Abelard, as in most things, is renowned for holding a controversial position on the extent of God's power. His thinking on the subject stems from what became known as the principal opinion of the twelfth century nominalist school, viz. once something is true, it is always true (*semel est verum, semper est verum*). God's will, like his knowledge, never changes. Whatever has been, is, or will be are events God has always known and events God has always willed. For God, then, to act differently would be to deviate from the axiom that what is true is always true. The consequence of such thinking manifests itself in a God whose power, from the point of view of other twelfth century thinkers, was very limited. God's capacity to act is limited to what he has done, is doing, or already plans to do. While Abelard can hold that God can do whatever he wills, he must admit that God can *only* do what he wills and nothing more.

For many thinkers such a restriction on God's capacity was unacceptable. Because of his influence on the rest of the Middle Ages, Lombard was the most important of Abelard's critics. But Lombard was more than a critic. In distinctions 42–44, where Lombard explicitly treats the issue of

Divine Power, he adopted many of Abelard's formulations, including the fact that God's knowledge and God's will do not change with the passing of time. However, in distinction 43, Lombard takes a stand against Abelard's conclusion that God can only do what he wills. Lombard makes a separation between God's pure capacity and his volition, saying, "God is able to do many things he does not will to do, and is able not to do what he does." In short, Lombard holds that sheer power goes beyond volition. God contains within himself the raw power to do anything that does not involve a contradiction. Whether he wills such things is a different matter.

With the introduction of a distinction between God's sheer capacity and his ordained will in his *Libri sententiarum*, Lombard determined the direction of all subsequent discussions in the medieval period. By the mid-thirteenth century, we find in the *Summa* of Alexander of Hales one of the fullest early descriptions of the distinction. Alexander writes that God's power, considered *absolute*, exceeds the divine will. But when God's power is considered from the standpoint of what God actually wills, *ordinate*, then God's power and will are coextensive (*Summa Halensis*, pt. 1, inq. 1, tr. 4, q. 1, m. 2, c. 2). At this point in history, the language of *potentia absoluta* and *potentia ordinata*, found in Alexander, did not suggest that there were two different powers in God from which he acted, but rather expressed two ways of looking at God's one single power. One way of looking at the power was absolutely or *absolute*, in abstraction from all other considerations. The second way was as an ordained power or *ordinate*, in connection with what God actually wills. The idea that there were two distinct powers in God was a later innovation.

Despite this nuanced use and sophisticated understanding of the Divine Power distinction developed by several thinkers throughout the twelfth and thirteenth centuries, the discussion of God's power at the level of *potentia ordinata*, for some, still appeared to place an unacceptable restriction on what God can do here and now. Thus, it appeared to carry with it a certain propensity toward the necessitarianism of the extreme Aristotelianism that many feared. This

affinity with a doctrine of necessity came to be a concern for thinkers during and after the condemnations of 1277. Consequently, some theologians after 1277, particularly concerned with safeguarding the freedom of God, were prone to use the distinction in different manner than was first intended, namely, as a distinction between different sources of power from which God could choose to act.

In addition to the concerns of post-1277 theologians, there was also a notable contribution from the burgeoning field of canon law at the turn of the fourteenth century. In attempts to safeguard the freedom of papal power, canon lawyers began speaking of papal power in terms of a distinction between power *de facto* and power *de iure*. Behind this distinction was the belief that the Pope had certain powers afforded him by the law (*de iure*), but that he also had the power to act outside of the law and even change the law (*de facto*). How canon law came to have an influence on the theological discussions of Divine Power is a complex story. However, the influence is unmistakable. John Duns Scotus often uses the language of *de facto* and *de iure* to accentuate the difference between a *potentia absoluta* and a *potentia ordinata* (e.g., *Ordinatio* I, dist 44; see Courtenay 1990: 101–103).

Throughout the rest of the fourteenth century, the Divine Power distinction was employed in various and often confused ways. Sometimes it was used only to highlight the hypothetical possibility that God could have acted differently, assuming of course that God's nature and will were other than they are. Other times, the distinction was used to emphasize the pure contingency of the created order. Such use emphasized that even though things typically act in a certain way, they need not necessarily act that way. God could in fact act out of his absolute power and change the current order and nature of things. This latter view, unfairly or not, has become in posterity closely associated with the *via moderna* of medieval nominalism and thinkers such as William of Ockham. Moreover, this latter use of the Divine Power distinction, emphasizing the contingency of the created order, was not without consequences for the progress of thought.

In the field of philosophy, the use of the distinction lies near the heart of fourteenth century mistrust about the level of certainty that natural reason could deliver. The introduction of the idea that God could change the created order left the once necessary relations between subject and accident, cause and effect, open to doubt. God could, for example, make a fire without heat despite its obvious contradiction with the current nature of things. Likewise, no longer could one be certain that if there was a cause it had to have an efficient cause. The oft repeated phrase, that "what God can do through secondary causes, he can do himself" suggested that although the natural order apparently requires that every event has a proper and mediate cause, God can on occasion suspend this requirement. God, in fact, could intervene and create the effect directly. In short, the use of Divine Power distinction to accentuate two unique powers in God caused many, by the mid to late fourteenth century, to call into question the amount of certainty that natural knowledge could claim for itself.

Theological discussions were also impacted by the later use of the Divine Power distinction, particularly regarding the issue of justification. Since the necessity of the created order was called into question by the activity of God's absolute power, it became plausible to conclude that former assurances of salvation through the activity of the church and causal effects of participation in the Eucharist no longer carried as much weight. In place of the older theology, which firmly accepted that God only acts from his ordained power, a new theology was offered that emphasized a covenantal relationship with God. This newer theology asserted that there are no assurances in the order of creation or in the ordained ministry of the church about the procurement of salvation. Rather it is always possible for God to act otherwise. For example, the question of whether God could damn Peter and save Judas was often discussed. Heiko Oberman has done much to connect this emerging theological discussion to the momentous events of the Reformation.

Finally, the influence of the Divine Power distinction also had ramifications for the beginnings of modern science. Scholars have highlighted the

fact that the ability to question the necessity of the created order made it possible for thinkers to begin envisioning new conceptual models of the world. Once the necessity of assumed relations was called into question, new possibilities could be envisioned. Pierre Duhem, at the beginning of the twentieth century, was one of the first historians of science to insist on the importance of the principle of *potentia absoluta* for understanding the emergence of modern science. Since he first presented this thesis, a long debate has continued over its validity. More recently, Edward Grant has renewed in certain respects the thesis of Duhem, and Francis Oakley has pointed to evidence of the continuing use of the Divine Power distinction well into the modern period.

Divine Suffering (Theopaschism)

Matthew J. Pereira

Department of Theological Studies, Loyola

Marymount University, Los Angeles, CA, USA

Abstract

Divine suffering (theopaschism) was a recurrent philosophical issue within theological discourse in the Middle Ages. Informed by the Scriptures, the Church Fathers, and then varied Hellenistic philosophical frameworks, Christian theologians largely agreed God was incapable of suffering as the divine nature was eternal, perfect, and immutable. Suffering meant there was a deficiency or change in the nature of something, which was deemed impossible for God, who by definition, was in the perfect state of eternal happiness. Theologians asserted that God was impassible, that is, without passion (*apatheia*) or disturbance that would entail change toward the more deficient. At the same time, the majority of theologians professed that Jesus Christ, the Word of God

and second person of the Trinity, was incarnated and suffered death upon the cross for our salvation. Medieval theologians negotiated this tension between divine impassibility and *apatheia* with their belief in Jesus Christ, who was of the same substance with the Father God and the Son (Word) of God who suffered and died through crucifixion. From the early church throughout the Middle Ages, theologians advanced various arguments, wherein they sought to protect the divine nature from suffering while also professing the Word of God suffered in the flesh to heal and restore humanity.

Anthropomorphism and Divine Suffering Within the Biblical Narrative

From the Pentateuch to the writings of the New Testament, God is depicted by anthropomorphic language, for instance, the Book of Genesis declared that the Lord “was sorry that he had made humankind on earth, and it grieved him to his heart” (*Genesis* 6:6). Furthermore, the emphasis on divine wrath persisted throughout the Scripture, as the Apostle Paul declares, “For the wrath of God is revealed from heaven against all ungodliness” (*Romans* 1:18). Medieval theologians argued that anthropomorphic language was not to be taken literally as God was not an actual “strong tower” (*Proverbs* 18:10) or “refuge and fortress” (*Psalms* 91:2) any more than literally moved to human emotions such as compassion and repentance. The biblical narrative transitions from the more anthropomorphic to a historical account of Jesus Christ, who is “God with us” (*Matthew* 1:23) as the Word of God “lived amongst us in the flesh” (*John* 1:1–14) and was “like his brothers and sisters in every respect. . . to make a sacrifice of atonement for the sins of the people” (*Hebrews* 2:17). God is literally enfleshed and incarnated in Jesus of Nazareth, which led to questions on the relationship between the divine nature and divine suffering, such as does God in Christ Jesus experience hunger, suffering, and death?

The foolishness of these questions was not lost within the New Testament. In his first letter to the Corinthian church, Paul declared, “For Jews demand a signs and Greeks desire wisdom, but we proclaim Christ crucified, a stumbling block to Jews and foolishness to Gentiles, but to those who are the called, both Jews and Greeks, Christ the power of God and the wisdom of God” (*1 Corinthians* 1:22–24). Returning to this declaration in the thirteenth century, Thomas Aquinas asserted that the cross of Christ is foolishness to the perishing because it contains the impossible by human wisdom, which is, “God dies, and that the omnipotent falls prey to the hands of violent men” (*In 1 Cor.* 1.3 [no. 47]). Not only unbelieving Jews or Greeks, but the earliest followers of Jesus struggled with his crucifixion and death. While walking with his disciples, Jesus revealed the Son of Man (himself) must undergo “great suffering” and “be killed” to fulfill his mission. Upon receiving this news, Peter took Jesus aside and rebuked him because the Messiah was not to be killed. Aroused by these interventions of his disciple, Jesus denounced Peter by declaring, “Get behind me, Satan! For you are setting your mind not on divine things but on human things” (*Mark* 8:31–33). The disciples expected Jesus to liberate Israel; thus, for the Messiah to suffer crucifixion ran contrary to their worldview. Following the resurrection of Christ, the early church leaders and subsequent theologians reinterpreted the crucifixion as part of the salvation story, which now extended to all who believed in the salvific power of Christ crucified.

The centrality of Christ crucified in the Christian tradition is underscored by the Eucharist, which was instituted by Jesus in the upper room, when he took and broke a loaf of bread, gave it to his disciples, instructing them, “This is my body, which is given for you. Do this in remembrance of me.” Jesus then took the cup and taught them, “This cup that is poured out for you is the new covenant in my blood” (*Luke* 22:17–20). Christ crucifixion is professed in the liturgies and creeds of the Catholic Church (i.e., Latin and Greek churches of the Middle Ages). Christ crucified stands at the center of the sacramental life; however, theologians have wrestled with divine

suffering, in part, due to Greek philosophical teachings and, more so, on account of the biblical testimony that attests to a sovereign, perfect, and eternal God.

Hellenistic Philosophy and Divine Suffering

The question of influence is difficult when ascertaining the variegated relationships between the Hellenistic philosophers and Christian theologians related to the issue of divine suffering. Adolf von Harnack (1851–1930) is well-known for arguing that Greek philosophy sullied the original teachings of Christianity (Harnack 1900). Following Harnack, it became a commonplace to assert that Platonism contorted the teachings of Jesus, including the doctrine that taught Jesus was the same nature as God as God alone can save humanity, exemplified by Athanasius of Alexandria (296–373) with the Nicene Creed of 325 (Elert 1957). The relationship between Hellenistic philosophers and Christian theologians was diverse and without a true center; however, it may be concluded that medieval theologians privileged the Scriptures and the rule of faith (*regula fidei*) over philosophical commitments. The Church Fathers adhered to the biblical notion of divine participation by correlating passibility and impassibility to proclaim that God loves us by divine compassion (Gavrilyuk 2004).

The Greek philosophical tradition espoused diverse teachings related to divine impassibility, but the prevailing position was that the gods could not be incarnated and suffered as it denoted change from perfection to imperfection. Critiquing Homeric stories about the gods and goddesses in the *Republic*, Plato (ca. 429–347 B.C.E.) argued that if gods changed, then it was to deficiency as the supreme divine nature can only be made a lesser being (*Republic* 380E–381A). Within his treatise *Timaeus*, Plato emphasized the mediator – the demiurge or motherly receptacle – who supported and located all changing things in this world (*Timaeus* 40E–41A). For Plato, the ultimate reality is eternal and immutable, whereas change always leads to the destruction of things (*Laws*

894A). Echoing Plato's critiques against the mythic stories on the gods assuming human form, Aristotle (384–322 B.C.E.) asserted that the unmoved mover was impassible and immutable; therefore, the divine nature was unmoved by this material world (*Metaphysics* 1073A). Christian theologians agreed with these teachings about divine perfection and immutability; however, at the same time, they believed the Word of God walked among us and suffered death for our salvation.

Early Christian theologians usually relied on the interpreters of Plato, notably Plotinus (ca. 205–269/270 C.E.), who synthesized various teachings from the Greek tradition. Plotinus advanced a tripartite hierarchy where the One was alone, transcending being and understanding; then second, the Mind (Intellect) was the mediating receptacle for intelligible forms; and third, the Soul was the lowest form that brings life into this world. Plotinus taught that the human ascent to the One entailed leaving our bodily and spiritual senses in flight from the “alone to the alone” (*Enneads* 6.9.11.51). Following Plotinus, late-antique theologians depicted the spiritual ascent toward the Father God in a similar manner; albeit the Unknown One (of Plotinus) was now revealed in Jesus. Whereas Greek philosophers largely rejected divine suffering in any form, Christian theologians professed, “God was pleased to reconcile to himself all things, whether on earth or in heaven, by making peace through the blood of his [Jesus] cross” (*Colossians* 1:20).

The Jewish philosopher, Philo of Alexandria (25 B.C.E.–50 C.E.), had significantly influenced Christian reflection on the divine nature and the Logos (Word) of God. In his treatise on divine immutability titled *On the Unchangeability of God* (*Quod deus immutabilis sit*), Philo affirmed the impassibility of God without employing the common Greek term *apatheia* (without passion) within this or any of his extant writings. Rather than employing the term *apatheia*, Philo depicted God as “non-turning (*atreptos*)” and without change; consequently, anthropomorphisms ascribed to God were intended for instruction without ontological significance. Rather than creating God in the image of philosophical

constructs, Philo employed Hellenistic teachings to distinguish the Lord from Hellenistic gods (Hallman 2007). Influenced by Philo's interpretive approach, the Church Fathers privileged the allegorical (spiritual) reading of Scriptures, which safeguarded the transcendent God from any literal take on the anthropomorphisms.

Divine Impassibility in the Second and Third Centuries of the Eastern Church

From the second century onward, theologians declared God suffered and died in Jesus Christ, the Incarnate Word of God, while insisting the divine nature was impassible. Christian apologists defended the rule of faith (*regula fidei*) against alternative readings of the Scriptures, including Docetism, which insisted the Son of God could never suffer bodily; therefore, the appearance of Christ crucified was phantasmal. Patripassianism (akin to Sabellianism Modalism) was another alternative reading that taught God existed in three modes (rather than in three relational persons) but was always one; therefore, Christ was the Father who literally suffered and died on the cross. Against these and other alternative positions, the Catholic Church professed that the Word of God, as a distinct hypostasis from the Father and Holy Spirit, died in his real flesh and bone body.

Eminent early theologians, including Ignatius of Antioch (ca. 35–108 C.E.), Justin Martyr (100–165 C.E.), and Irenaeus of Lyons (130–202 C.E.), taught that God was immutable and impassible and then reaffirmed the biblical story of God's descent in the person of Jesus Christ. With martyrdom awaiting him, Ignatius sent a letter to the Ephesian church, conveying his determination to follow the sacrificial example of Jesus Christ, who he called the "first passible and then impassible" incarnate God. According to Ignatius, the suffering incarnate God was worth emulation. Justin Martyr, who converted from Middle Platonism to Christianity, taught the incomprehensibility of God (*First Apology* 61.10) and then declared that the Scripture revealed a compassionate and long-suffering Father who healed

humanity through the Word of God. The Word of God reveals the Father but in Paul's words declared, that we now "see in a mirror, dimly...know only in part" (*1 Corinthians* 13:12). Writing against Gnostic teachers in *Against Heresies* (*Adversus Haereses*), Irenaeus asserted that God was impassible and immutable as he affirmed divine wrath without recognizing underlying contradictions against divine impassibility. Rather than outright rejecting divine suffering, early theologians embraced Christ crucified as the quintessential spiritual example of a life devoted to our loving Father, who is capable of divine wrath without enduring change in the divine nature. Tensions in the theological discourse on divine suffering continued among leading theologians including Alexandrian luminaries who reaffirmed divine impassibility with the salvific death of Jesus Christ.

Guided by Philo and Middle Platonism, Clement of Alexandria (150–215 C.E.) insisted that there were no natural relations or proper analogies between God and creation (*Stromata* 2.16.74–75). Whereas Ignatius imitated the passion of Jesus by martyrdom, Clement taught that the immutable and impassible nature of God was to be imitated by Christians (e.g., *Stromata* 5.11.67). Despite holding to divine impassibility in a vigorous way that passed his antecedents and contemporaries (Hallman 2007), Clement described God as the loving Father, and the Logos was called the image dwelling in us as our companion and counselor who feels with and for us (*Protrepticus* 10.84). Following Clement, Origen of Alexandria (185–254 C.E.) reflected upon the implications of God "for and with us" in Jesus Christ. Origen's most remarkable teachings on divine suffering are in his homily on Ezekiel 6:6, where he asserts the savior "descended to earth in pity for the human race, He suffered our sufferings before he suffered the cross and thought it right to take upon Him our flesh. For if He had not suffered, He would not have come to take part in human life. First he suffered then he descended and was seen." Historians have recognized the uniqueness of this passage from Origen, although, whether it was meant as a pedagogical point or a critique of divine impassibility is open to interpretation (Hallman

2007). Origen taught “God is impassible” and then later, in the same passage, asserted “God feels compassion for the one to be pitied; for God is not heartless” (*Selecta in Ezekiel* 16:8). Having reaffirmed divine compassion, Origen insisted on a figurative reading of biblical passages that depicted God with emotions that entail change and interruptions to eternal divine happiness (*Homily on Numbers* 23:2). Origen contended that God was unmoved by anger; therefore, divine vengeance was to be understood as instructive for correcting humanity. In *On First Principles* (*Peri Archon*), Origen declared that the divine Logos and human soul (of Jesus) are closely united but concluded the Word of God never suffered what Christ experienced within the body and soul (*Peri Archon* 2.9; 4.15).

Following Clement and Origen, purportedly, Gregory the Wonderworker (who was a student of Origen) wrote a treatise to Theopompus (*Ad Theopompum*) wherein he strongly affirmed divine suffering. Gregory contended if we held to the impossibility of divine suffering, then it prevented the divine will from acting freely. If the divine will is limited by divine nature, then, God cannot be truly omnipotent. Furthermore, Gregory distinguished divine suffering from true suffering, God freely chose to suffer for our salvation, and thus it was useful and salvific, which is different from real suffering. Gregory’s teachings are not entirely satisfying since human suffering can simultaneously be voluntary, utilitarian, and real suffering; nonetheless, his argument that divine suffering ultimately conquered real suffering and death was a notably unique teaching that went largely unnoticed by medieval theologians (Hallman 2007).

The father of Latin theology, Tertullian of Carthage (160–240), believed the Incarnation revealed that God suffered and changed (Hallman 2007). Furthermore, in *Against Marcian*, Tertullian argued that God had emotions that differed from human emotions in condition and expression in accordance with the incorruptible divine nature (*Adversus Marcionem* 2.16.6). Passibility was not according to divine nature as God is eternal and acting without the possibility of suffering (*Adversus Marcionem* 1.8.3). Many of these

aforementioned teachings of the Church Fathers became foundational for reflection in the fourth century when Emperor Constantine (ca. 272–337 C.E.) convoked the first ecumenical (i.e., universal) council at Nicaea (325) to promote unity in the Catholic Church (Hallman 1989/90).

Nicene Creed and Divine Suffering

Over 300 bishops attended this council, wherein the Nicene Creed was acclaimed as the catholic faith. The Nicene Creed professed “one Lord Jesus Christ, the Son of God, begotten of the Father, the only-begotten, that is, of the same essence of the Father, God of God, Light of Light, very God of very God, begotten, not made, being of one substance (*homoousios*) with the Father.” Thereafter, the creed declared “for us men, and for our salvation,” the Son of God “came down and was incarnate and was made man; He suffered.” The Constantinopolitan Creed of 381 reiterated the Nicene Creed, most notably, omitting “suffered” by adding Jesus Christ was “crucified” for “our salvation.” By the end of the fourth century, the imperially sanctioned creeds of the Catholic Church declared Jesus Christ was of the same substance as the Father and became incarnated, suffered, and was crucified, for our salvation. Reflecting upon the ecumenical creeds, the fifth-century theologians affirmed that the Son of God was crucified and then wondered, does this mean the divine nature suffered in Jesus Christ? The Nicene Creed, the Scriptures, and the Church Fathers were bedrock sources for reflections upon divine suffering from the fifth to the fifteenth century.

Cyril of Alexandria

Cyril of Alexandria and his rival Nestorius of Constantinople both assented to the Nicene Creed; however, the question of divine suffering led to a controversy resolved at the Council of Ephesus (431) (O’Keefe 1997; Gavriluk 2004). Nestorius taught that the divine and human natures were joined (*synapheia*) in Jesus Christ

rather than, as Cyril professed, this one unity (*henosis*) within the Incarnate Word of God. By teaching two natures (subjectivities) in Jesus Christ, Nestorius protected the divine nature from human suffering. Having taught “One nature (or hypostasis) of the Incarnate Word of God” as axiomatic to Christian faith, Cyril then furthered his argument in the *Twelve Anathemas* against Nestorius, where he declared, “Whosoever shall not recognize that the Word of God suffered in the flesh, that he was crucified in the flesh, and that likewise in that same flesh he tasted death and that he is become the first-begotten of the dead, for, as he is God, he is the life and it is he that giveth life: let him be anathema (anathema twelve).”

Cyril placed limits on Platonism by teaching divine suffering occurred in the flesh of the Word of God (Elert 1957). Within his later writings, such as the *Scholia on the Incarnation* (*Scholia de incarnatione Unigeniti*), Cyril shifted to “the impassible suffering” Son of God (O’Keefe 1997) and then returned to the theopaschite question in his mature treatise, *On the Unity Christ* (*Quod unus sit Christus*) (Hallman 1997). Although Cyril reached the status of a Church Father by the middle of the fifth century, his theopaschite teachings were problematic, thus marginalized and ignored up through the Council of Chalcedon (451). Council fathers at Chalcedon (save the Antiochene theologians) accepted divine suffering as a catholic teaching but resisted (ignored) Cyril’s *Twelve Anathemas* provocative language on the Word of God who suffered and died in the flesh (Diepen 1953).

Interventions by the abbot John Maxentius and his fellow Scythian monks, who interpreted the Chalcedonian Definition (451) with a Cyrillian emphasis on the Word of God who suffered in the flesh, led to the vindication of Cyril’s theopaschite teachings during the Second Council of Constantinople (553) under Emperor Justinian (ca. 482–565). Following this rehabilitation of his marginalized teachings, Cyril’s contributions shaped theological discourse in the Catholic Church (Greek East and Latin West) that proclaimed God freely loves the world by entering suffering and enduring death on the cross (Gavrilyuk 2004). Cyril’s teachings on divine

suffering stand as one turning point from Hellenistic constructs of divine passibility to a biblical understanding of God participating in this world (Elert 1957; O’Keefe 1997).

Augustine of Hippo and the Latin Tradition on Divine Impassibility

Turning momentarily from the crucified Christ to divine impassibility broadly in the writings of Augustine of Hippo (354–430), John Scotus Erigena (815–877), and Anselm of Canterbury (1003–1109) provides us with seminal teachings on the impassibility of the Father God in the Latin theological tradition. Augustine argues that human emotions ascribed to God are analogies intended to condescend to base human weakness (*De civitate Dei* XVI.53). He contends that divine pity toward humanity is devoid of misery; therefore, “if you take away the compassion which involves sharing of misery with him whom you pity, so that there remains the peaceful goodness of helping and freeing from misery, some kind of knowledge of the divine pity is suggested” (*De Diversis Quaestionibus ad Simplicianum* II.3). On divine repentance, Augustine contended that God’s mercy or repenting does not entail change since it was present by divine foreknowledge (*Enarrationes en Psalmos* 105.35). Augustine argued that divine judgment and divine wrath occur without emotional disturbance in God. For Augustine, *apatheia* or *impassibilitas* in Latin denotes an attribute understood as “a life without those feelings that take place contrary to reason and disturb the mind, [which] is clearly good and greatly desired, but does not belong to this life” (*De civitate Dei* XVI.8.4). Augustine insisted that nothing could hurt the divine nature but recognized emotive language was necessary even though words imperfectly described the loving outreach of God.

In *On the Division of Nature*, John Scotus argued in no way can the divine nature be acted upon as if God is a passive object. His commitment to divine impassibility comes to the foreground when recounting divine love may be understood in a metaphorical way. John Scotus

stated that God does not act or is acted upon, neither does God love nor is love. No category of action can be attributed to God; thus according to John Scotus, God is the “cause of all love, and is diffused in through all things, and gathers all things into one, and comes back to an end in Himself the loving movements (*De divisione naturae*).” Divine beauty draws all things to God; therefore, the divine subject is not acted upon as an object of love rather it is the one that draws all through divine beauty, that is, by the nature (attributes) of God.

The advent of scholasticism came with Anselm of Canterbury during the eleventh and the early twelfth century. Wrestling with paradoxes between divine impassibility and divine pity within *Proslogion*, Anselm declared that God shows pity by saving the wretched; then conversely, God could not truly be pitiful because the divine nature remains untouched by human sufferings and sinful deeds. Here, returning to Jesus Christ in *Why God Became Man* (*Cur Deus Homo*), Anselm concluded that whenever “we say that God suffers anything lowly or weak, we do not understand this in respect of the height of the impassible nature, but in respect of the weakness of the human substance which He wore” (*Cur Deus Homo* 1.8). Without suggesting strong dependence or direct influence, Anselm and medieval theologians discussed divine impassibility with terms that resonated well with the Greek philosophical tradition. When turning from their discussion of impassibility of God the Father to the crucified Word of God, medieval theologians distinguished between the divine nature and the human natures of Jesus Christ; thus in the passage cited above in *Cur Deus Homo*, the focal point of suffering is the human substance (nature) of the Incarnate Word.

Thomas Aquinas and Divine Suffering

Thomas Aquinas’ (1225–1274) contributions are unmatched by most Latin theologians except for Augustine, who he cites more than any other theologian or philosopher (Aristotle was his second most cited source). Thomas increasingly

relied on the Greek and Latin Church Fathers after collecting their writings throughout Dominican priories. Like the Scythian monks (Thomas never read their writings), Thomas held the Chalcedonian faith and Cyril’s *Twelve Anathemas* together, albeit, in a more rigorous philosophical framework. Reflective of the Scythian monks and Cyril, Thomas asserted that God suffered in a qualified manner in the Word of God. Employing the patristic notion of the “communication of idioms or properties (*communicatio idiomatum*),” he declared attributes belonging to the human and divine natures (of Jesus) may be predicated of both because of the union of the two natures in the Word of God (Gondreau 2009).

The Chalcedonian Definition (451) professed the unity of the one Word of God with a distinction between the human and divine natures (two nature Christology) where the “one and same Christ, Son, Lord, only-begotten, acknowledged in two natures which undergo no confusion, no change, no division, no separation.” Additionally, in his *Tome to Flavian*, Pope Leo affirmed the unity and distinctions in the Word of God by teaching, “Each form accomplishes in concert with the other what is appropriate to it, the Word performing what belongs to the Word, and the flesh (or the human nature) carrying out what belongs to the flesh (*Tomus ad Flavian*).” Following Cyril’s teachings in tandem with the Chalcedonian Definition, Thomas declared that the one hypostasis (or subject) of the Word of God possesses two natures wherein the human and divine are both attributed to the Incarnate Word.

Following John Damascene’s (676–749) teachings on the communication of the idioms, Thomas asserted Christ’s human actions belonging to the hypostasis of the Son of God. Thomas advanced a unique position (unshared amongst scholastics) teaching the humanity of Christ is the instrument (*organum*) by which the conjoined divinity acts within the one Word of God (*Summa Theologica* III, q. 62, a. 5). Jesus’ sufferings may be predicated of the divine nature because of the uniting of the two natures in the Word of God. Clarifying his argument, Thomas stated if the two natures are understood abstractly, then there is no predication between them, but when taken in

“concrete terms” as revealed in the hypostasis of the Incarnate Word, then one may “predicate indifferently what belongs to either nature” (*Summa Theologica* III, q. 16, a. 5). The distinction between the divine nature in itself and in the Word of God was vital for Thomas who explained the passion of Christ “belongs to the supposit (hypostasis) of the divine nature by reason of the passible nature assumed, but not on account of the impassible divine nature” (*Summa Theologica* III, q. 46, a. 12). One of the foremost interpreters of Thomas, John of St. Thomas (1589–1644), unpacked his teachings by explaining all predicates of the human and divine natures are concretely attributed to the supposit (hypostasis) of the Word; therefore we may assent to “the truth that God has died and suffered, etc., and that man is creator and God.” However, if nature is to be understood abstractly and apart from the supposit, then there can be no such sharing of this kind between the human and divine predicates (*Introduction to the Summa Theologiae of Thomas Aquinas*, Bk. I. Pt. III).

In addition to the Chalcedonian faith and John Damascene, Thomas returned to Cyril’s *Twelve Anathemas* within his monumental *Summa Theologica*. Thomas, like Cyril, emphasized the one hypostasis (or supposit) of the Word of God. Recounting the decisions at the Council of Ephesus (431), Thomas cited Cyril, “If anyone divides between two person or subjects those things which are said of Christ in the evangelical and apostolic scriptures...and applies some to a human being understood precisely as distinct from the Word of God, and others to the Word of God the Father alone, because only these are fitting of God, let him be anathema” (*Summa Theologica* III, q.2, a. 3, c.). Thomas contended that Christ’s sufferings must be attributed to the one subject of the Word of God, including the impassible divine nature, although, suffering is through reason of the human nature within the one hypostasis of the Word. Later in the *Summa Theologica*, Thomas cited again from Cyril’s *Twelve Anathemas*, declaring, “If anyone does not confess that the Word of God has suffered in the flesh, and been crucified in the flesh, let him be anathema,” then he concludes, “the suffering of

Christ belongs to a subject of the divine nature, by reason of the passible nature he has assumed, but not by reason of the impassible divine nature” (*Summa Theologica* III, q. 46, a. 12, c).

The Catholic Church, according to Thomas, teaches that “the impassible God suffers and dies” (*In 1 Cor.* 15:1 [no. 896]). Cyril, the Scythian monks, and, then centuries later, Thomas taught that the Word of God – who is fully divine and fully human – suffered in the flesh, although the divine nature was impassible. To clarify the difference between the Word of God who suffered in the flesh and the impassible divine nature, it is helpful to recount observations of a contemporary scholar who argued persons (e.g., subject and hypostasis) suffer, whereas nature does not suffer. The nature makes suffering possible in the given subject (Marshall 2009); thus, the humanity and flesh of Jesus made suffering possible in the Word of God.

Thomas distinguished between statements about Jesus as the subject (hypostasis) and assertions pertaining to his relations with human beings. Certain statements ascribed to Jesus do not belong to his nature; rather, they are made in connection with personal and relational properties (*Summa Theologica* III, q. 15, a.1, ad. 1). Among statements that are part of the constitution or nature of Jesus, Thomas included Christ incarnate who suffered for us, whereas the cry of forsakenness on the cross (*Matthew* 27:46 and *Mark* 15:34) belonged to the (second) relational type; therefore, these words were declared on behalf of humanity rather than reflective of the subjectivity of the Incarnate Word of God (*Summa Theologica* III, q. 15, a.1, ad. 1).

Divine Suffering and Medieval Philosophy

Without suggesting consensus, it may be concluded that medieval philosophers and theologians largely affirmed that the divine nature does not suffer or change; at the same time, they professed that Jesus Christ (Word of God and same substance with the Father) suffered and died on the cross for our salvation. Rather than resolving and reducing the mystery of salvation to a philosophical or theological argument, medieval theologians recognized

ambiguities and tensions within the mystery of salvation; then here, returning to Cyril, the Scythian monks and Thomas (among other theologians) declared that the Word of God suffered and died in the flesh (humanity) for our salvation.

Domingo de Soto

Benjamin Hill
Department of Philosophy,
The University of Western Ontario,
London, ON, Canada

Abstract

Domingo de Soto (1494–1560) was a sixteenth-century Paris-trained Spanish theologian. He is seldom remembered now, but his work was instrumental in the Thomistic revival of the sixteenth and seventeenth centuries. His philosophical influence was most significant in three areas. First and foremost were his contributions to the development of Thomistic natural law, especially concerning the development of individual, subjective rights within a natural law moral and legal framework. Second was his recognition that objects in free fall accelerate uniformly, which has been shown to have influenced Galileo’s thinking about free fall. Third was his infusing the logic of terms and propositions with sign theory, which was an important step to the development of semiotics and the logic of ideas, which subsumed logic to epistemology and dominated logical theorizing for nearly 300 years.

Domingo de Soto was born at Segovia in 1495. He began his studies at Alcalá but moved to the University of Paris in 1517. While at Paris (1517–1520) he studied under the influential nominalist Juan de Celaya and perhaps even attended lectures by Francisco de Vitoria, who was to found the “School of Salamanca” of which Soto was destined to become one of its greatest lights. He returned to Spain in 1520 to teach philosophy at Alcalá. In 1525 he joined the Dominicans and soon moved to the University of Salamanca. He published the first edition of his *Summulae* during this period. He taught theology at Salamanca from the “Chair of Vespers” from 1532 to 1549. His work on natural philosophy, *Super VIII libros Physicorum Aristotelis commentaria* dates from this period of Soto’s career. He also played a significant role in the first sessions of the Council of Trent (1545–1547). He was Charles V’s official theologian during the Council and was instrumental in the development of the Council’s position regarding grace and original sin. It was during this period that he wrote *De natura et gratia*, which was to have a significant influence on Molina. In 1552 he was promoted to the “Chair of Prime” in theology at Salamanca, replacing Melchior Cano. He retained this position until his retirement in 1556. It was during this period that he wrote his famous *De justitia et jure*. Soto died on 15 November 1560.

Soto’s influence on contemporaneous thinkers is greater than his current reputation among English-speaking historians of philosophy might suggest. In natural philosophy, he is thought to have been a significant influence on Galileo and is considered to have perhaps even helped lay the conceptual groundwork for the modern theory of dynamics. He also played a significant role in reorienting logical studies around the notion of a sign (*signum*), which was key to subsuming logic to epistemology and necessary for the development of the so-called logic of ideas. And in legal philosophy, Soto introduced and developed a subjectivist conception of rights, fusing it to the Thomistic objectivist conception of rights (*dominium*) and creating a new category of intrinsic, inalienable rights within individuals (Brett

1997, 2014). He was also instrumental in the sixteenth-century systematization and synthesis of Roman and canon law, which was a watershed moment in the history of legal and political thought (Gordley 1991).

The most noteworthy accomplishment of Soto’s natural philosophy seems to have been his description of free fall. In his commentary on Aristotle’s *Physics* Soto noted the phenomenon of uniform acceleration in a freely falling body through a uniform medium. This was at least 80 years before Galileo published his account of freely falling bodies in his *Dialogue on Two New Sciences*. Soto additionally noted that because of the uniformity of the acceleration, the speed of the falling body could be calculated via the mean velocity theorem, which had been developed by the Oxford Calculators. Another point of contact between Soto and Galileo appears to have been in the notion of *resistentia interna*, as argued by Camacho et al. (1994).

Duhem seems to have been the first to have noted a connection between Soto and Galileo, but William Wallace, who has devoted considerable effort to tracing the roots of and influences on Galileo, has done the most to bring Soto’s accomplishment in natural philosophy to light. Though there is clearly an influence between Soto and Galileo, there is nevertheless a fundamental difference between Soto’s mere description of this aspect of motion and Galileo’s analysis of it. There is no indication that Soto’s was anything other than an intuition or a serendipitous observation, unlike Galileo’s. In contrast to Galileo’s account, Soto’s was apparently not based on anything that might qualify as experimental data grounding his intuition.

Domingo de Soto’s *Summulae*, his main work on logic and logical theory, was indebted to Peter of Spain’s *Tractatus*. It is noteworthy for the emphasis it placed on the doctrine of signs. Although not unprecedented, in that Robert Kilwardby and, more famously, Roger Bacon in *De signis* had previously advocated taking the concept of sign as conceptually basic, Soto’s development of this move in Book I of the *Summulae* was what proved revolutionary. Pace John Deeley (Poinsett 1985), it was Soto whose

work initiated the trend to what Locke was soon to call “semiotic” (Locke 1975). This trend moved away from the formal aspects of logic and toward the psychological ones because of the reorientation of logic around the concept of sign and the recognition that signs – whether natural, conventional, or customary – principally require being conceived to be significative. Soto’s reorganization of logic around signs was what the Conimbriceans (the Jesuit commentators of Coimbra) and John Poinsett picked up on and brought to bear on the theological questions that so animated traditional scholastic logical studies. And it was through these thinkers that Soto’s focus was transmitted to the scholastic logics of the seventeenth-century, such as Martin Smeglecki’s, Bartholomew Keckermann’s, and Franco Burgersdijk’s. And finally, from them it migrated to the early modern logical works more familiar to us, such as Arnauld and Nicole’s *Logica or the Art of Thinking* and Locke’s *Essay*.

Within legal philosophy, Soto’s *On Justice and the Law* has proved very influential. The foundations of Soto’s political and legal thinking were not pragmatically oriented, like Machiavelli’s or other Renaissance humanists’. His foundations were more theoretical and were marked by a return to Thomas Aquinas’ natural law theory. Soto did not shy away from the practical applications and consequences of his legal thinking, especially regarding the Spanish conquests in the Americas and economic problems in Europe. But he was not striving to build an account of legal and moral principles out of experience. In this Soto was a member of a significant Iberian tradition of natural law theorists who revived and developed Thomas’ thought call the “School of Salamanca.” Credit for initiating this school goes to Francisco de Vitoria, one of Soto’s teachers at Paris (most likely) and his colleague at Salamanca. In addition to Soto, this tradition was to contain Luis de Molina and, most importantly, Francisco Suárez. The significance of this tradition lies mainly in the influence it held for the Northern European natural law theorists, either directly as in the case of Hugo Grotius or indirectly via Grotius and other lesser Dutch thinkers, as in the cases of Pufendorf, and Locke. Soto’s

contributions to this tradition are only now being explored by Spanish-speaking historians; there is little scholarship in English except for Hamilton’s dated (1963) treatment of the Iberian tradition as a whole and Annabel Brett’s works touching on Soto (see Bibliography). Anglophone scholarship on Soto suffers from a lack of translations. Aside from a translation of Bk. VI, q.2, art. 3 of *De justitia et jure* (Grice-Hutchinson 1952) and of *De natura et gratia* as an appendix to a recent PhD dissertation (Gaetano 2015), none of his works are available in English.

The Iberian natural law tradition began with the belief that there exists an order proper to creation which determines the rightness of positive law and which we can come to know through an analysis of the natures of created things. How, in other words, we ought to be is distributed in the world, determines what constitutes a proper or legitimate civil or canon law, and, by the fact of its distribution in the world, is present to the mind if only we would open our minds to receiving it. Soto begins *On Justice and the Law* by explaining the ambiguous notion of *jus* or law/rightness. He then subsumes this notion to a conceptual framework that recognized three types of law: eternal law, which is God’s order imposed onto things as their final causes; natural law, which is composed of the marks by which the mind comes to identify God’s eternal laws; and positive law, which is composed of states’ civil laws and the Church’s canon law. Soto then addresses various issues in distributive justice (Book III) and commutative justice (Book IV). The remaining eight books address numerous specific topics, including just war theory, property rights, contractual law, and economic issues.

All of Soto’s contributions to the development of this tradition stem from his addition of a subjective conception of rights to this framework (Hill forthcoming). A subjectivist conception of rights involves the recognition of rights inherent in, and maybe even inalienable from, the natures of humans as such rather than rights some individuals might have over the use of other things. For Soto, this arose because of the recognition that the natural inclination we have for self-preservation is morally significant as grounds for rational

behavior. It resolved a central tension in Thomistic natural law theory between morally insignificant natural inclinations and morally significant rational inclinations (Brett 1997). This novel idea was then put to use by Soto in rejecting absolutism and imposing limits on political authority (Soto 1556, bk. IV. q. 4, art. 1); in grounding international law (Brett 2014), in seeking to limit the abusive *encomienda* system in the Spanish Americas (Hernández 1991), the origins of private property (Soto 1556, bk. IV, q. 3, art. 1); in rejecting the idea of the “underserving poor” (Blank 2015); and in his conception of a just price for commodities and goods (Elegiod 2009).

Dominicus Gundissalinus

Alexander Fidora

Departament de Ciències de l'Antiguitat i de l'Edat Mitjana, ICREA – Universitat Autònoma de Barcelona, Bellaterra (Bcn), Spain

Abstract

Dominicus Gundissalinus (or Gundisalvi), Spanish Domingo Gundisalvo, c. 1110–1190, Archdeacon of Cuéllar (in the Diocese of Segovia), is the most prominent representative of the so-called Toledo School of Translators. Not only did he translate over 20 philosophical tracts from Arabic into Latin, including works of al-Kindī, al-Fārābī, Avicenna, Ibn Gabirol, and al-Ġazālī, he also authored five philosophical works: *Tractatus de anima*, *De immortalitate animae*, *De unitate et uno*, *De processione mundi*, and *De divisione philosophiae*. Relying on Arabic as well as

Latin sources, these works represent original, and often pioneering, contributions to the history of psychology (as the first instance of a Latin reception of Avicennian psychology), ontology, and metaphysics (with the introduction of the term “metaphysica” to the Latin West), as well as epistemology (giving up the traditional *ordo scientiarum*, i.e., the scheme of the liberal arts, in favor of an Aristotelian division of the sciences). In particular, his theory of knowledge and science, which is built around important elements from Aristotelian epistemology, was very influential in the Paris Arts faculty during the thirteenth century and was taken up by, among others, Arnulfus Provincialis, Robert Kilwardby, and Remigio dei Girolami. Some of Gundissalinus’ works were translated into Hebrew.

Dominicus Gundissalinus (or Gundisalvi), Spanish Domingo Gundisalvo, c. 1100–1190, Archdeacon of Cuéllar (in the Diocese of Segovia), is the most prominent representative of the so-called Toledo School of Translators.

Gundissalinus, who may have studied in France (possibly at Chartres) before he made his first appearance in Toledo in the year 1162, translated important philosophical texts from Arabic into Latin. Among his more than 20 translations, which he prepared with the collaboration of the Jewish scholar (Abraham) Ibn Daud and others, are such important works as al-Kindī’s *De intellectu*; al-Fārābī’s treatise *Kitāb iḥṣā’ al-‘ulūm*, adapted under the title *De scientiis*; Avicenna’s *De convenientia et differentia subiectorum* as well as his *Liber de anima seu sextus de naturalibus* (its translation being dedicated to the Archbishop John of Toledo) and his *Liber de philosophia prima sive scientia divina*, called *Metaphysica* (all three from his encyclopedia *Kitāb al-Shifā’*); the *Fons vitae* by Ibn Gabirol (Avicenna); and the *Summa theoricarum philosophiarum*, i.e., the *Maqāṣid al-falāsifa* by al-Gazālī, and others.

Moreover, Gundissalinus is the author of five philosophical works (Dominicus 1897). His *Tractatus de anima*, which marks the beginning

of the reception of Avicennian psychology in the Latin world, attempts to provide a purely rational account of the soul, its nature, and powers (Dominicus 1940). This topic is extended in his treatise *De immortalitate animae*, which seems to have been plagiarized by William of Auvergne. As in the former work, Gundissalinus’ declared intention is to put forward strictly rational arguments to prove the immortality of the soul, claiming that his proofs do not rely on external reasons – as the traditional proofs of the soul’s immortality are said to do – but that, following Aristotle, they proceed *ex propriis* (Dominicus 1999). The opusculum *De unitate et uno* develops Gundissalinus’ metaphysics along the lines of a discussion of the unity of the constitutive principles of reality, i.e., matter and form, taking over central issues from medieval Platonism and Ibn Gabirol in particular. This text, which was long attributed to Boethius and commented upon by Conrad of Prussia, enjoyed great popularity during the Middle Ages. (Some of its doctrines became common maxims, e.g., “Quidquid est, ideo est, quia unum est.”) (Dominicus 2006) The cosmological treatise *De processione mundi*, which carries on the discussion concerning the composition of matter and form, now with special attention to the *creatio ex nihilo*. In this tract, which was influenced not only by Ibn Gabirol, but also by Hugh of Saint Victor, Abraham b. Daud, and Hermann of Carinthia, Gundissalinus demonstrates an awareness of the distinction between philosophical and theological argumentation, contrasted explicitly by him, which is very remarkable for his time. It is worth noting that two of these works were translated into Hebrew, namely, the *Tractatus de anima*, by an anonymous translator in thirteenth-century Spain, and the *De unitate*, by Judah Romano in the first half of the fourteenth century in Rome.

Gundissalinus’ most elaborate work systematically, however, is (Dominicus 2007) *De divisione philosophiarum*. Drawing on Arabic sources (al-Fārābī, Avicenna, al-Gazālī, etc.) as well as on Latin texts (Boethius and the “School of Chartres”), Gundissalinus displays a comprehensive theory of human knowledge and science. The systematic importance of this work is twofold: on

the one hand, it breaks up the traditional scheme of the liberal arts in favor of an Aristotelian division of the sciences capable of integrating the newly “discovered” disciplines, i.e., the sciences of nature (such as optics and statics) as well as politics and metaphysics, the latter of which was first introduced to the Latin West under the name “*metaphysica*” by Gundissalinus. Yet, Gundissalinus’ *Divisio philosophiae* does not limit itself to open the traditional *ordo scientiarum* for new “material,” but, at the same time, its very concept of philosophy as a science distinct from theology as well as its specific foundation of the epistemological status of the different sciences and their irreducible plurality leads also to a formal reassessment of the notion of philosophy and science itself. Thus, for Gundissalinus, as for Aristotle, to whom he refers repeatedly in this context, the distinctiveness and autonomy of the particular sciences are grounded in their having different objects and methods, while their interrelatedness and interdependence result from their possible subordination one to another and from their internal differentiation.

Though the importance of this Toledan translator and philosopher for the history of philosophy is nowadays well acknowledged, his influence has still not been studied thoroughly. When dealing with Gundissalinus’ *Nachleben*, namely that of his *De divisione philosophiae*, histories of philosophy usually refer only to Michael Scot (d. before 1236) and his homonymous tract, which is preserved only in fragments, and to Robert Kilwardby (d. 1279) and his famous division of philosophy, *De ortu scientiarum*. Little is known, however, about the 50 years between these two testimonies to Gundissalinus’ influence. Yet it is precisely this period that was most crucial for the epistemological and institutional development of philosophy in the Paris Arts faculty. Even though this development has in itself not yet been analyzed in a conclusive manner, recent research on the Arts faculty has shown that Gundissalinus and his *De divisione philosophiae* played a central role in the constitution of philosophy as a distinct science in the Parisian milieu. Thus, it must be said that the so-called philosophical introductions at the Arts faculty by Arnulfus Provincialis, John

of Dacia, and many others, as well as that by Remigio dei Girolami, are highly dependent on Gundissalinus in their presentation of a clear and methodologically reflected understanding of philosophy.

Doxographies, Graeco-Arabic

Gotthard Strohmaier

Freie Universität Berlin, Berlin, Germany

Abstract

Due to the predominance of Aristotle in Arabic philosophy, there was a limited interest in his predecessors and the other philosophical schools of antiquity. Among the Greek doxographies available in translation were the *Placita philosophorum* ascribed to a certain Aetius, Hippolytus' *Refutatio omnium haeresium*, and a *History of the Philosophers* ascribed to Porphyry of Tyrus, known only in quotations, but very influential on similar Arabic compositions as the *Chest of Wisdom*, ascribed to Abū Sulaymān al-Sijistānī, al-Mubashshir ibn Fātik's *Choicest Maxims and Best Sayings*, al-Shahrastānī's *Book of Religions and Sects*, and al-Shahrastānī's *Promenade of the Souls and the Garden of Rejoicing in the History of Philosophy*. Some Muslims

with a positive attitude towards the Greek heritage tried to find their belief in the creation of the world and the hereafter already represented by the ancient Greek thinkers, what resulted in outright falsifications, which became in their turn mingled with the information found in the translations from the Greek. The standard of the Arabic doxographies was also impaired by the inclusion of material from the so-called gnomologies, where the ascription of anecdotes and wise sayings to the various philosophers was even more confused than in the Greek tradition.

The Greek heritage in Islam was dominated by a syllabus established in the late Alexandrian school, that is, Aristotle in Neoplatonic interpretation, and in close connection with the medical teachings of Galen of Pergamon (129–216 CE), whose philosophical ambitions largely coincided with the Stagiritic, for example, in the rejection of atomism, which later proved to be so stimulating in Europe since the Renaissance. Aristotle used to develop his ideas in a kind of dialogue with his predecessors, who became thus known through his works. But as he was, among Muslim philosophers, regarded as the summit of human thought which only rarely might be superseded, the interest in his forerunners as well as in other philosophical schools was limited. Avicenna (980 or earlier–1037) lists, in his encyclopedic *Kitāb al-Shifā' (The Book of Healing)*, the various doctrines of the Presocratics without quoting them by name. In a polemical correspondence with al-Bīrūnī (973–1048), he rejects the latter's idea that the sphere of fire below the moon might be not one of the four elements but only a transformation of heated air due to the speed of the heavenly spheres. He blames al-Bīrūnī for falling back onto the monism of the Presocratics, among whom he mentions Thales, Heraclitus, Diogenes, and Anaximander, here erroneously substituted for Anaximenes. The Jewish thinker Moses Maimonides (d. 1204), who was fully dependent on Arabic philosophy, gives, in a letter to Samuel ibn Tibbon, his translator into Hebrew the advice not to waste time with “old philosophy” and names in

this respect Empedocles, Pythagoras, Hermes, and Porphyry.

On the other hand, Muslims showed a great interest in world history, also seeking answers to questions such as who were the inventors of philosophy, when they lived, or whether they had any relations with the prophets of the Old Testament seen as forerunners of Muḥammad. Thales and the Seven Sages were as popular as in antiquity, and they appear even in the Persian epic of Ganjāwī Nizāmī (1141–1209), who lets Aristotle, Thales, Apollonius of Tyana, Socrates, Porphyry, Hermes, and Plato pronounce before Alexander the Great various speculations about how the world came into being, partly by the will of the creator, partly in an automatic process. These ideas have almost nothing to do with their actual teachings.

Serious information was available in the *Placita philosophorum* translated in Baghdad by Qusṭā ibn Lūqā (820–912), who ascribed them like others to Plutarch, whereas the real author is now assumed to be a certain Aetius (Daiber 2008). Their opinions are arranged according to subject matters, beginning with “nature,” “principles,” “the world,” “God,” “demons,” and so on. Diogenes Laertius, with his classification according to schools and biographies, remained unknown. There existed, however, a similar work ascribed to Porphyry of Tyros (Cottrell 2008), translated from a Syriac intermediary version and now lost in its entirety, but quoted rather often (see the entry on Porphyry, Arabic in this volume). Via the Syrian Christian tradition, Muslim authors became acquainted with the *Refutatio omnium haeresium* of the Roman presbyter Hippolytus (third century CE), who tried to show the inconsistencies of the various pagan doctrines. This tract was also used by the author of the *Turba philosophorum* for his quasi-philosophical introduction into his alchemical compilation (Rudolph 2005).

The most important Arabic doxography was the *Ṣiḡwān al-ḥikma* (*The Chest of Wisdom*), hitherto ascribed to Abū Sulaymān al-Sijistānī al-Mantiqī (d. 987), which exists now only in two large extracts, one of them available in print. It contains entries on 170 men, most of them Greeks, among them Thales, Anaximenes, Anaxagoras, Pythagoras, Socrates, Plato, Aristotle,

Alexander the Great, Diogenes the Cynic, Theophrastus, Hermes, Solon, Homer, Democritus, Euclid, Hippocrates, Ptolemy, Apollonius of Tyana, Galen, and John Philoponus, followed by Arab authorities like the famous translator Ḥunayn b. Ishāq. The Egyptian scholar al-Mubashshir ibn Fātik composed in the years 1048 and 1049 his *Mukhtār al-ḥikam wa-maḥāsīn al-kalim* (*Choicest Maxims and Best Sayings*), which enjoyed great popularity. Besides sages of the Egyptian Hermetic tradition, the legendary Luqmān of pre-Islamic Arabia (cf. sura 31), and the Church Fathers Basilus and Gregorius, the latter probably Gregorius of Nazianz, it has entries devoted to Homer, Solon, Zeno of Elea, Hippocrates, Pythagoras, Diogenes the Cynic, Socrates, Plato, Aristotle, and Alexander the Great. One of the number of existing manuscripts, preserved in Istanbul in the Topkapı Saray Museum (Ahmet III, 3206), is enriched with excellent miniatures exhibiting the Greek sages in Oriental garb. The work was about 1250 translated into Castilian under the title *Bocados d'oro*, followed by versions in Latin, French, Provençal, and English. The latter is believed to have been the first English book that appeared in print. Al-Shahrastānī's *Kitāb al-milal wa-l-niḥal* (*Book of Religions and Sects*), written in 1127, classifies the various Muslim and Christian denominations and pagan beliefs according to their relative nearness to the Islamic dogma. The Greek philosophers, who are followed by a lengthy chapter on Avicenna, are relegated to the end of the book because of their being most far away from the prophetic revelations (Janssens). Al-Shahrastānī's (d. between 1287 and 1304) *Nuzhat al-arwāḥ wa-rawḍat al-afrāḥ fī ta'rīkh al-ḥukamā'* (*Promenade of the Souls and the Garden of Rejoicing in the History of Philosophy*) relies heavily on his predecessors and is, therefore, of value for the establishment of their texts and the identification of doubtful readings of Greek names (Cottrell 2004–2005).

These doxographies share with Diogenes Laertius the peculiarity that anecdotal material from the so-called gnomologies was inserted to enrich the tales of the philosophers' lives and teachings. It corresponds only rarely with historical

reality, for example, when Socrates is asked why seawater is salty whereupon he urged the questioner to tell him first what kind of profit he would have from knowing it. This corresponds with the change from natural philosophy to ethics, what was well known to Muslim authors (Strohmaier 2003). Muslim doxographers were not aware of the fact that the gnomologies were plagued by great disorder regarding the ascription of the wise sayings and anecdotes to the various authorities. This went even so far that Socrates did find in the end his accommodation in the barrel of Diogenes. He was depicted as a great ascetic who despised the pleasures of this world and attacked idolatry, what caused the king of his time to kill him by poison. This was repeated even by the late Ayatollah Khomeini (1902–1989) who would, therefore, praise him as “a great theologian” (Strohmaier 1997).

In certain pious and mystic circles that were uneasy about Aristotelian rationalism, the pre-Aristotelian philosophers earned the reputation as bearers of an older and therefore more trustworthy wisdom. In consequence, a most radical tendency to assimilate the early Greek thinkers to Muslim beliefs led to outright falsifications. In the Pseudo-Ammonius’ *Ārā’ al-falāsifa* (*The Opinions of the Philosophers*), probably written already in the ninth century CE, the Presocratics, together with Plutarch, the Stoa, Epicurus, Pyrrhon, and Proclus, present creationist and Neoplatonic speculations, relying, though, partly on Hippolytus (Rudolph 1989). Later authors took this pseudo-epigraphy as seriously as the more reliable information gained from the translations from Greek.

This line was not followed by Ibn al-Qifī (1172–1248) in his *Ta’rīkh al-ḥukamā’* (*History of the Philosophers*), where he describes Thales as the first materialist who denied the existence of a creator and believed instead in the eternity of the world and also of the human race (Wöhrle 2014). Others sought to balance the contradicting reports by recurring to the idea that the ancient thinkers had undergone in their minds a development from an original truth to heresy. Al-‘Āmirī (d. 992) in his *Kitāb al-amad ‘alā l-abad* (*Book of the Final End in the Eternity*) kept to the idea, already cherished by the Church Fathers, that some of them had got their knowledge in Egypt and the Orient. Empedocles,

who lived at the time of the prophet David, would have kept company with Luqmān, the Arabian sage, and learned from his wisdom. But after his return to Greece, he followed his own imagination, what seemed to contradict the belief in the hereafter (Rowson 1988). Mullā Ṣadrā Shīrāzī (1571–1640), the leading representative of late Persian Shī’ite Neoplatonism, maintains that all of the old Greek philosophers believed in the creation of our world at a certain time and that the doctrine of its eternity only appeared when their followers did not understand any longer their wisdom.

Durand of St. Pourçain

Isabel Iribarren

Department of Catholic Theology, Strasbourg University, Strasbourg, France

Abstract

Dominican theologian best known for his deviation from Thomas Aquinas's teaching at a time when his order was involved in the promotion of Thomism. The first recension of his commentary on the *Sentences* (1307) was badly received by the order's authorities who, despite the appearance of a second, more

compliant version (1311), censured Durand's work in 1314 and again in 1317. In 1313, Durand was nevertheless appointed as lector at the papal curia in Avignon. In 1325, he was promoted as bishop of Meaux, an office which he held until his death in 1334. Between 1318 and 1325, Durand produced a final revision of his commentary. His work also includes five *Quodlibets* (1312–1316) and a treatise on the origin of political power (1329). He intervened in the major controversies of his time regarding apostolic poverty and the beatific vision. Durand's thought reflects the intellectual climate following the 1277 Paris condemnation, especially in its open departure from Aristotle, a stance which best explains his critical attitude toward Thomism. Durand draws a clear distinction between reason and authority which leads him to reject the notion of theology as a science. Theology rests on faith alone, and its object is not to produce knowledge about God but to direct us toward salvation. Pivotal to Durand's thought is the notion of relation, which acts as explicative principle notably in epistemology and in divine causality. Guided by a nominalist understanding of universals, Durand rejects the notion of intelligible species and explains cognition as a direct relation between the intellect and a singular object present to it. Likewise, he denies all causal power to divine ideas in order to underline the relation of dependence of creatures on God's free action. A forerunner to Ockham's nominalism, Durand seeks to eliminate unnecessary instances in favor of an affirmation of God's absolute power and infinity.

Corpus of the Article

The independent outlook of the Dominican theologian set him against his order's authorities at a time when it was actively involved in the promotion of Thomas Aquinas's doctrine. Born in Auvergne around 1275, Durand joined the Dominican convent in Clermont and was later sent to Paris to continue his studies at St Jacques. In 1307, he produced a first recension of his

commentary on the *Sentences*, probably a preliminary work prepared in some Dominican *studium*. In its open departure from fundamental Thomist theses in spite of recent Dominican legislation, this early commentary was badly received by the order's authorities. As a result, Durand was compelled to write a more compliant recension of his commentary, a work which corresponded in all probability to his first reading of the *Sentences* at the University of Paris, between 1310 and 1312.

During his short regency at Paris, Durand produced two *Quodlibets* and a couple of treatises, *De habitibus* and *De libero arbitrio*. In early 1313 Clement V appointed him as lector at the papal curia in Avignon, a post ratified in 1316 by the succeeding pope John XXII. During his time in Avignon, Durand determined in three quodlibetal disputations.

Wanting to set a precedent of Durand's case, in 1314 Dominicans issued a censure containing problematic theses extracted from both versions of his commentary. This censure was followed by another one 3 years later, this time aiming specifically at Durand's deviation from Aquinas's doctrine. Both censures were led by the provincial of France, Hervaeus Natalis, an advocate of Thomism and Durand's most determined opponent.

In 1317 Durand was appointed bishop of Limoux, an office which freed him from Dominican jurisdiction. In 1318 he was transferred to the bishopric of Le Puy, which he left in 1325 owing to a conflict with his canons. He regained Avignon, where he acted as theological advisor to the pope on several occasions: in 1318, in the case of the rebel *fraticelli*; again in 1322, during the poverty controversy with the Franciscans; and finally, in 1326, regarding the inquiry into William of Ockham's orthodoxy.

Between 1318 and 1325, Durand produced a final recension of his commentary, reaffirming his previous position, while mitigating its most problematic aspects. This version is alone acknowledged by the author as an authentic expression of his thought. It was widely diffused in the sixteenth century in a number of printed editions. This new redaction probably motivated a final tract against Durandus, *Evidentiae contra*

Durandum, produced in 1325 by a Dominican author known as Durandellus.

In 1326, Durand was appointed as bishop of Meaux. To this period belongs his political treatise on the origin of power, *De origine potestatum et iurisdictionum quobus populus regitur* (1329). Between 1331 and his death in 1334, Durand was involved in the beatific vision controversy, which saw the Paris theological establishment set against pope John XXII's opinion. Durand gave his expert opinion on the subject in *De visione Dei quam habent animae sanctorum ante iudicium generale* (1332), a work which earned the pope's hostility but whose view was posthumously vindicated by the succeeding pope, Benedict XII. Despite a life punctuated by controversy, Durand was highly respected in the later Middle Ages.

The character of Durand's thought is well illustrated by his double sobriquet of *doctor modernus* and *doctor resolutissimus*: an independent spirit prepared to espouse the most original views, while refusing to capitulate to recent magisterial trends. Drawing a clear distinction between reason and authority, Durand claims that when the issue does not directly concern an article of faith, "we should rely on reason rather than on the authority of some doctor, however famous" (*Sent.*, Prol.). On matters of faith, however, theology does not proceed demonstratively but derives its knowledge from revelation and rests on authority alone. Durand thus rejects the Thomist notion of theology as a speculative "science." The object of theology is not God's nature but the meritorious acts that lead to salvation.

Revealing of the intellectual climate following the 1277 Paris condemnation, Durand is very critical of Aristotelian philosophy and its relevance to theology. It is this stance which probably best explains his departure from Thomism. Three themes are particularly illustrative of Durand's thought and its polemical nature: the notion of "relation," the theory of cognition, and divine causality.

On the basis of a modal doctrine indebted in principle to Henry of Ghent, Durand defines relation as a mode of being really distinct from its foundation. As a mode, relation is both distinct from substances, in that it is incapable of

subsisting by itself, and irreducible to absolute accidents (like quality and quantity) in that it does not affect composition. Durand thus challenges the traditional interpretation of Aristotelian categories as a division between substances and accidents in order to introduce an alternative ontological division based on “absolute” and “relative” beings. The modal conception of relation presented obvious advantages for answering a number of questions. In Trinitarian theology, Durand rejects Duns Scotus’s notion of “formal distinction” between the essence and the divine persons in favor of a *real* distinction based on the notion of relation as a diminished being. As he saw it, a real distinction of this kind facilitates an explanation of personal distinction in God without jeopardizing the unity of the essence. On the question of the soul and its faculties, intellect and will constitute one and the same reality in the soul: they are distinct only according to their relation to the different acts of cognizing and willing, respectively.

In epistemology, Durand denies the existence of an intelligible species as a necessary principle of cognition. Cognition consists in the direct relation between the intellect and an object present to it. There is no need to posit an additional reality that would move the intellect to its object and make it intelligible. Durand’s reason for rejecting Aristotelian epistemology is closely connected to his commitment to nominalism: the primary object of knowledge is not a universal concept but a singular object outside the mind. A universal is only the end product of a process of intellection that starts with the perception of a singular object.

Durandus’s criticism of intelligible species forms part of a wider intellectual project which reacts against the positing of intermediary principles purporting to build a fool-proof causal system between God and his creation. This forerunner to Ockham’s principle of economy constitutes an attempt to safeguard God’s absolute power and the voluntary character of his creation. One expression of this is Durand’s denial of all causal power to divine ideas. God pre-contains creatures not formally, according to a pattern of imitability, but *virtually*, according to the way in which an efficient cause pre-contains its effects. The

relation between God and creatures is then not formal but strictly causal. Likewise, against the Thomist theory of sacramental causality based on some superadded virtue infused in the sacrament, Durand claims that the sacrament becomes efficacious rather on the basis of a voluntary pact established between man and God. Finally, Durand denies the necessity of an infused habit of grace in order to attain salvation. On the basis of his absolute power, God could affect the salvation of a man who has died without grace.

Durand’s readiness to depart from Aristotelian philosophy bears as much affinity to the approach of Franciscans such as Bonaventure and Peter John Olivi, as it heralds Ockham’s “nominalism” in both its epistemological and theological dimension. This could explain why Durand became the chosen target of Dominican censure, over other non-Thomist Dominicans like James of Metz or Dietrich of Freiberg. To question Aquinas on avowedly un-Aristotelian grounds was like revisiting the 1277 Paris condemnation.

Economic Thought in the Middle Ages

Giovanni Ceccarelli

Dipartimento di Scienze Economiche e Aziendali,
Università di Parma, Parma, Italy

Abstract

In the High Middle Ages, a distinctive Christian approach to economics starts to take form in relation to ecclesiastical properties. A paradigm of unselfish but productive use of wealth is set, using poverty as a model. From the eleventh century, canon law unfolds this broad paradigm drawing on Roman law: a juridical condemnation of usury is put forward which, however, is linked to derogations grounded on nonlegal principles.

During the thirteenth century, theologians take the lead in economic debates, influenced by two diverging approaches. A doctrine of usury and a theory of just price are developed, drawing on Aristotle. Loan on interest is rationally condemned on the assumption that money is sterile; economic exchange is explained as an objective process guided by proportional reciprocity.

Debates on voluntary poverty, on the other hand, reaffirm the importance of high-medieval conceptions. Trade is described as an activity from which the community derives benefits, and

the merchant's wealth is seen as the result of his status of expert trained in determining the value of goods. Canon law exceptions, combined with high-medieval emphasis on productivity, slowly undermine the usury doctrine. Credit provided by reputed professionals or institutions (merchant-bankers, municipalities) is seen as productive and permitted, while usury is associated with moneylenders.

The distinctiveness of the Christian approach emerges in comparison with other traditions. Jewish conceptions, developed within talmudic jurisprudence, rely on the idea that money is a material object without productive potential. This rationale is used to explain prohibitions of usury and to allow credit profits in the form of loans on security. Islamic tradition is heavily influenced by the predominance of religion. Economic issues, mainly discussed within Islamic jurisprudence, are rarely considered in purely philosophical terms. This leads to a distinctive approach, condemning credit gains except if lenders suffer the risk of losing their capital.

Strictly speaking, it is difficult to claim the existence of medieval economic thought. Though issues related to economics are considered in a number of texts, these are generally analyzed in the context of broader frameworks that refer to theological, legal, and philosophical problems. In spite of the fact that medieval thinkers put forward principles that in the long run will have an impact on economic analysis, these concepts belong to the different spheres (religious, legal, moral, etc.)

in which they are embedded. These ideas are also by-products of the language in which they are described, a century-old vocabulary that often takes form outside any concerns for economy. Given the influence of religion, one needs to take into account various economic traditions (Christian, Jewish, and Islamic), overlapping at times but also profoundly different. These traditions are not self-contained. They often interact with other ones, for example, Greek philosophy and Roman law. Such a complex frame needs, thus, a multilevel investigation.

The economic vocabulary that takes form during the Middle Ages goes back to the basic text of the Christian tradition: the Bible. The Gospels, for instance, provide a wide range of metaphors related to trade and money that hint at a productive use of riches combined with charitable redistribution. Perhaps one of the strongest economic images is provided by the mystery of the incarnation, by the choice made by God, infinitely powerful and wealthy, to become human, a decision that leads to the apparent contradiction of a Christ who embraces poverty while preserving his divine richness. This metaphor, named the “sacred commerce,” reveals, as well as many others (e.g., the parable of the talents and that of Jesus feeding the 5000), a crucial point: the dialectical relation between wealth and poverty, both in spiritual and in material terms (Todeschini 2009).

The ideas included in the Bible are further developed by the fathers of the church. Stimulated by this tradition, thinkers like Basil of Caesarea, John Chrysostom, Ambrose of Milan, Saint Augustine, and many others do address economic and social subjects. Charity is not seen as goods and money going from the hands of the wealthy to those of the needy, but it is considered as a complex exchange through which the opposition between material and spiritual wealth can be solved. Through the good use of riches, exemplified by charitable donations controlled by ecclesiastical authority, the poor gain the material aid that they need, while the rich earn salvation. Another relevant contribution comes from the monastic experience of the High Middle Ages. The choice of individual poverty by monks aiming to follow the example of Christ is

combined with the collective possession of land by monasteries. Moreover, monastic rules insist on good management of these properties, since an efficient system of exploitation provides goods that are not only necessary for self-consumption but also useful to relieve the poor in case of need (Todeschini 2008; Naismith 2015).

In the following centuries, economic issues are discussed in a number of writings, such as Carolingian laws, early papal norms, local synods, and councils. Yet, it is in the second half of the eleventh century, during the so-called Gregorian reform, that these discussions are carried on more systematically. The aim of this reform is primarily political (i.e., to restore the principle of the church’s self-government). Some relevant economic principles are, however, also put forward; possibly the most fruitful on theoretical grounds is that the church has a right to possess goods and revenues. Such a statement implies a juridical definition of what is ecclesiastical property, a definition that is first set by Peter Damian in a letter concerning episcopal goods. This definition can be briefly summarized in three points: (1) The ecclesiastical patrimony is sacred and thus inalienable; it can be increased but it cannot be reduced. (2) The church is not the owner of this patrimony but simply a manager of it on behalf of Christ and the poor. (3) A productive use of this patrimony is to be considered useful, since Christian society as a whole, and especially the poor, will benefit from such a use. It should be added that the content of this letter, shortly after its publication (1051), was embodied in ecclesiastical legislation (Todeschini 2004; Naismith 2015).

After the Gregorian reform, the Christian tradition is ready to extend its vision from ecclesiastical institutions to lay economy as well. During the second half of the twelfth and the first decades of the thirteenth centuries, a relevant contribution to this process comes from the expansion of the church’s legislation. Two major works set the beginning and the end of this period of intense juridical activity: the *Decretum*, a selection of various ecclesiastical writings (biblical passages, patristic works, papal norms, etc.) compiled around 1140 by the Camaldolese friar Gratian, and the *Liber extravagantium*, a collection of

papal decrees and canons of general councils issued by Pope Gregory IX in 1234. In these texts, issues emerging in the current “Commercial Revolution” are discussed in the light of the Christian tradition, in specific sections (addressing to theft, buying and selling, financial activity, etc.). It should be recalled, however, that in these juridical collections, economic issues are still mainly treated in connection to clerics and the church and that issues such as simony, tithes, and ecclesiastical revenues continue to be widely discussed (Todeschini 2009).

The “rediscovery” of Roman law starting at the end of the eleventh century also gives a strong boost toward a more theoretical approach. Besides opening a discussion on the connection among existing juridical systems (civil and canon legislation, natural and divine law, etc.), it provides a set of legal definitions (i.e., contracts), principles, and terms in which the economic ideas embedded in the Christian tradition could be organized. Furthermore, it favors a wide-ranging work of interpretation by lawyers in which canon and Roman law systems are often combined together according to the principle of *utriusque ius*. The relevance of these interpreters should not be undervalued, since their influence is often comparable to that of the main juridical texts and in some cases their comments will be included in the latter in the form of official glosses. It is in this period that, under the influence of law, the still jumbled tradition of the High Middle Ages tends to evolve into more systematic reasoning, and the first technical definitions of concepts like usury and just price start to take form.

Concerning usury, biblical prohibitions and their high-medieval interpretation were to be taken into account. While the Bible suggested a somewhat broad juridical definition of usury, in patristic and Gregorian texts, this activity is rather described as antisocial conduct (e.g., the tendency of hoarding wealth). If Gratian’s *Decretum* describes usury as “to receive something in excess of the principal” initially lent, the canon lawyer Huguccio of Pisa, at the end of the twelfth century, provides a definition grounded on the formal distinction between lease and loan contracts. While in the latter the ownership of the loaned good

passes to the borrower, in the former such a transfer does not occur; therefore, whereas the lessor can rightly claim a payment, a loan must be free of charge (otherwise it turns into usury). Huguccio hints at a principle that will turn out to be very successful in subsequent discussions: the use and the ownership of money may not be separated (Langholm 1992; Ceccarelli 2006).

In their quest for a definition of usury, ecclesiastical law and canon lawyers enlarge the analysis to a broader set of contracts: loans on security, partnerships, “life rents,” buying and selling on credit, dowries, etc. This way of reasoning allows detection of many cases of “hidden usury,” but also the discovery of several exceptions to the prohibition of receiving something in excess of the capital: 12 in all, according to the renowned list provided by Henry of Susa in the mid-thirteenth century. The rationale behind these derogations has two basic features. One (connected to the theories of the Gregorian reform) points out that due to its special status, the church could receive something in excess of the capital. The other comes from two Roman law principles, “loss occurring” (*damnum emergens*) and “profit ceasing” (*lucrum cessans*), which allowed consideration of interest as a form of compensation. During the thirteenth century, canon lawyers will cautiously start to combine these two features (i.e., status and compensation) in order to explain why merchant-bankers may claim the payment of interest without necessarily being considered usurers (Ceccarelli 2006).

In this century, theologians gradually supersede jurists in discussing economic issues. Initially included in major theological genres (such as *Summae*, commentaries on the *Sentences* of Peter Lombard, *Quodlibetal Questions*), by the last decades of the century, economic discussions are also addressed in specific writings devoted to buying and selling, usury, and restitution of disreputable gains. Though scholastic reasoning does not create legal norms, the great authoritativeness enjoyed by theologians leaves a strong mark on the Christian tradition of economics. A good example can be found in penitential handbooks that, from the late thirteenth century, aimed at popularizing theological teaching through

confession in order to bring the rules of Christian economic conduct to the masses (Langholm 2003).

Besides canon law and its interpretation, theological reasoning concerned with economics has two basic points of reference: Greek philosophical writings and the discussions on voluntary poverty. In the *Nicomachean Ethics* and in the *Politics*, translated in Latin in the mid-thirteenth century, Aristotle provided a language and a logical framework suitable for describing medieval economy on technical and moral grounds. Starting with Albert the Great, thinkers can draw on Aristotle for a number of concepts: the distinction between commutative and distributive justice, the just price as the benchmark to follow in exchange, and the idea that money measures the value of goods and hence in itself is not productive (Kaye 1998). Its influence is even greater regarding the approach to be followed, fostering efforts to explain in rational terms biblical prohibitions and canon law rulings. This leads scholastic thinkers to develop the so-called theories of usury and of the just price, in an attempt to provide a synthesis between Greek philosophy and religious doctrines (Langholm 1992). From the late thirteenth century, Galenic theories also begun to be influential, suggesting broader and more flexible ideas of equality. Aristotelian explanations of economic exchange are reconsidered in the light of a dynamic vision of it, in which justice could come from the interaction among conflicting forces (Kaye 2014).

Another relevant, and usually underestimated, stimulus comes from the issue of poverty in which some of the major scholastic thinkers of the thirteenth century are involved: Bonaventure of Bagnoregio, Thomas Aquinas, John Pecham, Peter John Olivi, etc. Dominicans and Franciscans, in order to defend their vow of mendicancy, are forced to define what poverty is in either theological, juridical, or economic terms. Drawing on the principles of the Gregorian reform (i.e., individual poverty, common property, and productive management of it), the writings in defense of voluntary mendicancy stress the importance of how material goods are used. This emphasis is rather common, but it is particularly clear among

Franciscans, whose rule forbids even collective property, claiming the right to use goods without possessing them. In short, the issue of poverty leads to a thorough analysis on subjective needs, and on the ways to evaluate material goods, that will have an incidental but substantial fallout on ideas concerning wealth and profit. As a matter of fact during the last decades of the thirteenth century, many of these concepts flow into writings devoted to lay economy. This explains why the great majority of scholastic thinkers who address economic issues come from the ranks of the Dominican and Franciscan orders. Their judgment of individual enrichment is related to poverty, just as much as it is to the Gospels, canon law, and Aristotle (Lambertini 1994–1997; Todeschini 2009).

Drawing on patristic teachings, theologians argue that the Edenic condition of common property was altered by the fall of man. Private ownership is considered a by-product of positive law and political institutions, yet scholastic thinkers generally agree that it may be revoked only under exceptional circumstances, namely, extreme economic need. With private wealth taken for granted, theological writings may focus on how gains are generated in economic transactions (Langholm 1992; Wood 2002).

A significant section of scholastic thought thus deals with trade and the profits that derive from it. By the mid-thirteenth century, the unfavorable view of trade based on the biblical episode of Christ's eviction of the merchants from the temple is replaced by a positive image of commerce that stressed its social usefulness. Among Franciscan in particular, merchants are depicted as professionals who satisfy the needs of a community by transporting goods from a region in which there is an abundance to another in which there is scarcity. The peak of this line of reasoning can be found in John Duns Scotus, who argues that where there is a lack of merchants, rulers should promote policies to attract them, in order to support the economic well-being of the state (Langholm 1992; Wood 2002; Todeschini 2009).

Theologians also try to establish why a merchant may buy a commodity at a certain price and resell it at a higher one. These discussions are

influenced by three different traditions: (a) Aristotle's commutative justice, which suggested that a criterion of proportional reciprocity should be followed in exchange, thanks to a medium able to measure the value of goods (i.e., money); (b) Roman law, which establishes that the cost of a commodity is determined by free bargaining, as long as it does not exceed by half the price normally fixed in the marketplace (principle of *laesio enormis*); and (c) the fathers of the church who teach that an object's value depends on its subjective utility and that only those who have a good reputation are to be allowed in the marketplace (Langholm 1992; Kaye 1998).

It is only in the thirteenth century that, strictly speaking, the debate about just price gets started. Although scholastic thinkers do acknowledge that objective factors – such as supply, demand, and production costs – have a direct incidence on prices, the idea of just price relies heavily on a subjective conception of value. A good example is provided by Peter John Olivi who, around 1290, argues that a good's economic value is dependent on its utility, either subjective (*complacibilitas*) or objective (*virtuositas*), and on its scarcity (*raritas*), but also on labor, expenses, and risks (*labor, expensae, periculi*) that individuals undergo during its production and commercialization (Langholm 1992; Todeschini 2009; Olivi 2016).

According to theologians, the number of features that need to be taken into account during the exchange does not allow precise determination of a just price; therefore, such a measure may fluctuate within a wide range of values (*latitudo*). This concept, derived from the debate on voluntary poverty, overcomes the problem, still unsolved in Thomas Aquinas, of the strict equivalence between exchanged goods claimed by divine law. By the end of the century, many theologians put forward the idea that the just price must be seen in the light of positive law, a framework in which a geometrical, and thus unbalanced, notion of justice is possible. In John Duns Scotus, for example, the perfect equivalence between things exchanged claimed by divine law (*equivalentia rei et rei*) is replaced by a latitude of values by referring to positive law (Kaye 1998, 2014).

In practical terms the issue appears to be less complicated, since the just price tends to equal the one determined by the marketplace in normal conditions. In order to explain an equivalence as such, scholastic thinkers adopt an expression – “common estimation” (*communis aestimatio*) – which has a twofold significance. On the one side, it may be considered as the result of supply and demand in its entirety, suggesting thus the idea of a suprapersonal and self-regulated process (Langholm 2003; Kaye 1998). On the other side, “common estimation” refers to the price settled by those individuals that the “market community” acknowledges as public professionals of commerce. For instance, according to Henry of Ghent, it is the fully experienced merchant (*expertissimus mercator*) who marks the just price of a commodity in the marketplace, and not the other way around, determining thus, through his professional skills (*industria*), the just value of a good (Todeschini 2009).

When discussing issues related to credit and usury, theologians have to deal with a frame in which the overlapping teachings of religion, law, and philosophy interact with everyday economic life. Usury is thus a complex phenomenon: it is a sin condemned by the Bible (i.e., divine law); it can be broadly seen as an improper use of wealth, as it was during the Gregorian reform, or strictly defined on juridical grounds, as canon lawyers do; it can be considered on its own, but it usually involves different contracts and contracting parties; finally, following Aristotle, it may also be explained in rational terms.

Focusing on this latter feature, it must be acknowledged that scholastic thinkers during the thirteenth and fourteenth centuries spare no effort to work out the so-called doctrine of usury. In order to prove, in rational terms, that usury is not only a sin but also against nature, a number of arguments are elaborated. Some are logically weak and quickly rejected, but others receive long-lasting approval. Drawing on canon law, theologians pick up the idea that in a loan property passes to the borrower and thus that it is unjust for the lender to ask for interest. Many arguments refer to the principle, inferred from Aristotle, that money in itself bears no fruit and that,

therefore, it is unreasonable to claim a compensation for its use. Another successful argument is that of “economic duress,” by which scholastic thinkers mean that a needy borrower does not fully consent to pay for a loan (Langholm 1992; Wood 2002; Armstrong 2016).

This theoretical framework does not conclude the theological debate on usury, but it has to coexist with several other points of view that tend to undermine its basis. Like canon lawyers, theologians are concerned with those cases in which payment of interests is not assimilated to usury. While the principle of “loss occurring” is rapidly accepted, that of “profit ceasing” is more controversial, but by the end of the thirteenth century, it finds a good number of supporters, especially among Franciscans (Langholm 1992).

Exceptions do not only refer to juridical abstractions but more commonly are inspired by everyday life. Scholastic thought widely acknowledges a peculiar status to a prominent figure of the late-medieval economy, the multispecialized businessman devoted to trade, banking activity, and textile manufacturing. This entrepreneur, whom theologians name *mercator*, responds to the model of good management and productive use of wealth propounded by the church, since he prefers to reinvest profits rather than hoarding them. As Peter John Olivi argues, money borrowed or lent by such businessmen ceases to be a barren measure of value and becomes a productive capital. Following this approach, in the fourteenth century, the Catalan theologian Francis Eiximenis can state, without putting the doctrine of usury in doubt, that merchants may sell the use of their money (Ceccarelli 2001; Todeschini 2008).

The emphasis on contracting parties’ status is favored by a shift in ecclesiastical legislation starting in the late thirteenth century. Canon law leaves aside the contracts in which usury can be found and focuses on those who commit this sin, heavily condemning a specific professional category: public moneylenders. During the fourteenth century, theologians are still concerned with the technicalities of usury, but they also devote great attention to a feature like the public reputation of

the contracting parties (Ceccarelli 2006; Todeschini 2009).

Another element complicating the picture comes from the discussion of annuities, a widespread type of loan on interest that was the result of a sale combined with usufruct of real estate (a parcel of land, a mill, a house). In the last decades of the thirteenth century, theologians reject the idea that such a contract amounts to usury and instead make a distinction between money and the right to receive money. Such a distinction bypasses many arguments concerning the doctrine of usury, yet it does not lead to its dismissal (Langholm 1992; Wood 2002; Kaye 2014). It may appear to be the by-product of a formalistic way of reasoning, typical of scholasticism, but as a matter of fact, it is connected to the economic paradigm developed during the Gregorian reform. While canon lawyers limited this type of credit to ecclesiastical institutions, theologians like Godfrey of Fontaines and Gerard of Abbeville deem it extendable to laymen. Not surprisingly, during the fourteenth century, the sale of a right to receive money is adopted by some theologians to support an emerging form of institutional credit: public debt (Todeschini 2009; Armstrong 2003).

A final feature that has to be considered derives from the Franciscan claim to use goods without possessing them. By shifting this idea from the realm of poverty to that of profit, John Duns Scotus suggests that the use and ownership of money may in some cases be separated, implicitly putting in doubt a basic argument of the rational condemnation of usury. This argument is seldom adopted, yet it may explain why, around 1320, two Franciscans, Gerard Odonis and Francis of Meyronnes, state that usury can only be condemned on the basis of the Bible, since no rational arguments prove that it is unjust (Langholm 1992; Ceccarelli and Piron 2009).

The Christian tradition is not the only one which has addressed economics. It is possible to find evidences of economic reasoning in medieval Jewish and Islamic sources as well. As in the previous case, religion is significant to the point that it is possible to consider two distinct economic conceptions that are typical of Islamic and Jewish tradition.

The latter one is grounded on the *Talmud*, a juridical text of the third century in which the broad economic prescriptions of the *Torah* are presented in a systematic form. From the eighth century, this source (in which religious and legal realms are strictly related) undergoes a process of revision through the two main genres of Jewish jurisprudence. Rabbinic advices on specific issues (*responsa* or *teshuvot*) allow interpretation of the *Talmud's* general norms in the light of the economic context of the communities of the diaspora. Talmudic commentaries expand economic reasoning by explaining and elucidating its juridical content. This latter approach reaches its highest point with Maimonides' *Mishneh Torah* (1178–1180), in which Aristotelian teachings are used to review the Jewish tradition and to provide an updated set of economic rules (Ohrenstein and Gordon 1992; Soloveitchik 2005).

Notwithstanding Aristotle's influence, the distinctive feature of talmudic jurisprudence lies in a material conception of money. Being considered only as a metal object, money is seen as an unreliable tool in establishing the value of commodities. In the exchange process, the price of money is determined by the quantity of goods that it allows one to purchase, and not the other way around. This approach, which basically denies any abstract or productive meaning to money, does not affect a substantially favorable opinion as to economic exchange and trade. Although buying and selling are seen as an extension of barter (in which monetary prices have only a surrogate function), prices established by market transactions are generally considered to be just. On the marketplace, the commodity embodies, in monetary terms, both objective factors (labor and costs) and individual judgments concerning its usefulness. On the same basis, investments in commercial ventures (*iska*) can determine a profit for the lender, since this gain is determined not by the money lent but by the merchandises exchanged (Ohrenstein and Gordon 1992).

The talmudic conception of money is crucial to understand the way credit contracts are dealt with in the Jewish tradition. Drawing on the *Torah*, the *Talmud* forbids both usury (*neschek*) and lending on interest (*tarbith*) among Jews, while it allows

them when the counterparts are foreigners. In general terms, rabbinic advices and talmudic commentaries connect these prescriptions to the religious obligation of communal solidarity. Yet they also explain them on juridical-economic grounds. The payment of interest is forbidden since it is impossible to establish the price of money in abstract terms, that is, without an immediate relation to other goods. On the contrary, such value can be determined when the money lent is related to commodities by means of a pledge on a borrower's property that, in case of default, passes to the lender. This logical frame is employed by medieval talmudic jurisprudence to develop a multifaceted system of credit structured on a number of contracts: double sale, deposit, mortgage loan, and simple pawnbroking (Soloveitchik 2005). This approach is not only revealing as to the uniqueness of this tradition; it may also explain the growing hostility toward Jewish moneylending expressed in Christian writings (Todeschini 2004).

From the eighth to the fourteenth century, a number of Muslim thinkers are engaged in discussing economic issues, in particular within the Sunni tradition. The most influential contributions come from two well-defined, but different genres. The first is Islamic juridical literature, and it follows a peculiar approach: a case-by-case analysis, on the basis of agreement among diverging opinions and reasoning by analogy, which leaves little space for theory. These texts aim at determining whether contracts are consistent with the Islamic law (*sharī'a*), that is, the teachings of the Qur'ān and the *Sunna*, integrated by the interpretation (*fiqh*) provided by the leading Sunni legal schools. The second genre is that of the political-philosophical treatises, mainly in the form of *Mirrors for Princes*. It is influenced by the Aristotelian tradition of the *oikonomika* (the "science of household administration") and thus opened to a broader theoretical reasoning (Ghazanfar 2003).

Differences also concern the topics that are addressed: while jurisprudence deals with credit activity, political philosophy focuses on merchants and trade. Such partition is determined by Islamic law prohibitions concerning economy: *ribā'* (broadly identifiable with lending on

interest), *ḥarām* (commerce of impure goods), and *ḡarar* (selling of risk). By the eleventh century, jurists (especially in the prevailing Hanafite school), supported by the ‘Abbāsīd caliphs who favored the merging of Islamic and civil law, obtain full jurisdiction on these issues. The results of these processes are significant in economic discussions: (a) they deeply interconnect religious and legal spheres, and (b) they exclude theological–philosophical reasoning from juridical interpretation (Johansen 1999).

Discussions on credit are thus developed focusing on single types of contracts to determine whether *ribā’* or *ḡarar* are involved. Since these bans were not originally set in juridical terms, the judgment provided by legal experts is dependent not only on the formal structure of contracts but also on other elements (e.g., the kind of commodity). Along with a general disapproval of loans on interest and an unfavorable opinion of credit sales, a number of particular cases and diverging opinions tend to coexist. There are rare attempts to find a rational basis of the prohibitions. Some, like al-Ġazālī (1058–1111) and Averroes (1126–1198), echoing Aristotle, argue that they derive from a broader ban to sell goods (e.g., money, provisions, etc.) that are used as a medium in economic exchange. Others, like Ibn Qayyim (1292–1350), state that they aim at safeguarding economically those who are in need from exploitation (Vogel and Hayes 1998).

The most common rational explanation put forward by Abū Dāwūd and Ibn Māja during the ninth century claims that the prohibitions condemn riskless gains. It is drawn from juridical discussions of commercial partnership contracts (*mudaraba*), in which the lender is entitled to receive a share of profit as long as he is liable for the invested capital. This rationale is highly influential, and it is adopted to argue in favor of several types of agreements in which capital and labor are involved, well beyond the realm of trade investment. It also fosters a peculiar approach concerning risk, setting a distinction between reasonably foreseeable events from which it is possible to profit and highly unpredictable occurrences whose economic exploitation is forbidden by *ḡarar*. The link between capital liability

and credit profits can be considered the most distinctive feature of the Islamic tradition. It allows development of a conception of finance consistent with religious and legal teachings, in which principles such as “loss occurring” and “profit ceasing” are not needed (Vogel and Hayes 1998).

Besides considering partnership contracts as standard trading techniques and reasserting that *ribā’* is forbidden by Islamic law, the political–philosophical literature seldom addresses credit activities. Money is generally seen as the medium that allows measurement of the value of goods, yet this argument is never considered in relation to the prohibition of *ribā’*. This lack of interest is counterweighted by a wide-ranging acknowledgment of marketplace functioning and by a favorable opinion of wealth derived from commerce. Drawing on al-Ġazālī’s moral justification of trade profits, political–philosophical treatises explain price increase in terms of a compensation for labor, costs, and risks suffered by merchants. The interplay between supply and demand as price determinants is fully described in the twelfth century by al-Dimashqī and al-Dīn al-Ṭūsī and later further developed by Ibn Khaldūn (1332–1406). The latter even provides relevant insights concerning consumption by distinguishing between the satisfaction of necessities and the desire of conveniences. However, *Mirrors for Princes* do not emphasize the role of merchants in Muslim society and seldom refer to trade as an activity that can increase the economic well-being of the community (Ghazanfar 2003).

Emotions

Simo Knuuttila
Helsinki Collegium for Advanced Studies,
University of Helsinki, Helsinki, Finland

Abstract

Two basic ancient approaches to emotions were the compositional theory of Plato and Aristotle and the Stoic judgment theory. Ancient philosophical theories were employed in early Christian discussions of sin and spiritual experiences. The most influential theological themes were the monastic idea of supernaturally caused feelings and Augustine’s analysis of the relations between the emotions and the will. Early medieval Latin discussions were formed by the reception of ancient themes through monastic, theological, medical, and philosophical literature. Avicennian faculty psychology strongly influenced early thirteenth-century theories of the nature and taxonomy of emotions. Albert the Great and Thomas Aquinas combined Avicennian and Aristotelian themes. Aquinas’ account of emotions in his *Summa theologiae* was the most extensive medieval contribution to the subject. The increasing interest in psychological voluntarism led many Franciscan authors to abandon the traditional view that emotions belonged only to the lower psychosomatic level. John Duns Scotus, William Ockham, and their followers argued that there were also emotions of the will, such as the unpremeditated acts of complacency and dislike and the moods of pleasure or distress – ideas which Adam Wodeham developed into the direction of Stoic cognitive theory. Aquinas’ taxonomy of emotions and Scotus’ analysis of the emotions of the will were the medieval theories which continued to influence early modern discussions.

The medieval psychology of emotions was essentially based on ancient sources. The new developments included the discussion of emotions as part of the Avicennian faculty psychology, thirteenth-

century systematic taxonomies, and late medieval reevaluations of the sharp divide between the emotions and the will.

The philosophical analysis of emotions (passions) was introduced by Plato and developed further by Aristotle, who distinguished between four basic components of an occurrent emotion. First, the “cognitive” element is an unpremeditated evaluation that something positive or negative is happening or may happen to the subject or to someone else in a way that is relevant to the subject. Second, the “affective” element is a pleasant or unpleasant feeling about the content of the evaluation. Third, the “dynamic” element is a behavioral impulse toward action typically associated with the actual emotion. Fourth, there are typical “physiological” reactions.

This compositional approach has been very influential in western thought. As for the first element, practically all ancient and medieval theories were cognitive, associating some kind of evaluation with an emotion. While the Stoics argued that emotions were basically false judgments of the rational soul, it was more usual to follow Plato and Aristotle, who distinguished between the nonemotional intellectual power and the lower emotional parts. This was the prevailing medieval view until John Duns Scotus introduced the conception of passions of the intellectual faculty of the will.

Plato and Aristotle taught that emotions were noneliminable psychosomatic reactions of an emotional part of the soul, which was divided into concupiscible and irascible powers. The Stoics argued that emotions were eliminable value judgments by which people mistakenly evaluated things from their subjective perspective. They divided emotions into four basic types, depending on whether the object was evaluated as a present or future good or a present or future evil (Table 1).

Emotions, Table 1 The four basic emotions of the Stoics

		Time	
		Present	Future
Value	Good	Pleasure	Desire
	Evil	Distress	Fear

This classification was quoted in many popular works, such as Boethius' *Consolatio philosophiae*, and was generally known in medieval times. The best-known part of Stoic philosophy is the philosophical therapy of emotions (*therapeia*) described in works by Cicero, Seneca, and Epictetus. Stoic therapy aimed at *apatheia*, the extirpation of emotions. The Stoic therapy was cognitive because emotions were regarded as false judgments. Other Hellenistic philosophers mostly followed Plato and Aristotle, arguing for the moderation of emotions (*metriopatheia*) – *apatheia* was regarded as impossible and inhuman. While Plato and his followers stressed the control and shrinking of emotions by the intellect, Aristotle also taught the edification of emotions as part of the good life and the importance of learning to feel right. Plotinus argued for *apatheia*, though this did not involve the disappearance of the emotional part – earthly emotions became useless in higher Neoplatonic spheres.

The Alexandrian theologians Clemens and Origen combined Stoic and Platonist ideas, arguing that freedom from emotion was part of Christian perfectibility and the precondition of divinization through participation in divine love (*agape*). This mystical union was described in highly emotional language, but supranaturally caused spiritual feelings, as experiences of the apathetic soul, were not called emotions. John Cassian made this combination of divine love with freedom from mundane emotions known in western monasticism. The Cappadocian fathers and Augustine, in contrast, were more inclined to *metriopatheia*. Monastic psychology also made use of the originally Stoic doctrine of first movements, which Origen, followed by Augustine and many others, applied to the Christian conception of sin. The Stoic idea, described by Seneca in *On Anger* (2.1–4), was that even apathetic people might react quasi-emotionally on exceptional occasions, but this was not really an emotion because it did not involve judgmental assent. Augustine taught that sinful thoughts which frequently occurred because of original sin became sins through assent. This was later developed into a detailed theory of the modes of assent as the degrees of venial and mortal sin. The

monastic literature on mystical ascent also developed introspective analysis of subjective feeling, which Bernard of Clairvaux called the sense of being affected by divine action.

In early medieval times, a new nonreligious impulse to analyze emotions was supplied by Latin translations of some philosophical and medical works. One of these was the late eleventh-century partial translation of the Arabic medical encyclopedia of 'Alī ibn al-'Abbās al-Mağūsī, the *Pantegni*, which contained various remarks on the emotions based on Galen's medical philosophy. Some elements of ancient medical and philosophical theories of emotions were also included in the translations of Nemesius of Emesa's *De natura hominis* from the late fourth century and John Damascene's *De fide orthodoxa* from the eighth century. An important psychological source book was the translation of the sixth book of Avicenna's *Shifā'*, often called Avicenna's *De anima*. Aristotle's *De anima*, which became the principal textbook in the middle of the thirteenth century, was translated c. 1150 by James of Venice.

The medical theory of the emotions concentrated on the Galenic ideas of the humors and the system of the spirits, the vitalizing spirits in the heart and the psychic spirits in the nerves and the brain. In the *Pantegni*, the physical aspects of the emotions were dealt with as slow or quick movements of the vital spirits toward the heart or away from it. This led to a popular medical classification of emotions (Table 2):

Avicenna divides the faculties of the sensory soul into apprehensive powers and moving powers. The apprehensive powers involve five external senses and five internal senses. The moving powers are divided into commanding and executive powers. Emotions are acts of the sensory commanding moving power, triggered by occurrent evaluations by estimative powers and

Emotions, Table 2 The medical classification of the emotions

		Centrifugal	Centripetal
Intensity	Slow	Joy	Distress
	Quick	Anger	Fear

accompanied by bodily affections and behavioral changes. The moving power of the intellectual soul is the will which, together with practical intellect, should control the emotions. The sensory commanding faculty is divided into the concupiscible and the irascible. The reactions of the concupiscible power are desires for things taken to be pleasurable, and the reactions of the irascible power are desires to defeat adversaries and repel things regarded as harmful. Avicenna also analyzed feelings as pleasant or unpleasant perceptions associated with estimative and moving acts. An influential part of his theory was that the estimative power moves the commanding power by noticing the helpful and harmful aspects of things, which are called “intentions.” As an occurrent emotion involves the acts of two separate powers, there must be some kind of governing awareness which combines these two acts.

Many authors employed the Avicennian view of emotions, one problem of which was that classification of emotions into those of concupiscible and irascible powers did not unproblematically correspond with Aristotle’s view that these powers had contrary acts. An influential new taxonomic idea introduced to solve this problem in the 1230s was that the objects of the contrary concupiscible acts were simply pleasurable or painful and the objects of the irascible acts were in addition arduous, difficult to obtain or to avoid. (Early examples of this terminology are found in the anonymous treatises *De anima et potentiis eius* and *De potentiis animae et obiectis*.)

