339).

Both Ġazālī and Maimonides took a more complex stance vis-a-vis the question whether the world had a beginning in time. In his *Incoherence of the Philosophers*, Ġazālī puts forward Philoponus' arguments against eternity from the impossibility to multiply and add to infinities with the aim of showing that the *kalām* arguments for creation, although these too associated with serious problems, are at least as rationally defensible as the arguments of Avicenna and Aristotle. Maimonides thinks the claim of the world's eternity has neither been proved by Aristotle nor disproved by the *kalām*, and argues in the second book of his *Guide of the Perplexed* that the existence of God as a first mover can be shown to follow from 26 premises, 25 of which he considers self-evident or easily provable. The 26th premise, stating the world is eternal, Maimonides claims to be "possible," and grants for the sake of argument.

While Bonaventure considered [1] Philoponus' arguments valid, and [2] as established the claim that the world had a beginning in time (*Sentences* 2, dist. 1, p. 1, art. 1, q. 2), Aquinas held, at the time of writing ST, that the world's eternity can be

neither proved nor disproved. Aquinas' arguments for a first mover and a first efficient cause, the first and second of his "ways," should therefore be seen as neutral with respect to this issue. By employing the distinction between causes essentially and merely accidentally required for a given effect, he argues, following Avicenna and Averroes, that only series of accidental efficient causes can proceed back to infinity (ST I, 46, art 2, ad 7). Consequently, Aquinas' first and second ways concern essential, or *per se* causes.

Like Aquinas, Scotus thinks very carefully about the status of his arguments, but unlike Aquinas, he presents his argument for the existence of God as a proof proper, as an Aristotelian demonstration, as a series of deductions from premises necessary, certain and self-evident. In his view, a demonstration *propter quid* (of the "reasoned" fact) of God's existence is not possible to construct, but a demonstration *quia* (of the bare fact) is.

In his very complex proof, Scotus begins by establishing that there exists in actuality a first entity in three different orders of things: the order of efficient causes, the order of ends or final causes, and the order of eminence or excellence. A key role in the arguments is played by the notion of an essentially ordered series of beings with respect to causality. In such a series, at each element pair, (1) the causes involved are contemporaneous, (2) a cause depends on the prior cause in the series for its own causality, and (3) the prior cause is more perfect, more eminent, than the posterior. Such a series cannot be infinite, according to Scotus, since without a first cause, the series as a whole would be uncaused. Scotus then argues that three primacies — that of being a first cause, an ultimate end, and the most excellent being — are properties of one and the same being, and that this first being is intelligent and endowed with will. Finally, he argues the first being is infinite.

Order and Finality

The medievals partly adopted the Aristotelian conception of nature or essence. But whereas Aristotle would consider order and purpose

immanent with respect to the natures, medieval thinkers thought order and purpose had a transcendent source: as being due to God the creator of the natural world. Rather than Aristotle, they would thus side with Plato, who in his *Timaeus* appears to put the ordering of the universe in the hands of an external craftsman or demiurge. In the third type of argument, proving the existence of God is a matter of proving that the layout of the universe as we find it requires that it be the result of purposeful fashioning, and thus that it be the product of an intelligent and benevolent Creator.

In the Christian tradition, an early proponent of arguments from perceived order and finality is Athanasius (c. 296–373). In book 3 of his *Contra gentes*, he argues that the orderly movement of the sun, the moon, and the stars should be enough for making us grant that there is God, and if we consider that the things we find around us are often composed of elements with mutually conflicting natures – something hot combined with something cold, something dry with something wet – resulting in things that line up with the purposes and needs of human beings, we should even more be thus convinced.

Although Boethius too, in the *Consolation* (book 1, prose 6), gives voice to a pattern of thought similar to Athanasius', arguments from perceived order and orderliness play no major role in medieval Christian philosophical thinking about the existence of God until the thirteenth century, when the influence of Aristotelian empiricism, and the new focus on epistemology, moves thinkers away from arguments *a priori* drawing on conceptual and metaphysical concerns toward arguments based on premises considered verifiable by experience. Aquinas argues in his Fifth Way that the near exceptionless regularity by which natural changes terminate in an optimal state can only be explained by there being an end which governs each change as such. Now since acting for an end (or acting with an end in view) can only be done by things capable of thought, there must be an entity with intelligence, namely God, who directs natural things that lack intelligence toward their ends.

Pseudo-Dionysius the Areopagite

Alexander Treiger

Department of Classics with Religious Studies,
Dalhousie University, Halifax, NS, Canada

Abstract

Pseudo-Dionysius (active c. 500 CE) is a Greek-writing Christian theologian whose identity remains an unsolved mystery. Under the pseudonym of Dionysius the Areopagite, St. Paul's Athenian convert (Acts 17:34), he composed four treatises (*The Celestial Hierarchy*, *The Ecclesiastical Hierarchy*, *The Divine Names*, and *The Mystical Theology*) and ten epistles. He may have authored additional treatises, referenced in his extant works, but no traces of these survive, with the possible exception of *The Symbolic Theology* (Mali, *Hat es die Schrift De symbolica theologia von Dionysius Ps.-Areopagita gegeben? Anmerkungen zu den Nachrichten des Sergius von Reš'aina über Dionysius Ps.-Areopagita*. In: M Tamcke (Ed) *Syriaca: Zur Geschichte, Theologie, Liturgie und Gegenwartslage der syrischen Kirchen*, 2. Deutsches Syrologen-Symposium (Juli 2000, Wittenberg). Lit, Münster, pp 213–224, 2002). Taken together, Dionysius' extant writings present a coherent theological system, deeply indebted to

Athenian Neoplatonism, in particular to the philosophy of Proclus (Perl, *Theophany: The neoplatonic philosophy of Dionysius the Areopagite*. State University of New York Press, Albany, 2007; Klitenic Wear and Dillon, *Dionysius the Areopagite and the Neoplatonist tradition: Despoiling the Hellenes*. Ashgate, Aldershot/Burlington, 2007).

Identity

Much effort has been expended in the attempt to uncover Dionysius' identity, yet none of the proposed solutions (Severus of Antioch, Peter the Fuller, Peter the Iberian, Sergius of Resh'aynā, and others) is satisfactory. A more fruitful approach may be to identify the milieu in which his writings were produced and to analyze their earliest reception. Internal evidence, including Dionysius' description of liturgical practices, indicates that he may have been active in Syria (Louth 1989). This is corroborated by his strong emphasis on the church hierarchy, likely directed against antinomian Messalian tendencies, prevalent in that region (Golitzin 2003). The possible link to Origenist circles in Palestine has also been explored (Perczel 1999, 2000, 2001). Dionysius' debt to Athenian Neoplatonism is undeniable, and it has been suggested that he could have received his philosophical education in Athens, as his pseudonym perhaps implies, and have been a student of Proclus or Damascius (Lilla 1994), though this is uncertain. The Dionysian writings were first used by the Miaphysites (Severus of Antioch and others) against the Chalcedonians in support of their Christological position but were later eagerly adopted by the Chalcedonians as well. This is largely due to the impact of the Chalcedonian bishop John of Scythopolis' scholia on the Dionysian corpus (mid-sixth century), written with a view to defending its orthodoxy (Rorem and Lamoreaux 1998).

Doctrine

In accordance with the Neoplatonic tradition, going back to Plato's description of the Idea of

the Good as "beyond being" (*epekeina tēs ousias*, *Rep.*, VI, 509b), Dionysius sees God as the creative cause of all being, which itself transcends the realm of being (*hyperousios*). Insofar as God is the cause of all the created beings, He is known through each and every one of them, and at the same time, insofar as He transcends the realm of being, He is not known through any of them: "He is all things in everything and nothing in anything, known to all from all things and to no one from anything" (*DN*, VII.3, 872A). This is the foundation of the two ways of speaking about God: cataphatic or affirmative theology, in which positive statements about God, based on His self-manifestation in the created realm, are made, and apophatic or negative theology, in which such statements are denied. Though negative statements about God are superior to affirmative ones, ultimately all statements about God, both affirmative and negative, are to be left behind and one is to enter the "truly mystical darkness of unknowing" (*MT*, I, 1000B–1001A), paralleling the darkness penetrated by Moses on Mount Sinai (Ex. 20:21 LXX). It is through unknowing that, according to Dionysius, God is most appropriately known and through silence that He is most fittingly praised (*MT*, I, 1001A; *Ep. 1*, 1065A–B; *DN*, VII.3, 872A–B).

God's self-manifestation in the created realm, which forms the basis of cataphatic theology, takes various shapes, from the Incarnation to scriptural and liturgical symbolism. Hence, much of the Dionysian corpus is concerned with such symbolism, in particular with the interpretation of divine names (Rorem 1984). This is done in three stages. The lost or fictitious work *Theological Representations* (summarized in *DN*, I–II and *MT*, III, 1032D–1033A) dealt with names associated with the doctrines of the Trinity and the Incarnation. *The Divine Names* dealt with scriptural descriptions of God derived from the intelligible realm (e.g., being, life, and wisdom). Finally, the lost or fictitious *Symbolic Theology* (summarized in *Ep. 9*; cf. *CH*, XV) dealt with scriptural descriptions of God drawn from the sensible realm, including such seemingly inappropriate imagery as God's falling asleep and being drunk. In the powerful apophatic finale of *The Mystical Theology*, Dionysius takes up these

descriptions again, but this time, he systematically denies their applicability to God (*MT*, IV–V).

The purpose of God's symbolic procession into the created realm is to purify, illumine, and unite all beings back to Himself (this triad – purification, illumination, and union – is adopted by Dionysius from Proclus). Purification, illumination, and union are effected through the two “hierarchies” (a term coined by Dionysius himself): the celestial hierarchy and the ecclesiastical hierarchy. The celestial hierarchy comprises nine orders of angelic beings, arranged in triads (the seraphim, cherubim, and thrones; dominions, powers, and authorities; principalities, archangels, and angels). The ecclesiastical hierarchy, also arranged in triads, comprises three sacraments (baptism, Eucharist, and consecration of the oil), three ranks of the clergy (hierarchs, priests, and deacons), and three ranks of laity (monks, lay people, and three minor groups: catechumens, penitents, and demon-possessed). Both hierarchies enable their members to imitate God and to be united to Him as far as possible (*CH*, III, 165A–B).

Influence

Dionysius' writings were influential in the original Greek, as well as in Latin, Syriac, Arabic, Georgian, Armenian, and Slavonic translations. There were as many as six translations of the Dionysian corpus into Latin between the ninth and the fifteenth centuries (by Hilduin, Eriugena, John the Saracen, Robert Grosseteste, Ambrogio Traversari, and Marsilio Ficino, in addition to an influential paraphrase by Thomas Gallus). Athanasius the Librarian (ninth century) translated John of Scythopolis' scholia into Latin. The scholia were subsequently integrated into a comprehensive textbook of Dionysian philosophy, which also included Eriugena's and John the Saracen's translations of the corpus and three Latin commentaries on *The Celestial Hierarchy*: by Eriugena, John the Saracen, and Hugh of Saint-Victor. This textbook was used at the University of Paris and other universities and schools from the thirteenth century onwards (Harrington 2004).

Dionysius' writings were widely read and commented upon in the Latin West (de Andia

1997; Boiadjev et al. 2000; Coakley and Stang 2008). The false belief that Dionysius was identical with the Gallic martyr Saint Denis, the patron saint of France, contributed to the popularity of his works. Eriugena adopted such Dionysian ideas as the distinction between affirmative and negative theology, the understanding of God as “super-essential” (echoing Dionysius' *hyperousios*), and the understanding of the world as God's self-manifestation. The Victorines (Hugh of St. Victor and Thomas Gallus), followed by Bonaventure, Hugh of Balma, and the anonymous author of the fourteenth century English treatise *The Cloud of Unknowing*, adopted the Dionysian theme of mystical unknowing, yet combined it with Bernard of Clairvaux's emphasis on love that transcends knowledge. Contrary to Dionysius' original intention, they interpreted mystical unknowing as involving affective union with God in love. This interpretation was rejected by the Dominicans Albert the Great and Thomas Aquinas, both of whom composed commentaries on Dionysius' works (Albert on the entire corpus, and Aquinas on *The Divine Names*). Aquinas rejected the Neoplatonic understanding of God as transcending the realm of being and reinterpreted the Dionysian notion that God is *hyperousios* as meaning that He is not any particular being but the very act of being, expressed by the infinitive “to be”.

The Dionysian corpus was held in highest esteem also in Rhineland mysticism, particularly by Meister Eckhart and Johannes Tauler. Nicholas of Cusa's *On Learned Ignorance* owes a debt to the Dionysian notion of mystical unknowing. A comprehensive commentary on the Dionysian corpus, based on Eriugena's translation and drawing on the entire scholastic tradition, was written by Denis the Carthusian. With the Renaissance and especially the Reformation, Dionysius' credentials as a purported disciple of St. Paul and even his orthodoxy started being questioned. Luther regarded him as more of a Platonist than a Christian and warned his readers to “stay away from that Dionysius, whoever he was.” Lorenzo Valla, and following him Erasmus, expressed doubts about the subapostolic dating of the Dionysian writings, though the question was not settled until the end of the nineteenth century, when

these writings' dependence on Proclus (d. 485) was conclusively demonstrated by Hugo Koch and Joseph Stiglmayr.

Despite the undeniable importance of Dionysius for western Christianity, the commonly cited assessment that his writings were more influential in the West than in the East is in need of qualification. In the original Greek, Dionysius' writings were foundational for later Greek theologians, such as Maximus the Confessor, John of Damascus, Simeon the New Theologian, and Gregory Palamas (de Andia 1997; Boiadjev et al. 2000; Coakley and Stang 2008). Sergius of Resh'aynā's Syriac translation and a revision of that translation by Phocas (late seventh century) were used by numerous Syriac authors, including Jacob of Edessa, John of Dara, Moses bar Kepha, Simeon de-Taybutheh, John of Dalyatha, and Bar-Hebraeus (Beulay 1987; Strothmann 1977–1978). Stephen bar Sudhaili's (?) *Book of the Holy Hierotheos*, a document of sixth-century Syriac Origenism, is ascribed to Dionysius' putative teacher Hierotheos.

In the early eleventh century, Dionysius' works were also translated into Arabic and circulated in the Arabic-speaking Christian circles in Syria and Egypt (Treiger 2005). Even prior to that, some Dionysian influence is discernible in the ninth-century Arabic Neoplatonic treatises: the *Liber de causis* and the *Theology of Aristotle* (D'Ancona Costa 1995; Adamson 2002). Through these treatises, Dionysius may have exerted certain influence on Islamic philosophy as well.

Ptolemy of Lucca

James M. Blythe

Department of History, University of Memphis,
Memphis, TN, USA

Abstract

Ptolemy of Lucca (Tolomeo Fiadoni) (c. 1236–1327) was a student of Thomas Aquinas, Dominican prior in Lucca and

Florence, and bishop of Torcello. He is chiefly known for his contributions to political thought. His most important book is *De regimine principum*, a continuation of Thomas' *De regno*, but he also wrote historical works, treatises defending hierocratic papal authority and limiting the powers of the Roman Empire, a commentary on the days of creation, and a history of the church. Ptolemy provided a previously lacking theoretical grounding for the realities and aspirations of Guelph republican city-states and thereby anticipated many of the tenets of Renaissance civic humanism. He presented republican government as the only suitable alternative for a virtuous people and identified monarchy with tyranny or despotism. He was perhaps the first writer to use the word "republic" as an antonym of "monarchy," instead of as a generic term for government. He was one of the first medieval writers to praise the Roman Republic in comparison with the Empire. His analysis of Rome complemented his original treatment of ancient Greek governments often praised as mixed constitutions and of the ancient Hebrew government, all of which he compared to certain medieval republics. He extended the common Four World Monarchy theory by denoting the church as a final fifth world monarchy, thereby reducing the Roman Empire to a time-bound state.

Ptolemy of Lucca, born Tolomeo Fiadoni to a Luccan merchant family, entered the Dominican Order at San Romano in Lucca and studied under Thomas Aquinas, probably in Rome (1264–1268). In 1272, he accompanied Thomas to Naples and studied with him there until his teacher's death in 1274, serving at times as his confessor. Around 1278, he wrote *De iurisdictione imperii*, incorrectly known as *Determinatio compendiosa*, defending papal authority in confirmation of the Roman emperor.

After returning to Lucca (date unknown), he was elected prior of San Romano several times between 1289 and 1299 and likely wrote *De operibus sex dierum*, incorrectly known as *Exameron*, a treatise on the 6 days of creation. In

1294, he was in Naples for the brief pontificate of Celestine V. In Lucca, he befriended Countess Capoana, widow of Count Ugolino of Pisa, after the latter's murder in 1289. She lived at San Romano and named Ptolemy one of her executors. He served as executor for other important figures, including Labro Vulpelli – a top official of the Ricciardi Bank, whose wife Agnese became a *conversa* at San Romano – and Cardinal Leonardo Patrasso. From 1300 to 1302, Ptolemy served as prior of Santa Maria Novella in Florence, returning in 1302 to Lucca as prior of San Romano. There he wrote *De regimine principum*, a continuation of Thomas' incomplete treatise on government (sometimes called *De regno*), *Annales*, a historical chronicle, and two short treatises on the Roman Empire.

In 1309, Ptolemy moved to Avignon, as Cardinal Leonardo's chaplain, moving to the house of Cardinal William of Bayonne after his patron's death in 1311. In Avignon, he wrote his church history, *Historia ecclesiastica nova*, dedicated to William. In 1318, Pope John XXII appointed him bishop of Torcello in the Venetian lagoon, and in 1320, he became entangled in a dispute with his superior, the patriarch of Grado (essentially archbishop of Venice) over the appointment of an abbeſs, leading to his excommunication in 1321 for disobedience, contempt, perjury, and mismanagement of episcopal property. John resolved the conflict, and Ptolemy, reportedly senile and accused of nepotism for allowing his avaricious nephews free reign, died in office.

Ptolemy traveled more than most contemporaries: throughout Italy and France, to Germany, and probably to Spain. Most of these trips were on behalf of his order: first as student and later as abbot, provincial preacher general, representative to provincial and general chapters, and elector of the master general. As he tells us, while traveling, he consulted local archives and libraries.

Ptolemy is primarily known as a political thinker. He provided a previously lacking theoretical grounding for the realities and aspirations of Guelph republican city-states and thereby anticipated many of the tenets of Renaissance civic humanism. He divided secular government

into political and regal forms, strongly preferring the former as the only suitable alternative for a virtuous and freedom-loving people. Unlike most scholastic writers, he loathed monarchy, identifying it with tyranny or despotism, while conceding that most peoples lacked the virtue needed for republican self-governance. Crucially, however, he considered secular monarchy, rooted in the corruption of human nature through sin, as a qualitatively different species of rule than the "sacerdotal and regal" rule of the pope, which stemmed from Christ and preserved the original, uncorrupted nature of monarchy. He was perhaps the first writer to use, although inconsistently, the word "republic" as an antonym of "monarchy," instead of as a generic term for government.

He was one of the first medieval writers to praise the Roman Republic in comparison to the empire, describing as ideal the former's government, which in his view evolved to incorporate democratic and aristocratic elements. In an original version of the common organic metaphor of society, Ptolemy raised the possibility of a government constructed with such harmony among its components that it achieves perfect stability, another idea usually associated with the Renaissance. His analysis of Rome complemented his original treatment of ancient Greek governments often praised as mixed constitutions (Ptolemy did not use this term) and the ancient Hebrew government, all of which he compared to certain medieval republics. His work is especially rich with specific examples, something lacking in much scholastic writing, and even contains some personal anecdotes. He tells us, for example, of his joy in reading and writing and of historical events he witnessed.

Ptolemy was unusual in supporting both republican government and papal hierarchy, although this was a reasonable position for one with his Guelph background, and he never envisioned routine papal interference with the internal government of a republic. In his expositions of imperial power, he maintained that the pope's authority over the Empire, although ratified by the Donation of Constantine, stems ultimately from his God-given authority as vicar

of Christ. Ptolemy extended the common Four World Monarchy theory, in which (usually) the Assyrian, Persian, Greek, and Roman Empires succeed each other, with the Roman lasting until the end of time, by denoting the church as a final, Fifth Monarchy, thereby reducing the Roman Empire to a time-bound state, but one with a special protective relationship to the church so long as it lasted.

Several scholars have questioned Ptolemy's republicanism. Miethke and Yun argue that he was neutral with respect to governmental forms, and that any apparent republicanism was in service to his primary concern of promoting papal hierocracy. Carron carefully parses the many concepts of republicanism and concludes that although Ptolemy was influential in future republican thought, he could better be described as a Guelphist using ideas from classical republican thought. Nederman and Sullivan, while accepting his republicanism, have argued that Roman sources were more central to his thought than Aristotle.

Ptolemy's historical works are flawed, but they sometimes depict events that he himself witnessed and serve as especially important sources for the history of Lucca and Tuscany in the eleventh through thirteenth centuries. The same goes for the history of the papacy from the early Middle Ages until 1294, and – if Ptolemy is responsible for the book's first continuation – to 1316, despite it being one of the early sources of the myth of a female Pope John (not yet Joan) and other apocryphal stories. It was also significant for its early catalog of the work of Aquinas and information on his life.

New learning and the political developments of Ptolemy's time called previous assumptions into question. Consequently, he engaged in a struggle, never quite successful, in almost everything he wrote, to reconcile conflicting outlooks, such as natural and supernatural causation, Augustinian and Aristotelian concepts of government, hierocratic and republican rule, and the active and the contemplative life. He also never found a satisfactory balance between his love of detail and his concern with pattern and meaning. One conflict, conditioned by his relationship with

several important women, is that between the Aristotelian view of women as defective men and his conviction that women were different from men, but had an equally important role. For example, he discussed at length whether women should be soldiers, concluding that they should not, but only because they had a more important role in the household. At the end of *De regimine principum*, Ptolemy proposed to write a separate treatise on household government and another on the virtues required for rulers and subjects, but he probably never wrote them.

Several other works Ptolemy mentioned are in the same category. He possibly intended for all or most of his works to form parts of an unfinished grand history of the world, comprising a secularly oriented *Historia quadripartita* and a spiritually oriented *Historia tripartita*. He also referred to a proposed treatise on moral philosophy, a catalog of the emperors, and a catalog of the Frankish kings.

Since Ptolemy's most original work was a continuation of a treatise of Thomas Aquinas and usually ascribed to Thomas, it achieved considerable circulation and was treated as authoritative. Although it is difficult to trace direct influence, it emerges clearly in the writings of several later writers, such as John Fortescue (c. 1395–c. 1477), Girolamo Savonarola (1452–1498), Niccolò Machiavelli (1469–1527), and Claude de Seyssel (died 1520), and was likely a factor in much of the political thought of the fourteenth through sixteenth centuries. His ecclesiological work also attracted interest at least through the fourteenth- and fifteenth-century conciliar debates. *De iurisdictione imperii* appeared in a revised edition after Ptolemy's death and was used in the work of Alvarus Pelagius (c. 1280–1352) and William of Ockham (c. 1288–c. 1347), among others, and it was included in a fifteenth century compilation of writings on church and state.

Q

Quantification

Catarina Dutilh Novaes

ILLC and Department of Philosophy, University of Amsterdam, Amsterdam, The Netherlands

Abstract

Medieval authors approached the semantic phenomenon now known as quantification essentially by means of the concept of supposition, more specifically the different modes of personal supposition. The modes of personal supposition were meant to codify the quantificational behavior of what we now refer to as quantifier expressions, and what the medievals referred to as syncategorematic terms. Perhaps the best way to understand the medieval approach to these quantifier expressions by means of the notion of supposition is as a two-step procedure that explicates their meaning and semantic behavior. First, the syntactical structure of the proposition, that is, the presence and order of its syncategorematic terms, determines the kind of personal supposition that each categorematic term has. Then, the semantic definitions of each mode of personal supposition determine the effect of quantifying syncategoremata over the quantity of objects involved in the assertion of a proposition. This entry discusses both groups of rules, and the contrasting thirteenth and fourteenth century approaches. The former is based on

the verification of propositions and focuses on the semantics of quantifier expressions taken individually; the latter focuses on the inferential relations of ascent and descent between propositions with quantifying syncategorematic terms and singular propositions of the form “This a is b,” and on the study of the global quantificational effect of syncategorematic terms in wider propositional contexts.

The phrase “medieval theories of quantification” is, properly speaking, an anachronism; medieval authors never used the term “quantification” in this sense, and even though they did treat semantic phenomena similar to what we now refer to as quantification, their theories differ from modern theories of quantification in significant aspects – to the point that this approximation may even be unwarranted (Matthews 1973). Nevertheless, their treatments of such phenomena are often insightful and sophisticated, justifying thus that we consider them from the viewpoint of modern theories of quantification, but provided that the term “quantification” be understood very broadly.

Broadly understood, quantification can be defined as a construct or procedure by means of which one specifies the quantity of individuals of the domain of discourse that apply to or verify a given statement. Typical quantifier expressions are “Some,” “All,” “None,” and they usually determine the quantity of individuals involved in an assertion. Medieval authors approached

quantification and quantifier expressions essentially by means of the concept of supposition, more specifically the different modes of personal supposition.

Besides supposition, they also treated quantificational phenomena from the vantage point of their theories of syllogisms, following the traditional Aristotelian approach. However, it is widely acknowledged that medieval authors did not contribute much to the development of Aristotle's theory of syllogisms for assertoric propositions, and that their main contributions concern modal syllogisms. Therefore, the innovations proposed by medieval authors with respect to quantification are not to be found in their theories of syllogisms, but rather in this typical medieval development, theories of supposition.

The different modes of personal supposition are indeed the closest medieval counterpart of our theories of quantification. The modes of personal supposition were meant to codify the quantificational behavior of what we now refer to as quantifier expressions, and what the medievals referred to as syncategorematic terms. Such analyses can be found in virtually every later medieval textbook in logic, but for reasons of space I shall focus on three representative texts: William of Sherwood's *Introduction to Logic*, William of Ockham's *Sum of Logic* (part I), and Buridan's *Treatise on Supposition*.

Perhaps the best way to understand the medieval approach to these quantifier expressions by means of the notion of supposition is as a two-step procedure that explicates their meaning and semantic behavior. First, the syntactic structure of the proposition, that is, the presence and order of its syncategorematic terms, determines the kind of personal supposition that each categorematic term has. Then, the semantic definitions of each mode of personal supposition determine the effect of quantifying syncategoremata over the quantity of objects involved in the assertion of a proposition.

In other words, the various theories of supposition presented by medieval authors typically have two groups of rules for the modes of personal supposition: the syntactic rules mapping terms in the propositional contexts created by quantifier expressions into modes of personal supposition;

and the semantic rules mapping modes of personal supposition into specific semantic behaviors (see Ashworth 1978). To illustrate this, let us first discuss the four Aristotelian classes of categorical propositions: universal affirmative (A), particular affirmative (I), universal negative (E), and particular negative (O); and provide the two kinds of rules for these propositional forms. (Notice that, even at early stages of its development, supposition theory already recognized a wide variety of quantifier expressions – unlike modern quantification theory, which started out with the existential and universal quantifiers and only later developed into a theory of generalized quantifiers. Notice also that, for medieval logicians, following Aristotle, all affirmative propositions have existential import, existential and universal propositions alike.)

- (A) Every *a* is *b*.
- (B) No *a* is *b*.
- (C) Some *a* is *b*.
- (D) Some *a* is not *b*.

Syntactical Rules

The syntactical rules for these four propositional forms are easily enumerable, but in practice the enumeration of rules becomes very long when authors attempt to cover a wider range of propositional forms. The rules below can be found in all of our authors (Sherwood, *Introduction to Logic*, §5.13.1; Ockham, *Summa logicae* I, Chaps. 71–74; Buridan, *Summulae de suppositionibus*, Chaps. 4.3.7 and 4.3.8.):

- The positive universal syncategorema “Every” (*omnis*) causes the term immediately following it to have confused and distributive supposition (*a* in (A)), and the term mediately following it to have merely confused supposition (*b* in (A)).
- A negative term, “No” (*nullus*) or “not” (*non*), causes all terms to its right to have confused and distributive supposition (*a* and *b* in (E) and *b* in (O)).
- The particular universal syncategorema “Some” (*aliquid*) causes the term immediately

following it to have determinate supposition (*a* in (I) and (O)).

- In the absence of syncategorematic terms immediately preceding a term, and of universal terms affecting a term mediately, a term has determinate supposition (*b* in (I)).

Semantic Rules

Authors account for the semantic behavior of the various modes of personal supposition in different ways, in particular with a clear cleavage between thirteenth and fourteenth century approaches. In the thirteenth century, with Peter of Spain, William of Sherwood, and Lambert of Auxerre, there was a tendency toward defining the modes of personal supposition in terms of the verification of the proposition or the supposition of its terms:

- Supposition is determinate when the locution can be expounded by means of some single thing, which is the case when the word suppositis for some single thing. (Sherwood, *Introduction to Logic*, §5.2.)
- Supposition is distributive when [the word] suppositis for many in such a way as to supposit for any. (Sherwood, *Introduction to Logic*, §5.2.)
- A term has merely confused supposition in a categorical proposition when it can be taken there for several of its supposita, not necessarily for all. (For want of a satisfactory formulation of merely confused personal supposition in our authors, this is Parsons' (1997, p. 45) "generic" version.)

By contrast, in the fourteenth century with Walter Burley, William of Ockham, and John Buridan, it became customary to define the modes of personal supposition in terms of "ascent and descent," that is, in terms of the inferential relations that do or do not obtain between a proposition and the singular propositions falling under it, of the form "This *a* is *b*" (see Priest and Read 1977; Spade 1996: Chap. 9).

Let (S) and (Q) stand for any syncategorematic terms, and the general form of a proposition P be

"(Q) *a* is (S) *b*." The generic definitions of the modes of personal supposition in terms of ascent and descent can be formulated as (see Ockham *Summa logicae* I, Chap. 70; Buridan, *Summulae de suppositionibus*, Chaps. 4.3.5 and 4.3.6.):

- A term *a* has determinate supposition in $P \Rightarrow A$ disjunction of propositions of the form "This *a* is (S) *b*" can be inferred from P but a conjunction of propositions of the form "This *a* is (S) *b*" cannot be inferred from P.
- A term *a* has confused and distributive supposition in $P \Rightarrow A$ conjunction of propositions of the form "This *a* is (S) *b*" can be inferred from P.
- A term *a* has merely confused supposition in $P \Rightarrow A$ proposition with a disjunctive term of the form "This *a*, or that *a* etc. . . is (S) *b*" can be inferred from P, but neither a disjunction nor a conjunction of propositions of the form "This *a* is (S) *b*" can be inferred from P.

The same applies *mutatis mutandis* to the predicate term. Notice that among the (A), (E), (I), and (O) propositional forms, merely confused supposition occurs only in predicate position (in (A) propositions). But more generally, it can also occur in subject position, such as in exceptive propositions of the form "Only *a* is *b*."

By applying the two groups of rules successively (first the syntactical rules and then the semantic rules), one obtains the desired result, that is, an account of the quantity of individuals involved in a given assertion, and thus of the semantics of quantifier expressions. For example, in "Every man is an animal," "man" has confused and distributive supposition and "animal" has merely confused supposition, according to the syntactical rules for "every." According to the semantic rules, this proposition asserts that "man" suppositis for all of the individuals falling under it (men) and that "animal" suppositis for several individuals, but not (necessarily) for all of those falling under it.

Terrence Parsons (1997) has made the compelling suggestion that the differences between the thirteenth and fourteenth century approaches can also be explained on the basis of the distinction

between the study of the semantics of quantifier expressions taken individually versus the study of global quantificational effect in wider propositional contexts. Indeed, fourteenth century authors had a keen interest in the effect of nested quantifier expressions, such as the effect of a negation over an affirmative universal quantifier. Take “Not every man is an animal”: according to the thirteenth century authors, “man” would have distributive and confused supposition, since it is preceded by “every.” But for fourteenth century authors, the negation preceding “every” would have the effect of suppressing its distributive effect, so that “man” would no longer have distributive and confused supposition but rather determinate supposition (see Karger 1993; Dutilh Novaes 2008). In sum, “[w]hat distinguishes the earlier theory from the later one is whether the mode of supposition of a term in a proposition is something that that term retains when its proposition is embedded in further contexts” (Parsons 1997, p. 43).

Further Developments

For reasons of space, I can only present the rough lines of the approach to quantification based on supposition. But medieval authors developed it further in several different directions, such as: the definition of valid inferences among different categorical propositions (see Karger 1993; Dutilh Novaes 2004); an analysis of multiple quantification (of subject and predicate) and of other quantifier expressions (see Ashworth 1978); discussions on what are now known as anaphoric pronouns (see Parsons 1994). Here I have discussed thirteenth and fourteenth century authors only, but fifteenth and sixteenth century authors refined the framework even further, dealing in particular with the difficulties that emerged from the earlier theories (see Ashworth 1974, 1978; Karger 1997; Dutilh Novaes 2008).

The modes of personal supposition have been a topic of heated debate in the literature, but a consensus as to their purpose and some of the technical details involved has not yet been reached. It is clear that they can be said to be a

general theory of quantification, but one must bear in mind that the overall approach is fundamentally different from modern post-Fregean theories of quantification.

Qusṭa ibn Lūqā

Cecilia Martini Bonadeo

Dipartimento di Scienze Storiche, Geografiche e dell'Antichità, Università degli Studi di Padova, Padova, Italy

Dipartimento di Filosofia, Università di Padova, Padova, Italy

Abstract

Qusṭa ibn Lūqā was a Melkite Christian translator of Greek origin who took part in the Graeco-Arabic translation movement in the ninth century Baghdad.

Qusṭa ibn Lūqā, called *al-Tarjuman*, “the Translator,” was born in Ba‘albak in contemporary Lebanon in 860. Ibn al-Nadīm in the *Fihrist* reports that he traveled to parts of the Byzantine Empire and brought back to Baghdad – where he spent most of his life – several Greek scientific manuscripts. Qusṭa ibn Lūqā was patronized by the ‘Abbāsīd court; he was also in contact with al-Kindī for medical–philosophical questions, as well as with other scholars of the time: he had an epistolary exchange with Ḥunayn b. Iṣḥāq and the

Muslim astronomer Abū ‘Isā ibn al-Munajjim, who had invited him to embrace Islam. Qusṭa ibn Lūqā's refutation of Ibn Munajjim's proof of Muḥammad's prophecy is extant. He retired in Armenia, where he died in 912.

Qusṭa ibn Lūqā was a native Greek speaker and had of course an excellent knowledge of Greek, but also of Syriac and Arabic. He translated into Arabic many Greek texts on natural science, mathematics, medicine, mechanics, and astronomy. In particular, he translated some treatises that in Late Antiquity were studied after Euclid's geometry as an introduction to Ptolemaic astronomy, and which formed together the so-called *Little Astronomy* or *Intermediate Books* (*Kutub al-mutawassiṭāt*). Among these are extant the versions of the *Spherics* (*Kitāb al-Ukar*) by Theodosius of Bithynia, the *Rising and Setting of the Fixed Stars* (*Kitāb al-Ṭulū‘ wa-l-ḡurūb*) by Autolycos, and the *Lifting-Screw* (*Kitāb Raf‘ al-athqāl*) by Hero of Alexandria.

As for philosophy, Qusṭa ibn Lūqā probably took in Baghdad and translated into Arabic a copy of Pseudo-Plutarch's *Placita philosophorum*. This doxography, edited and translated by Daiber (1980) as the *Aetius Arabus*, was the main source in the Arab world of the time for the knowledge of the Presocratics and of Stoic philosophy. Qusṭa ibn Lūqā is also recorded as the translator of Aristotle's *Physics* and Alexander of Aphrodisias' and Philoponus' commentaries on it.

According to the lists of the biographers, Qusṭa ibn Lūqā wrote more than 60 original works: commentaries on Euclid; treatises on astronomy, like the extant *Book on the Use of the Celestial Globe* (*Kitāb fī l-‘amal bi-l-kura al-nujūmiyya*) and the treatise *On the Configuration of Celestial Bodies* (*Hay‘at al-aflāk*); works on medicine, as the *Medical Regime for the Pilgrims to Mecca* (*Fī tadbīr al-badan fī l-safar*) and the *Book on the Reasons Why People Differ in Their Character Traits, Their Way of Life, Their Desires, and Their Preferences* (*Kitāb fī ‘ilal ikhtilāf al-nās fī akhlāqihim wa-siyarihim wa-shahawātihim wa-khtiṭiyyārātihim*); a treatise on the division of sciences, and writings on natural science. In this field, his treatise *On the Difference Between the Spirit and the Soul* (*Risāla fī l-farq bayn al-rūḥ*

wa-l-nafs), in Latin translation (*De differentia spiritus et animae*), was one of the books to be read within the program on Natural Philosophy at the Faculty of Arts in Paris in 1254.

Quṭb al-Dīn al-Shīrāzī

Cecilia Martini Bonadeo

Dipartimento di Scienze Storiche, Geografiche e dell'Antichità, Università degli Studi di Padova, Padova, Italy

Dipartimento di Filosofia, Università di Padova, Padova, Italy

Abstract

Quṭb al-Dīn al-Shīrāzī was a thirteenth-century Persian polymath, physician, mathematician, astronomer, philosopher, and Sufi.

Quṭb al-Dīn Maḥmūd ibn Mas'ūd al-Shīrāzī was born in Shirāz in October 1236 in a family of Sufi tradition. He began studying medicine under his father, who practiced and taught medicine at the Moẓaffari hospital in Shīrāz. After his father's death, his uncle and other physicians of his time trained him in medicine: Quṭb al-Dīn studied Ibn Sīnā's *Qānūn* (the *Canon*) and its commentaries including that of Fakhr al-Dīn al-Rāzī. Still young, he served at the Moẓaffari hospital as an ophthalmologist.

Some time after 1260, Quṭb al-Dīn left Shiraz for Maragha, where Naṣīr al-Dīn al-Ṭūsī had established the famous observatory, a point of attraction for many scholars from all over the country. In Maragha, Quṭb al-Dīn studied astronomy as well as Ibn Sīnā's philosophy and medicine. He read under Naṣīr al-Dīn al-Ṭūsī Ibn Sīnā's *Ishārāt wa-l-tanbīhāt* (*Pointers and Reminders*) and the *Kulliyāt* of the *Qānūn*. He

moved then to Khorasan, and decided to study and work in Juwayn with Najm al-Dīn ‘Alī ibn ‘Umar al-Qazwīnī al-Kātibī, a cofounder of the observatory in Maragha.

Quṭb al-Dīn traveled a lot, and some time after 1268 he went to Qazwīn, Iṣfahān, and Baghdad; later on, he traveled to Konya in Anatolia, where he probably met the famous Persian poet Jalāl al-Dīn Muḥammad Balkhī (al-Rūmī). Then, Quṭb al-Dīn was named by the governor of Konya judge of Sivas and Malatya.

In 1282, the Mongol Il-khān Aḥmad Takudār sent Quṭb al-Dīn to the Mamluk ruler of Egypt. Quṭb al-Dīn spent the rest of his life teaching Ibn Sīnā’s philosophy and medicine. He died in Tabriz in 1311 and was buried in the Čarandāb cemetery.

The encyclopedic knowledge of Quṭb al-Dīn is well documented by his Persian and Arabic writings: he wrote on philosophy following the illuminationist tradition, as well as on medicine, mathematics, geometry, astronomy, geography, Sufism, theology, law, linguistics, and rhetoric. Among his works are the *Durrat al-tāj* (*The Pearly Crown*), an encyclopedic work on philosophy, natural science, theology, logic, astronomy, mathematics, and music written in Persian around 1306 for the ruler of the Iranian land of Gilan; the *Sharḥ Ḥikmat al-Ishrāqī Shaykh Shihāb al-Dīn al-Suhrawardī* (*Commentary on al-Suhrawardī’s Philosophy of Illumination*) written in Arabic; the *Nuzhāt al-ḥukamā’ wa-rawḍat al-aṭibbā’*, a comprehensive commentary in five volumes on Ibn Sīnā’s *Kulliyāt* written in Arabic; the *Eḳtiārāt-e moẓaffari*, a treatise on astronomy in Persian; the *Nihāyat al-idrāk fī dirāyat al-aflāk*

(*The Limit of Accomplishment Concerning Knowledge of the Heavens*), where Quṭb al-Dīn describes the planetary motions, improving Ptolemy’s model and advancing the possibility for heliocentrism.

Radulphus Brito

Sander De Boer

Center for the History of Philosophy and Science,
Radboud University Nijmegen, Nijmegen, The
Netherlands

Abstract

Radulphus Brito (c. 1270–c. 1320) was a famous arts master in Paris, and is considered to be the most important proponent of a particular position in semantics, whose adherents are now called *Modistae*. He is best known, in his own times and ours, for his views on the semantic and ontological status of second intentions. Brito distinguishes these intentions in first and second as well as in abstract and concrete, and locates the resulting fourfold division in each of the three operations of the intellect (concept formation, judgment, and reasoning). He defended the uncommon thesis that at least some of the second intentions can be located in the Aristotelian categories, because they are caused by the external things themselves rather than by the intellect reflecting upon its acquired first intentions.

Lemma

Radulphus Brito (also called Raoul le Breton or Raoul Renaud), was a famous master of arts, born

c. 1270 in the northwest of Brittany in the town of Ploudiry, which lies in the diocese of St-Pol-de-Léon. In the past, Brito has often been identified with the Parisian master of theology Radulphus de Hotot, but this conflation has now convincingly been proven to be mistaken. Brito studied at the faculty of arts in Paris and became a master of arts there no later than 1296. He began studying theology, also at Paris and probably around 1299, while continuing to teach in the arts faculty. Brito read Peter Lombard's *Sententiae*, in the academic year 1308–1309 (at least book II and III) and his inception as a master of theology most likely took place in 1314 (although 1311/12 has also been suggested). Brito also held an administrative post at the university; he became the provisor – the administrative head – of the Sorbonne somewhere between 1312 and 1315 and held this post until at least 1319. He died c. 1320.

Bruto commented extensively on Aristotle, but, unfortunately, most of his works remain either unedited or merely partially edited. Although he wrote commentaries on natural philosophy (*Physics*, *On the Soul*, *Meteorology*), on the first two books of the *Metaphysics*, and on the *Ethics*, the bulk of his commentaries concern logic and grammar: on the *Ars vetus* (*Isagoge*, *Categories*, and *On Interpretation*), including Boethius' *De differentiis topicis* (*On Topical Differences*) and the anonymous *De sex principiis* (*On Six Principles*), as well as on the *Prior and Posterior Analytics*, the *Topics*, and the *Sophistical Refutations*. He also wrote a large commentary on *Priscianus*

Minor en left a collection of mathematical works called *Super parva mathematicalia*. Probably best known now are his *Sophismata*. In theology Brito seems to have written far less; all we have are his commentary on Peter Lombard's *Sententiae I-III*, a *Quodlibet*, and his so-called *Quaestiones in vespertiis* (*Evening Questions*).

Bruto's logical works in particular were very influential, and they remained so, at least in Italy, well into the fifteenth century. For example, Gennadius Scholarios' commentary on the *Ars vetus*, composed c. 1432–1435, is for a large part merely a translation and adaptation of several *quaestiones* written by Brito. After the fifteenth century, however, Brito fell into obscurity, and only his commentaries on the *Ars vetus* were ever printed.

Bruto is considered to be the most important proponent of a particular position in semantics which is found in the later thirteenth and early fourteenth century, and to which, for example, also Simon of Faversham and Boethius of Dacia adhered. These philosophers are now known as the *Modistae*. What they had in common is that they paid great attention to the manner in which terms have different signification according to their grammatical function in a proposition; hence the name *Modistae*, after *modus significandi*, one of their central concepts. These *Modistae* were also convinced that there is a close symmetry between language, thought, and reality.

One of the topics Brito is quite famous for concerns precisely this relation between thought, language, and reality, namely, his extensive discussions on the ontological and semantic status of first and second intentions. These discussions are quite detailed, but for a large part they rely on three basic distinctions. (1) First intentions – second intentions: when we grasp a thing in its proper being (*secundum modum essendi proprium rei*), for example, if we understand a man as a rational animal, we form a first intention (humanity). A second intention, in contrast, is formed when we understand the same thing in its common features (*secundum modum essendi communem rei*). For example, once we understand that humanity is found in many individuals (*ut est in pluribus*), we form the second intentions of

universality, genus, species, etc. Brito shares the common view in his time that these second intentions are the proper objects of the science of logic and he emphasizes that we always need to grasp the first intention of a thing prior to being able to grasp a second intention. However, he also emphasizes that this is not a causal priority (*causaliter et effective*). (2) Abstract intentions – concrete intentions: an abstract intention is defined by Brito as the “being informed” of the intellect, which enables it to tend toward something. This simply means that the abstract intention is a particular abstract concept in the mind of the knowing subject. A concrete intention, on the other hand, is something more than just the concept; it is composed of both the thing understood and the particular manner (*ratio*) of its being understood. More precisely, it is the object that is understood, exactly as being understood, and the concrete intention thus constitutes a firm connection between concepts and things. Both first and second intentions can be either abstract or concrete. (3) The three operations of the intellect: Brito takes over the common distinction between the first operation of the intellect which is forming concepts, the second operation of the intellect which is making a judgement, and its third operation which is reasoning. All three operations have their own sets of intentions. An example of a first intention of the second operation would be “Socrates is sitting,” whereas an example of a second intention would be “‘Socrates is sitting’ is a proposition.”

One of the questions that is of special interest to Brito is whether second intentions fall under one of the Aristotelian categories, which means roughly: whether they refer to some mind-independent reality. He attempts to answer this question by looking at the causes of the various intentions. According to Brito, both the first and the second intentions of the first operation of the intellect are primarily caused by the thing understood (although, of course, the agent intellect also plays a causal role, as it does in any concept formation, since it abstracts our concepts from our phantasms). All intentions of the second and third operation of the intellect, on the other hand, are solely caused by the intellect. Brito's view on

the causal connection of second intentions with the things themselves is distinctive, for many philosophers before him had instead argued that these second intentions are caused by the intellect when it reflects upon its own acquired first intentions. Since the main cause in forming a second intention is the external thing, Brito consequently concludes that these second intentions of the first act of the intellect must fall under the categories and have just as much reality (*entitas*) in this respect as the first intentions.

As for the intentions of the other operations of the intellect, we can either claim that they do not fall under the categories because they are caused by the intellect alone and not by the thing understood, or we can claim that they also fall under the categories because they are caused by something – the intellect – that is just as real a thing as the causes of the intentions of the first operation. If we choose the latter option, however, we have to at least concede that the second intentions of the second and third operations have less being than those of the first operation. Otherwise logic would turn into a science that studies things that are just as real as, for example, the objects of physics, which seems absurd. Brito was heavily criticized for his views on intentions by, among others, Hervaeus Natalis, Peter Auriol, and John of Jandun.

Bruto's natural philosophy and metaphysics have still not been studied closely. His commentary on Aristotle's *On the Soul* is quite interesting and seems to anticipate some important discussions in the fourteenth century on, for example, the particular difficulty that pertains to the science of the soul. Just like Thomas Aquinas, Brito holds that there is but one substantial form in man, which is the intellect. However, Aquinas' emphasis on the consequence of this position that the separated soul must be essentially incomplete without the body seems to be lacking in Brito.

Ralph Strode

Alfonso Maierù

Department of Philosophy, Sapienza University of Rome, Rome, Italy

Abstract

Ralph Strode was an English logician (fl. second half of the fourteenth century), a Master of Arts (Oxon.), and an author of a *Logica* in six treatises, whose manuscripts were soon dispersed, surviving with varying degrees of success. The treatise on *Consequentie* became a textbook at Padua University in the late fifteenth century and was published various times, sometimes with the one on *Obligationes*, and often with some commentaries by Italian logicians.

The logical doctrines dealt with in the *Logica* (the title is in manuscript Canon. misc. 219, which presents the complete six-part series: Maierù 1982, p. 100) can be introduced by presenting the first two treatises. The first, opening with a hymn to the seven arts, is a *summula* that supplies an introduction to terminist semantics with a synthesis of the doctrine of the proposition, followed by short syntheses of predicables, categories, and syllogism.

The second, *De principiis logicalibus*, devised as an introduction to the later more difficult treatises, starts from the Aristotelian distinction between reality, thought, and language (*res*, *intellectus*, *vox*) and insists on signification (natural, *ad placitum*), on the distinction between signification and supposition, and on the various types of propositions. There follows the doctrine of the *probatio propositionis*: after distinguishing the terms, making up the proposition into immediate and mediate, the proposition consisting of mediate terms is proved by *expositio*, given by a conjunction of propositions equivalent to the original proposition, illustrated mainly with reference to the universal affirmative proposition (while the negative is proved by the disjunction of

propositions, a procedure known as *probatio per causas veritatis*); in turn, the proof of a particular proposition is given by *resolutio*, that is, replacing the common term with the corresponding immediate term (the demonstrative pronoun) in the premises of an expository syllogism, which has singular premises and the original proposition as conclusion; the procedure known as *officiatio*, used for modal terms and verbs involving mental acts that condition the rest of the proposition, is also mentioned in this context (see the entry on “► [Richard Billingham](#)” in this volume). The treatise concludes with two series of rules, on consequences or logical inferences, on syllogism, and a first account of the doctrine of obligations.

The four most important treatises are *Suppositiones*, *Consequentie*, *Obligationes*, and *Insolubilia*, dealing with topics concerning logical discussion of the time.

Biographical Information

Fellow of Merton College, Oxford (documented in 1359 and 1360), he has been identified with the “philosophical Strode” to whom (along with “moral Gower”) Chaucer dedicated his *Troylus* (but two manuscripts of the poem have “sophistical” instead of “philosophical”: Reichl 1989, p. 134) and with Ralph Strode, Common Serjeant or Pleador of the city of London from 1374 and Standing Counsel for the city from 1386. Sir I. Gollancz, who suggested and defended this identification, tells us that the London Strode died in 1387, when his (lost) will was proved in the archdeaconry court of London and duly indexed in the archives of the archdeaconry. Furthermore, the logician of Merton has been identified with the Strode subject to a friendly challenge in two doctrinal responses by John Wyclif (fellow of Merton in 1356). Strode has also been suggested as the author of the poem *Pearl*. If this last attribution now seems unlikely, the other identifications proposed, and accepted by scholars such as Emden and Bennett, require further confirmation: recent historiography tends to separate and distinguish rather than accumulate multiple activities and expertise in one individual.

Doctrines

The most important part of Ralph’s legacy is to be found in the four major treatises. The treatise on supposition actually deals with two doctrines, set out at the start: supposition and exponible terms. Supposition, or the reference of a term, is the function of representation that the term performs in a proposition: when it stands for itself or for another similar term, Ralph says that it has material or simple supposition (like Buridan before him, discarding the traditional distinction of the two functions; there may be a reference to Ralph in the “Rudolfus Anglicus” who is associated with Buridan in identifying a simple with a material supposition, as indicated in an unpublished text quoted in Maierù 1982, p. 97n.); when the term stands for something other than itself, Ralph attributes personal supposition to it. Then, he illustrates how to distinguish the various forms of personal supposition and how they function. He goes on to treat the various exponible terms (exclusive and exceptive, *incipit* and *desinit*; *differit*; positive and comparative degree, superlative, with *maximum et minimum*, and reduplicative) and the propositions they give rise to, including the universal proposition. The use of exponible terms is particularly important in dealing with themes of natural philosophy: since the medieval masters made little effort to seek tools for measuring and evaluating natural phenomena, but concentrated rather on seeking adequate linguistic formulae, with the result of creating a highly technical language, governed by precise rules.

The treatise on consequences undertakes the distinction between formal and material consequence. For Ralph, any valid material consequence is an inference from the antecedent to the consequent, while a formal consequence also implies a connection of signification between antecedent and consequent: anyone who understands that you are a man, understands that you are an animal, because animal follows from the formal intellection (*de formali intellectu*) of man (Kneale and Kneale 1962, p. 292, refer to Abelard in this connection). It hence follows that any formal consequence is material, but not vice versa.

An example of a material consequence is a man is a donkey, so the stick is in the corner. Ralph supplies an extensive review of general and special rules, with a list of the various rules introduced into mediaeval tradition on the basis of *Prior Analytics* and *Topics*.

The treatise on *Obligationes* concerns the procedures for developing a scholastic dispute for two actors: the *arguens* or *opponens* is the one who starts the dispute and proposes the difficulties, and the *respondens* is the one who sustains the dispute, trying to avoid the difficulties, compared by Ralph to two combatants; according to Ralph, the aim of the exercise is mainly that of sharpening the novice's ability and testing his competence in not falling into contradiction with the premises accepted. In fact, the dispute starts from the position of a case and the corresponding utterance, which the respondent accepts and which he must not contradict, accepting (conceding) or denying the steps, later proposed by the other speaker, as he sees fit. The time of obligation lasts from when the case is admitted until the challenger gives the signal to interrupt the game (but everything concerning the dispute is regarded in relation to the initial moment of it): in the time of obligation, the respondent has to concede everything possible that is not contrary to what has already been admitted and conceded; but outside that time, he must reply truthfully. As the dispute unfolds between two speakers, Ralph claims that one needs to consider only what has been explicitly admitted vocally and not what emerges mentally, which has not come into play as such. Ralph's position seems to be in line with the tradition that regards this exercise as a test for the novice. But there is another use recognized for this activity, that of exploring what follows a hypothesis made in any discipline, so as to know what to do when a situation arises corresponding to the case examined. This aspect does not seem to be considered by Ralph (Ashworth 1993).

The final lengthy treatise on *Insolubilia* is divided in three parts: the first discusses the various positions, the second proposes to bring out the true opinion from them, while the third illustrates

various kinds of insolubles (insoluble, the author explains, has sense of a logical difficulty that is difficult to solve, but not absolutely insoluble). Ralph starts by presenting the opinions of the ancients and then goes on to examine those of the moderns, starting from Thomas Bradwardine's treatise, which he discusses in detail; he then examines the position of Roger Swyneshed and then two other modern positions (those of Dumbleton and Kilmington, not attributed, but identified by Spade 1975, to whom we also owe the discovery of the Erfurt MS, 4°255, conserving much of the authentic text; for the Oxford MS, Maierù 1982, pp. 103–110). The fifth opinion is Heytesbury's and the last that of Robert Fland, again not attributed. In the second part, Ralph evaluates the positions of Bradwardine, Swyneshed, and Heytesbury: he regards Bradwardine's conclusions as probable, presents nine conclusions, most of them drawn from Fland, against Swyneshed, and agrees with Heytesbury that an insoluble cannot signify as the terms in which it is formulated precisely demand, but that one should identify a further signification of the insoluble. In the third part, Ralph applies the results so far to the various types of insoluble (those that arise from our external and internal acts; those based on properties of the voice; and those that occur as simple, or composite and molecular proposition and in one of the various propositional forms).

In conclusion, faced with the situation of logic in his time, Strode sought to provide a doctrinal synthesis, paying particular attention to the teaching tradition of the discipline.

Ramon Llull

Henry Berlin

Department of Romance Languages and Literatures, University at Buffalo, SUNY, Buffalo, NY, USA

Abstract

This entry explores the relationship of the thought of Ramon Llull (Majorca, ca. 1232–1316), and of his Art in particular, to the traditional scholastic philosophy of his time. Central topics addressed are metaphysics and ontology, logic, rhetoric, and Llull's rationalist polemic against the Parisian Averroists.

Biographical Information

Ramon Llull was born ca. 1232 in the city of Majorca to a wealthy Barcelonese merchant who had settled on the island after aiding King James I of Aragon in its conquest in 1229. The principal sources of information about Llull's life, which leave many significant lacunae, are the “quasi-hagiographical” *Vita coetanea*, dictated to monks at the Carthusian house of Vauvert, near Paris, in 1311; scattered autobiographical references in Llull's own works; and a small corpus of documents, including Llull's will (Johnston, “Ramon Llull” 3–4; Jocelyn N. Hillgarth published Llull's will in his *Diplomatari lul·lià*). Little is known about the first decades of Llull's life, except that he married Blanca Picany, with whom he would have two children, in 1257, and that he served as a courtier to the future King James II of Majorca. Llull was convinced to devote his life to divine service when, around the age of 30, he was visited by a vision of Christ crucified over the course of several nights while composing a love song to an unnamed lady. Such service, he decided, would consist primarily in efforts to convert Muslims and other “infidels,” involving his own personal evangelizing

missions; the writing of a book, “the best in the world,” against the errors of the unbelievers; and the foundation, sponsored by the pope and Christian rulers, of monasteries where preachers might be taught the languages of those they sought to convert (this last prong would come to fruition with the founding of such a monastery at Miramar, on Majorca, confirmed by papal bull in 1276).

At this point, Llull began a 9-year period of study which included the purchase of an enslaved Muslim from whom Llull learned Arabic. Having been imprisoned after attacking Llull, who had rebuked him for blaspheming the name of Christ, this Muslim would eventually hang himself (much to the relief of Llull, who could not bear to execute a man he regarded as his teacher). Llull also studied Latin during this period, and it is evident from his first two works, a Latin compendium of the *Logic of Algazel* (ca. 1271–1272) and his own monumental *Llibre de contemplació en Déu* (*Book of Contemplation of God*, ca. 1273–1274) that he acquired substantial, if idiosyncratic, knowledge of theology and philosophy as well. Yet such knowledge was not sufficient, in Llull’s account, to produce the Art which would be the center of his intellectual and evangelizing project for the rest of his life. Rather, Llull recounts here another mystical experience: after the Muslim’s death, Llull spent 8 days on Mount Randa contemplating the divine, until God suddenly illuminated him, revealing the elements from which to construct his Great Art. This was the point at which Llull began to compose the *Ars compendiosa inveniendi veritatem* (ca. 1274), the first redaction of his total “onto-theo-logical” system (Colomer, *De la Edad Media* 57), which would undergo periodic, substantial revisions until approximately 1308 (Badia and Bonner 71–73; see below).

Little is known about the years immediately following this illumination, when Llull seems to have divided his time between Majorca and Montpellier, although Llull produced some of his best known vernacular works, such as the *Llibre de l’orde de cavalleria* and the *Llibre del gentil e dels tres savis* (*Book of the Order of Chivalry* and *Book of the Gentile and Three Wise Men*, both ca. 1274–76), during this period. In

Montpellier, he gave lectures on a new version of his Art, the *Art demostrativa* (ca. 1283). From 1287 on, Llull undertook a ceaseless series of peregrinations – including sporadic returns to Majorca – in which he sought the support of popes and kings, attempted to gain acceptance for his Art at the University of Paris (among others), and made missions to the North African cities of Tunis (1293 and 1315) and Bajaia (1307). Llull’s first stay in Paris (1288–1289) was marked by the Parisian masters’ rejection of his Art (leading to one of its major revisions), but it is also likely where he encountered Thomas Le Myésier, one of his most important early disciples, and the Latin Averroists, against whom he would later write several philosophical and theological polemics (see below). While the precise date of Llull’s death is unknown, he is likely to have died by the first months of 1316 on Majorca, where he was buried at the Franciscan church.

Llull is known to have produced some 260 works in Latin and Catalan (none of the Arabic texts alluded to in his writings survives), including, along with the various redactions of his Art, treatises on countless areas of medieval knowledge, encyclopedic works such as the monumental *Tree of Science* (1295–1296), and literary works ranging from devotional and autobiographical verse to his celebrated vernacular romances, the *Romanç d’Evast i Blaqueria* (ca. 1276–1283), which includes the Sufi-inspired *Llibre d’amic e amat* (*Book of the Lover and the Beloved*) and the *Llibre de meravelles* (*Felix or the Book of Wonders*, 1287–1289). In the sections that follow, I will focus on key philosophical-theological aspects of his thought, but it is important to keep in mind that Llull viewed all of his works, across languages and genres, as expressions of his Art and, thus, as serving the ultimate purpose of conversion to, and closing the schisms within, Christianity.

Llull’s Art: Development and Function

Llull’s illumination on Mount Randa revealed to him a set of essential characteristics of the divine, such as goodness, truth, and eternity, that Llull

calls “dignities.” These dignities were the starting point for Llull’s Art, which underwent several important changes over the course of Llull’s life. Lola Badia and Anthony Bonner have identified 4 fundamental stages in the development of Llull’s thought: a “pre-Art” stage in the early 1270s; the “quaternary” stage, in which, as its name indicates, the Art is governed by fourfold structures, based on 16 dignities; the “ternary” stage, in which these fourfold structures are reduced to 3 and the dignities themselves reduced to 9 (perhaps as a result of the quaternary Art’s rejection by the Parisian masters in 1289); and a “post-Art” stage, from 1308 to Llull’s death in 1316 (71–73). Alongside the several iterations of the Art itself, Llull produced many treatises either applying the Art to particular philosophical-theological problems (such as the Trinity and Incarnation) or showing how other scholarly disciplines, such as medicine and law, find a surer footing in the Art. As Bonner has noted, the Art “forms the backbone of all [Llull’s] other works” (*Art and Logic* 10).

Despite the Art’s structural development, the principles of its functioning remained relatively stable: taking the dignities as a starting point, the artist constructs demonstrations and answers questions through combinations determined by concepts such as contrariety, concordance, affirmation, and negation. In what is almost certainly the best known aspect of the Art, Llull created a series of figures – especially, but not exclusively, combinatory wheels and tables – which could be put to use by “artists” in disputation and composition. The following two figures, A and T from the ternary phase, can serve as examples (Fig. 1).

Figure A contains the nine dignities of the ternary phase; note that each is assigned a single, non-varying letter (i.e., the letters are non-algebraic; e.g., C always equals “greatness”). Fig. T contains the principles of relation among the dignities, which have the same ontological status as the dignities themselves (Bonner, *Art and Logic* 130–34), as well as the three species of these principles. Thus, Figure T’s EFG triangle deals with beginning, middle, and end; beginning subdivides into the species of cause, quantity, and time; middle into conjunction, mensuration,

and extremes; and end into privation, termination, and perfection. Two further tables show the binary and ternary combinations of these principles, allowing for the formulation of definitions and questions such as “goodness is great,” “concordance is good,” “whether goodness is concordant?” and “what is concordant goodness?” In this way, the Art, a “theological vision of the world that allowed [Llull] to account for everything,” provided an innovative method for divine contemplation (Batalla 48); yet it was the ability of this system to transcend metaphysical distinctions that made it ideal for Llull’s missionary purposes. The workings of the Art are extremely intricate and do change in some ways over time; Bonner’s *Art and Logic* is the best detailed presentation of the Art in all of its phases of development.

Superrealism, Rationalism, and Evangelism

Scholars have argued convincingly that Llull’s dignities drew inspiration not only from the Christian tradition of the divine names (Llull composed a poem in this tradition, the *Cent noms de Dieu*) but also from the Kabbalah’s *sefirot* (Hames 118–89) and the Islamic *ḥadras* (Pring-Mill 124–25, expressing skepticism). What is undeniable is that he expected the dignities to be unobjectionable to Jewish and Muslim audiences as elements of the divine nature and thus to be the basis for a renewed interreligious disputation eschewing arguments from revealed authority. The need for such a renewal is explained by the Jewish wise man in the *Book of the Gentile and Three Wise Men*:

Christians and Saracens indeed believe that God gave the Law to Moses, and each believes that our Law is true. But because they believe other things that are contrary to our Law, therefore, and insofar as they believe these things contrary to our Law, they disbelieve our Law. Moreover, we and the Christians agree on the text of the Law, but we disagree in interpretation and commentaries, where we reach contrary conclusions. Therefore, we cannot reach agreement based on authorities and must seek necessary arguments by which we can agree. (Bonner, *SWRL* 1: 170)

Ramon Llull, Fig. 1 Llull, *Ars generalis ultima* (BNF, Ms. lat. 6443C [fourteenth century], f. 113r; https://lullus.ub.uni-freiburg.de/files/lullus/DocPortal_derivate_00010177/schriften.html)

Llull was not alone in his skepticism toward arguments based on revealed authority; similar concerns can be found, for example, in the prologue of Anselm of Canterbury's *Monologion* (5) and, with the caveat that “in divine matters the natural

reason has its failings,” in Aquinas’s *Summa contra gentiles* (1.2.3). He was certain that the dignities could provide a basis for the “necessary arguments” described above because, for Llull, they are all at once the principles of epistemology,

metaphysics, and rhetoric. The Art is *inventive* (as in the title of its first iteration, the *Ars compendiosa inveniendi veritatem*) in that it allows the artist to formulate all possible true statements about existence, and it is *demonstrative* (as in the title of the *Art demonstrativa*) in that these statements are not just probable, as scholastic commentators on Aristotle's *Topics* would characterize the "inventive" arguments of dialectic, but necessary, "scientific" demonstrations based on self-evident principles (on the relationship of Llull's Art to the scholastic theory of the sciences, see Ruiz Simon). To the "necessary" demonstrations *propter quid* and *quia* extracted by the scholastics from Aristotle, Llull added the (superior, in his account) demonstration *per aequiparantiam*, constructed from things that are equal, unlike the "unequal" things on which demonstrations *propter quid* (which demonstrates the effect on the basis of its greater cause) and *quia* (which demonstrates the cause on the basis of its lesser effects). The terms of a demonstration *per aequiparantiam* are "equal" in the sense that one can be substituted for the other without harming the truth of the given statement, and this substitutability is grounded in the nature of the divine dignities, all of which are *unum secundum esse*, such that no *distinctio realis* exists among them, whereas the limits of human reason impose a *distinctio rationis* which saves this kind of demonstration (in Llull's account) from accusations of circularity or *petitio principii*. As Ruiz Simon notes in his discussion of the demonstration *per aequiparantiam* (238–73; here, 263 n. 324), the distinction between a *distinctio realis* and *rationis* is also found, for example, in the *Summa theologiae*'s discussion of the divine names (I, q. 13, a. 4, sol.).

Arguments based on the dignities could be extended to creation because, for Llull, the principles instantiated absolutely by the dignities govern creation as well. His discursive understanding of the divine nature undergirds a "super-realist" metaphysics that:

Tends to conflate the content of understanding or expression with the actual concept or word itself. Since for Llull that understanding or expression includes the perception of so many spiritual truths,

this superrealist metaphysics is already a virtual *allegoria in rebus*. Applied globally to things, concepts, and words, it is in fact a universal allegory, a kind of metaphysics of meaning. (Johnston, *Evangelical Rhetoric* 34)

By the ternary phase of the Art, this metaphysics was overwhelmingly trinitarian in structure and included Llull's theory of three "correlative" principles that exist in all beings (on the complicated development of the correlatives throughout Llull's career, see Gayà Estelrich, *La teoria luliana de los correlativos*). According to this theory, in the divine essence, each of the dignities is divided into three "subordinate principles – active, passive, and the act itself," making the divine essence itself constantly active (Pring-Mill 38–9). For example, divine goodness subdivides into the active *bonificativus*, passive *bonificabilis*, and the act of *bonificare*. As Robert Pring-Mill notes, these three principles are analogous to the "trinity" of matter, form, and their concordance (140), and indeed, the active nature of the divine was crucial to Llull's proofs of the Trinity:

In truth, God could not be one without being three. For if He were one and not three, his unity would be empty and imperfect, because without deifying it would be idle, just as his intellect without the understanding, the understood, and [the act of] understanding, and his will without the willing, the willed, and [the act of] willing [...] and so on with all of his dignities. (Llull, *Liber Praedicationis contra Ivdaios* 19; my translation)

Llull's belief that even purely spiritual entities consist of form and matter is a species of universal hylomorphism (Badia and Bonner 90 n. 16), and it is fundamental to his arguments for the Incarnation. The correlative structure extends to creation; for example, in Llull's 1303 *Logica nova*, man is defined as a "manifying" animal, composed of a "manifying" form, "manifiable" matter, and the act of "manifying" (cited in Pring-Mill 151). Indeed, Llull argues that there must be some trinitarian resemblance in men, because God would otherwise be "alien" to humanity (*Liber Praedicationis contra Ivdaios* 22; especially later in his career, Llull did not eschew entirely the use of authorities, and here, his argument depends on Ex. 34:14, "Non habeas Deum

alienum"). The linchpin of this argument is the Incarnation: on the one hand, God's activity (as first cause of creation) is proof of the Incarnation (*Liber de Trinitate et Incarnatione* 2.19); on the other, the Incarnation serves as the "mirror" of the Trinity (*Disputació de cinc savis* 3.1), establishing a "middle" between the divine and the human "through high and sublime participation" (*Liber Praedicationis contra Iydaeos* 22; for a detailed discussion of the role of the Incarnation in Llull's theory of signification, see Hughes). Participated resemblance also plays a crucial role in Llull's rhetorical theory, as when he argues in the *Rhetorica nova*: "Someone who says 'The queen is beautiful,' speaks beautifully by putting a substantive before an adjective in this speech. This is because a substantive has greater essence and nobility than the adjective predicated of it, which would lack a place to exist without it" (2.3.3). The ontological level of the signified determines the aesthetic quality and proper order of the signified. This participation is, of course, crucial for salvation, and it is therefore, and relatedly, the basis for knowledge of the divine: the Incarnation made possible the system of participated resemblance through which the divine essence can be contemplated in this world (*Liber de Trinitate et Incarnatione* 2.20).

The ability not only to contemplate the divine essence but to make demonstrative arguments based on it was key to Llull's polemic against the Parisian Averroists. For Llull, there is no conflict between reason and faith because, as Intellect explains in the *Disputatio fidei et intellectus* (1303), the two are in fact inseparable, each depending on the other to function properly and both, in turn, depending on grace (1.2-3; on this point, see Johnston, *Spiritual Logic* 297 and Llinàs 75). The very idea that faith and reason should be opposed or separately delineated threatens to undo the unity of Christian thought and provoke a return to paganism (van Steenberghe 127). This anachronistic view, more proper to the eleventh century than to the end of the thirteenth, has been said to be the most truly distinctive feature of Llull's thought (Colomer, *El pensament* 237). Yet Llull's status as an extreme rationalist, which rests on his firm

belief in the demonstrability of Christian doctrine through necessary reasons, should not be overstated; the relationship of faith and understanding in his thought places him on a continuum with thinkers such as Augustine, Anselm, Richard of Saint-Victor, and Roger Bacon (Batalla 66–67). Furthermore, as Josep M. Ruiz Simon has noted (92), his attempt to reunite *inventio* and *demonstratio* anticipates the projects of later thinkers such as Descartes, Francis Bacon, and Leibniz. Llull is undoubtedly idiosyncratic as a thinker and writer, yet he had a rigorous understanding of the relationship of his Art, as both critique and development, to scholastic philosophy.

New Haven, CT, USA

Abstract

One of the most influential exponents of Islamic philosophy and theology in the era after al-Ġazālī (d. 1111), Fakhr al-Dīn al-Rāzī (1150–1210) rearranged the structure of the philosophical *summa* in the Islamic East and thus also the curriculum of philosophical studies. His work contributes to the reconfiguration

of philosophy as *ḥikma* in Islam's post-classical period. He also integrates many arguments from Aristotelian philosophy (*falsafa*) into Muslim rationalist theology (*kalām*), a process that started shortly before al-Ġazālī. Original in his own thinking, Fakhr al-Dīn al-Rāzī was influenced by the systematic philosophy of Ibn Sīnā (Avicenna, d. 1037) and the response to it by Abū l-Barakāt al-Baġdādī (d. c. 1165). His works were widely studied, particularly during the thirteenth and fourteenth centuries. His commentaries on Ibn Sīnā's works, in which he often keeps a critical distance to *falsafa*, became the subject of super-commentaries that are among the most influential texts in Arabic philosophy and Islamic theology. Most influential, however, was his monumental Qur'ān commentary *Keys to the Unknown* (*Mafātiḥ al-ġayb*), in which through a well-structured rationalist analysis he aims at resolving many questions that are brought up in the text of revelation.

Biographical Information

Muḥammad ibn ʿUmar Fakhr al-Dīn al-Rāzī was born 1150 in Rayy, a city in central Iran that is now incorporated into Tehran, into a family of Muslim religious scholars. His father was a well-educated theologian, known as the “preacher of Rayy” due to his popular sermons. Thus, Fakhr al-Dīn is also known as Ibn al-Khaṭīb, “the preacher's son.” After studying with his father, who died in 1163, Fakhr al-Dīn continued his education with famous teachers at Nishapur in northeastern Iran. In Nishapur, he is said to have come into contact with the works of Ibn Sīnā, which set him on a path to study philosophy. Back in Rayy, he became close to Majd al-Dīn ʿAbd al-Razzāq al-Jīlī, a philosophical scholar and the author of an epistle on logic. When al-Jīlī was invited to teach at the Mujāhidiyya *madrasa* in Maragha in northwestern Iran, Fakhr al-Dīn went with him. He studied with al-Jīlī at the same time that another influential philosopher in Islam, Shihab al-Dīn Yahyā al-Suhrawardī (d. 1191), is said to have learned from him.