The most detailed early thirteenth-century classification was developed in John of la Rochelle’s *Summa de anima*. He regarded emotions as the acts of two moving powers, the concupiscible and irascible, both of which have several reaction types divided into contrary pairs. The concupiscible pairs are associated with contrary dispositions of liking (*placencia*) or disliking (*displacencia*) and irascible emotions with strength (*corroboratio*) and weakness (*debilitas*). The new systematic idea was to use these dispositions of feeling and behavior reactions as classificatory principles. The contrary emotions of the concupiscible power are classified as follows (Table 3):

Of irascible emotions with the “arduous and difficult objects,” ambition and hope (*spes*) pertain to future honor and prosperity, hope involving the belief that they will be achieved. The opposites are poverty of spirit and despair. Three emotions, pride, lust for power, and contempt, are associated with attempts to strengthen one’s social ranking and power. The opposite of pride and lust for power is humility, and the opposite of contempt is reverence. Of the acts directed toward evil things, courage is a desire to meet the enemy with confidence, anger is a desire for revenge, and magnanimity is rising up against evil. Three forms of the flight from evil are somehow opposites of courage: penitence toward past evil things, impatience with present evil things, and fear of future evil things (Table 4).

Also following Avicenna’s faculty psychology, Albert the Great and Thomas Aquinas treated

Emotions, Table 3 John of la Rochelle’s classification of the concupiscible emotions

	Self-regarding reactions				Other-regarding reactions	
	First orientation	Action initiation	Toward results	Toward durable results	Desiring good or evil for others	Distress about results
Liking	Appetite	Desire	Joy	Delight	Love hate	
Disliking	Distaste	Aversion	Pain	Distress		Envy pity

Emotions, Table 4 John of la Rochelle’s classification of irascible emotions

Strength	Ambition	Hope	Pride	Lust for power	Contempt	Courage	Anger	Magnanimity
Weakness	Poverty of spirit	Desperation	Humility		Reverence	Fear		
						Penitence		
						Impatience		

emotions as acts of the sensory moving powers. While Albert employed the classifications of Nemesius of Emesa and John Damascene, Thomas Aquinas put forward a new taxonomy which was probably influenced by John of la Rochelle. Albert argued that emotions should be regarded as qualities as Aristotle described them in *Categories* 8. Aquinas defended the traditional characterization of them as movements of the soul, finding the basic classificatory principles of emotions in Aristotle's doctrine of contrary movements in *Physics* V.5.

In discussing emotions in *Summa theologiae* II-1.22-48, Aquinas first divided them in terms of objects: the concupiscible emotions react to what seems good or evil at the sensory level, whereas the irascible emotions react to arduous sense-good and sense-evil. The sensory moving faculties are activated by objects through cognition, and the modes of the resulting emotional movements serve as further qualifications in defining particular emotions. The Aristotelian contraries of movements are of two types: approach to something and retreat from it or movements associated with contrary endpoints. The contrary movements of the concupiscible power are of the second type, toward contrary ends (sense-good and sense-evil). The contrary movements of the irascible power are of the first type, with respect to same objects.

Aquinas classifies (1) love, (2) desire, and (3) pleasure or joy as the three self-regarding concupiscible emotions with respect to the sense-good; the contrary movements with respect to sense-evil are (4) hate, (5) aversion, and (6) pain or distress. As for the irascible emotions, the arduous future sense-good may give rise to (7) hope or (8) despair, the arduous future sense-evil to (9) fear or (10) courage, and the arduous present sense-evil to (11) anger – this is without a contrary pair.

Aquinas' attempt to deal with emotions using Aristotle's doctrine of movement was not without its problems. In distinguishing between love, desire, and pleasure as the incipient movement, actual movement, and rest, he confusingly seems to treat emotions as the behavioral changes they are supposed to cause. These movements are not included in the distinction between the formal constituent, that is, the movements of the moving

power, and the material constituent, that is, the physiological changes, such as the movements of the heart, the spirits, and the humors. The background of the sometime equation of emotions with behavioral movements is that these are more appropriate to the analysis through Aristotle's *Physics* than the movements of the moving power which remain less clear. As for pleasure and distress, Aquinas explains that while one might speak about a stone as loving its natural place and desiring to be there, it does not make sense to speak about the pleasure or pain of a stone. Like Aristotle and Avicenna, Aquinas holds that pleasure or distress is a pleasant or unpleasant awareness and this is an aspect of emotions in general since some kind of pleasure is involved in positive emotions and some kind of pain in negative ones.

Aquinas' discussion of emotions, the most extensive in medieval literature, involves detailed terminological, psychological, and ethical remarks on each emotion type. Like all medieval authors, Aquinas argues that the intellectual soul should keep emotions under strict control, but he also criticized the Stoic *apatheia*. His theory and taxonomy were very influential until the seventeenth century.

John Duns Scotus regarded the taxonomies based on the notion of arduousness as artificial, and he also criticized the influential Avicennian idea that there are "intentions" in things which can be grasped by an estimative power which then moves the motive power – representations of a certain kind simply cause behavioral changes in some animals and others in others. The original part of Scotus' approach to emotions was to question the sharp divide between the passions of the sensory soul and the analogous phenomena in the will. According to Scotus, when one's will is fulfilled or frustrated, the next step is the apprehension of the actuality of what was desired or its contrary. Regarding this stage, Scotus says, "there follows a passion of the will, joy or distress, which is caused by the object present in this way." These passions are not directly caused by the will and are not free (*Ordinatio* III.15).

Scotus' longer list of the factors which are sufficient to cause distress as a passion of the

will involves apprehensions that something takes place contrary to one's (1) actual will against it, (2) natural inclination to happiness even though no particular act of will is actual, (3) emotional dispositions of the sensory soul, or something takes place (4) in accordance to what is reluctantly willed in circumstances in which the opposite is preferred but cannot be achieved (*velleitas*). There are corresponding factors which are sufficient to cause pleasure of the will. The intellectual soul is regarded as very emotional – its feelings are influenced by actual volitions or nolitions as well as by the inclinations of the will and the sensory part of the soul.

Scotus also treats liking and disliking, the unpremeditated first reactions and necessary concomitants of other acts, as analogous to sensory emotional reactions except that they are free acts. Ockham's theory of emotions is largely based on Scotus' ideas. John Buridan, who otherwise followed Scotus and Ockham, stated that liking and disliking as immediate reactions are not free and in this respect are also similar to sensory emotions in general. Influenced by Scotus' idea of emotional will, Adam Wodeham argued that volitions and nolitions are valuations, to which all human emotions can be reduced because of the unity of the soul. This assimilation of emotions to evaluative thoughts shows similarities to the Stoic theory, although Wodeham does not refer to Stoic authors.

Medieval theories of emotions were discussed in many influential Renaissance works, some of these concentrating on the differences between the theories of Scotus and Aquinas. John of la Rochelle's taxonomy of emotions was also known through a paraphrase in Gregor Reisch's popular early sixteenth-century encyclopedia *Margarita philosophica* (12.4–5).

the influence of Aristotle and a brand of Platonism, defend a heightened conception of knowledge defending the infallibility of objects (due to their necessity and universality) in as much as that of discursive methods (theories of demonstration). After a refresher on this double heritage, we will examine three models of scientific reasoning developed in the Middle Ages bolstered by different procedures of guaranteeing the certainty of knowledge and its application to a contingent world.

In general terms, epistemology can be taken to be a theory of knowledge, the examination of criteria of cognitive apprehension broadly construed, or in a more restricted sense, a theory of scientific knowledge the result of which being discursive procedures of deduction. The common ground between these two conceptions of knowledge is the central role played by a set of recurring concepts: certainty, truth, and assent. They are distinguished by their essential differences at the level of the objects of knowledge and above all, by their procedures of justification. If the first mode of knowledge reflects a quasi-everyday sense of the term, the second designates a perfect or even ideal state. In the Middle Ages, the term *notitia* was used to capture the first sense, and *scientia* to capture the second. *Notitia* includes fallible epistemic states that may turn out to be false, and which would merit more the name belief, while *scientia* is construed as that which uncovers the criteria of infallibility. The common point of the medieval approach to this notion is the exclusion of falsity, in virtue of the principle of *nihil scitur nisi verum*. Our interest here is in this stricter sense.

Medieval reflections on *scientia* primarily aim toward the elaboration of a theory of demonstrative knowledge, largely inspired by the Aristotelian tradition of the *Posterior Analytics*. This tradition, which stresses the deductive procedures that a science must put in place, is reinforced by Aristotle's remarks about science being an epistemic virtue, that is an *habitus*, characterized by its permanence and its inclination toward truth as opposed to mere opinion (*Categories* Ch. 8, *Nicomachean Ethics* VI, 3). Infallibility is

Epistemology

Abstract

In a general sense, epistemology aims to provide criteria for knowledge, and in a more restricted sense, an elaboration of a theory of scientific knowledge. The Medievals, under

thereby assured both by the subject and in method. This Aristotelian tradition is reinforced by a convergence with another tradition: the Platonism disseminated by St. Augustine. This tradition thus adds a demand of universality and immutability in the object of knowledge: science is certain knowledge of a universal and immutable object. This double heritage drove the Medievals to establish a theory of strict scientific knowledge and to face the gap that imposes itself between this conception of science and other forms of discourse. We will put the emphasis in this perspective on two points salient to medieval epistemology, one part being the status of its object, in particular its contingent objects, the other part the question of the epistemic criteria required to distinguish cognitive states.

Medieval conceptions of epistemology are rooted primarily in the theory developed in Aristotle's *Posterior Analytics*. The difficulty of this text, which is amplified by problems of translation, created as many problems regarding epistemological thought for the Medievals as it did solutions. In a general way, the following elements must be underscored. First, we find in this text an objective and discursive double determination of science. Indeed, science must be based on a universal, necessary, and eternal object (*Posterior Analytics* 1, 2, 71b 9–12; see also I, 30). We seem able, therefore, to exclude the idea of a science of the particular and contingent. Nevertheless, the exclusion of separate Forms (*Posterior Analytics* 1, 11) provides an empirical basis to science. Second, from the discursive point of view, knowledge is obtained by means of demonstration, so that all science is syllogistic and rests on a deductive structure. One such structure requires a kind of epistemic primacy of premises that guarantee a transfer of evidentness and truth. It is thus necessary that the premises, in addition to their necessity and universality required by the nature of the object, are equally true, primary, better known, prior to, and the cause of the conclusion (*Posterior Analytics* 1, 2, 71b 20–22). Even though the notion of certainty is not explicitly addressed by Aristotle, it is this focus on the primacy of premises and on the transference of their epistemic qualities that makes it possible for

the Medievals to explicitly develop the question of the reliability of science and its objects. The junction of these two determinations, objective and discursive, thus leads to the recovery of the ontological order by the discursive order, and a kind of isomorphism between them. In this way, to have scientific knowledge is to have a causal knowledge of an essence. This strict conception of science, as a body of adequate propositions to a particular kind of object, introduces a difference of kind between science and opinion. Since there is no science of that which can be otherwise, the disposition of reason toward this type of object cannot be described as science (*Posterior Analytics* 1, 33). This kind of epistemic state, capable of truth and falsity and marked by instability, is called opinion, and is able to induce accounts of different natures. Aristotle, by notoriously excluding that the same thing can be both an object of science and an object of opinion, seems to introduce a difference of kind and not merely of degree between science and opinion; a difference already reinforced by the exclusion of opinion from the set of intellectual virtues (*Posterior Analytics* I, 33, *Nicomachean Ethics* VI, 3). It is thus a strict conception of knowledge that the Medievals inherit from the *Posterior Analytics*. This conception is reinforced by one of the important mediations in the receptions of the text, namely Themistius' paraphrase, translated (from an Arabic version) by Gerard of Cremona. At the beginning of the second chapter (p. 247), the Byzantine commentator opposes a common sense and a proper sense of the notion of *scientia*. According to this latter sense, there is science if and only if we are capable of accounting for the reason why some thing exists, such that we accept that it cannot be otherwise. The Medievals find themselves thus confronted by a text that offers schema apt to guarantee the certain acquisition of truth, but at the cost of a strong dichotomy between science and opinion and the necessary and the contingent, at the heart of the field of epistemology. We have an example of the distress that may have given rise to this situation in one of the first medieval readers of the *Posterior Analytics*, John of Salisbury. In the *Metalogicon*, all the while emphasizing the difficulty of the text on account

of both the translation and the subject matter, John emphasizes that the modes of reasoning central to the book are primarily mathematical reasoning which deals with necessary objects. Thus, demonstrative logic is reduced to the mathematical, while the contingent is the object of probable logic that finds its tools in the *Topics* (see IV, 6, 8 and II, 3).

One of the aims of medieval epistemology is thus to soften, as much as possible, the scope of science without giving up the deductive rigor and certainty of its principles.

What makes the task of medieval philosophers more difficult is that these elements of the Aristotelian doctrine are reinforced by the second ancient tradition, namely, the tradition of Augustine's Platonism. In the *Theaetetus* (of which the Medievales were unaware) and the *Meno* (translated in the twelfth century but not widely read), Plato criticizes different definitions of science based on sensation and opinion, emphasizing from his position the gap between knowledge and opinion and between necessity and contingency. One such criticism opens the door for the Theory of Forms. Thus in the *Timeaus*, which is the principal source of information on Platonism in the Middle Ages, Plato contrasts the plausible knowledge of the sensible from the knowledge of the universal and necessary forms (27–28). This contrast is further reinforced by Augustine who is the chief figure in the Christian incorporation of Platonism. In the 83 *Diverse Questions*, q. 9, Augustine insists on the impossibility of perception of attaining authentic truth (*scincera veritas*), given the mutability of its object. In this way, only intangible objects that participate in the Divine and that are only knowable by the intellect falls within the scope of science as self-evident.

This act of excluding the sensible and the contingent from the domain of science rests on the Platonic theory of Forms assimilated in the Divine Idea and transposed in the Divine Intellect. These Ideas, both specific and generic, constitute the ontological structure of the world since it is from them that God created the sensible world (83 *Diverse Questions*, q. 46). These Ideas give an account of the nature of things and enable their permanence and stability since they are eternal

and immutable. The Augustinian position is basic since it legitimates the rationality of the sensible world and the legitimacy of a scientific study of creation, all the while echoing the foundation of such a science in God's knowledge. The principle that governs the creation of each thing (the special formulation), which is found in the Divine Understanding, must be found. It comes back to the human soul to know these Ideas, insofar as it is rational and reflects God's image, and once it is purified (that is to say, turned from the sensible). It is thus in the contemplation of these immutable Ideas where the highest activity of the rational soul is located. Augustine states explicitly (*Trinity* XII, 4) that it is in this activity that the soul reflects God's image. Science is thus that through which the soul becomes like God. To fill in this notion of the contemplation of Divine Ideas, Augustine develops an account which is one part theory of illumination and another which reinvests into the changing Stoic distinction between science and wisdom. In the first place, since truth is accessible to God and to Divine Ideas, human knowledge requires Divine Support: on the model that light illuminates sensible objects and renders vision possible, Divine Truth must illuminate intelligible objects in order to make them accessible to human intellect (*On the Teacher*, c. 39–40). Science as the certain and complete apprehension of an intelligible object is then not conceived on the model of abstraction but on that of perception or immediate universal intuition. Nonetheless, the understanding of a necessary and immutable universal is not exclusive to a worldly knowledge for, on the one hand, the process of the soul's turning to God depends on the sensible (see for example *De Ordine* II, c. 30–40), and on the other, like Plato, Ideas function to stabilize the sensible, so that Augustine distinguishes science as apprehension of the temporal with wisdom as the apprehension of the Divine.

Despite this distinction at the level of objects, the epistemic properties of certainty, evidence, and truth may be the same. To this Platonic dimension is a text which was important in the early Middle Ages for the theory of the faculties implicated in the knowledge of the sensible and the intelligible, respectively. It is the distinction

between cognitive faculties proposed by Boethius in the fifth book of the *Consolation of Philosophy*. This fundamental text for the theory of knowledge in medieval philosophy, prior to the rediscovery of Aristotle, proposes a complete description of the ways of knowing, paralleling and compatible Augustine's. The context is that of God's knowledge of future contingents and Boethius aims to show that one object is known differently depending on the quality of the faculty. At a first level is situated the activity proper to each sense. Sight and touch have different objects, given their functional differences (for instance, the simultaneity of sight opposes the succession of vision). At a second level, imagination allows the passage of matter to form (*figura*). It is the first level of abstraction that consists in a synthesis of the sensible given and to set aside the sensible particularities. At a third level, reason introduces true abstraction, that is, universalized abstraction. The particular form of imagination is robbed of its individual characteristics, which leads to the creation of a common form by means of an abstractive induction. Finally at the last level, intelligence allows the constructed universal to pass into a simple form (the Divine Idea) by the direct contemplation of the mind's eye. There is thus a set of faculties hierarchically organized by the function of their objects. Each superior faculty contains the inferior and has thus access to its objects, which implies a limitation of the inferior faculties: the senses are not moved without a material object, the imagination has not the capacity to abstract the universal, and reason lacks access to simplicity. In contrast, reason knows the particular since it rests on the senses and imagination to construct its object (i.e., a definition). Intelligence is the synthesis of all faculties: it is knowledge of the simple and the complex, the material and the spiritual, the particular and the universal. This triple heritage, Platonic, Augustinian, and Boethian, informs all epistemological reflection prior to the rediscovery of Aristotle. We find this in Bernard of Chartres, for instance, in his commentary of the *Timeaus* (*Glosae super Platonem*, 8, 325–353, with portent to *Timeaus*, 51de). Indeed, Bernard crosses reflection on objects and the faculties to reach a hierarchy of

faculties tied two at a time to the difference of nature between objects and to the degrees of epistemic justification implied. At a first level, sensation is tied to the sensible and produces an opinion entirely dependant on the testimony of the senses. On its own, this opinion can turn out to be true or false. Thus, opinion must be confirmed by reason which alone will be stabilized by the intellect. At the level of reason and intelligence, the objects are the intelligibles which are immutable; an immutability that bases certainty. Science is thus the certain apprehension of immutable objects.

Since the end of the twelfth century, the medieval philosophers were seeking to determine the criteria of knowledge inheriting a double tradition proposing an elevated cognitive model, tied to a demand of infallibility in the object of knowledge as well as in the subject. Philosophical thought on knowledge must then face the inevitable gap (already noted by John of Salisbury) between, on the one hand, a restrictive conception of scientific discourse and, on the other hand, the extension of the domain of objects. To account for the appropriation of ancient thought on science and its softening, we will briefly look at three models accounting for the three distinct approaches to this key question of infallibility. The first model, exemplified by Robert Grosseteste, consists in taking up the double Aristotelian and Augustinian heritage to articulate the distinction between science and wisdom. The second model, exemplified by Thomas Aquinas, proposes a naturalist reading of science that accounts for the contingency of the sensible. Finally, the last model, which we can call nominalist, and which is exemplified here by John Buridan, seeks an account for the science of the contingent in an Aristotelian framework.

The importance of Robert Grosseteste for medieval thought on Epistemology is measured in two ways: he is the first known commentator of the *Posterior Analytics* (c. 1220), a commentary which is marked by a strong consideration for Themistius; and he elaborates a theory of *scientia* which blends the double influence of Augustine and Aristotle. This first form of incorporation of Aristotle's discourse on science will have a lasting impact throughout the whole Middle Age.

Robert Grosseteste proposes a general definition for science in relation to the notion of belief in his commentary on chapter 33 of the *Posterior Analytics*. Here, he gives a broad meaning of *opinio* as *assensus* or *fides* which includes both science and belief since all that is known is believed. This brand of assent is specified in science and belief both by the function of the considered object and the degree of possible certainty. Belief is indeed the adherence of a proposition accompanied by fear (*timor*) that the opposite is true. In other words, belief leaves the possibility open that what we assent to turns out to be false. Belief can thus not exclude the possibility of error. Grosseteste restricts the notion of belief further by making it pertain exclusively to contingent things (*Commentarius*, I, 19, p. 278, 16–279, 29). Because of this, belief is not knowledge of the thing in its purity, that is to say its essence, but merely in its appearance, thus *qua* material and mutable thing. It is the possibility for the object to change that impedes the certainty of belief (280, 49–53 & 61–67). Conversely, knowledge eludes this deficiency at the level of object and its consequences at the level of certainty. Knowledge is indeed one disposition (*habitus*) acquired by necessary means and based in necessary things that cannot be otherwise, since it obtains purity and truth of the essence (281, 85–88 & 283, 136–137). In this way, it can be defined as complete knowledge of the thing in itself (278, 10–11). Nevertheless, Grosseteste distinguishes between several more or less strict senses of *scientia*. In a broad sense, science is the apprehension of truth, including contingent things (be it the indefinite contingent or the contingent understood as that which is produced most often). This broad sense of knowledge captures most of the restricted sense of opinion and it permits the preservation of the everyday use of knowledge to designate epistemic states that are not infallible. In contrast, the proper sense of knowledge rests on immutable objects and assumes the apprehension of the cause of the thing by means of demonstrative procedures (I, 2, 99, 9–100, 25). Like John of Salisbury, Robert Grosseteste maintains that this strict sense is exclusively concerned with

mathematics, which is absolutely exempt from deceit (I, 11, 179, 141–142).

Grosseteste thus defends a conception of knowledge as justified true belief (assent) and makes a distinction central in his general definition between different kinds serving as part of the nature of justification and part of the nature of the object in question. Knowledge in its strictest sense must appeal to demonstrative procedures apt to discovering the immutable essences of things. There is then no science of the contingent, properly speaking, since it is a form of essentialism that guarantees the certainty and infallibility of science. The nature of the known object conditions the type of certainty accessible. This essentialism is in turn guaranteed by the superior level that of the Forms or Divine Ideas (I, 7, 139, 96–130). It is at this level that Grosseteste reintroduces the Augustinian theory of illumination into the Aristotelian schema. This seems like the ultimate guarantee for knowledge and offers the highest possible degree of certainty by granting access to an absolutely immutable object. Thus, the role of abstraction is otherwise reduced, at least subordinated to the intellectual perception of Divine Ideas, made possible by illumination (I, 14, 212, 216–216, 291). In this way, despite the privileged granted to demonstrative procedures, knowledge is conceived on the model of vision; spiritual vision that apprehends intelligible when the mind's eye is illuminated by spiritual light (I, 19, 279, 29–280, 49).

The second model of *scientia*, exemplified by Thomas Aquinas, abandons the attempt to articulate Plato and Aristotle and goes no further than a natural model of abstraction to account for both the certainty of science and the possibility of knowing the contingent.

Strictly speaking, knowledge must benefit from a degree of certainty that guarantees absolutely its infallibility. This infallibility is grounded in both the nature of the discursive procedures employed and in the nature of the objects known. Because of this, by lecturing chapter 33 of the first book of the *Posterior Analytics* (*Expositio posteriorum*, L. I, l. 44), Thomas takes up the distinction between knowledge and belief by means of the distinction between objects.

Belief is defined as the adherence to immediate and nonnecessary propositions (I, 44, 5). Belief does not necessarily call to discursive procedures, and rests on contingent things that are able to be otherwise. This opposition between science and belief, intensified by the opposition between necessary and contingent, drives Thomas to a strict conception of knowledge as complete and evident knowledge of the thing's essence (I, 4, 2). Thus, it is essentialism that guarantees epistemology but which also introduces a radical difference between intellectual knowledge and sensible knowledge which belongs to opinion (I, 42, 6). The guarantee brought by essentialism, however, is reinforced by the discursive structure of science, which is a demonstrative habitus. Thomas thus develops a foundationalist conception of knowledge where the epistemic justification is primarily inferential: it is the reduction or resolution of conclusions to their principles that allows for the accordance with certainty required by knowledge. The syllogism serves to make explicit this reduction to principles and allows thus to evaluate the certainty of the known proposition. It is thus, overall, the certainty of the principles, by transference of justification, that guarantees the certainty of knowledge in general (see for instance *Met.* L IV, 1 6, n. 12). It is therefore the double essentialist and axiomatic model that grounds the infallibility of science for Thomas, at the cost of an important limitation in its scope.

This double essentialist and foundationalist orientation of science is nonetheless balanced by a strong dose of empiricism. Indeed, empiricism is reintroduced at a first level as a condition for the abstraction of essences and the access to principles. Thomas proposes a strict empiricist reading of the last chapter of book 2 of the *Posterior Analytics*: it is by an inductive step based on repeated experiences that we are able to abstract the necessary universal from the multiplicity of sensible contingents, in identifying an ontological structure vouching for permanence (*Expositio*, L II, 1. 20, n. 12–14). Contrary to Grosseteste then, Thomas excludes all intuition of essences, which are necessarily built for us. Empiricism works on a second level in allowing the reintroduction of a connection between science

and opinion. Effectively, Thomas admits that, in a broad sense or by analogy, we are able to label as science the certain assent (*existimatio certa*) to some contingent objects (*Expositio*, I, 42, 9). This extension of the sense of science is tied in part to the revival of the notion of *materia subiecta* introduced by Aristotle in the first book of the *Nichomachean Ethics*. Indeed, Thomas emphasizes in his commentary that scientific method must be adapted to its object and that it is wrong to demand a mathematical certainty for contingent things (*Sententia ethicorum*, I, 3, 1–5). In the case of natural science, Thomas admits that there is no science of the contingent as such. On the other hand, the scientific knowledge of essences makes a quasi-science of the contingent possible, insofar as we consider things that happen for the most part (*ut in pluribus, ut frequententer*). There would be no demonstration in the strict sense in the case of natural events that are frequent without being necessary. Through discursive procedures we obtain the certainty that the thing is true, not absolutely (*simpliciter*), but relatively (*secundum quid*) (II, 12, 5). The double empiricist and essentialist dimension of Thomas' epistemology allows an extension of the notion of science since there exists ontological structures that guarantee the regularity of phenomena and since we are able to recognize these structures. The contingent is an object of science in a broad sense that no longer allows complete infallibility but preserves a strong degree of certainty nonetheless. The science of the physical world will not be a demonstrative science in the strict sense, but it approaches it enough in the science elaborated in the *Posterior Analytics* to be qualified, despite all, scientific knowledge.

The third medieval model of *scientia* that we will examine draws on this weakened notion of knowledge to bolster the possibility of a science of the contingent. This model, used by the nominalists, notably John Buridan, separates the isomorphism between discourse and objectivity which underlies the two preceding models. The demands of necessity and universality, put forth by Aristotle and understood in a strict discursive sense, are taken to mean that the object of science is always the particular contingent. The aim is then

to preserve a form of certainty independent of all objective determination. The contribution of a nominalist like John Buridan to the theory of science plays out on a double level: on the one hand, in the preservation of a qualified infallibility of knowledge; on the other, in the semantic reinterpretation of the Aristotelian demands of necessity and universality.

Buridan defines knowledge by stressing its psychological dimension: knowledge is a species of the genus assent, in the same way as opinion. Knowledge and opinion are borne on an immediate or mediate proposition (the conclusion of reasoning). The distinction between these two kinds of assent does not primarily stem from the object in the place but from logical and psychological determinations that accompany each assent, since both science and opinion are able to bear on the same object (*Quaestiones super posteriorum*, I, 32). Distinguishing these two assents is thus primarily the manner in which they relate to their object. Opinion, according to the classic definition, accompanies the fear that the opposite is not true (*cum formidine*). Conversely, knowledge accompanies both certainty or firmness and evidentness. It is this double constraint of certainty and evidentness that guarantees the truth of the proposition known and begets the infallibility of knowledge (see *Quaestiones super posteriorum* I, 32; and, I, 2 et I, 7; *Summulae* VIII, 4, 3). Evidentness adds an objective determination to certainty which, understood as a psychological quality, could eventually accompany a false belief. It is thus at the level of evidentness that we find the definition of the true as the infallible apprehension of the truth. Yet Buridan distinguishes between two forms of evidentness: the first is said to be absolute, it is the evidentness of known by reflection that absolutely restrain assent; the second is said to be relative and depends on the ordinary course of nature. It gives an account of the evidentness of the principles of natural science known by induction. These principles, founded on the regularity of nature and a certain necessity of natural phenomena, can be made false by a supernatural power. But this hypothesis that underscores simply the contingency of creation does not consider the formation

of reliable propositions about natural events. Natural science is thus the apprehension of conclusions relative to regular phenomena deduced from principles known by induction (thus by means of experiment) and warranted by sufficient practical evidence, even if theoretically a counterexample cannot be absolutely counted out. On the side of knowledge, certainty and evidentness of knowledge guarantee both a certain disposition toward propositions and the permanence of this disposition.

From here, Buridan can resume the question of the status of the objects of science. While endorsing his Aristotelian orthodoxy and rejecting the idea of a science of the contingent (*Quaestiones super posteriorum*, I, 32), Buridan proposes no less than the grounding of science in a world of concrete particulars. Effectively, the distant objects of all science are those things signified by the terms that compose known propositions, and these terms are individual contingents (*Quaestiones super posteriorum*, I, 15; *Super ethicorum*, VI, q. 6). It must be explained how premises are able to be presented as necessary and eternal by Aristotle (74b5-7). Buridan holds that no creature (thus no proposition) can be eternal and necessary in this temporal sense. Similarly, nothing signified can be said to be necessary in itself. It is thus at the level of terms that the question of the necessity of eternity must be settled, by strict semantic means. Buridan effectively appeals to natural supposition to account for the omnitemporal reference of terms used in scientific propositions and to account for the unfalsifiable character of these propositions. Common concepts that compete for individual apprehension are indifferent to temporal determinations (*Quaestiones super posteriorum*, I, 16). The common concept indifferent to time is conceived on the model of genus and species and the elimination of specifying and individuating differences. Thus, we have general and abstract common concepts that are indifferent to the issue of time. These concepts form the basis of general signification of terms taken as universals and induce their omnitemporality: signification *sine tempore*. The mind then possesses the tools (a copula that cosignifies all times) to compose these concepts

and form propositions indifferent to time. The natural supposition must then account for the supposition of terms of one such mental proposition. Terms with such supposition have thus one form of perpetuity that allows saving Aristotle's intention to make premises and conclusions of propositions necessary and eternal, in the omnitemporal sense. Thus, a scientific proposition is an omnitemporal point of view, that is, unfalsifiable and evident, on a particular and contingent world.

Epistemology, Byzantine

Börje Bydén

Department of Philosophy, Linguistics and Theory of Science, University of Gothenburg, Gothenburg, Sweden

Abstract

Byzantine views on knowledge are strongly influenced by late antique Neoplatonic Aristotelianism. A basic assumption in this tradition is that the nature of cognitive states is dependent on the nature of the cognitive objects (which have independent existence). Thus, the possibility of knowledge is secured by the existence of knowable things. Modifications of the Neoplatonic views are sometimes prompted by religious considerations, but these are more to do with emphasis than with content. It was strongly emphasized by the Byzantines, for instance, that God's essence is beyond knowledge. Likewise, the Platonic theory of recollection was repeatedly condemned because it seemed to entail the soul's pre-existence; on the other hand, the idea that the soul at birth is a *tabula rasa* was in conflict with the Christian doctrine that it is created perfect, and therefore Aristotle's theory of concept formation was interpreted (e.g., by Eustratios of Nicaea) in a way that allowed for rational principles to be innate. In fact it is not uncommon to find in Byzantine writers rationalist accounts tracing the source of knowledge to innate soul-principles side by side (or nearly so) with endorsements of empiricist views suggesting that the first principles of knowledge are constructed from the individual forms of things.

Epistemology in Byzantium

There are no writings from the Byzantine period purporting to deal exclusively or exhaustively with questions relating to the nature, scope, and sources of knowledge. Such questions are

addressed primarily in four different (although partly overlapping) contexts: in discussions of the soul's various cognitive states and faculties, in discussions of the several divisions of philosophy, in discussions of Aristotle's theory of demonstration, and in discussions of Plato's theory of recollection. In addition to the relatively few works that partly focus on knowledge, there are of course numerous philosophical texts that allow inferences about some of the epistemological assumptions of their authors.

One pervasive assumption, inherited by the Byzantine philosophical writers from antiquity, is that the nature of cognitive states (e.g., knowledge [*epistēmē*], skill [*technē*], experience [*empeiria*], and practice [*peira*]) is dependent on the nature of the cognitive objects. Thus, knowledge is infallible on account of the unchangeability of its objects, which are universals, whereas skill is liable to err on account of the propensity of its objects, which are individuals, to change. Different cognitive objects are cognized by different cognitive faculties. Individuals are cognized by sensation, if they are present, and by imagination, if they are absent; universals are cognized by opinion, reason, and intellect. At any rate, this is what many Byzantine students of philosophy imbibed from textbooks such as David's *Prolegomena* or Nikephoros Blemmydes' *Epitome logica*. On occasion, Byzantine writers expressly identify the objects of the three parts of theoretical philosophy, that is, natural philosophy, mathematics, and theology with the objects of opinion, reason, and intellect, respectively.

The idea that human intelligence is insufficiently equipped for the knowledge of things divine has always been present in Greek philosophical thought. In Greek Patristics, this idea is endorsed in a radical version, inasmuch as God's essence (*ousia*) is considered to be in principle indescribable and incomprehensible and the object of faith alone; on the other hand, his attributes, including existence, unity, and being the creator of the world, are thought to be susceptible of proof. In the late Byzantine period, Gregory Palamas (1296–1359) introduced the notion that God's activities (*energeiai*) can be directly

perceived as "uncreated light." This perception (*aisthēsis*) involves both body and mind.

Apart from that, the influence not only of the Patristic but also especially of the Platonic tradition contributed to instil in Byzantine thinkers a general distrust of the senses as sources of knowledge. In his *Semeioseis gnomikai* (c. 1326), Theodore Metochites expressed sympathies for a view, which he ascribed to the ancient skeptics and traced back to the elenctic dialogues of Plato, namely that knowledge is impossible, at least in the domains of natural philosophy, ethics, and the arts (*technai*), where the objects studied are in constant flux. Theology, he thought, was a different case: the truth about things divine can be attained, but only through inspiration from above. As for mathematics, Metochites argued, in the *Semeioseis gnomikai* and elsewhere, that it is superior to natural philosophy, in that it alone studies objects that are in the strict and proper sense knowable (*epistēta*). Usually, he described these objects as being mental forms resulting from a process of abstraction starting with sense-objects, but he left no doubt in his *Poem* 10 that he really conceived of abstraction as only an aid to the recognition of forms already pre-existing in the soul, and thus probably adhered to the "projectionism" of late antique philosophers of mathematics such as Iamblichus and Proclus.

A concern with skepticism is evidenced also by two later attempts to refute skeptical arguments: a very short pamphlet by Nicholas Chamaetos Kabasilas in the mid-fourteenth century, and a slightly longer one of uncertain date, transmitted as chapter 3 of the so-called *Metaphysics* of Herennius, but this is not sufficient to justify some earlier scholars' belief in a revival of skepticism in the fourteenth century. Doubts about the possibility of knowledge *tout court* were never entertained in Byzantium, although such doubts concerning the realm of coming-to-be and passing-away may to some extent account for the apparent difficulties faced by Byzantine thinkers in dealing with Aristotle's theory of demonstration, to which we shall now turn. The *Posterior Analytics* was probably never included in the standard curriculum, but it is preserved in more than 100 manuscripts, and at least four

commentaries on the second book were written in the Middle and Late Byzantine periods. Those by Theodore Prodromos (born c. 1100) and George Pachymeres (1242–c. 1310) have not yet been published in print, whereas Leo Magentenios' commentary was edited by Wallies in CAG 13.3 under the name of John Philoponus. We shall return to the earliest and most important among them, namely that by Eustratios of Nicaea (c. 1050–1130), edited by Hayduck in CAG 21.1, after some brief remarks on the Aristotelian theory itself.

According to it, we have scientific knowledge of a fact if and only if we can demonstrate not only that it is a fact but also that it is a necessary consequence of other facts that are already known ("for science involves an account"). For fear of an infinite regress, Aristotle assumes that all the propositions that make up an individual science follow from a number of indemonstrable and necessary propositions or first principles. The problem dealt with in *Posterior Analytics* 2.19 is how we come to know the first principles. Part of Aristotle's solution to this problem is his theory of concept-formation. Scientific propositions typically take the form of one term's predication of another, quantified, term; as a consequence, knowledge of scientific truths is largely reducible to the possession of scientific concepts. At any rate Aristotle does not seem to feel the need to distinguish between the questions of how we come to know the first principles of science and how we come to have scientific concepts.

Scientific concepts are universals: species, genera, differentiae, properties, and accidents. The Neoplatonic theory of "three types of universals" was widely embraced in Byzantium. According to this theory, the word "dog" can refer (a) to the Form of Dog in God's mind (the universal *ante res*); (b) to the universal canine features somehow exhibited by Max, Meg, and Millie (the universals *in rebus*); and (c) to the concept of a dog in a human mind (the universals *post res*). The universals *in rebus* were thought of as being inseparable from the individuals by whom they were exhibited. Universals *post res*, which constitute the terms of scientific propositions, were thought of as being formed by a

process of "conglomeration" from individual forms received by the senses. This raises the question of what such a process must be like in order to convert the collected memories, or experience, of what is normally a proper subset of all existing individual cases into a true universal. Given the above-stated view on universals *in rebus*, it seems that this process must involve abstracting from all the individual features with which the universal features are inextricably united in the individuals; more alarmingly, perhaps, it must allow for terms to be predicated of other terms with necessity, in spite of the fact that our experience of the things referred to by those terms is normally limited to a proper subset of all existing individual cases (the problem of induction).

The standard late antique interpretation of Aristotle's theory of concept-formation assigns a crucial role in this process to the active intellect. Exactly what the active intellect is was explained very differently by the commentators: for Alexander of Aphrodisias it is a single and external entity, but for the Neoplatonic commentators it is part of each individual human soul. Its function is to make potential objects of intellect into actual ones, as light makes potential colors into actual ones. Sensible forms stored in imagination are potential objects of intellect, so far everyone agreed. But how are they reduced to intelligibility? The Neoplatonists would say that they must be matched against other forms, or rational principles (*logoi*), constantly being inscribed in the soul by the active intellect. For them, it is the reading of this script that Plato has in mind when he formulates his theory of recollection. This theory, as known from the *Meno* and the *Phaedo*, was universally repudiated in Byzantium, since it was considered to entail the pre-existence and even transmigration of souls.

It has been argued recently (Ierodiakonou 2010) that Eustratios introduces a Christian alternative to both Plato's theory of recollection and Aristotle's theory of concept-formation, which allows for innate knowledge without necessitating the assumption of the pre-existence of the soul. In a digression from his general introduction to *Posterior Analytics* 2.19 (257.33–258.27), Eustratios explains that the common and self-evident

concepts in the soul are resonances of the intuitions (*epibolai*) of the intellect. They are originally concealed owing to the influence of the vegetative and the animal parts of the soul, but with guidance from sense-perception or rational account the rational soul will eventually arrive at reflection upon them – which is not, Eustratios stresses, the same as recollection. Ierodiakonou drew the conclusion that Eustratios wished to “clearly distinguish his view from those of Plato and Aristotle in part in order to be in line with Christian dogma,” more specifically the doctrine that the soul, which is created with the body, is created perfect (*ibid.*).

That Eustratios did have this Christian doctrine in mind is borne out by a passage in his commentary on *Nicomachean Ethics* 6.3, where Aristotle’s statement that the principles must be better known than the conclusions in order for there to be scientific knowledge is defended as being “neither newfangled nor at loggerheads with [the Christian doctrine of] the first creation of man” (297.15–16). Here Eustratios explicitly states that the fact that man is created perfect from the beginning entails that he is active on the level of intellect, not only on that of discursive thought, which is to say that he comprehends the intelligibles immediately by simple intuition. But he can only do this insofar as he retains the position allotted to him by the Creator and directs his desire toward the intellectual realm: since he inclines toward a sensual life, he is deprived of his proper perfection and his intellectual eye is clouded. This is why he has recourse to sense-perception: through its activity, that is, the immediate cognition of particulars, it provides the intellect with material from which to construct universal concepts, which are likewise immediately cognized and from which scientific propositions follow. In this way, man is healed from his affliction and can again turn his attention toward the intellectual realm and his Creator. As to its substance, intellect is not liable to destruction, but its activities in this world involve imperfect and destructible things and will therefore perish. “It is natural, then,” Eustratios concludes, “that the inductive construction of the axioms of the sciences supervenes on the original perfection of the

intellectual part of the soul and its subsequent defection” (298.4–6). It has been pointed out (by Trizio 2016, 177–187) that – apart from the crucial detail that the soul is created with the body – Eustratios’ view has much in common with that of Proclus. What is not so clear is to what extent Eustratios believed that his view was different from Aristotle’s. One account in the late antique commentators that comes fairly close to Eustratios’ is the commentary on *De anima* 3.4, 429b29–430a2 by Philoponus, another Christian. Philoponus distinguishes between different degrees of “first” as well as “second potentiality,” and does not hesitate to ascribe to Aristotle the view that “the active intellect perfects the potential intellect and brings it to actuality, not by placing in it forms which are not there, but by bringing to light forms that are latent and concealed, owing to the torpor ensuing from birth” (40.34–37 ≈ Sophonias, 135.22–24). Now, Eustratios ascribes to Aristotle the view that intellect is potentially present in the soul from the beginning and brought to actuality through sense-perceptions (*In An. post.* 257.30–32). He also interprets him as saying that the soul, prompted by the senses, brings the rational principles (*logoi*) in itself from a non-active to an active state (265.18–24, and cf. 265.6–10), and he seems to agree that this is true. On the other hand, he repudiates the view that souls “substantially (*kat’ ousian*) proceed from potentiality to actuality and come to cognition of the immediate premisses through the senses” (258.22–23). It should be noted, however, that he never expressly ascribes this latter view to Aristotle; and so possibly, like Philoponus, he distinguishes the substantial actualization that he denies from the actualization that he affirms and ascribes to Aristotle, as starting out from a more remote potentiality.

Even if Eustratios sought for a position that he felt was “in line with Christian dogma,” he evidently did not have to abandon the paradigm of Neoplatonic Aristotelianism to find it. A position close to his was taken by Nikephoros Choumnos (1250/1255–1327), in his essay *Against Plotinus*. Choumnos’ express purpose is to prove that souls do not exist prior to their bodies; he admits that the

acquisition of knowledge poses a problem to which the theory of recollection may at first sight seem to offer the only solution; but this theory entails the pre-existence of souls to their bodies, and therefore he submits an alternative theory. According to the latter, since the soul is a perfect and immortal thing, its activities are likewise perfect and immortal. Thus, the human intellect – which is created simultaneously with the body – is exercising perfect knowledge from the very start, although its activity is often obscured through its immersion in flesh and matter. In some domains, no external aid is required; but in others, the intellect needs organs, in the first place discursive reason and opinion, and more remotely, sense-perception and imagination, to tear apart the material veil and show forth its cognitive light, which is of such a nature and intensity as to saturate all knowledge. What is commonly thought of as the acquisition of knowledge, then, seems on Choumnos' view to be in fact only the intellect's becoming aware of the actual knowledge that it already has. In fact, his account is not dissimilar to Neoplatonic accounts of recollection; yet he argues vehemently that since knowledge, being a substantial activity of the immortal soul, cannot be lost, that is, forgotten, neither can it be recollected. It is not quite clear whether the domains in which he considers no external aid to be required include theology or mathematics, or both. Probably he would assume, like Socrates in the *Meno*, that discursive reason is needed to become aware of mathematical knowledge. It is even less obvious exactly how the veil surrounding the intellect is supposed to be torn apart by the lower soul-faculties, but one may note that there is no reference in Choumnos' text to the exercise of any Christian virtues or ascetic practices.

A rationalist epistemology of the Neoplatonic type was also propounded in Barlaam of Calabria's *First Letter* (1336), written in reply to Gregory Palamas' doctrines. According to Barlaam, scientific knowledge rests on innate "substantial principles" (*ousiōdeis logoi*) in our souls, which are images of the creative principles in the Divine Intellect and thus indicative of the true causes of the natures of things. In other writings, however, Barlaam took a more empiricist

stance (see Sinkewicz 1981). The same apparent inconsistency is shown by his adversary, Nikephoros Gregoras, who railed, in his *Florentius* (c. 1333), against Barlaam's Aristotelianism and the notion that the first principles of science can be created from particular forms, pointing out that the latter are constantly changing. Later, however, in the context of his criticism of Palamas' doctrines, he argued that all scientific knowledge has its ultimate source in "self-taught" sense-apprehension; for God, he says, "has wisely distributed and deposited in nature beforehand this kind of primitive (or 'principle-generating', *archegonous*) roots like seeds, a very strong support for all the scientific disciplines and proofs, on the basis of which the very incontrovertible deductions of the truth are brought to a conclusion" (*Hist.* 3:405.6–406.17). A way to reconcile these passages might be to assume that Gregoras found fault with Aristotle not so much for being an empiricist on the source of knowledge as for being a radical conceptualist on universals; it is the conjunction of these two views that is asserted in the *Florentius* to be incompatible with the view that there is scientific knowledge. Empiricism requires the existence of universal forms in the particulars; conversely, to save conceptualism within the domain of natural philosophy, one must have recourse to some other source of knowledge.

Abstract

The dispute over essence and existence has a long and storied history in the Middle Ages, and for good reason. For medieval thinkers these concepts form the backbone of nearly every other metaphysical concern they have. The scholastic tradition looks to Boethius and Avicenna to go beyond an Aristotelian system that sees little need to make a distinction between essence and existence. Through the writings and disputes of Thomas Aquinas, Giles of Rome, and Henry of Ghent among others, a highly sophisticated debate took form about the nature of this distinction:

whether it is real, rational, or somewhere in between? It was a debate that left a lasting imprint on the rest of scholasticism, reaching all the way to Suarez. At stake in the dispute are concerns about the complexity of the created order, its created and therefore contingent status, as well as concerns about the nature of possibility and its knowability. Amid the highly technical debates ranging from Boethius to Suarez, medieval thinkers knew that it was in the precise and technical formulation of the relationship between essence and existence that such critical issues were to be decided.

In 1982, John Wippel wrote: “A complete history of this controversy concerning the relationship between essence and existence remains to be written” (Wippel 1982b: 392n37). This claim stands as true today as it did then. The dispute itself is as long as it is complicated. Questions of interpretation are debated today almost as fiercely as the problem itself in its own day. Given this complexity, this article can only serve to point out the general contours of the debate and to highlight the most influential contributions.

Early Influences

To begin we must turn to Boethius. However, to turn here first is already to make an interpretative choice. On the one hand, Boethius’ influence on the later scholastic disputes on the question is unmistakable. On the other hand, there is no scholarly consensus over whether Boethius himself ever actually conceived of such a distinction between essence and existence. The center of the controversy is found in the second axiom laid down by Boethius in a small theological treatise, referred to in its abbreviated form as *Quomodo substantiae*. Here, Boethius writes: *diversum est esse et id quod est*, “‘being’ and the ‘that which is’ are diverse.” Evidently, Boethius believes something to be distinct, but determining just what the *esse* and the *id quod est* are has proved to be an extremely difficult task.

There are some who see Boethius as simply making an Aristotelian distinction between primary (*id quod est*) and secondary (*esse*) substances (see Nash-Marshall 2000: 234). However, others think Boethius is going beyond Aristotle and identifying existence as a separate ontological component of every existing individual. Pierre Hadot, who pays particular attention to the Neo-Platonic influences of Boethius, argues that the distinction in Boethius is not between essence and a concrete instantiation. He insists, rather, that it is a distinction between the absolute act of existence and the individual being, which receives its own existence through its participation in the said act of existence (Hadot 1963). Granting this interpretation, we can see a real beginning to the essence–existence distinction. The essence of the *id quod est* cannot be said to be the cause of its existence. Rather, the *id quod est* is a *composition* between the absolute act of existence, *ipsum esse*, and the finite form that participates in that existence. By such participation, form limits and constricts the absolute existence to its finite character as it exists in the *id quod est* (see Nash-Marshall 2000: 231).

In the end, the right interpretation of Boethius is less important to the history of this medieval discussion than what his medieval successors took away from Boethius. Here, they saw proof that an Aristotelian essence of a thing was not sufficient to account for its actuality. This essence required something else, namely, *esse* and the causal efficacy of a divine creator. Much of the subsequent controversy is a reoccurring consideration of precisely this issue: is essence sufficient for existence, and, if not, what else is needed, where does it come from, and how is it related to its essence?

In addition to the early influence of Boethius on later scholastics, the work of Avicenna must also be recognized. While Boethius’ contribution focuses primarily on the notion of the absolute activity of *esse* and the insufficiency of an essence to explain existence, later scholastic thinkers generally looked to Avicenna to find a strong notion of a thing’s essence as having a kind of reality in its own right, distinct from its concrete existence. This is particularly noteworthy, given that it

remains controversial whether this emphasis on essence actually distorts Avicenna's position. Some scholars continue to argue that, in the end, existence is the true primary concept for Avicenna (e.g., Druart 2006: 337).

The *locus classicus* of this distinction, as Avicenna describes it, is found in his *Metaphysics of the Healing*, Book I, Chap. 5. It is here that he makes a famous distinction between what he calls the "existent" and the "thing." The former, for Avicenna, is the concrete existing thing replete with all the attributes and accidental predications that come with being a part of the actual world. The latter – the "thing" – is that which has a nature that makes it what it is (I.5.9). This nature of a "thing" is the true and essential core of any particular existent. Now, somewhat surprisingly, the term existence can be predicated of both the "existent" and the "thing." The "thing," Avicenna says, can be signified by the term existence, but only to signify, what he calls, the proper existence of some entity. But existence can also signify the affirmative existence of an entity. While the former sense of existence indicates the "whatness" of any reality stripped of every concomitant feature, the latter is meant to signify something beyond the mere essence of a "thing," namely, *that* the "thing" is.

For Avicenna, that a kind of existence is predicated of a "thing" and its essence is not necessarily an indication that he thinks an essence somehow has its own *separate* ontological status and then is subsequently composed with a further existence. On the contrary, it is more likely that this is his way of indicating that the same entity can be looked at from different perspectives. We can, on the one hand, consider something as an extra-mental reality partaking of all its accidental properties. From this vantage point, we are emphasizing its affirmative existence and its status as an existent. But we can also see the same reality stripped of its accidental characteristics including its extra- or even intra-mental existence. Here, we are attentive to the essential core of what exists, and thus we are attentive to its proper existence as a "thing."

With this said, it is important to recognize that scholastic commentators have not always read

Avicenna this way. In fact, many contemporary scholars have been working hard to combat precisely the reading given by these later scholastic interpreters (e.g., Rahman 1958, 1981). Henry of Ghent, for one, points to a certain text in Book V of Avicenna's *Metaphysics* as the source of his understanding of the "being of essence" or *esse essentiae* (Henry of Ghent, *Quodlibet* 1, q. 9). With this phrase – which would quickly enter into scholastic parlance generally – he meant to attribute a kind of independent existence to an essence prior to its status as actually existing. In Book V, cited by Henry, Avicenna does give explicit attention to the proper existence as distinct from its affirmative existence. Here, Avicenna is at pains to identify the whatness or essence of any reality, stripped of all concomitant and extraneous features. In considering animality, he notes that even though, inasmuch as it exists, it "exists with another," its proper existence remains distinct. Any additional element, such as its actual or affirmative existence, whether in the mind or extra-mental reality, should be seen as an addition that "occurs to it" (V.1.18 trans. Marmura 2005:153). To the minds of his scholastic readers, this phrase, "occurs to it," suggests that the "thing" with its proper existence need not be seen as dependent on the mind or some concrete instantiation for its meaning and reality. Concern will often be raised about the somewhat ambiguous ontological status of the being of an essence independent of its actual existence. Suarez, for one, will point to this as a fatal ambiguity that mars the discussion of essence and existence from this point forward (see Wells 1962: 437, 444). Despite these ambiguities and possible concerns, Avicenna remains extremely important. It is from these influential passages that Aquinas and all of the major thinkers in the thirteenth century will take their starting point.

The Scholastic Controversies

Aquinas supplies ready evidence of Avicenna's influence as well as the nature of the scholastic reception suggested above. In his commentary on Aristotle's *Metaphysics*, he offers what will

become the general characterization of Avicenna's position in the Middle Ages. There, he writes that Avicenna is correct to assert that existence is other than its essence, but, if existence as "occurring to" (*accidit ei*) an essence is to be understood as a kind of accident, then he mis-spoke (bk. 4, lect. 2, n. 558). (For an argument that this is not what Avicenna is doing, see Rahman 1981.) Aquinas does not want us to see a thing's existence as something different from the concrete existing individual itself. He writes that "it designates the same thing as the term which is applied to it by reason of its essence" (n. 558). While Aquinas' position on essence and existence is most famous for its insistence on a real distinction between essence and existence, he does not allow himself to suggest that essence might have an existence of its own or some reality apart from its existence: thus, his rejection of Avicenna's language of existence as "occurring" to an essence.

Aquinas' most definitive treatment on the subject is, of course, found in his treatise *De ente et essentia*. This is one of Aquinas' earliest works and marks the beginning of the most formative period of the dispute over essence and existence. In this work, he indicates one of the major theological issues at stake in this question for thirteenth-century theologians. He also provides one of the key arguments that will be considered again and again either as support for the real distinction or as an argument that must be refuted.

The key theological issue at stake for Aquinas is the simplicity of God. Aquinas' metaphysical presuppositions force him to deny any material composition in angels. But this leaves him with a real difficulty of explaining just why angels do not possess the same absolute simplicity as God. He finds his answer to this conundrum in the real distinction between essence and existence. While angels do not have a material composition, they remain like other material creatures on account of the fact that their existence is not their own, but is received from another (*DEE*, c. 4, para. 6).

The most compelling argument that Aquinas gives for this distinction and the consequent complexity in creatures is found in the fourth chapter of his treatise. He argues that whatever cannot be

conceived of apart from something is in no way distinct from it. But, he reasons, the essence of man and of a phoenix, for that matter, can be conceived without being conceived as existing. Thus, their essence and existence must be distinct (*DEE*, c. 4, para. 6). Those who want to deny the real distinction will repeatedly face this objection and more often than not will deny the minor premise, viz., that an essence can truly be conceived without also conceiving its existence.

Aquinas' treatise marks one of the first formalized scholastic defenses of the real distinction. However, his is not the only influential voice. In fact, what later came to be identified as the Thomistic position may owe less to Aquinas himself than to one of his students, Giles of Rome. Giles treats the distinction between essence and existence in several places, but his two most explicit works on the topic are his *Theoremata de esse et essentia* and his later *Quaestiones disputatae de esse et essentia*. With these two works, undoubtedly influenced by his well-documented disagreements with his Parisian colleagues, Henry of Ghent and Godfrey of Fontaines, Giles established himself as one of the central disputants in perhaps the most contentious debates at Paris during the 1270s and 1280s.

Though divine simplicity seems to be the dominant concern of Aquinas, in these works and others, Giles repeatedly indicates that he thinks the real issue at stake here is the possibility of creation and the truly contingent nature of reality. Without a real composition, Giles argues that all creation is impossible and all reality is in fact necessary (e.g., *TCC*, prop. 29). This is something that comes out clearly in the fifth theorem of his *Theoremata* as he provides an analogy as to how we are to understand this composition. He writes: "to understand the creation of beings, which requires a composition of essence and existence, we may think of that kind of generation which Plato speaks of" (*TEE*, th. 5, Murray 1953: 37). Giles is referring to the way a Platonic Form, even as it enters into a kind of composition with the particular thing, remains its own distinct and separate entity. He compares this to the way the "self-existing" existence remains separate from the existence of a thing, "in so far as from this

separate existence the existence flows into the essence of a creature in which the essence participates" (*TEE*, th. 5, Murray 1953: 37).

Two elements of this description need to be emphasized since they are repeatedly affirmed by Giles. The first is that existence must be seen as its own reality apart from its attachment to any essence. Thus, the composition of essence and existence must be seen as a composition of two things (*duae res*) (e.g., *TEE*, th. 19; *QDEE* q. 9). The second, which follows from this, is that Giles, unlike Aquinas, introduces the separability criterion of the real distinction; namely, he insists that essence and existence are, in principle, separable things. Both of these elements will become essential components of the standard formulation of the real distinction. Likewise, it will increasingly become the standard description of the Thomistic position, much to the dismay of those Thomists who believe Giles has severely distorted the true position of Aquinas.

Giles is not immune from the critiques of his own contemporaries either. While among them is, as noted above, Godfrey of Fontaines, his most severe critic is Henry of Ghent. Henry looks at Giles' description of essence and existence as two realities (*duae res*) and insists that if essence is going to be considered an independent thing apart from its affirmative or actual existence, then essence and existence cannot really be distinct (*Quodlibet* 1, q. 9). In order to explain why this is so, Henry introduces what he calls an "intentional distinction" between essence and existence. With echoes of Avicenna in the background, Henry argues that if essence is separable and prior to its actual existence in the world, as Giles suggests, then it must retain a kind of existence and therefore cannot really be separated from existence. To clarify his position Henry identifies two kinds of existence: the being of the essence (*esse essentiae*) and the being of existence (*esse existentiae*). Henry insists that an essence prior to its creation has a kind of existence that it receives from its formal cause (i.e., the ideas of the divine mind or the divine exemplar). To say something has *esse existentiae*, therefore, is not to attribute existence to something that previously existed without existence (as if this made sense), nor is

it to attribute existence to a thing twice. Rather, it is to indicate a new relation of efficient causality in addition to the relation of formal causality between God and the creature. Thus, Henry concludes that there is not a real distinction between essence and existence, but an intentional one (*Quodlibet* 10, q. 7). While notoriously ambiguous, the notion of an intentional distinction is generally taken to mean that there is a recognizable difference between a thing's existence and a thing's essence that is not merely a product of the mind. Nevertheless, contra Giles, there is no sense that essence and existence can ever be truly separate or that one can be entirely without the other.

Besides the disagreement over terms and formulations, Henry's different position can also be attributed to a difference in concern from either that of Aquinas or Giles. While Aquinas is concerned with divine simplicity and Giles is preoccupied with preserving the possibility of creation, Henry is most explicitly concerned with preserving a kind of scientific knowledge of possibilities. For him, having knowledge about the merely actual is deemed insufficient as long as the actual could, in principle, be different. To have knowledge, then, derived from what is merely possible is thought to provide a much higher level of certainty. One of the most conspicuous places where this concern is raised is in Henry's interest in the proofs for God's existence. Knowledge of God's existence derived from the actual existence of a creature was thought by Henry to be inferior and less certain than knowledge of God's existence derived from the mere possibility of creaturely existence (see *SQO* a. 25). However, in order for such knowledge to be possible, he needs to find an object of such a science. Clearly, the ability to posit a kind of existence for not yet actualized, but possible, essences is a key component of preserving this kind of knowledge.

While the voices of Aquinas, Giles, and Henry are certainly the most influential for any further discussions of the distinction within the scholastic tradition, some of the earliest historical perspectives on this distinction divide up the history of the dispute slightly differently. No one has done more to shape the way we think about the history of the

dispute than Francis Suarez. In his 31st question of his *Disputationes metaphysicae* he recognizes three distinct schools of thought.

The first school is what Suarez labels the *thomisticae*. He asserts that this school holds that the distinction between essence and existence was a distinction between *duae res*, two distinct or independent realities that could in principle be separated (*DM* 31, I, 3–10). Thus, we can see how dramatically the influence of Giles would come to distort the original position of Aquinas for centuries.

The second school is identified as the *scotisticae*. Suarez describes the distinction defended by Scotus and those of his school as a modal distinction between the essence as a genuine reality and its existence as particular mode of being. While this is the picture that posterity attributes to Scotus, we receive little clarity on the matter by looking to Scotus himself. Scotus devotes little to no explicit positive attention to how he views the relationship between essence and existence (O'Brien 1964: 61). What little there is to be found comes indirectly from a discussion on the nature of Christ and his human existence (*Ord.* III, d. 6, q. 1). From this discussion, Suarez concludes that this modal distinction is a weaker type of real distinction, where the essence remains an independent reality, but that the same cannot be said of existence. As a mode, existence acquires an ontological status similar to that of whiteness, which cannot exist without a subject, even though the subject *can* exist without whiteness (*DM* 31, I, 11). Contemporary scholars remain divided over whether Scotus ever actually recognized a modal distinction and where it fell among the distinctions of real, formal, and rational. Suarez further shows his lack of historical precision on the matter by attributing this position to Henry of Ghent as well. While this is not a particularly accurate description of Henry's position, Suarez certainly characterizes him this way because of the resemblance of the intentional distinction to Scotus' modal distinction.

Finally, Suarez points to a third historical position, which asserts that the essence and existence of a creature are distinguished by reason alone. Under this heading, Suarez includes an eclectic

mix of people that cannot be said to form one particular school. Here, he includes Godfrey of Fontaines, Durand of St. Pourcain, Peter Auriol, and Gregory of Rimini among many others (*DM* 31, I, 12). Having mentioned the nominalist Gregory of Rimini, it is notable that Suarez fails to mention William of Ockham, who should be included in such a list. And while no one position can capture such an eclectic mix of people, Ockham's rejection of any thing other than a rational distinction between essence and existence is notable for its simplicity and reliance on the formulation of the real distinction provided by Giles. In *Quodlibet* 2, q. 7, Ockham considers the claim that essence and existence are two distinct things (*duae res*) and therefore separable. He concludes that if essence and existence are really two things, they must be either substances or accidents. But, being neither, they therefore cannot be two things nor can they be separated. Thus, no real distinction exists.

Final Remarks

Suarez' historical survey of this distinction, while perhaps misleading at times, is nevertheless helpful in that he brings a critical eye to the long tradition that has preceded him. In ending his survey, he points to what he sees as a critical ambiguity that has haunted the dispute as far back as Avicenna. For him, this ambiguity lies in the notion of essence and its status as an independent reality (*res*), a proper existence, or the being of an essence (*esse essentiae*). Suarez argues that in any conception of the distinction between essence and existence, an essence can be seen *both* as an actuality *and* as a mere potentiality. However, it is extremely important to be aware of which perspective one takes. He argues that any real distinction, either between two things or a thing and its mode, is simply nonsensical when essence is considered as actual. What else can we mean by an actual essence except that it is in existence? Thus, there is no distinction in this case. But if essence or the *esse essentiae* is conceived as the mere potentiality of some actual essence, then clearly actual existence need not be

involved. However, in this case, Suarez insists that we are not talking about some reality or a thing, but about no-thing (*DM* 31, II, 1). In this way, he can explain away what has always been one of the most critical arguments on behalf of the real distinction since Aquinas first raised it: namely, that it appears that we can think of an essence apart from its existence. Suarez will gladly admit this, yet he will point out that what is being thought of in this case is not the actual essence of some reality, but a potentiality or mere possibility that is distinct from existence. Moreover, this possibility cannot be attributed to some existing essence. Rather, the possibility belongs to the potency within the cause of the actual essence, not the essence itself. In the case of creatures, the possibility of an actual essence lies in the potency of God to make such a reality exist (*DM* 31, II, 2). In this light, the affirmative existence (*esse existentia*) becomes, for Suarez, a superfluous entity. It can bear no relation to the nonentity of a potential essence, nor is it needed to accompany an actual essence, for such an entity, simply by being actual, already exists.

In this final analysis, Suarez draws out what has been a central tension of this controversy almost from its inception. He draws attention to the fact that the problem of essence and existence is really a problem about the nature of possibility and reality. It is a dispute that asks about the ontological status of possibilities. It asks: how can such possibilities be known scientifically if they do not first have some ontological weight? It is equally a question about the source of possibility. If possibility is a feature of language and derived from the actual world, then in what sense can the world be said to be contingent? If possibility retains its own independent status, does this allow for contingency, but at the same time limit the range of God's power? But if possibility is identified with God's power absolutely, then is there any sense in which possibility can be understood scientifically, and does this render God's actions altogether inscrutable and ultimately arbitrary? The dispute over essence and existence, therefore, forms the metaphysical backbone of nearly every other issue important to medieval thinkers. Thus, it is only appropriate

that Aquinas begins his treatise on essence and existence with the saying of the Philosopher: "a small error in the beginning leads to a large error in the end." It is undoubtedly the scholastics' deep appreciation of this point that motivates their tireless investigation of essence and existence and the metaphysical subtleties that follow.

Ethics

Bonnie Kent

Department of Philosophy, Irvine School of Humanities, University of California, Irvine, CA, USA

Abstract

Neoplatonists, who argued for the immortality of the soul and complete happiness only after the death of the body, seemed to early medieval thinkers the best of ancient moral philosophers. The study of Aristotle's *Nicomachean Ethics* in the thirteenth century did not altogether change this perception. It did mark the beginning of heated debates about what people can know by reason, unaided by special grace, about human freedom of choice, the relation between virtue and happiness, and a host of other issues. Naturally acquired virtues, which play only a small role in the ethics of Thomas Aquinas, gained greater importance in the ethics of later masters. Taking a closer look at Aristotle's *Ethics*, fourteenth-century masters wondered which of his various claims were meant to be conceptual, not merely generalizations about empirical psychology. Does Aristotle think that moral virtues are by their very nature inseparable, so that there is a necessary connection between them, or only that people

rarely acquire one moral virtue without acquiring all the others? Arguments focused especially on what virtuous dispositions explain about morally good actions. If only someone with a virtuous disposition can choose morally good acts for good reasons, how can they make the choices necessary to acquire a virtuous disposition? Aristotle's theory looks circular. Maybe virtuous dispositions instead explain how someone can choose morally good actions consistently, easily, and with pleasure. But do these factors make the actions any better in moral terms? If not, do virtuous dispositions truly figure in ethical theory, or are they important only in psychological accounts of human action? These fourteenth-century arguments represent a significant advance in ethical theorizing, at least as philosophers understand it today.

A full account of medieval ethics would have to include the Byzantine, Muslim, and Jewish traditions, each with its own periodization and leading theorists. Here we shall focus on medieval ethics in the Latin West, which many think reached its peak in the thirteenth century, with the study of Aristotle's *Nicomachean Ethics*. The work of Thomas Aquinas (d. 1274) attracts particular attention by today's philosophers. Indeed, interest in the ethics of Aristotle and Aquinas runs so high that two clarifications are necessary.

First, scholars of the Latin West did not need Aristotle to introduce them to the naturalistic ethical theories of antiquity. They learned about Stoic and Neoplatonic ethics – even something about Epicureanism – from works by Cicero, Seneca, Macrobius, and many other authors. With no access to Aristotle's *Ethics* at all, Peter Abelard (d. 1142) developed an impressively complete ethical theory. Second, Aquinas belonged to the very first generation of Latin scholars to study the complete text of Aristotle's *Ethics*. Masters of later generations usually gave the kind of naturally acquired virtues that Aristotle describes a larger role in their ethical theories than Aquinas himself did. Reading only selections from

Aquinas' work, people today sometimes mistake his discussions of God-given virtues for discussions of naturally acquired virtues. A closer look at Aquinas' *Summa theologiae* reveals that naturally acquired virtues play only a small, strictly subordinate role in his ethical theory.

In Questions 63 and 65 of the *Prima secundae* (the first part of the second part of the *Summa*), Aquinas argues that all virtues we acquire through our own resources, without any special grace, are intrinsically imperfect or incomplete (*imperfectus*). They constitute virtues only in a relative sense (*secundum quid*), for they have as their end the imperfect happiness attainable in this life, not the ultimate end of complete happiness in the afterlife. Aquinas therefore places more weight on faith, hope, and charity: theological virtues supernaturally “infused” by God. More important, he posits a long list of infused moral virtues with the same names as their naturally acquired counterparts (justice, courage, temperance, etc.). These God-given moral virtues, presented by Aquinas as virtues *simpliciter*, differ in kind, not merely in degree, from naturally acquired virtues. They take as their rule divine law, not human reason, and can be increased only by God, not by our own actions. According to Aquinas, seven other God-given dispositions rank even higher infused moral virtues on the scale of excellence. These are the Gifts of the Holy Spirit discussed in patristic writings and mentioned in scripture: wisdom, knowledge, understanding, counsel, courage, piety, and fear.

The questions about grace and merit with which the *Prima secundae* ends represent a transition to the *Secunda secundae* (the second part of the second part), where Aquinas seldom even mentions naturally acquired virtues. He organizes this part of the *Summa* around seven God-given virtues: the three theological virtues of faith, hope, and charity, followed by the cardinal virtues of prudence, justice, courage, and temperance. More specific God-given virtues appear as parts of the cardinals: either as integral parts of a cardinal virtue, different species (“subjective” parts), or related secondary virtues that an individual might or might not develop (“potential” parts).

The seven Gifts are included, too, with four woven into the section on theological virtues, and the remaining three woven into the section on the cardinal virtues.

Other than Aquinas' fellow Dominicans, most later medieval thinkers rejected his dual scheme of naturally acquired and infused moral virtues. The secular masters Henry of Ghent (d. 1293) and Godfrey of Fontaines (d. 1306/1309), the Franciscans John Duns Scotus (d. 1308) and William of Ockham (d. 1347), even the Dominican Durand of St. Pourçain (d. 1334), all argued strongly against positing moral virtues infused by God. They thought a simpler scheme, with only naturally acquired virtues and the infused virtues of faith, hope, and charity, far superior. The growing importance attached to naturally acquired virtues drew sharp criticism from the Augustinian Gregory of Rimini (d. 1358). In his commentary on Book II of the *Sentences* (dist. 26–28, q. 1), Gregory argued that only God-given moral virtues are genuine virtues; nobody lacking God's special grace can even perform a morally good act. Gregory listed Aquinas among the "saints and doctors" who agreed with him. In fact, Aquinas occupied a middle ground between the warring factions; but at least Gregory came closer to understanding his ethics than readers who overestimate its Aristotelian aspects.

Can one even abstract a moral philosophy from Aquinas' works? Of course, the answer depends on one's conception of moral philosophy. Medieval discussions of the subject changed considerably over time. We might distinguish roughly between three periods: the first, when most scholars took Neoplatonic ethics as the finest example of ancient moral philosophy; the second period, beginning in the early thirteenth century and ending in 1277, when theologians at Paris successfully opposed a new, more narrow conception of moral philosophy; and the third, enormously diverse period from the end of the thirteenth century onward, when scholars turned more toward problems of ethical theory. One such problem was whether ethics can qualify as a "science" in the strict Aristotelian sense.

Moral Philosophy and Moral Science

Scholars of the Roman Empire divided philosophy into logic, physics, and ethics, giving ethics pride of place. The main purpose of philosophy as a whole was the same as the purpose of moral philosophy: to articulate a conception of the highest or supreme good (*summum bonum*) – that which makes us happy and which we seek strictly for its own sake – and to explain how we can attain it. In order to explain how we can attain it philosophers had to specify the role of virtue. Is virtue constitutive of, partly constitutive of, or instrumentally related to the happy life? Equally important, philosophers were expected to present their view of God (or the gods) and spell out the implications for human life. While they were free to claim, as Epicureans did, that the soul dies with the body and that the gods take no interest in human affairs, it was incumbent upon them to argue for these points.

Augustine (d. 430) suggested that pagan thinkers got the big questions right but usually got the answers wrong. For him the supreme good was God, not happiness, virtue, or any other human state of mind. In Book VIII, Chapter 9 of *City of God* (*De civitate Dei*) Augustine praised "the Platonists" – meaning Neoplatonists – for recognizing that the soul is immortal, that God is the supreme Good, and that our own happiness lies in the enjoyment of God. Nevertheless, he faulted all pagan philosophers for teaching that we can make ourselves good and happy. For Augustine, both virtue and happiness are gifts of God's grace, not natural consequences of human self-development.

Augustine's idea of moral philosophy survived well into the twelfth century. Consider, for example, Abelard's *Dialogue* (*Collationes*) between a Philosopher, a Jew, and a Christian. Describing ethics as the branch of learning at which all others aim, the Christian suggests that there are differences only about how to name it. Christians call this discipline "divinity" because it aims at reaching God, whereas philosophers call it "morals," because people come to God by means of good behavior. Not only does Abelard's

Philosopher agree, he also agrees that ethics concerns the supreme good and how we attain it, that the soul is immortal, and that philosophers look forward to happiness in the afterlife.

The thirteenth century witnessed striking changes in the intellectual milieu. With the rise of universities came conflicts between two newly created professional classes: the faculty of theology and the (lower) faculty of arts, dedicated to the study of logic, grammar, and rhetoric, and Aristotle's works. Thanks to the labors of translators, a vast body of material about natural philosophy, psychology, and ethics became available in a fairly short time – not only works by Aristotle but also works by various commentators, including and especially the Muslim commentator Averroes. While this new material attracted interest in all universities, members of the Paris arts faculty embraced it with exceptional enthusiasm. Bonaventure (d. 1274), Aquinas, and other theologians soon began writing and preaching against doctrines circulating in arts: the denial that the individual soul is immortal, that humans have free choice, and other doctrines many considered ruinous to moral philosophy.

The controversy at Paris came to a head in 1277, when the bishop condemned over 200 theses as “obvious and loathsome errors.” Among them were the claims that “Happiness is had in this life and not in another,” that “After death a human being loses every good,” and sundry theses either denying or limiting the will's free choice – all propositions the bishop believed members of the arts faculty had declared “true according to philosophy.” The condemnation did not imply that philosophy proved the condemned propositions false, only that it did not prove them true, and no mention was made of Aristotle. In theology as well as arts, at Paris and elsewhere, Aristotle remained the most heavily cited philosophical authority until the end of the Middle Ages.

Some masters continued the Neoplatonic pattern, treating as central to moral philosophy the immortality of the individual soul and happiness in the afterlife. Others, convinced that we cannot know these truths by natural reason unaided by grace, conceived of moral philosophy along

different lines. The study of Aristotle's works raised important new issues and generally transformed the language of debate. In substance, though, medieval ethics remained heavily eclectic. Most scholars, even masters of arts, had at best a weak sense of the historical Aristotle. Sometimes their distortions of his *Ethics* arose from efforts to interpret it charitably; sometimes they probably owe more to ignorance of what the text actually says.

One should not assume that most medieval scholars studied Aristotle's *Ethics* in the period after 1246–1248, when they had access (in theory) to a complete Latin translation of the work. While virtually all students of arts and theology heard lectures on some books of the *Ethics*, many never heard lectures on all of it, let alone read the text. The references to Aristotle with which they embroider their works often come from collections of excerpts, works by other masters, or a combination of the two.

In a way, the *Ethics* did less than the *Posterior Analytics* to shape later medieval discussions of ethics as a “science” or area of knowledge. (*Scientia*, the Latin word often translated as “science,” can equally be translated as “knowledge.”) Following Aristotle, masters distinguished between theoretical sciences, practical sciences, and mere arts or skills, such as medicine and navigation. Where theoretical sciences aim at truth for its own sake and practical sciences guide us in choosing actions, arts and skills aim at producing some external result beyond the action itself. Nobody doubted that ethics is practical; but is it a science in the strict sense? Despite Aristotle's references to ethics as a science, one might wonder how it could satisfy the stringent requirements set forth in Book I, Chapters 1–4, of the *Prior Analytics*. There Aristotle argues that someone can have unqualified knowledge or science (*epistēmē*) only of self-evident propositions and conclusions deduced from them through a demonstrative syllogism.

Are at least some moral principles self-evident (*per se nota*)? Aquinas, Duns Scotus, and William of Ockham all agreed that some are. By the same token, all singled out some first principle of practical reason – a very general one, such as “Good is

to be done; bad is to be avoided” – and presented it as the foundation for precepts of natural law. Natural law figures no less prominently in the works of Scotus and Ockham than it does in the works of Aquinas (Möhle 2003; McGrade 1999). All three believed that ordinary people can, and often do, recognize the truth of basic moral principles.

Why, then, are Scotus and Ockham sometimes seen as proponents of divine command theory? Confusion arises partly from comparisons between nontechnical discussions by Aquinas and highly technical discussions two or three generations later, by masters preoccupied with Aristotle’s requirements for unqualified knowledge. For example, Aquinas claims that all other precepts of natural law are “based on,” or “flow from” from the first, foundational principle. God could add new precepts, but even God cannot dispense from such basic principles as the one that prohibits killing an innocent person. Aquinas grants that God can command such a killing, as he did in ordering Abraham to sacrifice Isaac; yet Aquinas denies that this was really a case of dispensing from the prohibition against killing.

As Scotus sees it, the command to Abraham shows that God can dispense from the prohibition against killing, and indeed, from all precepts of the Decalogue except the first three. Scotus, however, divides the first three precepts from the others with reference to requirements more stringent than Aquinas’. The first group consists of principles either true by the very meaning of their terms or that follow necessarily from such principles. Although precepts of the second group fail to meet these high standards, Scotus describes them as evidently true and immediately recognized to be greatly in accord with principles that do meet the standards.

Ockham takes a more expansive view of self-evident moral principles. He includes not only principles true by the meaning of their terms but also principles evident from experience, such as “An angry person is to be mollified by fair words.” Ockham shares Scotus’ view that God’s command can override a moral principle that the agent would otherwise be obliged to follow, as it did in the case of Abraham. But what modern authors

usually mean by “divine command theory” involves a more radical thesis, attributed to Ockham in the seventeenth century by Francisco Suarez (d. 1617): no act is bad except insofar as it is prohibited by God. There is no persuasive evidence that Ockham defended this view (Kilcullen 1993).

On the whole, divine command theory represents a concern for early modern thinkers, not for their medieval predecessors. For examples of issues that did interest later medieval thinkers readers might consult a work by John Capreolus (d. 1444): the *Defenses of the Theology of St. Thomas Aquinas* (*Defensiones theologiae Divi Thomae Aquinatis*). The leading Dominican at Paris in the early fifteenth century, Capreolus labored to defend Aquinas against criticisms raised by Scotus, Durand, Gregory of Rimini, and other fourteenth-century authors. No objections connected with divine command theory were among them. Instead Capreolus included arguments about the natural desire for happiness, about the connection of the cardinal virtues, and about “whether naturally acquired virtues (*virtutes habituales*) are necessary for human beings.” Disputes on the first two topics began in the early Middle Ages. The third did not emerge as an area of concern until the fourteenth century, when scholars began arguing about the place of virtues in ethical theory.

Happiness and the Supreme Good

Is happiness the supreme good? Is it our sole ultimate end, so that whatever actions we choose, we always choose them for the sake of happiness? Medieval thinkers addressed these questions long before they encountered the puzzling line of argument in Book I of the *Nicomachean Ethics*. Their differences of opinion owe something to different impressions they had of Augustine’s teachings.

Again and again Augustine claims that the supreme good is neither virtue nor pleasure nor any other psychological aspect of a human being. The supreme good is God; happiness lies rather in our enjoyment of God. In declaring the supreme good something external to human beings

Augustine firmly rejects the anthropocentrism dominant in ancient ethics. As we are made happy by God, so too are we made good by God, not by our own learning and practice.

Did Augustine regard happiness as the ultimate end of all human actions? His successors came to different conclusions, with good reason. In some places, especially in early works, Augustine seems to accept the thesis that whatever we seek, we seek for the sake of happiness. He aims mainly to establish that only eternal, God-given happiness can truly satisfy us. In other works Augustine stresses instead two different kinds of motivations, which he relates to two different kinds of goods: a worthy or intrinsic good (*bonum honestum*), which has value in its own right, and a merely useful good (*bonum utile*), which has value only as a means to something else. Worthy goods have “intelligible beauty”; these are goods to be enjoyed, never used. Indeed, Augustine claims that the greatest human perversion consists in willing to use objects of enjoyment, or willing to enjoy objects of use. The emphasis here – on different motivations we might have for valuing an object or person, not on the all-embracing quest for happiness – accords with Augustine’s conviction that we truly love something only if we love it for its own sake.

Boethius (d. c. 524) solved the problem of the supreme good in a way readers today find rather strange. In Book III of his *Consolation of Philosophy* (*De consolazione philosophiae*), Lady Philosophy argues that the supreme good is happiness and the supreme good is God. Because there cannot be two different supreme goods, God himself is happiness. The argument depends on the idea that happiness, like goodness and justice, belongs to the divine essence. As it is more correct to say God is goodness and justice than that God is good and just (because God has no accidental properties), so it is more correct to say that God is happiness than that God is happy.

Anselm of Canterbury (d. 1109) agreed that God is the supreme good, that God is goodness, and that God is justice, but he resisted identifying God with happiness. Hence Chapter 1 of Anselm’s *Monologion* moves directly from the axiom that whatever we desire, we desire because

we regard it as good, to distinguishing between goods with intrinsic worth (*honestum*) and goods that are only useful. In later works, such as *On the Fall of the Devil*, Anselm enlists the distinction between two goods to argue for two related inclinations (*affectiones*) of the will. If we always will whatever we do for the sake of happiness, even for the great reward of eternal happiness, God looks like nothing more than a means to our own ends. Focusing on the problem of motivation, Anselm argues that God must have created humans and angels, beings he holds morally responsible for their actions, with two inclinations of the will: the inclination to happiness or what is advantageous (*commodum*), which even animals have, and the inclination to justice, righteousness (*rectitudo*), or what has intrinsic worth. Anselm considers the inclination to one’s own advantage natural and inalienable. In contrast, he thinks that the inclination to justice was separated from human nature through Adam’s sin and can be restored only through God’s grace. Without this inclination, Anselm laments, the will is never free, because our natural freedom of choice is useless.

The study of Aristotle’s *Ethics* did not alter the basic division between theorists who saw nothing morally problematic about happiness as the end of all our actions and those who did. Like Boethius, Aquinas argued that the highest good of human beings is happiness. Happiness is our ultimate end, so that whatever we desire, we desire for the sake of happiness. Happiness, however, can be understood either as an object or as our attainment or possession of that object. In the first sense, Aquinas explains, God himself is happiness; in the second, happiness is our enjoyment of God. His ethical theory represents the best-known example of medieval eudaimonism.

As Aquinas endorsed, with modifications, the position of Boethius, so Scotus endorsed, with more radical modifications, the position of Anselm. Detaching Anselm’s analysis from its theological mooring, Scotus recast the inclination to justice as an inalienable feature of the human will, indispensable for moral agency. On his view, even fallen human beings without God’s grace can choose actions because we regard them as good in themselves, not merely because we regard them as

good for us. Granted, our natural inclination to happiness is so strong that we could not reject (*nolle*) perfect happiness if offered. Nevertheless, Scotus contends, we could still not will (*non velle*) such happiness; so the will's choice would still be free, not necessitated by the natural appetite for happiness.

Ockham carried this line of reasoning to a more extreme conclusion: we could choose to reject even perfect happiness if offered. Did Ockham also claim that we can will evil as such or will evil for its own sake? On this topic there is room for doubt. Unlike most of his predecessors, Ockham considers the axiom, "whatever we will, we will under the aspect of a good," either true although completely trivial or substantive but false. If what one means by "good" is just anything at all that people will, the axiom is true. On the other hand, if one means by "good" something useful, pleasurable, or intrinsically valuable, the axiom loses its status as a true but empty proposition and becomes a substantive proposition about human psychology. In this second sense, Ockham argues, the proposition is false, because we can will an act we believe to be neither useful, nor pleasurable, nor intrinsically valuable, such as worshipping false gods. Ockham does not say that we can will such an act because we believe it to be evil, only that we can will it while recognizing that it is good in none of the three ways indicated.

The Connection of the Virtues

Of all ancient arguments for the unity of the virtues, the arguments by early Stoics conflicted most sharply with common sense. They presented every virtue as an aspect of a single, indivisible wisdom. On this view, whoever truly has one virtue has them all; whoever lacks any virtue actually has no virtues. Stoics embraced two paradoxical corollaries: that all sins or faults (*peccata*) are equal, and that an individual progresses in an instant from having nothing but vices to having all of the virtues.

As Stoics saw all virtues as aspects of human wisdom, so Augustine saw all virtues as aspects of God-given charity. The superficial resemblance of

his position to Stoic teachings made him all the more concerned to spell out the differences. He did so in a letter to Jerome attacking the intellectualism and perfectionism of Stoic ethics (Letter 167). For Stoics, Augustine explains, virtue is a kind of wisdom that hardly anyone ever achieves. For Christians virtue is a kind of love that many people have as a gift of grace. Where Stoics insist that those who fall short of perfect virtue have no genuine virtues at all, Christians recognize that nobody on the face of earth has perfect virtue. None are without sin; and since sin comes from vice, none are without vice. But this does not imply that Christians with charity have no virtues. They progress by degrees, increasing in virtue over time, like someone moving from darkness into light.

Augustine's letter attracted considerable attention in the Middle Ages. Not only did the Christian in Abelard's *Dialogue* use it refuting the all-or-nothing conception of virtue and the equality of sins, Peter Lombard included excerpts from it in Book III, Distinction 36 of his *Sentences* (*Sententiae*). The *Sentences*, compiled entirely from Peter took to be patristic teachings, went on to become the standard theology textbook for medieval universities.

When they had only Books I–III of Aristotle's *Ethics*, readers assumed that he regarded moral virtues as separable. Surely a person could perform just acts (for example) without performing brave ones, thereby acquiring the virtue of justice without the virtue of courage. Only when they had the complete *Ethics* did scholars learn the argument in Book VI, Chapter 13, for the mutual connection between all moral virtues and the intellectual virtue of prudence. Some found the argument convincing. Others suggested that only the four cardinal virtues are inseparable from each other. Peter John Olivi (d. 1298), one of Aristotle's sharpest critics, attacked a key premise in his argument: that prudence has an indivisible unity. According to Olivi, each moral virtue does have a prudence related to it, but these various prudences are distinct dispositions. Thus a person can be virtuous in one area, such as matters involving temperance, and still vicious and imprudent in other respects.

Perhaps the most significant development of the fourteenth century was Scotus' reframing of the dispute as one about the necessary connection of virtues. In his commentary on Book III, Distinction 36 of the *Sentences*, Scotus divides prudence much as Olivi does. He grants that no moral virtue can exist without the prudence related to it, because the very concept of moral virtue includes prudence. Nevertheless, he argues, there is no necessary connection between moral virtues or between the prudences related to them. An individual might even attain perfection in one virtue while wholly lacking another, just as she/he might have perfect hearing while wholly lacking the capacity to see. Scotus does not suggest that this is likely. His interests lie chiefly in conceptual issues, not in empirical psychology.

Dispositions, Actions, and Free Choice

Early medieval thinkers knew that ancient philosophers classified virtue as a psychological disposition (*habitus*), not as a kind of passion or mental act. Whether Augustine also regarded virtue as a disposition, albeit one given by God, became a topic of dispute in the late twelfth and early thirteenth centuries. But by the mid-thirteenth century the idea that God infuses virtuous dispositions into human adults, perhaps even into baptized babies, was well entrenched. As a result, the first Latin commentators on Aristotle's *Ethics* saw no conflict between philosophers and theologians about classifying virtues as dispositions. They did, however, see a major conflict between the structure of pagan and Christian ethics. The anonymous commentator of the Paris arts faculty and Robert Kilwardby (d. 1279) both explained it in the same way. Philosophers teach that our own good actions precede and produce virtuous dispositions; theologians teach that virtuous dispositions are infused by God, so that the disposition precedes and causes good actions. Philosophers think that actions are worth more than dispositions, whereas theologians take the opposite view (Buffon 2004).

Do naturally acquired dispositions suffice to ensure morally good actions? Even scholars who

studied the complete *Ethics* resisted its suggestion that truly virtuous people are beyond the reach of temptation. As they saw it, even the best disposition never ensures that someone will act well; it only inclines him to do so. The virtuous person can fail to choose good actions, even choose bad ones, so that his character gradually degenerates.

Is a virtuous disposition at least necessary for morally good acts? In Article 1 of *On the Virtues in General* (*De virtutibus in communi*), Aquinas says that we should distinguish between what someone does and the way in which she does it. Someone without a virtuous disposition can indeed choose morally good acts for good reasons. However, she cannot choose such acts consistently, easily, and with pleasure. According to Aquinas, these are the three reasons why people need virtuous dispositions.

Discussion in the early fourteenth century turned to a different problem: what virtuous dispositions explain about morally good actions – not whether they benefit us but why it is necessary for a theorist to posit such dispositions. Working to develop a naturalistic account of ethics, masters took a closer look at Aristotle's theory. Does it avoid circularity? If only someone with a virtuous disposition can choose a morally good act for the right reason, how can anyone choose the kind of actions he must in order to acquire a virtuous disposition? On the other hand, if virtuous dispositions do not account for the moral goodness of a person's actions, what do they explain?

If we must posit dispositions in order to explain how someone can choose morally good acts, consistently, easily, and with pleasure, do these factors make the chosen acts better in moral terms, or do dispositions figure only in psychological explanations? Are consistency, ease, and pleasure even features of actions, or rather features of agents? Scotus pioneered this line of reasoning in Book I, Distinction 17 of his *Ordinatio*. Durand took it farther, developing it into a full-scale assault on Thomistic ethics. His objections were not soon forgotten. A century later, when Capreolus penned his *Defenses*, he casts Durand as Aquinas' chief critic on this topic (Kent 2005, 2008).

Fourteenth-century debate about virtuous dispositions can be perplexing, for virtually all participants agree that an action is morally good only if the agent's choice accords with "the dictates of right reason." By this they mean a correct judgment by the agent herself about what she should do in this particular situation, including the appropriate end of action. For example, it is not enough that she choose to return money she borrowed from Joe when she promised to return it; she must choose to return the money because she owes it to Joe, not because she hopes to be praised or fears that he might harm her. On what issue, then, did fourteenth-century scholars divide? Some, such as Gerald Odonis (d. c. 1349), endorsed what they took to be Aristotle's position: only people with virtuous dispositions can make morally good choices, because they alone can have the right motivations. Others, including Scotus and Durand, insisted that people without virtuous dispositions can have the right motivations and make morally good choices. If ordinary, non-virtuous people lack this capacity, how can they ever make the kind of choices necessary in order to acquire a virtuous disposition?

This is not to say that ordinary people are able to judge and choose correctly in all of the complex situations that a virtuous person can; nor is it to say that they will find it as easy as a virtuous person to choose the correct act for the right reason, rather than from some self-serving motivation. The thesis is more modest: it is possible for ordinary people to make morally good choices in some situations, however seldom they do. This is the very position that Buridan attributes to Aristotle in Question 4 of his commentary on Book VI of the *Ethics*. On his view, Gerald's interpretation leaves Aristotle with a circular account of the relation between virtuous dispositions and morally good actions.

Philosophers still worry that Aristotle's *Ethics* looks circular, just as they still wonder whether various premises in his arguments are meant to be conceptual truths or claims about empirical psychology. The range of interpretations is no smaller than it was in the fourteenth century, when scholars of the West began arguing about the

place of virtues in the overall structure of Aristotle's theory.

Abstract

Revealed religions have presented very vigorous moral codes and placed great emphasis on personal and social salvation, attainable through the respect of the law received directly from God. All of them have created norms originating in a conception of humans as ethical beings searching for happiness through the improvement of their natures and modes of conduct. Because these religions were closely linked to community life, ethics became linked to politics. In the Arab world, ethics developed from the Qur'an and other religious sources,

and also from Greek philosophical texts. Whatever forms it took, ethics strove to establish the criteria by which a given form of human behavior could be considered morally good. The subject received serious theoretical consideration in the work of some philosophers, subsequent to their readings of Plato's *Republic* and Aristotle's *Nicomachean Ethics*. Arabic philosophers saw it as being within an anthropology inspired by Greek philosophy and also linked it to politics. Its purpose was to understand human life and reach humankind's ultimate goal: happiness.

The difficulties entailed in the distinction between morals and ethics are well known. The amount of entries on the topic in the most notable dictionaries and philosophical lexica shows the difficulties involved in disentangling the meanings of these terms. Sometimes, the field in which they are used is presented as the defining difference between them: while morals seem to have more to do with religion, ethics could be taken as being more linked to philosophy. In support of this differentiation based on the area of use, it is usually advanced that Socrates is considered as the pioneer of the part of philosophy to which ethics and politics belong, practical philosophy, which studies individual or collective human action. However, this distinction is not clear: that morality is more closely related to precepts and norms, to laws and rules, and ethics is more concerned with human behavior in relation to virtue or excellence, does not prevent ethics from being the science of morals, the part of philosophy that has taken up the study of human behavior.

This is related to the way in which the issue of ethics has been formulated in the Islamic world, whose foundational text in itself contained a hermeneutics to which its followers had to commit: Muslims must read the word, the word of God, which is the text revealed to the Prophet. But this is not merely about reading what is written. Laid down as eternal and immutable, the Qur'an is not impassive: the purpose in reading it is to give meaning to the text, to interpret it, to understand it. This is a reading that wishes to discover what

the text really says, even if what it really says is actually different for each of the believers who read and interpret it. From this emerged the science of interpretation, whose aim was to reach the true and original meaning of the revealed text, hidden behind its apparent meaning.

The reading and interpretation of the revealed text gave rise to different applicable levels of meaning. These outlined a set of ideas that were subsequently developed, explained, and commented upon by very diverse groups of thinkers who, in trying to unravel what is hidden behind the text, revealed the sometimes-invisible contradiction between the apparent or external and the hidden or internal that is found at many of these levels. The ethical-juridical field was one of the main areas of interpretation, a fact that allowed the Qur'an to become the sole law of Islam; at once, a religious, political, and ethical law, by which all of Muslim society must be governed.

In addition to containing the doctrinal principles of Islam, the Qur'an became a behavioral guide for believers that covered all aspects of human life. Its dogmatic content is very limited; nevertheless, it has functioned as a normative ethical code, which attempts to determine how one should live under the one God. It contains numerous passages regulating the moral life of believers; but strictly speaking, it is not a book of ethics, which sets out moral theories. Nevertheless, Islamic law was founded on this Book and developed into a system of obligations; it established what form should be taken by human beings' relationship with God, with other humans, and with themselves. Fundamentally, it prescribes that God is in command and humankind must obey, and therefore, must "submit" to Him. Morality was, therefore, expressed in terms of divine acts and dictates. Reason had to abide by divine mandate and recognize that which God has willed for all eternity; therefore, morality could not be based on autonomous reason, but on the imperatives of the Law.

However, because human conduct is based more on moral than legal judgments, it was necessary to make decisions and formulate valid behavioral rules, which were taken by jurists to

have emanated from Divine Will. For this reason, it was in the field of law that the first developments of scriptural morality appeared. Along with the reflections of the theologians, the aim was to provide an answer to the main question surrounding the divine mandate: should it be obeyed because whatever God orders is inherently good or, conversely, is it good because it is a divine mandate? Similar issues received a double theoretical formulation on whether ethics should be considered an objective or subjective set of norms. The answer depended on the legitimacy conceded to human reason as a source of ethical knowledge. If its legitimacy was accepted, then the objectivity of the mandates had to be recognized, because they are good and just in themselves. This was the solution arrived at by the Mu'tazilite theologians. However, if the independence of reason was not accepted, rather it was excluded from revelation, then the mandate had to be considered as good, and this precisely because God has willed so; therefore, ethical normativity would depend entirely on the will of God, a position that asserts ethical subjectivism. This was the voluntarist solution formulated by the majority of traditionalist theologians.

As this idea impregnated all aspects of Muslim life, morality was externalized into a wide range of expressions, which cannot be exclusively limited to philosophical ethics, but took in other fields, such as education and literature (*adab*), which reflected profane morality, as well as religion itself. This moral feeling can be seen in general literary works, in gnomic, mystical, and religious texts.

Ideas from non-Islamic traditions were added to the first ethical reflections by jurists and theologians. On the one hand, there was literature of Persian origin with ethical-religious ideas based primarily on Zoroastrianism, embodied in fables, aphorisms, poems, anthologies, and other texts. On the other hand, there were materials from the Greek world, which in addition to its gnomic literature, brought a folk ethics, understood as medicine for the soul, and a philosophical ethics, which favored the appearance of a moral thought that was focused more on humankind than on God or the law – a moral thought which reconciled and

ordered reason and desires in an attempt to avoid conflict between them and to ascribe human reason its true worth.

All of this paved the way for the development of the four types of ethical thought, which, according to Hourani (1975), appeared in the Islamic world: (1) Normative religious ethics, (2) Normative secular ethics, (3) Ethical analysis in the religious tradition, and (4) Ethical analysis by philosophers. It is this last point that concerns us here.

The ethical theories born out of the Greek philosophical tradition reflect Platonic and Aristotelian thought, and combine them with some elements taken from Stoicism. With a few exceptions, almost all of these theories show a close link between ethics and politics, considering them as two sides of the same reality relating to humankind, understood in its individual and social dimensions that were inseparable in a society, like the Islamic one, that had its beginnings in the link between religion and community. The union of ethics and politics was seen in this way by Ibn Rushd (*On Plato's Republic*): "This art has been divided into two parts. In the first part, the habits and volitional actions and conduct are treated generally, and here, is made known their relation to each other and which of these habits is for the sake of the others. In the second part is made known how these habits are established in the souls, which habit is ordered to which other habit so that the resulting action from the intended habit may become as perfect as can be, and which habit hinders which other habit" (Lerner 1974).

On the other hand, the ethical reflections seem to correspond to two different traditions. One is more popular, understanding ethics as medicine or therapy for the soul, as a necessary preparation for initiation into the study of philosophy. The other is more scientific and is based on the knowledge of Greek philosophical texts, considering ethics as demonstrative knowledge.

Plato's dialogues were known, and it was soon discovered that Socrates had been the instigator of the ethico-political current in Greek philosophy, as stated by several Arab biographers and historians of Greek culture and philosophy. The attribution of numerous statements and anecdotes of

ethical nature to Socrates show the high appreciation that the Greek philosopher's figure had in the Islamic world and in Arabic literature for his remarkable contribution to the ethics. The Islamic thinkers knew Aristotle's different works on ethics, but it was the *Nicomachean Ethics* that definitively shaped ethical thought in Arabic philosophy. This work offers a model of the ideal life different to that presented in the Qur'ān, as well as instructions on how this can be achieved in human society. Aristotle's text was translated, although information on the translation is not very clear among the Arab bibliographers. Regardless of the translator's identity, it is important to emphasize the wide spread and influence enjoyed by this work in the Arab world. Al-Fārābī wrote a commentary on it. Ibn Sīnā seems to have been inspired by it. Traces of it can be seen in Ibn Bājja. Ibn Rushd wrote a commentary or paraphrase on it, of which the Hebrew and Latin versions still survive. Aristotle's work was, therefore, much read and commented in the Islamic world.

Al-Kindī (d. c. 870) showed a degree of interest the ethics of politics and a certain Stoic influence, maybe originating in Simplicius' commentary on Epictetus' *Manual*. In his *Epistle on the Quantity of Aristotle's Book*, al-Kindī grants ethics a place among the sciences as the first of the practical sciences. His conception of the soul is linked to Neoplatonism. He maintains that the soul belongs to the spiritual or divine world, to which it must return. In order to return to its world of origin, the soul must free itself from sensory ties, through the four Platonic virtues: wisdom, justice, courage, and moderation. In another of his treatises, related to the "consolation of philosophy" genre, he insists on the idea of abandoning mundane things to focus on the intelligible world. Humankind's goal should be the Platonic idea of imitation of God, attained by way of human virtues. This is what human happiness is about, something attainable by each person through his or her individual action.