After completing his studies in Maragha, Fakhr al-Dīn taught at *madrasas* in Marand (Azerbaijan) and Hamadan (central Iran), but would soon move to Khwārezm, the delta region where the Amu Darya (Oxus) river once flew into the Aral Sea. Khwārezm is today split between Uzbekistan and Turkmenistan. The first 20 years of his career, Fakhr al-Dīn benefitted from the patronage of members of the court of the increasingly powerful Khwārazmshāh Tekish (reg. 1172–1200). One of his earliest works is *The Instruction in the Science of kalām* (*al-Ishāra fī al-ʾInstructāa*), a fairly traditional handbook of rationalist theology (*kalām*). Another early work is his influential *Utmost Limits of Rational Knowledge in Theology* (*Nihāyat al-ʾuqūl*), a fully-fledged *summa* of *kalam* that established his fame as a rationalist theologian. Fakhr al-Dīn left Khwārazm around 1194 and entered into the service of the Ġurid dynasty, the most important rivals of the Khwārazmshāhs, who ruled over Afghanistan and northern India. Despite strong opposition from conservative and traditionalist scholars at their courts, both rival dynasties, the Khwārazmshāhs and the Ġurids, competed for Fakhr al-Dīn, a situation that greatly benefitted him and made him very rich. Under the Ġurids, Fakhr al-Dīn worked at various places in Afghanistan until one of their sultans, Ġiyāth al-Dīn Muḥammad (d. 1203), built a *madrasa* for him in Herat (western Afghanistan). In Ġurid service, Fakhr al-Dīn began work on his voluminous Qurʾān commentary and his last *magnum opus* in philosophical theology (*ilāhiyyāt*) *The Higher Issues* (*al-Maṭālib al-ʾāliya*). Fakhr al-Dīn was occupied with these two works until his death, not finishing any of them and leaving that task to his students. In Herat, like in many places earlier, Fakhr al-Dīn was violently opposed by more traditionalist scholars and by the populace. He needed to rely on bodyguards for his safety.

When in 1208 Herat fell into the hands of the Khwārazmshāh ʿAlā l-Dīn Muḥammad (r. 1200–1220), the son of Tekish, who earlier had been a student of Fakhr al-Dīn, he was again honored and patronized by this dynasty. Although ailing and frail, he traveled with the Khwārezmshāh to his capital Gurganj and

continued to work on his Qurʾān commentary and the book on metaphysics. Returning to Herat, Fakhr al-Dīn fell ill in 1209 and died there on March 29, 1210, among his family and his students. He was buried at a cemetery outside of Herat where his grave is still present.

Thought

Fakhr al-Dīn al-Rāzī was the most important philosopher and theologian in Islam in the century after al-Ġazālī (d. 1111) and much of his work complements al-Ġazālī's activity and consolidates the project started by him. With al-Ġazālī begins the integration of techniques and teachings developed by Muslim philosophers (*falāsifa*) such as Ibn Sīnā (d. 1038) and al-Fārābī (d. 950) into the discourse of Muslim rationalist theology (*kalām*). Al-Ġazālī approached this project from two sides: first, by criticizing attitudes and certain teachings held by the Muslim *falāsifa* most famously in his *Incoherence of the Philosophers* (*Tahāfut al-falāsifa*), and second, by adopting positions and teachings that were developed by *falāsifa* and that appeared to him the best solutions to the problems at hand. Thus, al-Ġazālī first identified elements in the tradition of *falsafa* that were unfit to be integrated into Muslim theology and, second, he integrated those elements that he saw fit, without, however, telling his readers in theology from where he had adopted them. In fact, in his most public statements, such as his widely read autobiography *The Deliverer from Error* (*al-Munqidh min al-ḍalāl*), al-Ġazālī takes a very critical stance toward the tradition of *falsafa* that gives his readers the wrong impression that he was an enemy thereof.

Fakhr al-Dīn al-Rāzī wrote both works in philosophy (*ḥikma*) and theology (*kalām*) where he used slightly different methods. In theology he followed al-Ġazālī in his strategy of integrating techniques, arguments, and teachings which were developed in *falsafa* into Muslim theological literature. In contrast to al-Ġazālī, however, he saw no need to hide his appreciative attitude toward *falsafa* behind overtly critical comments and public rejections. Other than al-Ġazālī, who read the

books of Ibn Sīnā and al-Fārābī very closely but never quotes them appreciatively, Fakhr al-Dīn engaged in an active discussion with the works of the *falāsifa* quoting them wherever necessary. While al-Ġazālī aimed at introducing some teachings of the *falāsifa* to the Muslim theologians without encouraging religious scholars to study the books of the *falāsifa* themselves, Fakhr al-Dīn had no reservation to make Muslim theologians familiar with the teachings of the *falāsifa* and to encourage them to study these books.

The integration of philosophical arguments into Muslim theology happened in books like *The Utmost Limits of Rational Knowledge*, *The Book of Forty Points* (*Kitāb al-Arbaʿīn*), or in *The Higher Issues* that were all written for students of *kalām*. Fakhr al-Dīn's second great accomplishment happened in works that he would characterize as "philosophical" (*hikmī*). Whereas works in *kalām* offer rational interpretations of information that humans have received from revelation, the field of philosophy (*ḥikma*) allows only arguments based on reason. Here, in his books on philosophy, Fakhr al-Dīn engaged actively in a dialogue with Ibn Sīnā. He composed a commentary to Ibn Sīnā's most theological book, his *Pointers and Reminders* (*al-Ishārāt wa-l-tanbīhāt*), where he inquires whether Ibn Sīnā's arguments are indeed convincing. His openly critical attitude toward *falsafa* was later criticized and countered in a super-commentary by Naṣīr al-Dīn al-Ṭūsī (1201–1274). Together with this super-commentary, Fakhr al-Dīn's commentary on the *Pointers and Reminders* became part of the *madrassa* education up until the twentieth century.

In the decade before his commentary on *Pointers and Reminders*, Fakhr al-Dīn had already written two philosophical *summae* where he presents a philosophical system that covers logic, the natural science, as well as metaphysics and philosophical theology. One of his earliest works is his *Eastern Investigations* (*al-Mabāḥith al-mashriqiyya*), where he lays the groundwork for all his later philosophical achievements. A few years later, in 1184 he wrote a shorter version, *The Summary in Philosophy and in Logic* (*al-Mulakhkhaṣ fī l-ḥikma wa-l-manṭiq*, MS Berlin, Staatsbibliothek, Or. oct. 623). This would

become a highly influential textbook in philosophy and have also a profound influence on Muslim theology (Eichner 2009). After producing a novel division of the field of philosophy, the book isolates philosophical problems and offers a discussion of all available solutions. Fakhr al-Dīn established this technique based on earlier developments by Abū l-Barakāt al-Baġdādī (d. c. 1165), a Jewish-born physician active in Baghdad and western Iran, who had published his *Book of Well-Considered Teachings* (*Kitāb al-Muʿtabar*) around the middle of the twelfth century. Al-Baġdādī's work is a comprehensive philosophical *summa* in three parts (logic, natural science, and metaphysics) and follows in its structure the Aristotelian curriculum as it had been established in late antiquity and also been followed, for instance, by Ibn Sīnā. Unlike Ibn Sīnā and other *falāsifa*, who rarely discuss the pros and cons of their adversaries' positions but are mostly concerned with presenting their own teachings, Abū l-Barakāt includes in each chapter a detailed discussion of different arguments and solutions to a problem, without, however, associating them to certain individual thinkers of the past. Rather, his discussion aimed, at least at the outset, at a balanced and sober comparison of all available solutions to a philosophical problem that would eventually lead to the adaptation of a "well-considered position" (*muʿtabar*), which he thought to be superior to its alternatives. It is most remarkable that in this project Abū l-Barakāt admits the arguments and positions of *kalām* theologians – most notably that of Ashʿarite *kalām* presented in al-Ġazālī's *Incoherence of the Philosophers* – to the debate of philosophical problems, the catalogue of which is largely determined by an Aristotelian curriculum of studies. Abū l-Barakāt's work was thus the first book in the Muslim philosophical tradition, where arguments from Aristotelian *falsafa* stood side-by-side with that of theological *kalām*, and where the position eventually adopted could be one or the other, or a combination of elements from both traditions, or, what was also possible, even both positions, when these were regarded as cum-possible.

Fakhr al-Dīn's own technique of writing about philosophical problems owes much to Abū

l-Barakāt's *Book of Well-Considered Teachings* in that he attempted to look at any given problem from various angles and would openly discuss and consider points of views that were earlier not regarded worthy of serious consideration. This applies particularly to the teachings of Ibn Sīnā, which impressed Fakhr al-Dīn tremendously. Fakhr al-Dīn's style of philosophical writing also adopts the *kalām* technique of "exhaustive investigation and disjunction" (*al-sabr wa-l-taqṣīm*), where the consequences or implications of a given position are fully investigated, individually discussed, and often dismissed and refuted one by one. These two features, that is, the comparison of various view-points and an exhaustive discussion of all their implications, lead to very thorough, yet at the same time quite tiresome writing. The discussions in Fakhr al-Dīn's two philosophical *summae* are often divided into various aspects and subspects, which may reach the number of several dozens. His texts remind the modern reader of academic or legal dissertations that use a system of variously leveled cardinal numbers (such as 1.2.6.3.14) to illustrate their internal divisions and their structure. In the Arabic tradition, they revolutionized the way scholars wrote about philosophy.

Fakhr al-Dīn's two *summae* introduced a novel division of the philosophical sciences that replaced the traditional ones in Aristotelian philosophy, based on the curriculum of studies as it had been handed down from Andronicus' edition of the works of Aristotle in the first century BCE. Fakhr al-Dīn regarded this new structure as his own original contribution (al-Rāzī, *al-Mabāḥith*, 2:557). In his *Summary in Philosophy and in Logic*, he maintains the most basic division of philosophy into (1) logic as a tool of philosophical inquiry and (2) that part of philosophy that deals with proper subject matters. This latter part is divided into three "books" (singl. *kitāb*): (1) *On the Things that Are Common [to All Being]* (*fī l-umūr al-ʿamma*), (2) *On Substances and Accidents* (*fī l-jawāhir wa-l-aʿrāḍ*), and (3) *On Philosophical Theology* (*fī al-ʿilm al-ilāhī*). The most significant change in Fakhr al-Dīn's division is the dissolution of metaphysics into two different parts (Eichner 2007). The roots of this dissolution lie

in Avicenna, who had already argued that metaphysics is concerned with two different subject matters and can thus be divided into two parts, namely, into metaphysics proper, that is, the science that deals with "the existent insofar as it is existent" (*al-mawjūd bi-mā huwa mawjūd*), and into *ilāhiyyāt*, that is, philosophical theology that deals with knowledge about the Creator and the First Cause, that is, God. While Ibn Sīnā did not develop this distinction into a proper division of metaphysics, some of his students and followers, most importantly Bahmanyār ibn al-Marzubān (d. 1066) and al-Lawkarī (d. after 1109), divided their sections on metaphysics accordingly.

Unlike Bahmanyār and al-Lawkarī, Fakhr al-Dīn also develops a new division of what was earlier called "the natural sciences" (*al-ṭabīʿiyyāt*). The celestial bodies, for instance, are no longer treated in a segment that would represent the equivalent of Aristotle's book *On the Heavens* (*De caelo/Fī l-samāʾ*), but rather in a chapter "on uncomposed bodies" (*fī l-aḡsām al-basīṭa*). That chapter, in turn, is part of a broader discussion of bodies (*fī l-aḡsām*), which together with souls and intellects form the three subdivisions in the segment on substances (*fī l-jawāhir*). The divisions in Fakhr al-Dīn's *Summary in Philosophy and in Logic* follow an Avicennan–Aristotelian analysis of the subject matter of philosophy. This analysis is no longer determined by such criteria as the place where these things are found ("in the heavens"), for instance, or whether they belong to a certain class of being like minerals, but rather by more systematic analytic criteria, such as the difference between substance and accident, whether the substance has a body or is immaterial, whether the bodies are composed or uncomposed, lifeless or living, and animated or inanimated. Overall, this leads to a new perspective on philosophy that will have a lasting influence on later works on these subjects. Fakhr al-Dīn's *Summary in Philosophy and in Logic* constitutes the basis out of which the most influential works in the Islamic philosophical tradition evolve. Among them are al-Bayḍāwī's (d. c. 1286) *Risings Lights* (*Ṭawālīʿ al-anwār*) and ʿAḡud al-Dīn al-Ījī's (d. 1355) *Book of Stations* (*Kitāb al-Mawāqif*), works that

together with the commentaries on them stood at the center of philosophical and theological instruction in Islam between the fifteenth up until the twentieth centuries. Fakhr al-Dīn al-Rāzī is the most important link in the evolution from Avicennan philosophy to Post-Avicennan *kalām* (Eichner 2007).

While admired for their precision, Fakhr al-Dīn al-Rāzī's philosophical encyclopedias are not always easy to read, and next to none of these texts have been translated into European languages. The *Summary in Philosophy and in Logic* still waits to be edited. In many of his works, stating his own opinion to any given philosophical problem was secondary to Fakhr al-Dīn who mostly aimed to provide an exhaustive discussion of all aspects and implication involved. This technique of exhaustive discussion is also applied in his monumental Qur'ān commentary *Keys to the Unknown (Maḥātib al-ḡayb)*, which is highly regarded for its well-structured discussion and rationalist analysis of textual and theological problems (Jaffer 2015). Given that its ultimate goal is the interpretation of revelation, however, the book does not count among Fakhr al-Dīn's philosophical works. In his nonphilosophical books, Fakhr al-Dīn wrote as an Ash'arite theologian who, like al-Ġazālī before him, modified certain Ash'arite teachings or augmented certain Ash'arite explanations with teachings and elements taken from philosophical literature, most importantly Ibn Sīnā. Here, he went even further than al-Ġazālī, who condemned the philosophical teaching that the world is created from past eternity and has no beginning in time as unbelief and apostasy. Fakhr al-Dīn disagreed stating, first of all, that this should not be a matter of religious doctrine since there is no scriptural basis to al-Ġazālī's position (al-Rāzī, *al-Maṭālib*, 4: 29–32; Griffel 2009: 116–120). A discussion of the various arguments on this subject leads to the conclusion that the *falāsifa* are unable to prove the pre-eternity of the world but that their adversaries are equally unable to prove the opposite. True to his spirit as a thorough scientist and philosopher, Fakhr al-Dīn left this question open (İskenderoğlu 2002).

Fakhr al-Dīn al-Rāzī accepted al-Ġazālī's earlier "Rule of Interpretation" (*qānūn al-ta'wīl*) that aimed at resolving conflicts between reason and the literal wording of revelation. That rule says that all passages in revelation should be accepted in their literal meaning unless they violate the results of a valid demonstration (*burhān*). In such cases, allegorical interpretation (*ta'wīl*) must be applied and the text should be understood as a metaphor (al-Rāzī, *Ta'sīs al-taqdīs*; Heer 1993). In his most mature thought in *The Higher Issues (al-Maṭālib al-āliya)*, Fakhr al-Dīn also followed al-Ġazālī in his cosmological views: God creates events in this world through chains of secondary causes of which He is the only efficient cause (*fā'il*; Shihadeh 2006: 39–44). Ash'arites teach that humans do not "create" their own acts; rather these acts are "acquired" when God creates them within us. Like al-Ġazālī, Fakhr al-Dīn interprets the human's "acquisition" (*kasb*) of his or her actions in terms of secondary causality: the human's actions are causally determined by his or her motives (singl. *dā'in*), while the motive has causes that are grounded in the human's knowledge, which again is caused by events in the outside world. Thus, God creates the human acts through chains of secondary causes just like He creates every other event in this world. These teachings combine classical Ash'arite views about the predestination of human acts and their creation through God with an Avicennan–Aristotelian view of secondary causality. While human actions are causally determined by their proximate and remote causes and thus not the result of free choice (*ikhtiyār*), the notion of "acquisition" (*kasb*) expresses the fact that humans are given the impression that they choose freely. In an adaptation of one of Ibn Sīnā's dictums, Fakhr al-Dīn al-Rāzī taught that the human is "a compelled actor in the guise of a free agent" (al-Rāzī, *al-Maṭālib*, 9:25; 9:57; Gimaret 1980: 134–153; Shihadeh 2006).

In some matters, Fakhr al-Dīn sides openly with the *falāsifa* against earlier Ash'arite teachings, such as on the important issue of how prophecy is verified. The Ash'arite school, with its insistence on a divine command theory of ethics, had always maintained that prophecy cannot be

proven by rationalist criteria. Judgments about the soundness of a prophet's revelation have no bearing on whether or not that person is truly a prophet. Prophecy can only be verified through a criterion that lies outside of revelation. In the case of earlier Ash'arites, this is the prophetic miracle – a suspension of the laws that govern creation – that God performs in order to prove the claims of a prophet. Realizing that the existence of prophetic miracles poses numerous problems for a rationalist theologian who accepts secondary causality, al-Ġazālī had already abolished this element of Ash'arite thought and replaced it with a criterion based in the Sufi experience (Griffel 2009: 194–201). Fakhr al-Dīn al-Rāzī aims at a more radical change of Ash'arite doctrine by arguing that prophethood can be verified if the prophet's revelation calls for those actions that we know from reason are good and if it forbids those that we know from reason are bad (al-Rāzī, *al-Maṭālib*, 8:103; Abrahamov 2000; Shihadeh 2006: 129–142). He thus shifts from a divine command ethics toward an Aristotelian position about the moral good where the focus lies on the development of virtuous character traits (*akhlāq*). This had significant repercussions for various elements of Fakhr al-Dīn's theology, including his work on Islamic law (*fiqh*). Among the jurists of Islam, for instance, Fakhr al-Dīn is the one who most forcefully argued to make the rational consideration of public benefit (*maṣlaḥa*) a vital part of the jurists' decisions (Shihadeh 2006: 69–73; Opwis 2010: 88–131).

Realism

Helsinki Collegium for Advanced Studies,
University of Helsinki, Helsinki, Finland

Abstract

Realism is a philosophical position that attributes extramental existence to certain kinds of entities, for example, universals, categories, relations, or propositions.

In philosophical language, the word realism is polysemous. One can be a realist, as opposed to an idealist, if one defends the view that material objects exist externally to us and independently of our sense experience; one can be a direct realist in the theory of perception if one holds that perception is a direct awareness of external objects, a moral realist if one believes that there are objective moral values, a scientific realist if one holds that scientific knowledge is about theory-independent phenomena and that such knowledge is possible even about nonobservable entities, a modal realist if one believes that possible worlds are as real as the actual world. In the history of medieval philosophy, the term realism is used first and foremost in the field of ontology. In this context, it indicates the fact that one attributes – in ways that vary greatly from case to case – extramental existence to certain kinds of entities. In consequence, a philosopher cannot be said to be a realist in any absolute or general fashion, but only in reference to universals, categories, relations, propositions, etc. A realist about Aristotelian categories, such as Duns Scotus for example, holds that the extramental world is divided into ten kinds or categories among which none can be reduced to another. A realist about relations holds that something more than the terms of the relation corresponds in extramental reality to our relational concepts. A realist about propositions, such as

Walter Burley, holds that propositions exist in the world. However, realism about universals is the position that concentrated the most defenders, and also the most vocal critics. Realism about universals holds that universals – first and foremost the genera and species of the category of substance, such as animal, hedgehog, squirrel, or man – are things outside the mind. The question can be formulated in the following terms: is universality a mode of being or is it only a property of language? The realist holds that it is a mode of being; however, this is about the only thesis we can attribute to all realists, as there are a number of different realist theories that cannot be reduced to each other.

Let us begin by distinguishing the two main families of realist theories, Platonic realism and Aristotelian realism. The difference between these theories is that Aristotelian realism defends the existence of universals in individuals, whereas Platonic realism grants them a mode of existence as separate from individuals.

This distinction of different types of realism draws on an older distinction, which dates back to middle Platonism, between two types of entities, in Greek *idea* (idea) and *eidos* (form). As noted by HB Gottschalk (1987): “from the early first century AD, it seems, Platonists distinguished the Platonic Form, ‘eternal pattern of natural objects’ from a Form immanent in particulars. The second comes straight from Aristotle and was designated by the term *eidos*, which had been used both by Plato and Aristotle, while the purely Platonic word *idea* was reserved for the first” (36.2:1144–1145). This distinction was refined by Neoplatonic authors in the so-called theory of the three states of the universal. This theory is a doctrinal product of the Neoplatonic exegesis of Aristotle’s *Categories* and Porphyry’s *Isagoge* and was inspired by the Neoplatonic project of seeking harmony between the philosophies of Plato and Aristotle. This theory is present in Ammonius (*In Porphyrii Isagogen*, 41:10–20), Elias (*In Porphyrii Isagogen*, 49:20–25), and David (*In Porphyrii Isagogen*, 120:8–14); it is

also found in Simplicius (*In Aristotelis Categorias*, 82:35, 83:22). It distinguishes: (1) Universals that are before the multiple (*pro tôn pollôn*) – these are the ideal models or paradigms, which subsist in the Demiurge’s intellect; (2) Universals in the multitude (*en tois pollois*): the participated forms, which are inseparable from matter and immanent to particulars; (3) Universals that are after the multiple (*epi tois pollois*): concepts, which are abstracted from immanent forms. This theory was transmitted to the Latin world through the intermediary of the translations of Avicenna’s *Logic*, Eustratios of Nicaea’s commentary to the *Nicomachean Ethics*, and through Simplicius’ commentary to the *Categories*. The Latin version of this theory that distinguishes between *ante rem*, *in re*, and *post rem* universals was soon to become a commonplace of scholastic thought on universals. This theory also involved speaking of the theological universal, the metaphysical universal (whose characteristic is *esse in multis*), and the logical universal (whose characteristic is *dici de multis*). The nature of the *ante rem* universal may be considered in a strong and in a weaker version: in the strong version, “*ante rem* universal” refers to a real entity that is independent from both the human and divine minds, a pure Platonic form; in the weaker version – of which a specifically Christian form was widespread – “*ante rem* universal” refers to a divine idea (all these ideas put together are supposed to constitute the totality of God’s knowledge). This theory allows us to identify precisely which entities are those whose ontological status is discussed; more fundamentally, the relative importance given to one type of entity with respect to others provides three types of ontology. Before characterizing them, let us note that these types of universals are not mutually exclusive – philosophers are frequently found to defend several of them in parallel. Note also that two types of universals are accepted as really existing by almost all medieval philosophers: the *ante rem* universals in their weak version and the *post rem* universals. The idea of divine ideas was naturally linked to the Christian belief of the philosophers in question and was not questioned, even by strongly antirealist authors such as Peter Abelard.

However, the emphasis put on these moderate *ante rem* universals indicates the importance which a philosopher gives to exemplarism in his philosophy and shows the level of Platonism of his thought. Similarly, *post rem* universals were universally accepted. No one thought of doing without concepts. The mode in which we grasp them – theory of abstraction versus illumination – may, indeed, be debated, but not their existence.

So we have three possible combinations: (1) Platonic ontology: defense of strong *ante rem* universals (this form is hardly found at all until the end of the Middle Ages). (2) Aristotelian realist ontology: rejection of strong *ante rem* universals, defense of *in re* universals. This theory is frequently encountered: it reflects Aristotle's frame of mind, rejects separated universals, and states their existence as being only in individuals. (3) Aristotelian particularist or nominalist ontology: everything that exists is particular; both strong *ante rem* universals and *in re* universals are rejected. Universality is a property of terms only. This illustrates the fact that the main debate that took place in the framework of Aristotelianism was that of accepting or rejecting *in re* universals. Authorities that can be called upon in defense of the first solution include Augustine and Priscian; upholders of both (2) and (3) can call upon passages from Aristotle's texts.

A passage from Priscian's *Institutiones grammaticae* (XVII, 44; GL3, 135: 1–10) in which he speaks of the "generic and specific forms of things, which exist in an intelligible way in the divine mind before they come forth in bodies" played an important role in establishing this theory, just as did Augustine's question *De ideis* (*De diversis quaestionibus* 46), which transmitted the theory of Platonic universals as divine ideas. Augustine says that these ideas are in God's mind (*in ipsa mente Creatoris*) and nowhere else, thus confirming the Middle- and Neoplatonist understanding of ideas as the Demiurge's thoughts. Conversely, the rediscovery of Aristotle's *Metaphysics* played against strong *ante rem* universals. Aristotle's criticism of Platonic ideas clearly provoked scholastic mistrust of separate universals. The *Organon*, through three fundamental texts – Chap. 5 of the *Categories*,

Chap. 7 of the *Peri hermeneias*, and a passage from the *Posterior Analytics* – provides most of the arguments in favor of *in re* universals. Chapter 5 of the *Categories* is central on three theses: genera and species are substances, genera and species are beings (*onta* in Greek), and genera and species exist thanks to primary substances. Chapter 7 of the *Peri hermeneias* shows the same way by stating that among things (*tôn pragmatôn*), some are universal and others are particular. The third text, which was unknown to early medieval realists, is *Posterior Analytics* II, 19 which was interpreted as describing the universal to be both an abstract concept, "the one apart from the many" (*parà tà pollà, unum praeter multa*) and an immanent form which "is identically present in them all." On the other hand, a philosopher who only believed in the existence of *post rem* universals could refer to the well-known passage from the *De anima* in which Aristotle states that the universal animal is either nothing or is posterior (I, 1402 b720).

The medieval debate mainly focused on the admission or rejection of *in re* universals, and it did so within the framework of the exegesis of Porphyry's *Isagoge*. In the *Isagoge* (ed. Busse, 1:10–15), Porphyry states – without giving his own answer – three questions on the ontological status of universals: do genera and species exist or are they only concepts? Are they bodies or incorporeals? Are they separated from the sensibles [i.e., the individuals] or do they exist in them? In this passage, Porphyry codifies the alternatives and possible answers to the question of the ontological status of universals (it is with this passage in mind that the theory of the three states of the universal was elaborated).

The history of medieval realism had ups and downs, quiet periods during which realism was an implicitly accepted doctrine that ended in crisis when virulent criticism cast strong doubts on the soundness of the theory. Roughly, we can identify three stages in the medieval history of realism. A first phase began with John Scottus Eriugena and lasted until the beginning of the twelfth century and William of Champeaux; this period ended abruptly with the powerful criticism of immanent realism by Peter Abelard. The second

phase of development, that of the so-called moderate realism of the Doctors of Scholasticism, began at the University of Paris and included, in different ways, Robert Kilwardby, Thomas Aquinas, Duns Scotus, and the first Walter Burley; it was deeply shaken by William of Ockham's questioning of the soundness of realism in any form whatsoever (*Sent.* I, dist. II, q. 3–7, pp. 74–266). However, realists were not led by Ockham's criticism to abandon their theory, but proposed new versions of it – this is the third phase, illustrated by the late Burley, Wyclif, and their followers.

During the early Middle Ages, realism was mainly defended by four thinkers: John Scottus Eriugena, Odo of Cambrai, Anselm of Canterbury, and William of Champeaux, in his first theory of universals, the so-called material essence realism. There was no proper dispute about universals during the early Middle Ages until Peter Abelard; realism developed without being argued against a rival theory. However, early medieval realism does constitute a determinate metaphysical theory, which can be summarized in six theses. The theory states (1) the real existence of universals, that is, of the natural kinds to which particulars belong; (2) that universals do not exist separately from particulars; (3) that they constitute the substantial being of the particulars which are subordinate to them; (4) that a genus or species is entirely and simultaneously present in each of its subdivisions; (5) that the specific substance is common to all members of a species; and (6) that individuals of the same species are individuated by a unique bundle of accidents. In this theory, the universal man is taken to exist simultaneously in each of its particulars and to be fully realized in them. Socrates is composed of the universal man – which constitutes his essence, common to all the members of the species – and of a bundle of accidents, the *collectio proprietatum* in Anselm's words. There is no essential individuation of particulars. An individual does not have its own essence – essential being is provided by the specific universal. From the point of view of substance, Socrates is no different from man. The thesis of the complete realization of the universal in each individual follows Aristotle's statement

that substances do not admit of more or less. The theory also follows Aristotle's immanentism since universals have no existence separate from individuals. In the case of Eriugena (*Periphyseon* 463A; ed. Jeaneau, vol. I, 32:887–893) and in that of William, according to Abelard's testimony (*Logica ingredientibus*, ed. Geyer 12:27–32), this realism goes with realism about the categories that are described as being the ten highest genera of being, *decem genera rerum* in Eriugena's words.

In the thirteenth century, a different kind of realist theory appeared. The intellectual background of this period was very different from that of the early Middle Ages. The thirteenth century is characterized by the rediscovery of the entire corpus of Aristotle's writings and the beginning of the practice of *quaestio* in the recently founded universities. This in turn implies organizing arguments into *pro* and *contra*, and leads to an increased determination of positions, and through more explicit distinctions, to a higher degree of technicality of positions. The discovery of Avicenna's writings provided two central new doctrinal elements: the theory of the three states of the universal and Avicenna's distinction between a nature as such and the universality that a nature can have in the mind. Animal in itself is taken to be neither universal nor particular – to quote a famous saying: "Horseness (*equinitas*) is only horseness"; the nature is neutral to either extramental or intramental existence. However, if to this nature are added spatiotemporal accidents, one obtains an individual substance, but if the mind's universality is added to it, one obtains the universal notion. Also, developments in philosophy of language mean that realist doctrines from that time also involved a semantic theory (from the twelfth century and Peter Abelard onward, to give a theory of universals is also, perhaps even primarily, to answer the problem of the reference of common names). Besides some "generous" ontologies, such as that of Robert Grosseteste, who posits among universals creative ideas in his commentary to the *Posterior Analytics*, and Albert the Great who, in his commentary to the *Isagoge*, explored in detail the theoretical possibilities of the Avicennian doctrine of the three states of the universal, the constitution of

the so-called moderate realism can be observed. Although each philosopher who defends this type of theory does so through his own particular variation of it, a number of common points can be noted between the various representatives of what historians have taken the habit of calling the moderate realist view. This view has some features that can be found in various authors. First, the acceptance of the framework provided by the doctrine of the three states of the universal. Universals are clearly not self-subsistent entities, but exist only in particulars as their main metaphysical components. Disagreements persist as to their mode of being outside the mind. The most common opinion is that universals exist potentially (*in potentia*) outside the mind, and actually (*in actu*) within the mind.

Although it touches the borders of what may still be considered as a *realist* theory, Duns Scotus' theory of common natures (*Ordinatio* 2 d. 3 p. 1 qq. 1–6) deserves particular mention, partly in reason of the historical role it was to hold. His theory is based on two elements: the “common nature” (*natura communis*) and the principle of individuation, the “haecceity” (*haecceitas*) or individual differentia. Following Avicenna, Scotus holds that the common nature is “indifferent” to existing in any number of individuals, and in that way it is common; it is also prior to being universal or particular. But it has extramental existence only in the particular things in which it exists, and in them it is always “contracted” by the haecceity (the individual differentia, which is also called a “contracting differentia”). So the common nature humanity exists in both Socrates and Plato, although in Socrates it is made individual (or contracted) by Socrates haecceity and in Plato by Plato's haecceity. When the haecceity is combined with the common nature, the result is a concrete individual, like Socrates, that differs from everything else. The humanity of Socrates is particular and nonrepeatable, as is the humanity of Plato; yet, humanity itself is common and repeatable, and it is ontologically prior to any particular humanity. The mode of unity of the common uncontracted nature is a real unity that is “less than numerical unity.” However, common humanity does not exist in individuals. It has been

suggested that the reason for which we can state that Socrates' contracted nature is, in a way, “the same” as Plato's contracted nature, despite the fact that contracted natures are completely individualized by the individual differentiae, is the following: Socrates' contracted human nature retains a real potency to be the contracted nature of Plato, and vice versa, while this does not hold in the case of the contracted cat-nature of Felix.

The fourteenth century was a new golden age for realism, despite Ockham's criticism. Burley, whose first theories had been criticized by Ockham, gave a new version of his theory, and Wyclif defended a realism that later inspired the movement of the Oxford realists and, in the fifteenth century, of the Prague realists. Burley holds that a universal actually exists in an individual, not as a singular, but as a universal. The universal exists wholly as one and the same in each individual belonging to it. (Burley describes as follows the position he upholds: “*Alia est opinio, que ponit universale habere esse solum in suis singularibus et quod universale secundum se totum est in quolibet suo singulari.*” *Tractatus de universalibus*, ed. Wöhler, 20:16–17.) According to Burley, the universal is one, not in the way in which an individual is one, but in a way that is peculiar to it. He distinguishes “numerical identity in the strict sense” and “specific or generic identity” which denotes a genuine identity relation, the relation which a universal bears to itself. He states that universals exist outside the mind and that they are really distinct in the individual, but rejects the thesis according to which the universal has separate existence. Wyclif holds that the universal really exists in the particulars and that it is identical to them (*De ente in communi*, Chap. 5, p. 58). There is a real identity between the universal and the individual, since they share the same empirical reality (that of individuals). Only reason allows us to distinguish in an entity that which is universal from that which is particular; this distinction is only formal. Universals are really (*realiter*) identical to, but formally (*formaliter*) distinct from their individuals. Universals and individuals are the same identical things if conceived as first intentions, and differ from each other if conceived as second intentions (i.e., considered as universals and individuals, in this case

they have opposite constituent principles: *communicabilitas*, i.e., the disposition to be common, and *incommunicabilitas*, the impossibility of being common, respectively). Wyclif's theory involves a revised version of the three states of the universal: he states that a universal may be (1) universal by causality, (2) universal by community ("a thing shared by many supposits [individuals understood as bearer of universals and of accidents] such as human nature"), or (3) universal by representation (*De univ.* i, 6–22). Wyclif's thought was continued by the "Oxford Realists" – the Englishmen Robert Alynghon, William Milverley, William Penbygull, Roger Whelpdale and John Tarteys, the German Johannes Sharpe, and the Italian Paul of Venice.

Abstract

A term of art, originally Italian, becoming common usage in other European vernaculars in the late sixteenth century. It meant practical reflection, albeit in writing and general in form, about all aspects of statecraft (reason = reasoning, discussing, considering, but also a ground or justification for acting; state = government, the prince's position, the institutional

order of a “commonwealth” or “principality”). It claimed practical usefulness in virtue of its grounding in experience and history, contrasting itself with “mirrors of princes,” which were supposedly ignorant of the realities of politics. More narrowly, reason of state meant a “Machiavellian” disregard for legal, moral, and religious considerations when the “interests of the state” or “necessity” required it. Particularly contentious were the justifiability of dishonesty, duplicity, breach of faith and even treaty obligations, violence against opponents and competitors, illegal taxation, disregard of the claims of traditional institutions and officeholders, and the practice of religious toleration. Opponents of “reason of state” attempted to demonstrate that, on the contrary, adherence to religion, morality, and legality was the best policy, in that it earned providential rewards, but also that in strictly pragmatic terms it was most likely to bring political success. However, these proponents of “true reason of state” acknowledged that strict adherence to these norms was sometimes impossible, and when it was, statesmen must attempt to avoid the greater evil. Having become the subject of a vast literature and even a standard university topic, reason of state faded as an issue in the later seventeenth century. *Realpolitik* from the nineteenth century onwards resembles it, with the state representing a morality superior to the norms of legality and private morality, a view in turn contested by advocates of human rights and international morality.

Reason of state is often identified with the contention that the state and its agents are not bound by some of the rules of ordinary morality; more theoretically, that the well-being of the state is the ultimate value, which overrides, or is autonomous of, the demands of morality or religion (e.g., Meinecke). But no early modern author explicitly endorsed the latter contention, whereas no one who acknowledged political authority as legitimate could deny the former (private persons were not, for example, morally entitled to

ennoble, expropriate, imprison, interrogate, execute, fight wars, etc). The distinctive identity of early modern reason of state is better understood in terms of its specific linguistic and historical context.

The adoption of the term presupposes that *stato*, state, *état*, etc. were already familiar in the sixteenth century, usually to designate princely regimes. Reason of state became common usage among political cognoscenti in Italian in the 1540s (it does not occur in Machiavelli), in other European languages from the 1580s, but in German only in the early seventeenth century; the Latinization “ratio status” is also relatively late. This was a time of unparalleled religio-political conflict and belligerence.

Botero’s *Della ragion di stato* (1589) was the first book to use the term in its title. Like most authors, both Catholics and Protestants, who articulated the concept, he explained it as meaning discussion of the “means for preserving stable rule over a people” to which his book was devoted, the *ars gubernandi* as it came to be called. Botero noted, however, that reason of state was used in a more restricted sense to refer to extraordinary actions required by emergencies, and also to the noxious attitudes and policies prescribed by Machiavelli, and all too commonly practiced. Machiavelli was already a byword for contempt for morality, legality, and religion. Gentillet (1576) had blamed the St Bartholomew’s Day Massacre of Huguenots on the “Machiavellian philosophy” of Catherine de’ Medici and her court. “Machiavellians,” “atheists,” and “politicians” (a word already acquiring pejorative connotations) were commonly linked. “True reason of state” (e.g., Ribadeneira), “prudence,” *civilis prudentia* or *civilis doctrina* (Lipsius, Mariana), or *arcana* (Clapmarius, Besold) was presented as in part a critique of Machiavelli’s “false and impious” reason of state. Its authors nevertheless made significant concessions to it, although their endorsement of Machiavellian propositions was equivocal and circumspect (e.g., Boccalini, Mariana). Most of them were fully conversant with *The Prince* and other works of Machiavelli, which became increasingly available in Italian and in translation

in the latter years of the century. His thought was often misrepresented (he did not, for example, actually say that “the end justifies the means,” the epitome of Machiavellianism). But he invited such misinterpretation by his delight in shocking, his incomplete trains of thought, extravagant generalizations, limited political experience and knowledge of history, which Bodin, Possevino, and Fitzherbert, for example, pointedly criticized, and what to Anti-Machiavellians seemed parodies of Christian religion and moral philosophy.

Reason of state thus presented itself as practical reflection about *politica*, intended for princes and their advisers, and based on the twin teachers of prudence: experience and history. These were summarized in maxims which, with the aid of new or newly fashionable concepts, served to express a cynical and pessimistic view of politics and human nature. The disorder of the time evidently made such a view particularly plausible. Fashionable concepts included “interest” as the summary term for motives, usually selfish ones, the terminological family politics, *police*, *policy*, *politica*, *politique(s)*, *Polizey*, etc., and new coinages like “statecraft.” Maxims passed from book to book included: a state cannot be governed with rosaries; a man who does not know how to dissemble does not know anything about ruling; *oderint dum metuant* (it does not matter if they [i.e., the subjects] hate, so long as they fear); “dead men don’t bite” etc. Tacitus became fashionable as an appropriately excoriating political commentator on *arcana imperii* (the secrets of ruling). Lipsius and Ammirato set out their reason of state in the form of commentaries on his work, and even Botero, who paired him with Machiavelli as authorities for those who preferred reason of state to conscience, evidently found him highly instructive.

Reason of state was premised on pessimistic “descriptions” of politics and human nature. These were, however, neither new nor heterodox: Aristotle and Augustine could be cited in support. But it also offered prescriptions premised on these descriptions. Mirrors for princes and moral philosophy instructed rulers to advance the well-being and safety of their subjects and also their virtue and their *pietas*, by defending and

upholding true religion. They moreover required princes to respect moral, legal, and religious norms and obligations, not least in order to set a good example to their subjects. The premise was that they could do all this without endangering themselves or their state. The reason of state literature could not base itself on this premise, because it envisaged princes whose positions and states were vulnerable to competing factions and allegiances, civil war, and foreign enemies, who often joined forces with domestic dissidents and rebels. In these conflicts religion, relied on by all known peoples as the principal social cement, was itself the foremost cause or justification of division and insubordination.

Reason of state thinkers, therefore, argued for the restoration of religious uniformity and the suppression of religious dissent (“heresy”), by whatever means might prove effective. Religious toleration of dissenting politically organized communities was decried as “false reason of state,” a subordination of the religious obligations of rulers to “policy” which was both impious and contrary to political prudence, since religion was the indispensable underpinning for political obedience, and “heretics” were by nature insubmissive. Bodin and the French *politiques* were counted atheists and Machiavellians for advocating it. However, where the enforcement of religious uniformity demonstrably endangered the prince, the state, or favored minorities, Catholic as well as Protestant reason of state was perfectly prepared to endorse religious toleration. The justifications were political “necessity,” which “has no law,” as another maxim said, and the orthodox moral principle of choosing the lesser evil (*ad maiora mala vitanda*), the greater evil being the weakening or even elimination of a prince or regime. “Necessity” thus licensed departures from strict rules of religion and morality. It was a concept with a respectable pedigree in moral philosophy and casuistry, which recognized that there can be no moral duty to do what is morally impossible.

Again, partly but not only in the same context of religio-political conflict, reason of state licensed extralegal, duplicitous, or possibly violent measures against domestic political competitors, conspirators, and factions, and in the

conduct of foreign affairs generally. With respect to “heretics,” especially Calvinists, Botero argued for divide and rule, depriving them of public office, arms, and resources (even by extra-legal taxation), destroying their morale by fomenting suspicions among them, eliminating ringleaders, and operating swiftly and in secrecy to stamp out rebellion and conspiracy at birth. Reason of state endorsed the expulsion or forcible conversion of the *moriscos* in Spain. In short, prudent and religious ends evidently licensed efficacious means, however morally suspect. Even assassination might be justifiable, as when the Emperor Ferdinand II authorized Wallenstein’s assassination in 1634. Overriding legal and moral duties was *a fortiori* permissible in diplomacy and in war, in which morality was always at a discount (*inter arma silent leges*), despite natural law and *ius gentium*. Reason of state could even justify alliances with heretics and Turks against coreligionists.

Not only adherence to legality, but all the traditional princely virtues must be tempered by “prudence.” Thus clemency might need to be overridden by the demands of exemplary justice. Liberality, again, must not be confused with profligacy, and husbanding and increasing public resources was the prince’s duty (Contzen). This meant increasing taxation. Political resistance to increased taxation was justified by appeals to traditional legal rights and “fundamental laws.” Bodin’s theory of sovereignty could be used to neutralize such “legal” justifications for political resistance (even if he himself had not done so in the case of taxation). But reason of state was not principally juridical in character: it was always (in its most favorite term) “political,” that is concerned with interests, ways, and means, and what worked, and it was the requirements of ruling, irrespective of legal “niceties” that counted.

Duties of veracity and keeping promises presented special difficulties, given the absolute theological prohibition of lying as in all circumstances evil; moreover treaties, contracts and promises were manifestly indispensable for civil and diplomatic relations, which depended on consistent adherence to the natural law principle *pacta sunt*

servanda (promises/treaties must be kept). Machiavelli had notoriously argued that princes might need to break their word, on the grounds that in a wicked world, inflexible fidelity merely made them vulnerable. Reason of state here maintained a strictly anti-Machiavellian position, even insisting on keeping faith with heretics. All the same, duplicity might be indispensable, and various distinctions needed to be made. Secretiveness was a positive virtue in princes and counsellors, and essential for successful implementation of policy. But it was morally unproblematic since it violated no other duty. Again, amphibology (ambiguous speech) relied on the gullibility of others, and was therefore their problem. Simulation and dissimulation (pretending not to know or want or be what one does know or want, or vice versa) seem to fall into the same category, even though Aquinas had condemned them as lying. The Jesuit theologian Lessius straightforwardly allowed even outright lies as the lesser evil in very serious matters, such as defending the innocent. His friend Lipsius more cautiously distinguished three degrees of duplicity: he allowed dissimulation and secrecy (distrust) as “slight” and morally inconsiderable, bribery (of counsellors of foreign princes) and deception more reluctantly as “moderate,” but condemned violations of faith, removal of privileges and open aggression against foreign countries as unjustifiable. The heading for his discussion was “mixed prudence”: that is, mixing *honestas*, prudence, and deception.

Reason of state in the narrower sense became a standard *topos* in German Protestant Universities in the seventeenth century, as well as in manuals of statecraft such as Contzen’s, and then fell out of fashion. Nineteenth-century proponents of *Realpolitik* may be regarded as continuators of the tradition.

Remigio dei Girolami

Teresa Pugh Rupp

Department of History, Mount Saint Mary's
University, Emmitsburg, MD, USA

Abstract

Remigio dei Girolami, O.P. (c. 1245–1319) was a Florentine Dominican preacher, teacher, and theologian. He studied with Thomas Aquinas at the University of Paris. Remigio spent most of his career as lector of theology at Santa Maria Novella, the Dominican house in Florence. Dante may have been one of his students, but the evidence for this is inconclusive. Through his numerous sermons and treatises, he transmitted scholastic ideas to his fellow Dominicans and the people of Florence, as well as applying them to the local situation. *Contra falsos ecclesie professores* (before 1298), Remigio's treatise on the church, shows him to have been a moderate papal hierocrat. His political treatises, *De bono communi* (1302) and *De bono pacis* (1304), were written in response to the 1301–1302 factional crisis in Florence between black and white Guelfs. Often considered to be extreme examples of medieval anti-individualism, they are an interesting adaptation of the theory of wholes and parts and of the theological concept of the order of charity to a specific political situation. In *De bono communi*, Remigio argues that the common good (which he identifies with the good of the commune) ought to come before particular good by inserting the commune into the traditional order of charity (God, self, neighbor, body), either before or after the self, depending on whether the commune is considered to be an integral or a universal whole.

Remigio dei Girolami was a Florentine Dominican teacher, preacher, and theologian. His family, the Girolami, were wool merchants active in Florentine politics; his father, brother, and nephews served as priors, the executive body in the Florentine commune, multiple times in the second half of the thirteenth century. Remigio studied the liberal arts at the University of Paris, then joined the Dominican order there, probably in 1268, and studied with Thomas Aquinas (he refers to Thomas in one of his sermons as *magister meus*). He returned to Paris, probably in 1298–1300, as bachelor of the *Sentences*, receiving his magisterium in theology in 1304 from Pope Benedict XI. Remigio held several offices in the Dominican order; for example, he attended general chapters in 1292 and 1301 and he served as prior of the Roman province from 1309 to 1311. Remigio spent most of his career as lector of theology at Santa Maria Novella, the Dominican house in Florence. His prologues, or introductory lectures to his courses, show that he must have taught the Bible, the *Sentences*, and Aristotle's *Ethics*, which were the standard texts at Dominican theological *studia*. Remigio is significant as a transmitter of scholastic ideas through his teaching and preaching and for his application of those ideas to real-life situations in the commune.

Some scholars think Remigio's students may have included Dante. In the *Convivio*, Dante states that after the death of Beatrice in 1290, he sought consolation *ne le scuole de li religiosi e a le disputazioni de li filosofanti* ("in the schools of the religious and the disputations of the philosophers"; *Conv.* 2.12.7.). It has long been assumed that Dante was referring to the Franciscan school at Santa Croce and the Dominican school at Santa Maria Novella, whose lector in the 1290s and for much of Dante's lifetime was Remigio. There is no direct evidence for this connection, however, and neither figure ever mentions the other. Dominican statutes forbade outsiders from attending lectures in philosophy (which Santa Maria Novella, as a *studium* in theology, did not offer anyway), but disputations were more public. It is possible that Dante attended either Remigio's

theology lectures or his disputations, perhaps thereby learning his Aristotelianism, but the question remains open.

Dante may or may not have heard Remigio teach, but he definitely could have heard him preach. Remigio's sermons are collected into three manuscript volumes preserved in the Biblioteca Nazionale in Florence. They are arranged into Lenten sermons and sermons *De tempore*, *De sanctis*, and *De diversis materiis*. This last category includes several sermons preached on communal occasions, such as sermons on peacemaking, a group of sermons to the Florentine priors, and reception sermons for various visiting dignitaries. For example, Remigio preached at the official reception of Charles of Valois, brother of King Philip IV of France, who as "peacemaker" presided over the black Guef takeover of Florence and the exile of the whites, including Dante and Remigio's nephews, in 1301–1302.

Another codex in the Biblioteca Nazionale contains Remigio's treatises on a variety of subjects, such as *Contra falsos ecclesie professores*, *De bono communi*, *De bono pacis*, *De peccato usure*, *De subiecto theologie*, and *Divisio scientie*. Other works include quodlibets, a commentary on the Song of Songs, a set of biblical distinctions, and a theological encyclopedia, *Extractio ordinata per alphabetum*. Remigio spent his final years annotating and cross-referencing his works in his own hand to facilitate their use as preaching aids for his fellow Dominicans.

The thesis of Remigio's treatise on the church, the *Contra falsos ecclesie professores* (probably written before 1298), is "how the catholic church knows all things." In 99 chapters, Remigio proves how the church "knows" the liberal arts, the natural sciences, medicine, ethics, metaphysics, the mechanical arts, and theology. Chapters 6–37 of *Contra falsos*, on how the church "knows" geometry, are usually read as the equivalent of a treatise on ecclesiology. Geometry measures greatness, and the church is great in size, strength, and authority. Remigio's views on papal power place him as a moderate hierocrat who believes in the ultimate superiority of spiritual power but

grants considerable autonomy and value to temporal power.

In Remigio's political treatises *De bono communi* (1302) and *De bono pacis* (1304), written in response to events in Florence, he applied the theory he had learned at the university to the factional conflicts between the black and white parties, identifying the common good (*bonum commune*) with the good of the commune (*bonum communis*). *De bono communi* was probably composed to be a source for sermons; it demonstrates its thesis, that the common good ought to be preferred to particular good, with proofs by authority, examples, and reason (followed by a set of objections and replies), which were the three methods of developing a medieval sermon. *De bono pacis* has a narrower, more legalistic focus; it argues that property losses sustained in the factional conflicts ought to be forgiven for the good of peace.

Remigio's political philosophy is usually considered to be an extreme example of medieval anti-individualism. In an oft-quoted phrase, Ernst Kantorowicz termed him "that curious thomistic proto-Hegelian" (Kantorowicz 1957). Scholars cite such passages from *De bono communi* as *Qui non est civis non est homo* ("he who is not a citizen is not a man") and his supposed statement that a citizen ought to be willing to go to hell in place of his commune as evidence of Remigio's extreme exaltation of the common good at the expense of individual worth.

Remigio expresses his most extreme statements about the community's superiority over the individual in terms of the whole's priority over the part. These extreme statements, however, are reserved for when he considers the community as an integral whole – Florence – whose parts cannot even exist outside the whole. Usually ignored, however, is that Remigio is well aware that a city is also a universal whole – the Florentines – whose parts are simultaneously wholes in themselves and a part of a larger whole.

The double nature of the whole influences Remigio's use of the *ordo caritatis*, or order of charity, a key concept for understanding his political philosophy. Based on the Gospel commandment to love God and your neighbor as yourself,

the order of charity was developed in the context of commentary on Song of Songs 2:4, *Ordinavit in me caritatem*, "He ordered charity in me." The standard order, as given by Augustine in *De doctrina Christiana* (1.23) and quoted in Peter Lombard's *Sentences* (3.28.1), is God, self, neighbor, body. To argue that the common good takes preference over individual good, Remigio places the commune into the traditional order, as one of the objects of love required of a Christian. Where it goes in the sequence, however, depends on whether he is thinking of the commune as a universal whole or an integral whole.

When the commune is considered as an integral whole, then it is to be loved immediately after God and before the self. When it is thought of as a universal whole, then, as a collection of neighbors, it is placed after love of self. Faced with a situation in which parts (in Latin, *partes*, the same word as "parties") were destroying the whole, Remigio emphasized the city's integral unity and the obligations of the parts to love it more than themselves. But he did not forget the existence of individual citizens who must love both themselves and their neighbors. The view of Remigio as an extreme anti-individualist oversimplifies and obscures the distinctiveness of his political thought.

Richard Billingham

Egbert Bos

Philosophy, University of Leiden, Leiden,
The Netherlands

Abstract

Richard Billingham has become famous for his handbook *Speculum puerorum terminus est in quem resolvitur propositio* (*Mirror of Youngsters or a Term in Which a Proposition is Analyzed*). The book gained wide popularity in Europe, especially in eastern Europe and Italy, as can be gathered from the great number of manuscripts and commentaries handed down to us. The tract is on the analysis of a proposition with the help of an analysis of an analyzable term used in it. Once such an analysis has been completed, it is easier to assign the reference (*suppositio*) or another property of a term and to establish the truth of the proposition. The *probatio*-theory was especially used in natural science, for example, by William of Heytesbury (before 1313–1372/3).

Life

We do not know much about Richard Billingham's life. He was a fellow of Merton College from 1344

to 1361; in 1357, he was a subwarden (still in 1361); and in 1349, a regent Master of Arts. He was also a bachelor in theology. In Merton the Oxford "Calculatores" were active, of whom Walter Burley, Thomas Bradwardine, William of Heytesbury, and Richard Kilvington are well known. These philosophers applied mathematical and semantical instruments to natural science.

Thought

In his tract *De significato propositionis* (*On the Signification of the Proposition*) Billingham asks whether an affirmative or negative proposition is true on the condition that it signifies precisely as it is. In his solution of this question he says that he will reject any form of signification of a proposition that implies the existence of an entity signified by the complex whole; by this he probably means a *complexe significabile*, although this expression is not mentioned here. The theory of the *complexe significabile* was advocated by a.o. Adam of Wodeham (c. 1298–1358) and Gregory of Rimini (c. 1300–1358). According to Richard a proposition like "Socrates runs" means the contingent reality to which the subject term refers. One should not imagine, Billingham says, that, when "Socrates exists" is true, there should be some independent entities that can be labeled "that Socrates exists."

In his *Speculum puerorum* Richard presents the theory of the proof (*probatio*) of propositions or analysis of propositions. *Probare* ("to prove," or, in this context, better "to analyze") refers to the analysis of a proposition with the help of the analysis of a complex term used in the proposition. Once such an analysis has been carried out, it is easier to assign the reference (*suppositio*), and the truth of the proposition can be determined. The analysis is the direct and immediate aim of the theory, whereas the ultimate, but indirect concern is to determine truth or falsity.

Richard divides terms into immediate and mediate ones. A term is called "immediate" with respect to cognition. In this case there is a relation between the human mind and the individual thing

known, he says. Examples of immediate terms are nouns such as "I," "you," "this," and verbs such as "is." A pronoun like "this" is immediate; a transcendent term such as "being" is immediate because it refers to an individual reality, because it is the first thing known by the intellect. As to the question whether *Hoc est* ("this is") is immediate, Billingham answers in the affirmative. "This is" is directly immediate, he says, while "this was" (past tense) and "this will be" (future tense) are indirectly immediate.

Billingham does not explicitly define "mediate terms." Mediate terms are those that are not immediate, and therefore they can be analyzed. In this analysis, one should pay attention to the first analyzable term, that is, the common, or mediate term, in contradistinction to an immediate term.

There are three kinds of mediate terms:

1. *Termini resolubiles* ("resoluble terms") such as "man," which is a common term and has inferior things under it. The analysis of "a man runs" (*homo currit*) is as follows: "this runs, this is a man, therefore a man runs."
2. *Termini exponibiles* ("exponible terms"), such as *incipit* ("begins"), which can be explained by two or more propositions; for instance "this begins to exist" is explained by "this exists now and not immediately before it was such that it existed." Thus the exponible term is analyzed.
3. *Termini officiabiles* ("functionalizable terms"); these precede a proposition, such as "it is contingent"; for example, "it is contingent that you exist" is analyzed into the proposition "you exist is contingent which precisely signifies that you exist, therefore it is contingent that you exist." Functionalizable verbs denote not only an act of knowledge (for instance "to know," in "you know a man to exist" is analyzed into: "you know such a proposition 'a man exists,' which precisely signifies that a

man exists, therefore you know a man to exist”), but also modalities (for example, “potentiality,” “necessity”).

Richard pays special attention to the “expository syllogism,” that is, a syllogism with a middle term which twice is singular, referring to individual things. The notion of expository syllogism goes back to Aristotle. The example Richard gives is the one given above to illustrate the analysis by resolution: “this runs, this is a man, therefore a man runs.” Having established this analysis of a proposition by way of resolvable terms, he claims to have arrived at the basis of the so-called expository syllogism. One should realize that a proposition on account of its resolvable term could be proven on account of a lower term, hence the rule: *ab inferiori ad superius distributive et sine dictione habente vim distributionis vel negationis valet consequentia* (“the inference from an inferior to a superior in a distributive way and without a word having the power of distribution or negation is valid”). Billingham notes that it is upon this rule that the expository syllogism is built. This syllogism is the basis of all other syllogisms. According to Richard, the expository syllogism obtains in syllogisms of all figures. In the third figure it is most evident, however.

The tract in which we find Richard’s theory on inferences (*consequentiae*) is perhaps not the most important one on this subject in medieval logic; it seems to be a compilation. He defines *consequentia* as an aggregate made up of an antecedent and a consequent together with an inferential sign and interprets the inference with the help of the expression “it is understood in” (*intelligitur in*), saying, for instance, a formal inference is the case when a consequent is understood in the antecedent, like in “Peter is a man, therefore Peter is an animal.” Billingham understands it to be an act of knowledge, not a kind of objective understanding.

In natural theology, Billingham holds radical views, at least according to an anonymous contemporary author of a tract preserved in the Vatican. According to this author, Billingham says that it is not the task of a philosopher to state that there is only one infinite first being. For a

philosopher is limited to conclude that this first being is either a substance or an accident. One cannot say that the first being is a substance, for a man does not possess a concept of substance. Billingham argues that during the Eucharist one never knows whether or not under the accidental property a substance is present or not. Neither can the first being be an accident, for in that case God would be less perfect than a substance.

Secondly, according to the anonymous, Billingham said that it is not evident to us, mortals, that substances are different from accidents (here Billingham comes close to Nicholas of Autrecourt, Michalski notes).

Thirdly, all philosophical propositions are based on faith and things believed, which could be labeled – somewhat anachronistically – a fideist position.

In his commentary to the *De anima*, Nicholas Oresme notes (if one follows Michalski) that according to Billingham, man only perceives accidents and that a substance is as hidden as the first mover of the heavens.

Richard Brinkley

Laurent Cesalli

Department of Philosophy, University of Geneva,
Geneva, Switzerland

Abstract

Richard Brinkley, OFM (fl. c. 1350) was an English logician and theologian of the middle of the fourteenth century. Among his works, only a *Summa logicae* and some fragments of theological works are known to us. Brinkley is a realist philosopher (he acknowledges real universals and genuine propositional significates), although his position is much more moderate than that of Burley or Wyclif, for example. Most of his criticisms in the *Summa* are directed against Ockham, although he agrees with him on some doctrinal issues, like for example the thesis of semantic subordination of written and spoken language to mental language. Brinkley's philosophical orientation is characterized by the tension between the explicitly formulated methodological aim of segregating logic and

metaphysics, and the philosophical necessity of considering them both.

Life, Works, and Philosophical Orientation

Richard Brinkley was a Franciscan friar active in Oxford in the middle of the fourteenth century (Gál and Wood 1980:73–77). His theological work was known in Paris from 1362 onward and influenced bachelor theologians like, for example, Denis de Montina, Henricus Totting de Oyta, and Petrus de Candia (Kaluza 1990:188–191). The only extant work among Brinkley's writings is an extensive, anti-nominalist logic handbook (*Summa logicae*). Fragments and abbreviations of his theological works (a commentary on the *Sentences* and three sets of theological questions respectively referred to as *Questiones super Sententias*, *Quaestiones breves*, and *Quaestiones magnae*, Kaluza 1990:172–174) have been edited. Furthermore, Brinkley is known to be the author of (lost) *Distinctiones scholasticae* and *Determinationes* (Ashworth and Spade 1992:49). In at least two places in the *Summa logicae* (part II, *De universalibus*:333 and at the beginning of part III, *De praedicamentis*, Gál and Wood 1980:69), Brinkley alludes to a planned work on metaphysics, but, if such a work was written at all, nothing more is known of such a tract. As for his philosophical orientation, Brinkley is a realist and is often engaged in polemics against Ockham. His theory of the significance of propositions bears affinities with the ones of Walter Burley and John Wyclif although Brinkley's position is much more moderate than that of his realist fellows (Cesalli 2007:301–309).

The *Summa logicae*

Brinkley's *Summa* is conserved completely in two manuscripts (Prague, Státní knihovna ČSR, MS 396 8 (III. A. 11), f^o 31^{ra}–140^{ra}; Leipzig, Universitätsbibliothek, Nr. 1360, f^o 1^{ra}–105^{vb})

and only partially (part VII, *De obligationibus*) in another manuscript (British Library, Harley 3243, f^o 47^{ra}–56^{rb}). The work is divided into seven parts (an announced eighth part on sophisms is missing):

1. *De terminis*
2. *De universalibus*
3. *De praedicamentis*
4. *De suppositionibus*
5. *De propositione*
6. *De insolubilibus*
7. *De obligationibus*

There is no doubt about the authenticity of the work. Its date of composition is difficult to determine, but there are good reasons to think that it was composed as early as 1345–1350: Brinkley's theological work was influential in Paris in 1362 and the standard *cursus* of a theologian would require that he first writes on logic and only later on theology (Kaluza 1990:169). The *Summa* is also of some doxographic significance since it is the only text through which the opinions of William Birmingham and Richard Billingham about the significata of the proposition are known (M.J. Fitzgerald, introduction to Brinkley's *De significato propositionis*:3–4).

Logic and Metaphysics in the *Summa logicae*

In the prologue of the *Summa*, Brinkley makes it clear that his main motivation for writing is the consideration of logic in itself and in contradistinction to metaphysics (*ut logica in se consideretur et a metaphysica distinguatur*, see Gál and Wood 1980:79). Such a segregation has to be, he goes on, because some of the moderns neglect logic for metaphysics and vice versa. This sheds some light on Brinkley's philosophical stance: both logic and metaphysics have to be considered, but the only way to achieve this consists in holding the two disciplines strictly apart. To some extent, Brinkley sticks to this

programmatic line (and he possibly wrote a metaphysical tract as well), but as we will see on the base of the three cases presented below, his logic is not always free of metaphysical considerations.

Universals

The structure of Brinkley's *De universalibus* is symptomatic for the tension between the methodological aim of segregating logic and metaphysics, and the philosophical necessity of considering them both. Before commenting on the five porphyrian *praedicabilia* (*genus, species, differentia, proprium, accidens*), Brinkley begins by distinguishing different senses of the word *universale* according to logic, physics, and metaphysics (*De universalibus*:299–300): the logician conceives of it as a common term predicable of several things; for the philosopher of nature, it is the indeterminate character of the first cause as far as its possible effects are concerned; according to the metaphysician, it is an essence (*quidditas*), which is “communicable” to many different individuals. Accordingly, when a logician says *homo est species* (= *S*), he is speaking of a term only, to the effect that *homo* (= *t*) in *S* is taken in material supposition (ibid.:306). If Brinkley's position is compared to the ones of Burley and Ockham, we obtain the following picture: on the one hand, he disagrees with Ockham and Burley who both think that *t* has simple supposition in *S*; on the other, he agrees with Ockham that *t* in *S* is taken non-significatively (because *homo* was not imposed to signify a term, but human beings) and disagrees with Burley who maintains that *t* in *S* is taken significatively. Since Brinkley acknowledges a kind of metaphysical universal, he clearly is a realist. But what exactly is the ontological status of such real universals? The discussion of the personal and simple supposition (see below, point 2) provides some hints: the essence of a given thing (e.g., the humanity of a human being) is a metaphysical part present in any member of the species: “Just as the line which is in Socrates can be understood without Socrates but

cannot exist without him, the humanity which is in Socrates can be understood without Socrates although it cannot exist without Socrates" (ibid.:303). This allows to qualify Brinkley's position as a medieval form of immanent realism.

Signification and Supposition

Like most of the medieval logicians, Brinkley acknowledges three ontological types of terms: inscriptions, vocal sounds, and concepts (mental terms), and just like Ockham – the target of most of his criticisms otherwise – he defends the thesis of semantic subordination of the two conventional types of terms (written and spoken) to the natural signs constituting mental language: a sign *S 1* is semantically subordinated to a sign *S 2* if *S 1* and *S 2* signify the same thing *x* and *S 2* can signify *x* without *S 1* but not vice versa (Cesalli 2004:460). The *impositio nominum* relates a vocal sound to a thing and not to a concept, although the relation to a thing depends on a concept of that thing: the imposition presupposes the cognition of the thing to be named. As far as extra-mental terms are concerned, the difference between signification and supposition is twofold: on the one hand, the former is conventional whereas the latter "arises from the nature of the thing" ("*suppositio non oritur ex principio voluntatis, sed ex natura rei*," *De suppositionibus*, 1): once a vocal sound has been imposed, its actual use within a proposition casts it into formal, objective relations, which do not depend on any convention: as Brinkley puts it, the validity of the inference "a man is running, therefore Socrates, or Plato, or . . . is running" is objectively secured. On the other hand, signification is a dyadic notion, and supposition is a triadic one: to signify, for a term, means to be related to an intellect (namely to the intellect of the hearer) and to a thing; to supposit, for a term, means to signify and to be related to another categorematic constituent (subject or predicate) of a proposition. Brinkley's idea that signification involves a relation to the intellect of the hearer ("*terminus autem significans necessario includit duos respectus: unum ad intellectum sui significat, et alium ad*

rem quam significat," *De terminis*, 1, Gál and Wood 1980:80) is close to the one found in the first lines of Roger Bacon's *De signis* ("*signum est in praedicamento relationis et dicitur essentialiter ad illud cui significat*"). As for Brinkley's typology of supposition, the cases of material and simple supposition have to be briefly addressed. We saw in the previous section that in the *De universalibus*, Brinkley considers that *homo* in *homo est species* has material supposition, whereas this sentence is a classical example for simple supposition. In his tract on supposition, Brinkley says that simple supposition is the case when a "common term stands for a thing as non-restricted, i.e. for a thing really communicable to many" ("*suppositio simplex est quando terminus communis supponit pro re ut non contracta sive pro re pluribus communicabili ex parte rei*," *De suppositionibus*, 3) and gives the example *homo est primo risibilis*. Therefore, Brinkley considers the term *species* as strictly metalinguistic although he acknowledges real universal things. Finally, Brinkley criticizes the notion of material supposition because if a term would really stand for himself, then supposition would not be relational anymore; but according to its definition, it has to be relational (*De suppositionibus*, 2; on Brinkley's theory of signification and supposition, see Cesalli 2013).

Propositions and Truth

Richard Brinkley's theory of the proposition is a case of "propositional realism" in the sense that the author of the *Summa* acknowledges specific significates for propositions, which are not reducible to the significates of the constituent parts of the propositions (Cesalli 2007:241–309). Contrary to Burley and Wyclif who speak of propositions which are not signs but significates (*propositio in re* for the former, *propositio realis* for the latter), Brinkley only uses the term *propositio* for complexes of signs (written, spoken, and mental). The principle of semantic subordination (see above, point 2) holds for propositions as it does for their constituents: every nonmental proposition is a sign in virtue of a mental

proposition (*De propositione in genere*, §54). But this does not mean that a nonmental proposition signifies a mental proposition (rather, as we shall see, every proposition, mental or not, has a significate, which is not a proposition). In spite of subordination, the three types of propositions are functionally equivalent: any proposition, be it mental or not, is the vehicle of a complex cognitive content (*ibid.*, §49). When addressing the question of the formation of a mental proposition, Brinkley insists, that when the intellect produces a mental proposition, it does not combine concepts, but it exerts its combining and dividing activity on the very things of which concepts are natural signs (*ibid.*, §48). Brinkley answers the question of the nature of the propositional significates as follows: one has to know that one calls “significate of the proposition” this thing or these things which is or are signified through a proposition, so that the significate of this proposition “Socrates sees Plato” is this thing Socrates, and this thing Plato, and the vision through which Socrates sees. Therefore, from these, as combined and integrated with each other in a correct order results the whole, adequate and primary significate of this proposition (*Unde primo sciendum quod significatum propositionis vocantur illud vel illa, quod vel quae per propositionem significatur; ut significatum istius propositionis “Sortes videt Platonem” est haec res Sortes, et haec res Plato, et visio qua Sortes videt. Et hae res sunt omnia significata per istam propositionem. Et ideo, ex istis debite ad invicem ordinatis resultat et integratur totale, et adaequatum, et primum significatum illius propositionis, De significato propositionis*:34).

For Brinkley, then, the propositional significate is something like an ordained complex of things. In his tract on the significate of the proposition, Brinkley extensively criticizes the opinions of Richard Billingham (*modus rei*), William Birmingham (*compositio mentis*), and Richard Ferrybridge (the propositional significate is nothing be the significate of its subject term, *ibid.*:52–99). At the beginning of his tract on sentential reference, Brinkley announces that he will address the question whether the “truth of a proposition arises from its significates as from its

cause” (“*si ex illo <significato> tamquam ex causa in propositione veritas oriatur*,” *ibid.*:34). Although this point is not discussed as such in the *Summa*, the element of response that can be gathered converges toward a positive answer to that question: the ordained complex of things – one would want to say, the state of affairs – signified by a proposition is also its truth-maker (Cesalli 2007: 297–299).

Richard Fishacre

R. James Long

Department of Philosophy, Fairfield University,
Fairfield, CT, USA

Abstract

Richard Fishacre (c. 1208–1248), the author of the first Sentences-Commentary composed at Oxford, distinguishes in the prologue to that

work between moral (biblical) theology and speculative (philosophical) theology. Focusing in his Commentary on the latter, he famously viewed philosophy as propaedeutic to theology much like Abraham's relations with Hagar was a necessary prelude to Sarah's fruitfulness. One of the earliest members of the Grosseteste school, he influenced a generation of Oxford Dominicans to follow and provoked the opposition of the Franciscan master, Richard Rufus. His greatest contributions lay in the area of natural philosophy, especially his speculations on the nature of light, the nature of the heavens, the eternity of the world, and the division of the waters in the Genesis text; he also has interesting things to say about the absolute power of God. Of the divine attributes, he considered infinity to be the most significant. He quotes Aristotle with approval, though his direct acquaintance with the Aristotelian corpus was limited. As was the case with most of his contemporaries, both his metaphysics and his philosophy of human nature were rooted in what historians have labeled Augustinianism. He was, for example, a proponent of a plurality of forms in material substances and spiritual matter. His view of the free choice issue is also noteworthy and influenced Bonaventure's thought on the subject.

Biographical Information

Richard Fishacre was born in the diocese of Exeter, in the south of England, of Norman ancestry. As a young man, he went to the schools at Oxford, where he entered the Order of Preachers. Subsequently, he came under the tutelage of Friar Robert Bacon, the first Dominican master in theology at the fledgling university. We have no record of when Fishacre incepted in theology, but the best estimate is about 1240. There is persuasive evidence that his major work, a commentary on Peter Lombard's *Books of Sentences*, the first such work composed at Oxford, was the work of a master. Though commenting on Lombard's *Sentences* eventually was set as a requirement for the degree and hence the exclusive province of

bachelors, Fishacre's Commentary is the work of a mature scholar and was composed between the years 1241 and 1245 (Long and O'Carroll 1999, pp. 15–26).

Nicolas Trivet, writing two decades later, testifies that Fishacre lectured in theology along with Bacon, but it is not clear which of the two was *magister regens*, a term not in use among the Dominicans. Whatever the case, death came for Fishacre in 1248, when he was approximately 40 years of age (Long and O'Carroll 1999, pp. 26–29).

His rather brief life did not afford Fishacre the time to write much. In addition to his *Sentences* Commentary, comparable in size and scope to the one being composed during the same decade at Paris by Albert the Great, he is credited with a commentary or *postillae* on the Psalms, but if this work survived the dissolution, it has not been identified. However, we do have in addition to several sermons a single copy of a treatise on heresies and also on the Ascension of Christ, both of which have been edited (see Long 1978, 1993). Lastly, we possess four *quaestiones disputatae* (on the subject of light, the nature of the heavens, the eternal duration of the world, and the waters above the firmament), written after the completion of his Commentary and inserted into later copies of that work (see Long 2010, pp. 315–363).

Philosophy

Fishacre's metaphysics can be located comfortably within the Christian Neoplatonic tradition: being is essence. The divine being is completely what it is, simple and immutable; the metaphysical scandal is change, and to the extent that creatures change, they are shot through with nonbeing. Given his metaphysics, it is not surprising to find Fishacre an enthusiastic champion of Anselm's *Proslogion* argument. His list of ten arguments for God's existence, all but one the kind Aquinas would label *a priori*, includes three that are patently variations on the Anselmian argument (see Long 1988).

Of the divine attributes, it is God's infinity that is the focus of Fishacre's attention. It has been

argued, in fact, that Fishacre is the first western thinker to attach such importance to the issue (Sweeney and Ermatinger 1958, pp. 191–192). He takes up the doctrine condemned at Paris in 1241, namely, that neither men nor angels will ever behold the divine essence. The problem, as he sees, is the infinite distance between the creature and the Creator. It is precisely this matter of distance (*elongatio*) that becomes Fishacre's most telling argument for God's infinite power: there is an infinite distance between nothingness and prime matter (in other words, between nothing and something); but the greater the distance to be spanned the greater the power required; therefore, creation *ex nihilo* requires infinite power.

Does infinite power, however, imply that there are no limits? Is God, for example, free to undo the past? The solution for Fishacre lies in a distinction: power over the past is of two kinds. There is first the power to reconstitute in being something that had ceased to be; the other is to cause that which in fact had been not to have been, to make it such, for example, that Caesar, having crossed the Rubicon, did not cross the Rubicon. The latter according to Fishacre is not within God's power (see Long 2007).

With respect to his philosophy of knowledge we find ourselves in a world which Aristotle would not have recognized. The species of the thing, which Fishacre calls the "word by which the exterior thing speaks to me," reaches as far as my innermost sentient power (the common sense) – but no farther. It is axiomatic that the inferior cannot act on the superior, and thus the word cannot beget itself in the mind. Rather, Fishacre invokes the authority of Augustine: the soul in marvelous fashion and with equally marvelous speed produces in itself a similitude of that species which is in the common sense – that is, it makes itself like and conforms itself to that received species, just as light conforms itself to the water with which it comes into contact (*In 2 Sent.* 1:228).

The soul, says Fishacre, is like a *tabula*, but not a *tabula rasa*. In fact, on the canvas which is the soul are to be found the likenesses of things, like pictures, which are illuminated by the divine Light. In this life, however, the soul focuses on

the pictures, not on the canvas, much less the light itself: the soul knows neither itself nor God directly. It is, however, owing to the presence in the soul of all forms that Aristotle can say "the soul is in a way all existing things."

This noetic is rooted in a philosophy of human nature for which Fishacre is remotely indebted to Saint Augustine, but more proximately to Robert Grosseteste. Typically, soul and body are in his view separate substances; however, it is not the case that a human being is essentially a soul and the flesh merely a garment, notwithstanding the opinion of Avicenna and "certain theologians" – among whom he numbers Hugh of St. Victor.

In defining the soul, however, Fishacre resorts to a stratagem first attempted by Avicenna and in his own time by Albert the Great: namely, the soul is a *forma coniuncta* according to its being (*esse*) but a *forma separata* according to its essence; put thus, the human form occupies a middle position between the *forma elementaris* and the *forma angelica*. Although the doctrine is not developed systematically or in much detail, Fishacre's talk of a rational and a sensible form in the human composite cashes out as at least tacit acceptance of a plurality of forms. He is careful to describe the three contemporary opinions on the subject, but then hesitates to embrace any of the three, possibly owing to one of the objections against pluralism, namely the authority of the *De ecclesiasticis dogmatibus*, whose author he presumes to be Augustine. Reluctant openly to contradict the unambiguous testimony of the bishop of Hippo, Fishacre was nonetheless in practice a pluralist (see Long 1975).

As to the other half of the *binarium famosissimum*, namely universal hylomorphism or the doctrine of spiritual matter, Fishacre, like the majority of his contemporaries, was unquestionably a proponent. Composed of matter and form are the human soul and the angel. But it is in his teaching concerning the latter that Fishacre works out the full implications of spiritual matter – almost as if the angels constituted a kind of metaphysical testing ground.

His discussion of reason and will eventually yields to the issue of *liberum arbitrium*, the free choice of the will. Devoting more pages in his

Commentary to this question than any other, Fishacre's discussion constitutes a self-standing treatise on the subject, dependent on Grosseteste's treatment, yet displaying a remarkable subtlety and independence of thought. How is this power which is called *liberum arbitrium* related to reason and will? His conclusion is that act of free choice is the turning back on oneself in the act of willing or, better, on its own incomplete will and passing judgment on it. Since therefore *liberum arbitrium* is the medium between the apprehension and incomplete will on the one hand and the completed will or consent on the other, it is defined by each of the extremes (see Long 1995).

How does one summarize Fishacre's philosophical position? He was not hostile to Aristotle, indeed he was convinced that Aristotle is in possession of the truth about the created realm; but aside from the logical and biological works, he had only a passing and for the most part indirect acquaintance with the *corpus Aristotelicum*. Could he fairly be labeled an Augustinian? In the sense in which Augustine is obviously his preeminent authority, and from whom he never explicitly parts company, the answer is a resounding "yes." Yet Fishacre has positions that are decidedly non-Augustinian: his teaching on spiritual matter, for example, or on the plurality of forms, or on the direct knowledge of the soul (see Long 2006). The safest course finally is to avoid labels and to see Richard Fishacre as a venturesome thinker, deferential to the established authorities, but showing signs of an emerging independence of mind in the few works that can be dated toward the end of his career.

Richard Fitzralph

Stephen E. Lahey
Department of Classics and Religious Studies,
University of Nebraska, Lincoln, NE, USA

Abstract

Richard Fitzralph, d. 1360, Archbishop of Armagh, completed *Sentence* commentary at Oxford in 1328 and was active at Avignon until 1344. He compiled a critique of the Franciscan doctrine of *usus pauper* based on the theory of grace as foundation for just lordship. His *De pauperie salvatoris* would become very influential in late medieval antifraternalism and also influenced Wyclif's political thought. He also was at the forefront of Avignon's embassy to the Greek and Armenian churches, and his *Summa de quaestionibus Armenorum* gives a record of late medieval conceptions of the relation of Catholicism to the Orthodox traditions.

Richard Fitzralph (c. 1300–1360) called Armachanus, Archbishop of Armagh (1346–1360), studied at Oxford 1315–1328, was chancellor of the university 1332–1334, and became prominent at Avignon after refuting John XXIII's controversial position on the beatific vision. Subsequently he served as papal representative in conferences held with the Greek and Armenian churches from 1337 to 1344, where he compiled a formulation of the differences separating the Roman from the Orthodox churches in the *Summa de quaestionibus Armenorum*. The *Summa*, for which there is no modern edition, served as

an important theological document into the Counter-Reformation and provides a valuable window into fourteenth-century conceptions of the Eastern churches and their theologies. As Archbishop, Fitzralph was active in the reform of the Irish church and, in doing so, developed a careful and penetrating critique of the mendicant orders in his eight-volume *De pauperie salvatoris*. His critique of the mendicants was later associated with Wyclif's thought, which detracted from his reputation in the fifteenth century, but he was counted among the most influential Oxford theologians by his contemporaries and immediate successors.

Fitzralph's *Sentence* Commentary

Fitzralph's *Sentence* commentary appears to have been influential in staking out a generally mediating position in Oxford's "Golden Age" of theology. The Ockhamists, broadly construed as those influenced by Ockham's metaphysics and epistemology, including Adam Wodeham, Robert Holcot, and, to a lesser extent, Walter Chatton and William Crathorn, made one camp, and their opponents, including Walter Burley, Thomas Wilton, and Thomas Bradwardine, led the other, although the range of thought of the period defies simple classification. Later theologians came to understand Fitzralph's position as incorporating elements of each in the establishment of a philosophical theology consonant with a traditional approach, yet sensitive to the complexities of *Moderni* thought. A thorough understanding of Fitzralph's position will only be possible with the publication of his *Sentence* commentary, though, and what follows is a very general sketch of his position.

Fitzralph was strongly influenced by Henry of Ghent in three areas. He supported Henry's belief that intellect, memory, and will are distinct within the human mind, and so serve as an image of the Trinity, his epistemic account includes species, and he distinguished between sensory and intelligible knowledge, following Henry in asserting that the human mind relies upon divine illumination for understanding. Each of these positions

runs against the Ockhamist position, which has led scholars to classify Fitzralph as among the traditionally minded critics of Ockhamism. Presently it seems clear that, while Fitzralph represents an epistemological approach representative of a generally traditional position consistent with Henry of Ghent, he was by no means the ardent theological traditionalist that Bradwardine was, as is apparent in his position regarding God's knowledge of future contingents.

The need for recognizing a distinction of some sort between memory, reason, and will is based on the traditional Augustinian understanding of our capacity to recognize the Trinity through analogy with our own mental structure. By the fourteenth century, this position did more than signify allegiance to an Augustinian view of the mind's faculties, though; it indicated a firm stand on the question of the compatibility of faith and human reason. Before Ockham, it had been a standard for Thomists and Scotists to account for the apparent conflict between unaided human reason and the Christian faith by stipulating that properly understood the truths of the faith perfect rational understanding. Regarding the analogy of the human mind to the Trinity, the relation only becomes comprehensible once the reason makes the appropriate recognition of the possibility of real distinctions. The relation of the divine persons is a distinction holding between three really distinct persons in one divine nature; this is an element of the faith, which, when recognized, allows the faithful reason to perceive a similar, but by no means identical, relation holding between the faculties within the human mind. Ockham's response was to argue that certain theological truths, foremost among them those regarding God's triune nature, so far exceed human reason as to preclude the applicability of basic logical rules. This amounts to the need for recognizing a difference in kind between faith and reason, rendering impossible the unaided reason's recognition of similarity holding between the threefold structure of the human mind and the relation of the divine persons. Hence, Fitzralph's arguments in favor of the reasonability of recognizing this similarity represent a determined opposition to Ockham's separation of theology and philosophy.

Fitzralph's defense of a species-based epistemology is another instance of this opposition to Ockhamism. Roger Bacon had constructed an epistemic model based on the apparent functioning of the eye, arguing that the objects we perceive project their actual appearance by means of species or apparent images that we perceive and that serve as the basis for our understanding of the world. Philosophers had followed this species-based epistemic model, using it as the basis for complex accounts of the apprehension, perception, conceptualization, and comprehension of objects in the world. Ockham's rejection of the species account was based on the threat of skepticism he believed it entailed; if what we perceive of an object are the species, and not the object itself, what basis is there for certainty that the species are reliable indicators of the object and its properties? Ockham rejects the species account in favor of what philosophers today would call "direct perception"; when we perceive an object, we do not perceive the appearance of the object, but the object itself. This is not to say that the eyes actively reach out in some manner to "touch" the object. Instead, Ockham believes that the object we perceive acts upon our vision, producing a veridical intuitive cognition of the object. This simplified model was popular and led to considerable discussion regarding the possibility of error; if we directly perceive the object, how to account for illusions? And given that God is sufficiently powerful to cause us to perceive what is not there, how to be certain that this does not happen with some regularity? Ockham's rejection of species was influential on Wodeham and Auriol, and those who defended species in epistemology were among the minority in mid-fourteenth-century Oxford. Hence, Fitzralph's assertion that the older model, reliant on species in accounting for human perception, puts him in the anti-Ockhamist camp, but this does not mean that his position is consonant with Aquinas or Scotus. In his argument in favor of the need for divine illumination for intellectual cognition of God and eternal truths, he rejects the Thomist argument that sense-based knowledge can lead to intellectual understanding of higher truths.

Following Henry of Ghent, he distinguishes between two kinds of illumination. In one, all human beings capable of rational understanding are given access to the higher truths of mathematics, logic, and metaphysics, but in the other, God provides the elect with an understanding of the theological truths of the faith.

Fitzralph was also active in the ongoing Oxford debates regarding motion, time, and eternity, following the lead of the Mertonian "Calculators" who had revolutionized Aristotelian physics with their attention to mathematical analysis of problems that had generally been the province of a more purely philosophical approach. The Mertonian Bradwardine, whose innovations typify the Calculators' method, was also notably Augustinian in his attitude toward Ockham in the question of predestination and human free will. Despite advocating a notably Augustinian epistemology and following the Mertonian approach in questions of physics, Fitzralph was unwilling to endorse Bradwardine's profoundly deterministic approach in refuting Ockhamist arguments regarding God's knowledge of what for us are future-contingent events. Rather than engaging in concentrated analysis of questions of kinds of necessity or distinguishing between species of grace, as was common in the ongoing debates that came to define Oxford theology in the mid-fourteenth century, Fitzralph relied on scriptural precedent alone to assert the compatibility of God's foreknowledge and human free will.

De pauperie salvatoris

By the 1350s, the Franciscan poverty controversy had evolved from its earlier focus on arguments regarding *usus pauper*, shifting to the friars doing pastoral work outside of diocesan supervision. While at Oxford, Fitzralph's attitude toward the friars may have been friendly, but when he became the Archbishop of Armagh in 1346, his opinion changed, and he developed a concerted philosophical criticism of the mendicant ideals into a collection of seven books entitled *De pauperie salvatoris*. While he held respect for their ideals of apostolic poverty and their

commitment to pastoral care, he could not understand their reasoned refusal to cooperate with the ecclesiastical hierarchy as they made use of its property. In analyzing their position, he catalogues the species of private, communal, and corporate property relations then common in fourteenth-century dialogue regarding property ownership and authority. At the same time, he developed the idea that grace alone is the justification for any instance of dominion or just lordship, which is ultimately directly associated with God's eternal lordship. Human lordship was initially shared by all, which entailed communal use and ownership of property, but the fall introduced private property ownership and a corresponding political authority, which is the hallmark of the postlapsarian world. God infuses certain instances of this lordship with grace to facilitate justice in the fallen world, although Fitzralph is not especially clear regarding the hallmarks of this grace. This theory of grace-founded lordship was influential in later political theory, most especially in the thought of John Wyclif.

Richard Kilvington

Elżbieta Jung

Department of Philosophy, University of Łódź,
Łódź, Poland

Abstract

Richard Kilvington (c. 1302–1361) (i.e., Covington, Chilingtonensis, Kaylrygton, Kyluxoton with many spelling variants exist) received his master of arts (1324/1325) and doctor of theology (c. 1335) in Oxford, where he and Thomas Bradwardine constituted the first academic generation of the school so-called Oxford Calculators, a group of philosopher-mathematicians whose discoveries led to the development of a new mathematical physics. Along with Richard Fitzralph, Kilvington was involved in the battle against the mendicant friars' privileges. Kilvington's academic career, a relatively short stint early in his life, ended when he was about 33, and launched him on the successful diplomatic and ecclesiastical trajectory. He was in service of Edward III and took part in diplomatic missions. His career culminated in his service as a dean of St. Paul's Cathedral in London. Although he originated new ideas and methods in logic, natural philosophy, and theology and influenced his contemporaries and followers, he has been little studied until recently.

All of Kilvington's philosophical works: *Sophismata*, *Quaestiones super de generatione et corruptione* (written before 1325), *Quaestiones super physicam* (c. 1326), and *Quaestiones super libros ethicorum* (before 1332) as well as his commentary on Peter Lombard's *Sentences* (c. 1334) stem from his lectures at Oxford. (Only *Sophismata* has been edited and translated. All other works are still in manuscript.) In accordance with fourteenth century Oxford practice, the number of topics Kilvington discussed was reduced to a few central and probably most important subjects. The extensive use of the *sophisma* scheme, the mathematization of ethics and theology, and a frequent consideration of hypothetical cases (*secundum imaginationem*) place Kilvington's works in the mainstream of fourteenth century English academic tradition. The application of terminist logic, and the refutation of the Aristotelian prohibition of metabasis resulted in Kilvington's broad use of logic and mathematics in all branches of scientific inquiry. Like other English thinkers, Kilvington focused on three primary disciplines: logic, mathematical physics, and a new theology based on methods and insights achieved in the first two areas. Many of the issues, he dealt with, are thus considered common to the fields of mathematics, logic, natural philosophy, and theology.

In his *Sophismata*, Kilvington mostly concentrates on supposition of terms in propositions about motion and change (especially instantaneous), increase and decrease, remission and intension, measurement and time. The first 11 sophisms deal with alteration as extrinsically limited, both at its beginning and at its end. Sophisms 29–44 reveal Kilvington's interest in local motion, debated with respect to causes (i.e., active and passive capacities) and with respect to effects (i.e., time, distance traversed, and speed in motion). Thus, he can be placed among the fourteenth century pioneers who considered separately the problem of local motion with respect to the causes (*tamquam penes causam*), and with respect to the effects (*tamquam penes effectum*). He considers both uniform motion, that is, a

motion with equal speed and difform motion, either with equal or unequal acceleration, caused by voluntary and natural agents. He sees the possibility of measurement of instantaneous speed in comparison to speed in uniform and accelerated motion. The last four sophisms address epistemology and the logic of knowledge, dealing with the sentences on knowing and doubting.

In his questions on generation and corruption and in his *Physics*, Kilvington works, basically, to establish differences between generation, alteration, and augmentation; to determine the rules for action of causes of changes; and to find rules for a division of different types of *continua*. Like most medieval natural philosophers, Kilvington accepts the Aristotelian statements that “everything which is moved is moved by something” and that “there cannot be a motion without an acting capacity (*virtus motiva*) and a passive one (*virtus resistiva*)”; without resistance, the motion would not be temporal. Motion occurs whenever the ratio of an acting capacity (a force) – F to passive capacity (a resistance) – R is a ratio of *maioris inequalitatis*, that is, when the ratio of F to R is greater than 1:1. Thus, Kilvington affirms that every excess of a force over the resistance suffices for motion, what means that ever a force is greater than the resistance there is a motion. This grants that a force is bounded by a minimum upon which it cannot act (*minimum quod non*), that is, by the resistance, which is equal to a force. Since when a force is equal to the resistance, the ratio of F to R is 1:1, and in such case there is no motion. For a passive capacity, Kilvington accepts the *minimum quod sic*-limit “with respect to circumstances.” He is in accord with Aristotle and claims that to establish a limit for Socrates power of vision (a passive one), we should point to the smallest thing we can see. It happens, however, that we can see not only a small thing like a grain, but also a big one, like a cathedral, if we are close to it. Therefore, not in every case can a passive capacity be described by a *minimum quod non*.

The action of an active capacity upon a passive one that results in motion is already described in Book 7 of Aristotle’s *Physics*. A new

understanding of the Euclidean definition of double proportion, however, stimulated the most useful innovation of the fourteenth century, making it possible to reformulate Aristotle’s rules of motion. In order to produce a mathematically coherent theory, Kilvington insists that the proper way of measuring speed of motion is to describe its variations by double ratio of force and resistance as defined by Euclid, that is, as a duplication of the proportion itself. Speed thus varies arithmetically, while the proportions of force to the resistance determining speed vary geometrically. (So, when proportion of force to resistance is squared, speed will be doubled.) This new function provides values of the ratio of F to R greater than 1:1 for any speed down to zero, since any root of a ratio greater than 1:1 is always itself also a ratio greater than 1:1. And thus Kilvington avoids a serious weakness of Aristotle’s theory, which cannot explain the mathematical relationship of F and R in slow motion, where speed is less than 1.

In theology, Kilvington applied new methods from logic and mathematical physics to typical fourteenth-century problems. He is mostly interested in issues concerning human and God’s love, fruition, human will and freedom, God’s absolute and ordained power, and God’s knowledge of future contingent. All theological problems are analyzed in “modern” language of terminist logic. None of these issues is considered separately from the Creator, therefore Kilvington relates each human action to God. The established order of nature is a result of God’s ordained power, but God can act against the established order with his absolute power. Both God’s powers are absolutely (*simpliciter*) infinite, but God’s absolute power is infinitely greater, that is, more capable to act, since thanks to this power, says Kilvington, God might undo the past or annihilate the world. But there are also actual, “dependent” (*secundum quid*) infinities created by God, such as intensively infinite capacity of a human soul to love, to joy, and to suffer. Like Duns Scotus, Kilvington claims that God’s knowledge, existence, and will are His essence. Therefore, with regard to God’s absolute knowledge assertive

statements about past and present, and contingent statements about future has the same value of certitude, since they have absolute necessity, which refers only to God. With regard to His ordained knowledge, such statements do not have the same value of certitude, and they have only ordained necessity, which refers to the natural, ordained law. Everything revealed absolutely by God happens with absolute necessity, because otherwise He could make Himself incapable to pick up a blade, and this is impossible, because it is a contradiction. Everything revealed by God's ordained power depends on God's absolute will and can be changed. But once changed and revealed it would have ordained necessity forcing, thus, a new law.

Kilvington defends the superiority of the will within moral action, underlining that by free will a human need not sustain a prior choice, or even make any choice at all. But even if an individual makes no choice, this is also a free choice. The cooperation of will and grace, a gift of the Holy Spirit, results in meritorious acts. Grace has an infinite capability to act upon the will, but only in this sense that it is able to decrease continuously the resistance of the will and make it more ready to cooperate, and not that grace infinitely increases its own activity. A lack of knowledge or ignorance does not excuse wrong or sinful choices of the will.

Kilvington's teachings on logic, natural philosophy, and theology influenced both English and Continental thinkers. Richard Bilingham, Roger Roseth, William Heytesbury, Adam Wodeham, Richard Swineshead, John Dumbleton, Adam Junior, and Roger Swineshead were among those English scholars who benefited from Kilvington's works. Kilvington's works also influenced Parisians like Nicholas Oresme, John Buridan, John Mirecourt, Johannes de Burgo, and Thomas of Cracow. Thomas Bradwardine, however, was the most famous beneficiary of Kilvington's questions on motion. In his renowned treatise on the velocities in motion (*Tractatus de proportionibus velocitatum in motibus*), Bradwardine included most of Kilvington's fundamental arguments for the new law of motion describing the relation of forces and resistances.

Richard of Campsall

Henrik Lagerlund

Department of Philosophy, Stockholm University,
Stockholm, Sweden

Abstract

Richard of Campsall (c. 1280–1350) was an English Master of Arts and Theology at Oxford. He wrote a very influential commentary on Aristotle's *Prior Analytics* and influenced later English theology. Very few of his works have survived.

Not much is known about Richard of Campsall, and very little written by him has survived to this day or perhaps still lies in manuscripts undiscovered in some library. He was, however, a fellow of Balliol College in Oxford while studying arts in the very early years of the fourteenth century. Later, as a Regent Master of Arts, he was a fellow of Merton College between 1307 and 1308. He seems to have finished his question commentary on Aristotle's *Prior Analytics* – his earliest logical work – before his regency. He lectured on the *Sentences* of Peter Lombard in 1316–1317 and was the Regent Master of Theology at Merton College after 1322. The date of this death is very uncertain, but some have suggested that he died sometime between 1350 and 1360.

The only surviving complete work, alongside some minor treatises, is his commentary on the *Prior Analytics*. He was, however, very well known in England in the early fourteenth century and is referred to in many theological works of the time. He seems also to have influenced William of Ockham and a whole range of later English thinkers on both logic and theology.

One of the major debates in early fourteenth-century England was about the nature of intuitive and abstractive cognitions. Campsall played an important role in this debate. He argued that there is no need to posit a real distinction between intuitive and abstractive cognitions – one and the same cognition can fulfill both functions. He argued instead that a cognition is intuitive simply if the object it is about is present and it is abstractive if the object is absent. This view was rejected by both Ockham and Walter Chatton.

Campsall's commentary on the *Prior Analytics* is important primarily because he seems to be the first commentator, as far as we know, to systematically apply the distinction between modal sentences taken in a composite (*in sensu composito*) and divided (*in sensu diviso*) sense to Aristotle's modal syllogistics (the distinction roughly corresponds to what we now call *de dicto* and *de re* modal sentences). This distinction, which was not used by Aristotle himself, was known at least since Abelard, but it had not been used systematically before Campsall. This is a very important development in the history of

logic, since applying this distinction to Aristotle's logic opens up whole new perspectives and ultimately changes the original system. Campsall thus stands on the threshold of a whole new logic, which later fourteenth century authors like Ockham and John Buridan developed.

Richard of Middleton

Richard Cross

Department of Philosophy, University of Notre Dame, Notre Dame, IN, USA

Abstract

Richard of Middleton, Franciscan Friar, was born in or before 1249. He became Master of Theology at Paris in 1284, where he presided over one regular and three quodlibetal disputations. He edited his *Sentence* commentary between 1285 and 1295. He probably died in 1307/1308. His thought owes much not only to Bonaventure and the Franciscans of the 1270s and 1280s, but also to Henry of Ghent and Thomas Aquinas. Richard's metaphysics and theory of cognition are largely Aristotelian, whereas his natural philosophy tends to follow the more eclectic trends of his Franciscan *confrères*. Thus, he affirms both the plurality of substantial forms in one substance and universal hylomorphism. His most distinctive doctrines are that degrees of a quality can be construed in quantitative terms, and that substantial forms admit of degrees, a view that he uses to explain how material substances are composed of the four elements.

We know very little of the life of the Franciscan Richard of Mediavilla. Traditions dating back to the early sixteenth century have Richard as an Englishman, possibly based on the probable misidentification of Richard as the canon lawyer Ricardus Anglicus (a misidentification encouraged by Richard's evident familiarity with a great deal of

canon law). But Louis-Jacques Bataillon has recently shown that Richard was from Menneville (in Picardy), not one of many possible Middletons. He became Master (Professor) of Theology at the University of Paris in 1284. Given that one canonical requirement for promotion to a professorship in Theology was to be 35 years old, we can infer that Richard was born sometime before or during the first 8 months of 1249. In 1278, he began the statutory 2 years of lectures on Lombard's *Sentences* at Paris. In 1283, while still Bachelor of Theology, the Minister General of the Franciscans, Bonagratia, appointed him to serve on a commission of seven theologians whose remit was to examine propositions from the works of the Spiritual Franciscan Peter John Olivi. The result – the so-called *Rotulus* – was the condemnation of Olivi's works in 34 propositions on a range of theological topics. In all probability, Richard produced his set of 45 *Quaestiones disputatae* in 1284, followed quickly by three *Quodlibeta* (1284–1285, 1285–1286, and 1286–1287, respectively). He worked on the revision and publication of his *Sentences* commentary between 1285 and 1295 (in book 4 he mentions a “recent” privilege granted to the Franciscans – that is, the Bull *Ad fructus uberes* of Celestine V, November 27, 1294; but he makes no mention of Boniface VIII's important *Liber sextus decretalium* of 1298). The 1304 stationers' lists in Paris show that an exemplar of Richard's *Sentences* commentary was published and was available for hire (the standard way of disseminating and copying university texts in early fourteenth-century Paris). He should perhaps be identified as the R. de Mediavilla who became Provincial Master of the French Franciscans on September 20, 1295. An ordered list of the deaths of Franciscan Masters of Theology places Richard between Walter, Bishop of Poitiers (who died in 1307), and Duns Scotus (who died in 1308). So it may be that his death occurred in one or other of these 2 years.

Richard's thought owes much to his three great predecessors, Bonaventure, Aquinas, and Henry of Ghent, and he eclectically synthesizes from all three, rejecting where he sees fit. The result is nevertheless a coherent and impressive whole, analytically incisive, one that continued to be

regarded as authoritative into the fifteenth century. Richard was even invoked in interventions at the Council of Trent.

Richard follows Thomas Aquinas in adopting a very attenuated form of realism on the question of universals: common natures have no reality independent of their instantiations, but are nevertheless “multiplied” in the particulars that instantiate them. Following Henry of Ghent, Richard explains individuation in terms of a merely negative feature: the negation of divisibility. But Richard explicitly rejects what he takes to be Henry's teaching on the common nature, namely, that common natures have some sort of reality independent of their instantiations, as objects of divine cognition distinct from the divine essence. Richard posits a merely rational distinction between a thing's essence and its existence: to talk of a thing's existence is simply a way of drawing attention to the fact that it has a relation to divine efficient causality. Richard follows Henry of Ghent in holding that the various concepts of being (*ens*, *esse*) are analogical, including no common concept. *Ens* is the first object of the human intellect, but, following Bonaventure, Richard maintains that the transcendental property of goodness is prior to that of being.

Richard agrees with Aquinas' Aristotelianism in rejecting a role for divine illumination in all human cognition, accepting instead that human knowledge derives from the senses. The universal concept exists potentially in the phantasm, and is abstracted by the agent intellect. This abstract mental content is impressed in the possible intellect and actualized in occurrent cognition – the expressed species or mental word. Richard accepts too that our knowledge of God is derived empirically, on the basis of arguments from cause and motion, and he rejects Bonaventure's appropriation of Anselm's ontological argument.

Given that goodness is higher than being, Richard argues that the will is a higher power than the intellect. The will is a self-mover, with the liberty of indifference – granted the condition that the will can only choose when there are reasons for an action: the will can choose between different actions given that each of the actions has some rational motivation. But talk of powers

requires some care here: Richard follows Henry in supposing that talk of intellect and of will are simply ways of talking about the fact that the soul can be related to different sorts of object. (So strictly, the soul is a self-mover with the liberty of indifference, in relation to the different kinds of things it can do; and it is a more perfect function of the soul to be able to choose than it is for the soul to be able to cognize).

There are various novel features of Richard's natural philosophy, the area in which he made perhaps his most significant contributions. For example, he proposed a new account of increase and decrease in the degrees of a quality. He suggests that we should think of such changes on the analogy of quantitative changes: each degree of a quality represents an "amount" of that quality – a *quantitas virtutis*, opposed to the extension of the substance in which the quality inheres: *quantitas molis*. Increases and decreases in the intensity of a quality are understood in terms of changes in the quality's *quantitas virtutis*. As Richard sees it, lower degrees of a quality are in potency to higher degrees – a position he derived from Henry of Ghent. Higher degrees actualize this potency, and this actualization relation is required to explain how it is that degrees of a quality have some kind of intrinsic unity, just as the potency-actuality relation between matter and substantial form explains the unity of a substance composed of matter and form. Scotus took up Richard's quantitative understanding of the degrees of a quality, though he rejected the potency claim that Richard borrowed from Henry.

Richard followed the standard Franciscan line, against Aquinas, in accepting a plurality of substantial forms in animate substances, something he took to be required to explain the generation and corruption of such objects. In addition to this, he posited a novel theory of matter, one designed to accommodate Aristotelian accounts with more standard Franciscan ones. According to these latter accounts, matter must have some actuality all of its own if it is to persist through substantial change. Richard accepts that there is such matter and that it is what enters into composition with

substantial forms as the constituents of a material substance. But he holds that there is a more Aristotelian sort of matter too: pure potency from which forms are "educated." This pure potency somehow inchoately contains the forms which are educated from it, and Richard posits it in order to circumvent the worry that forms are created *ex nihilo* when they begin to enter into composition with matter. Richard posits too a third kind of matter, proper to angels: incorporeal, unextended matter. The idea is that an angel is a self-mover, and anything that is a self-mover must include active and passive components (form and matter): the active component is what moves something, and the passive component is what gets to be moved.

A further distinctive feature of Richard's natural philosophy is his belief that substantial forms, as well as certain accidental ones, admit of degrees. One standard problem in Aristotelian physics is to provide an account of the way in which the four elements exist as components of material substances. Richard's solution has two stages. First, since substantial forms admit of degrees, elements can be educated to greater or lesser degrees from the potency of matter. Secondly, although fully blown instances of the elements are incompatible with each other, lesser degrees are not: they can interpenetrate and thus compose different kinds of things. In the background here is Averroes' view that nonelemental substances include the elements and their distinctive qualities in a remitted or fragmented state.

In addition to this, there is considerable evidence that Richard paid great attention to empirical experience and to inductive arguments made on the basis of such experience: something which is taken to be evidence of his having spent some time in Oxford.

Richard of St. Victor

John T. Slotemaker

Department of Theology, Boston College,
Chestnut Hill, MA, USA

Abstract

The writings of Richard of St. Victor contain exegetical, mystical, and theological texts. The exegetical writings of Richard are grounded in the works of Hugh of St. Victor. These exegetical writings support an ambitious project of tracing the soul's spiritual ascent – and its objects of contemplation – as the soul ascends from imagination to reason and finally beyond reason. This spiritual project culminates in Richard's systematic treatise on the Trinity, in which he considers the nature of the Triune God as the highest level of the soul's spiritual contemplation.

Richard of St. Victor (d. 1173) was a member of the Augustinian canons regular at the Abbey of St. Victor, located on the left bank of the Seine just outside the city walls of twelfth-century Paris. Richard probably arrived at the Abbey after the death of Hugh (1141) in the 1150s, and he follows Hugh closely in his exegetical, mystical, and theological writings. Richard was elected sub-prior of the abbey in 1159 and prior in 1162, spending much of his time as prior under the problematic abbacy of Gilduin.

Richard continued the intellectual program begun by Hugh of Saint Victor, employing a similar exegetical method and operating within the same intellectual framework as Hugh. This is evident in Richard's reliance on Augustine of Hippo, and his own intellectual debt to Hugh. But, given these similarities, Richard's own works are more “scholastic” in nature. The methodological approach of Richard's *De trinitate* and his reliance on Anselm's concept of “necessary reasons” anticipate certain late twelfth- and early thirteenth-century developments in trinitarian

theology. Richard's works are collected in *Patrologia Latina* 196 and are currently being edited in modern critical editions.

Exegetical and Spiritual Writings

The influence of Hugh's *Didascalicon* on Richard is significant, as he relies on the division of the sciences and theory of exegesis that Hugh established. This is evident in Richard's *Liber exceptionum* and *De Emmanuele*: the former is an introductory work of Scriptural exegesis, the latter a significant response to the "Judaizing" exegetical practices of the students of Andrew of St. Victor. Richard's theory of exegesis is perhaps best approached through two of his most influential tropological and spiritual works: *De duodecim patriarchis* (*The Twelve Patriarchs*/also referred to as *Benjamin minor*) and *De arca mystica* (*The Mystical Ark*/also referred to as *Benjamin major*).

The Twelve Patriarchs is a tropological and spiritual exegesis of the Genesis account of Jacob, his four wives (Leah, and her handmaiden Zelpha; Rachel, and her handmaiden Baal), and their twelve offspring (patriarchs). The work is an analysis of the soul's affective and rational powers: Jacob representing the rational soul, with Leah and Rachel symbolizing affection (*affectus*) and reason (*ratio*) respectively. The other aspects of the rational soul are represented by Zelpha and Baal, who symbolize bodily sense and imagination. Further, the 12 sons of Jacob represent various aspects of the above rational powers: (1) Leah's six sons represent the virtues that discipline the will; (2) Zelpha's two sons represent the governing of deeds; (3) Rachel's two sons represent contemplation and asceticism; (4) and Baal's two sons represent the governing of thoughts. For Richard, when the soul's affective and rational powers (four wives) are properly governed by their respective virtues (12 children/patriarchs), the soul is properly ordered and fit for contemplation.

Richard develops in *The Twelve Patriarchs* a sophisticated philosophical psychology that is

substantially expanded in *The Mystical Ark*. The latter work, influenced by the Pseudo-Dionysius' *Celestial Hierarchy*, lays out six degrees of contemplation; the first two degrees are located in the imagination, the second two in reason, and the final two transcend reason. The work traces the soul's spiritual ascent and the various objects of speculation that are present to the soul in its ascent. The result is an epistemological as well as spiritual analysis of the human soul and its objects of knowledge and contemplation.

Theological Speculation

Richard's longest and most theologically sophisticated work is his *De trinitate*, a book that is best understood as building on the program of the soul's ascent described in the *Twelve Patriarchs* and *The Mystical Ark*. Richard's *De trinitate* is known for three aspects: (1) a redefinition of the Boethian definition of person; (2) his argument or "proof" of the Trinity from love in book 3; and (3) his emphasis on a "social Trinity." These three generalities, while not entirely misleading, must be considered within the work as a whole and as part of Richard's larger mystical and theological project.

The *De trinitate* is divided into six books of twelve chapters each. The prologue and the introductory section of the work is largely methodological and essential to locating the work within Richard's spiritual and epistemological writings (*De trin.* Prol.-1.10). Within the schema laid out in the *Mystical Ark*, Richard argues in this methodological discussion that the analysis of the Trinity belongs to the fifth and sixth stages of the soul's ascent and therefore transcends reason. The second section of the work, which concludes book I (*De trin.* 1.11–1.25), is an exposition of the divine unity. Richard focuses on the supremacy and unity of the Divine nature. Book II is an analysis of the attributes of God: eternal, immutable, immeasurable, etc. This discussion also considers the attributes of power and wisdom (*potentia/sapientia*), anticipating the discussion

of the personal properties in chapter V. After considering the divine unity Richard turns to the plurality of the divine persons in chapter III, offering an “argument” for the necessity of the divine persons grounded in the nature of divine love. Richard’s argument, within the context of the prologue, must be understood as transcending reason in the soul’s ascent to God, and not as an Aristotelian demonstration. The fourth book considers the correlation of the divine unity and plurality as expounded in the terms person and existence – offering in conclusion a redefinition of the concept of person as used in trinitarian discourse (*singularem aliquem rationalis existentie, De trin.* 4.24). Book V continues the analysis of the Divine persons and their personal properties. This discussion is significant for Richard’s reluctance to follow Hugh in appropriating power, wisdom, and goodness (*potentia, sapientia, benignitas*) to the Divine persons, given the critique of Abelard’s use of this triadic structure by theologians like Gautier of Mortagne (PL 209, col. 573–590; see also Richard’s *De tribus appropriatis personis in trinitate*, PL 196, col. 991–994). In the final book, Richard considers the divine processions and locates the distinction of persons in the processions of the Son and the Holy Spirit from the Father.

Richard’s trinitarian theology is significant historically because of his emphasis on, and divergence from, certain aspects of the Augustinian tradition. His influence is evident in the trinitarian theology of Bonaventure and Henry of Ghent and their emphasis on the divine processions. This focus on the divine processions is followed by numerous Franciscan authors in the thirteenth and fourteenth centuries, including John Duns Scotus who also adopts Richard’s definition of person in trinitarian discourse.

Richard Rufus of Cornwall

Jennifer Ottman and Rega Wood
Department of Philosophy, Indiana University,
Bloomington, IN, USA

Abstract

Richard Rufus of Cornwall was a scholastic philosopher-theologian who flourished between 1231 and 1256. He lectured at Paris on the newly rediscovered Aristotelian *libri naturales*, most importantly on Aristotle's *Metaphysics*. Subsequently, as a Franciscan, he lectured on theology at Oxford and at Paris. At the start of his career, he was most influenced by Averroes, but within a few years he wrote a treatise disputing many of Averroes' views, particularly on the divine intellect and on individuation. In theology, Rufus' dispute with Richard Fishacre set the stage for generations of controversy between Franciscans and Dominicans on the nature of the will. Nonetheless, his works were unremarked and mis-attributed for centuries after 1350. But though the rediscovery of his works did not begin until 1926, Rufus' influence on Roger Bacon, Albert the Great, and John Duns Scotus has already been documented.

Biographical Information

Richard Rufus of Cornwall's first appearance in the historical record is his entrance into the Franciscan order in Paris, probably as a master of arts, about 1238. He made his profession in England and lectured on the *Sentences* at Oxford around 1250 and at Paris around 1253–1255. He became the fifth Franciscan regent master in theology at Oxford in 1256, succeeding Thomas of York, and is last heard of in November 1259, as the recipient of the bequest of a habit. Most of the information we have about him comes from Franciscan sources: Adam Marsh, Thomas Eccleston, and Roger Bacon. Marsh tells us that Rufus was brilliant and beloved by all. Eccleston lists him as

the fifth Franciscan lector in theology at Oxford. According to Eccleston, Rufus was a master famous at Oxford and at Paris who brought acclaim to the Franciscan order when he joined the order at Paris. Roger Bacon agrees that Rufus was famous, but claims that this was only with the foolish multitude; the wise considered him insane (Raedts 1987, pp. 1–10).

His major works fall into two broad categories: the Aristotelian commentaries originating in his teaching career in the Parisian arts faculty before 1238 and the theological works of his later years. The Aristotelian commentaries can only be loosely dated in relative terms, but the earliest, perhaps ca. 1231–1235, seem to be the *Memoriale in Metaphysicam*, a set of brief questions, and a commentary on the *Posterior Analytics*, only a fragment of which survives. They were followed by commentaries on the *Physics* and *De generatione*, ca. 1232–1236, and on the *De anima*, subsequent to the *Physics*, and then by the *Scriptum in Metaphysicam*, a lengthy and highly developed work, ca. 1237–1238 (Lewis and Wood 2011, pp. 49–54; Wood 2001, pp. 153–155; Wood and Andrews 1996, app. 1, pp. 341–343). The major theological works ascribed to Rufus are two *Sentences* commentaries. The earlier of the two, referred to here as the Oxford commentary, is dated to Oxford around 1250 (Raedts 1987, pp. 20–39; Wood 1992, pp. 258–262). The second commentary, referred to here as the Paris commentary, is an abbreviation of Bonaventure's *Sentences* commentary with significant additional material, some but not all of it drawn from the Oxford commentary; it post-dates Bonaventure's completion of his own commentary about 1253, but probably not by very long (Raedts 1987, pp. 40–63; Wood 1992, pp. 262–263). There are also a handful of disputed questions and short independent treatises, both philosophical and theological. The two most important of these are the *Contra Averroem*, which follows the *De anima* commentary and precedes the *Scriptum in Metaphysicam*, and the *Speculum animae*, which follows the *Scriptum* and precedes the Oxford *Sentences* commentary (Etchemendy and Wood 2011, pp. 83–104).

The attribution of all these works to the same author has been the subject of scholarly debate, as has their dating. One source of difficulty is that the Oxford *Sentences* commentary's use of the *Scriptum in Metaphysicam*, while extensive, is not unambiguously classifiable as authorial reuse. Not only does the *Sentences* commentary recite the opinions put forward in the *Metaphysics* commentary in the third person, ascribing them to "philosophers," but more difficult to explain, the author of the *Sentences* commentary more than once comments (in the first person) that he simply does not understand the *Metaphysics* commentary's positions. Peter Raedts (1987, pp. 94–105) concludes in his study of Rufus' place in the history of Oxford theology that the two works could not be by the same person, with the consequence that he assigns the *Sentences* commentary to the Cornish Franciscan and the *Metaphysics* commentary to an unknown author. Timothy B. Noone (1989), in reply to Raedts, agrees on the nature of the problem but argues for the opposite solution, crediting Rufus with authorship of the *Metaphysics* commentary, which he places at Oxford in the 1240s, and judging the authorship of the *Sentences* commentary unproven. Rega Wood (1992, pp. 257–258; 1994, pp. 89–92), following a suggestion previously made by Gedeon Gál (1975, 137n6), believes that both works are by Rufus, but that the *Scriptum in Metaphysicam* was written before Rufus entered the Franciscan order, so that the apparently strange form of self-reference is an expression of Rufus' Franciscan humility and his desire as a friar and theologian to distance himself from his earlier secular career.

Silvia Donati (2005) also accepts the attribution of both the Oxford *Sentences* commentary and the *Scriptum in Metaphysicam* to Rufus, but she finds no convincing external reasons to attribute *In Physicam* and several of the other Aristotelian commentaries to Rufus and significant doctrinal reasons to reject the attribution. In her view, the similarities of both style and doctrine among *In Physicam*, *In De generatione*, *In De anima*, and *In Analytica posteriora* make it plausible that these four works do have a single author, but that author is unlikely to be Rufus. Wood's

(2009) reply to Donati, defending the attributions, argues that Donati is too quick to read these early works in the light of later authors, rather than on their own terms, and too quick to see doctrinal inconsistency where Wood sees differences in context, doctrinal development, or the creative exploration of ultimately rejected solutions (see also Lewis and Wood 2011, pp. 17–48). Since the editing and publication of these works is not complete, this debate will no doubt continue; for the purposes of this article, however, it will be presumed that Rufus is the author of all the works discussed here.

Thought

As one of the first Latin authors to teach Aristotle's newly rediscovered natural philosophy in the 1230s, Rufus engaged extensively with the works of Aristotle's great Arab commentator Averroes, both as a guide to Aristotle and as a thinker in his own right. In his first *Metaphysics* commentary and in his *Physics*, *De anima*, and *De generatione* commentaries, Rufus was most strongly influenced by Averroes, whose views he generally adopted, but even at this stage, his approach to Averroes was not uncritical. Unlike Bacon, he had little interest in Avicenna and other Arab authors (Lewis and Wood 2011, pp. 61–63; Noone 1997, pp. 254–255; Wood 2007). Like Rufus, Bacon lectured at Paris on the newly introduced *libri naturales* before becoming a Franciscan: Rufus in the 1230s and Bacon in the 1240s. Not surprisingly, Bacon was both influenced by Rufus and rejected some of the views Rufus stated, including his views about the logic of empty classes and real names, about divine ideas and the agent intellect, and about the eternity of the world, projectile motion, and place; perhaps more surprisingly, Rufus was sometimes readier to disagree with Aristotle and Averroes than Bacon was (Wood 1994, 1997).

Possibly influenced by Robert Grosseteste, late in his secular career Rufus began to move away from Averroes. His *Contra Averroem* was designed to refute Averroes' views on divine knowledge and on individuation (Karger 1998),

while in his *Scriptum in Metaphysicam* Rufus cited Grosseteste as “a man most excellent in knowledge” (*vir excellentissimus in scientia*), a striking deviation from the standard medieval practice of referring to contemporaries merely as anonymous *quidam* or *aliqui* (“some people”) and one that testifies to his high regard for Grosseteste. Notably, though Bacon in his late works presented himself as the defender of an older tradition exemplified by Grosseteste, in opposition to what Bacon claimed were the dangerous novelties propagated by Rufus, Rufus’ *Scriptum* shows far greater appreciation of and engagement with Grosseteste’s works than Bacon’s questions on the *Metaphysics*. On the interpretation of Aristotle’s views on the eternity of the world, the possibility of a multiplicity of eternal truths, and divine knowledge of future contingents, the differences between Rufus and Bacon can be traced back to Rufus’ more extensive use of Grosseteste (Noone 1997).

As an Oxford bachelor of theology, Rufus continued to rely on Grosseteste’s works but also drew on the works of his Franciscan predecessors at Paris, the *Sentences* gloss of Alexander of Hales and the *Summa* compiled under Alexander’s name. Leading patristic authorities were Anselm of Canterbury, Bernard of Clairvaux, Hugh of St. Victor, and especially Augustine. Most immediately, however, Rufus was responding to Richard Fishacre, the Dominican master of theology responsible for the earliest surviving Oxford *Sentences* commentary. Rufus reused large portions of Fishacre’s commentary in his own work while also regularly criticizing Fishacre’s views. Fishacre himself may have known some of Rufus’ earlier work (Wood 2002, pp. 328–336), but the two men had fundamentally different approaches to their task. Where Fishacre sought to justify what was at the time the curricular innovation of lectures on the *Sentences* by characterizing the *Sentences* as a branch of Scripture, Rufus did not hesitate to draw a sharp line between the two, or to relegate the *Sentences* to a subordinate position. Reflecting Grosseteste’s influence, Rufus claimed that commenting on Lombard was not doing theology, since Scripture is by itself the complete and perfect theology and requires

no summary. His lectures were rather an attempt to elucidate some obscure statements subordinate to theology (Raedts 1987, pp. 122–151; Wood 2002, pp. 292–300).

At the same time, and perhaps precisely because he did not feel the need to tie his lectures on the *Sentences* as closely to the theologian’s traditional task of Scriptural exegesis as Fishacre did, Rufus felt free to bring his knowledge of Aristotelian logic and natural philosophy, more extensive than Fishacre’s, broadly to bear, even as he sought to minimize solely philosophical excurses, in part by referencing his earlier philosophical works, such as the discussion of individuation in his *Contra Averroem* (Wood 2002, pp. 336–337). On controversial questions like the plurality of forms in the human soul (Callus 1939), he drew sharp distinctions between philosophers’ and theologians’ views. As in his Aristotle commentaries, he was especially interested in questions raised by the text itself, whether apparent ambiguities or contradictions within the *Sentences* or objections that might be raised on other grounds, sometimes based on philosophical principles and sometimes on the additional patristic quotations he regularly supplied. He then deployed the same resources in the attempt to resolve these questions, producing an important work that influenced John Duns Scotus. Among the more interesting questions Rufus addressed was the nature of the human will, on which his reply to Richard Fishacre anticipated the long dispute between Franciscans and Dominicans about whether the will should be seen as primarily a volitional or an intellectual faculty (Raedts 1987, pp. 201–221).

In his second commentary on the *Sentences*, Rufus took Bonaventure’s *Sentences* commentary as the basis for his own work, most often abbreviating and digesting Bonaventure’s massive commentary for the benefit of his own students. As a result, Rufus’ Paris commentary is for long stretches more classically scholastic in form, reproducing the tight structure of Bonaventure’s carefully organized disputed questions. Nevertheless, Rufus disagreed with Bonaventure where he felt it necessary, not least where he felt Bonaventure’s opinion lacked

sufficient patristic support. He sometimes substituted his own solution for Bonaventure's and sometimes offered it as an alternative, and he also abandoned Bonaventure entirely on occasion, taking up questions Bonaventure did not explore. Typically Rufus' own contribution is briefer than his presentation of Bonaventure's views. However, Rufus' critical comments on Bonaventure were incisive and exercised an independent influence – on Robert Kilwardby, for example (Wood 2002). Bonaventure himself, moreover, seems to have been influenced on occasion by Rufus' Oxford *Sentences* lectures (Wood 2002, pp. 317–319, 338–339) and also to have known some of his other works (Wood 1992, pp. 268–270; 1994, pp. 98–99). Like his more famous fellow Franciscan William of Ockham, Rufus generally sought to minimize the number of metaphysical entities posited to explain any given phenomenon, a habit that roused the critical ire of at least one medieval reader of his Paris *Sentences* commentary, but one that is closely connected to his origination of the formal distinction, credited to “ancient doctors” (*antiqui doctores*) by its most influential proponent, the likewise Franciscan John Duns Scotus (Gál 1975). His views on individual forms directly influenced Scotus (Wood 1996).

Perhaps no less significant for the development of early scholasticism is Rufus' influence on the next generation of secular arts masters at Oxford. Both Adam Buckfield and Geoffrey Aspill knew Rufus' Aristotelian commentaries well and drew on them for their own work, as did a number of anonymous authors associated with one or another of these masters. Rufus' *Physics* commentary was probably used by Buckfield (Donati 1998, pp. 136–142) and was clearly influential on the broader body of later English commentators, at least two of whom quoted Rufus extensively (Trifogli 2000, pp. 31–33). Rufus' rejection of actually infinite magnitude (Trifogli 2000, pp. 95–99), his explanation of the immobility of place through the immobility of the celestial nature (Trifogli 2000, pp. 171–175), his view that the place of the heavens is their outermost surface (Trifogli 2000, pp. 197–202), and his arguments for the extramental reality of number

and time (Trifogli 2000, pp. 223–225) are only some of his opinions that would find an echo in later authors. His views on place seem to have remained familiar in Paris as well, where they may have been known to Thomas Aquinas (Wood 1994, pp. 124–126). Rufus' *De generatione* commentary was used by Bacon, Buckfield, Aspill, and several anonymous authors (Lewis and Wood 2011, pp. 8–11, 84–97). Aspill's questions on the *Metaphysics* adopted Rufus' reductionist account of the unity of being, and while Aspill rejected Rufus' views on the difference between the metaphysician's and the logician's treatment of being, the analysis of this difference that he developed in response to Rufus became a constitutive element of a distinctively English commentary tradition extending down to Scotus (Donati 2014).

Rufus' theory of appellative terms, as developed in his *Scriptum in Metaphysicam*, influenced Buckfield, Albert the Great, and several anonymous authors (Wood 2008–9). For Rufus, appellation is the function of predicates and refers to forms, while supposition is the function of subjects and refers to form-matter aggregates, but since the same term, a noun such as “human being” (*homo*), can refer to both forms and aggregates and to both universals and individuals, the problem is to determine just what is being referred to any given case. In Rufus' theory, each such appellative term has two significates, each of which in turn has two modes. The primary significate is a form, which may be considered either as it is distinct from its appellates or as it is multiplied in them. In the former case, it is a universal in the soul; in the latter, it is a substantial quality instantiable in and predicable of multiple individuals. The secondary significate is a form-matter aggregate, which similarly may be considered either as it is distinct from its suppositos or as it is multiplied in them. In the former case, it is the nonindividual subject of definition; in the latter, it is the individual subject of propositions, from a logical perspective, or the extramental aggregate individual, from an ontological one. Crucially, this was for Rufus not only a logical theory about the meaning of terms, but just as much an ontological one about what it is that links mental

concepts and extramental objects and allows us to rely on a degree of real correspondence between the two.

This last aspect of the problem was further developed in a brief epistemological treatise written after the *Scriptum* and prominently referenced in the prologue to the Oxford lectures on Lombard, a work entitled *Speculum animae* in the manuscript that preserves it (Etchemendy and Wood 2011). The *Speculum* was Rufus' exposition of Aristotle's claim in *On the Soul* (3.8) that "the soul is in some manner all things." In it Rufus distinguished between the proximate and remote objects of apprehension. The remote objects are nature forms properly classified in the Aristotelian categories, while the proximate objects of apprehension are species forms not included in the Aristotelian categories. It is as it is actualized by species forms that the soul is all things, according to Rufus. Thus Rufus did not consider Averroes' version of the barrenness claim – namely, that the soul cannot receive a form it already has – a problem for self-understanding, since the form understood differs ontologically from its nature form (Normore 2007, pp. 128–129).

As Bacon noted, Rufus was famous not only in his own lifetime but for about 50 years after the presumed date of his death in about 1260. However, after 1350 Rufus was no longer cited, and his works were not rediscovered until the twentieth century. They exercised only an indirect influence on later scholasticism not just because their discussions were brief and not fully adumbrated but also because Rufus' commitment to intellectual humility led him not to name his own works even when quoting from them. Nonetheless, Rufus is an important figure in the history of scholasticism both because of his brilliant arguments and because he played an important role in setting the agenda for later scholasticism.

Richard Swineshead

Edith D. Sylla

Department of History, North Carolina State University, Raleigh, NC, USA

Abstract

Richard Swineshead (fl. c. 1340–1355, Oxford, England) is most famous as the author of the *Book of Calculations* (*Liber calculationum*), which treats various topics of natural philosophy using a mixture of logic and verbal mathematics. The book was apparently meant to support students in the Arts Faculty at Oxford who were taking part in required disputations.

Biographical Information

“Richard Swineshead” is here taken to be the name of the author of the well-known *Book of Calculations* (*Liber calculationum*), produced at Oxford University probably in the fifth decade of the fourteenth century. Because of his identification with this book, Swineshead was often called “Calculator” by Continental scholars who used his work in the later fourteenth and fifteenth centuries. There is some uncertainty about his first name – and there were several people with the last name Swineshead associated with Oxford in the fourteenth century who have been confused with one another – but for purposes of this work, it is perhaps sufficient to know that Richard Swineshead was probably not the same person as Roger Swineshead, who wrote the works *De insolubilibus*, *De obligationibus*, and *De motibus naturalibus* at Oxford in the 1330s, and who may have been a Benedictine monk and master of sacred theology. The Richard Swineshead who is the topic of this article probably also wrote short works, known only in manuscript, titled *De motu*, *De motu locali*, and *De caelo*. His name appears in the records of Merton College, Oxford, possibly in 1340; certainly in 1344; and yet again in 1355. Otherwise, very little is known of his life.

Thought

In his *Book of Calculations* (*Liber calculationum*), Richard Swineshead provided an introduction to quantification techniques within a number of different natural philosophical categories, such as qualities, illumination, and local motion. At Oxford University in the fourteenth century, students in the Faculty of Arts took part in disputations testing their ability to detect fallacious reasoning and to argue for one point of view over another. The core discipline that they used in their arguments was logic, particularly the “new logic,” based on the “supposition” of terms within propositions, that is, with the way that terms in propositions refer to things in the physical world or to intentions in the mind. After about 1330, however, disputants used not only logical theory but also other sets of analytical tools, such as the analysis of first and last instants (or beginning and ceasing), of maxima and minima, and of the intension and remission of forms such as warmth and coldness or white and black. Swineshead’s *Book of Calculations* included 16 treatises, each one dealing with a different problem area. Swineshead built upon the work of Thomas Bradwardine *On the Proportions of Velocities in Motions* (1328), as well as upon William Heytesbury’s *Rules for Solving Sophisms* (1335). It was probably the perceived achievement of Bradwardine in formulating a mathematical law or function relating forces, resistances, and velocities in alteration and augmentation and diminution, as well as in local motion, that encouraged later fourteenth-century scholastics to intensify their attention to mathematical or quantitative topics, combining logical and mathematical techniques and focusing special attention on infinity and continuity.

One terrestrial subject matter to which calculations had been applied before the fourteenth century was the matter of calculating the degrees of compound medicines, on the Galenic theory that many diseases occur because the person is too hot, too cold, too wet, or too dry, and that the fundamental purpose of medications is to bring the state of the sick person back to the temperate or normal. Usually, there were supposed to be four degrees in

any quality, ranging from the insensible, to the sensible, the strong, through to the lethal. The pharmacist might mix medicines of varying degrees in order to get a compound medicine of an intermediate degree, strong enough to counteract the imbalance in the sick person’s body, but not too strong.

The first and most famous treatise of the *Book of Calculations*, which is sometimes found separately, was concerned with the “intension and remission of forms” or with how the increase or decrease in the intensity of a quality should be measured. If the compounding of medicines had been a primary locus for such concerns before the fourteenth century, it was the intensification of charity or grace given by God that held the attention of theologians in the later Middle Ages, a topic always dealt with in connection with Distinction 17 of Book I of Peter Lombard’s *Book of Sentences*, the primary textbook of systematic theology in medieval theological faculties. The theory of the intensification of grace had many problems special to it, since it was assumed that God gives grace freely – how one’s grace may increase over time does not follow exactly the same pattern as, for instance, the increase of one’s strength over time as the result of doing exercises. Nevertheless, it was in commentaries on Book I, Distinction 17, of the *Sentences* that discussions of the intension and remission of forms most often occurred.

In the *Book of Calculations*, the question of intension and remission of forms is discussed mainly in terms of “any quality you please.” The first subject was whether the intensity of a quality should be measured by its nearness to the maximum degree (and remissness by distance from the maximum degree) or if, instead, intensity should be measured by distance from zero degree and remissness by closeness to zero degree. Of course, the practical problem of the best reference point for measures of quality is familiar to us because of the difference between the Fahrenheit and Celsius temperature scales. For Swineshead, the problem was more abstract. Measuring from the maximum degree might not make sense if there was, in fact, no maximum degree in a given quality. In the case of hot and cold, familiar at the time because of its

importance in medicine and pharmacy, there was the problem of relating hot and cold. For instance, is something twice as hot therefore half as cold? Should a body be considered to be both hot and cold at the same time, or should the temperature scales be arranged so that heat decreases down to zero and then cold begins to increase, as do degrees below zero on modern temperature scales?

After additional treatises on problems of measuring qualities and alteration, Swineshead turned to problems of measuring rarity and density, as well as the velocity of increase or decrease in size. In Treatise VII, he raised the problem of “reaction” – if body A warms body B next to it, will not body B cool body A at the same time? How should the power of a body to heat another body be measured and how should the power of resistance of the body acted upon be measured? After discussing maxima and minima, and a special problem of what would happen if a thin rod fell within a channel running through the middle of the earth, Swineshead came to the problem of speeds of local motion, where he applied Bradwardine’s theory that velocity depends upon the ratio of force to resistance in such a way that a geometric increase in the ratio will lead to a linear increase in velocity. Later treatises measure the diffusion of illumination and the gradual increase over time in the quality of a body that is more affected near the agent affecting it.

Probably the most impressive descendant of Swineshead’s *Book of Calculations* was the *Book of the Triple Motion* meant as an introduction to Swineshead’s book, written by the Portuguese scholar Alvarus Thomas and published at Paris in 1509. Although in the 150 years between the two books there had been relatively few scholars capable of mastering Swineshead’s technicalities, Alvarus Thomas was certainly up to the job.

Robert Greystones

Robert Andrews
Georgetown University,
Washington, DC, USA

Abstract

Robert Greystones was a Benedictine monk, born before 1290, died in 1334. He attended Durham College in Oxford around 1306–1326, where he lectured on the *Sentences* between 1320 and 1323. His *Sentences* commentary is a valuable guide to the intellectual climate at

Oxford immediately after William of Ockham but before successors such as Robert Holcot and Adam Wodeham. His single complete surviving manuscript is made all the more useful because of its many named and quoted references to his contemporaries, some otherwise unknown. Greystones reveals Scotist tendencies, but not dogmatically so. An insistence upon God's unlimited power, as established by the Condemnation of 1277, led Greystones to radical skepticism about human knowledge. Like Descartes, Greystones held that we can be certain about our own existence (*ego sum*), but not about the conditions of that existence: whether we are in this life or the afterlife, in a body or not. Since God has the power to interfere in the sensations we receive, we cannot be certain about the existence of any external object. We have no certain knowledge of cause and effect, the existence of substances, or any contingent event. Preempting Descartes' appeal to a beneficent, nondeceptive God, Greystones says: God does not deceive. But you deceive yourself if you insist on believing that something exists when you know that it might not! You know that God can intervene at any instant and thus that you can never completely trust your senses. Greystones' skepticism, cutting-edge but representative of his intellectual milieu, is strikingly significant in light of the later historical development of philosophy.

Life

Robert Greystones was born before 1290, likely in Greystones, South Yorkshire, although perhaps his surname derives from the Greystanes family in the county of Durham. It was at Durham that he entered the Benedictine Order between 1300 and 1310. Likewise he attended Durham College at Oxford around 1306–1326, where he lectured on the *Sentences* between 1320 and 1323. By 1332 he was back at Durham as subprior. His election as Bishop of Durham in 1333 was nullified, because the Pope had already filled the position. He died in late 1334 (Greystones 2017).

Philosophy

Robert Greystones had almost no influence after the first century subsequent to his philosophical activity. His most important work, a lengthy *Sentences* commentary with associated texts, survives in a single Westminster Abbey manuscript, although a few extracts of that commentary were included in a miscellany assembled by the Carmelite Stephen Patrinton about 1390. The selections chosen by Patrinton indicate that there was some interest in Greystones' skeptical positions before they were forgotten for 600 years. Kennedy (1985), editing these texts, found it natural to place them in the late fourteenth century; but Greystones was an innovator, not an epigone.

Greystones's commentary is of special interest to the historian of philosophy because, atypically, it provides frequent marginal notes identifying the many near-contemporaries cited – names such as John Duns Scotus, William of Ockham, William Alnwick, Robert Cowton, Henry of Harclay, Richard Campsall, and John of Reading; but also lesser-known names such as Robert of Walsingham, Gerard of Bologna, Nicholas Trevet, (Johannes?) Kykeley, Luke (of Ely?), and an otherwise unknown Surrey (Courtenay 2008). For some of these authors' views, Greystones may be the only identifying source.

Most of what is currently known about Greystones' thought concerns his views on free will and skepticism, although much of his writings remains to be investigated. In his insistence on the primacy and power of the will, Greystones is much like Duns Scotus; while Greystones is an early interpreter of Scotus, accessing his views through the explanations of Alnwick and Harclay (Greystones 2017, p. xxxviii), he is not an uncritical defender, as is evidenced in the many instances where he criticizes specific arguments of Scotus. At other times, he makes his own way along the *via Scoti*. The question concerning the impeccability of the blessed in heaven is instructive. For Scotus, the capacity for choice and so for sinning remains, but its exercise is prevented by God who "holds" the will, much as someone blindfolded still retains the bare capacity to see but is prevented from exercising that capacity

by imposed circumstances. But, Scotus' contemporaries objected, if coercion is to act against a thing's nature or inclinations, how is God's "holding" a free creature not coercion? Greystones' reply to these objections is astonishing: God does not and cannot coerce anything, since God is the all-powerful, sovereign Creator: "His power is not bound to the laws or numbers [i.e., natures] of creation, therefore whatever He does concerning a creature, He does not act against nature, since whatever God does concerning a creature is natural to it" (Greystones 2017, pp. lviii, 93).

Another instance of Greystones going his own way is the case of the divine will. Greystones denies Scotus' position that what is free need not be contingent and that God loves himself both necessarily and freely. Greystones's definition of freedom is the power for alternatives. Thus God's acts with regard to His own nature, being without alternatives, are necessitated, but with regard to creation, alternatives are possible, and His acts are free (Greystones 2017, p. lxiii).

Insistence upon God's unconditional power, carried out to its extreme conclusions with logical consistency, resulted in Greystones' skepticism. Others of an earlier generation had confronted similar skeptical threats, but by various strategies had attempted to avoid them. William of Ockham, for instance, utilized Duns Scotus' distinction between intuitive and abstractive cognition to forestall skepticism; humans have certain knowledge of external reality because it is presented in direct, intuitive cognition. But already John of Reading preempted this strategy: God could instill in us an intuition indistinguishable from intuitive cognition without the existence of an external object. William of Alnwick subsequently proposed a further distinction of intuitive cognition into aptitudinal and actual intuitive cognition: if God were to introduce in us cognition of a non-existent object, we would have aptitudinal intuitive cognition only – thereby providing some sort of certainty concerning actually present objects. But Greystones readily dismisses this move: if God could infuse a non-referring intuitive cognition, He could also infuse a non-referring aptitudinal intuitive cognition. We cannot be certain

about the existence of any external object merely because of an appearance.

Greystones arrives at a series of other radical and disconcerting results. Causal effect cannot be known – as later Nicholas of Autrecourt and much later David Hume maintain, there can be no proof from effect to cause. We cannot distinguish between first and second causes. There is no proof from induction. Substances cannot be known by their accidents – as also later suggested by Thomas Manlevelt (van der Helm 2012). There is no knowledge of contingent events. It is impossible to have knowledge of the external world. These conclusions are not proposed as hypothetical or counterfactual; they are conclusions deductively derived from the possibility of direct divine intervention into any aspect of creation, including human cognition, guaranteed by the 69th proposition of the Condemnation of 1277.

Nevertheless, Greystones does not dismantle all human knowledge. Firm in Greystones' worldview – as in Descartes' – is a commitment to the incorrigible truth of logically necessary propositions, such as "a whole is greater than its parts" or "a triangle has three sides." Human certainty extends to all logically necessary statements – and this is perhaps rather extensive, since all sciences depend upon the principles of mathematics and logic (Greystones 1994, p. 167). The certainty of necessary propositions for Greystones is absolute; if *per impossibile* God did not exist, it would still be true that a triangle has three sides and that a whole is greater than its parts.

Certainty also arises from direct and immediate sensation, within given parameters. We may be certain of our immediate phenomenological experiences, such as that I appear to see a white patch; conclusions drawn from that observation, such as that the white patch is a rabbit, are not at all certain. As Descartes will later hold, I may be certain of my own existence (*ego sum*) and life (*ego vivo*); but Greystones hedges that certainty with reservations: I do not know whether I am alive in this life or the next; I do not know whether my consciousness has been, *Matrix*-like, transferred into another body; I would not even know if I shared my body with another consciousness. I cannot be certain of the existence of anything

external to my consciousness. Furthermore, Greystones, two centuries before Descartes, anticipated and rejected Descartes' appeal to a benevolent, nondeceptive God: God does not deceive, but you deceive yourself if you consider yourself to be certain that a thing exists when you know that it might not (Greystones [forthcoming](#)).

Greystones' skepticism cannot be said to have had any direct influence upon the history of philosophy. Apart from the extracts by Patrington, his original work remained buried in a single manuscript. However, Greystones was representative of a series of philosophers who carried their shared presuppositions to extreme skeptical conclusions. Greystones was the earliest of the tradition of Nicholas of Autrecourt, William Crathorn, *Monachus Niger* (the Black Monk), Nicholas Aston, the mysterious and peculiar John Went (Kennedy 1983), and likely unknown others, who influenced Peter of Ailly, who in turn influenced the educators of Descartes. These figures were part of an unrecognized subcurrent in the development of modern philosophy. The rediscovery of Greystones requires not just a footnote to, but a rewriting of, the history of philosophy.

Robert Grosseteste

Cecilia Panti

Dipartimento di Studi letterari filosofici e di storia dell'arte, Università degli Studi di Roma Tor Vergata, Rome, Italy

R

Abstract

Robert Grosseteste (c. 1168–1253) was an outstanding figure in thirteenth-century intellectual life. He developed an original cosmological theory, the so-called metaphysics of light, based on light as the first common form of all bodies and elaborated a scientific method based on the importance of geometry and experience in the explanation of natural phenomena, which he considered as effects of the action of luminous rays. He introduced the Aristotelian natural philosophy to the western Latin world, producing the first commentaries

on Aristotle's *Physics* and *Posterior Analytics* and translations of *De caelo* and *Nicomachean Ethics*. As a theologian, Grosseteste enriched the Augustinian tradition with the doctrines of the Greek Fathers, mainly Pseudo-Dionysius, whose writings he translated and commented. His originality also emerges in his writings on free will, time, and God's foreknowledge. As bishop of Lincoln, he focused on removing ecclesiastical abuses and promoting the pastoral care, acting as a prominent leader in English ecclesiastical and political life. His intellectual heritage influenced both scientific developments and political movements, mainly in fourteenth-century England.

Life and Works

Grosseteste was born into a humble Anglo-Norman family in Suffolk (c. 1168) and was probably educated at the cathedral school of Lincoln, since he first appears with the title of master in a Lincoln document (c. 1189). A letter (c. 1192) by Gerard of Wales recommends him for his excellence in liberal arts, canon law, and medicine to Bishop William de Vere of Hereford, where Grosseteste remained until the bishop's death (1198) (McEvoy, 1982, pp. 4-7). The high reputation of Hereford for scientific learning likely encouraged Grosseteste to produce his first scientific opuscula *On Liberal Arts* and *On Sound Generation*. The following 25 years are particularly obscure. According to Callus' biography (in Callus ed., 1955), Grosseteste taught the arts at Oxford until 1209, when the schools closed. He moved then to Paris to study theology and returned in 1214 to become the first chancellor and to teach theology until 1229/1230. The evidence for the chancellorship comes from a controversial anecdote, claiming that he was, in fact, entitled *magister scholarium*. Southern (1986) proposed an alternative biography, which places Grosseteste in the provincial setting of England. A few legal documents from c. 1213 to c. 1225 testify to Grosseteste's administrative position in Hereford, in association with the archdeacon, later bishop, Hugh Foliot, whom he followed to France

during the papal interdict of England (1209–1213); but, according to Southern (1986), Grosseteste neither was in Paris nor studied theology there. Instead, he occasionally taught the arts in English schools, while his stable teaching in Oxford – and possibly his chancellorship – started after 1225, when he received a prebend in Abbotsley, became a priest, and, finally, began to lecture in theology. Goering (in McEvoy 1995) rejected Southern's disagreement regarding Grosseteste's familiarity with the Parisian milieu, which is indirectly testified by Grosseteste's friendship with Parisian theologians (mainly Alexander of Hales and William of Auvergne) and his writings from the 1220s. A Parisian contact can be inferred also from Grosseteste's precocious knowledge of Averroes and from the circulation and sources of his cosmological writings of the years 1220–1225: *On the Sphere*, *On Comets*, and *On Heavenly Movements* (Grosseteste 2001, pp. 43–53). Also a controversial charter of 1223 might corroborate his Parisian connection (Schulman 1997; against which see McEvoy, in Mackie and Goering 2003, pp. 19–20). Grosseteste's entire scientific and philosophical production belongs to this obscure period. It comprises his major treatises on Easter computation (*Computus*), on light metaphysics (*De luce*), and on optics and mathematical verification of natural phenomena (*De lineis, angulis et figuris-De natura locorum* and *De iride*) and his commentaries on Aristotle's *Posterior Analytics* and *Physics*. The latter was probably assembled later from Grosseteste's glosses, with additions which also circulated independently (*De finitate motus et temporis*).

Grosseteste's last 25 years are well documented. In 1229/1230 he became the first lecturer to the Oxford Franciscans. His familiarity with the Friars turned into an enduring friendship and a strong spiritual empathy, particularly with Adam Marsh (Gieben in McEvoy 1995). As a theologian, Grosseteste lectured on Scripture, disputed theological questions, and preached university sermons (Ginther 2004). His theological writings have noteworthy philosophical implications and include a brief commentary on *Ecclesiasticus* 43:1–5 and some opuscula on divine

causality (*De statu causarum*, *De subsistentia rei*, and *De ordine emamandi causatorum a Deo*), on truth (*De veritate* and *De veritate propositionis*), on God's foreknowledge and free will (*De scientia Dei* and *De libero arbitrio*), and on God as first form and the location of angels (*De unica forma omnium-De intelligentiis*). In the 1230s Grosseteste also attended to his major exegetical works: *De decem mandatis* (with remarks on ethics), the *Hexaëmeron* (largely influenced by Augustine and Basil, with large sections on cosmology and against the eternity of the world), and *De cessatione legalium* (on human happiness and natural law). He also commented on the Pauline *Epistula ad Galatas* and wrote a large collection of sermons, among which were the *Ecclesia sancta celebrat* (on human nature), and a huge variety of theological annotations, the *Dicta*.

In 1235 Grosseteste was elected bishop of Lincoln, the largest diocese of England. He was a compromise candidate, but he acted as a powerful and rigorous leader. The Minors were his assistants in ecclesiastical duties and also procured him Greek books. In 1239–1241 he began to make translations from Greek. His translations include the works of John Damascene; the entire corpus of Pseudo-Dionysius, enriched with Grosseteste's own commentary; the *Testament of the Twelve Patriarchs*; the *Nicomachean Ethics*, with accompanying Greek glosses and Grosseteste's annotations; parts of the Greek lexicon *Suidas*; and parts of Aristotle's *De caelo* with Simplicius' commentary. Grosseteste also compiled a *Tabula* of topical concordances of his Christian and non-Christian readings, covering theological and philosophical items, each associated with an indexing symbol. In addition, he composed some Anglo-Norman poems, including the allegorical *Chasteau d'amour*, on world creation and Christian redemption, as well as texts on household management and courtly etiquette. As a bishop, Grosseteste instituted an innovative program of pastoral care, applying principles he had previously elaborated in his pastoral works, including the famous *Templum Dei*, on confession. Also, many of his letters are concerned with his innovative political and pastoral ideas, which drove him to disagree both with the secular and the ecclesiastical power

(Robert Grosseteste 2010). The Lincoln Chapter appealed to the papacy against his innovations, but Grosseteste successfully defended himself in 1245, at the First Council of Lyons, to which he returned in 1250 to criticize the inadequate policy of Pope Innocent IV. He clashed again with the papacy in 1253, in a vigorous letter (n. 128) concerning the appointment of an incompetent cleric. His rebellion made him a hero of the anti-papists, and his ideas influenced church reformers, first and foremost John Wyclif. Grosseteste died in October 1253. Three attempts for his canonization failed. His philosophical and theological ideas influenced thirteenth-century Franciscan thinkers (mainly Thomas of York, Richard Rufus of Cornwall, Roger Bacon, Bonaventure, and the Dominican Richard Fishacre) and fourteenth-century Oxonian philosophers (Adam Wodeham, William of Ockham, Thomas Bradwardine, and William of Alnwick). His fame on the continent was mainly due to his commentary on *Posterior Analytics* and his Greek translations. A detailed essay in modern and medieval historiography on Grosseteste is by McEvoy (in O'Carroll 2003). The catalogue of Grosseteste's works by Thomson (1940) needs an overall updating (partly made by McEvoy 1982; Panti 2013).