Al-Fārābī (d. 950) wrote his *Enumeration of the Sciences* with a definite program, which does not include ethics among the sciences described. He knew Greek ethics, because he had read

Aristotle's *Nicomachean Ethics*. The Aristotelian idea that ethics is part of politics is picked up and assimilated by this Muslim philosopher, as can be seen from the use made of it in his works on politics. When dealing with the political regime most able to guarantee excellence and human virtue to citizens, he presents philosophy as a reflection on happiness and how it can be achieved in human community. The idea that all things tend toward good is the guiding principle of his thought on happiness, the ultimate aim aspired to by humans as composed of the body and soul. His ethical doctrine, which leads to politics, is set within an Aristotelian psychology and involves a metaphysical exploration of reality. He also recognizes the importance of Socrates' way, characterized as consisting on the investigation of justice and the virtues.

Happiness is studied in several of his books: the aim of human life is to attain happiness. But the happiness he concerns himself with is not happiness as understood in the Qur'ān, where it seems to refer to the state that will be reached by the blessed in the next life (XI, 105–108). The happiness that al-Fārābī is thinking of is reached in this world; it is the happiness related to humankind in general and not to Muslims in particular. This happiness is obtained on two levels, the individual and the social: it is a happiness that only humans, in the realization of their potential as individuals, can reach by cultivating moral and intellectual virtues, something that it is only possible to achieve within a society. His concept of freedom, which is of Greek origin, is pervaded by the Muslim tradition in which he lived, as can be seen in the abundant use of Islamic terminology.

Happiness is every man's ultimate goal: "Because the purpose of man's existence is the attainment of ultimate happiness, in order to obtain it, he must know what it is, establish it as his aim and give it his attention; then, he must know what qualities are needed to reach happiness and then, he must put them in to practice," he states in *The Political Regime*. This is a happiness that implies knowledge and action, theoretical and practical learning: humans must first of all discover those things that help to attain happiness and must then carry them out.

It is difficult to define the nature of happiness. At times, it seems to be a purely theoretical activity, at others, an exclusively political one; at yet other times, it appears to both a theoretical and political activity. The purpose of human life is the attainment of happiness, since it is a purpose chosen for itself, not for any other reason. Whoever wishes to attain it must follow a path: "The human things through which nations and citizens of cities attain earthly happiness in this life and supreme happiness in the life beyond, are of four kinds; theoretical virtues, deliberative virtues, moral virtues, and practical arts" (*The Attainment of Happiness*) (Mahdi 1969). The first three virtues mentioned relate to philosophy in the narrower sense. Therefore, happiness can only be reached through philosophy.

In this text, he makes no reference to the individual as the most important subject of happiness, and instead, uses the terms "nations" and "citizens," and therefore, speaks in the plural. Human nature can only be perfected in a social context: "In order to preserve himself and to attain his highest perfections, every human being is, by his very nature, in need of many things which he cannot provide all by himself. . . . Therefore, man cannot attain the perfection, for the sake of which his inborn nature has been given to him, unless many societies of people who co-operate come together who each supply everybody else with some particular need of his" (*The Perfect State*) (Walzer 1985). Faithful to the Muslim community in which he lives and to the Platonic and Aristotelian tradition, al-Fārābī does not see happiness or humankind's supreme and ultimate perfection as pertaining to the isolated and solitary individual, but as something that can only be attained in a society, with the help of someone to point out the way. He follows Plato in maintaining that humans need a teacher or guide who can lead them toward happiness. This teacher or guide is the philosopher, who must become the ruler of the excellent or perfect city, the only society in which humans can achieve true happiness.

The philosopher-ruler must have perfect knowledge of the political science, because this is the only route to happiness: political science is primarily concerned with happiness. It also deals

with actions, ways of living, moral qualities, customs, and voluntary habits. Political science is about the knowledge of those things that the inhabitants of cities can use to reach happiness through political association. Politics then, becomes a science integral to the purpose of humankind. Using politics, the philosopher-ruler must find the excellent, perfect, ideal city in which citizens have the best possible conditions so that each, according to their abilities, can realize their ultimate potential, their perfect ethical life.

Life in society is necessary for the attainment of this goal. A person cannot tackle life's necessities and assure his existence in solitude. People must unite with others in perfect or imperfect communities. There are several kinds of societies, but true happiness must be obtained in the right kind of City: "The most excellent good and the utmost perfection is, in the first instance, attained in a city, not in a society which is less complete than it. But since good, in its real sense, is such as to be attainable through choice and will and evils are due to will and choice only, a city may be established to enable its people to co-operate in attaining some aims that are evil. Hence, felicity is not attainable in every city. The city, then, in which people aim through association at co-operating for the things by which felicity in its real and true sense can be attained, is the excellent city, and the society in which there is a co-operation to acquire felicity is the excellent society" (*The Perfect State*, Walzer 1985).

This city fulfills the order of the universe and society is ordered in its image. It falls to the prophet-legislator to make this perfect state into a reality, through the enlightenment received from the Active Intellect. It is also necessary that humans believe in this mission, which implies knowledge of the hierarchical order of the universe and reflection on it in order to perceive clearly the place and function of the prophet-legislators, philosopher-ruler, and first chief.

This chief should possess all the perfect qualities and bring together all governing duties, applying political science as its greatest expert. He is a statesman, philosopher and prophet, legislator, and educator. He is a philosopher because he is endowed with speculative and practical

knowledge. Through philosophy, he can know the divine order of the universe; it follows that the Excellent City's most important governor must have a thorough knowledge of theoretical philosophy, because only through this can he set about ordering society in the same way that God Most High has ordered the universe. This imitation is the supreme purpose of all philosophy, according to the maxim he takes from Plato. The task of practical knowledge lies in the awareness of all the actions needed to establish and preserve virtuous customs and habits in the city, those able to lead the inhabitants toward true happiness; a task that requires long experience.

This ruler, on whom depend the good deeds of citizens aimed at reaching happiness, has the ability to define, determine, and direct these actions toward happiness. Only the government of the state by philosophy can guarantee this. In this way, al-Fārābī established how the state he had in mind – a true likeness of Plato's *Republic* – should be governed by norms originating in reason, by virtue of the knowledge of the whole universe acquired by the philosopher. Any community that was not governed by rational laws would be an imperfect state.

However, the attainment of happiness also has another aspect, the individual, because living in a city is not enough to obtain supreme happiness. There is one prominent idea in al-Fārābī's writing: the attainment of happiness is an individual task, because humankind's path toward it begins with the realization of one's individual potentialities; a human being does not achieve perfection alone due to a set of innate principles with which he or she is born, but through activity. The attainment of intellectual virtues leads humans, with the aid of moral virtues, to theoretical contemplation, but only after choosing between the different options offered by reason. This path is not found in the city, but in an individual's personal life, as can be inferred from *The Perfect State*: "The presence of the first intelligibles in man is his first perfection, but these intelligibles are supplied to him only in order to be used by him to reach his ultimate perfection, that is felicity. Felicity means that the human soul reaches a degree of perfection in its existence where it is in no need of matter for its

support, since it becomes one of the incorporeal things and of the immaterial substances and remains in that state continuously for ever. But its rank is beneath the rank of the Active Intellect" (Walzer 1985). The attainment of individual happiness must follow a path from grammar to logic and from there to the rest of philosophy.

Ibn Sīnā (d. 1037) emphasized the distinction between theoretical philosophy and practical philosophy. The purpose of the latter is to acquire opinions on human action. He divided it into three classical parts: ethics, economics, and politics. Ethics is concerned with showing humans what their actions and habits should be like so that their lives in this world and the next can be happy. However, he did not deal with ethics in his vast work. He insisted on humankind's need for a social context, in which to develop perfectly, which makes it seem that his conception of ethics is much related to politics: Muslim law is the norm that defines the conduct humans should follow in individual and social life.

Ibn Bājja (d. c. 1138) adopted the Aristotelian contemplative ideal, according to which humankind's happiness depends on fully realizing the intellectual life. This is achieved when the human intellect becomes one with the Active Intellect, which leads the author to develop the classical theme of intellectual progression, from a state of pure intellectual potentiality to maximum focus and contact with the Active Intellect, only attainable by some. This purpose, intellectual perfection, can only be achieved in the perfect and virtuous state, founded on nature, whose inhabitants are united by love and whose actions are always upright.

But as the perfect city does not exist, the only happiness in the four imperfect, unjust, and perverse states is that of the recluse, the individual who obtains happiness by his or her own thought and by his or her own reason. Ibn Bājja's most important work, *The Regimen of the Solitary*, is not a treatise on political science, rather a guide to the attainment of true happiness, intended for the philosopher living in the imperfect city. This man orients his search for happiness toward the only place where no external authority can oppress or subjugate him, that is, inside himself, in so far as

Ibn Bājja transforms the political and community reason of his predecessors into individual ethical reason, rejecting the political role of the philosopher and favoring the solitary life. Because of this, in his thought reason becomes ethical reason, because the problem he debates in his work is fundamentally ethical: the only attainable happiness in the cities is that of the recluse who reaches happiness through his own cognitive abilities and their inherent perfection. The individual, therefore, becomes the true subject of ethical life, a truly free, autonomous, and self-sufficient subject, who achieves the inherent and specific function of the human being: the perfection of intellectual ability. Moral actions perfect life, correspond to the spiritual form, and ennoble humans; but purely intellectual acts convert them into the most excellent and divine beings.

Ibn Ṭufayl (d. 1185) took this view of ethics to its extreme. A person cannot reach true happiness using reason even while living in a society: the philosopher must live totally alone, outside society; nonphilosophers cannot be enlightened, because they are ruled by external ritual norms, imposed by a religion. Happiness is only reached in solitude.

Ibn Rushd (d. 1198) dealt explicitly with ethics and politics as interrelated forms of knowledge, convinced that the supreme good, ultimate perfection, and happiness of humankind could only be reached in the perfect city. In his paraphrase of Aristotle's *Rhetoric*, he develops the theory of *eudemony* as an essentially community and social happiness. He highlights the importance of political discourse for the community, since language should give rise to virtuous and just actions as an essential condition for an honest and reasonable life. Finally, he states that rhetoric is composed of the arts of discourse and ethics; that is, of politics.

Throughout the *Faṣl al-Maqāl*, Ibn Rushd speaks of the ultimate human happiness linked to the religious Law. At the beginning of his paraphrase of Plato's *Republic*, he states that the work deals with practical or political science, whose object differs from that of the theoretical sciences, because its purpose consists of actions that belong to volition, based on free will and choice: actions that must be characterized as

ethical depend on human volition, and as such, humans are able to control them. Two areas are distinguished within the science of ethics. The first is general or theoretical and deals with the customs and habits of the soul, the general problems on which political actions are based. The second is strictly practical: it shows how those customs and habits are established in the soul and how their organization takes place within social groups. According to Ibn Rushd, Aristotle's *Nicomachean Ethics* is related to the first area, while the second area is the subject of Aristotle's *Politics* and Plato's *Republic*.

In his commentary on the *Nicomachean Ethics*, where Aristotle talks about the subordination of the sciences and states that politics is the science that can provide humans with the most desirable purpose, as the good of humankind, Ibn Rushd insists that the main purpose of ethical discourse is the government of the city and, more specifically, the good that must be striven for in that government. He recognizes that the most important thing about politics is the noble art of governing the city, and therefore, what must be taught is how political government should be directed toward the happiness of the citizens. Politics should also contain observations relating to human happiness, which can only be attained if humans are considered as citizens of a state and not as isolated beings, as maintained by Ibn Bājja and Ibn Ṭufayl. The virtues by which human beings can reach happiness can only be obtained while living in a community: a lone human being cannot achieve all the virtues, that are impossible to reach unless there is cooperation within a group of individuals. In order to develop their ethical lives, humans need the help of others: the final result is a society in which religious law and political law make possible the attainment of happiness through philosophy, whose study is commanded by the religious law itself.

Ethics, Byzantine

George Zografidis

Department of Philosophy, Aristotle University of Thessaloniki, Thessaloniki, Greece

Abstract

Ethics in Byzantium was not a systematic philosophical discipline, but an occasional response to particular problems posed in everyday life or in interpreting the Scripture. Ethical views on virtues and vices, evil and passions, the Good, the commandments and their observance, labor, marriage and family, sexual life, spiritual exercises, death, resurrection, deification are scattered through a diversity of texts, philosophical, theological, and hagiographical, letters, “mirrors of princes,” etc. Moral reasoning was inseparable from theology and ethics

could not be autonomous but, with few exceptions, was a Christian ethics for a particular Christian society. The two ingredients of Byzantine ethics were early Greek Patristic thought and ancient Greek ethical theories (Stoic, Neoplatonic, and Aristotelian). Revelation, hence scriptural authority and tradition, was the ultimate source of Byzantine ethics.

The Nature of Byzantine Ethics

It is questionable whether the notion of *philosophical ethics* as an autonomous inquiry that examines or establishes the principles of human morality existed in Byzantium. Certainly, moral concerns were present in everyday life and the formulation of codes of moral behavior was familiar to Byzantine culture. However, Byzantine *ethics*, that is, in the sense of a second-order activity that reflects on and makes self-conscious this morality, did not seem to exist. Nevertheless, we must be aware that the concept of “Christian ethics” is also questionable, at least before modernity. In Byzantine texts occur ethical judgments, exhortations to virtue, and statements describing moral experience in a way that is perhaps more important to the fields of religion and psychology; and there are also statements defining ethical terms. Concepts and maxims did not form a whole of universalizable and justified propositions that evaluate or determine kinds of behavior. One may get the impression that the Byzantines deal with problems in a rather unsystematic way as an occasional response to particular problems posed by practice or while interpreting Scripture. This tendency is reflected in texts that are abundant in admonitions and edifying stories – with recurring themes as spiritual exercises, the treatment of the body, virtues, or marriage – but include no systematic treatises. Also, ethics did not find its way to the philosophy curriculum.

Another basic aspect of Byzantine ethics is that it is an ethics for a Christian society, that is, shaped in the context of a premodern spirituality according to which human conduct is dependent on God’s will and the society has an eschatological orientation. Hence, there is no sharp

distinction between religious and secular ethics or between the public and the private; moral reasoning is inseparable from theological and the realm of ethics cannot be autonomous. A non-Christian ethics is inconceivable in Byzantium and Byzantine ethics cannot in principle be something distinct from (or independent from) religious ethics – with few interesting exceptions.

Being Christian, Byzantine ethics does not avoid an inherent paradox: it is addressed to man in general (as an image of God) claiming for universality, but it is adjusted to a particular society; it can only have temporal character, codifying the way of life of a community that heads to the Kingdom of Heaven, and it seems solidified in a society that understands itself as the realized Kingdom of God. In addition, it conceives moral precepts and goodness in terms of commandments and obedience respectively, and at the same time in terms of personal relation and love. Such an ethics cannot be easily characterized as deontological, of divine command or virtue ethics.

If the questions “how should I live?” or “what kind of life is ethical?” were central questions of Greek ethics, for the Byzantines philosophy – as theoretical endeavor – is not entitled to answer such fundamental questions. It was only in twelfth century that the question of the nature of ethics as a discipline was put by the commentators of Aristotle’s *Nicomachean Ethics*; and the answer was that it could be a science but not in the strict Aristotelian sense, because it does not proceed from universal premises.

Perhaps the only possible mission of Byzantine ethics would be the rational and systematic exposition of principles already accepted or the discussion of moral problems with the help of Greek moral thought. What Byzantines preferred was to see ethics (and “Christian philosophy”) as a way of life based on the imitation of Christ and aiming at the formation of the “new man.” The essence of Christianity was not taken to be a moral teaching or a law, that is, to impose moral rules and principles. Byzantines did not seek to determine what action is right in any given circumstance (judged by justified general principles) but to evaluate a person’s life considered as a whole; it is the communion of human being with the source of

goodness that warrants its authentic relations with other people and finally the realization of itself. Ethics concerns the individual, its horizontal relations to other individuals (after Jesus' command to love one's neighbor as oneself), and also man's vertical relation to God, a personal relation with the final goal of the restoration of the "society of righteous."

The Sources of Byzantine Ethics

The two ingredients of Byzantine ethics are Greek patristic thought and Greek moral philosophy.

(a) *Patristic Foundations*: Byzantine ethics is indissolubly bound to the moral teaching of the Early Church that was based on Scripture, through its interpretation by the Greek Fathers (especially in cases where the allegorical method was used to extract its "moral meaning"). The scriptural basis of Byzantine ethics is revealed in almost every text and is exemplified in the long tradition of exegetical treatises (e.g., on *Job* or on Paul's *Epistles*). In the Greek East there was not a single figure whose thought influenced ethics, like Augustine in the West. Influential texts were Clement of Alexandria's *Paedagogus*, Origen's *On Principles* III, Cyril of Alexandria's *Catecheses*, the speeches of John Chrysostom, and the Cappadocians' ethical works. Basil of Caesarea wrote many ascetic and ethical works that influenced the development of Eastern monasticism and addressed many issues concerning the attainment of the perfect virtuous life.

The numerous and popular *Lives* of ascetics were a reminder that spiritual perfection though an ideal can be attained in this life. Toward this ideal aimed hundreds of practical *Chapters* (e.g., Maximus the Confessor), a series of works *On Virginity*, numerous *Sayings of Fathers*, and ascetic manuals like that of Macarius, Evagrius Pontikos, Neilos, and Diadochus of Photike. This kind of literature and its theology of temperance reached its climax at the Collection of *Philokalia*

(*Love for What Is Beautiful/Good*) that has remained popular for centuries among Orthodox people. The terms "ethics" and "ethical" occurred in Patristic literature mainly to denote Christian moral life, and Byzantine Fathers of the fourth and fifth century (e.g., John Chrysostom and Theodoret) insisted on the organic relation between ethics and dogma.

(b) *Ancient Greek ethical tradition* is the second ingredient of Byzantine ethics. In the formation of their moral teaching, the Fathers used ideas and concepts derived from Greek philosophy. They owe much to this tradition and this fact was recognized by pagans and by Christians. Origen and Gregory of Nyssa had already accepted the utility of certain aspects of pagan ethics and in many issues the Greek ethics was not to be reversed but integrated. The late antique amalgam of Platonism, Stoicism, and popular moral tradition was quite familiar to Fathers and the Byzantines learn it both indirectly and directly through *florilegia* and by studying the ancient texts.

Some major topics of Late Antiquity ethics found their way to other literary forms such as epistolography; for example, a considerable bulk of letters of consolation based on a long tradition, Christian and Pagan. The ideal of a wise man and the figure of the philosopher teacher as a paradigm, moral exhortation, the inner relation between virtue and knowledge (and vice to ignorance) passed to Christian morality. Greek ethical concepts as pleasure and happiness (*eudaimonia*) lost their importance; the assimilation to God was the ultimate goal, but even this echoed a Platonic dictum. Stoic ethics was present in the Christian adaptations of Epictetus' *Manual* and can be traced later on in Barlaam's *Ethics According to the Stoics* and mainly in Pletho's *On Virtues*, greatly indebted to Epictetus. (Neo)Platonic ethical theory influenced Byzantine ethics in many issues, like its solution to the problem of evil. More importantly, the main structure of Byzantine moral theological thought (via the Cappadocian Fathers) owes much to later Platonic tradition: to overcome the passions and the corporeal

existence; the purification of the soul by virtue in order to attain to the supreme good and contemplate (or unite with) God; or the ethical connotations of the ascent to the ontological hierarchy. The popularization of philosophical ethics and the therapeutic role of philosophy contributed so that the moral treatises of the Christian writers found an audience prepared and eager to use them as a practical guide to moral growth.

Aristotelian Ethics and Its Byzantine Reception

The presence of Aristotelian ethics can be attested in two ways: the influence of Aristotle's ethical views and the occupation with Aristotelian texts. While Aristotelian logic had a continuous presence in Byzantine thought and education through handbooks and the *Organon* itself, the fate of *Nicomachean Ethics* was different. A great number of the manuscripts (almost 200) of the three Aristotelian ethical treatises verifies the interest in reading and commenting on them in the twelfth century, when the Byzantines undertook the task to write commentaries on works of Aristotle, among them the *Nicomachean Ethics*. So did Eustratios of Nicaea, Michael of Ephesus, and others. Eustratios used Platonic and Christian elements and discussed not only definitions and terms but also the ethical views of Aristotle. Michael followed Alexander of Aphrodisias and Alexandrian Neoplatonists; the comments on Books 2–4 are a compilation of Neoplatonic scholia. Pachymeres in *Philosophia* XI was not an “explanator” and omitted several chapters of *Nicomachean Ethics*; his text is more like an epitome with few additional remarks. Two paraphrases were composed later by Konstantinos Palaeokappas (?) and Ps.-Olympiodorus; the latter – once attributed to Emperor John VI Kantakuzene – must be a paraphrase of the comments by the Neoplatonic Olympiodorus. It is difficult to say that the study of *Nicomachean Ethics* changed ethical reasoning in Byzantium as it did in the West. Anyway, the interest in Aristotle was not confined to commentaries but it is evident in texts of Psellos, John Italos, Nikephoros Blemmydes, and other Byzantine

philosophers and scholars who were familiar with the Aristotelian texts. The debate of Platonists and Aristotelians in the fifteenth century touched also ethical issues. Of interest is the critique of Aristotelian ethics by Plethon, who doubted whether the Aristotelian mean helps to make the fundamental distinction between good and evil (as a result of Aristotle's degradation of the soul) or to understand the relation of pleasure to happiness.

Texts and Thinkers

Certainly, a unified picture of Byzantine ethics throughout 12 centuries is misleading; the same is true for a dual-aspect approach that distinguishes sharply between an ascetic and a “humanistic” current. There are differences and tensions between monks, clergymen, and intellectuals; they depend on many factors, like the writers' intellectual and religious background and milieu, their apprehension of ecclesiastical and historical realities, and their intended audience. The texts produced mostly in Constantinople, in monastic circles or in the imperial court and addressed to the Emperor, monks, intellectuals, laypersons, or ordinary people.

Secular ethics as such could not exist in Byzantium and the superiority of “extreme philosophy,” that is, ascetic morality, is stressed in many Patristic texts. We can discern two aspects of religious ideal behavior, the ascetic ideal (the mortification of the flesh and the life of a hermit) and the monastic ideal (the virtue of humility and the communal life). The majority of early theological literature and treatises like *On Virginity* emphasized these ideals. The same line of thought continued in early Byzantium with Maximus the Confessor's various *Chapters*, John of Climacus' *Heavenly Ladder*; later with topically arranged *florilegia* like John of Damascus' *Sacra Parallela*; and, finally, with Symeon's the New Theologian *Ethics* and *Catecheses*, Nicetas Stethatos' *Three Hundred Practical Chapters* (on the purification of the intellect, on love, and on the perfection of life), and the Hesychastic movement with

Gregory Palamas. Nicholas Kabasilas' *On the Life in Christ* is a landmark in Byzantine spirituality. Although this rigorous discipline was addressed mainly to monks, it played a decisive role in the formation of Byzantine ethics.

A few reactions against the unqualified acceptance of these ideals were noted; intellectuals such as Bishop Eustathios of Thessalonike (twelfth century) praised also virtuous married people and Plethon attacked Christian monasticism in general. There are also moderate views that are not antireligious but relatively independent from the Orthodox learning and influenced by Greek philosophy (Psellos, Metochites' *Ethical Discourse*). Subversive texts like the *Lives of Fools in Christ* (St. Symeon, St. Andrew) and the *Didactic Admonitions* (known as *Spaneas*) or the idiosyncratic case of anti-Christian ethics (Plethon). The primacy of religious ethics did not prevent several forms of secular ideals of behavior to emerge in texts of Psellos, Kekaumenos, or Eustathios concerning family and women, the moderate enjoyment of life, the knightly ideal, etc. The optimistic view trusted God, no matter how weak human nature was considered to be, but many intellectuals held a pessimistic attitude – especially in the Empire's hard times – and were reluctant to endorse Christian virtues without qualification, while expressing a feeling of vanity not calmed by the acknowledgment of God's providence.

Ethical views are scattered through a diversity of texts, not only philosophical or theological. Hagiography and epistolography are valuable sources for everyday morality and historiography offers pages where moral criteria are applied at the description of characters. The "mirrors of princes" were more an ethical discourse than a political treatise; in many examples of this genre is depicted the ideal image of the Emperor – a combination of Christian virtues and other moral principles. Rhetoric speeches and exercises, though full of clichés and conventional themes, contributed to the discussion of characters and virtues. All these literary genres often function as a magnifying or a distortive mirror, nevertheless they are indispensable for the study of Byzantine ethics.

Concepts and Themes

Major and favorable themes are: virtues and vices, evil and passions, the Good, the commandments and their observance, labor, marriage and family, sexual life, spiritual exercises, asceticism, Church and secular power, social problems, wealth and poverty, war, death, resurrection, and deification. Moral considerations are grounded in human nature and its relation to God not in the abstract but in the postlapsarian condition. The scope of ethics is determined by the evaluation of this condition – whether man is totally corrupted or likeness to God was dimmed but remains capable to attain similitude. In either case man cannot be the foundation of ethics, notwithstanding the possibility of moral knowledge. Revelation, hence scriptural authority and tradition, turns to be the ultimate source of Byzantine ethics.

How can good be defined? The *Euthyphro*'s dilemma can be Christianized: Is the good because God loves it [or: commands it] or God loves it [or: commands it] because it is good? For the Byzantines, the second option is unthinkable because it assumes a morality independent of God's will. Their choice of the first option was not weakened by the obvious difficulty that in this case morality could be the product of an arbitrary will. In their theological perspective, God is conceived not as an impersonal cause but as a person whose will created the world; and this will is also expressed by the moral order of this world.

For human beings the options are two: (a) estrangement from God and good, and a voluntary spiritual death. (b) The care of the self: deliberate obedience to divine commands and purification of the intellect and of the senses. The ultimate goal of *homo byzantinus* is deification, to live a "life proper and according to nature, i.e., assimilating to divine nature." This goal cannot be achieved without God's cooperation and it is in this life that man has to regain his authentic being: holy men and, primarily, Jesus are the embodied models to be imitated. Pleasure was almost expelled (see however Metochites), but the vocabulary of love reenters to express the personal relation of man to God. Man is united with the object of its desire – "sinks in God's

beauty and love; pleasure and divine sweetness surge within him” (Symeon). This mystic communication with God is suitable to the realities of *homo byzantinus* who, although a member of the Church, felt insecure and subordinated himself to various political and social hierarchies. The superiority of contemplative life is undeniable, not only in its ascetic form.

As for the practice of Byzantine ethics, we have to keep in mind that though the texts are full of canons and precepts and declare constantly the ideal of a pious ascetic life we must not get the wrong impression that this normative ethics ruled over Byzantine society – no matter how theocentric it was. The attitudes of Byzantines toward sexual life, wealth and poverty, philanthropy, or marriage reveal an antinomic element in ethical theory and practice. On the one hand, obedience to prescriptive rules enacted from above (God, Emperor), intolerance and repression; on the other hand, dispensation, adaptation of the rules to given circumstances and to man’s condition, that is, the principle of “economy,” accepted by the Church and justified by Incarnation. There was a dissonance between the immutable principles of “official” religious ethics and the moral behavior of everyday faithful people.

Virtues and Vices

Virtue (*arete*), excellence of character, is in accordance with human nature, while vice and evil are against nature. Byzantine texts treat of moral subjects by using clichés, maxims, and conventional themes (*topoi*) that were common in Greek literature and rhetoric; for example, the theme of the man at a crossroad and the choice between a life of virtue and one of vice. Catalogs of virtues and vices were inherited from the Stoic and Platonic tradition and from the Bible, and the Byzantines adopted Greek definitions and classifications. In Fathers like Maximus or Gregory Palamas and also in theologians and philosophers like Psellos, Blemmydes, or Metochites, virtue is connected to knowledge and it serves as a means to the knowledge of God. It is through exercise that human beings can control irrational desire and replace it by rational will. However, in the theological literature the attainment of virtue is not possible by the

soul’s own faculties, but it is considered as a gift; other thinkers, especially in the Paleologan renaissance, appreciated more the contribution of reasoning and knowledge to this goal.

Maximus in his *Chapters on Love* recapitulated the earlier Patristic tradition: to the cardinal (“general”) virtues of the “heavenly man” – righteousness (justice), moderation, prudence, and courage – the three main theological virtues are introduced: faith, hope, and love. To all these many were added, some in a new Christian sense: philanthropy, piety, humility, mildness, and clemency. Vice (*kakia*) is a habitually evil disposition, an inclination to wrongdoing and to sin that alienates from God. To the eight sinful desires (*logismoi*) that named Origen – gluttony, fornication, avarice, grief, wrath, torpor, vainglory, and arrogance – many were added. They belong either to the reasoning faculty, to emotion, or to desire. The vices of reasoning (impiety, heretical opinion, faithlessness, and blasphemy) are worse in effects than those of the two lower parts of the soul, for example, anger, wrath, bitterness, fear, cowardice, zeal, envy, vainglory, or luxuriousness, prostitution, theft, divinations, painting of the face. Reasoning is enlightened when love and charity as well as purity and virtue rule over the two other parts. Intellect is where morality resides since there occur the deliberations of acts; so there could be no actual evil if not a previous evil thought – the sin concerns first of all the intellect.

Free Will and the Problem of Evil

For the Byzantines, the cause of evil can be neither God nor matter. The Neoplatonic doctrine for the evil as the privation of the good makes evil compatible with free will and providence but it does not solve the empirical problem. One solution is that God has his own unknown reasons to permit wrongdoing; this purposefulness of evil supports a “soul-making theodicy.” The choice of evil is a matter of free will, though it may be due to ignorance, weakness of will, pride, or disobedience. Even if the blame is put on devil, it is by his own will that he became the originator of the evil. Besides, a man who would never commit the evil in virtue of his nature is not free. So, the

existence of evil is the proof of man's freedom and a consequence of its use. Yet the threat to the existence of ethics is not removed if God's foreknowledge makes all human actions predestinated and determined. Thinkers like Photios and Blemmydes believed that predestination (too close to the Greek concept of fate) is incompatible to the Christian conception of freedom. Many others, like Germanos, John of Damascus, Psellos, Metochites, and Scholarios, asserted that the belief in Providence does not contradict human free will; foreknowledge is not the cause of things to happen. So rational action and moral responsibility are possible in regard to "things that depend on us." The issue was also present in the Platonists–Aristotelians controversy in the fifteenth century; thus Plethon argued for fate (*hemarmene*) and necessity, whereas Theodore Gazes demonstrated Plato and Aristotle in agreement.

We can say that for the Byzantines behavior is judged as "good" or "bad," but this evaluation is not the ultimate insofar as it is made on general ethical principles. Putting aside the emphasis on reasoning or experience, what counts is whether behavior, that is, human life, is grounded in "real life" ("in Christ," as Kabasilas would phrase it) or leads to (spiritual) death; hence the "ontological" character of Byzantine ethics. In a context that is characterized by theological traditionalism and philosophical antiquarianism, the emphasis would be on ascetic or on secular features, on rigorous canons or on their "economical" enforcement, on sin or on penitence. Goodness and holiness can be seen as two aspects of the human life that is being lived as a response to God's "wishing-to-be-in-us" (Rowan Williams). And thus Byzantine ethics appears not so much as a theoretical discipline to be found in statements or arguments, but as a practice narrated in a variety of texts.

Ethics, Jewish

Hava Tirosh-Samuelson

School of Historical, Philosophical and Religious Studies and Center for Jewish Studies, Arizona State University, Tempe, AZ, USA

Abstract

In the Aristotelian schema of the sciences, ethics and politics were closely intertwined: ethics had social dimensions, even though it studied the individual, and politics was ethical,

even though it focused on society and the state. In medieval Islam and Christendom, Jewish ethics evolved through the interaction with non-Jewish philosophy. The goal of Jewish ethics was to produce the virtuous individual who possesses the character traits necessary for the attainment of wisdom that culminates in the knowledge of God. Jewish ethics posited a dialectical relationship between religion and philosophy: the cultivation of the virtuous character was a rational project predicated on the study of philosophy and the employment of reason, but the goal of this endeavor was the knowledge of God to the extent this is feasible for humans. The knowledge of God, in turn, was expressed in actions that imitated God's perfection in the sociopolitical sphere. The dominant theme of medieval Jewish philosophical ethics was the meaning of happiness and the ways to attain it. Within the discourse on happiness, Jewish philosophers reflected on the meaning of being human; the relationship between the body and soul; the conditioning of character through acquisition of virtues, desirable virtues, and undesirable vices; the human propensity to sin; and God's rewards and punishments in his works and in the afterlife. These themes were discussed in diverse literary genres, such as self-standing philosophical treatise, commentaries on Aristotle's *Ethics*, supercommentaries on Averroes' commentaries on the *Ethics*, biblical commentaries, and ethical wills. The major contributor to Jewish philosophical ethics was Moses Maimonides (d. 1204) who effected the most extensive integration of Aristotelianism and rabbinic Judaism. Post-Maimonidean Jewish philosophical ethics in Christendom was framed in the context of the interreligious debate on the salvation of the individual soul, a contested terrain between Judaism and Christianity.

Jewish Ethics: A Religio-Philosophic Discourse

Within medieval Jewish philosophy, ethics holds a peculiar status. On the one hand, the number of Jewish philosophical texts devoted exclusively to

ethics (i.e., a theory of character formation and right action) was relatively small. On the other hand, ethical reflections were inseparable from metaphysics, cosmology, psychology, epistemology, politics, and theology so that ethics was inherently linked to reflections on the origin and structure of the world, the nature of human beings, the purpose of human life, the production and effects of knowledge, philosophy as a way of life, the ideal political regime, and the relationship between humans and God. The broad scope of Jewish philosophical ethics was especially evident from the second half of the twelfth century, after it absorbed the Aristotelian classification of the sciences. For Aristotle and the Aristotelians, ethics belonged to practical philosophy that studies voluntary actions and involves deliberations about things that are subject to change. Although ethics studies the individual and politics studies on society and state, ethics and politics were closely intertwined: ethics has social dimensions and politics is ethical.

Jewish ethics evolved through the interaction with non-Jewish philosophy in medieval Islam and Christendom. Utilizing concepts and theories articulated first by non-Jews, Jewish philosophers adapted them to the case of Judaism, often in order to argue the spiritual superiority of Judaism over the competing religions and schools of thought. Since Jewish philosophers held that, in principle, human reason and divine revelation cannot be in conflict with each other, non-Jewish sources were used to the extent that they were deemed to be true. If an apparent conflict between the ethical ideals of Judaism and other ethical teachings arose, it was due either to misunderstanding of philosophy or to misinterpretation of the divinely revealed tradition.

The goal of Jewish ethics was to produce the virtuous individual who possesses the character traits necessary for the attainment of wisdom that culminates in the knowledge of God. To be virtuous, one had to observe divinely revealed commandment, but such observance was predicated on holding true opinions about God and the world, knowledge that could be obtained only through the study of philosophy. Jewish ethics, thus, posited a dialectical relationship between religion and philosophy: the cultivation of the virtuous

character was a rational project predicated on the study of philosophy and the employment of reason, but the goal of this endeavor was the knowledge of God to the extent this is feasible for humans. The knowledge of God, in turn, was expressed in actions that imitate God's perfections in the sociopolitical sphere. Thus, ethics exemplifies the fundamental compatibility between divinely revealed Judaism and the pursuit of wisdom in medieval Jewish philosophy.

The dominant theme of philosophical ethics was the meaning of happiness (*hatzlaha*; *osher*) and the ways to attain it. In accord with Aristotle, happiness was understood to mean human flourishing, or well-being, and it was regarded as an objective standard rooted in the nature of human beings, a standard that organizes all activities into a meaningful pattern for the duration of one's entire life. The happy or flourishing life is a life in which what is objectively good for human beings is attained when they conduct themselves in a particular manner and undertake those activities that promote what is objectively good for humans as members of the human species. Within the discourse on happiness, Jewish philosophers reflected on the meaning of being human; the relationship between the body and soul; the conditioning of the character through acquisition of virtues, desirable virtues, and undesirable vices; the human propensity to sin; and God's rewards and punishments in this world and in the afterlife. The views of medieval philosophers about happiness changed over time, reflecting changing historical circumstances and varying interactions with non-Jewish schools of thought.

Jewish ethical writings were composed of various literary genres. One literary type was the self-standing treatise devoted primarily to ethical issues as articulated by the prevailing philosophical conventions. Maimonides inaugurated a second literary genre when he included his ethical reflections as part of his legal works, thus demonstrating that Aristotelian ethics was integral to Judaism. Maimonides paved the way for Jewish commentaries on Aristotle's *Ethics*, a third literary genre, mostly written as supercommentaries on Averroes' commentaries on the *Ethics*. Whereas these commentaries were composed for the small

intellectual elite of trained philosophers, they influenced the larger educated public when their ideas were incorporated in philosophical commentaries on the Bible. Thus, the biblical commentary itself served as vehicle for the dissemination of philosophical ethics. A fifth literary genre for Jewish ethics was the "ethical will," namely, texts of moral instruction technically addressed to the son of the author but intended for the education of the larger reading public. Finally, philosophical ethics was popularized when authors trained in Jewish philosophy composed rhymed prose to critique certain social classes or expose social ills. By using satire and parody, they eloquently and wittily inspired the reading public to cultivate certain virtues and avoid certain vices. Although these texts are not technically philosophical, they reflected the philosophical education of their authors and the philosophic sensibility they intended to disseminate. Through these genres, ethics played an important role in the formation of medieval Jewish culture and education. Ethics was an applied science par excellence.

Rationalist Religious Ethics in Islam

Saadia Gaon (d. 941) inaugurated Jewish philosophical ethics in the tenth treatise of *al Amānāt wa-l-i'tiqadāt* (*The Book of Doctrines and Beliefs*) (Rosenblatt 1948). Saadia wrote this text to defend rabbinic Judaism against the critique of the Karaites, Jews who regarded Scripture alone as normative source of Jewish law and who denied the authority of rabbinic Oral Law. Following the example of the Mu'tazilite school of *kalām* (i.e., Muslim speculative theology), Saadia attempted to demonstrate that rational arguments are compatible with Scriptural and rabbinic teachings. As a Jewish Mu'tazilite, he was concerned with the themes of divine unity, divine justice, rewards and punishments, and good and evil actions. Saadia was the first to introduce philosophical anthropology as the basis of Jewish ethics and the first to note that the goal of Jewish philosophic learning is the attainment of happiness.

Saadia establishes that happiness pertains to the quality of the human soul, and therefore, he examines various theories on the nature of the human soul and its association with the body. According to Saadia, humans are a temporary combination of two substances – body and soul – both created by God and are united by him. The soul is not strictly speaking a non-corporeal substance; rather, it is made of a refined substance that is not devoid of matter altogether, even though it is qualitatively different from the corporeal body, “a dark place” in which the luminous soul is imprisoned for the duration of its life on earth. The human soul needs the body as its instrument of action, and therefore, the well-being of the soul is predicated on the well-being of the body, although the latter requires control of the body by the soul.

The interdependence of body and soul explains why Saadia insists on the doctrine of bodily resurrection: even though on earth the two substances separate and the soul of the righteous continues to live on as immortal substance, in the end of time as a result of divine intervention, the individual soul will be recombined with its corresponding body. For the duration of human life on earth, a proper balance between the soul and body constitutes the morally good life, for which one is rewarded with eternal life and the recombination of body and soul in the eschatological remote future. The ethically good life is thus a balanced life in which all the aspects of the human composite are given appropriate expression within a hierarchy of goods. The ideal practice that yields the good life is rooted in moderation and self-control, but Saadia does not provide the details how to achieve the ideal balance because the moral path is already charted by the precepts of the revealed Torah as interpreted by the rabbis.

During the tenth and eleventh centuries, two strands shaped Jewish philosophical ethics in Islam: the sociocultural program known as *adab* and systematic philosophy (*falsafa*), especially the blend of Neoplatonism and Aristotelianism generated by the Ismāʿīlīs. The *adab* culture was based on knowledge culled from prose books of tales, fables, anecdotes, practical advice, and popularization of scientific information, all gleaned

from the philosophic and scientific heritage of the Hellenistic world interspersed with some material from India. In the *adab* program, the Hellenistic ideals of moderation and self-control were combined with educational ideals that fit the needs of the Muslim state and the peculiarities of the Muslim religion. The philosophers (*falāsifa*) shared the *adab* culture but went beyond it by establishing ethics as “the science of character” (‘*ilm al-Ahklāq*’) (Fakhry 1994). These speculations were based on Aristotle’s *Nicomachean Ethics* which was translated into Arabic by Ishāq b. Hunayn (d. 911). The most thorough reworking of Greek ethics in Islam was articulated by al-Fārābī (d. 950), who composed a commentary on Aristotle’s *Nicomachean Ethics* (no longer extant) as well as systematic reflections on happiness in several works. His fusion of Aristotelian ethics, Plato’s political philosophy, and Plotinus metaphysics will exert deep influence on Moses Maimonides (d. 1204), but until then Jewish philosophers were influenced by the Ismāʿīlī strand of Shīʿite Islam whose, spread by the religious brotherhood from Basra, *Ikhwān al-Ṣafāʾ* (Sincere Brethren of Purity). Their philosophic encyclopedia blended elements from Neo-Pythagoreanism, Neoplatonism, Hermeticism, and Aristotelianism, an amalgam that did not appear to threaten the religious mentality of Muslims or Jews, because it retained the belief in the personal immortality and viewed the pursuit of intellectual perfection as a religious activity.

Solomon ibn Gabirol (d. 1058) in Muslim Spain is a typical example of a Jewish thinker whose ethics combined the *adab* culture with the Aristotelian “science of character” and Ismāʿīlī metaphysics. Gabirol drew on Hunayn b. Ishāq’s collection of aphoristic, biographical, gnomic, and anecdotal literature entitled *Adab al-Falāsifa*, which was translated into Hebrew under the title *Musrey ha-Philosophim* (*The Moral Teachings of the Philosophers*). For this reason, another collection of Arabic moral aphorisms that circulated in a Hebrew translation under the title *Mivhar ha-Peninim* (*Choice of Pearls*) was attributed to Solomon ibn Gabirol. From the vast encyclopedic knowledge of Arabic learning, Ibn Gabirol culled his philosophic-scientific knowledge, molding it

all into his own philosophy that had a strong Neoplatonic tinge, while also departing from prevailing Neoplatonism on some important points. His *Islākh al-Akhlāq* (*Tikkun Middot ha-Nefesh; Improvement of Moral Qualities*) is a distinct Jewish contribution to the “science of character” in Islamic philosophy.

For Gabirol, human temperaments are rooted in human physiology, as understood by the medical ethics of Galen and Hippocrates. Hence, moral training is biologically based. Echoing a common theme in the writings of the *Ikhwān*, Gabirol presents the human species as a microcosm in which the four elements and the four humors reflect the mathematical assumptions of the Pythagorean tradition. The rational soul is defined as “pure, stainless, and simple,” and the proper management of the body by the soul should exhibit the control of the rational soul. Human well-being in this life requires the hegemony of reason over the passions and appetites of the body. If reason fails, one falls prey to the irrational desire of the body and loses the “enduring happiness which man can reason in the intellectual world, the world to come” (Wise 1966 [1902]: 31). The principles that underlie proper human conduct constitute the medicine of the soul, which is analogous to the medicine of the body. The wise man is like “skillful physician who prepares prescriptions, taking of every medicine a divine quality” (Wise 1966 [1902]: 34).

The ultimate end of this medical management is not life in the temporal order but rather the everlasting existing of the rational soul in the intelligible realm. The ideal person is one who reaches a well-balanced condition of the body and soul: he makes the rational soul govern his passions. The ideal virtues include meekness, modesty, capacity to love, compassion and mercy, cheerfulness and good disposition, good will and contentment, alertness, generosity, and valor. The vices include pride, impudence, capacity to hate, cruelty, wrath, envy, sloth, niggardliness, and cowardice. The virtues are generally in accord with rabbinic tradition, except for the virtue of magnanimity, which reflects his courtier social setting. The moral life means the conditioning (or “improvement”) of the soul’s desire: by

perfecting oneself morally and intellectually, the human soul can attain the ultimate religious goal of human life.

Other Jewish philosophers in the eleventh century – Joseph ibn Zaddik and Abraham bar Hiyya – shared this outlook, whose most elaborate expression can be found in the work of Bahya ibn Paquda (d. 1156) *Farā’id al-Qulūb* (*Hovot ha-Levavot, Duties of the Heart*) (Mansoor 1973). Ibn Paquda shared the intellectualist religiosity of the Jewish thinkers and the Neoplatonic metaphysics presupposed by them, but he was critical of a superficial endorsement of the *adab* culture among the Jewish courtiers. He held that the essence of being human is the intellect and human well-being depends on the excellence of the intellect. Since the rational soul does not belong to this world, the happiness of the soul cannot be experienced in this world, but only in the afterlife. The quality of one’s life will determine whether or not the individual rational soul will attain the desired perfection. Bahya’s book is most similar in orientation to al-Ġazālī’s *Kimyā-yi Saadat* (*The Alchemy of Happiness*) whose goal was to show how life in accordance with the teaching of the Qur’ān leads to love of God, the ultimate end of human life. Like al-Ġazālī, Bahya offers a therapeutic program that can either prevent the sickness of the soul or halt it in case sickness takes root. Yet the proper care of the soul is feasible only for those who possess an accurate knowledge of the structure of the universe created by God and a correct understanding of the human condition.

By the mid-twelfth century, the notion that happiness pertains to the perfection of the soul and that it is attainable for those who observe the Torah and ensure that their reason controls their emotion and bodily urges was shared by many Jewish philosophers. However, the more Jewish philosophers gained access to the teachings of Aristotle, the more they understood the perfection of the soul exclusively in terms of perfection of the rational soul, namely, the intellect. Consequently, reflections on virtue and happiness were now intertwined with an elaborate theory of knowledge and much of it was derived from the Hellenistic commentators on Aristotle.

The most extensive integration of Aristotelianism and Jewish ethics was effected by Moses Maimonides. Although he was deeply indebted to Muslim and Jewish predecessors, especially al-Fārābī, Ibn Bājja, Ibn Gabirol, and Ibn Pakuada, Maimonides created a new ethical discourse on virtue and happiness by making explicit the Aristotelian foundation of rabbinic ethics (Weiss 1991). For Maimonides, Aristotle's teachings, to the extent that they are true, are perfectly compatible with the revealed Torah and that as such they are authoritative to Jews. Moreover, Maimonides claims that the Torah should be read as an esoteric text whose inner meaning is identical with Aristotle's physics and metaphysics. The Torah teaches philosophical truths necessary for the attainment of happiness in the language of human beings, namely, through figurative speech. Finally, Maimonides claims that the Torah established the ideal political regime in which human happiness can be attained, provided one know how to interpret the Torah correctly and understands its philosophical meaning.

Maimonides adopts the Aristotelian notion that to become morally virtuous, humans must practice the middle way (Weiss and Butterworth 1975), but he also departed from the Aristotelian ideal in some important respects. Maimonides agrees with Aristotle that a human being is born with certain disposition, due to a particular material makeup, and that humans can acquire good character traits by habitually practicing good deeds. When humans act "just right," they acquire the intrinsic states of character out of which flow good actions. Maimonides has to work out the tension between moderation and supererogation that existed in rabbinic moral philosophy. He does so by asserting that the middle between extremes characterizes God's mode of operation; the ways of God describe those moderate traits. The Torah commands humans to walk in God's path, namely, to choose the mean between extreme (Maimonides 1949, Hilkhot Deot 28:9).

The moral virtues require the exercise of practical reasoning, and its excellence is the virtue of practical wisdom. On the surface, it seems that practical reasoning is unnecessary because the Torah itself determines what the right action is in

each and every case. Yet practical reason played an important role in Maimonides' virtue ethics (Kreisel 1999). On the basis of al-Fārābī's *Aphorisms of the Statesman*, Maimonides speaks about the practical intellect (*'aql al-`āmali*) as a faculty involved in ethics and politics, enabling humans to govern, and to produce "knowledge of the regimen to be adopted by the individual or by society in the pursuit of its well being" (Kreisel 1999: 75). Maimonides, however, subsumed practical reason into the activity of the imagination, a mental capacity that is particularly strong among prophets and legislators, all except the Prophet Moses, whose imagination was perfect, but whose prophetic experience itself did not involve the imagination. It was only the communication of Moses' perfect cognitive experience to the people of Israel at Sinai that involved the power of imagination, translating conceptual knowledge into figurative speech. Much of Maimonides' philosophical ethics focuses on analysis of the perfection of Moses' prophecy that anchors the perfection of Mosaic Law.

Practical wisdom is indeed an intellectual virtue that features prominently in the good life, but it does not constitute the ultimate end of human life; that status is reserved to theoretical wisdom. To be fully perfect, the human intellect must transcend the feature that makes it human, namely, its association with the body (Kellner 1991). By cognizing the intelligible order of reality, the human rational potential is both actualized and substantialized. The perfect intellect – the acquired intellect – is a substance separable from the body as Aristotle hinted in *De anima* III:3. This state of being is what the rabbis designated as the world-to-come (*olam ha-ba*), which Maimonides defines as "the ultimate end toward which all our efforts ought to be devoted . . . the ultimate and perfect reward, the final bliss that will suffer neither interruption nor diminution" (Mishneh Torah, Hilkhot Teshuvah 9:2). Maimonides' interpretation of *olam ha-ba* diminishes the apocalyptic and eschatological features of that concept in rabbinic Judaism, since *olam ha-ba* is but a state of being of the perfected rational soul. But who can achieve such elevated state of being? Maimonides leaves the answer to this question rather obscure, giving rise

to ongoing controversy. In general, Maimonides understood *olam ha-ba* as an ideal whose pursuit gives direction to human life, but whose attainment is nearly impossible because it requires acquisition of the sciences, as well as acting in accordance with the Torah's prescriptions. Such restrictive interpretation of *olam ha-ba* makes the traditional belief in personal immortality highly suspect. While Maimonides listed this belief among the thirteen dogmas of Judaism, he viewed it as necessary for the life of the Jewish polity rather than a true belief.

Jewish Ethics in Medieval Christendom

In the thirteenth century, rationalist vision of the philosophical life disseminated among the learned Jewish elites in Spain, Provence, and Italy through translations of philosophical texts from Arabic into Hebrew, philosophic-scientific encyclopedias, summaries and paraphrases of philosophical texts, and philosophical commentaries on the Bible that implemented Maimonides' hermeneutical principles. Demographic and political changes shifted Jewish life from Islam to Christendom, but Jewish thinkers perpetuated the terminology, themes, authoritative texts, and outlook of the Judeo-Arabic philosophical tradition. Jewish philosophical ethics was now composed in a Christian environment and written exclusively in Hebrew. Jewish thinkers helped to translate the Aristotelian corpus from Arabic and Hebrew into Latin, but, in turn, Aristotelian scholasticism would shape the Jewish-Christian intellectual and religious encounter. Whereas in Islam philosophic ethics generated political theories about the ideal regime necessary for the attainment of happiness, in the Christian West, philosophical ethics was configured in the context of the interreligious debate about the salvation of the individual soul, a contested terrain between Judaism and Christianity.

Shem Tov Falaquera (d. 1290) in Christian Spain illustrates the transition of Judeo-Islamic philosophic tradition to the new Christian milieu (Jospe 1988). Falaquera's *Reshit Hokhmah* (*Beginning of Wisdom*) was based on al-Fārābī's

Enumeration of the Sciences, and it illustrated how philosophic knowledge constitutes human happiness: through the study of philosophy, one could acquire correct knowledge about the world and the proper ways to conduct oneself in the world. Falaquera, who was familiar with Aristotle's *Ethics*, radicalizes the legacy of Maimonides by clarifying that moral perfection in itself does *not* constitute the ultimate end of human life. The ultimate end of human life is contemplation of necessary truths, culminating in the knowledge of God. Taking his cue from the philosophical elitism of Ibn Bājja, Falaquera (even more than Maimonides) highlights the alienation of the philosopher, who devotes his life to the contemplation of truth, and the uneducated masses who pursue imaginary happiness. Falaquera proposed asceticism conflict with the political nature of humans, emphasized by Plato, Aristotle, al-Fārābī, and Maimonides, and even calls into question the need of humans to propagate the species through sex. Since female sexuality is one of the major detriments to philosophic happiness, Falaquera's book is replete with misogynist comments (Jospe 1986). In general, Jewish Aristotelian philosophers excluded women from the attainment of intellectual perfection and the blissful joy of the world-to-come.

The philosophic ethos was not only a cultural posture; it also affected the interpretation of Scripture as the followers of Maimonides applied his general hermeneutical principles to the interpretation of Scripture. One such example was the Provençal thinker Joseph ibn Kaspi (d. c. 1335) whose knowledge of Aristotle's *Ethics* was derived not only from Arabic summaries of the text, as was the case of Falaquera, but also from Averroes' *Middle Commentary on the Ethics*, which was now available in a Hebrew translation by Samuel ben Judah of Marseilles (Berman 1967), who also translated Plato's *Republic* into Hebrew. The availability of these two texts in Hebrew during the 1320s would change the course of Jewish ethical discourse. Ibn Kaspi summarized this rather cumbersome translation in his *Terumat ha-Kesef* (*Offering of Silver*) in addition to a digest of Aristotle's *Ethics* (Mesch 1975). He regarded the *Ethics* as a practical guide

for the urbane, philosophically sophisticated Jews who wished to harmonize rabbinic Judaism and philosophy. Entitled *Yoreh Deah (Teacher of Morals)*, Ibn Kaspi's "ethical will" to his son, Solomon, is a kind of Jewish *adab* literature (Abrahams 1954 [1926]). Referring to *Adab al-Falāsifa* of Ishāq b. Ḥunayn and to Aristotle's *Ethics*, Ibn Kaspi claims that the Torah itself (both Written and Oral), if interpreted correctly with the help of Maimonides' *Guide* and Aristotle's works (especially *Physics*, *Metaphysics*, and the *Ethics*), enables one's soul to experience the world-to-come, the *summum bonum* (*ha-tov ha-shalem*). The very commandments of the Torah perfect the practical and theoretical aspects of the soul, leading one to eternal life. For Ibn Kaspi, then, there is no tension whatsoever between Aristotle's *Ethics* and the Torah, because "the Greek philosopher lived during the Second Temple, and he learned from the Jewish Sages all the true things that he wrote" (Abrahams 1954 [1926]: 133). In fact, Aristotle "had presumed to interpret our precious truths, attributing the exposition to himself, while he stole it all from the books written on the subject by King Solomon and others" (Abrahams 1954: 141).

An even more profound and extensive engagement with Aristotle's *Ethics* was articulated by Levi ben Gershom (Gersonides), the most original Jewish philosopher whose astronomical expertise brought him to be associated with the Papal court in Avignon during the 1320s. A scientist who was at the forefront of the study of mathematical astronomy as well as a serious practitioner of astrology, Gersonides construed ethics as "a necessary human response to the randomness of this reality through new form of reading the Bible" (Green 2016: 9). His biblical commentaries, composed after 1328, are derived from the biblical texts practical and useful "lessons" (*toalot*) and showed how the character of biblical narratives exemplifies specific virtues. Thus, the practical virtue of diligence (*haritzut*) is illustrated in the conduct of the patriarch Abraham (Horwitz 1997), and the practical virtue of endeavor (*hishtadlut*) is demonstrated in the conduct of several biblical characters: Isaac's endeavor to bless Esau, Rebecca's attempt to ensure that her son Jacob

will be blessed, Joseph's endeavor to bring his father and family to Egypt, and Miriam's attempt to save her brother Moses. What is novel about Gersonides's ethics is the attempt to root moral perfection in physical perfection, that is, to provide a biological (i.e., scientific) explanation to moral conduct (Gaziel 2008). Gersonides went beyond Maimonides' *Eight Chapters*, by highlighting a "new layer of virtues such as *hishtadlut* (endeavor), *haritzut* (diligence), and *hitkhakmut* (cunning) in certain strategems which are focused on creating the material strength necessary to overcome the random whims of fortune. None of these virtues claims to know or change the decree of the stars with human force, but through physical and material strength one can strive to evade or withstand its impact" (Green 2016: 33). Ethics was thus another expression of Gersonides' rationalist worldview.

Although Jewish philosophers became more familiar with Aristotle's *Ethics* in the early fourteenth century, the science of ethics remained secondary in importance to physics and metaphysics for the following reasons. First, with respect to ethics, there was little conflict between traditional Judaism and philosophy; they both shared the pursuit of wisdom, the ethos of self-control, and the ideal of moderation. The main challenge of Aristotelianism lay in physics and metaphysics, and for this reason, Jewish philosophers devoted their attention to these sciences. Second, in the Aristotelian schema of the sciences, "practical philosophy" was secondary in importance to "theoretical philosophy," and ethics was viewed either as the preparatory acquisition of the virtues or as the application of theoretical knowledge to social reality. And third, in Judaism, the praxis of religious life was determined by *halakhah*. The Jewish philosophers lived by the strictures of Jewish law but after Maimonides none of them made a significant contribution to the study of *halakhah*. The science of ethics was thus absorbed into philosophy of law, rather than viewed as an independent science that charts its own praxis.

During the fifteenth and sixteenth centuries, Aristotle's *Nicomachean Ethics* began to engage

Jewish philosophers more than ever before. In 1405, the *Ethics* was translated anew into Hebrew by Rabbi Meir Alguades, the Chief Rabbi of Castilian Jewry and a personal physician to several Castilian kings. He consulted not the Arabic original of Averroes' *Middle Commentary* but also the Latin translation by Hermann the German, which had been composed in 1240 and was the standard version among Christian scholastics, the original translation of Samuel ben Judah and another anonymous translation, which was ascribed not to al-Fārābī, the actual author, but to Thomas Aquinas (Berman 1978, 1988). Thus, by the early fifteenth century, the *Ethics* was available in Hebrew in a hybrid text that fused elements from Ibn Rushd, al-Fārābī, and Aquinas, and this Hebrew translation generated new Hebrew commentaries by Joseph ibn Shem Tov in the 1440s (Regev 1983). He composed a short commentary, a summary on *Ethics*, and eventually a long commentary. On the basis of these studies, he was able to compose *Kevod Elohim (The Glory of God)*, a systematic attempt to prove that Aristotle's ethics and Judaism were perfectly compatible (Ibn Shem Tov 1556). As a financier in the court of King Enrique IV, Ibn Shem Tov was familiar with Latin commentaries on the *Ethics* and with the function of the *Ethics* as a guide to right conduct among the governing elite. Like the authors of the *adab* literature in Islam, who were interested in the *Ethics* because it showed how to wed wisdom and politics, Ibn Shem Tov appreciated the relevance of the *Ethics* to his own life at the court. Although by the 1440s the Jewish courtiers lost their political power in Spain, the *Ethics* could still provide them with ideological justification to their elitist self-perception (Tirosh-Rothschild 1998: 212–224).

For Ibn Shem Tov, the *Ethics* is to be read as a recommendation for the social-moral life. What Aristotle says about human happiness (both practical and theoretical aspects) pertains merely to temporal life in this world, because as a pagan, he did not have access to the revelation of Scriptures. Jews should consult Aristotle if they wish to know how to conduct themselves in this world, especially, if they wish to hold their position in the court. Aristotle was correct to state that human happiness does not lie in the acquisition of wealth,

power, honor, fame, or bodily pleasures, as most people assume, but in an activity of the soul in accordance to virtue. He was also correct to subordinate the moral virtues to the intellectual ones and to place speculative reason above practical reason. But most important, Aristotle was right when he emphasized that only the knowledge of God constitutes ultimate happiness. Through the contemplation of God, man lives not only human life, but the "divine life which is the most happy."

Taking his cue from Thomas Aquinas' commentary on the *Ethics*, Ibn Shem Tov argues that Aristotle spoke only about temporal, imperfect happiness in this world, which is *not* the ultimate end of human life. The ultimate felicity or perfect happiness is to be found only in the afterlife and is only attainable by following the Torah. The distinction between two orders of happiness – an imperfect, natural, and temporal happiness and a perfect, supernatural, and eternal happiness correspond to the distinction between the natural and the supernatural, between philosophy and revealed knowledge, between conventional law and divine law, and between reason and faith. This outlook was shared by most Jewish thinkers in the second half of the fifteenth century, giving Jewish philosophy a much more traditional bent.

Alguades' new translation of the *Ethics* together with Ibn Shem Tov's commentary became the standard text among Sephardic Jewish intellectuals in the late fifteenth and throughout the sixteenth centuries. Isaac Arama (d. c. 1492), for example, used it extensively and adopted Ibn Shem Tov's views (Septimus 1999). Like Ibn Shem Tov and Aquinas, Arama also distinguished between two orders of happiness – temporal and transcendent. With great respect for the practical reasoning of the *Ethics*, Arama attempted to show that the moral teachings of the Torah were compatible with it. Whether the Torah is "this-worldly" or "other-worldly" was one of the bones of contention in the Jewish-Christian polemics. Arama was involved in various polemical exchanges, and he reports a debate with a Christian preacher in which Arama used the practical reasoning of the Torah as a claim for its superiority over the Christian doctrine of grace. In the fifteenth century, the *Ethics* was commonly

used by Jewish philosophers who viewed it either as response of practical wisdom, useful especially for the ruling classes, or as a text that showed the compatibility of rational knowledge and religious faith or as support against Christian polemicists. In the last decade of the fifteenth century, another Hebrew translation of the *Ethics* with a commentary was composed by Baruch ibn Ya'ish, indicating not only the continued Jewish interest in the ethics but also familiarity with new humanists' translations of the *Ethics* (Tirosh-Samuelson 2003: 423).

The Italian humanists translated the *Ethics* anew and composed new commentaries, comparing Aristotle's analysis of human well-being with post-Aristotelian moral philosophies, especially Stoicism and Epicureanism (Trinkaus 1965, 1970). In 1416–1417, Leonardo Bruni composed a new Latin translation to the translation of Robert Grosseteste's text, and in 1457, the Byzantine humanist, Johannes Argyropoulos, translated the *Ethics* into Latin from the Greek original. The humanists in Italy were obsessed with the meaning and purpose of human life, perhaps because they did not belong to any existing social institution or more personally, because of the precariousness of the tumultuous politics of Italian city-states in the fifteenth century. The basic insecurity of the humanists led them to adopt Stoic themes and postures toward the vicissitudes of life. The humanist discourse on happiness has a noticeable pessimistic strain and “snobbish aloofness” even when it is expressed by people who were successful in politics and quite wealth. The Stoics' emphasis on virtue as the only good, their rejection of external goods, and the counsel of apathy were easily combined with Christian values and postures. The *Ethics* continued to inspire European translations into vernacular languages as well. It was translated into Italian by Bernardo Segni (1504–1558), and in the 1540s and 1550s, the Italian Benedictine scholar, Joachim Perion, an avowed Ciceronian, translated the *Ethics* once more into Italian, provoking much criticism from other humanists. His translation led to yet another Italian translation published in Venice in 1558 and later in Paris by the French humanist Denys Lambin (Lines 2013; Miller 2012).

Jewish intellectuals in Italy were fully aware of the humanist movement and in some cases contributed to it by teaching leading humanists and introducing them to Jewish and Muslim philosophical sources and to kabbalah, the Jewish mystical tradition (Idel 1983). Yohanan Alemanno (d. 1504) is an example of a Jewish humanist who embraces the new cultural sensibilities and involves himself in the expansion of the discourse on happiness. His *Song of Solomon Virtues* was composed as the introduction to his commentary on the Song of Songs entitled *Hesheq Shelomo* (*The Desire of Solomon*) at the request of Pico della Mirandola in 1488–1489. The biblical king was considered the author of the Song of Songs, which the medieval scholars (Jewish and Christians) largely interpreted as an allegorical text about the progression of the soul, culminating in the mystical union with the Active Intellect or with Christ. Pico was interested in the Song of Song as a guide for the attainment of intellectual perfection in this life. Alemanno translated for Pico the commentary of Moses Narboni on Ibn Ṭufayl's *Hai ibn Yaqzan* and composed his own commentary on the Song of Songs to help Pico better grasp the meaning of the allegorical text.

Alemanno composed the *Song of Solomon's Virtues* to present a Jewish alternative to Renaissance Platonism (Lesley 1976). He believed that a proper exposition of Solomon's successful attainment of perfection would inspire other Jews to follow the rigorous but not impossible program to achieve perfection within the boundaries of Jewish life. As a biography of an illustrious historical persona, it was also in accord with the humanist attempt to draw lessons from history. To instruct Jews of his time how to attain perfection in this life, Alemanno composed the detailed analysis of King Solomon's virtues and achievements, culminating in conjunctions with God, or more precisely with the six Sefirah, Tife'eret, the center of the Sefirot that emanated from God. Combining Aristotle analysis of the virtues in the *Ethics* with post-Aristotelian treatment of the Roman rhetoricians, especially Cicero, Alemanno articulates an elaborate analysis of human virtues and the requisite knowledge that enables one to acquire the virtues. The virtues, the arts, and the

sciences are all arranged in an architectonic order from the lowest to the highest. This structure comprises a “ladder of perfections” that Solomon himself ascended and which the reader is invited to imitate.

The impact of humanism on Jewish thought was evident not only in Italy but also in the Ottoman Empire where Jewish refugees from Iberia reconstituted Jewish cultural life and consolidated the medieval intellectual heritage. This community absorbed individuals who for decades lived as Crypto-Jews under the watchful eye of the Inquisition. When these ex-conversos joined the Jewish fold, they introduced their coreligionists to university learning in which Aristotle’s *Ethics* was paramount. The most important contribution to Jewish ethics in the sixteenth century was made by Moses Almosnino (d. c. 1581), a teacher, preacher, judge, and communal leader in Salonica (Bnaya 1996). His new commentary on the *Ethics*, *Peney Moshe* (*The Countenance of Moses*), shows intimate familiarity with a long list of Christian commentaries on the *Ethics* by Eustratius, Albert the Great, Thomas Aquinas, Gerald Odonis, John Buridan, Walter Burley, Faber Stapulensis, Jacobus (Jacques Lefvred’Etaples), and Agostino Nifo. Relying on these commentaries is indicative not only of the breadth of Almosnino’s knowledge but also of the continued interest in Aristotle’s work during the sixteenth century.

Like other humanist scholars, Almosnino devoted much effort to determine the correct text of Aristotle’s *Ethics* by comparing the textual variants at his disposal (Tirosch-Samuels 2003: 426–438). Yet the main contribution of *Peney Moshe* lies not in philological observations but in the attempt to anchor the *Ethics* in the Bible and rabbinic literature while disseminating an ethics derived from late scholastic commentaries. The commentary on the *Ethics* enabled Almosnino to preach and teach that moral perfection for Jews could not come except through a unique blend of philosophy and faith. The teaching of Aristotle, so Almosnino argued, is best exemplified by the moral teachings of King

David and King Solomon, recorded in Psalms, Proverbs, and Ecclesiastes as interpreted by the rabbinic sages. Like Alemanno, Almosnino portrays King Solomon as the embodiment of the Renaissance ideal *homo universalis*, the wisest of all ancient sages, and claims that the religious poetry of King David compares favorably to Greek and Roman poetry. The very attempt to prove that the Bible equals the aesthetic, moral, and intellectual achievements of the ancients necessitates a rereading of Scripture against this background of humanist culture. The result was a distinct Jewish moral philosophy that fused Jewish, Aristotelian, Platonic, and Stoic elements. In the ancient Jewish sources, Almosnino rediscovered the humanist emphasis on the dignity and worth of the human personality, the primacy of the human will, and the striving for personal immortality through cultivation of moral virtues. As much as intense suffering made the Iberian Jews receptive to the humanist emphasis on human emotions and passions, so did the Bible provide them with evidence that the virtuous man who lives by the Torah is able to transcend the limitations of this world.

In regard to the moral virtues, Almosnino takes a different approach than Maimonides and his Greek source, Aristotle. For Almosnino, the moral life is not only a means to an end but the very core of religious life in this world. The moral life that is guided by practical reason is informed by values of religious tradition. By imitating divine perfections revealed in the Torah, the devotee can acquire the moral virtues and attain the necessary self-spiritualization that leads to *devequt* in this world and eternal life after death. Moreover, for Almosnino, the moral life of action is the very arena where one manifests the perfection of the will and the total devotion to God. Hence, the highest virtue in this life is not the intellectual virtue of philosophical wisdom but rather the virtue of prudence. Such an approach is closer to the Christian understanding of the moral life than to Maimonides’. Unlike Maimonides, Almosnino views love as the perfection of the will and, therefore, the perfection of practical

reason. The love of God belongs to the realm or praxis (*ma'aseh*) rather than theoria (*iyyun*). The ultimate end of human life is the love of God, a love of the honorable that enables the human will to resist the passions. It is through the love of God that one attains the perfection of all virtues in this world and for which one is rewarded with eternal life. The love of God is everlasting and inexhaustible because it is an unconditional love. Love is not communication between two perfect intellects but love of the infinite details of the beloved. Only a perfect will that can discern the infinite variations of particulars can love God, the most perfect will, unconditionally. Those who unconditionally love the Torah, the manifestations of God's infinite love, love God and enjoy everlasting salvation.

Almosnino's religious ethics was expressed didactically in his *Regimento de la vida* (*Sefer Hanahagat Ha-Hayyim; The Book of the Regimen of Living*), which he composed in Spanish with a Hebrew introduction for the instruction of his nephew (Zemke 2004). Moral, intellectual, and religious training, which lead to human well-being, must begin at a young age since the disciplined acquisition of virtues liberates the soul from its corporeal conditioning, restoring it to its heavenly abode. The book was most popular in the community of ex-conversos in Amsterdam and was printed in Latin characters in 1729. But it was in this very community that medieval Jewish philosophical ethics encountered the most devastating critique when Spinoza (d. 1677) challenged the identification of Torah and Wisdom that undergirded the entire discourse. His ethical theory is deeply rooted in medieval philosophy (Jewish as well as Christian) but also resonates with Stoic teachings that enjoyed significant revival during the sixteenth century.

With Spinoza, the premodern discourse on virtue and happiness within the Jewish religious tradition reaches closure. Although the discourse changed over time in accordance with Judaism's interaction with surrounding civilizations, the discourse perpetuated certain themes. Jewish approach to happiness has much in common with Aristotle's view since both Jews and the

Greek philosophers agree that happiness is predicated on the cultivation of virtues and the attainment of knowledge. At the core of the Jewish conception of happiness is the identification of Torah and Wisdom, which entails that Jews pursue wisdom as part of their loyalty to God. As Jews encounter philosophy and its related sciences in medieval Islam, they expand the category of "wisdom" and devise new courses of study for the education of the virtuous person. These changes provoked debates about the curriculum and generated the rise of alternatives to rationalist philosophy – kabbalah. Yet both philosophy and kabbalah agree that the ultimate end of life pertains to the soul and that it can be experienced fully only in the afterlife. Since focus on the salvation of the soul was also the bone of contention between Jews and Christians and the cause of much of Jewish suffering in the late Middle Ages, the debate on happiness shaped the interaction between the two monotheistic religions, even though Jewish intellectuals expressed themselves in terms borrowed from their cultural environment. Aristotle's *Ethics*, the major text that analyzed virtue and happiness, provided the conceptual vocabulary for reflections on virtue and happiness in the matrix of the Jewish religion.

Eustratios of Nicaea

Katerina Ierodiakonou

Department of Philosophy and History of

Science, University of Athens, Athens, Greece

Department of Philosophy, University of Geneva,
Geneva, Switzerland

Abstract

Eustratios of Nicaea was an extremely erudite Byzantine scholar who produced commentaries on Aristotle's ethical and logical treatises. He seems to have belonged to the intellectual circle of Anna Komnene in the 1120s/1130s. His works, in which he followed ancient commentaries, some of which are now lost, but also added his own remarks, were particularly instrumental in the transmission and rediscovery of Aristotelian thought in the Latin West.

Biography

Eustratios was born in c. 1050 and died in c. 1120. He was a pupil of John Italos, but during his master's trial in 1082, he managed together with some other pupils of Italos to convince the synod of their innocence and signed a letter in which they anathematized Italos' heretical doctrines. At the time, Eustratios was merely a deacon, but he soon became the Metropolitan of Nicaea. He was also asked by the emperor Alexios I to participate in various theological debates with the Latin Church and with the Armenians (or Monophysites), until he himself was finally condemned for heresy in 1117. The reasons for his condemnation are a rather complicated matter involving both theological and political issues, but the main charge against him was his sharp distinction between the divine Logos and Christ incarnated, a distinction which presented Christ as less than equal to his Father. In this connection, it is also important to note that Eustratios, just

like his teacher Italos, was famous for his strong conviction of the propriety of using Aristotle's syllogistic in theology; he even stated that Christ himself had argued with the help of Aristotelian syllogisms. Indeed, Eustratios tried in his theological treatises to prove the truth of Christian dogmas by using logical arguments, which often take the form of a series of standard syllogisms of the three Aristotelian figures or of Stoic indemonstrable arguments. The titles of two of these treatises are indicative: *Syllogistical demonstration of how to honor and worship the holy icons* and *Refutation of those who claim that Christ has one nature, on the basis of logical, physical and theological arguments*. Thus, he was forced to abdicate but was rehabilitated after his death and cited as an authority at the council of 1157. Most probably, during the years of his theological disgrace, Eustratios took part in Anna Komnene's project for the revival of Aristotelian scholarship and produced his exegetical works. Anna Komnene in the *Alexiad* (14.8), the history she wrote of the events during the reign of her father Alexios I (1081–1118), presents Eustratios as an extremely erudite scholar both of religious and of secular literature as well as a master of dialectic.

Thought

What we have of his work as a commentator are his comments on the first and sixth book of the *Nicomachean Ethics* and his commentary on the second book of the *Posterior Analytics*, all of which are in the tradition of the large exegetical commentaries of Late Antiquity. It may be that in the case of the *Nicomachean Ethics* the reason why he chose to comment on these particular books was that the rest of Aristotle's ethical treatise had been commented on or was commissioned to be commented on by Michael of Ephesus and other anonymous commentators. It is not clear, however, why Eustratios chose to comment only on the second book of the *Posterior Analytics*, especially since it seems that the

whole of Alexander of Aphrodisias' commentary was still accessible. The comments on the *Nicomachean Ethics* were translated in the thirteenth century by Robert Grosseteste and became very influential in the West through the agency of Albert the Great.

In interpreting Aristotle's works, Eustratios followed the Neoplatonic philosophers, though at certain places he advocated theses which slightly deviated from those of all ancient philosophers and tried to be more in close agreement with his Christian beliefs. For instance, concerning the issue of the knowledge of first principles, Eustratios' view differs both from what Plato and the Platonists standardly held about the knowledge of the Ideas as well as from what Aristotle said about the understanding of first principles. Commenting on *Posterior Analytics* 2.19, Eustratios started his account in a clearly Neoplatonic manner, by claiming that, since in the hierarchy of beings the soul comes right after the intellect, it participates more than anything else in what the intellect grasps, and thus the common and self-evident notions which it possesses, are nothing but resonances of what the intellect grasps. But in what follows he did not defend the view that the human soul regains pieces of knowledge which it possessed at some former time nor that it has only potential knowledge which then becomes actual. On the contrary, he argued that the human soul has full knowledge of the principles, the common, self-evident concepts, already when we are born, but that this knowledge is obscured by our bodily impulses. It is only when our soul is guided either by our sense perceptions or by appropriate teaching that the common and self-evident notions come forth, so that we, as it were, wake up and can immediately assent to the first principles. There should be no doubt that Eustratios is influenced here by Neoplatonic views, which he tried to integrate into his Christian outlook. For the human soul, according to the Christian doctrine, when created by God, is created with all the knowledge it needs. If human beings lose sight of the knowledge and understanding which their soul possesses, it is only because they are susceptible to and overwhelmed by the impulses generated by their body. On the

other hand, if human beings manage to purify themselves from the bodily passions, they can come to have knowledge of the ultimate truth.

Concerning the problem of universals, Eustratios, just like his teacher Italos and many other Byzantine philosophers, defended the Neoplatonists' theory according to which universals exist in three modes; namely, they exist as universals "before the many (particulars)" in God's mind, as universals "in the particulars" within perceptible individuals, and finally as universals "after the particulars" in the form of concepts acquired by our mind by abstraction of the common characteristics of perceptible individuals. Joannou and more recently Lloyd have presented Eustratios as following Italos in being a nominalist, i.e., in adhering to the position that universals are mere names stripped of all reality and existing only in the human mind. However, on Giocarinis' view Eustratios should not be regarded as a nominalist, since he follows the Platonic tradition which treats the universals before the particulars as the thoughts of Intelligence, and thus they enjoy actual existence; as to the other types of universals, they are solely *in intellectu* as bare concepts or thoughts, which are not acquired by abstraction but the human mind possesses them right from the beginning. Finally, Benakis has labeled Eustratios' position on universals conceptual or moderate realism and stressed that it is not a nominalist position, since even the a posteriori status of the universals after the particulars does not alter the fact that they do exist.

In this context, Eustratios' account of the distinction between *gene* and *eide* is pertinent. According to Eustratios, *gene* do not subsist (*anupostata*), whereas *eide* can be said to subsist; for since *eide* come right after the particulars while *gene* come after *eide*, *gene* are mere concepts or thoughts (*ennoemata*), and have only a faint resemblance to perceptible individuals, whereas *eide*, as soon as matter is added to them, actually subsist in perceptible individuals. In fact, Eustratios recognized three different senses of *eidōs*: it can be understood either as a species, as a form common to many perceptible individuals, or finally as the form in a specific

individual. Hence, when Eustratios draws a distinction between *gene* and *eide* as having different ontological status, he thought of *eide* not as species, because *eide* as species are, just like *gene*, mere concepts or thoughts which do not subsist; he rather thought of an *eidos* understood either as a form common to many perceptible individuals or as the form in a specific individual, and it is in these two senses that *eide* are said to subsist insofar as they subsist in the perceptible individuals. Against Plato, therefore, he would object that *eide* do not have separate existence outside the divine mind, while against Aristotle, he would object that *gene* and *eide*, understood as species, are not even secondary substances. In fact, Eustratios uses every chance to stress, in his commentaries as well as in his theological treatises, that God's thoughts and the particulars are substances (*hupostaseis*) and exist per se, whereas what the human mind acquires by abstraction from the common characteristics of perceptible individuals either merely subsists or does not even subsist.

al-Fārābī, Abū Naṣr

Philippe Vallat
IFPO-Damascus, IFPO Abu Rumaneh,
Damascus, Syria

Abstract

Abū Naṣr al-Fārābī, known in the Latin West as Alfarabius or Avenasar, is one of the most influential thinkers in the history of Arabic philosophy. Most of his preserved works are introductions to, and abridged or lemmatic commentaries on, Aristotle's logics. The interpretation of the *Organon*, from the *Categories* to the *Posterior Analytics* and from the latter to the *Poetics*, forms in his view a curriculum consisting of a twofold system of science, each part of which he respectively assimilates to the climbing out of Plato's Cave and to the return. Philosophy is the Whole in which Aristotelian science is ordained toward the political end assigned to philosophy by Plato.

Biographical Information

One biographer, Ibn Khallikān (d. 1282) tells us that Abū Naṣr al-Fārābī lived 80 years. There is no other information to confirm his date of birth. Based on his *nisba*, the most likely place of origin of his family is in the district of Fārāb in Transoxiana (Turkestan), in the small town of Vastj, as

Ibn Ḥawqal (d. after 967) claims, or in the town of Fārāb which gave its name to the district. Judging by his *Political Regime* 103, and *Grand Book on Music* 57–58, he was neither of Turkish nor of Arab descent, but most probably Persian.

The date and place of his death are better known. According to Mas'ūdī (d. 956), he died in Damascus, in Rajab 339 (December 950–January 951). Šā'id al-Andalusī (d. 1070) adds that he died there under the protection (*kanaf*) of Sayf al-Dawla (r. 945–967), although *kanaf* means a form of tutelary authority which Sayf al-Dawla, the Hamdanid Emir of northern Syria (Aleppo, Diyar Mudar, Diyar Bakr), never had upon Damascus. Nonetheless, some notes in the manuscripts of al-Fārābī's *Perfect State* inform us that he left Baghdad and went to Syria in 942, possibly to Aleppo, his presence there being recorded by an undated dedication of a commentary to one of his students. According to the same notes, he was already in Damascus in 943 and there completed the *Perfect State*, before going to Egypt (between July 948 and June 949) and returning to Damascus, hardly leaving any time for an acquaintance with the Emir.

From the semiautobiographical relation of his curriculum preserved by Ibn Abī Uṣaybi'a (d. c. 1269), we can infer: first, that al-Fārābī was taught logic in Baghdad by the Christian Abū Bishr Mattā ibn Yūnus (d. 940) from Porphyry's *Isagoge* to the *Prior Analytics*, I, 7; second, that al-Fārābī broke away from him, apparently accusing him and Christians in general

of observing a clerical ban on teaching beyond *Prior An.*, I, 7, that is, from I, 8 to the end of the *Posterior Analytics*, although Mattā is known to have translated it. Al-Fārābī's account of his curriculum seems to echo a rivalry between the two men, later to be interpreted ideologically, like other related texts, as a religious quarrel between Christian and Muslim scholars. Indeed, al-Fārābī says he was taught logic till the end of *Posterior Analytics* by another Christian, Yūḥannā b. Ḥaylān. This apparent inconsistency might be explained if al-Fārābī applied to himself what he says about the rest of the curriculum, beyond *Prior Analytics*, I, 7, that is, that, despite the ban, it was still studied among Christians albeit covertly. In his view, Ibn Ḥaylān may have been a representative of this tradition. In any case, this supposition is in accordance with Fārābī's main intention in this text, to present himself as the heir of an unbroken chain of teaching from Alexandria to Baghdad. In this regard, J. Watt has shown that there were two trends within the Syriac commentary tradition: one which indeed restricted the logical training to the first part of the *Organon*, terminating at *Prior Analytics*, I, 7, but which had deep roots in the ancient world; and the other represented by the "Syriac writers who were proficient in Greek" and who "adhered throughout to the other strand of this two-strand tradition, that of the full *Organon*." In al-Fārābī's view, Ibn Ḥaylān probably belonged to the latter.

We cannot know for certain where and when he studied with Ibn Ḥaylān, or where he taught his foremost pupil, the Christian Yahyā ibn 'Adī (d. 974). Similarly, it is hard to determine if al-Fārābī succeeded Mattā at the head of a school in Baghdad, before moving to Syria and whether he taught in a *scholē* or in one or more private schools.

In his *Grand Book on Music*, 58, dedicated to Vizier Abū Ja'far al-Karkhī (June–August 936), al-Fārābī states that he was in relation with Greeks who were not Byzantine Christians, but "pure" or "faithful" Greeks whose musical practice he refers to as being akin to the one systematized by "the Ancient Greeks" in their books on musical theory. They lived in a "land" "in the vicinity" of the Empire of the Arabs to which many were

emigrating. Whatever the bearing of this information on the history of Hellenism, al-Fārābī claims he was acquainted with some "faithful Greeks" living somewhere along a border region where pagan culture was still alive. In northern Mesopotamia, Ḥarrān, which enjoyed some autonomy in the first half of the tenth century, seems a likely candidate. Apart from al-Mas'ūdī's (d. 956) other accounts of the traces of pagan intellectual life in Ḥarrān, this is further evidence of the relationship between *falsafa* and a persistent form of pagan culture.

His *Grand Book on Music* being a well-known work of maturity composed in Baghdad, the general absence of information concerning al-Fārābī's teaching activities during his time there is puzzling.

Works and Influence

Al-Fārābī, who did not have any Greek, worked as a commentator and teacher. As such, he was indebted to Alexander of Aphrodisias, Themistius, and the members of the Neoplatonic School of Alexandria (sixth century) and probably to Simplicius, that is, to the commentators of Aristotle known in Arabic. He claimed to be heir to the Alexandrian scientific curriculum, the Aristotelian part of which he, along with his Christian colleagues from the "School of Baghdad" (tenth to eleventh century), contributed to reestablish, before the tradition of commentaries on Aristotle was revived in Andalusia by Avempace (Ibn Bājja, d. 1139) and Averroes (Ibn Rushd, 1126–1198), followed by Jewish and Latin philosophers. In fact, the religiously indifferent Saracen philosopher staged by Peter Abelard in his *Dialogue of a Philosopher with a Jew and a Christian* may have been Avempace whose sole declared master was al-Fārābī.

Though he wrote commentaries on Plato's *Laws*, Euclid's *Elements*, and Ptolemy's *Almagest*, al-Fārābī mainly devoted himself to the interpretation of the Aristotelian treatises on logic and physics. According to the known lists of his works, he composed long or lemmatic, as well as brief or paraphrastic, commentaries on all

the treatises of the *Organon*, most of the longer ones being lost. As for the physical treatises, he commented upon the *Physics*, *On the Heavens and the Universe*, *On Generation and Corruption*, *Meteorology*, and perhaps upon the *De anima*. All of them are apparently lost. He also wrote on specific themes from the *Physics*: *On the Void*, *On the Divisible and the Indivisible*, *On Finite and Infinite Power*, *That the Movement of the Spheres Is Eternal* and *On Changing Beings* – of which only the first has been preserved. The titles of these works and what we learn from those that were preserved show that he never departed from the Greek view that the world is eternal. He was opposed to the philosophical and theological trend of thought originating in John Philoponus' *Against Aristotle* and *Against Proclus on the Eternity of the World*. His refutation of the former has been preserved. His commentary on *Physics VIII* also seems to have been preserved, albeit in a Latin translation, that remains to be edited and studied. Apart from the previously known Latin translations of a few treatises, that is, *De intellectu*, *De scientiis*, *Liber exercitationis ad viam felicitatis* – the first two having significantly influenced Latin Scholasticism – other works may have been translated and therefore made available to Albert the Great, such as the paraphrase of, and possibly also the long commentary on Aristotle's *Posterior Analytics*. In the same way, excerpts from al-Fārābī's masterpieces, the *Political Regime* and the *Perfect State*, may have been known in Latin. A long sentence common to these works is often quoted by Latin authors.

Al-Fārābī's allegedly deeper influence on Arabic-speaking philosophers is paradoxically difficult to assess. Although Avicenna (Ibn Sīnā: 980–1037), Avempace, Averroes, Maimonides (1135–1204), and a few others knew his works and held him in high esteem, the fact remains that most of his writings rapidly failed to be copied, and therefore read. That some texts were ultimately preserved can most probably be attributed to Avicenna's deference to him and the respect paid to Avicenna's philosophical achievements by numerous philosophers, especially in the East of the Islamic world. Apart from the philosophers mentioned above, al-Fārābī's writings were

attacked and emended early on. Avempace's urge to defend him against allegations of being a heretic is what informs us of the widespread accusations started by the Persian theologian al-Ġazālī (1058–1111).

Furthermore, there is proof of the emendation of al-Fārābī's thought. A few decades only after his death, Miskawayh (936–1030), a Muslim polymath directly acquainted with some of his genuine works, ascribed to him a sort of social climber's guide to life at Court. The text, a pastiche of al-Fārābī's style, predicates the prevailing community opinion as a criterion of truth, when compliance with popular opinion is what al-Fārābī's philosophy emphatically denies. This bowdlerization of his thought did not stop at Miskawayh.

Thought

The Hierarchical Structure of Being

From the Ptolemaic geocentric cosmology, al-Fārābī elaborated a standard onto-cosmology which was later adopted to varying degrees. Here are its tenets.

Being eternally emanates from the First Principle. In the same way that a productive act necessarily follows from any immaterial substance in actuality, this emanation process is inherent to its substance, therefore does not proceed from deliberation nor is aimed at an extrinsic end. Each of the ten secondary Intellects emanates from the First through the one immediately superior to it. They are self-subsistent substances, coeternal with the First. The tenth Intellect is the Active Intellect which constitutes the formal, efficient, final and exemplar separated cause of human intellects and the agent of their preservation in being if they succeed in becoming free of matter.

The being of each of the celestial spheres emanates from each Intellect independently. Their soul is not enmattered. Each one has a specific substrate. There is no fifth element common to all of them. The upper sphere impresses on them a common movement from which the *prima materia* proceeds eternally. Through their differentiated movements with regard to one another

and to *materia*, the four elements and qualities of the sublunary world are brought forth, set in motion, and combined to make up sensible substances. The paradigm of this combination is provided by the Active Intellect which aims, as a final cause, to foreordain the physical influences exerted by the celestial bodies so that the sublunary species can emerge from these influences. Thus, the spheres themselves do not take part in a plan, but through their influence are ordained to bring about a goal which they ignore. Given that each one acts autonomously, regardless of others and of the providence exercised by the Active Intellect toward human intellects, their respective physical influence may come into conflict with each other and with the Active Intellect's activity. As a result, various contingencies affect the sublunary world.

The System of Science

According to al-Fārābī, philosophy is a concordant reading of Plato and Aristotle. In his system, the Neoplatonized Aristotle weighs heavier than Plato. However, the type of Neoplatonism he elaborates from the translated material at his disposal is unique. Though he declares Aristotle to be his Master, which he undeniably was, the claim needs to be refined.

With Aristotle, he shares the conviction that philosophy is what man can know through his own natural ability and an uncompromisingly rational method presented in the *Posterior Analytics*. "Philosophy" even comes to specifically signify the demonstrative science obtained through this method, that is, primarily the first philosophy or metaphysics. For, strictly speaking, and in conformity with the Neoplatonic understanding of "metaphysics," only that which is *beyond* nature and is free from matter can demonstratively be known. With Alexander of Aphrodisias, he shares the view that the human soul is a mixture of the four elements and as such is corruptible. Though given by the Active Intellect, human reason is at first merely an enmattered disposition. But he concurs with the Greek Neoplatonists on the possibility of a transmutation of human condition attained through the progressive acquisition of knowledge up to the *theoria* of the

divine principles. Finally, with Plato he shares the conviction that philosophy is the only hope of salvation for humanity and therefore must achieve a concrete political end, the establishment of a philosophical regime or civic religion, failing which philosophy cannot accomplish its true end.

This conviction makes particular practical ends and universal theoretical sciences dependent upon each other for the realization of philosophy's end. This is not conceivable within the framework of Aristotle's thought, since knowledge, being universal, cannot be prescriptive regarding particular actions. Aristotle's ontology, epistemology, and ethics are then redefined so that virtues can be seen as particular instances of universal transcendental norms, and not only as relative and immanent middle grounds between excess and defect. This requirement gives birth to a remarkable theory wherein Being and knowledge are divided up according to the statistical degrees of actuality of their respective forms: (1) always or necessarily existent → divine Intellects; (2) necessarily existent for an indefinite period of time → celestial spheres; (3) possibly occurring most of the time → most natural phenomena and rules of virtuous human actions; (4) equally occurring and not occurring → association and dissociation of homeomeric substances; (5) occurring most rarely → indefinable events and phenomena. While (1–5) encompass all the degrees of Being except *materia*, (1–3) gather all knowable forms, (1) being metaphysics, including the definition of human felicity, (2) astronomy, and (3) physics and ethics, including politics. Not only does he thus interpret the doctrine of the threefold modes of being of the universals, he also presents this statistical scale as a redefinition of Plato's Line in *Republic*, 509d–511e. In effect, sound opinion, seen as the type of knowledge possible in the case of (3), is the likeness of science found in (1) and (2). Bearing in mind the metaphysical end of human life, that is, felicity, the philosopher-king must define the principles of sound theological opinions, institute pedagogic religious symbols accordingly, and establish legal forms which will prove possible in most cases and as long-lasting as possible given the contingency of human affairs and natural

phenomena. In turn, these opinions, symbols, and legal forms, along with the affects which they induce in the souls, are regarded as a likeness of, and a preparation to, eudemonic contemplation.

Philosophy as Pedagogy

The gap between universality and particularity being filled, the virtuous city becomes an achievable program, its goal being to remove evitable contingencies, alleviate those that are inevitable, and supply the pedagogical conditions for the Active Intellect to act upon people's minds and set them free from matter. The philosopher's main task is to relay the plan of the Active Intellect by means of the appropriate education. Becoming human implies acquiring knowledge. Education is the substitute *pro tempore* of the Active Intellect whose activity is mainly that of a final cause. And since this activity concerns all human beings of sound constitution, the city-state can in theory encompass all the temperate climates on earth where sound human beings live.

In brief, man, however corruptible like other generated and composed substances, can become a perpetual reality thanks to the philosophical knowledge dispensed within the virtuous city. Only a philosopher-legislator can shape the civic religion capable of dispensing this knowledge in the appropriate fashion and of preparing nonphilosophers' souls for immortality. The philosophical religion contains in an analogical form the same salvific knowledge as the one in theoretical teaching. This implies that all the city's institutions, whether cultic, legal, or cultural, are pedagogically oriented to fit the philosopher's aim.

The systematic nature of al-Fārābī's thought lies in the link established between (a) the physical definition of human nature; (b) the metaphysical definition of its ultimate end, immortal felicity; and (c) politics, which is the primary means of realizing this end: to enable each citizen to partake of immortality when he/she does not possess it by nature. Consequently, politics deals with worldly goods in so far as the allocation of goods within the city is the material condition for supreme felicity to be attained, their just allocation being possible only if felicity remains the Law's goal. Felicity represents the common good.

Starting from the working hypothesis that what man desires the most is to satisfy his bodily needs, al-Fārābī comes to the conclusion that one other desire more specifically characterizes humanity: the desire to ascertain the ultimate causes of phenomena and human experience. Philosophy's role is to provide this knowledge and philosophy is therefore the most desirable thing. In turn, philosophy teaches that its own acquirement is what allows human beings to escape their fate and become immortal souls. Thus, each individual should be given the opportunity to assimilate philosophy in a way possible to him- or herself (*Philosophy of Aristotle*). To make this teaching possible is the very purpose of the virtuous regime.

Nowhere does Aristotle put forward the idea that everyone needs to assimilate philosophy, especially if "philosophy" is taken to mean "first philosophy" and if this knowledge is seen as the condition of becoming immortal. The epistemological pattern and general architecture of Fārābī's thought are in fact a new elaboration of the Alexandrian philosophers' pedagogical doctrine and a generalization of the ideal of contemplative life as put forward in the tenth book of the *Nicomachean Ethics* – a generalization which al-Fārābī conceives as the true purpose of the philosopher's return into the Cave and as a form of reconciliation between leisure and active life, theory and practice, scientific and political activities.

Al-Fārābī genuinely hoped for this program to be applied by sovereigns-philosophers. The main evidence for this is the repeated claim that a philosopher incapable of accomplishing the political end of philosophy is an impostor who demotes philosophy to a trifling endeavor. Moreover, his writings mention the constitution of armies attended by pedagogues and, as mentioned in the quotation below (see p. 350), the fight to the death which will inescapably occur between philosophy and historical religions for the control of people's souls. In order to bring in the new political order, he advises the Prince to convince people of the corrupt form of the existing Law and of the need to restore it to its original true version. Stratagems, persuasion, and compulsion must combine for the philosopher's political plan to materialize. Such

concrete proposals suggest that he may have wanted to suit his actions to his words. Ultimately, he views suicide as preferable to living in a world where the philosophical way of life cannot become a reality.

How al-Fārābī Composed His Political Works and How to Read Them

On the basis of all the principles mentioned above, al-Fārābī proceeds with several corollaries scattered all over his works. The First Cause is only the proximate cause of the being of the secondary Intellects (*Political Regime* 31:12–13). Therefore, it cannot be viewed as the cause of what comes to be and passes away within the sublunary world. No divinity rules over the world (*Perfect State* 304:3–4). The doctrine of God's knowledge of particulars is vehemently repelled (*Political Aphorisms* §86; cf. *On De interpretatione* 98:11–19). Those who claim some political authority received directly from God are impostors (*Perfect State* 258:4–9; 304–308:§12). One shall note here that the “Ancients” to whom R. Walzer's translation attributes the doctrines stigmatized in *Perfect State* ch. 18–19 do not appear in the Arabic text. There is no inspiration (*ilhām*) which could supposedly precede knowledge acquired through teaching (*On Demonstration* 82:1–8). About the philosopher-prophet of the *Perfect State*, al-Fārābī explicitly states in the same work that he needs no prophetic insight, *indhār*. Philosophers are the only ones who can govern with knowledge of the true purpose of human existence, which is obtained through physical and metaphysical investigation (*Political Aphorisms* §94: 95, 14–96, 11; *Attainment of Felicity* §57: 186, 13–187, 5; *Book of Religion* 66:8–10). With regard to this knowledge, a “prophet” or enthusiast, *mūhā ilayhi*, cannot be said to be more knowledgeable than a soothsayer, *kāhin* (*Political Aphorisms* §94: 98, 4–99, 2). “Revelation” (*waḥiy*) is a word employed by the ancient philosophers to refer to the “conjunction” of the perfected human intellect with the Active Intellect (*Political Regime* 79, 3–80, 1). A true religion can

only rely on a true, demonstrative philosophy (*Book of Particles* §147; cf. *Attainment of Felicity* §56: 184, 14–16), meaning that its founder must have been perfectly trained in demonstrative syllogisms. To sum up *Political Regime* 85, 12–87, 4 and 104, 17–105, 6: the symbols chosen and used by the philosopher-king in order to institute a true religion necessarily contain hidden contestable *topoi*, *mawāḍiʿ al-ʿinād* (cf. *Book of Dialectics*: 361) – an allusion to Aristotle's *Topics* VIII and *Categories* X. These *topoi* serve as a test. Those in the perfect city who succeed in detecting these dialectical *topoi* are apt to be instructed. Among those men, some are philosophers by nature and hence deserve to be elevated to demonstrative truth – a direct reference to Plato's *Republic* and to the prisoner who has been untied and is given the chance to ascend out of the Cave (515c ss.). The men who, on the contrary, come short of perceiving the *topoi* embodied in the symbols are believers for whom philosophically chosen symbols are sufficient, meaning that these symbols incorporate all the truth needed for their mental capacity to be truly perfected.

Al-Fārābī envisaged two possibilities: (a) a religion built on a perfect demonstrative philosophy, the perfect or virtuous religion whose dialectical or rhetorical premises (or tenets) have been defined by the philosopher who at the same time has the capacity to ascertain the truth and what truly is in the likeness of it – see Aristotle, *Rhetoric* 1355a 14–18 and cf. *Book of Religion* §4:46; *Attainment of Felicity* §53–54: 178–181; (b) religions built on various types of defective philosophy – *Book of Particles* §§108–158. Al-Fārābī regarded all religious communities and political regimes in his day as depraved (*fujūr*), ignorant (i.e., of philosophy: *jāhiliyya*) and in disarray (*dālla*), compare: *Book of Religion* 45:18–19; *Summary of the Perfect State* 86:10–12; *Political Aphorisms* §90: 92, 16–17; cf. *Enumeration of the Sciences* 107–113. Put together, these statements unambiguously mean that the perfect religion was still to be founded.