Thought

Metaphysics and Physics of Light

The notion of light occupies a relevant place in Grosseteste's philosophy and theology, as the fundamental monographs by McEvoy (1982, 2000) clearly show. After his early scientific interests in astrological causality, Grosseteste elaborated his own original doctrine (partly influenced by Avicenna and Avicbron) in his most famous short work, *De luce* (Panti 2013), arguing that light (*lux*) is "corporeity," that is, the first common form which gives dimensionality to the a-dimensional prime matter. Grosseteste builds his own cosmology according to this ontological principle, asserting that, at the beginning of time, first light and first matter multiplied infinitely producing the sphere of the universe, which is structured by

light's replicability (*replicabilitas*) into finite-sized bodies of infinite "light-atoms." Therefore light, according to the Aristotelian concept of entelechy, produces the transition from physical potentiality to actuality (Gieben 1966; Grosseteste 2011). In addition to light, natural bodies include other substantial forms, except the outermost heavenly sphere, which is the simplest body. It emits a luminosity (*lumen*) which operates over the lower bodies as an active force, entering within the elements to cause movement, sound, colors (as explained in his short *De colore* (Robert Grosseteste 2013b)), and every natural change, including sense perception. This is the so-called theory of light incorporation (Panti 1999). Light also explains some features of the Aristotelian cosmos developed in the commentary on *Physics*. Basically, Aristotle's three principles of form, privation, and the underlying subject are interpreted as light, the impurity of light in things, and first matter (Lewis 2005).

Thanks to its infinite and indivisible constituents – the light-atoms – every physical body is "measured" through an original mathematics of infinities, introduced in *De luce*, which aims to connect Aristotelian physics and Platonic cosmology. Grosseteste's commentary on *Physics* further develops such an idea, asserting that the true measure of bodies is provided by their different-sized infinities, which only God can count in definite mathematical numbers (Lewis 2005). Besides, the very existence of physical bodies presupposes a Creator of infinite power, for the passing from nothing to being (i.e., from a-dimensionality to dimensionality) requires an infinite efficient power. But in his theological works, such as *De unica forma* and *De statu causarum*, and in the late commentary on Pseudo-Dionysius, Grosseteste develops the idea that the creature's being also needs to be constantly supported by God, who gives it its own form by modeling it to himself, as a vessel shapes water by adhering to it (Gieben in O'Carroll 2003). Grosseteste, following Augustine, describes divine creation as the infusion of the first form, which is now considered to be the simple and separate exemplar in God's mind, by virtue of which a thing exists (Panti

2012a). In his theological works, Grosseteste also uses his metaphysics of light to explain the heavenly movements, associated with angelic operations (McEvoy 1982, part 2; Panti 2017), although in his earlier *De motu supercelestium* he follows the Averroistic doctrine that the heavenly movements are produced by a purely intellectual power (Grosseteste 2001).

In conclusion, Grosseteste develops two complementary ideas on natural being: as a physical body, everything is "made of" atoms of light/form and matter; as a creature, everything is "shaped" from divine light/form, which is its external and perfect exemplar.

Theory of Science and Optics

Grosseteste's short works in optics, particularly his *De lineis-De natura locorum* and *De iride*, assign great importance to mathematics in scientific explanations of the physical world. This is because natural agents act upon the senses or matter through the multiplication of their "species," or rays, according to the agent's distance, the angle of their incidence, and the sphere or cone resulting from their multiplication, a view later developed by Roger Bacon (Hackett in McEvoy 1995). The geometrical attitude of Grosseteste's physics illustrates the basic assumptions of his theory of science, developed in his *Commentary on Posterior Analytics* (Rossi in McEvoy 1995). Firstly, there is a double inquiring path, called "resolution" and "composition." Resolution or analysis starts with observations to arrive at universal laws, while composition or synthesis moves from universal laws to infer particular facts. Both ways are verified through experimentation and a clear distinction between why (*propter quid*) and how (*quia*) a fact happens. Scientific demonstration of how a fact happens implies the move from effects to cause; conversely, the demonstration of why it happens moves from cause to effects. Secondly, the Aristotelian theory of the subalternation of the sciences implies that the principles of optics are conclusions in geometry. Thus, mathematics is the highest and *propter quid* science, being based first on axioms, and every natural science

ultimately depends on it (Laird 1987). This methodological principle accompanies the theory that light gives the universe both its physical and its mathematical structure, being its first form and acting according to linear rays and geometrical figures. Thirdly, if the human intellect were not lapsed because of the original sin, it would not rely on the senses in its proper operation, but contemplate the exemplar forms; so, in the present life repeated sense experience moves reason to formulate an “experimental” universal principle. The *universale complexum experimentale* is a sort of universal proposition which sets forth the links of causality between two events (Rossi 2008). These three basic principles have nourished Grosseteste’s modern reputation as the beginner of the western experimental method (Crombie 1953). Grosseteste’s claims on controlled experiment have been more rightly linked to everyday observation (Marrone 1986; Hackett in Mc Evoy 1995), but even in his works on optics, Grosseteste fails to apply them. This is true of his *On the Rainbow*, though in this work he is the first in medieval science to introduce the law of refraction as the main cause of the rainbow. Such a theory was criticized by Roger Bacon (Eastwood 1989), who nonetheless admired Grosseteste’s scientific methodology, which he deems to be useful for both natural science and theology. Bacon’s criticism, in fact, points only against Grosseteste’s wrong application of refraction as the cause of the phenomenon of rainbow (Panti 2016). Surely, Grosseteste’s emphasis on mathematics was his chief legacy to natural philosophy in fourteenth-century Oxford.

Theological Issues

Grosseteste’s theological doctrines have strong philosophical implications, mainly on eternity, time, free will, and divine foreknowledge. Grosseteste’s answers to Aristotle’s arguments on the eternity of the world (Dales 1986) are expounded in his *Hexaëmeron* and in *On the Finitude of Motion and Time* and are finally based on the assumption that Aristotle, using just his reason (*aspectus*), could not achieve the truth, which is understood only when one’s will

(*affectus*) is directed to the unchanging divine realm. In his *On Truth* Grosseteste states that truth is the adequacy of each thing to its exemplar in God’s mind, and only divine light can properly illuminate the human mind to grasp it (Lewis 2008). In the epistolary treatise *On the unique form of everything*, Grosseteste develops the theme of divine exemplarism, and the influence of Augustine is particularly relevant (Rossi 2016). Here, as well as in other theological works, light and its effects become a source of inspiration for developing metaphors and symbolism on the ways in which the human mind receives gifts from the divine light (Panti 2014). Grosseteste also develops a doctrine of time, which has strong theological implications, though it is expounded in his commentary on book 4 of the *Physics*. He closely relates time to existence: the latter being the dependence of every creature on God, which implies its adherence to the divine “all at once” being. Time is the thing’s privation of such *at-onceness* of eternity, so that natural existence is not instantaneous (Marrone 1983).

De libero arbitrio is Grosseteste’s most influential work on how to reconcile God’s foreknowledge with free will. His solution is different from that of Boethius and Anselm and implies that there is a family of modal notions according to which future events and true propositions about them may be contingent and that freedom requires only this kind of contingency (Lewis 1991). Duns Scotus’ accounts of nontemporal modality were perhaps partly influenced by this solution; moreover, Grosseteste states with Eriugena that there is no temporal priority of God’s power to its act, but just a causal priority. As regards free will, the novelty of Grosseteste’s account is that freedom is considered a capacity to will alternatives, since the choice of good or evil is not intrinsic to reason and will, otherwise grace would be superfluous. Evil comes from *nihil*, the essential foundation of creaturely life (Lewis 1996).

Finally, Grosseteste’s psychological doctrine concerning the naturalness of the union of soul and body to form the perfect human nature has a strong theological implication in Grosseteste’s idea that Christ’s highest sacrifice for human

redemption was his voluntary submission to the separation of soul and body (McEvoy 1982, part 4).

Robert Holcot

John T. Slotemaker
Department of Theology, Boston College,
Chestnut Hill, MA, USA

Abstract

Robert Holcot was an English Dominican theologian and philosopher who was philosophically influenced by the work of William of Ockham and other English philosophers of the early fourteenth century. He is often considered a "skeptic" with respect to what human reason can know about theological truths (Trinity, Incarnation, and Eucharist), although such an interpretation of Holcot is misleading. Holcot, because of his patronage to Richard de Bury and his access to Bury's library, displays

a remarkable familiarity with classical literature and philosophy. His lectures on Wisdom were widely read in the late-medieval period.

Robert Holcot (b. c. 1290–d. 1349) was an English theologian, philosopher, and biblical exegete from the village of Holcot near Northampton. He entered the Dominican order at Northampton and went to Oxford sometime around 1326, commenting on Peter Lombard's *Sentences* during the years 1331–1333. After lecturing on the *Sentences*, Holcot became a Dominican regent master of Theology at Oxford – and, according to tradition, at Cambridge as well – prior to returning to the Dominican priory at Northampton in 1343. Holcot remained at the priory until his death of the plague in 1349.

The writings of Robert Holcot are located chronologically at the apex of English Scholasticism (1330–1340), or what William Courtenay has called "New English Theology" (Courtenay 1987: 268–274). A contemporary of the other great English Scholastics of that decade – Thomas Bradwardine, William Crathorn, Thomas Felthorp, Robert Halifax, Richard Kilvington, Roger Rosetus, and Adam Wodeham – Holcot's writings simultaneously represent the influence of logic in England during the mid-fourteenth century, and a remarkable familiarity with classical Latin authors. Beryl Smalley is correct to note that the result of this diversity is that scholars know of "three Holcots": (1) the "Scholastic" writer who is often criticized for his intellectual skepticism, and for his "semi-Pelagianism"; (2) the assistant of Richard de Bury, the noted bibliophile, who was well versed in classical authors; (3) the English preacher, who had a significant impact on preaching in fourteenth-century England (Smalley, 5–6). Unfortunately, there is not yet a comprehensive overview of Holcot's life and works, and the three perspectives on Holcot noted by Smalley have yet to be adequately harmonized.

Writings, Texts, and Manuscripts

The writings of Holcot include: a commentary on Peter Lombard's *Sentences* (*De stellis*, a

commentary on Aristotle's *De caelo* that was originally part of his commentary but circulated separately), the *Sex articuli, De imputabilitate peccati*, the *Sermo finalis* (his concluding sermon to his lectures on the *Sentences*), the *Quaestiones quodlibetales*, the *Moralitates*, the *Convertimini*, *Postilla super librum Sapientiae* (lectures on the Book of Wisdom), lectures on Matthew, lectures on the Book of the Twelve Prophets, select lectures on Ecclesiastes, and a sermon collection.

The above works can be divided into five general categories. First, Holcot wrote specifically theological works: a commentary on each book of the Lombard's *Sentences* (6, 4, 1, and 8 questions on the four books of the *Sentences* respectively), and *De imputabilitate peccati*. Second, he also was involved in ordinary and quodlibetal debates, which were often more explicitly philosophical: the *Quaestiones quodlibetales*, and his *Sex articuli* that discuss questions of epistemology. Third, Holcot lectured on various books of the Bible, and produced the following Scriptural commentaries: his lectures on the book of Wisdom (*Postilla super librum Sapientiae*), a commentary on Ecclesiastes and on the 12 minor Prophets. Fourth, he composed two works for preachers: the *Moralitates* and the *Convertimini*. Finally, there is also a collection of Sermons preached by Holcot throughout his career.

The majority of Holcot's writings are only available in late fifteenth-/early sixteenth-century editions and numerous manuscripts. Selected quodlibetal questions have been edited: the *sex articuli*, the *sermo finalis*, and the *tractatus de stellis*. Thus, the more philosophical works have been edited, but few of his theological works, sermons or commentaries. The best introduction to Holcot's theological writings is found in the work of Fritz Hoffmann and Heiko Oberman.

Faith and Reason

Robert Holcot's quodlibetal question, *Utrum theologia sit scientia* (Muckle (ed) 1958), is a detailed investigation into the scientific nature of theology. The Scholastic authors of the thirteenth and fourteenth centuries debated the question of whether theology is a practical or speculative

science, or whether it was primarily deductive or declarative, but they tended to agree that it was a science. Holcot, breaking with tradition, concludes that theology is not a science per se, if *scientia* is understood strictly as demonstrable knowledge. That is, theological truths – such as the existence of God – are not demonstrable by the viator in this life. Holcot, following William of Ockham, argued against the traditional proofs for the existence of God as developed by earlier theologians such as Anselm, Thomas Aquinas, and John Duns Scotus. Holcot argues that human reason cannot demonstrate the existence of God; and while Holcot quickly dismisses arguments based on empirical premises (i.e., cosmological argument), he devotes more attention to Anselm's ontological argument.

Beyond the question of the scientific nature of theology, fourteenth-century theologians were increasingly concerned with the applicability of Aristotelian logic to certain revealed theological truths (such as the Trinity and the Incarnation). The medieval Scholastics generally agreed that Aristotle's logic was universally valid, and corresponded to natural reason. But, in certain instances there was a tension, or conflict, between Aristotelian syllogisms and particular doctrines. In *Determinatio X* Holcot considers various syllogisms regarding the Trinity that prove particularly problematic (Gelber 1974: 381–443). There he considers the following expository syllogism (a third figure syllogism with a singular middle term):

- *Essentia est Pater* (The Divine Essence is the Father)
- *Essentia est Filius* (The Divine Essence is the Son)
- *Ergo, Filius est Pater*. (Therefore, the Son is the Father)

The problem, of course, is that the individual propositions are true and the conclusion is false, despite the seemingly valid syllogistic form. Medieval authors had proposed various solutions to the problem – that is, Ockham denied that a term that is simultaneously one thing and many things (*essentia* above) is a singular term – but Holcot rejected such solutions that are grounded

in positing a “real,” “conceptual,” or “formal” distinction between the Divine Essence and the Persons of the Trinity. Instead, he followed Richard Campsall in developing a theory of alternative logic.

Holcot argues in his commentary on the *Sentences* I.5 and in *Determinatio X* that there is a twofold logic that applies to all of reality: the *logica naturalis* (logic of nature/natural order) and *logica fidei* (logic of faith). Because of this argument, Robert Holcot, along with the author of the *Centiloquium Theologicum* and Richard Campsall, are often considered “skeptics” with respect to the relationship between faith and reason. But, as Fritz Hoffman and Hester Gelber have argued, the charge of skepticism is unjustly applied to Holcot.

Holcot did not reject Aristotelian logic (*logica naturalis*) or deny that the Trinity can be understood rationally according to particular logical rules. The problem, according to Holcot, is that Aristotle’s logic is not universal; the Divine Trinity and Incarnation are revealed realities that Aristotle did not know about, and therefore did not take into account in his logical works. But, from this it does not follow that the logic of faith is irrational, and in fact Holcot argues that it is fitting (*non est inconueniens*) that natural logic is inapplicable to the Trinity given that faith concerns realities that transcend the physical world (*Sent.* I, q. 5, f. 2ra). Instead, Holcot proposes various rules for excluding middle terms that can stand for one thing and many things simultaneously in an expository syllogism. These rules of faith (*logica fidei*) are logical, grounded on reason, and offer a “supplemental logic” that is applicable to trinitarian syllogisms.

Covenantal Theology

The theological developments of the early fourteenth century, in authors such as John Duns Scotus and William of Ockham, emphasized the contingency of the world and God’s sovereignty to have chosen the actual world from among various possible worlds. Inherent in the discussion of the contingency of the world was the theological

distinction between God’s absolute power (*potentia absoluta*) and his ordained power (*potentia ordinata*). The absolute power of God can bring about anything that does not involve a logical contradiction, but, of all of the unactualized possibilities, God chooses or ordains according a logically consistent subset of these possibilities (*potentia ordinata*). This basic distinction is found throughout Holcot’s works, and informs his own covenantal theology.

According to Holcot, God *de potentia ordinata*, established a covenant or pact with humanity. This is developed in Holcot’s *Postilla super librum Sapientiae* and Commentary on the *Sentences*, where he argues that God freely established a covenant with humanity to give grace to all who make full use of their natural abilities. Through this covenant that God enters into freely the human being who “does his/her best” (*facit quod in se est*) merits a reward (*meritum de congruo*) from God. There are two points about this general picture that are important: first, Holcot strongly holds that God’s ordained power is radically free and not bound to anything other than the law of non-contradiction; second, the semi-Pelagian position above is contextualized within a broader understanding of God’s eternal predestination. That is, Holcot holds that all good works are the effect of God’s predestination in that God’s prevenient grace provides the possibility for human good works.

Influence

The works of Robert Holcot were important throughout the fourteenth, fifteenth, and sixteenth centuries. His lectures on the book of Wisdom have been called a “medieval bestseller,” and almost every significant library in late medieval Europe is said to have possessed a copy (Smalley, 10). Further, his theological and philosophical works were widely available, and read seriously, by sixteenth-century theologians. Thinkers as diverse as Martin Luther and Michael Servetus engaged Holcot’s trinitarian theology and soteriology, although much more work on the later middle

ages is necessary before scholars can get a clearer picture of the influence of Robert Holcot, and “New English Theology,” on subsequent thinkers.

Robert Kilwardby

José Filipe Silva

Department of Philosophy, History, Art and Culture Studies, University of Helsinki, Helsinki, Finland

Abstract

The English Dominican Robert Kilwardby (1215?–1279) divided his career in between Paris and Oxford. First as a student and then as a master at the Faculty of Arts in Paris in the period 1231–1245, he produced the earliest comprehensive group of commentaries of the arts syllabus that came down to us, with comments on the subjects of grammar, logic, and ethics. After 1245, approximately, he moved back to England where he entered the Dominican Order, studied and then taught theology at Oxford and began a promising institutional career, which had however negative effects in his academic production – almost inexistent after this date. In 1261, he was elected Provincial of the Order in England and in 1272 was

appointed Archbishop of Canterbury, duty he performed until his designation as Cardinal of Porto and Santa Rufina. As a philosopher, Kilwardby is best described in his systematic attempts to find middle ground between the thoughts of Aristotle and Augustine, on matters as diverse as sense perception and the nature of matter. In case of irresolvable conflicting views, as it is the case of intellectual cognition, Augustine is preferred since he is more enlightened than Aristotle in spiritual matters (as Kilwardby himself repeated). Kilwardby is well known as the author of an important encyclopedic work, the *De ortu scientiarum*, which constituted one of the most copied introductions to knowledge in the medieval period. He died in Viterbo, at the Papal court, in 1279, in the mist of the controversy surrounding his participation as the head of the so-called 1277 Oxford Prohibitions. This event, identified as an attack against his Dominican Brother Thomas Aquinas, in particular against his thesis of the unicity of substantial form, contributed largely to the negative way Kilwardby was seen by his and our contemporaries: as a conservative neo-Augustinian, fighting the progress of Aristotelianism and Thomism. Whether he fits into this picture is a matter open to dispute, and recent scholarship has significantly contributed to revise this historical view: his early commentaries on Aristotle are clear statements to the high-level of Aristotelian scholarship he was capable of, namely by attempting to provide solutions to apparently contradictory accounts in different Aristotelian texts, for instance, about the nature of truth. It may however explain the poor circulation of some of his more philosophical works, with the exception of his *Commentary to the Prior Analytics*, which was published under the name of Giles of Rome.

Life

Robert Kilwardby, or Robertus Kilewardbii, Kilvirbi, Kulverbi, Kalverbi as his name is

misspelled in medieval manuscripts, was an Englishman born either in Leicestershire or in Yorkshire (Sommer-Seckendorff 1937). The date of his birth, unknown, is assumed to have been 1215 because he started his studies at the University of Paris in 1231, becoming master of Arts around 1237. He taught at the Faculty of Arts between 1237 and 1245, when he moved back to England. Around 1245, he entered the Dominican Order (Sommer-Seckendorff 1937) starting a rather successful ecclesiastic career. He taught theology at Oxford from c. 1254 until 1261, when he was elected Provincial of the English Dominicans. In 1269, he participated in the Dominican General Chapter in Paris, where he, together with Thomas Aquinas (and three other members), was responsible for analyzing the process of Bartholomew of Tours. A sign of his intellectual standing within the Order is the questionnaire on doctrinal matters sent in 1271 by the Master General of the Dominicans, John of Vercelli, to Kilwardby, Albert the Great, and Thomas Aquinas. The 43 questions, which should be answered in a *forma taxata*, deal with a wide range of problems, from the cause of motion of the celestial bodies to the location of Hell and the nature of the punishing fire (Chenu 1930; Silva 2007). Continuing his successful ecclesiastic career, Kilwardby was appointed Archbishop of Canterbury in 1272. Two of his acts as Archbishop were the coronation of Edward I, at the Westminster Abbey (August 19, 1274), and the issuing of a list of prohibited articles in Oxford in 1277. This latter event took place on the 18th of March, 1277, just 11 days after the Condemnation of 219 theses in Paris. In Oxford, Kilwardby, at the head of a meeting including all the regent and non-regent masters of the University, issued a list of 30 propositions on the subjects of grammar (4), logic (10), and natural philosophy (16). These propositions were prohibited for being primarily philosophical mistakes and secondarily against Christian faith. The closeness in time to the Condemnations of Paris of March 7, 1277, has given rise to far-reaching speculation concerning the connection between these two events. Upon close inspection, however, no proof of the connection has been presented beyond reasonable

doubt. This is the case especially in what concerns the suggestion that Kilwardby would have acted under Papal orders and targeted specific authors. In fact, the direct targets of these propositions have yet to be identified (Lewry 1981a). Nevertheless, already in Kilwardby's time, some of the propositions in *naturalibus* were interpreted as aimed at the teaching of Thomas Aquinas, namely those propositions related with his unicity of substantial form. The strongest reaction came in the form of a letter written by Peter of Conflito, a disciple of Thomas Aquinas. In his reply, Kilwardby sets out the most complete defense of the doctrine of the plurality of substantial forms in human beings. Kilwardby's clarity of expression cannot be overlooked and its importance should not be diminished: prior to this letter, most pluralists presented their views in a non-committed way, *as one among many* theoretical possible takes on the matter (Bonaventure is a striking example of this attitude). Kilwardby on the other hand is adamant in his objections to this doctrine and emphatic in presenting the *philosophical* motivations for his criticism. As evidence for the supposed explicit targeting of Aquinas is difficult to come by, some scholars have insisted on the institutional reaction which took place when the General Chapter of the Order to which both Aquinas and Kilwardby belonged, meeting in Milan (1278), decided to send a commission in order to investigate and punish those who blackened the writings of Thomas Aquinas in *scandalum ordinis*. The results of this commission are not known but the fact of its institution has been seen as a sign of the Order's willingness to stop Kilwardby from attacking his brother Dominican. How accurate this interpretation is remains the subject of debate, especially because of the inconsequential nature of the threat, if that commission would have really been targeting Kilwardby: the Order did not have the power to remove him from office because the Archbishop is nominated by the Pope. What we do know is that the next Chapter of the Order, held in Paris, repeated the advertence and promoted the praise of Thomas' works. The appointment in 1278 by Pope Nicholas III of Kilwardby to Cardinal of Porto and S. Rufina, which allowed him to move from England to

Italy, has also been seen from two very different perspectives: according to some, this constituted an attempt to stop Kilwardby's actions against Thomas and Thomism; according to others, which seems more probable because it takes into account the Pope's own philosophical stand on this issue, he acted in order to protect Kilwardby from his own Order. In any case, Kilwardby died in 1279, soon after his arrival at the Papal court in Viterbo in circumstances that remain unclear.

Works

A complete list of works by Kilwardby includes texts on logic, grammar, theology, and natural philosophy in a career that spans for several decades and around two centers of learning: Paris and Oxford. It is important to bear in mind that although Kilwardby died in 1279, he stopped writing philosophical and theological works around 1256, when he produced his *Sentences* commentary. After this date, we only know two important works, the *De 43 questionibus* (from 1271 or 1272) and *Epistola ad Petrum de Conflato* (from 1277 or 1278). So, the majority of his work was written in a period of roughly 25 years, that is, between 1231 and 1256.

Among the works of the Parisian period should be counted the Course on the *Logica vetus*, which consist of a set of commentaries on the *Isagoge*, *Praedicamenta*, *Perihermeneias*, *Liber sex principiorum*, and *Liber divisionum Boethii* (Lewry 1978), the commentaries on the *Analytica priora* (c. 1240, Ebbesen 1997; published as Giles of Rome), on the *Analytica posteriora*, on the *Priscianus minor*, the *In librum topycorum* (of uncertain attribution), on the *Sophistici elenchi*. From the Oxford period are the works *De natura relationis*, *De ortu scientiarum*, *De spiritu fantastico*, *De tempore*, and his *Sentences* commentary in the form of questions, the *Quaestiones in quattuor libros sententiarum*, from the same period are also some minor theological works, namely the *De confessione*, *De necessitate incarnationis*, *De conscientia et de synderesi*, the *Tabulae super originalia patrum*, the *Arbor consanguinitatis et affinitatis*, and some sermons

(the *Sermo in capite ieiunii* and the *Sermo in dominica in passione*). Worth mentioning is a letter expressing some criticism over Franciscan poverty (*Epistola ad novitios de excellentia ordine praedicatorum*), which survives in the reply of his successor at the Archbishopric of Canterbury, John Pecham (*Tractatus contra fratrem Robertum Kilwarby*). Considered unauthentic are the commentary on the *Priscianus maior*, and the *Sophismata grammaticalia* (Grondeux and Rosier-Catach 2006). Doubts have also been cast concerning the authorship of the commentaries *In barbarismum Donati*, the *De accentu prisciani*, and the *Sophismata logicalia*, which can only be fully dispelled after the critical edition of these works appear and other commentaries from the same period have been studied. The identification, first proposed by Gál (1953) of the commentaries on the *Physics* and on the *Metaphysics*, which are ascribed to him by the medieval Catalogus Stamsensis, has been called into question (Callus 1963) and is now thought to be the work of Geoffrey of Aspill. In the case of the *Physics* commentary no doubts are left after the (recent) publication of this work by (Donati et al. 2017).

Thought

As a central figure of the thirteenth-century philosophy and theology, both in Paris and in Oxford, Kilwardby was influenced by, and in some cases in contact with, the major figures of the period, namely Robert Grosseteste, Richard Fishacre, Richard Rufus of Cornwall, and Bonaventure. The presence of Bonaventure in Kilwardby's *Sentence* commentary is unequivocal, for example, on the topic of Trinitarian theology, and the influence of Rufus has also been noted (Wood 2002), but further research is needed after the issues of attribution surrounding this author have been settled. On the other hand, researchers have been stressing the influence of Kilwardby's commentaries (*Categories*, *Prior* and *Posterior Analytics*) on Albert the Great (Ebbesen 1981; Cannone 2002; Thom 2007), and Roger Bacon (de Libera 1987), but also

Lambert of Auxerre, Simon of Faversham, Radulphus Brito, and Richard of Campsall (Lagerlund 2000). Recent work by both Mora-Márquez (2015) and Hansen (on John Pagus, 2012) has provided a more detailed context of these grammatical and logical developments.

Moving now away from the context to the substance of Kilwardby's thought, the first aspect to consider is logic, which Kilwardby defines as the science of discursive reasoning, and as such it is essential and auxiliary to all other fields of inquiry. But as the aim of inquiry is knowledge, especially or primarily the necessary truth found in the conclusion of a demonstrative syllogism, the task of logic is to discover its rules (Silva 2012a). Although Kilwardby notes at places how syllogisms can be constituted by transcendental (i.e., formalized) terms, he does emphasize the ontological implications of his syllogistic theory, namely his focus on syllogisms with propositions that express per se necessities, which implies an essential relation between subject and predicate (Lagerlund 2000). A correctly formulated proposition expresses something essential about the reality, and the way we understand reality to be (Thom 2007). Kilwardby analyses syllogisms into matter (the constituting terms and propositions) and form (figure and mood). He applies the same matter-form analysis to words. Words are made up of utterance (*vox*), the modulated vocal expression, and the act of signifying, that is the bringing about of a signification to the mind of the hearer (words primarily signify concepts, which signify things). In this context, meaning is defined as the relation of a sign to that of which it is a sign (Lewry 1978, 1981b). Kilwardby's grammatical theory was equally influential. In his commentary on the Priscianus minor, which remains unedited, Kilwardby analyzes the correction (*congruitas*) and the completeness (*perfectio*) of sentences in cases where the rules of construction are not observed. Whereas a normal construction represents the intention of the speaker in correct grammatical terms (Kneepkens 1985), in the case of figurative constructions Kilwardby considers them ungrammatical *simpliciter* but congruous *secundum quid*, that is with relation to the meaning intended by the speaker. This has been

characterized as the formulation of a criterion of grammaticality which is based on authorial intent (Sirridge 1990). But such a sentence can be accepted only because the hearer has the capacity to, from the meaning of the ill-formed utterance, understand what the meaning intended by the speaker was (Rosier 1994).

Kilwardby also comments on the *Ethica vetus et nova*, that is, books I–III of the *Ethica Nicomachea* (Lewry 1986). Although the authorship of the commentary has been open to dispute, recent work by Celano (2016) seems to have settled the matter in favor of Kilwardby, and the edition is forthcoming. This ensemble of ethical and logical treatises constitutes the most comprehensive set of commentaries by a known master of Arts that has survived. In both cases, he introduces the works according to Aristotelian doctrine of the four causes, which became a standard feature of texts from the period: the material cause concerns the subject of the work in question, the formal cause the mode of procedure (*modus* and *ordo*), the final cause the purpose of the work (*utilitas*), and the efficient cause the authorship (Lewry 1978). The importance of Kilwardby's commentary on the *Ethica* resides in the fact that shows the early reception of this work and before the translation of the full Aristotelian treatise. With access to a very limited part of the text, Kilwardby's commentary displays the ability of the Dominican to distinguish between the Aristotelian and Christian understanding of virtue, as in the analysis of happiness, virtue, and human goodness in philosophical terms independent from theological doctrine. The philosophical happiness (*felicitas*) is taken as not coincident with the theological beatitude (*beatitudo*) (Celano 1986, 1999). By holding with Aristotle that human virtuous actions are the cause of happiness, and not the union with God that the theological reading stressed, Kilwardby departs from the positions of his contemporaries. Kilwardby explains that, for Aristotle, happiness is attainable by human beings during their life (Lewry 1986; Celano 1986). In his works, Kilwardby shows an acquaintance with the works of Aristotle, not limited either to the works commented or to commonplaces (Lewry 1978; Brown 1996; against Long 1996; see Silva 2015), as well as an attempt to provide an accurate and

systematized account of Aristotle's text (Thom 2007).

The influence of Averroes is felt in Kilwardby's logic (Lewry 1978; Lagerlund 2000; Cannone 2002) and natural philosophy (McAleer 1999). On two topics, however, Kilwardby criticizes Averroes: on the dependence of the unity of time on celestial motion in the *De tempore*, and on Averroes' theory of one intellect common to all human beings. About the latter, Kilwardby considers it to be contrary to philosophical truth, faith, and even Aristotle's intention. Kilwardby argues against Averroes, that only with respect to the different parts of the same body, and not to different bodies, can the soul be one. Moreover, as the soul is the form of the body (*forma corporis est anima*), there cannot be the same form for all men. Finally, if there would be only one soul to all men, the same soul would know and ignore, be saved, and damned. Kilwardby develops also an important epistemological claim concerning the way the intellects of different human beings are distinct even when they have the same object of thought because the intelligible is one only in species and not numerically (*simulacrum eiusdem rei sensibilis a diversis intellectum non est idem numero sed specie solum*). Plato's likeness is the same only according to the species in the minds of Socrates and Cicero. Universals, which exist in the divine mind as causal forms or exemplars, exist both in the human mind and in real things (Silva 2012). As the essences of real individual things, universals are abstracted by the mind from the species received through the senses. The mind considers that which is common to the multitude of the images, therefore the unity of the universal is based "on agreement in essence" (*convenientia essentiae*) (Lewry 1981a; Silva 2012a, 2013b).

Kilwardby is also the author of a widely circulated introduction to the arts (their classificatory scheme, the definition of their objects and methods), the *De ortu scientiarum*, written c. 1250, which has been qualified as an optimistic encyclopedia. It is based on the Aristotelian notion of science and on the model of Hugh of St. Victor's *Didascalicon de studio legendi*, although the influence of other

classificatory schemes can be found, for example, Gundissalinus' *De divisione philosophiae* (Alessio 2001; Silva 2013a; Maierù 2013). Philosophy is defined as the study of both divine and human things, in order to live virtuously. Also in his commentary on the *Ethica vetus et nova*, Kilwardby stresses that knowledge is motivated by a moral end (Celano 1999), and in the introduction to the *Isagoge* he insists in the perfection of the soul by knowledge and virtue (Lewry 1978). Philosophy (*scientia humana commendabilis*) is divided in *speculativa* (which is further divided into *naturalis*, *mathematica*, and *divina*); *activa* (which is further divided into *mechanica* and *ethica*); and *sermocinalis* (which is further divided into *grammatica*, *logica*, and *rhetorica*) (see Silva 2013a). Following Hugh, Kilwardby includes the mechanical arts in the classificatory scheme, with some terminological changes in order to approach them to the social–economical context (Alessio 2001), and the replacing the *theatrica* for the *architectonica*. As in Hugh, magic (*scientia humana vituperabilis*) is excluded from the sciences.

It is in the *De ortu* as well as in two later works, the *De 43 questionibus* (from 1271) and the *Epistola* (from 1277 to 1278), that we find Kilwardby's notion of *materia naturalis* or *physica*. This is a particular important notion because it stands at the core of Kilwardby's doctrine of the plurality of forms in any composite (Silva 2012a; Donati 2013). Natural matter is impregnated with active potencies, which Kilwardby identifies with the Augustinian seminal reasons. Active potencies are potencies because they strive for form considered as full actuality, but striving (*appetere*) already displays a certain activity, which means that these potencies must be a form of some kind. If that is the case, as Kilwardby argues it is, the difference between the complete form and the active potency is their degree of actuality rather than a difference of essence. The role of these active potencies comes into full view in the explanation of animal generation. Active potencies are transmitted with the semen and are educed from matter through the action of the corporeal spirit, as the vegetative and sensitive forms of the soul. In the case of human

beings, this is then completed by the reception of the intellective form, directly created by God and infused at a certain stage of fetal development (Silva 2007). This principle of double origin – naturally generated and directly created – is used by Kilwardby to justify the necessary composite nature of the human soul. At the same time, Kilwardby reinforces the conception of a composite soul by arguing that each one of the *potentiae* (vegetative, sensitive, and intellective) is responsible for certain operations different in kind. The vegetative and the sensitive forms are qualified as the principle of life because through them the being they inform performs the operations of life, self-motion and sensation, while the intellective form is not act of any part of the body and does not operate through bodily organs but is capable of producing intelligible knowledge and understanding.

It has just been showed that the intellective soul has a different origin and mode of operation. As the result, it is also qualified as having a different kind of being: the intellective *potentia* is an individual of its kind (expressed in Latin as a *hoc aliquid*) and it is the perfection of a body informed by the sensitive *potentia*. What that means is that once infused in a particular body by God, the intellective potency connects the previous *potentiae* (vegetative and sensitive), completing and perfecting them. That perfection seems to indicate something in terms of power-reach but especially means that by it that individual being is completed in its species, as a properly human being. One of the main problems in the doctrine defended by Kilwardby, the plurality of substantial forms, is how to account for the unity among the *potentiae* and between the *potentiae* and the body informed by them. Together the three substantial forms constitute one composite unity due to their natural inclination to each other and to the body. The relation of the rational soul with the body is essential and not accidental, being precisely that which distinguishes the human and angelic rational soul (both are composed of a material together with a formal principle, in a declaration of universal hylemorphism). Also the body is a composite substance constituted by an ordered series of forms. For all this, Kilwardby is

said to hold a plurality of substantial forms in human beings.

Kilwardby also wrote a commentary on the *Sentences*, in the form of questions (c. 1256). Kilwardby discusses, especially in questions 35–36 of the first book, the problem of the Trinity. The persons are distinguished in the following way. God Father begets God Son from His own substance and the Holy Spirit proceeds from both. The origin, and the way of being originated, brings about opposite relations between the persons: generating, being generated, and proceeding. Divine persons are relations, not in the sense of inhering (otherwise they would be accidents), but in the sense of being related to something extra se (and as such are substances). Moreover, love comes from knowledge, as another expression of Trinitarian relation. The Father and the Son know each other as they are, and the love which arises from this knowledge is the Holy Spirit. An analogous reasoning is applied to the human rational soul, as the image of the divine Trinity.

Although there is a certain continuity of thought between Kilwardby's Parisian and Oxford periods, namely by his use of logical reasoning into theological questions, at least on two subjects Kilwardby changed his mind. The first concerns the cause of movement of celestial bodies, and the second the cause of individuation. About the former, while earlier he holds that celestial bodies are moved by their intelligence, later Kilwardby prefers the original solution from John Blund's *Tractatus de anima*, that is, the natural inclination of the celestial bodies' own weight (Silva 2007). In both solutions, Kilwardby is arguing for celestial motion to be a natural rather than violent motion, as in both cases the cause of motion is internal to the thing moved. About the latter, in his *Sentences* commentary, Kilwardby argues that both matter and form are intrinsic causes for individuation: matter as the passive cause (*causa receptiva*), form as the active cause. This particular individual actual being (*ens actuale et individuum*) is the actual designation (*signatio actualis*) of matter by form. Form designates matter, and designating matter, designates itself *secundum diversas rationes*. The property that characterizes the individual as such is actual existence. This actual existence of the individual is

substantial to the individual and accidental to the species, meaning that the ceasing to be of the individual does not affect the species (and the corresponding universal).

A central issue in Kilwardby's work is the attempt to conciliate the philosophy of Aristotle and Augustine (Lewry 1983), and when this proves not to be possible, he sacrifices Aristotle in favor of Augustine. This is particularly acute in his *De spiritu fantastico* (1256–1261). The Aristotelian scent given by the subtitle of the text – *de receptione speciarum* – is compensated by the strong Augustinianism present in the text. Together with Augustine and Aristotle, this work also displays the influence of Jean de la Rochelle's *Tractatus*, Costa ben Luca's *De differentia spiritus et anima*, and Pseudo-Augustine's *De spiritu et anima* (Lewry 1983). For Kilwardby, sensible knowledge is dependent on the sense object impressing the sensible species in the sense organ, but the passivity of the organ is tempered by the activity of the sensory soul, the efficient cause per se of perception. Kilwardby offers two accounts for perception, one focusing on physiological aspects, like the reception of the species and the activity of the internal spirits (vital and animal) together with the system of ventricular location of the powers of the soul; the other, psychological in nature, focuses on the activity of the soul, immaterial and dynamic, capable of producing from and by itself the images of the sensible objects (Silva 2012a; Silva and Toivanen 2010). This activity of the soul in the process of sense perception consists of two motions: the sensitive soul reacting (simultaneously, possible due to its spiritual nature) to the affection of the body, which results in the soul making an image from the species impressed in the sense organ; the second motion consists on the soul turning upon itself and seeing the image of the object made in itself, through which the object is then perceived (Silva 2008, 2012a, 2013b). The result of this action is then kept by the power of memory, which makes this information available for further cognitive operations. Kilwardby explicates the existence of three distinct memories that deal with different kinds of information: the lower (*brutalis*), which we have in common with

animals and that belongs to the sensitive part of the soul; the middle memory (*rationalis inferior et exterior*), which belongs to the rational part of the soul, but is still about sensible information; and finally, the higher rational memory (*rationalis superior et interior*), which is dedicated to intellectual knowledge.

Robert of Halifax

Kimberly Georgedes
Department of History and Anthropology,
Franciscan University of Steubenville,
Steubenville, OH, USA

Abstract

Robert of Halifax (c. 1300–c. 1350?) was an English Franciscan theologian active between 1325 and 1350. His only extant work is his commentary on the *Sentences*, probably

written c. 1334 at Oxford although the dating is uncertain. His commentary consists of nine questions, pertaining to books I and II of the *Sentences*, and is a good example of the types of *Sentences* commentaries produced in this period, which concentrate on fewer questions than previously, but in more detail. Although dealing with theological questions pertaining, for example, to grace, merit, enjoyment, and matters of the will, he discusses issues important for natural philosophy, such as light and vision, the continuum, and cognition. He followed the perspectivist tradition concerning vision and espoused a Neoplatonic metaphysics of light. Regarding cognition, he proves to be more a Scotist than Ockhamist, and he argues against Ockham in the question on the “middle act of the will,” a topic that attracted a great deal of attention in this period. The date of his death is unknown, but is thought to be sometime around or after 1350.

Very little is known for certain about Robert of Halifax, O.F.M., also known as Eliphath, Alifas, Elephas, or Olephad. The information available places Halifax among the English Franciscan theologians between 1325 and 1350. Robert was likely born at or near Halifax in Yorkshire around 1300, and probably entered the Franciscan order c. 1318 around the age of 18. It is likely that before being sent to the university to study theology, he studied philosophy at the custodial school in York. His university studies began probably around 1324. Based upon the fact that Halifax cited Wodeham, who lectured at Oxford between 1331 and 1332, and was in turn cited by Gregory of Rimini, who read at Paris in 1342–1343, Halifax most likely read the *Sentences* at Oxford between 1333 and 1340, although narrowing that date further is difficult. Halifax was the fifty-sixth Franciscan lector at Cambridge, the date for which was calculated to c. 1336, which, if true, would place his *Sentences* commentary around 1334. Nevertheless, the date of this lectorship is uncertain, and there are legitimate reasons for dating his commentary between 1336 and 1338 as well. Toward the end of the 1340s, Halifax returned to

Yorkshire where he was licensed to hear confessions in 1349 and 1350, and resided at the convent of Doncaster. The date of his death is unknown (Courtenay 1973).

Although historians have paid relatively little attention to Halifax, as compared to his contemporaries Fitzralph (c. 1300–1360), Wodeham (d. 1358), and Holcot (c. 1290–1349), Halifax nevertheless made a fine reputation for himself both in England and on the Continent, particularly at Paris, as is demonstrated by the fact that he was cited and quoted by figures such as Gregory of Rimini, John of Mirecourt, and Hugolino of Orvieto. His popularity is also attested to in that his *Sentences* commentary had survived in seventeen partial or complete manuscripts, all located on the Continent (Courtenay 1973), although one located in Magdeburg was lost during World War II (Georgedes 1995).

Halifax's commentary on the *Sentences*, his only known work, is a particularly good example of the type of commentaries produced in the first half of the fourteenth century. From the late thirteenth century, the writing of *summae theologiae* became less important, and in the fourteenth century, commentaries on Lombard's *Sentences* became the most significant source not only of theology but arguably also of philosophy, and at times the only source available for a given author, as in the case of Halifax (Courtenay 1987). Moreover, Halifax's commentary reflects other trends of the period, one of which is a change in content. The use of new analytical tools (particularly the new logic), mathematical language (e.g., the language of measurement, such as the intention and remission of forms), as well as interest in aspects of natural philosophy (physics in particular) were reflected in the concentration more on epistemological and empirical problems, although discussed in the context of theological questions, especially questions pertaining to acts of the will, grace, and merit. Another trend is a change in the structure of *Sentences* commentaries. Authors began to concentrate on fewer questions rather than commenting on the entire *Sentences*. Moreover, commentators began to cite the names of

those whose opinions they argued for or against rather than using the vague "opinion of others." The English theologians, like Halifax, writing between 1325 and 1350, were foremost in these developments. These changes allowed commentators to engage in more speculation, especially via the more extensive use of the distinction of God's absolute and ordained powers, as well as to give more in-depth answers to questions that were of particular interest to them (Courtenay 1987).

Halifax's commentary, although short, is not an abbreviation. It consists of nine total questions that loosely follow Lombard's organization of the *Sentences*, and which were designated under two different forms in the fourteenth century, as "questions" and also as "Book, distinction and question." He begins with a "principium," designated as question 1. Questions 2 and 3 concern the Prologue; questions 4, 5, and 6 pertain to Book I distinction 1; question 7 pertains to Book I, distinction 2; and questions 8 and 9 pertain simply to Book II. Questions 4, 5, 6, and 9 deal with acts of the will, while questions 1 and 9 deal with aspects of merit and punishment, and question 8 deals in particular whether the angels advance in merit. Questions 2 and 3 deal with aspects of the study of theology, knowledge, and foundations of belief (for the list of the complete questions, see Courtenay 1973).

Within the context of question 2 (question 1 of the Prologue: *Utrum per exercitium studii in veritatibus theologiae possit theologus ad maiorem notitiam devinire, quam sit notitia fidei*, which deals with acts of believing and knowing, and the certitude of knowledge), question 5 (Bk. I, dist. 1, q. 2: *Utrum aliquis actus voluntatis possit esse subito productus a voluntate*, "Whether some act of the will can be suddenly or immediately produced by the will"), and question 8 (Bk. II, q. 1: *Utrum angeli beati in merito proficiant?* "Whether the blessed angels advance in merit?"), Halifax discussed light and the mechanism of illumination, vision, and cognition. In doing so he proved to be more of a disciple of Scotus than Ockham, for example, utilizing Scotus' definition of intuitive and abstractive

cognition rather than Ockham's. Halifax also used perspectivist arguments regarding vision, meaning that he argued for *species in medio*. Interestingly, he references both Robert Grosseteste and Pseudo-Dionysius in his discussions, and thus Neoplatonic light metaphysics plays an important role in his views, again, very unlike Ockham (Tachau 1982; cf. Lang's discussion of q. 2, 1930). Nevertheless, Halifax is more representative of the "calculatory tradition" (Murdoch 1975, 1978; Maier 1949), rather than the epistemological issues related to vision and cognition (Tachau 1982). More study is needed to elucidate his thought on these issues, however, and to properly place him within the tradition.

The question that drew a great deal of attention from Halifax's contemporaries was question 4 (Book 1, d.1, q.1): *Utrum inter frui et uti sit aliquis actus voluntatis medius qui nec sit fructio nec usus* ("Whether between enjoyment and use there is some middle act of the will, which is neither enjoyment nor use"). Halifax was responding to Ockham's assertion that there was such a middle act of the will, which was neither enjoyment of God nor use of anything else (*Ordinatio* I, d. 1, q. 1). Halifax argued that, on the contrary, one may legitimately enjoy only God, and everything other than God may only be the object of use. This response places Halifax squarely in the midst of the Augustinian revival occurring at Oxford and Paris around the mid-fourteenth century. He also maintained, this time contrary to Wodeham, that the viator could not himself actively cause love for God or enjoy God above all and for his own sake in this life without grace except according to God's absolute power (*de potentia absoluta*). Nevertheless, this is impossible according to God's ordained power (*de potentia ordinata*) (Georgesdes 1995, 1997; Courtenay 1973).

Further study of Halifax will greatly advance our knowledge of fourteenth-century scholasticism, the calculatory tradition, views of light and light metaphysics (which are important for the history of science in this period), cognition, and enjoyment.

the University of Haifa, Kiryat Shmona, Israel

Abstract

Roger Bacon was born in Ilchester in either 1214 or 1220. After his matriculation at Oxford, he was one of the pioneers to teach Aristotle at the University of Paris. His return to Oxford in the late 1240s marked a turning point in his career. He joined the Franciscans in 1257, and in 1267/1268, he sent three works, comprising a plan for the reorganization of Christian studies, to the Pope. In his Parisian phase of career, he developed the idea of the utmost significance of the speaker's intention and original theories of imposition and equivocation. He affirmed that universals are extramental, believed in innate confused knowledge, and held to the theory of universal hylomorphism. In his mature phase of thought, he proposed an order of sciences in which the practical sciences received precedence, advocated the use of experimental method, developed the theory of the multiplication of species, and combined it with Alhacen's ideas on light and vision. By this move, he initiated the tradition of the science of *Perspectiva* in the West. Bacon viewed nature as a coherent system governed by laws and formulated some of them. He stressed the importance of mathematics in providing scientific explanations and drew geometrical diagrams exemplifying various optical phenomena. Bacon described the details of the workings of the sensitive soul and ascribed complex cognitive capacities to animals. He presented an original classification of signs and reversed the linguistic triangle prescribed by Aristotle and Boethius. His view of matter as positive and worthy of investigation found expression in his strong notion of representation, advocating the need to portray both formal and material aspects in cognitive contents and language.

Biographical Information

Roger Bacon was born in Ilchester, Somerset, either in 1214 or 1220, and was probably matriculated first at Oxford. The date of his MA degree would be about 1240, assuming that he was born in 1220 and that a scholar typically earned the MA at the age of 20. During the 1240s, Bacon was lecturing in the faculty of arts at Paris. His lectures covered Aristotle's *Metaphysics*, *Physics*, *De sensu et sensato*, probably *De generatione et corruptione*, *De animalibus*, and *De anima*. It thus appears that Bacon was one of the early lecturers on Aristotle's *libri naturales* in Paris. About 1247, Bacon gave up his membership in the arts faculty at Paris and returned to Oxford.

The move to Oxford has been assumed to mark the turning point in his interests. This turn involved a broadening of his outlook in the direction of Robert Grosseteste's (1168–1252) philosophy and the contents of various Arabic sources. He may have been assisted in this new direction by Grosseteste's intimate, Adam Marsh (1200–1259). It is not entirely clear where was Bacon stationed in the years 1247–1256. There is evidence which places him in Paris in 1247, 1251, and 1256 (Hackett 1997), and it has been suggested that he returned to Paris and studied theology there (Crowley 1950). It may be the case that when he decided to undertake private study, it was done at Oxford, where he had a greater chance of finding teachers and books in his new interests, but he went to Paris to find *experimentores*, such as Peter of Maricourt (fl. 1269) (Power 2013).

Bacon joined the Franciscans about 1257 and reports a series of hardships in the first 10 years of his life as a Franciscan. He accused his superiors of burdening him with duties and punishing him with isolation, hunger, and “unspeakable violence.” In those first years as a Franciscan (until 1266), Bacon wrote the *De mirabilis potestate artis et naturae*, and *De computo naturali*. This was the period of his most intense occupation with optics, and in the late 1250s or the early 1260s, he wrote *De multiplicatione specierum* and *De speculis comburentibus*. Following a

short correspondence with Guy de Foulques (C 1195–1268), who was elected Pope as Clement IV, Bacon sent him in 1267/1268 the *Opus majus*, *Opus minus*, and *De multiplicatione specierum*. The Pope died in the same year, so Bacon received no answer, and no result had followed from his writings.

In the late 1260s and early 1270s, Bacon probably wrote his *Communia naturalium* and *Communia mathematica*, mature expressions of many of his theories. This was also the period of Bacon's intense occupation with language. The Greek and Hebrew grammars belong to the phase immediately following the *Opus majus*. These were followed in 1271 or 1272 by the polemical *Compendium studii philosophiae*, in which Bacon criticized the Franciscan and Dominican orders for their educational practices. His edition of the *Secretum secretorum* was completed at Oxford, sometime after 1278 (Williams 1994).

A chronicle, from about 1370, reports that Bacon was condemned and imprisoned by his order for "certain suspected novelties." The chronicle further tells us that Bacon's works and doctrines were to be avoided by all, since the order had rejected them (Crowley 1950). Bacon was supposedly confined to the Paris convent around 1277–1279, by Jerome of Ascoli (d. 1292), the Franciscan minister general (Sharp 1930). The reason for this condemnation is unknown. Perhaps it had to do with Bacon's association with the spiritual branch of his order, a branch perceived as a threat by his superiors.

In 1292, at a chapter of the order held in Paris, just after Jerome of Ascoli's death, certain prisoners were set free. It is possible that Bacon may have been one of them (Easton 1952), although the duration of his imprisonment is unknown. The last evidence of Bacon's life is the *Compendium studii theologiae*, which he left unfinished. This was a grammatical work, repeating many of the themes and ideas that had appeared long before in his *De signis* (a part of the *Opus majus*). It is reasonable to assume that he died in 1292 or soon thereafter (Easton 1952).

His Philosophy

Bacon's works from before 1247 differ on several aspects from his later works. Before 1247 he wrote on grammar (*Summa grammatica*), logic (*Summa de sophismatibus et distinctionibus* and *Sumulae dialectices*), and questions on several Aristotelian and pseudo-Aristotelian texts, which were probably the notes of his lectures, copied down much as he gave them in Paris (Easton 1952).

The *Summa grammatica* was a systematic exposition of the principal points of syntax in the tradition of the Priscian commentaries (Rosier-Catach 1997). Bacon's idea of the utmost significance of the speaker's intention appeared already in this early text. He claimed that the speaker may distance himself from the proper grammatical rules in order to express some precise idea. In his early works on logic, Bacon developed his notion of imposition and his theory of equivocation, according to which a word which is applied to both an entity and a nonentity is the most extreme case of equivocation (Maloney 1984).

In this early period of his thought, Bacon held the agent intellect to be an inseparable part of the soul. He endowed it with the function of abstracting the incoming *species* from their material conditions, a function he would abandon later on. In some of his early works, he mentioned functioning innate exemplars, providing the soul with knowledge of universals, while in others he referred to innate knowledge as vague and indistinct. In his mature works, these will be replaced with the talk of an innate capacity to acquire language, construct arguments, and recognize logical fallacies (Raizman-Kedar 2009). Bacon objected to the idea that matter is one in number in all things, and held to universal hylomorphism, according to which all things except God are composed of matter and form. Thus, Bacon will speak of the matter of both corporeal and spiritual beings, and hence of "spiritual matter" (Crowley 1950).

At this point too, he affirmed that universals are extramental and exist within particular, material objects. The soul does not make universality, so he believed, but finds it as a constituent of beings.

He denied that the rational soul was the cause of universality, for even if it did not apprehend things they would still resemble one another (Maloney 1985). The universals in the mind, so he thought, are likenesses of external things, that is, they are the *species* of the “real” universals, those which are, in particular, physical objects. The same position appeared in his mature writings, especially in the *Communia naturalium*.

In the mature period of his work, Bacon abandoned the commentary literary style. He composed two general works, proposing and explaining his vision of the reform in Christian learning (the *Opus majus* and its two abridgements, *Opus minus* and *Opus tertium*, and the *Communia naturalium*); two optical treatises (*De speculis Comburentibus* and the *De multiplicatione specierum*), of which the latter presents not only his account of light and vision but of natural causation in general; one extended mathematical tract (*Communia mathematica*); and several works on language and semiotics (*De signis*, *Grammatica Graeca*, and *Compendium studii theologiae*). Some of his writings (such as *Opus tertium* and *compendium studii philosophiae*) were devoted in part to social and political criticism. To this are added some small treatises on medicine and alchemy (such as *De erroribus medicorum*) and of course, Bacon’s edition of the *Secretum secretorum*, touching on topics such as government and the conduct and education of rulers.

The *Opus majus* was to a great extent a plea for the study of the practical arts and sciences. These, Bacon exclaimed, rank higher than the speculative sciences. Accordingly, for each science Bacon added a list of its possible uses. Thus, knowledge of foreign languages can foster the development of commerce and secure peace between nations and knowledge of alchemy can be used to prolong human lives. Theology and moral philosophy are the most practical of them all, since they actively contribute to man’s salvation. These sciences should therefore be considered the summit of human knowledge and all the other disciplines considered their aides (Lindberg 1987).

Bacon maintained that a theologian must undergo a full liberal arts training. This conviction

stands at the heart of his proposal for revising the curriculum in the universities. Bacon wanted theologians to be versed not only in the liberal arts but also in the seven practical sciences, including perspective, astronomy, the science of weights, medicine, experimental science, alchemy, and agriculture. Without knowing these subjects, he argued, the theologians would not be able to understand the literal meaning of Scripture, and consequently fail to grasp their spiritual meaning as well.

The method of inquiry to be used in pursuing these sciences should be, according to Bacon, “experimental science,” since logical arguments alone cannot provide the certitude our mind requires. If we wish to attain certitude, we must actively experience the things of the world, using our senses. Bacon listed three tasks for experimental science: to investigate the conclusions of the speculative sciences, to construct new instruments and technologies, and to supply prognostications and predications. It appears that Bacon’s *experimentum* was not simply a repetition of Aristotle’s empiricism, but in fact a critique of pure syllogistic reasoning. There is evidence in *Opus majus* for actual experimental work with instruments in which Bacon was involved (Hackett 2006, 2008/9).

A conspicuous feature of Bacon’s advocacy for a new order of studies has been his praise of mathematics as essential to the study of all other sciences. Although his name is not subscribed under any significant mathematical achievement, he grasped better than most of his contemporaries the fecundity of mathematics as a principle of scientific explanations, and its ability to provide certainty in science. When combined with experimental science, math guarantees full truth free from error or doubt (Lindberg 1982). In advocating for the study of *Perspectiva*, Bacon applied geometrical analysis to optical phenomena wherever possible, thereby pushing the mathematization of light and vision as far as it could go before the seventeenth century revolution (Lindberg and Tachau 2013).

Bacon’s major later work on Physics was the *De multiplicatione specierum*. In this work, he described the details of what he considered the

most fundamental mechanism of natural causation, namely the propagation of species. Although the term had a rather large circulation in thirteenth-century philosophical texts, Bacon had given it a systematic treatment to be found nowhere else. He defined a species as “the force or power by which any object acts on its surroundings,” and posited it as efficient not only on the sensory level but within natural processes as well. A species, Bacon contended, is produced by every active nature; the list of active natures includes not only color, light, and other sensible accidental qualities, but also universals and substances. A species resembles its agent in “nature, specific essence, and operation” and belongs to the same category as its agent. Thus, the species of substance is substance, the species of accident is an accident, and the species of a composite is composite. Bacon established the principle that a species is brought forth out of the potentiality of the matter of the recipient and through it an agent renders its surrounding similar to itself (Raizman-Kedar 2009).

Bacon emphasized the material and natural existence of species, in both medium and senses. There is no “spiritual being” in the medium as was taught by other scholastic philosophers. For Bacon, universal causation is corporeal and material, and matter itself is not just pure potentiality but is positive in itself (Raizman-Kedar 2009). The action of species is of a natural character, which is uniform and necessary. The species’ activity conforms to a set of “laws of nature” (or laws of material forms or of multiplication). Bacon did not only state in general that such laws exist, but actually formulated a few of them, such as the law of reflection and the law of refraction. He prescribed laws that apply in other domains than species, such as the law of the gravity of water and the law of universal nature. These laws form a system, in which some laws derive from others and some are ordered in relations of subordination. At the top there is the overriding law, namely, the law of universal nature, which governs the continuity of matter and the equilibrium among its parts. Bacon declared that the search for laws had not been completed, and more laws can be derived from

the ones already discovered. In Bacon’s eyes, the search for laws is not a theoretical endeavor, for it has a definite practical goal – to enhance human life (Kedar and Hon 2018).

Bacon’s alchemical theory was unique and quite original. He distinguished between theoretical alchemy which teaches how things arise from elemental origins, such as precious stones, metals and pigments, and practical alchemy, which teaches the manufacture of these same products by using chemical technologies of stratification and distillation. Practical alchemy, Bacon believed, can assist mankind to prolong human life. Such prolongation can be achieved by creating an “equal body,” in which the dominating element has been corrupted. The corruption is made by optical instruments, which gather the celestial rays of beneficent stars and project them onto elemental bodies. The body made equal now propagates species, which reproduce the action of the beneficent celestial bodies, by means of which remedies are found and evils are eliminated (Newman 1997).

Bacon’s most notable scientific achievement was the initiation of the tradition of *Perspectiva* in the Latin world and its addition to the *Quadrivium*. He was a very competent reader and transmitter of the fruits of Arab scholarship, and especially of Alhacen (935–C 1039). He adopted Alhacen’s principle of emanation from each point on the object’s surface and argued that the vision-producing rays are only those that are perpendicular to the eye. He successfully communicated the geometrical principles of reflection in mirrors, the precept of equality of the angles in incidence and reflection, and the rules governing the location, size, and direction of images in different kinds of mirrors. The phenomena of refraction were dealt with successfully all the same, and Bacon established the principles of refraction at interfaces of various shapes and various media, all accompanied by geometrical diagrams. In *De speculis comburentibus*, he presented a minute treatment of the phenomena of pinhole images (Lindberg and Tachau 2013). He found by means of observation the universal 42 radius of the rainbow and suggested that the different colors are caused by reflections from small drops of

water, from each of which “reflection occurs as from a spherical mirror” (Lindberg 1966).

He then sketched the psychological processes involved in vision. According to Bacon, sight can perceive 22 visible qualities among which are light, color, remoteness, position, corporeity, shape, size, continuity, number, and motion. Of these, only light and color are perceived directly, since they alone produce species. The other visual qualities are deduced from the way the species of light and color are arranged on the surface of the eye, an arrangement which accurately reflects the original proportions within the issuing object. In deducing visual information, both humans and animals employ a kind of syllogism which resembles reasoning. Bacon ascribed complex cognitive capacities to animals; he adduced that spiders spinning their webs and monkeys taking revenge on people who have hurt them are examples of animals’ ability to learn from experience and to plan their actions accordingly (Hackett 2013).

Bacon’s faculty psychology, derived almost exclusively from Avicenna (C 970–1037), divided the brain into three chambers. The first chamber – *phantasia* – houses the common sense and imagination. Upon receiving the species, the common sense first makes judgments concerning each sense separately, discerning the distinctive kind of information supplied by the proper senses. The species are then retained in the imagination. In the middle chamber of the brain, the estimative faculty receives the species of the substantial nature of things, and memory, located in the rear chamber, retains them. The species retained in both *phantasia* and memory are multiplied all the way to cogitation, located in the middle cell of the brain. This faculty is responsible for the syllogistic mode of cognition and serves as the link between the sensitive and the rational soul in men (Smith 2015).

At this point, Bacon detached the agent intellect from the soul and identified it with God. He considered that according to Aristotle the agent had to be substantially other than the patient and therefore the potential intellect and the active one must be set apart. He then divided the rational soul in two: the speculative intellect and the practical

one, which he recognized as the will. He designated the speculative part to the speculative sciences, yet ascribed rationality only to the practical intellect, dealing with the practical sciences, because it alone employs deliberation and freedom of choice (Raizman-Kedar 2009). In his moral philosophy, he relied heavily on Seneca (C 4 BCE–CE 65) and strove to make his ideas known.

In his mature phase of thought, Bacon developed more fully his ideas on language and the imposition of words. He presented an original classification of signs, in which one class included natural signs, representing their significates by concomitance, inference, and consequence, by likeness or in the manner of cause and effect. The other class comprised of signs given by a soul, which could be given either by employing one’s free will or naturally, as if by an instinct. Words belong, according to Bacon, to the second category of signs given by soul. Words differ from natural signs in that no essential linkage exists between them and their significates; they differ from signs given by soul naturally, in that they are based upon pure conception and arise from cognitive and rational processes involving knowledge, reflection, deliberation, and choice. The thing to which a voice is attached depends entirely on the speaker’s intent. Since in most acts of speech we intend to name extra mental objects or events, Bacon argued that this external thing is what the word signifies, and not, as Aristotle and Boethius (c. 480–524/525) claimed, the image of the thing within the mind (Maloney 1983).

No cognitive act, Bacon stipulated, can occur without a due representation of the matter of the thing cognized. All aspects of an object must be a part of its representation and therefore a species represents the whole composite of form and matter. He expressed the same view in his theory of signs. The word, Bacon declared, does not represent only the form or essence of the named thing, but signifies the composite of matter and form as a whole. Against Averroes (1126–1198), who argued that a word represents the form alone since the form is more worthy than matter, Bacon answered that a composite has whatever is of

worth in a form and beyond this the worth of matter. This conception of representation is tightly linked with his view of matter as inherently positive and as an important factor in human life. His stress on the importance of the practical sciences is but another expression of the same position (Raizman-Kedar 2009).

Roger Marston

Stephen F. Brown

Institute of Medieval Philosophy and Theology,
Boston College, Chestnut Hill, MA, USA

Abstract

Roger Marston (c. 1235–1303) was an English Franciscan theologian who studied in Paris in the 1270s, when the challenge coming from Aristotle's philosophical works was reaching fever pitch in the university. He returned to England and became a doctor of theology at Oxford where he left a significant collection of *Disputed* and *Quodlibetal Questions* dealing with the inner operations of the triune God and with creation, with the fallen nature of man and the limitations of his natural powers, especially the will as a remedial agent, and with the nature of the soul, knowledge and freedom. He is considered a significant voice in the Franciscan school, which provided him with a strong collection of influential Franciscan companions, including St. Bonaventure, Richard of Mediavilla, William of Ware, Matthew of Aquasparta and his immediate teacher, John Pecham. This movement represented in a significant way the Augustinian tradition as it faced the alternative Christian Aristotelian vision of reality, presented mainly by Thomas Aquinas.

Roger Marston, as witnessed by the manuscripts of his works, was an English Franciscan. During his lifetime, more than 32 English parishes, towns and townships carried the name "Marston," so modern scholars debate the exact location that bequeathed him his name. The lists of Franciscan lectors at Oxford and Cambridge and of Franciscan Provincial Ministers, his own declarations, and his many references to the writings of other Franciscans establish his membership in the Order of Friars Minor. It is quite likely that Roger was born around 1235. After joining the Franciscans and completing his novitiate year, he studied

theology for three or four years at an English studium before going on to Paris. He was in Paris for the school year 1269–1270 and spent his years there as a bachelor of theology, returning to England before the school year 1276–1277. He incepted at Oxford, and was known as a doctor of Oxford and Cambridge, not Paris. Most recent scholarship places him in Cambridge during the academic years 1276–1278 and ties his inception at Oxford to the school year 1281–1282. After teaching at Oxford, he was elected the 13th Provincial Minister of the English province in 1292, an office he held until 1298. With sparse evidence to support it, he is supposed to have spent his last years as guardian at Norwich and to have died there in 1303.

There is also only slight evidence that Roger wrote a commentary on Peter Lombard's *Sentences* before he became a Master of Theology. However, manuscript references to it are vague and no text has been found. All of Roger's literary productions are magisterial works: *Disputed Questions* and *Quodlibet Questions*. His *Disputed Questions* have been gathered and edited under three titles: *De aeterna emanatione*, *De statu naturae lapsae* and *De anima*. *De aeterna emanatione* (*On the Eternal Emanation*) is a collection of seven questions, which center on the inner operations of the divine nature considered in itself and in comparison to the origin of creation, and also on the generation of the Son and the production of the Holy Spirit within the Godhead. *De statu naturae lapsae* (*On the State of Fallen Nature*), limited to two questions, examines whether man was created with a faulty nature or whether his present condition is due to an inheritance derived from a fall from the original state of nature, and then asks whether man can attain rightness of will on the basis of his own natural powers. The ten-question treatise, *De anima* (*On the Soul*), treats a wide variety of puzzles dealing with the nature of the soul and its faculties of intellect and will, including self-knowledge, the sources of our knowledge of all things, and the challenges to human freedom. The *De anima* questions depend on Matthew of Aquasparta's *De cognitione* (*On Knowledge*), disputed in 1278–1279, and on Henry of Ghent's

Quodlibet V (1280). The *Disputed Questions*, then, seem to be the product of Roger's work as a Master at Oxford. Henry of Ghent's various *Quodlibeta*, along with other sources, also provide clues to the dating of Roger's four *Quodlibets*. The latest research places Roger's *Quodlibet I* before Easter 1282, *Quodlibet II* before Easter 1283, *Quodlibet III* before Christmas 1283 and *Quodlibet IV* during Lent 1284. All of Marston's surviving works thus fall within the academic years 1282–1284 when he was teaching at the studium of St. Anthony in Oxford.

The principal sources outside the Franciscan order employed by Marston were St. Augustine, St. Anselm, Richard of St. Victor, Robert Grosseteste, Thomas Aquinas and Henry of Ghent. Roger borrows abundantly from St. Augustine for both his theology and philosophy, especially for his theory of science and his judgments concerning the insufficiency and errors of the philosophers in regard to the knowledge of God and even of the world. Using the words of Augustine, Marston praised Plato and Aristotle "who knew many things concerning the one God." Yet, echoing Augustine, and in this case Roger Bacon also, he noted that "all philosophers erred in something." For instance, because they had a false view of man's ultimate end, they fell short in their view of truth and also in their way of living. He warned "philosophizing" theologians, "drunk with philosophic nectar," not to mix the wine of Sacred Scripture with the water of worldly philosophy. Speaking of the immortality of the soul, Roger says: "I believe firmly that the arguments of the Saints are much more efficacious than all philosophic statements, even though in regard to this matter the same truths are affirmed by the Fathers and the philosophers." He refers to St. Anselm and Richard of St. Victor as his teachers and he follows them as the faithful interpreters of St. Augustine. He considered Robert Grosseteste as the *Commentator* of Pseudo-Dionysius and cites in all cases his translations of the *Angelic Hierarchy*, the *Divine Names* and *Mystical Theology*. He also employed the Bishop of Lincoln's commentaries in disputing Richard of Mediavilla's interpretation of St. Augustine's

illumination theory of knowledge. He bears great respect for the subtlety of Thomas Aquinas, but, like many of his contemporary Franciscan colleagues, he judged him to be one of the "philosophizing" theologians who abandoned St. Augustine's teachings and dedicated themselves too much to worldly philosophy. He also criticized Pelagian leanings he found in Aquinas' early writings, though he noted that Thomas either retracted or contextualized his positions on grace and will in his later works. Marston praised Henry of Ghent, whose *Quodlibet* questions served as a major source for Roger's four *Quodlibeta*. He praised his deep philosophical knowledge, noting that he had been steeped in it since infancy. He criticized some of his theories concerning human knowledge and the plurality of forms in man, but these criticisms must be read carefully, since for the most part, he is criticizing Henry as his teachings are presented by opponents, such as William of Ware.

Roger's main Franciscan sources were Alexander of Hales, St. Bonaventure, Richard of Mediavilla, William of Ware, Eustachius of Arras, William de la Mare, Matthew of Aquasparta, and beyond all, his teacher, John Pecham. These authors held many positions in common, so that they have been considered by many historians of medieval philosophy and theology as a unity, usually described as "the Franciscan School." Among their common philosophical doctrines are the primacy of the will, the plurality of forms and the theory of divine illumination. In the sixth of the *Disputed Questions on the "De anima,"* Roger followed Matthew of Aquasparta as he attempted to show how in contemplation the will added a further dimension of savoring experience to whatever is attained by the intellect. The plurality of forms, stressing the increasing developments of living things, was rooted in the teachings of Alexander of Hales and St. Bonaventure, but its explanation was brought to full strength by Marston in the criticisms of the unity of form position of Thomas Aquinas as presented by John Pecham and William de la Mare. In the third of his *Disputed Questions on the "De anima,"* Marston, following Matthew of Aquasparta, acknowledged how

the material content of our knowledge arises from the senses, but that the certainty of our knowledge needs a different ground, i.e., illumination by the eternal reasons, to provide its guarantee. In these matters where the late thirteenth-century Franciscans share common positions, in whole or in part, Marston is known for his long citations from fellow Franciscans, especially John Pecham, and is even accused by some modern historians of plagiarism. The editors of his *Disputed Questions* admitted that “not rarely” do we see long citations from St. Bonaventure, Matthew of Aquasparta and John Pecham in his works. However, the editors of the *Quodlibeta* caution us not to read “not rarely” as identical with “always,” “on the whole,” or “quasi word for word.” To see his originality amid this commonness, it is necessary to note also the differences and to read Marston with exceptional care.

Roger Roseth

Olli Hallamaa

Department of Systematic Theology, University of Helsinki, Helsinki, Finland

Abstract

Roger Roseth, an English philosopher–theologian, belonged to the generation of Franciscan scholars immediately following William of Ockham. Roseth composed his only surviving

work, a *Sentences* commentary, in the mid 1330s. Where Roseth received his theological education is not known, but his affiliation with Oxford authors, his style, and the content of his book all suggest that he was trained in England. Although we know little about Roseth, his work was once rather renowned: at least 17 preserved manuscripts containing the text or parts of it attest to its popularity. Roseth displays a strong interest in contemporary logic and natural philosophy; he is considered to be one of the key witnesses of the significance of Oxford calculators for English theology.