As for the relations between demonstrative philosophy and existent religions built on

defective kinds of philosophy, he describes them as destructive of each other (cf. Aristotle, *Physics*, I 9, 192a21–22) He says:

If the religion transferred to them [*sc.* a certain people] is a religion which stems in its very beginning from an ancient and corrupt philosophy, either rhetorical or dialectical or sophistical, and if the sound and demonstrative philosophy is then transferred to them after that, the latter will contradict that religion in all respects and this religion will totally contradict that philosophy. And then each of them will tend to annihilate the other. Whichever prevails in establishing itself firmly in the souls will annihilate (*abṭalat*) the other and whichever takes over (*qaharat*) this nation will eradicate (*abṭalat*) the other from it (*Book of Particles* §150, translated from M. Mahdī's unpublished and improved edition; cf. *Book of Letters* §150:155–156).

Above are some of the data which show why, in the *Perfect State*, al-Fārābī purposely elaborates doctrines which seem at variance with his own thought. These doctrines are in fact symbols and contain *mawāḍiʿ al-ʿinād*, contestable *topoi*. The doctrine of prophecy, which cannot be philosophically conceptualized since God knows nothing but himself and hence cannot reveal anything about human affairs, is nonetheless tactically necessary to fulfill the purpose of the treatise. This means that the *Perfect State* is not a theory or description of the perfect city, but is, rigorously speaking, performative in the sense that it actually founds the city. The possible intelligent reader of the *Perfect State* is in fact the potential philosopher apprentice to whom al-Fārābī alludes in the abovementioned crucial passage of *Political Regime*. The latter work represents the key to understanding what al-Fārābī had in mind when composing the former: in order to be recognized as a philosopher apprentice, the reader of the *Perfect State* must be able to detect its *mawāḍiʿ al-ʿinād* or internal contradictions. This is why the *Perfect State* is performative: it brings together the fundamental conditions for the institution of the perfect state to take place. In other terms, the *Perfect State* was meant to bring to al-Fārābī's and his possible successors' attention the individuals firstly capable of receiving a complete philosophical training and subsequently apt to become

the rulers of the future perfect city. Such is the concrete historical meaning of the training of young philosopher-apprentices which is also briefly described in the *Attainment of Felicity*. In short, al-Fārābī never departed from the view that the philosopher's role is to teach and to rule.

The fact that the unity of composition of the *Perfect State* and the *Political Regime* has escaped interpreters' attention can be explained by the prevailing approach which analyzes each treatise separately. In fact, al-Fārābī's work or at least his three main political treatises, the *Perfect State*, the *Political Regime*, and the so-called *Political Aphorisms*, first need to be envisioned and examined as an organic whole in order to then be understood individually. Al-Fārābī alludes to the connection between these three works in his *Summary of the Perfect State* where he refers to seemingly unknown "Addenda" (*ziyādāt*), the description of which coincides with the content of *Political Regime* and *Political Aphorisms*. M. Mahdī, who edited *Summary of the Perfect State*, was the first to suggest that the *Political Aphorisms* might be a part of the Addenda in question.

al-Fārābī, Latin Translations of

Mauro Zonta

Dipartimento di Studi Filosofici ed

Epistemologici, Università di Roma, Rome, Italy

Abstract

Some of al-Fārābī's philosophical works were translated into Latin during the Middle Ages. Two of them were translated literally from Arabic by Gerard of Cremona around 1175: the *Enumeration of the Sciences*, and a summary of books V–VIII of Aristotle's *Physics*. Other Farabian works were translated into Latin in a less literal way: the *Enumeration of the Sciences* was "re-written" by Dominicus Gundissalinus in his *De scientiis* (c. 1154–1166). There are Latin translations, probably by Gundissalinus, also of the treatise *On the Intellect*, of the *Book of Exhortation to the Way of Happiness*, as well as of part of *The Sources of Questions*; the introduction and the beginning of the *Long Commentary* on Aristotle's *Rhetoric* was translated by Hermann the German, in 1243–1244. Al-Fārābī's *Summaries* and *Long Commentaries* on Aristotle's *Organon*, as well as his *Commentaries* on the *Physics* and the *Nicomachean Ethics*, might have been translated into Latin, since they are apparently one of the sources of Albert the Great. Moreover, some short works ascribed to al-Fārābī were translated into Latin, but their Farabian authorship is not sure.

Al-Fārābī was well-known as an interpreter of Aristotle, but the medieval Latin translations of only a few works by him have come to us (Salman 1939). Probably, medieval Latin philosophers were more interested in Averroes, who replaced al-Fārābī for them as a faithful representative of the Arabic interpretation of Aristotle's works; most quotations from al-Fārābī's commentaries on Aristotle come from Averroes' own commentaries (Steinschneider 1869: 39). A number of Latin translations of Averroes' works were based upon the already existing Hebrew translations,

which covered almost all of them, while only a limited number of al-Fārābī's works had been translated into Hebrew. It should also be noted that al-Fārābī had been active in Iraq, while Averroes was active in Andalusia, nearer to the main centers of medieval Latin philosophy.

Probably, the main philosophical work by al-Fārābī translated into Latin and read during the Middle Ages was his *Enumeration of the Sciences* (Arabic: *Iḥṣā' al-'ulūm*). There were two different translations of it, both of which written in Toledo in the second half of the twelfth century. Dominicus Gundissalinus (or Dominic Gundisalvi) translated, or better "re-wrote," al-Fārābī's work into Latin, under the title *De scientiis*, probably between 1154 and 1166, while he was active as a translator of Arabic texts at the court of the Archbishop of Toledo, John of Castelmoron-sur-Lot. This translation was first published by William Chalmers in 1638; a first critical edition of it, by Manuel Alonso Alonso, appeared in 1954 (Gundisalvi 1954), and a second one, together with a German translation, has been published by Jakob H. Schneider (al-Fārābī 2006). In reality, this work was a sort of adaptation of the contents of al-Fārābī's work on the demand of its Latin readers; it was employed by Gundissalinus as a source of his *De divisione philosophiae* (Steinschneider 1869: 83; Gundissalinus 1903), as well as by other medieval Latin philosophers, like Vincent de Beauvais (Gundisalvi 1954: 143–167). A more faithful, literal translation of al-Fārābī's original Arabic text of the *Enumeration of the Sciences* into Latin was made in Toledo around 1175 by the Italian scholar Gerard of Cremona. This translation was probably based upon the same Arabic manuscript used by Gundissalinus for his own translation, and might have been influenced by the latter; after a first noncritical edition of it by Ángel González Palencia (al-Fārābī 1932: 117–176), a critical edition and a German translation by Franz Schupp appeared (al-Fārābī 2005). The musical section of this work has been studied in detail by Henry Farmer (Farmer 1934): he compared the Arabic original text of it with both Latin translations. A tentative reconstruction of the relationship between these two versions and the other witnesses of the textual tradition (the Arabic manuscripts of the original text, its quotations among other medieval authors, and two Hebrew translations of it), leads

to the conclusion that both versions were based upon an "occidental" version of the text, which came to Spain before 1150, and was partially different from the "oriental" version of it, known in the Middle East (Zonta 1990).

Other philosophical works by al-Fārābī or ascribed to him were translated from Arabic into Latin during the Middle Ages, probably by Gundissalinus (Alonso Alonso 1947). The treatise *On the Intellect* (Arabic: *Fī l-'aql*) was translated into Latin under the title *De intellectu*: this translation was first published together with some works by Avicenna in 1508, another time together with the *De scientiis* in 1638, and finally in a very good, although noncritical edition, with a French translation, by Étienne Gilson (Gilson 1929: 108–141). A medieval Latin translation of al-Fārābī's *Book of Exhortation to the Way of Happiness* (Arabic: *Kitāb fī l-tanbīh ilā sabīl al-sa'āda*), bearing the title *Liber ex(er)citationis ad viam felicitatis* and extant in a unique manuscript, has been published by Dominique H. Salman (Salman 1940). Part of a philosophical work commonly ascribed to al-Fārābī, *The Sources of Questions* (Arabic: *'Uyūn al-masā'il*), was translated into Latin. This translation, bearing the title *Fontes quaestionum*, covers paragraphs 1–6 of the whole work, and was published in critical edition (Cruz Hernandez 1950–1951: 316–318).

A different case is that of al-Fārābī's *Summaries* and *Long Commentaries* on the whole Aristotelian *Organon* (including Porphyry's *Eisagoge*), as well as his *Commentaries* on Aristotle's *Nicomachean Ethics* and *Physics*. In this case, it is not yet sure if medieval Latin translations of them were really made (Salman 1939: 247–248, 253–256), apart from that of some short passages of the *Summaries* (Salman 1939: 260–261, 1948; Grignaschi 1972: 44–45). As for the *Organon*, the existence of such translations was discussed in detail by Mario Grignaschi (Grignaschi 1972). According to Grignaschi, these texts were translated into Latin before 1250 c., since Albert the Great quoted or at least read some passages of them. In any case, al-Fārābī might have influenced Albert the Great's philosophical thought (Cortabarría Beitia 1954).

There are two other philosophical works by al-Fārābī, whose original Arabic text is now lost

but was partially translated into Latin during the Middle Ages. The whole introduction and the first passage of al-Fārābī's *Long Commentary* on Aristotle's *Rhetoric* (about *Rhet.* 1354a1–2), lost in their original Arabic text, were translated into Latin by Hermann the German (Hermannus Alemannus) at Burgos in 1243–1244 under the title *Didascalia in rhetoricam Aristotelis ex glosa Alfarabii*; they are found in a unique manuscript, and were first published according to a partial and revised version (as *Declaratio compendiosa Alfarabii super rhetoricorum libros Aristotelis*) in 1481; then they were critically edited by Grignaschi (al-Farabi 1971: 125–252). A short summary of books V–VIII of Aristotle's *Physics*, *Distinctio Alfarabii super librum Aristotelis de naturali auditu*, possibly a fragment of a wider commentary on the *Physics*, was translated into Latin by Gerard of Cremona. It is still extant in at least five manuscripts, and has been published according to three of them (Birkenmajer 1935). The authorship of other works ascribed to al-Fārābī and transmitted by the Latin tradition only is not yet sure. A very short, otherwise unknown *Liber Alfarabii* about some points of botany, still unpublished, has been found in a unique manuscript (Paris, Bibliothèque Nationale de France, lat. 7156, folio 82v: Hoefer 1842: 326; Steinschneider 1869: 77). A short treatise *De ortu scientiarum*, or *Epistula de assignanda causa ex qua ortae sunt scientiae philosophiae et ordo earum in disciplina*, ascribed to al-Fārābī and preserved in five manuscripts, has been published in a critical edition (Alfarabi 1916); however, its Farabian authorship is still in doubt, since its contents appear to be partially different from those of the *Enumeration of the Sciences* (but see Alonso 1946).

Feudal Law

Joseph Canning
Girton College, University of Cambridge,
Cambridge, UK

Abstract

There is no consensus among historians on the subject of feudal law, and the notion of “feudalism” is contested. The traditional approaches, the broader one treating feudal society, the narrower focussing on the contract between lord and vassal, have been questioned as being constructs of modern historians. The *Libri feudorum* was the main text of medieval feudal law and was the subject of *ius commune* jurisprudence. The core notion in feudal relations was the bond of fidelity or fealty. Feudal bonds limited the ruler. They were found in a range of relationships in secular and ecclesiastical society. Both the parties benefited in a feudal relationship. With the development of forms of state from the twelfth century, the feudal aspect of rulership was by no means purely personal. Feudal notions persisted beyond the Middle Ages. Feudal custom was perceived as part of natural law.

The subject of feudal law is one of the most contentious among historians. There is no general agreement about the nature of feudal relations and, indeed, whether the term “feudalism” has any real meaning. What is at stake is a fundamental organizing principle for understanding the Middle Ages.

The debate in the middle of the twentieth century featured two approaches. The first saw feudal relations as so pervasive as to justify the concept

of feudal society. The classic exposition of this view was Marc Bloch's masterpiece, *La société féodale* (1940, English trans., 1961). The other, while accepting the larger vision, chose to focus on the contract between lord and vassal – this would be represented by F.L. Ganshof's magisterial work, *Qu'est-ce que la féodalité?* (1944, English trans., 1952). The first approach would include the peasantry and issues of serfdom, the second would not. This comfortable arrangement was shattered by Elizabeth Brown (1974) who argued that feudalism was a construct produced by modern historians and projected back onto the Middle Ages, a construct, which did not conform to the multifarious reality of medieval life. Susan Reynolds (1994) deepened the elaboration of this thesis by seeking to demonstrate that the feudal models with which most historians had been working derived ultimately from the theories of sixteenth-century lawyers themselves drawing on the works of late medieval jurists: that the whole edifice of feudal law, let alone the concept of “feudalism,” was built on the unsound foundations of lawyers' theories distanced from the infinitely complicated real world of medieval society. The legal historian, Kenneth Pennington (2004), arguing from a detailed knowledge of feudal, Roman, and canon law, responded critically to Reynolds.

Feudal law was essentially customary, but it came to some degree to be written down. The most important text was the *Libri feudorum*. This was mainly based on Lombard feudal law. Its first recension dated back from the mid-twelfth century and was created by Obertus de Octo, a judge at Milan. Almost all the manuscripts of the first two recensions vary; some include eleventh- and twelfth-century statutes of the Emperors Conrad II, Lothar II, and Frederick I. The first commentary on the *Libri feudorum* was written (on the second recension) by the Roman law jurist, Pilius in c. 1200. The final, vulgate recension added constitutions of Emperor Frederick II. It also included the famous letter of Bishop Fulbert of Chartres, written in c. 1020, and which had become the *locus classicus* for the obligations and duties incurred by a vassal through the feudal oath of fealty. This had been included in Gratian's handbook of canon law, the *Decretum*. The letter's inclusion in the *Libri feudorum*, together with the

fact that Pilius was a civilian, neatly demonstrated that the jurisprudence of the feudal law was a product of the *ius commune* – the combined Roman and canon law approach to legal scholarship. The canonist, Huguccio, had already treated the principles enshrined in the letter of Fulbert as applying to relationships within the ecclesiastical hierarchy and to those between the emperor and ecclesiastics – such principles did not just apply to the feudal bond between lord and vassals (Pennington 2004).

The consolidation of the place of the *Libri feudorum* in the scholarship of the *ius commune* came with the commentary of Accursius in the 1220s (based on Pilius' commentary). From the 1230s, the *Libri feudorum* were treated as part of the Roman law, the *Corpus iuris civilis*. They were added as a tenth collation to the *Authenticum*, the form in which Justinian's *Novels* were transmitted to the Middle Ages. This meant that the *Libri feudorum* became a standard part of civilian jurisprudence through the medium of Accursius' *Glossa ordinaria*, the culmination of the work of the school of the Roman law Glossators. Further commentaries were written on the *Libri feudorum*, notably that of Baldus de Ubaldis (1393). Indeed, feudal law continued as an integral part of the jurisprudence of the *ius commune* into the early seventeenth century.

Feudal matters were also treated in many secular, legal codifications after the early thirteenth century. For example, Frederick II's *Constitutions of Melfi* (1231), for Sicily, included the succession and bestowing of fiefs and was commented on by jurists. Similarly, in Castile and Leon, the *Siete partidas* (1256/1258) of Alphonso X, and, in France, the *Etablissements de S. Louis* (1272/1273) treated feudal customs.

Feudal relations varied at different times and places, but there persisted the core notion of the personal bond of fidelity, or fealty. This established a contract with rights and duties on both sides. It was a mutual bond which either party could treat as broken by the other's perceived violation of feudal law. At the political level this marked the beginnings of a right of resistance to the ruler. Feudal law, in short imposed limits on the ruler – as Baldus famously said of grants of fiefs by the emperor, "God has subjected the laws to him, but has not

subjected to him contracts by which he is bound" (*deus subiecit ei leges, sed non subiecit ei contractus ex quibus obligatus est*) (Commentary on *Libri feudorum*, 1.7). Whereas in Roman law there was no inheritance of obligations entered into by contract, a ruler's successor did inherit a feudal contract.

The feudal bond could be found in a range of relationships within both secular and ecclesiastical society. It was a bond which applied far more widely than just to the relationship between the lord and his vassal: according to this, a lord received an oath of fealty, following the act of self-surrender known as homage, from a man who thereby became his vassal and received a benefice or fief (*feudum* – hence "feudal") in land or rents in return, to enable him to perform the required services (primarily military) for his lord. Feudal notions became so entrenched that, by the late Middle Ages, relationships which originally had not been seen as feudal at all became feudalized: a prime case would be the way in which the fourteenth-century popes claimed that at his coronation the Roman emperor swore to the pope an oath of fidelity, which was feudal in nature, a contention rejected by the imperial side because it suggested that the Empire was a papal fief. Earlier in the Middle Ages, the papacy had not seen the emperor's oath in terms of feudal fidelity but of subordination.

Feudal bonds created an enduring relationship in a way that was useful to both sides. A major example is provided by late medieval Italy. The lords (*signori*) who increasingly supplanted republican forms of government from the mid-thirteenth century onward were in part legitimized by grants of imperial or papal vicariates, which were feudal in form. This arrangement aided the emperor or the pope, who did not lose ultimate sovereignty over the fief, and gave the *signori* rights of public jurisdiction. It was particularly helpful in the case of Giangaleazzo Visconti, when the emperor-elect, Wenceslas, took the further step of creating him duke of Milan in 1395. The feudal nature of this grant meant that Wenceslas, Giangaleazzo, and lawyers supporting them could argue that this was not the alienation of imperial rights forbidden by Roman law. (This did not prevent Wenceslas' fall from power in 1400 on these grounds.)

The general problem for historians is how much they should privilege feudal notions in interpreting medieval society. To overemphasise them would indeed be to mislead. At the level of rulership and government, from at least the twelfth century, apparatuses of power and nascent bureaucracy indicated the emergence of forms of state. This meant that the feudal aspect of rulership was by no means purely personal, because fiefs came to be seen as grants of the royal or imperial office. Papal fiefs fitted in with this view: those receiving them became vassals not of the individual pope but of St. Peter. The notion of office further explained why feudal contracts were inherited by subsequent rulers.

Feudal notions were peculiarly persistent. Snobbery and the desire to consolidate upward social mobility partly explained the pursuit of feudal titles in the late Middle Ages – the preeminent civilian jurist, Bartolus of Sassoferrato (d. 1357), for example, was immensely proud when Emperor Charles IV gave him a coat of arms. But far more was involved. Feudal ideas became part of the intellectual web for understanding the world. This is best summed up by the contention put forward by jurists from the thirteenth century onward that feudal custom formed part of natural law, a perception deriving ultimately from the Aristotelian and Ciceronian notions of custom as second nature (Canning 1987: 82–83; Ullmann 1967: 83).

Form and Matter

Catherine König-Pralong
Philosophisches Seminar, Albert-Ludwigs-Universität Freiburg, Freiburg im Breisgau, Germany

Abstract

The notions of form and matter are treated in very different contexts before and after the Latin translations of the Aristotelian physical and metaphysical texts. Up to the second half of the twelfth century, the Platonic tradition

(directly, through the *Timaeus*, and indirectly) and Augustine of Hippo presented matter as a formless receptacle that precedes the reception of forms. The problem lies in forms coming to be in matter. A parallel tradition begun by Boethius engages in an ontologizing reading of Aristotle's *Categories* that leaves matter in the margins of formal ontology. Starting from the thirteenth century, the new context of Aristotelian epistemology reoriented the debate considering the ontology of compound things. Form and matter are then conceived as metaphysical principles that account for change (Thomas Aquinas), or as the constituent parts of things (the Franciscan tradition). In fourteenth-century England, several theories arose that, while very different among themselves, presented matter and form as absolute things. In Germany, a new metaphysics of forms arises that excludes matter from philosophical discussion.

In medieval ontology, the notions of form and matter most often serve to describe the condition of individual things. According to some authors, only things belonging to the sensible world and subject to change are composed of matter and form. For others, such a composition also extends to beings beyond the sphere of fire (from the moon outwards): although they are not subject to generation and corruption, they are material insofar as they are multiplied and individuated within the same species. Form (*morphē/forma*) is the principle of determination that makes a thing what it is in actuality. Matter (*hylē/materia*) is the receptive principle or the potential "substrate," which signifies of what a thing is made or in which it is. The notion of matter allows one to account for change, and for the differentiation and multiplication of individual forms.

Nevertheless, this conceptual pair has very different meanings according to era and author. The Middle Ages can be divided into two philosophical periods: before and after the Latin translations of the Aristotelian physical and metaphysical texts.

1. The first period runs from the end of Antiquity and Augustine of Hippo (354–430) to the second half of the twelfth century. During these

eight centuries, the Latin Middle Ages did not have access to Aristotelian physical and metaphysical works. The (direct and indirect) Platonic tradition set the terms of discourse on physics. The first part of Plato's *Timaeus* (to 53c) is transmitted in the Latin translation made by Calcidius (c. 321). There, Plato distinguishes three primordial genera (48d–52c): (a) immutable and intelligible forms, which are the eternal models of mutable things; (b) sensible and mutable forms, which are the copies of these forms in matter; (c) the matter, in which these copies come to be. Plato describes matter as the universal receptacle or mother. It constitutes the form's alterity: it is outside all forms so that it may be that in which the forms come to be. As opposed to the form, which is in itself intelligible, matter is not intelligible – one only perceives it in "dream." Plotinus (c. 205–270) would add that matter is nonbeing and evil, insofar as it is the opposite of the one (*Enneads* II, 4).

Following this Platonic line, Augustine of Hippo gives an interpretation of matter that would have much success during the Middle Ages. Commenting on the beginning of *Genesis*, he compares matter to the shadowy abyss from which God separates things and organizes the world. In the *Confessions* (*Confessiones* XII, 6) and in *De Genesi ad litteram* (I), he describes matter as an absence of form (*informitas*) and an almost-nothing (*prope nihil*), but which is something. Created *ex nihilo*, this formless material is gradually formed thanks to dispositions that are present in it from its creation: *seminal reasons* (*semina, rationes seminales*), which Augustine borrows from Stoic physics (*De Genesi ad litteram* III.12; IV.33; V.7). Such a reading of *Genesis* allows Augustine to affirm the ontological priority of nothing to the world, and of matter to forms. Terrestrial things, forms engaged in matter, are essentially transitory, mutable, and corruptible.

Medieval commentaries on the *Timaeus* only appear by the middle of the twelfth century. The most Platonic moment of the Latin Middle Ages occurs at the time of the so-called "School of Chartres." William of Conches and Bernard of

Chartres composed glosses on the *Timaeus*. With respect to the issue of form and matter, the most important work from this time is perhaps Bernard Silvestre's *Cosmography*, a poem mixed with prose commentaries, which, modeled on the beginning of Ovid's *Metamorphosis*, tells the origin of the world. As with Augustine, matter (*Ylē*) precedes the formation of the world. Bernard names this shadowy material *Silva* (forest). Matter is wild, but it is also halfway between good and evil. The intellect (*Nous*) must organize it, that is, give it form. In this Platonic tradition, the pair matter/form also constitutes the projection into nature of the Fall and the turning away from the Good.

Alongside Augustine, the other great philosophical authority of the High Middle Ages was Boethius (c. 480–524/525), the Latin translator and commentator of Aristotle's logical treatises. Among other texts, Aristotle's *Categories* and Boethius' *Commentary on Porphyry's Isagoge* played the role of ontological treatises during this period. In this context, the question of substance is not posed in terms of matter and form, but in terms of a Platonized Aristotelian logic: how a genus descends into its species and how the species is individuated. Boethius explains the individuality of substances without recourse to matter, relying on a unique bundle of accidents in each thing. The hylemorphic composition of things does not appear among the problems addressed in the Boethian tradition.

In the ninth century, John Scotus Eriugena retranslated the works of the Pseudo-Dionysius the Areopagite and adopted Proclus' system of formal emanation. The ontological reading of the Porphyrian tree, begun by Boethius, receives a strong Proclian flavor: the genus is the most formal entity, that is, both the most universal and the most essential, and it descends into its species and their individuals by emanation (see, in particular, the *Annotationes in Marcianum*). Such a formal ontology leaves little room for matter.

2. The second period is that of the reception of the Aristotelian physical and metaphysical corpus. Starting in the second half of the twelfth century, almost the entirety of Aristotle's texts, as

well as numerous Arabic and Byzantine commentaries and treatises, are translated into Latin from Greek and Arabic. In the *Physics* (II, 1–3) and the *Metaphysics* (VII, 3, 7–8, 10–11), Aristotle considers matter and form as intrinsic and constituent principles of mutable things or “composites.” In physics, matter explains the continuity of change: in transformation, what was wood becomes ash. In the material thing, matter expresses potentiality, the possibilities of becoming. It is also the principle that allows one to say in what a thing is and of what it is constituted. The Aristotelian vision is the opposite of Augustine's: according to Aristotle, act and form are always prior to potency and matter, otherwise it would be necessary to posit an absurd nonbeing – chaos – that existed before being (*Metaphysics* XII, 7, 1072a7–19).

During this Aristotelian period, three works from the Arabic-speaking world, translated into Latin, played a major role: the “*Metaphysics*” of the *Shifā'* by Avicenna (Ibn Sīnā), the *Fountain of Life* (*Fons vitae*) of Avicbron (Ibn Gabirol), and the commentaries on Aristotle's works by Averroes (Ibn Rushd).

Avicenna (980–1037) bequeathed to the Latin world a Neoplatonic cosmology and a metaphysics of forms. The cosmos is ordered by a procession of ten intelligences, purely formal substances that cause the world by their essential activity (*Metaphysics* IX, 4). Material things come about by means of the cosmos' emanationist dynamics: they are the exterior traces of the activity of intelligences that are always in act. All the bodies of the cosmos, terrestrial and celestial, are composed of a receptive matter and a form or soul infused in it by an intelligence. With respect to terrestrial matter, it constitutes the stuff that receives the forms emanating from the last of the ten intelligences, the “agent intelligence,” understood as “giver of forms” (*dator formarum*).

Written in the middle of the eleventh century, the *Fountain of Life* of Ibn Gabirol provided the model for “universal hylemorphism.” Ibn Gabirol also adopted a Neoplatonic cosmology, but he gave the matter/form pair a universal, ontological

scope: matter is the original material of the whole cosmos. All created substances are composed of matter and form, from the most perfect and universal celestial intelligences down to natural and corporeal beings, characterized by their particularity. In this system, particularity, and not materiality, is the indicator of a degraded state, as in the ontological readings of Porphyry's tree. On the joint authority of Ibn Gabirol and Augustine, the majority of Latin scholastics associated with the angelic intelligences and with the human intellect a proper matter, independent of any bond to a body.

In his commentaries on the *Physics*, the *Metaphysics*, and *On the Heavens*, Averroes (1126–1198) returns matter and form to their Aristotelian epistemic context: these principles are only discovered in the course of an investigation of physical changes. Against Avicenna, Averroes specifies that only natural things of the sublunary world are composed of matter and form. The celestial bodies are incorruptible; therefore, they are not composed of matter (*In De caelo* I, c. 20). Matter is the potential principle that explains sublunary change: generation, corruption, and accidental changes. According to Averroes, matter is endowed with “indeterminate dimensions” (three-dimensionality), which assure the possibility of being immediately divided into as many individual substances as there are forms in act to determine it.

Aristotle's philosophical texts were read and commented at the University of Paris and in England from the beginning of the thirteenth century. In the middle of the century, the lectures of Albert the Great provide a first glimpse of the points of scholastic debate. Albert rejects Ibn Gabirol's universal hylemorphism and adopts Averroes' approach: only natural (sublunary) beings are composed of matter and form (*Summa theologiae* II, tr. 1, q. 3–4). Commenting on the *Metaphysics* (*Metaph.* II, tr. 3, c. 10), he describes matter and form as correlative principles, intrinsic to the thing. Matter as such is the desire for form. It is therefore necessary that the form be present in it in an inchoative manner, as in an embryonic state. Albert calls this inclination and this desire on the part of matter for a form *inchoatio formae*

(*Metaph.* I, tr. 5, c. 8; XI, tr. 1, c. 8). He places Aristotelian nature in a Neoplatonic cosmological frame: these embryos of forms, which evoke Augustine's seminal reasons, are infused in prime matter by the celestial intelligences. The action of natural agents still must realize in act the forms that in an inchoate state preexisted in matter.

From approximately 1260, the interests of university theology carried over into ontology and physics. Three particularly important questions arose concerning matter and form: (a) Can God create some matter without form? (b) Do a plurality of substantial forms cohabit the same substance, in particular, that of a human? (c) Is there matter in spiritual and separate substances (i.e., in angels, in the pure intelligences of Peripatetic cosmology, or in human intellects considered separately from the body)?

Thomas Aquinas (1224/1225–1274) decides the three questions in a distinctly Aristotelian fashion:

- (a) God cannot make matter exist without form, since prime matter is pure potentiality. The entire being in act of a substance proceeds from its form, to which the matter is essentially relative. According to this view, matter is deprived of any ontological weight. Considered in itself, matter is a metaphysical principle diametrically opposed to form. It accounts for the potentialities of natural substances. At the level of physical reality, however, it does not enjoy any proper substantiality or actuality. On this basis, Thomas criticizes the theory of seminal reasons (*Sentences* II, dist. 12, q. 1; *De potentia*, q. 4; *Quodlibet* III, q. 1; *Sententia libri Metaphysicae* VII; *De principiis naturae*, c. 4; *In libros Physicorum* II).
- (b) Consequently, Thomas rejects the coexistence of a plurality of substantial forms in one same individual. If matter is pure potency, then the actuality of the first form provides complete being for the substance. In the case of man, the rational soul realizes the whole man in substance. It is impossible to suppose a partition of prime matter that would be prior to the

reception of the substantial form, or that remains under a plurality of substantial forms, because such a division can only come about by an act of information, to which matter, pure potency, is repugnant by definition. In the substantial composite, however, matter remains the principle that allows the explanation of accidental change (man can grow, acquire knowledge, etc.) and then corruption (death) (*Quaestio de anima*; *Summa theologiae* I, q. 75–76).

- (c) Thomas limits the composition of matter and form to the world of generation and corruption. He refuses to explain individuation and the mutability of angels and intelligences by means of a certain type of matter, a spiritual matter. According to Thomas, angels are pure forms, although imperfect ones; they are not therefore individuated under an angelic species, but there are as many angelic species as angels (*De spiritualibus creaturis*; *De ente et essentia*).

These doctrines constitute the points of contention during the debates that took place in the last quarter of the thirteenth century. Some authors (such as Giles of Rome, Godfrey of Fontaines, Richard Knapwell, and Giles of Lessines) defended Thomas' theses, with adaptations and modifications. But the majority of doctors and almost all Franciscans attacked them. In 1277, Giles of Rome is condemned for having maintained Thomas' solution to the first problem (a). Thomas' solutions to the other two questions (b and c) were condemned in 1277 at Oxford, and in 1286 at London.

- (a) The majority of the Franciscans grant that matter has some ontological weight proper to it and a minimal actuality. John Pecham affirms very clearly that God could make matter exist without form (*Quodlibet IV*, q. 1). The secular master Henry of Ghent holds the same thesis, invoking divine omnipotence. If matter is essentially something, it is also possible that God could bring it about in isolation, in an order different than the one actually realized (*Quodlibet I*, q. 10; *X*, q. 8). To grant matter its

own substantiality, and to justify its minimal actuality, Bonaventure reworked the theory of seminal reasons (*Sentences II*, dist. 7, pars 2, art. 2, q. 1; *II*, dist. 15, art. 1, q. 1). Only some of the Franciscans would follow him down this path (e.g., Roger Marston, *Quodlibet II*, q. 22).

- (b) The plurality of substantial forms is a doctrine shared by almost all Franciscans (with the notable exception of Peter John Olivi's doctrine: *Sentences II*, q. 50–51). The Franciscan approach is more empiric and less metaphysical than that of Thomas. Man is a microcosm that contains in act the divisions observed in the larger world. His body, his nutritive soul, his sensitive soul, his intellectual soul, and each of the intermediate degrees is endowed with a proper substantiality. The matter/form pair becomes the means of graduating the scale of being and the parts of a being, from the less perfect (the more material) to the more perfect (the more formal). The same entity can be conceived as matter or form, according to the perspective one takes; for example, the sensitive soul is the matter of the intellectual soul, but the form of the nutritive soul (see, e.g., Matthew of Aquasparta, *Quaestiones de anima XIII*; Richard of Middleton, *De gradu formarum*; John Pecham, *Quodlibet IV*, q. 11; and also Roger Bacon, *Libri communium naturalium I*, pars 2, dist. 1–2, who superimposes the distinction between matter and form on that between genus and species).
- (c) Consequently, Ibn Gabirol's universal hylemorphism is largely adopted by Franciscan theologians, following Bonaventure (*Sentences II*, dist. 3, pars 1, art. 1). Matter is not confined to the physical world, nor is it conceived of as a principle opposed to any actuality. On the contrary, it is endowed with a minimal actuality and coexists with form in every created substance, including the angels. It accounts for their condition as creatures: limitation, mutability, potentiality, individuality, and receptivity.

In the fourteenth century, two new traditions appear, one English, the other German.

In England, John Duns Scotus (c. 1265–1308) places the problem of matter and form in a global metaphysical context. In this metaphysics, everything that is possible is also real, intelligible, and endowed with a certain formal characteristic, prior to any concrete and created existence. If matter is not nothing – if it is legitimate to speak of matter – it is therefore something in itself possible. Scotus grants to the matter a certain reality and a formal entity at metaphysical level, a more foundational level than that of its physical existence. In a concrete substance, matter and form remain two distinct absolutes, joined by a relation of connection. Composition becomes therefore the distinguishing mark of the world and of created substances (*Lectura* II, dist. 12, q. unica).

Among Scotus' numerous critics, William of Ockham (1285–1347) rejects the Scotist metaphysics of the real possible, and proposes a physics of existence and an ontology of the singular. If discourse is extramentally relevant, its terms must supposit for singulars. This logicolinguistic critique likewise leads to a rejection of Thomas' solution, where matter is a metaphysical principle. According to Ockham, matter and form are two absolute singulars and are in act in each compound substance. Prime matter is immediately divided into as many substances as actually exist in the world. With an epistemology radically opposed to that of Scotus, Ockham also makes matter absolute; thus he insists on substance being compound (*Summula philosophiae naturalis* I, c. 9–11; *Expositio in librum Physicorum* I, c. 16–18; III, c. 14).

The German tradition, with such representatives as Dietrich of Freiberg (c. 1250–1320) and Berthold of Moosburg (d. after 1361), develops a metaphysics of forms that excludes matter, relegating it to the world of the contingent and the corruptible. In his treatise *De quiditatibus entium*, Dietrich gives a new reading of Aristotelian ontology. Scientific discourse describes only the necessary and per se relations of which Aristotle speaks in the *Posterior Analytics* I, 4. Only forms and the formal properties of things can be the object of such discourse. Matter is not intelligible, because it is contingent and potential; it is

able not to be and to be otherwise than how it is. If one considers the compound substance, matter is posterior to the form and does not enter into the quiddity or the definition of the thing. It no longer has a place in the necessary discourse of metaphysics. In commenting on Proclus, Berthold of Moosburg arrives at the same sort of conclusions by a different path.

Francesc Marbres

Christopher Schabel
Department of History and Archaeology,
University of Cyprus, Nicosia, Cyprus

Abstract

Francesc Marbres, wrongly known as “John the Canon” since the fifteenth century, was a Catalan from Barcelona, an Austin Canon at Tortosa Cathedral in today’s Spain, and a Master of Arts at Toulouse. He composed an influential set of unfinished questions on the *Physics* around 1330 and died and was buried in Paris, where he was studying theology. His work on the *Physics* did not circulate widely until the mid-fifteenth century, when it was copied frequently and then printed several times by 1520. Marbres explicitly employed mainly theological works in his *Physics*

questions, especially those of the early fourteenth-century Franciscans John Duns Scotus, Peter Auriol, Francis of Marchia, Landolfo Caracciolo, Gerald Odonis, and Francis of Meyronnes, but also the secular Thomas Wylton. Tacitly he used the writings of some Catalan contemporaries. Thus Marbres was perhaps the main path via which the exciting physical ideas of several Parisian theologians reached the sixteenth century.

A set of questions on the *Physics* survives partially or wholly in almost 40 known manuscripts and was printed eight times between 1475 and 1520. Usually attributed to “Johannes Canonicus” (sometimes identified as a Franciscan) in the witnesses and in the scholarly literature, in some colophons the questions are also assigned to Johannes Marbres or Franciscus Marbres, who is further identified as a Catalan and a canon of Tortosa. The text on the *Physics* has been variously dated to the first half of the fourteenth century and to the mid-fifteenth century. A letter of Pope John XXII dated 1321, however, informs us that he granted Franciscus Marbres, a cleric from Barcelona, a canonry in Tortosa, farther south on the Mediterranean coast, where the cathedral chapter consisted of canons regular of the Augustinian Order. The only other documentary sources located so far record that Francesc Marbres (his name in Catalan) borrowed the *Sentences* from the cathedral library in 1330, arranged to be away from Tortosa at the same time, died as Master of Arts, and was buried in Paris while studying theology. Internal evidence in his *Physics* questions and colophons specify that Francesc had studied arts at Toulouse.

“John the Canon” has played an important role in the historiography of fourteenth-century natural philosophy at least since the fundamental works of Pierre Duhem, with Anneliese Maier, Marshall Clagett, Edward Grant, and many others devoting attention to his questions on the *Physics*. Because many of the author’s sources had never been printed, however, and sometimes were not even available in accessible manuscripts, the nature of Francesc Marbres’ work and the extent of his debt

to Francis of Marchia, Gerald Odonis, Landolfo Caracciolo, and others were unknown. Studies and editions of the texts of those Franciscans, together with some careful detective work (starting with Duhem himself) on the writings of scholastics whom Marbres does not cite, have allowed historians to conclude that Marbres' questions on the *Physics* are fundamentally a work of compilation, although with additions of his own. Marbres thus took the salient doctrines of recent and contemporary scholastics and presented them in his questions, accepting or critiquing them according to his own views. In this way, Marbres' *Physics* questions provide a window into early fourteenth-century physics while participating in the debates.

Active just before John Buridan at a time when the Oxford Calculators were just getting started, Francesc Marbres considered the most important natural philosophers, either positively or negatively, to be recent theologians: the Franciscan John Duns Scotus and the Friars Minor active in the two decades after the Subtle Doctor's death, especially those who read the *Sentences* at Paris from 1317 to 1321, namely, Peter Auriol, Landolfo Caracciolo, Francis of Marchia, and Francis of Meyronnes. Gerald Odonis, another important source, did not lecture on the *Sentences* at Paris until 1327–28, but he was already active at Toulouse a decade earlier, and Marbres may have encountered him there. Marbres also engaged explicitly with the physical theories of the English secular Thomas Wylton and, to a lesser extent, his colleague Walter Burley, the English Franciscans William of Ockham and William of Alnwick, as well as the Italian Minorite Alexander of Alexandria and the Italian Carmelite Gerard of Bologna. Interestingly, Marbres also borrowed from and was influenced by at least three contemporaries from, or teaching in, his native land. Garrett Smith has shown that Marbres employed the works of the Franciscan Peter Thomae, active at the Barcelona convent in the 1310s and 1320s, and Duhem, Edward Mahoney, Marek Gensler, and Smith have demonstrated the connection between Marbres and his Aragonese Franciscan contemporary Antonius Andreas. Finally, a Catalan bachelor whom Marbres cites in his first question has

turned out to be the Augustinian Hermit Bernat Oliver, who lectured on the *Sentences* at Paris in the 1320s.

Only two manuscripts date to the fourteenth century. The overwhelming majority of the witnesses, both in manuscript and in print, date from the period 1450–1520. Thus the historical impact of Marbres' questions on the *Physics* lies in the fact that they transmit, explicitly or tacitly, the physical theories of the abovementioned early fourteenth-century theologians to the scholastics active on the eve of the "Scientific Revolution." Marbres was primarily a Scotist follower of Francis of Marchia, but he dealt with the often innovative un-Aristotelian physical views of other early fourteenth-century authors. The fact that Marbres' sources were mainly theological works, as opposed to commentaries on the Philosopher's writings, certainly facilitated Marbres' presentation of so many new theories.

By 1520, many of the works of Scotus, Meyronnes, Burley, and Ockham were readily available in print. This is not true for most of the other authors whom Francesc Marbres employed in his questions on the *Physics*. Marbres was particularly interested in metaphysical questions about the ontological status of number, time, place, motion, form, matter, privation, *genus* and *differentia*, and wholes and parts, and he usually presented differing Franciscan positions on these issues. Among the hot topics of the day for which Marbres' text offers the most exciting new theories, one finds questions on the univocity of the concept of being (the current subject of a study by Garrett Smith), the principle of individuation, divine foreknowledge of future contingents, the infinite, the vacuum, the intension and remission of forms, atomism, and change in general.

Gerald Odonis was an indivisibilist regarding the continuum. He treated the subject in several places, but for the early modern natural philosopher, Francesc Marbres' presentation of Odonis' position in the first question of book VI would have been the most accessible. Francis of Marchia's portrayal of Peter Auriol's radical theory of divine foreknowledge, together with Marchia's own popular refutation, was never printed, but Marbres incorporated most of it into

question 4 of book II, ostensibly on fortune. At times revisions to Marbres' questions and the confusion of later scribes and printers resulted in a garbled text, such that Odonis was seemingly deprived of the credit for his application of the theory of *virtus derelicta* of projectile motion (which he and Marchia developed, influencing Buridan's later *impetus* theory) to assert the possibility of finite motion in a vacuum. Regardless, Marbres' readers had access to this anti-Aristotelian view in his question 4 of book IV. In contrast, Odonis was made into a proponent of the notorious succession or replacement theory of the intension and remission of forms in book V, question 3, when "Godfrey" (of Fontaines)'s name was rendered "Gerald" and then even "Gerald Odonis" in the later witnesses. Nevertheless, the readers obtained an overview of the ideas in the debate between Godfrey, Antonius Andreas, Marchia, and Walter Burley. In book IV, question 1, Marbres offered Auriol's reductionist doctrine of place, but the readers would not have known that it was through the lens of Landolfo Caracciolo, who went on to reject Auriol's opinion. When asking whether God could produce an actual infinite in book III, question 3, Marbres centered his response around the disagreement between Thomas Wylton, Auriol, Marchia, and Francis of Meyronnes in ca. 1320. Marbres did not finish his questions, breaking off in the middle of the first question of book VIII, before he was able to give his version of the innovation that has made his champion, Francis of Marchia, most famous, the *virtus derelicta* itself.

Francesc Marbres' questions on the *Physics* described the *status quaestionis* of physical theories on the eve of Buridan, Oresme, and the Oxford Calculators and transmitted those theories to the early modern period. A critical edition is needed in order for us to determine how exactly Marbres compiled his work, to view that *status quaestionis* more clearly, and to help trace if and how Marbres' transmission of these ideas influenced sixteenth-century developments. Garrett Smith's findings for book I, question 3, on univocity give an idea of the interest of such an endeavor: Thomas Aquinas, James of Viterbo, John Duns Scotus, Gerard of Bologna, Thomas

Wylton, Peter Auriol, Francis of Marchia, Francis of Meyronnes, William of Alnwick, Peter Thomae, Antonius Andreas, and Gerald Odonis make their appearances, along with Scotists in general, since Marbres is one of the first to employ terms like *scotizantes* to characterize the developing doctrinal school within the Franciscan Order.

Francis of Marchia

Roberto Lambertini

Dipartimento di Scienze Storiche, Documentarie, Artistiche e del Territorio, Università di Macerata, Macerata, Italy

Abstract

Francis of Marchia (also known as Franciscus de Esculo, de Apponiano, or de Pignano, called sometimes Franciscus Rubeus, either a nickname or a family name) was a Franciscan theologian, who became *doctor theologiae* in Paris and taught also in other Franciscan *studia*, such as that located in Avignon. Little is known about his life. His biography is however marked by his rebellion against the Pope John XXII, when in 1328 he decided to side with Michael of Cesena and fled Avignon. After

escaping from Avignon, he spent many years at the Franciscan Convent in Munich, under the protection of the excommunicated German emperor Lewis IV of Bavaria. In 1343 he recanted. After this date, he disappears from the extant records.

Although an important part of his works still awaits an edition in print, Francis of Marchia has already emerged as an interesting and innovative thinker in many fields. Scholars are still discussing the actual significance of his criticism of Aristotle's theory of motion and of his rejection of a substantial difference among terrestrial and celestial bodies. His position concerning the relationship between God's foreknowledge and human freedom proved to be very influential, so that specialists speak of a "Marchist school" in this field. Francis' treatise *Improbatio*, aiming at a radical refutation of John XXII's bull *Quia vir reprobus*, deeply influenced the formation of Ockham's political thought.

Francis was born in the small village of Appignano, not far from Ascoli Piceno, in central Italy. The only reliable information we possess concerning his career as a theologian in the Franciscan Order derives from his writings. Combining what it is known about other Franciscan masters who were active in the same years with evidence contained in his commentary on the *Sentences*, it is possible to date his lectures as bachelor of the *Sentences* to the academic year 1319–1320. Francis' commentary has come down to us in different versions, which numerous scholars have studied and (partially) edited in recent decades. The editorial enterprise is still in progress, but it is already clear that Marchia read the *Sentences* not only in Paris, but also elsewhere, as was the case for many theologians from the Mendicant Orders, although it is not yet known exactly where and when. After his Paris lectures Francis revised his commentary into a *scriptum* that may have been completed, according to a colophon, in 1323.

Some historians have maintained that Francis was acting as *lector* at the Franciscan convent in Avignon in 1324. This is quite possible, but the

earliest explicit mention of him in this position, bearing the title of *doctor in sacra theologia*, dates to 1328, in the first document related to his rebellion against Pope John XXII. While in Avignon, Francis had come into contact with the minister general of his Order, Michael of Cesena, who had been summoned by the pope in 1327 and later forbidden to leave the city without permission. In the difficult months of tension between the pope and the leadership of the Franciscan Order, stemming from the controversy over the doctrine of absolute poverty, but worsened by the dispute with the excommunicated German Emperor Louis of Bavaria, Francis moved over to the side of his minister general. In 1328 Francis fled Avignon along with Michael of Cesena, Bonagratia of Bergamo, and William of Ockham, signed the appeals in which they accused John XXII of heresy, and, with Bonagratia, Ockham, and Henry of Thalhheim, coauthored the *Allegationes religiosorum virorum*, defending Michael of Cesena. Francis was probably the first to respond to the papal bull *Quia vir reprobus*, penning a long treatise entitled *Improbatio*. In 1331 he signed the letter sent by Michael of Cesena to the general chapter of the Friars Minor in Perpignan. From a vitriolic letter of Gerald Odonis to Michael of Cesena, we learn that Francis had been robbed of a rather large sum of money while heading to Munich, probably in Como. Newly discovered documents confirm this passage through Como.

Fragments of a trial record inform us that at one point (most probably in 1341) Francis was in the hands of the Roman Church. At first he tried to defend his position, claiming that his statements were compatible with the doctrine held by Pope John XXII. In the end he recanted, on December 1, 1343. He then disappears from our records, although a late-fourteenth-century source (the Franciscan Andrea Richi) reports that Francis wrote a treatise in which he argued in favor of the compatibility of Nicholas III's *Exiit qui seminatur* with John XXII's *Cum inter nonnullos* (that is, the contrary of what he had maintained while siding with Michael of Cesena). This work does not seem to have survived.

Francis of Marchia's thought is far from having been investigated in full, so the present entry is

limited to certain aspects. For several decades Francis' writings have been the object of interest for historians of science, because in his commentary on book IV of the *Sentences* he puts forth an account of projectile motion that is different from that of Aristotle. It centers on the idea that a projectile can continue to move when no longer in contact with the source of its motion, because this source has impressed a certain *virtus* on the projectile. Since this *virtus* is, so to speak, "left" in the projectile by the mover, it is called *virtus derelicta*. Such a *virtus* diminishes gradually during motion, and this progressive diminution explains why projectile motion comes to an end. It is easy to see why Francis could have been considered a sort of "forerunner" of Galileo Galilei. Nevertheless, on the one hand, most recent studies have shown that Francis did not invent the basis for his account of projectile motion, but it had been circulating for decades in European arts faculties among commentators on Aristotle's *Physics*, although few authors supported it at length or with Francis' arguments; on the other, the link between *virtus derelicta* and the modern theory of inertia has been fundamentally reassessed. While scholars debate the true relationship between the *virtus derelicta* approach to a theory of motion and seventeenth-century mechanics, it is beyond doubt that Francis' theory exerted an important influence, even on authors who only partially accepted his suggestions or who rejected them. Something similar holds for Francis' rejection of Aristotle's distinction between celestial and terrestrial matter. However "revolutionary" such a claim may appear at first glance, Francis did not draw the consequences as a "modern" reader would expect, so the connection between his position and the "Scientific Revolution" is not as close as some historians of thought claimed in the past.

More recently, scholars have investigated Marchia's ideas concerning necessity and contingency with respect to divine foreknowledge. Like many Franciscan authors of his era, Francis is acquainted with the innovative theories Peter Auriol formulated in his lectures on the *Sentences*, reacting to them. In particular, Francis opposes Auriol's opinion that propositions concerning

future contingents are neutral, in the sense that they are neither true nor false. Francis of Marchia develops a solution to the problem that, while avoiding the existence of indeterminate future contingents, still maintains that contingency exists, and not only in an accidental way, that is, because of the shortcomings of our limited human knowledge, but also in itself, grounded in God's freedom. Francis therefore supports a kind of "determinism" that does not rule out the possibility of human freedom. On this point, Francis found many followers in the fourteenth century, so that Chris Schabel speaks of a "Marchist" school.

Generally speaking, as our knowledge of the theological debates of the first decades of the fourteenth century increases, the influence that the thinker from Appignano actually exerted is turning out to be much greater than expected. This also holds true in the field of political theory. In his almost word-for-word refutation of John XXII's *Quia vir reprobus* (which in turn resembles more a scholastic treatise than a papal bull), the lengthy *Improbatio*, Francis discusses some issues that connect the defense of the Franciscan theory of poverty to political theory. In particular he develops John Duns Scotus' account of the origins of ownership and *dominium* in general into a refutation of Pope John's claim that the division of property among men is a divine institution. According to Francis, on the contrary, the institution of ownership is nothing but an ad hoc solution to the problems caused by Original Sin. God's plan and human nature privilege the community of goods. To some extent this influences the postlapsarian state as well, since humans can still renounce property by taking a religious vow that allows them to live in a state closer to perfection. Moreover, in cases of extreme necessity, the rule of property ceases to be valid and the person in need can use what she/he requires to survive. Like ownership, political power is also solely of human and not of divine origin. This claim implies that, in order for temporal power to be legitimate, it need not be authorized by the spiritual power, because it belongs to the sphere of autonomous human initiative, which tries to adjust to the negative consequences of the Fall. As Hilary S. Offler and Jürgen Miethke have

shown, such ideas deeply influenced William of Ockham in the early stages of his involvement in the debate on Franciscan poverty and also paved the way for his political theory.

Francis of Meyronnes

William Duba

Department of Philosophy, University of
Fribourg, Fribourg, Switzerland

Abstract

Francis of Meyronnes, O.F.M. (c. 1288–c. 1328), was a Provençal Franciscan theologian and sermonist. Francis studied with John Duns Scotus at the University of Paris and came to prominence in the early 1320s as a bachelor and then master of theology at Paris. His works were extremely influential from the years immediately following his teaching into the modern era, but only a small fraction is edited. Heavily influenced by John Duns Scotus, he does not hesitate to modify or abandon Scotus' thought. His metaphysics is heavily realist: he explicitly declares his allegiance to Platonic ideas, which he understands as identical with quiddities and beings of essence, and he holds that propositions have real existence. Francis' doctrine of divine knowledge largely derives from Scotus; his notion of intuitive and abstractive cognition, on the other hand, differs by positing that intuitive cognition is the mental seizing of an

object with all its merely formally distinct modes, and can occur through species. Francis defines place as the located object's presentiality as related to God, and time as the flux of place to God. His sermons have been praised for their mystical and ascetic quality, but his treatises on the mystical and ascetic topics have been characterized as impersonal. In his political writings, Francis favored the subjection of secular authority to the pope.

Born in the village of Meyronnes in Provence, Francis of Meyronnes joined the Franciscan convent of Digne and entered the Franciscan educational system. Between 1304 and 1307, he was sent to the University of Paris, where he attended the lectures of his confrere John Duns Scotus. After teaching in the provincial *studia* of the Franciscan Order, Francis returned to Paris as a Bachelor of Theology and lectured on the *Sentences* of Peter Lombard in 1320–1321, notably engaging in debate with the Benedictine Pierre Roger (later Pope Clement VI) and the Dominican John of Prato. In 1323, Francis was promoted to master of theology, and elected provincial minister of Aquitaine. In 1324, he appears at the Papal Curia in Avignon, giving sermons and holding theological debates, and served on a diplomatic mission to Gascony. He died in Piacenza.

Francis of Meyronnes benefited from the patronage of the Angevin dynasty, to which his family was related. On May 24, 1323, in a letter instructing the chancellor of the University of Paris to award Francis the title Master of Theology, Pope John XXII notes that Robert of Anjou, King of Naples, requested this promotion. In autumn of the same year, Francis was present at the death of St. Elzéar de Sabran, who had come to Paris to negotiate Charles of Anjou's marriage. Francis also pronounced Elzéar's funeral oration. Francis dedicated to Robert of Anjou his commentary on the works of Pseudo-Dionysius the Areopagite.

Referred to by later generations as the *doctor illuminatus* or *acutus*, the *magister abstractionum* and even the *princeps scotistarum*, Francis of Meyronnes had immediate and lasting impact

through his writings, above all his commentary on the *Sentences* of Peter Lombard, which exists in over 100 medieval manuscripts. Subsequent Franciscan theologians, such as Himbert of Garda (1320s), Aufredo Gonteri Brito (1325), and Pastor of Serrescudio (1332–1333), summarized or copied Meyronnes' works in their own commentaries on the *Sentences*. Fifteenth-century thinkers cite not only Francis' thought, but also refer to *mayronistae* and *via mayronis*. Many of Meyronnes' works exist in numerous early modern printings. Yet this very breadth and diversity in Meyronnes' writings has proved a hindrance to modern scholarship. A handful of select passages and minor treatises are available in modern critical edition, and nearly half of Meyronnes' writings are accessible only in manuscript. Contemporary studies on particular subjects reveal Meyronnes' originality and philosophical interest, but not even the fundamental study of Roth (1936) achieves a comprehensive overview of his thought.

Francis of Meyronnes is a reputed Scotist, referring frequently to John Duns Scotus as *doctor noster*, and is perhaps the earliest author to speak of opposing schools of thought at Paris, which some scholars interpret as indicating the existence of a Scotist and a Thomist school. He defends many doctrines characteristic of Scotus, such as the Immaculate Conception and the univocity of being, and he uses Scotistic notions, such as the formal distinction, *haeccitas* as principle of individuation, and the division of being into being-in-actuality and being-in-objective-potency. In outlining his specific opinions, however, Francis does not hesitate to oppose the mature position of Scotus. Meyronnes criticizes Scotus' doctrine of formal nonidentity *ex natura rei*, and instead defines the formal distinction as founded on really different intrinsic modes inhering in the same thing.

Among ancient authorities, Francis of Meyronnes favors Augustine and the Pseudo-Dionysius the Areopagite, and even compiled selected texts with commentary for each of these authors. His use of the Pseudo-Dionysius is idiosyncratic, perhaps deriving from his stated belief that Dionysius received from Paul formal instruction in the content of the Beatific Vision.

Meyronnes treats the Pseudo-Dionysius' works as a guide to positive knowledge about God in this life, interpreting these treatises of Greek negative theology in terms of fourteenth-century western scholasticism.

Augustine likewise exerted a powerful influence on Francis' realism. While rejecting all arguments from reason for the necessary existence of divine ideas, Francis claims on the authority of Augustine that they do exist. He distinguishes these infinite and exemplary "theological ideas" from "metaphysical ideas." Ideas in the theological sense are foundational relations, distinct from formal relations in that foundational relations require only the foundation to exist, and not the term, whereas both must exist in the case of a formal relation. Francis identifies ideas in the metaphysical sense as the ideas of Plato, properly understood, and not as Aristotle presents them; indeed, Francis calls Aristotle the "worst metaphysician" for having misunderstood Platonic ideas. Presumably, Meyronnes interprets Platonic ideas through Augustine, for the only work Meyronnes cites as being written by Plato is Porphyry's *Isagoge* to the *Categories*. For Meyronnes, "idea" in the metaphysical sense, "quiddity," and the "being of essence" (*esse essentiae*) all refer to the same thing: the formal nature of a reality, abstracted from all intrinsic modes, including existence, actuality, reality, and contingency. As such, the quiddities are independent of any rational or real relation of production and contemplation. With respect to the being of essence, creatures are said to be in (objective) potency prior to being in actuality and having the mode of existence (*esse existentiae*).

Francis of Meyronnes argues for the priority of the will over the intellect in the divine determination and knowledge of contingent propositions. Following Scotus, Francis divides God's determination into four logically ordered instants (instants of nature), corresponding to the divine essence's presentation of the terms of all possible propositions to the intellect, said intellect's generation of necessary and contingent propositions, the determination of contingent propositions through the action of the will, and, finally, the knowledge of these propositions by the divine intellect.

Propositions, as complexes of things existing together or divided, have real (subjective) existence, and on them is founded the proposition as it exists objectively in the mind. Francis bases this subjective existence on the real identity and formal distinction of extramental beings, such as “man” and “white.” For as these beings are really the same thing, a formal relation holds between them, and a formal relation requires the existence of both term and foundation. Objective mental existence comes about through intuitive cognition, in this life, based on infallible human sensation; intuitive cognition can occur through *species*. In intuitive cognition, the mind grasps the entire thing, including all its really identical (and formally distinct) modes, including existence. In contrast, abstractive cognition occurs when the mind considers merely the essence, “quidditatively in quidditative being,” which Francis identifies as a concept of first intention. Francis develops two other types of cognition, namely discursive and inferential (*illative*) cognition, the latter being the means by which the rational soul is self-aware. Cognition itself is really identical with a relation to the cognized being, and so not even God could cause an intuitive cognition of a nonexistent.

Francis’ doctrine of relations also plays a major role in his natural philosophy. Place is the presentiality (*praesentialitas*) of the thing to God, that is, the relation of the located thing to the eternal and ubiquitous unmoved mover; motion involves changing presentiality, and hence is a *fluxus formae* rather than a *forma fluens*. Time is a foundational relation of the succession of places, and therefore is, in Meyronnes’ words, “the flux of presentiality to God” (*In II Sent.* 2.14). As a consequence, all created reality is mobile, at least metaphorically: God has the power to make the Earth revolve (but does not).

Francis of Meyronnes was a prolific sermonist; Roßmann praises the ascetic and mystical quality of his sermons and declares them closer to the *devotio moderna* than those by Meister Eckhart (Roßmann 1972). Yet studies of Meyronnes’ other works touching on ascetic and mystical topics have revealed that he focuses on detached, rational analysis. Speaking of his commentary on the

writings of Pseudo-Dionysius, one scholar observed “Meyronnes seems to hide his own religious experience behind the objectivity of the discussion” (Alliney 2002).

Francis authored a treatise on apostolic poverty, arguing for the radical poverty of Christ and the Apostles. In his political writings, Francis was a papal hierocrat, and in a quodlibetal question, he managed to align his political philosophy with his biggest patrons, maintaining that the Kingdom of Naples was all the more noble because it was subordinate to the Church. Francis remained an ally of John XXII and produced pro-Papal consultations on ongoing theological and philosophical controversies, including the 1324 proceedings against William of Ockham and the *Lectura in Apocalypsim* of Peter John Olivi.

Francisco de Vitoria

Holly Hamilton-Bleakley
Brampton, UK

Abstract

Francisco de Vitoria (1485–1546) was a Spanish theologian and philosopher known in the history of philosophy as a major figure in the revival of the study of Thomism in the sixteenth century. He used Thomism to formulate influential responses to the spiritual and political issues of his time, such as the Reformation, the nature of sovereignty and the notion of the sovereign state, imperial expansion, and the rights of conquered peoples. As a Counter-Reformation theologian, he asserted the goodness and rationality of man's nature, which were manifested in his natural inclinations, irrespective of man's reception of grace or spiritual status. His doctrine of natural inclinations had political consequences, and made him an opponent not only of Lutheranism but also of republicanism, as political authority – and particularly monarchy – was natural to man, not a result of his sinfulness, and its purpose was to enable man to fulfill his God-given human nature. The source of political authority was God, and God was therefore the source of human law, which men must see as binding in conscience. Yet, Vitoria contributed not only to the idea of a God-given mandate for the exercise of political power, but also to the idea of the limits of political power, as it must be constrained by the fulfillment of man's humanity.

Francisco de Vitoria (1485–1546) was a Spanish theologian and philosopher who was a leading figure in the sixteenth-century revival of Thomism, a movement which was central to early modern ideas about natural law, individual rights, and the state. This revival of Thomism is associated most closely with the “School of Salamanca”

or, the “Second Scholastic”, a group of Spanish theologians and jurists spanning two generations who wrote immensely influential works on moral and political philosophy. Vitoria is known as the “father” of this school, as nearly all of these scholars were either his students, or students of his students.

Vitoria was born around 1485. He entered the Dominican Order in Burgos in 1506. In 1509 he went to study in Paris at the Collège de Saint Jacques, where he eventually studied under the Thomist Peter Crockaert, who, in a pivotal move for the history of ideas, changed the set text in his lectures from Lombard's *Sentences* to Aquinas' *Summa theologiae*. Vitoria continued this tradition when he himself became a professor. Vitoria returned to Spain in 1523, and was elected Prime Chair of Theology at the University of Salamanca in 1526.

Vitoria published nothing of his own during his lifetime; what we have of his works are notes taken by his students during his lectures. Vitoria lectured on the *Summa theologiae* as well as on the *Sentences*, and he also gave several *relectiones*, which were longer and more formal lectures given at a certain time during the year on a particular academic problem. Since they have a distinct focus, these “relectiones” are, therefore, an especially good source for becoming familiar with Vitoria's thought on a variety of different subjects.

Vitoria's fame comes not because of his role in the revival of Thomism, but rather because of his role in employing Thomism to develop a political philosophy which was responsive to the challenges of sixteenth-century Europe, such as the notion of the sovereign state, the Reformation and the questions which it raised about the nature of the power of the church as well as the power of the state, and the conquest of America and imperial expansion. He is known in the history of political thought, perhaps most famously, for his writings on “international relations,” by which is meant his theory of the just war, the legitimation of the Spanish conquest of America, and his theory of the rights of the American Indians as the indigenous people of a conquered territory. His Thomist

approach enabled him to formulate a theory of rights in which all human beings had rights because of their inborn rational nature, rights not dependent upon God's grace or the righteousness of the individual. He could, therefore, assert that the Indians had rights over themselves and their property although they were non-Christians. Because much scholarly work on Vitoria has been done on his treatment of these subjects of human rights and imperial expansion (Fernandez-Santamaria 2005: 58–59; Pagden and Lawrance 1991: xxxi–xxxii and 383–387; Tierney 1997: 255–256), I will focus on his responses to other challenges of his time, specifically the sovereignty of the state and some of the theological and political problems posed by the Reformation. Addressing these issues will allow us to look at some of the more basic elements of his political thought, namely, his theory of natural law, natural inclinations, naturalness of the state, and the location of sovereignty. I regret that for reasons of space it will not be possible to treat his theory of the church in this article.

Vitoria's most systematic treatment of political questions is the *De potestate civili*, which is one of his earliest *relectiones*, delivered in 1528. The political theory that Vitoria lays out here was formed in the shadow of two major rebellions: the *comuneros* revolt of 1521–1522 and the Peasants' War of 1525. The first was republican in inspiration, the second, Catholics saw as a direct result of Lutheranism (Cargill Thompson 1984: 99–100). Despite the differences between republicanism and Lutheranism, both led to what Vitoria perceived as disrespect for political authority. Neither saw the state as natural to man in his present condition, and therefore both portrayed political authority in a way that could lead to discontent and unrest.

Vitoria's thinking on political issues throughout his career was of course not limited to countering republicanism and Lutheranism. However, these movements set the agenda for Vitoria in two ways. First, the fact that they "dissuade . . . simple men from due obedience to their princes . . ." was to make the preservation of the civil order a central theme in Vitoria's political thought; anarchy was to be avoided through political obedience and

a strong monarchy. Second, the way in which he tries to counter these issues in *De potestate civili* – by proving the necessity and legitimacy of political authority through showing that political society is the arrangement best suited to man because it fulfills his rational, human nature – sets the framework of his theory which was to endure throughout his work. I will first briefly set out some republican and Lutheran arguments and their political consequences, and then look at the way Vitoria used elements in his theory to directly or indirectly counter these arguments.

In 1520, the cities of Castile rebelled against Charles I in what is now known as the *Comunero* movement. Due to various grievances committed by the king, the members of these cities grouped together to form a body of representatives (*procuradores*) which saw itself as a parliamentary institution, which could convene itself and legislate without regard to the king's will (Fernandez-Santamaria 1977: 55). Although the movement was crushed by royal forces in 1522, the fundamental questions which it raised about the nature of sovereignty were kept alive through the publication of the *Tractado de república* in 1521, written by Trinitarian friar Alonso de Castrillo, who was sympathetic to the movement (Fernandez-Santamaria 2005: 292).

In his treatise, Castrillo had tried to discredit the idea of royal power, arguing that the political servitude which it represented was far from natural. According to Vitoria, the republican cause "denied that kingly power or any kind of rule by a single person comes from God" and affirmed "that all sovereigns, generals, and princes are tyrants and robbers of human liberty" (*De potestate civili*, 1.5, trans. in Pagden and Lawrance 1991). Instead, they argue that "man was born free," since in the state of innocence "no man was master and no man was slave." God has never decreed that men "should suffer the dominion of some other man who had violently arrogated sovereignty to himself," which is the way in which they portray the relationship of a king to his subjects. The result of these arguments is that they "stir up sedition against our rulers."

In Vitoria's view, Lutheranism, too, led to political disobedience, but for different reasons.

Luther's main political work, *Secular Authority: To What Extent It Should Be Obeyed*, appeared in March, 1523, and argued that there were limits to political authority, which should not be overstepped by the ruler. These limits were a result of Luther's view of the purpose of government, which in turn resulted from his view of the nature of man. Man in his human nature is sinful and naturally inclined to act against the law which God has given to him; political authority, which is ordained of God, is founded solely to restrain these natural inclinations for evil and malice. Its purpose is to "punish the wicked and protect the just." It is, therefore, a purely temporal authority; that is, its laws "extend no further than the body, goods and outward, earthly matters," such as maintaining order and peace (*Von Weltlicher Oberkeit*, in *Luther and Calvin on Secular Authority*, ed. Höpfl). Thus, if secular rulers "command anything that is contrary to God's word or which involves disobedience to God, they must not be obeyed (Cargill Thompson 1984: 97)."

Vitoria's basis for refuting both of these positions is his view of the origin and purpose of political society and, therefore, of political authority. This, in turn, is founded on his theory of natural law and man's natural inclinations, so I will turn to this aspect of his theory first.

Following Aquinas, Vitoria maintains that there are four varieties of law: eternal law, natural law, human law, and divine law. Eternal law is God's dictate of practical reason which governs all of his creation, and natural law is the participation of rational creatures in this *summa ratio*. It was accessible to man in two ways; the first way was through a set of "first" principles self-evident (*per se nota*) to man's understanding. *Per se nota* principles were known to man through a habit called *synderesis*. They consisted of principles such as "good is to be done and evil avoided" and "do unto others as you would have others do unto you," and could be recognized as true by everyone. These were regarded among scholastics as implanted by God in man, and were proof of man's inherent rationality and sense of justice, which could be developed through good education and experience.

The second way in which natural law was recognizable to man was through divinely implanted natural inclinations towards certain ends. Just as in speculative reasoning there are principles which are *per se nota*, so too there are principles which are *per se nota* in practical reasoning. Yet, the process by which these principles are known is different for each. In the case of practical reasoning, man knows the *per se nota* principles through *natural inclinations* which he has; these natural inclinations thus indicate the way in which God has ordered man to live, and therefore indicate precepts of the natural law. Vitoria explains: "if a thing is against natural inclination it is prohibited, if it is according to natural inclination it is a precept" (*Comentario al tratado de la ley*, trans. in Pagden and Lawrance 1991).

It was through his theory of natural inclinations that Vitoria was able to offer some of his strongest refutations of Luther – both of Luther's concept of man, as well as of his concept of political society. Although Vitoria discusses his notion of natural inclinations in his commentary on qu. 94 of the *Summa* without mentioning theories which may be opposed to it, in his *De homicidio* he offers a sustained defense of natural inclinations, specifically directing his arguments against current ideologies in which "nature and grace, law and natural inclination" are opposed to one another (*Relecciones*, ed. Gatino, 3:26).

Vitoria recognizes here that there is a diverse group of scholars and theologians arguing for the opposition of man's nature and the law of God: some are Aristotelians, who argue that although man by nature is inclined to seek what is good, the "good" which man naturally seeks is really the "pleasurable," which is most often sinful and against the law of God; others note that man is naturally inclined against what is demanded by virtue and the law of God, such as the commandment to have charity toward others and love God more than himself, as man is naturally inclined to preserve himself before others. Still others show through Scripture that the natural inclination of man is to sin and seek out what is bad. Yet, the conclusion drawn through all these arguments is the Lutheran contention that "all the works of

every human being are sinful,' and man is able to do nothing good of himself without the grace of God.

Vitoria asserts that he cannot believe that "human nature, which an all powerful and most wise God formed in his image," could have been created with bad inclinations and a depraved character, such that he would be inclined "to his own destruction and condemnation." Rather, "the inclination of human nature is immediately from God Himself," and it is therefore impossible for that inclination to be toward what is bad. God is the author of human nature, and Vitoria invokes Aristotle to explain how this authorship is to be understood: God created man with his particular form, by which is dictated man's end, and whatever gives form, also determines the consequences of that form. Thus, only God can be the cause of human inclinations, which are toward the end which God has established for man.

If we say therefore, that "man is naturally inclined to the bad," that inclination, along with the motions toward sin which follow from that inclination, must be imputed to God. Since God would not give a particular end to man, and a nature completely repugnant to it, Vitoria argues that nature inclines us only toward the good, and "thus everything that is contrary to natural inclination is bad."

Vitoria's theory of the origin of the state – and therefore of civil power – follows directly from this notion of natural inclinations. Man is naturally inclined toward political society, first because he lacks certain physical qualities which would enable him to live alone; and second, man's "rational soul itself makes man need partnership" (*De potestate civili*, 1.2). Both man's reason and his will can only be perfected by interacting with others. So, God "was responsible for endowing men with the necessity and inclination which ensure that they cannot live except in partnership." The city is the partnership which best fulfills these needs, and is therefore the most natural arrangement for men to establish. In this way, the city is God-given, since God has given man his form, and man's form dictates that he live in partnership with others. Furthermore, since God made man "part of the republic," he also gave man

a natural inclination toward the social virtues, such as to love the common good more than his own proper good (*De homicidio*:31).

Vitoria uses this notion of political society fulfilling man's God-given human nature as the foundation of his arguments for political obedience, and even (against the republicans) for the divine right of kings. First, since political society is God-given, and the city cannot exist without some ruling power, civil power is also God-given. Throughout his work, Vitoria cites many times the Pauline phrase "whosoever resisteth the power, resisteth the ordinance of God."

In order to counter republican arguments, it is essential to identify the location of this power. Vitoria attempts this in *De potestate civili*. He maintains that "first and *per se*" civil power resides in the commonwealth itself, for "there is no convincing reason why one man should have more power than another" (1.4). Thus, the commonwealth has this power as a whole body, and it has this power collectively "over the individual members of the commonwealth" (1.5).

However, it is impossible for the whole commonwealth to exercise this power over itself. It is therefore "necessary that the government and administration of affairs be entrusted to certain men who take upon themselves the responsibilities of the commonwealth and look after the common good . . ." Although republicans declare that there cannot be liberty in any system other than government "by the whole commonwealth," Vitoria dismisses this idea, arguing that there is no more liberty in rule by the multitude than there is in a monarchy or aristocracy (1.8). Yet, Vitoria is interested in justifying royal power in particular. The establishment of rulers – indeed, of a king – does not represent political servitude; for, not only does the naturalness of political society show that the relationship between king and subject is not one of unnatural dominion, but also, the commonwealth, as possessor of civil power over itself, sets up its own sovereign to administer its affairs.

Initially, Vitoria held that even though sovereignty resides in the body of the people, the ruler does not have his power from the people: "sovereigns are set up by the commonwealth, [but] royal power derives immediately from God . . . therefore

we must say about royal power exactly what we have asserted about the power of the commonwealth, namely that it is set up by God and by natural law” (1.5). Vitoria then used this idea of the divine right of kings to argue for political obedience. Because God is the source of political authority, he is also, therefore, the source of human law, for “a work of God is not only one which He performs Himself, but also one which He produces through intermediate causes” (3.1). For Vitoria, this means, *contra* Luther, that human laws are binding in conscience. It is incorrect to say that “secular power is solely temporal,” and therefore “has nothing to do with conscience.” Although he maintains a distinction between temporal and spiritual authority, Vitoria’s notion of man and the divine origins of the ruler’s power allows him to dismiss the limits which Luther had placed on secular power. Rather, Christ has decreed obedience to rulers, and their laws therefore are binding in conscience, just as divine laws are.

These ideas of the ruler’s power and his laws coming directly from God are conservative to be sure; the most likely explanation for them is Vitoria’s fear of anarchy and desire for political order. In Vitoria’s later writings, he seemed to drop the idea of the ruler’s power coming directly from God, and asserted instead that the ruler’s power came wholly from the people; however, he continued to maintain the importance of a strong monarchy, as well as the fact that human law was ordained of God and was therefore binding in conscience (Tierney 1997: 294–295).

Yet, Vitoria’s conservative conclusions were based on Thomist principles of the rationality and goodness of man. These principles allowed him to set out two essential political doctrines. First, political power, although ordained of God, was separate from spiritual power – an idea that was to become crucial with the rise of the monarch as head of state and of church, as with Henry VIII. Second, the individual as political subject was a rational being who had certain natural inclinations, pointing toward his end as a human being. The fulfillment of these inclinations gave political power its purpose, but also its limitations. The agenda of political authority was written according to man’s God-given needs and rights,

not according to his unworthiness, or the ruler’s desire for power. From these foundations, Vitoria would contribute to the idea of a just and limited secular power in a way that Lutheranism never could. Although his successors of the “second scholastic” were to come to different conclusions than Vitoria as they faced their own problems and fought their own ideological battles, they owed to him the beginnings of a crucial project to reinsert man’s inherent rationality and goodness into the heart of sixteenth-century political thought.

Future Contingents

Simo Knuuttila

Helsinki Collegium for Advanced Studies,
University of Helsinki, Helsinki, Finland

Abstract

The philosophical debate concerning the truth-value of singular statements about future contingents derives from Chap. 9 of Aristotle's treatise *De Interpretatione*. In his influential commentary, Boethius assumed that Aristotle qualified the validity of the principle of bivalence with respect to singular future contingent propositions – they only have the disjunctive truth-value “true or false.” Abelard believed that Aristotle assumed that future contingent statements were true or false, though not determinately true or false before the actuality of the things to which they refer. He retained the principle of bivalence for all assertoric statements but rejected the universal application of the stronger principle that every assertoric statement is determinately true or determinately false in the sense of having determinate truth-makers. As for interpreting Aristotle, later medieval thinkers were inclined to follow Boethius rather than Abelard. However, since theologians usually thought that

divine omniscience presupposed bivalence, the discussion of future contingents was divided into historical constructions of Aristotle's view and the systematic discussions in theology which usually followed the Abelardian lines. An influential formulation of this approach was put forward by William of Ockham. Boethius, Thomas Aquinas, and many others thought that God could know future contingents only because the flux of time was present to divine atemporal eternity. Peter Auriol argued that from God's atemporal knowledge one could not conclude that future contingent propositions were true or false at all. This view found some supporters until it was damned by Pope Sixtus IV in 1474. Many late medieval thinkers defended God's ability to foreknow free acts. This led to the famous middle knowledge theory of the counterfactuals of freedom which was put forward by Luis de Molina in the sixteenth century.

The philosophical debate concerning the truth-value of future contingent propositions derives from Chap. 9 of Aristotle's treatise *De Interpretatione*, where it is asked whether predictions such as “There will be a sea battle tomorrow” are true or false, whether they are necessarily true if true, and whether their truth entails that future things are inevitable. Some Stoics took Aristotle to deny that future contingent propositions are true or false, as Boethius reports in his longer commentary on Aristotle's *De Interpretatione*. Future contingent propositions were regarded as true or false in Stoic logic, and the universally valid principle of bivalence was taken to imply the predetermination of all future events. Boethius regarded the Stoic view of future contingent propositions as well as the Stoic characterization of Aristotle's position as false, his interpretation being based on the distinction between definite and indefinite division of truth and falsity in the contradictory pairs of propositions. According to Boethius, Aristotle argues that if all pairs of contradictory propositions definitely divide truth and falsity and all propositions are definitely true or definitely false, then everything necessarily occurs as it does. The fact that contingent future

things, events, and states of affairs are not determined refutes the thesis that all affirmations or negations are definitely true or definitely false. The disjunctive pairs of contradictory future contingent propositions can be said to divide truth and falsity only in an undifferentiated and indefinite way. Most contemporary commentators believe that in Boethius' view these propositions are neither definitely true nor definitely false and therefore neither true nor false. In answering the Stoic criticism, Boethius might have thought that future contingent propositions have the disjunctive property of being true or false, which would mean something other than simply lacking a truth-value. The same view is ascribed to Ammonius and some other late ancient thinkers. Another contemporary interpretation of Boethius holds that future contingents are not definitely true or false, because their truth-makers are not yet determined, but are true or false in an indeterminate way. No qualification of the principle of bivalence is involved. True statements are either determinately true or simply (indeterminately) true. Boethius' formulations often suggest that future contingent propositions are true or false without being true or false, but perhaps he was not quite sure about this.

The past and the present are necessary in Boethius. Prospective contingent alternatives with respect to a future event remain open until the relevant causes are settled or the event takes place and the alternative options vanish. Even though Boethius developed an elaborated conception of diachronic future alternatives with respect to a given future time, he did not associate this with the idea of simultaneous alternatives at that time. In his opinion the actuality of a state of affairs excludes its possible alternatives. Correspondingly, he seems to think that the truth of future propositions would mean that things cannot be otherwise, for the antecedently assumed actuality of future truth-makers implies that alternative prospective possibilities refer to things that are rendered temporally impossible by the actualized alternatives.

In his logical works, Peter Abelard argues that future contingent propositions are true or false, although not determinately or necessarily so, and

takes this to be Aristotle's view as well. The difference between future contingent propositions and other propositions has nothing to do with a difference with respect to bivalence; it concerns the determinateness or indeterminateness of the truth and truth-makers of propositions. The central thesis of Chap. 9 of Aristotle's *De Interpretatione* is that of all contradictory pairs of propositions necessarily one part is true and the other false. This does not imply that one is necessarily true and the other necessarily false, although one is true and the other false.

Abelard pays attention to some propositions about past and present states of affairs the truth and falsity of which depend on future contingents, such as "Socrates is the name of a man going to eat tomorrow" or "He has spoken falsely," when this is said of a man who said yesterday that Socrates will eat tomorrow. The truth and falsity of propositions of this kind are not knowable without knowledge of future contingent states of affairs which are indeterminate and epistemically inaccessible to human beings. Hence, the propositions have an indeterminate truth and falsity and do not differ from future contingent propositions in this respect. Propositions are indeterminately true or false if their truth depends on indeterminate future contingent states of affairs. Abelard also remarks that God knows whether any proposition is true and false, but this supranatural knowability does not make things necessary.

In discussing the necessity of the present, Abelard follows Boethius in stating that what is actual at a certain point of time is necessary in the sense that it can no longer be avoided, but he also argues that unrealized alternatives may be possible at the same time in the sense that they could have happened at that time. The actuality of a contingent state of affairs at a specified future time does not exclude the nontemporal possibility of simultaneous alternatives, nor does the truth of a proposition about this state of affairs make it necessary. This is the background of Abelard's deviation from Boethius' view of the truth and falsity of future contingent propositions.

According to Albert the Great and Thomas Aquinas, Aristotle argues in *De Interpretatione* 9 that future contingent propositions differ from

other assertoric propositions in not being determinately true or determinately false. Their general view of the structure of Chap. 9 is similar to that of Boethius. Instead of the Boethian definite-indefinite distinction, Albert and Aquinas employed the terms “determinate” and “indeterminate,” as Abelard and many other medieval commentators did. Assertoric propositions are related to truth or falsity in the same way as their correlates are related to being or nonbeing. When future things are indeterminate with respect to being and nonbeing, the contradictory propositions about them must also be indeterminate with respect to truth and falsity. A future contingent proposition and its denial form a disjunction which is necessarily true. The members of this disjunction are disjunctively true or false. The indeterminate truth or falsity of a member of the disjunction does not imply that it is true or that it is false. It is merely true or false. Because of the prospective indeterminateness of a sea battle, the propositions pertaining to it must be true or false under disjunction, being related to either, not to this or that determinately. Following Boethius, Aquinas thinks that contingency pertains to the future. Past and present things are necessary. The absence of the idea of synchronic alternatives in Boethius’ approach makes a true proposition about a future contingent event determinately and necessarily true. In his commentary on *De Interpretatione*, Aquinas describes this assumption by stating that if something concerning the future is posited to be true, it is not possible that this not be in the future (I.13).

The interpretation of Aristotle which restricted the bivalence with respect to future contingent propositions was also defended by the Arabic commentators al-Fārābī and Averroes. Among Latin authors, it was put forward by many later commentators, such as Walter Burley and William of Ockham. John Buridan read Aristotle in the same way as Abelard. All assertoric statements are true or false though those about future contingents are not determinately true.

Since theologians usually thought that divine omniscience presupposes bivalence, the discussion of future contingents was divided into

historical constructions of Aristotle’s view and the systematic discussions in theology that usually followed the Abelardian lines. Boethius argues that God is atemporal and has timeless knowledge of everything. God’s timelessness involves his having the whole history present to him simultaneously. God’s knowledge is not foreknowledge, since it is not temporally located, but the predictions of future contingents are true or false from the point of view of God’s eternal knowledge of the things referred to. This approach was very influential and was further developed in Aquinas’ theory of God who grasps all combinations of things at particular times by one eternal vision. God has an immediate knowledge of all things and their relative temporal order, though none of them is past or future with respect to His cognition. The objects of divine omniscience are necessary by supposition (i.e., with respect to God’s knowledge and providential plan), but many of them are contingent with respect to their proximate causes. God can supranaturally inform lower intellects about these things – otherwise there could not be true prophetic predictions. This is how Aquinas tries to combine the doctrine of divine omniscience and the lack of definite truth and falsity in future contingent propositions.

Medieval critics found the idea of the non-temporal presence of each instant of time to God’s eternal vision problematic. Ockham believed, like Scotus, that future contingent propositions are true or false, that created wills are nondetermined free causes the acts of which are contingent, and that God knows these without their being eternally present to God. Scotus and Ockham argued that only God and the present things are actual. While Scotus preferred to distinguish God’s eternal knowledge and choice from the temporal order sharply, Ockham thought that they could be treated as temporally past. This led him to ask how God’s foreknowledge as something past and fixed is compatible with the contingency of the future things. Ockham’s answer was that even though God’s foreknowledge is past, its content is future, and as far as it is about future contingents, it is itself contingent. This is the hallmark of what is called the Ockhamist view

of divine foreknowledge – it shows similarities to Abelard’s analysis.

Many early fourteenth-century authors were interested in the distinctions between determinate and indeterminate truth and falsity. Ockham characterized all prospective truths, whether necessary or contingent, as temporally unchanging and therefore determinate, but there were other suggestions as well. Some authors who associated the notions of indeterminate truth and falsity with the denial of bivalence for future contingent propositions held that these should not be treated as true or false in theology. One of these was Peter Auriol, who argued that even God is aware of the future in a way which does not imply that future contingent propositions are true or false. This view found some supporters until it was damned by Pope Sixtus IV in 1474.

Giving up the Boethian-Thomistic view of the atemporal presence of the flux of time to God, many authors wondered how God can foreknow the free decisions of people. This question was dealt in the theory of middle knowledge by Luis de Molina (1535–1600). In addition to the general knowledge of metaphysical possibilities and historical actualizations in the chosen world, God has a third kind of knowledge (*scientia media*) which comprises the hypothetical truths about possible beings. In creating the world, God knows of possible free creatures and what they would do in various possible situations. Molina’s “middle knowledge” theory about counterfactuals of freedom was actively debated in the sixteenth and seventeenth century, and it has remained a living theme in the philosophy of religion.

G

Gabriel Biel

Pekka Kärkkäinen
Faculty of Theology, University of Helsinki,
Helsinki, Finland

Abstract

Gabriel Biel (c. 1410–1495) was a theologian in Tübingen and a leader among the Brethren of Common Life. He was the most widely known representative of the late medieval *via moderna*, which was greatly influenced by fourteenth-century thought. He was the first professor of theology to teach the *via moderna* at the University of Tübingen, and he also had a remarkable impact on the Brethren of Common Life. Biel studied in Heidelberg, Erfurt, and Cologne. After graduation, he was a cathedral preacher in Mainz and joined the Brethren of Common Life before receiving a professorship of theology in Tübingen. Biel's main works consist of a commentary on the mass, *Canonis missae expositio*, and a *Sentences* commentary, *Collectorium in quattuor libros Sententiarum*. Both in philosophy and in theology, he was a close but not unoriginal follower of William of Ockham. Biel's *Sentences* commentary is formally an abridgement of Ockham's commentaries, but several other authorities, including Thomas Aquinas, Bonaventure, John Duns Scotus, Gregory of Rimini, Peter of Ailly, and John Gerson, are cited

extensively. In metaphysical and epistemological views, Biel closely followed Ockham, adopting his criticism of intelligible and sensory species, but rejecting his notion of multiplicity of substantial forms. Biel's ethics was mostly inspired by Ockham but also by Scotus and Gregory of Rimini.

Gabriel Biel was born in Speyer in about 1410. He was already an ordained minister when, in 1432, he matriculated in the faculty of arts at the University of Heidelberg. There he received the baccalaureate degree in 1435 and the master's degree in 1438. Thereafter, he served as a master in Heidelberg; but in 1451 he took up with study of theology in Erfurt, where he matriculated in the faculty of arts. In 1453, Biel matriculated in the faculty of theology at the University of Cologne, but in 1457, he received a licentiate of theology in Erfurt, although he never earned a master's degree.

Soon after receiving the licentiate degree, Biel moved to Mainz, where he served as a cathedral preacher and vicar for several years. In the struggle over the see of Mainz, Biel sided with Adolf of Nassau, who was appointed as archbishop by the pope. In the course of the controversy, Biel even had to flee Mainz and subsequently wrote a treatise entitled *Defense of the Apostolic Obedience*. During his years as a cathedral preacher, Biel joined the order of the Brethren of Common Life and subsequently stayed in Brethren Houses at

Marienthal, Butzbach, and Urach. During that time, he became an influential leader among the Brethren. In 1484, Biel was appointed as professor of theology at the University of Tübingen and became the first professor to represent the *via moderna* on the theological faculty. In 1485 and 1489, Biel was elected Rector of the university. During his last years, Biel retired from academic life and served as provost of the Brethren House of St. Peter's at Einsiedeln in Schönbuch, where he died in 1495.

The main corpus of Biel's philosophical writings, most of which date back to his early years as a master in Heidelberg, has not been thoroughly studied. The focus of research has been on his mature theology, although the philosophical views of his major theological works have also attracted some attention. In his philosophical views, Biel seems to have been a close follower of Ockham. This impression may partly be due to the fact that in the first book of his *Sentences* commentary, which is the main source for Biel's philosophical views, he mainly abbreviated Ockham's more elaborate discussions. In his discussion of theological issues, Biel also utilized extensively the views of other authorities, such as John Duns Scotus, Gregory of Rimini, Peter of Ailly, John Gerson, and even Thomas Aquinas and Bonaventure.

Biel based his metaphysical and epistemological views on Ockhamist conceptualism and ontological principle of parsimony. These included the views that all entities in the world are either singular substances or accidents and that there are no universal entities, but rather universals are merely accidents in the human mind. In Biel's theory of knowledge, the starting point is found in the intuitive cognition of present singular entities based on sense perception, which are a presupposition for further cognitions. According to Biel, the mind forms universal concepts out of similarities between the concepts of singular entities, and therefore the universal concepts are not conventional, but rather natural mental signs of the extramental similarities (*convenientia rerum*), insofar as the mind apprehends such similarities. In accordance with Ockham, Biel rejected the notions of

intelligible and sensory species as unnecessary. He also discussed the *factum* theory of universal concepts adopted by early Ockham but clearly opted for Ockham's mature theory of universal concepts as acts of thinking about many things at once.

In his psychology, Biel did not slavishly follow Ockham, although it is noteworthy that, unlike most of the contemporary proponents of the *via moderna*, he shared Ockham's criticism of the species theory of cognition and even defended it with the help of a detailed analysis of the sensory process. However, following the common view of the *via moderna*, Biel rejected the view, shared by Ockham, of multiplicity of substantial forms in a human being. According to Biel, intellectual and sensitive souls are not really distinct entities but merely names of faculties of one, undivided intellectual soul, which is the substantial form of the human body.

Biel's ethics is largely based on Ockham's views. Moral qualities of the external actions are primarily judged according to their underlying intentions, which should be consonant with the will of God. While sharing much of Ockham's ethics of divine command, Biel placed more emphasis on natural reason in agreement with Scotus and Gregory of Rimini. Therefore, Biel rejected the possibility that God would let human beings have the intention to hate God. The main undertone of Biel's ethics still remains voluntarist and consonant with ethical positivism. According to Biel, God does not will anything because it is good or right. Furthermore, God can do something that he himself has declared to be unjust, yet whatever it is becomes morally right whenever it is done by God. While aware of the shortcomings of this position, Biel often argued for the immutability of moral order as an actually established order of creation.

According to Biel, the moral reasoning takes place through inborn faculties dedicated to this purpose: synderesis, conscience, and right reason. These faculties rely on different kinds of laws, which are hierarchically ordered under the supreme and eternal law, which is identical with God's will. Knowledge of the eternal law is

gained through three kinds of inferior laws: natural, biblical, and positive human laws. Among these, natural law has precedence, since it is directly derived from the eternal law, and its commands are known to all men through the dictates of right reason. Biel also acknowledged the possibility of an error in conscience, which delivers the final recommendation for particular actions to be done, and he tried to solve the related problem of conflicting moral precepts.

Galen, Arabic

Ivan Garofalo

Emeritus prof. of University of Siena, Department of Classical Studies, Siena, Italy

Abstract

Galen of Pergamum (c. 129–c. 216) is one of the main authors of the Imperial period and the most influential medical writer in the medieval Greek, Latin, and Arabic worlds, as well as in the Renaissance. The translations of almost the whole of his work that were made into Arabic had an enormous impact on the Mediterranean civilization. These Arabic translations were in turn translated into Latin and had a huge influence on the Latin world up to the sixteenth century, to say the least. Moreover, the Arabic (or Arabo-Latin) translations are of great importance for establishing the text of the Greek Galen, even when the Greek text is extant, since these were made from Greek models much older than our manuscripts.

While recent literature has well explored the immense fortune of Galen in the Arabic world, both as a physician and as a philosopher (Pormann and Smith, *Medieval Islamic medicine*. Edinburgh: Edinburgh University Press, 2008), here I will limit myself to review the perspective that follows the history of Galen's tradition. I will address the Arabic and Arabo-Latin translations of Galenic works, namely, of the translations of the *Compendia*, of "Ioannes" Synopsis, of the Arabic commentaries of Alexandrian origin (Ibn Riḍwān, Abū l-Faraj ibn al-Ṭayyib, 'Alī 'Abbās al-Mājūsī, etc.), and, only selectively, the indirect tradition of the translations (Ḥunayn, al-Rāzī, al-Ruhawī, al-Kaskarī, al-Birūnī, etc.). Excellent repertoires are available for this analysis: Sezgin (*Medizin-Pharmazie-Zoologie-Tierheilkunde bis ca 430 H. Gesch Arab Schr 3*. Leiden: Brill, 1970), Ullmann (*Die Medizin im Islam*. Leiden: Brill, 1970), Strohmaier (1994, *Antike Naturwissenschaft in orientalischem Gewand/Lettre*

AKAN-Einzelschriften; Bd 6. Antike Naturwissenschaft und ihre Rezeption. Wissenschaftlicher, Trier, 2007), and Boudon-Millot (see editions *Ars medica*, *Protrepticus*, *Quod optimus medicus*, 2007).

Biography

The Arabic sources go back to the late-Alexandrian scholarship (“Ioannes Grammatikos, also author of commentaries on Galenic works”). As for their reliability or unreliability, they preserve genuine information along with a sometimes bizarrely incorrect chronology. These sources transmit a longer life span for Galen than the *Suda*, which grants him 70 years (129–199/200). This extension of Galen’s life allows to better distribute the great number of Galen’s elderly works. According to Nutton (2005), who argued the best for the new date (now generally accepted), Galen lived up to 216/217. This is also accepted by Schlange-Schöningh (2003).

The following is a list of editions (full or partial) of Galen’s works translated into Arabic. The first part includes those of the Alexandrian Canon, while in the second part the editions are grouped per genera.

De sectis: edition of the Arabic translation by Selim Selim, Cairo 1977; the MS Princeton Garrett 1075 has been used by Garofalo (2007).

Ars medica (Selim): Arabic translation used by V. Boudon-Millot in her edition, Paris 2000a.

De pulsibus (Selim): Arabic translation used by Garofalo (2009b).

Ad Glauconem: Arabic translation by Selim (1972).

Minor Anatomy (*De oss. De musc. diss., De ven. art. diss.*): critical edition of *De nerv. diss.* by Dubayān (2000) (and of the *compendium*: v. infra), Arabic translations used by Garofalo in Galien, tome VII and tome VIII, Paris 2005 and 2008.

De temperamentis (also *De inaequali intemperie, De bono habitu*): study by Garofalo (2006).

De elementis: Arabic translation used for the edition of De Lacy (1996).

De nat. fac.: see the *compendium*, infra.

De febr. diff.: two editions online, De Stefani (2004) and Wernhard (2005).

De pulsibus, major work (*De diff. puls., De caus. puls., De dignot. ex puls.*): see *compendia*.

De crisisibus: the Arabic translation has been used by Alexanderson for his edition of the Greek text.

De diebus decretoriis: Garofalo (2003b).

De locis affectis: Garofalo (1995).

De sanitate tuenda: the *compendium* and the *Synopsis* of “Ioannes Grammatikos” have been studied, v. infra.

De methodo medendi: Arabic translation and Arabo-Latin translation used by V. Lorusso for the edition of books I–II (thesis, Pisa, Scuola Normale Superiore 2010). Excerpts in Rāzī: Weisser (1997). Garofalo (2016).

Synopsis of *De methodo medendi*: Arabic translation of the second book discovered by I. Garofalo in ms. Princeton Garrett 1075, containing the Arabic translation of some *compendia* of the Alexandrians (v. infra), Garofalo (2000a).

Noncanonical Works

Biography

De libris suis, De ordine librorum suorum: Arabic translations used by V. Boudon-Millot, Galien tome I, Paris 2007 (with bibliography).

Philosophy

De propriis placitis: Known until Boudon-Millot-Pietrobelli’s edition (2007), only in the Arabo-Latin translation edited by Nutton (1999), now available in Greek (from MS Vlatadon 14). A comparison with the Arabo-Latin translation allows a better evaluation of the (poor) method used by the translator in rendering the Arabic.

De placitis Hippocratis et Platonis: Strohmaier in De Lacy’s edition 1996. The Arabs knew a tenth book in addition to the nine known to the Greek tradition.

Logic

De demonstratione: The great work (15 books) that was lacunary in Ḥunayn's times is known through scanty fragments in Greek and quotations in Arabic authors that have not yet been fully collected. The edition promised by Pines (1986) never appeared.

Ethics

De indolentia: the edition by Boudon-Millot and Jouanna (2010) allows to place the fragments of the Arabic indirect tradition. More use can be made from it to constitute the Greek text.

Quod optimus medicus sit quoque philosophus: the edition of the Arabic translation (lege Bauchmann 1965) has been used by Boudon-Millot (2007).

Protrepticus: excerpts of the Arabic indirect tradition (also Arabic-Hebrew) used by Boudon-Millot (2000b).

Anatomy

Anatomicae administrationes: edition of the Greek text (I–IX) and of the Arabic translation by Garofalo (1996, 2000a) (Italian translation of the whole work by Garofalo 2001).

Physiology

De motibus dubiis: Arabic translation with the Arabic-Latin one, edited by V. Nutton and G. Bos (2011).

Diagnostics

De symptomatum diff., *De sympt. causis* (*Liber de causis*): O. Overwien examines the Arabic tradition of *De symp. diff.* in CMG V 5, 1 ed. by B. Gundert (2009), pp. 103–152.

Medicine

De methodo medendi: Ursula Weisser (1997) studied Rāzī's excerpts of this work.

Pharmacology

Most of Galen's pharmacological works, *De comp. med. per locos* and *per genera*, have been excerpted by al-Rāzī, Ibn al-Bayṭar, and many others.

Hippocratic Commentaries

All the Arabic translations of the Hippocratic Commentaries should be reexamined, in particular,

Commentary on *Nat. hom.* used in German translation by Mewaldt. The lemmata have been edited by Mattock and used by Jouanna in his edition of *De nat. hom.*, CMG 1 1.3. The hypothesis may be advanced that Ḥunayn did not dispose of a commentary with lemmata and has inserted the lemmata from a manuscript of Hippocrates akin to our manuscript (see Jouanna introd. p. 99 ff.).

The commentary on *De frac.* is lost; excerpts in al-Rāzī.

Commentary on *Acute Diseases*: A. Pietrobelli used the Arabo-Latin translation (thèse Paris 2008).

Commentary on *Ar. aq. loc.*: Sezgin (2001) published a facsimile of the Cairo manuscript, critically edited by Strohmaier.

Commentary on *Aph.* The lemmata, edited by Tytler (1832) form a (quasi) continuous text used by Caroline Magdelaine (in collaboration with I. Garofalo), for her edition, thèse Paris 1994.

Commentaries on *Epidemics* I, II, III, VI: The pioneer work of Pfaff on the translations of the commentaries on *Epid.* needs to be updated; Vagelpohl and Hallum are preparing the edition of the Arabic translations of *Epid.* I and *Epid.* II. Project of Swain-Pormann (2008), <http://www2.warwick.ac.uk/fac/arts/history/chm/activities/galen/> (with bibliography). The mistakes, omissions, and arbitrary interpolations by Pfaff are innumerable; see Garofalo (2009a) (*Epidemics* I and II) and Garofalo (2010) (*Epid.* III and VI).

Commentary on *Hum.* Garofalo (2005b, 2009b). Collection of the fragments in preparation.

Commentary on *Off.* Partially preserved in Arabic, edited by Mattock, now used by Raiola-Garofalo for critical edition (see Raiola 2005).

Pseudo-Galen

Many pseudo-Galenic books produced in late-Alexandrian age enjoyed great appreciation in

the Arabic world and were translated first into Arabic and then partially into Latin, therefore greatly influencing western medicine. A few examples follow: *De dissolutione continua*, Bos and Garofalo (2005), Arabic-Hebrew, and Arabic-Latin translations. The pseudo-Galenic commentary on *De septimanis*, edited by Bergsträsser (1914), of some utility for the Greek text, seems of non-Greek origin. *On Iusiurandum*: Overwien (2009). *On De nat. pueri*: Giorgianni (2010) in view of the edition in CMG; a compilation of non-Greek origin.

Compendia and Synopses, Arabic Commentaries

A great influence on the Arabic world was exercised by the Alexandrian *Compendia* of the 16 groups of the works of Galen, also through ‘Alī Abbās and the excerpts in al-Rāzī: Garofalo (2000a, 2003a), Pormann (2003) (with Bibliography).

Compendium of *Ad Glauconem*: Garofalo (1995).
Compendium of *De diebus decretoriis*, with Italian translation of the compendium of the III book: Garofalo (2000a).

Compendium of *Nat. fac.*: Paola Annese, Thesis, Siena, 2005.

The Synopsis of “Ioannes Grammaticus,” a compendium of the 16 groups of books, with an introduction explaining the Canon: Garofalo (2001).

The Commentary of Ibn al-Ṭayyib on the *Ars medica*: lege Garofalo (2008b).

The Commentary of Ibn al-Ṭayyib on *De temperamentis* and *De elementis*: Garofalo (2006).

The Commentary of Ibn Riḍwan: Boudon (2000a).

Indirect Tradition

The indirect tradition of the Arabic Galen is immense. To mention just a few names: ‘Alī Abbās, who depends also on the *Compendia*;

al-Rāzī, whose *Hāwī* is a treasure of excerpts from the Arabic Galen; the translations and the *Compendia*, and many works by Ḥunayn (Garofalo 2009b), Maimonides (Bos 2004; Bos and Garofalo 2007), al-Kaskarī (Pormann 2009), and al-Ruhawī (Overwien 2009; Muggittu 2010). Alī ‘Abbās’ *Liber regius* and Rāzī’s *Hāwī* were translated into Latin. A great part of Galen was virtually known to the medieval West, in addition to the pre-Salernitan translations (Palmieri 2005; Garofalo 2009d).

The Translators

The most recent study after the basic works by Bergsträsser (1913) and Meyerhof (1926) is Micheau (1997), who also gives information on Ḥunayn and his school’s patrons and commissioners. For the Arabic-Latin translators Constantinus the African, Gerard of Cremona, Marc of Toledo, etc., see Jacquart and Micheau (1990).

Galen and Hippocrates

Galen has been the most important intermediary for the knowledge of Hippocrates in the late-Alexandrian period and in the Arabic medicine. The direct translations of Hippocratic works are not numerous, while many more were created by collecting the lemmata of the Galenic commentaries (Overwien 2008).

Language

The language of the translators Ḥunayn, Ḥubaysh, ‘Īsā, and others, first studied by Bergsträsser, has been often examined. Now we have the fundamental instrument, the *Wörterbuch* (2002–) with two supplements 2006 and 2007, by M. Ullmann, who discusses problems of attribution of the translations (in part. *De loc. aff.* attributed to Ḥunayn (contra Garofalo 2000a)). In general, Ḥunayn has a freer style, Ḥubaysh and ‘Īsā are more literal. The more frequent stylistic features are

hendiadys, parataxis, and change of rhetorical interrogations into statements. Misinterpretations are rare.

Garlandus the Computist

John Marenbon

Trinity College, University of Cambridge,
Cambridge, UK

Abstract

Garlandus is the author of a *Dialectica*, probably written late in the eleventh century or at the turn of the twelfth. The treatise covers the whole of the Aristotelian–Boethian curriculum. It is remarkable for its consistency in treating logic as a discipline concerned with language, rather than things in the world. In this respect, it has strong affinities with what appear to have been the views of Roscelin of Compiègne.

MS Orléans Bib. mun. 260 contains a logical treatise which is named, in the *incipit*, as “the rules of Master Gerlandus about dialectic”; the same treatise also exists, anonymously, in MS Paris BNF lat. 6438. The identity of its author (Gerlandus, Garlandus, Iarlandus) is disputed. There is a reason to believe that he was one of three scholars of this name who were connected with Besançon. The work's editor, De Rijk (Garlandus Compotista 1959: xvii–xxvi) attributed it to the earliest of the three, St Garlandus, who taught at Besançon in the 1080s and died in 1100 as Bishop of Agrigento, on the ground that the Paris MS dates from the late eleventh century and so the other two candidates would have been too young to write the treatise. Yukio Iwakuma, however, on the basis of expert advice, redated the Paris MS to the early twelfth century and

proceeded to argue that the treatise was written by a Garlandus who taught in Besançon in 1118 and lived at least until 1149. He dates the *Dialectica* to the first years of the twelfth century (Iwakuma 1992: 47–54). In fact, however, there is no decisive reason to choose between these two Garlandusses, or indeed a third, who was a schoolmaster at Metz in 1111–1128. And the time of composition of the work could be anything from the 1070s to the 1120s, although a date early in this range seems more likely (cf. Marenbon forthcoming: 194–195).

The parts of the *Dialectica* correspond to the main logical textbooks in use at the time. It begins with a treatment of the five predicables (*Isagoge*) and it goes on to discuss the Ten Categories (*Categorias*) and then how propositions are built up from words, and their logical relations to one another (*On Interpretation*), before considering topical arguments (*De topicis differentiis*) and categorical and then hypothetical syllogisms (*De syllogismo categorico*, *De syllogismo hypothetico*). At times, Garlandus refers to “the book,” which seems to be a text, perhaps adapted, of Boethius’ logical treatises (Garlandus Compotista 1959: xlvī–xlix).

Garlandus seems to be one of a group of logicians, mostly identified from the second-hand accounts, who in the late eleventh century, and perhaps later, expounded the logical textbooks of Aristotle and Boethius *in voce* rather than *in re*: that is to say, they took the logical terms discussed by Porphyry and Aristotle, such as “genus,” “accident,” “substance,” “quality,” as words which, in the context of logic, signify other words, rather than things (cf. Iwakuma 1992; Marenbon 2004: 27–34; Marenbon 2011; Cameron 2011 – for a critique). “Genus,” for instance, signifies genus words, such as “animal,” or “substance,” substance words, such as “man” or “horse.” Garlandus sticks to this way of interpreting even where the authoritative ancient texts would be much more easily read as discussions about words that signify things. For example, when Porphyry defines an accident as that which comes to and is absent from a subject without the subject’s being corrupted, he seems to have in mind, as what is signified by “accident,” some

sort of thing, such as Socrates’ whiteness, which he loses when he acquires a suntan. Garlandus (1959: 10, l. 25–11, l. 6), however, gives a contorted exegesis that makes the statement apply to substance words and accident words. Recent work by C.J. Martin, still in progress, suggests that this strategy might derive from a quite sophisticated and consistent view about the constituents of reality, which is close to that developed by Roscelin at the end of the eleventh century.

Another striking feature of the *Dialectica* is the frequent presence of sophisms – what Garlandus calls *sophisticae cavillationes*. These are arguments in which a contradiction – usually that “man is not man” – is shown to follow from a certain proposition by an (often overelaborate) logical deduction. The solution to such sophisms often involves the clarification of the proposition in question or its context.

al-Ġazālī, Abū Ḥāmid Muḥammad

Taneli Kukkonen

Department of History, University of Jyväskylä,
Jyväskylä, Finland

Abstract

There have long been two contending narratives when it comes to situating Abū Ḥāmid Muḥammad al-Ġazālī (Algazel/Algazali) (1056–1111), Islam’s most renowned theologian, within the history of philosophy. According to one, Ġazālī proved the scourge of the Arabic philosophers when he pointed out their various pretensions and self-contradictions and when he advocated a retreat to fideism as well as a practically oriented mysticism. On this view, Ġazālī’s philosophical explorations were of a uniformly dialectical character, aiming solely at defending the faith, in keeping with the tradition of Islamic speculative theology (*kalām*). The competing story has it that Ġazālī became so enamored of philosophy that, against his protestations, he became a crypto-Avicennian himself. On this reading, Ġazālī either salvaged philosophy for the uses of Muslim theology and mysticism, or else fatally corrupted the two with its taint. Both views have it right, and wrong. Ġazālī’s criticisms of the Arabic Aristotelians are piecemeal and local, and he certainly appropriates from the philosophers far more than he rejects. At the same time, Ġazālī’s commitments do not lie with the Peripatetics any more than with the Ash‘arite school of theology, a tradition which he also criticizes. Rather, Ġazālī is involved in developing a fresh synthesis that would reflect the insights he sees as crucial to authentic wisdom: the world’s profound contingency, the role played by the divine attributes in shaping this world, the rational soul’s ultimate destiny in the next, and the need for constant spiritual striving and prophetic guidance in purifying the soul to the point where it can attain its destiny.

Life and Works

A fair amount is known about Ġazālī’s life and career. This has less to do with his purported autobiography, *The Deliverer from Error* – which, aside from being an intellectual treatise rather than an actual biography, is also very much a literary construct – and more with Ġazālī’s fame and notoriety already during his lifetime. Many came to accept Ġazālī’s immodest self-evaluation according to which he was the sixth Islamic century’s appointed “renewer” of the Muslim faith; those who did not suggested less elevated motives for his various activities (see Griffel 2009).

Ġazālī was born in 1056 in Ṭūs, Iran. His studies in the Islamic sciences took him first to Jurjān, then to Nīshāpūr, where he studied under the famed Ash‘arite theologian al-Juwaynī (1028–1085). Ġazālī’s early reputation was built as a lawyer in the moderate tradition of al-Shāfi‘ī. In 1091 the powerful vizier to the Seljuq sultan, Nizām al-Mulk, invited Ġazālī to teach at the Caliphate’s flagship college in Baghdad. The appointment effectively thrust Ġazālī into the spotlight as a rising star within the Sunni learned community. Ġazālī proceeded to write expositions of speculative theology, among them *The Mean in Belief*, and tracts defending Sunni orthodoxy against the Ismā‘īlī sect, then in control of Fātimid Egypt, as well as “the philosophers” – in actuality, al-Fārābī and Avicenna. In the *Incoherence of the Philosophers* (4.3–5.4), Ġazālī justifies this procedure by postulating that these two most accurately convey the thought of Aristotle, who in turn is by common consent the “absolute philosopher” and “first teacher.” It is, then, with a Platonically tinged Aristotelianism that Ġazālī had to grapple; and it is notable that the philosophical notions most attractive to him – the immaterial nature and otherworldly orientation of the rational soul, the creative role of the ideas in the divine mind – carry a Platonic stamp.

In 1095, Ġazālī experienced a spiritual crisis which resulted in him resigning from his post at the Nizāmiyya. Ġazālī came to regard his own pugnacious academic persona as displaying disdainful intellectual pride; he also found it

impossible to accept anymore the patronage of worldly rulers, given that he would then also be expected to serve their worldly aims and become complicit in their corrupt rule. After an initial bout of seclusion and pilgrimage, Ġazālī taught privately for a period of 10 years, during which time he completed his masterwork, *The Revivification of the Religious Sciences*, a practically oriented guide to disclosing the spiritual significance of prescribed Muslim practices.

Ġazālī eventually resumed teaching at a state school, though, as he himself insisted, this was not a return to what once was (*Deliverer*, 49.23–24). No longer dogmatic or dialectic, Ġazālī's late works all urgently preach the need for salvation and a virtuous life. These works, hortative and allusive in character, advance a series of provocative stances seen from the standpoint of traditional Muslim theology, stances that in places are closely aligned with the Arabic Peripatetic tradition.

Ġazālī died in Ṭūs in 1111, his reputation as both Avicennian and anti-Avicennian already firmly established. His works quickly gained currency in the Islamic world, which they have since enjoyed uninterrupted.

Thought

Although Ġazālī did not call himself a philosopher, his writings contain much philosophically interesting material. Ġazālī's observations regarding the philosophers' theoretical edifice are illuminating, and his assaults on its weak spots incisive. (Because of the pithiness of his summaries, Ġazālī's *Intentions of the Philosophers* became a widely used textbook in Latin and Hebrew circles. The scholastics only learned of Ġazālī's anti-Avicennian polemics with the 1328 translation of Averroes' response, *The Incoherence of the Incoherence*.) Because of his asserted independence from the various schools and refusal to accept anything on authority or *taqlīd* (e.g., *Deliverer*, 10.21–11.7, 15.9–14; Frank 1991–1992), Ġazālī is also free to take his thoughts in striking new directions.

But for all the inherent interest in the notions he puts forward, Ġazālī has proved a notoriously slippery thinker. Ideas often remain underdeveloped, alluded to more than fleshed out, and it is sometimes unclear whether their implications have been worked out at all. Part of the problem lies in Ġazālī's adaptable attitude toward terminology, which led to Averroes' memorable complaint that "with the Ash'arites he was an Ash'arite, with the Sufis a Sufi, and with the philosophers a philosopher" (*Faṣl*, 22.6–7; cp. Ġazālī, *Deliverer*, 10.10–20; on Ġazālī's vocabulary see Lazarus-Yafeh 1975). Part of it stems from the 1095 rupture in Ġazālī's career. Though Ġazālī never disowned his earlier work, there are discrepancies between the early legal and dogmatic works and the later spiritual ones that are not easily explained away. For instance, Ġazālī early on subscribes to a divine commandment theory of ethics, which sits uneasily with the more naturalistic view of the good that the later works assume. Still, certain basic tenets carry throughout Ġazālī's career.

Demonstration and Doubt

It is useful to start with Ġazālī's legal condemnation of the philosophers. On three counts, the Arabic Aristotelians are to be regarded as unbelievers: because (1) the philosophers subscribe to the pre-eternity of the world, (2) deny that God knows particulars, and (3) reject bodily resurrection, the *falāsifa* fall foul of the creedal confession of the Muslims. (On an additional 17 charges, the philosophers are to be deemed heretics). These positions are offensive not so much because they contradict the apparent meaning of Scripture – Ġazālī is prepared to reinterpret revelation where reason demands – but because of the necessitarian line of reasoning that has brought the philosophers to them. In Ġazālī's mind, the philosophers presume to dictate the terms on which God's encounter with creation must take place, a procedure that unduly restricts God's absolute power (*qudra*). Because the conclusion is unacceptable, the philosophers' reasoning must be faulty.

Because Ġazālī accepts the demonstrative scientific ideal endorsed by the Muslim philosophers from al-Fārābī onward, he needs to find fault

either with the philosophers' formal inferences or with their premises. Typically he concentrates on the latter, claiming that what the philosophers regard as the necessary and self-evident starting points for knowledge are in fact anything but that. For instance, the common conviction that certain things are causes for others is ultimately indemonstrable, since all we ever perceive are things happening concurrently (*Incoherence*, 166.1–168.10). The philosophers' rejection of a first moment of time at which God created the world from nothing is likewise untenable. They may claim that this is a necessary truth of reason, but the simple fact that not all people share the same intuition shows that it cannot be a primary, axiomatic truth, nor can the philosophers demonstrate their thesis inferentially (*Incoherence*, 17.6–15). The same approach is employed time and again both in the *Incoherence* and in other polemical works: Ġazālī cleverly exploits the distinction between conceivability and imaginability, maintaining that many things that do not fall within the parameters of our everyday experience may nevertheless be possible to a transcendent agent (see Kukkonen 2006).

Ġazālī's methodological skepticism in the *Deliverer* is to be viewed in this light. To accept straightforwardly Ġazālī's description of a self-induced skeptical crisis is to ignore the profoundly literary character of the work. Stephen Menn has situated Ġazālī's autobiography in a line of philosophical self-assertion that stretches from Galen to Descartes (Menn 2003). The narrative is similarly filtered through Ġazālī's later association with the "sober" Sufism of al-Junayd (Ormsby 1991). The *Deliverer's* passages on doubt and certainty ultimately aim at pointing the way toward an epistemology whereby God acts as the guarantor of all veridical perceptions, whether sensory, intellectual, or supraintellectual. Even so, there are important self-imposed limits to Ġazālī's radicalism, starting with his willingness to defer to reason as a yardstick for determining which beliefs are warranted. This differentiates his position from the thoroughgoing fideism of the Ismā'īlīs, whose irrationalism Ġazālī opposed (see Kukkonen 2010).

Contingency and Necessity

As already noted, Ġazālī advocates the adoption of Peripatetic logic as a tool for Muslim theology. He grounds his endorsement in the assertion that Muḥammad himself employed logic when arguing with the heathens (see *The Just Balance*, *passim*). The claim serves two purposes, since in addition to justifying the teaching of logic among Muslims it can be made to substantiate the claim that logical reasoning is by no means exclusive to the Aristotelians, but instead reflects a universal human capacity, one that which all are equally well equipped to exercise (*Deliverer*, 9.16–18; *Incoherence*, 22.10–23.3).

The philosophers' necessitarianism, however, meant that their logic needed to be conceptualized along new lines if it was to be domesticated for the uses of a voluntarist theology. The single most valuable tool in this realignment is Ġazālī's fresh consideration of the modal notions. Building on Aristotle's definition of the potential as that which may or may not be (*Metaphysics*, 9.3–4) and Avicenna's rephrasing of the same in terms of "contingency of existence" (*mumkin al-wujūd*), Ġazālī forcefully emphasizes the contingency of the entire created order. Against the Arabic Aristotelians, whose analysis of the modal terms standardly proceeded along temporal and statistical lines (the necessary is that which is true always, the possible sometimes, the impossible never), Ġazālī maintains that possibilities are not to be judged in relation to the actual world at all. Instead, "the possibility to which they have alluded reduces to an intellectual judgement" (*qaḍā' al-'aql*: *Incoherence*, 42.2), where the judgment in question has to do with whether two propositions are mutually compatible. A single thing cannot be at once temporal and eternal, for instance, nor can something be human without being an animal; by contrast, there is nothing to preclude one from saying that God was (first alone) and that He then was with the world (31.13–20, 32.14–33.18).

On Ġazālī's view, impossibilities do not constitute objects of God's power (*Incoherence*, 175.5). Because all impossibilities ultimately reduce to explicit contradictions, this in no way threatens divine omnipotence (38.17–18). This

also means that several questions of a broadly metaphysical nature – e.g., whether secondary causality is real, whether the soul is ultimately material or immaterial – do not require a definitive resolution, since both possibilities are real for God and because either solution will yield a sufficient understanding of the world's contingency in relation to God, who is the only true necessary existent. Ġazālī's noncommittal stance on such issues signals neither obfuscation nor confusion, but instead a carefully weighted attitude to what is demonstrable and what is not (also important, from the salvific point of view). This we can see from the one thesis to which strict adherence is required, namely that the world has a temporal beginning (*Incoherence*, 40.15): for here, to believe with the philosophers that the world is eternal is to fall into the temporal-frequency trap when interpreting the modalities. (An eternal world would include all possibilities, just as the Neoplatonic philosophers had suggested, but leaving nothing out implies that God had no choice but to include everything). Instead, the world's very createdness ensures its contingency, and hence the role of the divine will in making a difference between alternatives that are in themselves indifferent with respect to existence or nonexistence.

Taken together, Ġazālī's suggestions amount to the view that possibilities are to be judged in terms of compossibility. This prefigures John Duns Scotus' pioneering work in possible-worlds semantics, although Ġazālī nowhere draws out the systematic implications of his innovations the way Scotus does (see Kukkonen 2000). Ġazālī's interest does not lie in modal metaphysics as such, but in developing a modal theory that would produce theologically acceptable results. Nevertheless, Ġazālī's further theologically motivated remarks to the effect that this is the best of all possible worlds generated a lively debate among Muslim theologians, one whose theoretical dimensions are as yet inadequately researched (see Ormsby 1984).

The Divine Attributes, God-Talk, and Creation

One of the most fertile problems in early Muslim theology concerned the reality of the divine

attributes. By introducing Aristotelian predication and semantics as a framework for tackling the problem, Ġazālī was able to shift the terms of the debate. In so doing, he prepared the ground for further Platonically influenced thinkers in the mould of Ibn al-ʿArabī (1165–1240), though in the process, some of the finesse of the earlier Islamic discussions was lost.

Ġazālī's position is that the unity of the divine attributes is a case of Aristotelian accidental unity or identity (*Met.* 5.6.1015b18–20, 5.9.1017b26–27). The *idem quod* of the sentence “The First is the same as the Last” is one and the same, namely, God, but distinct from either the ostensible subject or the predicate term (*Beautiful Names*, 29–31). This resembles the identity theory of predication advanced concurrently by Peter Abelard, although again by comparison Ġazālī's remarks appear undercooked. At any rate, for Ġazālī the further fact that the meaning of each term (“God,” “first,” “last”) is distinct from the others signals that each refers to a distinct quiddity and reality, whose meaning we can begin to uncover through observing its manifestations on the material plane. Notwithstanding his intentional reading of the divine names, then, Ġazālī regards the attributes not only as real but as the blueprint according to which creation proceeds. They are given to the world first in the very act of God granting existence to things, second in the teleologically oriented imitation in which each thing is allowed to become what it most truly is (*Beautiful Names*, 79–82). The two phases correspond to Avicennian efficient and final causality, and more generally to the Neoplatonic motions of procession and return (Gr. *próodos*, *epistrophē*). They also make possible the human act of cognizing and thereby the specifically human mode of perfection, which consists in knowing the realities of things (*ḥaqāʾiq al-ashyāʾ*: *Beautiful Names*, 82–84, 146–147).

Ġazālī's insistence on understanding the revealed names first and foremost in the context of divine perfection allows him to sidestep the thorny issue of analogical versus equivocal predication when it comes to divine and worldly properties. Though we have no recourse but to use words in the light of their mundane reference, a

believer will take it on faith that each of the revealed names of God refers primarily and absolutely to a transcendent form of perfection. A full disclosure of the real semantic range of such perfection terms remains conclusively out of our reach, while an imperfect understanding of them will depend on the dual process of abstraction from worldly particulars and illumination from above (*Beautiful Names*, 50–58, 162–171). The latter constitutes our primary task and vocation, as per Muḥammad’s exhortation for us to meditate on the divine names. Ġazālī’s cosmology thus becomes intimately intertwined with his psychology.

Psychology

As in many respects, so in psychology it is difficult to gauge the actual distance between Ġazālī’s views and those of the philosophers whom he criticizes. In some places, Ġazālī speaks of the soul as if it were a bodily accident in the *kalām* sense, while in others he advances the Avicennian picture of soul as separate substance and hylomorphic form. He also insists on the reality of bodily resurrection in the *Incoherence*, yet describes the pleasures and pains of the afterlife in imaginative and incorporeal terms in the final section of the *Revivification*. Ġazālī even declares the reality of the heart (his preferred term for soul) a mystery on a par with the divine essence.

Such vacillations notwithstanding, Ġazālī in his mature work clearly adapts the explanatory framework of Peripatetic teaching, with the five outer senses feeding the five inner senses, which in turn are in charge of unifying the perceptual field and providing information for the purposes of action and contemplation – the provinces of the practical and theoretical intellects, respectively. Ġazālī also appropriates Platonic moral psychology, in which the appetitive and irascible impulses are unruly elements to be brought under the rational soul’s control, and the Avicennian understanding of the soul’s executive powers (see, e.g., *Revivification*, bk. 21 and the *Jerusalem Ascent*, *passim*).

The central problem that Ġazālī encountered in his philosophical sources had to do with how the vaunted “true realities,” that is, essences of things are grasped. In true Aristotelian fashion, al-Fārābī

had emphasized the role of abstraction (*tajrīd*) in the acquisition of knowledge, while the school of al-Kindī (d. c. 870), extending at least as far as al-‘Āmirī, contended that the eye of the intellect opens up to a world all its own, in a process from which the senses are excluded. Avicenna appears to have wanted to split the difference, with an elaborate process of abstraction leading up to an emanation of the intelligibles from the Agent Intellect (see Gutas’ and Hasse’s contributions to Wisnovsky 2001). Ġazālī more or less follows Avicenna, with two important differences: (1) the highest intelligibles are the divine attributes themselves, for which no true likeness exists in the created world and whose emanation therefore cannot be a matter of necessity, (2) the preparatory work required for the reception of these exalted principles need not be exclusively the province of the scientist or Sufi, instead, the purificatory virtues available to all are sufficient for such a diffusion of divine grace to take place. Ġazālī sees an allusion to this doctrine in the Prophetic tradition citing God’s “gusts of beneficence,” and also in the famous “light verse” of the Qur’ān (24:35). The latter gave rise to a whole elaborate exegesis in Ġazālī’s *Niche of Lights*, the most notorious of his mystical treatises.

Ethics

Ġazālī enthusiastically embraces the Platonic simile of the soul as a mirror in need of polishing. His ethics, therefore, essentially form a propaedeutic to the realization of the contemplative ideal. Still, by emphasizing the particular nature of the various ailments which afflict individual human souls, Ġazālī gets to add a distinctive Islamic flourish to an otherwise Hellenic system. Since few can aspire to be scientists or hermits, and because the active life puts all kinds of obstacles in the aspirant’s way, as does basic human weakness, philosophy with its universal prescriptions cannot hope to aid effectively each and every individual. In the face of this quandary, the Law handed down by the Prophet shows its truly miraculous character; whosoever follows its prescriptions, finds his or her soul improved, and discovers that there are limitless depths to its application. The marvelous character of the divine Law is shown precisely in

its applicability to each and every human situation. Muḥammadan prophecy effectively performs the same function as theurgy did for the late ancient Platonists, allowing for divinity to reach directly to the individual level, past the restrictions associated with the general Platonic perfecting mechanism of soul-approximating reason.

On a practical level, Ġazālī's ethics owe much to Abū Tālib al-Makkī's (d. 996) *Nourishment of the Hearts* as well as to the "reformation of character" literature exemplified by Miskawayh's (d. 1030) treatise of the same name (see Sherif 1975; Gramlich 1992–1995). Some of the salient features include Ġazālī's choice of *metriopatheia* both as an ideal and as a practically attainable goal against an apathetic intellectualism; an emphasis on constant vigilance and merciless scrutiny in examining one's own motivations, which often are shown to be more venal than one would like (Ġazālī attributes these systemic moral failings to the whisperings of the devil mentioned in the Qur'ān, which appear to constitute an active principle counteracting the divine purpose); and an overall two-tier system, whereby a small elite is given the rarefied task of pursuing a truly contemplative happiness, while the majority of believers are left to lead a more rounded, if also mundane, life in accordance with the outward prescriptions of Muḥammad's religion (Kukkonen 2008).

George of Trebizond

John Monfasani

University at Albany, New York, NY, USA

Abstract

The Renaissance rhetorician and translator George of Trebizond (1396c.–1474) transferred the Byzantine Plato-Aristotle controversy to the Latin West in 1458 with the

publication of his *Comparatio Philosophorum Platonis et Aristotelis*, which is a vigorous demonstration of Aristotle's agreement with Christian doctrine and an equally vigorous condemnation not only of Plato but of the whole Platonic tradition up to his time as represented by the Neoplatonic philosopher George Gemistus Pletho (d. 1454). George's *Comparatio* provoked Cardinal Bessarion to publish in 1469 in defense of Plato his *In Calumniatorem Platonis*, the next major milestone in the Renaissance controversy.

Biographical Information

George of Trebizond (5/6 April 1396c.–1474) earned his daily bread as a teacher and practitioner of Latin eloquence and rhetoric, as a papal secretary, and as a translator of a wide array of Greek classical and patristic texts into Latin, just as you would expect from one of the most prominent of the Quattrocento humanists. But he passionately pursued other interests besides: astrology and astronomy, theological issues dividing the Greek and Latin churches, conversion of Mehmed the Conqueror to Christianity to save the world from apocalyptic catastrophe, and, most pertinently for our purposes here, the defense of medieval Aristotelianism against the growing moral and intellectual threat posed by Platonism. Indeed, it was George who triggered the Renaissance Plato-Aristotle controversy by domesticating in the Latin West what had previously been a Byzantine quarrel.

Born the son of a priest in Crete, most probably in the city of Candia, George came to Venice in 1416 ostensibly to serve as a Greek scribe. His linguistic brilliance allowed him to start teaching Latin by 1420 and by 1434 to produce the first major textbook of rhetoric in the Renaissance, the *Rhetoricorum Libri V*. In 1426, he had become a Roman Catholic, a move which facilitated his entrance in 1439 into the papal court in Florence, where it was resident at the time. In 1444, after the papacy had returned to Rome, George became a papal secretary and remained connected to the papal court and Rome in one way or another until his death. The last notice we have of him is

a document of 28 November 1473, recording his donation of three manuscripts to the Dominican church of *S. Maria sopra Minerva* near his home in Rome.

Three factors propelled George's entrance into the Plato-Aristotle controversy. The first was his belief in the coming apocalyptic disaster pre-saged by Mehmed II's capture of Constantinople. The second was his admiration of medieval scholasticism and Aristotle, more than half of whose corpus of writings he translated into Latin in the 1440s and 1450s, including the zoological works and the pseudo-Aristotelian *Problemata*. Finally, there was the personal element as the Platonist, Cardinal Bessarion (d. 1472), in the 1450s turned his support to a rival Greek translator, Theodore Gaza (d. 1475), who had made a new translation of the *Problemata* and embarked on a new translation of Aristotle's zoological works. George had long been suspicious of Platonism because he believed that the contemporary Byzantine Platonist and Bessarion's teacher, George Gemistus Pletho (d. 1454), was a neopagan. But now he understood that Platonism, whose moral principles undergirded Islam, was threatening to destroy the moral and intellectual integrity of the Latin West and lead to its destruction, just as it had to the destruction of Byzantium.

The result was first George's *Protectio Aristotelis Problemata* of 1456 in criticism of Gaza's translation and the nefarious Platonic conspiracy of the Bessarion circle, though the cardinal remained unnamed. Then, in 1458, he published in Latin his *Comparatio Philosophorum Platonis et Aristotelis*. In bk. 1, George showed that Aristotle was the father of learning and Plato a silly dilettante. Bk. 2 proved how Aristotle agreed with Christianity on creation, the immortality of the created soul, divine providence, and a trinitarian God, while Plato had none of this, starting with the preexistence of eternal souls. George conflated Plato and Neoplatonism to prove that Plato believed in a sequence of gods resulting in a lower god as the creator of the material universe. The *Comparison* culminates in bk. 3's demonstration of Plato's moral turpitude, whose philosophy of pleasure was taken up by Epicurus and then by Mohammed ("the third Plato"). Now, the minions of the pagan Pletho want to transfer this corruption

to the Latin West. George ends by warning of the coming of the "fourth Plato" who will undermine the West.

Bessarion answered almost immediately, in 1459, with a Greek work, which of course was ineffective in what was now a Latin controversy, but which he eventually arranged to have printed in Latin in expanded form as the *In Calumniatorem Platonis* of 1469. George responded in turn with a now lost set of *Annotationes*. So the *Comparatio* remains our sole substantial source for George's philosophical thought apart from the slight opus-cule that he wrote in Greek in late 1457/early 1458 defending against the Platonists Aristotle's statement in *Physics* 2.199a8–b33 that Nature, like art, is purposeful but does not deliberate. George did not fare well in his confrontation with Bessarion. His *Comparatio* did not appear in print until 1523, 50 years after his death, when Bessarion's *In Calumniatorem* had already been printed three times, and in a horribly faulty edition marred not only by a legion of mistaken variants but also by textual dislocations that made comprehension impossible in sections.

Thought

George of Trebizond considered himself a faithful Aristotelian and Aristotle an inspired forerunner of much Christian truth. Since he put his philosophical thoughts to paper in a polemical work intended to condemn Plato and glorify Aristotle, George needed a standard of truth by which to measure both philosophers. That standard, he stated, was Christian dogma. But in applying this standard, he revealed an interesting mix of philosophical positions. George was also an admirer of Thomas Aquinas, but, as we shall see, he actually opposed Thomas on multiple points.

Psychology: In bk. 2 of the *Comparatio*, which was the philosophical core of the book, George vigorously argued for hylomorphism and the multiplicity of substantial forms against Thomas Aquinas' assertion of the unity of substantial form. Based on the principle that everything other than God must be a composite and on his reading of Aristotle, George insisted that in

humans, as the vegetative soul is succeeded by the sensible soul and then the intellective, the prior soul is not erased but becomes the matter of the superior soul. In accord with this logic, he goes on to argue for the reality of spiritual matter as the explanation of the composite nature of the human soul after death, remarking that he really cannot understand how Thomas could posit such a thing as the soul's inclination to body after death. George seems to have taken Thomas' position as an explanation of the composite nature of the soul post mortem rather than as the philosophical justification for the Christian belief in the resurrection of the body. Making capital of Aristotle's statement in *On the Generation of Animals*, 2.736b27–29, that the rational soul enters from the outside, George argued that Aristotle believed with Christians that each human soul was a special divine creation infused into the fetus at a certain stage of its development and that it was immortal surviving the death of the body. George was thus able to contrast Aristotle's agreement with Christianity with Plato's notorious doctrine of the pre-existence of souls and metempsychosis. If Aristotle seems not to have discussed life after death, as he should if he believed in the immortality of the soul, it is because the relevant books have been lost. George developed a somewhat fanciful proof to demonstrate what books have been lost, but the important aspect of his discussion is that he was the first in the Renaissance to try seriously to identify what parts of the Aristotelian corpus have been lost and how this happened.

God and Creation: Concerning God, George pursued two lines of argument: what God is and what He does. Much exercised by Pletho's charge, in his 1438 treatise on the points of divergence of Aristotle from Plato (the correct title, as Börje Bydén has shown, rather than the "differences" between the two philosophers) that triggered the fifteenth-century controversy that Aristotle's God is merely the first in a coordinated series of gods, George argued that to Aristotle God is absolutely the First, not in any coordinated series, and is separated from all else by the infinite divide between creator and creatures. Moreover, creation was an act of divine will rather merely a

spontaneous product of the divine nature since "the creator intellect thinks what it wants and what it wants it thinks." And since Aristotle in bk. 2 of *On Generation and Corruption* (2.338b3–5) makes the sun the cause of generation and corruption by its oblique passage through the zodiac, Aristotle's God created the sun as his instrument, and therefore Aristotle's God is the efficient cause and not simply the final cause of the universe. Assimilating Plato to his Neoplatonic successors, he further charged Plato with idolatry because Plato really did have a series of a first god, a second god, and a third god, proving once again the harmony of Aristotle with Christianity and Plato's contradiction. Moreover, relying especially on Aristotle's statement in *On the Heavens* 1.268a12–20 that "the last, the middle, and the beginning have the number of the whole universe . . . this is in fact the number of trinity itself," and that this is the reason why we naturally resort to trinity in worship of the gods, George argued that according to Aristotle, all of nature is suffused with trinity and that consequently Aristotle had an inkling of the trinitarian nature of God. He understood that trinitarian *vestigia dei* ("footprints of God") are stamped throughout nature. George thus embraced medieval exemplarism as an expression of sound Aristotelian doctrine.

Platonism, on the other hand, George tells us, pointing to dialogues such as the *Phaedrus* and the *Symposium*, preached hedonistic pederasty. Furthermore, Plato's political philosophy, as seen in the *Republic* and *Laws*, the latter of which George had translated, leads to a city that is oppressive, morally obtuse, and both demographically and economically impossible. As an immigrant himself, George attacked Plato's rules on the treatment of resident aliens as well as his system of eugenics as immoral and destructive of a prosperous, functioning society. Indeed, Plato's coercive marriage policy in the *Laws* will inevitably lead to military as well as demographic disaster, quite apart from the perverse moral and psychological effects they will have on the citizens. He viewed Plato's recommendation in the *Laws* to have boys and girls exercise naked together as leading to the opposite of the moral regime Plato said he was proposing, as was true, of course, for the communal sharing of

women in the *Republic*. Plato's disparagement of Greece's Four Heroes (Pericles, Cimon, Miltiades, and Themistocles) while putting himself forward as the supreme law giver shows how jealous and tyrannical was his nature. Probably no one until Karl Popper in our time offered as a severe and sustained critique of Plato's political philosophy as did George in bk. 3 of the *Comparatio*. The one discordant note in this jeremiad against Plato was George's praise of the philosopher for anticipating Venice's brilliant mixed constitution. George was trapped here because he had earlier cooked up this dubious discovery when seeking Venetian patronage for his translation of the *Laws*. Be that as it may, George became one of the earliest and most important writers to sound the theme of Venice as the perfect republic because of its mixed constitution.

George Pachymeres

George Zografidis

Department of Philosophy, Aristotle University of Thessaloniki, Thessaloniki, Greece

Abstract

George Pachymeres (1242–c. 1310) was a Byzantine philosopher and teacher, learned in many fields (*polyhistor*), and the leading historian and scholar of his time. A prolific writer and copyist of Greek philosophical texts, he was one of the most productive Byzantine commentators. He contributed significantly to the understanding of Aristotle's philosophy by presenting in an abridged accessible form the entire Aristotelian corpus (*Philosophia*). He also played an important role in the revival of Platonic studies in Late Byzantium by teaching Plato and reading the Neoplatonists. His commentary on Pseudo-Dionysius shows his Christian approach to issues raised within the Platonic tradition. Pachymeres is one of the most representative scholars of the Early Palaiologan Renaissance.

Biographical Information

Born in Nicaea 1242 – died in Constantinople c. 1310. Byzantine philosopher and scholar, prolific miscellaneous writer, teacher and ecclesiastical man, representative of the intellectual movement in the Early Palaiologan Renaissance (middle thirteenth to middle fourteenth century), and perhaps the most important historian of his age. Pachymeres was member of a Constantinopolitan family that after the Latin occupation moved to Nicaea; there he received his encyclical education and returned to Constantinople after its recovery (1261). Until 1267, he studied rhetoric, the *quadrivium*, and philosophy with Gregory of Cyprus at the School of George Akropolites.

In Constantinople, the new dynasty of Palaiologans could not reestablish Byzantium as a powerful Empire but the Emperors encouraged

the intense study and re-appreciation of the Greek past that the Byzantines had inherited. Well-educated high officials formed a learned elite that, besides its occupation with state affairs, found scholarly interest, intellectual excitement, and sometimes relief in the world of ancient Greek literary, philosophical, and artistic culture. The Fourth Crusade and the looting of Constantinople heavily affected higher education, since the texts that used to be easily available in the capital's libraries were destroyed or scattered. Thus, the rediscovery and reproduction of these texts were one of the main preoccupations of Early Palaiologan scholars.

In this milieu, Pachymeres began his clerical and teaching career. He was only a deacon (1265), but his acknowledged abilities and his knowledge of civil and canon law helped him to ascend to the high office of *protekdikos* (a member of an ecclesiastical tribunal, 1285) and of *dikaiophylax* (judge, 1277) by imperial appointment. He had involvement in state and ecclesiastical affairs that he describes in his *History*. Before 1275, Pachymeres held a chair as *oikoumenikos didaskalos* (high degree teacher) in the so-called Patriarchal School, where he taught philosophy, the *quadrivium*, and perhaps rhetoric. He earned great reputation through his teaching activity, and his role as a teacher was strongly emphasized by his contemporaries.

Pachymeres, besides his philosophical work, wrote an extensive history, a paraphrase of the *Coprus dionysiacum*, a treatise *On the Holy Spirit* (PG 144, 923–930), manuals on the four sciences of the *quadrivium*, many rhetorical exercises, a commentary on the *Iliad* (1275–1276), and few poems. For this reason, he has been called an “early humanist.”

Thought

Pachymeres' extensive work came out from his long teaching activity, and his didactic style is present in his scientific works. His acquaintance with many aspects of Greek culture, including sciences, is evident throughout his work; for example, in his *History* Pachymeres refers to

Plato's *Laws* and to Aristotle's *Nicomachean Ethics* when he exposes his own views on the right government. One of his main concerns was to read, teach, and interpret philosophical texts. For this reason, he copied philosophical texts by Plato and Aristotle as well as commentaries by the Neoplatonists or earlier Byzantine scholars.

His philosophical activity went together with his teaching of the sciences. The *Quadrivium* (c. 1300) written perhaps as notes for Pachymeres' teaching served as a textbook. It contains sections on mathematics (based on Diophantus and Nicomachus of Gerasa), astronomy (based on many writers from Aratus to Theon), music (based on Claudius Ptolemy), and geometry (based on Euclid). This manual, although not original, was much used (as the number of its manuscripts suggests), contributed to the revival of the study of physics and mathematics, and reflected the interests of the philosophers and scholars of the Early Palaiologan period.

Pachymeres, especially, while commenting on Pseudo-Dionysius, is careful not to adopt Platonic or Aristotelian views that contradict Christian doctrine, like, for instance, the existence of the Platonic ideas or the pre-existence of matter. For him “philosophy is like a divine gift such that has never been given and will never be given to humans by God” (*Philosophia*, Book 1, f.2r). And it is the occupation with philosophy that permits someone to detach himself from the uncertainty of human life (a reality too familiar to a historian as Pachymeres) and to achieve assimilation to God.

Until recently, Pachymeres has been known as an Aristotelian, in virtue of his *Philosophia* (last decades of thirteenth century). This much-read work is preserved in 35 manuscripts and consists of 12 books that epitomize the Aristotelian writings with the exception of *Poetics*, *Rhetoric*, and *History of Animals*. As later titles indicate, *Philosophia* is an *Epitome of the entire philosophy of Aristotle*. Pachymeres' concern about Aristotle can also be attested in his running commentaries on the *Organon*, *Physics*, *Metaphysics*, and *Nicomachean Ethics* and in his codices that contain works such as *Physics* and *On the Parts of Animals* with Michael of Ephesus' *Commentary*.

Pachymeres was familiar with the Platonic Corpus and the Neoplatonists. Two of his codices are important for Late Byzantine Platonic studies, containing many Platonic dialogues and commentaries. The Platonic dialogues that he copied are not identical with the ones that were usually commented on by the Neoplatonists nor their order is the same with the order that was established from fifth century onward. This fact and the references to the Platonic corpus indicate that perhaps he systematically taught Plato's works. He has also been proved not a mere copyist but he has made critical remarks to certain Platonic texts (*Republic*, *Symposium*). He copied three Platonic commentaries that first reappeared in the thirteenth century, namely Proclus' on *Parmenides* and on the *First Alcibiades* and Hermias' on *Phaedrus* (we owe to him its first extant manuscript). After copying Proclus' unfinished *Commentary on Parmenides* he copied also as a sequel a *Commentary* that is now attributed to him because of its similarity to his exegetical method. This text is the only extant late Byzantine commentary on Plato.

All these show that Pachymeres was not another Byzantine Aristotelian or interested only in Aristotelian philosophy. Actually, he was one of the main pioneers in reviving the study of the Platonic tradition. Even his commentary on the *Corpus areopagiticum* cannot be seen separately from his preoccupation with Proclus. Pachymeres, studying an unquestionable Christian authority, concludes accurately that there are affinities, even in the vocabulary, between Pseudo-Dionysius and Proclus (PG 3, 116A); but – as he believes that the writer of *Corpus* was Paul's pupil – he assured that “the Athenian philosophers appropriated Dionysius' treatises and concealed this fact, in order to be considered as the fathers of his divine discourse.” Nevertheless, the commentary on Pseudo-Dionysius shows an objective link between the long Platonic tradition and Byzantine, theological and philosophical, thought.

At his introductory letter to the *Paraphrase of Corpus dionysiacum* Pachymeres defines himself neither as an “interpreter” (*exêgêtês*) nor as a “paraphrastist” (*paraphrastês*) but as a simple

“listener” (*akroatês*) to Dionysius' text (PG 3, 112B), that is, a reader. His extensive paraphrases of the *Corpus* seem more an adaption of the earlier commentary of Maximus Confessor (seventh century). Pachymeres does not simply paraphrase but he analyzes the obscure points. He makes references to the Bible, to earlier Byzantine writers (mostly Dionysius' commentators) and to Greek literature, and he adds his personal thoughts.

In *Philosophia*, Pachymeres does not always use the same method. He selects and copies passages to interpret them, he simplifies the text, he is paraphrasing it, or he interpolates his own statements. Thus, his text is a condensed introductory interpretation of the whole Aristotelian philosophy. In his (mostly unedited) running commentaries, Pachymeres returned to the Late Antiquity tradition of extent commentaries, dividing the text into lemmas and commenting on the entire text.

In his *History* (about the years 1255–1308) Pachymeres, although involved in public life, succeeds in offering a moderate narration of events that he knew from first hand, adding only few personal comments. The reference to unexplained phenomena that he attributes to divine intervention does not change his rather pessimistic outlook on human and especially Byzantine affairs. His ideas about the proper conduct of rulers are based on *Nicomachean Ethics* and they are dispersed in the *History*. For Pachymeres, “truth is the soul of history and he who prefers lies to the truth is sacrilegious. It is better to be silent than to repeat facts inaccurately” (*Histories*, I.23).

His rhetorical works were not intended as public orations nor they have to do with his involvement in public affairs. They are connected to rhetorical theory and have their models in Late Antiquity and particularly in the Second Sophistic. Pachymeres went beyond the preparatory phase of *progymnasmata* and wrote also more demanding rhetorical studies. Few of them, taking Antiquity as their subject, have theoretical/political interest. In the first, Pachymeres makes an encomium of democracy putting it in the mouth of the Athenian statesman Pericles. In the second, the philosopher has persuaded the tyrant to resign and claims for himself the title of

“tyrannicide.” The philosopher (and philosophy) proves to be useful to the city, when he uses against political power his own weapons, namely the knowledge of the beings and science!

Pachymeres gained his reputation as a philosopher in virtue of his *Philosophia*, a work that was imitated by later thinkers as Joseph Rhakendytes or Philosopher in his *Encyclopedia* (a compilation of Pachymeres’ *Philosophia* and Nikephoros Blemmydes’ *Epitome*), and Theodoros Metochites. *Philosophia*’s rich manuscript tradition shows that it was read and copied until the eighteenth century. The part on music of the *Quadrivium* influenced Manuel Bryennios in his *Harmonica*. Pachymeres’ teaching and writings played a significant role during the Early Palaiologan Renaissance and his manuals were used for a long time and, translated into Latin, by Italian humanists.

George Scholarios (Gennadios II)

John A. Demetracopoulos

Department of Education, University of Patras,
Patras, Greece

Abstract

George Scholarios (Gennadios II) was the first patriarch of Constantinople (1454–1456) after the capture of Constantinople by the Turks. His principal interests were theological; still, he proved one of the most versatile and prolific Byzantine authors and the most fervent Byzantine Thomist and Aristotelian. An opponent to the religiously colored Platonic philosophy of the only non-Christian thinker of the Byzantine era, George Gemistos (Plethon), he combated him by means of the Christian Aristotelianism of Thomas Aquinas, whom he regarded as one of the best Christian authors that had ever existed. He also regarded Aristotle as the best philosopher and his philosophy as fully compatible with Christianity. A huge part of his literary work consists of translations, adaptations, and abridgments of scholastic writings (such as by Aquinas, Radulphus Brito, Peter of Spain, and Armandus of Bellovisu). He tried to create a synthesis of Aristotle and Aquinas and the Patristic and Byzantine theological thought.

Life

Scholarios (c. 1400–1472), born in a rich family, studied the traditional philosophical curriculum. His teachers implanted into him a love for Orthodoxy but also for the Latin theological tradition and especially Thomas Aquinas, the greatest – according to Scholarios – Latin theologian and one of the greatest Christian thinkers of all times. In the context of the pro-union politics of emperor John VIII Palaiologos (1425–1448) and of patriarch Metrophanes II (1440–1443), he participated in the council of Florence (1438–1439)

by promoting an “economical union” with the Roman see “for the nation’s sake.” From 1443 onward, he adopted an extremely antiunionist attitude. In 1450, removed from court by the new emperor (1448–1453) Constantine XI Palaiologos, he became a monk, taking the name “Gennadios.” After the fall of Constantinople, Mehmed II the Conqueror, who knew of his strong anti-Latin stand, made him a patriarch (Gennadios II; early 1454). Soon he resigned and retired on Mount Athos and in a monastery near Serrihai (northern Greece), where he devoted himself to writing and discussions with Muslims on the true religion up to his death.

Thought

Scholarios was primarily interested in theology. Yet, he had a wide knowledge of the ancient Greek philosophical literature and had studied the Greek translations of some major Latin Christian works (such as Augustine’s *De Trinitate* and Aquinas’ two *Summae*) produced in the thirteenth and fourteenth centuries. In combination with his own knowledge of Latin, this made him interested in philosophy, especially Aristotle, and in the question of the relationship of this philosophy to Christian thought.

He mainly developed his views on it in the context of his polemics (1443 onward) against the religious philosophy of George Gemistos (Plethon). Scholarios wrote a refutation of Plethon’s short but bitter anti-Aristotelian lecture in Florence (1439) *On the Issues on Which Aristotle Contentiously Disagrees with Plato*, labeled *Against the Impasses Ignorantly Imputed by Plethon to Aristotle* (1443/1445). The topics treated there are God and his relation with the world; Aristotle’s doctrine of the homonymy of “being”; his doctrine of “primary substance”; his conception of the “universal” as “matter” and the “particular” as “form”; his view on the simultaneity of the “relatives”; his principle of contradiction and its implications on determinism; various matters of human psychology; the Aristotelian conception of virtue as “meanness”; the ultimate end of human being; the famous cosmological ether

problem; whether the source of sun's heat is its nature or, as Aristotle said, its rapid motion; the question of the cause of the motion of stars; teleology in nature and its relation with Providence; Aristotle's rupture of the universal law of causality by construing human deliberation as ultimate principle of many things; his conception of "movement" or "change" in general; and Aristotle's rejection of Plato's Forms.

The central discrepancy between Scholarios and Plethon stems from Plethon's rejection of Aristotle's doctrine of "entelechy" as immanent in everything and cause of the transition from "potentiality" to "actuality"; Plethon's Neoplatonic metaphysics postulated a hierarchy of beings, each of them responsible for the existence and the qualities of its inferior. Scholarios objected in a clearly Thomist spirit that God is the *causa remota* of whatever goes on in the world and governs the world by having implanted to each sort of creature a power to directly produce some concrete effects, this power being Aristotle's self-"actualization."

Scholarios was so filled with indignation at reading Plethon's major work, the *Laws*, where a highly elaborated pagan, anti-Christian utopia was described, that he threatened the author to burn him alive (in fact, he finally burnt Plethon's writing). He regarded Aquinas' Christian Aristotelianism as a perfect tool to combat Plethon. Radicalizing some arguments of Aquinas and based on Simplicius' *Commentary* on the *De Caelo*, he claimed that Aristotle did not believe in the eternity of the world and that God, to Aristotle, is the cause not only of the movement in the world but also of the very existence of the universe. Scholarios also compiled a *Florilegium Thomisticum*, both from the *Summa contra Gentiles* and the *Summa theologiae*, which he intended to use as a source of arguments for producing a refutation of Plethon's *Laws*, as well as another *Florilegium Thomisticum*, from the *Summa contra Gentiles* (III, 84–106), in order to refute especially Ch. II, 6 of Plethon's masterpiece, which circulated as an independent treatise *On Fate*. Scholarios, taken up with his anti-Catholic struggle, did not find time to write these refutations; still, the Thomistic arsenal of the

intended refutation and his systematic treatises *On the Divine Providence and Predestination* stand as a mark of what he had in mind when saying that Plethon's philosophy is insane. Instead of Plethon's Platonic doctrine of the incorruptibility of the human intellect, which postulates the eternal preexistence of the human soul, Scholarios deemed the Thomistic doctrine of the simultaneity of coming into existence of body and soul as more consistent. Instead of Plethon's Neoplatonic-Averroist doctrine of the faculty of "phantastikon" as the "medium" between intellect and body, Scholarios adopted the Aristotle-based Thomistic doctrine of how a created soul forms a "direct" union with body. Against Plethon's doctrine of fate, Scholarios adopted Thomas' doctrine of the way and the degree the superlunar world affects humans in the context of God's providence as well as of Predestination and free will.

Scholarios also produced a Thomistico-Scotistic interpretation (Thomas Aquinas, Duns Scotus, Francis of Meyronnes et al.) of Gregory Palamas' distinction between God's 'essence' and 'energies,' based also on Radulphus Brito's doctrine of logical and metaphysical 'distinctions'. God's *energeiai* are *intentiones/epinoiai*, whose mode of existence is partly objective and partly subjective; God's simplicity is grasped multifariously through the results of His creative and gratifying activity. Scholarios also suggests that Palamas' solution to the problem of God's simplicity and multiplicity is close to John Duns Scotus' application of the *distinctio formalis* to God.

Scholarios also produced an *Ars vetus*, which was almost fully and verbatim based on Radulphus Brito (regarding Porphyry's *Isagoge* and Aristotle's *Categories*), Thomas Aquinas (regarding Aristotle's *De interpretatione*), and some other scholastic sources, many of which included a lot of material from the Late Antique Greek commentators on Aristotle's logic. His paraphrases of Aristotle's natural works (*Physica*, *De caelo et mundo*, *De anima*, *Parva naturalia*, *Meteorologica*) seem to be an abridgment of Theodore Metochites' paraphrases, enriched with certain sporadic notes by means of which he repelled some anti-Aristotelian arguments by

the Platonist George Pachymeres. Of Aquinas' *œuvre*, besides his selective translation/abridgment of Aquinas' Commentary on the *De interpretatione*, he translated the *De ente et essentia* along with Armandus de Bellovisu's Commentary on it (into which he inserted an interesting discussion of the problem of the divine simplicity in Thomistic, Scotist, and Palamite terms), the Commentary on Aristotle's *De anima* and a part of the Commentary on *Physics*, and the pseudo-Thomistic *De fallaciis*. Besides, he elaborated an abridgment of Demetrios Kydones' translations of Thomas' *Summa contra Gentiles* and of the I^a, I^a II^{ae}, and the II^a II^{ae} of the *Summa theologiae*. His versions of Aquinas' Commentary on the *Posterior Analytics* and on *Metaphysics* are not extant. He also translated the greater part of Petrus Hispanus' *Summulae logicales* and Gilbertus Porretanus' *De sex principiis* and a part of Radulphus Brito's *Ars vetus* (on *intention/epinoia*). He also wrote a short treatise *On the Compatibility of Aristotle's and Plotinus' Definitions of Human Happiness* as well as an *Encomium of Aristotle*.

Abstract

Gerald Odonis (c. 1285/90–1349) was a Franciscan from the south of France who taught theology at Toulouse in the 1310s and lectured on the *Sentences* at Paris in 1327–1328. He

was elected minister general of his order in 1329 and, after a controversial reign in which he supported Pope John XXII on the issue of apostolic poverty, was named patriarch of Antioch and administrator of Catania in 1342. Gerald wrote an influential *Ethics* commentary, an important set of questions on the *Sentences*, a *Quodlibet*, an economics treatise, and numerous tracts on topics in logic, metaphysics, and natural philosophy. Although his thought can be characterized as Platonist in many ways, he is most conspicuous for being intrepid. As a natural philosopher, Gerald is best known as an atomist, but he also held innovative views on projectile motion, the plurality of worlds, and the cessation of celestial motion after the Last Judgment. As a theologian, Gerald defended unpopular positions on a number of issues, most famously the beatific vision. In metaphysics, he was a strong realist. In ethics, where his impact was most pronounced, Gerald espoused opinions that furthered the voluntarist tendencies of his order. Even as an economic theorist, Gerald's defense of the legitimacy of what were considered usurious practices put him outside the mainstream of his time.

Gerald Odonis – also known as Geraldus/Gerardus/Giraldus Otto/Oddo/Odon/Hodonis and, in the vernacular, Guiral Ot – was born c. 1285–1290 in Camboulit, a village in southern France near Figeac, where he joined the Friars Minor. Rising in the Franciscan educational system, by early 1316 he was bachelor of theology at Toulouse, where he composed a short tract on signs of the Last Judgment and the economics treatise *De contractibus*. He also read the *Sentences* at Toulouse, making a name for himself with the *reportationes* that circulated from these lectures, although only a few questions from book II survive, incorporated into Gerald's later Parisian questions from the late 1320s. Between these lecture series, Gerald probably penned at least a portion of the philosophical treatises preserved primarily in a Madrid manuscript, some of which may stem from his Toulouse

Sentences questions. The logical works and the *De intentionibus* have been published, while those on metaphysics and natural philosophy are in preparation. Also presumably during this phase, Gerald wrote his most influential work, the first Franciscan *Ethics* commentary, which survives in 18 codices, received two incunabula editions, and earned Gerald the nickname *Doctor moralis*. With these writings and his pastoral works, sermons, and biblical commentaries, Gerald was thus already well known when the Franciscans assigned him to lecture on the *Sentences* at Paris, which he did during the 1327–1328 academic year. Although the popularity of Gerald's written version suffered because of the ensuing decades of decline in Franciscan theology, nevertheless 11 manuscripts preserve one or more books of this almost completely unpublished work, which incorporates material from his earlier philosophical questions and his *Ethics* commentary.

Gerald was promoted soon afterward, since as master of theology, with the backing of Pope John XXII, Gerald was elected Franciscan minister general on June 10, 1329, replacing the deposed Michael of Cesena. During his turbulent reign, Gerald sided with Pope John against rebellious Franciscans on the issue of apostolic poverty, and he even defended John's controversial views on the beatific vision, writing a treatise – now published – based on a quodlibetal disputation he held in Paris in Advent 1333. Afterward Gerald devoted himself to the administration of his order and acted as papal nuncio in Central Europe fighting the Bogomile heresy, before stepping down as minister general in late 1342 when the new Pope Clement VI appointed him Latin patriarch of Antioch. Since Antioch was in Muslim hands, Gerald received the see of Catania in Sicily, where he died in 1349 during the Black Death.

As a thinker and author, Gerald was remarkably bold, clear, succinct, independent, often original, and sometimes brilliant. Some of the pioneers of the study of medieval science – Pierre Duhem, Anneliese Maier, and John Murdoch – recognized this, even though they usually had access to mere fragments of Gerald's oeuvre. Since Gerald's Toulouse *Sentences* questions

have not been identified, his precise relationship with such contemporaries as Henry of Harclay and Francis of Marchia is unclear. For example, in *De motu* and later in distinction 14 of his Parisian questions on II *Sentences*, Gerald discussed the old problem of how projectiles continue in motion after contact with the mover has ceased, defending the following conclusions: "First, a projectile separated from the thrower is not moved by the containing medium. Second, it is not moved by a *virtus impressa* impressed on the containing medium. Third, it is moved by a *virtus derelicta* left in it by the thrower." Gerald thus rejected the prevailing Aristotelian view and endorsed what his Franciscan confrère Marchia defended at much greater length. The two extant versions of Gerald's text appear to postdate Marchia's, but what had Gerald taught at Toulouse? Whatever the relationship between Marchia and Gerald, their idea of a *virtus derelicta* – a force left behind – in the projectile was later adopted and developed by John Buridan in his theory of impetus.

In natural philosophy, Gerald is most famous for his atomism. Henry of Harclay (d. 1317), chancellor of the University of Oxford, was the first important atomist in medieval western Christendom – unless Gerald proposed an indivisibilist theory at Toulouse, in which case they came up with their opinions simultaneously. By the early 1320s, Gerald and the Oxford theologian Walter Chatton were espousing the theory, which Nicholas of Autrecourt would later adopt, against fierce opposition from many scholars. Gerald presented his anti-Aristotelian theory in two separate but related treatises *De continuo*, preserved in one manuscript each (plus a fragment for one of them). Gerald was at pains to make his opinion known, for versions of the two treatises were incorporated into his Parisian *Sentences* questions, in book I, distinction 37, and book II, distinction 44, so that ten witnesses carry all or part of the work: this was a medieval best-seller, known to Francesc Marbres (a.k.a. John the Canon), Nicholas Bonet, Nicholas of Autrecourt, and, directly or indirectly, early modern authors.

Nicholas Bonet called Gerald a "Platonist" with regard to his brand of atomism, and

Platonism does run through Gerald's works, even his *Ethics* commentary. On the subject of a possible plurality of worlds, treated in distinction 44 of his questions on II *Sentences*, Gerald went beyond his scholastic predecessors and contemporaries, explicitly arguing in favor of Plato over Aristotle in defending God's power to make more than one world. Rather than just state this as fact, as required after the Condemnation of 1277, Gerald gave analogies to show by example how different worlds of the same type would each have different centers to which and from which heavy and light objects would fall or rise, without the different worlds interfering with each other, contrary to what Aristotle had maintained. Gerald reasoned that the circulation of the blood in different humans works this way, and he surmised that similar phenomena are observed in the northern and southern hemispheres with respect to opposite poles. In his discussion, Gerald hints that there is a mutual attraction between a heavy body and the center of the world. To Aristotle's claim that beyond the heavens of this world there is neither place nor body, Gerald asserts not only that the contrary is possible, but "I would not even consider it very untoward if in reality, right now, *de facto*, one said that beyond the heavens there is a place and an infinite space, although an empty vacuum." If in expressing similar views later, Nicholas Oresme drew inspiration from any scholastic, the best candidate is Gerald Odonis.

If Gerald Odonis' opinions on the continuum and projectile motion in some ways parallel the theories of contemporaries such as Francis of Marchia and Henry of Harclay, his audacious ideas about some other aspects of natural philosophy have no precedent. Gerald's discussion of nature after the Last Judgment in book IV of his *Sentences* questions illustrates his originality. In keeping with an exegetical tradition, Gerald states that the celestial bodies would miraculously become immobile after the Apocalypse. Unlike the other authors, however, he emphasizes that it would not be a definitive cessation of celestial motion but just an interruption. While other theologians strive to prove that celestial immobility is compatible with Aristotelian cosmology, Gerald is of the opposite opinion, recalling that according

to the Philosopher, the existence of celestial movers is pointless without the motion of the spheres and rest is unnatural for superior bodies. Gerald also asserts that the permanent cessation of celestial motion would damage the terrestrial world, because the influence of the celestial bodies would be distributed unequally in the different terrestrial zones, thus destroying all species of animals, which is unacceptable, because all that God has created, including animals, is good. Gerald's argument expressly contradicts the common theological opinion of the thirteenth and fourteenth centuries that animals are useless in the post-apocalyptic world and should thus disappear after the Last Judgment. The resumption of celestial motion after a short interruption changes the vision of post-apocalyptic nature. In the new universe imagined by Gerald, the relationship between celestial bodies and the terrestrial world remains the same, and the laws of ordinary (Aristotelian) physics are still relevant.

As a theologian also, Gerald Odonis put forth radical views. In his *Quodlibet*, he defended Pope John XXII's very unpopular assertion that the saints in heaven do not experience the beatific vision until after the Last Judgment. One need not maintain that Gerald did this solely to score points with the pope, for Gerald espoused many unpopular opinions on matters unrelated to papal proclamations. For example, except for Matthew of Aquasparta, Latin theologians since 1054 agreed that the Last Supper took place as a Passover meal, when unleavened bread was in use. In distinction 12 of book IV of his *Sentences* questions, Gerald rejects the consensus and interprets the Gospels as the Greeks did: the meal happened before Passover, when leavened bread was eaten – although Gerald claims that Jesus instituted a new rite, employing unleavened bread.

One could maintain that Gerald's "Platonic" proclivities show up in his brand of Augustinian theology. In the contexts of divine foreknowledge and predestination, he proposed radical interpretations of two Augustinian *dicta*: for foreknowledge, "God does not know what is to happen differently from what has happened," and for

predestination, “This will of God cannot be unjust, for it springs from deeply hidden merits.” For Gerald, the first passage entails that God knows the future as past, while the second leads Gerald in the direction of semi-Pelagianism, abandoning the prevailing view that the predestination (of the elect) stems solely from God’s will. This is in line with what Gerald emphasizes in his *Ethics* commentary: humans can do good by themselves through free will; although humans need God’s help, God cannot do it alone, without human consent. For Gerald, ethics is none other than the study of human free will, because without the will’s free ability to choose and determine itself, there is no basis for morality. Gerald’s discussion is squarely Franciscan, exhibiting much of the fascinating Franciscan analysis of human free will in the 1320s, but Gerald seems to have worried less than most of his confrères about the burden of theological tradition. Gerald’s *Ethics* commentary heavily influenced John Buridan and European thought in general.

In metaphysics, in his *Sentences* questions and separate treatises Gerald Odonis opposed the prevailing denial of extramental existence to universals. He also supported the univocity of the concept of being, holding that there is a nature common to God and creatures in extramental reality, and common to particular and universal nature. It has been said that Gerald’s rather strong realism has a “Platonic flavor.” Thus in distinction 1 of his questions on II *Sentences*, Gerald enumerates and defines nine different kinds of being that a creature has before it receives “posited being” with creation: producible being, ideal being, intelligible being, intellected being, willable being, willed being, possible being, positive being, and quiddative being.

Gerald Odonis’ realism also influenced his logic. In his *De principiis scientiarum*, the most original of his logical treatises, Gerald is particularly interested in the ontology of logical principles: the law of noncontradiction (*De nullo simul esse et non esse*) and the law of the excluded middle (*De quolibet esse vel non esse*). For Gerald, these principles, which are necessarily

true and basic for all sorts of knowledge, concern something mind-independent, existing in extramental reality. The subject of these principles is neither something existing in the mind (*entia rationis*) nor real being (*esse reale*). According to Gerald, the law of noncontradiction and the law of the excluded middle refer to *esse tertio adjacens* (or “statemental being,” to use De Rijk’s term). By this Gerald means a specific kind of extramental being, expressed in propositions with the copula *est* (*S est P*, the subject is the predicate). In elaborating this concept, Gerald has some predecessors, since, on the one hand, the theory of *esse tertio adjacens* develops the notion of composition put forward by Peter of Spain while, on the other, it is close to John Duns Scotus’ ideas about the verb *est*.

Finally, even Gerald’s economic thought is remarkable. In his economics treatise, in essence, Gerald justifies what was called usury, providing a theory for acceptable banking practices in which interest is justly charged as compensation for the loss of utility of the money lent to the borrower. These are only a few of the topics on which Gerald expressed opinions that deserve our attention for their intrinsic interest and their impact on the history of ideas.

Gersonides

Steven Nadler

Department of Philosophy, University of Wisconsin-Madison, Madison, WI, USA

Gersonides (Levi ben Gershom [acronym RaLBaG], 1288–1344), one of the most important figures in the history of Jewish philosophy, was a fourteenth-century rabbi, philosopher, scientist, and Bible commentator who flourished within the Jewish community in the tolerant environment of Provence. The primary influences on his thought are Aristotle (through the commentaries of Averroës) and Maimonides. His most important philosophical work, *The Wars of the Lord*, is a wide-ranging treatise in the tradition of Maimonidean rationalism. Its five books cover such topics as the immortality of the soul; dreams, divination, and prophecy; divine knowledge and providence; free will; and creation and cosmology. He is also the author of treatises of biblical exegeses, including influential commentaries on the Pentateuch, Job, and Song of Songs, as well as work in astronomy, mathematics, and *halakhah*.

Biography

Little is known about Gersonides' life. He was born in Provence in 1288 and was probably the son of the Talmudic scholar Gershom of Bésiers. Under the rule of the Duke of Anjou and, later, the Pope (then based in Avignon during the Papal schism), Jews in Provence enjoyed a relatively high degree of toleration, even support, and a rich intellectual tradition was able to flourish in

this hospitable environment. While Gersonides, unlike Maimonides, was not a major religious leader in the community, his stature in Provence and beyond was high, both during his lifetime and after. He died in 1344.

The primary influences on Gersonides' philosophy are Aristotle (through the commentaries of Averroës) and Maimonides. He wrote all of his works in Hebrew, and it is uncertain whether he knew Latin, Arabic, or even Provençal. His Bible commentaries include works on the Pentateuch, Job, Song of Songs, Daniel, Esther, and Ruth, and several of these serve as useful supplements to his philosophical writings; they often provide an accessible discussion, through Biblical texts, of philosophical matters treated more technically in his supercommentaries on Averroës and, especially, in his own original philosophical masterpiece, *The Wars of the Lord* (*Sefer Milchamot ha-Shem*, completed around 1329).

In many respects, Gersonides was a more radical thinker than Maimonides, less deferential to either Aristotle or rabbinic tradition and willing to depart from traditional views when philosophical reasoning demanded it. Thus, while he agreed with Maimonides in rejecting Aristotle's views on the eternity of the world, he also rejected creation ex nihilo and favored the Platonic position of divine creation operating on a preexisting material substrate.

Philosophy

Gersonides' most important, systematic, and influential treatment of philosophical matters is *The Wars of the Lord*. The monumental treatise is divided thematically into six books: *Immortality of the Soul*; *Dreams, Divination, and Prophecy*; *Divine Knowledge*; *Divine Providence*; *Heavenly Bodies and Their Movers*, *the Relationships Among These Movers*, and *the Relationship Between Them and God*; and *Creation of the World*. His discussions are often characterized by scholastic style, first explaining and refuting the views of others and then presenting his own opinions, supported by both logical argument and biblical citation.

Nowhere is Gersonides' philosophical originality and technical virtuosity on greater display than in his treatment of three issues of major concern to medieval philosophers: the immortality of the soul, theodicy and the nature of divine providence, and the problem of reconciling divine foreknowledge and human freedom.

Immortality of the Soul

Gersonides offers a thoroughly Aristotelian conception of the human soul and of its capacity for immortality, but one that also stands in stark contrast to the views of other latter-day Aristotelians, such as Alexander of Aphrodisias and Averroës. The topic of the immortality of the soul is of supreme importance for Gersonides, for upon it depends not just the metaphysical fate of the soul, but also human happiness and well-being – and not only in the afterlife, but in this life as well.

Gersonides begins his discussion by singling out that part of the soul that is the prime candidate for immortality. The soul is composed both of parts that use the body in their functioning (such as sensibility and imagination) and pure intellect. That part of the soul that does depend on the body – and, in particular, the senses and the imaginative faculty – for its operations is called the material intellect. The material intellect is pure potentiality, the bare capacity for thought. Like all potentialities, it must reside in a subject; it cannot be a substance in its own right. Gersonides argues at length against the view that the subject of this disposition is a soul understood as an incorporeal substance distinct from the body. If such were the case, the disposition would belong to an actual intellect – a form – and would not have any potentialities. In fact, the material intellect is a disposition of the body (with “body” understood in Aristotelian terms as a substance composed of both matter and form). It is a capacity or potentiality that the animated human body has, because it is informed by the soul and its faculty of imagination, to contribute to the acquisition of knowledge through the mediation of sensation. It is basically the living human organism's capacity to transform sensory input into knowledge.

The material intellect is also, therefore, along with the body, corruptible and mortal – it comes to an end with a person's physical death.

Left to its own devices, the material intellect will not generate knowledge. True knowledge is the intellectual grasp of abstract, universal truths – it is conceptual in nature, not sensory – and the unaided material intellect can receive only the images of particular things. The senses and the imagination give us only limited access to individual objects in the world around us. What supplements the material intellect and makes it possible for a knower to transcend this acquaintance with particulars and apprehend more general things – such as essences, mathematical truths, and natural laws – is what Gersonides calls the Agent Intellect. Understanding just how this higher intellect functions requires a brief excursion into the cosmos itself.

In the medieval Aristotelian cosmology that Gersonides inherits, the universe is a series of concentric material spheres. On most accounts, there is, first, an outermost sphere encompassing the universe as a whole; its turning initiates the motions of the inner spheres. Gersonides himself, however, rejects such a starless sphere undergoing diurnal motion. For him, the outermost sphere of the universe is the sphere holding the fixed stars. Within this sphere lie the other spheres that, in their perpetual circular motion, each carry around either one of the five known planets, the sun or the moon. At the center of the universe, within the innermost sphere of the moon, stands the earth itself. The spheres are animate beings. Like all substances, they are constituted out of matter and form. They are also, therefore, intelligent, ensouled beings, and their motion is explained in part by their desire and volition.

Associated with each sphere, but distinct from it, is a separate intellect. This is the immaterial spirit or incorporeal intelligence that governs that sphere. It needs to be distinguished from the indwelling soul that animates each sphere. In fact, the separate intellect is that whose perfection each sphere's indwelling soul desires to emulate. Each separate intellect explains (again, only in part) the motion of its corresponding sphere (as the desire to emulate a perfect being gives rise to circular –

that is, perfect – motion) and the arrangement of its contents. All of the separate intellects flow from God and serve as God's intermediaries for the spheres they govern.

The separate intellect governing the sublunary realm – that is, the earth and the phenomena that lie between the earth and the moon – is called the Agent (or Active) Intellect. This eternal and incorporeal soul plays two roles in the world. First, it is causally responsible for all of the physical phenomena in nature: their natures, their arrangements and sequences, their interactions, and especially the laws that govern these. While God is the remote and ultimate cause of everything in the sublunar realm, the more proximate agent (and working on God's behalf) is the Agent Intellect. It is the agent responsible for the existence of things in the sublunar world: primarily by being the generative source of all the forms constituting natural things, but also by being the cause of the order and hierarchy of things, as well as of the general course of nature. The Agent Intellect actively governs the dynamics of the natural world.

Because the Agent Intellect is an intelligent cause, it possesses full knowledge – the maker's knowledge – of the order it imposes on things in the world. The Agent Intellect contains the concepts of all beings, organized comprehensively and systematically, such that the totality of what the Agent Intellect knows constitutes an exhaustive body of science. Its knowledge is a kind of complete and archetypal blueprint for the world it governs. Gersonides, in fact, calls it "the rational order of the terrestrial world," although its science also includes knowledge of all celestial phenomena as well. It is an eternal and incorruptible order, in contrast to the changing, corruptible, and temporal ordering of things and events that instantiates and dynamically exemplifies it. This knowledge in the Agent Intellect exists in "a perfect and unified manner."

The second role played by the Agent Intellect is epistemological, related to human knowledge. It is a role made possible, in fact, by its first role as intelligent cause. The Agent Intellect is responsible for illuminating human minds and generating human cognition of the general concepts of things

and of universal truths, that is, true science. Because of the intellectual union between the human intellect and this higher, separate intellect, the potential of the material intellect can be actualized, and the human being can acquire a knowledge of things that goes beyond mere sensory acquaintance through particular images. The world, in effect, becomes intelligible to the human intellect via the Agent Intellect. If knowledge is the apprehension of the forms of things, the grasp of their essential and general features, then what the Agent Intellect does, through its own knowledge of the forms, causes the human intellect's understanding of them.

The forms of things are just their general natures. The general nature of horse is in every horse. Through repeated sensory perception, through the reception of particular images in the imaginative faculty of the material intellect, the intellect (moved by the Agent Intellect) can abstract from the particularities that distinguish one specific sensible encounter with an object of a certain kind from another of the same kind and reach an understanding of that common nature. After seeing a number of horses, one comes to understand what a horse is essentially. The Agent Intellect makes this process possible by illuminating the human intellect with that eternal order it contains; it informs the human intellect with the general knowledge required for it to make intelligible sense of sensible particulars.

What we are ultimately after is, in fact, not just the essence of this or that particular kind of being. Part of what is contained in a nature is a set of functions that will allow one to see a thing in all of its intrinsic and relational characters. What we truly seek is a complete and unified system of such truths. The real object of knowledge for a human being is the intelligible order of things as contained within the Agent Intellect. Because this order is eternal, universal, and immutable, it exclusively possesses the characteristic features of true knowledge. This, then, is how the human mind – initially limited by its union with a material body – moves past sensible cognition via images to the apprehension of the intelligibles, of the forms of things without their matter. Through this process, aided by the intelligent

cause of the world's order, the human mind comes to an understanding of the true order of the world. Its knowledge grows, in fact, to mirror (as much as possible for human beings) the knowledge that is in the Agent Intellect itself.

The result of all of this in the knower – the cognition of the very order inherent in the Agent Intellect – is what Gersonides calls the acquired intellect. Gersonides notes that “it is clear that the acquired intellect is the perfection of the material intellect brought about by the Agent Intellect.” The acquired intellect is a body of conceptual knowledge. It is an intellectual attainment on the part of the knower; it just *is* that person's knowledge of eternal truths. Because it is only a partial grasp of a larger whole, and a not entirely systematic one at that, the acquired intellect is not identical with the knowledge in the Agent Intellect itself. But the content of the acquired intellect reflects to some degree the knowledge in that higher spirit.

What is immortal in a human being, for Gersonides, is nothing beyond the acquired intellect. Despite the fact that the acquired intellect is generated in us, it does not follow that it is corruptible; Gersonides rejects Aristotle's claim that everything generated is corruptible. Because the rational order of the world in the Agent Intellect is eternal and incorruptible, our knowledge of that order (once it is acquired) must likewise be eternal and incorruptible, since knowledge takes its character from the object known. Moreover, he argues, the acquired intellect (unlike the material intellect) is both immaterial and separable from the body and thus not subject to the forces that destroy the body. Hence, he concludes, the acquired intellect is immortal. When a person dies, the soul understood as the material intellect ceases along with the body. As a result, all further acquisition of knowledge necessarily comes to an end as well. But the acquired intellect remains. The immortality available to any human being consists only in this persistence, after the death of the body, of the knowledge that he or she has acquired in this lifetime.

To his contemporaries, Gersonides must have seemed to be treading perilously close to – if not right into – the eye of – the Averroist storm.

Among the Arabic Aristotelian's greatest sins, at least in the eyes of his Christian critics, was the denial of an individual, personal immortality. Averroës had argued that the material intellect in a human being is not a particular product of the union of a body (matter) and an individual soul (form), but rather simply the manifestation in that person of the single, all-embracing Agent Intellect. Thus, a person's soul – the form animating his body – is nothing but the Agent Intellect itself, and his cognitive powers and achievements are simply the direct activity in him of that higher intellect, which actualizes certain potentialities in his body. All human beings, that is, literally share the same form – the Agent Intellect is common to them all. And a person thinks only because of his union or conjunction with the Agent Intellect and the intelligibles it contains. Although in itself general, the Agent Intellect undergoes a temporary process of individuation when it is attached to and embodied in an individual human being in a lifetime. But since the Agent Intellect is, in truth, one, and thus the same in and for all individuals, when a person dies, all such individuation acquired through the body disappears and his soul reverts back to its transcendent, separate, impersonal existence as the pure Agent Intellect. There is no *personal* immortality for Averroës.

Gersonides is aware of the philosophical problems here. For example, if all human beings literally share the same intellect, he argues, then how can we account for the different intellectual attainments of different people? But of even greater importance, it seems, are the religious and theological objections he has in mind. As Gersonides goes to great lengths to distinguish his own view of the soul from that of Averroës, he concentrates especially on the issue of personal immortality. If the human intellect is really nothing but the Agent Intellect, then immortality is of no practical value or moral consequence. For, he suggests, it would follow that *all* human beings, whatever their character or virtue – “be he fool or sage,” good, or evil – will, because they literally share the same eternal soul, obtain this alleged immortality. Moreover, if immortality is indeed a totally impersonal affair, as Averroës

claims, then it can have no relevance for our very particular lives.

Gersonides believes that his doctrine of personal immortality avoids these problems. Each person's acquired intellect is, he argues, a unity, numerically one, and thus can be distinguished – without any reference to the body at all – from other acquired intellects, even if those intellects have some knowledge in common. “One piece of knowledge can be common to Reuben and Simon yet differ in them insofar as the kind of unity differs in them; so that, for example, the unity in the acquired intellect of Reuben differs from the unity in the acquired intellect of Simon.” What gives each acquired intellect its unity and identity is both the amount of knowledge it involves and the content or character of that knowledge – not just its items but also the way they are connected or synthesized. Different people acquire different, and different amounts of, intellectual knowledge. This will presumably allow one disembodied acquired intellect to be distinguished from another. And Gersonides seems to think that a sense of selfhood will accompany this unity. He speaks of the happiness and pleasure that the immortal soul will feel when, having been released from the body, it will contemplate the knowledge it acquired during its temporal, embodied existence.

Divine Knowledge and Future Contingents

The problem of divine knowledge for Gersonides is centered on two basic questions: Does God have knowledge of particulars, especially the particular actions of individual human beings? And how can an omniscient God's knowledge of future contingent events leave the contingency of those events unaffected? If God knows from eternity that a person will commit a certain action, then it would seem impossible for that person not to commit that action; thus, the problem runs, the act would not really be free, and the person could not be held morally responsible for performing it. This is the classic problem of how to reconcile divine foreknowledge with human freedom.

With regard to God's knowledge of particulars, Gersonides tries to steer a middle course between the Aristotelian view that God does not know particulars at all, but only universals (including the species of things), and Maimonides' view (which Maimonides claims is the only one consistent with Torah) that God knows every particular in all its particularity. Gersonides says that God does have knowledge of particulars, but not in their particularity. God lacks the right kind of cognitive faculties, such as sense organs, to grasp the temporal, mutable features that distinguish different individuals of the same kind. What God does know of particulars is all of those aspects of them that are determined by the species to which they belong and the more general laws of nature that govern them. Just as God knows of every molecule of water that it will contain two hydrogen atoms and one oxygen atom, and of every grain of salt that it is soluble in water, so He knows of every single human being that he will have reason and certain instincts. God has knowledge of particular events only to the extent to which they are “ordered in a determinate and certain way” by the laws of nature; He knows how things in general behave according to their kinds. And this knowledge covers most of what happens in nature.

But for Gersonides, there is a certain domain of events in the world of which God has no particularized knowledge, namely, the free choices of human beings. These are not determined by the species or laws – otherwise they would not be free – and so they escape the eternal knowledge of regularities that God has. God may know the general patterns of things, but these patterns can be disrupted by human volitions. For this reason, Gersonides denies that “God knows this affair with respect to this particular man as a definite individual.” God may know what a human being of a certain kind would, in general, do in certain circumstances, but there is always the possibility that in such circumstances, a free agent will not do what a member of the species will ordinarily do. Thus, God does not know for certain how such an agent will act.

This account of God's knowledge of particulars provides Gersonides with an easy (although

highly controversial) answer to the problem of reconciling divine foreknowledge and human freedom. Essentially, Gersonides says that God does not in fact have foreknowledge of free human actions before they occur. God may know that human beings, given their native endowments, will sin, but He does not know whether or not a particular human being will sin in certain circumstances.

Gersonides is not concerned that this position undermines divine omniscience. For him, omniscience does not mean knowing everything; rather, it means knowing everything that is in principle knowable. And, he insists, future contingents are simply not knowable. Unlike events in the past, the particularities of contingent events that have not yet taken place have no determinate truth value and therefore cannot be known.

Divine Providence

Gersonides' account of providence is, as he himself explicitly notes, much like that of Maimonides. He begins with the question of whether divine providence extends to individuals or is (as Aristotle claims) limited only to eternal and unchanging things. The phenomenon of prophecy, evidence of God's communication with particular individuals, rules out the Aristotelian option (a position that, he insists in his *Commentary on the Book of Job*, also represents Job's despondent view). So now the question is simply whether providence extends to all individuals (and at all times) or only to some individuals. Gersonides argues against providence being connected to all the actions of all individuals – the view he attributes to Job's friends Eliphaz, Bildad, and Zophar – on the grounds that (a) this would involve God in actively causing evils, for we frequently see people suffer, and (b) it is clearly falsified by experience, which seems to present a good deal of disorder and a lack of justice in the distribution of the world's goods. The challenge for Gersonides, then, is to explain how divine providence extends to some but not all individuals (the view he attributes to Elihu) even

though God has no knowledge of particulars as particulars, and to do so in a way that accounts for the suffering of the righteous and the prospering of the wicked in this world. His solution is to place immediate responsibility for human flourishing upon individual human beings themselves. "God has endowed man with reason so that he can avoid these evils as far as possible."

Gersonides, again like Maimonides, is concerned with two species of providence, both of which are explained in naturalistic terms within an Aristotelian framework. First, there is a general providence that extends across all of nature and, thereby, to all human beings. Second, there is what he calls special or individual providence. This is the protection that, as on Maimonides's account, comes only to a certain class of human beings, namely, those who, through the use of their intellects, achieve a union with the Agent Intellect and a consequent insight into the ways of nature.

The source of evil, Gersonides says, is never God. Nor does it come from the forms of things. Rather, evil has its origins either in matter or in chance. By "matter," he means the mixture of elements in material nature (including human bodies) and the human choices that may be influenced by this. By "chance," Gersonides understands the unfortunate effects upon human beings of occurrences of nature. These occurrences are as causally ordered as anything else in the sublunar realm: they are "the evils that befall man from the patterns determined by the arrangements of the heavenly bodies." What is accidental and a matter of chance is the evilness of their results relative to human beings and their ends; it is an evil that is unforeseen and unintended by the natural causes of such things and bears no relationship to peoples' deserts. As Gersonides notes, it is the "evil resulting from these events [for human beings] that is due to chance."

Now nature has provided in a general way for all creatures through the endowments of the species. Each type of animal has been given the appropriate means necessary for its survival. And the more noble the creature, the greater its capacities for self-preservation. General providence, then, derives, like all the determined aspects of

nature, from the ordinary causal course of nature as this is driven by celestial bodies and through the Agent Intellect. All individual human beings are thus endowed by nature with the faculties and instincts that they need for survival in a world governed by laws which themselves derive from the same celestial influences. The heavenly spheres provide us with desires, thoughts, and intentions for action that are to our benefit. The general celestial providence thus takes care of all individuals *qua* members of the human species, but not *qua* particulars. It extends to all humans as humans in their interactions both with material nature and with each other, without taking any account of their particularities, especially their moral differences, their virtues, and vices. Naturally, although this general ordering of nature aims for the best, and generally results in good, sometimes it brings about evil or accidental misfortunes. Although we have, by general providence, the wherewithal to deal for the most part with what fortune brings our way, we are not, by nature alone, prepared to deal with all the threats to our well-being. Nature is still a risky environment, full of potential harm and obstacles to our flourishing.

This is where special providence comes in. Although God has not ordered the patterns of the heavens such that no evil is to occur, nonetheless “he has given man an instrument whereby these evils can be avoided – reason.” Thus, in addition to the astral-based (general) providence, there is also an intellect-based providence available to human beings, through the achievement of which they can escape (or at least limit) the occasional unfortunate effects of general providence. Through the proper use of his intellect, an individual human being perfects himself and becomes closer to the Agent Intellect, discerns that Intellect’s maker’s knowledge of the essences of things and of the patterns and laws of nature, and thereby attains a higher degree of protection from nature’s vicissitudes. The person enjoying special providence is a person who, through the actualization of his intellect and the acquisition of higher knowledge, is better equipped to obtain what is good and avoid any evils impending from the ordinary course of nature. As the human mind

comes to an understanding of the true order of the world and its knowledge grows, in fact, to mirror (as much as possible for human beings) the knowledge that is in the Agent Intellect itself, one becomes enlightened. Unlike the general run of people, “who are not within the scope of divine providence except in a general way as members of the human species,” this person knows how nature operates; he can predict what, according to nature’s laws, the future will bring and generally be able to put nature’s ways to his own use. “His providence with respect to individual men consists [precisely] in informing them of the good or evil that is to come upon them, so that they will avoid the evil and pursue the good.”

This kind of communication between the Agent Intellect (and, ultimately, God, from whom its knowledge derives) and a particular human being does not require any knowledge of or action upon particulars *as* particulars on God’s or the Agent Intellect’s part. The knowledge acquired by the person who has developed his intellect is neither itself particular nor aimed at anyone in particular. It is general information – perhaps best captured by a system of conditional propositions (if *x* occurs, then *y* occurs) – that is there for anyone to pursue and tap into. Still, as a matter of fact, only the truly righteous – those who are guided by reason – will attain it. If virtue is the pursuit of intellectual perfection – as Gersonides believes – then this special providence is the natural product and reward of virtue. The truly righteous person will, for the most part and just *because* of his intellectual achievements, obtain the goods that this world has to offer and avoid its evils. Sinners, on the other hand, will in general be punished – not directly, through some particular directive from God (since God cannot be the cause of evil, nor can he know particulars *as* particulars), but by being left out in the cold. Those who do not pursue virtue, who do not perfect their intellects, will be subject to the vicissitudes of nature. Without the knowledge possessed by the virtuous, sinners cannot properly navigate their way through nature and guard themselves accordingly.

Why, then, is it the case that evil things *do* sometimes happen to righteous people and good

things to sinners? Why do we see the virtuous suffer while the wicked prosper? In Gersonides' own words, a righteous person occasionally *does* "become the target of the arrows of fortune," as these are ordered by the heavenly bodies, that is, by nature. Is this not a counterexample to Gersonides' theory of providence?

Gersonides offers a two-pronged response to this objection. First, he focuses on the impersonal universal and deterministic forces that bring the goods and evils in question to individuals independently of their deserts. He notes that just because the wicked person is abandoned to chance, to whatever nature may bring his way, there should be little wonder that sometimes nature will bring along things that benefit him. What is important is that his acquisition of these benefits is due entirely to accident and not to any judgment about what he is due in terms of reward and punishment. Similarly, Gersonides concedes that in this life no one, not even the most virtuous, can completely escape nature's inconveniences. Reason does indeed afford the righteous a relatively high degree of well-being in this world, but the protection is not complete.

Gersonides then downgrades the importance of those alleged goods that sinners seem to enjoy and the alleged evils that afflict the righteous. When we examine the nature of the goods and afflictions in question, we should realize that these are almost always material benefits and evils, affections of one's body and one's material well-being. And in the ultimate scheme of things, these are not the true goods for a human being; when it comes to our proper happiness, they are of little consequence when compared to the true good, knowledge. The righteous, through their virtue – their intellectual perfection – *do* in fact succeed in obtaining the true good; the wicked, on the other hand, never fail to fall short of proper human happiness (although they may not realize this). The celestially determined distribution of material benefits in this world is not necessarily governed by justice in all of its details; that is why sometimes the righteous suffer and the wicked prosper with respect to these "goods." But the distribution of the true good necessarily is just and right.

Ultimately, Gersonides grants, even this supreme spiritual condition is achieved only imperfectly in this world, given the persistent demands of the body. True happiness, an undisturbed state of perfection, is attained only in the world to come, the afterlife wherein the intellect experiences pure spiritual joy unencumbered by the inconveniences of the body.

Gersonides's second approach to the objection is to go beyond the generalities of nature and explain why, in fact, the virtuous are sometimes afflicted with even these lesser evils. He offers three specific reasons for this phenomenon. First, and most important, not even righteous individuals are immune to the pleasures of the senses, and thus sometimes, the union between a person's intellect and God through which providence is conveyed is loosened, even broken. In this case, the individual, although generally virtuous, enjoys no more protection than the wicked. They, of course, are responsible for their own misfortunes. Second, God may dispense evils to a person in order to prevent greater evils that would come by the ordinary course of nature. Finally, God sometimes brings evils upon a good person for the purpose of edification, to save him from some minor sin he is about to commit.

Still, there will be many cases that cannot be so rationalized, and one can then ask why God does not act directly to prevent all such injustices, to keep evil things from happening to righteous people and good things from happening to wicked people, especially the ones that occur simply by the ordinary course of nature? Or, since Gersonides' God does not really act at all once the moment of creation has passed, why did not God institute a different plan, one that does not result in any natural but accidental and undeserved evils (or fewer evils) for righteous individuals nor any benefits for sinners? Does not this situation serve to undermine God's justice?

Gersonides argues that although there are indeed "infrequently occurring evils" as a result of the celestial patterns – general providence – nonetheless the ordering imposed by these patterns and directed by the Agent Intellect is, on the whole, for the best. The ordinary course of

events, as embedded in the general and providential laws of nature, represents the best of all possible worlds (to use a somewhat later phrase). Yes, sometimes these laws do have unfortunate consequences. But it is important to realize that whatever goods accrue to sinners does not come to them *because* they are sinners (that is, as an intended reward for their sin). Lacking the special providence belonging to the virtuous, sinners are abandoned to the “accidents that are ordered by the heavenly bodies”; they are left to their own rather meager devices. Sometimes what that order brings along to them is, in fact, bad fortune, but sometimes what it brings happens to contribute to their worldly prosperity. Such are the (ordered) accidents of nature. But these consequences do not represent an intended evil in nature, since its arrangements are, on the whole, the best possible. The generality of the course of nature will sometimes have unfortunate but unintended consequences in individual cases. But if the general order is truly the best, then it must not be changed or contravened for the sake of achieving or avoiding some particular effects. In this regard, Gersonides’ theodicy resembles that of later philosophers such as Leibniz and Malebranche.

al-Ghazālī’s Maqāṣid al-Falāsifa, Latin Translation of

Jules Janssens

De Wulf-Mansion Centre, KU Leuven, Leuven, Belgium

Abstract

al-Ghazālī’s *Maqāṣid* was translated at the end of the twelfth century into Latin in Toledo and in all likelihood without the introduction (which in the Arabic tradition might well have been added at a later time). The Latin Scholastics were not completely wrong in considering it a philosophical compendium largely inspired by Avicennian ideas, insofar as the text is indeed largely based on Avicenna’s *Dānesh-Nāmeḥ*. In this sense, it is understandable that they used it only as a secondary rather than as a primary source.

Translation

In Toledo, toward the end of the twelfth century, Dominicus Gundissalinus, together with the still enigmatic “Magister John (of Spain)” (Burnett 2002), translated al-Ghazālī's work known as *Maqāṣid al-falāsifa* (*The Intentions of the Philosophers*). However, the title of the work given by the Latin translators was not *Intentiones philosophorum*, but *Summa theoreticae philosophiae* – the former title only appearing in the translation of the prologue, which is absent in all manuscripts except for Paris, BN, lat. 16096, which dates to the last quarter of the thirteenth century (Salman 1936: 118). On the basis of the *stemma codicum*, Lohr (1965: 229) inclines to believe that the prologue was not included in the original translation. Important differences in terminology, but, above all, the articulation of al-Ghazālī's name in the nominative as “Abuhamedin Algazelin” and the use of *De philosophorum intentionibus* as the (new) title of the work (Salman 1936: 125), make it even less probable that the prologue was translated together with the main text and rather point to an anonymous later translator. Furthermore, the almost complete ignorance of the prologue by the vast majority of the thirteenth (and even fourteenth)-century authors undoubtedly corroborates this view. Roger Bacon seems to constitute the one notable exception, and even then only in one of his later works, that is, the *Communium naturalium*. Bacon is to be contrasted with the mature Raimundus Marti (d. 1285 c.) a Spanish missionary. When writing his early work *Explanatio symboli apostolorum* (where he quotes the *Maqāṣid* under the title “*Intentiones physicarum*”), Marti considers, in line with the common opinion among the Scholastics, al-Ghazālī as a “philosopher”, but in his major work *Pugio fidei* (where he quotes passages of several works of al-Ghazālī among which are the *Tahāfut*, but not the *Maqāṣid*), he presents the latter as a defender of the faith against the (all too) rational philosophy (Janssens 2015). Bacon in contrast continues to detect in al-Ghazālī a genuine philosopher, and hence he clearly ignored the true nature of the *Tahāfut*, whose title is

translated in the prologue as *Liber controversiae philosophorum*, not as *Ruina philosophorum* as Marti had done. For Bacon the prologue, like the introduction to Avicenna's *Shifā'*, intends to make clear that the present work does not offer a full exposé of the most profound philosophical insights; nevertheless, beautiful philosophical secrets have been hidden in it (Bacon, III, 250). Finally, the prologue may have already been absent from the Arabic manuscript at the disposal of Dominicus Gundisalvi and Magister John. Indeed, the prologue, in which the title of the work is indicated as *Maqāṣid al-falāsifa*, in all likelihood was added at a later time (Hana 1972: 892–895), although it might also stem from a will to decontextualize the book (Shihadeh 2011: 88). Moreover, the work reveals itself to be a slightly interpretative translation into Arabic of Avicenna's Persian encyclopedia *Dānesh-Nāmeḥ* and thus shows up as a kind of student's thesis, commonly designated at the time as *ta'liq* (Janssens 2006a: VII, XI). Ultimately, the commonly accepted intimate link between the *Maqāṣid* and the *Tahāfut* – the former work being a neutral presentation of the doctrines of the philosophers so that the reader could better understand the *refutation* of these doctrines in the latter – is, even if one places its redaction after that of the *Tahāfut* (Griffel 2006: 10), highly questionable, especially in view of important terminological differences as well as the use in the *Maqāṣid* of only Avicennian texts (Reynolds 2002; Janssens 2006a: X). Hence, the absence of the prologue is not necessarily the result of a historical misfortune in the transmission of the text, whether in the Arabic or in the Latin tradition, or of any deliberate omission. It might simply reflect the oldest state of the text. Also the very title of the work as given by the Latin translation, again, *Summa theoreticae philosophiae*, offers perhaps an indication of a reliance on a primitive version, insofar as it presents itself almost as a possible, although not very literal, translation of the Persian *Dānesh-Nāmeḥ* (*Book of Knowledge* or *Book of Science*). Whatever the case may be, the Latin translation was not always transmitted in its original unity. Its various parts were often copied separately, and especially the treatise on logic

seems to have been regarded as a more or less independent unit (Lohr 1965: 232). The other two parts – metaphysics and physics (in that order in full accordance with Avicenna's *Dānesh-Nāmeḥ*) – were sometimes designated as *Philosophia Algazelis*. This helps explaining why in 1506 P. Liechtenstein published the work in Venice under the title *Logica et philosophia Algazelis arabis*, of which a second edition appeared in 1532 (Daiber 1990: 232). It might also be worthwhile to note that Ramón Llull made a compendium of Arabic logic in Latin, titled *Compendium logicae Algazelis*, which he based mainly, although not exclusively, on the logical part of al-Ghazālī's *Maqāṣid* Llull set it moreover into Catalan verses as *Logica de Gatzell* (d'Alverny 1994: VII, 7).