The exiguous biographical facts about Roseth stem from information in the text itself and in the manuscripts containing the text. Roseth wrote his single work, *Lectura super Sententias*, after 1332 but no later than 1337. The *terminus post quem* is based on the reference Roseth makes to Adam Wodeham's Oxford lectures, given during the academic years 1332–1334. The *terminus ante quem* is the year when the oldest preserved copy of Roseth's work was made at the Franciscan convent in Norwich. Some marginalia indicate that Roseth was an English Franciscan. The manuscripts spell the author's name in various ways; the current spelling is adopted from MS Chigi B. V-66. Modern scholarly literature also uses the Latin equivalent, Rosetus.

Roseth presumably received his education at Franciscan schools, and was most likely acquainted with the intellectual heritage of Duns Scotus and William Ockham. It is not very clear how deeply these predecessors influenced Roseth's thought since he never reveals his indebtedness to either of them. Although Roseth does not explicitly refer to Scotus or Ockham, a careful reader can find passages in Roseth that witness their influence. Thus, for example, in his discussion on the question of whether the will is the cause of its own acts, Roseth seems to reflect some of the themes Scotus had taken up in his *Lectura* II, d. 25. Ockham's influence can also be seen in some of Roseth's views, such as his claim that the moral value of an act is based on the

agent's intentions only, and not on the external act itself.

Such occasional similarities do not, however, indicate that Ockham's ideas had a profound influence on Roseth. Since he refrains from discussing issues that would reveal his attitude toward Ockham's central ideas, such as in metaphysics, it is difficult to determine how deeply Roseth had absorbed Ockham's thought. Roseth's scattered remarks show that his views are similar to Ockham's in some points, while in others he deviates from Ockham's opinions. Roseth's sketchy description of relation is in accordance with Ockham's nominalistic theory of the categories, whereas the definition of *fallacia accidentis* omits Ockham's proposition based on his theory of mental language; and Roseth's remarks on the theory of cognition seem to presume *species in medio*, which Ockham had considered as superfluous. But even if Ockham's direct impact on Roseth's thought may have been sporadic, the intellectual milieu, which Roseth shared was markedly shaped by Ockham's work. This influence is one of the reasons Roseth and his Oxford contemporaries applied so-called metalinguistic analysis in their writing; that is, they dealt with scientific questions in a propositional context. The extensive use of propositional analysis may have been motivated by the need to guarantee the certitude of scientific knowledge in a world that after the nominalistic turn appeared as radically contingent. Thus, scientific knowledge was based not on contingent individuals as such, but on the propositional knowledge about these individuals. In this approach, the propositions carry the desired certainty. The linguistic turn in philosophy and theology became one of the hallmarks of English scholarship in the second quarter of the fourteenth century.

In fourteenth-century English theology, metalinguistic analysis appeared in the wide employment of contemporary logic and in the use of analytical languages that Oxford natural philosophers used to discuss various topics in physics. Bachelors in theology, when reading the *Sentences*, analyzed theological problems by using logical tools such as supposition theory, the doctrine of the compounded and divided

senses of propositions, and the study of consequences. The analytical languages they adopted from natural philosophy included rules for change (intention and remission of forms), limit decision (*de maximo et minimo*, *incipit*, and *desinit*), continuity, and infinity. Robert Holcot and Adam Wodeham are well known among the theologians writing in the new style, but other representatives of this new English theology, such as Roseth have only recently invoked scholarly interest.

Although Oxford thought constitutes Roseth's intellectual background, he appears to be an independent mind who is reluctant to reveal his indebtedness to any particular author. It is, however, obvious that Roseth stands closer to his fellow Franciscan Adam Wodeham than to the Dominican Robert Holcot. Roseth and Holcot merely shared a similar style, which may have been the reason why sections from Roseth's *Lectura* were incorporated into Holcot's *Sentences*, printed at Lyon in 1497. Wodeham had a more profound influence on Roseth; in fact, he is the only confrère Roseth quotes by name. Roseth's direct reference to Wodeham's Oxford lectures is critical, but Roseth sides with his views in other instances as well, although he does not mention Wodeham's name. Roseth's discussion on Trinitarian logic, for example, is strikingly similar to Wodeham's treatment. The other Oxford contemporary mentioned by Roseth is Thomas Bradwardine. When apparently using Richard Kilvington's and Roger Swyneshed's writings, however, he does not explicitly refer to his sources.

The single work that has so far been attributed with certainty to Roseth is a collection of questions that apparently came from a lecture course he prepared on the *Sentences*. The work mirrors the changes in the *Sentences* commentaries, which emerged, particularly in England, during the second quarter of the fourteenth-century. Commentaries written in the new style no longer followed the structure of Peter Lombard's work but concentrated on the topics the author found most interesting. The *Sentences* now contained fewer, yet considerably longer, questions than traditional commentaries. In Roseth's *Lectura*, the text requires 90 manuscript leaves (counted from MS

Bruxelles, Bibliothèque Royale 1551) but is divided into a mere five questions of which only one has a counterpart in Peter Lombard's work: the fourth question, in which Roseth discusses themes related to the augmentation of charity. Of the other questions the first deals with conscience, the second focuses on the nature of the acts of will, the third is divided into an article on Trinitarian logic and a proof of God's existence, and the fifth raises the question of whether some creatures can be infinite. These topics have, broadly speaking, theological relevance, but they do not comprise a systematic account of essential theological questions. In fact, although the topics give an impression of a theological work, much of Roseth's material is not particularly theological but derives rather from various branches of philosophy. A typical example of this is the question on conscience, which begins with an article about the problem of assigning limits to different capacities such as vision or the power to lift heavy objects. Despite its theological origin, this chapter was copied and circulated as a separate treatise in natural philosophy under the title *De maximo et minimo*.

Roseth's keen interest in the languages of measurement and his ample use of propositional analysis characterize his work. Roseth's arguments often deal with infinitely divisible continua by which he discusses theories pertaining to continuous change and the related question of the correct understanding of infinity. These arguments are mostly comprised of thought experiments (*secundum imaginationem*) in which infinite divisibility seems to initiate something that is actually infinite. This result, however, is at odds with the traditional Aristotelian understanding, which allows only potential infinity. Roseth, who was a firm adherent of the Aristotelian notion of the infinite, presents the arguments leading to actual infinity as counterexamples of his own views. In the discussion, Roseth eventually disproves the arguments, thus giving his own position indirect support. Since the arguments involving actual infinity are designed to be refuted, Roseth's book is not an enquiry on infinity as such. Rather, the examples concerning infinity play a methodological role in his writing.

Yet, when the alleged infinite is based on God's essence or absolute power, actual infinity seems to be unavoidable. Roseth resolves such problematic cases by pointing out that the relation to an infinite God does not give rise to an actual infinity in the created order and that God's absolute power is restricted by general laws of thought. Thus, for example, it does not follow from God's ability to perceive any proportional part of a proportionally divided continuum that the number of those proportional parts is actually infinite since the unending mathematical series are unending even for God.

Roman Empire

Karl Ubl

Department of History, University of Cologne,
Cologne, Germany

Abstract

The Empire and the papacy represented the unity of Latin Christendom. As secular head of Christianity the emperor did not enjoy the same stability in his position of leadership as the pope. An emperor only held office for roughly half the years elapsed between 962 and 1493, as long vacancies interrupted the chain of emperors. Moreover, the concept of Empire was in constant flux. Contrary to the papacy, which was defined by a corpus of canonical laws and conciliar decrees, the Empire was shaped by collective memory and by individual interpretation. The concept of Empire varied according to the knowledge held of the Empire of antiquity. Some authors characterized the office of emperor as an exclusively secular authority which had been

established by Augustus. Others emphasized the Christian duties of the emperor, referring to the famous penance of the emperor Theodosius I in front of Ambrose of Milan. In Rome, the concept of the emperor as head of the city itself had never truly died out. Equally, a king was referred to as emperor in Spain and in England, if he dominated other kings in his region. Yet, in spite of this erratic concept of Empire, it inspired a philosophical discussion about the necessity of a political world order. This discussion emerged in the late Middle Ages and anticipated early modern theories about supranational institutions and the deficiency of nation-states.

When Charlemagne received the imperial crown from Pope Leo III on Christmas Day of the year 800, his dominion over the Frankish kingdom had in fact not been significantly enhanced. The new title of emperor signified his hegemony over Western Europe and his coequality with the Byzantine emperor in the East, but the political landscape had only changed in one respect: after 800, Charlemagne claimed authority over the duchy of Rome, which had traditionally fallen under the sovereignty of the Byzantine Empire. This claim, however, clashed with the aspirations of the pope, who was aiming at territorial autonomy and political leadership in the duchy of Rome. The Donation of Constantine, forged presumably in the decades preceding the imperial coronation, was meant to bolster these aspirations. Therefore, it was all the more important for the pope that the bestowal of the title of emperor remained his exclusive right. Whereas Louis I and Lothar I were crowned emperor by their predecessors, Pope Leo IV recovered this right in 850 when he bestowed the imperial title to Louis II. From this point onward, the pope's right to grant the imperial coronation in the church of St. Peter became the norm throughout the Middle Ages. Consequently, a strong relation between empire and papacy emerged. In the centuries before the Gregorian reform, the emperor claimed to have a supervisory authority over the pope and the papal election. In 963 and 965, Emperor Otto I removed

a pope from office who had not complied with his political intentions. Otto III continued this precedent by appointing several of his own advisors to the Apostolic See, thereby disregarding the traditional procedures of a papal election. This imperial right was further enhanced when several candidates contended for the papal office during a schism in 1046. In this situation, Henry III removed three popes who claimed legitimacy and appointed a candidate on his own. Even after the papal election had again been regulated by well-defined laws, this right of arbitration between contenders for the papacy persisted until the fifteenth century. During the Great Schism, the German king and would-be emperor Sigismund assumed the leadership of the Council of Constance (1414–1418) in his role as defender and advocate of the church (*defensor et advocatus ecclesiae*).

Above all, the medieval emperor was the church's advocate and the patron of the Apostolic See. In contrast, his competence to crown kings was rather elusive. Bohemia was part of the Holy Roman Empire, and the emperor crowned its king in 1085, 1158, and 1198. The coronation of kings in Cyprus and Armenia by Emperor Henry VI were, however, isolated cases. During the early and high Middle Ages, the emperor did not claim a universal authority or rights of interference in sovereign states. The concept of the Empire as a universal dominion over the Christian world emerged only after the renewal of Roman law in the twelfth century. The Hohenstaufen emperors sporadically used the concept of *dominus mundi* as a propaganda tool, but it did not take center stage in political discourse. Equally, it was first with the Hohenstaufen emperor Frederick I that an emperor stressed his affiliation to the Roman emperors by adding two laws to the *Corpus iuris civilis* of Justinian. This relation to the ancient emperors had been strengthened by the idea that the Roman Empire had been succeeded by the German one (*translatio imperii*), which gained increasingly universal approval during the twelfth century.

In the academic discussion of the law schools, the concept of a *dominus mundi* had several meanings. The jurists at the universities adhered to this

concept in order to sustain the ongoing validity of Roman law. But rather than support the universal aspirations of the reigning Roman emperor, they were foremost interested in theoretical debates on the source of law and the relation of the *princeps* to lesser communities. The reality of the Holy Roman Empire only rarely impinged on these debates. The jurists held the view that the world order of Roman law which centered upon a universal emperor was valid *de iure*, even though the emergent nation-states were *de facto* independent units. Since Pope Innocent III acknowledged in 1202 that the French king did not recognize any superior power, this position of *de facto* independence defined the common ground for the continuing debate. Even imperialist thinkers such as Bartolus de Sassoferrato and Baldus de Ubaldis had to come to terms with this exemption from imperial authority. The notion of a universal world order continued to remain the guiding idea against which the reality of the later Middle Ages had to gain legitimacy. The French jurists in contrast considered their king as an emperor in his realm (*rex imperator in regno suo*) and claimed a *de iure* autonomy from the middle of the thirteenth century.

In this debate among jurists, the rights and competences of the emperor were never precisely outlined. Not until the longest vacancy of the imperial office (from 1250 to 1312) came to an end did philosophers adhering to the revisionist policy of Henry VII articulate the emperor's rights in detail. In a letter addressed to the French king Philip the Fair, Henry did not shrink from claiming superiority in secular matters, an affront unique in the Middle Ages, which was answered by a firm and immediate rebuttal. When the Hohenstaufen dynasty ended, the French king obtained the position of leadership in Christianity and considered himself superior to the German ruler. This rebuttal of Philip the Fair inaugurated a fierce debate between adherents of the empire and their opponents. The most distinguished of the followers of Henry VII were Dante Alighieri and Engelbert of Admont. This debate continued into the reign of Louis IV in the writings of Lupold of Bebenburg, Marsilius of Padua, and William of Ockham.

Dante Alighieri (d. 1321), the famous Italian poet, hailed Henry VII as the savior of the infamous state of Italian politics, and was the first philosopher to vindicate the necessity of a universal world monarchy in the context of Aristotelian political thought. In his *Convivio* (1308), he had to overcome a huge obstacle: the fact that the Aristotelian framework was neither compatible with a universal monarchy nor with the idea of a commonwealth aiming at religious salvation. After the death of Henry VII, Dante again turned to the topic of universal monarchy in his famous treatise *Monarchia*. The first part of this treatise is dedicated to the question of whether a universal empire is necessary for the common welfare; the second to the defense of the right of the Roman people to the imperial office; and the third to the rejection of any theory implying the subordination of the emperor to the pope. His main argument in favor of universal monarchy assumes that human nature is prone to conflict, which can only be settled by an ultimate authority. Thus, lasting peace is dependent upon the existence of a universal emperor. Under this condition of peace, mankind can attain its ultimate goal, this being the actualization of human intellect which Dante identifies with the felicity attainable in this life. The emperor is described by Dante as a Platonic philosopher king, unaffected by passions and base motives. His power, therefore, would have no constitutional limitations or checks and balances and would only be "delimited by the ocean."

In the last year of Henry VII's reign, the abbot Engelbert of Admont (d. 1331) composed a treatise justifying the revisionist politics of the emperor in Italy. In his *De ortu et fine Romani imperii* (1312), Engelbert combined the Aristotelian reasoning in favor of a universal monarchy with the genuine medieval tradition of a Christian empire. In contrast to Dante, Engelbert's emperor derives his authority not only from philosophical arguments but also from his role as advocate and patron of Latin Christianity. Moreover, he does not recommend unlimited power for the emperor or a strictly authoritarian universal order. Instead, in his view, the emperor's role is merely to ensure the application of Roman law and to adjudicate jurisdictional disputes. Peace, stability, and

human felicity would only be guaranteed through a hierarchical political order. Engelbert embraced the argument that Christianity would be in need of secular leadership in the organization of crusades and for combating the heathens. Despite this defense of the empire, Engelbert allowed for individual exemption from imperial rule in the cases of France and Spain. In the case of Italy, he insisted that it should again be subject to the emperor's authority, in accordance with the policy of Henry VII.

In his conflict with Pope John XXII, Louis IV ("the Bavarian") firmly adhered to the concept of a universal empire. Louis claimed that imperial authority stemmed solely from the election of the German electoral princes and rejected the need of papal approval. Lupold of Bebenburg (d. 1363), a jurist and bishop of Bamberg, gave a theoretical justification of this position. In his *Tractatus de iuribus regni et imperii Romanorum* (1338), he attached to the German kingdom the same formulas of national sovereignty which had already been developed for the French monarch during the thirteenth century. The king of the Germans should thus in the same way be independent of papal approval, and his authority should rest exclusively on the election by the electoral princes. Concerning universal empire, Lupold was more cautious than his patron. He did not envisage a hierarchical world order but accepted the exemption of the French kingdom from imperial authority. Lupold argued that the emperor was set apart from the other kings in one important respect, this being the entitlement to exert several reserved rights not only in the Empire, but also in the other nation-states (e.g., the appointment of notaries). Lupold, therefore, continued to insist on the universal authority of the empire. This persistence should not be understood as reactionary traditionalism. The imperial tradition was a decisive factor in the emergence of a German identity throughout the high and later Middle Ages, as the German identity coalesced around the unique position of the emperor and the succession of the Empire from the Romans to the Germans. The emperor was regarded as patron of the church, temporal leader of Christianity, and as

surety in view of the coming of the Antichrist. This doctrine of a Christian imperial monarchy continued to command much assent even outside the Empire.

Marsilius of Padua and William of Ockham, both of whom were under the protection of Louis IV, used the theory of a universal empire to counter the claims of the papacy regarding universal rulership as formulated by Boniface VIII and John XXII. Marsilius had been a defender of popular sovereignty and republican government but began to defend the principle of a universal empire when he argued against papal claims to universal jurisdiction over temporal rulers. The emperor was to take the place of the pope, even in ecclesiastical matters, as the ultimate judge of clerics and the head of church councils. Marsilius dedicated his main work, the *Defensor pacis*, to Louis IV. After his flight to Louis in 1326, this adherence to the empire grew even stronger. In his later works (*De translatione imperii*, *Defensor minor*), Marsilius again defended the position of the emperor.

William of Ockham wrote the most extensive work on the problem of empire. Part 3.2 of his *Dialogus* is exclusively dedicated to this subject. Following the scholastic tradition, he dealt with the debate on universal empire in the context of the Aristotelian debate on the ideal constitution. Like Dante and Engelbert, he inquired whether imperial authority was necessary for the common good of humanity. His answer is ambiguous, although he generally seems to favor imperial rule because of its possible convenience in resolving disputes among nation-states. He argues that the leadership of the emperor should come into force in cases of appeal to him as the ultimate judge, in cases when the exercise of his reserved rights is demanded, and in cases where decisions of general principles need to be made. In most instances, however, he argues that national kingdoms should be permitted to maintain their sovereignty. This ideal constitution would not imply a hierarchical derivation of jurisdiction from the emperor, nor would it be implemented without regard to the historical situation. If the nation-states would not tolerate an

intervention by the emperor or if no suitable king could be found to hold the imperial office, this ideal constitution would become inexpedient. Expediency was the principle and measure by which Ockham dealt with the topic of the ideal constitution.

During the fifteenth century, the problem of universal empire again resurfaced in the context of the enduring schism between the Roman and Avignonese papacy. After the church proved incapable of resolving the dispute between three competing popes, the German king and would-be emperor Sigismund assumed the task of unifying the church. The theorists of the conciliar movement assigned the emperor a central role in the convocation of a church council in order to reduce papal authority. When a schism broke out between Pope Eugene IV and the Council of Basel, the conciliarists hoped to gain support from the emperor. It was during this crisis that Nicholas of Cusa (d. 1464) wrote his treatise *De concordantia catholica*, in which he argued for a symmetrical construction of both secular and ecclesiastical authority. Pope and emperor would together fulfill the position of leadership among Christians, whereas church councils and imperial assemblies would function as a balance on monarchical power, as he considered rule without consent to be tyrannical. It is important to note that this understanding of imperial rule shows strong influences from the Christian tradition. Nicholas called for reform in the church as well as in the Holy Roman Empire.

It was also during the fifteenth century that the idea of unrestricted imperial rule experienced an unexpected Indian summer. Aeneas Silvius Piccolomini (d. 1464), later to become Pope Pius II, argued for strict imperial authority to be accepted among Christian kingdoms in his treatise *De ortu et auctoritate Romani imperii*, dedicated to his patron, Emperor Frederick III. Aeneas Silvius supported the restoration of the imperial rule of Antiquity and rejected the medieval idea of national sovereignty. This view was echoed by jurists like Peter of Andlau (d. 1480) and Antonio Roselli (d. 1466). After the ecclesiastical schisms had been resolved, the emerging

threat from the Ottoman Empire further encouraged this new debate concerning the necessity for a universal temporal leader to rule in western Christendom.

Roscelin of Compiègne

Margaret Cameron

Department of Philosophy, University of Victoria,
Victoria, BC, Canada

Abstract

Roscelin of Compiègne's reputation in the history of philosophy was secured by his critical interaction with the more famous Anselm of Canterbury and Peter Abelard. Since no writings in his hand, save for one letter written to his former student Abelard (Reiners, *Der Nominalismus in der Frühscholastik: Ein Beitrag zur Geschichte der Universalienfrage im Mittelalter. Beiträge zur Geschichte der Philosophie des Mittelalters*, 8(5). Münster, 1910), have been identified, and reports of his positions come from critical or even hostile sources, determining the precise character of Roscelin's philosophical and theological views is difficult and controversial. Evidence suggests that he was part of a group of scholars who advanced a novel and sophisticated approach to the study of logic at the end of the eleventh century.

Little is known of Roscelin's biography. He was born sometime around the middle of the eleventh century. Roscelin's letter to Abelard, which criticizes the views found in Abelard's *Theologia summi boni* and for which Abelard was

condemned at the Council of Soissons in 1121, gives us some idea of his life span.

Roscelin reportedly held the view that “if three persons are merely one thing and not three individual things like three angels or three souls in such a way that by will and power they are entirely the same, then the Father and the Holy Spirit *has* become incarnate with the Son” (Anselm 1946). Anselm’s reply was this: “Either he wants to set up three gods or he does not understand what he is saying.” Several versions of *De incarnatione verbi* indicate Anselm’s effort to denounce the view of his former friend; at the time of its final publication, Roscelin had been denounced at the Council of Soissons (c. 1090–1092) for commitment to tritheism.

Some scholars claim that Roscelin’s effort to avoid heresy (that the Father became incarnate with the son and thus suffered) might have been the motivation for the allegedly tritheistic Trinitarian thesis (Mews 2002). Possibly it is explained by the new approach to the study of dialectic. Roscelin was one of a number of dialecticians in the late eleventh century who, according to the report of a later chronicler, “was the first in our time to institute the doctrine of words (*sententia vocum*) in logic.” What is meant by “*sententia vocum*” is debatable. The same approach to logic is described as “sophistical,” and its followers were members of a group with many followers, including Robert of Paris, Arnulfus of Laon, and led by some unknown figure named John (Iwakuma 1992). Anselm also refers to the “witty little sophisms” that Roscelin engaged in, but it seems that his approach to dialectic was not all play since, according to Anselm and Abelard, Roscelin also held strong views on the non-reality of relations, composition, properties and dispositional properties, and universals (Kluge 1976; De Libera 1996; Erismann 2008).

According to Anselm’s characterization of Roscelin’s view, genera and species are no more than *flatus vocis*, breaths of spoken air. This is usually taken to mean that universals are identified as words. Peter Abelard’s theory of universals is described as more advanced than his former teacher’s: Abelard insists that the universal is

more than mere air (*vox*) since it is the spoken word insofar as it is significant (*sermo*). Possibly Roscelin had not worked out a sufficiently robust theory to handle the signification of universal words, although another aspect of his view (namely, the denial of the distinction between a substance and its properties, as when he denies that color is something distinct from the colored body) suggests that he adhered to the definition of names given in Priscian’s *Institutiones grammaticae* that the name signifies substance with quality (Mews 2002).

Many of Roscelin’s theses can be grouped together according to the common goal of denying metaphysical plurality in reality, that is, that multiple things can in any way be one. Roscelin denies the unity of universal wholes, such as several individual humans constituting one species human, or several species constituting one genus. The species-name “human” is a mere word; only individually distinct substances exist. Roscelin also denies the composition of integral wholes, such as a house composed of parts. According to Abelard, “our teacher Roscelin had a doctrine so crazy that he didn’t allow anything to be composed of parts; but in the same way he attributed species to be only words, he did the same for parts” (Abelard 1970). “Part,” like “species” and “genus,” is a mere utterance, devoid of metaphysical import; possibly Roscelin regarded anything but names for individual substances to be second-order logical terms, or terms of second imposition. The position could not have been worked out with great precision since it was left open for Abelard to mock. The extent of Abelard’s intellectual debt to Roscelin is unknown, and little help is given by Roscelin’s hostile letter to his former student dissociating his theological views from the controversies surrounding Abelard’s. Roscelin is not mentioned once in Abelard’s autobiographical *Historia calamitatum*.

Some of Anselm’s characterizations of Roscelin’s beliefs are ambiguous. According to Anselm, Roscelin does not recognize the distinction between a substance and its properties, or substances and dispositions, and he denies the reality of relations. Should these comments be understood as positive positions put forward by

Roscelin (e.g., “there is no distinction between a substance and its properties”) or as implications of other views he holds? No answer is clear from Anselm’s text. There have been several recent attempts to reconstruct Roscelin’s doctrine (Kluge 1976; Jolivet 1992; De Libera 1996; Mews 2002; Erismann 2008). Another promising avenue for reconstructing Roscelin’s views is suggested by the *Dialectica* by Garlandus (Garlandus 1959; Tweedale 1998; Martin forthcoming).

Sa'īd ibn Dādhurmuz

Veysel Kaya
Department of Islamic Philosophy, İstanbul
Üniversitesi, İstanbul, Turkey

Abstract

Sa'īd b. Dādhurmuz is a syncretist intellectual who was active in the eleventh century of Islam. He was a philosopher, theologian, and mystic at the same time, and his oeuvre exhibits an attempt to combine certain philosophical, theological, and mystical tendencies in classical Islamic thought. While he maintains the philosophical tradition of al-Kindī, the first Muslim philosopher, he also supports the contemporary Mu'tazilite theology in pivotal theological issues. His inclination towards the Sufi tradition is apparent in some aspects of his writings. Sa'īd b. Dādhurmuz is the author of three epistles, *Epistle on the Superiority of the Hereafter over this World* (*Risāla fī Faḍl al-ākhirā alā l-Dunyā*), *Epistle on Soul and Spirit* (*Risāla fī l-Nafs wa-l-rūh*), and *Epistle on Unity* (*Risāla fī l-Tawḥīd*). Despite the importance of his philosophical project, his name does not feature in any bibliographical source, a situation that kept his writings in a very limited circulation.

Theological and Philosophical Teachings

In Sa'īd b. Dādhurmuz's vocabulary, God is described with many names, such as the Creator, Eternal, First Creator, Pure Thatness, Pure Identity, First, True First, True One, First One, Pure Truth, First Truth, Pure Light, Pure Good, and First Cause. According to him, all these names indicate an aspect which sets God as a unique entity among other beings. Indeed, God is the true bearer of all these names; He is creator in real sense, one in real sense, existent in real sense. All beings except Him can only be described with these attributes in a figurative and accidental (*'Aridi*) way. God is not only the cause of the essences of things, but the cause of their existences. Sa'īd b. Dādhurmuz makes the distinction of the essence of things (*māhiyya*, *waḥdāniyya*) and their existences (*anniyya*, *wujūd*). In order to demonstrate God's ultimate power of creating, the universe must be accepted as being originated in time, that is to say, everything beside God has a starting point in time due to the free choice of God. Thus, Sa'īd b. Dādhurmuz supported the thesis that the world is created from nothing, as was supported by his predecessors such as al-Kindī and the Ikhwān al-Safā.

In accordance with his stance on the creation of the world, Sa'īd b. Dādhurmuz adopts the Mu'tazilite principles that the universe is the

aggregate of bodies and accidents. Bodies cannot be separated from the four accidents of generation (*al-akwān al-arba'a*), that is, motion, rest, compositeness, and division. Since these four accidents are evidently subject to change, they are originated (*hādith*) and cannot be seen as eternal entities. Therefore, bodies which can coexist with these accidents in every moment are also originated. This leaves God as the only thing which truly deserves to be called "eternal" (*qadīm*). If bodies were eternal, they would not have changed from the state in which they were in eternity. This is because the eternal cannot change from the attribute of eternity. Similar to that, the originated being cannot change from the true nature of origination. Were it so, the eternal would be originated, and the originated eternal. To state that, is to invalidate the true nature of things. God, as the maker (*fā'il*) of the world, is neither a body nor an accident, because he is the maker of the bodies and accidents, and he is the one who brought them into existence. Besides, the very name of the world (*'ālam*) connotes choice and perfection. Choice and perfection only come from who rules and brings to perfection, that is, God.

There are three ways to acquire the knowledge of things. First knowledge comes by one of the five senses, which are sight, hearing, smell, taste, and touch. Second, it comes by one of the rational faculties, which are thinking, reflection, judgment, true estimation, and pure mind. The third and last way of knowledge is argumentation and necessary demonstration, which is the definitive way of establishing certainty. When it comes to the knowledge about God, certainty can only be achieved about that God exists, not what God is. In other words, God's essence is beyond reach for human mind, while his existence is within the borders of human cognitive capacity. In fact, the knowledge of God is one of the most evident propositions, in that it is necessarily entailed by anyone's inference about the ontological state of the world. Sa'īd b. Dādhurmuz calls this "the common way," that is, the innate knowledge in the natures of created beings which brings them to the existence of the Creator the Exalted. Besides,

there is "the special way," applied by theologians and philosophers with the usage of argumentation and necessary demonstration, all of which depend on a set of rational inquiries. To these two ways of knowing the existence of God, inspired by the Sufi terminology of his time, Sa'īd b. Dādhurmuz adds the way of "light" (*nūr*). Among the servants of God, there are some very special people who are endowed by the divine light; this light enables them to grasp not only the knowledge of God but the knowledge of all other beings. This inclination puts Sa'īd b. Dādhurmuz's stance very close to the mystical tradition, as was supported by such Sufis as Abū Yazīd Bistāmī and al-Hakīm al-Tirmidhī.

Sa'īd b. Dādhurmuz holds that it is essential to have the correct knowledge about the nature of the spirit/soul (*rūh/nafs*), in order to truly understand human beings' place among other beings. One has to acknowledge the existence of the spiritual substances (*al-jawāhir al-rūhāniyya*) as separate entities from material substances. Human spirit (*rūh*) is defined as "a spiritual substance, living by virtue of itself (*bi l-dhāt*), knowing *in potence*, active with divine guidance." Thus, the idea of some naturalist philosophers and heterodox groups (*ahl al-bida'*) that spirit is a material substance, or an accident, or a bodily mixture (*mīzāj*) is not correct. Human beings' salvation is directly related to the knowledge of spirit. This is because the attainment of the eternal bliss in the Hereafter is accomplished only through theoretical sciences and virtues, all of which are related to the human soul, rather than the human body. Sa'īd b. Dādhurmuz also discusses the three parts of soul, the cogitative, concupiscent, and irascible soul according to Plato's teaching, and particularly points to the fact that Plato's division is fully compatible with the prophetic wisdom. In relation to this notion, as is seen in the writings of other Islamic, Jewish, and Christian philosophers in his milieu, Sa'īd b. Dādhurmuz brings forward the fourfold enumeration of ethical virtues as "prudence (*iffa*), courage (*shajā'a/najda*), wisdom (*hikma*), and justice (*'adāla*)," known as "cardinal virtues" throughout the middle ages.

Saadia Gaon

Jonathan Jacobs

Department of Philosophy, John Jay College of Criminal Justice/CUNY, New York, NY, USA
Doctoral Faculty of Philosophy, CUNY Graduate Center, New York, NY, USA

Abstract

Saadia Gaon (Saadia ben Joseph) (882–942) has an important place in medieval Jewish philosophy and was a distinguished translator (of Bible into Arabic), commentator, author of a Hebrew dictionary and the earliest known Hebrew grammar, and a contributor to liturgy. In *The Book of Beliefs and Opinions*, he formulated many of the main problems of medieval Jewish philosophy. While later thinkers disagreed with him in many respects (e.g., Maimonides criticized his views and his method), medieval Jewish philosophy owes a great deal to him. He was not doctrinally committed to one or another philosophical approach or system, such as Neoplatonism or Aristotelianism. While his thought shows the

influence of *kalam*, dialectical theology, he is important for helping shape a broadly rationalist disposition in Jewish philosophy, maintaining that key elements of Judaism can be shown to have the support of reason. In *The Book of Beliefs and Opinions*, he argues that there are adequate replies to skeptics and other critics who object that Judaism lacks rational justification. His distinction between “laws of reason” and “laws of revelation” has had considerable influence on many thinkers’ treatments of the issue of “the reasons of the commandments.” In that discussion he distinguished different levels of how evident are the rational supports for commandments. Also, Saadia discussed extensively the various parts of the soul, the basic motivational tendencies of human beings, and the question of what is the best life for a human being. He elaborated a rich moral psychology with some Platonic resonances and some Aristotelian resonances, integrated in a way that showed the wisdom of Torah as the guide to life. His discussion of repentance, merit and demerit, prophecy, creation, divine foreknowledge, Messianism, and other topics exhibits considerable philosophical sensitivity along with very great knowledge of Torah and tradition. He addressed a great many particular topics of moral psychology with considerable subtlety. Saadia was also the head of a major Talmudic academy in Babylonia and was a vigorous critic of *Karaism*. Little is known of his education or personal life, but his was a very active, engaged, life, of notable and enduring accomplishment.

Saadia is a key figure in medieval Jewish philosophy. “Gaon” is the title of the head of a Talmudic academy. Saadia was Gaon of the Babylonian academy at Sura. He was born in Upper Egypt and died in Sura, after living there for several decades. He had lived for a time in Palestine and in Baghdad. It is not known by whom or where he was educated, but he had very extensive knowledge and made contributions of numerous kinds.

In addition to his knowledge of Jewish texts and Hebrew language, he exhibited philosophical sophistication but without following the central doctrine or method of any particular philosopher. As a young man, he completed what was the first Hebrew dictionary and also wrote a Hebrew grammar. He also translated the Bible (or at least, most of it) into Arabic, and he wrote commentaries on several of the books of the Bible. His translation and commentaries have long been important to Jews in Arabic-language countries. In addition, Saadia wrote a number of halakhic works (works on Jewish law), and he compiled a prayer book – a *siddur* – including some poetry he wrote himself. His philosophical ideas and his contributions to Jewish tradition remain notable and relevant.

Saadia was no stranger to dispute. In one important instance, this involved disagreement with Ben Meir (Gaon of the Talmudic academy in Palestine) over the regulation of the calendar. In another, he refused to endorse a verdict of the exilarch. Also, he had a prominent role in the controversy over *Karaism*, which he criticized severely. These were serious disputes, and reputation, influence, and standing were very much at stake in them. However, his importance to philosophy is based on the fact that his great work, *The Book of Beliefs and Opinions*, largely set the topical agenda of much of medieval Jewish philosophy. It was perhaps the most important work in Jewish philosophy since Philo. In it, Saadia developed arguments for the existence of God, elaborated on central issues in philosophical theology, and formulated views on providence, free will, repentance, and other matters of philosophical psychology. His conception of the epistemological role and significance of tradition fits very aptly with an enlarged interest in that issue in recent decades as well as being important in its own right.

The Book of Beliefs and Opinions has a broadly rationalist character, though not in the sense of his philosophical ideas constituting a demonstrative system. It opens with an extensive treatment of epistemological considerations aimed at showing how Judaism is a religion of reason in the sense

that Jewish faith-commitments and Jewish tradition can be shown to be rationally defensible and can answer skeptical challenges. In part, Saadia was motivated to write the book by concern that many Jews felt a measure of doubt concerning their faith. There were numerous influential Muslim and Christian defenses and articulations of those faiths and challenges to Jewish thinkers to defend their religion. Saadia supplied a powerful philosophical voice to Judaism, and the central role he ascribed to rational justification shaped a great deal of later, important Jewish thought, if not by endorsement of his views, at least in terms of identifying key philosophical issues.

Saadia and Maimonides were much influenced by Islamic intellectual culture. Maimonides objected to the evident influence of *kalām* on Saadia's thought, insisting that Saadia was a dialectical theologian rather than a "genuine" philosopher. His criticism may be somewhat unfair. Saadia was both philosophically alert and philosophically sophisticated, though his thought did not explicitly reflect the pronounced influence of one or another specific philosophical theory, such as Neoplatonism or Aristotelianism. Like the *mutakallimūn* (practitioners of *kalām*), Saadia accepted a number of religious claims and doctrines and then sought to show how reason supported them, and he defended those claims and doctrines against objections. Despite the influence of *kalām*, there is a strong role for the authority of reason in his thought. The doctrines in question, such as free will or God's creation of the world, can be shown, he argued, to be rationally defensible. In either refuting or obviating skeptical considerations, Saadia argued that along with reason and sense, Scripture and tradition are sources of evidence (a stance that would have been widely acceptable to his readers). This proved to be an enduringly important philosophical move, given the significance of tradition to Jewish life and the conception of how it is informed by wisdom. (And, as mentioned, the epistemology of tradition is a topic of genuine interest in our time.)

Another especially important aspect of Saadia's approach is that he argued that among the commandments is the obligation to cultivate

and develop rational understanding to the fullest extent possible. This shaped a highly significant current of medieval Jewish thought. Its influence is detectable in the thought of Bahya ibn Paquda, Maimonides, and Gersonides among others. The notion that enlarged and deepened understanding is vitally important to fulfilling the commandments, to striving to imitate God, and, thus, to aspiring to holiness is crucial to medieval Jewish thought, and Saadia was an early, founding figure in developing it. He did not embrace intellectualist perfectionism in the way that Maimonides did, but the development and deepening of understanding were centrally important to Saadia.

Saadia's distinction between "laws of reason" and "laws of revelation" was highly influential in medieval Jewish thought, even though several thinkers revised his formulation of it. For example, it figures centrally in Maimonides' thought, though he disagreed with Saadia over the explication of rational justification of the commandments. Saadia held that some of the commandments are such that we can ascertain the rational justification for them unaided by revelation and other commandments are such that we could not do so, though they are not arbitrary or without reason. This notion – that divine wisdom informs divine will and that the commandments are rationally supportable – powerfully shaped Jewish thought in respect to the epistemology of tradition. Though Saadia did not think that human beings could discern the reasons for a great many ritual commandments and commandments concerning diet, purity, and so forth, he held that they have a measure of utility we can discern and that there are reasons for them, even if those reasons exceed our grasp to some extent. However, some commandments concerning fundamentally important moral matters, such as those concerning gratitude owed to a benefactor, wages being owed to a laborer, the duty not to cause harm, and some others, are rationally evident – are truths of reason – thus highlighting the place of reason in acceptance of the obligations of Torah. (Maimonides was more emphatic about all the commandments being supported by reason, while he disagreed with Saadia over the issue of

whether some of the commandments are fully rationally evident, i.e., truths of reason.)

This issue, of course, motivates the question of why revelation was necessary. Saadia argued that revelation is necessary for two main reasons. One is that great many commandments are such that, while there are rational justifications for them, we are not able to ascertain those justifications by unaided reason. The commandments are for our good (given God's wisdom and benevolence), but divine wisdom exceeds ours, and it has formulated commandments for our good, though we cannot always understand just how that is so. A second reason is that, even for those that are rationally evident, the specifics of how they are to be fulfilled are not evident, and revelation of that sort of specificity reflects divine graciousness and spares human beings a great deal of disagreement and uncertainty. Saadia noted that we might know, just through reason alone, that we are not to steal, but we do not know through reason alone just what are the specific conditions of ownership and what ownership implies. Similarly, we might rationally determine that it is wrong to commit adultery, but it is not rationally evident just what constitutes proper marriage and so forth. Prophecy (revelation) was needed in order for mankind to be guided to holiness, but there is nothing in prophecy (or in Judaism overall) that is in conflict with reason or ultimately beyond the reach of reason even though our comprehension is finite.

The Book of Beliefs and Opinions also contains extensive discussion of creation, redemption, and *olam haba* (the world to come), including a detailed treatment of merit and demerit. In addition to the important epistemological material early in the work, Saadia took up the most fundamental theological issues – creation *ex nihilo* and the divine nature, human free will, and divine justice (including Messianic redemption and also resurrection). Saadia's conception of how reason and revelation are mutually reinforcing and how the claims of both can be integrated in the pursuit of truth shaped an important current of Jewish thought. He sought to show that rational inquiry and speculation could strengthen Jewish faith rather than raise doubts about it.

He was a key figure in developing an understanding of Judaism, in which reason, ritual, worship, rabbinics, and moral life all have vitally important roles and he did much to explicate the relations between them. He said that he was motivated to write his philosophical work because of widespread doubt and confusion. He wanted Jews to be able to overcome that kind of demoralization and to be strengthened in their faith. The depth of Saadia's insights, the emphatic insistence on the role of reason in Judaism properly understood, and his integrative vision were formative for a great deal of succeeding Jewish philosophy, even if much of it was elaborated through methods different from his own.

Some of his works are lost, but it is notable that his work in numerous areas including grammar, liturgy, and commentary as well as philosophy has had enduring influence. He made significant contributions to philology, linguistics, commentary, liturgy, and philosophy. The depth and breadth of his expertise and the lasting influence of his contributions are really quite striking. He was an encyclopedic, creative, and ambitious thinker. He combated *Karaism* and other attacks on rabbinic Judaism and defended and invigorated tradition with philosophical acumen and argument. He made a crucial contribution to articulating Judaism in a way that involved essential roles for rational understanding and revelation. As remarked above, his philosophical work does not clearly show the stamp of a particular "school" or theory; yet, it reflects a powerful, original mind, actively engaged in multiple arguments and inquiries and deploying resources from all of them.

al-Sarakhsī, Aḥmad ibn al-Ṭayyib

Peter Adamson

Philosophy Department, LMU Munich, Munich, Germany

Abstract

Aḥmad ibn al-Ṭayyib al-Sarakhsī (c. 835–899) was a ninth-century polymath and student of the more famous al-Kindī. He worked in a number of fields, including philosophy, geography, refined literature (*adab*), and scientific areas such as medicine and astrology. His writings are almost entirely lost, and it is thus unclear to what extent his philosophical output went beyond transmitting the thought of his master al-Kindī.

Greek-inspired philosophy (*falsafa*) in the Arabic-speaking world became widespread in the tenth century, the time of al-Fārābī and his school, as well as various forms of Neoplatonism. But the philosophical tradition began already in the ninth century with the first reception of philosophical works translated from Greek into Arabic. Even among the relatively few practitioners of *falsafa* during this early period, al-Sarakhsī must be seen as a lesser figure. However, his importance is difficult to judge because not a single philosophical work of his is extant in its entirety. We are thus forced to reconstruct both his life and his thought

as best we can from later reports about him, which include lists of the works that made up his originally voluminous corpus. This reconstruction has been done in a series of studies by the late Franz Rosenthal (see especially Rosenthal 1943), which are the main basis for this entry.

Al-Sarakhsī was presumably born in Sarakhs in Khurasan and probably in about 835 CE. We know this with reasonable exactness because he tells us that he is 61 years old in a work he is writing for “the Caliph,” probably al-Muʿtaḍid (whose reign began in 892). We also know that he died in 899 after falling from favor in the Caliphal court in 896. This catastrophic fall from grace, which involved imprisonment, beating, and ultimately execution, seems to have resulted from a political intrigue, but the exact reasons are shrouded in uncertainty (see Rosenthal 1943: 25–34 for the conflicting reports). It may be that he had expressed religious views, for instance pro-Shīʿite sentiments, that made him an inconvenient figure to maintain at court.

Prior to his disgrace, al-Sarakhsī's career had reached its peak with important administrative duties under al-Muʿtaḍid. He had been appointed tutor to al-Muʿtaḍid when the latter was still a young prince, much as al-Sarakhsī's master al-Kindī had been tutor to Aḥmad, the son of the Caliph al-Muʿtaṣim (who reigned 833–842). When al-Muʿtaḍid ascended to the throne, al-Sarakhsī became a “boon companion,” and he was later given oversight over mercantile accounting (*hisba*), perhaps on the strength of having written on the subject of fraud (Rosenthal 1943: 24).

The chief intellectual event of al-Sarakhsī's career, however, occurred earlier when he became the student of al-Kindī. As Rosenthal (1943: 17) puts it, “it is certainly no exaggeration that he owed al-Kindī very much of his scholarly achievement.” In fact, many of the titles of al-Sarakhsī's works duplicate titles of al-Kindī's, and we may thus speculate that al-Sarakhsī was merely a transmitter of these treatises. Unfortunately, due to lack of textual evidence, we are unable to say how much he might have reworked his material. Other titles ascribed to Sarakhsī show that he in any case tended to agree with

al-Kindī's philosophical stance. For instance, both argued against atomism and in favor of the infinite divisibility of the body.

Al-Sarakhsī is thus a member of what might be called the "Kindian tradition" (for this phrase, see Adamson 2007) and takes his place along two other first-generation associates of al-Kindī's as an important transmitter of Kindian thought. The other two associates are Abū Zayd al-Balkhī, teacher of the well-known al-ʿĀmirī, and Abū Ma'shar, who was arguably the greatest astrologer of Islam. Astrology seems to have been a shared enthusiasm among the Kindians. Al-Sarakhsī followed al-Kindī in using astrological calculations to determine the duration of the reign of the Arabs. He also wrote a work that must have provided a philosophical rationale for the science of astrology, entitled *On the Main Principles of Philosophy and the Establishment of Astrology*. In this he would have been following al-Kindī and Abū Ma'shar, though it must be said that a fragment preserved from this work (see Rosenthal 1943) strikes an un-Kindian note in saying that the Qur'ān encourages us to study the stars but without "searching out a reason or investigating into a cause." (Perhaps this should be seen as an extraneous remark by a later transmitter.)

Another fragment that may derive from an astrological work is a remarkable discussion by al-Sarakhsī on the subject of erotic love (*ishq*) and why it manifests in a desire to kiss the beloved (see Rosenthal 1961). He explains, in a manner reminiscent of Plato's *Symposium* or *Phaedrus*, that the lover desires a commingling of souls but is unable to achieve this and thus seeks the passageway of the beloved's breath.

The stars also play a role in a well-known report by al-Sarakhsī, which claims to repeat al-Kindī's account of the star-worshipping Ṣābiāns of Ḥarrān (see Rosenthal 1943: 41–51). This report is preserved in three different versions, the most detailed being in the *Fihrist* of Ibn al-Nadīm. Particularly striking is the claim that the Ṣābiāns followed the teaching of Aristotle. All three versions claim that the Ṣābiāns were influenced by the *Physics*. The *Fihrist* version then adds that they adopted Aristotelian views about demonstration, natural bodies,

meteorology, the soul, and dreams. Their view about God is described as follows:

God, in their opinion, is one. No attribute can be applied to Him, and no positive statement can be made about Him, and, therefore, He does not fit into any syllogism. This opinion is in agreement with Aristotle's opinion in the *Metaphysics* (Rosenthal trans.).

Although al-Sarakhsī does not identify his own views with those of the Ṣābiāns, it is tempting to detect here an echo of ideas that are found in the works of al-Kindī, for instance, his *On First Philosophy* (cf. al-Kindī's characterization of Aristotle's *Metaphysics* in his *On the Quantity of Aristotle's Books*).

This raises the question of al-Sarakhsī's attitude toward Islam. As mentioned above, unorthodox religious views may have played a role in his downfall. Some evidence suggests that he tried to integrate Islam with philosophy, which again would be a characteristically Kindian project. Not only did he quote the Qur'ān in support of astrology, but he reports *ḥadīths* (sayings of the Prophet) and is placed by one later author in a group of authors who fused *kalām* (Islamic speculative theology) with philosophy (see Rosenthal 1943: 34–35; also in the group is the somewhat later historian and philosopher Miskawayh, who has likewise been associated with the Kindian tradition).

Al-Sarakhsī also participated in an interreligious dispute regarding the doctrine of the Trinity, serving in this debate as al-Kindī's representative (see Moosa 1972). Al-Sarakhsī's attempted refutations never get far in the account we have, because the report is authored by a Christian who describes the event as a stunning victory by al-Sarakhsī's opponent, the Bishop of Kaskar. Still, it is worth reading the account alongside al-Kindī's brief refutation of the Trinity, which is extant thanks to a counter-refutation by none other than al-Farabi's Christian student Yahyā ibn 'Adī. Kindī's refutation deploys ideas from the Aristotelian tradition, arguing that the Persons of the Trinity cannot be identified with any of the Porphyrian predicables. Similarly, al-Sarakhsī asks the Bishop whether the Persons are differentiated essentially or accidentally (neither, replies the Bishop).

Also typical of the Kindian tradition is participation in the refined Arabic literary culture of the ninth–tenth century. This culture of refinement (*adab*) saw its greatest exponent in a rough contemporary of al-Sarakhsī's, al-Jāhiz. Al-Sarakhsī's own contributions to *adab* include a kind of mirror for princes, entitled *On the Appropriate Behavior of Kings*, which is probably extant (see Rosenthal 1995; on the fusion of philosophy and *adab*, see further Rowson 1990). He is credited with many sayings and witty remarks, which are the subject of praise and quotation by later authors.

He is also praised for the breadth of his knowledge, which took in not only the fields mentioned already but also geography and medicine. Some of his geographical notes are extant, including information he collected while on a military expedition with al-Mu'taḍid in 884 (on this see Rosenthal 1943, 1951). In medicine we know nothing but a few fragments and titles of lost works. It is however interesting to see that the great physician and philosopher Abū Bakr al-Rāzī criticized al-Sarakhsī's refutation of Galen on the subject of bitter foods. (Al-Sarakhsī also disputed with Galen over *al-maḥall al-awwal*, “first location” – the meaning is unclear.)

All of this – the openness toward explicitly Muslim theological speculation, the practice of *adab* and of astrology, and expertise in a wide range of disciplines – is distinctive of other members of the Kindian tradition. If more of al-Sarakhsī's output were extant, we would have a better idea of the philosophical and cultural commitments of the Kindian intellectual heritage.

Schools in the Twelfth Century

Christophe Erismann

Helsinki Collegium for Advanced Studies,
University of Helsinki, Helsinki, Finland

Abstract

There is no general agreement on the meaning of the expression “twelfth-century schools” and the reality of some of them, mainly of the famous School of Chartres, has been seriously challenged. Without solving this problem, we can distinguish three types of institution: (1) The cathedral schools: Notre-Dame of Paris, Chartres, and also Laon, Orléans, Reims. These schools are, first and foremost,

places where theology was taught. (2) Collegial or canonical schools: the most interesting example is the School of Saint Victor. (3) Private schools, led by independent masters, based in Paris and focusing their teaching on dialectic, logic, and the liberal arts but also interested in theology. Schools are different from each other regarding their institutional status, the authoritative texts on which they focus, and their doctrinal inclination.

The expression “twelfth-century schools” refers to a historical object that is difficult to outline and define. Roughly, it is used to speak of the essentially urban multiplication of institutions of teaching and training in central and northern France, mainly in the area around Paris, and of the revival of scholarly thought that came with it. However, according to the interpretation one gives to this expression, its extension may vary considerably. This is because the existence of some schools has been questioned – for example, the reality of the most famous school of the twelfth century, the School of Chartres, has been challenged by Richard Southern; Valerie Flint has given an analogous criticism of the School of Laon – but also because there is no agreement on what is meant by the word “school.” It is the task more of research on intellectual culture and the social history of ideas to determine what the nature of these schools may have been, than that of the history of philosophy *stricto sensu*. A historian of philosophy can acknowledge the fact that some authors influence others or defend the same theses, or disagree; however, it is difficult to provide proof of the reality of the institutional organization of given intellectual centers. Despite the general climate of skepticism, two facts justify our speaking about “schools” – at least in a weak sense – during the twelfth century. The first is obvious: in all periods of history, teaching and training in philosophy required a minimal framework and structure. The second pertains to the unquestionable activity of masters: in a way unprecedented until the twelfth century, some particularly original and charismatic thinkers initiated an intellectual movement, had

an indisputable posterity and attracted around them a group which perpetuated their thought; the twelfth century is clearly, to quote the expression of David Knowles, “the age of the secular masters.”

Previously, teaching was mainly given in monastic schools (Fleury and, more importantly, the Abbey of Bec are good examples); this type of structure began to wane, and monastic schools closed to students from outside. New structures appeared or acquired renewed dynamism: during the twelfth century, a phase of active teaching took place, in particular – and this was new – in towns, masters opened their schools and currents of thought were constituted, in which a feeling of belonging can be identified. The history of this century is particularly rich regarding the teaching of philosophy: in towns, cathedral schools developed, such as Notre-Dame in Paris, a new kind of philosophical work led by authors associated to Chartres flourished, the School of Saint Victor was founded, the Parisian schools of logic were created and grew, innovative thought such as that of Gilbert of Poitiers had a remarkable posterity, an important center for medieval spirituality developed at the Abbey of Clairvaux, and the first universities were founded (in 1200, Philip Augustus issued the privilege to the schools in Paris which marks, at least symbolically, the beginning of the University of Paris).

Grouping these diverse phenomena under the generic name of twelfth-century schools is probably imprecise, such are the differences between them. We may, however, distinguish three types of institutions:

1. The cathedral schools: Notre-Dame of Paris, Chartres, and also Laon, Orléans, Reims. These schools are first and foremost places where theology was taught, although in the case of Chartres for example, great interest was shown for grammar and natural philosophy.
2. Collegial or canonical schools: the most interesting example is Saint Victor.
3. Independent or private schools, led by independent masters, also sometimes called *sectae*.

All these schools were based in Paris and taught dialectic, logic, and the liberal arts. In many cases, theology was associated to logic; it is thus appropriate, following Yukio Iwakuma and Sten Ebbesen, to call such schools logico-theological schools.

Schools differ in their nature and history; some continue a tradition, while others reflect the innovative approach of the twelfth century. Schools can also be distinguished from each other according to the content of their teaching. Some, such as Laon, had recognized expertise in theology, whereas the independent schools became specialized in the teaching of logic, which came to be seen as their hallmark. These schools also differ through the texts that found their teaching: we can observe particularly remarkable climaxes such as the exegetical tradition of the *Timaeus* at Chartres or that of the Pseudo-Dionysius at Saint Victor. In contrast, the schools of dialectic, both of realist and nominalist inclination, are clearly focused on Aristotle's logical writings. However, some thinkers cross these lines. William of Champeaux first taught at the School of Notre-Dame in Paris before founding Saint Victor; and he was interested in Aristotelian logic. Gilbert of Poitiers, who was chancellor at Chartres from 1126 to 1137, was also highly competent in logic, but had little interest in the exegesis of the *Timaeus*.

Let us consider these three types of schools by focusing, in the first two cases, on the examples that provided the most interesting philosophical contribution, Chartres for the first type and Saint Victor for the second. For the third type, we shall consider the case of the Porretans.

The Cathedral Schools: The Case of Chartres

It is not the role of this entry to decide who, of Richard Southern or the supporters of the School of Chartres (N. Häring, P. Dronke, and E. Jeaneau), is correct. We can adopt a neutral attitude by saying that Chartres can be described as a group of twelfth-century masters working in

various centers, who shared some interests but not others, some references but not all.

Among the Chartrian masters, the first of the new school was Bernard, master at Chartres by c. 1119 and chancellor by 1124, dying perhaps by 1126. Bernard initiated one of the fields of reflection characteristic of the Chartrian milieu: divine ideas. This theme originates in two texts that were centrally important to thinkers associated with Chartres – the *Timaeus* and Boethius' *Opuscula sacra*. As a Platonist, Bernard distinguished between the ideas, which are eternal, and the forms, reflections of the ideas, created by nature with the things which they specify. It was he who originated the phrase “native forms” (*formae natae*). This reading was echoed by later authors associated with Chartres who found a similar idea in Boethius. Bernard of Chartres inspired a community of learning (to use an expression less controversial than “school”) in which Platonic texts, notably the *Timaeus*, Macrobius' *Commentary on the Dream of Scipio* and the *Consolation of Philosophy* played a key role.

Among his disciples, two were great philosophers: Gilbert of Poitiers (born c. 1080, a canon of Chartres in 1124 and chancellor there from 1126 to 1137 succeeding to Bernard) and William of Conches (c. 1080–c. 1154). William of Conches wrote glosses to Boethius' *Consolation of Philosophy*, to Macrobius' *Commentary on the Dream of Scipio*, and possibly to the *De nuptiis Philologiae et Mercurii* of Martianus Capella, as well as a *Philosophia* and a commentary on Priscian's *Institutiones grammaticae* based on the anonymous eleventh-century *Glosule to Priscian*. He wrote a *Dragmaticon* – largely a reworking of his *Philosophia*, made during his spell in the household of the Duke of Normandy, after he had left the schools.

Thierry (“the Breton” or “of Chartres”) became Chancellor in about 1142; previously he had taught in Chartres and almost certainly at Paris. Thierry demonstrates various interests, touching on rhetoric, logic, mathematics, and natural philosophy. His most distinctive philosophical teaching – in which both his realism and his Platonism are expressed – is his activity as commentator on Boethius' *Opuscula sacra* (some of the texts

published under the name of Thierry were probably written by disciples). In his exegesis of Boethius, Thierry denies proper substantial reality to individuals; he considers that the essence is common to the individuals of a same species and that it is possessed in proper by none of them. Only the images of the forms exist in matter, and they come from the real forms that exist in the divine mind. According to him, a species is one and the same form for all the subordinate individuals. In Plato, Socrates, and Cicero, Thierry sees three distinct human beings, three individuals who differ through their accidents. But in them all, there is only one nature, humanity (*una natura una et eadem sit humanitas in omnibus*). The plurality of individuals comes from the diversity of accidents, not from diversity of natures (see the *Commentum super Boethii librum de trinitate*, I, 8; Häring (1971) 64:66–82 which reflects Thierry's teaching).

Whatever may be the status of their school, we can mention some common elements of the intellectual projects of the various concerned authors. The first common trait of the thinkers associated with Chartres is a strong commitment to the *artes liberales* (as distinct from theology). This is true for authors such as Bernard of Chartres, William of Conches, and Bernard Silvestris, who, unlike most of the leading teachers of their time, remained – insofar as we can judge – masters of the arts and did not venture into theology at all, and for those like Thierry of Chartres and, to an even higher extent, Gilbert, who were interested in theology and demonstrated a vivid desire to integrate the seven liberal arts into theological reflection. The second is to believe in the relevance of reading pagan texts as allegories of Christian truth. The most noticeable example of this phenomenon is the interpretation according to which Plato's *Timaeus* is to be related to theology, and that Plato's teaching in this work is consistent with the first chapters of *Genesis*. Thierry of Chartres is probably the thinker who went furthest in this direction, by identifying, in his early commentary on the 6 days of the creation, that which Plato called the *anima mundi* as the Christian Holy Spirit (*Tractatus de sex dierum operibus*, in *Commentaries on Boethius by Thierry of Chartres*

and his School, ed. N. M. Häring (Toronto, 1971), 566–567: “*Plato uero in Timeo eundum spiritum mundi animam uocat [. . .]. Christiani uero illud idem Spiritum sanctum appellant*”). It is possible that Abelard's *Theologia summi boni* is, at least in part, an answer to this attempt to relate Platonic teaching to Christian doctrine. The third is the important role given to grammar: Bernard of Chartres, William of Conches, and Bernard Silvestris greatly valued the study of grammar; however, differently from the Parisian masters and their contemporaries, they were not interested in logic. The fourth concerns their characteristic interest for natural philosophy.

The importance of these common points must not be exaggerated. We may indeed acknowledge the central role occupied by Boethius' *Opuscula sacra* in the thought of some of the authors associated with Chartres. Gilbert and Thierry both wrote commentaries on these texts. However, their reading is different in many ways, the most obvious being that Gilbert develops a particularist ontology on the basis of his interpretation of the *Opuscula sacra*, whereas Thierry defends an unsophisticated universalism. From this fundamental disagreement stem many others, on essential unity (Thierry insists against Gilbert that humanity is one for all men; when he mentions Gilbert's opinion on this point, he adds the comment *quod omnino falsum est*), on the explanation of individuality (Thierry defends a literal reading of Boethius, according to which the individuality of an individual is explained by accidental properties, whereas Gilbert limits the role of accidents to the epistemological distinction between two individuals of the same species, ontological individuality being caused by the fact that each individual possesses its own essence).

Collegial or Canonical Schools: Saint Victor

Saint Victor is a particular case in the landscape of twelfth-century schools. It is a new school, related to a city, constituted on the basis of converging intellectual interests, whose members share the spirit of a school. However, it is different from

other institutions that were created in the twelfth century by its limited interest in logic and the arts of language (with the obvious exception of its founder, William of Champeaux, who was an important dialectician) and by its monastic status.

Following a virulent controversy with his disciple Abelard on the topic of universals, William of Champeaux, who had until then been a master in Paris, decided to renounce his chair at Notre-Dame and, in 1108 (or 1111, as convincingly argued recently by Constant Mews) retired, with some students, outside of town, at the Saint Victor hermitage. Following the explicit demand of Hildebert of Lavardin, he pursued his teaching there. In 1113, William became the bishop of Châlons and obtained that “his” school of Saint Victor become an abbey of regular canons and that it adopt the so-called rule of Saint Augustine.

Hugh of Saint Victor gave great intellectual vivacity to the school, but changed its focus from what had been William’s, being less interested in speculation about language and logic. Hugh (Hugo de Sancto Victore) is the first theologian of the school; this German thinker was a master at Saint Victor from 1125 and directed the school from 1133; he died in 1141. As a theologian, he was interested in a variety of topics, both speculative and moral; his two main works are the *Didascalicon de studio legendi*, which provides a method of reading and a systemic presentation of Greek and late ancient science and the treatise *De sacramentis fidei christianae* which is, both in content and form, one of the first theological sums of the Middle Ages. To these two writings we may add his *Expositio* on the *Celestial Hierarchy* of Pseudo-Dionysius. This work, strongly influenced by Eriugena’s commentary, was to be added to the Dionysian corpus of the University of Paris and thus influenced scholastic thinkers.

The *Didascalicon* is an *ars legendi*, which aims at providing students with advice on what must be read (*quid legendum*), in which order (*quo ordine*) and how (*quo modo*); it is also a great widening of intellectual perspectives, an attempt to organize knowledge as a coherent whole, and a treatise of exegesis. Central to this text is an attempt to organize all profane

knowledge around holy knowledge: “All the arts of nature serve divine science; inferior wisdom, correctly ordered, leads to superior wisdom.” One must master profane knowledge before holy knowledge. Like William of Conches, he believed that all fields of knowledge are related. Knowledge of the liberal arts is necessary: “Learn everything, and then you will see that nothing is superfluous” (*Didascalicon*, VI, 3). All forms of knowledge serve wisdom because they help to understand the Holy Scriptures. Hugh believed that the knowledge of the liberal arts should be oriented toward the meditation of Scriptures and is accomplished through contemplation. The second part of the *Didascalicon* (books V and VI) is dedicated to Holy Scripture and constitutes a short exegetical treatise. Hugh gives a theory of the three senses of the Scriptures: historical, allegorical, and tropological. The historical sense or history is the literal meaning. This meaning must be sought as the basis of any reading. The allegorical sense is the dogmatic or theological sense *par excellence*. It consists in the discovery of the organization of creation and of the meaning of human history. Tropology gives the moral meaning of the Scriptures.

In his treatise dedicated to “the holy signs of natural and written law,” the *De sacramentis fidei christianae*, Hugh presents himself in many ways as renewing Latin theology. On the basis of the architectonical structure of John Scottus Eriugena’s *Periphyseon*, and the movements of *exitus* and *reditus*, he tells the story of the destiny and creation of men. The general framework of this sum is provided by time: the time of nature, the time of written law, and the time of grace. He speaks of the creation (*opus conditionis*) and of the fall, then of the “restoration” (*opus restaurationis*) – Christ, the Church, and the sacraments. Beyond the traditional notion of sign inherited from Augustine, Hugh offers a new use of the notion of symbol, until then unknown to Latin theology, in which the efficacious symbolism of sacraments is justified by an analogy or resemblance (*similitudo*) founded in the nature of things themselves that supposes a natural ontological relation between that which signifies and that which is signified.

Several other thinkers contributed to the development of a School of Saint Victor, in which doctrinal research and spiritual life were intrinsically related. Achardus (Achardus de Sancto Victore or A. Abricensis or A. of Bridlington), theologian, preacher, and philosopher, was the abbot of Saint Victor from 1155 to 1160 before becoming the bishop of Avranches, where he died in 1171. He is the author of a treatise *On the Unity of God and the Plurality of Creatures* (*De unitate Dei et pluralitate creaturarum*), in which he gives a metaphysical reflection on the one and the many. Achardus develops an original doctrine on the relation between the plurality of creatures and the true unity of God. The plurality of creatures reflects an intelligible plurality “which immediately adheres to the supreme unity.” The second plurality – that of things, created or possible, as they are thought by God – is founded in a distinction, which is internal to the unity of God himself.

Richard (Richardus de Sancto Victore or R. Parisiensis) was master and then prior of Saint Victor until his death in 1173. He was interested in many things and was a philosopher, a theologian, a historian, an exegete, and a mystic. We cannot be certain that Richard was a direct student of Hugh, however, his work was strongly influenced by the author of the *De sacramentis*, whose thought he continues. His *Liber exceptionum* is a propaedeutical work characterized by his interest for the liberal arts and philosophy, written in the spirit of the *Didascalicon*; like Hugh, Richard preached a lot and composed several commentaries on the Bible. The Middle Ages retained more of his spirituality than his exegesis. In the *Divine Comedy*, Dante places him in the Heaven of the Sun, in a group of 12 blessed doctors of holy science. In Dante’s text, Thomas Aquinas presents him in the following way: “Richard who, in contemplation, was more than a man” (*Paradise*, X, 131–132). His main work, the *De trinitate*, proposes to understand the mystery of the Trinity according to a method inspired by Anselm of Canterbury’s contemplative dialectic. Richard seeks to “present, in support of what we believe, reasons that are not only plausible, but necessary, and to elucidate and explain truth.” Richard insists on the necessary

character of his method: the existence of eternal realities is absolutely necessary, they have always existed, and will certainly never cease to exist; they are always what they are, they cannot be different from what they are.

Godfrey (Godefridus) joined the School of Saint Victor around 1155 to become the student of Richard. He wrote an allegorical and moral exegesis of the story of creation (*Microcosmus*) and a *Source of Philosophy* (*Fons philosophiae*), a collection of verses that gives, among other things, a reflection on the body of Christ (*Anathomia corporis Christi*) and a division of philosophy that continues Hugh’s research.

Walter (Gualterus) came to Saint Victor under Gilduin and became prior in 1173, after Richard. Toward 1177, he wrote a text in which he reacts against the theological and philosophical innovations of his day – a manifest of fundamentalist theology – the *Contra quatuor labyrinthos Franciae*. This violent pamphlet is aimed at several innovative theologians of his time, the “band of four”: Abelard, Peter Lombard (who compiled the *Sentences*), Peter of Poitiers, and Gilbert Porreta. Abelard, who had been a violent adversary of William of Champeaux, the founder of Saint Victor, is taken to represent the excesses of dialectic. Peter Lombard, despite having spent time at Saint Victor, is reproached for the influence his *Sentences* had on Abelard’s dialectics. Peter of Poitiers, who had disseminated the work of Peter Lombard his master, is accused of the same crime. Gilbert of Poitiers, who had already been condemned in Reims in 1148 by Bernard of Clairvaux, symbolizes the inappropriate use of metaphysics in theology.

Logico-Theological Schools

The twelfth century saw the flourishing of competing and self-consciously different schools of liberal arts, mainly dialectic and logic, probably all based in Paris, a city which underwent at the time a period of very rapid growth. This multiplication can be explained by a historical process, which Richard Southern called the deinstitutionalization of the *schola*, that is, the fact that

teaching became detached from the corporate schools of the past and attached to an individual master who taught wherever he could find a place to teach. While cathedral schools only admitted one master, in Paris it was possible to buy a *licentia docenti* by paying a fee to the cathedral authorities and to open a school and settle as a master. These masters received money from their students in response to a new and growing interest of students who sought new skills and knowledge which traditional institutional schools were, by their nature and function, not well adapted to provide. The success of this new type of teaching was such that, according to Southern, there were at least 25 well-known schools within a hundred miles of Paris. These schools, also called *sectae*, were of various size and nature.

With Peter Abelard's *The Story of My Misfortunes* and John of Salisbury's *Metalogicon*, we have kept two lively descriptions of the twelfth-century schools.

These various schools produced introductions to logic, logical treatises, and commentaries, for example, to the *Categories*, to Aristotle's *De interpretatione*, or to Porphyry's *Isagoge*.

The main ones are the following:

1. The *Nominales*. This is the name given to the followers of Peter Abelard. A good testimony of the work done in this school was the *Summa dialectice artis* of William of Lucca, a thinker who was also very open to the ideas of Gilbert of Poitiers. Nominalism about universals (genera and species are *vocabula* or *voces*) is an important thesis of the school; however, the teaching of the school went further, covering theses such as, topical *loci* are not required (*apti*) for syllogisms; one may not infer a negative claim from an affirmative.
2. The *Porretani*. Gilbert of Poitiers had a posterity and influence unequalled in the twelfth century. He had disciples and enthusiastic defenders of his theological thought. An excellent testimony of the reflection produced by the Porretan movement is the *Compendium logicae porretanum*. This text develops one of the main lines of Porretan ontology, ontological particularism, according to which everything which exists is particular. This position rejects universals as shared entities, since the Porretan doctrine states that no entity can exist simultaneously in two spatiotemporally distinct individuals: "nihil quod sit in uno est in alio" (*Compendium logicae porretanum*, III.15). The *Compendium* retains the thesis according to which being comes from the form; however, contrarily to what the realists defend, the same form cannot be common to Plato and Socrates. Therefore, according to this text, there are as many humanities as there are men (*quot homines, tot humanitates*).
3. The *Parvipontani* (so called because they gathered at the Petit Pont in Paris) or *Adamitae* were the followers of Adam of Balsham, sometimes also called Adam of the Petit Pont, the author of a treatise called *Art of Discussing* (*Ars disserendi*), which demonstrates an innovative approach to logic. The second part of the only surviving copy of this text is indeed not Adam's own work, but that of members of his school.
4. The *Meludinenses* or *Robertini*: the disciples of Robert of Melun. The most interesting literary production of this current is the *Ars meliduna*, a text from the 1170s/1180s. The *Ars meliduna* contains an original theory of universals, some elements of which are Stoic in origin. Universals exist, and belong to a realm of their own, different from that of concrete beings. They are outside sensible things and are understood outside them; they are participated by many sensible things (*a pluribus participabilis*). They are not substances or properties and they can only be grasped by the intellect.
5. The *Albricani* or *Montani*: the disciples of Alberic (de Monte) in a school on the Mont Sainte Geneviève. A good testimony of the work of this school is provided by a text that discusses the traditional points of the teaching of logic: the *Introductiones montanae maiores*.

The most interesting case is that of the *Porretani*. On the basis of the thought of a master – Gilbert of Poitiers – we see the constitution of a real current of thought, composed both of people who were deeply influenced by his thought (the

most noticeable example being no doubt Alan of Lille who, in the years 1160–1180, both in his *Summa Quoniam homines* and in his *Rules of Theology*, makes extensive use of Gilbert's ontology and philosophy; Simon of Tournai can also be mentioned), and of people who took to heart to defend his theology against accusations of heresy (Hugh of Honau's quest for references to Patristic authorities, in particular from Hugh Etherian, in order to defend Gilbert's theological positions is characteristic; the result of this work can be found, among other places, in his treatise *De homoysion et homoeysion* and in his *Liber de diversitate naturae et personae*). The years during which Gilbert taught in Paris (1137–1142) were probably decisive in the formation of his "school." Gilbert's influence can be found both in logic and in theology, in works as diverse as the *Summa Zwettlensis* (written before 1150, maybe by Peter of Vienna), the *Tractatus invisibilia Dei* for the theological aspect, and for the years 1150–1170, in the *Compendium logicae porretanum*, the *Glosulae porretane super Priscianum minorem*, the *Commentarium in Categorias Aristotelis* for the logical and semantical aspect. Gilbert's influence is still perceptible in the last years of the twelfth century, as shown by a remarkable text, the *Dialogus Ratii et Everardi*, written by the Porretan Cistercian Everard of Ypres.

A Doctrinal Perspective on the Chartres Versus Paris Distinction

The difference between types of schools is institutional, but also doctrinal in nature. We could expect the distinctive criterion to be the fact of privileging in one case the arts of language and in the other theology. However, this criterion quickly leads to a dead end. The schools of logic – first and foremost the Porretans – were fascinated by theology and there was strong interest for grammar at Chartres. Thinkers such as William of Champeaux and Peter Abelard worked both as logicians and as theologians. The divide between types of schools is more to be found in the old

opposition between Platonism and Aristotelianism. Platonic thought clearly dominates the writings of authors associated with Chartres (although this statement must be moderated in the case of Gilbert), in particular the tradition of the *Timaeus* and Platonic authors of late Antiquity. The same can be said of the School of Saint Victor (let us just mention the importance of the Pseudo-Dionysius, the paradigm of Christian Platonism, in the thought of Saint Victor); the central influence of Augustine in cathedral schools confirms this; nothing of this sort can be observed among the Parisian masters of logic. The dominant influence among the new masters is that of Aristotelianism. Whether they were realists or nominalists, the scope of their work was determined by Aristotle's *Categories* and Porphyry's *Isagoge* for ontology, and completed by the *De interpretatione* for philosophy of language. This fact causes a fundamental distinction. For example, even if the two doctrines seem close, realism developed on the basis of the *Categories* and Porphyry (such as the material essence realism of William of Champeaux) is very different from realism inspired by Boethius' *Opuscula sacra* read in a Platonic universalist way (such as that developed by Thierry of Chartres or Clarembald of Arras). In the first case, separate forms are not admitted, real forms are immanent to individuals and do not exist outside them. The second version is based on the Platonist metaphysical principle according to which "forms" of the sensible world (the enmattered forms) are not the real forms, but only images of real forms. Enmattered forms are caused by prototypical forms (the real forms which are in God), of which they are only degenerate images.