Reception

The work was well known among most thirteenth-century Scholastic thinkers. The earliest quotations are probably those found in one of the independent works of one of the translators, that is, Gundissalinus' *De divisione philosophiae*, although without any explicit reference to the *Maqāṣid* (Gundissalinus 2007, *passim*; Janssens 2014: 566). Also the anonymous treatise from around 1225, *De anima et de potentiis eius*, uses al-Ghazālī's work without mentioning it (Hasse 2000: 192). This was not an uncommon practice, as can be shown by the case of Godfrey of Fontaines (Wippel 1981: 72, n. 88). Therefore, one may suspect that many other writings of this time include such implicit quotations. Whatever be the case, one also finds a large number of explicit references to it in a wide variety of authors. Many times the reference is simply to "Algazel," and frequently in direct combination with Avicenna, that is, as *Avicenna et Algazel*. In this latter form, it appears *inter alia* in Roland of Cremona (Hasse 2000: 41–42) and John Quidort (Quidort 1964 33: 131), as well as in such major Scholastic thinkers as Albert the Great, Thomas Aquinas, and Siger of Brabant. The very intimate link between Algazel and Avicenna is particularly stressed by Albert the Great, who in his *De homine*, states that al-Ghazālī's positions are a

summary, *abbreviatio*, of those of Avicenna and that the former follows the latter's footstep (*sequens eius vestigia*) (Hasse 2000: 63). In the same vein, Dietrich of Freiburg calls al-Ghazālī an *abbreviator* of Avicenna (Dietrich 1977: 144). Henry of Ghent, in his turn, presents al-Ghazālī as *expositor Avicennae*, someone who explains Avicenna (Henry of Ghent 1984: 117). As for William of Auvergne, he sees al-Ghazālī, together with Avicenna and al-Fārābī, as a follower of Aristotle, *sequax Aristotelis* (William of Auvergne 1674: 112b). Finally Robert Grosseteste refers to him as *Algazel philosophus* (Grosseteste 1995: 73), and as such he is also considered in the (Pseudo-?)Giles of Rome's *Errores philosophorum*, where in Chapter 9 mention is made of 18 philosophical errors related to his thought (Giles of Rome 1944: 44–47). In 1376, this list of errors was included in the *Directorium inquisitorum* of Nicholas Eymerich (Lohr 1965: 231). Concerning the work itself, it never seems to have been referred to by a general title, but always by its parts, designated most of the time as *Logica* and *Metaphysica*, as especially attested by Roger Bacon. In the latter's commentary on the *Secret of Secrets*, one also finds mentioned the part on *Naturalibus* (Bacon, V, 11), but this does not seem to have been a very common designation. Matthew of Aquasparta preferred the designation *Philosophia* when referring to an item related to the physical part (Matthew of Aquasparta 1959: 158) and, thus, in all likelihood, considered both parts of metaphysics and physics as constituting one unity, as seems to be frequently the case with the title *Metaphysica*. It should also be noted that when John Blund calls al-Ghazālī's metaphysics *commentum primae philosophiae*, he is not necessarily referring to a title but may simply be offering a description of the work as written in the tradition of a specific Aristotelian book (Hasse 2000: 20).

On the doctrinal level, in view of the very nature of the work, that is, as a slightly interpretative translation of Avicenna's *Dānesh-Nāmeḥ* that is complemented now and then with variations from other Avicennian writings, it is not surprising that the vast majority of the central ideas have their counterparts in Avicenna as

well. This is the case, for example, for the logical thesis that the unknown can only be known by something already known, for the psychological doctrine of the two faces of the soul, and for the metaphysical distinction between essence and existence. The notion of “Giver of forms,” *Dator formarum*, is one of the rare cases where al-Ghazālī presented a new idea, at least for his Latin readers (since they had no access to Avicenna's *Ta'liqāt*, which constituted most probably al-Ghazālī's source (Janssens 2006b)). Otherwise one looks in vain for any systematic use of new – at least, compared to the Avicenna Latinus – philosophical ideas in the *Maqāṣid*, and when they do occur, it is only by minor additions, for example, al-Ghazālī's introduction of the example of the camel in order to illustrate the theory of the evil eye, mentioned by Robert Grosseteste, Roland of Cremona, and Peter of Spain (Hasse 2000: 168–169 and 290). Hence, one easily understands why for Thomas Aquinas, and almost all Scholastics in agreement with him, al-Ghazālī was neither a very important nor an original thinker (Hanley 1982). In the fourteenth century, explicit references to the *Maqāṣid* became rare, except perhaps in Spain where one finds an anonymous Castilian manuscript offering many quotations (Lohr 1965: 231). However, al-Ghazālī's name did not disappear totally in fourteenth-century Scholastic thought, and, in fact, it appears many times in a list of several philosophers, as is the case in John of Jandun (Brenet 2003: 246, n. 1) and John of Ripa (Combes 1956: 166, n. 2). All in all though, the influence of the Latin translation of the *Maqāṣid* remained rather limited.

Gilbert of Poitiers

Luisa Valente

Dipartimento di Filosofia, Sapienza Università di Roma, Rome, Italy

Abstract

Born, Poitiers after 1085; died, Poitiers 1154. According to Gilson, Gilbert was the greatest metaphysician of the twelfth century. He was a profound thinker, original and coherent, famous in his time for the complexity and boldness of his philosophical theology. He provoked both violent disapproval and great enthusiasm. Brought to trial for heresy in 1148, he came out of it without being condemned; rather, his thought had a considerable number of followers in the so-called Porretan School. Through his followers, he exercised a significant influence on the theology of the second half of the twelfth century. In his mature thinking, he went far beyond what he had learned during his apprenticeship: at Chartres, philosophy of a Platonic stamp based on the *Timaeus* and on the *Consolation of Philosophy* and *Opuscula sacra* of Boethius; at Laon, theology founded on Biblical exegesis and the Fathers. In his *Commentary* on Boethius' *Opuscula sacra*, his fundamental work, he developed a profoundly innovative "rational" theology and an autonomous and broadly coherent philosophical reflection. It combines the Platonic doctrine of the preeminence of form with a keen sense of the primacy of the concrete and the singular. It consists of,

principally, an ontology, a philosophy of language, and an epistemology, all closely interconnected. Only the principles (God, prime matter, ideas) are simple, and only in God is being everything that he is. Created entities, by contrast, receive their being from something other than themselves (from God), and they are composed of an ordered aggregation of forms. Forms are always inherent in a substrate. Common natures do not exist; everything, compounds and forms, is singular: the humanity of every man is similar to but different from that of any other man. But not everything that is singular is an individual – only concrete entities and the compounds of forms that constitute the complete form of every concrete entity are individuals: their individuality consists in the fact that, if they are considered as wholes, they are dissimilar from any other compound thing. Universals are collections of singular forms gathered together by the intellect on the basis of the resemblance that is found between the singular entities. When we speak about natural objects, a name signifies a concrete entity and one of its properties or forms; the subject of the proposition represents the concrete entity, and the predicate represents a form inherent in it. The language of the philosophy of nature reflects what it investigates: the compound constitution of creation. It lends its own terms and its own formal structures to the other two speculative sciences, mathematics and theology. The correct understanding of a text is attained when, by distinguishing the appropriate discipline to which it belongs, the interpreter gathers, beneath the surface of the words the “meaning in the author’s mind.”

Biography, Apprenticeship, and General Characteristics of His Philosophy

Gilbert was born in Poitiers shortly after 1085 and began his studies there under Hilary of Poitiers. Later he moved to Chartres where he was one of the students of Bernard. At Poitiers and Chartres, he studied the liberal arts, in particular grammar,

dialectic, and rhetoric – in which his knowledge was legendary – and Platonic philosophy. He studied Plato’s *Timaeus* with Calcidius’ commentary and Boethius’ *Opuscula sacra* and *Consolation of Philosophy*. From Chartres he moved to Laon, where under Anselm and Ralph he was educated in the understanding of the Fathers and Scripture. He was a master at Chartres from 1124 at the latest (at least according to most scholars, but see Gross-Diaz 1996) and, starting sometime between 1137 and 1141, at the cathedral school of Paris, where he had John of Salisbury among his students. John remarked that his teaching appeared obscure and arcane to the beginners but that the experts, used to his original terminology and complex style, found it to be of great profundity. His teaching at Paris was cut short in 1142 when he was named Bishop of Poitiers, where he died in 1154. The rational and philosophical style of doing theology earned Gilbert, among others, an accusation of heresy by Bernard of Clairvaux (who also persecuted Abelard), from which he had to defend himself in front of the Pope in 1147 and, later, in 1148 (Maioli 1979: XVI–XXI; Nielsen 1982: 30–38). He was accused, in particular, of holding that the divine nature was identical, not with God but with a form, just as in the case of humanity, which is not identical to man but with the form thanks to which a man is a man, and of holding that the properties (*generatio, filiatio, processio*) through which the three persons of the Trinity are distinguished are distinct from the persons themselves (*Pater, Filius, Spiritus Sanctus*). Although Gilbert emerged from the trial without being formally condemned, there remained an aura of suspicion about him and his work. Nonetheless, his thought and his special terminology were appropriated and reworked to various degrees, by a certain number of thinkers working in the second half of the twelfth century, who are usually known collectively as the “Porretan School” (Marenbon 1988, 2002; Catalani 2009). These masters in turn, and in particular Alain of Lille, exerted an influence on other teachers of the period, above all with regard to the semantics and the logic of theological language (Valente 2008a). Among the works of Gilbert, the fundamental one is his Commentary on

the *Opuscula sacra* of Boethius (except for *De fide catholica*), edited by N.M. Häring. Other certainly authentic works, unedited except for some fragments, are a commentary on the Psalms (studied by Gross-Diaz 1996) and one on the epistles of St. Paul (some passages are edited and discussed in Nielsen 1982). Various other writings attributed to Gilbert by editors are found to be inauthentic (Nielsen 1982: 40–46); in particular, the so-called *Liber sex principiorum*, already attributed to him by Albert the Great (Lewry 1987), is not Gilbert's.

Ontology

Forms and Substances

The ontology of Gilbert (general accounts in Jolivet 1992b: 141–146; Marenbon 1998: 168–171; Jacobi 1996: 12–14; Jacobi 2002: 74–76; Valente 2013: 100–122), which has pertinently been called a “metaphysics of the concrete” (Maioli 1979), is a combination of doctrines, broadly coherent, but not without indeterminate elements. It is distinguished by, above all, its theory of forms, of individuals, and of universals. It also adopts an original vocabulary, whose basic elements are the terms *subsistens*, *subsistentia*, *concretio*, and *tota forma*.

Subsistens (which will be translated below as “subsistent”) corresponds to Boethius' *id quod est* (*De hebdomadibus*), that is, “the <thing> which is” (cfr. de Rijk 1988: 75), the determinate entity, which is such from the inherence of a multiplicity of forms. As a synonym for *subsistens*, Gilbert uses the term *substantia*, in virtue of the fact that it “is under” (*sub-stat*) the accidents; *substantia*, however, is ambiguous, because it is also able to refer to forms.

Subsistentia (“subsistence”) corresponds to the *esse* or *id quo* of Boethius, i.e. “that through which the <thing> which is is,” the formal principle which makes the subsistent exist and which confers on it its substantial properties. The *subsistentia* is referred to also as *natura*, *nativorum forma*, and *esse*. The *subsistentiae* can be simple or composed of other *subsistentiae*: *humanitas* is composed of *animalitas*, *rationalitas*, etc. Of the

subsistent Gilbert says that “it has” (*habet*) the *subsistentiae* or “participates” (*participat*) in them. To include under one general name both subsistents and subsistences, Gilbert uses the neutral plural (e.g., *singularia*) or the term *substantiae*. In the constitution of the subsistent, the accidental forms are added to the subsistence: they confer on the subsistent its accidental characteristics of quality and extension (quantity).

Concretio (“concretion”) is a term that refers to the ordered aggregation of the many subsistences and accidental forms that constitute the subsistent. These forms support (*con-crescere*) one another, beginning from the more generic and descending gradually in ever-increasing determinateness: they are related to one another as *generales* and *differentiales*; in this way, the formal structure of the subsistent follows the order of Porphyry's tree. The more general forms are the causes of the increasingly less general forms that adhere (*adsunt*, *adhaerent*; e.g., *albedo* to *corporeitas*) to them, in a relation of consequence (*complexionis consequentia*). The first subsistence, the most general, is preceded only by the primary cause and constitutes the basis of the process of ordered aggregation of forms that constitutes the subsistent (*Comm. De hebdomadibus*, p. 209, ll. 67–85). It is not clear, however, if this first subsistence is a maximally indeterminate substantial form, which “precedes” the *corporeitas* and the *spiritualitas*, the two most general forms that distinguish the corporeal from incorporeal things, or if it is one of these two.

Tota forma (“complete form”): the forms of a single subsistent taken together and in their totality constitute the *tota* or *propria forma* or *proprietas* (in the case of Socrates, it can be called *socrateitas*), which confers to the subsistent at a time that it is something and its unity. The *tota forma* is made up of all the subsistences and all the accidental forms of quality and extensive quantity, which the subsistent actually (*actu*) has had, has, and will have in the future, and even those which it will never have, but could possibly have according to the potentiality of its own nature (*naturâ* or *potestate*: *Comm. De trinitate* p. 144, ll. 75–77; cf. *Comm. Contra Euticen* p. 274, ll. 81–82). In

one passage, Gilbert says that the forms that constitute a complete form are infinite (*Comm. De trinitate* p. 90, l. 50). The numerousness of the forms that make up the complete form, which extends to the future and the possible, makes impossible an adequate understanding of this by man: finite reason cannot but proceed through partial representations of things (Maioli 1979: 46; Jacobi 1995a: 80s., 1996: 14; Valente 2013: 112). The unifying principle that holds together in an individual and organic whole the totality of the substantial and accidental forms that constitute the *tota forma* is God as *simplex auctor* or *qui est solum bonum* (*Comm. De hebdomadibus*, p. 219, ll. 42–57), from which every subsistent “flows” (*fluxit*: p. 220, l. 81). Yet Gilbert also speaks of the *unitas* of the subsistent as deriving from the “coaccidental unity” (*unitas coaccidens*) that accompanies every form, substantial or accidental (*Comm. Utrum Pater*, p. 176, ll. 15–22). The accidental determinations of non-extensive quantity and the other seven categories do not make up a part of the total form; these seven categories do not correspond to forms but only indicate extrinsic relations that the subsistent maintains with other subsistents (*extrinsecus affixa, status*).

As can be seen, concepts of simplicity and composition are fundamental to Gilbert’s ontology. Entities are either simple or composite. Above all, the principles, also called *genuina*, that constitute the object of theology – God, prime matter (*yle, silva*), the archetypal ideas – are simple entities because they do not derive their being from a multiplicity of other entities. In the Commentary on Boethius, Gilbert does not dwell on the contrast between the theory of the plurality of principles and Christian doctrine, while in the biblical commentaries he adopts Augustine’s view of the creation of matter (Jolivet 1992a). The forms or *subsistentiae*, which go on to constitute subsistents, originate as images or copies or reflections (the manner of this derivation is not better specified) of the exemplary idea (*exemplar, ydea*). Of these forms, those are simple which are not in turn composed of other forms, like *corporeitas* or *albedo*; but they are not simple in the same respect as the principles, as the forms do not exist if they are not within a compound. Most

entities are compound, that is to say, created subsistents (*nativa*) and the greater part of their forms. Subsistents are compound both in the sense that, in order to constitute them, their *esse* or formal principle must inhere in something (this type of compound is called *coniunctio*) and in the sense that their complete form is constituted of a multiplicity of forms (*concretio*). Moreover, some subsistents are made up by putting together a number of subsistents as their parts, such as man, constituted of his body and his soul, which constitute his parts, each with their own forms (*compositio*). The forms of the subsistent parts are at the same time forms of the whole subsistent: the rationality of the soul of Socrates and the whiteness of his body are the rationality and whiteness of Socrates.

The moment of origin of the constitution of a subsistent through the *coniunctio* of *esse* in it is the divine act, which makes the forms inhere in the subsistent. It is called *generatio* or *creatio*. With respect to this original moment, the theory of Gilbert seems to present a serious problem: “what the *quo est* makes into the *quod est* cannot be the *quod est* itself – so what is it?” (Marenbon 1998: 169). A possible response is that there is no substrate, in which the forms inhere to constitute the subsistents, except for a subset of the forms that constitute the whole; so that, supposing we were mentally to abstract all the forms from the subsistent, nothing would remain: ultimately, the subsistent would be identical with the total form. But this solution is a speculation that goes beyond Gilbert’s text (Jacobi 1996: 16). Another possible reply, closer to Gilbert’s text, is that the original substrate in which the forms inhere is the “primordial cause,” which is spoken of in *Comm. De hebdomadibus* (p. 209, ll. 67–85), that “precedes,” in the process of the *concretio*, the most general form. But the problem remains, what is this primary cause: prime matter, God, the ideas? In any case, how is the most general subsistence related to the primordial cause? The response that Gilbert would probably have made is that man cannot give an answer to this question, as his knowledge, discursive and distinct, is limited to the world of compounds (philosophy of nature) and the forms abstracted from these (mathematics) and cannot raise itself so as to grasp their

relation with the absolute simplicity of the principle from which they originate.

Singularity and Modal Theory of Individuality

Gilbert's theory of individuality is clearly distinct from a long tradition, in which Boethius, Eriugena, Anselm of Canterbury, William of Champeaux, Thierry of Chartres, but not Abelard concur (called STI: "standard individuation theory" by Gracia 1988; cfr. Maioli 1974: LI–LII). According to STI it is the accidents alone, which make individuals of the same species being numerically one and the same unique "communal quality" (*qualitas communicata*) is found complete (*tota*) in every individual of the same species: Cato and Cicero are one identical entity – *idem* – in that, belonging to the same species man, they share the same *humanitas*, while they are numerically different from one another – *plures* – only because of the diversity of their accidents. For Gilbert, rather, the numerical diversity of subsistents is due, not only to the accidents but to all of the forms, accidental and substantial, which come together to constitute them: there exist as many diverse *humanitates* as men. The differences in the accidents do not provide the basis for the numerical diversity of subsistents but merely indicate it. Singularity, that is, being numerically one, is an intrinsic characteristic of every entity, whether it is a subsistent or a form, and is presented in Gilbert's ontology as a primary, non-deducible given. Moreover, unlike his predecessors, Gilbert in consequence considers the concepts of singularity and individuality to be different. The set of individuals is a subset of the set of singulars: everything that exists is singular, but not all that exists is both singular and individual. Only subsistents and complete forms of subsistents are singular and individual. The subsistent (e.g., Socrates) and the *tota forma* of each subsistent (*socrateitas*) are singulars and individuals that is to say not dividuums, because they are not similar to any other entity either in act or just in potency (*Comm. Contra Euticen*, p. 272, l. 45–274, l. 93). By contrast, a form is dividuum which, whether simple (rationality) or compound (humanity), turns out to be, judging from its effects, similar to other forms, if not in act then

at least in potency. On the basis of this similarity, these forms are said to be *conformes* to each other (the humanity of Socrates and that of Plato are similar in potential and in act; the being-the-sun of the sun is similar not in act but at least in potential to the being-the-sun of another sun, which does not exist, did not exist, and will never exist, but could exist: *Comm. Contra Euticen*, p. 273, ll. 68–74). Finally, those entities which, though dissimilar from every other entity, are nonetheless part of another individual are not themselves individuals, for they share their own formal characteristics with the compound whole. The soul is not therefore an individual since it shares its formal characteristics with man, of which, with the body, it is a part. Since it is not an individual, the soul is not a person either, according to the Boethian definition of the person as "*naturae rationabilis individua substantia*" (*Comm. Contra Euticen*, p. 271, l. 14–274, l. 95). It should be observed, however, that Gilbert gives this definition with an important clarification and modification: the clarification is that no person can be part of a person; the modification is that for him the characterization of person as rational is purely conventional, due to the usage of philosophers. Strictly speaking, even plants and animals are persons: for they are individual substances, which are each dissimilar to every other entity and are not parts of any further compound entity (*Comm. De trinitate*, p. 146, ll. 14–23). In this sense, it would seem that Gilbert does not make a real distinction between person and individual (Elswijk 1966: 192; Maioli 1979: 339; but the interpreters disagree over Gilbert's characterization of the concept of person; cf. Nielsen 1982: 62–64; Marenbon 1988: 346; Jacobi 1996: 17–19; Valente 2013: 115–122).

It has been observed (Knuuttila 1987, 1993: 75–82; recalling Nielsen 1982: 62–64, 180, 184) that, since he considers that the properties the subsistent does not ever effectively possess but could possess according to the potency of its own nature are parts of the total form, he is proposing a "modal" theory of individuality. This conception presupposes the idea of possible worlds and possible alternative histories of the world and the conviction, not really argued for, of the stability of individual identity across various possible

worlds and various possible histories (Knuuttila 1993: 81). But Gilbert's modal definition of individuality seems to have the undesirable consequence of dissolving the very individuality he wishes to define: indeed, if taken literally, Gilbert's definition seems to imply that the complete form of every individual of a species includes all the possible determinations of every other individual of that species. It follows that the complete forms of individuals of the same species would all be similar to each other and so *dividuae* (Marenbon 1998: 171). Gilbert's appeal to a modal definition of individuality, and thus to the idea of different worlds and histories, can be traced to a keenly felt need to conserve as far as possible God's omnipotence, which is not subject to any necessity whatsoever except in that of certain basic rules of logic set out in the theory of topical argumentation. Of which parts the various subsistents are composed and of which general, differential, and accidental subsistences the complete forms of the subsistents of different species are composed also depend on God's omnipotence and will and are not necessary in an absolute sense. Such compositions are governed by the merely relative necessity of the habitual course of things (*consuetudo rerum*) and of the usual condition of natural beings (*usus nascentium, qui vocatur natura: Comm. De trinitate*, p. 164, ll. 34–41; *Comm. Contra Euticen*, p. 304, ll. 83–91).

Universals and the Realism of Forms

According to Gracia (1988: 164), the bases of Gilbert's doctrine of universals are constituted by two postulates: the singularity of everything, whether forms or subsistents, and the individuality of the complete forms of subsistents and of subsistents themselves (if they are not in turn parts of a composite subsistent). In addition to these, there is the similarity (*similitudo*) or conformity (*conformitas*) between singular entities, whether both subsistences and subsistents. Indeed, even though the latter are individuals and thus different from every other being, they are, nevertheless, similar to different groups of other individuals if their formal determinations are considered separately (Socrates is similar to Plato and to Cicero if

one considers their respective whiteness, rationality, etc.). According to Van Elswijk (1966: 200), the similarity between groups of beings seems to be a third postulate of Gilbert's ontology. But Maioli (1974: 326–328, 1979: 344–347) maintains that, for Gilbert, the *conformitas* is to be explained by the derivation of native forms from exemplary ideas. Whatever the case, the universal (genus or species) is a collection (*collectio*) of a multiplicity of forms that are, in themselves, singular. It is constituted by the intellect on the basis of similarities apprehended between groups of singular entities. According to Gilbert – who in this respect can be placed beside Abelard – the unity of a species, like that of a genus, does not correspond to any common nature but is the product of abstraction (“*humana ratio abstrahit*”) and language (“*dicuntur unum et idem*”). At the level of reality, only singular beings exist, some of which are also individuals, which are grouped into those similar to each other (Maioli 1979: 341–364; Valente 2008b, 2013: 122). Inasmuch as subsistences are formal constituents of particular subsistents, one can speak of a “realism of forms” in Gilbert (Jolivet 1992b). However, one certainly cannot speak of a realism of universals, even though his theory seems to postulate a foundation in re of the universal, consisting in the *similitudo* or *conformitas* of individuals belonging to a group according to the *consuetudo rerum*.

Philosophy of Language

Hermeneutics

Gilbert's philosophy of language takes as its starting point the Boethian–Aristotelian triad *vox-intellectus-res* (*De interpretatione* 16a4) and the grammatical conception of names as signifying substances and qualities (Priscian, *Institutiones grammaticae* II, 18 and 19). But what distinguishes it above all is its “pragmatic” and “hermeneutic” approach: language is perceived principally as an instrument for communicating meaningful contents between human beings. Gilbert very often refers to the speaker (*locutor*), the author of a written text (*auctor*), the hearer (*auditor*), the reader (*lector*), and the

interpreter (*interpretes*); he speaks of the sense or concept in the mind of the one who speaks (*sensus/conceptus/intellectus mentis eius, qui loquitur*) and of the vigilance (*vigilantia*), attention (*attentio*), and intelligence (*intelligentia*) of the addressee. In *Comm. De trinitate*, prol., 21–24, he brings to light an intrinsic and inevitable discrepancy between the three levels of language, thought, and reality, both from the speaker's point of view (from the *res* through the concept to the word) and from that of the interpreter (from the word through the concept to the *res*). Although things can be thought thanks to concepts and signified through words, the range of the real is much vaster than that which can be conceived in thought. The sphere of thought is, in turn, much broader than the sphere of what can be expressed in words.

This is true both for discourse about God and for that about creatures. There cannot be a concept of God nor a proper way for him to be expressed, because of his simplicity, which does not allow any particular aspect to be isolated in a concept or word. Analogically but inversely, an adequate concept of a creature cannot be formed due to the inexhaustible complexity of its formal structure. Language is even weaker than thought because of the frequent lack of appropriate words (*inopia verborum*), the improper use of language (*translatio, usus*), and the inevitable ambiguity of many terms (*multiplicitas, ambiguitas*). As a consequence (Jolivet 1998; Valente 2004: 168–171; Marenbon 2013), the correct interpretation of a text requires taking this discrepancy into account: it would be misleading to believe that one could pass directly from the intellection of spoken or written words (*intellectus quem scripta faciunt*) to the truth of things. One should be constantly aware that these two instances are mediated by the thought of the author of the text (*intellectus ex quo <scripta> facta sunt*) – a thought that corresponds only to a certain degree to the letter of the text as it has been written, on the one hand, and to the reality of things, on the other.

Starting from taking into consideration in this way the mediating role of the concept in the mind of the author, the process of interpretation unfolds.

From the letter of the text (*significatio*), the interpreter seeks, above all, to reach the thought of the author (*conceptus* – or *intellectus* – *auctoris*) in order to judge the written text in relation to it.

Second, the interpreter seeks to specify in what measure the author's thought grasps the truth of things, in the constant awareness that this measure is necessarily limited, and to evaluate the discourse that has been made in relation to the things themselves that have been conceived. It is particularly important to take into account the *conceptus auctoris* when analyzing theological discourse, which is always improper in its literal meaning and is to be interpreted taking into account that it is inevitably based on an (albeit nonarbitrary) transposition of terms and linguistic forms taken from natural philosophy (*proportionalis transumptio*). Besides the *conceptus auctoris*, another aspect to be taken account of in the interpretation of a text, in every discipline, is usage (*usus, auctorum usus*), which does not always respect lexical proprieties or syntactic rules and which, in time, can also modify the meaning of terms from that of their original institution (*vis/natura nominis*). Moreover, according to Gilbert, a fundamental requirement for reaching a true understanding of a text and avoiding misunderstandings is to pay great attention to the propositional context (*ratio propositi*). Gilbert refers particularly to the *vigilantia lectoris* and the *ratio propositi*, because it is well known that propositions with the same name as subject, but placed on different disciplinary levels – those of the philosophy of nature, of logic, and of mathematics (see below) – speak of different things. The determination of the level of discourse to which a passage in fact belongs is not attributed by Gilbert, as in the logic of terms, to the distinction between different forms of *suppositio* (a concept Gilbert himself often uses, almost always in the sense of a reference to subsistents by the author of the text by way of the subject term of a proposition: Valente 2011) or, as is the case in certain logical and theological texts of the twelfth century, to the identification of a particular improper rhetorical use of language (*transumptio, translatio*; cfr. Kneepkens 2000: 257). Rather, Gilbert proposes a reconstruction and general

contextualization of whatever is being considered in order to arrive at a correct *intelligentia* of a text in each of the different sciences: besides the grammatical and logical rules and the improper use of language studied in rhetoric, one should consider the nature of things, as taught by the philosophers, as well as the intention of the author. Whoever remains attached to words and their functions, and does not seek to understand beyond and above them the “meaning in the mind of the one who speaks,” understands neither others nor himself and is a source of great danger (*Comm. Contra Eutichen*, p. 296, l. 31–298, l. 97).

The Meaning of Nouns and the Theory of Predication in the Philosophy of Nature

Gilbert’s theories of the meaning of names and of predication are intrinsically connected not only to the grammatical conceptions of his time which derived from a Platonic reading of Priscian’s grammar, and to the foundations of the *logica vetus*, but also to his own personal ontology (Maioli 1979: 79–99; Marenbon 2013; Valente 2013: 127–131). Ordinary language, to which the language of natural philosophy is led back, reflects the ontological structure of created reality, albeit in the limited manner already discussed (Jacobi 1995a: 96–100). If Priscian affirms that the noun signifies substance and quality, this is to be understood in the sense that it signifies both the subsistent and the subsistence or form. *Homo* signifies as much the particular man (*substantia nominis, id quod est*) as the form *humanitas* (*qualitas nominis, id quo est*). It is for the context (*ratio propositi*) to suggest which of the two meanings is actually intended by the author in different propositions: in “*Homo est risibilis*” the singular man, in “*Homo est individuorum forma*” the form *humanitas* (*Comm. Contra Eutichen*, p. 296, l. 31–297, l. 66). Like the significate of the noun, predication also reflects the duality of subsistents and forms that dominates the created world. In natural non-metaphorical discourse, the author refers to (*supponit*) – by means of a noun in the subject position – the subsistent or *id quod est* as that of which is being spoken; through the predicate the author expresses the inherence of the form or the *id quo est*, which the predicate

signifies in the subsistent referred to by the subject term: in “*Socrates est homo*,” “*est homo*” expresses the inherence of the form *humanitas* in the individual represented by the name “Socrates.”

Every subsistent has many names according to which of the forms it is being considered under: Socrates is called “Socrates” if his proper form *socrateitas* is being considered, “white” if his accidental form of whiteness is being considered, “man” if his substantial form of humanity is being considered, and so on. When a proposition is formulated to affirm something about the subsistent, first of all one of its possible names is chosen in order to indicate it as the object of discourse. But such names are chosen in view of what one wishes to predicate: “we do not predicate in order to supposit so much as supposit in order to predicate” (*Comm. Contra Eutichen* p. 349, l. 50 s.). Among the predications of natural philosophy, which are true in a proper sense, in some, the form signified by the predicate stands in a relation of consequence to that signified by the subject, which is its cause according to the internal order of the agglomeration of generic and specific forms that constitutes the subsistent (*complexionis consequentia*). For example, “*corporeum est album*” – given that the form of whiteness is an effect of corporeity; corporeity cannot exist without some color-form. Such propositions are called *consequentes*. But there are also cases of propositions which, although they have the external form of subject + predicate and are true in a proper sense and not the result of metaphorical discourse, nevertheless do not respect the *complexionis consequentia*. An example is “*corporeum est rationale*”: although Socrates really is corporeal and rational, there is no relation of consequence between his form rationality and his form corporeity. For rationality is caused by the spirituality of Socrates’ soul and not by the corporeity of his body, signified by the term *corporeum*. Such propositions are called *accidentales tamen verae conexiones* and provide a model for interpreting various theological propositions. For example, the proposition “God has died” is true since Christ is God and Christ has died, even though he died inasmuch as he was a man, and not inasmuch as

he is God (*Comm. Contra Euticen*, p. 345, l. 29–348, l. 8; de Rijk 1987: 164–170).

The predication of natural philosophy are also further distinguished in relation to the substantial or accidental function within the ontological structure of the subsistent of the form signified by the predicate, as well as in relation to Aristotle's classification of the ten categories (Maioli 1979: 83–101; *Comm. De Hebdomadibus*, p. 198, ll. 76–90). Substantial predication expresses the irreplaceable elements which cause a subsistent to be and to be this particular subsistent – its *subsistentiae*, the forms that make up its substantial being (*esse aliquid in eo quod est*). Accidental predication expresses characteristics of a subsistent which may or may not be found in it without producing or destroying its being or its being this or that particular subsistent. They express only its accidental being (*tantum esse aliquid*). A further, different distinction is made between predication *secundum rem* or *inherentium* and those that are *extrinsecus comparatae* or *non inhaerentium* (*De trinitate*, p. 134, l. 77–138, l. 78). Independently of their being accidental or substantial to a given subsistent, the forms signified by predication of substance, quality, and extensive quantity are always inherent in the subsistent, and the predication which expresses them are thus “according to the thing.” On the other hand, predication of non-extensive quantity as well as of the remaining seven categories express, despite their subject–predicate form, not true inherence but external circumstances or relations of various types between subsistents and things other than themselves (*status*). Gilbert therefore calls them “extrinsically compared.”

The Three Speculative Sciences

Gilbert mentions a broad range of branches of human knowledge. In *Comm. De trinitate* (p. 115, ll. 3 s.), he lists the following *facultates*: *naturalis*, *mathematica*, *theologica*, *civilis*, and *rationalis*, which differ on the basis of the different genera of their respective objects of study. In *Comm. De hebdomadibus* (p. 189, ll. 52–60), he considers mathematics, “a discipline of the highest rank,” which consists of the four arts of

the quadrivium, arithmetic, geometry, music, and astronomy, as well as the “other disciplines such as those of the categories and the analytics.” In all these disciplines, one proceeds by way of demonstration, beginning from terms or rules that constitute the starting points for deduction and induction. Central to Gilbert's system, however, is the triad of speculative sciences that consists of physics or philosophy of nature, mathematics, and theology, which is set out by Boethius in his *Commentary to Porphyry's Isagoge*, second edition, and in the *De trinitate* II, but goes back to Aristotle (Haas 1987; Jolivet 1990; Jacobi 1995b; Marenbon 2002; Valente 2013: 131–134). According to Gilbert, natural philosophy studies concrete subsistents and their inherent forms. It is the fundamental science in the sense that it is the basis for the transfer (*transumptio*) of terms and forms to all the other sciences. In Gilbert's sense of the term (which is not the usual one), mathematics considers forms, which in reality can only exist in subsistents, as abstracted from them. Thus, in mathematics, predication (e.g., “*homo est individuorum forma*”) express only an apparent inherence. The case of theological predication is analogous, because in God there is no difference between form and subsistent, so that in theology predication does not express any inherence and is therefore not predication in the strict sense. Due to the lack of adequate expressions for speaking about God, the patristic *auctoritates* and the theologians transfer and apply improperly names and categories proper to natural *scientia* and, thus, to natural language. But they do so, on the basis of rational proportion (*rationis proportio*). And so when, for example, somebody states that God is a substance or a certain substance, this should not be understood in the same sense as when somebody states that a man is a substance in non-theological discourse. The *ratio* for which something can be said to be a *substantia* is its *substare*; subsistences as well as subsistents are called “substances” inasmuch as they serve as substrates – *substant* – for accidents. But in God there is no distinction between substance and accident. Therefore, when the category of substance is predicated of God, it is done improperly, on the basis of the *ratio* according to which God

“sustains” all things (“*substat omnibus*”; *Comm. Contra Euticen*, p. 284, ll. 74–90) as cause and principle. At the same time, however, it is God alone who properly is in the fullest sense, just as it is of God alone that one can say in a full sense that he is good. All other things that are not God are and are good in a lesser and derived sense, that is, through a *denominativa transumptio* o *transumptiva denominatio* (Jolivet 1987; Valente 2008a: 123–149). As can be seen, in philosophy of nature and in theology, a chiasmic relation between language and being is established: on the level of language, discourse about nature founds the discourse about God, whereas on the ontological level, divine being is the foundation and source of created being (which derives from it through *fluxus*). Moreover, given that names in natural discourse denote objects on the basis of their forms, discourse about nature could not be constituted if there were not, thanks to mathematics, a way of considering separately forms, which in reality are inseparable from subsistents. Yet natural discourse not only lends the terms and formal structures to theology but also to mathematics itself, in the discourse of which they are used differently from their original definition and from the valid norms of natural discourse. The three speculative discourses are thus interrelated in a complex way, by reciprocal foundational relations and transfer of terms and formal structures. The role of mathematics as a discipline, however, was not well defined by Gilbert and would be given closer attention by some of his followers (Marenbon 2002). In any event, Gilbert considered philosophy of nature, mathematics, and theology – the three branches of speculative philosophy – also as being each a step in a hierarchical, ascendant order. Human knowledge starts from what is more “external” (*exterior*: physics), goes through what is “internal” (*interior*: mathematics), and ends up with what is most “intimate” (*intima*: theology). Theology is the most perfect and secret science, which is correspondingly reserved to a very exclusive elite among the philosophers: that of the “theological philosophers” (*Comm. De trinitate*, p. 66, l. 24–67, l. 54; *Comm. De hebdomadibus*, pp. 183, l. 1–185, l. 5; 193, l. 47–194, l. 88).

Giles of Rome, Political Thought

Chris Jones
University of Canterbury, Christchurch,
New Zealand

Abstract

Giles of Rome (c. 1243/7–1316) was the first member of the order of Augustinian Hermits to be appointed regent master of theology at the University of Paris and later became archbishop of Bourges. By 1282, he had composed *On the Rule of Princes*, a manual of instruction for secular rulers dedicated to the future French king Philip IV. The work, which

proved immensely popular throughout the later Middle Ages, drew heavily upon Aristotelian ideas to offer a portrait of the ideal ruler. Giles considered a well-educated hereditary king free from any form of limitation to be best able to obtain the common good for those he ruled. During the 1290s and first years of the fourteenth century, Giles became closely associated with Pope Boniface VIII and subsequently involved in his struggle with Philip IV over issues of ecclesiastical jurisdiction. In the course of one of these Franco-papal disputes, Giles composed *On Ecclesiastical Power*, a work which drew on Aristotelian language to establish and defend an influential vision of society’s structure in which temporal power was entirely subordinated to spiritual power. Giles argued not only that all legitimate secular rule, but even all legitimate right to property, was ultimately derived from the church. His model equated the power vested in the church with the power vested in the papal office and thereby established the pope as the ultimate authority in both spiritual and temporal affairs. The pope possessed an authority free from any effective limitations, although Giles argued he should, in imitation of God’s governance of the universe, seek to restrain himself from interfering in temporal affairs in all but exceptional circumstances. The two phases of Giles’ political thought have sometimes been considered contradictory although they share a similar view of hierarchical structures and the nature of rulership.

Biographical Information

Giles of Rome (c. 1243/7–1316) is known as “Blessed Doctor” (*Doctor beatus*), “Most Fundamental Doctor” (*Doctor fundatissimus*), and, less respectfully, “Verbose Doctor” (*Doctor verbosus*). The occasional attribution of the surname Colonna to Giles is probably due to his origins in a specific district of the city of Rome, rather than to any association with the powerful family of that name (Boase 1933). At

approximately the age of fifteen, Giles joined the newly established Augustinian Hermits, entering the order's Roman convent. Moving to study in Paris, he completed the arts course sometime in the 1260s and became a bachelor of theology around 1270, after which he lectured on the *Sentences* of Peter Lombard and wrote commentaries on several of Aristotle's works. It is probable that he attended the lectures of Thomas Aquinas between 1269 and 1272. The first period of Giles' Parisian career was brought to an abrupt end in 1277 when he was censured as part of a more general condemnation of Aristotelian ideas by the bishop of Paris, Etienne Tempier.

Giles' activities and location between the end of March 1277 and his appearance at his order's Chapter General held in Padua in 1281 remain unclear. Traditional assertions that he served as a tutor to the future French king, Philip IV the Fair, in the years after he was censured are not supported by any extant evidence. After a period spent in Italy, Giles was able to resume his academic career in Paris in 1285 becoming the first regent master in theology to be appointed from the Augustinian Hermits. In 1287, his opinions were declared to be the official position of his order. This was followed by a rapid series of promotions, including his election as prior general of the order in 1292 and his appointment as archbishop of Bourges in 1295.

From mid-1296, Giles spent much of his time in Italy in the service of Pope Boniface VIII. Following the latter's conflict with the Colonna cardinals, Giles returned to Bourges in August 1299. As the Pope's second confrontation with Philip IV worsened, Giles travelled to Rome in 1301 not returning to his see until after Boniface's death in 1304. In 1305, he took part in the enquiry that censured the Eucharistic views of John of Paris. In the following years, Giles dedicated works to Philip IV's uncle, Robert, count of Clermont-en-Beauvaisis, and the Angevin king of Naples, Robert I. He adopted a position favorable to Philip IV in the process that led to the condemnation of the Templars at the Council of Vienne in 1311–12. Giles died at the papal curia at Avignon on December 22, 1316.

Overview

According to one contemporary source – possibly written by a fellow Parisian scholar, Godfrey of Fontaines – by the mid-1280s, Giles enjoyed a greater reputation in Paris than any other inhabitant. This reputation was primarily built upon his philosophical and theological works. Giles' philosophical ideas were expressed in a series of commentaries, six quodlibetal disputations held between 1286 and 1292/3, and in a number of collections of disputed questions (*Quaestiones disputatae*). Much of his theological thought was summarized and developed in the 76 sermons he preached in the course of his career. In the theological and metaphysical positions he adopted, Giles was highly influenced by the thought of Thomas Aquinas. Despite an association with Thomist ideas that contributed, at least in part, to his censure in 1277, Giles was not, however, unwilling to criticize and modify Aquinas' thought on numerous points. In the period following his censure, he developed a new interest in the thought of Augustine of Hippo, whose works he appears to have revisited (Briggs 2016). With regard to metaphysics, Giles was a particular exponent of the doctrine of the unity of substantial form and argued strongly in favor of a “real distinction” between essence and existence in opposition to the contemporary position of Henry of Ghent.

Giles' exploration of what may be considered “political” topics represents a mere fraction of his literary output. The essence of his political thought appears in two works, although elements of it are also reflected in an oration – if a sixteenth-century tradition is to be given credence – that he preached at Philip IV's coronation in January 1286 (Del Punta et al. 1993), in his tract *On the Abdication of the Pope* (*De renunciatione pape*, c. 1297), in at least one of his sermons (Luna 1992), and in his later commentaries on the *Sentences* (c. 1309) (McAleer 1999). His thought may be divided into two distinct phases. In the 1270s and early 1280s, Giles considered the ideal organization of temporal power and the process by which a secular ruler capable of achieving the common good could be fashioned. From the

late 1290s, he turned his attention to the nature of spiritual power and questions of the proper relationship that ought to exist between the temporal and spiritual powers and the nature – and limitations – of the keystone of the spiritual power, the pope.

On the Rule of Princes

Context

The earliest traces of Giles' political ideas are found in his commentary on Aristotle's *Rhetoric* (c. 1271–74) and in his *De differentia Ethicae, Politicae et Rethoricae* (Lambertini 2016). The first phase of Giles' political thought, his exploration of the organization of the temporal power and the ideal ruler, appears developed fully, however, in his treatise *On the Rule of Princes* (*De regimine principum*). Probably written at the request of the French king Philip III, the work was intended as an educational tool for the instruction of Philip's son, the future Philip IV. That this treatise was complete by 1282 is confirmed by the existence of a dated French translation commanded by the king. Traditionally, the treatise has been seen as a product of the years after Giles' university career ended abruptly in 1277, although it could date from as early as 1270, the year of Philip III's accession. Despite his royal dedicatee, the treatise was written, according to its author, with a much broader audience in mind: it was Giles' intention to instruct not only the future king in rulership, but also his subjects (1.1.1).

Structure

On the Rule of Princes' 209 chapters are distributed between three books, themselves subdivided into ten parts. The first of these books concerns the ruler's governance of himself. Its four parts begin by explaining that a ruler will achieve the greatest happiness by loving God and acting prudently. The book continues with an exploration of the nature of the virtues, the passions, and the behavior of men in varied circumstances. In his second book, Giles' focus shifts to the governance of the family. Here, in three parts, he explores marriage and the conduct of women, the education of

children, and the management of a ruler's household. In the work's final book, the scope broadens to consider the manner in which a political unit is to be governed. Giles begins by considering – and often refuting – the views of philosophers concerning the nature and organization of states. In the final two parts, he explores how government is to be conducted in times of peace and ends with a treatise on warfare.

Key Concepts

For Giles, the ideal model for political units is the kingdom. At the core of his conception of the ruler of such a kingdom is the belief that the ideal king should be unshackled by any limitations. It is preferable that kingship be “regal,” in which the ruler makes the law, as opposed to “political,” in which those governed make the law (for the distinction: 2.1.14). Government by a regal ruler, who is distinguished from a despotic ruler by his focus on the common good, is the most perfect form of government because the position of such a ruler is a more perfect reflection of the natural ordering and hierarchy of the universe. Such a king should accept counsel and will wish to do so, but Giles makes clear that nothing obliges him to do so.

In considering the various forms in which secular power may be exercised, Giles displays an unreserved preference for hereditary kingship. While he recognizes, in theory, that elective kingship would be a preferable method of selection, all practical experience indicates that hereditary kingship offers greater stability. This is, in part, because the people will more easily accept the sons of previous rulers and, in part, because the knowledge that his progeny will succeed him will ensure the quality of a king's rule (3.2.5).

Giles assumes that, if properly educated, a ruler will always seek to uphold the common good (Renna 1978). He makes no provision for the possibility that such a ruler will seek his own good and, in so doing, become a tyrant. Nor, in this first phase of his political thought, does Giles seek to address two issues in particular. In common with Peter of Auvergne, he offers no analysis of the relationship that will exist between his regal king and the spiritual power (Renna

1978). Nor does his assessment take any account of the existing feudal structures of contemporary society (Krynen 1993).

Foundations

In its purpose, the instruction of the ruler, Giles' treatise can be categorized as part of the "mirrors for princes" genre. More specifically, it can be considered part of a uniquely Capetian tradition that began with the instruction manual offered by the Dominican Vincent of Beauvais to Philip III. Giles' portrait of secular rule is differentiated from the majority of contemporary mirrors for princes by the fact that many of its key concepts originate in the Aristotelian corpus. Engelbert of Admont was one of very few authors who attempted a similar cross-pollination (Blythe 1992). Alongside Aristotle's works, Giles employed Vegetius' *De re militari* in the final part of his third book as a source for military matters. He also used Aquinas' *De regno* (Lambertini 2016).

Giles was keen to present his treatise as a simple vulgarization of Aristotle. While this is true to a certain extent – the work draws heavily upon the *Politics* and the *Nicomachean Ethics*, conspicuously avoiding the use of Scripture and the Fathers more common in mirrors for princes – Giles' self-assessment is slightly misleading. Giles is, firstly, heavily reliant on Aquinas for his interpretation, particularly the latter's commentaries on the *Politics* and the *Summa Theologiae* (Lambertini 1995). At the same time, Giles moves beyond both Aquinas and Aristotle, drawing conclusions neither would have been likely to find acceptable. Aristotle, and following him Aquinas, for example, drew a distinction between civil and domestic government; Giles' belief in a natural universal hierarchy tends to break down the Aristotelian distinction, and he is inclined to use the family as a model for the discussion of modes of rulership (Blythe 1992). More striking still, while basing his arguments on material drawn from Aristotle, Giles will often draw conclusions diametrically opposed to those originally intended. In the most significant case, he adapts Aristotle's criticism of kingship to present an argument which purports to demonstrate the Greek philosopher's preference for regal

rule over all other forms of government and employs a similar approach to demonstrate Aristotle's alleged support for hereditary kingship (Lambertini 1995, 2016).

Giles had been the earliest Parisian scholar to prepare a commentary on Aristotle's *Rhetoric*. As he employed Aristotelian concepts drawn from the *Politics* and the *Ethics* to construct his model of regal kingship, so too did he draw upon the *Rhetoric* in his general structuring of *On the Rule of Princes* and to imbue his ideal ruler with one of his key characteristics: Giles' king, above all, needed to know what an orator needed to know, that is, how to persuade those under his rule so that they might act in the interest of the common good (Coleman 1998).

It may be the case that for Giles, as for other contemporary Parisian authors writing in the mirrors for princes genre, the model of the ideal king that lay behind his abstract figure is the French king Louis IX (Genet 2003). Giles' marked preference for hereditary kingship may also find its origins in contemporary circumstances, in particular in the chaos that had erupted in the contemporary Empire – in which an elective system operated – after the death of the Emperor Frederick II in 1250. The imperial experience stood in stark contrast alongside the relative peace of contemporary France where an hereditary system prevailed.

Influence

With the exception of the pseudo-Aristotelian *Secret of Secrets* (*Secretum secretorum*), *On the Rule of Princes* proved to be the most successful product of the mirrors for princes genre and enjoyed considerable longevity, with approximately 300 Latin manuscripts surviving and 11 printings between 1473 and 1617. To the 36 surviving manuscripts of the earliest – simplified – French translation by Henri de Gauchy (1282) can be added six alternative French translations and versions in German, Italian, Swedish, English, Castilian, Catalan, Portuguese, and Hebrew. This popularity probably arose from Giles' presentation of his treatise as a systematic exposition of Aristotle. The work was one of a limited number to cross the boundaries between the lecture

theater – where it was employed from the fourteenth century as part of the University of Paris’ arts curriculum (Briggs 1999, 2016) – and the rest of society. Multiple copies, in both Latin and French, resided in the royal library of the French king Charles V, while translations were commissioned by men such as the lieutenant of the bailiff of Orléans (Merisalo 1998; Briggs 1999). The work was referenced by, among others, Chaucer, Dante, and Bartolus of Sassoferrato, while the French version was employed by Christine de Pizan (Krynen 1993; Briggs 1999, 2016).

On Ecclesiastical Power

Context

The second phase of Giles’ political thought developed as he became enmeshed in the controversies that marked the pontificate of Boniface VIII (r. 1294–1303), the man responsible for his promotion to the archbishopric of Bourges. Giles’ initial exploration of the nature of the papal office came in his *On the Abdication of the Pope* where he set out to defend Boniface against the claims of the Colonna cardinals that he had unjustly usurped the position of his predecessor, Celestine V. Giles sought to establish both the legitimacy of papal resignation, and also that the nature of the papal office, whose incumbent was responsible to God alone, meant that a pope could not be removed except of his own free will (Eastman 1990). John of Paris later adapted and reinterpreted elements of this work in his *On Royal and Papal Power* (*De potestate regia et papali*). In the opening years of the fourteenth century, Giles was led to develop his concept of the papal office more fully and to incorporate it into a much broader study of the relationship between spiritual and temporal power in the treatise *On Ecclesiastical Power* (*De ecclesiastica potestate*).

Although Giles’ authorship of *On Ecclesiastical Power* was questioned in the early-twentieth century, it has been since established convincingly (Kuiters 1958). The precise date of the treatise is unknown, but it was certainly written before November 1302 and probably composed either

in the first half of that year or in the latter part of 1301. The argument, however, that it must predate John of Paris’ *On Royal and Papal Power* has been refuted comprehensively (Ubl and Vinx 2000). It is probable that in composing the treatise Giles drew on ideas he had originally expressed in a sermon, although it cannot be proved conclusively that the sermon preceded the tract (Lambertini 2016). It is generally accepted that *On Ecclesiastical Power* was produced as a defense of papal authority in the wake of the conflict that arose between Philip IV and Boniface VIII after Philip’s officers arrested the bishop of Pamiers in July 1301. While Giles’ assertion that he was writing because of the hostility of much of the laity towards the church’s exercise of authority in temporal matters (1.1) tends to support this, one alternative theory suggests that the treatise was part of a broader papal response to Thomist-Aristotelian trends that were considered threatening to the traditional cosmology (Ullmann 1976).

Structure

On Ecclesiastical Power is formally divided into three parts. It is loosely organized and includes a great deal of repetition, features which suggest the work may have been composed in haste (Dyson 2003). Nominally, the first part concerns the relationship between the temporal and the ecclesiastical powers and the second the relationship between the ecclesiastical power and property. The first three chapters of the latter may have originated as a separate treatise in defense of the right of the church to own property against the extreme claims of the Spiritual Franciscans (Dyson 2003). In the third part Giles foresees and seeks to address possible objections to parts one and two based, primarily, on the decretals of Popes Alexander III and Innocent III.

Key Concepts

The second phase of Giles’ political thought is marked by three key ideas, which when combined offer the ultimate hierocratic theory embodying the most extensive claims on behalf of papal authority to emerge in the Middle Ages. Firstly, Giles argues that the exercise of temporal authority is only legitimate when it is sanctioned by

the ecclesiastical power and, indeed, such authority is ultimately derived from the church. The temporal and spiritual powers remain separate – there remain, in Bernard of Clairvaux’s terms, two swords as Giles is keen to emphasize (1.7–9; 2.13–15) – but the temporal is completely subordinate to the spiritual power, just as the body is, of right, subordinate to the soul (1.7). Secondly, it is not only possible for the church to own property, but legitimate ownership of *all* property, even lay property, is ultimately dependent upon the church. The man who inherits property from his father possesses it only imperfectly; to possess it justly his possession must be perfected by the church via baptism and penance (2.7). Finally, all the power that exists in the church is vested in the person of the pope as Peter’s successor.

The pope possesses a fullness of power (*plenitudo potestatis*) that effectively makes him the spiritual equivalent of the regal king described in *On the Rule of Princes*. In common with that king, the pope is unshackled by the requirement that he obey the law but, again in common with his portrait of the ideal secular ruler, Giles does not expect the pope to exercise his power in an arbitrary manner. While God possesses the power to suspend the rules governing the natural operation of the universe, He chooses to do so only in exceptional circumstances. Giles contends that the pope should act similarly with regard to temporal affairs. The pope, while possessing a “superior and primary” lordship (*dominium*), will normally impose a bridle and halter on himself and refrain from its exercise (3.7). He will only suspend the “immediate and executory” power of the temporal ruler in exceptional cases. While in theory such cases may encompass virtually anything (3.5–8), Giles believes it is those which threaten peace that should be the pope’s particular concern (2.10).

While Giles is not concerned with relations between temporal powers in either phase of his political thought, he does express a clear preference for the ultimate subordination of all temporal power to that of the Roman emperor in *On Ecclesiastical Power* (2.13). At the same time, somewhat paradoxically, the treatise does, at certain points, appear to accept the existence

of multiple independent temporal rulers as of right (e.g., 1.5).

Foundations

Giles’ theory of the relationship between ecclesiastical and temporal power is rooted in his acceptance of a thoroughly Augustinian analysis of man, one that implicitly rejects Aristotelian arguments in favor of the naturalness of political organization and property. Lordship for Giles, either over people or over property, is essentially unnatural to man and a consequence of the Fall. In order for either rulership or property to be legitimized, man must be reconciled to God and such reconciliation is only possible through grace administered via the church. The total subordination of the temporal to the spiritual is reinforced by Giles’ view that, following principles drawn from Aristotle’s natural philosophy, in a properly ordered universe inferiors must be subject to superiors. The order, hierarchy, and relationships that underpin Giles’ model are reminiscent of the feudal structures of contemporary society (Dyson 2003).

The arguments of *On Ecclesiastical Power* are drawn primarily from scriptural sources and the Fathers. Giles is particularly keen to find historical precedents in Scripture that support the preeminence of the spiritual power both in terms of dignity and in terms of precedence. He relies heavily on Aristotelian reasoning to argue his case, but few of the points he makes could be considered novel. The argument that the spiritual precedes the temporal in time and dignity, for example, is drawn from Hugh of Saint-Victor, while his case for the subordination of the temporal to the spiritual originates in Bernard of Clairvaux and his argument in favor of the pope as the pinnacle of society is ultimately derived from the canonists. Giles’ theory of property is rooted in Augustinian thought (Dyson 2003), although it is possible that this, and his broader conception of papal power, have more specific origins in ideas developed by John Pecham (Coleman 1987). While Giles is not entirely in agreement with his sources – he departs, for example, from the position of both Pope Innocent IV and Aquinas when he declares that infidels

can never legitimately own property (McIlwain 1932) – the novelty of Giles’ position is founded primarily upon his ability to synthesize a consistent theory of ecclesiastical and papal power from his sources.

Influence

Giles’ claim that his work was intended for the education of all Christian people (2.12) is reminiscent of the approach he adopted in *On the Rule of Princes*. The treatise’s style and complexity, however, appear to have resulted in a much more restricted audience, and only six manuscripts remain extant from the period before 1500. While the limited diffusion of Giles’ text is particularly striking when compared to contemporary works on a similar theme (Miethke 2000), the treatise provided a source for those who drafted the papal bull *Unam sanctam* (November 18, 1302) (Rivière 1926). It was also employed in future defenses of papal power written by the Augustinian Hermits James of Viterbo and Augustine of Ancona and the Franciscan Alvarus Pelagius, although James, Giles’ former student, deviated from his master’s position on several points (Boase 1933; Dyson 2003).

Consistency

It has been sometimes suggested that Giles’ thought underwent a profound change between its first and second phase and that, in effect, he chose to abandon a novel Aristotelian perspective inspired by the recently rediscovered *Politics* in favor of a more traditional Augustinian perspective (Scholz 1903). It is more probable that each phase represents Giles’ thought on a different conceptual level (McCready 1974). *On the Rule of Princes* considers a microcosm: the best means of organizing the secular state and the formation of its ideal ruler. *On Ecclesiastical Power* is strikingly different in tone but only because the author’s perspective has altered to consider a larger structure within which the secular state appears as simply a component part. In fact, two features of Giles’ thought offer striking examples of consistency: he subscribed to a conception of hierarchy that led him to favor models of unrestrained regal rule and – echoing

ideas found in Aquinas and most Thomists (Wilks 1963) – he also suggested that such rulers, whether kings or popes, should and will impose limitations on themselves.

Giovanni Pico della Mirandola

M. V. Dougherty
Philosophy Department, Ohio Dominican
University, Columbus, OH, USA

Abstract

Giovanni Pico della Mirandola (1463–1494) was an Italian Renaissance polymath. Although best known for his *Oration on Human Dignity* (*Oratio de dignitate hominis*), which is regarded by some historians as a manifesto of Renaissance humanism, Pico composed other philosophical, theological, and literary works. A constant throughout his philosophical writings was his attempt to synthesize competing philosophical views. Pico resurrected the ancient proposal that Plato and Aristotle were not opposed on major philosophical principles. His outlook sought to bring about a *concordia* or resolution among philosophical schools, and his most dramatic effort in this regard was a planned public disputation of 900 theses drawn from philosophical, theological, and esoteric sources. Because of his concordist tendencies, he cannot be identified as a strict Aristotelian, Platonist, Thomist, or adherent of any particular philosophical school. One of the first Christians to explore the Kabbalah, he examined Hebrew texts for confirmations of Christian theological tenets with the hope that such connections could be of service in apologetics. Pico's bibliophilic passion, joined with his facility with languages, placed him in a position unrivaled in his time to gather views from a wide variety of sources. His famous library

was replete with texts of major as well as obscure figures, and his studies of Arabic, Greek, and Hebrew gave him a range of source materials unparalleled in his day. Pico inhabited in the highest literary circles of his time, and counted among his contacts were the Florentine Platonist and translator Marsilio Ficino, the powerful ruler Lorenzo de' Medici, the humanist Angelo Poliziano, and the Dominican Girolamo Savonarola. His later works included a metaphysical treatise *On Being and Unity* (*De ente et uno*), a massive anti-astrological diatribe called the *Disputationes against divinatory astrology* (*Disputationes adversus astrologiam divinatricem*), and biblical commentaries.

Biographical Information

Giovanni Pico was born in his family's castle in Mirandola. Heir to the Counts of Mirandola and Concordia, Pico was in a privileged situation to follow academic interests free from financial concerns. In his early years, he pursued a wide-ranging education at many major centers of learning. Among the many subjects of his interest, he studied canon law in Bologna, classics in Ferrara, Aristotelian and Averroistic philosophy in Padua, and medieval scholasticism in Pavia and Paris. He learned to read and write Greek, Arabic, and Hebrew, in addition to possessing a powerful command of the humanist Latin of his day. Our knowledge of the elements of Pico's short life is aided by the *Vita* or *Life* penned by his nephew, Gianfrancesco Pico della Mirandola, who was a philosopher in his own right and served as the literary executor of Giovanni's works, posthumously editing and publishing his uncle's *Opera omnia* in 1496.

Pico's significant literary contacts for the transmission of Arabic and Hebrew ideas included the Averroist philosopher Elijah del Medigo; the unsavory Flavius Mithridates, who at Pico's request translated a large body of Hebraic writings into Latin, which largely served as Pico's introduction to Kabbalah; and Yohanan Alemanno, a

friend of Pico's who served as an important conduit for Jewish philosophical ideas.

The year 1486 was a significant one for Pico. It marked a period of intense literary productivity and included unusual public events that required the interventions of Lorenzo de' Medici. On the way to Rome to dispute his 900 theses, Pico abducted the wife of a tax official of the Medici family. It is possible that she was complicit in this plan. Nevertheless, Pico was imprisoned and only released by the influence of Lorenzo de' Medici. When Pico's Roman plans for a disputation failed and he had to flee church authorities, again Lorenzo stepped in, and his offer to the pope to keep Pico under his watchful eye extricated the young philosopher from a difficult position. It should be noted that Pico played a minor role in shaping the Florentine political scene; Pico was responsible for persuading Lorenzo to bring Savonarola to Florence.

From 1488 onward, Pico spent most of his time in Florence under the protection of Lorenzo de' Medici. Pico's interests during his later period appear theological, since he worked on biblical commentaries and short spiritual works, of which two letters to Gianfrancesco stand out as exemplary. In 1494, Pico was rehabilitated when Pope Alexander VI rescinded all condemnations of Pico's works. Clothed in the Dominican habit, Pico died in Florence in November 1494. At his side was Savonarola, who later gave Pico's funeral oration. Pico was buried in the Dominican church of San Marco in Florence. In 2007, his remains were examined forensically for evidence of the cause of his death. There are hints that Pico may have been poisoned, but the evidence is likely to remain inconclusive.

After Gianfrancesco's publication of Giovanni's *Opera omnia*, anglophone readers were first introduced to Pico by the translations by Sir Thomas More of some of Pico's letters, religious opuscula, and Gianfrancesco's *Vita* in the early sixteenth century.

Thought

From Pico's epistolary corpus, the June 3, 1485, missive to the Venetian humanist Hermolao

Barbaro stands out for its fame as well as its philosophical content. In this piece, which he later titled *On the Mode of Discourse Appropriate for Philosophers* (*De genere dicendi philosophorum*), Pico revived the ancient debate on the relation of philosophy and the discipline of rhetoric. Pico champions the superiority of scholastic Latinity over its classical counterpart, yet does so while employing a wide range of rhetorical techniques. The apparent contrast between the style and substance of the letter has puzzled generations of interpreters. A reply to Pico, until recently attributed to Philip Melancthon, continued the ancient debate among later literary figures. Pico's first philosophical work of substantive length, however, is his *Commentary on a Canzone of Love of Girolamo Benivieni* (*Commento sopra una canzone d'amore di Girolamo Benivieni*) of 1486. Using the pretext of a commentary, Pico explores issues in Neoplatonic metaphysics and in some passages implicitly critiques the views of Marsilio Ficino.

Without doubt, Pico's best-known work is the *Oratio de dignitate hominis*. The *Oratio* was never published in Pico's lifetime, though in a preface, Gianfrancesco implied the work's early circulation in manuscript form when he published it in the 1496 *Opera omnia*. In the first part of the *Oratio*, Pico famously sets forth the view that human beings have no nature or form, and by choice humans are free to become the higher and lower natures in the hierarchy of being, where ultimate unity with God is championed as the highest option. The work can be read as a philosophical exploration of the traditional doctrine of human deification found in the Neoplatonic and Christian traditions. Pico employs the literary device of a conversation between God and the first man to expound his view, and he implies that moral choices determine an individual's acquired form or nature. In addition to these remarks on the human condition, the *Oratio* also defends other views. The middle portion of the work can be read as either a protreptic or an apology for the discipline of philosophy, and the latter part of the work examines Pico's proposal for a public debate.

Pico's remarks on the human condition in the *Oratio* have been subject to a wide variety of

interpretations. While the claim that human beings lack a nature or form may appear to some to anticipate elements of twentieth-century existentialist philosophy, some commentators have questioned whether a myth presented in the context of an oration can be a reliable source for metaphysical views. At least, the style of the *Oratio* is far removed from the traditional genres of philosophical writing, even though Pico uses scholastic terminology. Nevertheless, the *Oratio* is arguably the most famous philosophical text of the Renaissance period. In presenting the view that human beings lack a fixed nature, Pico is perhaps anticipated by some Patristic and medieval texts. The views of Origen and Boethius may have been direct influences on him in this respect, and judging from the extant lists of the contents of his library and the references he gives to their works throughout his writings, Pico was familiar with both thinkers.

The *Oratio* was intended merely to serve as the opening preface to Pico's planned disputation of his *900 Theses* (*Conclusiones DCCCC*), which he published in Rome in 1486. The *900 Theses* consisted of a collection of authoritative views garnered from well-known as well as obscure authorities from philosophy, theology, and other disciplines, to which Pico appended theses he personally proposed "according to his own opinion." Pico's collection of theses for the Roman debate was not his first attempt to compile authoritative opinions; in the *Vita*, Gianfrancesco reported that as a young student of canon law, Pico anthologized a digest of decretals. At the end of the published *900 Theses*, Pico appended an advertisement offering to pay the traveling expenses of any philosopher or theologian willing to join him for the disputation. Pico envisioned that the pope would preside over the event with the College of Cardinals in attendance. The public event, however, never occurred; Pope Innocent VIII convened a group of theologians and canonists to investigate the orthodoxy of the theses. Of the 900, 13 theses were identified as either being outright heretical or exhibiting a propensity to heresy.

Pico's response to the condemnation was a quickly penned defense called the *Apology* (*Apoloogia*) published the following year. In it, Pico

criticized the commission's findings severely and defended the orthodoxy of his suspect theses. He argued that his theses were set forth as proposals to be disputed and should not be approached in the way one approaches ordinary academic writing. Pico's *Apology* exhibited no contrition, and it spectacularly failed to secure exoneration. Pico fled Rome to France, only to return safely to Italy with the protection and favor of Lorenzo de' Medici.

Pico's next major work, *Heptaplus*, *On the Sevenfold Exposition of the Six Days of Genesis* (*Heptaplus de septiformi sex dierum Geneseos enarratione*), dates from 1489. In this biblical commentary on the early part of Genesis, Pico explicitly rejected the traditional fourfold medieval modes of exegesis that examined biblical texts in terms of the literal, allegorical, moral, and anagogical senses. Instead, Pico approached Genesis as an esoteric work containing latent philosophical doctrines. Pico argued that Moses was a philosopher of the first order who placed philosophical truths under guise of images and figures in the work. The *Heptaplus* presupposes a complex hermeneutical theory that seeks to unpack a latent Neoplatonic emanationist metaphysical scheme from the beginning of the Hebrew scriptures.

Another metaphysical treatise, the short *On Being and the One* (*De ente et uno*), was completed by Pico in the early 1490s but not published in his lifetime. It was intended to be part of a larger planned work reconciling the metaphysical principles of Plato and Aristotle, to be titled *Concordia Platonis Aristotelisque*. In the short completed treatise, Pico contended that Plato and Aristotle were not in disagreement on the relationship of being and unity, and Pico examined texts from Plato's *Parmenides* and *Sophist* and Aristotle's *Metaphysics* in his attempt to bring the two philosophers together. In attempting such a reconciliation, Pico places himself in an ancient tradition that sought a harmony between Platonism and Aristotelianism. Pico knew he was not the first to seek a general compatibility between Academic and Peripatetic thought, and even in the early *Oratio* and in the *Apologia*, he explicitly identifies Boethius, Simplicius, and John Philoponus as predecessors who tried, but

ultimately failed, to secure a lasting reconciliation of Greek metaphysical thought. Strikingly, Thomas More removed every mention of Pico's interests in *concordia* in his English iteration of Gianfrancesco Pico's *Vita*.

Pico's longest work is his posthumously published diatribe against astrology, the *Disputationes against Divinatory Astrology* (*Disputationes adversus astrologiam divinatricem*). In 12 books, Pico engaged in a multipronged polemic against adherents of astrology. Pico was careful to distinguish between natural causes and occult ones, and he condemned the latter. He separated human causes from celestial ones and ridiculed the presuppositions of ancient and contemporary astrological views. Finally, in the last book of the work, Pico presented a striking history of astrological theory and practice. Numbered among Pico's works are also short religious opuscula including an unfinished commentary on the Psalms.

The works of 1486–1487 as well as the later *De ente et uno* exhibit Pico's commitment to finding *concordia* or harmony among seemingly opposed philosophical views. For this reason, he has been regarded by some historians as a syncretist. While the designation of syncretism is in many ways a fitting characterization of his thought from the period, it should be noted that Pico did not espouse the view that all philosophers were defending the same position using different terms and expressions; Pico privileges the claims of Christianity and sought external confirmations of them. Similarly, he finds in ancient poetry veiled references to Neoplatonic metaphysics, and the writings of Kabbalah are used to confirm some tenets of Christianity. The hermeneutical tools used by Pico in his project of *concordia* involve allegorical and figurative readings of ancient texts. Pico occasionally gave very general characterizations of his method, indicating that what appears opposed at the level of words (*verba*) may turn out to be in concord at the level of substance (*res*); the true interpreter must distinguish the kernel (*medulla*) from the mere outer shell (*cortex*) of words. Insofar as Pico is willing to apply his interpretive techniques to classical poetry, again in search of finding confirmation of

metaphysical and theological tenets, he can be viewed as a sophisticated Renaissance exponent of *prisca theologia*.

Godfrey of Fontaines

Catherine König-Pralong
Philosophisches Seminar, Albert-Ludwigs-
Universität Freiburg, Freiburg im Breisgau,
Germany

Abstract

Godfrey of Fontaines was one of the most influential masters of the University of Paris from the last quarter of the thirteenth century. Against Henry of Ghent, for whom theology is endowed with reason that is eminent, universal, and all-encompassing, Godfrey defends the autonomy of philosophical reason within

its own domain. In interdisciplinary fields, where theology and philosophy come into contact, he advocates a perspectivist epistemology, and he defends a probabilistic conception of scientific truth. Among the theologians after the Condemnation of 1277, he was one of the most fervent defenders of philosophy. He further develops the theories of masters of the Arts Faculty in the 1270s and employs them against the theologies of contingency that flourished in the interim.

Godfrey of Fontaines was born in the principality of Liège (modern Belgium) shortly before 1250. We know nearly nothing about his life outside the university (Wippel, *The metaphysical thought of Godfrey of Fontaines. A study in late thirteenth-century philosophy*. Catholic University of American Press, Washington, 1981, pp. xv–xxi). At the University of Paris, however, we know that this secular priest was one of the most famous masters of theology during the last quarter of the thirteenth century. He died c. 1306–1309.

Godfrey studied at the Arts Faculty of Paris probably from 1270 onward. There, he would have been able to hear the lectures of the “Averroist” masters who defended the autonomy of philosophical research, notably Boethius of Dacia, Siger of Brabant, and later, Jacques of Douai. He would have also attended the debates that provided the grounds for the condemnation of Aristotelianism issued on March 7, 1277. He could also have gone to the lectures of Thomas Aquinas, who had a second regency as master in the Faculty of Theology of Paris between 1268 and 1272.

From this first period dates a precious student's notebook, started by Godfrey in 1271 and finished around 1277 (Glorieux 1931). This collection witnesses the author's taste for philosophical works: among other texts, it contains the treatise *On the Eternity of the World* (*De aeternitate mundi*) by Siger of Brabant, and that by Thomas Aquinas, abbreviations of some works by Boethius of Dacia, and a *reportatio* of Siger of Brabant's *Questions on the Metaphysics*

(*Quaestiones in Metaphysicam*). Moreover, it also carries transcriptions of theological texts from a little later, such as the *Theoremata on the Body of Christ* (*Theoremata de corpore Christi*) composed by Giles of Rome between 1274 and 1276, and some notes taken during Henry of Ghent’s first quodlibetal disputation (Christmas 1276).

From 1274, Godfrey was a student in theology at the University of Paris. He studied under Henry of Ghent and Servais of Mont Saint Elias. He was promoted to master in 1285 and served as regent master until 1298/1299. In the Faculty of Theology, his main colleagues were Henry of Ghent and Giles of Rome, with whom he held running debates that lasted for years. Fourteen *Quodlibets* (*Quodlibeta*) stand as witness to his intellectual activity during these 14 years of teaching. In 1298, he left the university to fulfill ecclesiastical missions. Then he held a second regency in the Faculty of Theology around 1303/1304; his 15th *Quodlibet* comes from this period (Table 1). Godfrey’s literary production also includes *Ordinary Questions*, of which some have been preserved (notably the *Disputed Questions on the Virtues*).

Godfrey had an important personal library that included numerous contemporary works, which he left to the College of the Sorbonne. The 37 surviving manuscripts comprise one of the major sources for the documentation of the debates on the eternity of the world and the distinction between being and essence in the period between 1272 and 1300 (Duin 1959).

In the controversies that engulfed the Faculty of Theology during the years 1280–1300, Godfrey frequently opposed his fellow theologians and revived solutions defended in the

1270s by the arts masters condemned in 1277. He repeatedly protested the continuation of this condemnation (*Quodl. VII*, q. 18, 404; *Quodl. XII*, q. 5, 102), which also touched upon some of Thomas Aquinas’ positions. Godfrey’s influence is particularly clear on James of Viterbo, who succeeded Giles of Rome as Augustinian master of theology in 1293. His influence is also very important on the German master Dietrich of Freiberg, for whom Godfrey served as a conduit: Godfrey provides at least partially the means for Dietrich’s awareness of the Parisian theological controversies and transmits to Dietrich the elements of the philosophy of the arts masters of the 1270s.

1. Godfrey’s work is remarkable for its reflections on methodology. From the middle of the century, the University of Paris was the battleground for a war between the faculties (and maybe also between disciplines). Before 1275, some arts masters (like Siger of Brabant) had defended the autonomy of philosophical research against the attacks of theologians who wanted to reduce its scope and pretensions. At the same time, the theologians felt obliged to specify the status of their discipline. In spite of being a master of theology, Godfrey did not make all other disciplines a unified field over which theology alone reigned supreme.

Against Henry of Ghent, he challenged the notion that theology was a science properly speaking (*Quodl. IX*, q. 20). Theological knowledge is a form of wisdom (*sapientia*), while the philosophical disciplines, first of all metaphysics, are sciences (*scientiae*). Theology necessarily presupposes faith. The truths that are most certain are not thereby also evident (*Quodl. IX*, q. 20), such as the trinity (*Quodl. VII*, q. 2). Clearly,

Godfrey of Fontaines,
Table 1 Dating of the

		<i>Quodlibet XV</i>	1303/1304

theology provides understanding of what is believed, and it facilitates the interpretation of sacred texts, but biblical exegesis only produces probable knowledge (*Quodl. VIII*, q. 7). On the other hand, metaphysics, the highest of the sciences, knows the truths that are evident to natural reason. This is why propositions about God, known evidently, belong to metaphysics and not to theology, as is the case concerning the propositions that affirm that God is the first being, that He is simple, in act, pure intellect, and so on (*Quodl. IX*, q. 20).

In so doing, Godfrey challenges Henry of Ghent's understanding of theology, in particular its epistemic nature. According to Henry, theology is the most universal and the most certain science, and the certitudes of the other forms of scientific knowledge proceed from it. Godfrey, on the other hand, holds that theology furnishes a less certain knowledge than that provided by other sciences with respect to their proper objects. Godfrey defends an epistemological perspectivism that grants each discipline its object and certitude.

On Godfrey's reading, Aristotle's metaphysical science is autonomous, absolutely speculative, and it concerns human happiness insofar as it is attainable on Earth. On the other hand, theology is a composite discipline, both speculative and practical. It must provide speculative knowledge of what is the ultimate goal, but this goal – the beatific vision of God – is only attained in the afterlife. Theology is therefore also a practical science, concerned with the life of the faithful and with the preparations for obtaining future beatitude (*Quodl. XIII*, q. 1).

From his first *Quodlibet* (q. 5) on, Godfrey criticizes the superficial and irrational (*"irrationabilitas"*) attacks on philosophy by some theologians. He condemns the vanity (*"curiositas"*) of his fellow theologians who construct complicated theoretical edifices to explain the status of the dead body of Christ and the possibility that it was or was not burned (*Quodl. III*, q. 6). Godfrey's approach becomes particularly evident in his positions on interdisciplinary questions, that is, in considering issues at the border of theology and philosophy. Here, Godfrey establishes a probabilistic epistemology.

Anthropology is one of these frontier zones. Theological truth – christology in this case – touches upon natural philosophy, because Christ is both God and man. Some theologians, such as John Pecham, the author of the London condemnation of April 30, 1286, reconfigured anthropology to meet the requirements of dogma. To guarantee the identity of the living and dead body of Christ, they believed they had to impose a pluralist anthropology. Accordingly (and against what Thomas Aquinas believed), man is not substantially informed by the rational soul alone but by a succession of natural forms: the forms of the elements, of mixtures, the body, the nutritive soul, the sensitive soul, and, finally, the form of the rational soul. At death, the soul is separated from the body, but the latter remains univocally body in virtue of the permanence of the form of corporeity. Henry of Ghent developed a simpler solution, positing a dimorphism that makes the form of the body and the rational soul cohabit the same being.

According to Godfrey, John of Pecham was out of line (*Quodl. III*, q. 5, 207: *"graviter excessisse"*) in censuring the unicist anthropology of Thomas Aquinas as propounded by Richard Knapwell. In 1286, the same year as the London condemnation, Godfrey broached the question twice (*Quodl. II*, q. 7 and *Quodl. III*, 5). His treatment has two goals: (a) to protect philosophy from theological incursions (b) to relativize the certitude obtained in interdisciplinary fields.

(a) Godfrey insists that Christ is a man like any other, if one considers his humanity in the light of human reason. The body of Christ after death need not be substantially the same as that before death. That it is identical is neither evident by faith proceeding from authority nor is it evident to natural reason. Therefore, one should not infer anthropological consequences from it. According to Thomist anthropology, the body of the living Christ and his cadaver could be different substances, as it is the case for Peter's body (when alive), and his cadaver.

(b) Godfrey likewise shows that the unicist thesis of Thomas Aquinas is the most reasonable and philosophically the most coherent. It explains the unity of man without injury to major

ontological principles, such as matter's pure potentiality. Nevertheless, Godfrey counsels prudence when treating questions that touch on theology. Examining the theses of others, he establishes a hierarchy of levels of certitude: the unicist thesis is the most probable, followed by Henry of Ghent's dimorphism (see also *Quodl. X*, q. 10), and in last place is the pluralist position that was dominant at the time, which, from a philosophical point of view is weak and thus the least probable. Even when theological and philosophical interests collide, Godfrey claims that each has its own specific objects and methods.

2. In metaphysics, Godfrey begins by distinguishing four "terms" he describes as "the most general" (*Quodl. XIII*, q. 3, 193): being and nonbeing, act and potency. These four terms form two analogous pairs of opposite and exclusive principles. Potency is related to act as nonbeing to being. From 1285 (*Quodl. I*, q. 7) until the end of his career, Godfrey incessantly insists on this bipolarity. In this sense, Godfrey's metaphysics is a metaphysics of the excluded middle. There is no intermediate way of being, such as relational being, between being and nonbeing. Likewise, potency is opposed to act in an absolutely primary sense, such that there is no intermediary. Potency designates a thing that absolutely does not exist and it designates such a thing insofar as it is still in its cause (e.g., the artifact in the mind of the artisan or the fruit in the seed). The copula potency/act is a copy of the pair nonbeing/being and explains the dynamics of contingent beings (i.e., every being except God). *A fortiori*, starting from the experience of beings existing in act, the notion of potency permits the postulation of a nonbeing capable of coming to be.

In 1286, Godfrey took part in an important debate on essence (*essentia*) and existence (*esse*) where Giles of Rome opposed Henry of Ghent. Giles took the real distinction between existence and essence sketched by Thomas a generation earlier to an extreme. Henry of Ghent defended a moderate thesis: existence does not differ really from essence. Nevertheless, the distinction between existence (*esse existentiae*) and essence (*esse essentiae*) is not solely one of reason; it is "intentional," since the essence of something can

be conceived as nonexistent. Following Avicenna, Henry posited a sort of intermediate state for essence, independent of or "indifferent" to its being conceived in the mind and to its being brought to be in extramental reality. Each in their own way, Giles and Henry wanted to explain the contingent character of created essences: they were able not to have been. Godfrey rejects Giles' real distinction and Henry's intermediate solution, which postulates an absurd third way of being between being and nonbeing (*Quodl. II*, q. 2). He repeats the "Averroist" solution defended by Siger of Brabant c. 1273; like Siger, Godfrey places the question in a semantic context (*Quodl. III*, q. 1). Being (*esse*) and essence (*essentia*) differ as two ways of signifying. The word "being" signifies the being concretely, as the word "to run" signifies the action of the person who runs; the word "essence" signifies the abstract being, as the noun "running" signifies the activity of running in an abstract manner. On an ontological level, one should not postulate any other way of being than that of the being itself: concrete, individual, and determinate. The creator's omnipotence sufficiently explains the contingency of the world.

3. In ontology, the primary distinction is that between substance and accident (*Quodl. I*, q. 20; *Quodl. VI*, q. 4). Since substances are what exist absolutely, accidents only exist by attribution to a substance. Like Albert the Great and Dietrich of Freiberg, Godfrey follows the Averroist interpretation of Aristotle according to which an accident is only a disposition (*dispositio*) of a substance. This dependence on substance excludes any rational explanation for an accident persisting without substance, as happens in the sacrament of the Eucharist. Any philosophical justification of the per se subsistence of accidents would amount to denying the distinction between substance and accident, that is, the primary distinction in ontology (*Quodl. VI*, q. 5).

This distinction grounds a theory of the analogy of being (*Quodl. III*, q. 1). The concept of being is ontologically (*in essendo*) and semantically (*in significando*) analogous. The notion of being is predicated of all subjects. Neither equivocal (homonymous) nor univocal in the sense of

a genus, being is diversified by itself and not by a *differentia*. It does not have the unity of a genus or a species but rather it accompanies confusedly every conception of something real. The notion of “being” is predicated of all subjects in the same sense, but to greater or lesser degrees, according to prior and posterior; substance is more primarily being than accident, which is only called being by attribution to substance. The unity of the concept of being is a unity of order that relates diverse elements according to a common characteristic shared by each of them to different degrees. Although Socrates is an animal just as a dog is an animal, Socrates *is* not in the way a dog is, nor like the white that is in him is, nor like God is. “Being” signifies all beings, supposing their reciprocal relations and the order established between them according to their degrees of perfection with relation to the first being (substance from an ontological point of view, God from a metaphysical point of view).

4. In natural philosophy, Godfrey applies his vision of exclusive opposition between act and potency. Matter is pure potency; only form is act (*Quodl. X*, q. 9). Therefore, matter cannot be created without form. In 1285 (*Quodl. I*, q. 4), Godfrey tries to rehabilitate this position, associated with Thomas Aquinas and condemned in 1277 by Etienne Tempier. In 1297/1298 (*Quodl. XIII*, q. 3), he defends the same principles in order to refute the Augustinian theory according to which the seminal reasons of things are already present in prime matter. He challenges the theory of Henry of Ghent, for whom matter has something essential proper to it, the Franciscan theories that grant matter a minimal actuality, as well as Peter John Olivi’s description of matter – Godfrey does not even admit that matter joins with an “aptitude” before its union to form.

5. In psychology, Godfrey agrees with Thomas’ interpretation of *De anima III* (*Quodl. VI*, 15). The possible intellect and the agent intellect are two faculties of the same individual soul. Human cognition necessarily proceeds from the sensible thing. Godfrey explains intellectual cognition without positing illumination of the soul (Henry of Ghent) or innate ideas. The agent intellect’s work of abstracting from sensations

suffices to bring about cognition in the soul (*Quodl. V*, q. 9–10; *Quodl. VII*, q. 9). Cognition of the object comes about when the possible intellect receives the species (*species*) of the thing known, a species stripped of its individuating and material conditions. Godfrey insists on the receptive phase of the process: the intellect alone cannot cause efficiently and formally the cognition, because a created power cannot reduce itself from potency to act (*Quodl. I*, q. 7; *Quodl. IX*, q. 19; *Quodl. XII*, q. 1). The received species, however, does not coincide with the object known: it is not what is known but that by which the mind knows the extramental object (*Quodl. I*, q. 9; *Quodl. VI*, q. 6).

In the important debate on the relative functions and nobility of the intellect and the will, Godfrey takes a strong intellectualist position. Against the Franciscan positions and the Condemnation of 1277, he defends the unconditional superiority of the intellect over the will (*Quodl. VI*, q. 10). The intellect takes pride of place, both because its object is specific and because it plays a causal role with respect to the will; the will only desires something if the speculative intellect first apprehends that thing and if the practical intellect brings about the voluntary act. Against Henry of Ghent, Godfrey states again the first principle of his metaphysics: a power cannot move itself (*Quodl. VI*, q. 7). The will, a power of the soul, cannot be cause of its own act. The intellect causes the voluntary act not only in terms of formal causality (in making present to the will a desirable object) but also in terms of efficient causality (insofar as the will follows the judgment of the intellect).

When he treats the moral question of free choice (*Quodl. VIII*, q. 16), Godfrey criticizes the Giles of Rome’s compromise solution, and through it, the position of Thomas Aquinas. Free choice is not formally situated in the will alone, even if the apprehended object is present in it. The action of the intellect is at least as free as that of the will. The intellect is eminently free and sovereign in determining the will’s choice. To defend such a thesis, once again, Godfrey brings back elements of the philosophy of the arts masters in the 1270s, particularly the discussions of Siger of Brabant on necessity.

Alongside these philosophical themes, Godfrey's work has a great many discussions pertaining to ecclesiology, canon law, religious practices, and pastoral care.

Gottschalk of Nepomuk

Alexander Baumgarten
IRHT, Paris, France
Faculty of History and Philosophy,
Babeş-Bolyai University, Cluj-Napoca, Romania

Abstract

Gottschalk of Nepomuk was a Bohemian Cistercian monk, trained as a theologian at St. Bernard's College in Paris in the 1370s. He died shortly after completing his *Quaestiones super Libros Sententiarum*. His commentary on all four books of Lombard's *Sentences* survived in only one manuscript at the Jagiellonian Library (Krakow), and it is currently being edited. In the prologue, Gottschalk discusses the problem of theology as a scientific habitus and confines the object of

knowledge as a *complexe significabile* to the domain of theological knowledge. From a doctrinal perspective, the author belongs to a more general intellectual movement from the latter half of the fourteenth century, along with John Hiltalingen of Basel, James of Eltville, and others. Gottschalk's work develops themes common to English theologians from the first decades of the fourteenth century (e.g., Walter Chatton, Robert Holcot, Adam of Wodeham), but also relies on the texts of various Parisian theologians, such as Thomas of Argentina, Gregory of Rimini, John Mirecourt, and Henry of Ghent. His doctrinal orientation consists in both the adoption and criticism of Gregory of Rimini's thought.

Thought

His commentary on the *Sentences* seems to be Gottschalk's only work; it was preserved in a single manuscript and composed at the end of the fourteenth century at Paris; the manuscript is written in a single hand, but without mentioning the name of the scribe. The manuscript is now at the Jagiellonian Library in Krakow under the no. 1499, having as incipit *Utrum per discursum theologicum possit haberi habitus proprie scientificus* (Kozłowska et al. 2012). We can, however, believe in the existence of at least three manuscripts that could have circulated, since this is obviously not the autograph; the manuscript is incomplete (the scribe notes the absence in the model he followed of several discussions regarding the relative properties of the divine nature – f. 41rb), and V. Doucet (1954: 34) notes the existence of a manuscript in Turin that probably burnt in 1904. The manuscript contains commentaries on all four books of Peter Lombard's *Sentences* and has a prologue in which the author discusses the nature of theology as a scientific disposition and also its hermeneutical value. It is certain that the work was accompanied by principal questions, which are mentioned by the author himself (74vb).

The commentary is organized in the form of *quaestiones*, which select topics from the content of Peter Lombard's work that was currently debated at the Protestant Faculty of Theology in Paris when Gottschalk was bachelor in theology. Gottschalk's doctrinal orientation can be clarified by studying the four *quaestiones* of his prologue from two points of view. The first is formal and implies studying the use of its sources. The second relates to the content and reflects how the originality of this author stems from the subtle combination of its sources, the juxtaposition of which often leads to new meanings in relation to those present in its sources.

It is known that the authors of *Sentences* commentaries dating from Gottschalk's period composed their works out of selected fragments of authors from previous generations, going back to the thirteenth-century authorities (in Gottschalk's case, Henry of Ghent). The preference for authors from previous decades is visible, in Gottschalk's case, in the use of English post-Ockhamist theology, recently introduced in Paris, and often the subject of controversy for Parisian theologians, as well as two Parisian theologians: Thomas of Argentina and Gregory of Rimini. Gottschalk uses these sources by selecting from their texts parts that are next adapted to their new context, often being radically rearranged. This technique was originally called by D. Trapp a reading *secundum alium*. Trapp identified Gottschalk as a doctrinal descendant of Gregory of Rimini, based on the numerous passages borrowed from the commentary on the *Sentences* of the latter (Trapp 1956: 251). The expression was criticized by M. Brînzei, which proposed in turn the expression "bricolage textuel" (Brînzei 2011: 560) as more appropriate to the complexity and doctrinal originality of these authors. In the particular case of Gottschalk, this complexity is verified by the way he, although copying from the massive work of Gregory of Rimini, often uses sources shared with this author (especially Adam Wodeham or Robert Holcot) to form a criticism of Gregory of Rimini.

At the level of his prologue, Gottschalk of Nepomuk may appear today to be an original author: his theses, grounded in an epistemology

centered around the concept of *complexe significabile*, are linked to an explicit support of a primate of a legitimate and competent interpretation of Scripture that is above the decisions of the ecclesiastical authority. At first glance, this last sentence could put its author in a pre-reformist tradition. However, his ideas could be more correctly understood in relation to his contemporary debates and as a possible defense of the theologian's position in the university and the university in relation to the church.

The first question of his prologue, indebted to Gregory of Rimini and Walter Chatton, discusses the nature of the scientific disposition (*habitus scientificus*) of theology, anchored in the hermeneutical condition of transmitting the doctrine, but emphasizing (originally from its sources) the historical condition of the legitimacy of interpreting Scripture: the longer we move away from the original writing of the sacred text, the more legitimate the interpretation is, since our condition is more different than the original context of the sacred text. The second question, which features William Ockham, John of Ripa, Gregory of Rimini, and Robert Holcot, contains an epistemological discussion and criticism of Gregory of Rimini. Gottschalk's main accusation against the Augustinian theologian is the latter's way of seeing the nature of the object of science. If, for William Ockham, this object had been the proposition and, for Walter Chatton, it was the object outside the soul, a third solution, proposed by Adam Wodeham, was recovered and supported by Gregory of Rimini. According to this theory, the subject of science is signified in a complex way, that is, the object that the human mind signifies through the propositional structures that it can form (*complexe significabile*). Gottschalk's critique aims to restrict the validity of this theory exclusively to the sphere of theology, where the signified in a complex way can guarantee the legitimacy of its significance. We may possibly assume that such a position rests on a theory of the proposition as an object of knowledge in the sciences other than theology.

The third question discusses the relationship between reason, will, and assent in producing

faith. It is based on a paraphrasing of *Summa*, IX–X, by Henry of Ghent, and proposes a primacy of the authority of the community of believers enabled to interpret the Scripture, as opposed to ecclesiastical authority. Henry of Ghent had only discussed the exceptional case in which believers who have already benefited from a historical transmission of doctrine (so it is excluded the case of newly converted) can freely interpret the text of the Scripture. Instead, Gottschalk proposes a hierarchy between God, Scripture, the community of believers, and the Church (“loquimur de effectis fidelibus, id est iam conversis, dico quod non debent seu tenentur magis fidem adhibere contentis in Sacra Scriptura quam Ecclesiae” – ed. Baumgarten 2016: 180, lines 16–19). Finally, the last question, indebted to Thomas of Argentina, is inserted into the fourteenth-century discussion of the distinction between the abstract knowledge and the intuitive knowledge. Godescalc proposes that within the limits of his condition as *homo viator*, man can have intuitive knowledge about the divine nature, even if this knowledge is proportionate to his condition, and can be strictly used only within the limits of a *notitia argumentativa* that properly belongs to the theologian.

In Book I, the author is interested in discussing questions about the Trinitarian relations and the possibility of their rational demonstration, the human possibility of having an intuitive knowledge of the divine nature, the relationship between divine processions, as well as the grace and predestination. The second book contains questions about the angelic movement and communication, as well as about the will and nature of angelic responsibility. Book III contains the sketch of a Christology, with an emphasis on the full presence of divine attributes in the soul of the incarnate Christ. In the last book, traditionally devoted to the sacraments, Gottschalk insists on baptism and the Eucharist, discussing the relationship between their original institution and their historical condition, deriving from here the last themes of his commentary: penitence and its system of distribution in the ecclesiastical hierarchy.

Impact

The reception of Gottschalk’s work in the immediate period seems to have been intense: in 1369, Jean Regis makes use of his commentary as an implicit source; John Hiltalingen of Basel cites him several times in the prologue of his own commentary on the *Book of Sentences* (e.g., see Marcolino’s edition 2016:193, l. 1); and James of Eltville, in the prologue of his *Sentences* commentary, is preoccupied with rejecting Gottschalk’s theory of *complexe significabile*, returning to Gregory of Rimini’s position (see James of Eltville, f. 1ra-b). However, the subsequent reception of Gottschalk’s work is still not researched. The contemporary recovery of the Cistercian’s thought began with the author’s incorporation into a current of skepticism of the fourteenth century by Cardinal K. Michalski (1921) and continued with D. Trapp’s analysis of the Augustinian theology of the same century. Parts of Gottschalk’s work were edited by Bakker (1999) and Schabel (2014), and the editing of the entire work is in progress.

Greek Texts Translated into Hebrew

Mauro Zonta

Dipartimento di Studi Filosofici ed

Epistemologici, Università di Roma, Rome, Italy

Abstract

Only few Greek philosophical texts by Aristotle and by some of his main interpreters were partially or totally translated into Hebrew during the Middle Ages in Spain, France, and Italy; all these translations were based upon the previous Arabic and Latin ones. In the twelfth century, part of chapter 1 of book I of Aristotle's *De anima* was translated from the Latin *translatio vetus*. Some translations were made in the thirteenth century, from the medieval Arabic versions by Ibn al-Biṭrīq, Ḥunayn ibn Ishāq, Ishāq ibn Ḥunayn, Yahyā ibn 'Adī, and 'Īsā ibn Zur'a. Aristotle's *Meteorologica* was translated by Samuel ibn Tibbon; Themistius' *Paraphrase* of book XII of Aristotle's *Metaphysics*, and Pseudo-Aristotle's *Problemata Physica*, were translated by Moses ibn Tibbon; Themistius' *Paraphrase* of Aristotle's *De caelo et mundo*, and Aristotle's *De generatione et corruptione* and *De anima*, were translated by Zerahyah Hen; Aristotle's *Historia animalium*, *De partibus*, and *De generatione animalium* were translated from Michael Scot's Arabic-into-Latin version. Other translations were made in the fourteenth century, from the Arabic versions by Eustatius, Ishāq ibn Ḥunayn, Thābit ibn Qurra, and Naẓīf ibn Ayman. Aristotle's *Posterior Analytics*, *Physics*, and books I–X and XII of his *Metaphysics*, as found in Averroes' *Long Commentaries* on them, were translated by Qalonymos ben Qalonymos; Qalonymos also translated Nicolaus Damascenus' *De plantis*. Book I of Alexander of Aphrodisias' *De anima* was translated by Samuel of Marseilles; the *De intellectu* ascribed to Alexander was translated as found in Averroes' commentary on it; "Bryson"'s *Economics* was

translated by David ibn Ya'ish. All the translations of Aristotle or Pseudo-Aristotle's works made in the fifteenth century were based upon the medieval Latin versions by William of Moerbeke, Durand of Alvernia, Leonardo Bruni, and John Argiropoulos. They include the *Nicomachean Ethics*, translated by Meir Alguadez; books I and III of the *Economics*, translated by an anonymous scholar; books I–IV of the *Physics*, translated and commented on by Judah Messer Leon; books I–XII of the *Metaphysics*, translated by Baruch ibn Ya'ish. Baruch also translated the *Nicomachean Ethics* and the *Economics*, and might have translated Aristotle's *De anima*, as found in the Latin version of Averroes' *Long Commentary* on it.

In medieval Jewish thought, an important role was played by two main currents of Ancient Greek philosophy: Neoplatonism and Aristotelianism. However, the Jewish approach to each of them appears to have been different. Neoplatonism was mostly known to medieval Jewish authors working in Islamic lands (Muslim Spain, Tunisia, Egypt, and Iraq) through the medieval Arabo-Islamic interpretations of it, as found in a number of ninth- and tenth-century Arabic works: Pseudo-Aristotle's *Theology*, the *Liber de causis*, Pseudo-Empedocles' *Book of the Five Substances*, and the *Encyclopaedia of the Brethren of Purity*. Medieval Neoplatonic Jewish authors knew Arabic well, so that they did not need Hebrew translations of these texts. The case of Jewish Aristotelianism is different. In Spain, France, and Italy a number of medieval Jewish philosophers, working in the period 1150–1500, show to have known Aristotle's thought and doctrine. In reality, most of them approached Aristotelian philosophy via Arabic paraphrases and summaries of Aristotle; they particularly employed those by Averroes, where Aristotle's original words were not literally reproduced, but “interpreted” and adapted by the Arabic philosopher to his own thought. However, the knowledge of Arabic language was not so diffused among European Jewish philosophers, as it was among their colleagues living in Islamic

lands; on the other hand, not all of them seem to have known medieval Latin language, into which the whole of Aristotle's works were translated during the thirteenth century. They had to use the work of more or less professional Jewish translators, who rendered into Hebrew a number of the extant philosophical Arabic texts; after 1400, some of them continued this translation work by applying it to a number of medieval Latin texts. To sum up, only few Greek philosophical texts, mostly by Aristotle and some of his followers (Pseudo-Aristotle, Nicolaus Damascenus, Alexander of Aphrodisias, Themistius), were translated into Hebrew during the Middle Ages; some of them are part of Averroes' *Long Commentaries*, where the original words of Aristotle were literally quoted not in their original Greek text, but according to some of their medieval Arabic translations. Also, a non-Aristotelian Greek text, ascribed to the Neoplatonic author Bryson, was translated into Hebrew. A first list and partial examination of the characters of these translations was made at the end of the nineteenth century (Steinschneider 1893: 42–275); a tentative historical sketch of them was made at the end of the twentieth century (Zonta 1996a), mostly on the basis of the critical editions of some of them.

Probably, the first Greek philosophical text translated into Hebrew included the first paragraphs of Aristotle's *De anima*, book I, chapter 1 (402a1–403a2). This short passage was put at the beginning of an anonymous Latin-into-Hebrew translation of Dominicus Gundissalinus' *De anima*; since it covers a series of questions about man's soul, the translator probably inserted it in order to introduce some of the themes discussed in Gundissalinus' work. This partial translation, extant in a unique manuscript, was probably made in Spain, maybe in Catalogna (Teicher 1956: 409–414). It was allegedly based upon a medieval Greek-into-Latin translation even older than found in the so-called old translation (*translatio vetus*) of the *De anima*; but from an attentive analysis, it seems to depend on the latter instead (Zonta 1996a: 193–195). Since the “old translation” was made around 1150, this Hebrew version should be put after that date, possibly at the end of the twelfth century.