Sense Perception, Theories of

Pekka Kärkkäinen

Faculty of Theology, University of Helsinki,
Helsinki, Finland

Abstract

Medieval views of sense perception took as their starting point the ancient theories, among which Aristotle's view was the most influential. The Augustinian tradition considered the soul as the active agent in perception, with it not being affected by the sense organs. The Aristotelian tradition, for its part, considered the sense as a passive faculty, brought into actuality by sense data. Several late medieval authors, inspired by Averroes, developed the notion of an agent sense, an external non-material agent needed for the actualization of the act of perception in addition to forms in the sense organs. The Aristotelian view was mediated to Latin philosophy largely through Avicenna's faculty psychology. As an explanation of the causal influence of the perceived object on the sensory faculty, a theory of the multiplication of forms was widely accepted. The forms were considered as similitudes of the perceptibilities of the objects, and their function was to make the perception of a particular perceptibility actual. There was a wide discussion on the metaphysical nature of these forms. Some authors adopted the view that the causal influence is to be explained merely by action at a distance. The medieval philosophers commonly described the physiological processes involved in perception with help from the medical and optical traditions. The main sensory faculty was seen as located either in the brain or in the heart. The medieval view on perception was committed to the idea of perceptual realism. Awareness of illusions and misperceptions did not lead to skepticism about the possibility of sense perception rendering veridical knowledge but instead to some reflections on the notion of objective being

distinguished from real being. The philosophers also presented diverse views of the conceptuality of sense perception.

Among ancient philosophical views on sense perception, the most influential in the Middle Ages were those of Aristotle and Augustine. Aristotle's theory of perception in *De anima* and *De sensu et sensibilibus* formed the basis of medieval philosophical theories. Particularly important was Aristotle's view on the act of sense perception as an actualization of the power of perception, triggered by the perceived object. Another influential philosophical tradition behind the medieval theories was the Platonist view. An important factor in the Platonist tradition was that it considered the soul as the prime agent in sense perception. Stoic views were particularly influential in the explanation of the physical causal chain that is necessary for sense perception to take place.

Augustine was a major figure in the mediation of ancient views on sense perception to the Middle Ages. Before the adoption of the Aristotelian corpus as the basis of western natural philosophy, Augustine's views were dominant, and his influence remained even long afterward. He adopted the Aristotelian view of the change in sense organs caused by the object of the sense. Augustine explained the physical causation of the change by discussing the change of the elements in the medium and in the corporeal spirits, which he described according to the medical tradition.

For Augustine, the physical process of perception was not, however, only a passive process of being affected by external activators. Similar to the Stoic optical tradition, Augustine thought that a ray emanating from the eye was necessary for seeing to take place. Incidentally, he also referred to the Stoic metaphor of the stick in describing the active nature of physical processes involved in sense perception. The view that vision involved the physical change of a medium emanating from the eye was commonly rejected by Arabic thinkers such as Avicenna and Alhazen and subsequently by later Latin philosophy. Augustine also developed the notion of an inner sense,

which mediates between external perception and the activity of the soul. He also utilized the Aristotelian distinction between common and proper sensibles.

According to Augustine, as a psychological process, perception takes place as an activity of the soul, which he described in Platonist rather than Aristotelian terms. The soul directs its attention toward the corporeal change in the sense organ and notices it, without being affected by it. At the same time, the soul produces in itself an image or a similitude of the perceived object, which is identical to the image in the sense organ, except that the former is immaterial. The mind then contemplates this immaterial image. Augustine's ideas were appropriated during the Middle Ages in various ways, but in particular, his view on the activity of the soul was adopted by Robert Kilwardby and many twelfth-century writers.

The most influential view on sense perception was the Aristotelian model, which was transmitted to the Latin West mainly through Avicenna's *De anima*. After the introduction of Aristotelian philosophy during the formation of the universities in western Europe, Aristotle's *De anima* soon became part of the curriculum in arts faculties. Students were obliged to participate in the lectures and exercises based on this book as a part of their studies in natural philosophy. Sense perception was also discussed during the study of natural philosophy in the teaching of *De sensu et sensato*. Although Avicenna's *De anima* was not, strictly speaking, a commentary on Aristotle's corresponding work, it provided a frame of reference for the teaching. Later Averroes' commentaries on *De anima* and *Parva naturalia* also became important for Latin commentators.

A central part of the Aristotelian theory was the notion of a teleological dependence between the perceptible qualities and corresponding faculties of the soul. The perceptual faculties were understood as potentialities, which were in a state of waiting to be actualized as perceptions by an impulse from specific external objects of perception. This view presupposed a causal link between the perceptibility of the external world and the faculty of perception.

There were different views on the causal mediation of the impulse. The prominent view was to posit a chain of qualitative changes, which multiplied themselves in the mediating matter. Averroes, whose thought became influential among later writers, stated that the changes are of a material nature in the external objects but that their degree of spirituality gradually rises when they reach the sense organs and the soul.

Averroes often called these spiritual changes "intentions"; Avicenna had earlier used the same term for certain qualities of the objects, which are perceived by an internal sense called "estimation." Both uses of the term influenced later Latin philosophy. The notion of spiritual change was used in this context to explain how the impulse was transmitted through the mediating matter without making the medium itself perceptible. Aquinas thought that the spiritual change in the medium indicates that the lower substances have to some extent the capability of non-corporeal causation typical of higher substances. As well, many writers pointed out the influence of higher spheres as an explanation of spiritual changes.

Various authors considered the different amounts of spirituality that were necessary to explain this causation. Sight was often used as the standard of sense perception but at the same time was seen as more spiritual than the other senses. In the causation of smell and sound, ordinary physical changes such as vibration of air and movement of material particles played a considerable role. Even during the late Middle Ages, authors still argued for both the spiritual and corporeal mediation of sensory impulses. Jean Buridan attempted to show that even the perception of smell and touch presupposes a spiritual change in the medium in addition to an ordinary physical one. In doing this, he hinted at the existence of rays of heat, which mediate the perception of heat. There were also discussions on whether light is mediated by an instantaneous change in the medium or whether the multiplication of changes takes a definite period of time. Peter John Olivi and William of Ockham rejected the idea of spiritual changes in the medium and

considered the notion of action at a distance as sufficient for explaining the causal chain. Their views gained only minor support.

The faculties of perception were divided according to the different objects and organs of perception. The standard division derives from Avicenna, who enumerated five external senses (sight, hearing, smell, taste, and touch) and five internal senses (See the entry on ► [“Internal Senses,”](#) this volume). Averroes considered the “common sense” as part of external rather than internal senses. Among later authors, some functions in external perception were attributed to common sense. While some authors attributed the perception of perception to the external senses, most medieval writers agreed with Aquinas on the contrary position.

Although the distinction between the external senses was for the most part considered as unproblematic, theoretical foundations for the distinction were commonly presented. Therefore, the senses were usually distinguished according to their particular objects and organs. There was also some discussion of the number of external senses, which derived from questions surrounding the sense of touch. This sense had manifold objects, which ranged from qualities of cold and hot to such as phenomena as pleasure and pain.

The physiological process of perception was discussed with the help of ancient medical and optical traditions. Avicenna’s fusion of Aristotelian and Galenic ideas had a notable influence on the later *De anima* tradition, but similar ideas were known even before the introduction of Aristotelianism in the medieval West through a medical compendium called the *Pantegni* and through the works of Qusṭa ibn Lūqā, Nemesius of Emesa, and John Damascene. As a physiological process, perception was understood to take place in the sense organs. Avicenna posited the physiological site of vision in the pupil and in the connection of the optic nerves. According to Avicenna, common sense, which is located in the front part of the brain, consummates the act of perception. Later Latin Aristotelians followed Avicenna’s view but also attributed to common sense the capability of perception of perception. Alhazen and Roger Bacon developed the optical theory of the

generation of the image in the pupil, which they thought was the primary sensory organ of vision.

Avicenna’s view that the primary physiological seat of perception is in the nerves, and especially in the front of the brain, was not universally accepted. It was grounded on the Galenist medical tradition, which was designed to explain the cognitive defects found in the context of lesions in the brain. The awareness of the Aristotelian view, which posited perception as being in the heart, made itself known among several authors. Averroes was a prominent proponent of the Aristotelian heart-centered view, and, during the late Middle Ages, John Buridan advocated this same view. Some authors identified the brain-centered view as one of physicians and the heart-centered as one of philosophers.

The medieval view on perception was committed to the idea of perceptual realism. The Aristotelian tradition called the objects of perception perceptible forms (*species sensibiles*), which denoted the perceptual qualities of extramental material objects. Acts of perception in the soul were considered to be essentially about these objects. The changes in the medium and in the sense organs were also called perceptible forms; these were not considered intentional objects of perception but as still formally identical to the perceptual qualities of the objects. Their function was to enable acts of perception concerning perceptible objects. John Duns Scotus, in particular, stressed the distinction between the presence of a perceptible form in the soul and the intentional act of perception of an object.

During the late Middle Ages, William of Ockham defended a view according to which sense perception is essentially not conceptual but rather a preconceptual process, which was a necessary precondition for the concept formation of the intellect. According to him, however, it did not consist of a mere flow of information but included also acts of discrimination between various sensory contents. On the contrary, some of Ockham’s contemporaries like Adam Wodeham and John Buridan considered some conceptual or semi-conceptual features as essential for sense perception.

The reliability of sense perception was discussed in optical treatises. Alhazen proposed

eight conditions for veridical vision. Six of these were requirements for any act of vision: distance between the object and the eye, direct opposition of the object before the eye, light, sufficient magnitude of the visible object, transparency of the medium between the eye and the object, and density of the visible object. In addition to this, he listed two further requirements for veridical vision: time and a healthy eye. Alhazen's list was used and commented on by later perspectivists. The awareness of such phenomena as illusions and misperceptions did not lead to skepticism about the possibility of sense perception rendering veridical knowledge. In the late Middle Ages, however, Duns Scotus distinguished the element of the objective being of the sensory objects in the intentional content of perception. Accordingly, Peter Auriol argued for a distinctive objective being using a series of examples from misperceptions such as the illusory ring of light, which is produced by a moving torch. Furthermore, Auriol proposed that the ring has an objective or intentional existence in the air, without having a real extramental existence.

The Aristotelian view considered perception essentially as a passive faculty, but this view was never accepted without qualifications. Averroes suggested there was an agent sense, an operative principle outside the human soul, which would be active in sense perception in manner analogous to the agent intellect in concept formation. Some authors took Averroes' remarks as significant, and the discussions about agent sense continued until sixteenth-century philosophy. Among fourteenth-century philosophers, it was common to point out that the soul is the primary sensing agent, since a material entity cannot produce an immaterial act. Some of the later Aristotelian writers, who emphasized the activity of the soul in sense perception, saw this view as a combination of Augustinian and Aristotelian ideas.

stay in Alexandria, he was very likely in contact with the Alexandrian Neoplatonic school of Ammonius Hermias: allusions and quotations from the latter's logical commentaries are to be found in Sergius' treatises on logic, together with quotations from John Philoponus' edition of Ammonius' courses. His translations of astronomical treatises fit this context as well. Sergius introduced Greek philosophy in Syriac as a living system of problems and not as a heritage of the past. Moreover, this philosophical mediation is original from a theological point of view: this newly introduced "pagan" wisdom is reinterpreted as a gift of God's own Wisdom to the ascetic. Therefore, Sergius reinterprets it as a component of an ascetic progression – which is heavily influenced by Evagrius Ponticus' doctrine – on the way to the contemplation of God. These remarks have led to the recent hypothesis that Sergius thinks here of a new sort of Christian *cursus studiorum* which, instead of culminating in Plato, would culminate in the Christian Platonist Pseudo-Dionysius.

Sergius of Resh'aynā

Emiliano Fiori

Vrije Universiteit Amsterdam, Leiden, The Netherlands

Abstract

Sergius of Resh'aynā (d. 536), a Syriac doctor and philosopher of the fifth to sixth century, studied in Alexandria and worked as a doctor-in-chief in his native town in Mesopotamia. He died in Constantinople. Sergius produced a wide range of original works and translations in the fields of theology, philosophy (logic and physics), and medicine, but he is best known as the first Syriac translator of the corpus of Pseudo-Dionysius the Areopagite. During his

Biography

The biographical details at our disposal for Sergius are scarce: no new source has been discovered since Baumstark (1894). Most of the biographical information concerning Sergius is to be found in the sixth century chronicle of Pseudo-Zacharias, the Syriac continuator of Zacharia of Mytilene's chronicle, which was also written in the sixth century, and now is extant only in Syriac. The Pseudo-Zacharias (IX, 19) provides us with most of our knowledge about Sergius' life: archiater, that is, doctor-in-chief, in his native city of Resh'aynā, east of the Euphrates between Ḥarrān and Nisibis, he studied for a long time in Alexandria, mainly medicine. He read many Greek doctors, and was fond of the teachings of Origen; he knew Greek as well as Syriac, and was the author of a discourse on faith and of a very good translation of Dionysius' works, together

with a preface to the latter. In the last year of his life, that is, 536, Sergius, having gone to Antioch to complain by the Chalcedonian Patriarch about Resh'aynā's bishop, was found clever and intelligent by the same Patriarch, who decided to send him to Constantinople, where the emperor Justinian needed ambassadors to send to pope Agapitus, in Rome. On his return from Rome to Constantinople, Sergius died.

Works

It is still difficult to establish the real extent of Sergius' writings. They can be subdivided as follows: (1a) original theological works, (1b) original philosophical works, (2a) theological translations or paraphrases, (2b) philosophical translations or paraphrases, and (2c) medical translations or paraphrases from Galen, not treated here. We will not mention the works attributed to Sergius, but surely not written by him.

Here, we give only the extant works:

- (1a) The *Discourse on Spiritual Life* (*SpL*), used by Sergius as a preface to his translation of Pseudo-Dionysius' *corpus*; edited and translated by Sherwood (1960–1961) and now newly translated by Fiori (2008), on the base of a wider collation of mss.
- (1b) The *Treatise Composed by Sergius Archiater of Resh'aynā on the Categories of Aristotle the Philosopher*. It is a short introduction to the Aristotelian treatise. Not published; partial translation and commentary in Hugonnard-Roche (2004, pp. 53–163).
 - The *Commentary to Theodore* (*CT*), whose real title is *Writing Composed by Mar Sargis the Archiater on the Aim of All the Aristotelian Writings*. Not published; partial translation in Furlani (1922); translation and commentary of the Preface and the first book (of seven) in Hugonnard-Roche (2004, pp. 165–231). It is in fact a longer treatise on the *Categories*, to be understood in the tradition of the Neoplatonic commentaries on Aristotle.
- (2a) While it is doubtful that Sergius was the translator of the S2 version of Evagrius Ponticus' *Kephalaia Gnostika* (see Guillaumont 1962, pp. 14–227), he is assuredly the author of the first Syriac version of the Dionysian *corpus* (*CD*). An introduction to this version has been provided by Perczel (2000). (Perczel 2004 has edited and translated Sergius' translation of the fourth Epistle.) Hornus (1970) has edited the first chapter of the *Mystical Theology*.
- (2b) The *Treatise on the Causes of the Universe, Which Has Been Composed By the Priest Sergius of Resh'aynā According to the Doctrine of Aristotle the Philosopher; [Showing] That It Is A Globe* (*CU*). Unpublished, and translated by Furlani (1923), it is in fact a sort of epitome of some arguments of a longer treatise by Alexander of Aphrodisias *On the Universe*, whose original Greek text is not extant and can be read in Arabic (edition in Genequand 2001). Discussed by Miller (1994), who advances some legitimate doubts about the attribution to Sergius.
 - A version of the pseudo-Aristotelian treatise *Peri Kosmou/De mundo*, edition De Lagarde (1858), studied at length by Ryssel (Ryssel 1880–1881).

Thought

As Furlani (1922, 1923) had already pointed out, and Hugonnard-Roche (2004) has confirmed, Sergius is influenced by the Alexandrian Neoplatonism of the beginning of the sixth century. From a close reading of his logical texts, it is evident that he refers, even quoting directly from it, to Ammonius' commentary *On Categories*; sometimes, he is nearer to John Philoponus' editions of Ammonius' courses: it is the case of a corollary on space in the fourth book of his *CT*, quoting John Philoponus' edition of Ammonius' *On Physics*. He also develops some personal points of doctrine. These remarks fit Pseudo-Zacharias' mention of Sergius' stay in Alexandria. His astronomical writings could fit this philosophical context as well: if the *CU* is really to be attributed to

him, one could think that, selecting from Alexander's much longer treatise only the arguments which pertain to the spherical shape of the universe, Sergius (or someone who was soon confused with him, and this cannot be by chance) wanted to contribute, siding with Philoponus, to a famous Syriac–Greek controversy about this topic, whose witnesses are Cosmas Indicopleustes' *Topography* and John Philoponus' *On Creation*. Thus, it seems that Sergius is not simply an interpreter of Greek philosophy for a Syriac-speaking milieu: he introduces that philosophy into Syriac culture as a living body of current problems. Nonetheless, for Sergius this philosophical education, which was the basis of the Neoplatonic *cursus studiorum* culminating in the study of Plato, is to be reinterpreted in the context of a different *cursus*: not a scholastic, but an ascetic one. As Sergius says in the preface to his *CT*, according to the traditional Christian teaching, not everything is good in Greek philosophy: the ascetic must separate what is good from what is bad. The outcome of this separation will be the grafting of pagan philosophy on an ascetic ascent entirely shaped by the model of Evagrius Ponticus, from the *praktikē* to the *physikē theōria*. What is good in physics is reinterpreted as biblical contemplation, guided by the Wisdom of God, of the principles of the world. This ascent culminates in *theologia*. This progression is evident in the *SpL*, where it is clear (see paragraphs 101–113) that philosophical knowledge is a gift of God to the ascetic and is placed under the authority of two Church Fathers, whom Sergius considers as complementary to one another: Evagrius and Dionysius the Areopagite. This is so evident that Bettolo (2005), followed by Hugonnard-Roche (2009) and Fiori (2008), proposed to interpret Sergius' translation of the *CD*, the Platonic rewriting of Christian philosophy, as an ideal substitute in the new Christian *cursus* for the study of Plato as the ultimate goal of a radically new *cursus*.

al-Shahrastānī, Muḥammad ibn ‘Abd al-Karīm

Emily J. Cottrell
Department for Religious Studies, Leiden
University, Leiden, The Netherlands

Abstract

Abū l-Faṭḥ Muḥammad al-Shahrastānī was a Muslim theologian (*mutakallim*) and a historian of religions from northern Iran who lived under the last Seldjuks of Khorasan. He composed commentaries on the Qur’ān and a monumental history of religions, which remains to this day a primary source for scholars of various different fields. He taught at the Nizāmiyya *madrassa* in Baghdad and was considered a Sunni scholar until modern scholarship has attempted to demonstrate that he may rather had been a crypto-Ismā‘īlī.

According to the Arabic medieval sources, Muḥammad ibn ‘Abd al-Karīm ibn Aḥmad al-Shahrastānī (Tāj al-Dīn, Abū l-Faṭḥ) was born in 467/1074, 469/1076, or 479/1086, and died in 548/1153. He studied theology in Nishapur: Qur’ānic commentary (*tafsīr*) and dialectic

theology with Abū l-Qāsim al-Anṣārī, a colleague of al-Ġāzālī, and jurisprudence with Abū Naṣr al-Qushayrī (see further Monnot 1998). In 510/1117, he came to Baghdad where he started to teach theology at the Nizāmiyya *madrassa*, which he did for 3 years. When he returned to Iran in 514/1120, the Seldjuk Sandjar had just taken the title of Sultan and Merv, his capital, was a center of attraction for scholars. Shahrastānī became the *nā‘ib* (deputy) of the chancellery and one of the closest confidants of the Sultan. His death followed shortly that of Sandjar, in 1153.

Along with shorter works in the field of dialectical theology (*kalām*), he authored a Qur’ān-commentary (the *Mafātīḥ al-asrār*) and an imposing history of religions and philosophies (the *Kitāb al-Milal wa-l-Niḥal*, *Book of Religions and Sects*). Many of his works are lost, but his thinking seems to have been evolving from Ash‘arism to Ismā‘īlism, as was first established by the Iranian scholar Muḥammad Riḍa Jalālī Nā‘īnī in 1964. Further, studies by Diane Steigerwald, Guy Monnot, and Wilferd Madelung have finally ascertained the connections between Shahrastānī’s so-called Ash‘arism and his actual crypto-Ismā‘īlism (see Steigerwald 2005, p. 265 and Steigerwald 1997, pp. 298–307). Although the traditional Islamic textbooks would follow the medieval sources in seeing Shahrastānī as an Ash‘arite, Madelung and Meyer consider that al-Shahrastānī may be described as “Sunni socially and communally, but as Shī‘ite and Ismā‘īlī in some of his core beliefs and religious thoughts.” (al-Shahrastānī, *Muṣāra‘at al-jalāsifa*, introduction, p. 4). As noted by Steigerwald (2005, pp. 265 and 268–270), Monnot proved already in a series of lectures given in 1986 that al-Shahrastānī believed in a living Imam, an element linking him to the Nizari Ismā‘īlīs of his time.

His first preserved work of importance, the *Kitāb al-Milal wa-l-Niḥal* (*Book of Religions and Sects*), written in 521/1127–1128 while working at the chancellery of the Seldjuk Sultan Sandjar, is an encyclopedia of past and contemporary religions as well as philosophical currents. The Khorasanian context, with its mosaic of people and religions, must have been particularly fitting to such an enterprise. Shahrastānī’s information on the Greek philosophers is mainly

derived from the *Šiwān al-Ḥikma* (*Chest Box of Wisdom*), attributed to Abū Sulaymān al-Sijistānī and from the Arabic translation of Pseudo-Plutarch’s *Opinions of the Philosophers*. But he also makes use of other works on the ancient Greeks (see the introduction of Jean Jolivet, in al-Shahrastānī, 1986–1993). The *Milal wa-l-Nihāl* remains fundamental for modern scholars’ knowledge of Zoroastrianism, Mazdakism, and Manichaeism, as well as of the different Islamic sects, as one could expect. Moreover, it encompasses Hinduism, Judaism, Buddhism, Greek philosophy, and different Christian currents. According to Monnot and Steigerwald, the Šābians in the *Milal* develop the views of the Ismā‘īlīs, and this is also the case with their so-called opponents, the *ḥunafā’* (plural of *ḥanīf*, “monotheist”).

The *Nihāyat al-aqdām fī ‘ilm al-kalām* (*The Last Degree in Theological Science*) was composed after the *Milal*, which is quoted several times. The title uses a pun between *aqdām* (steps) and *iqdām* (eternity of the world), but a quotation from the *Majlis* (see Steigerwald 2001:86 (text) – 87 (translation): *Nihāyat al-aqdām al-a‘māl*, i.e., “The latest steps are in (good) actions”) ascertains the first reading. Shahrastānī studies in 20 chapters the basic rules (*qawā‘id*) of the theological sciences, according to the Ash‘arite method. The themes he discusses in detail, comparing the arguments of the theologians and the Greek and Muslim philosophers, are the following: the temporal origination, i.e., adventicity of the world, the adventicity (*ḥudūth*) of existents, divine unicity, divine attributes, matter and nothingness, divine knowledge, divine will, eternal logos (*al-kalām al-azālī*), the unicity of the logos, the attributes of hearing and seeing, the vision of God, the theory of divine acts, prophecy, paradise and hell, imamate, miracles, and abrogation. As a conclusion to the *Nihāya*, Shahrastānī gives a separate *Treatise on the Question of the Perennity of the Single Substance* (*Mas‘alat fī ithbāt al-jawhar al-fard*, in *Nihāya*, p. 505–514). According to Monnot, Shahrastānī seems to have been willing to explore in the *Nihāya* the limits of Ash‘arite theology (*ET*², p. 215).

An incomplete Qur’ānic commentary, the *Mafātīḥ al-asrār wa-maṣābīḥ al-abrār* (*The Keys of Mysteries and Lamps of the Rightfuls*) was composed from 538/1143 on. The extant part of the unique manuscript goes as far as the second sura, *The Cow* (*al-Baqara*). In the introduction, Shahrastānī gives some general directions as to the study of the Qur’ān. According to Monnot (1998), it is a valuable commentary of no less importance than al-Ṭabarī’s and Fakhr al-Dīn al-Rāzī’s. Traces of Ismā‘īlī influence in this text and in the other books composed by Shahrastānī led Jalālī Nā‘īnī to suggest that Shahrastānī may have been a Nizārī Ismā‘īlī. His hypothesis was later on pursued by Muḥammad Tāqī Dānishpazūh who established in 1968 that Shahrastānī must have been at least in part a follower of some Ismā‘īlī beliefs while at the court of Sanjar and in Khwārazm. Shahrastānī’s exegetical methods were attacked by Zāhīr al-Dīn al-Bayhaqī (c. 490/1097–565/1169), for using philosophy side by side with traditional exegesis (see *Tatimmat-Šiwān al-ḥikma*, s. v. al-Shahrastānī).

Shahrastānī’s last work, the *Muṣāra‘at al-falāsifa* (*Struggling with the Philosophers*), was first studied in a doctoral dissertation by Suhayr Muḥammad Mukhtār in Baghdad before she published the text in Cairo in 1976. A new translated edition with an introduction was given in 2001 by T. Meyer and W. Madelung. Unachieved by Shahrastānī who mentions the disasters of his time, the book addresses theological issues with specifically aiming at refuting Avicenna’s theories and the influence they had reached on the debates. Specifically, Shahrastānī points out the contradictions in Avicenna’s theory of the Necessary being (*wājib al-wujūd*), which he regards as being merely anthropomorphist (see Steigerwald 2005, p. 266). Pointing out a contradiction in Ibn Sīnā’s theory of essence and existence, Shahrastānī notes that in order to be intrinsically necessary, a thing must be absolutely simple. Shahrastānī’s answer to the dilemma is to elevate God above existence, as would the Ismā‘īlīs, and to consider existence as a purely equivocal term (Madelung and Meyer 2001, introduction, p. 11). Following a device already in use in the *Kitāb al-Milal*, the use of *al-shar‘ al-ḥanīfī*

(the “*ḥanīf-law*”) in the *Muṣāra‘at al-falāsifa* points, according to Madelung and Meyer (2001), to the Ismā‘īlīs. *Ḥanīf* is in itself a problematic notion, originally meaning “pagan” in Aramaic, and which came to be used for the “pure monotheism” of Ibrāhīm (Abraham) in the Qur’ān.

Two undated works have also been published: (1) The *Risāla fī ‘ilm wājib al-wujūd*, *An Epistle on the Knowledge of the Necessary Being*, dedicated to Sharaf al-Zamān, Abū ‘Abd Allāh Muḥammad ibn Yūsuf al-Ilāqī, d. 536/1141. (2) The *Majlis al-khalq wa-l-amr* is the Arabic title of an untitled Persian treatise (*Conversation on Creation and Divine Instauration*). Following M. Jalālī Nā‘īnī, G. Monnot brought to evidence many of the elements of cosmology shared between the *Majlis* and Ismā‘īlī beliefs in a series of lectures (see *Annuaire de l’École Pratique des Hautes Études*, 1983–1988). Further doctrinal evidences were gathered by Diane Steigerwald in different publications (see below, bibliography). In the *Majlis*, Shahrastānī is openly critical of both the Mu‘tazilite and the Ash‘arites, the former being accused of *ta‘īl*, or of falling into an extreme negative theology, while the latter being accused of *tashbīh*, that is, anthropomorphism, for giving to God attributes that should be reserved to living creatures. The *Majlis* is a cosmological discourse on the Intelligible world, here assimilated to the *amr*, or “God’s Order” (taken from the Qur’ānic notion of immediate creation, also known as “instauration” (*ibdā‘*) following God’s order: “Be!”), described as eternal, and the Sensible world, or *khalq*, that is, “creation,” described as limited and adventice. The distinction between *amr* and *khalq* is already used by Ibn Sīnā and in al-Gāzālī’s latest works. An analysis of the two notions (further identified, respectively, to the One and the Multiple) and of this dichotomy in the writings of some important Ismā‘īlī authors is given by Steigerwald in her introduction to the translation of the *Majlis*, pp. 34–39.

Al-Shahrastānī lived in a time of transition between “the Shī‘ite century” and the Sunni reconquest, first at the hands of the Seldjuks and soon at that of the extreme Sunni Ghaznavids. The living transmission of philosophy in northern Iran

remains to be studied, as is the role played by both the Ismā‘īlī propagandists and the strong Buddhist and Christian communities of Central Asia. Finally, further research on the history of Ismā‘īlism may shed some light on the particular trend al-Shahrastānī represents.

Département des Sciences de la Foi et des Religions, Philosophie, Université de Fribourg, Fribourg, Switzerland

Abstract

Al-Shahrazūrī, (Muḥammad ibn Maḥmūd, Shams al-Dīn), the “Ishrāqī” (d. between 1288 and 1304) was a Muslim philosopher of the Ishrāqī (“Illuminationist”) school, strongly influenced by Neoplatonism. He is primarily

known as the biographer and commentator of the Persian philosopher Shihāb al-Dīn Yaḥyā b. Amirak Suhrawardī (1155–1191) known as the Shaykh al-Ishrāqī (the “Master of Illumination”). Ishrāqī philosophy follows an anti-Peripatetic path initiated in the twelfth century by Abū l-Barakāt al-Baḡdādī and ‘Umar ibn Sahlān al-Sāwī, which has to be considered, in the post-Avicennian context, as a reaction to Avicenna’s philosophy. Al-Shahrazūrī organized the Ishrāqī philosophy into a new system that had not been elaborated by Suhrawardī, the founder of the school.

Al-Shahrazūrī’s life is difficult to reconstruct as he has left no trace in the Arabic and Persian biographical dictionaries. The circles to which he may have belonged would lead one to expect to find some information about him in Ibn al-Fuwaṭī’s *Majmā’ al-ādāb fī mu‘jam al-alqāb*, yet the parts of the volumes that could have contained an entry on Shahrazūrī seem to be forever lost. Some scholars have attempted to connect him with the Shahrazūrī-family of scholars of Aleppo, but no concrete evidence has been offered (see Mascitelli 1995–1996: the identification seems improbable as none of al-Shahrazūrī al-Ishrāqī’s book titles are listed in any of the bibliographies given for the shaykh of Aleppo). A mistake in the reading of the colophon of a Vatican manuscript (MS Città del Vaticano, Biblioteca Apostolica Vaticana, ar. 299) of Shahrazūrī’s *Divine Symbols and Parabols Kitāb al-rumūz wa-l-amthāl al-lāḥūtiyya* led a number of scholars (including Dozy, Sachau, and Corbin at an early stage) to believe that Shahrazūrī might have been a direct disciple of Suhrawardī, but this was certainly not the case. (The date reads clearly 911 and not 611, as wrongly reproduced by Levi della Vida from the early catalogue of A. Mai.)

A number of elements on Shahrazūrī’s life can be retrieved from manuscripts’ colophons:

- The date of 665/1266–67 for the composition of a first version (see below) of the *Promenade of Souls (Nuzhat al-arwāḥ)* is given by the MS Istanbul, Esad Efendi 3804.

- The *Metaphysical Tree* (*Shajara al-ilāhiyya*) was achieved in 680/1282 and copied once in Siwas (whose *qāḍī* at the time was none other than Quṭb al-Dīn Shīrazī) during al-Shahrazūrī's lifetime in jumādā al-awwal 687/June 1288, according to the MS Istanbul, Esad Efendi 1926.
- The composition date of the *Commentary on the Philosophy of Illumination* (*Sharḥ ḥikmat al-Ishrāqī*) is given as 685/1286 in the MS Istanbul, Esad Efendi 1932 (see Schmidtke and Pourjavady 2006:77 following Karabulut and Karabulut 2005, t. I/6, no 8408, 5) and a copy of the same commentary by Ibrāhīm 'Abd al-Raḥmān al-Irbilī on 14 shawwāl 704 (9 May 1305) gives Shahrazūrī as passed away (see Cottrell 1999, for the complete text of the colophon of MS London, Brit. Lib. Codex 427 [=Arund. Or. 36], erroneously identified by Rieu (1894) in his *Catalogue* as the *Ḥikmat al-Ishrāqī* by Suhrawardī, whereas it is Shahrazūrī's commentary on it).

While the biographical data make it certain that Shahrazūrī cannot have been a direct disciple of Suhrawardī, it is surprising to discover that Shahrazūrī shares with his master a common historiography of ancient philosophy which is ultimately rooted in such works as the anonymous *Ṣiwān al-ḥikma* (see Gutas 1982) and the *Mukhtār al-ḥikam* of Mubashshir ibn Fātik. In turn, these important eleventh-century histories of philosophy may rely on some lost translations emanating from both Ḥunayn b. Ishāq's and al-Kindī's circles in Baghdad. The history of Greek philosophy is linked by both Suhrawardī and Shahrazūrī to the ancient Persian and Egyptian civilizations, and they use here and there Gnostic-related myths, apparently familiar to Ibn Waḥshiyya in his *Nabatean Agriculture* and in his book on the "Ancient Alphabets" (actual title: *al-Shawq al-mustaham fī ma'rifat rumūz al-aqlām* (*Flowing Desire for the Knowledge of the Symbols Traced by Pens*)) where the myth of Hermes and his sister as the tutelary figures of the Ishrāqī lineage appears for the first time (uncritical edition and translation by Hammer 1806, tr. p 29–30/Ar. p 101; compare the translation by Matton 1976; the attribution to Ibn

Waḥshiyya has been rejected by Hämeen-Anttila 2006:21).

This historiographical framework of Ishrāqī philosophy is explored by al-Shahrazūrī in the *Promenade of Souls and Garden of Rejoicings in the History of the Philosophers* (*Kitāb nuzhat al-arwāḥ wa rawḍat al-afrāḥ fī ta'rikh al-ḥukamā'*), a three-part work on the history of philosophy from Adam (!) to Suhrawardī organized as follows: Part 1 – Historical and geographical introduction, Part 2 – Bio-bibliodographical chapters on the "Ancients," and Part 3 – On the "Moderns." A supplement of short biographies of Afḍal al-Dīn Kāshānī, Kamāl al-Dīn ibn Yūnis, Naṣīr al-Dīn Tūsī, and some less-known figures may be from another hand (see Cottrell 2004–2005b, for details on this supplement and a list of the manuscripts and editions where it appears).

The *Nuzhat al-arwāḥ* opens with an exhortation to study philosophy following the path of the Ancients (mainly Greeks and Egyptians, but Zoroaster, as well as the Biblical Adam and Seth do also figure, see Cottrell 2010a, b) and explicitly claims that the imitation of the ascetic way of life and the meditation of moral sayings will lead to the separation from the body and to the ascension toward the higher principles. What follows are 40 chapters on the main figures of ancient philosophy and medicine – principally reproduced from Mubashshir ibn Fātik and the *Muntakhab Ṣiwān al-ḥikma* – and around 90 entries on the main "philosophers of the Islamic period," starting with Ḥunayn b. Ishāq and culminating with longer entries on Avicenna and Suhrawardī. The two main sources used for the chapters on the Moderns are the *Muntakhab Ṣiwān al-ḥikma* and the *Tatimmat Ṣiwān al-ḥikma* of al-Bayhaqī (known in Persian as Ebn Funduq). Apart from being influenced by the Neoplatonic theory of the progressive ascent towards truth, the *Nuzhat* represents the file of a scholar, and it was probably enriched all along his life by al-Shahrazūrī. The three editions of the text clearly represent two different recensions, of which only the longer one (edited by Abū Rayyān and Abū Shuwayrib) uses Shahrastānī's *Book of Religions and Sects*. Suhrawardī's treatises are quoted only in the

Suhrawardī biography. Shahrazūrī also made use of an anonymous collection of poems written by famous “modern” philosophers and compiled under the title of *Itmām al-Tatimma*, which appears in the four manuscripts of the *Muntakhab Ṣiwān al-ḥikma*, on which see Gutas 1982. The whole *Ṣiwān*-cycle was at some point summarized by Ġaḍānfar al-Tabrīzī (born in 630/1232–3, d. before 692/1293), a contemporary of al-Shahrazūrī quoted by him as *al-ustādh* (“the Teacher,” also used as a simple honorific title). On the detailed utilization by Shahrazūrī of these sources in the *Promenade of Souls*, see Cottrell (2004–2005b).

In his *Commentary on the Philosophy of Illumination* (*Sharḥ ḥikmat al-Ishrāqī*), al-Shahrazūrī defines it as a philosophy based on the illumination (*Ishrāqī*) of thought, including visions and contemplation, in which the role of light is underlined. In the aftermaths of al-Sāwī and Abū l-Barakāt al-Baġdādī’s criticisms, Suhrawardī had departed from Aristotle in rejecting the theory of prime matter and form, and by criticizing the categories, which he reduces to five (see Ziai 1990b; Ziai and Alwishah 2003). Fundamentally, the epistemological method of the Aristotelians is rejected, the Stoic *lekton* theory introduced, and priority is given to the (Neo-)Platonist way of *anamnesis*. The self-conscious being is at the same time the knower and the known and there is no differentiation between the subject and the object. In the *Ishrāqī* system, this theory became known as “knowledge by presence” (*al-‘ilm al-ḥuḍūrī*). This development is reminiscent of Plotinus’ *Enneads*, partly known to Suhrawardī and to al-Shahrazūrī under the title of its Arabic-adapted translation, the *Theology of Aristotle*. Another theme of crucial importance in *Ishrāqī* philosophy is the existence of a realm of semi-embodied figures, different from the world of the Platonic forms and inferior to it, known as the *‘ālam al-mithāl* (see Ziai 1998). Identified with the realm we access through dreams and visions, it met the criteria both of the Qur’ānic cosmos, where dreams played an important role (it is considered that the human soul, when asleep, leaves the sublunary world and is directly connected to God), and of the ancient Persian lore, which was

integrated by Suhrawardī into his syncretistic system.

Hossein Ziai distinguishes two main trends among the commentators of Suhrawardī: one is represented by al-Shahrazūrī, who “tends to emphasize the symbolic and distinctly non-peripatetic components of Illuminationist philosophy,” while the second, represented by the works of Ibn Kammūna (d. 682/1284), “emphasizes the discursive and systematically philosophical side of the philosophy of Illumination and makes every attempt to define Illuminationist symbolic language in terms of standard philosophical terminology” (see Ziai 1995b). Quṭb al-Dīn Shīrāzī, using both authors, attempted a synthesis of the two.

While the *Commentary on the Philosophy of Illumination* was known and was already used by Corbin in his edition of Suhrawardī’s text, it has not been edited in its entirety until the 1993 edition of Hossein Ziai. The *Commentary on the Intimations* (*al-Tanqīḥāt fī sharḥ al-talwīḥāt*) by al-Shahrazūrī however remains unpublished in its entirety. The recent edition by Ziai and Alwishah (2003) of the second part (on Physics) of Ibn Kammūna’s commentary of the same text (written before Shahrazūrī’s) has finally given access to the totality of the text. An important study of the *Intimations* contents is given by Ziai in his introduction, and addresses the questions on Peripatetic philosophy presented in the text and the answers given by both Suhrawardī and Ibn Kammūna: definition of the body, question on the atoms, form and matter, direction and motion, space and void, time, nature and faculties of the soul, the intellect, the rational soul, and intuition. A comparative analysis of the three texts (Suhrawardī’s, Ibn Kammūna’s, and Shahrazūrī’s) should result in a better comprehension of Shahrazūrī’s originality, but only a few manuscripts are available. Ziai notes that the answers of Suhrawardī are in some ways an anticipation of Descartes’ theory of the sensible object.

The Divine Tree of the Sciences of Divine Realities (*Kitāb al-shajarat al-ilāhiyya fī ‘ulūm al-ḥaqā’iq al-rabbāniyya*), or *Metaphysical Tree* in Ziai translation, is the magnum opus of al-Shahrazūrī. Composed a little before the

Commentary on the Philosophy of Illumination, it enlarges the discussion on the main themes already present in this fundamental text, but according to a novel organization. The text is divided into five main epistles (methodology and division of the sciences, logic, ethics and political philosophy, physics, metaphysics) and consists of discussions, following what Ziai has labelled the “constructivist” method of the Ishrāqī-s (see Ziai 1993, 1995b). Important quotations from the Stoics, from the Muʿtazilite and Ashʿarite theologians, from the Sufis, from al-Fārābī and Avicenna are given and remain to be studied in the light of the extant publications. As for the circle where it was possibly written, Naṣīr al-Dīn Ṭūsī (d. 672/1274) is mentioned as recently deceased, confirming the date of the composition given by one of the Istanbul MSS (680/1282).

The *Kitāb al-rumūz wa al-amthāl al-ilāhiyya fī al-anwār al-mujarrada al-malakutiyya* (Divine Symbols and Parables About the Simple Lights of the Celestial Realm), for which we have consulted the Yale manuscript (MS Yale, Landberg 509) and the forthcoming edition by M. Privot, is a text influenced by Sufi (and Ismāʿīlī?) teachings, focused on the metaphysical themes of Ishrāqī philosophy: the knowledge of the self, the soul’s journey to its Creator, and the perception (*idrāk*) of the metaphysical lights, in a Platonic context that was already present in Suhrawardī. The book is an in-depth analysis of the Ishrāqī theory of the Soul, though its layout may seem less rigorous than other works by al-Shahrazūrī. The introduction is a series of notes on some “philosophical” *hadiths*, such as “Who knows himself, knows his Lord” or Qurʾānic extracts. Al-Shahrazūrī seems to have aimed at reconciling the metaphysical theory of light and darkness in Suhrawardī’s works with the beliefs of mainstream Islam, and on a larger scale, to defend philosophy in a language accessible to a “mystical” or “spiritual” audience. Faithful to Ishrāqī syncretism, he also quotes Jesus, who would have said the following, “When I will leave this body, I shall be standing in the air, at the right of the Lord’s throne.” It should be mentioned in this context that in his biography of Suhrawardī in the *Promenade of Souls* (*Nuzhat*

al-arwāḥ), al-Shahrazūrī has compared the spiritual exercises practiced by the master to those of the Christians.

In the peculiar syncretism proper to Ishrāqī philosophy, Persian mythology is not ignored by al-Shahrazūrī. Thus, the Sun is once given its Persian name, following the *Ḥikmat al-Ishrāqī* (the manuscripts offer both *khurshīd* and *hūrahsh*, while it is the latter which is to be found in Suhrawardī, see Privot 2001:314–317). The Sun of the sublunar world is here given the powers of a Demiurge, leaving intact the inaccessibility of the One in accordance with a typical element of Neoplatonism since Proclus (whose works were widely accessible in Arabic). In turn, a study of the genealogy of this Proclean element in the Syriac-speaking context should shed some new light on al-Suhrawardī’s syncretism.

Siger of Brabant

François-Xavier Putallaz

Département des Sciences de la Foi et des Religions, Philosophie, Université de Fribourg, Fribourg, Switzerland

Abstract

Siger of Brabant (c. 1240–c. 1284) is one of the most controversial authors of the Middle Ages, and there are conflicting opinions about him. Some see him as one of the most dangerous heretics which were condemned by the Bishop of Paris in 1277. Others regard him as one of the most remarkable philosophers of the thirteenth century, whom Dante Alighieri includes in his “Paradise” alongside Thomas Aquinas, Albert the Great, and King Solomon. It is true that he before 1270, as a young professor of the Faculty of Arts in Paris, defended a heterodox thesis, which was inspired by Averroes’ commentary of Aristotle, that there is only one intellect for all humans. Clearly such a position

suppresses any immortality of the soul. The evolution of Siger's thought is very clear, however. He progressively abandons this thesis for the interpretation of Thomas Aquinas. But in other areas he defends an original view, namely a complete separation of philosophy and the teachings of theology. According to him, philosophy should have full autonomy, although within limits. He took stands on some of the most passionate debates at the end of the thirteenth century, such as freedom and the eternity of the world, and Siger of Brabant remains one of the most controversial thinkers of all time.

Introduction

Siger of Brabant (c. 1240–c. 1284) is one of the most controversial authors of the Middle Ages, and there are conflicting opinions about him. On one hand, some see him as the symbol of a dangerous heresy at the University of Paris. Siger of Brabant, along with Boethius of Dacia, is seen as the figurehead of a movement that sees philosophy as self-sufficient, detached from theology, and hence as the spokesman of disbelief in the Middle Ages. Since the studies of Ernest Renan in the nineteenth century, he is associated with the movement called “Latin Averroism,” which comes from the name of the Muslim philosopher Ibn Rushd known in the Latin West under the name “Averroes.” Siger is criticized for having supported three theses opposing Christian faith. Firstly, that there exists only one intellect unique to all humans, thus destroying any belief in the immortality of the soul and all personal judgments after death; secondly, that the universe has no beginning, which destroys the belief that the world was created by God; and thirdly, that human freedom exists in name only.

There seems to be good reason for these charges against Siger of Brabant. He was summoned to appear before the Inquisitor of France, Simon du Val, on January 18, 1277. Some think

he would have fled from Paris to plead his case directly to the Pope in Orvieto. However, in 1284, he fell into disfavor, and was murdered by his secretary who had gone mad. The great Parisian condemnation of March 7, 1277, the most important intellectual censorship of the Middle Ages, was largely directed against him. He was considered to be an anti-Christian thinker, and a scandal amongst his contemporaries. He angered the Bishop of Paris, Etienne Tempier. From 1268, Bonaventure vehemently criticized the theories of Siger in several of his university sermons, and in 1270, Thomas Aquinas wrote the well-argued work *De unitate intellectus* to take apart the interpretation that Siger gave Aristotle.

On the other hand, Dante Alighieri did not hesitate to reserve a place in paradise for him. He placed him alongside Peter Lombard, King Solomon, and Dionysius the Areopagite, but especially together with Albert the Great and Thomas Aquinas, who presents him with the highest praise: “It is Siger's eternal light, in teaching at the Rue du Fouarre, that by demonstrating truths created hate and envy” (Dante, *Par.* X, 136–138). Siger is thus presented as one of the most remarkable philosophers of the thirteenth century, and as one of the most “excellent doctors of philosophy.” But who was really this “*Sigerus magnus*” mentioned in several manuscripts?

The Life and Works

The edition of Siger's major works was done in the 1970s and since then historians have been able to place him in the proper historical perspective. To account for the contrasting judgments about him, one should follow Fernand van Steenberghen's judgment and distinguish three distinct periods of his career.

First Period: Before 1270

The first mention of Siger of Brabant dates to August 27, 1266, when the papal legate Simon de Brion calmed a crisis dividing the Faculty of Arts in Paris. Paris University was in fact made up

of four faculties. Three higher faculties: medicine, canon law, and particularly theology, which were accessible only after having studying for several years at the largest faculty, the Faculty of Arts. Siger was a professor in the Faculty of Arts at a time when it was involved in serious intellectual and political disputes. The four nations that composed it were also divided by controversy. Siger, in the Picardy Nation, was portrayed as a troublemaker. He was suspected of having participated in the kidnapping of a master of the French Nation and of having locked him up. This is the traditional view, which makes Siger to be a leader and head of a sect whose ideas became a kind of “radical Aristotelianism,” highly critical of Christianity.

On the contrary, other historians have concluded that Siger was innocent in the kidnapping case, that political tensions had nothing to do with the philosophical debates about Aristotle, and especially that Siger was a character of limited importance. Was he the head of a sect or an unimportant person? The views are certainly divided.

Besides some logical works a commentary on the third book of the *De anima* of Aristotle, *Quaestiones in tertium de anima*, has been found from Siger's career before 1270. It was transmitted in the form of a *reportatio*, that is, as unreliable notes of the teaching of the master. This book is of great importance because it is the only witness to the “Averroistic” period in which he defended the thesis of the unity of the intellect.

Second Period: 1270–1275

From 1272 to 1275, the Faculty of Arts in Paris was divided into two groups, each claiming to be the legitimate leader of the University. A dissident minority had promoted Siger of Brabant as Rector and head of Paris University due to his strong personality. Indeed the manuscripts speak of the *pars Sigeri*. For some historians, it was his strong philosophical ideas that made Siger a leader. At the source of tension was the bold thesis that Siger wanted to free the Faculty of Arts from the dominance of theology, and free reason from any control of faith. According to other historians,

such as R.-A. Gauthier, the crisis was purely institutional, without doctrinal issue, and Siger was never the leader of any “Averroistic sect.”

In addition to logic texts, two books from this period are in direct response to the debates of the 1270s, namely the *De aeternitate mundi* and *De anima intellectiva*. Alongside the *Quaestiones naturales et morales*, they are the four published parts of the *Quaestiones in metaphysicam*, which focus on the heart of the debate, namely the relationship between philosophy and theology.

The chronology of the writings of Siger is decisive here, because it shows a profound evolution of the question of the unity of the intellect. Under the effect of the first censure by the Bishop of Paris, dated to December 10, 1270, and particularly under the influence of Thomas Aquinas' *De unitate intellectus*, Siger approaches Thomas' position to the point of rejecting his earlier ideas on Aristotle's interpretation and the unity of the intellect. However, we must be careful not to assume that this evolution affects all of his thinking.

Third Period: After 1275

Little is known about the third period of his life. Certainly the condemnation of March 7, 1277, was directed at several of his theses, but it is not certain that, summoned to appear before the Inquisitor of France, Siger would have fled Paris in 1276 to plead his case to the papal curia. It is not certain any more that he was murdered by his secretary who had gone mad, and there is no basis for a connection between his teachings and his death. Not much is needed, however, for legend to take hold of history: “The tragic death of Siger has succeeded in making him, for opponents without pity, the kind of heretic that is punished by Heaven” (Gauthier 1984:28). It is also probable that he ended his life peacefully as a canon in Liege.

The last known work of Siger is the *Questions on the Book of Causes*, on which the masters of the Faculty of Arts had to spend seven weeks lecturing, dating from the years 1275–1276. In this work, which in the Middle Ages was attributed to Aristotle, Siger comments on 57 questions that address several major problems of metaphysics.

Thought

Before 1270: The Problem of the Unity of the Intellect

The *Quaestiones in tertium De anima* is a document typical of his first teaching. It gives the impression of a young professor (master) of 30 years, teaching at the Faculty of Arts, infatuated by philosophy, and not caring much for the religious implications of his theses. The primary doctrine concerns “the unity of the intellect,” inspired by the third book of Aristotle’s *De anima*. According to this literal interpretation, there exists only one “possible intellect” for the whole of humanity. What is this intellect? According to the doctrine of Aristotle, the intellect has a dual function. On the one hand, it is “active,” like a light that illuminates the sensible images in order to identify the intelligible core. This process of abstraction makes bare the essence of material things to render them compatible with the intellect. On the other hand, the intellect is “passive” in that it receives these intelligible abstract forms. It is this function that is called the “possible intellect.”

However, according to Thomas Aquinas’ interpretation, for example, it is clearly the individual human being, Peter or Socrates, that is the subject of this intellect. It is not the intellect that thinks, but the human being, this human being of flesh and bones. According to Thomas, the intellectual soul, its substantial form, is what constitutes the human being. For Siger, however, the intellect is completely separated from matter. Not only is it not material, as demonstrated by Aristotle, but it is apart from individual humans. The intellect is a separate and eternal substance, unique in species, genderless and incorruptible, therefore it cannot play the role of substantial form of the body. This is the thesis called “Averroistic” about the unity of the intellect, which Siger indeed reads in the Muslim thinker’s commentary of the books of Aristotle.

Is Siger really then this “independent spirit and vigorous thinker” that he has been described as? Or did he simply have second-hand knowledge of Averroes’ books? It is probably by reading Aquinas’ *Commentary on the Sentences* that

Siger discovered the Averroist movement, which defends the separation and the unity of the possible intellect. Siger seems to have been content to unite several views without noticing the inconsistency of holding them simultaneously. We discover an author of limited culture, where lack of information does nothing to the faculty of invention. Once again, opinions differ.

From 1270 to 1275: The Eternity of the World Between Faith and Philosophy

On December 10, 1270, the Bishop of Paris exercised his authority by condemning 13 theses, some of which defended the unity of the intellect and the eternity of the world. At first glance, each of the denounced theses were opposed to the foundational truths of the Christian faith in that they seemed to deny the immortality of the soul, responsibility and merit, the beginning of the world, prescience, and divine providence, as well as the fire of hell. That was why these errors were condemned and why Etienne Tempier threatened to excommunicate anyone who professed them. The Bishop of Paris believed that the truths of faith should instead lead philosophers to realize the theological implications of their statements and to invite them to correct their doctrines. On March 7, 1277, the Bishop of Paris went even further, solemnly condemning 219 theses, including several theses aimed directly at Siger of Brabant and his colleague, Boethius of Dacia (Hissette 1977:314). He blamed them for holding that some statements are true for philosophy, but false according to the Catholic faith. These philosophers, he said, act as if there were two contradictory truths.

Let us illustrate this difficulty with the controversial issue of the eternity of the world. Here is the problem. The inaugural words of the *Genesis* reads: “In the beginning God created the heavens and the earth.” This asserts that the world began to exist temporally. It seems also to absolutely contradict the Aristotelian belief that the world is eternal. Everything had gone very fast when, on March 19, 1255, the Faculty of Arts in Paris introduced into its mandatory program the main and newly discovered works of Aristotle. The clash was unavoidable.

All the thinkers of the late thirteenth century were involved, and the debate took on considerable proportions. Bonaventure, for example, fought tirelessly since 1267 against this error, in which he denounced the hypothesis of a creation *ab aeterno*. The eternity of the world ruins the Holy Scripture, because it describes a world that, having no history, excludes the whole idea of salvation. According to Bonaventure, it is contradictory both to maintain that things are created *ex nihilo* and that the world is eternal.

This is not the way in which Thomas Aquinas saw things. According to him, it is impossible to rationally prove the thesis of the beginning of the world, which is a truth revealed by faith. From a philosophical standpoint, the creation does not prevent the theoretical possibility of an eternal world, because the notion of creation does not have as a consequence the duration of the created world. It expresses an ontological dependence, not a temporal succession. In fact, being created is not the beginning of being, but it means “depending on another” or “receiving its being from another.” It is not then contradictory that the world is created, that is, dependent upon another, but does not have a temporal beginning. Only faith can give an answer to the question about the beginning of the world, not philosophy. In short, for Thomas Aquinas, the beginning of the world is an article of faith that cannot be proven false by reason.

Siger of Brabant also realizes that faith teaches as true that the world and the human species had a beginning, and he never ventured to deny this. But in his eyes, it is illusory to think that philosophy can demonstrate such truths. All the evidence we can come up with is doomed to fail, since they are inconsistent arguments. Siger’s intention is not to demonstrate the opposite of the truths revealed, nor to suggest that the world is eternal. He only wants to show the weakness of the arguments that are in favor of the beginning of the world and the human species.

He adopts a position fairly similar to that of his colleague Boethius of Dacia. When a science, like physics, demonstrates that the world has no beginning, this in reality stems from its own empirical principles. Conversely, when a Christian states

absolutely (*simpliciter*) that the world began to be, he does so by reference to an absolute cause that does not take into account the consideration of the physicist. On the one hand, the physicist says the truth, but only from the principles that are his own. In his proof that the world did not have a beginning, he adopts his conclusion under the condition of the validity of his principles (*ex conditione*). On the other hand, the Christian bases his argument on other principles. He is right in arguing that the world began, because he judges this from a superior cause. Even if their conclusions are contrary, both can be right, but they adopt different perspectives. Thus there is no contradiction, because one does not disagree with the other in the same respect. It is by misunderstanding this subtle distinction that these philosophers have been criticized for defending a “double truth,” and that philosophy denies the truth of faith.

But Siger does not cease to repeat that he proceeds by following the proper method of philosophy. He begins from the principles of experience, which, far from being absolute, are only conditional. It is from this relative data alone that he reasons to the consequences that necessarily follow. This approach, albeit false in its conclusion, should not be distorted or hidden. Philosophy remains indeed a search for truth, but Siger offers a different conception of truth than that of Thomas Aquinas. A truth within certain limits set by the validity of its principles. These are limited and empirical principles, and hence will never yield an absolute truth.

In his eyes, to proceed philosophically, is “to methodologically abstract from faith,” and it is to follow rationally and logically a thought to its conclusion via certain principles. But its premises, drawn from sensory experience, are inevitably unstable, and this is why errors can occur. Herein lays Aristotle’s approach. Siger’s profession, as master in the Faculty of Arts, consists precisely of commenting on Aristotle’s texts in deducing conclusions from partial principles based on experience. Therefore, metaphysics cannot lay claim to an absolute truth (*simpliciter*), which is the prerogative of faith, anymore than physics. “We are looking rather for the philosophers’ intention than

for the truth, since we proceed philosophically” (*De anima intellectiva* VII, 101). Siger therefore never denied the truth to be eminently theological. He only maintained that, because of its limitations, metaphysics does not attain the absolute truth of faith (*simpliciter*). The philosophical truth is only conditional (*ex condicione*). Hence the astonishing thesis according to which human reason leads to conclusions that must then be denied from a religious viewpoint (*Quaestiones in metaphysicam* III, 9, Dunphy 144).

In an original manner, Siger of Brabant ensures the autonomy of philosophy, but he does so by setting strict limits and by circumscribing the scope of its validity. It is by limiting the scope of philosophy that its autonomy is assured. Commenting on Aristotle is to abstract from all revealed truth, and settle for a mere human experience. This clarifies the overall project of Siger, which of course is transferable to other issues, for example, the human soul. “Our main intention is not to seek the truth about the soul, but to clarify the opinion proposed by the philosopher” (*De anima intellectiva* VI, 99). The absolutely true conclusion about the human soul is not philosophical, but revealed and theological. Given this, Siger never proposed the absolute truth about this issue. This was indeed what was imposed by the decree issued by the Faculty of Arts on April 1, 1272, which prohibited teachers from straying from their competences and meddle in theology. But they did not understand Siger’s project, and this is the reason why, on March 7, 1277, the Bishop of Paris not only censored the theses on the eternity of the world, but also on the soul animating humans, and the new conception of philosophy that was offered by some teachers of the Faculty of Arts in Paris.

Besides the theses about the unity of the intellect, and eternity of the world there was yet another thesis, which aroused strong reactions, namely one concerning freedom. Siger did not have the slightest doubt about the existence of human freedom, but the way in which he explained it gave the impression that he denied it. He compares human desire to animal desire. Animals are not free since they are all subject to

instinct that leads them to determined objects. They have no freedom to change their judgments. A human is endowed with free choice. His desire is not chained to any particular object because he is free to judge otherwise. He is not a slave to his desires. It is the intellect that is free, however, not the will, which necessarily follows the intellect’s judgments.

It is this radical form of moral intellectualism that was condemned by the Bishop of Paris in 1277. In fact, if the development of the intellect is sufficient for a good life, and to do what is good, it is not clear why a human being would need to be saved by Christ. Does philosophy propose to supplement faith? Is this enough to ensure the happiness of humans? It is in this way that the censorship of 1277 interpreted the doctrines of Siger of Brabant. The Bishop condemned the following thesis: “If reason is right, so is the will” (*si recta ratio et voluntas recta*), since this thesis seemed to revive the heresy of Pelagius, namely that since science is sufficient for the rectitude of the will, why then would humanity still need the grace of God?

After 1275: Return to Orthodoxy?

The last known work of Siger is his *Commentary on the Book of Causes*. A careful reading of the book confirms that Siger had definitely abandoned the thesis of the unity of the possible intellect. Indeed, after having presented the philosophical motivation for the position of Averroes, he adds: “But this position is heretical to our faith, and it also appears irrational (*irrationalis*)” (*Quaestiones super Librum de causis* q. 27, 112). The novelty lies not in the rejection of this view, evidently opposed to Christian doctrine, but in his strong affirmation that the thesis of the unity of the intellect does not hold up even in the eyes of reason. On this particular question, there is no doubt that Siger had finally abandoned his way of reading Aristotle before 1270. Thomas Aquinas’ *De unitate intellectus* had him finally convinced. On other points, Siger approaches the Thomistic doctrine, particularly when he states that God, the first cause, is *ipsum esse per se subsistens* (q. 9a), that we must

hold a composition of essence and existence in angels (q. 22), and that each immaterial substance is a species (q. 24).

Historians have concluded that Siger had ended by completely endorsing the doctrines of Aquinas. But this is a conclusion drawn too quickly. Indeed, the explicit desire to stay within the limits of orthodoxy does not constitute the most important aspect in his late work, which provides an interesting example of Siger's intellectual mentality and of his way of working. The 57 questions in this book have indeed literally borrowed many views from the commentary that Thomas Aquinas had himself given on the *Liber de causis*. There are also views borrowed from the *Commentary on the Physics* and especially from the *Summa theologiae*. For example, in question 8 Siger wants to define the notion of eternity. He cites word for word the *Summa* I, 10, 1, but without mentioning his source. However, this usage of the text actually hides important changes. Aquinas' work is exploited, but Siger changes its meaning in order to say something else.

One must avoid judging this practice according to our modern standards and from the accusation of "plagiarism," firstly, because the use of texts of other authors was common practice, and, secondly, because Siger uses some texts of Thomas Aquinas to turn them against him. We have an example in the analysis of the relationship between the primary cause (God) and the secondary causes. Siger begins by criticizing the belief of the "vulgar and popular men" who tend to attribute everything to God, and to ignore the autonomy of the created world. The direct intervention of God must be excluded, and philosophy rejects any direct divine intervention. Thomas Aquinas had also been anxious to strengthen the autonomy of the world and secondary causes, but he nonetheless explained that God always reserves the possibility to directly intervene in the course of events. By using the same texts as Thomas did Siger reversed this thomistic doctrine and logically excludes that the primary cause may alter the natural course and create, for example, an "accident" existing without a "substance." It is clearly the doctrine of the Eucharist which is

here undermined. Siger's thesis made it impossible that the bread, while retaining its unchanging physical properties, transformed into the body of Christ. When Siger is critical of the theologian's ability to argue in a sophisticated manner, it is difficult to maintain that he has at any point agreed with the doctrine of Thomas Aquinas.

Siger of Brabant remains one of the most fascinating witnesses of the philosophical debates that had developed in the wake of Bonaventure and Thomas Aquinas. The true significance of his work is revealed if we relocate its usage in the institutional and historical context of the 1270s, and we refrain from making him the spokesman of "Averroism," which perhaps never existed in the thirteenth century.

Simon of Faversham

John L. Longeway

Department of Philosophy, University of Wisconsin, Kenosha, WI, USA

Abstract

Simon of Faversham, c. 1260–1306, was a commentator on Aristotle's works, particularly in logic and on the soul. He taught at Oxford, primarily in the Arts, and although he took the degree in Theology and became Chancellor of the university, almost none of his work outside the Arts survives. His initial formation seems to have been Thomist, whom he follows in his Avicennan understanding of universals, but in his later writings he took issue with Aquinas on the real distinction, following Henry of Ghent, and absorbed much from Giles of Rome. Nonetheless, even in his later works, he takes distinctively Thomist positions in his *Posterior Analytics* commentary, favoring Thomas on the nature of the highest sort of demonstration and the use of the fourth kind of per se statement in demonstration. These were major points of controversy, and Simon's positions reflect the dominance of the Thomistic view of them in later Scholastic work.

Simon of Faversham (c. 1260–1306) was a commentator on Aristotle's works, particularly those on logic and the soul. He was educated at Oxford, and although his commentaries seem to reveal a residence at Paris in the 1270's and 1280's, reflecting in particular the influence of Peter of Auvergne, he spent the rest of his life at Oxford, where he became Chancellor in 1304. Following chiefly Aquinas, he also uses Giles of Rome on many occasions in his commentary on the *Sophistici elenchi*, as well as his account of the nature of logic in his *Posterior Analytics* commentaries. In his second question-commentary on the *Posterior Analytics*, Question 49, he explicitly attacks Thomas and follows Henry of Ghent on the real distinction between essence and

existence (though he does not attribute his view to Henry), though he had followed Aquinas in Question 20 of his commentary on the *Categories*, written much earlier in his career. Simon's objection to Thomas' view is this: if existence differs from essence in creatures, then it is something added, though Thomas, of course, insists that it is not an accident added to the essence, as Avicenna thought. (This common criticism of Avicenna probably misinterprets him, but it was generally accepted as correct at the time on the authority of Averroes.) But if existence is added to essence, then it is a kind of actuality. Now Thomas says it is primary actuality, but this cannot be, for essence is the primary actuality. The essence of a human being, for instance, is rational, not just potentially rational, and so there is a kind of primary actuality here. Nor can it be an added secondary actuality, either, as Thomas confesses. So existence is nothing real added at all to essence, and so does not really differ from essence. But it differs in some way from essence, and that means it differs in formula (*ratio*).

What is the formula of existence? Well, one considers a substance as existing when one considers it insofar as it is part of the causal order, and itself caused by something to be part of that order. So existence is the sort of being possessed by something which is the effect of another thing. It is *esse in effectu*, a being in an effect. Finally, borrowing a notion from Giles of Rome, Simon argues that existence falls under the category of substance, for there are substantial relations; for instance, the relation between matter and form falls under substance. *Esse in effectu*, then, is the sort of being a particular substance has, as opposed to *inesse*, which is the sort of being an accident has.

The phrase "*esse in effectu*" is borrowed from Avicenna (*On First Philosophy* V 1). The term "*esse in effectu*" is accompanied by two other terms, "*esse essentiae*," and "*esse universale*." Simon's Sophisma holds that one can speak of the essence as it is part of the natural world and a particular to be found interacting with other particulars in the natural world, or without reference to anything outside itself (*esse essentiae*), or as it is conceived in the intellect (*esse universale*), so

that it can be asserted of different things. The picture comes from Avicenna, and plays a role in Thomas' thought as well. Like Thomas, Simon insists that the universal concept has a foundation in the essence itself, which is real quite independently of the concept, though it is neither universal nor particular in itself, both because it is not in itself brought under the consideration of the intellect, and because it is not in itself multiplied, or for that matter, singular, in the way that individuals entering into natural causal processes are. But the Sophisma never uses the term "*esse in effectu*," preferring to speak of being in matter or in particulars, or outside the soul, when it wants to indicate existing particulars. Moreover, it does not discuss the real distinction either, restricting itself to a consideration of universality. Like the *Categories* commentary, it seems to predate the reconsiderations that produced the criticism of Thomas in Simon's *Questions on the Posterior Analytics*.

Simon prefers Aquinas in his most characteristic doctrines in his account of the highest sort of demonstration (*demonstratio potissima*), arguing that the real definition of the subject term is the middle term and relying on the fourth mode of per se predication (predicating a thing of its cause) to explain the connection between the real definition of the subject term and the definition of the attribute which is concluded of the subject. This view is rejected by Grosseteste, Albert the Great, and Giles of Rome, though it became the usual view in later authors. Simon follows Aquinas on these matters even in the second *Posterior Analytics* commentary, in which he differs with him on the real distinction.

Simon assumed that the meaning of a term, taken independently of its function in a sentence of signifying individuals, was the nature it indicated. This puts him in the Modist school of interpreting supposition, identifying not the term itself, but something real outside it, as that which is common to the supposita of the term, that is, those items referred to by the term in its sentential contexts. In particular, Simon holds, second intentions do not merely reflect the way in which the intellect classifies individuals, as Thomas asserted, but what the individuals have in common that enables that classification, a view

perhaps first put forward by Henry of Ghent, who held that the second intentions signify things in some manner, not merely acts of the intellect. Thus Simon argues in the *Questions on the Categories* that the categories have a real resemblance, though they have no common substantial form, a view further developed in Duns Scotus.

These points should all be regarded with caution, as a definitive study of Simon's work has yet to be written.

Skepticism

Christophe Grellard

Philosophy, University of Paris 1 Panthéon-Sorbonne, Paris, France

Abstract

Every inquiry into skepticism in the Middle Ages aims at seeking the missing link that would allow the understanding of how we changed from the ancient conception of skepticism as a way of life (living without belief) to a modern conception of skepticism as the general critique of knowledge. The medieval reception of the ancient mode of skepticism and the transformations they made after its reception allow us to understand this evolution. Thus, the Middle Ages occupy a nodal place in the history of skepticism.

Strictly speaking, there is no skeptical school in the Middle Ages insofar as no one, except John of Salisbury, explicitly claimed to be a skeptic. Medieval epistemology on the other hand accords a place of growing importance to the question of skepticism, ultimately finding incontrovertible the examination and refutation of skeptical arguments. In a way, skepticism in the Middle Ages is primarily a construction lacking a historical foundation; a set of arguments against the possibility of knowledge and a test for all theories of knowledge. Nonetheless, the consideration of these arguments, conjoined with the development of a set of theories of knowledge attuned to the fallibility of human reason and to the problem of induction drove, at the end of the Middle Ages, some philosophers to develop theories of knowledge that produce skeptical effects, limiting the hold of our capacity for knowledge (e.g., Nicolas of Autrecourt, William Crathorn, Robert Holcot). It is in this sense that we can speak of a medieval form of skepticism proper in the fourteenth century.

In order to understand how the medieval skeptical vision was elaborated, we must examine the

medieval reception of ancient skepticism. If Sextus Empiricus' *Outlines of Pyrrhonism* was available in Latin near the end of the Middle Ages, it is not possible to tell today if the text had any readers. In the same fashion, Cicero, whose texts were more widely circulated, could have influenced John of Salisbury (who does not seem to know of the *Academics*, however) and Henry of Gent, but his real influence remains quite minimal. Indeed, the construction of the image of skepticism as that which denies the possibility of knowledge stems from the conjunction of the Augustinian influence and the rediscovery of Pre-Socratic (Democritus, Protagoras, Heraclitus) arguments via Aristotle. Presenting neo-Academic doctrines in a synthetic manner in *Against the Academicians* II, 11, Augustine shows what we can call the logical structure of skepticism. The point of departure and the crux of the Academic position is that nothing can be known. Augustine draws the conclusion, typically skeptical according to him: the sage must suspend assent. This suspension of assent would be taken as a general doubt in the Middle Ages. Augustine thus emphasizes the fundamental status of the thesis according to which nothing can be known (that is to say an object of *scientia*, or to be known with certainty). This thesis is proved by the *Academics* by showing that it is impossible to find a perception that is an evident criterion of truth. Augustine goes on to elaborate a typology of skeptical arguments: (1) disagreement among people (i.e., relativity of knowledge); (2) the fallibility of the senses; (3) dreams and madness, and, finally; (4) paralogisms and sophisms. (1) permits the emphasis that there are no evident and universal criteria for truth, (2) and (3) that the sources of knowledge are not reliable, and (4) that error is found just as much at the level of reasoning as it is in the testimony of the senses. This thus frames the portrait of skepticism as that which denies the possibility of knowledge due to the impossibility of distinguishing truth from falsity since uncertainty is found just as much in objects as it is in the knower. The model of skepticism inherited in the Middle Ages is taken from here. Faced with this kind of skepticism, there is a

complementary double attitude: skepticism must then be refuted by showing that there is evident knowledge (the cogito, mathematics, revealed truths). Once refuted, however, it becomes legitimate to make a limited use of skepticism as a test to distinguish true and false knowledge. Use and refutation: a schema that we find throughout the Middle Ages. If the Augustinian model determines the whole of the medieval conception of skepticism, it will be enriched, however, by the superposition of different traditions. The first enrichment stems from the rediscovery of the pre-Socratic tradition through Aristotle, beginning in the twelfth century. Two sets of texts are important. One, stemming from the *Posterior Analytics*, and book II of the *Metaphysics*, drive the questions of what we must demonstrate and, more generally, justify. It is in this context that the medievals examine the problem of skepticism: can we know anything? Can we apprehend truth? The second set of texts is made up of book IV of the *Metaphysics*. The analyses of Heraclitean, Protagorean, and Democritean doctrines give rise to the examination of a host of arguments thought to be skeptical. According to Aristotle, upholding that all that is apparent is true makes it no longer able to distinguish the true from the false. More often, the reading of these texts allows giving an ontological basis to skeptical doctrines: it is because they hold, like Heraclitus, that all things are in flux, and because they deny the principle of noncontradiction that the Academics hold that we cannot know anything. The second enrichment is properly medieval and results from reflection, mostly from Duns Scotus, on the radical contingency of the created and on the omnipotence of the Divine. The basic idea is to not set a limit to Divine freedom. From here, we must emphasize that the created world is not simply the actualization of Divine Ideas, according to logical necessity, but that the status of this world is contingent and that it could be otherwise. In a like manner, we must pass to a working conception of God's omnipotence. God *de facto* intervenes by means of his Divine power in creating the world with a set of laws, but he maintains the possibility to intervene in the course of things to modify it, through his absolute power. Reflection

on the possibility of God substituting secondary causes in cognitive processes (to substitute the causality of the perceived object) leads to the idea of a deceptive God.

We find in the thirteenth century a resurgence of the problem of skepticism taken as a challenge put to our ability to gain knowledge. It is in this context (and even if Academics are not always explicitly mentioned) that the interest in the problem of our access to truth and our capacity to sufficiently justify our knowledge occurs. Schematically, we can distinguish between three types of responses to the skeptical challenge: an *a posteriori* response, or a weak response seeking to limit the scope of error in order to not give weight to skeptical arguments. It is a response that contextualizes knowledge. We find this notably in Thomas Aquinas and Siger of Brabant, and mostly in John Buridan. Two *a priori* or strong responses accept the presuppositions of skepticism and seek to face it on its terms. It consists of one part theories of knowledge that rest on illumination (in particular, St. Bonaventure and Henry of Ghent), and another part foundationalist theories that base knowledge in *a priori* principles, the clearest expression of which is found in Duns Scotus. We will examine briefly the positions of St. Bonaventure, Thomas Aquinas, and John Duns Scotus.

The skeptical question appears in Bonaventure in his questions on *The Knowledge of Christ* q. 4, as strongly tied to the teaching of Augustine. It displays an intellectualist reading of skepticism, seemingly inherited from a misunderstood Platonism. According to the skepticism identified by Bonaventure, Divine Light is the only mean of knowledge. Bonaventure criticizes this thesis as a reduction of all knowledge to knowledge of Divine Being. It removes the distinction between worldly knowledge (knowledge of the *viator*) and beatific vision, between the knowledge of things in God and direct knowledge of things, between science and wisdom, and between reason and revelation. The problem with skepticism is the reduction of knowledge to the one intelligible world (knowledge of Forms). And yet, this intelligible world is inaccessible to the human mind after the fall (the Christian dimension to

skepticism is explicit here). Faced with this kind of skepticism, Bonaventure defends another conception of illumination: Divine reason is the driving and regulating principle, that is, that which rules the action of human reason. There is no direct intervention as there is in the case of infused knowledge, but only God's presence in the act of intellectual knowing. However, it is just a step from created reason from whence it gets its partial character. God is the standard of Supreme Truth that allows for all inferior truth. The consequence of this recourse to Divine rule is the stability of the object of knowledge and the infallibility of knowledge, two necessary conditions for knowledge (infallibility on the side of the subject and stability on the side of the object). Thus, the conditions for knowledge required by the skeptics (a knowledge that cannot be false and of which we know is not false) can be filled in. But, we must add a final condition for knowledge: completeness in the understanding of the object. Indeed, there are three modes of being: being in spirit, worldly being, and being in the Divine Intellect. Created truth cannot grasp but the first two modes of being where truth is conditional: there is mutability of the sensible world, thus there is mutability in our thoughts of the sensible world. We must then grasp the last mode of being, which is impossible without Divine aid: the mind, not being transformed by God, has not complete, clear, and distinct knowledge. The idea of illumination is that Divine Ideas are the conditions and basis for abstraction, that is, for intellectual knowledge. There is an *a priori* structure to knowledge: we do not know Divine Ideas directly but they serve as standards for human knowledge. We thus find in Bonaventure a view of illumination tied to the theme of Heraclitean skepticism on the mutability of the sensible: evident knowledge supposes immutability, and this is only found in the Divine understanding. Rational thought is the highest form of knowledge that we can attain in this world, but it is a weakened form of the true intellectual knowledge that we will have in the glory of the beatific vision. We must distinguish between degrees of knowing and admit that our knowledge does not perfectly match certain criteria admitted to be necessary for knowledge such as clarity and

fullness. Theories of illumination, because of the importance of the Augustinian influence, are perfect examples of the use of skepticism: they use skeptical arguments to show the necessity of a divine guarantee and the insufficiency of purely natural means of knowledge, and they refute skepticism by means of this intellectual knowledge guaranteed by God. However, we find skepticism surfacing in such a theory since the completeness of knowledge is only guaranteed in an eschatological perspective.

We can present the contextualist position (which consists in limiting the scope of the validity of skeptical arguments to limit its reach) by borrowing Thomas Aquinas' view on the role of Adamic knowledge in the *Questions on Truth*, q. 18, a. 6. The question is to know if Adam, who had an ideal form of knowledge before the fall, could have erred. This thought experiment allows us to determine an exemplary situation from which we can evaluate our own knowledge. Thomas advances two arguments to show that Adam could not have been in error. First, before original sin, there could have been a defect but not a corruption. In epistemological terms, this signifies that either Adam knew truth, and he knew it completely and perfectly, or he did not know it at all. Thus, Adam could have ignored certain things (he is not omniscient) but could not err. Adam could not have incomplete knowledge since it stems from hasty assent. And yet, for Adam the assent is always proportional to the object known. Second, the intellect is created by God to be capable of truth. It can thus know the truth without error, as is attested by the indubitable knowledge of first principles. Consequently, error, the act of the intellect of confusing truth and falsity or approving an incomplete opinion, is a consequence of the fall, that is, a disorder making way for the natural order willed by God. Thus, Adam had but true, firm, and evident knowledge. Skeptical arguments allow to assure that we determine criteria of truth sufficient to elude the skeptical challenge. In the argument from dreams, Thomas replies by qualifying the weight of the objection: on the one hand, in dreams assent is not free, thus the question of error meant as epistemic responsibility does not arise. On the other hand, dreams

stem from sensation, thus it is a particular case. Since Thomas does not consider that we could be dreaming permanently, the objection from dreams is not relevant; not for Adam nor for us. In return, the argument from sensible illusions poses the problem of the conditions for perception and sensory Adamic knowledge. And yet, as a good Aristotelian, Thomas reckons that all knowledge stems from experience. His answer stays no less extremely classical: there is no error at the level of proper sensibles; error is in judgment. The entire skeptical problem is thus reduced to the problem of judgment: the gap between the intellect and the sensible given. The difficulty for us, by comparison with Adam, lies thus in the mastery of sensation by the intellect and in the application of the principle of correction. As such, Adam masters his sensation perfectly thus either he recognizes a situation of appropriateness between the intellect and its object and he judges veridically, or he recognizes an absence of this appropriateness and he corrects his judgment, or if correction is impossible (as when asleep), he differs it. What the case of Adam shows us is that skepticism results from an accidental situation of separating sensation and the intellect, a separation that we can bridge by the temporary suspension of judgment and by the correction of the sensible by the intellect. Thus in a general way, even after the fall, man is created capable of truth, and in normal conditions of cognitive function we are able to judge correctly. Error is but factual, and skepticism does but emphasize that we can occasionally ignore this or that parameter in the knowing of an object. Justifying our knowledge does not then consist in excluding all possible logical objections, of rejecting *a priori* all sources of error, but only in delimiting the scope of what we know and what we do not know. In as much, Thomas' answer is a *posteriori* and cannot, quite evidently, satisfy the skeptic.

John Duns Scotus, for his part, proposes in his *Commentary on the Sentences* L. I, d. 3, q. 4, a foundationalist and rationalist response to the question of justification by explaining the role of principles while at the same time maintaining the demand of infallibility. Against the skeptical position, Scotus aims to provide three categories of

infallible truths that cover the whole of the edifice of knowledge: logical truths, introspection (knowledge of one's mental states), sensible and experimental truths. In effect, Scotus distinguishes between sensation or direct perception and experience or induction (understood as a collection of sensations). The category of logical principles, examined first, regroups at once first principles and propositions known in themselves. The infallibility of these principles is connected to their logical form: these propositions are only known by the analysis of the terms by the connection of including the predicate in the subject. The knowledge of this relation accompanies the truth of this proposition and an evident assent of the intellect. We then have here an *a priori* form of knowledge independent of experience. The second category of evident truths is that of sensation and experience. First, experimental knowledge (i.e., induction) rests on two parameters: the frequency of a case and the addition of a causal principle. If a repeated experience reveals constant reactions in natural agents, then we can conclude with an infallible certitude that the observed effect is proper to this agent and that it will always produce the same effect. This observational reasoning is guaranteed by a causal principle known in itself, that is, a principle which belongs to the first category, according to Scotus, and which maintains that the effect which is frequently a restrained cause is the natural effect of this cause. The principles that base experience are found in sensible knowledge in a way. We must here distinguish two situations, either the convergence of the products of different senses or a conflict. In the first case, the convergence allows to conclude with absolute and infallible certainty about perception. In effect, this convergence supplies the principle of frequency to which induction calls upon. It is, once again, the causal dimension of knowledge that enables its justification. If an object produces uniform impressions that converge on two or more senses, we can then be sure of the truth of our perceptions. Conversely, in the second case, the certainty of sensation rests on the capacity of the intellect to correct the sense. In such a situation, truth is known only through *a posteriori* justifications, through the help of an

infallible intellectual knowledge and thanks to the convergence of several senses. Thus in the case of seeing distant things, sight may err but natural reason tells us that a distant object acts in a weakened manner. As such, once we have realized that sense cannot furnish reliable information in this context we can seek for ways to overcome this inadequacy. The third category is that of mental states: influenced by Augustine's *cogito*, Scotus holds that the apprehension of our own mental states is as certain as principles in themselves. Scotus thus defends a strong response to skepticism; a response that tries hard to defend a model of knowledge where truth, evidence, and infallibility are necessary conditions for knowledge. To do so, he employs a foundationalist and rationalist conception of knowledge: first principles of knowledge, the most evident principles, are *a priori* principles known by the intellect outside of all sensation. And these principles are the ultimate basis of knowledge, which permit the infallible justification of sensible truths. Therefore, we have of the movement of foundation of knowledge on intellectual principles: sensible truths are based on the principle of causality that justifies the cognitive value of sensation. The same causal principle, along with the principle of uniformity of nature, warrants induction. Thus, all reliability of experience comes from first principles, known *a priori* only through the analysis of terms.

Next to these attempts to refute skepticism we find a group of philosophers defending a fallibilist conception of knowledge, such that the majority of our knowledge is never absolutely evident and always susceptible to be otherwise. While most of these philosophers are active in the fourteenth century, the most important and the only to explicitly call himself a skeptic (*academicus*), is a philosopher from the twelfth century, John of Salisbury. This philosopher insists on the cognitive fallibility of Man; a weakness that renders difficult his access to truth: Man must be satisfied with mostly having likely knowledge, and his probabilistic truths conflict such that, Man, incapable of overcoming this is reduced to uncertainty and hesitancy (*Metalogicon*, IV, 40). John of Salisbury's theory of knowledge allows putting this moderate conception of skepticism into

place. This seems to be a fallback to a kind of fallibilism and a probabilism tied to the imperfection of our cognitive apparatus. Proposing a phenomenology of knowledge in several places, Salisbury emphasizes how the process, by which we gain knowledge passing through sensation, imagination, and memory (faculties of the synthesis of sensation) and then, by the prudence of reason and an intellectual judgment, runs the risk of incompleteness and error at each step. In describing the progressive elaboration of our concepts, stemming from sensation up to reason, he stresses hard that, fundamentally, all knowledge is approximate knowledge. The work of analysis and synthesis run at each level by different faculties, works to define precisely the object of knowledge by situating it by its differences and similarities, in relation to what is already known. What interests John of Salisbury are the steps of this approximation and the degrees of justification wherein our knowledge claims to be. A distinction is imposed between judgment (*sententia*) and opinion. Judgment, which is the object of prudence, creates a strong confidence that practically excludes error and allows a reliable approximation of truth, meanwhile opinion is an unjustified belief (*Metalogicon*, II, 5). John of Salisbury thus distinguishes between degrees of justification that determine an assent more or less firm depending on the reliability we can claim to. The importance accorded to the probable is justified both by the reality and the limits of our faculties. As such, to judge veridically with absolute certainty supposes on our part a capacity to judge which events are necessary. But specifically, such complete apprehension of the laws of nature is impossible for us and reserved to God alone: it is too difficult from our point of view to distinguish that which occurs often from that which occurs always (*Metalogicon*, II, 13). It is thus a recourse to a theme from Christian skepticism (only God knows truly what is true) which justifies the recourse to the probable in the study of nature, as far as possible, where thought about the contingent is permitted. From here, we are driven to a philosophical skepticism: the difficulty to perceive truth inclines us to follow the Academics. We must renounce certitude and necessity in the

field of natural philosophy since all that is corporeal and mutable, is contingent and free of necessity, and we must admit that demonstration is not possible but in the domain of mathematics.

Sophisms

Mikko Yrjönsuuri

Department of Social Sciences and Philosophy,
University of Jyväskylä, Jyväskylä, Finland

Abstract

In the medieval sense of the word, a sophism is a problematic sentence that is discussed in a technical manner, usually including a solution showing how the apparent problems arise. Sophisms were used from the twelfth century onward as exercises for student in their first years of university studies, but at least in the fourteenth century sophisms were also used for purposes more accurately described as research. The problems with single sentences were for the most part logical or linguistic, but also many issues of natural philosophy were addressed as sophisms. Collections of sophisms may have circulated as exercise books but in the mature form of the genre established authors wrote their own collections, since the solutions provided an efficient context for presenting philosophical doctrine.

The Structure and Uses of Sophisms

A sophism in the medieval sense of the word is a problematic sentence that is argued for and against the case (*casus*), often against an assumed background situation. The solution of a sophism typically consists of the correct evaluation, an explanation of the problems involved, and a resolution of the argument or arguments for the wrong

evaluation. For example, “all men are all men” (*omnis homo est omnis homo*) can be argued for as a predication where the same is predicated of the same, or by pointing out that “this man is a man, and that man is a man, etc.” The same sentence can be argued against since from a universal predication a particular follows, but “some man is every man” is false, and thus the sophism itself must be false. The sophism is solved through distinguishing two senses of “every man”: the sophism is true if it is taken to claim that the set of all men is the set of all men, but false if it claims that each singular men would be all men.

Sophisms had an important role in the medieval university education. It seems clear that sophisms were actively discussed in medieval universities from the twelfth century to the Renaissance. In medieval writings, sophisms were most importantly discussed in specific collections of sophisms of different kinds. Different authors from the same period would typically discuss roughly similar lists of sophisms. It seems that sophisms would circulate among teachers in roughly the same manner in which logical examples circulate among logic teachers nowadays.

Twelfth- and thirteenth-century sophisms deal mainly with linguistic and logical issues. In the fourteenth century, problems of natural philosophy are addressed through sophisms. These topics belonged to the first years of medieval university education, and indeed sophisms seem to have formed an important part of the first years of study. In fourteenth-century Oxford, a student who had done two years of disputations on sophisms, was called “Sophista.” Later in the Renaissance, the title started to be used in a pejorative sense.

Magister Abstractionum

A particularly important early collection of sophisms was known as the work of “*magister abstractionum*,” or “magister Ricardus Sophista.” The collection was composed around 1230s or 1240s and contained over 300 sophisms, which

are characteristically logico-linguistic. Scholarship has not yet satisfactorily identified the author. Richard Fishacre and Richard Rufus of Cornwall have been suggested among others. One possibility is that the collection evolved from the work of many authors using sophisms in their teaching. In any case, the collection circulated several decades as the work of “magister abstractionum,” and it was well known even in the 1330s.

Natural Philosophy “*secundum imaginationem*”

In the fourteenth century, sophisms were used also for the purposes of natural philosophy. They were particularly important in the work of the so-called Oxford Calculators, especially Richard Kilvington and William Heytesbury. Commentators have wondered whether their sophisms really can be directed at first-year students, given the complexity of the issues involved. Rather, it may seem that sophisms were appropriated as a methodology for studying nature “*secundum imaginationem*,” which would involve assuming a casus and reasoning what would happen given such a casus. For example, assume that a hole is drilled through the earth and a stone dropped into it. Will it stop when it reaches its Aristotelian natural place at the center of the earth, or continue further as the *impetus*-theory of movement would have it? One crucial finding achieved by the *secundum imaginationem* – method that may have found its way to modern physics was the mean speed theorem.

Logical Sophisms in the Fourteenth Century

One important technique used in the solution of sophisms was *expositio*, which typically turns a sentence containing a problematic term or expression into a conjunction of two or more simpler sentences. Thus, for example, “Socrates begins to be white” equals “Socrates is not white and immediately Socrates will be white.” Although *expositio* was a very general logical technique,

the sophisms on beginning and ceasing – on limit-decision problems – can be singled out as an especially important group of such sophisms where also questions of natural philosophy were dealt with.

Epistemic logic was one central interest of Richard Kilvington and William Heytesbury in their respective collections of sophisms. Kilvington’s sophism 47, for example, is “the king is seated,” when it is assumed that if the king is seated, you know that he is, and if he is not seated, you know that he is not. The gist of the sophism is that you may be forced to doubt whether you know that the king is seated, and whether such doubt is in general possible. Also William Heytesbury addresses the issue in his sophisms.

One interesting group of fourteenth-century sophisms concerns insolubles. For example, John Buridan’s *Summulae de dialectica* contains as the last part of the work a large collection of sophisms, including a group of 20 sophisms dealing with self-referential paradoxes. As Buridan does not tackle insolubles seriously anywhere else in his logic, it seems safe to suppose that at least he did not take sophisms simply as a teaching tool. Rather, sophisms were also considered a methodology for serious study.

Sophonias

Denis M. Searby
Department of Romance Studies and Classical Languages, Stockholm University, Stockholm, Sweden

Abstract

Sophonias is the author of paraphrases of Aristotelian works, most probably active in the latter half of the thirteenth century (see Hunger I:25–26, 37 nn. 139–140, II:267–268; PLP 11 p. 49 no. 26424; Praechter in RE 15,2, col. 1099; Searby In: Goulet R (ed) *Dictionnaire des philosophes antiques*, VI. Paris, pp 473–477, 2016).

He is almost certainly to be identified with Sophonias, the monk from the same period, who lived in Constantinople and spent time in Thessaloniki, concerning whom reliable historical data exists.

Biography

We begin with the works attributed to him as the basic starting point. Two paraphrases of Aristotle's *De anima* and *Parva naturalia*, attributed in the manuscripts to the “very wise Sophonias,” form a clear point of departure in establishing his authorship. According to Wendland, the manuscripts of the *Parva naturalia* can be divided into two classes, one attributing the work to Sophonias and the other to Themistius. The latter attribution is clearly wrong, since the work is based on the later commentary of Michael of Ephesus. Sophonias must have lived long enough after Michael to allow for the text transmission of the latter to become corrupt, since he often agrees with the readings in the inferior group of manuscripts for Michael (cf. [Wendland CAG V.6 pp. VI, X–XI](#); see also [Rose 1867](#)).

Sophonias introduces *De anima* with a preface distinguishing between commentaries and paraphrases. The *De anima* preface is important both for its description of Sophonias' method and for the indication of his intention to apply his method first to *De anima* and then to other treatises (cf. [Sophonias 1883](#) *De anima* 2,38–3,1). This provides grounds for attributing to one and the same author the similar, anonymous paraphrases of the *Categories*, the *Prior Analytics* I, and the *Sophistici elenchi*, all edited in vol. 23 of the *Commentaria in Aristotelem Graeca* (= *Sophonias 1884a*, [1884b](#), [1884c](#), respectively). The paraphrase of the *Prior Analytics* is erroneously attributed in some manuscripts to Themistius but is actually a compilation of the commentaries of Alexander and Philoponus.

Due to their similarities, however, all the treatises in *CAG* 23 may reasonably be attributed to Sophonias. Thus, we are furnished with more precise arguments as to dating. Given the author's use of Blemmydes and Leo Magentenios, Ebbesen

(1981:333) regards a date after 1250 as very probable for the paraphrase of *Sophistici elenchi* and is inclined toward dating it after 1275. Apart from the Aristotelian paraphrases, there is also a brief letter from a “monk Sophonias” to Joseph the philosopher; this letter must have been written between 1307 and 1325, the period when Joseph lived in Constantinople (cf. Mercati 1925). There is also a declamation written in the person of “Paul discoursing in Athens” ascribed to the “very wise monk Sophonias” in *Codex Marcianus Graecus* 266 (Searby and Sjörs 2001; cf. Mioni 1981:383–386). From the vocabulary, style, and philosophical content of the declamation, it is likely that this author was the same as the Aristotelian paraphrast.

In recent times, Sophonias has also been suggested as the translator of parts of the *Speculum doctrinale* of Vincent de Beauvais into Greek. On ff. 225v–228r cod. Vaticanus gr. 1144 contains a collection of sentences under the title “Ἐκ τοῦ ἄκτορος λατινικοῦ βιβλίου” which, according to Sternbach 1900/01, goes back to books IV and V of the *Speculum*. This discovery remained unnoticed until in 1986 Aerts published an edition of the text in Vat. Gr. 1144. In 1997, Pérez Martín supplemented this edition with that of a similar text from cod. Vaticanus gr. 12, ff. 187r–193r. Pérez Martín considers it likely that the anonymous translator of the sentences in the book of the “actor” (= auctor) was the monk Sophonias, but her suggestion rests on slender grounds.

There are important references to Sophonias from this period in various other sources. We have, first of all, Pachymeres’ statement that Sophonias the priest-monk (hieromonachos) was sent by Andronikos II Palaiologos to Italy to negotiate the marriage of his son Michael IX to Catherine de Courtenay (Pachymeres, IX,5, ed. Failler 1984–2000: 227,22 ff.). This embassy, corroborated in historical records (cf. Perrat and Longnon 1967; Dölger 1960:18 no. 2156a; Failler 2002), ended without success in 1296. Moreover, cod. Vat. gr. 1104 ff. 23–46 contains an important letter to Sophonias from Simon of Constantinople, a Greek speaker and Dominican friar, which makes reference to an embassy to Charles d’Anjou as

having already occurred; portions of this letter are published in Laemmer (1866) t. II, t. I, sectio I, 121–125, sectio II, app. XXXII–XXXV, sectio III 312–314. The same friar Simon (c. 1235–1325) dedicated the second book of his work *De processione Spiritus Sancti etiam ex Filio* to Sophonias, using the title *hieromonachos* (cf. Congourdeau 1987: 165–74). Both Sophonias and Manuel Holobolos (c. 1245–1310/14) are described as typifying well-known intellectuals of the preceding generation in a letter directed to Makarios Chrysokephalos, metropolitan of Philadelphia (Walther 1973:229, 28–30). A Latin manuscript in the library of Uppsala University contains a treatise written by Guilelmus Bernardus de Gaillac (Guillaume Bernard) who, in 1307, founded the Dominican monastery in Pera. On f. 5r of this treatise (Stegmüller 1953:342), written after he had left Pera, Guillaume reveals that he was personally acquainted with Sophonias the monk, for he informs us that Sophonias the “kalogeros or monk” knew both Greek and Latin and “had suffered persecution on account of his confession of the true faith as taught by the Roman Church.” Sophonias’ connections with the Roman Church may be one reason why the emperor sent him on an embassy to the West.

Thus, in the same period in which Sophonias the paraphrast of Aristotle must be assumed to have been working, we also find Sophonias the monk, well versed in the intellectual issues of the day, a Greek equipped with the knowledge of Latin, with ties to Dominicans in Constantinople and Pera (cf. Congourdeau 1987:165–174, 175–181). A pertinent observation in this regard has been added by Congourdeau 1987:180 n. 26, namely, that the letter of Simon to Sophonias, written to him as a good friend but before his apparent adoption of the Roman faith, contains numerous references to Aristotle, whom Simon does not cite in his other extant letters (cf. also Congourdeau 1987:168 n. 19). Given this background, a number of scholars have claimed that Sophonias the monk is identical with the paraphrast. Already Fabricius suggested that the paraphrast was the monk to whom Simon of Constantinople had written (Bibl. gr., vol. XI

p. 714 = Lib. V c. XLI). Valentin Rose argued strenuously for the identification of the two, and he has been followed in this by subsequent scholars.

One complication in tracing the history of Sophonias is presented by an extant letter dated 1308 and written by the priest-monk (hieromonachos) Sophronias to Charles d'Anjou (Charles de Valois), addressing him as "emperor of the Romans"; this monk was one of the five Byzantine supporters in high positions who wrote to Charles, urging him to take the Byzantine throne to save it from the Turks (cf. Congourdeau 1987:181 n. 28; Kourousès 1974:312 n. 1; Laiou 1972:216). Was this Sophronias really the monk Sophonias? It would seem so, especially given the embassy to Charles and the attested "conversion" of Sophonias to the Roman Church, despite objections raised by Laiou (p. 216) as to the names being "quite different." The name "Sophronias" occurs only once, on the back of the parchment letter, in the bold address to Charles as emperor of the Romans, according to the text edited in Moranvillé. The name was omitted in the original edition of the letter in Du Cange (1657) and appeared first in print in Omont's revision (Moranvillé 1890:86). The salient point here is that the name "Sophronias" is so rare as not to be included in any form in either the *Lexicon of Greek Personal Names* or the *Thesaurus Linguae Graecae*. Since the name appears not to have been in use at all, one may speculate, given the rest of our knowledge about him, that the author of the letter to Charles is our monk Sophonias and that the name on the back of the page is some kind of error written by someone other than the original sender.

In any case, the identification of the paraphrast and the monk provides a coherent historical context and should be regarded as very probable. Hayduck (CAG 23,1 p. V n. 2) raises one minor objection, saying that the identification of the two does not entirely suit the date of Laur. gr. VII,35 as estimated by Bandini and by Hayduck's colleague Vitelli, though this point is left undeveloped. This ms is dated to the thirteenth and fourteen centuries, the paraphrase of *De anima* belonging to the earlier part. This does not, however, present any real difficulties, given that the ms, while not

regarded as the archetype, is held by Hayduck to be very close to the archetype (*pace* Ebbesen 1981:333). Harlfinger 1976 has more recently described the ms simply as dating from the thirteenth to fourteenth centuries.

Thought

Although today we might scoff at the endeavor, paraphrasing Aristotelian treatises as difficult as the *De anima* is an impressive enterprise in any language, let alone in the higher style of ancient Greek. It may well have been undertaken in connection with teaching, but we have as yet no further evidence on that point. As he explains in the preface to *In De anima*, Sophonias aimed not merely at paraphrase but at a combination of paraphrase and commentary. For him, the defining characteristic of a commentary is that the commentator divides the philosophical work into discrete, verbatim quotations and adds his own clarification of the philosopher's words that, as Sophonias states, are often "oracular" in their obscurity. Characteristic of paraphrases is that the paraphrast speaks in the voice of Aristotle, rewriting the text in his own style and clarifying the meaning through examples and similes, doing this in a continuous composition as opposed to one arranged under different headings. In the paraphrases conventionally ascribed to him, Sophonias never cites either Aristotle or his other sources by name, but he stays very close to the original texts, abridging considerably, replacing difficult or obscure words here and there, and adding some glosses and examples. Whole sentences are lifted directly from Aristotle with scarcely a change or only moderate ones. The major changes are due to abridgement and omission. The same approach is also applied to his commentary sources, which, moreover, also go through a process of combination.

Most historians of philosophy hold that Sophonias contributes nothing of his own in the way of argument or interpretation, apart from his peculiar method of paraphrase and compilation as well as certain scattered remarks here and there (but see

Blumenthal 1997; Bydén 2006; Ebbesen 1981: 333–340; Tatakis 2003:203). However, both at the beginning and end of the *De anima*, Sophonias does allow himself to speak in his own words. In the preface, he explains his aims and methods, as already mentioned; in an epilogue, he reveals his philosophical, or rather theological, interest in how Aristotle's psychology relates to the question of the immortality of the soul and the resurrection of the body, an interest he has also already indicated earlier in the treatise (see CAG 23,1 p. 7. 29–38, and p. 132,39 – 133,24; cf. Constantinides 1982:131, n. 109). With regard to the Aristotelian tradition, Sophonias' chief value today lies in his offering an indirect tradition for the textual transmission of Aristotle, and he is occasionally cited as a textual witness by the editors of Aristotle. He has proven valuable in corroborating fragments of Philoponus' lost commentary on Book 3 of *De anima* (cf. Van Riet 1965) and may prove useful in similar as yet unstudied contexts.

Species: Sensible and Intelligible

Abstract

Aristotle regarded the mind as capable of grasping forms detached from matter. Most of his medieval and Renaissance followers interpreted this conception along the lines of a theory of abstraction, grounded in the mediating role of representational forms called “intentions” or “species.” The theory of species addresses the issue of how perception and cognition of sensible reality is brought about; it attempts a non-circular analysis of this process, that is, with the aid of formal principles, such as the species that are not direct objects of perception or cognition, and of mental capabilities, such as the agent intellect, that are not knowing faculties. This approach was not universally accepted. In particular, after Thomas Aquinas’ death, a long series of controversies developed about the necessity of species. The controversy spans a period from the second half of the thirteenth century until the end of the seventeenth century. Here only medieval discussions are analyzed.

“Species” in classical Latin had an active sense (“seeing,” “sight,” “look,” “view”) and an passive sense (“outward appearance,” “shape,” “form,” “figure”). Cicero translated the Platonic *idéa* with “species” or “forma” (*Academica*, I, viii). Seneca introduced the Latin “*idea*” (*Epistulae*, 58 and 65), but later writers, such as Apuleius and Augustine, continued to use “*forma*” or “*species*” for the same Platonic term. Most likely, the medieval controversy about species would have

taken a different course, if the Aristotelian *eidos* in *De anima*, III had not been translated with “species” (passive sense), in addition to the other rendering “forma.” This translation significantly affects the philosophical perspective, because in medieval philosophy “species” assumes instrumental and representational connotations, whereas the Aristotelian form stands for the defining characteristics of a thing. The Arabic-Latin version of *De anima* by Michael Scotus (c. 1220) offers “forma” for *eidos* in the crucial sections about the presence of the form of the stone in soul and about intellectual soul as *topos* or *eidos eidon* (*De anima*, III.8, 431b30-32a3). “Species” for *eidos* is the rendering of the Vetus Translatio (by James of Venice, around the middle of the twelfth century) in the same sections – an example followed by William of Moerbeke, whose translation set the terms for the subsequent species controversies.

According to the theory of species, sense perception occurs when sense organs are affected by external stimuli (sensible species); it consists essentially in the production of sensory representations called “*phantasmata*,” i.e., the product of the inner senses (common sense, imagination or phantasy, “*aestimativa*” and/or “*cogitativa*”), capable of organizing and transforming the information received from sense organs and external senses. Then the active feature of the human soul (agent intellect) derives, by abstraction from sensible representations, an intelligible species, which is received by the mind, and allows the latter to know, by an individual and simple act, the “*quidditas*” associated with the intelligible species. The sensible species is the link between sensible objects and the sense organs, while intelligible species bridges a receptive, interpretation-independent activity (sense perception), and the more specifically cognitive processes such as judgment, reflection, discursive thinking, and syllogistic reasoning. Thus, the sensible species which impinge on the sense organs and the intelligible species which trigger the mental act are strictly instrumental, that is, they are viewed as *quo* and not as *quod* (Thomas Aquinas, *S. theol.*, I, q. 12, a. 9; q. 14, a. 5; q. 85, a. 2; *De ver.*, q. 10, a. 8, ad 2um). This means that human soul grasps

what is transmitted through relevant intermediate “events,” rather than these intermediate events themselves; it grasps the sensible essences progressively detached from matter and individuating conditions. The intentional species must be distinguished from the so-called “*species expressa*,” which corresponds to the concept.

Medieval discussions of mental representation are not only constrained by Aristotle’s cognitive psychology, but also by Augustine’s views on “species” and cognition, and the Arabic development of the idea that cognitive processes involve progressive abstraction through perceptual and cognitive faculties up to immaterial contents. Influenced by Stoic doctrines on sense perception, Augustine assigned a prominent function in our knowledge of sensible reality to (what he calls) the “species” (i.e., shape, figure or form) of material things. He postulated the existence of a chain of entities, interchangeably referred to as “forms,” “images,” “similitudes” or “species,” originating in sensible bodies, penetrating sense organs and eventually reaching perceptual and cognitive faculties (*De musica*, VI, c. 11; *De Genesi ad litteram*, XII, c. 24; *De trinitate*, XI, c. 9). Their presence enables one to attain knowledge of distant bodies or to recall objects perceived in the past. Arabic commentators embodied Hellenistic ideas on cognitive impressions and mental representations in their interpretation of Peripatetic cognitive psychology. The evolution of the concept of “*intentio*” – the Latin translation of *ma‘qul*, the Arabic translation of the Greek *noema*, and of *ma‘na*, which reaches back to the Hellenistic *ennoia*, based in turn on a Stoic-Neoplatonic mediation of the Aristotelian *logos* – in Arabic philosophy, from Alhazen to Averroes, enables one to discern various ingredients of the doctrine of intentional species in Scholastic cognitive psychology. The Arabic intention also echoes the Epicurean *prolepsis* (the effect of an involuntary and unconscious mental mechanism, viewed as the basis for conceptualization), and the *phantasiai kataleptikai* of the Stoics (unerring cognitive impressions, providing reliable data for discursive reasoning): it is both a representational item and the result of the soul’s operations on the effects of sensation. Alhazen’s

intentions, material, albeit non-corpuscular, messengers of specific features of the sensible object, reappear in the doctrine of (sensible) species, and particularly in the strand associated to perspectivistic optics. Avicenna's and Averroes' doctrines of intention, which merely represents the sensible thing-to-be-known, provide rather sophisticated accounts of how a perceptual content is delivered to and becomes present in the soul. In Avicenna, the feature that moves the senses is captured as "*intentio*" by the inner senses, which are capable of some rudimentary form of abstraction. Also, Averroes distinguished between the presence of a perceptual content in the soul as "*intentio*," and the sensible object as such. Avicenna and Averroes, however, did not distinguish precisely, at the intellectual level, between representation and known content. In point of fact, it is not until Aquinas that this distinction is explicitly drawn and convincingly argued for.

After the spread of Aristotelianism in the West, two different doctrines of species were developed by Roger Bacon (and other representatives of perspectivistic optics) and by Thomas Aquinas. Roger Bacon worked out a doctrine of the multiplication of species, based on the central claim that all natural causation occurs according to a process of emanation, the paradigmatic example of which is the propagation of light (Lindberg 1983: IIII–IXXI). Bacon significantly broadens the meaning of the term "species": no longer used to describe specific perceptual events, it comes to denote the likeness emanating from any given object, independently of whether a perceiving being is present to receive it, defining the central meaning of "*species*" as "*primus effectus agentis*." E.g., the visible object generates or "multiplies" species of light in the transparent medium (*De mult. specierum*, II.i, 90), proceeding in all directions through the medium until they reach and are "impressed" on the eyes of the viewer. Once received in the sense organ, each species is again multiplied along the optic nerves into the internal senses. Thus, Bacon provides a physical analysis of the processes that are causally responsible for vision in particular, and for sense perception in general. The internal sensitive

faculties of the soul complete the process of apprehending sensible objects. This does not entail that the process of multiplication of the species continues at the intellectual level, and exerts influence upon conceptualization. Bacon's view on this point is akin to Augustine's, who adopted a mechanical model only for the initial stages of sense perception. When Bacon speaks of species present in the rational soul and originating from the "*cogitativa*," he merely qualifies them as instruments of our soul, without presupposing any abstraction from or impression of these species: Bacon maintains that all species are essentially material, whereas the human soul is strictly spiritual (*Opus maius*, pars V, 9).

Thomas Aquinas' theory of mental representation displays a complete symmetry between sense perception and intellectual knowledge, distinguishing in both stages between *quod* and *quo*. In its contact with external reality, the human soul grasps the sensible object in its formal structure, that is, in its "*esse spirituale*" or "*intentionale*" (*In De anima*, I, lectio X, 159). Perception is an intentional and causal transaction between soul and reality (*In De anima*, II, lectio XXIV, 553), and depends on sensible species, that is, on the external object inasmuch as it affects the medium and the sense organs. Sensible species are brought about by an action of bodies, inasmuch as they participate in a mode of action proper to separate substances (*De pot.*, q. 5, a. 8). The full actualization of the physiological structures of the senses enables the human soul to construct a representational device called phantasm. The phantasm, in turn, enables the agent intellect to produce the intelligible species. The intellect abstracts and receives the species from the senses. Their ultimate origin, however, is the divine light, giving rise to the "*lumen intellectus agentis*," which produces them effectively (*Summa theol.*, I, q. 84, a. 4, ad 1um). Although the various modes of being for intellect, species and object may change, they are identical with respect to their formal structure in the cognitive act. Hence, according to Thomas, man does not know a deformed, "spiritualized" object: he is capable of grasping the intelligible structure of sensible objects, for material beings naturally tend toward

an “*esse spirituale*” – in the same way the human mind is capable of containing more forms than just its own.

The doctrine of species began to be perceived as controversial during the later thirteenth century. Roughly speaking, criticisms involve two main types of objections. Ontological objections purport to show that physiologically embedded representations cannot determine the immaterial soul. Logical objections attempt to demonstrate that the idea of a formal mediation in perception and/or intellectual knowledge is intrinsically inconsistent. Major critics, including Henry of Ghent and William Ockham, argue that the sole purpose of perception and knowledge, according to the species doctrine, is to construct an internal copy of the perceived or known thing. But this view involves an infinite regress: if seeing or knowing simply amounted to constructing a copy of the thing seen, one would have to make another copy to see the copy, and so on. The fourteenth-century controversies on the issue of species – marked by lively exchange and mutual influences between Franciscans, Dominicans, Averroists, and Augustinian Hermits – show that it is misleading to speak schematically of a conflict of ideas between doctrinal schools. Staunch defenders and vigorous opponents of the species can be found among Dominicans as well as Franciscans. The Dominicans mostly abide by Aquinas’ teachings. There are, however, outstanding exceptions, such as Durand of St. Pourçain. Influential representatives of this order, such as Thomas Sutton, suggest essential modifications; others, such as Hervaeus Natalis, express strong reservations. In turn, the psychological views of Duns Scotus and his disciples are heavily influenced by Aquinas. Furthermore, one may detect doctrinal affinities on the generation of intelligible species between some Augustinian Hermits – Giles of Rome and Alphonsus Vargas Toletanus, for example – and the Averroist school.

Henry of Ghent accepted sensible species, but rejected intelligible species (*Quodlibeta* IV, q. 21, and V, q. 14): (1) abstracted species presupposes that the intellect cannot receive anything from the senses; (2) any mediating species would become the object of knowledge, thus preventing a

cognitive grasp of essences; (3) the intelligible species as a singular entity could never mediate knowledge of a universal essence; (4) postulating intelligible species forces one to accept the undesirable consequence that the intellectual act is a necessary physical phenomenon, independent of the will; (5) a formal mediation leads to an infinite regress of cognitive representations.

Peter John Olivi rejected both sensible and intelligible species, because he thought it crucial to support the active nature of the cognitive powers (*In II Sent.*, q. 58 and q. 74). Perception occurs by means of a “virtual” or an “actual attention,” and mental acts do not depend upon intelligible species. In general, if intelligible species were the effective principle of intellectual cognition, cognitive capabilities should be assigned to them, rather than to the soul. Any interaction between species and the cognitive faculty in the production of the cognitive act must be excluded, since the latter, like the intelligible species, is a simple effect. Moreover, if species mediate between mind and object then either the proper object of the mind becomes unattainable or objects can be known both through species and through themselves. Thus, Olivi holds that representation through species interposes a veil between mind and object. Finally, if the species is an instrument in the production of mental acts, then the cognitive faculty would have a function different from the generation of knowledge. This last claim derives from Olivi’s basic assumption that the cognitive faculty either has an exclusive role in the generation of knowledge or none at all.

Other critics active at the turn of the thirteenth and fourteenth centuries, such as Godfrey of Fontaines, Radulphus Brito and John Baconthorpe, identified the species with the intellectual act itself, and argued for this identification using the Aristotelian thesis that the mind is “nothing” before it effectively knows.

John Duns Scotus considered the doctrine sensible species as uncontroversial. Instead, answering criticisms of Henry of Ghent, Peter John Olivi and Godfrey of Fontaines, he advanced two related arguments for the necessity of intelligible species (*Ordinatio*, lib. I, dist. 3, q. 1): (1) sensible things, in their concrete existence, are not

“proportionate” to the immaterial intellectual act, and must be differently “presented” to the human mind; and (2) knowledge of the universal can be attained only through species.

Most medieval Averroists, including John of Jandun, accepted sensible and intelligible species. The production of the latter by perceptual faculties ensure that human beings can be cognitively joined to a separate intellect. Indeed, Averroist cognitive psychology is bound to postulate links preserving the continuity of the causal chain from perception to knowledge: gaps in this causal chain would show that no effective co-operation occurs between sensible faculties and the unique intellect.

Many critics of species exclude a priori any direct contact between mind and (the information contained in) sensory representations. The most extreme formulation of this view is in Durand of St. Pourçain (*In II Sent.*, dist. III, q. 6, 9–10), who gave his opinion that the doctrine of species was introduced to explain sense-perception, and was transferred to the explanation of intellectual knowledge; he then proceeds to criticize the doctrine of sensible species as follows: “*Omne illud, per quod, tamquam per repraesentativum, potentia cognitiva fertur in alterum, est primo cognitum; sed species coloris in oculo non est primo cognita seu visa ab eo, immo nullo modo est visa ab eo ergo per ipsam, tamquam per repraesentativum, non fertur in aliquid aliud.*” Rejecting any mediating principles, Durandus stated that the mind has a direct and conscious cognitive grasp of whatever may “encounter,” determine or influence it. The thesis of the direct cognitive grasp of sensible objects will be more convincingly argued for by William of Ockham, who expressed the most radical opposition to the species, and put forward an alternative view that avoids the metaphysical obstacles usually associated with the idea of formal mediation. He regarded species as ontologically suspect and as epistemologically superfluous, and introduced a new view of perception and intellectual cognition, based essentially on a direct (semantic) relation between the human mind and sensible reality. Ockham rejected both sensible and intelligible species on the ground that intermediary entities

or functions between the human intellect and individual things would terminate the cognitive act, thus making actual objects inaccessible. This criticism of the species doctrine, whose principal targets are Thomas Aquinas and Duns Scotus (*In II Sent.*, q. 13), is strictly related to Ockham’s dismissal of epistemological views dominated by the perspectivist-optical model, inspired in its central features to the Arabic interpretation of the Neoplatonic theory of emanation. His five arguments in defense of the claim that (intelligible) species are superfluous became a milestone in the species controversy: (1) if the species has to secure the assimilation of soul and object, then one would only attain knowledge of accidents, through processes possibly involving an infinite regress; (2) there is no need of species representing objects, for the objects are capable of representing themselves; (3) the idea that matter cannot interact with immaterial entities does not ensure the necessity of species for knowledge acquisition; on the contrary, it establishes that sensible reality does not play a causal role in the production of intelligible species. If, by contrast, one assumes that the material world has a causal efficacy on the mental realm, then it can also weigh directly on the production of the intellection; (4) only the object and the intellect are needed in cognition, because intellectual knowledge does not depend on anything else; (5) assuming that species are necessary for joining object and mind involves, once again, the threat of infinite regress. After Ockham, other authors reject or simply dispense with intelligible species. For example, Gregory of Rimini played down the role of species, grounding the primary acquisition of knowledge in intuition, and understanding species chiefly in terms of memory contents. Roughly speaking, Gregory held that the mind has direct access to cognitive contents that are committed to memory as representations.

During the first fifty years following Aquinas’ death, sensible and intelligible species were the subject of intense philosophical dispute. From the 1320s onward, the issue gradually disappeared from the philosophical agenda, and few doctrinal innovations were introduced until the second half of the fifteenth century. Three characteristic

features mark the fifteenth-century speculation as the cradle of later Renaissance disputes. Firstly, many authors advanced profoundly eclectic views, whether convincingly argued for or manifestly inconsistent, as is illustrated by the works of John Capreolus and Paul of Venice, respectively. Secondly, a return to Albert's psychology, sometimes interpreted in decidedly Neoplatonic terms, dominates the psychological accounts of some North-European Dominicans. Thirdly, a "new" Thomism arises during the second half of this century, as is exemplified by the works of John Versor and Peter Crockaert.

Stephen Langton

Riccardo Quinto

Dipartimento di Filosofia, University of Padua,
Padua, Italy

Abstract

Stephen Langton was born in England around the mid-twelfth century. Around 1170 he arrived in Paris, where he was to remain until 1206, becoming one of the most outstanding

theologians of the newly established university. In 1206, Pope Innocent III made him a cardinal and brought him to Rome, where he probably taught theology until 1207. Hoping thereby to resolve a disputed election to the see of Canterbury, the pope consecrated him archbishop on June 17th, 1207. But King John refused to accept him in England until July 16th, 1213. SL spent the intervening years in exile, mainly at the Cistercian abbey of Pontigny. Once in England, he supported the rebel barons against John and played a key role in the negotiations leading to Magna Carta (June 1215). He was subsequently suspended by the pope and left Britain once again. Also in 1215 he took part in the Fourth Lateran Council. Reestablished by Honorius III in 1216, he governed the archdiocese until his death in 1228. All SL's numerous works that have come down to us are theological works: he did not write any philosophical works nor did he comment on any philosophical text. His *oeuvre* as a whole can be considered as the enactment of a great project of theological training inspired by Peter Cantor, which comprises the clarification of theological statements, a comprehensive study of the Bible, and also a pastoral training for theologians, aiming to make them good preachers and zealous propagandists for the sacrament of penance. Nevertheless, in three of his works (the *Sentence Commentary*, the *Summa magistri Stephani*, and the *Quaestiones theologiae*) SL enunciates a series of philosophical positions, mainly in the field of logic and semantics, but also on other topics, such as God's will and omnipotence, human freedom, and the nature of the soul.

SL was born around the mid-twelfth century (probably between 1150–1155) into a Lincolnshire family of the minor nobility. Around 1170 he arrived in Paris, where he was to remain until 1206, becoming one of the most outstanding theologians of the newly-established university. In

1206 Pope Innocent III made him a cardinal and brought him to Rome, where he probably taught theology until 1207. Hoping thereby to resolve a disputed election to the see of Canterbury, the pope consecrated him archbishop on June 17th, 1207. But King John refused to accept him in England until July 16th, 1213. SL spent the intervening years in exile, mainly at the Cistercian abbey of Pontigny. Once in England, he supported the rebel barons against John and played a key role in the negotiations leading to Magna Carta. The pope suspended him from his functions, and he left England for Rome, where he took part in the Fourth Lateran Council. Reestablished by Honorius III in 1216, he lingered in Rome until 1218 before going back to England. In the following years, despite some other trips to Continental Europe and to Rome, he devoted himself to the government of the archdiocese until his death, at Slindon (Sussex) at the beginning of July (6th or 9th), 1228.

SL's works comprise the following: a commentary on Peter Comestor's *Historia scholastica*, the first version of which probably existed before 1176, while the text was reworked in 1193; a commentary on Peter Lombard's *Sentences*, which has been called the "first example of a genuine Sentence Commentary" (Landgraf 1939); a commentary on the Pauline Epistles (which constitutes an imposing *Glossa in Magnam Glossaturam*, or "super-gloss" on Peter Lombard's *Collectanea*), and one on the Catholic Epistles. From his work of presiding over theological disputations in the Paris schools between c. 1180 and 1206 at least 200 *Quaestiones theologiae* (in different versions) are preserved. He also began a short theological *Summa*, which remained unfinished. He commented upon most of the biblical books from Genesis to Revelation (except Job, Psalms, Baruch, and Daniel; Gospels lost), and his commentaries are preserved in different redactions. Besides this, he wrote several works to support pastoral care and more than 300 of his sermons survive (if we consider the various versions, there are almost 500 of them).

All SL's numerous works that have come down to us are theological works: he did not write any philosophical works (such as a treatise on logic) nor did he comment on any philosophical texts. His *oeuvre* as a whole can be considered as the enactment of a great project of theological training inspired by Peter Cantor, which comprises the clarification of theological statements, a comprehensive study of the Bible, and also a pastoral training for theologians, aiming to make them good preachers and zealous propagandists of the sacrament of penance (Quinto 1998, 2005b). Nevertheless, in three of his works (the *Sentence Commentary*, the *Summa magistri Stephani*, and the *Quaestiones theologiae* – the Commentary on Paul's Epistles have not been sufficiently studied yet) SL makes clear a series of philosophical positions, mainly in the field of logic and semantics. While deeply committed to Peter Lombard's theological project, he joins other contemporary Lombardians by critiquing and developing it, expanding on topics and arguments in the *Sentences* and substituting or adding to the authorities cited. For instance, in discussing the Lombard's definition of *persona* he demonstrates a direct knowledge of Boethius' *Contra Eutichen et Nestorium*. His acquaintance with Aristotle is probably limited to the logical works: although Landgraf maintained that SL referred to the *De anima* in his *Sentence Commentary* (ed. p 123), the passage can also be understood as a reference to *top.* IV, 5 (Bk 126a: Quinto 2010:77), which he also quoted in his question *De libero arbitrio* (ed. Ebbesen and Mortensen 1985:183). The topics which mainly lead SL to express his philosophical views are Trinitarian theology and the problem of the hypostatic union, but he also uses a highly technical method of analyzing statements in other subjects too, such as ethics (Quinto 2009:374–377) and, in particular, sacramental theology (Rosier-Catach 2004:231–260, 346–401, 456–461).

The most characteristic feature of SL's thought is his aim to regulate the use of human language in theology, with the following principal goals: (a) to justify, as far as possible, the validity of theological statements already known to be true (because they are accepted by the ecclesiastical tradition);

(b) to avoid other statements known to be false (or nonorthodox) deriving from accepted theological statements; and (c) to “generate” from admitted premises other correct theological propositions, whose orthodoxy is not warranted by tradition, but by the internal coherence of the system itself (cfr Ebbesen 1987; Valente 2008:374, 385–386). In other terms, SL's “system” aims at explaining *why* certain theological statements are true and others are false, even though the latter seem to be necessarily implied by the former. One important tool he uses in this project is a principle that has been called “the *eadem ratione* principle,” described by Ebbesen (1987:28) as follows: “This principle, which is ever-present though never explicitly formulated, states that if some proposition or inference, *p*, is true or valid, then *q* is too unless it can be shown that *q* differs from *p* in some relevant respect.” In order to show why some statements or inferences differ from others that seem at first sight to be similar or identical, Langton concentrates in particular on the meaning of the terms. For him, meaning is influenced, on one hand, by the propositional context (although with some limitations, see Valente 2008:378–379) and, on the other, it depends on different semantic components (*suppositio*, *significatio*, *consignificatio*, and *modus significandi/modus supponendi*) which contribute to the total meaning of each term. For this reason we can say that SL elaborates a semantic which is both *analytic*, and, at the same time, *contextual*.

As far as the Trinity is concerned, the system recognizes nine “entities,” namely, (1) the one essence (called *Deus*, *deitas*, *essentia*); (2) the three Persons (*Pater*, *Filius*, *Spiritus Sanctus*), and (3) five “notions” or personal properties which distinguish the Persons (*paternitas*, *innascibilitas*, *spiratio*, *filiatio*, and *processio*). The essence can be referred to by neutral pronouns (*quid*), the Persons by masculine (*quis*), and the notions by feminine (*quae*). These three different groups of nouns and pronouns (*quid*, *quis*, *quae*) are in theological discourse the equivalent of what the ten Aristotelian categories are in ordinary language, and can be called “quasi-categories”. These distinctions are particularly

important when placed together with the fundamental principle of absolute divine simplicity, according to which “everything (*quidquid*) that is in God is God.” This makes it possible, for instance, to explain why, although the Persons *are* God, and there are three of them, we cannot infer from this that there are three Gods: Persons and Essence, in fact, belong to different quasi-categories (*quis, quid*), and predicates of the Persons cannot be transferred to the Essence (SL, *In Sent.* I, 1, 2, ed. Landgraf p 3; Ebbesen 1987:405–408). In the same way, the distinction between different semantic components of terms allows us to maintain a difference between sentences on God (which are otherwise mere tautologies). For example, “*Deus est iustus*” and “*Deus est misericors*” could mean the same, since both can be transformed into *Deus est Deus* (God, in fact, *is* his own mercy, as he also *is* his own justice). These sentences, however, are different thanks to the semantic component called *consignificatio*: although *iustus* and *misericors* both *suppone* and *signify* the divine essence, they also *consignify* (or signify secondarily) different effects in creatures and this makes the two sentences differ (SL, *Summa*, ed. Ebbesen and Mortensen 1985:41–47). “*Deus est iustus*” and “*Deus est iustitia*” are also different: although *iustus* and *iustitia* *suppone* and *signify* the same thing (i.e., the divine essence), they differ in their *modus significandi*, *iustus* signifies divine essence “*ut inhaerentem*” and *iustitia* signifies it “*ut supponentem*” (SL, *Summa*, ed. Ebbesen and Mortensen 1985:37). In conclusion, SL’s “system” can be seen on one hand as a way of preventing the formation of incorrect theological statements, and on the other as a way of preventing theological discourse from being a mere repetition of tautologies. In this context, an important role is played by the theory of supposition of terms, whose elaboration seems to take place at the same time in logic and theology (not without reciprocal influence between the two disciplines) toward the end of twelfth century (Ebbesen 1987:419–24; Valente 2008:361–374, 388–389).

Because of his reverence for the normative value of traditional authorities SL can be considered a pupil of Peter Lombard (like Peter of

Poitiers and Prepositinus of Cremona), but for his interest in a systematic description of the functioning of theological language, his more mature use of logics and semantics (besides grammar), and his desire to “generate” (and not only to “repeat”) orthodox propositions, he can be somehow linked to the school of Gilbert of Poitiers.

In any case, SL is characterized by his strong originality and independence of judgment (on his openly stated disagreement from Peter Lombard, see Landgraf 1939:119–127; Quinto 2010:72–76). Commenting on Peter Lombard’s *Sent.* I, 45, c. 7, he states his disagreement with Augustine’s teaching on God’s will in *ench.* 24, 96: for Augustine, though evil is not good, it is nevertheless good that evil exists besides good. The reason for this is that, since God does not prevent evil from being performed, the existence of evil is somehow contained within God’s will. For SL, the fact that God does not prevent evil does not mean that He wants evil, or that He wants evil to be. On the contrary, God simply “does not want” evil. In order to maintain this, SL distinguishes between two meanings of “does not want”: “does not want” (*non vult*) can be understood either as the third person of the Latin verb *nolo*, or as the result of placing a negation before the third person of the Latin verb *volo*. God “does not want” evil to be in this second sense; see SL, *In I Sent.*, d. 47, c. 7, and d. 46, c. 3, ed. Landgraf:63–66 (the position is confirmed in SL’s unedited *Quaestio theologica De uoluntate Dei*, from which it is taken over by William of Auxerre: Quinto, forthcoming). He is also original in his elaboration of the concept of person: he in fact denies (against Hugh of St. Victor and the *Summa sententiarum*) that the soul united to the body is a person, and also contests Peter Lombard’s opinion that the soul becomes a person when separated from the body; for SL, in order for it to be a *substantia individua*, it is not enough for a substance not to be actually united with another substance: it must also not have the ability (*aptitudo*) to form a compound (such as man). For this reason, not only is the soul never a person, but neither is Christ’s human nature a person, because it is united with divinity, together with which it

forms the Person of the Incarnated Word (cfr Ebbesen and Nielsen 1996; Nielsen 1999; Bieniak 2006; Rossi 2007:164–171; Quinto 2010:66–69).

As far as it is possible to state at this point in research, SL's elaboration of a number of topics reflects the philosophical concerns and contributions of late twelfth-century theologians and remains of critical importance in the thirteenth century, influencing William of Auxerre and, through him, Alexander of Hales and Bonaventure among Franciscans, and Hugh of St. Cher among Dominicans (Ebbesen 1987:408–410; Quinto 1999; Valente 2008:343–344, 379–393).

Substance, Accident, and Modes

Gyula Klima

Department of Philosophy, Fordham University,
New York, NY, USA

Abstract

This entry presents the Aristotelian distinction between substance and accident and the interpretational problems it generated for medieval philosophers and theologians. A survey of the extensional and intensional problems of the distinction and some of the solutions proposed for them will lead to an analysis of the theoretical need to introduce the new ontological category of modes in late-medieval philosophy, paving the way to the abandonment of substance–accident metaphysics in early modern philosophy.

Aristotle's Ontological Square

The medieval distinction between substance and accident goes back to Aristotle's remarks in his *Categories*, describing what is often referred to as his "Ontological Square" (Angelelli 1991). The basis of the fourfold distinction is provided in terms of two pairs of criteria, namely, *being in/not being in* and *being said of/not being said of* a subject, yielding what is meant to be an exhaustive and mutually exclusive division of the realm of all existents. The resulting division

was usually taken to provide the division of all entities into particular and universal substances and particular and universal accidents (Table 1).

This is the most fundamental division of the Aristotelian ontology of actual entities. Accordingly, slight differences in its interpretation led to vastly different solutions to several problems it generated, both in metaphysics and in theology. The following discussion provides a sampling of these problems, relating them to these interpretational differences.

Some Problems with the Ontological Square

The problems generated by the Aristotelian Ontological Square can be grouped into *extensional* ones on the one hand (dealing with the extent of these divisions) and *intensional* ones (dealing with their interpretation), on the other. The *extensional* problems concern the *sufficiency* and *necessity* of the division of entities provided by the Square. The *intensional* problems are related to the interpretation of the extent (what counts as an existent in what sense) and criteria (what does it mean for something to *be in/said of* or *not to be in/said of* a subject) of the fourfold division.

The problem of the *sufficiency* of the division is whether it really comprehends *all* entities, or perhaps there are others that cannot be placed in any of the four domains of the Square. The problem of the *necessity* of the division is whether it contains perhaps more than what is needed for classifying all entities, that is to say, whether it contains some nonentities.

The first, naturally emerging Aristotelian suspicion concerning the Square should be that about its *necessity*. After all, the division is supposed to contain universals, whereas Aristotle denies the existence of universal entities. If, therefore, the Square contains universals and universals are not entities, then it seems that the Square has to contain some nonentities, i.e., it contains *more* than is *necessary* for the classification of all entities, for all entities are either particular substances or particular accidents, but there are no universal substances or accidents among real existents.

The problem of *sufficiency*, however, is generated by considerations concerning entities that somehow would not seem to fit into Aristotle’s fourfold division. A case in point is provided by the *significata of propositions*, described most poignantly by the anonymous author of the twelfth-century tract *Ars Burana* as being “extra-predicamental,” i.e., as not belonging to any of the ten Aristotelian categories, namely, the category of substance and the nine categories of accidents (De Rijk 1967: 357–359). Earlier on, Abelard’s *dicta* were also assigned by him a peculiar place, apparently outside the Aristotelian Square. And later authors, continuing in the tradition of assigning propositions their *significata* as distinct from the *significata* or *supposita* of their categorematic terms, would also place them outside the divisions of the Square: thus *enuntiabilia* as conceived by thirteenth-century authors, or the *real propositions* of Walter Burley, or the *complexe significabilia* of Adam Wodeham or Gregory of Rimini, not being identifiable with either substances or accidents, were placed in their own, separate category (Nuchelmans 1973, 1980).

The problem with all these additions is that since Aristotle’s division was provided in terms of contradictory criteria, it was supposed to be an exhaustive and mutually exclusive division of *everything there is*.

This way of putting the problem, however, directly leads us to the *intensional* problems of the Square. Aristotle’s opening words in the relevant passage indicate that his division is supposed to cover *all existents*. However, depending on the interpretation of what we take to be existent and in

Substance, Accident, and Modes, Table 1 The Aristotelian Ontological Square

	Is not in a subject	Is in a subject
Is not said of a subject	Particular substance	Particular accident
	<i>This man</i>	<i>This whiteness</i>
Is said of a subject	Universal substance	Universal accident <i>whiteness</i>
	<i>Man</i>	

what sense, different items will be taken to fall within the realm of existents to be divided by the Square.

Taking his cue from Boethius' remarks concerning the subject matter of Aristotle's *Categories*, almost a millennium later Thomas of Vio Cajetan characterized the entities to be considered here in the following way:

if one is to ask whether it is words or things which are principally treated of here, we have to say that it is things, though not absolutely, but insofar as they are conceived in an incomplex manner, and, by consequent necessity, insofar as signified by words. (Cajetan 1939: 5)

Cajetan's interpretation of the subject matter of the *Categories* provides an elegant solution to both problems with the Square posed above. Since the entities to be considered here are not only mind-independent real beings but any objects of our simple concepts, universals fit into the Square, even if there are no mind-independent entities existing in a universal manner, insofar as universals are *beings of reason*, having some foundation in reality. For the same reason, however, *enuntiabilia* are ruled out, insofar as they are the objects not of simple, but of complex concepts, namely, of complex thoughts formed by the judgment-forming intellect.

Clearly, Cajetan's solution is able to accommodate beings of reason, because it presupposes the Thomistic interpretation of what and how *being* is divided in the Aristotelian Square, namely, the extension of an analogical notion into the extensions of its *analogata*. According to this doctrine, the extent of the Aristotelian Square should cover both beings in an absolute sense, without qualification, and beings in some diminished sense, with qualification (see the entry on Being in this volume).

This is, in fact, the basis of Aquinas' understanding of the Aristotelian idea of *inherence*, that is, an accident's *being-in* a subject. For an accident *to be* is nothing but for its subject *to be informed* by it or, conversely, for it to be in its subject: *accidentis esse est inesse* ("for an accident to be is for it to be in (a subject)"). This is precisely why on Aquinas' conception an accident cannot be said *to be* in the same sense as a

substance. When we say that an accident, say, the whiteness of a sheet of paper, exists, the act of being signified by the predicate of this predication is not the *act of being of this sheet of paper* without qualification (for that would be the substantial act of being of this sheet) but the *act of being of the sheet with respect to its whiteness*; it is not *the being of the sheet* absolutely, but rather, it is *the sheet's being white*. So, the *act of being of the whiteness of this sheet* is nothing but an *act of being of the sheet*, although, of course, it is just an accidental act of being of the sheet: the sheet may continue in its own existence even if its whiteness perishes, say, when the sheet is dipped in black ink.

Aristotle Versus the Theology of the Eucharist

However, this interpretation of the Aristotelian notion of the inherence of an accident in its subject seems to be in direct conflict with the theological doctrine of the miracle of the Eucharist, which would require at least the logical possibility of the existence of the accidents of transubstantiated bread and wine without inhering in any substance. For if for an accident to exist is for its subject to be informed by it, then it seems to involve a direct contradiction to claim that an accident exists and yet it does not inform any subject.

The theological requirement of the separability of accidents in continued existence from their subject, therefore, introduced a number of complications into the interpretation of the Aristotelian doctrine of accidental being. The fundamental question is whether the Aristotelian doctrine is absolutely incompatible with the theological doctrine of the Eucharist or whether there is some authentic interpretation of the Aristotelian doctrine that would allow the separate existence of accidents to be at least supernaturally possible, i.e., free from contradiction.

A striking exposition of the "incompatibilist position" is provided in the fourteenth century by John Buridan, who argues that since Aristotle's position is incompatible with Christian faith, Christians actually have to have a radically

different concept of accidental being from that of Aristotle (Bakker 2001: 247–257). On Buridan's view, the Aristotelian position necessarily implies that an accident is inseparable in continued existence from its subject precisely because on that position for an accident to be is for it to be in a subject, whence the very concept of an accident must be connotative, necessarily implying its being an accident *of* some substance. Therefore, Buridan finds it inevitable that Christians, who uphold the supernatural separability of accidents, must part company with Aristotle on the issue of accidental being, as well as the Aristotelian doctrine of the analogy of being. For Christians, the accidents persisting in the Eucharist without a subject ought to be conceived by means of absolute concepts without any connotation of their subject and so as *beings* in exactly the same sense as their underlying subject.

Thus, Buridan's analysis closely ties together the Aristotelian doctrine of the analogy of being with that of the absolute inseparability of accidents in continued existence, and, consequently, he also holds that the theological doctrine of the supernatural separability of accidents directly leads to the conception of the univocity of being with regard to substance and accident.

In fact, the nominalist theologian Marsilius of Inghen, summarizing what he takes to be "the common opinion of many theologians" on the basis of the doctrine of the philosopher, John Buridan, explicitly draws the conclusion that on the basis of this opinion, "being" should be regarded as a genus common to substance and all accidents or at least to those accidents that are supernaturally separable in continued existence by divine power. Marsilius, however, does not want to side with the common opinion as described by Buridan. Working out what he takes to be a "more metaphysical" solution, he affirms the analogy of being between substance and accident; still, he does not equate it with the inseparability of accidents in the way Buridan does. He argues that substance and accident do not have the sort of essential agreement on the basis of which we could form a common univocal concept of the two; however, this does not mean that an accident remaining of the same nature

could not be miraculously preserved in its being (Bakker 2001: 257–264).

So, the question really is whether Buridan is correct in claiming that the Aristotelian doctrine of the analogy of being inevitably leads to the claim of the inseparability of accidents in continued existence and thus whether upholding the theological doctrine of the Eucharist entails the commitment to the denial of the doctrine of the analogy of being with regard to substance and accident. The position of Duns Scotus certainly may give this impression. However, Aquinas, who definitely upheld the Aristotelian view concerning the analogy of being, found it to be compatible with the Christian doctrine of the Eucharist.

On Aquinas' view, the division of "being" into substance and accident is not the division of a genus by means of essential, specific differences but a division of the extension of an analogical term into its *analogata*, in which the nature of the thing, determining the kind of being the thing has, functions as a diminishing determination added to a distinct determinable, the act of being of the thing (Klima 2002). Thus, the kind of being the thing demands by its nature is determined by the thing's nature. However, if a superior power overrides the natural tendency of this nature to have a certain kind of being, this does not take away the natural tendency of the thing itself and hence does not destroy the thing's nature, just as a heavy body would not lose its natural tendency to be down, even if an external power lifts it up. The crucial point in Aquinas' solution, therefore, is the Avicennian interpretation of Aristotle's doctrine of the analogy of being, as based on the real distinction between the essence and existence of created beings. For this is what grounds his claim that even if the actual mode of being of an accident changes in the Eucharist (from "inherent" to "subsistent"), still, this may leave the distinct nature of the thing unaffected, which only contains the natural tendency to be in a subject.

But then it should not come as a surprise that the philosopher Siger of Brabant, who rejects the Avicennian interpretation of Aristotle and sides with Averroes in rejecting the real distinction between essence and existence in creatures,

could not endorse this sort of solution (Siger of Brabant 1972a: 41). His position is actually the closest to the position of Aristotle as described by Buridan. In his commentary on the *Metaphysics*, after vehemently denying the thesis of the real distinction between essence and existence in the creatures as stemming from an error of Avicenna's (Siger of Brabant 1983: 34), Siger insists (in his reply to one of Aquinas' arguments for the real distinction) that the act of being (*esse*) need not multiply in beings because of something added to it, but rather it is multiplied on account of its *ratio essendi* (its mode of being), the diversity of which in different kinds of beings is entailed by Aristotle's claim that *ens* cannot be a genus (Siger of Brabant 1983: 36–37). However, in the question directly addressing the issue whether existence is a genus, Siger explicitly concludes that the reason why *ens* cannot be a genus is that the *ratio essendi* of accidents, being a non-absolute *ratio*, cannot be the same as the *ratio essendi* of substances, which is an absolute *ratio* (Siger of Brabant 1983: 101). In a different context – most notably in the context of the question whether the intellect can be both subsistent and inherent – he also insists that these *rationes essendi* are so incompatible that they cannot belong to the same thing (Siger of Brabant 1972: 79–80). Indeed, in the context where he directly addresses the question of what sort of quiddity accidents have, he explicitly asserts an accident does not have a *ratio essendi*, except in relation to a substance, whence it cannot be defined, except in relation to substance (Siger of Brabant 1983: 341).

The implication of all this, along with Siger's identification of essence with existence, is clearly that the same thing, while remaining the same thing, cannot have one *ratio essendi* after the other, and thus, an accident, having the *ratio essendi* of an inherent being, cannot, while remaining what it was, an accident, have later on the *ratio essendi* of a subsistent being, on pain of contradiction. But this leaves him with a sheer "fideistic" position concerning the possibility of the separate existence of accidents in the Eucharist, without resolving the contradiction with his philosophical conclusions, provoking both Aquinas' philosophical criticisms, while

defending his own "Avicennean Aristotle," and the wrath of Augustinian theologians, rejecting Siger's "Averroistic Aristotle."

It was this kind of "Averroistic Aristotelianism," famously condemned in 1277, which was sternly rejected by theologians such as Henry of Ghent and later Duns Scotus. However, since they also rejected the Avicennean–Thomistic thesis of the real distinction of being and essence, they more radically reinterpreted the Aristotelian distinction between substance and accident, ending up with positions closer to what Marsilius (taking his cue from Buridan) described as "the common opinion" of theologians.

In general, the most fundamental issue concerning the interpretation of the Aristotelian notion of inherence and its compatibility with the doctrine of the Eucharist seems to be whether the Aristotelian notion can consistently be interpreted in such a way that according to this interpretation transubstantiation does not have to destroy the nature of accidents. Aquinas' "Avicennean solution" is based on the thesis of real distinction between essence and existence; on the basis of which, even if the mode of being of the thing changes, this can leave the distinct nature of the thing unaffected.

Those, however, who rejected this Avicennean interpretation of Aristotle, be they philosophers, like Siger or Buridan, or theologians, like Henry of Ghent or Duns Scotus, ended up either with an irresolvable conflict between their Aristotelianism and their faith, as Siger did, or with a more radical departure from Aristotle in their interpretation of the Aristotelian doctrine of the analogy of being, as Henry, Scotus, and Buridan did. Either way, abandoning the Thomistic interpretation of the Aristotelian distinction seems to drive a wedge between faith and reason, culminating in the attribution of radically different notions of accidental being to philosophers and to theologians by Buridan. Perhaps, this is what motivated Marsilius of Inghen's "more metaphysical" solution, echoing the gist of Aquinas'.

The gist of Marsilius' solution is the permanence of the natural tendency of the accident to be in a subject, even if its actual existence changes from inherent to subsistent, just as it was in

Aquinas (Bakker 2001: 262). However, for Marsilius, the nominalist theologian, this solution was no longer based on the Avicennian interpretation of Aristotle provided by Aquinas but rather on the strict separation of what is naturally and what is only supernaturally possible, indeed, on a radical separation of theological and secular philosophical and scientific discourse initiated in many ways by the nominalism of William of Ockham (see Klima 2009).

Ockham's nominalism, on the other hand, was partly motivated by what he perceived as entirely futile *metaphysical* problems concerning the categories, based on a mistaken *semantic* conception of his contemporaries (Klima 1999a). His new semantic conception motivated by this perception, in turn, led to a radical transformation of scholastic discourse and, along with other conceptual changes in late-medieval philosophy, to the emergence of the possibility of completely and systematically eliminating accidents really distinct from substances and thus eventually to the collapse of the scholastic substance–accident metaphysics in early modern philosophy.

The Problem of the Distinction of Accidents and the Emergence of Modes

As we have seen, the theological problem of the Eucharist naturally gave rise to the intensional problem of the interpretation of the Aristotelian notion of the inherence of accidents. Particular philosophical problems concerning the distinction of specific kinds of accidents from each other as well as from their subject, however, tended to give rise to a number of more specific extensional problems of the necessity and sufficiency of the Aristotelian division.

The framework of the medieval discussion concerning the distinction of specific kinds of accidents was provided by Aristotle's distinction of the ten categories, namely, distinguishing substance from the nine categories of accidents: quantity, quality, relation, action, passion, time, place, position, and habit. One fundamental question concerning the distinction of the categories was precisely what sort of items these categories

classify. Are they words, or the concepts expressed by these words, or are they the entities themselves already fitted into the broader framework of the Ontological Square by Aristotle?

Various authors handled these issues variously in their interpretation of Aristotle, but few would have subscribed to a simplistic “mirroring” idea, namely, the idea that the ten classes of simple words “mirror” ten classes of simple concepts, which in turn “mirror” the ten fundamental classes of entities there are in reality.

In the first place, that the relationship between words and concepts is more complicated is clear from the phenomena of equivocation (one word expressing several concepts) as well as synonymy (several words expressing the same concept) and translatability (different words in different languages expressing the same concept) or from the fact that a simple word may express a complex concept and a complex phrase may occasionally convey a simple concept (Buridan 2001: xxxvii–xxxix).

In the second place, the relationship between concepts and things is quite complicated as well: universal concepts comprehend several particular things (even if several particular things of the same kind), but even the same (kinds of) things may be conceived in terms of radically different concepts (as, e.g., all triangular things may also be conceived as trilateral and vice versa).

Thus, even the medieval *modistae*, who insisted that the modes of signifying of words (*modi significandi*) follow upon our ways of understanding things (*modi intelligendi*), which in turn reflect the way things are (*modi essendi*), would not have subscribed to the simplistic mirroring view of semantic relations; and, a fortiori, such a view would have been rejected by their late medieval, especially, nominalist critics (Marmo 1999). But still, especially in the thirteenth-century literature on Aristotle's *Categories* and *Metaphysics*, there were various speculations about the sufficiency of Aristotle's classification (in the so-called *sufficiantiae* literature), trying to establish that his ten categories comprehend all entities, sorting them into their ten and only ten most universal essential kinds (McMahon 2002; Gracia and Lloyd 2006).

However, apart from the issue of the *sufficiency* of the categories to classify all entities into their essential kinds, there was also the intriguing question of the *necessity* of Aristotle's categories, as far as the classification of real entities is concerned, for nobody seems to have denied the usefulness of Aristotle's classification of predicable terms and the concepts they express in the ten genera he distinguished, establishing a certain system of them all; but there were serious doubts as to whether this classification is at the same time the classification of the essential, natural kinds of all entities there are. Are there really (at least) ten classes of really distinct, essentially different entities in the universe?

One consideration that prompts this conclusion is the following piece of reasoning, which may be dubbed the *argument from separability*:

1. Any entities that can exist without each other are distinct from each other.
2. The entities in distinct categories can exist without each other.
3. Therefore, the entities in distinct categories are distinct from each other.