The first complete, albeit not yet literal translation of a Greek philosophical–scientific text into Hebrew, based upon an Arabic version, was made at the beginning of the thirteenth century by one of the main medieval Arabic-into-Hebrew translators: Samuel ibn Tibbon. A well-known Provençal Jewish philosopher of Spanish origin, Samuel wrote his version of Aristotle’s *Meteorologica* while he was sailing the Mediterranean Sea, in 1210; it was published in a very accurate critical edition, based upon five or six of the many extant manuscripts and upon a comparison of the medieval Arabic and Latin versions of Aristotle’s work, and translated into English (Fontaine 1995). Samuel’s version is not a mere translation of Aristotle’s work. He states in the introduction to it that he began to base it upon the early-ninth-century Arabic version by Yaḥyā ibn al-Biṭrīq, which is still extant; however, he found Ibn al-Biṭrīq’s version so confused, that he decided to correct it by consulting a number of manuscripts of it, as well as a lost Arabic translation of Alexander of Aphrodisias’ Greek commentary on the *Meteorologica* (second century). As shown by a detailed analysis (Fontaine 1995: lxii–lxxi), Samuel interpreted and commented on some passages of Aristotle’s work by referring not only to Alexander (whose Greek original is still extant), but also to Avicenna’s part 5 of the section on the *Physics* of his *The Cure (al-Shifā’)*, to Averroes’ *Middle Commentary* on the *Meteorologica*, and to another unidentified Arabic source. The textual transmission of Samuel ibn Tibbon’s version appears to be rather intricate: he might have written a first “rough” version of his work (a sort of “working-copy”), but he might have also revised his translation after having copied and diffused it among scholars (Fontaine 1995: xxi–xxviii).

A more literal, less “interpreted” version of a Greek philosophical text was made some decades after by another member of the Ibn Tibbons family: Moses ibn Tibbon, Samuel’s son, who worked in Provence as a philosopher and a translator of philosophical and scientific works in the period 1240–1283 c. In 1255, he translated into Hebrew, from the Arabic version by Ishāq ibn Ḥunayn, the *Paraphrase* of book XII (*lambda*) of Aristotle’s *Metaphysics* by the Greek rhetor and philosopher

Themistius (317–388). Themistius’ work includes a nonliteral reworking of the contents of Aristotle’s, according to a Neoplatonic interpretation of them; the original Greek text is lost, but the Arabic version of it is still extant. Moses ibn Tibbon’s translation is preserved by a number of manuscripts, and was published in a critical edition (Landauer 1903). A sixteenth-century Latin version of this translation, made by Moses Finzi, was first published in 1558; however, the best modern version of Themistius’ text as found in Arabic and Hebrew, which is based upon a tentative reconstruction of the contents of the original text, appeared in French (Themistius 1999). Moses ibn Tibbon also translated into Hebrew part of another Greek philosophical work: Pseudo-Aristotle’s *Physical Problems (Problemata physica)*. His literal translation was made in 1264 from the ninth-century Arabic version by Ḥunayn ibn Ishāq. This Arabic version, which is still extant, is not directly based upon the original text, but rather upon a later Greek revision of it, surely made after the end of the second century, maybe at the sixth-century by the Alexandrian school of Aristotle’s interpreters. The Hebrew version covers only the first 4 of the 17 books of the Arabic text; it is found in three manuscripts, and was published in a critical edition (Filius 1999: 663–793).

Zerahyah ben Isaac ben Shealtiel Hen was a Jewish philosopher and translator of philosophical and medical works from Arabic into Hebrew; he was from Barcelona, but worked in Rome in the period 1275–1290 c. He had a rather good knowledge of Arabic, a language that was almost unknown among Jews in Rome; for Roman Jews he wrote a number of translations, including those of some Greek-into-Arabic versions of Ancient philosophical works. His translations are usually literal, but are often marred by mistakes or omissions: he seems to have written many of them in the same period, possibly in a hurry. Some of Zerahyah’s versions probably aimed at creating a sort of *Corpus Aristotelicum Hebraicum*, a collection of works by and about Aristotle, which should have been a Jewish parallel to the Latin *Corpus* (Zonta 1996a: 222–225). According to what Zerahyah states in a passage of his *Corpus*,

he finished these versions in Rome in 1284; they included three important Greek philosophical works. The first and most interesting of them is Themistius' *Paraphrase* of Aristotle's *De caelo et mundo*. Zerahyah's translation of Themistius' work is very precious for the knowledge of it, since the text is lost both in its Greek original, and in its medieval Arabic version, apparently made by Yahyā ibn 'Adī, and no trace of another translation of it (in Syriac, or in medieval Latin) is extant. The Hebrew translation is preserved in four manuscripts. Two of them, dating back to the fifteenth century, were employed for the first edition of the work (Landauer 1902); however, the editor failed to notice the existence of the other two manuscripts. The most ancient of them, probably copied in Rome in 1284 and now in Florence (Biblioteca Nazionale Centrale, II.II.528), is surely the archetype of the textual tradition of the work, and should be employed for preparing a new critical edition of Themistius' *Paraphrase* (Zonta 1994a). As a matter of fact, also the partially reworked Latin translation of the text, made by Moses Alatino in 1568–1573, was apparently based upon this archetype.

Probably immediately after Themistius' *Paraphrase*, Zerahyah translated Aristotle's *De generatione et corruptione*. Here, the original Greek text is obviously extant; however, Zerahyah's translation is useful for the reconstruction of the medieval Arabic version of Aristotle's work. In fact, the original text of this Arabic version, probably made (according to Zerahyah's own statement) by Ishāq ibn Ḥunayn, is lost; its terminology and textual variants can be reconstructed both from Zerahyah's translation, and from another medieval translation of it: the Latin version by Gerard of Cremona (1175 circa). Something similar happens as for Zerahyah's translation of Aristotle's *De anima*: he rendered into Hebrew the first two books and chapters 1–7 of book III from Ishāq ibn Ḥunayn's lost Greek-into-Arabic version, made before 910, and chapters 7–13 of book III from another lost Greek-into-Arabic version, by Abū 'Alī 'Īsā ibn Zur'a (943–1008). Both translations by Zerahyah were published in critical editions (Tessier 1984; Bos 1994) on the basis of two extant manuscripts,

found in London and in Rome and copied in Italy during the fifteenth century. However, both editors failed to notice the existence of a third manuscript, found in Jerusalem (National Library of Israel, 4° 1108): the text of it, probably copied in the first quarter of the fifteenth century, is clearly independent from that of the other ones, and might be employed for correcting some points of them (Zonta 2007: 379).

Another important work by Aristotle was rendered into Hebrew, possibly in the same period when Zerahyah worked on his own translations: Aristotle's *Book on Animals* (*Liber de animalibus*). This was the name given by the medieval Latin tradition to the collection of the three main zoological works written by the Greek philosopher: the *Historia animalium*, the *De partibus animalium*, and the *De generatione animalium*, covering 19 books as a whole. The *Book on Animals* was translated into Hebrew neither from the Greek original text, nor from the Arabic translation ascribed to Ibn al-Biṭrīq, but from the Latin version of the latter, made by Michael Scot in southern Italy around 1220. The Hebrew translation was apparently made by a certain Samuel ha-Levi in an unknown date. It is preserved in four manuscripts, one of which (found in London, British Library) appears to be the oldest, and probably also the most faithful one: it was written down at the end of the thirteenth century, in Sephardic script, but it includes some glosses in a northern French dialect (Furlani 1922: 255–256). This fact would suggest that the translator was not Samuel ha-Levi Abulafia, who rendered from Castilian into Hebrew some scientific text around 1275, but another Hebrew scholar, having the same name but working in northern France. Since the translation was clearly employed as a source in Gershom ben Solomon's encyclopedia, *The Gate of Heavens* (1275–1300 circa), its possible date should be probably put not much before 1300 (Zonta 1996a: 195–196, 1999: 48–52).

A number of Arabic-into-Hebrew translations of Greek philosophical works were made by a well-known Jewish translator: Qalonymos ben Qalonymos of Arles (born around 1287 – died after 1328). He worked in Provence in the period

1307–1320 circa, and his translations covered many texts; some of them were made in a hurry, and were later corrected by other scholars – or even by Qalonymos himself – according to a reexamination of the Arabic text. In 1314, Qalonymos translated Nicolaus Damascenus' *Book on Plants* (*De plantis*) from the Arabic translation by Ishāq ibn Ḥunayn and Thābit ibn Qurra. Qalonymos' translation, found in some manuscripts, was published in a critical edition (Drossaart Lulofs and Poortman 1989: 407–436); however, it appears to be not very useful for the reconstruction of the lost Greek original text, since the latter is partially or totally transmitted through a number of other versions (into Syriac, Arabic, Latin, and even medieval Greek). The Spanish philosopher Shem Tov ibn Falaquera (1225–1295 circa), who knew and quoted some Greek philosophical texts in his own works (Zonta 2004), inserted into book IV of his own philosophical encyclopedia, *The Opinions of the Philosophers*, many passages from an otherwise unknown *Alexandrian Summary* (*Summa Alexandrinorum*) of Nicolaus' *Book on Plants*, which he himself translated from Arabic into Hebrew (Drossaart Lulofs and Poortman 1989: 388–405; see also Zonta 1993: 337–340); however, this “summary” might be 'Īsā ibn Zur'a's compendium of the Arabic translation of Nicolaus' work.

In other cases, Qalonymos made an Arabic-into-Hebrew version of a Greek philosophical text from Averroes' *Long Commentary* on it: in a *Long Commentary*, the Arabic translation of the Greek original text is divided into a number of passages, and each of these passages is commented on by Averroes himself in detail. By this way, Qalonymos translated three Aristotle's works: the *Posterior Analytics*, the *Physics*, and the *Metaphysics*. Averroes' *Long Commentary* on the *Posterior Analytics* was translated by Qalonymos at the end of 1314 (Steinschneider 1893: 95–96): it includes both books of the commentary, so being very useful for the reconstruction of the text of Averroes' commentary on book II, which is lost in Arabic and is preserved by a medieval Latin translation only. (Its utility for the textual history of the still extant Arabic translation

of the *Posterior Analytics*, by Abū Bishr Mattā ibn Yūnus, has not yet been examined.) Around 1315, Qalonymos also translated Averroes' *Long Commentary* on the *Physics* (Steinschneider 1893: 122–123). His version included Ishāq ibn Ḥunayn's still extant Arabic translation of Aristotle's text, and Averroes' commentary on it, which is lost in its original text and is otherwise known in a medieval Latin translation. Possibly in the same period, Qalonymos might have translated Averroes' *Long Commentary* on the *Metaphysics*: this translation was first edited and then totally revised by Moses ben Solomon of Salon, possibly a pupil of Qalonymos (Zonta 1996a: 243). Averroes' commentary covers only books I–X and XII of Aristotle's work. However, it is really important for the textual reconstruction of the Arabic transmission of the *Metaphysics*, since it is the only one extant witness of the medieval Arabic translations of some parts of it: that of book I, by Ishāq ibn Ḥunayn, that of book II, by Naẓīf ibn Ayman, and that of books III–X and XII, mostly by Eustathius. (Moreover, the original Arabic text of Averroes' *Long Commentary* is transmitted by only one manuscript, where some parts of the text are missing, so that the Hebrew versions by Qalonymos and Moses of Salon, together with the medieval Latin version, have been very usefully employed for reconstructing and editing the whole text of Averroes' work: Averroès, 1938–1952.)

Another important case of an Arabic-into-Hebrew translation of a Greek philosophical work made in Provence is that of Alexander of Aphrodisias' *Book on the Soul* (*De anima*). This translation was based upon Ishāq ibn Ḥunayn's medieval Arabic version, which is now lost; it covers only book I of the whole work, and was made by a contemporary of Qalonymos ben Qalonymos: Samuel ben Judah of Marseilles. Samuel stated in the introduction to his own translation (Berman 1978: 317–320) that he had written a first version of this work while he was in Murcia (Spain), in 1323, but revised this version later, while he was in Montélimar (Provence), in 1340. This revised version, preserved in three manuscripts, is not yet published (apart from an initial passage: Günsz 1886). However, it was

employed for the critical edition of the Greek text of Alexander's work (Bruns 1887), published in the series *Commentaria in Aristotelem Graeca*, whose apparatus includes a number of references to the variant readings found in the relevant passages of Samuel's translation (rendered into German). Samuel of Marseilles might have been the Arabic-into-Hebrew translator of another work, al-Fārābī's *Long Commentary* on Aristotle's *Categories*: a number of shorter or longer passages of an anonymous translation of this work, whose original Arabic text is lost, are found in the unique manuscript of a work by a late-medieval Jewish philosopher, Judah ben Isaac Cohen, and were published and translated into English (Zonta 2006c). Probably in the same period and in the same geographical area, another short work ascribed to Alexander of Aphrodisias was translated from Arabic into Hebrew: the *De intellectu*. This text was rendered into Hebrew as included into an Arabic commentary on it, Averroes' *Commentary on Alexander of Aphrodisias' On the Intellect*, which was based upon Ishāq ibn Ḥunayn's Greek-into-Arabic version. Averroes' work is transmitted by two ways. An incomplete copy of the original Arabic text, still extant in a Judeo-Arabic work by the Spanish Jewish philosopher Joseph ibn Waqqar (1360 c.) and translated into Hebrew, was published in a noncritical edition (Zonta 2001a). Another, direct Hebrew translation of the Arabic text of Averroes' work, covering only the first part of it, was probably made before 1340 and appeared in a critical edition (Davidson 1988); this translation was commented on by the Provençal Jewish philosopher Moses Narboni, who might have ordered it or even made it by himself. After 1350, only one Greek philosophical text was rendered into Hebrew from its Arabic version: a short book on the administration of the house, the *Economics*, ascribed to the Greek philosopher Bryson. The original text of "Bryson"'s work is lost, but its contents are preserved in some different medieval Arabic and Latin versions. One of these anonymous Arabic versions was translated into Hebrew by David ben Solomon ibn Ya'ish, a member of a famous family of Spanish Jewish physicians and scholars, who wrote it in Sevilla around 1375; Ibn

Ya'ish's Arabic-into-Hebrew translation, which is really very useful for reconstructing the lost original text of "Bryson"'s work, was published in a critical edition (Plessner 1928: 145–203).

In the fifteenth century, Arabic was no more the main and most important language of philosophy and science among European Jewish thinkers; a number of them, not only in Italy but also in Spain, read and employed medieval Latin texts instead. Therefore, some translations of Greek philosophical texts by Aristotle or ascribed to him, many of which were still ignored or almost neglected by Jewish philosophers, were made in this period. These translations were not based upon their Greek-into-Arabic versions, as most of the previous ones, but were made from the medieval Greek-into-Latin or Arabic-into-Latin ones. Around 1400, a Jewish physician of the king of Castile, Meir Alguadez, translated into Hebrew Aristotle's *Nicomachean Ethics* for another Jewish scholar, Benveniste ibn Labi. In his introduction to the translation (Steinschneider 1893: 210–212), he states to have based it upon a Latin version, since the extant Arabic version of the work, already translated into Hebrew (in reality, Averroes' *Middle Commentary* on the *Nicomachean Ethics*), was full of mistakes and alterations; he allegedly consulted also medieval Latin commentaries on Aristotle's work. Alguadez ascribes the Latin version he employed for his own translation to Boethius; in reality, a philologic–terminological analysis of Alguadez's version (Rothschild 1993: 697–698) shows that it was based upon the medieval Greek-into-Latin translation by Robert of Lincoln (d. 1253), as revised by William of Moerbeke around 1260–1270. Alguadez's Latin-into-Hebrew translation is found in a number of manuscripts; it was published in a noncritical edition, accompanied by a commentary, at the end of the eighteenth century (Satanow 1790). Another Latin-into-Hebrew translation of the *Nicomachean Ethics* was made later, by a Jewish philosopher and translator working in Castile or in southern Italy from 1460 (or 1480) to 1490 c.: Baruch ibn Ya'ish. The latter translation is preserved in only one manuscript, found in Hamburg; the analysis of some key-passages of it has shown that it was

based upon two fifteenth-century Greek-into-Latin versions of Aristotle's work, both of which were made in Italy: that by Leonardo Bruni of Arezzo, written in 1416–1420, and that by John Argiropoulos, going back to the period 1456–1470 (Zonta 1996a: 273–274). Ibn Ya'ish's translation was employed by Samuel Altortos, a pupil of him, for writing down a commentary on the *Nicomachean Ethics*, apparently based upon Ibn Ya'ish's own interpretation of Aristotle's words (Zonta 2006c: 111, 119–120).

In his above-mentioned introduction to the *Nicomachean Ethics*, Alguadez wrote that he intended to translate also Aristotle's *Economics* and *Politics*. In reality, although no Hebrew translation of Aristotle's *Politics* is extant, there were at least two anonymous, partial Latin-into-Hebrew translations of the *Economics* falsely ascribed to Aristotle (Zonta 1996a: 260–262, 274, b). Both of them include only book I and III of the work, about household and about the importance of having a good wife. The older translation, made before 1440 circa, is found in a number of manuscripts; in some of them, it includes an introduction, ascribed to a certain “Abraham ibn Tibbon,” where it is stated that this work was based upon the original Greek text. The name of the translator appears to be fictitious, and was probably added by a later copyist for giving more value to the translation; the real translator might have been a Spanish Jew (maybe the Castilian Jewish philosopher Joseph ibn Shem Tov, died around 1460). This translation was based upon the Latin version of the *Economics* by Durand of Alvernia, made in Anagni near Rome in 1295, and was revised according to the commentary on Pseudo-Aristotle's *Economics* by Leonardo Bruni (1420–1421). Bruni himself retranslated books I and III of the *Economics* into Latin: this version was employed by another anonymous Jewish author (probably, Baruch ibn Ya'ish) for writing a new Latin-into-Hebrew translation of the pseudo-Aristotelian work, found in one manuscript (Zonta 2006c: 112).

Baruch ibn Ya'ish translated into Hebrew another work by Aristotle: books I–XII of the *Metaphysics*. Baruch based this translation, written around 1485 for Samuel Sarfati, upon the

thirteenth-century Greek-into-Latin version by William of Moerbeke (Steinschneider 1893: 157–158). This translation, preserved in some manuscripts, includes a long introduction by the translator: here, Baruch states that he made this work, since the previous Hebrew translation of the *Metaphysics*, based upon the Greek-into-Arabic version (found in Averroes' *Long Commentary*), was so altered with respect to the original Greek text, that not only its words, but even its contents were substantially different from those found in Aristotle's work. Another work, including an Aristotelian text, might have been translated from the Latin by Baruch ibn Ya'ish: Averroes' *Long Commentary* on Aristotle's *De anima*. An anonymous Hebrew translation of it, based upon the medieval Latin version ascribed to Michael Scot (first half of the thirteenth century), was made before 1470 circa, and is extant in four manuscripts. Very probably, the same translator rendered into Hebrew a Latin Scholastic work, John of Jandun's *Quaestiones in De anima* (Zonta 1994b; see also Zonta 2006c: 113–114); according to a hypothesis that has not yet been confirmed by sure proofs, this translator was Baruch ibn Ya'ish (Wolfson 1963: 100–104).

Also the first half of Aristotle's *Physics* was translated from Latin into Hebrew in the second half of the fifteenth century, and a great part of this translation is still extant. According to David Messer Leon, his father Judah Messer Leon wrote a very big commentary on books I–IV of the *Physics* while he was in Mantua (1473–1475); in this work, he reproduced and commented on not only Averroes' *Long* and *Middle Commentaries* on the *Physics*, but also the “Christian text” (in Hebrew: *ha-nusha' ha-nozrit*) of Aristotle's work. The original text of books I–III of Messer Leon's commentary was found in three manuscripts (two in Milan and one in Cambridge: Zonta 2001b); two more manuscripts (copied from the above ones) were found in Budapest and in Moscow (Zonta 2006c, 142 notes 24–25), while the text of book IV seems to be missing. From a philological examination of the text as found in the five extant manuscripts, it is clear that the above-mentioned “Christian text” employed by Judah Messer Leon was a Hebrew

translation of books I–IV of the *Physics* as found in the medieval Greek-into-Latin version by William of Moerbeke. Probably, the translator of Moerbeke's version was Messer Leon himself, who knew very well both Latin language and Latin texts about the *Physics* (Zonta 2006c: 214–280), and was a very important member of the fifteenth-century “Hebrew Scholasticism.”

Gregory Akindynos

Georgi Kapriev

Faculty of Philosophy, Sofia University
St. Kliment Ochridski, Sofia, Bulgaria

Abstract

Gregory Akindynos (1300–1348) is one of the most important figures during the first phase of the hesychastic controversy in Byzantium. Practicing himself the hesychastic way of life, he attacked the main thesis of Palamas, who differentiates natural and creative energy of

God in connection with creation. He does not deny the essential uncreated energy of God, but he considers it identical to the divine essence itself. This energy is embraced by the creative energies of God. Akindynos' teaching is entirely Christological. According to him, there can be no other access to divinity except for Christ and the practicing of supernatural love, called forth by the sacramental participation. In order to prove his theses, Akindynos develops a precise hermeneutic teaching concerning the works of the Christian fathers.

Biography

Gregory Akindynos was born about 1300 in Prilapos (Prilep). Gregory is his monastic name and Akindynos (faultless, trustworthy) is a byname. He received his education in Thessaloniki, studying predominantly rhetoric, ancient philosophy, and Christian literature. Among his teachers, one could mention Gregory Bryennios and Thomas Magistros. Toward the 1920s, he became acquainted with Gregory Palamas. Akindynos visited him after 1331 on the Athos and wanted to be introduced by him in the spiritual practice. In 1332, he moved once again to Thessaloniki, but after 1333, he stayed more often in Constantinople. In Thessaloniki, he met Barlaam of Calabria but did not become his student. In 1336, Palamas sent to Akindynos, who already knew the first version of Palamas' *Apodeictic Treatises* (1334), a letter in which he criticizes the syllogistic doctrine of Barlaam in his anti-Latin treatises. In regard to the problem of the possibility of an apodeictic syllogism concerning God, Akindynos defends the view of Palamas and rejects Barlaam's radical apophantics. Until 1341, he, himself practicing the hesychastic way of life (but not the psychosomatic technique), played the role of a mediator between Palamas and Barlaam. In the course of time, he got closer to the patriarch John XIV Kalekas and to the princess Irene Choumnena Paleologina, who supported him as her spiritual father. Akindynos, who acted meanwhile as the leader of one of the four main spiritual trends in Constantinople at the time, criticized in

1340 Barlaam's treatise *Against the Messalians* by attacking his view on the hesychastic prayer technique and on the light of transfiguration. He wrote five books altogether against Barlaam. This is the reason why he was indignant at his being made equal with Barlaam by the Council in July 1341, although the first doubt in him about the Palamite theology was already casted. During the Civil War, Akindynos carried out intense anti-Palamite activity. From that time, most of his texts are against Palamas, his *Antirrhetika* being the main work. In 1347, a Council explicitly condemned his doctrine, and John Cantacuzenos sent him into exile. Akindynos died before May 1348. In fact, he was anathematized only after his death by the Palamite molded Council of May 27, 1351, and his name was entered in the *Synodicon of Orthodoxy* among the heretics.

The Doctrine

The activity of Akindynos is connected to the controversies of the time. He refutes the main thesis of Palamas who distinguishes, with regard to creation, one natural and one creative energy of God. According to Akindynos' critical account, this thesis points to an objective and real division of God in essence and energies, introduces multiplicity in the simplicity of divine nature, and, moreover, establishes a mediator between God and creation.

Akindynos himself differentiates between two uses of the term "energy." "Energy" in its improper sense denotes the natural qualities of God, which are identical with the indivisible divine essence. This highest "energy" is uncreated and not shared in, absolutely inaccessible and indeed invisible. "Energy" in its proper sense is used for the Charismata, Gifts, and the other creations of God, which are created for our good. This created energy is the visible action by which God's deeds are expressed. Unlike Barlaam, Akindynos does not deny the presence of the uncreated energies within creation. But the created grace is the bearer of the uncreated one, which enables the deification of man, i.e., the realization of the uncreated grace. The deification

takes place, thanks to the incarnation of the divine Logos. The teaching of Akindynos is entirely Christological. According to him there can be no other access to divinity except for Christ, the sacraments, and the practicing of supernatural love, called forth by the sacramental participation.

Akindynos does not reject the opportunity for man to participate in God, but he insists that the mystery of God and his actions are not intelligible. God can be partaken of only in the way the center of a circle is shared by all radii and the circumference of the circle; these do proceed from the center of the circle, without coinciding with it or comprising it completely. Here no distinction is presumed between essence and energies. It should be also noticed that by the different beings, God is partaken of in a different way, depending on the potential of their essence. This fact would remain completely unexplicable, Akindynos argues, if we had to do with a participation in the eternal divine essence, whereby it would necessarily be an eternal participation of the creature in God. Thus the created would be coeternal with the Creator.

The actual participation in God is not accomplished in the field of the essential being. It is likening to God through unification with Him within divine love. The participation in God is neither essential identity nor a possession of a common energy, but an interpersonal community of love. Love is characterized as an "uninhabited relation." A decisive peculiarity of this relation is the metaphysical gap between the loving and the loved. Within the relation of love takes place the union of man and God and exactly in it occurs the deification of man.

Akindynos does not accept the negative syllogistic of Barlaam. He claims that his own theses are based entirely on the tradition of the Fathers and their adequate interpretation. The authenticity is said to be the decisive criterion for the truth of the theological statements. Akindynos' argumentation relies fundamentally on literary critics, which is applied in terms of a scrupulous hermeneutic. The basic principle here is studying the language of the Fathers and separating the polemical, metaphorical, and analogical expressions from the properly dogmatic statements. From that point of view is raised the requirement

for taking also into consideration the spiritual context, in which the given text appeared, as well as the intertextual connections in which the concrete statement is made. Akindynos aims to show that Palamas uses the statements of the Fathers incorrectly, with no consideration for their own context, undertaking arbitrary abbreviations and even additions. Besides, Akindynos claims that Palamas did not comprehend the symbolic character of the theological discourse and its symbolic figures.

²Department of History and Archaeology, University of Cyprus, Nicosia, Cyprus

Abstract

Gregory of Rimini (d. 1358) was an Italian member of the Augustinian Hermits active toward the middle of the fourteenth century. His major work of theology and philosophy, his commentary on the first and second book of Peter Lombard's *Sentences*, reveals a powerful and organized mind, widely read in the philosophical and theological literature from

antiquity to his own time, and unafraid of taking seemingly radical views on pressing issues of the day. He had a large impact on many areas of the Scholastic debate right into the sixteenth century. This entry concentrates on two of the most influential areas of his thought: his theory of cognition and his ideas on divine foreknowledge, predestination, and God's power to change the past.

Life, Works, and Thought

The Augustinian Hermit Gregory of Rimini (aka *de Arimino*, *Ariminensis*) was born around 1300 in or near the Italian city of Rimini on the Adriatic coast, about 160 km south of Venice. He probably joined the Augustinians in his hometown, where he would have begun his elementary studies. We are uniquely fortunate to have detailed information about his career from a papal letter of January 1345, in which Clement VI supports Gregory's ambition to be promoted to master of theology at the University of Paris. The data the Pope provides suggest that the Augustinians sent Gregory to their Paris convent to study theology in 1322 or 1323, when Clement (Pierre Roger, OSB) was himself active in Paris as a theologian. For 6 years, Gregory remained at his order's main *studium generale*, attached to the university, where he would have learned the theories of John Duns Scotus, Durand of Saint Pourçain, and Peter Auriol, perhaps via contact with such Augustinian scholars as Gerard of Siena, James of Pamiers, and Michael of Massa.

From 1328 or 1329, his order assigned him to teach theology at important Augustinian *studia* in northern and central Italy: Bologna, Padua, and Perugia. Separate documentary evidence confirms that, at least from late 1332 to early 1337, Gregory was lector at the order's *studium* in Bologna, the city that housed the greatest law faculty of the medieval world. Since the General Chapter of the Augustinian Order was held at Siena in 1338, perhaps this was the occasion of his being transferred from Bologna. Clement's letter suggests that Gregory first went to Padua and then to Perugia, but it is possible that his stay in one of

those cities took place before his sojourn in Bologna. Although he could have come into contact with the works of the Oxford Franciscans William of Ockham and Walter Chatton while at Paris, it is probable that his extensive knowledge of their writings and certainly those of later Oxonian theologians, especially the Franciscan Adam Wodeham and the secular Richard FitzRalph, was acquired in Italy, whither exciting new English ideas had spread by the 1330s.

During the academic year 1340–1341, perhaps at the Augustinian General Chapter meeting in Montpellier in 1341, the Augustinians ordered Gregory to return to Paris, this time to teach as bachelor of theology at the central *studium* of his order's school system. After a year or two of preparation, it seems that Gregory delivered his lectures on the *Sentences* during the 1343–1344 school year. It is likely that Pope Clement's letter had the desired effect and that Gregory became Parisian master of theology in 1345. Traditionally, he would have been obliged to remain at Paris to act as regent master, and in 1345–1346 he would have presided over and determined a quodlibetal disputation while making revisions on his *Sentences* commentary, removing certain passages for the final written version (these deleted passages are known, counterintuitively, as the *additiones*, and have been included in the recent critical edition of Gregory's *Sentences* commentary).

In late 1346, as master of theology, Gregory was back home in Rimini, but in 1347 he was again teaching at the Augustinians' Padua *studium*. He spent several years in Padua, until in 1351 the Augustinian General Chapter at Basel assigned him to return again to Rimini to teach theology at the newly founded *studium* there. He was no doubt still based in Rimini when, on 20 May 1357, he was elected prior general of the Augustinian Order at the General Chapter held in Montpellier, replacing another towering figure in Augustinian theology, Thomas of Strasbourg. It was perhaps as prior general that Gregory produced his question on usury. He remained at the head of the order until his death in late 1358.

Gregory's doctrinal influence earned him the nicknames *Lucerna splendens*, *Doctor acutus* or

authenticus, and “Torturer of Infants.” Compared to most other major Scholastics, however, very little survives from Gregory’s pen. Some of his correspondence as prior general has been preserved, as well as biblical commentaries. A disputed question *De usura*, of philosophical interest, was printed in 1508 and 1622 (Kirshner 2015). But his reputation is built on his partial *Sentences* commentary based on his Paris lectures, covering the first two books of Lombard’s textbook. Numerous medieval manuscripts – 20 complete witnesses for book I alone – and some eight printings from 1482 to 1532 attest to its popularity, and at least one section, part 2 of book I, distinction 17, *De intensione et remissione formarum corporalium*, circulated as a separate treatise (see Loewe 2014 for a study of Rimini’s thought as found in this treatise). It is one of the few large theological works of the fourteenth century to have received a complete critical edition, in six volumes.

Gregory’s work is generally characterized by clear and well-organized exposition; he most often endeavors to distinguish and explain various senses of the most important terms he is using on any issue, thereafter dealing with a number of earlier and contemporary views on the matter, in the process giving his own opinion. His thought exhibits, in the terms of Damasus Trapp (1956), both a logico-critical attitude and a historico-critical attitude. The first of these involves a critical stance toward the elaborate metaphysical systems that were popular especially in the thirteenth century; it also involves privileging the extramental singular in both ontology and cognition. The second of these attitudes is characterized by an attention to detail when it comes to citing and quoting other thinkers, from very recent authors like Peter Auriol, William of Ockham, and Adam Wodeham, to important earlier writers like Aristotle, Anselm, and, most significant of all to Gregory, Augustine. In addition to those two attitudes, perusal of Gregory’s *Sentences* commentary reveals a thinker who routinely draws razor-sharp distinctions, constructs arguments and analyses of impressive logical rigor, and offers coherent and often startling positions on a great number

of issues. Indeed, Gregory was clearly rather uninhibited when it came to maintaining unusual views. Thus, he argued, against most of the Aristotelian tradition, for the possibility of actual infinities, prompting Anneliese Maier to call him “a radical infinitist” (Maier 1964: 82–84), and in defending this view and the consequences of it for the continuum Gregory develops an analysis of the infinite that “represents a huge advance on that of his predecessors and contemporaries” (Cross 1998: 109). In philosophical theology, Gregory argues for a fully deductive science of theology (Brown 1998: 653–655), he stresses God’s absolute simplicity to such a degree that he denies any distinction whatsoever between the divine attributes and the divine essence, and he develops a Trinitarian theology of radical minimalism on which person, personal property, and essence are all strictly identical, while nevertheless the one God is three really distinct persons (Friedman 2013: Chap. 12, Sect. 5).

Cognition, Philosophical Psychology, and Theory of Knowledge

Gregory of Rimini developed a detailed theory of cognition that would be the subject of critical discussion into the sixteenth century. The foundation of his view is that cognition comes in two varieties: intuitive cognition involves no representational intermediaries, whereas abstractive cognition does involve representational intermediaries. The intermediaries at issue here were called “species.” Species were taken to be representational entities that came in several kinds. “Species in the medium” were held to convey information about some extramental thing from the thing itself to a cognizer’s external senses; “sensory species” were posited to convey that information further through a series of internal senses in the brain (e.g., common sense, imagination); and finally, as what was called an “intelligible species,” the relevant information was conveyed in immaterial form further still to the immaterial intellect. In addition to their role in

conveying information, species were appealed to as the means by which we could recall information that we had earlier obtained; thus, the species of, say, gold found in the imagination could be recalled even when not in the presence of gold, and upon recollection it could be used, for example, in creating an image of a golden mountain. Gregory's theory of cognition is predicated upon the adoption of the theory of species. This was not an entirely obvious move: many Scholastics in the thirteenth and fourteenth centuries had rejected species outright, perhaps most famously William of Ockham. Gregory takes Ockham to task on several grounds. First, he claims that Ockham contradicted explicit and implicit testimony of the saints, and particularly St. Augustine. Second, he argues that certain cognitive functions that we know we have, like memory, are impossible to explain without the preservation of some representational entity; the representational entity in question is a species.

Gregory draws his account of species into the heart of his cognitive theory by basing upon it his own use of the then-popular distinction between intuitive and abstractive cognition. For Gregory, intuitive cognition is direct cognition of some object, and he holds that intuitive cognition is the foundation for all further cognition. In contrast, we have abstractive cognition when we perceive an object through some sort of representation, that is, through a species. In fact, all abstractive cognition is essentially linked with an intuitive cognition, inasmuch as an intuitive cognition of the species is a necessary precondition for having an abstractive cognition of the object represented by the species (if I just had an intuitive cognition of the species, without the further abstractive cognition, then I would be thinking about the species and not about what the species represents). This is why Gregory, again disagreeing with Ockham, claims that intuitive cognition has no necessary link with the existence of some extramental object (Tachau 1988: 358–370).

Thus, Gregory claims that intuitive cognition of singular extramental things is the origin of all our knowledge, providing us with the raw

material to then go on and remember, imagine, analyze, think, and reason. Gregory says:

the first knowledge of the intellect, namely by the primacy of generation, is intuitive knowledge of some sensible singular . . . if it were asked, which singular is that first knowledge of, it should be said that it is of that singular that first moves the senses with a sufficient motion, after the child is able to understand (*I Sent.*, d. 3, q. 3, in Gregory of Rimini 1979–1984, vol 1 [1981]: 409, ll. 2–4, 10–11).

Here we see clear evidence for Trapp's view that Gregory gave the singular extramental thing a privileged position in his philosophy (on Gregory's theory of cognition and esp. universal concepts, see now Girard 2017).

With regard to propositional knowledge, Gregory rejects the view of such important Scholastics as Ockham and John Buridan that thought has a compositional nature and further that concepts are arranged into mental propositions much like words are arranged into sentences in spoken and written language (i.e., as a mental language). Gregory claims instead that mental propositions are formed all at once as a unity; their semantic complexity is in no way mirrored by any compositionality of mental acts or objects. Gregory argues for this view by asking how else one could explain the difference between the following two mental propositions "every whiteness is an entity" and "every entity is a whiteness." In spoken or written language, these two sentences, one true and the other false, would be made unambiguously distinct by the spatial or temporal ordering of the component words. But there is no such ordering to be found in the immaterial intellect. Thus, according to Gregory, the only way to explain the distinction between the two propositions is to hold that mental propositions are formed all at once as a unity (Ashworth 1981: 73–75; Panaccio 1999: 292–296; Friedman 2009: 113–115). Although Gregory did not originate the "unity" view of the mental proposition, his name became associated with the position into the early modern period.

When we turn from mental propositions to mental attitudes like knowing and believing, we come to yet another development that Gregory

became renowned for: the *complexe significabile*. The view descends from the English theologian Adam Wodeham (d. 1358). Wodeham had claimed that the object of knowledge and belief is neither extramental things (Walter Chatton's view) nor propositions about extramental things (Ockham's view), but rather it is "what is able to be signified complexly" or "propositionally," that is, the *complexe significabile*, which he also says is the total object of a proposition. In trying to keep his ontology lean, Wodeham rejects that the *complexe significabile* is a thing; it is merely a mode of being, an item with a special ontological status outside of the Aristotelian categories and postulated solely to explain how our knowledge and beliefs can track reality. In adopting Wodeham's view, Gregory made several changes, including his explicit acceptance that, with the term "thing" understood correctly, one could call the *complexe significabile* a "thing." This lack of concern for strict ontological parsimony made Gregory's view a target for such later thinkers as Buridan (Zupko 1994–1997; Bermon 2007). It was through Gregory's work that Wodeham's *complexe significabile* was passed on to the continental universities, and thus it was in general his understanding of the position that was the center of attention into the sixteenth century (Ashworth 1978).

Philosophical Theology: Divine Foreknowledge, Predestination, and God's Power to Change the Past

Gregory's doctrine and impact on the interrelated problems of divine foreknowledge and predestination have been well documented, and in addition, his view on God's power to change the past has received some attention. Gregory's treatment of foreknowledge is primarily in reaction to Peter Auriol's radical position from the 1310s. Auriol held that although we cannot comprehend how God knows the future, this occurs in a way that leaves propositions about the contingent future neither true nor false, but neutral. For Auriol,

this protected both the immutability of divine knowledge and the freedom of the human will, the main source of contingency in the world, for if anything, including foreknowledge and the truth or falsity of propositions, preceded the future, that future would be necessary, not contingent. In this, Auriol claimed the support of Aristotle in *De interpretatione*, ch. 9.

Gregory agreed with Auriol on some of these points: that how God knows the future is incomprehensible; that, contrary to the view of some prominent theologians, Aristotle had indeed denied that propositions about the contingent future are true or false; and even that true (and false) propositions about the future would always and immutably be true (or false) up until the time to which the propositions refer. But Gregory's conclusion is the opposite of Auriol's, for Aristotle and Auriol are mistaken: all propositions about the future are either true or false, since de facto either the Antichrist will exist or will not exist at time *x*, and therefore either "the Antichrist will exist at time *x*" is determinately true and "the Antichrist will not exist at time *x*" is determinately false, or vice versa.

Is the future not therefore necessary? Gregory appeals to elements of the common position that had been developing at Paris and Oxford, especially since the time of Scotus. Only God is absolutely necessary; all else is contingent, because God's will is free and acts contingently with respect to creation. Since it is logically possible for things to have been and to be other than they are, while it is nevertheless the case that true propositions about the contingent future have always been immutably and determinately true, ultimately those propositions are only contingently true and not necessarily so. Gregory went on to appeal to common logical devices, such as the distinctions between the composite and divided senses of propositions and between conditional and absolute necessity, to explain how there could be contingency – and human freedom – in the world (Schabel 2000: 264–274).

By the fourteenth century, discussions of predestination had often been reduced from a mass of

subtopics to the specific issue of whether humans play any role in their salvation and damnation and, if so, how. Following the late-antique controversy over pelagianism and semi-pelagianism, most early-medieval views tended to the opposite extreme and left little real room for human causality, even in the case of damnation. In the thirteenth century, the standard position was more nuanced, focusing on God as the cause of salvation and humans as the cause of damnation. Starting with Peter Auriol, a number of theologians proposed theories that tended toward semi-pelagianism, especially the Franciscans William of Ockham, Walter Chatton, and Gerald Odonis, and Gregory's confrere Thomas of Strasbourg (Schabel 2002).

Gregory of Rimini strove to destroy this trend. In a series of five conclusions, Gregory attacks every proposed solution. The first conclusion states that no one is predestined because of a good use of free will, that is, there is no positive cause of predestination on the part of those predestined. The second opposes Auriol: no one is predestined because it is foreknown that he will be without a habitual or actual obstacle to grace, which for Gregory means original or actual sin. The third is that predestination comes solely from God's mercy. Having thus rejected the positions that allowed for some human causation in salvation, Gregory goes much further. In conclusion four, he asserts that no one is reprobate because of a foreseen bad use of free will, and the final conclusion is that no one is reprobate because of a foreseen obstacle to grace. If Gregory had stopped with his third conclusion, his position would not have been very different from those of Aquinas and Scotus, but his last two conclusions put him in the company of some early medieval adherents of what has been called double-predestination, drastically limiting humans' causal role in the process of damnation (Vignaux 1934; Halverson 1998).

Can God change the past? Since Gregory asserts that the past is not strictly speaking necessary, but rather contingent, one might think that God can change the past. Yet Gregory never

asserts this, although he avoids denying it as well. Certainly for us the past is immutable and, unlike the future, we cannot make it so the past did not exist. Given his analysis of propositions that include past and future elements, such as "God foreknew that Peter would sin at time A," it seems that Gregory does maintain that the past simply cannot be changed. He writes:

One must know that some of the propositions about the past depend on the truth of some propositions about the future in order for them to be true, just as this proposition ['God foreknew that Peter is going to sin at time A']. For in order for it to be true, it is required that this proposition be true: 'Peter will sin at A,' which indeed is about the future. . . . But there are some propositions whose truths do not depend on the truths of any propositions about the future, for instance these: 'God created the world,' 'God was incarnated,' 'Peter was white,' and innumerable other propositions. But whatever the case about these last propositions, it is agreed concerning the first ones that they are contingent, if the propositions about the future, on which they depend, are contingent. . . . (I Sent., d. 38, q. 2, a. 3 in Gregory of Rimini 1979–1984, vol 3 [1984]: 302, l. 30–303, l. 5).

It seems, then, that Gregory does draw a modal distinction between the past and the future and that, in agreement with the Oxford *opinio communis* of his day, some sort of fixity applies to the past that does not apply to the future.

Impact

Much further research is needed on the philosophy and theology written from the Black Death to the Reformation and beyond in order to determine with precision Gregory of Rimini's influence on later thinkers. We can already say, however, that Gregory's thought had a tremendous impact in the century after his activity. Thus, he exerted a pervasive influence on several leading Parisian theologians of the late fourteenth century, for example, the Cistercians Pierre Ceffons and James of Eltville and the secular Peter of Ailly. When Ailly's colleagues, Henry of Langenstein and Henry Totting of Oyta migrated to Vienna to establish the new university's theology faculty,

they brought Gregory of Rimini with them, notably in their positions on divine foreknowledge. For the next half century, if not longer, Gregory, via Langenstein and Oyta, was the explicit basis for the Viennese doctrine. More importantly, on predestination, where Langenstein and Oyta were largely silent, the Viennese adopted Gregory's teaching as well. Later, in the early sixteenth century, Gregory's ideas on mental propositions and the *complexe significabile* were the subject of a lively debate (Ashworth 1978: esp. 88–99, Ashworth 1981). In philosophical theology, there is evidence for *Gregoriistae* and a *via Gregorii* in the early sixteenth century, when Gregory's works were available in print, but whether this was a general trend or rather applies primarily to Augustinian Hermits or only to specific issues is a matter of debate. Given the limited scope of his pertinent surviving writings, the existence of a school of thought is *prima facie* questionable, yet his commentaries on the first two books of the *Sentences* provided a forum for discussion on a broad range of topics (Oberman 1981). There can be no doubt that Gregory's clear stance on the issues of divine foreknowledge, grace, and above all predestination remained current throughout the later Middle Ages. Gregory's position was more extremely predestinarian than that of any other major Scholastic, and the importance of his view at Vienna—arguably the leading university in Germanic lands – and beyond suggests that Martin Luther had to have known early on about the main later medieval advocate of the doctrine that he himself would famously defend. Indeed, Luther singles out Gregory as the one scholastic who upholds the true Augustinian doctrine of predestination (Oberman 2002: 123–124).

Gregory Palamas

Georgi Kapriev

Faculty of Philosophy, Sofia University
St. Kliment Ochridski, Sofia, Bulgaria

Abstract

Gregory Palamas (1296–1357) is the acknowledged systematizer of Hesychasm. His philosophical–theological synthesis is focused on the so-called “energy” doctrine. According to this doctrine, every existing essence has its powers and expresses two types of energies or activities, which can be defined, respectively, as “causal” and “existential”; though the essence of every being remains unknowable in itself, it becomes knowable by means of its realization in action. The energies of the first type have a beginning and an end in their end product, while the latter are the very life of the essence, their existential expression *ad extra*. Palamas is regarded as the last teacher of Orthodoxy hitherto, and his doctrine underlies the theological systems of the contemporary Orthodox Churches.

Biography Gregory Palamas was born in Constantinople in the family of the senator Constantine Palamas. He received classical education for the purpose of a public career. Among his teachers, one mentions Theodore Metochites by whom Palamas, among other things, gained knowledge of Aristotle's doctrines. In 1314, however, he chose the monastic life and went to Athos. For 2 years, he was under the spiritual guidance of the hesychast Nikodemos. After his death (1316), Palamas became a monk in the Great Laura. During the Turkish invasion in Athos, he went in 1322 to Thessaloniki, where he was ordained to priesthood. In 1326, he became a hermit near Veroia. In 1331, he was again in Athos as a hermit at St. Sabbas. In 1333–1334, he was an abbot of the Esphigmenu monastery. His first writings date from this time.

In the second half of the 1330s, within the course of the disputation with Barlaam, he began to expose

his teaching in written form as a polemic defense of hesychasm and systematization of the hesychastic views. The first part of the debate (1335–1337) concerned the possibility of constructing apodeictic syllogisms about divinity and the way of applying Aristotle's doctrine and apophatic theology; thus knowing God and the limits of knowledge were put into question. Meanwhile, Barlaam attacked the practice of the hesychasts. Central was the question as to whether the Tabor light, the vision of which the hesychasts experienced, is created or not. This phase of the hesychast controversy ended in 1341 through the official acceptance of the Palamite teaching and the condemnation of Barlaam. The second phase, which was marked by the controversy with Gregory Akindynos, developed during the period of the Civil War in the Byzantine Empire (1341–1347) and was strongly politically colored as Palamas and his followers supported Kantakouzenos' party. Palamas was temporarily put in prison, and a synod called by the patriarch John XIV Kalekas excommunicated him on November 4, 1444. After Kantakouzenos ascended the throne (1347), Palamas was ordained bishop of Thessaloniki. At that time began the attacks of Nikephoros Gregoras against Palamas. The synod of 1351 anathematized Barlaam and Akindynos, reprehended Gregoras and his followers severely, and proclaimed Palamas' doctrine a dogma. This state of affairs did not change even after the dethronement of Kantakouzenos (1354). The last years of his life was devoted to his duties as a bishop. He died on November 4, 1357. The council of 1368 declared him a saint. Palamas is considered as the last teacher of Orthodoxy hitherto, and his teaching is accepted as the official doctrine of the contemporary Orthodox Churches.

Among the writings of Palamas, one should mention the two published 1335–1336 treatises about the procession of the Holy Spirit as well as the *Anepigraphae*, directed against John XI Bekkos. As his main writing one considers the *Triads*, produced between 1338 and 1340, which contains a polemic defense of the hesychastic way of life. Worth mentioning is the dialogue *Theophanes* which appeared in 1343. An important source is the detailed *Antirrhetika* against Gregory Akindynos and Nikephoros Gregoras.

The mature works of Palamas are the *150 Psychological, Theological and Ethical Chapters* that elucidate in systematic form the Palamite mode of thinking. Palamas is also the author of a large number of small treatises, letters, and 63 homilies.

The Doctrine

The focus of Palamas' system is the so-called "energy" doctrine, which is developed by him to its ultimate consequences. This doctrine, being based on Book IX of Aristotle's *Metaphysics*, was discussed by the Aristotelian commentators and especially by the Neoplatonists and, as early as the fourth century, a number of prominent Greek-speaking theologians adopted it in their teachings. It constitutes a crucial element of the metaphysical views of most of the Byzantine philosophers and theologians, however, without necessarily being the center of those doctrines. According to this doctrine, each existing essence has its powers and gives expression to two types of energies or activities, which can be defined, respectively, as "causal" and "existential"; though the essence of every being remains unknowable in itself, it becomes knowable by means of its realization in action. The energies of the first type have a beginning and an end in their end product, while the latter are the very life of the essence, its existential expression *ad extra*. From this perspective Palamas differentiates the creative and the deifying energy of God. According to Palamas, the saints are able, without becoming God by nature, to receive by grace the very essential or natural energy of God, which is uncreated and defined as the proper divine existence. The energies are realities (*pragmata*) but not essences (*ousiai*). The energy is not identical with the essence, nor does it constitute a separate substance, being the activity of the essence par excellence. This distinction is neither conceptual nor yet a real division (*pragmatike diairesis*); it is rather an actual differentiation (*pragmatike diakrisis*). Anyway, Palamas does not identify the distinction in a strictly logical manner. This is done only by George (Gennadius II) Scholarius.

The Light of Tabor is, according to the hesychasts, the expression of the natural divine energy on the part of Christ. The participation in this energy is exactly the deification, which can be received already in this life. In this connection Palamas underlines the free cooperation (*synergia*) of man; with the experience of the divine, man lives the life of God in God Himself. The Palamite Christocentrism is based exactly on the personal presence of the Savior – by essence, by energy, and by hypostasis – in history. Through Christ people obtain the possibility of direct communion with God, not mediated, say, by the hierarchy of angels. This existential participation in the essential energies of God does in no way replace the sacramental participation. It rather presupposes the sacramental life in Christ and is construed by Palamas precisely on the basis of the Eucharist.

Palamas does not underestimate the natural intellect and philosophy; he treats them as divine gifts, which are the condition and the cause of any knowledge. Thereby God is recognized as the cause of being. Nevertheless, the knowledge of God achieved in this way by man is only partial. The proper knowledge of God is the direct vision of the natural divine energy. This supernatural light is given to all, but only the saints see it. It is a positive existential experience and practice beyond rational knowledge, including the speculative theology. This positive experience goes beyond the cataphatic as well as the apophatic way of knowing God. Palamas does not refer to a next phase in the process of knowing, but to another sphere of knowledge, which is the field of true encounter with the living God. Both spheres of knowledge are not only subordinated but also coordinated within man.

Palamas insists that human nature is superior to that of the angels, precisely because man has flesh. This is why man receives life not only as essence but also as energy and man's spirit (*pneuma*) is life given to the body. Exactly, the body is the organ which coordinates between the natural and supernatural energies of man that are subordinated in the *nous* and are sent out of the flesh in the world. Palamas rejects the psychological interpretation of man and considers human beings as

psychosomatic entities; thus the stress is not on the nature, but on the hypostasis, which is conceptualized as the boundary and the center of the world.

Guido Terreni

Thomas Turley
Department of History, Santa Clara University,
Santa Clara, CA, USA

Abstract

Best known for his theological works, the early fourteenth-century Carmelite Guido Terreni demonstrated considerable independence and originality in his philosophical views. A follower of Godfrey of Fontaines and Aquinas, his defense of Aristotelian positions sometimes took novel turns, and he departed from Aristotle in important respects, for example, on forms. He denied that universals actually exist, challenged Aquinas' definition of natural law and the derivation of human law, and developed economic theories that may have influenced Buridan and Oresme.

Born in Perpignan around 1270, Guido Terreni (Gui Terré, Guiu Terrena) entered the Carmelite order at an early age. He studied with Godfrey of Fontaines at Paris near the turn of the fourteenth century and by 1312 was the third Parisian master of theology produced by his order. From 1313 to 1317 Guido served as Carmelite regent master at Paris; his students included fellow-Carmelites Sibert of Beek and John Baconthorpe. Elected Prior General of the Carmelites in 1318, Guido became a prominent theological advisor to Pope John XXII. In 1321 he was elevated to the bishopric of Majorca; in 1332 he was transferred to the diocese of Elne. Throughout this period, he continued to produce theological commentaries and polemics. Guido died in 1342. He is

commonly called “Doctor Breviloquus” or “Doctor Mellifluus.”

As a master of theology Guido was very active, producing not only a commentary on the *Sentences* of Peter Lombard but at least six quodlibets, 13 *quaestiones disputatae*, 12 *quaestiones ordinariae*, and commentaries on Aristotle's *Nichomachean Ethics*, *Physics*, *Metaphysics*, *Politics*, and *De anima*. His major theological works are the *Concordia evangelica* (a Gospel harmony), a commentary on Gratian's *Decretum*, a *Summa de haeresibus*, and two major responses on the Franciscan poverty question, the *De perfectione vitae* and its subsequent *Defensorium de perfectione vitae*. These works insured Guido's reputation. Particularly important were the *Summa de haeresibus* and the *Concordia evangelica*, both on subjects of broad interest. They were widely distributed in manuscript and early modern printed editions.

Guido's works on philosophical subjects were less fortunate. The Carmelites came late to the medieval universities and never had a large representation there; consequently, they failed to construct the apparatus necessary to assure the widespread copying of their masters' works. This seems the reason that many of Guido's early works are no longer extant, including his commentaries on the *Physics*, *Politics*, *Metaphysics*, and the *Sentences*. The loss of the latter has been particularly serious for scholars, as these lectures contain key elements of a medieval philosopher's thought early in his career. Guido did address many of the most important philosophical questions of his era in other - surviving works - his quodlibetal questions and commentaries on the *Ethics*, *Physics*, and *De anima* - but these too present difficulties. The quodlibetal questions are preserved in a single, corrupt manuscript, and the commentary on the *De anima* survives only in fragments reproduced in topical manuscript collections and in Guido's later theological works.

Generally, Guido Terreni adhered to the views of his master Godfrey of Fontaines on major questions; however, his philosophy also shows the strong influence of Thomas Aquinas, Durand of Saint-Pourçain, and other prominent

Dominicans. For example, on the problem of knowledge he followed Thomas and Godfrey, but on lesser questions he took eclectic positions that he felt conformed with the views of the church fathers. His theological discussions also reflect a serious concern to harmonize patristic and modern thought.

The surviving questions of Guido's *De anima* give a clear picture of his views on the intellect and knowledge. The intellect is prior to the will both in knowledge and in the contemplation of God. While charity can be said to be prior in a relative sense during the soul's earthly life, knowledge (vision) is prior in an absolute sense in that it will be the happiness the soul will ultimately enjoy. Terreni's approach to the problem of knowledge generally follows Aristotle. Humans can understand the essences of things through the action of the agent intellect alone. No special illumination of the sort posited by Augustine is necessary. The knowledge thus gained must be knowledge of the essences of things, because only that which has being can effectively move the intellect or more generally act as causes. Accidents, perceived in mere sensory experiences, cannot effectively cause, as they have being only in a secondary sense. Any epistemological theory that holds that the senses bring knowledge must be wrong. Guido even contends that interpreters of Augustine have misunderstood his meaning regarding illumination. The light Augustine speaks of is, according to Terreni, the light of the agent intellect as it participates in the divine light.

Guido holds that the sensitive and vegetative powers reside in the composite of body and soul, while the intellect and will reside only in the soul. The intellect issues directly from the soul, and the will issues from the intellect, because only one effect can flow immediately from one principle that is entirely simple. The intellectual soul relative to its faculties is not active, but passive or potential, just as any subject contains its faculties only potentially. Guido also identifies the agent intellect with the possible intellect on the grounds that realities should not be multiplied without reason. (Here he contradicts his commentary on the *Ethics*, which distinguishes the two

intellects). On the relation of the faculties of the soul to the essence of the soul, Guido maintains that the faculties are different from the soul and are permanent qualities – again, because only one effect can follow from a simple principle.

The soul is humanity's substantial form, according to Terreni. For him, this means that it is found in every part of the body because all forms are extended in their quantified matter. His demonstration that the human powers of intellect and will are spiritual rather than organically based ignores Aquinas's argument that the intellect is immaterial because humans can comprehend general concepts and instead relies on the human capacity to understand infinity. Since no material thing is infinite, Guido declares, the intellect that gives humans the capacity to understand infinity must itself be immaterial.

Guido denies that universals actually exist. For him, they are only discernible resemblances between substances that are, in fact, individually distinct. Their resemblance is merely a relation based in substances being compared and discernible to the intellect, that is, a conformity of sense perceptions. Thus, genus and species are conformities of sense perception; they differ only in that species are predicated less generally than genera. The influence of Godfrey of Fontaines, Gerard of Bologna, and Henry of Harclay is clear in this discussion.

Guido's treatment of forms varies from Aristotle's in some respects. For Guido, form is the principle of individuation. Responding to Scotus's claim that things can be formally distinct without being really distinct, he argues that, since forms are real, a formal distinction is a real distinction. The same form can be both identical to another form and different from it, depending on how it is related to other things. And formalities may differ in that one form may connote something another does not, despite being identified in the same subject. Guido rejects Richard of Mediavilla's claim that forms can evolve into one another by citing the traditional Aristotelian notion that substantial change occurs suddenly, after a number of accidental changes. He also denies Giles of Rome's assertion that accidental forms can vary.

Although Guido stays close to Aristotelian and Dominican teachings, his solutions can be surprising and creative. For example, the analysis of economic theory found in his commentary on the *Ethics* and his *De perfectione vitae* offers an apparent defense of the Aristotelian virtues that depend on wealth, such as magnanimity. These were normally ignored or viewed suspiciously by later Christian theorists. Further, Guido provides an unusually sophisticated analysis of supply and demand conditions as determinants of value and demonstrates an understanding of the economic impact of government alteration of money, especially the debasement of coinage, that may well have influenced Buridan and Oresme decades later. Similarly, Guido proposes a unique perspective on law. Inspired by Aquinas but simplifying his position considerably, Guido defines natural law as the act of human reason – not the power of reason, as Aquinas had said, but the act, functioning properly and with God's grace. In opposition to Thomas, Guido declares that all human laws are derived from natural law, as long as they are either direct conclusions or remote deductions from common principles. And on the nature of final cause, Terreni vigorously defends the view that an end in its intentional being is a real cause.

His unusual views on the rational soul, on universals, and on ethics distinguish Guido Terreni as a philosopher. The extent of his influence on subsequent scholarly debate is still to be determined.

Happiness

Anthony Celano
Department of Philosophy, Stonehill College,
Easton, MA, USA

Abstract

The medieval concept of happiness has its origins in the writings of Aristotle and Augustine. Both Aristotle and Augustine posit a single end for all human moral activity: for Aristotle that end is *eudaimonia*, the perfection of the potentialities within the human soul; for Augustine that end is beatitude, the eternal perfection of the soul granted by God. For centuries, Augustine's ideal dominated medieval moral thought, but in the thirteenth century medieval authors had to confront philosophical challenges to the Christian understanding of human perfection. The earliest commentators on the Ethics of Aristotle understood Aristotle's notion of happiness as a perfect activity of the soul as support for their own belief in the possibility of the perfection of the beatified soul. The writings of Robert Kilwardby, Albert the Great, and Thomas Aquinas redirected the attention of medieval authors to questions of the relation between earthly happiness and perfect beatitude, the cause of happiness, and the function of moral and intellectual virtues as the foundation of human goodness. Aristotle's notion of

happiness never supplanted the Augustinian view of human purpose, as is evident in the criticisms of the philosophical doctrine of happiness by Henry of Ghent, John Duns Scotus, and William of Ockham.

The intellectual antecedents to the medieval understanding of the ideal of happiness lie in the writings of Aristotle and Augustine. Augustine's influence on the doctrine of happiness remained generally unchallenged until the beginning of the thirteenth century when Aristotle's *Nicomachean Ethics* became an integral part of the curriculum of the arts faculties of the universities of western Europe. Aristotle considers the goal of ethical deliberation to be the determination of the nature of happiness (*eudaimonia*). Despite the verbal agreement concerning the definition of happiness as living and acting well, opinions differ concerning its true nature. Aristotle seeks to refine the notion of happiness by describing the essential characteristics of that end which all human beings seek. Happiness must also be that which is desired for its own sake, and never as a means to attain a superior goal (*Nicomachean Ethics* = NE, 1097a28–29). Aristotle restricts his investigation to a search for a practical good, since were a separate supreme good to exist, it would contribute little to an understanding of human moral purpose (NE, 1096a30–35).

The general characteristic of happiness as a final, self-sufficient end to which all actions are

directed tells little about its specific nature, as Aristotle freely admits. In order to determine specifically human goodness, one must examine the proper function of human beings (NE, 1097b29–35). Aristotle considers the most proper human actions to originate in the soul, and the most fitting human existence to be the active life of the rational faculty (NE, 1098a3–4). Aristotle’s preliminary discussions on the nature of human goodness conclude with his summary of the prerequisites for happiness: the human function is a certain kind of life, which is an activity of the soul in accordance with reason; and the performance of this activity must harmonize with what a good person does according to his own particular excellence or virtue (NE, 1098a13–16). The acceptance of these conditions leads Aristotle to formulate his own definition of happiness as of happiness as a final, self-sufficient end to which all actions are directed, and if there are more than one virtue in accordance with the best and most complete (NE, 1098a17–18). The inclusion of the phrase, “more than one virtue,” has provoked much discussion concerning the exact meaning of Aristotelian happiness, both in the medieval and modern eras. Aristotle at times seems to indicate that happiness consists in the supreme human activity of intellectual contemplation to which all other actions must be directed. At other times he seems to claim that only a life of both intellectual and moral virtue can make a person truly happy (Cooper 1975; Nussbaum 1986). In Aristotle’s view, the one who can best resolve the conflicting demands of the theoretical and practical lives is the *phronimos*, the person of practical wisdom. The practically wise can know what is good for the individual and the society and the best means to attain it (Celano 2015). Aristotle also implies a distinction between the essential nature of happiness (*eudaimonia*) and the life of virtue blessed with all the benefits of good fortune (*to makarion*). These topics were examined most carefully in the medieval commentaries of the thirteenth and fourteenth centuries. Whatever the ultimate determination of these questions may be, Aristotle clearly viewed happiness as a human activity that could be attained by human efforts within a lifetime.

Augustine, like Aristotle, considers human goodness to be a self-sufficient end toward which all human activities are directed. Despite modern translations that often render the words, *beatitudo*” and “*beatus*,” as “happiness” and “happy,” Augustine generally distinguishes between the concepts of happiness and beatitude. His preferred notion of human goodness is beatitude, which consists in the eternal life granted by God. Augustine interprets Paul’s exhortation to the Thessalonians to desire without cessation (5, 17) as a reference to the blessed life which is nothing other than eternal existence given by God alone (*Epistula* 130, 4, 9). Earlier in the same letter, Augustine compares earthly happiness (*felicitas*) unfavorably with eternal beatitude. He admonishes Christians not to consider themselves to be great because they enjoy those pleasures that flow only from a fountain of earthly happiness (*terrenae felicitatis*). Augustine advises them to condemn and scorn these things. (*Epistula* 130, 3, 7). In another letter Augustine again dismisses temporal happiness (*felicitas*) in favor of the beatitude whereby the soul becomes blessed (*beata*) when its mutable nature is turned to the immutable good (*Epistula*, 140 2, 3 and 23, 56).

Augustine’s understanding of the nature of true beatitude remains remarkably consistent throughout his long and prolific literary career. In an early work devoted specifically to the topic of goodness and beatitude, the *De beata vita*, Augustine argues that the possession of what one desires brings beatitude. He adds another condition that one must desire, and pursue, only good things. Augustine then excludes transitory goods from those objects that could possibly bring beatitude, since he notes that all of these objects of desire may be lost. Even when they are in our possession we fear that we may lose them. Augustine makes the same arguments in the tenth book of the *Confessions* (X, 25) and letter 130. What completes the soul and fulfills human desire is wisdom, and true wisdom for Augustine is the recognition of divine truth. Augustine claims that the full satisfaction of the soul is the blessed life, which is gained through the pious and complete recognition of God through whom one is led to the truth enjoyed in the highest manner (*De beata vita* 4, 35;

Confessions 10, 22). In book II of *De libero arbitrio* Augustine argues that no one can become blessed except by means of the supreme good, which is discovered in the truth called wisdom (*De libero arbitrio* II, 9, 26; *Confessions* 10, 24). Despite the doubts of his student, Evodius, Augustine argues that a common, immutable and objective truth, which is separate from, and superior to, the human mind is the supreme good that reveals all true goodness. Only one who enjoys this truth is indeed blessed (*beatus*) (*De libero arbitrio*, II, 13, 36). Early in his career Augustine relies on both philosophical and scriptural arguments to determine the nature of wisdom and beatitude. He praises the conclusions of the Platonists that he views as harmonious with the sacred truths of Christianity (*Contra academicos*, III, 20, 43), but later in his *Retractiones* Augustine regrets his praise of human reason, since it could bring great errors to Christian belief (*Retractiones* I, 14). In the *Retractiones* Augustine doubts seriously the ability of human reason to bring one to beatitude. He admits that as far as human nature is concerned nothing is better in mankind than mind and reason. One who seeks beatitude, however, should not live according to that mind, for then one would live according to man, whereas to attain beatitude one must live according to God. In order to achieve beatitude the mind should not be content with itself, but should subject itself to God (*Retractiones* I, 12).

While the moral doctrines of Boethius, Anselm, and Abelard are interesting, and at times innovative, they do not significantly alter the Augustinian ideal of human goodness. The primary challenge to Augustine's notion of beatitude occurs in the thirteenth century when the *Nicomachean Ethics* was translated into Latin (Wieland 1981). The earliest commentators on the *Ethica vetus* (books II and III of the NE) and the *Ethica nova* (book I) failed to notice any great difference between Aristotle's and Augustine's concepts of human goodness. The early attempts to understand Aristotle's ideal of happiness were based upon its designation as a perfect activity of the soul. To these Christian authors no act could be more perfect than the soul's union with God. They, therefore, understood Boethius' definition

of beatitude as a "perfect state with an accumulation of all goods" to be a fitting definition of the supreme human activity (Celano 2006). An anonymous commentator on the *Ethica nova* considers the Aristotelian and Boethian notions of human goodness to be similar when he claims happiness to be nothing other than ultimate perfection. This perfection is the delight in the union of potency with its own act. This commentator, while explaining the text of Aristotle, signals his preference for the teachings of Augustine and Boethius when he uses terms such as "perfection" and "delight" to describe the union of the soul with the Supreme Being. Like other authors of this period he shifts the emphasis from the soul's activity to the divine object of contemplative action. Happiness, therefore, actualizes every potential within the soul by apprehending and contemplating the first cause (Tracey 2006).

Another anonymous commentator of this era understands happiness to be the unqualified perfection of the soul. All human endeavors become merely means whereby the soul is joined to the Supreme Being, and this being is happiness in the proper sense. Human beings cannot attain happiness through their virtuous activities; they can only be joined to happiness as the Supreme Being itself (Gauthier 1975). This understanding of the meaning of happiness appears in the works of the commentator erroneously identified as John Pecham, Arnoul of Provençe and the compiler of the examination guide for students in the Arts Faculty at Paris (Celano 2006). During this early period of assimilating Aristotle's ethics, Robert Kilwardby distinguishes clearly between the philosophical ideal of happiness and the Christian belief in perfect beatitude. He limits Boethius' definition of beatitude to what is "perfect" in the genus of human operations. He no longer views happiness as a separate object to which one is united, but rather restricts it to the perfection of the potential within the human soul. Happiness, as determined by Aristotle, is an act (*opus*) that is proper to a human being *qua* human, and cannot be the absolute perfection of the separate soul. Kilwardby argues that his contemporaries misunderstood Aristotle's definition of happiness as the perfect activity of the soul. For Kilwardby, a

concept of limited perfection within a genus is necessary to understand the meaning of Aristotle's central idea of moral goodness properly. Kilwardby, like Albert and Thomas, allows for the possibility that Aristotle thought the absolute perfection of the separate soul to be possible, but he dismisses such a discussion as irrelevant to philosophical speculation (Celano 1999).

Albert the Great's early work on goodness, the *De natura boni*, contains a notion of happiness heavily influenced by the insights of Augustine and Boethius. Albert considers the ultimate perfection of the soul to be unattainable through human efforts, since no one can comprehend God without error. Through its own powers the soul may perform virtuous acts that merely prepare it for the reception of the supreme perfection of beatitude. Albert's *De bono*, however, represents a transitional phase in his understanding of happiness and beatitude, since he considers the question both in Aristotelian and Augustinian terms. Albert provides in the first Latin commentary on the entire text of the *Nicomachean Ethics*, the *Super ethica*, his most profound and complex determination of the questions concerning human happiness. Albert here concentrates upon the problem of human happiness on earth, and relegates the problem of the absolute perfection of the soul to theological considerations (Müller 2001). The unifying element within moral theory is contemplative happiness, the intellectual activity of wisdom that elicits and completes all other human acts. The practical realm is governed by prudence, which is the primary operation of civic happiness, and to which all moral virtues are directed. Albert so closely identifies the habit of civic happiness with that of prudence itself that he says civic happiness is the activity of prudence, which regulates and determines all other moral virtues. Albert's understanding of the directive force of the virtues of wisdom and prudence leads him to conclude that there are two distinct human ends: (1) civic happiness, which is ordered to (2) contemplative happiness. The former happiness disposes a human being to the latter by calming passions and permitting uninterrupted intellectual activity. By identifying the goal of contemplation, and therefore all human endeavors, to be

knowledge of the first being, Albert believes his interpretation to be consistent with the intention of Aristotle. Albert seeks to define human goodness only insofar as it falls within the category of *operata bona*. Although the division of happiness into two distinct types, each complete within its own order, is a misreading of Aristotle's own doctrine, Albert's explanation of happiness had enormous influence on subsequent commentaries on the *Nicomachean Ethics*. In the thirteenth century only Thomas Aquinas and Boethius of Dacia rejected Albert's interpretation in favor of a unified concept of happiness, in which both contemplation and moral practice contribute to the single human goal of happiness (Celano 1987).

In his commentary on the *Nicomachean Ethics* Thomas Aquinas limits his discussion to a consideration of the supreme end among all human actions (*summum omnium operatorum*). Thomas' distinction between the philosopher's *felicitas* and the theologian's *beatitudo* permits him in his philosophical works to concentrate upon the way in which a person attains human happiness during a lifetime. Aristotle's praise of the contemplative life convinces Thomas that happiness results from the exercise of the soul's intellectual abilities. While both Albert and Thomas understand contemplation to be the supreme achievement of a human being, Thomas does not divide the intellectual and moral virtues into two distinct types of happiness (*due felicitates*). He regards these virtues as complementary elements of human perfection, which together constitute human happiness.

Since contemplative activity is essential to the attainment of happiness, Thomas must identify that object which best perfects the intellect. He concludes that happiness is achieved through an intellectual union of man with God. This knowledge of God is, however, imperfect and interrupted while the soul remains joined to the body. The natural desire of humans to know leads them to speculate metaphysically upon the nature, and primary cause, of all being. Even Aristotle argued that the object of metaphysics is divine, and that no one can be happy without some knowledge of the first being. In this way the pursuit of philosophical knowledge and the desire for religious illumination are similar. In order to

explain the concept of a single universal end for individual human beings, and to account for individual accomplishment of such an end, Thomas in the *Summa theologiae* divides the goal of human actions into the *finis cuius* (the end of which) and the *finis quo* (the end by which). The former term refers to the first being, which is the exact same object of contemplation for all; the latter term designates the activities of individual human whereby happiness is achieved, and which may differ according to the levels of virtue attained.

Thomas follows Albert in distinguishing happiness further into that which is according to the best which can be (*secundum optimum quod esse potest*) and that which exists essentially (*secundum esse*). This distinction does not indicate the difference between Augustinian beatitude and Aristotelian *eudaimonia*, but rather a division within human goodness on earth. This classification allowed Thomas and other commentators to resolve satisfactorily the dilemma of Solon, who warned against judging a man happy until death places him beyond the reach of misfortune. Happiness in its essential nature is the exercise of virtuous activity, which remains largely unmoved by grave misfortune. Happiness according to its best state can only occur when a virtuous person is blessed with a multitude of the benefits of good fortune. The latter concept is equivalent to Thomas' notion of imperfect beatitude because it designates the best possible human life (*beatitudo*), which can always be subject to change and loss (*imperfecta*). Thomas argues that misfortune may tarnish beatitude (*coinquinat beatitudinem*), but it alone cannot destroy happiness. Only the cessation of virtuous activity can deprive one of happiness (Bradley 1997).

The Arts Masters of the medieval university, who commented upon the ethics of Aristotle, generally avoided the difficult question of the relation between the philosophical ideal of happiness and the Christian concept of perfect beatitude. Unlike Augustine, they did not urge others to scorn and condemn earthly happiness, but they cannot come to a resolution concerning the way in which the virtuous life contributes to the expectation of the perfect vision of God. Thomas, like many others in this era, argues that Aristotle was not concerned

with the fate of the soul after death, but did not expressly deny the possibility of eternal perfection. Although Thomas concludes from philosophical principles that the knowledge of God that constitutes perfect beatitude must be considered superior to imperfect beatitude or happiness, he is very careful in his formulation of the relation between the two ideals of human perfection. He says in his commentary on the *Sentences* and in the *Summa theologiae* that human happiness participates somehow in perfect beatitude according to the condition of human nature. Thomas does not make explicit the nature of this participation, since he is aware of the danger in claiming that human actions somehow merit eternal beatitude. The participation of which he speaks is most likely the similarity between the intellectual processes of beatitude and happiness. On earth one may attain a fleeting and partial understanding of the first cause through contemplation; after death this understanding is made complete and eternal.

Two extremely important figures at Paris during this time were Siger of Brabant and Boethius of Dacia, both of whom were primarily interested in philosophical solutions to the important questions of their era. Their many logical works certainly reflect their teaching in the Arts Faculty. Although they wrote no commentary on the NE, they did produce some interesting contributions to moral thought, even if they were limited in length and scope. Siger left a few questions that address themes in the NE, but they comprise only a few pages in a modern edition. Siger discusses the question whether ultimate happiness consists in the supreme human activity and which state is best suited to philosophers (Stegmüller 1931; Bazan 1974). More interesting than these few questions is perhaps Siger's lost work, *De felicitate*, which the Renaissance thinker, Agostino Nifo, cited in his treatise on the intellect. In the few citations of Nifo Siger may have defended a position taken by Boethius of Dacia in his *De summo bono* (Nardi 1945).

Boethius of Dacia's treatise differs from the usual methods of commenting closely upon a required text and he prefers to concentrate on a single topic related directly to the notion of happiness found in book I of the NE. Boethius

himself states that his subject is the first principle, which is the philosophical term for *Deus gloriosus* and how it affects human happiness (Boethius of Dacia 1976). His discussion on Aristotle's notion of human goodness depends upon his acceptance of Aristotle's idea that for each power of the soul there must be a corresponding supreme good. Boethius combines the virtues of the speculative and practical intellect and concludes with Thomas Aquinas that the supreme human good consists in knowledge of truth and the practice of morally good actions. Boethius does not produce a traditional commentary, but composes a treatise arising from topics in the first and tenth book of the NE. His primary concern is stated in the title of the work, the supreme good, which is God. But Boethius limits his consideration of the first being to the way it affects human happiness, both as its object and cause. He also considers both the problem of the meaning of imperfect beatitude and the more difficult question of the relation between human achievement and the religious expectation of perfect bliss: "For he who is more perfect in the beatitude, which we know through reason is possible to a human being in this life, he is closer to the beatitude, which we expect in the future life through faith." In his short treatise Boethius of Dacia has carefully selected the most important topics raised in the first book of the NE.

Thomas' modest claim about the participation of happiness in beatitude and the work of Siger and Boethius provoked a swift and hostile reaction from theologians, who preferred Augustine's notion of human perfection to Aristotle's ideal (Celano 1990). Henry of Ghent criticizes those whom he believed to have overemphasized human actions at the expense of the divine object of universal desire. For Henry, beatitude is the vision of the essence of God, which is hidden from human science and results only from the will's reception of divine grace. Such a reception may occur imperfectly on earth and perfectly after death. John Duns Scotus, like Bonaventure before him, prefers to ignore the question of the connection between earthly happiness and eternal beatitude. Scotus identifies true beatitude with the supreme perfection of a beatificable nature in complete union with its highest object. Because

reason knows nothing concerning the true nature of happiness (*felicitas*), the opinions of Aristotle and other philosophers have no authority whatsoever. William of Ockham prefers the terminology of Augustine (*frui* and *diligere Deum*) to that of Aristotle (*felicitas* and *cognitio Dei*) when discussing human goodness. Ockham dismisses any natural progression from knowledge of created causes to an understanding of the first cause. He also denies the existence of any natural inclination to human perfection, and views moral goodness and human fulfillment as the result of the will's desire to love God above all things. While Albert and Thomas attempted to discover a connection between imperfect earthly knowledge of God and the perfect vision of the divine being, Ockham insists that the topic of beatitude is best treated as a matter of faith. No natural means can determine with any certainty that the beatific vision is a universal goal for all human beings. Ockham doubts that human reason can identify God as the cause of beatitude, but he does admit that complete divine causality is a more likely explanation than any that involves human cooperation.

Despite the importance of the *Nicomachean Ethics* within the curriculum of the medieval universities, Aristotle's ideal of human happiness never replaced the doctrines of Augustine and Boethius, who identify true human beatitude with the absolute perfection of the separate soul. Some thinkers, such as Meister Eckhart and Johannes Tauler, reject the Aristotelian virtues completely in favor of the Christian practices of acceptance (*Gelassenheit*) and detachment (*Abgeschiedenheit*) (Enders 1996). Even in works of authors sympathetic to philosophical moral speculation the tension between rational and religious ideals is never resolved. Thomas Aquinas in a sermon delivered relatively late in his life indicates his acceptance of the Christian path toward human perfection when he states that an old woman after the coming of Christ knows more about living well and has a greater knowledge of God than any philosopher with all his arguments (Ayo 1988). Since living well and cognition of God are synonymous with Aristotle's notion of happiness, Thomas, like many of his

contemporaries, recognizes the superiority of the Christian understanding of human perfection over the accomplishments of philosophical reason in the final determination of the nature of human happiness and beatitude.

Hasdai Crescas

Tamar Rudavsky
Department of Philosophy, The Ohio State
University, Columbus, OH, USA

Abstract

Hasdai ben Judah Crescas (c. 1340–1410/1411) is the last outstanding original Jewish philosopher in the late medieval period. Although Crescas had no interest in science *per se*, he was embroiled in precisely the same set of scientific issues that occupied scholastic philosophers after the condemnation of 1277. His major work *Sefer Or Adonai (The Book of the Light of the Lord, 1405–1410)*, finished several months before his death, is a polemic against his two Aristotelian

predecessors Maimonides and Gersonides. In this work, Crescas sought to undermine the Aristotelian cosmology and physics that pervaded the works of his predecessors. Crescas' critique of Aristotelianism was momentous in that while arguing for the liberation of Scripture, he was arguing as well for the liberation of science. Thus, many of his anti-Aristotelian arguments contain what turn out to be scientific innovations.

Biographical Information

Hasdai ben Judah Crescas (c. 1340–1410/1411) is the last outstanding original Jewish philosopher in the late medieval period. Although Crescas had no interest in science *per se*, he was embroiled in precisely the same set of scientific issues that occupied scholastic philosophers after the condemnation of 1277. Crescas was born in Barcelona and studied with the famed philosopher Nissim ben Reuben Girondi. In 1389, he assumed the post of rabbi of Saragossa. In 1391, responding to riots against the Jews, Crescas wrote a polemic *Sefer bittul Iqqarei ha-Nozrim (The Book of the Refutation of the Principles of the Christians, 1397–1398)* in which he argued that major Christian principles such as Original Sin, the Trinity, and Transubstantiation are all self-contradictory and philosophically absurd. His major work *Sefer Or Adonai (The Book of the Light of the Lord, 1405–1410)*, finished several months before his death, was written as a polemic against his two Aristotelian predecessors Maimonides and Gersonides. In this work, Crescas sought to undermine the Aristotelian cosmology and physics that pervaded the works of his predecessors. A final extant work is his philosophical and halakhic *Sermon on the Passover (Derashat ha-Pesah)*, which contains discussions of miracles, faith, and free choice.

Philosophical System

Crescas' major philosophical work *Or Adonai* was directed against those Aristotelians (e.g.,

Maimonides and Gersonides) who in his mind, used Aristotle's arguments to undermine Judaism. In an attempt to weaken Aristotle's hold upon Jewish philosophy, and to uphold the basic dogmas of Judaism, Crescas subjects Aristotle's physics and metaphysics to a trenchant critique. The work is divided into four books that analyze (1) the roots or first principles (*shorashim*) of Scripture, (2) the fundamental beliefs or cornerstones (*pinnot*) of Scripture, (3) the true doctrines of Scripture (*de'ot amitiot*), and (4) some non-obligatory speculations in Scripture (*de'ot usevarot*). This distinction is based on Crescas' belief that the principal beliefs of Judaism are those without which there could be no revealed religion in general, or Judaism in particular. All of his anti-Aristotelian diatribes thus occur against the backdrop of Scriptural concerns. As Harvey has pointed out (Harvey 2007), Crescas' critique of Aristotelianism was momentous in that while arguing for the liberation of Scripture, he was arguing as well for the liberation of science. Thus, many of his anti-Aristotelian arguments contain what turn out to be scientific innovations.

Book One of *Or Adonai* addresses the roots of Jewish belief, central of which is belief in God. Maimonides had provided Aristotelian arguments for the existence, unity, and incorporeality of God, maintaining that correct beliefs about God must be based in sound Aristotelian principles; these arguments were based on 26 propositions drawn from the corpus of Aristotle's physics. Crescas, however, objected to Maimonides' approach, arguing that God's existence, unity, and incorporeality cannot be based on philosophical proofs, for these "proofs" are themselves based on faulty propositions. Crescas thus proceeds to show the weaknesses inherent in each of the 26 propositions adduced by Maimonides. For example, Crescas rejects Aristotle's theory of place and argues that place is prior to bodies: in contradistinction to Aristotle's conception of place, space for Crescas is not a mere relationship of bodies but is the "interval between the limits of that which it surrounds" (Wolfson 1929: 195). Space is seen by Crescas as an infinite continuum ready to receive matter. Because this place or extension of bodies is identified with space,

there is no contradiction in postulating the existence of space not-filled with body, i.e., the vacuum (see Wolfson 1929: 38–69). Crescas, in fact, assumes that place is identical with the void, on the grounds that "place must be equal to the whole of its occupant as well as to [the sum of] its parts" (Wolfson 1929: 199).

Further, Crescas rejects Aristotle's theory of time, arguing that the correct definition of time is that it is the measure of the continuity of motion or of rest between two instants. By *hitdabequt*, Crescas means to emphasize that time is not to be identified with physical motion or bodies, but with the duration of the life of the thinking soul. Time is "indeed measured by both motion and rest, because it is our conception (*tziyurenu*) of the measure of their continuity that is time" (Wolfson 1929: 289). On this basis, Crescas concludes that "the existence of time is only in the soul" (ibid). It is because humans have a mental conception of this measure that time even exists. The continuity of time depends only upon a thinking mind, and is indefinite, becoming definite only by being measured by motion. Were we not to conceive of it, there would be no time. It is in this context that Crescas comes closest to reflecting his near scholastic contemporaries Peter Auriol and William of Ockham, both of whom develop a subjective theory of time.

In book two of *Or Adonai*, Crescas lists the six beliefs that are intrinsic to a notion of divine revelation: God's knowledge of particulars, Providence, God's power, prophecy, human choice, and the purposefulness of the Torah. Each of these beliefs is then analyzed in light of the tension between religion and reason. In each case, Crescas reintroduces his rejection of an Aristotelian intellectualistic conception of the relation between God and humanity. Versions of this intellectual Aristotelianism can be found in Crescas' predecessors Maimonides and Gersonides, and includes the following sorts of positions: God does not know particulars; God cannot exercise providence over particulars; God's power is limited by the laws of nature; prophecy is a natural phenomenon that requires intellectual preparation on the part of the prophet; free will is possible, since God has no knowledge of future events; and

the purpose of Torah is to provide intellectual, as opposed to moral, perfection. Crescas rejects their views, arguing that God acts toward the world with goodness, love, and grace. Against Gersonides, for example, Crescas affirms God's knowledge of future contingents, even those determined by human choice. He then argues that human freedom is only apparent and not genuine: humans think they are free because they are ignorant of the causes of their choices. Human responsibility for action lies not in the actual performance of the action, but rather in the agent's acceptance of an action as its own. The feeling of joy an agent feels at acquiescing to certain actions, e.g., fulfilling the commandments, is the reward for that action. So too, God experiences joy in giving of himself to the world (Crescas 1990: 123–205).

Of the non-fundamental obligatory beliefs, Crescas in book three distinguishes those beliefs that are independent of specific commandments (e.g., creation, survival of the soul, reward and punishment, resurrection) from those dependent on specific commandments (e.g., the efficacy of prayer, the spiritual value of the festivals). The denial of even the non-fundamental beliefs, according to Crescas, leads to heresy. In this context, his discussion of the doctrine of creation is noteworthy. In contradistinction to Maimonides who in *Guide* 2:25 argued that the doctrine of creation is necessary to uphold the validity of Judaism, Crescas argues that one could believe in revelation even if the world were eternal. In fact, he goes on to argue that the doctrine of creation is best understood as eternal emanation of the world: the world is both created and eternal (see Crescas 1990: 273–318; Feldman 1980).

Many scholars have tried to trace the formative influences upon Crescas' thought. In his recent study of Crescas' *Sermon on the Passover*, Ravitzky has argued that Crescas' discussion of will appears to reflect a connection to Latin scholasticism in its acceptance of Scotist ideas regarding the moral and religious primacy of the will (Ravitzky 1988: viii). After noting important similarities and differences between Aquinas' and Crescas' conceptions of belief, Ravitzky turns to a comparison of Scotus and Crescas, arguing that

both philosophers reject their predecessors' insistence upon an intellectualist conception belief that leads to ultimate felicity, and replace it with a conception of belief based on the primacy of will (Ravitzky 1988: 54–60).

In a similar vein, Harvey suggests that Crescas' work was "perhaps connected in some way with the pioneering work in natural science being conducted at the University of Paris" (Harvey 1998: 23). More specifically, Harvey has compared the works of the two contemporaries Nicholas Oresme and Crescas, arguing that they are the two most important philosophers representing the new physics. Working in Pamplona in the 1330s, both argue for the existence of many worlds, both claim that many worlds do not imply existence of more than one God, and both argue that generation and corruption in the sublunary world is evidence for successive worlds. Crescas himself describes his analysis and critique of Aristotelian science as having "no small benefit for this science" (Wolfson 1929: 180). In fact, it can be argued that Crescas' critique of Aristotle helped lay the groundwork for the abandonment of Aristotelian science in subsequent centuries.

Heloise

Constant J. Mews

Centre for Religious Studies, School of Philosophical, Historical and International Studies, Monash University, Clayton, VIC, Australia

Abstract

Heloise (c. 1095–1164) was the lover and intellectual partner of the controversial philosopher and theologian, Peter Abelard (1079–1142), and abbess of a religious community that he entrusted to her, the abbey of the Paraclete from 1129 until her death. She is most well-known for the letters that she exchanged with Peter Abelard c. 1132/1133, after reacting to his *Historia Calamitatum*, in which he argued that providence had enabled him to survive a turbulent career in which she herself was profoundly implicated. Whereas Abelard had presented their affair simply in terms of lust, Heloise emphasizes that she had always been

driven by ideals of selfless love. In a third letter, she extends her interest in the ethics of intention, asks him for an account of religious women in history, and a rule better adapted to the needs of women. Widely revered for her learning, she prompted Abelard to provide many writings for the Paraclete, including responses to a series of 42 *Problemata* about questions presented by inconsistencies within the Bible. Mews (The lost love letters of Heloise and Abelard, 2nd edn, 2008. St Martin's Press, New York, 1999), Mews (J Mediev Latin 19:130–147, 2009) argues that she is the young woman whose voice is preserved in an exchange of over 100 Latin love letters (the *Epistolae duorum amantium*) between a controversial teacher and his brilliant pupil, preserved in a fifteenth-century manuscript of Clairvaux.

Biographical Information

From Abelard's *Historia Calamitatum*, we learn that Heloise was the niece of Fulbert, a canon of the cathedral of Notre-Dame, Paris. She had been raised and educated at the royal abbey of Argenteuil but had moved to Paris to live in her uncle's house in the cathedral cloister, in order to pursue further her studies. Nothing is known of her father, but her mother could have been Hersende of Champagne, a noble widow of Anjou, who befriended the controversial preacher Robert of Arbrissel, c. 1095, and enabled Fontevraud to be established c. 1100 as an abbey of which she became the prioress (Robl 2003; Mews 2006). Heloise inherited a similar revulsion for hypocrisy in religious life as inspired Robert of Arbrissel and the early community at Fontevraud but combined this with a profound interest in classical literature and ethics, echoing the interests of Baudri of Bourgueil and his literary circle, which included women connected to religious houses like Argenteuil.

Her relationship with Abelard developed through an intense exchange of letters c. 1115–1117, climaxing in her becoming pregnant and giving birth to Astralabe. She initially resisted Abelard's insistence that they should

marry with arguments recalled by Abelard in the *Historia Calamitatum*. After reluctantly yielding to Abelard's desire for a secret marriage, Heloise moved back to Argenteuil, but only became a nun; thereafter, Abelard had been castrated and had chosen to become a monk at St. Denis. Heloise rose to become prioress of the community at Argenteuil until 1129, when the nuns were expelled by Suger, abbot of St. Denis, who successfully took over the abbey in that year, replacing the nuns with his own monks. This prompted Heloise to obtain from Abelard control over the oratory, dedicated to the Paraclete that Abelard had initially established in 1122, after escaping from St. Denis. Abelard recalls these early years of the Paraclete in the *Historia Calamitatum*, ostensibly written to provide encouragement for a "friend" then experiencing distress but quite likely intended to offer guidance and support for the nuns of the Paraclete. Heloise proved much more successful than Abelard in building up this community, obtaining papal protection for it in 1131. By resuming contact with Abelard, through both letters and visits, Heloise elicited from him a significant series of letters and writings, by putting issues and questions to him that had a significant effect on his own intellectual development. The authenticity of her letters, once questioned by scholars, is now widely accepted (Newman 1992). She became widely respected by contemporaries for her wisdom, learning, and literary activity, otherwise only known through her exchanges with Abelard.

Thought

Perhaps the most celebrated statement of Heloise is her rejection of the notion of marriage and external wealth, articulated in her initial response to Abelard's *Historia Calamitatum*. In a phrase that would be picked up by Jean de Meun in *The Romance of the Rose*, she says that she would rather have not married and be called his prostitute (*meretrix*) than to obtain the wealth of the whole world as the empress (*imperatrix*) of Augustus

(Letter 2, ed. Hicks, 49). Although this has often been read in a romantic sense as a declaration of her selfless love, Heloise's argument here is part of a broader ethical reflection that true love is like true friendship in not being based on any external reward but is pursued solely for the sake of the other person. Heloise takes the Ciceronian ideal that friendship should not be pursued for personal gain but here transposes it to her own situation that of her friendship with Abelard (Mews 2007). She does not accept Abelard's presentation of their love (*amor*) in the past, as having been essentially lustful in character. After Abelard had responded with a letter urging her to turn her attention to Christ, away from the past, Heloise develops further arguments in her impassioned second letter about her failure to feel truly repentant about her past behavior, because she is certain about the fundamental rightness of her love for Abelard – even if she had committed sins in the eyes of the Church. These arguments challenge Abelard's contrast between selfish lust and the love he thinks she should develop for Christ.

A similar emphasis on selfless love is evident in the young woman's letters in the *Epistolae Duorum Amantium*, attributed to Heloise by Mews (1999), Piron (2005), and Newman (2016), a view contested by Von Moos (2003) and Ziolkowski (2004). In letter 25, she responds to his attempt in letter 24 to answer her question about the nature of love, by adopting quite a different approach from her teacher. Whereas he had paraphrased Cicero's notion that love creates a common mind to emphasize that love already existed between them, she argues that true love is more of an ideal that they strive to reach, but which must be distinguished from general precepts about loving one's neighbor, and must involve the correct inner disposition. In letter 49, she engages on an extended reflection, linking *amor* to *dilectio* and *amicitia* as not concerned with external gain. This prompts her teacher to reflect in letter 50, that she was not so much inspired by Cicero, as giving him instruction – an accurate observation given that Cicero had only theorized friendship within an all-male

context and had not related *amicitia* to the notion of *dilectio*. During their early relationship, Abelard may have admired such ideas in Heloise, but he was then more preoccupied intellectually by questions of logic than of ethics.

Heloise seems to have had more influence in shaping Abelard's ethical ideas after resuming correspondence with him in the 1130s. Her emphasis, however, is always that outward behavior should reflect inner intention (Georgianna 1987). This underpins her critique of contemporary religious life. The 42 questions or *Problemata* that she puts to Abelard similarly show that she was also acutely aware of contradictions within the scriptural record and shared Abelard's concern to identify its underlying significance, beyond the variation evident in specific accounts within the Bible.

Henry Harclay

John T. Slotemaker
Department of Theology, Boston College,
Chestnut Hill, MA, USA

Abstract

The works of Henry Harclay include his unedited commentary on the *Sentences* and 29 *Quaestiones ordinariae*. The early Parisian commentary of Harclay demonstrates a Scotistic and realist influence, while his latter questions at Oxford break with John Duns Scotus in numerous ways that anticipate the writings of William of Ockham. Harclay's positions on universals and relations are central to understanding his break with Scotus as he develops an antirealist position on both universals and real relations.

Henry Harclay (b. c. 1270– d. 1317) was an Englishman and a theologian who served as the Chancellor of Oxford University from 1312–1317. He was ordained to the secular clergy (1297) and lectured on Peter Lombard's *Sentences* at Paris around 1300; he became a master of theology at Oxford sometime before 1312. These dates and locations place Harclay in an interesting historical position between John Duns Scotus and William of Ockham; lecturing on the *Sentences* while Duns was in Paris and serving as chancellor until the same year Ockham began his lectures on the *Sentences* at Oxford (1317–1319). During his chancellorship, Harclay often sided with the University against the Dominican Order, a policy that is often evident philosophically and theologically in his critiques of Thomas Aquinas (Maurer 1954: 5–7). Harclay is particularly strong in his opposition to Aquinas on the immortality of the soul, arguing that Thomas betrayed the Christian faith in his attempt to reconcile it with Aristotle (Maurer 1957: II 40–44).

The writings of Harclay can be divided into a Parisian period (Commentary on Book I of the *Sentences*) and an Oxford period (*Quaestiones ordinariae*). The commentary on the first book of

the *Sentences* is unedited and exists in two codices (MS Vat. lat., 13,687 and Casale Monferrato, Biblioteca del Seminario Vescovile, MS b 2); the 29 *Quaestiones ordinariae* have recently been edited and translated by M. Henninger and are published in the series *Auctores Britannici Medii Aevi* (2008). The earlier work originating from Paris demonstrates a close adherence to the writings of Scotus, often adhering to the Subtle Doctor's argumentation or citing him explicitly (Henninger 1981). Harclay is a careful and subtle thinker, developing complex arguments and citing both patristic and medieval authorities with remarkable precision.

The Ontology of Universals and Relations

Harclay's position on universals in his unedited commentary on the *Sentences* remains obscure, but it is clear that by the time he wrote *Quaestio de universali* at Oxford he is increasingly critical of Scotus' strong realist theory of universals. Harclay states that in extramental reality the only things that exist are singular (*quod in re extra animam nulla est res nisi singularis*); commonness, it must be stressed, is not an extramental reality (Gál 1971: 211). Harclay's position is that there is no extramental common nature; two singular things (individual) are related by relations of similarity.

Harclay's position is that an individual can be conceived either distinctly or indistinctly, and the example Harclay uses is that of Socrates and Plato. When Socrates is conceived distinctly, he is known through a particular concept, when he is conceived indistinctly, he is known through a universal concept. But, as Harclay argues, indistinct knowledge of Socrates is confused knowledge; that is, if one has indistinct knowledge of both Plato and Socrates standing a half mile away, one conceives of Plato and Socrates as human beings through a universal concept (human being) that does not distinguish Plato from Socrates. This knowledge is confused in that it cannot distinguish the universal concepts representing Plato and Socrates. Harclay insists that all knowledge, whether conceived distinctly or indistinctly,

is of individuals. The distinct knowledge of Socrates is clearly of an individual, but so is the indistinct knowledge of Socrates in that the confused concept exists as a singular thing in the soul in that it is not predicable to another extramental thing. In the example above of indistinct knowledge, this is evident in the fact that there would be two indistinct concepts of human being in the soul of the observer.

The position defined above was criticized by Ockham because surprisingly Harclay argues that both the confused concept of Socrates and the singular extramental thing are both universal; the confused concept is universal because it represents many indistinct things in the species (different human beings), and the singular extramental thing is universal when it is conceived indistinctly. The obvious objection of Ockham being that the same thing cannot be both universal and particular (the singular extramental thing above would be both universal and particular for Harclay).

Harclay's theory of real relations developed in conversation with and in reaction to Scotus' theory of relations, as Henninger has demonstrated (Henninger 1989). The first position held by Harclay in his *Commentary on the Sentences* was similar to that of Scotus, but he would eventually come to reject Scotus' ontology of real relations in his *Quaestiones ordinariae*.

Scotus held that a real relation was an extramental relative thing, a *res*, which is distinct from but inheres in its foundation. This formulation is rejected by Harclay who agrees with Scotus that in order for there to be a real relation it is necessary for there to be two extramental realities that exist, but argues that the relation is not a mind-independent thing (*res*) that inheres in a foundation. The point is that the relation is not a *tertium quid*, but a non-inhering condition in one of the extramental realities (things) to the other. For example, if Socrates is being seen by an Ox – to use Harclay's example – there is not a real relative thing that inheres in Socrates. Rather, the Ox is “to the other,” or toward Socrates, in a new way, what Harclay calls *aditas*. Henninger has fleshed out Harclay's account of real relations in great detail, demonstrating this “non-inhering condition of *a* toward *b*” (*aditas*) as the distinctive aspect of Harclay's theory of relations (Henninger 1987: 118).

Conclusion

The writings of Henry Harclay are theological in nature, and his position on almost every philosophical topic is intertwined with a theological vision. While this dichotomy is admittedly anachronistic, it must be insisted that for Harclay the questions above involved significant theological implications. For example, the discussion of real relations has significant implications for both Trinitarian theology (Trinitarian relations) and God's relationship to creation.

The philosophical and theological views of Henry Harclay are significant as a witness to the intellectual development between Scotus and Ockham, but also possess an intrinsic philosophical quality that warrants much greater appreciation. It has been surmised since Armand Maurer's work on the univocity of being that Harclay is an important antecedent to Ockham; a position that has been supported since by G. Gál and M. Henninger (Gál 1971: 183; Henninger 1989). The publication and translation of Henry's *Quaestiones ordinariae* will certainly assist in establishing Henry's place in medieval philosophy and theology and his complex relationship to both Scotus and Ockham.