If this argument is sound, then the ten categories provide a mutually exclusive (and hopefully also exhaustive) tenfold classification of all entities.

However, in this argument, a great deal depends on the interpretation of its second premise. The obvious justification for this premise is the fact that accidents are "separable" from their subject as well as from each other in the sense that a subject may continue to exist while its accidents come or cease to inform it, independently from each other. (Of course, this natural "separability" of accidents must not be confused with the question of their supernatural separability *in continued existence* discussed above.) After all, on Porphyry's description of accident, "accident is what comes and goes without the destruction of the substrate" (Spade 1994: 11). For example, the white sheet of paper that turns black when dipped in ink certainly continues to exist, while its whiteness is gone, and the same goes for its other accidents in the other categories.

We need not be detained here too much by the issue of naturally inseparable accidents discussed by Porphyry, such as the blackness of a crow (to use his example), which are inseparable only assuming the present course of nature, but could be separated from their subject (without preserving them in continued existence) in a different system of nature, simply on account of their non-essentiality. So, in a different system of nature, with different laws in force, the same subjects could be present without their actually naturally inseparable accidents. For instance, in a different system of nature, there could be white crows. (Indeed, we could actually produce them even in this system of nature by dipping them in hydrogen peroxide, but Porphyry apparently did not think of this cruel possibility. Thus, a better example of a naturally inseparable accident in his sense might be the yellow color of pure gold.) By contrast, in a different system of nature, the same subjects could not be present without their essential properties, because then they would just not be the same things. We certainly could not have crows that are not crows or animals or bodies (or gold that is not an element or does not have atomic number 79).

However, the justification of premise (2) above in terms of the Porphyrian definition clearly presupposes that what we are referring to by means of the abstract term "whiteness," namely, the accident that verifies the corresponding concrete term "white" of this sheet, cannot cease to be referred to by this term unless it ceases to exist, that is to say, that this abstract term is an essential predicate of this accident. For, if the term were not an essential predicate of this thing or would not refer "rigidly" to this thing, to use the contemporary jargon, then the thing could cease to be referred to by the term "whiteness," i.e., it could cease to be whiteness, without ceasing to exist. And so, even if the white sheet *was* identical with its whiteness, it could cease to be white without its whiteness ceasing to exist, for its whiteness could just cease to be whiteness without ceasing to be.

To be sure, in the case of this example, one may have the intuition that the thing that is called "whiteness" cannot cease to be whiteness without ceasing to be. However, consider another example in the category of quality, in the species of shape,

such as straightness. Scholastic “realists” (for the significance of the quotes see Klima 2008) committed to the essentiality of abstract terms in this species would have to claim that when, say, a piece of wire is straight, then this is because the matter of this piece of wire is informed by the quality of straightness, and so when the wire is bent, its straightness is destroyed while the wire itself continues to exist, which clearly indicates that the wire and its shape are not the same thing.

However, what if this shape is not construed as a simple quality essentially named “straightness”? After all, for the wire to be straight is just for its extremes to be maximally distant; thus, the wire’s shape is nothing, but the way its quantity is extended; indeed, one may say, it is just this quantity extended this way. But of course when the wire goes from straight to bent, its quantity does not cease to exist; it just goes from existing in one way to existing in another. However, these “ways,” that is, *modes* of being of this quantity, are not further things added to this quantity: they are the quantity itself arranged one way or another, on account of which it once can be called straight and then bent. Therefore, straightness is nothing but the quantity of the wire arranged in a certain way, not a thing really distinct from this quantity. Indeed, if quantity terms can be analyzed along similar lines, then its quantity can also be identified with a material substance, for again, then the dimensions of the substance are nothing but the substance itself, its matter being arranged in a certain way.

This is precisely the gist of the idea of Ockham’s nominalist program of “ontological reduction,” whereby he sought to get rid of all sorts of “weird entities” to which his realist opponents were apparently committed (see Klima 1999a, b). Perhaps, the best illustration of the kind of ontological commitment Ockham wanted to eliminate can be found in the following passage, coming from the auspiciously titled treatise, *A Very Useful and Realist Logic of Campsall the Englishman Against Ockham*:

there are individuals subjected to each category that are really distinct from the individuals of another category of which it [their category] is properly and directly predicated; for example, we can truly

assert: ‘This is [a] when’ pointing to the relation which is caused by the motion of the first movable [i.e., the celestial sphere of the fixed stars] in the inferior things, so that, if that individual had a distinct proper name imposed on it, one could just as truly respond to the question: ‘What is it?’ by saying: ‘[A] when’, as one can reply to the question ‘What is it?’ asked about a man, by saying: ‘A substance’. (Pseudo-Campsall 1982: 216–217)

Indeed, the realist author of this treatise is willing to go as far as to claim that denying the real distinction of individuals in the ten categories would lead to the destruction of philosophy and science:

we should see whether a when-ness is distinct from absolute things. . . . And this appears but some quibble: for denying that in any category there is to be found a thing distinct from the things of all other categories amounts to denying philosophy in general and several particular sciences that deal with these categories. (Pseudo-Campsall 1982: 327)

The most important point in these passages is that our realist author would take the categories as well as their subordinate genera and species to be essential predicates of their particulars. But this is precisely the assumption that allows “the argument from separability” to go through, thereby generating a “Porphyrian forest” consisting of distinct Porphyrian trees (the arrangement of genera and their subordinate species) in each category. Consequently, it is no wonder that this is precisely the assumption that Ockham’s and his followers’ new semantic conception would systematically undermine, allowing them to cut down what they took to be the realists’ “Porphyrian forest,” leading to commitment to all sorts of “weird entities” in one’s ontology, causing all sorts of apparently insoluble problems in one’s logic, metaphysics, and physics (for some of Ockham’s particular arguments, see Klima 1999a).

The gist of the Ockhamist idea, as I have indicated above, was that abstract terms in the accidental categories can be analyzed in terms of their nominal definitions, revealing the complex conceptual structures “covered-up” by the syntactic simplicity of these terms. But within the Ockhamist semantic framework, the revelation of this complex conceptual structure at the same

time reveals that the corresponding term is a non-essential predicate of its particulars, which means that “the argument from separability” cannot stand in the way of identifying this particular with one in another category. Thus, providing such “eliminative definitions” could become a powerful analytic tool for carrying out the Ockhamist program of reducing the really distinct ontological categories to two (substance and quality – as was Ockham’s original program) or three (substance, quality, and quantity – as was Buridan’s program).

Indeed, this conceptual tool in principle could have been used to eliminate all real accidents, even in the category quality, leaving only substances whose matter being arranged in different ways is what causally accounts for their various properties classifiable in the system of the categories, in the framework of an atomist physical theory. Buridan, however, who was well aware of this possibility (explored by his contemporary John of Mirecourt), rejected atomism as “an obscure and dangerous” doctrine (Buridan 1989: 122) and argued for the real distinction of some species of quality, quantity, and substance (for more on this, see Klima 2003).

However, despite the nominalists’ charges to the contrary, authors working in the older semantic framework did not have to be committed to a full blown “Porphyrian forest.” Even if they did not have the systematic analytic tool of “eliminative nominal definitions” that the nominalists could apply in eliminating unwanted ontological commitment to distinct entities in the accidental categories, these authors could still use other conceptual means to identify or “quasi-identify” entities across categories, provided they could abandon on principled grounds the crucial assumption of the essentiality of abstract terms in accidental categories.

One such conceptual tool was the distinction between two types of relations: relations in being (*relationes secundum esse*) and relations in speech (*relationes secundum dici*). It is only abstract relational terms of the former type of that would be essential predicates of distinct relation-things; abstract relational terms of the latter type would just be relative denominations of absolute things

in other categories. Apparently, some authors would identify this distinction with the distinction between real relations (*relationes reales*) and merely conceptual ones (*relationes rationis*). However, Cajetan insisted that the former distinction is one to be applied *within* the realm of real relations.

But similar considerations allowed the identification or quasi-identification of items in other categories. For instance, Aquinas would often cite Aristotle’s authority to endorse the identification of action and passion with the same motion or a location with the dimensive quantity of the locating thing. In all such cases, what allows the identification of items across categories is the consideration that the terms referring to these items need not be their essential predicates, which neutralizes the force of the argument from separability. But the conceptual device of allowing the nonessentiality of abstract terms in accidental categories in and of itself would only produce the recognition of conceptual distinctions of otherwise really identical items in one’s ontology, just like the merely conceptual distinctions produced by the nominalists’ eliminative definitions.

Another important conceptual tool among non-nominalists, combined with allowing the non-essentiality of abstract terms, but also emphasizing the mind-independence of some distinctions, involved tweaking the notions of unity and distinctness. This is how Henry of Ghent’s *intentional distinction* and Scotus’ *formal distinction* and later Suárez’s *modal distinction* were all capable of providing a way to “quasi-identify” items across categories without, however, *fully* identifying them. The best description of this strategy can be found in Suárez’s presentation of his modal distinction, as being somehow halfway between a full-blown real distinction and a mere conceptual distinction:

I think it is true without qualification that there is among created things a certain actual distinction which is found in nature prior to any activity of the mind and that such distinction is not so great as the distinction between two altogether separate things or entities. This distinction, to be sure, could be designated by the general term “real,” inasmuch as it is truly verified in reality, and is not merely an extrinsic denomination issuing from the intellect.

However, to differentiate it from the other, namely, the major real distinction, we can call it either a “distinction from the nature of the case,” thus applying to this imperfect distinction a term that is in common use, or more properly a “modal distinction.” For, as I shall explain, this distinction is invariably found to intervene between a thing and its mode (Suárez 1947: 27).

So, what is a mode? Suárez is well aware of the fact that modes are not his invention. He mentions Giles of Rome, Durand of Saint-Pourçain, and especially Petrus Fonseca, as his forerunners on this issue, although he could have mentioned even earlier figures, such as John Peter John Olivi or Peter Auriol. Indeed, even earlier, Albert the Great tended to refer to all accidents as the modes of substance, but he probably did not have in mind the specific notion of a *mode* in Suárez’s sense, which, following Fonseca, Suárez carefully distinguished from the broader senses of the term.

In this specific technical sense, a mode of something “is something affecting [it] and, as it were, ultimately determining its state and manner of existing, without adding to it a proper new entity, but merely modifying a pre-existing entity” (Suárez 1947: 28).

So, modes are something real, indeed, as Suárez insists, mind-independently distinct from the things of which they are the modes, and yet they are not *as* distinct as one thing from another, as a real accident would be distinct from a substance. Indeed, they are not sufficiently distinct to be separable even by divine power; thus modes could not be sustained in separation in the way accidents can in the Eucharist. Therefore, modes in this strict sense constitute a genuinely new category wedged “between” the categories of substance and accident.

Of course, this characterization of modes and their distinction from the substances and accidents of which they are the modes makes the problem of the sufficiency of the division of being into substance and accident return with a vengeance. Suárez valiantly struggled with the problem, trying to save the idea of sufficiency, but his solution may have just added to the sense of later generations that the distinction is radically flawed.

Indeed, the conceptual tools introduced by late-medieval realists and nominalists discussed above opened up the possibility of totally eliminating the distinction, which, after a flourishing of talk about modes of substances instead of their real accidents, is basically what happened in the early modern period.

al-Suhrawardī, Shihāb al-Dīn Yaḥyā al-Maqtūl

Cécile Bonmariage

Fonds de la Recherche scientifique, Bruxelles, Belgium

Abstract

Shihāb al-Dīn al-Suhrawardī (d. Aleppo, c. 1191) is a mystical philosopher who founded a new tradition in Islamic thought, that of Ishrāq (“Illuminationism”). This term applies first to a new method: Suhrawardī introduces illumination or knowledge by presence as the foundation of a sounder way to apprehend the universe and ourselves. Ishrāq is also a new understanding of what is, conceived of as the participation of all that is in one fundamental reality, Light. Suhrawardī's thought had lasting influence on later Islamic speculative tradition, especially in the East, as an alternative trend to the “Peripatetic” tradition represented by thinkers such as Avicenna.

Biographical Information

Born in Suhraward near Zanjān (NW Iran) in the middle of the sixth/twelfth century (probably c. 549/1155), Shihāb al-Dīn Yaḥyā b. Ḥabash b. Amīrak al-Suhrawardī received his first education in Maragha. After a few years of travel in quest of knowledge in Anatolia, Syria, and possibly Isfahan, he arrived in Aleppo, probably in 579/1183. There he gained the favor of the court,

then ruled by al-Malik al-Zāhir Ġāzī, the son of Saladin. This short period of favor was followed by a dramatic reverse of fortune, instigated by local religious scholars, which resulted in Suhrawardī's condemnation to death by the order of Saladin. The earliest account known, 'Imād al-Dīn's *Bustān al-jāmi'*, a chronicle contemporary with the event, mentions Suhrawardī's death in the year 588/1192. One century later, Shahrāzūrī speaks of the end of 586 or of 588/1191 or 1192. In the same thirteenth century, Ibn Khallikān rejects the date 588 and gives precise dates according to two different accounts: Suhrawardī was incarcerated and then strangled on 5 Rajab 587/July 29, 1191; his dead body was carried out of the citadel of Aleppo on Friday, end of Dhū al-Ḥijja 587/January 17, 1192. Suhrawardī was then 38 in lunar years, or 36, or even 50 according to another version related by Shahrāzūrī. The accounts are no more precise regarding the manner in which Suhrawardī died (starvation to death, strangulation, execution followed by crucifixion for several days), and the ultimate reasons for his condemnation, probably a mix of religious and political factors.

During his short life, Suhrawardī produced an impressive number of writings both in Arabic and Persian, some very brief, others lengthy, written in various styles, from allegoric tales to scholastic treatises very much in the manner of the writings typical of Islamic philosophers in the Peripatetic tradition. His works comprise four major philosophical treatises written in Arabic: *al-Talwīḥāt* (*The Intimations*), *al-Muqāwamāt* (*The Oppositions*), *al-Mashārī' wa-l-muṭārahāt* (*The Paths and Havens or Conversations*), and *Kitāb Ḥikmat al-Ishrāq* (*The Philosophy of Illumination or Book of Illuminationist Wisdom*), his masterpiece completed in 582/1186 (*Ḥikma* § 279). These treatises are accompanied by shorter texts of different types: mystical allegories such as the *Qiṣṣat al-ḡurba al-ḡarbīya* (*The Story of the Occidental Exile*), epitomes of philosophy such as the *Hayākil al-nūr* (*Temples of light*), and prayers and invocations.

Thought

Suhrawardī's thought represents a profound change in Avicennan philosophy on which it is founded. The main points of divergence have to do with epistemology and with the conception of the structure of reality. Suhrawardī's writings denote a strong dissatisfaction with discursive rationality and the will to find an alternative ground on which to build a sounder system to apprehend the universe and ourselves. This ground is found in intuitive knowledge, the kind of knowledge experienced by mystics in their visions, but also in the experience of self-knowledge. This "presential knowledge" or "knowledge by presence" (*'ilm ḥuḍūrī*), which is thus for Suhrawardī the only way to truly access what is, is characterized by the fact that it is not mediated through any image or representation. It allows for a direct vision, an intuition, providing the principles of a new comprehension of reality. As stated in the introduction of *Ḥikmat al-Ishrāq*, beside the sciences drawn from the observation of phenomena perceived by our senses, such as geometry, there are sciences built on principles known from our experience of the spiritual: "Those who do not proceed according to this method have no share in wisdom; doubts will toy with them!" (*Ḥikma* § 6).

The integration of presential experience as a source for knowledge does not entail a complete dismissal of discursive rationality. The recommendation made at the end of the *Ḥikmat al-Ishrāq* states unequivocally that this book should not be made available "except to whom has mastered the Peripatetic method," which is precisely the method using discursive argumentation (*Ḥikma* § 279). However, discursive rationality alone cannot lead to true knowledge because it lacks the validity given by mystical experience. Only the speculative mystic who brings together mystical vision and excellence of reasoning can reach certainty. Hence the end of the quotation just given: "... and who is enamored of the Light of God." Mystical experience is still more important than reasoning skills however: in a hierarchy of

sages given in the same book, second to the speculative mystic are sages who follow the mystical path with no attempt at speculation, followed by those who are skilled in discursive rationality without mystical experience (*Hikma* § 5).

In metaphysics, Suhrawardī builds an elaborate system centered on Light. From the Light of lights emanates a vertical hierarchy of pure immaterial lights, paralleled by a horizontal order of lights, and from these emanations and the interactions between the different orders, further entities are produced. There is thus a gradual unfolding of Pure immaterial lights – triumphant (only concerned with themselves and the higher realms) and regent (i.e., those ruling over the bodies) – of accidental lights, and obstacles to light (*barzakh*), that is, the bodies.

The main characteristics of Suhrawardī's metaphysical system are as follows. Everything is conceived of as participating in one fundamental reality, Light. Even that which is an obstacle to light is caused by light and defined by its relationship to light. Lights are primarily differentiated by their degree of intensity: the level of their share in light makes them what they are and is the very principle of individuation, even if other elements are also included the further one gets from the higher levels. Intensity is also understood in dynamic terms: a reality can be more or less what it is, says Suhrawardī, thus introducing movement in the category of substance. A corollary of this principle is the ontological weight given to the lowest degrees of light: this is a metaphysics attentive to the multiple instances of light, a metaphysics of lights rather than of Light. Finally, Suhrawardī reintroduces Platonic Ideas of some sort, the "Lords of species," and maintains the reality of a separate World of images.

On human nature and destiny, Suhrawardī considers human soul as an immaterial light imprisoned in this world and using the body as a tool to perfect itself, in order to escape from its exile in the material world and reach the world of Lights. Some passages in the *Hikmat al-Ishrāq* showing sympathy toward the affirmation of

transmigration of souls (*tanāsukh*) have led to discussions by later Ishrāqīs and opponents as to how this should be understood (*Hikma* § 229–236). Questions of conscience of self and personal identity are also of special interest for Ishrāqī thought.

Suhrawardī presents his system as a break from the views of the "Peripatetic" (*mashshā'ī*) philosophers of Islam (even though some of his writings are written in their manner, see *Mashhārī* § 208), and many of his theories are introduced as an alternative to their erroneous conception (e.g., on definition, syllogism, hylomorphism, metempsychosis, Platonic Ideas, and "being" conceived as anything beyond a mental attribute). This break is presented as a return to the doctrines of the first sages – Greeks, Persians, Indians, etc. – with tutelary figures such as Hermes, Plato, and Zoroaster.

Suhrawardī's writings had a lasting influence in Islamic thought, not only through a line of commentators and disciples such as Ibn Kammūna (d. 683/1284), Shahrāzūrī (thirteenth century), and Quṭb al-Dīn al-Shīrāzī (d. 710 or 716/1311 or 1316), but also as a method, considered as a distinct trend in contrast with the *mashshā'ī* tradition, and as a set of questions and problems. To mention just one example, Suhrawardī's insistence on the purely mental character of universals, especially of being, had a profound impact on later debates on the essence/existence distinction.

Modern scholarship is divided on how to interpret the different aspects of Suhrawardī's thought. This debate, which has consequences on the classification of Suhrawardī's writings, is doubled by an interrogation on the importance of Suhrawardī's departure from Avicenna, itself depending greatly on the manner Avicenna's thought is understood. Some scholars stress the mystical aspects, others the Iranian heritage, yet others, the philosophical aspects, with a will to fully acknowledge the scholastic elements in Suhrawardī's writings. This last approach led to a better grasp of the importance of Suhrawardī's logical theories (it is interesting to note that only the parts on metaphysics were included in Corbin's edition of the *Tahwīḥāt*,

Muqāwamāt, and *Mashārī*’, and that his translation of the *Kitāb Hikmat al-Ishrāq* skips over the first part on general questions regarding logic and epistemology). A few scholars have also pointed to other intellectual traditions, which may have contributed to Suhrawardī’s system, such as Ismā‘īlī thought, opening new perspectives still to be explored.

Supposition Theory

Catarina Dutilh Novaes

ILLC and Department of Philosophy, University of Amsterdam, Amsterdam, The Netherlands

Abstract

Supposition theory is one of the most important later medieval semantic theories (in the Latin tradition). Supposition is the property of terms (occurring in propositions) of standing for things, so that these things can be talked

about by means of propositions, and supposition theory (in its different versions) is a theory codifying the different *uses* of terms in propositions, based on the idea that one and the same term can stand for different things when occurring in different propositional contexts. The different kinds of supposition are attempts to capture the phenomenon of semantic variation prompted by different propositional contexts. The theory emerged in the twelfth century, and the two main traditions contributing to its development were the tradition of commentaries on Aristotle's *Sophistical Refutations* and the tradition commenting on the fourth-century grammarian Priscian. Supposition theory acquired its first mature form in the thirteenth century, with the terminist/summulist tradition (in the works of William of Sherwood, Peter of Spain, Roger Bacon, and Lambert of Lagny/Auxerre), and was further developed in the fourteenth century by authors such as Walter Burley, William of Ockham, and John Buridan.

Introduction

Supposition is one of the properties treated within the doctrine of the properties of terms, a doctrine whose development started in the twelfth century and which then became the cornerstone of later medieval semantics (see Read 2006, and the entry on Terms, Properties of in this volume). In fact, the development of this doctrine from the twelfth century onward consists precisely in “the growing dominance of just one of the properties of terms, supposition” (De Rijk 1982:161). Indeed, by the fourteenth century the concept of supposition had almost entirely superseded or absorbed the other properties of terms for the purposes of semantic analysis. A section (often several chapters) specifically on supposition is to be found in every single logical textbook of the thirteenth and fourteenth centuries (not to mention the several *De suppositionibus* treatises in the fourteenth century).

Very generally put, supposition is the property of terms (occurring in propositions) of standing for things, so that these things can be talked about

by means of propositions. Thus described, it may appear to be the medieval counterpart of the modern concept of reference, and indeed such a comparison has often been put forward. But there are also significant dissimilarities between medieval theories of supposition and modern theories of reference, and in fact this comparison can be quite misleading (see Dutilh Novaes 2007: chap. 1). Rather, it seems more appropriate to view medieval theories of supposition as having no exact modern counterpart – one must attempt to understand them in their own terms. Moreover, throughout the centuries the concept of supposition “developed in response to a variety of needs, and one mistake of modern attempts at interpretation is to seek a unique rationale” for its various formulations at different stages of its development (Read 2006: Introduction).

Nevertheless, a fairly accurate general characterization of the different versions of supposition theory is as a theory codifying the different *uses* of terms in propositions; such variations of uses are important as such, but they are also crucial for key logical concepts such as truth, (fallacious or valid) inference, and propositional content. In other words, a trait common to the different formulations of the theory is the idea that one and the same term can stand for different things when occurring in different propositional contexts, thus having distinct semantic contributions to the content of a proposition at each time. The different kinds of supposition are attempts to capture the phenomenon of semantic variation prompted by different propositional contexts. Indeed, theories of supposition deal with four main kinds of semantic variation:

1. Whether a term is taken literally or metaphorically.
2. The different ontological kinds of the *things* that one and the same term can stand for – the *supposita*: (extra-mental) individual entities, universal entities, mental entities, or linguistic entities.
3. The different temporal and modal statuses of the *supposita*: present, past, future, actual, or possible.
4. The different quantities of entities required to verify or falsify a proposition.

(1) The first kind of variation is usually codified by means of the distinction of proper vs. improper supposition. For reasons of space, though, improper supposition will not be analyzed in any detail here, and we shall concentrate on proper supposition. (2) The second kind of variation is accounted for by means of the distinction of the main kinds of proper supposition, usually personal, simple, and material supposition (such as in Ockham’s *Summa logicae*). The contextual element usually thought to provoke this kind of variation is the ontological kind(s) of the things of which the other term in the proposition is correctly predicated, as suggested by an oft-repeated motto (Ebbesen 1981:41): “subjects are such as the predicates permit” (see Sherwood 1966:113). (3) The third kind of variation is addressed by the concepts of ampliation and restriction, originally independent properties of terms that in later developments were absorbed by the supposition machinery. The contextual element usually (though not always) thought to provoke this kind of variation is the tense (past, present, future) and the mode (actual, possible, necessary) of the verb in the proposition. (4) The fourth kind of variation is dealt with by means of the distinction of the modes of (common) personal supposition, whose main modes are confused and distributive, merely confused, and determinate supposition (such as in Ockham’s *Summa logicae*). The contextual element usually thought to provoke this kind of variation is the presence or absence of syncategorematic terms (i.e., terms such as “every,” “some,” “no,” “not”) and word order. (This last distinction is treated elsewhere in this volume; see the entry on Quantification.)

Among the other early properties of terms, the only one having resisted total absorption by supposition in the long run is the property of signification. Indeed, while the notion of supposition implies that a given term does not have a stable, general meaning, but rather that its semantic contribution depends fundamentally on the propositional context (and thus on specific uses), the property of signification is thought to be context-independent and pre-propositional. Signification concerns the first imposition of what a term shall be used to talk about, whereas supposition

concerns uses of a term that already has a signification, and the semantic variations that may be prompted by the propositional context.

Another important point to bear in mind is that supposition theory was not simply a sterile exercise, developed for purely theoretical reasons. Much to the contrary, supposition theory was widely used as a semantic tool in an ample range of fields, most notably theology (Brown 1993) and physics. Hence, besides the bare presentations of the theory that one encounters in medieval logical textbooks, the theory actually put to practice is perhaps even more fascinating. For reasons of space we shall not deal with specific applications of supposition theory, but one should bear in mind that supposition theory was essentially developed to be *used*, to be put to practice as a semantic tool for the analysis and interpretation of discourse, and thus also to deal with matters of truth and inference in different fields of investigation.

In what follows, I present a chronological account of the development of supposition theory in the twelfth, thirteenth, and fourteenth centuries. Such a partition although obviously somewhat arbitrary is nonetheless supported by the significant coherence within each century. Moreover, it should not be taken to imply that after the fourteenth century no developments worth mentioning took place: much to the contrary, in very late medieval authors one finds sophisticated solutions to many of the issues left open by previous generations (see Dutilh Novaes 2008a; Ashworth 1974). Nevertheless, these three centuries embody what we could call the “classical era” of supposition theory.

Early Developments: Twelfth Century

The historical emergence of supposition theory was the topic of De Rijk’s groundbreaking study *Logica modernorum*, published in three volumes (De Rijk 1962/1967) and including the edition of a wide range of twelfth- and thirteenth-century crucial (anonymous) texts. De Rijk identified two main traditions contributing to the development of supposition theory: the tradition of

commentaries on Aristotle’s *Sophistical Refutations* and, more generally, of theories of fallacies; and the tradition commenting on the fourth-century grammarian Priscian. This account is still thought to be essentially correct, but since the publication of De Rijk’s study, some scholars (e.g., Ebbesen 1981) have questioned certain aspects of De Rijk’s account. Also, it appears that other elements (such as the theological tradition stemming from Gilbert of Poitiers’ writings; see Kneepkens 1987 and Valente forthcoming) must also be taken into account to explain these developments. Furthermore, it is now believed that a more cautious timeframe for the seminal texts would be the very last decades of the twelfth century and the first decades of the thirteenth century, differing thus from De Rijk’s earlier dating of these texts. Nonetheless, the significance of these two traditions – the grammarian tradition and the tradition on the fallacies – is beyond any doubt, so let us examine how exactly the suppositional framework may have emerged from them.

At this early stage (second half of the twelfth century), *suppositio* is often related to the syntactic act of putting a term as the grammatical subject of a proposition (see Kneepkens 1987). But it has been argued (Ebbesen 1981) that even at this early stage, the *suppositio* terminology is used not only to refer to a syntactic act but also to the semantic relation between a term and what it stands for, which was later to become the standard notion of *suppositio*. In fact, these two apparently different acceptations of the *suppositio* terminology (present, for example, in the twelfth-century grammarian Peter Helias, whose *Summa super Priscianum* is a key text for these developments) – the syntactic one and the semantic one – are not really dissimilar if one considers that the prototypical subject of a proposition is a substantive noun and that, according to the grammatical tradition following Priscian, a noun signifies a substance together with a quality. Hence, by placing a noun as the subject of a proposition, one also naturally invokes the substance that the noun signifies. The noun “man,” for example, signifies the individual primary substances that are men insofar as they instantiate the universal nature humanity, and thus it may stand for men in a proposition.

Moreover, following Aristotelian hylomorphism, universal natures and qualities are usually viewed as corresponding to forms, which are combined with matter to give rise to individuals. Thus, in the twelfth century, to be a *suppositum* is regularly used in the sense of being the bearer of a name or, equivalently, of a form/quality: and indeed, the notion of “bearer of form” is (according to Ebbesen 1981:38) crucial in the early development of supposition theory.

Unsurprisingly, in this period supposition is often viewed as a property pertaining exclusively to the subject term, the corresponding property for predicates being copulation; but soon thereafter (e.g., in the first English texts of the thirteenth century – *Logica “Cum sit nostra,” Logica “Ut dicit,”* and *Introductiones Parisienses*), supposition is seen as a property of predicates as well.

But even at this early stage, it is also widely acknowledged that terms can be used to stand for things other than what they signify depending on the specific context of use. Particularly in the formulation of grammatical theories, one must often use a term to talk about the very term itself (for example, to say that “man” is a noun and that “to run” is a verb), and thus not to talk about the thing(s) they usually stand for. Now, in order to indicate this autonymic use of a term, twelfth-century authors belonging to the grammatical tradition (such as in William of Conches, Adelard of Bath and Peter Helias (De Rijk 1962:108–109)) often spoke of terms being “materially imposed” (*materiale impositum*) in such cases. The notion of *materiale impositum* is the forerunner of the later notion of material supposition (see Rosier-Catach 2003), to appear for the first time in William of Sherwood, which again indicates the crucial role of the grammarian tradition for the development of supposition theory.

As for the fallacies tradition, it is immediately apparent why the fact that the very same term can be used in different acceptations is of crucial importance for the diagnosis of fallacious arguments; Ebbesen (1981:39) argues that in the twelfth century this might have been seen as the main purpose of supposition theory. Generally speaking, fallacies are arguments that appear to be sound in that they seem to display one of the

forms usually associated with sound arguments (for example, a valid syllogistic mood), but which are in fact unsound in that they feature true premises leading to (what appears to be) a false conclusion. The challenge is to identify where the problem lies, i.e., what (semantic) phenomenon is behind the false appearance of validity. A standard example of a fallacy is:

<i>Homo est dignissima creaturarum</i>	(Man is the worthiest of creatures)
<i>Sortes est homo</i>	(Socrates is a man)
<i>Ergo Sortes est dignissima creaturarum</i>	(So Socrates is the worthiest of creatures)

This is an obvious fallacy because the premises are true but the conclusion is false, and yet it does seem to present a valid (syllogistic) form. Intuitively, we immediately perceive that the problem lies in the different uses of the middle term “man” in the first and second premises: in the first one, “man” seems to stand for the nature common to all men, i.e., humanity, while in the second one it seems to stand for a particular man, i.e., an individual instantiating the common nature.

Traditionally, a fallacy such as this one is diagnosed as a fallacy of equivocation, as “man” is used in equivocal ways in the first premise and in the second premise. Now, it is precisely this variation of uses of one and the same term in different propositional contexts that supposition theory seeks to codify. In the case of the example above, supposition theory will allow the theorist to say that the term “man” supposits for different things in the first and second premises (a common nature vs. an individual man), and thus that it has different kinds of supposition. Typically, the occurrence of “man” in the first premise is said to have simple supposition (insofar as the proposition is true), whereas the occurrence of the same term in the second premise is said to have personal supposition (insofar as the proposition is true). Indeed, in the fourteenth century, with Ockham (*Summa logicae* I chap. 65) and Burley (*De puritate* Longer Treatise §44), the distinction between personal, simple, and material supposition is still associated to the fallacy of equivocation. Now, for an inference to be valid, the

recurring terms must supposit for the same things in all premises, and thus must have the same kind of supposition; in these early developments, one encounters formulations of rules of the form “no inference is possible from supposition A to supposition B” (Ebbesen 1981:39).

The Age of Terminism: Thirteenth Century

The first decades of the thirteenth century are characterized by logical texts (several of which are edited in De Rijk 1962/1967) still presenting supposition theory in its early stages. Its first reasonably mature versions, where it acquires the more or less standard shape it was to retain for many centuries, are to be found in the writings of the thirteenth-century terminists, also known as “summulists” because they produced complete overviews of logic (*summa*, “sum” or *summula*, “little sum”) where the properties of terms, and supposition in particular, occupy a key position. The main authors of this generation are William of Sherwood, Peter of Spain, Roger Bacon, and Lambert of Auxerre/Lagny, each of them having written at least one comprehensive logical text.

Moreover, the thirteenth century is also the period when the Oxford/Paris opposition becomes significant. In effect, while in the twelfth century the development of supposition theory is restricted to the Parisian schools, the thirteenth century witnesses the emergence of a distinctively Oxford school in logic, and concerning supposition in particular, even though there were many points of mutual influence between the two centers (see De Libera 1982). One distinctive characteristic of the Parisian tradition is the importance of natural supposition, which is usually construed as the non-contextual, stable supposition of a term (resembling thus the notion of signification), as opposed to accident supposition, i.e., the supposition that a term actually acquires in a given propositional context (such as in Peter of Spain and Lambert of Auxerre/Lagny). Indeed, natural supposition is the only variation in the development of this concept that concerns terms out of a propositional context.

The four authors just mentioned each offer a particular version of supposition theory, each with its own divisions and subdivisions (for trees representing these divisions per author, see Spade 1996:272–276). In fact, the different versions of the theory recognize different divisions and subdivisions of supposition, but they mostly agree on the definitions of the kinds of supposition that they do recognize. For the present purposes, let us examine the divisions and subdivisions presented by William of Sherwood in his *Introduction to Logic*, as his theory contains all the kinds and modes of supposition that remained influential throughout the fourteenth century and beyond.

Sherwood’s first division of proper supposition is between formal and material supposition. He defines formal supposition as “when a word supposits what it signifies” (William of Sherwood 1966:107), as signification is inherently related to forms: for Sherwood, the signification of a common term is the universal form it corresponds to, e.g., humanity in the case of “man.” But formal supposition is of two kinds: simple supposition is when a term supposits “for the signified form”; personal supposition is when a term supposits “for a thing bearing the form” (Sherwood 1966:107), that is, for the individuals instantiating the universal nature. Indeed, these are the definitions of personal and simple supposition that one generally encounters in writings of the thirteenth and fourteenth centuries (with an important modification regarding simple supposition brought about by Ockham, as we shall see). Material supposition is opposed to formal supposition in that it is not significative; indeed, Sherwood continues the tradition of referring to autonymic uses of a word (i.e., standing for itself) as “material,” as in the notion of *materiale impositum* discussed above.

These three main kinds of proper supposition – personal, simple, and material – are in effect to be found in most fourteenth-century texts (except for those following Buridan in his dismissal of simple supposition), and account for the variation of ontological kinds of supposita (variation (2) above). Interestingly, none of the other thirteenth-century main texts has either formal or material supposition as kinds of supposition, but they all have personal and simple supposition: for

Roger Bacon and Lambert of Auxerre, what Sherwood understood as material supposition, namely, the supposition of a term for itself or for other expressions *qua* expressions, becomes a variation of simple supposition. But formal supposition and especially material supposition make a resounding comeback in the fourteenth century.

Another division of formal supposition presented by Sherwood is between common and discrete supposition. It is unclear whether Sherwood intends it to be a subdivision of the simple-personal division or the other way round – or perhaps as an independent division altogether. Either way, the subsequent tradition usually treats this distinction as a subdivision of personal supposition: common supposition is the supposition of common terms, i.e., of terms not meant to designate one specific individual, while discrete supposition is the supposition of singular terms such as proper names and demonstrative pronouns, which pick out one specific individual.

For Sherwood, personal common supposition is further subdivided into determinate and confused supposition; confused supposition is then divided into merely confused, and confused and distributive; and finally, the latter is divided into mobile and immobile. The divisions of the modes of personal common supposition are then to be found in virtually all subsequent texts (although the mobile vs. immobile distinction tends to disappear), and account for the different quantities of *supposita* that are required for the verification of different propositional contexts (variation (4) above, treated elsewhere in this volume.)

As for variation (3) above, it is usually accounted for by means of the concepts of ampliation and restriction, as in William of Sherwood, Peter of Spain, and Lambert of Auxerre/Lagny; Sherwood also discusses this kind of variation within the context of his theory of composite and divided senses of modal propositions. The idea is that some propositional contexts amplify the range of *supposita* being supposed for by a term, for example in a modal sentence such as “A man can be white”; in this case, the supposition of “man” is not limited to the presently existing men, but also to possible men. A similar phenomenon occurs with tensed propositions. Other contexts

restrict the range of supposition, for example, when an adjective modifies a noun, such as “white man.” But ampliation and restriction usually do not generate sub-kinds of supposition, rather it is usually said that the supposition of a given term is amplified or restricted.

In the last decades of the thirteenth century, there was a marked decline of the influence of terminist logic, in particular in Paris, where an alternative approach to semantics became very influential, that of the *modistae* (Ebbesen 1981, 1985). The *modistae* influence in Oxford was less intense, but still felt. In any case, terminism did not go into total dormant state in this period, as is sometimes thought: Roger Bacon’s *De signis*, where a sophisticated version of supposition theory is presented (improving his own earlier theory presented in his *Summulae dialectices*) was written in the last decades of the thirteenth century, in Oxford (see De Libera 1982).

Later Developments: Fourteenth Century and Beyond

In the fourteenth century, terminist logic somehow reemerges as the chief doctrine for semantic analysis, completely replacing the *modistae* theories. In the very first years of the century, at Oxford, Walter Burley writes a *De suppositionibus* treatise, essentially taking over Sherwood’s distinctions of supposition. At the same time, Burley seems to have been the first to introduce quite a few innovations, which were to remain influential in the fourteenth century and beyond (see Brown 1972). Thus, one can say that Burley’s treatise inaugurates fourteenth-century-style supposition theory.

The next important text in the development of supposition theory was composed in the 1320s by William of Ockham, also an Englishman: his *Summa logicae*. Ockham’s *Summa* is revolutionary for many different reasons, among which his purely extensional definition of signification – for Ockham, a common term such as “man” signifies each and every man, not the universal humanity. Another important innovation developed by Ockham (but with earlier signs in the thirteenth

century, for example, in Lambert of Auxerre/Lagny; see Read 2006: Sect. 3) is the idea that the concept itself is a sign, just as written and spoken terms. In fact, Ockham develops the idea of a mental language functioning very much like written and spoken language, and thus equally apt to undergo semantic analysis; indeed, Ockham applies the supposition apparatus also to mental propositions (see Panaccio 1999), but with some paradoxical results (see Spade 1980).

While Ockham was clearly inspired by Burley's treatise (the section on the supposition of relatives is almost an exact copy of the same section in Burley's treatise see Brown 1972), he had to adjust the supposition machinery to the ontological and semantic modifications he had introduced. Thus, for Ockham simple supposition is no longer the supposition for an extra-mental universal, as such things simply do not exist in his ontology. Rather, he reformulates simple supposition as the supposition for the mental term corresponding to the spoken or written term in question. Similarly, personal supposition becomes the supposition for the thing(s) that the term signifies, given his reformulation of the notion of signification (*Summa logicae* I, chap. 64). For the rest, in particular with respect to the subdivisions of the modes of personal supposition, Ockham maintains the traditional divisions.

After Ockham, one important tradition in the fourteenth century (following Buridan) simply dispenses with simple supposition altogether, maintaining only personal and material as the main kinds of proper supposition. The idea is this: if simple supposition is the supposition for a mental term, as Ockham has it, then it is in fact a kind of material supposition (Buridan, *Summulae de dialectica* 4.3.2). Like Ockham, Buridan rejects the existence of extra-mental universals, so for him simple supposition becomes a superfluous concept.

Another author writing in the Buridanian tradition, Marsilius of Inghen, introduces another important innovation, namely that of applying the subdivisions traditionally reserved to personal supposition to material supposition as well (see Marsilius of Inghen 1983 and Dutilh Novaes 2008a: Sect. 2). With this move, it becomes

possible to "quantify" over occurrences of spoken, written, and mental terms being the material *supposita* of terms, just as one quantifies over the extra-mental individuals that are typically (but not always) the personal *supposita* of 5in all, in the fourteenth century supposition theory is widely applied to a variety of topics; in fact, it becomes an over-arching methodological tool. Ockham, for example, makes extensive use of it for theological as well as physical analyses. In effect, a significant application of supposition theory in the fourteenth century is to the issues surrounding the dogma of the Trinity (see the entry on Trinitarian Logic in this volume). Moreover, the theory continues to develop well into the fifteenth and sixteenth century. (The interested reader is urged to consult the secondary literature on these developments, in particular the work of E.J. Ashworth.)

Conclusion

For reasons of space, this brief overview has touched upon only some of the important aspects in the development of supposition theory only. However, it seems that two general issues must still be addressed, concerning the very gist and purpose of the theory: (1) What is to determine the kind(s) of supposition that a term has in a given proposition? (2) Is there always only one (correct) kind of supposition for a term in a given propositional context? These are difficult questions with no single answer; different authors seem to have held different views.

Concerning (1), most authors seem to hold that the propositional context is indeed the main determining element, as suggested by the maxim "subjects are such as the predicates permit." Some authors (such as Paul of Venice, at the end of the fourteenth century; see his *Logica parva*, p 27), however, maintain that the desired truth of the proposition, or in any case its intended meaning, is what governs the kinds of supposition allowed for its terms. Others, such as Buridan, seem to think that ultimately the agreed-upon interpretation of a statement by the speakers involved in the situation is what really determines the supposition of a term. Yet other authors, in particular Ockham,

present rules for the determination of the supposition of the terms in a given propositional context that seem to function almost algorithmically (see Dutilh Novaes 2008b).

As for the second issue, Ockham (like Burley and many other fourteenth-century authors) in fact allows for multiple possibilities of kinds of supposition for a term in one and the same propositional context, entailing thus that the context does not always uniquely determine the supposition of a term. For Ockham, supposition theory is an important device for the generation of the (often multiple) possible readings of propositions (corresponding to the different kinds of supposition permitted by a given propositional context), what in the fourteenth century is known as “distinguishing” propositions. But not all authors insist on the possibility of generating the multiple readings of propositions by means of supposition theory: in earlier developments, the underlying idea seems to be that there should be a unique correct kind of supposition for a term in a given propositional context. However, in both cases supposition theory is essentially a theory for semantic analysis and interpretation.

Syllogism, Theories of

Henrik Lagerlund

Department of Philosophy, Stockholm University, Stockholm, Sweden

Abstract

Aristotle's theory of the syllogism is one of the most influential theories ever developed. The theory of the syllogism for assertoric sentences was a remarkable achievement by Aristotle and it was virtually complete already from the beginning. Medieval logicians could generally not add much to it. Small changes were made and it was systematized in different ways. It was not until John Buridan in the mid-fourteenth century reworked logic in general and placed the theory in a context of a wider logic of consequences that the picture of syllogistics also changed. The theory of the modal syllogism was at a completely different stage of completion in the *Prior Analytics*, and in the hands of the medievals, it went through a remarkable development.

In the *Prior Analytics*, Aristotle presents the first logical system, that is, the theory of the syllogism. A syllogism is a deduction consisting of three sentences – two premises and a conclusion. Syllogistic sentences are categorical sentences involving a predicate and a subject connected by a copula (verb), and they are divided into four different classes, namely, universal affirmative (A), particular affirmative (I), universal negative

Syllogism, Theories of, Table 1 The three Aristotelian figures of the syllogisms

I	II	III
$A-B$	$B-A$	$A-B$
$B-C$	$B-C$	$C-B$
$A-C$	$A-C$	$A-C$

(E), and particular negative (O) sentences. Aristotle writes them as follows:

- A – “*A* belongs to all *B*” (*Aa B*).
- E – “*A* does not belong to any *B*” (*Ae B*).
- I – “*A* belongs to some *B*” (*Ai B*).
- O – “*A* does not belong to some *B*” (*Ao B*).

The subject and predicate in the categorical sentences used in a syllogism are called terms (*horoi*) by Aristotle. There are three terms in a syllogism, a major, a minor, and a middle term. The major and the minor terms are called the extremes (*akra*), respectively, major extreme (*meizon akron*) and minor extreme (*elaton akron*), and they are the predicate and the subject of the conclusion. The middle (*meson*) term is what joins the two premises. These three terms can be combined in different ways to form three figures (*skhēmata*). Aristotle presents the following three in the *Prior Analytics* (*A* is the major, *B* the middle, and *C* the minor term): When the four categorical sentences are placed into these three figures, Aristotle ends up with the following 14 valid moods (in parenthesis are the medieval mnemonic names for the valid moods) (Tables 1 and 2).

A fourth figure was discussed in ancient times as well as during the Middle Ages. In the Aristotelian syllogistic, it had the following form: By treating this figure, we derive additional valid moods, which are all mentioned by Aristotle in different parts of the *Prior Analytics* (see, for example, *An. Pr.* I.7, 29a19–29). The fourth figure moods are the following (Tables 3 and 4).

If one carries out a simple calculation based on the four categorical sentences and the four figures, we find that there are 256 possible combinations of sentences and of these 24 have traditionally been thought to be valid. To the 19 already mentioned, two subalternate moods in the first figure (Barbari and Celaront), two subalternate moods in

Syllogism, Theories of, Table 2 The three figures with names

First figure	$Aa B, Ba C$; therefore, $Aa C$	(Barbara)
	$Ae B, Ba C$; therefore, $Ae C$	(Celarent)
	$Aa B, Bi C$; therefore, $Ai C$	(Darii)
	$Ae B, Bi C$; therefore, $Ao C$	(Ferio)

Syllogism, Theories of, Table 4 The fourth figure with names

Fourth figure	$Ba A, Ca B$; therefore, $Ai C$	(Bramantip)
	$Ba A, Ce B$; therefore, $Ae C$	(Camenes)
	$Bi A, Ca B$; therefore, $Ai C$	(Dimaris)
	$Be A, Ca B$; therefore, $Ao C$	(Fesapo)
	$Be A, Ci B$; therefore, $Ao C$	(Fresison)

the second figure (Camestrop and Cesaro), and one subalternate mood in the fourth figure (Camenop) have to be added.

The difference between the first figure and the other figures is that the syllogisms in the first figure are complete syllogisms, while the syllogisms in the other two figures are incomplete. This distinction is important in Aristotle’s theory, since a complete syllogism is an immediately obvious syllogism, and an incomplete syllogism requires proof. This gives the first figure of an axiomatic character, while the proofs of the incomplete syllogisms are arrived at foremost through reduction to the complete syllogisms.

The reductions of the incomplete syllogisms were made by Aristotle through conversion rules. He states the following conversion rules in *An. Pr.* I.2, 25a1–26:

- (1) $Aa B \Rightarrow Bi A,$
- (2) $Ai B \Leftrightarrow Bi A,$
- (3) $Ae B \Leftrightarrow Be A.$

(1) was called an accidental (*per accidens*) conversion, and (2) and (3) were called simple (*simpliciter*) conversions during the Middle Ages. Particular negative sentences do not convert at all, according to Aristotle.

In Chapters 3 and 8–22 of Book I of the *Prior Analytics*, Aristotle extends his theory to include syllogisms involving modally qualified categorical sentences. An Aristotelian modal syllogism is a syllogism that has at least one premise modalized, that is, which in addition to the standard terms contains the word necessity, possibility, or contingency. Aristotle's terminology is not entirely clear, however. He uses necessity and possibility, but he works with two notions of possibility. In his preferred sense, which is foremost used in the *Prior Analytics*, possibility is defined as that which is not necessary and not impossible. This sense of possibility was called contingency in the Middle Ages. In another sense of possibility, which Aristotle used foremost in *De interpretatione*, possibility is placed on an equal footing with that which is not impossible. The first concept of possibility, which I henceforth will call contingency, is used in the modal syllogistic. The second concept of possibility is not treated systematically in the *Prior Analytics*.

Logic in the Middle Ages is generally thought to have started with Boethius (c. 475–526). He wrote quite extensively on the theory of the syllogism. He managed to produce a translation of the *Prior Analytics*, which was not well known, however, until the twelfth century, but he wrote two textbooks on the categorical syllogism. One is known as *On the Categorical Syllogism* (*De syllogismo categorico*) and the other has been given the title *Introduction to Categorical*

Syllogisms (*Introductio ad syllogismos categoricos*). He also wrote an interesting book called *On Hypothetical Syllogisms* (*De hypotheticis syllogismis*).

Boethius makes no substantial contribution to the theory of the syllogism. He was foremost an important transmitter of the theory to later logicians and his works contain a clear presentation of the Aristotelian theory. The presentation is, however, in one important aspect different from Aristotle's. In Boethius works, the categorical sentences involves "is" (*est*) and not "belongs" as Aristotle's. The four sentences thus become

- A – "Every *B* is *A*."
- I – "Some *B* is *A*."
- E – "No *B* is *A*."
- O – "Some *B* is not *A*."

In this way, it is more obvious that they are subject predicate sentences and moreover that the syllogisms are deductions and not conditional sentences. A consequence of this is that the four figures will look different as well, namely (Table 5).

Systematically, Boethius change makes no difference whatsoever and all medieval logicians writing after him universally adopted it, but it makes the evident character of the first-figure syllogisms less apparent. This is not a quote

The first known commentary on the *Prior Analytics* in the Latin West can be found in an anonymous work. The author has been called Anonymous Aurelianensis III and the work dated to c. 1160–1180. The theory of assertoric syllogism was repeated and summarized in almost all logic works from the early thirteenth century, but there are no major commentaries until the 1240s when Robert Kilwardby (d. 1279) writes his *Exposition on the Books of the Prior Analytics* (*In libros Priorum analyticorum expositio*).

Syllogism, Theories of, Table 5 The four figures according to Boethius

I	II	III	IV
$B-A$	$A-B$	$B-A$	$A-B$
$C-B$	$C-B$	$B-C$	$B-C$
$C-A$	$C-A$	$C-A$	$C-A$

Kilwardby has very little to add to the theory of assertoric syllogism, but his interpretation of the modal syllogistic is quite remarkable and highly interesting. It was also very influential in the thirteenth century; for example, Albert the Great, Simon of Faversham, and Radulphus Brito all follow him in their interpretations, which means that all the major commentators of the *Prior Analytics* in the thirteenth century followed Kilwardby.

He assumes from the beginning that Aristotle's theory is correct and makes it his project to find the interpretation that shows this. He begins by considering a counter-example to the accidental conversion of necessity sentences, namely,

- (4)
"Every literate being is necessarily a human being."

According to the conversion rules accepted by Kilwardby (4) should be converted to

- (5)
"Some human being is necessarily literate,"
(4)
is obviously true while (5) is false.

Kilwardby preferred solution to the above counter-examples is based on a distinction between sentences that are necessary *per se* and those that are necessary *per accidens*. He writes, When it is said: "Every literate being is necessarily a human being," this subject is not something which can be said *per se* of this predicate, but since "literate being" is not separated from that which belongs to a human being itself, the proposition is conceded to be necessary, but when a proposition is necessary in this way it is necessary *per accidens*. Therefore, when Aristotle says that necessity propositions are convertible, he means that only the propositions that are necessary *per se* are convertible.

The idea is here that since "human being" is not predicated *per se* of its subject "literate being," the sentence (4) is not a *per se* necessity sentence and, therefore, not convertible. (4) is a necessity sentence, not of the *per se* type, but only of the *per accidens* type, since it is necessarily true only in the sense that being a human being and being literate are not separable. Kilwardby implies that the relation between subject and predicate term must be of a

special kind if a sentence is to be called necessary *per se*. In (4), "literate being" and "human being" do not have the close *per se* relation Kilwardby demands of a convertible sentence.

Kilwardby thinks that sentences *per se* should be understood in the way Aristotle explains them in *An. Post.* I.4–6. Aristotle discusses four different notions of *per se* (*kath' hauto*) predication, but Kilwardby seems only to have the two first in mind when referring to *per se*. Aristotle says that the first type of *per se* predication (*per se primo modo*) occurs when the definition of the subject includes the predicate. The second type of *per se* predication (*per se secundo modo*) occurs when the definition of the predicate includes the subject. The best characterization of the first relation is the genus-species model, that is, that the definition of a species includes its genus. The second relation is often characterized by a *proprium* (property), since a *proprium* is included in the definition of a subject; for example, in "a human being is able to laugh." The term "human being" is included in the definition of the predicate "being able to laugh." A sentence is *per se* necessary if it includes any of these two predications, according to Kilwardby. Necessity *per accidens* belongs to all other necessity sentences that do not have the intrinsic relation between subject and predicate.

Around the time, William of Ockham (c. 1287–1347) wrote *Summary of Logic* (*Summa logicae*). Medieval logic was starting to change. More emphasis was put on the theory of consequence. Such a theory was developed by Abelard as part of his discussion of the topical inferences and the hypothetical syllogism. During the thirteenth century, it was developed as part of the topics, but in the fourteenth century, there started appearing works solely on consequences. The most famous one is perhaps John Buridan's *Treaties on the Consequences* (*Tractatus de consequentiis*), but we also find earlier authors like Walter Burley that stress consequences over syllogisms. Burley probably wrote *On the Purity of the Art of Logic* (*Puritate de arte logicae*) as an answer to Ockham's famous book. For Ockham, however, the most important formal inferences are still syllogisms, and he devotes most of Book III of the *Summa* to it.

John Buridan (c. 1300–1358) is perhaps the foremost logician of the Middle Ages and in his hands the theory of the syllogism is reworked and developed well beyond anything seen before in the history of logic. The two foremost logical works of Buridan are the *Treaties on Consequence* and the *Summulae de dialectica*.

In the *Treatise*, he bases his theory of the syllogism on his philosophical semantics and treats the syllogistic inference as a special case of a much wider theory of consequences. As his immediate predecessors he is almost uninterested in the assertoric syllogistic and moves quickly to temporal, oblique, variation, and modal syllogisms, but this does not hinder him from making some original contributions to the theory.

A syllogism is a formal consequence, according to Buridan. The theory of syllogism is hence only a branch of the theory of formal consequence. It is distinguished by having a conjunctive antecedent and a single sentence as consequent, and furthermore by having involving three terms. This last condition is not a necessary one since Buridan also treats syllogisms involving more than three terms.

Buridan treats all the three famous figures and he notes that the conclusion can be either direct or indirect. In an indirect conclusion, the minor term is predicated of the major instead of the other way around. Since the premises are part of a conjunction as the antecedent of a consequent, they can easily be transposed, which means that he can define the fourth figure as a first figure with transposed premises and an indirect conclusion. Hence, he does not need to discuss it independently of the first figure.

A formal consequence holds for Buridan by the principle of uniform substitution, that is, such a consequence is valid for any uniform substitution of its categorematic terms. A syllogism is a special kind of formal consequence since it requires for its validity that terms be conjoined across sentences. How the principle of uniform substitution works in such a case is a bit tricky and it requires him to bring his general semantics and the notions of distribution into the theory of the syllogism. To spell out the relation of the terms and hence the validity of first figure syllogisms, he reformulates

the traditional *dictum de omni et nullo* rules. They can be formulated in the following way:

(7)

Any two terms, which are called the same as a third by reason of the same thing for which that third term supposits, not collectively, are correctly called the same as each other.

(8)

Any two terms, of which one is called the same as some third term of which the other is called not the same by reason of the same thing for which that third term supposits, are correctly called not the same as each other.

One could say a lot about these rules, but the term that carries most of the weight here is of course “supposits.” Supposition is a theory of reference, and it is terms coreferentiality in the different sentences in a syllogism that is going to be the decisive thing in determining whether the principle of uniform substitution is satisfied or not. It is at this point, he brings in his theory of distribution.

The rules governing distribution of terms in a sentence is given as part of his account of common personal supposition. A term is distributed if it in a sentence is taken to refer to all it signifies – the most obvious example is if the term is in the scope of a universal quantifier. He gives five rules for when a term is distributed, but in short, one can say that universals distribute subjects, negatives distribute predicates, and no other terms are distributed. If we stay within the square of opposition, then we get that universal affirmative sentences have the subject term distributed, universal negatives have both terms distributed, particular affirmative have neither term distributed, and particular negative have only the predicate term distributed.

Given the theory of distribution, he turns his attention to the syllogisms, and we see now that in order for a combination of premises to be acceptable, the middle terms need to be distributed, otherwise we will not have a formally acceptable consequence. Buridan approaches it combinatorially. Given four different sentences and two places they can be in, we get 16 possible combinations. Some of these can, based on the rules for distribution, be ruled out immediately. A combination with only negative premises will not work at all; hence, EE, EO, OE, and OO must be rejected. II has both middle terms undistributed

Syllogism, Theories of,

Fig. 1 John Buridan's octagon of opposition for modal propositions

and can thus be rejected. In the first figure IA, OA, and OI have a middle term undistributed. The other eight are accepted. In the second figure, we see that AA, AI, and IA must be rejected because of an undistributed middle term. The other eight are accepted. In the third figure IO and OI have an undistributed middle but the remaining nine combinations are accepted.

There are some surprises in the assertoric syllogistics in Buridan's presentation. In the second figure, he accepts indirect conclusions for IEO (Tifesno) and OAO (Robaco), and in the third figure indirect conclusions for AOO (Carbodo), AEO (Lapfeton), and IEO (Rifeson). He also accepts syllogisms to what he calls "uncommon idiom for negatives," that is, when the predicate term precedes the negation. This adds another three in the first figure and two in the second. If we add this up and include all the indirect conclusions, we get 33 valid moods as opposed to 19 in the Aristotelian syllogistic. If we then add the supplementary subalternate (weakened) conclusions, we get in the traditional 24 valid moods, but in Buridan's systematization of the theory we get 38.

A theory that all thought was perfect and could not be developed further is in the hand of Buridan changed quite radically. As a matter of fact, Buridan is quite right in accepting these additional 14 moods. They are valid. After having done all this in just a few pages – as mentioned Buridan is rather uninterested in the assertoric syllogistics – he turns to the temporal, oblique, and modal syllogistics. Of these, it is the modal syllogistics he spends the most time on.

A temporal syllogism is made up of sentences involving temporal ampliation of the copula. In such a sentence, the supposition of the subject term is

extended to include past and future things as well as present. The syllogistics for sentences involving oblique terms is important for Buridan's general theory of consequence, since it is here that we find the rules governing the behavior of oblique terms in distributive contexts. His investigation is extraordinarily detailed and maintains a high level of rigor, which is almost unbelievable for someone not having the symbolic tools of contemporary logic.

The syllogistics for composite modal sentences is straightforward and Buridan uses only a couple of pages in the *Treatise on Consequences* to outline its basic structure. The theory of the syllogism for divided modal sentences is given a much more thorough treatment. For Buridan, a modal copula always ampliates its subject term to stand for not only present, past, and future beings but also possible beings unless the supposition of the subject term is explicitly restricted to only actual beings. Based on this, he can outline an exhaustive account of the logical relations between quantified divided modal sentences, which he presents in the octagon of opposition. Slightly simplified and assuming that the complete octagon can be formed by some trivial equivalences holding between the modalities it can be presented in the Fig. 1.

Syncategoremata

Netherlands

Abstract

The distinction between categorematic and syncategorematic words (*syncategoremata*) can be traced to two main sources, viz., the grammarian Priscian (sixth century) and the famous author (commentator and translator of Aristotle's works) Boethius (c. 480–526). With the increasing intertwinement of grammar and logic from the eleventh century and the emergence of treatises on logic in the twelfth century onward, the *syncategoremata* gradually became a subject of interest in their own right. The development of theories on *syncategoremata* is closely connected with the emergence of theories on the properties of terms, particularly theories of supposition. The most important factor leading to the development of these related areas of study is the medievals' keen interest in the interpretation of linguistic expressions within the context of the propositions they occur in, a method of analysis that has become known as the contextual approach (De Rijk, *Logica modernorum*. A contribution to the history of early terminist logic. vol I: On the twelfth century theory of fallacy. vol II, Part one: The origin and early development of the theory of supposition; Part

two: The origin and early development of the theory of supposition. Texts and indices. Van Gorcum, Assen, 1962–1967).

Generally speaking, the class of words labeled *syncategoremata* included expressions that, more than their categorematic counterparts, require a context of expressions in order to be meaningful. Nouns and verbs, such as “man” and “to run,” were considered as having a more definitive meaning than expressions like “every” or “not.” In the early days of the *syncategoremata* studies, the criteria for distinguishing categorematic from syncategorematic words were not entirely clear; authors used both syntactic and semantic criteria to separate the two classes from each other. The different ways of describing the two classes of words sometimes led to different lists of syncategoremata (Braakhuis, *De 13de eeuwse tractaten over syncategorematische termen*. Deel I: Inleidende studie. Deel II: Uitgave van Nicolaas van Parijs' *Sincategoreumata* (diss.). Kreps, Meppel, 1979).

Throughout the Middle Ages, logicians developed their own views about the precise characteristics of *syncategoremata*, including their identity, nature, and (linguistic and logical) function(s). The late twelfth and entire thirteenth centuries produced separate treatises on syncategorematic words, and later on, the topics and analyses featuring in them were incorporated into works of a wider range. The medievals' ideas on *syncategoremata* are not only important for understanding their accounts on language and logic but also shed light on their views in other areas of research (Braakhuis, *De 13de eeuwse tractaten over syncategorematische termen*. Deel I: Inleidende studie. Deel II: Uitgave van Nicolaas van Parijs' *Sincategoreumata* (diss.). Kreps, Meppel, 1979; Kretzmann, Syncategoremata, exponibilia, sophismata. In Kretzmann N, Kenny A, Pinborg J, Stump E (eds) *The Cambridge history of later medieval philosophy*. Cambridge University Press, Cambridge, pp 211–245, 1982).

Historical Development of the Concept

The use of ‘syncategorema’ as a technical term derives from a well-known passage in Priscian’s *Institutiones grammaticae*, in which he lists the parts of speech (*partes orationis*). In this passage, Priscian refers to the “dialecticians” (most probably the Peripatetici), who distinguish between two parts of speech: the first kind include nouns and verbs, such that when they alone are combined in a proposition they make up a complete statement; the second kind are called *syncategoremata*, that is, consignifying, i.e., having a particular meaning in combination with categorematic words.

While we do not find the expression *syncategorema* as such in his works, Boethius does have clear views about the notion of consignificare. He considers nouns and verbs (including adverbs, participles, pronouns, and interjections) as the only parts of speech; conjunctions and prepositions are not parts of speech, because they either do not have a complete signification of their own or none at all, except when they are used in combination with the ones that do. This idea fits in with his view that only nouns and verbs can function as the subject or predicate of a proposition; the copula *est* (is) and *non est*. (is not), the expressions *omnis* (every), *nullus* (no), and *aliquis* (some) (i.e., the *signa quantitatis*, expressions we now know as quantifiers) do not, but merely indicate the quality and quantity respectively of the propositions they occur in, e.g., *omnis homo est animal*. The semantic function of these signs of quality and quantity is to consignify.

The *syncategoremata* became a distinct topic of interest from about the middle of the eleventh century, when logic first entered the domain of grammar and the two fields became increasingly intertwined. Grammarians commenting on Priscian’s works were particularly interested in providing explanations for the division into different parts of speech, and both grammarians and logicians attempted to deal with the correct way of interpreting linguistic expressions. The logicians’ concern with the *syncategoremata* is to be seen in the context of the *logica modernorum*, which

emerged from the second half of the twelfth century. From then on, the study of syncategorematic words became part of the standard literature on logic.

Several works on grammar, such as the *Ars disserendi* by Adam of Petit Pont (1132), the *Glosses on Priscian* by William of Conches (c. 1080–1154) and the *Summa super Priscianum* by Peter Helias (taught in Paris c. 1140), pay attention to the semantic function of *consignificare*. While Adam appears to confine *consignificatio* to prepositions and conjunctives, his account offers evidence that he also uses the expression in a broader sense for words that acquire a more determinate meaning within a particular context. William’s treatise explicitly distinguishes several uses of the expression *consignificare*, viz., as equivalent to “to secondarily signify” (*secundario significare*), as in “a verb consignifies time” (*verbum consignificat tempus*) to “denominate” (*denominare*), as in “the predicate consignifies the subject” (*predicatum consignificat subiectum*), and as used for that which by itself signifies nothing, but only when it is combined with some other meaningful expression. It is in this latter way that conjunctions and prepositions consignify. He considers the *signa quantitatis* a separate group of nominal expression, alongside expressions that signify a substance (such as “Socrates” and “man”), those that signify things that inhere in a substance (such as “whiteness” and “blackness”), and the ones that signify fictitious entities (such as “goat-stag” and “chimera”); they do not signify a substance or quality, but modes of speaking about things (*modus loquendi de rebus*). Peter Helias also devotes considerable attention to Priscian’s division of parts of speech. In his view prepositions and conjunctions are indeed classes of words and have the same kind of semantic function as prepositions, conjunctions, adverbs, and pronouns do, viz., to consignify (Braakhuis 1979).

In the *Dialectica*, the *Logica ingredientibus* and the *Glossae super Perihermeneias*, the logician Peter Abelard (1079–1142) explicitly devotes attention to the semantic function of

prepositions and conjunctives; of these expressions he says that they have no definitive meaning on their own but only in combination with other linguistic expressions or that they have no meaning whatsoever but only come to consignify when they are combined with other expressions. In general, their function is to indicate some property of that which is signified by the nouns and verbs they are conjoined with. The *signa quantitatis* are counted among the parts of a proposition (*partes propositionis*); they are nominal expressions, but it is difficult to decide what they signify. Of the expressions *est* and *non est*, like *si* (if) and *et* (and), he also says that they do not have a meaning of their own; they only contribute to the affirmative or negative force (*vis affirmationis vel negationis*) of an expression, because they produce a composition or division in the mind. Abelard identifies the basis of these expressions with the intellect's way of conceiving that which is signified by the subject and predicate of the proposition at issue. The expressions *necessarium* (necessary) and *possibile* (possible) do not have a signification of their own either; their semantic function is comparable with that of the copula and conjunctives.

In the period after Abelard, the treatment of syncategorematic terms is incorporated in discussions on fallacious reasoning. In a number of works dating from the third quarter of the twelfth century, syncategorematic words are extensively discussed: they are considered important because they can lead to fallacies and misunderstandings. In the *Fallaciae Parvipontanae* syncategorematic words feature in a section on the fallacy of equivocation: the class of words labeled as *syncategoremata* is identified with that of indeclinable expressions. The *Ars Emmerana* also mentions expressions like *unum* (one), *tantum* (only), *solus* (alone), and *nisi* (unless), which are identified as words that can easily produce fallacies. In the *Tractatus De univocatione Monacensis*, we find similar remarks to the effect that expressions like *tantum*, *solus*, and *nisi* can cause problems in inferences. The *Ars Meliduna* considers the *signa* and the words *solus*, *tantum*, and *preter* as *syncategoremata*. The *Tractatus Anagnini* devotes discussions to distributive

terms, such as *omnis*; infinite terms, such as *non-homo* (not-man); and exclusive terms, such as *tantum* (only), *nisi* (unless), *preter* (but), and *solus* (alone). The focus is on the congruity and incongruity of propositions. In the *Introductiones Montanae maiores*, reference is made to words that cannot be classified as parts of speech, because they do not have a certain *significatio*, but are said to “consignify” instead: examples mentioned are *pro* and *si*, the latter of which was later classified as a syncategorematic word. The tract also pays attention to the *signa quantitatis* and how to interpret a number of problematic propositions in which they occur.

The *Dialectica Monacensis*, which was presumably written somewhere between the end of the twelfth and the beginning of the thirteenth century, lists three kinds of equivocation, one of which is connected with the occurrence of a syncategorematic word in a proposition: among such words are exclusive and exceptive words, prepositions and conjunctives (that can cause ambiguity). Furthermore the expressions *incipit* (begins) and *desinit* (ceases) are reckoned among the *syncategoremata*; so is *est*, insofar as it involves the composition of subject and predicate. Although there is evidence suggesting that the author of the *Dialectica Monacensis* also wrote a treatise on *syncategoremata*, the treatises on which research has been done all stem from the thirteenth century. Other treatises, which deal with *sophismata* (*Sophistaria*), take grammatical and logical distinctions as their starting point for the study of *syncategoremata*.

In general, the thirteenth century forms the highlight of intensive study of syncategorematic words. Throughout this time, the medievals gradually came to form their own ideas about the distinguishing features, the nature and function of syncategorematic words. *Syncategoremata*-treatises proper, which emerged from about the last quarter of the twelfth century onward until the final quarter of the thirteenth century, were devoted to the systematic explanation of syncategorematic words, adding puzzling sentences (*sophismata*) to demonstrate the logical behavior of these words in different propositional contexts. *Syncategoremata* were also at the focus of interest

in treatises called *Distinctiones*, which were manuals organized around logico-grammatical rules connected with the use of syncategorematic expressions in specific propositions. The difficulties surrounding the use of *syncategoremata* in propositions featured in *sophismata* collections, which came to be known as *Abstractiones*, after the title of a work by the thirteenth-century master known by the name of Magister Richard Sophista; these works were not so much devoted to theoretical reflections on the nature of *syncategoremata*, but instead offered an array of puzzling sentences containing one or more syncategorematic expression along with possible ways to solve them.

Syncategoremata treatises were compiled by several authors, such as Robert (Roger?) Bacon (whose treatise was written around the first quarter of the thirteenth century), Jean le Page (who taught in Paris between 1225 and 1235), Peter of Spain (whose treatise dates from the second quarter of the thirteenth century), William of Sherwood (who wrote his treatise between 1230 and 1240), Nicholas of Paris (whose treatise was written between 1240 and 1250), and Henry of Ghent (whose tract was written between 1240 and 1250).

In the fourteenth century, all kinds of material discussed in the *syncategoremata* treatises find their way into more general works on logic and works devoted to *sophismata*. Some of these *sophismata* specifically deal with physical problems, particularly those connected with the analysis of motion; examples are found in the tradition of the *De probationes propositionum*, inspired by Richard Billingham (fl. c. 1340). Prominent authors such as William of Ockham (c. 1287–1347), John Buridan (c. 1300–1362), and Peter of Ailly (1350–1420) speak about the distinction between categorematic and syncategorematic expressions in connection with their accounts of mental language.

Systematic Development of the Concept

Throughout the history of logic and grammar, we gradually see that the list of words labeled as syncategorematic is expanded. While initially

only conjunctives and prepositions were counted as such, the list ultimately came to include all the words that do not function as the subject or predicate of a proposition, but nevertheless modify the expressions they are conjoined with and thus affect the interpretation of the entire proposition they occur in.

The lists of syncategorematic words continued to vary, because two distinct criteria (based upon an ambiguity in the notion of *consignificare* and *dispositio*) were used to discern categorematic from syncategorematic words. The more syntactic criterion identifies syncategorematic words as those that do not function as the subject or a predicate of a proposition but only modify the relationship between subject and predicate. The semantic criterion singles out syncategorematic words by their semantic function, as consignifying a disposition or circumstance of the “things” (*res*) indicated by the categorematic expressions they are conjoined with. The semantic criterion to distinguish the *syncategoremata* is initially the most dominant in the treatises of Robert (Roger?) Bacon, Nicholas of Paris, and Henry of Ghent, whereas in John le Page’s, Peter of Spain’s, and William of Sherwood’s treatises, the syntactic criterion prevails. However, even these two distinct criteria in themselves did not give a sufficient reason for labeling words as either categorematic or syncategorematic. Throughout their treatises, most authors in fact used both criteria to make the distinction, albeit to different extents. In treatises by English authors, we also find another distinction, namely, between the categorematic and syncategorematic use of certain expressions (e.g., “alone” (*solus*) and “infinitely many” (*infinita*)) (Braakhuis, 1979). While continental authors do not mention this distinction explicitly, they do have similar explanations as to how one particular word can be used in two different ways. For instance, in his discussion of the *sophisma* “infinitely many are infinitely many” (*infinita sunt infinita*), Henry of Ghent mentions that the word *infinita* can be taken to refer to *res* (“things”) of a specific amount, or it can be taken as a *modus*, indicating that whichever amount of things one has in mind, the amount of things at issue will always be larger.

The words labeled syncategorematic came to include the following: the verb “is” used as a *tertium adiacens* (i.e., as part of an attribution); the negation “not”; the modal adverbs “necessarily” and “contingently”; the exclusives “only” and “alone”; the exceptives “except” and “unless” (preter, preterquam); the distributive signs “every” (*omnis*), “whole” (*totum*), “both” (*uterque*), and “of whatever kind” (*qualislibet*); the consecutives “if” (*si*), “unless” (*nisi*), and “but that” (*quin*); the copulatives (like “and”); the disjunctive “or” (*vel*, *aut*); the adverbs “whether” (*an*); and the verbs “begins” (*incipit*) and “ceases” (*desinit*). The *Syncategoremata* authors were inclined to say that syncategorematic words do not signify, but rather carry out what they indicate. Thus, the word *negatio* signifies a negation (as a something), whereas the expression *non* (“not”) in a sentence performs it or carries it out (Nuchelmans 1988). In most *syncategoremata* treatises from the continent, the negation “not” was marked as the basic principle of all other syncategorematic expressions, into which they could all be analyzed. In the fourteenth-century accounts of mental language, the focus on the function of syncategorematic expressions became predominant (Braakhuis 1979).