Henry of Ghent

Pasquale Porro

Dipartimento di Scienze Filosofiche, Università di Bari, Bari, Italy

Abstract

One of the most prominent figures at the Faculty of Theology in Paris during the last quarter of the thirteenth century, Henry of Ghent has been traditionally considered a conservative, “Neo-Augustinian” theologian, fighting against the spread of Aristotelianism and Arabic philosophy – an impression that seemed to

be confirmed by Henry's participation in the commission set up by Bishop Tempier in view of the famous condemnation of March 1277, and by his heated controversies with those theologians closer to the doctrinal legacy of Thomas Aquinas, such as Giles of Rome and Godfrey of Fontaines. However, the progress of the new critical edition of *Opera Omnia* Henry's – begun in Leuven by Raymond Macken in 1979 and now continued by an international team – has already demonstrated that this image needs to be substantially revised. Indeed, Henry sought to reconcile traditional Augustinian theories with some of the basic principles of Aristotelian epistemology and Avicennian ontology, thereby giving rise to a complex and original synthesis, certainly different from that of Thomas Aquinas, but also from that of the Franciscan masters of his day.

Biographical Information

Henry's date of birth is unknown, but should presumably be placed before 1240. Information about his career is also scarce. He was in Paris in 1265; from 1267, he begins to appear in the documents as *magister*, though nothing is known about his presumed teaching activity at the Faculty of Arts. From 1276, the year in which he disputed his first *Quodlibet*, until his death, Henry was Regent Master at the Faculty of Theology. He was canon of Tournai, archdeacon of Bruges (probably from 1277), and archdeacon of Tournai (from 1279). His name was recorded in the death register of Tournai cathedral on June 23, 1293.

During his university career in Paris, Henry was personally involved in almost all of the important events in university and ecclesiastical life. In 1277, he was a member of the commission of theologians set up by Bishop Tempier in order to censure propositions considered erroneous that were being taught at the Faculty of Arts and that would be condemned on March 7 of the same year. Nevertheless, not only did Henry affirm on different occasions that he neither understood nor

approved of the condemnation of certain articles, but he himself was pressured by Tempier and the papal legate Simon of Brion to distance himself from the theory of the unicity of substantial form in man.

From 1281, the year of the publication of the papal bull *Ad fructus uberes* issued by Pope Martin IV, Henry represented the main theological reference point for the faction of prelates (secular clergy) in their conflict with the Mendicant Orders concerning the privileges granted by the Pope to the latter in matters of confession.

Henry is the author of a monumental, though incomplete, *Summa* (the second part *De creaturis* is missing, even though it was surely envisaged in the general plan of the work), 15 *Quodlibeta*, disputed and published while writing the *Summa* (Gómez Caffarena 1957), a short commentary on the *Book of Genesis* (*Lectura ordinaria super sacram Scripturam*), a lengthy treatise on the issue of confession (*Tractatus super factum praelatorum et fratrum*), as well as a few sermons. The authenticity of the *Quaestiones variae* recently published in the series of the *Opera omnia* is doubtful. Other still unedited works are of uncertain attribution: a treatise on the *Synkategoremata* (probably authentic), a commentary on the *Physics*, and an incomplete commentary on the *Metaphysics*.

Thought

Knowledge, Intellect, and Will

Henry's *Summa* does not open with a direct treatment of God, but with a detailed analysis of the problem of human knowledge, beginning with the classical skeptic's question: can man know anything at all? Taking knowledge in its most generic meaning, for Henry it is undeniable that man is able to know something through the senses and without divine intervention. Moving on to knowledge in the strict sense, things get more complicated. Following Augustine's *Soliloquia*, it is important to distinguish between what is true and truth itself: sensation only grasps *id quod verum est* ("what is true"), while knowledge of the truth implies the knowledge of the

nature or essence of a thing, which can only be gained by comparing the thing itself to its *exemplar*.

There are, however, two exemplars: (a) the universal species of the object that the mind obtains by abstraction, on the basis of sensible data (in this case, the truth of the *res* is the conformity between the really existing thing and its mental representation); (b) the ideal form present in the divine mind that acts as the formal cause of creatural essences, and from this perspective the truth of a thing is its ontological conformity to its eternal model. This double relation thereby produces two different levels of truth: on the one hand, the truth of Aristotelian science, deriving from the purely natural faculties, through an abstracting process; on the other, the "sincere truth" (*sincera veritas*), obtained only through divine illumination. The first truth does not have the same infallibility, purity, and absolute certainty as the second; nevertheless, it is necessary for the fulfillment of the second: the action of the divine *exemplar* can only work on a concept already obtained by the intellect through abstraction. For Henry, divine illumination does not directly provide the mind with any content, but rather certifies definitively the representation of a thing present in the human intellect as coinciding with the representation existing *ab aeterno* in the divine intellect. The action of divine illumination is therefore neither a direct donation of intelligible contents, independent of the conditions of sensible knowledge, nor is it a simple purification, preparation or refinement of the mind in order to predispose it to intellectual knowledge; rather, it is the certification of our created *exemplar* by the uncreated one (Macken 1972).

Over the years, however, Henry seems gradually to abandon this theory of the double *exemplar* in order to make room, on the one hand, for a reworking of the defining process of essences through their progressive determination, as described by Aristotle in the *Posterior Analytics* (Marrone 1985, 2001), and on the other, for a reinterpretation of illumination as the constant presence in act, albeit in a recess of the mind (*abditum mentis*), of the image of God (*Quodl.* IX, q. 15; cf. Emery 2001).

In this evolution, the partial rejection of the function of intelligible species (*Quodl.* III, q. 1; *Quodl.* IV, q. 7) is particularly important, and anticipates the similar solution adopted by “nominalists” a couple of decades later. For Henry, the particular phantasm is made immaterial and universal by the abstraction of the agent intellect and imprints itself on the potential intellect without the mediation of an intelligible species that is numerically different. The phantasm is therefore the efficient cause of intellectual knowledge, or better, of the first operation of the intellect (that of simple understanding). Henry does not eliminate sensible species, however, nor does he eliminate all types of representation in the sphere of intellectual activity. Indeed, after the phantasms are impressed on the possible, or potential, intellect, making simple understanding possible, the intellect then forms complex judgments and produces its own species, or *verbum* (mental word), as a result of this activity.

Concerning the relation between will and intellect (an issue to which he dedicates no less than 20 quodlibetal questions), Henry can be considered a voluntarist (Müller 2007), even though with regard to the more “radical” voluntarists, such as Walter of Bruges, he does not confine himself to interpreting the role of reason as that of a mere “advisor,” but instead as that of a cause (albeit a *causa sine qua non*): without the prior knowledge of the intellect, the will cannot desire anything (Macken 1975, 1977). In other words, for Henry the intellect and the good that it proposes are not the sole or necessary origin of the motion of the will; however, by presenting the objects that this faculty can freely choose, reason is the *conditio sine qua non* of the action of the will itself, which otherwise would be prey to sensible appetites and the determinism of the passions. Moral action is therefore performed both by the intellect, which presents the kinds of good to choose, and by the will, which freely chooses one of these, yet without being forced to opt for that which is judged best by reason.

Metaphysics

Following Avicenna, Henry affirms that every *res* possesses its own “certitude” (*certitudo*) that

makes it what it is, that is, that expresses the objective content (the essence or *quidditas*) by which every thing is identical to itself and is distinguished from other things. This content can be considered in itself, as independent from its physical (and particular) or mental (and universal) existence: in itself, essence is just essence (“*essentia est essentia tantum*”). Nevertheless, every *res* only exists in physical reality or in the mind. Possessing an absolute concept does not mean possessing an absolute, separate existence. More simply, through such a concept, a thing can be considered independently of all that does not form part of its essential content and that therefore constitutes an additional determination. For instance, physical or mental existence, particularity or universality, do not form part of “horseness” as such. Yet for this very reason “horseness” as such does not exist; instead what exists are horses as individuals (individual *supposita*) and the universal concept of “horse” which the mind obtains by abstraction from them (Porro 1990, 1996). Actual existence is therefore an “intention” (*intentio*) that occurs to essence without adding anything real, and so it differs from essence only in an “intentional” way.

The term *intentio* designates here a “note” (a feature or trait) of the essential content of a *res*, which does not differ from it in any real sense, nor from its other identifiable “notes,” yet can nevertheless be expressed through an independent concept (*Quodl.* V, q. 6). *Intentio* is thus the fruit of an operation of the intellect, which delves inside (for Henry *intentio* comes from *intus tentio*) the thing to which the intention itself belongs, by considering its constitutive “notes,” and gives rise to different concepts. It can also be said that intentions really exist in a *res*, but only potentially, whereas their distinction is an operation of the intellect alone.

While two distinct things differ in a real sense, all that gives rise to different concepts, albeit founded in the same simple thing, differs intentionally (*Quodl.* V, q. 12). In an intentional distinction, in other words, the very same thing is expressed by different concepts in different ways. From this perspective, an intentional distinction seems akin to a purely logical distinction, to the

point that the two are often confused. Nevertheless, in the first case, one of the concepts excludes the other (one can be thought of separately, in the absence of the other), whereas in the case of a distinction based on reason the various concepts are perfectly compatible. As Henry explicitly states, this means that everything that differs in intention differs in reason too, but not vice versa. Unlike a purely logical distinction, an intentional distinction always implies a form of composition, even though this is minor with regard to that implied by a real difference. Actually, for Henry there are two levels of intentional distinction: a major and a minor. In the major, none of the intentions includes the other or others, even though they are all part of the same thing; moreover, it has two modes: the distinction between the differences in man (rational, sensible, vegetative, and so on) and the distinction between genus and specific difference (animal and rational). In the minor, the concept of one intention includes the other but not vice versa. And here Henry lists four modes: the distinction between species and genus; the distinction between living and being in creatures; the distinction between a *suppositum* and its nature or essence; and the distinction between a *respectus* (relation) and the essence on which it is founded. The distinction between essence and existence belongs to the last mode.

Yet independently of actual existence, and preceding it, essence is already constituted as such in a specific being, which Henry calls *esse essentiae*. This must not be taken as a real separate being, but indicates only the fact that a *res* thus constituted has an objective content and so it is objectively possible; that is, it can be placed in act by God. Indeed, not every *res* conceivable by the human intellect corresponds to a nature that can be actualized. The being of essence thus coincides with the possibility, or the ability, to receive actual existence that a purely imagined *res* does not have. Henry appeals here to the distinction between *res a reor reris* and *res a ratitudine* (cf. *Summa*, art. 21, q. 4; art. 24, q. 3). In the first case, a thing is considered in its purely nominal conception, to which a reality, outside a purely mental one, need not correspond (*reor* is here synonymous with *opinor* – “to imagine” or

“to suppose”). In the second case, a thing is “certified” (*rata*) by the fact that it possesses at least the being of an essence. If the nothing that stands in opposition to a *res a reor reris* cannot even be conceived, the nothing that stands in opposition to a *res a ratitudine* is not the lack of actual existence, hence nonexistence in the physical world, but rather the lack of formal constitution: the fact that a thing can be conceived (e.g., a chimera or a mountain of gold) without being “certified” as a determined essence. For Henry even the distinction between *esse essentiae* and the content (*realitas*) of an essence is of an intentional type, even though Henry was initially tempted to make a distinction based on reason alone between essence and its essential being (*Quodl.* I, q. 9; a spectacular example of this change of position is the recasting of q. 4, art. 21 in the *Summa*).

Every essence is what it is in reason of its nature (*Quodl.* X, q. 8), albeit through participation (*participative*), since the very fact of being an essence, content aside, is dependent on God. Essence is therefore not strictly an “effect” or “product” of God, and yet it is constituted only through a relation of participation in, or imitation of, the divine essence. More precisely, *esse essentiae* belongs to essence because of its eternal relation to God as formal cause. It is only in virtue of this relation that essences can also come into actual existence, which signals a new relation between a creature and God, the latter now as efficient cause. In the first case, essences depend on the divine intellect, in the second, on the divine will. Being therefore always indicates a relation in creatures, which is simple for essences in themselves (*esse essentiae*), and twofold for actualized essences (*esse essentiae* plus *esse existentiae*). Nevertheless, the two types of relation are not perfectly symmetrical. In the first place, while essence can be conceived independently of its existence in the physical world, it cannot be conceived independently of its being-essence, otherwise it would be a mere figment. Consequently, the relation that forges *esse existentiae* is in some way accidental, whereas that which forges *esse essentiae* is essential. In the second place, since God chooses, from all the essences eternally constituted as such by His intellect, those that He will

actualize over time, on the basis of His free will, one relation is such from eternity, while the other takes place in time.

Essences thus correspond to divine ideas, which represent their eternal exemplars. More precisely, according to Henry, an idea is in God for the fact that divine essence is in some ways imitable by creatural essences. God's knowledge of what is different from Himself coincides with the knowledge of the different ways in which He considers Himself imitable, since divine knowledge is not determined by the presence of external objects, but rather is itself the formal (exemplary) cause of its own contents. Here, however, the classic question of the relation between divine simplicity and creatural multiplicity again arises. Were God to know immediately the plurality of creatable objects (essences), His simplicity and unity (divine knowledge is not really distinct from divine essence) would be irremediably compromised. On the other hand, if God did not have access to the multiplicity of all that is distinct from His essence, He would not know anything. So, according to Henry, divine knowledge has a primary object, which is divine essence itself, absolutely simple and indivisible, and a secondary object, which is in some way "other" than divine knowledge. To avoid any excessively brusque passage, the knowledge of this secondary object is then subdivided into two distinct moments: in the first, every creatural essence coincides with divine essence itself; in the second, every such essence is taken as distinct, endowed with a specific *modus* of being – *esse essentiae* – which nevertheless always derives from a relation of formal participation in the divine essence. In Henry's vocabulary, these two moments indicate respectively the *exemplar*, which is the divine idea, and the *exemplatum* (also called *ideatum*), which is an essence fully constituted in its quidditative content and so able to be placed in act, depending upon divine free will.

One might ask whether God possesses this same freedom in bestowing *esse essentiae* on possible essences, that is, on (doubly) secondary objects of His knowledge. Unlike what happens for the being of existence, the reply would seem to be negative in this case. As mentioned above,

there is an asymmetry between the relation of efficient causality and the relation of formal dependence that conjoin creatures and Creator: while the former is in time, the latter is eternal. This means that the distinction between what is possible and what is not possible is necessarily such from eternity. Moreover, since essences can never cease to be in their essential being (i.e., in their being eternally thought by God), they are absolutely necessary. As such, not only can they not be destroyed, but they cannot even be modified. With respect to actual existence, all essences are equally indifferent with regard to the Creator's power, so that God can place in act one *res* before another as He chooses, without any mediation, whereas in their own being essences are arranged in a hierarchical order that God himself, on whom that order depends, cannot modify. This fact has at least two consequences. In the first place, according to Henry, God cannot now introduce *ex novo* a new essence in any part of the series without irremediably destroying the whole order. In the second place, since there is a perfect correspondence between creatural essences and divine ideas, the latter are numerically finite, like the former (Porro 1993). This theory, which is highly unusual to say the least, is explicitly put forward by Henry on at least two occasions in his *Quodlibeta* (*Quodl.* V, q. 3 and *Quodl.* VIII, q. 8), before being partially retracted, albeit reluctantly, in virtue of an unspecified article condemned in Paris (*Quodl.* XI, q. 11).

Analogy of Being and Knowledge of God

In describing the role of divine illumination in the cognitive process of the human intellect, Henry is always careful to specify that God functions only as *ratio cognoscendi* and not as *obiectum cognitum*. From another perspective, however, God is also the first known object of the human intellect, according to one of Henry's most famous and characteristic doctrines (*Summa*, art. 24, q. 7; Laarmann 1999; Goris 2007). More precisely, God is not the first but the last concept in the order of rational knowledge, after the knowledge of creatures, but He is the first object of natural knowledge, which concerns the first and most general intentions. In this kind of knowledge,

our intellect always proceeds from what is most indeterminate. God, as subsisting and absolute being, is contained within the indeterminate concept of being, and it is for this reason that every time an *ens* is conceived, the *ens primum*, God, is also conceived, at least on more general levels of knowledge.

Between creatural being and divine being there is, of course, no real identity, but only a form of community originating precisely in the indeterminacy of the most general concept of being. Divine being is indeterminate and indeterminable; in itself, it eludes all possibility of determination. Being in general initially seems just as indeterminate, though not because it is indeterminable: the process of human knowledge aims at an ever more complete determination of being as a given thing. Nevertheless, at the level of our first, confused knowledge, our intellect is not able to distinguish between the negative indeterminacy of God (*indeterminatio per abnegationem*) and the privative indeterminacy of creatures (*indeterminatio per privationem*), and so it forms a single concept.

The equivocal term “being” is thus interpreted by our intellect as a univocal term, and this gives rise to a peculiar form of analogy. As a matter of fact, the first concept of being is both equivocal and univocal at the same time: it is equivocal in itself, since it signifies two completely heterogeneous realities (finite and infinite, being in potency and being absolutely and purely in act); it is univocal for the human intellect, since at this initial level the distinction remains hidden to our comprehension.

Yet it is this peculiar form of analogy, or community, that offers the only positive starting point for a metaphysical demonstration of the existence of God, a demonstration that, in appealing to Avicenna and to Augustine’s *De trinitate*, proceeds by investigating this falsely univocal concept of entity in order to isolate the notion of God as pure, necessarily existing Being (*Summa*, art. 22, q. 5; art. 24, q. 6). To this demonstration Henry also adds some a posteriori proofs – in the order of efficient, formal, and final causes – that nevertheless refer exclusively to the existence of God *de complexo*, in other words, to the truth of the statement “God exists” (*Summa*, art. 22, q. 4).

Other Characteristic Doctrines

We can only briefly mention here other characteristic elements of Henry’s metaphysical and theological system:

- The theory of human dimorphism: man alone has two substantial forms, one of which is the rational soul (*Quodl.* II, q. 2, after the hesitations of *Quodl.* I, q. 4 and the subsequent threats by Tempier and Simon of Brion).
- The essential identity between grace and glory (*Quodl.* IX, q. 13; cf. Arezzo 2005).
- The defense of the role of human merit in the doctrine of divine grace, at least in terms of congruity (*Quodl.* VIII, q. 5).
- The superiority of the active over the contemplative life, under given conditions, in the present life (*Quodl.* XII, q. 28).
- The relative superiority of personal over common good in the hierarchy of spiritual goods (*Quodl.* IX, q. 19).
- The formulation of a basic vocabulary of human rights (see especially *Quodl.* IX, q. 26 – “whether someone condemned to death can legitimately escape” – in which the idea of a natural right to survival seems to emerge for the first time in western thought).
- The elaboration of an authoritative doctrine of time, based on a reworking of Averroes’ theory, according to which time coincides, in its material aspect, with the continuity of motion, and in its formal aspect, with the division (*discretio*) applied to this motion by the numbering activity of the soul (*Quodl.* III, q. 11, in clear opposition to Augustine’s doctrine of time).
- The admission of a distinction between *potentia ordinata* and *potentia absoluta* in the case of the pope, and the refutation of this distinction in the case of God. For Henry *potentia absoluta* always indicates the possibility of acting in a disorderly way, which the pope, who is capable of sinning, possesses, but God does not (*Tractatus super facto praelatorum et fratrum*; cf. Porro 2003).
- The severe criticism of Aquinas’ and Giles of Rome’s doctrine of the subalternation of theological science to the science of God and the Blessed (*Summa*, art. 7, qq. 4–5).

- The doctrine of *lumen supernaturale* (“supernatural light”), which is the prerogative of theologians only, and which makes their scientific habit superior to that of the “philosophers” (*Quodl.* XII, q. 2; Porro 2009).

- Thomas Aquinas
- Time
- Truth, Theories of
- Will
- Will, Weakness of

Indeed, one of the central concerns throughout Henry’s career was the vindication of the absolutely scientific nature of theology. Moreover, it is the Master of Theology’s duty to give, on request, his authoritative opinion on any topic; hence the numerous questions of a pastoral, social, political, and even economic kind that make Henry’s *Quodlibeta* one of the richest and liveliest theological works of the entire Scholastic production (Porro 2006). Henry’s influence has been considerable, especially in the first decades of the fourteenth century: for instance, even though both John Duns Scotus and William of Ockham criticize many of Henry’s doctrines, they consider him to be the most authoritative master of thirteenth century Scholasticism.

Heresy

Rupert John Kilcullen

Department of Politics and International
 Relations, Macquarie University, North Ryde,
 NSW, Australia

Abstract

Medieval theologians took their concept of heresy mainly from the texts of Jerome and Augustine quoted in Gratian's *Decretum*. Thomas Aquinas argued that anyone who pertinaciously denies even a minor item of church or Bible teaching falls into heresy. Ockham developed criteria for pertinacity and argued that a Christian, even if his or her opinions

are actually in error, cannot be regarded as pertinacious simply for refusing to defer to the teaching of a pope.

Medieval theologians at first do not seem to have reflected much on the concept of heresy. Peter Lombard in the *Sentences*, for example, asks the question what is heresy, but gives a very uninformative answer (PL vol. 192, col. 868). The concept of heresy was more seriously explored in the textbooks of canon law. Gratian's *Decretum* (written some time around 1150) includes a significant collection of patristic texts relating to heresy, and the collection of decretals issued in 1234 by Gregory IX (the *Liber extra*) includes titles concerning Jews, Apostates, Schismatics, and Heretics (Friedberg, vol. 2, col. 749ff). Gratian's Causa 23 (Friedberg, vol. 1, col. 889ff) concerns warfare, compulsion, and physical punishment directed against the wicked, including heretics. In C.24 q.3 cc.26–31 Gratian offers materials toward a definition of heresy drawn mainly from Jerome and Augustine. The texts quoted suggest that a person who has been a member of the church becomes a heretic by pertinaciously maintaining a false doctrine despite correction.

Thomas Aquinas

The first major theological treatment of heresy was by Thomas Aquinas. He refers explicitly to Gratian as the source of some of his quotations from the fathers, and Gratian could have been his source for others also.

Thomas holds that revelation comes to individuals mainly in two ways, through the Bible and through the teaching of the church. "The formal object of faith is the First Truth, as manifested in the sacred scriptures and the teaching of the church. Anyone who does not adhere, as to an infallible and divine rule, to the teaching of the church, which proceeds from the First Truth manifested in the sacred scriptures, does not have the habit of faith but holds things that belong to the faith in some other way than by faith. . .

A heretic who pertinaciously disbelieves one article is not ready to follow church teaching in all things – but if not pertinaciously, then he is not a heretic but only one who errs" (ST 2–2 q.5 a 3). He refers here to the articles of faith, but the argument could be applied to the secondary objects of faith, such as the proposition that Abraham had two sons. Thomas makes this application later (ST 2–2 q.11 a.2). This thesis, that anyone who pertinaciously disbelieves or doubts even such minor point as that Abraham had two sons has no faith at all, illustrates de Guibert's statement, "*Tandis qu'Augustin refuse de mettre dans cette catégorie d'hérétiques ceux qui erreraient sur un détail de la vérité révélée, nous mettons aujourd'hui [1920] sur le même rang toute négation de vérité révélée, quelque'en soit l'importance et le lien avec l'ensemble de l'économie chrétienne*" (de Guibert:381): this development seems to be due to Thomas Aquinas.

Thomas quotes Jerome's remark that "heresy" comes from the Greek word for choice, and says that heresy is the species of unbelief found in those who profess the Christian faith but corrupt its teachings by choosing to assent not to what Christ really taught but to their own ideas. False opinions in geometry are not heresies, since heresies are in matters belonging to the faith – namely the articles of faith, which belong to faith directly and principally, and the secondary objects of faith, denial of which leads to disbelief in some article of faith. For the secondary objects, implicit faith is enough, and it is possible to err about such matters without being a heretic. Thomas quotes Augustine (from the *Decretum*, C.24, q.3, c. 29): "We should by no means class as heretics those who defend a false and perverse opinion in no pertinacious spirit, but seek the truth with careful solicitude, ready to correct their opinion when they have found the truth," because they do not choose against the doctrine of the church. Jerome and Augustine differed on some questions, but neither was a heretic because the questions either did not concern faith or had not yet been determined by the church. Pertinacious defense of an error in a matter determined by the church would be heresy. The authority to decide matters of faith belongs to the pope (for this Thomas quotes *Decretum*, C.24

q.1 c. 12, Friedberg, vol. 1, col. 970; cf. ST 2–2 q.1 a10, where he refers to *Decretum*, d.17 c. 5, col. 51); Jerome, Augustine, and other orthodox doctors never defended any error against the authority of the pope (ST 2–2 q.11 a.2 ad 3).

William of Ockham

The next major treatment of heresy and heretics was by William of Ockham in Part 1 of his *Dialogus*. In this work, Ockham does not speak in his own person, but it is generally possible to recognize which positions he recommends, and for brevity, I will summarize the argument as if it were directly presented. The interpretation can be confirmed from other works not in dialogue form, notably *Contra Ioannem* and *Contra Benedictum*, in which Ockham speaks directly in his own person. The whole of Part 1 of the *Dialogus* is concerned with heresy and heretics, but in this article we will restrict our attention to the first four books.

In 1 Dial. 1 Ockham argues that the topics of heresy and heretics belong primarily to theologians. In the prologue to his *Summa aurea* the canonist Hostiensis claims that the science of canon law is the “science of sciences,” comprehending both all law and theology. “All ought to be led by it and not by their own understanding.” (On this claim, and on the rivalry between canonists and theologians, see Scott.) Ockham rejects such claims. Canon law is a collection of Bible texts, texts of the fathers, imperial laws, and statutes and determinations of councils and popes, touching on theological and moral matters (c. 8). The canonical science is subalternated to theology and moral philosophy (c. 10). Canonists may have better memory of the canon law texts, but the theologians can understand them more deeply. It is for theologians, not canonists, to decide what is heresy and how to determine whether an individual is a heretic. Canonists are experts on the legal processes, but “it pertains to theologians to judge by universal rules whether the ecclesiastical laws about punishing heretics in certain ways and about the way of proceeding against them are

contrary to the divine scriptures, because if such laws were opposed to sacred scripture they should not in any way be tolerated” (c. 15).

In 1 Dial. 2 the question is, What counts as catholic truth and what as heresy? In early times opponents of heresy referred to “the rule of faith” as the measure against which orthodoxy is to be tested. Sometimes the rule of faith seems to be a summary of leading doctrines that candidates for baptism were expected to know, sometimes the general purport of the Christian tradition (Kelly:39, 40, 43). Canonists sometimes seemed to think that heresy was any disagreement with or disobedience to the pope, yet at other times they acknowledged that a pope might become a heretic. For some (Marsilius, and later the Protestants) the rule of faith is the Bible. For Ockham, the rule of faith is what it was also for Thomas Aquinas, namely “sacred scripture and the teaching of the whole church, which cannot err” (CI, 72.34–5). This rule is twofold: it may be difficult to ascertain what is the teaching of the whole church, but someone who has access to the Bible will, in some cases, be able to find a sure answer in its text. “Concerning many questions of faith those learned in sacred letters can be certain of catholic truth, notwithstanding the question or doubt of anyone else whomsoever” (CB, 250.4–6).

Ockham tries to clarify the notion of catholic truth by listing five classes of truths that catholics (members of the universal church) are obliged to believe (1 Dial. 2.2, 5), namely: (1) anything contained in the Bible, either explicitly or by necessary implication; (2) anything handed down, outside the canonical scriptures, from the Apostles; (3) factual information in chronicles, histories, etc., that are worthy of trust; (4) anything necessarily implied by the Bible and tradition together, or by either in conjunction with chronicles etc.; (5) new undoubted revelations made by God to the church. Corresponding to the five kinds of truths that catholics are obliged to believe are five kinds of “deadly errors” (1 Dial. 2.17). However, these truths and errors are not equivalent to catholic truths and heresies respectively. What makes something catholic truth is revelation by God to the church in one or other of the modes corresponding to (1), (2), and (5).

To identify apostolic tradition or post-Apostolic revelation (categories (2) and (5)) would require historical research, but there is a short cut. Ockham interprets Matthew 28:20, “I am with you all days, even unto the end of the world,” as a promise that error will never prevail in the church (1 Dial. 2.3, etc.). If at some period (e.g., in the recent past) catholics all held that some proposition is a truth of faith, then it is indeed a truth of faith: even if we cannot find any basis for it in the Bible, even if we cannot trace the process by which this belief was handed down from the Apostles, even if we have no evidence of a post-Apostolic revelation, we can be sure that it is a truth of faith that came to the Church in one or other of these three ways.

In 1 Dial. 3 the question is, What makes a person a catholic, and what makes a person a heretic? A person is a catholic if he or she has been baptized and holds the whole of the catholic faith; a heretic is anyone who has been baptized (or presents himself as such) who pertinaciously rejects or doubts any catholic truth whatsoever (1 Dial. 3.3). To explain how it is possible to hold the whole of the catholic faith, Ockham draws on Thomas Aquinas’ distinction between explicit faith and implicit faith. To believe a truth implicitly means (a) to believe explicitly some other truth in which it is implied and (b) not to believe pertinaciously anything inconsistent with it (1 Dial. 3.1). (Thomas Aquinas perhaps supposed the second point but did not make it explicitly.) Catholics must have explicit belief in some catholic truths (CI, 45.35–40; cf. 2.1 Dial. 11.13–23), but it is enough to believe the others implicitly – that is, to have explicit belief in a something that implies the rest, namely that whatever is contained in the Bible and the teaching of the church is true (CI, 46.20–22). Thus, someone who believes that everything in the Bible is true implicitly believes that Bilhah was the mother of Dan even though he has never read Genesis 30:5–6, unless for some reason he believes pertinaciously that Bilhah was not the mother of Dan. People who regard themselves as orthodox catholics may be heretics without knowing it, if they hold pertinaciously some belief (even on some minor matter) that is really inconsistent with

something they have never realized was a catholic truth (1 Dial. 4.2, 4; 2.1 Dial. 11.106ff).

According to Thomas Aquinas, it belongs especially to the pope to draw up formulations of the articles of faith. Ockham agrees: it is especially the function of the pope, aided when that is appropriate by a council, to settle doubts about the faith (1 Dial. 2.14). However, according to Ockham a pope may become a heretic (as the canonists and even papalist theologians also generally acknowledged (see Tierney 1955: 57–67; McGrade 1994: 148ff.)). Neither pope nor council nor any part of the church is infallible. Christ’s promise to be with his church all days does not guarantee that any part of the church will never err. “What is promised to the whole and not to any part ought not to be attributed to any part, even to a more principal part” (1 Dial. 5.22). What Christ’s promise does guarantee is that there will be somewhere in the church at least one person who speaks out against a false doctrine being presented as catholic truth (1 Dial. 5.28). If a pope or council asserts that some doctrine is catholic truth and some catholics, even a few illiterate lay people, contradict that assertion, the deniers may be right – they may be witnesses to the truth, speaking out against false doctrine being asserted as catholic truth.

In 1 Dial. 4 the question is, what is pertinacity and how can it be established? In 1 Dial. 4.5–34 Ockham discusses 20 possible ways of recognizing that a person is pertinacious and a heretic. According to the fourth way, for example, if a person denies any catholic truth that is widely disseminated as catholic among all catholics, including those with whom he has been living, he is immediately, without further examination, to be judged a heretic – though he can be excused if he can prove (e.g., merely by oath, if he is an uneducated person) that he did not know that this truth was catholic (1 Dial. 4.11). Another way is the seventh, the way of “legitimate correction,” according to which a person can be adjudged pertinacious if he does not change his mind when shown from the Bible or otherwise that his opinion is not catholic truth (cf. CI, 52.2–6; see McGrade 1974: 48ff). Even an illiterate is not obliged to change his mind just at the

behest of some prelate; such a person may defend a heresy a thousand times before the pope without being pertinacious or a heretic. Before he can be judged pertinacious, it must be shown to him, in a way suited to his education and understanding, that his opinion is heresy (1 Dial. 4.15–24). On the other hand, according to the eighth way, anyone, including a pope, who tries to impose a heresy as catholic truth on others by commands, threats, punishments, promises, oaths, etc., is to be judged pertinacious without examination to see whether he is ready to be corrected – the attempt to impose his erroneous opinion on others is sufficient proof of pertinacity (1 Dial. 4.25). Like a simple person, a pope or other prelate can put forward and defend a heretical opinion without being a heretic as long as he does not attempt to impose it on others: as soon as he tries to impose it by authority he can be adjudged pertinacious. Ockham's discussion of the ways of proving pertinacity amounts to a defense of freedom of discussion within the church. Concerning the Inquisition, he remarks: "Some people say that inquisitors and some prelates often proceed unfairly and unjustly. For they say that many are unlearned and simple men blinded by greed and avarice who try to condemn those accused of heresy in order to acquire their goods. And therefore no assertion should be based on their practice" (1 Dial. 4.21).

Ockham had the same conception of the rule of faith as Thomas Aquinas had and a very similar view of implicit faith and of pertinacity. Ockham perhaps puts less emphasis on the distinction between articles of faith and the secondary objects of faith, though Thomas also held that there can be heresy in the pertinacious rejection of any detail of the Bible. Ockham's discussion of how pertinacity is recognized was an original contribution. According to Thomas, the fact that Augustine and Jerome never defended their opinions against the authority of the pope showed that they were not heretics, whereas according to Ockham even an illiterate might defend a heresy before the pope "a thousand times" without being a heretic.

Dialogus was copied and studied, for example by Peter of Ailly who made an *abbreviatio* of the work, and in the fifteenth century it was printed

twice. Ockham's ideas on the fallibility of pope and councils and on the role of individual dissenters in witnessing to catholic truth were not adopted by later theologians or canonists. His 20 ways of proving pertinacity were taken over by Turrecremata in his *Summa de ecclesia*, lib. IV pt. 2 c. 16 (according to a communication from Thomas Izbicki to A.S. McGrade).

After the Middle Ages

Medieval Christian thinking on unbelief was based on the proposition that "without faith it is impossible to please God" (Hebrews 11:6), interpreted as meaning that God requires of every human being adherence (at least by implicit faith) to the particular body of doctrine found in the Bible and the teaching of the church. Some post-medieval writers put forward another view of what God requires. According to Pierre Bayle, we are required, not to believe the Bible and the church, but to search for truth and believe and act on whatever seems true – if there is any sin in relation to belief, it is not failing to believe the orthodox doctrine, but negligence and self-deception in the search for truth, of which the orthodox may also be guilty. A human being is not in a position to judge whether another person is guilty of such sin, and in any case human authority is not called on to punish it. Under the influence of such ideas, the punishment of heretics came to seem simply unjust.

Hermes Trismegistus

Charles Burnett

The Warburg Institute, London, UK

Abstract

Hermes is best known in the Renaissance as the supposed author of the *Corpus Hermeticum*, a collection of 17 Greek texts on spiritual education of which 14 were translated into Latin by Marsilio Ficino in 1463. One text of the ancient *Corpus Hermeticum* was translated into Latin

in late Antiquity under the title “Asclepius” (the Greek text is lost), and was the main conduit through which the doctrine of Hermes Trismegistus was known in the Latin West. The theoretical Hermeticism in the *Corpus Hermeticum* was accompanied by numerous texts of technical Hermeticism (in alchemy and talismanic-making), most of which were transmitted via Arabic.

In the older Classical tradition we find two Hermes. In the *Asclepius* (fourth century CE) Hermes Trismegistus states that his grandfather (or ancestor) was the god Hermes. Saint Augustine (*De civitate Dei*, VIII, 8) identifies the older Hermes as the son of Maia, daughter of Atlas, and Mercurius Trismegistus as his grandson. In the Arabic tradition, however, we find three. Abū Ma‘shar (787–886), in his *Kitāb al-ulūf* (*Book of the Thousands*), had stated that the first Hermes lived in Egypt before the flood, the second in Babylon, and revived the sciences after the flood, and the third, once again in Egypt, taught alchemy and passed on his wisdom to Asclepius. This appears to be a survival of a legend in ancient Egyptian history, as told in the *Book of Sothis* that one Hermes inscribed Egyptian knowledge on stone before the Flood, and another recovered it after the Flood. This became known to Arabic scholars through a chronicle written by Annianus (after the fifth century), who is cited by Abū Ma‘shar, al-Birūnī, and Bar Hebraeus. But Abū Ma‘shar makes the second Hermes a Babylonian, perhaps because of his Iranocentricity. The story of the three Hermes then became embedded in the alchemical tradition, and in this way reached the Latin West.

In their catalogue of medieval Latin Hermetic texts, Paolo Lucentini and Vittoria Perrone Compagni list 41 different works, extant in some 400 manuscripts. Most of these give instructions on the various materials to be used to make talismans and to summon spirits, so providing the practical aspect to the theory of the *Asclepius*. However, it cannot be immediately assumed that all these works were thought to be by an Egyptian Hermes or to convey Egyptian wisdom. When Hermes is quoted

by Abū Ma‘shar, he is a Persian, and this is reflected in Hermann of Carinthia’s *De essentiis* (1143), in which quotations of “Hermes” (or “Hermes Persa”) refer to citations from Abū Ma‘shar’s *Great Introduction to Astrology*, whereas quotations of “Trismegistus” refer to the *Asclepius*.

A significant number of texts in Arabic purport to convey the occult teaching of Hermes as transmitted by Aristotle to his royal pupil Alexander (the pseudo-Aristotelian *Hermetica*), and excerpts from these books survive in Latin translation (*Antimaquis, De luna secundum Aristotelem, Liber de quattuor confectionibus*).

No overlap has been observed between the Arabic texts attributed to Hermes and the Greek Hermetic corpus, but it is undoubted that the Greek *Corpus Hermeticum* originated in Egypt. Of Egyptian origin, also, is the art of alchemy, with which Hermes’ name is closely associated, and the magical art, which used spirits (daemons) in its operations. A leitmotif in Hermetic works is the discovery in an underground chamber or crypt of a stele made of marble, ebony, or emerald with mysterious writing or symbols on it. The best-known of these steles was the emerald tablet of Hermes, on which is written a hymn that encapsulates the mystery of alchemy. This first appears in Latin in a mid-twelfth-century translation of the *Secret of Creation* of Pseudo-Apollonius, made by Hugo of Santalla (see the entry on “► [Apollonius of Tyana](#)” in this volume).

The *Asclepius* remained the best-known conveyor of Hermetic doctrine in the Latin West. It was known to Lactantius in the second century CE and Augustine in the fourth, and was copied and quoted frequently in the Middle Ages and the Renaissance. It takes the form of a dialogue between Hermes Trismegistus and Asclepius. The Egyptian context of the conversation is presumed from the beginning, but the first explicit mention is in Section 24, when the conversation turns to statues “ensouled and conscious, filled with spirit and doing great deeds, foreknowing the future, and predicting by prophecy, dreams and other means.” During the course of this conversation, Trismegistus refers to Egypt as an “image of heaven” and states that “our land is the temple of the whole world.” The editor and

commentator on the *Corpus Hermeticum*, A.-J. Festugière, had claimed that the Egyptian element of the *Corpus* is only a veneer, and that the texts represented rather the academic culture of Hellenistic Alexandria. But discoveries in Armenian and in the Coptic papyri of Nag Hammadi prompted a reappraisal of the Egyptian roots of the doctrines.

These are some of the doctrines, as expressed in the *Asclepius*. The administration of all things is by the heavens, as “a perceptible god” (Section 3), but through the agency of the sun and moon, and the aid of daemons (5). Man is a “great wonder” with the capacity for becoming a god; everything is permitted to him, and he can know all things (6). The sensible universe is a “second god” created by the master and shaper of all things, and man was brought into being to admire this creation (8); hence there are three gods: the master of eternity, the universe, and mankind (10). Man’s aim should be to disdain earthly possessions and seek out the divine (11). Music brings all knowledge into its correct sequence (13). In the beginning, there was *hylē* (the Greek word used for matter), infused with spirit, which had the capacity for coming into being and procreating (14). God fills all things with spirit (16); matter nourishes bodies, spirit nourishes souls (18). All mortal and immortal things and all sensible and insensible things are connected in that they all depend on one thing (19). God cannot be named, is of both sexes, and ever pregnant with his own will (20). Man is superior to the gods in that he is both mortal and immortal, whereas gods are only immortal (21). Man can call down souls into appropriate matter in order to make living statues, which have the power of looking after things and foretelling the future (24); this is the art of making gods (37). Hymns, praises, and sweet sounds in tune with heaven’s harmony keep the statue-god happy in the presence of mankind. It is these lesser gods who help humankind through loving kinship, looking after individual things and giving advice for the future (38). The world is eternal, governed by the action of the sun and the movement of the stars (30), and regulated by *heimarmenē* (fate), necessity, and order (39). God requires no gifts other than worship and prayer (41).

The emphasis on ensouling matter, making “gods” who can help man, binds the theoretical Hermetic texts of the *Corpus Hermeticum* with the technical ones, such as the *Antimaquis*, and the various texts on making talismans. For a talisman is analogous with a statue, in that it is made of natural substances, but endowed with soul or spirit through the performance of various ritual acts, and spirits of the upper world are summoned to do the bidding of the practitioner. The *Corpus Hermeticum* enjoyed a new vogue after Ficino’s translation of 1463, under the title *Pimander* (printed in 1472), and encouraged the idea of a “perennial philosophy” or “ancient theology” founded by sages of hoary antiquity. Only with the debunking of an age-old Hermes by Isaac Casaubon in 1614 did the Hermetic doctrines start to lose their interest.

Hervaeus Natalis

John P. Doyle

Department of Philosophy (Professor Emeritus),
St. Louis University, St. Louis, MO, USA

Abstract

Hervaeus Natalis was a fourteenth century Dominican philosopher and theologian. Both before and after he became Master General of his Order, he took part in different political as well as theological controversies, in the course of which he defended the doctrine of Thomas Aquinas. Historians, however, have questioned his Thomistic orthodoxy, inasmuch as he departed from Aquinas on important doctrines such as the distinction of essence and existence in creatures, individuation, truth, and relation. He was the first medieval philosopher to introduce and discuss the notion of intentionality, which had important ramifications both within his own century and in centuries to come.

Biography

Hervaeus Natalis (Variants of his surname include: de Nedellec, Nédélec, Nédélek, Noël; and of his forename: Arveus, Erveus, Hervé, or Harvey) was born in Brittany probably between 1250 and 1260, and he entered the Dominicans in April of 1276. From 1302 to 1307, he was in Paris studying theology at the convent of Saint-Jacques. On June 26, 1303, while a *Bachelor sententiarus*, he was one of numerous Dominicans at Saint-Jacques who signed the petition of Philip the Fair, seeking to convoke a council, which would judge Boniface VIII on the subject of royal versus papal jurisdiction. Also during this period, Hervaeus composed his *Commentary on the Sentences of Peter the Lombard* and received his licentiate in 1308. Besides his *Sentences commentary*, he authored other works and engaged in numerous controversies, which resulted in various polemical writings. Among these was a *Defense of the Doctrine of St. Thomas*, plus works directed against Duns Scotus (1266–1308), Peter Auriol (d. 1322), Henry of Ghent (1217–1293), James of Metz (fl. 1295–1309), Jean de Pouilly (d. c. 1321), and especially Durand of Saint Pourçain (c. 1275–1334). In 1309, Hervaeus became Provincial Superior of the Dominicans in France. In 1318, he was elected Master General of his Order, in which office he remained until his death at Narbonne on August 7, 1323. Worthy of note here is that Thomas Aquinas (1225–1274) was solemnly canonized at Avignon on July 18, 1323, but Hervaeus, who as Master General had vigorously promoted his cause, was too ill to attend.

Thought

Whatever his purpose, Hervaeus was at best an eclectic Thomist. Thus, he denied the central Thomistic doctrine of a real distinction between essence and existence in creatures. In his most explicit work on proving God's existence, Hervaeus, to some degree influenced by Duns Scotus (1266–1308), from among the famous five ways of Aquinas, embraced only the second

from efficient causality and the fourth from degrees of being. He downgraded the first way from motion, although in his *Treatise on Second Intentions*, without mentioning Thomas by name, he seems to accept, and even to highlight, this first way. Other points of departure from Thomism included an embrace of a real unity of species and a doctrine, which in contrast both to Thomas' quantified matter and Scotus' *haecceitas*, attributed individuation to a combination of an extrinsic cause and the intrinsic essence of a thing. Again, he taught a doctrine of relation, which centered on connotation and came close to that later adopted by William of Ockham (c. 1284–1349). At the same time, he allowed for real as well as conceptual relations and, for example in his *Quodlibet* I, question 9, he affirmed the reality of the last six Aristotelian categories. The distinction between real and conceptual relations was important for Hervaeus' understanding of intentionality. While intentions had been discussed by many others from Avicenna (980–1037) on, Hervaeus apparently first coined the term “intentionality” (*intentionalitas*), which he used 235 times in his *Treatise on Second Intentions*. Here two things to note are: (1) for him intentionality was basically a relation from the known, or the knowable, to the knower, and (2) the point of departure for his discussion was not the *De anima* but rather the *Metaphysics* of Aristotle. In this last, the key was Aristotle's distinction between real being in the categories and being as true. More specifically, the relation involved for Hervaeus in the constitution of the whole order of intentionality was not a real categorical relation from knower to known but a conceptual relation in the opposite direction. Connected with his teaching on intentionality was his doctrine of truth, which he described as a relation of conformity between a thing in its objective being and the same thing in its real being. Again connected is his non-Thomistic position that creatures from all eternity have in the mind of God not actual but rather objective being. This position was later rejected not only by most Thomistic commentators, such as Cajetan [aka Thomas de Vio (1469–1534)], Ferrara [Franciscanus de Silvestris Ferrarensis (1474–1528)], Domingo Bañez (1528–1604),

and John of St. Thomas (1589–1644), but also by Luis de Molina (1535–1600). It was, however, accepted by Molina's fellow Jesuit, Francisco Suárez (1548–1617), who in his famous *Disputationes metaphysicae* (Salamanca 1597) cited Hervaeus 77 times. Other things to mention now are Hervaeus' views on temporal and spiritual jurisdiction, and also on dominion, rights, and ownership. All these views, which have links yet to be explored with his intentionality theory, had importance for changing understandings of state and church, for government and subordination of power within the church, as well as for objective and subjective rights, in the early fourteenth century and after.

Heymeric of Camp

K. Meredith Ziebart

Department of Philosophy, Université du Québec à Montréal, Montréal, QC, Canada

Abstract

Heymeric of Camp (van de Velde) was a theologian and leading representative of the Albertist school at Cologne in the fifteenth century, and the author of approximately 30 philosophical as well as theological works, of which only a fraction have been printed or edited. He served as rector of the University of Cologne and its representative at the Council of Basle, and is remembered as a friend and confidant of Nicholas of Cusa, who briefly studied theology under him at Cologne. Heymeric's thought is generally considered to belong to the scholastic Neoplatonic tradition, and is strongly impressed by the influence of Albert the Great as well as by the *Ars generalis* of Ramon Llull.

Life and Work

Heymeric was born approximately in 1395 in Zon (Brabant), in the vicinity of Eindhoven in what is now the Netherlands, and died on August 11, 1460 in Leuven, Belgium. Between 1410

and 1420 he studied in Paris, where he came under the tutelage of John de Nova Domo. From 1420 to 1422 he taught philosophy in Diest (vicinity of Leuven), where he composed his first major work, the *Compendium divinatorum*, a handbook on the subject of metaphysics. In 1422, he entered the Theology faculty at Cologne. Works belonging to Heymeric's theological studies include a *Sentences* commentary, the *Quadripartitus quaestionum supra libros sententiarum*, and commentaries on Aristotle, including the *Quaestiones supra libros philosophiae rationalis, realis et moralis Aristotelis*, *Compendium logicae*, *Compendium naturalis philosophiae*, and *Compendium ethicorum*. He became Master of theology at Cologne in 1428 and was appointed professor of theology shortly thereafter. In 1432, Heymeric was made rector of the university, and between 1432 and 1435 he represented the university at the Council of Basle. During this time, he composed a lengthy conciliar tract, the *Disputatio de potestate ecclesiastica*, a defense of the revelations of St. Birgitta of Sweden (*Dyalogus super reuelacionibus Beate Birgittae*), as well as a number of important philosophical works. From 1435 to 1453, Heymeric served as professor of theology at the University of Leuven.

His early philosophical work, the *Compendium divinatorum*, which presents an emanation model of reality whereby creation is a hierarchical unfolding into plurality of the divine first principle, already manifests the strongly Neoplatonic orientation of Heymeric's thought. He maintains in this work that, by virtue of its emanation, the inner structure of everything in the universe bears a Trinitarian structure which is an image, or assimilation, of its divine principle. Accordingly, each substance is a unity, but with an inner Trinitarian structure — the most fundamental of which is determined as *esse*, *posse*, and *operari* — that corresponds to the divine persons. This Trinitarian model of reality is further developed in a later work, entitled the *Theoremata totius universi*, where the divine Trinity is mirrored in creation through triadic structures such as *unitas*, *veritas*, and *bonitas*. Although Heymeric does not explicitly identify his approach as Albertist in these works, his trinitarian theory is heavily marked

by the influence of Albert the Great, especially the latter's commentary on the *Divine Names* of Pseudo-Dionysius.

In his *Tractatus de sigillo aeternitatis* (1432–1435), the central figure is that of an encircled, equilateral triangle with lines extending inward from each corner to the center of the circle. The circle symbolizes the unity of God, the triangle symbolizes the Trinity, and the radiating lines stand for the external working of the divine power in creation. Heymeric maintains that this divine symbol is the best means for making the trinitarian structure of reality apparent, due to its ability to communicate traces in the lower echelons of the human understanding (*ratio*) to its upper echelons (*intellectus*). In this way, the symbol is not only the key to all scientific knowledge, but will lead one to the first principles of that knowledge, that is, to their divine archetypes.

The *Colliget principiorum iuris naturalis, divini et humani philosophice doctrinalium*, written during his Basle years, is Heymeric's largest work next to the *Disputatio*, and comprises a wide-ranging survey of philosophical principles. The *Ars demonstrativa*, written around the same time, develops a method of demonstration through a peculiar application of the Aristotelian principle of non-contradiction, whereby a series of philosophical as well as theological truths are shown to be true via a process of demonstrating the absurdity resulting from the assertion of their opposite.

De signis notionalibus (1435–1460), a treatise written most probably during Heymeric's professorship at Leuven, revisits the question of how observation of aspects of creation can in a step-wise manner lead to knowledge of the divine Trinity, and belongs to the tradition of *vestigia trinitatis* treatises of the likes of Bonaventure's *Itinerarium mentis in Deum*. In this work, he brings forth many examples of such *vestigia* found in nature, including the Trinitarian structure of the four elements, whereby each is seen to be comprised of a triad of characteristics interrelated in a manner that mirrors the divine Trinity. So, for example, fire is alleged to consist of the characteristics of warmth, dryness, and lightness, such that warmth is the primary characteristic, out of

which is generated dryness, and out of these both proceeds lightness. Another of Heymeric's late works is the *Centheologicum* (c. 1454), a compendium of 100 different philosophies, including sections on Nicholas of Cusa and Ramon Llull.

All of Heymeric's speculative works are concerned with finding a universal form of knowledge that will encompass both philosophy and theology. Trinitarian concepts play an important role in this universal knowledge. Because it is an image of the divine Trinity, the human soul is a *thesaurus omnium scibilium*, which can be unlocked through self-knowledge, and which therefore has the potential to grasp through natural means not only all human knowledge, but divine truths as well. In so affirming the ability of human reason to discover divine wisdom, Heymeric comes down firmly on the side of the *via antiqua*, as one who rejects the nominalist division of philosophy and theology.

Heymeric and Nicholas of Cusa

Nicholas and Heymeric were lifelong friends and exerted a mutual influence in terms of philosophical ideas. As mentioned, Cusa studied theology under Heymeric at Cologne in 1425–1426, and they were colleagues at the Basle council. Heymeric makes reference to Cusa's works *De docta ignorantia* and *De pace fidei* in his *Centheologicum*, and refers to Cusa as "Praeceptor meus" in a letter. On the other hand, it was probably Heymeric who introduced Cusa to the philosophy of Ramon Llull, and Heymeric's writings on the subject of Christianity and Islam in his *Disputatio* had a marked effect on Nicholas' *De pace fidei* and *Cribatio Alkorani*. There are three codices containing manuscripts of works by Heymeric in the Cusanus Library in Bernkastel-Kues (Cod. Cus. 24, containing Heymeric's commentary on the *Apocalypse*; and Cod. Cus. 105 and 106, containing the *Compendium divinorum*, *Quadripartitus quaestionum supra libros sententiarum*, *Quaestiones supra libros philosophiae rationalis, realis et moralis Aristotelis*, *Theoremata totius universi fundamentaliter doctrinalia*, *Ars demonstrativa*, *Tractatus de sigillo aeternitatis*,

Disputatio de potestate ecclesiastica, and *Colliget principiorum*).

Heymeric and Albertism

It was as a student of John de Nova Domo, the founder of the Albertist school, that Heymeric came to be a representative of Albertism, a fifteenth-century movement which defended Albert the Great's reading of Aristotle against the interpretations of its major competitors, namely the Thomists, Scotists, and Nominalists. Albertism is distinguished from the other schools of thought by its strongly Neoplatonic orientation. One of its key distinguishing features is the teaching that it is possible for the intellect to attain knowledge of separate substances in this life and without the mediation of sensible experience. In defending this as an interpretation of Aristotle, the Albertists relied heavily on the concept of the "intellectus adeptus," taken from the Islamic Aristotelians. In 1423, Heymeric penned the *Tractatus problematicus* (*Problemata inter Albertum Magnum et Sanctum Thomam*, printed in Cologne in 1496), an Albertist tractate in which he first identifies and rejects the position of the Nominalists, before examining the points of difference as well as agreement between the Thomists and Albertists. This treatise incited a violent response from Thomist Gerard de Monte, who rejected the notion that there might be any points of agreement between Albertists and Thomists. Heymeric's influence on academic theology in the fifteenth century — especially through the *Tractatus problematicus* — was considerable, and his activities as a representative of Albertism were largely responsible for the institutional solidification of the Albertist school at Cologne and beyond.

Hildegard of Bingen

Constant J. Mews

Centre for Religious Studies, School of Philosophical, Historical and International Studies, Monash University, Clayton, VIC, Australia

Abstract

Hildegard of Bingen (1098–1179) was brought up from the age of 7 at the monastery of Disibodenberg, near Mainz, Germany. Little is known of her early life until a mystical experience in her 43rd year prompted her to start recording her visionary insights in *Scivias* (*Know the Ways*), a work that gained the approval of both St. Bernard and Pope Eugenius III at the Council of Trier in late 1147 or early 1148. Soon after 1150, she succeeded in moving with her female community from Disibodenberg to Rupertsberg near Bingen. There she became famous as a prolific author and as a spiritual guide and counselor for both her nuns and the wider community. Although not trained in philosophy, her visionary treatises, *Scivias*, the *Liber vitae meritorum*

(*Book of Life's Rewards*), and the *Liber divinorum operum* (*Book of Divine Works*) reveal her desire to interpret religious doctrine in the light of nature. She was profoundly interested in the therapeutic properties of plants, stones, and living organisms in the natural world, as well as in the capacity of music to restore the human soul. Although she never traveled outside of Germany, she was widely recognized by contemporaries across Europe as being one of the most extraordinarily gifted women of her day.

Biographical Information

Hildegard reveals relatively little about her early life, other than that ever since the age of 5, she had been gifted with “secret and wonderful visions,” which she had once spoken to a woman under whose care she had been placed (Jutta, daughter of the Count of Sponheim), but that by the age of 15 she had learned not to speak about them, out of fear of what others might say (*Vita Hildegardis* II.2). Having been offered to Disibodenberg as a child, she was formally enclosed as a recluse there in 1112, along with Jutta – who was 6 years older. According to the *Life of Jutta*, written soon after her death in 1136, Hildegard's mentor was widely known as offering advice and healing, but who was committed to extremes of self-mortification (Silvas 1999, 65–84). Only gradually did Hildegard move out of her shadow. She recalls that her life changed in 1141 with a mystical experience of “the living light” by which she claimed to understand the true meaning of the scriptures, of the Fathers (and also of some philosophers, she would later add) (*Scivias*, Prol.; *Vita Hildegardis* II.2). She was encouraged to record her insights by close friends, in particular by a monk called Volmar and Richardis von Stade. She spent the next 10 years working on *Scivias*, or “Know the Ways” (of the Lord). Yet, only after prolonged bouts of illness and after getting support from St. Bernard and Pope Eugenius III at the Council of Trier (1147/48) was she able to move with 18 nuns to a new monastic site, at Rupertsberg, where she was officially the

magistra with Volmar as provost, but operated as its abbess (*Vita Hildegardis* II.7). She quickly became widely recognized as a healer and visionary, consulted by bishops, monks, and simple layfolk. She engaged in extensive correspondence with contemporaries at the same time as composing many songs for the liturgy at Rupertsberg. At this abbey, she devoted herself to writing not just about the Church and Scripture but about the healing properties of natural elements and creatures, psychological development, and the relationship of the natural world to the process of redemption.

Hildegard went on several preaching tours in Germany and was particularly concerned by the growth of heretical groups that rejected the worldliness of the established Church. In the final year of her life, Hildegard and her nuns were excommunicated by the archbishop of Mainz, ostensibly for burying an excommunicated nobleman in their grounds. This prompted an impassioned defense of their right to sing the liturgy and thus recreate the original voice of Adam in Paradise (*Epist.* 23). While this excommunication was lifted shortly before her death on September 17, 1179, Hildegard's devoted admirers never succeeded in getting her recognized by the papacy as a saint.

Thought

Hildegard's first major work, *Scivias*, is concerned with the evolution of *Ecclesia*. She describes and comments on 13 visions (subsequently illustrated in the manuscript produced under her direction). While she professed ignorance of the technical skills of exegesis, she uses visual images to highlight her reading of the great themes of creation, the fall of humanity and the redemption, and the return of *Ecclesia* to a godly path. Identifying herself with John the Divine, she quotes extensively from Scripture to explain that although the natural universe was created by God, humanity had been led astray (*Scivias* I). Her frequent theme is that natural *viriditas*, or greening power, has fallen away and that it is only through God's love that *viriditas* can be restored (Mews 1998b). Hildegard gives detailed advice to different orders within the

Church about how they ought to lead their life. Rather than single out Eve as the temptress of Adam, she sees the devil as having ensnared Eve, mother of creation, but *Ecclesia* as the reawakened Bride, mother of the faithful, destined for mystical union with Christ (Newman 1987). Much of the third part of *Scivias* is taken up by an account of the elevation of *Ecclesia* through the Virtues, to which Christians can appeal for support in their effort. It concludes with a series of mystical songs that serve to remind a sluggish soul of her true calling, expanded in her *Ordo Virtutum* (*Order of Virtues*), a morality play about the soul's journey. Hildegard also included songs in her *Symphonia of celestial harmonies*, songs that she may have started to compose long before she moved to Rupertsberg in 1150.

In the *Liber subtilitatum rerum creaturarum* (*Book of the Subtleties of Created Things*), preserved as two separate texts, the *Physica* and the *Causae et curae* (*Causes and Cures*), Hildegard considers not only how did God create all things but how creation, rightly used, can help restore human health to physical and spiritual balance (Moulinier 1995). Her teaching recapitulates some familiar themes of traditional medical wisdom, but placed within a spiritual framework, in which physical illness is seen not simply as a means for testing spiritual stamina, but as a sign of spiritual imbalance within the human being. Hildegard constantly refers to physical illnesses by which she was afflicted throughout her life. Whereas Jutta seems to have treated the body by ascetic exercises, Hildegard understood the spiritual life as involving a restoration of physical as well as spiritual harmony. She developed the psychological aspect of her teaching in the *Liber vitae meritorum*, composed after 1158, on a visual image to highlight her teaching about conduct that ultimately leads away from God. Using apocalyptic imagery to warn against vices of infidelity, slothfulness, and worldly love, and the consequences of such behavior on those who follow such vices, she sees herself as a legitimate philosopher, though wiser than those who simply trusted in head knowledge (*Liber vitae meritorum* III.9).

In 1163, Hildegard started her greatest composition, the *Liber divinorum operum* (*LDO*), a vast synthesis of visionary teaching, expounded

through her technique of describing and commenting on a series of 10 visions. The task took her another 10 years to complete. While Hildegard was never trained in the schools, she would have been exposed to theological works like the *De sacramentis* of Hugh of St. Victor, with its theme of God's plan for restoring humanity to God. She takes a very different tack, however, from scholastic theologians. The first section of *LDO* is devoted to a symbolic account of the natural world and the relationship of the human person to the wider universe. She has an apocalyptic figure proclaim her distinctly dynamic vision of the life force, divine in origin, that sustains creation:

I am the supreme and fiery life, which sets aflame all living sparks, and breathed forth nothing dead, and I judge all things as they are. [...] For the air lives in viridity and flowers, the waters flow as if they live, the sun also lives in its light (*Liber divinorum operum* I.1.2).

With this rich poetic writing, Hildegard distances herself from traditional philosophical categories about divine being and instead emphasizes the divine force that sustains the created world. Her consistent theme is that body and soul need each other to survive and that imbalance in this relationship disturbs the entire order of creation.

Hugh of St. Victor

John T. Slotemaker
Department of Theology, Boston College,
Chestnut Hill, MA, USA

Abstract

The writings of Hugh of St. Victor encompass pedagogical, exegetical, theological, and spiritual works. These four areas of Hugh's thought are brought together by various themes, the

central one being the creation of the world by the Triune God and redemption of the world through the grace of the incarnation and the sacraments of the Christian Church. This unifying theme is worked out exegetically, spiritually, and systematically through a conception of world history that takes into account the historical and eschatological realities revealed in the Christian Scriptures. The present article briefly traces these themes as they are woven through Hugh's central works.

Hugh of St. Victor (b. 1097/1101–d. 1141) was a member of the Augustinian canons regular at the Abbey of St. Victor, located on the left bank of the Seine just outside the city walls of twelfth-century Paris. Perhaps a student of William of Champeaux, Hugh was profoundly influential in the intellectual flowering that took place in western Europe from the early twelfth to the mid-thirteenth century. Hugh, called by his contemporaries the *secundus Augustinus*, was significantly influenced by Augustine of Hippo; Hugh's influence can be traced in the writings of Richard of St. Victor, Adam of St. Victor, Thomas Gallus, and Bonaventure.

Like many of the victorines, Hugh is more of a theologian and biblical exegete than a philosopher in any modern sense of the term, and his works can be divided into pedagogical, exegetical, theological, and spiritual works (Poirel 1998: 37–47). The writings of Hugh (including numerous misattributions) are collected in the *Patrologia Latina* 175–177 and are currently being edited in modern critical editions.

Hugh's Pedagogical Division of Philosophy

In his *Didascalicon*, Hugh divided philosophy (the sciences), following Augustine's *De doctrina christiana*, into four basic categories: (1) theoretical, (2) practical, (3) mechanical, and (4) logical. The theoretical sciences consist of theology, mathematics (arithmetic, music, geometry, and astronomy), and physics. The practical sciences

are made up of individual concerns (ethics), domestic concerns (economic), and public concerns (political). The mechanical sciences consist of fabric making, armament, navigation, agriculture, hunting, medicine, and theatre. Finally, the logical sciences are divided into grammar and the art of reasoning (demonstration, dialectic, and rhetoric). The divisions explicated above inform Hugh's other pedagogical works such as *De institutione nouitiorum*, *De grammatica*, and *De tribus maximis circumstantiis gestorum* (*Chronicon*). These works emphasize the importance of historical learning and memory as well as proper exegetical method.

Biblical Exegesis

The Abbey of St. Victor was characterized by a focus on biblical exegesis (Smalley). From Hugh and Andrew of St. Victor's reevaluation of the historical sense (Zinn) to Herbert of Bosham's interest in the *hebraica veritas* and Hebrew exegesis (Goodwin), the school had a significant impact not only on twelfth-century exegesis but also on the subsequent medieval tradition. The Hugonian corpus includes theoretical works of exegesis (*De scripturis et scriptoribus sacris*, PL 175, col. 9–28; *Didascalicon*) and several important individual exegetical works (*Expositio super Psalmos*, PL 177, col. 589–634; *Homiliae in Ecclesiasten*, PL 175, col. 113–256).

Again, following Augustine (*De doctrina christiana*), Hugh divided Scripture into three distinct scriptural types: (1) literal (historical), (2) allegorical, and (3) tropological (moral). The literal sense, as Hugh understands the category, is closely related to a historical understanding. Hugh places a strong priority on the historical sense, and it functions as a guide by which he evaluates the other senses, in particular arguing against an uncontrolled or undisciplined use of the spiritual sense (*Didascalicon* 6, 3; *De scripturis et scriptoribus sacris* 3–5). A particular passage of Scripture can be understood to have a literal, allegorical, and tropological sense, implying that these are not “competing” categories in Hugh's exegesis.

Theological Speculation

Hugh's pedagogical and exegetical works form the foundation of his *De sacramentis christianae fidei*, a work that is often considered the first theological *Summa* of the high medieval period. This systematic work is not Hugh's only theological treatise, although judging by the extant manuscripts *De sacramentis* (224 mss.), and the shorter *De tribus diebus* (114 mss.) are Hugh's most significant theological tracts for the later Middle Ages (Poirel 1998: 41–43).

Hugh argues in the prologue to *De sacramentis* that readers are often distracted by various unorganized and disparate volumes, therefore he proposes a systematic order that is contained in a single *Summa*. He argues that the subject matter of the Scriptures is the restoration of humanity, and this restoration is found in two works: (1) the work of creation (*opus conditionis*) and (2) the work of restoration (*opus restaurationis*). This basic division of the treatise is between the time before the incarnation and the time after the incarnation. The first work includes all things that came into being in the time before the incarnation including angels, humanity, the fall, human restoration, the sacraments (sacraments of the Hebrew Bible), faith, and the law. The second work is an explication of the restoration of creation through the incarnation and the sacramental nature of all of reality. In Hugh's language, "the work of restoration is the incarnation of the word with all his Sacraments" (*opus restaurationis est incarnatio Verbi cum omnibus sacramentis suis*; PL 176, col. 183). Hugh explicates the narrative of creation, fall, and redemption in the first book of *De sacramentis*, leaving to the entire second book an elaborate discussion of the incarnation of the Word and the divine grace given through the sacraments.

The narrative of creation and redemption found in *De sacramentis* is also the significant theme of the Ark trilogy and numerous other writings, locating the heart of Hugh's thought in the plan of redemption as worked out in the grace of the incarnation and the sacraments of the Christian Church. The exegetical, mystical, aesthetic, and theological threads of Hugh's oeuvre are intricately woven together in his short work *De tribus diebus*.

Spirituality

The culmination of Hugh's theological enterprise – and clearly the most copied, and presumably read, works – are his spiritual writings. Some of these works, such as the *Soliloquium de arrha animae* (327 mss.), *De virtute orandi* (226 mss.), and *De archa Noe morali* (152 mss.) exist in hundreds of manuscripts, demonstrating that they were incredibly popular spiritual writings (Poirel 1998: 44–47). The works that have received the most scholarly attention recently are Hugh's triad of works on the theme of Noah's Ark: *De archa Noe morali* (or *De archa Noe*), *De archa Noe mystica* (or *Libellus de formatione arche*), and *De vanitate mundi*.

The Ark trilogy is an elaborate schema in which the human heart or soul is related to God. God, throughout the trilogy, is found to dwell in the human being through knowledge and love; knowledge constructs the structure of faith, the Ark, and love is that which gives the Ark its beauty and embellishment. God dwells in the human heart as if in a temple or an Ark. But, the relationship between God and the human heart is worked out through a complex structure of scriptural and historical imagery. This work is begun in *De archa Noe morali* and continued in *De archa Noe mystica*. The latter work encapsulates all of Biblical and Church History, emphasizing the place of the Church (CCCM 176:127; PL 176, col. 685) and its human inhabitants from Adam through the pontificate of the present Pope Honorius (CCCM 176:128–132; PL 176, col. 686–7). The final work in the triad, *De vanitate mundi*, is in the form of a dialogue between Reason and the Soul. The work continues the same theme, in which the Ark saves humanity from the flood and brings it to God – who both resides above, but is also the helmsman, or captain, of the Ark.

Ibn Abī Jumhūr al-Aḥsāʾī

Mathieu Terrier

LEM (UMR 8584), CNRS, PSL, Paris, France

Abstract

Ibn Abī Jumhūr al-Aḥsāʾī (d. after 904/1499), was a Shīʿī theologian and a philosopher who spent his life between his homeland of Baḥrayn, the sacred Shīʿī places of Iraq, and Khurāsān. His bibliography is mainly divided in works of Imāmi classical theology (kalām) and works combining theology with philosophical and mystical ideas. In his magnum opus, the *Mujlī mirʾāt al-munjī fī l-kalām wa l-ḥikmatayn wa l-ṭaṣawwuf* (“The Book of the Illuminated, Mirror of the Savior, on Theology, the Two Wisdoms, and Sufism”), he upheld the harmony between Twelver Shīʿism, Sufism, and – Peripatetic as well as Illuminist – philosophy. Shīʿī scholars would eventually adopt contrasted attitudes towards him; however, his influence upon the “philosophical Renaissance” in the tenth-to-eleventh/sixteenth-to-seventeenth-century Iran was certainly decisive

Muḥammad Ibn Zayn al-Dīn Abī l-Ḥasan ʿAlī b. Ḥusām al-Dīn Ibrāhīm, known as Ibn Abī Jumhūr al-Aḥsāʾī (d. after 904/1499), was a Shīʿī theologian, philosopher, and mystical thinker of the

second half of the ninth/fifteenth century. He is commonly associated with Sayyid Ḥaydar Āmulī (d. after 787/1385-86) and al-Ḥāfiẓ Rajab al-Bursī (d. after 813/1410-11), as a prominent representative of the rapprochement between Twelver Shīʿism, Sufism, and philosophy, during the somewhat chaotic post-Mongol period in Eastern Islamic world. However, he was much more acquainted with philosophical doctrines than these two. He can be seen as one of the main agents of the integration of Avicennism and Illuminationist philosophy into the Shīʿī thought. Although he composed all his work in Arabic, his influence was mainly in Iranian Shīʿī circles. In this regard, his influence upon the “philosophical Renaissance” in the tenth-to-eleventh-/sixteenth-to-seventeenth-century Iran shall not be overlooked.

His Life

Little is known about Ibn Abī Jumhūr al-Aḥsāʾī's life. The scant information available to us is mainly due to self-testimonies contained in his writings, his colophons, and the *ijāzas* (licenses to teach some scholarly works) that he issued or received (Schmidtke 2009; al-Ghufrānī 2013). He was supposedly born in 838/1435 in the village of al-Taymiyya in the region of al-Aḥsāʾ. Located in the northeast of the Arabian Peninsula, this area belonged to the historical province of Baḥrayn, along with the present-day Baḥrayn islands, and is

known for an early period as a Shī'i center (Shaybī 2011, Vol. 2, p. 312; Muwaḥḥid 1988, p. 635; Schmidtke 2000, pp. 14–15; Lawson 1996, p. 662). In the mid-fifteenth century, the rule of the Sunni Banu Jabr put the Shī'is under pressure to convert; however, the region continued to produce Shī'i scholars who frequently travelled to Iraq for further study (Newman 2013, p. 148).

Ibn Abī Jumhūr spent his life between the region of Baḥrayn, the sacred Shī'i places of Iraq, and Khurāsān in the northeast of Iran. At that time, Arab and Persian worlds were not so politically and culturally separated, and Ibn Abī Jumhūr made many trips back and forth between the two areas. He carried out his earliest studies in traditional sciences in al-Aḥsā', under the tutelage of his father Shaykh Zayn al-Dīn 'Alī b. Ibrāhīm al-Aḥsā'ī (d. before 895/1489–90). Then he set out for Najaf in Iraq, which houses the shrine of the first Shī'i Imām 'Alī b. Abī Ṭālib (d. 40/661) and was the main center for Shī'i learning. He completed there his formation in religious sciences, notably in the circle of Shaykh Sharaf al-Dīn Ḥasan b. 'Abd al-Karīm al-Fattāl (fl. 870/1465–66), from whom he received an *ijāza*. In 877/1472, at the age of 40, he took the way of Mecca to perform the pilgrimage. Upon completion of the *ḥājj*, he spent some months in Karak Nūḥ, Jabal 'Āmil (present-day South Lebanon), a reputed Twelver Shī'i center, where he integrated the circle of Shaykh 'Alī b. Hilāl al-Jazā'irī (d. between 909/1504 and 915/1510), from whom he also received an *ijāza* (Shūshtārī 2014–15, Vol. 5, p. 602; Schmidtke 2000, pp. 16–17). After a short stint back in his homeland, he travelled again to the Shī'i sacred places of Iraq, under the sovereignty of the Sunni Ottoman Empire. From here, he set out for Khurāsān to visit the mausoleum of Imām Riḍā (d. 203/818) in Mashhad. On the road, he composed his *Risāla Zād al-musāfirīn fī uṣūl al-dīn*, a treatise on dialectic theology (*kalām*). In Mashhad, he took part in theological debates with a Sunni scholar named al-Fāḍil al-Hirawī in 878/1483; one of these controversies, about the succession of the Prophet and the imāmate of 'Alī b. Abī Ṭālib, is reported by the Shī'i-oriented historian Nūrallāh Shūshtārī (d. 1019/1610) (Shūshtārī 2014–15, Vol. 5, pp. 603–620).

Ibn Abī Jumhūr spent most of the last decades of his life in Mashhad and other cities of Khurāsān. In 886/1481–82, he visited Baḥrayn and Qaṭīf, and in 893/1488, he achieved in his homeland his *Nūr al-munjī min al-ḡalām* (see below). In 894/1488–89, he made a second pilgrimage in Mecca, followed by a 2-year stay in Najaf. Then he came back to Mashhad, where he completed his *Mujlī mir'āt al-munjī* (see below), in 896/1490. In 904/1499, he composed in Madīna what seems to be his last work, a commentary on *al-Bāb al-ḥādī'ashar*, a theological treatise of al-'Allāma al-Ḥillī (d. 726/1326). The last piece of evidence of his life is an *ijāza* issued in Ḥilla, Iraq, in Rajab 906/1501 (Fārmad in *Mujlī*, pp. 65–67; Schmidtke 2017, pp. 400–401). At the very same year, the young leader of the Safavid brotherhood, Shāh Ismā'īl (r. 906–930/1501–1524), and his troops of fanaticized dervishes, took the city of Tabriz, the capital of the Aq Quyunlu state, and proclaimed Shī'ism as the religion state of Iran. The death of Ibn Abī Jumhūr must have occurred after this event, but its date remains unknown.

His Thought

Ibn Abī Jumhūr's bibliography is mainly divided in works on theology (*kalām*) in a conventional style, on the one hand, and works combining theology with philosophical – Peripatetic as well as Illuminationist – and mystical thought, on the other hand. The first group notably contains his treatise *Zād al-musāfirīn*; its autocommentary *Kashf al-barāhīn li-sharḥ Zād al-musāfirīn*, achieved in 878/1474; and his creedal tract *Maslak al-aḥmād fī 'ilm al-kalām*, composed in 886/1482 (IAJ 2014). The second group contains *al-Durra al-mustakhrija min al-lujja*, a brief epistle introducing the metaphysics of lights, composed between 886/1483 and 888/1483; its autocommentary *al-Bawāriq al-muḥsiniyya li-tajallī al-durra al-jumhūriyya*, completed in 888/1483; and the *Mujlī mir'āt al-munjī fī l-kalām wa l-ḥikmatayn wa l-taṣawwuf*, an autocommentary of *al-Nūr al-munjī min al-ḡalām*, which was in turn an autocommentary of the

Maslak al-afhām fī ʿilm al-kalām (Fārmad in *Mujlī*, pp. 85–86; Ṭihirānī 1934, Vol. 20, p. 13; Madelung 1978, pp. 147–156; Schmidtke 2000, pp. 28–30).

The earliest works of Ibn Abī Jumhūr do not witness of any philosophical or mystic influence, despite a certain inclination toward rationalism. He may have get acquainted with the philosophy of Avicenna and the “Peripateticians” (*al-mashāʾiyyūn*), as well as the “wisdom of Illumination” (*ḥikmat al-ishrāq*) of Shihāb al-Dīn Suhrawardī (d. 587/1191), through the teaching of Shaykh Ḥasan al-Fattāl. As for Sufism, and in particular Ibn ʿArabī’s theosophy, he seems to have become learned in it even later. However, it is noteworthy that philosophical mysticism was a living tradition in his homeland Baḥrayn, counting scholars such as Kamāl al-Dīn Mītham al-Baḥrānī’s (d. after 681/1282), whose *Sharḥ Nahj al-balāgha*, a commentary of the collection of sayings attributed to the Imām ʿAlī, is quoted by Ibn Abī Jumhūr in his *Mujlī*.

The first stage of Ibn Abī Jumhūr’s philosophical thought appears in his *Durra al-Mustakhrija min al-lujja* and its autocommentary *al-Bawāriq al-muḥsiniyya*. The former epistle deals with spiritual conduct (*sulūk*) through five stations (*maqām*). It describes the fall of the soul from the higher world to the lowest, and its release from the latter, while drawing the metaphor of a bird in a cage; it also describes the progress from religious “blind imitation” (*taqlīd*) to “independent judgment” (*ijtihād*). The author adopts many concepts and topics of Illuminationist philosophy, like the “incorporeal lights” (*anwār mujarrada*) and the “victorial lights” (*anwār qāhira*), by quoting Suhrawardī’s *Kitāb Ḥikmat al-ishrāq* and the *Risālat al-Zūrāʾ* of his contemporary Jalāl al-Dīn al-Dawānī (m. 908/1502-03) (IAJ 2014, 598 sq); in its autocommentary, he also quotes Ibn Sīnā’s poetry on Soul (*Qaṣīdat al-naḥs*) (IAJ 2014, pp. 464–465). The conclusion of both epistles contains a complain (*shikāya*) against the “sons of the time” and a recommendation not to disclose this teaching to the common people (*al-ʿāmm*).

The *Mujlī mirʾāt al-munjī fī l-kalām wa l-ḥikmatayn wa l-taṣawwuf* (“The Book of the Illuminated, Mirror of the Savior, on Theology,

the Two Wisdoms, and Sufism”) is undoubtedly the author’s *magnum opus* on philosophy and theology. As suggested by its title, its purpose is to reconcile, and to integrate into Twelver Shīʿi theology, various elements coming from Ashʿari and Muʿtazili theologies (*kalām*), which are reputed to be contradictory with each other; concepts and positions inherited from the Peripatetic or speculative philosophy (*baḥthiyya*) as well as from the Illuminationist or intuitive philosophy (*dhawqīyya*), both designated as “the two wisdoms” or “philosophies” (*al-ḥikmatayn*); and basic topics of Ibn ʿArabī’s theosophy, identified to Sufism (*taṣawwuf*) (*Mujlī*, pp. 134–135). It is noteworthy that the philosophical and mystical topics are absent in the matrix epistle and appear gradually in its commentary and supercommentary. Ibn Abī Jumhūr’s main source in the field of philosophy is the monumental work of Shams al-Dīn Shahrazūrī (d. between 687/1288 and 704/1305), a disciple of Suhrawardī, entitled *Rasāʾil al-Shajara al-ilāhiyya fī ʿulūm al-ḥaqāʾiq al-rabbāniyya* (“Epistles of the Divine Tree. On the Sciences of the Divine Realities”), completed in 680/1281, of which he must have had a copy at his disposal. Throughout the *Mujlī*, numerous lengthy passages of the *Shajara* are quoted without mention of their source (Schmidtke 1997). As for the field of Sufism, he mostly borrowed his information and argument from Ḥaydar Ḍamulī’s *Jāmiʿ al-asrār wa manbaʿ al-anwār* (“The Sum of Secrets and the Source of Lights”), a manifesto for the unity of Sufism and Shīʿism.

Ibn Abī Jumhūr’s primary concern in his *Mujlī* was apparently to establish the right of philosophy to exist within Islamic religion. He upheld a pre-established harmony between divine Law (*sharʿ*) and Intelligence (*ʿaql*), synthesizing between the rationalist meaning of *ʿaql* and its early Imāmi conception as “hierocratic Intelligence” (Amir-Moezzi 1994, pp. 6–13). “In truth, as Intelligence is a divine Law which is revealed from the inner, the divine Law is an Intelligence coming from the outer. Both support each other and help each other. Because the divine Law is Intelligence, God denied the latter to the infidels in different loci of His holy book, like in his saying: “Deaf are they, and dumb, and blind: for they do not use

their reason" (2:171, transl. Asad). As for Intelligence as being a divine Law, that is what God has claimed in His saying: "It is harmonious with the nature which God has designed for people. The design of God cannot be altered. Thus is the upright religion, but many people do not know" (30: 30, transl. M. Sarwar), where He gives to Intelligence the name of religion. About the unity of both Intelligence and Law, He said: "Light upon Light," meaning the light of Intelligence and the light of Law. He also said: "God guides to His Light whom He will" (24: 35, transl. Arberry), making of both lights one and the same light" (*Mujlī*, pp. 935–936). This passage may remind us Averroes' argumentation in his *Faṣl al-maḡāl fī mā bayn al-sharī'a wa l-ḥikma min al-ittiṣāl* ("Decisive Treatise Determining the connection between the [Islamic] Law and Philosophy [or Wisdom]"). However, it is unlikely that Ibn Abī Jumhūr had the slightest knowledge of Averroes' work, which seems to have not penetrated the Eastern Islamic world. Moreover, it is noteworthy that his argument had more impact in the Shī'i intellectual world than Averroes' one in Sunni Islam. As an illustration, this passage is resumed in Quṭb al-Dīn Ashkiwarī's (d. between 1088/1677 and 1095/1684) *Maḥbūb al-qulūb* ("The Beloved of the Hearts"), in support to the harmony between Imāmi religion and Greek philosophy (Ashkiwarī 1999, I, p. 102; Terrier 2016, pp. 187–188).

In the field of theology, Ibn Abī Jumhūr adopted many of the Shī'i Sufi Ḥaydar Āmulī's mystical views, rather than the rationalist positions of Imāmi or Mu'tazili theologians. He distinguished three levels of testifying the divine unity (*tawḥīd*), respectively opposed to three degrees of infidelity (*kufṛ*): at the top level, the "testimony of the ontological unity" (*al-tawḥīd al-wujūdī*), in other words "unity of existence" (*waḥdat al-wujūd*), an idea inherited from Ibn 'Arabī and condemned as a form of pantheism by a number of theologians, whether Sunni or Shī'i; at the intermediary level, the "testimony of the unity of divine attributes" (*al-tawḥīd al-ṣifātī*); and at the lowest level, the testimony of God's unity according to exoteric Islam (*al-tawḥīd al-islāmī*) (*Mujlī*, pp. 477–478). He

quoted Āmulī stating that "the *tawḥīd* is the vision of unity in the very multiplicity and the vision of multiplicity in the very unity (...), the contemplation of the gathering (*jam'*) in the detailed explanation (*tafṣīl*) (...); the distinction between the divine Real and the human creature (*tamyīz al-ḥaqq 'an al-khalq*) and the annihilation of the latter within the former" (*Mujlī*, pp. 484–485; Āmulī 1989, p. 75). Likewise, he borrowed Āmulī's doctrine – mainly developed in the latter's treatise on Qur'anic exegesis *al-Muḥīṭ al-a'zam* – of correspondences between "the book of Qur'an" (*al-kitāb al-qur'ānī*); "the book of horizons" (*al-kitāb al-āfāqī*), i.e., the physical world or *macrocosmos* (*al-'ālam al-kabīr*); and "the book of souls" (*al-kitāb al-anfusī*), i.e., the inner self or *microcosmos* (*al-'ālam al-saghīr*); each of these three books possesses letters, words, verses, and surahs. In this frame, absolute mankind is the locus of manifestation of the Qur'anic verse "*bi-smi-llāh al-rahīmān al-rahīm*" ("In the name of God, the Merciful, the All-Compassionate") in the book of horizons; and the rational soul (*al-naḡs al-nāṭiqa*) is its correspondent in the world of the souls (*Mujlī*, pp. 496–498; Āmulī 1996).

When confronting, on several issues, the views of philosophers and those of theologians, Ibn Abī Jumhūr generally adopted those of the former while arguing that the views of both groups are essentially identical. On the discussion whether God has created the world *ex nihilo* or *ex novo* or whether creation is coeternal with God, its first cause, he supported the Avicennan idea of an essential and not temporal "createdness" of the world (*ḥudūth dhātī*), on which he saw an agreement between wise philosophers and prophets (*al-ḥukamā' wa l-anbiyā'*) (*Mujlī*, pp. 357–409). By the way, he resumed the distinction made by Avicenna and echoed by Shahrāzūrī between time (*zamān*), i.e., the relationship of changing things between them; meta-time or second eternity (*dahr*), i.e., the relationship of immutable entities with changing things; and no-time or first eternity (*sarmad*), i.e., the relationship of immutable essences between them, which is God's thought of the thought (*Mujlī*, p. 362).

As for the proof of God's existence, Ibn Abī Jumhūr stated that the demonstration of the "divine wises" or "metaphysicians" (*al-ḥukamā' al-ilāhiyyīn*), deducting His existence from the very nature of existence (*wujūd*), was superior to the argumentation of theologians (*mutakallimūn*) and physicians (*ṭabī'īyyūn*) (*Mujlī*, pp. 514–515). On the uniqueness of God, his Essence, as well as his Science, he scrutinized the positions of a number of philosophers and mystics, such as Avicenna, Suhrawardī, Naṣīr al-Dīn al-Ṭūsī (d. 672/1274), and Athīr al-Dīn al-Abharī (d. circa 663/1265). Concerning the Essence of God, he recalled Avicenna's thesis, according to which the quiddity (*māhiyya*) of God is not added to His individual existence (*annīyya*) but is His very existence; in other words, "what God is" is none other than His act of being. Ibn Abī Jumhūr defended this opinion against the criticism of Suhrawardī, according to whom existence is no more than a point of view taken on quiddity and went so far as to affirm that the Necessary Being was devoid of quiddity (*Mujlī*, pp. 519–524). In regard to Science as an essential attribute of God (*ṣifa dhātiyya*), he argued that divine Science was not a knowledge acquired by means of forms (*bi-l-ṣuwar*), or by representation (*taṣawwuri*), but a knowledge through enlightenment (*ishrāqī*), unveiling (*kashfī*), and presence (*ḥuḍūrī*), without any intermediary between God and the object of knowledge (*Mujlī*, p. 544). He also stressed that God's Science of his own Essence was his very Essence (*Mujlī*, p. 551). These theological views would eventually be adopted and developed by the Shī'ī philosophers of the eleventh-/seventeenth-century Iran Mīr Dāmād (d. 1041/1631) and Mullā Ṣadrā (d. 1050/1640-1).

Ibn Abī Jumhūr upheld that the divine Providence (*'ināya*), universal and eternal (*kulliyya*, *azaliyya*), guides everything to the perfection defined for it by means of love (*'ishq*) or desire (*ishti'yāq*). Reproducing an excerpt from Shahrāzūrī's *Shajara*, whose leitmotif comes from a short writing of Avicenna, he asserted that love runs through all the existents, so that no existent can be devoid of it, since all the existents, according to their own perfections, seek to reach the perfections of the Necessary Being and strive

to become similar to Him. The Creator is the end of all the existents, the goal of their design. Therefore, love and desire are the causes of the existence of all existents with their own possible perfections (*Mujlī*, pp. 575–576. Shahrāzūrī 2004, Vol. 3, p. 628) Finally, Ibn Abī Jumhūr regarded the existence of the Perfect Man (*al-insān al-kāmil*), conceived as the locus of manifestation of the divine attributes of perfection, as the ultimate goal of the creation. The impeccability (*'iṣma*) of Prophets and Imāms is to be seen as a necessary effect of divine Emanation (*al-fayḍ al-ilāhī*) or eternal Providence (*Mujlī*, pp. 997–998).

In accordance with Islamic orthodoxy, Ibn Abī Jumhūr stressed the impossibility of unifying the human spirit with God. However, he supported the idea, developed by philosophers, of a unification of the subject of intellection with the Intelligible (*ittiḥād al-'āqil wa l-ma'qūl*), a conception inherited from Aristotle's *De Anima*. Quite surprising, he asserted that this noetic process was the motive of the Sufis' ecstatic utterances (*shaṭaḥāt*), like the famous declaration of al-Ḥallāj (executed in 309/922): "I am the Real (God)" (*anā l-ḥaqq*). In support of this idea and in defense of those who have expressed it, he put forward scriptural arguments (*manqūl*), based on the Qur'an and *Ḥadīth*, and other rational arguments (*ma'qūl*) (*Mujlī*, pp. 647–651). By doing so, he seemingly attempted to save together philosophers and Sufis from the accusation of heresy.

In this concern, Ibn Abī Jumhūr emphasized the need to interpret the Qur'an in order to reconcile the truthfulness of Revelation with the demonstrations of reason. Spiritual exegesis (*ta'wīl*), distinct from literal commentary (*tafsīr*), consists in discovering the inner or hidden meaning (*bāṭin*) of verses whose apparent meaning (*ẓāhir*) contradicts the truths of reason, as in the case of anthropomorphic verses. According to him, such an exegesis is an obligation made to the true scholar by God in the Qur'an, especially in the verse 3:7: "It is He who sent down upon thee the Book, wherein are verses clear that are the Essence of the Book, and others ambiguous. As for those in whose hearts is swerving, they follow the ambiguous part, desiring dissension, and desiring its

interpretation; and none knows its interpretation, save only God and those firmly rooted in knowledge. . .” (transl. Arberry modified) (*Mujlī*, pp. 653–659). Once again, his argument, undoubtedly influenced by the Mu‘tazili theology, is reminiscent of that of Averroes in his *Decisive Treatise*. Ibn Abī Jumhūr’s inspiration, however, remains basically Illuminationist. In his interpretation of several Qur’anic verses, God is described as an incorporeal Light, a symbol which he claimed to be already present in the doctrine of ancient philosophers such as Pythagoras, Empedocles, Socrates, and Plato. Interestingly, by the way, Ibn Abī Jumhūr attributed the ecstatic account found in the *Theology* of the Pseudo-Aristotle to Plato, following the lead of Suhrawardī and against the Arabic text (*Mujlī*, pp. 724–726).

Ibn Abī Jumhūr also supported the existence of the *mundus imaginalis* (*‘ālam al-mithāl*), intermediary between the intelligible and the sensible world, as conceived by Suhrawardī and theorized by Shahrāzūrī, which he identified with “the absolute imagination” (*al-khayāl al-muṭlaq*) as evoked by Ibn ‘Arabī (*Mujlī*, p. 186). This world is said to embrace the perfect apparitional forms (*ashbāh*) of the first Intellect (*al-‘aql al-awwal*) and other separated Intelligences and to have many strata (*ṭabaqāt*), each of them encompassing an infinite number of individuals. Some strata are luminous and pleasurable, which are those of paradise (*ṭabaqāt al-jannān*); others are tenebrous and painful, which are those of hell (*ṭabaqāt al-jahīm*). Thus, the imaginary world is assimilated to the isthmus (*barzakh*) described in many *ḥadīths*, where the events following natural death and prior to the great Resurrection (*qiyāma*) occur. According to Ibn Abī Jumhūr, all Prophets and Sages have confirmed the existence of this world (*Mujlī*, pp. 775–779).

On the issue of the creation of human acts (*khalq al-a‘māl*), in other words of free will (*ikhtiyār*) versus determinism (*jabr*), Ibn Abī Jumhūr supported the happy medium expressed by the Shī‘i Imāms’ formula: “Neither predestination nor unrestricted human delegation (*tafwīd*), but something in between” (*Mujlī*, pp. 795–825). On the level of God’s unity of existence and acts,

there is no agent but He within the whole system of existence; but on the level of multiplicity, i.e., of the manifestation of divine unity, every cause is responsible for its effects, which attests the reality of human responsibility (*taklīf*), the necessity of a Law (*sharī‘a*), and the need of a Prophet-legislator to guide mankind toward its perfection in society (*Mujlī*, pp. 803–805). Free will, responsibility, and duty thus participate in the divine, universal and eternal, Providence.

As for the fate of the soul after death, Ibn Abī Jumhūr widely followed the views of Shahrāzūrī by quoting extensively from the latter’s *Shajara* without identifying his source. In his assumption, the human rational soul is not incarnated in the body but governs it and uses it as an instrument to reach perfection. Therefore, according to what Shahrāzūrī considered to be the view of the ancient sages of Greece, Egypt, and other nations, perfect souls and intermediate ones in perfection are disembodied after death, while deficient souls undergo a process of metempsychosis (*tanāsukh*) in order to purify themselves (*Mujlī*, pp. 1575–1599; Schmidtknecht 1999).

The *Mujlī* also contains an apology of Sufism from the Shī‘i point of view. Ibn Abī Jumhūr resumed from Ḥaydar Āmulī’s *Jāmi‘ al-asrār* a twofold argumentation, mytho-historical and ontological, establishing the affiliation of Sufism to the “true religion” of the Shī‘i Imāms. First, he asserts that the great masters of ancient Sufism, such as Ma‘rūf al-Karkhī (d. 200/815) and Abū Yazīd al-Bastāmī (d. 234/848 or 262/874), were initiated by Imāms (Āmulī 1989, pp. 225, 431, 614–615; *Mujlī*, pp. 1245–1246 and 1262–1264), which is credible in some cases and impossible in others. Secondly, he supports the essential harmony between the exoteric religion, the Sufi path, and the pure spiritual contemplation: “Know that Law (*sharī‘a*), Path (*ṭarīqa*) and Truth (*ḥaqīqa*) are synonymous terms for the single Truth, which is the Truth of Muḥammad’s Revelation viewed from different standpoints and at different levels. There is no contradiction between these standpoints and levels. The Revelation (*shar‘*) is like the complete almond containing the shell, the kernel, and the kernel of kernels (*lubb al-lubb*): the shell may be likened to

the Law, the kernel to the Path, the kernel of kernels to the esoteric Truth of the Innermost (*al-ḥaqīqa al-bāṭina li-l-bāṭin*), and the almond is the gathering of all” (Āmulī 1989, pp. 14, 41, 344; *Mujlī*, p. 1072).

Sufis have often made use of this triadic theme for defensive purposes, arguing that the initiatory Sufi path is the necessary link between religious Law and divine Truth. However, the meaning of the terms and the general conception of their relationships seem to be different for a Shīʿī philosopher. Ibn Abī Jumhūr considered the spiritual Truth (*ḥaqīqa*) as the object of a direct contemplation (*mushāhada*) obtained by the combination of intellectual speculation (*baḥṭh*) and mystical experience (*taʿalluh*), so that philosophical gnosis becomes the ultimate science that conciliates the exoteric religion and the life forms of Sufism. He wrote: “The Law is the expression of assent to the Prophets’ words, of action in conformity with their orders through imitation and obedience. Path is the expression of the realisation of the acts and customs of the Prophets through certainty and embellishment. Truth is the expression of the contemplation of the spiritual states and stations of the Prophets through spiritual unveiling and tasting (*kashf^{an} wa dhawq^{an}*), and of their abiding through spiritual state and ecstatic consciousness (*ḥāl^{an} wa wijdān^{an}*)” (*Mujlī*, p. 1078). Moreover, the reason Ibn Abī Jumhūr emphasized this fundamental unity was not only to protect the Sufis from serious accusations made against them but also to protect these very accusers, the Shīʿī jurists (*fuqahāʾ*), against their own guilty ignorance: “The reason for the accusation of infidelity and heresy aimed at this sect [the Sufis], is only the ignorance of their principles and rules. Indeed, if [the doctors of the Law] knew the founding principles [of the Sufis], if they realized that Law, Path and Truth are truly synonyms to designate a single reality, that of Revelation, they would not use such language, and would leave aside this fanaticism (*taʿaṣṣub*) (...); they would strip their hearts of these envious and thoughtless words, and would free their souls from the abyss of sophisms and doubt” (*Mujlī*, p. 1081).

Finally, Ibn Abī Jumhūr placed this synthesis of theology, philosophy, and Sufism under the

aegis of Twelver Shīʿī imāmology, by dealing at length with Imām ‘Alī’s *walāya*, i.e., his covenant with God and his sovereignty, both spiritual and temporal, over believers. He recalled all the scriptural evidence of ‘Alī’s designation (*naṣṣ*) as the Prophet’s successor and denounced the misdeeds of the first three caliphs (*Mujlī*, pp. 1161–1217 and 1349–1457). In his views, ‘Alī is the paragon of all virtues, the origin of all sciences, whether mystical or rational; his nature is theophanic, if not divine, as attested by sayings attributed to the Prophet or to ‘Alī himself (*Mujlī*, pp. 1223–1346). Ibn Abī Jumhūr quoted from Ḥaydar Āmulī some esoteric *ḥadīths* where the Imāms claim their connection or even their unification with God (Āmulī 1989, pp. 363–364 and 676; *Mujlī*, p. 1682). Conventional Shīʿī scholars generally regard these *ḥadīths* as spurious, dangerously similar to the Sufis’ ecstatic utterances (*shaṭaḥāt*), and the conceptions that they corroborate as “exaggeration” or “extremism” (*ghuluww*). As a Twelver Shīʿī, Ibn Abī Jumhūr asserted that ‘Alī’s *walāya* was passed on after him to 11 successive Imāms, the last of whom being in occultation (*ghayba*) until the end of historical time (*Mujlī*, pp. 1459–1495). However, ‘Alī and Muḥammad represent together for eternity the Perfect Man, which is the finality of divine Providence (*Mujlī*, pp. 1503–1523).

It shall be kept in mind that this work was written only 10 years before the young Shāh Ismāʿīl established Shīʿism as the official religion of Iran (906/1500-01) – in other words on the eve of a new era for Shīʿism, Sufism, and philosophy. Ibn Abī Jumhūr was maybe the last Shīʿī thinker to be able to urge reconciliation between these traditions without having to defend himself from attacks launched by the Shīʿī orthodox party. He seems to have called his Shīʿī fellows to a real spiritual revolution by breaking out of narrow legalism and opening themselves to intellectual speculation and mystical experience (Shaybī 2011, Vol. 2, p. 319). Yet, the proclamation of Shīʿism as the religion state resulted in a completely different revolution. ‘Alī al-Karakī (d. 940/1534), a contemporary of Ibn Abī Jumhūr who had also been a pupil of al-Jazāʾirī in Jabal ‘Āmil, after becoming the official theologian of

the Shī'i Safavid state, eventually defined an orthodoxy opposed to the gnostic Shī'ism as defended by Ibn Abī Jumhūr (Shaybī 2011, Vol. 2, p. 313; Arjomand 1984, pp. 133–137; Abisaab 2004, pp. 15–20). However, the latter's call did not remain unheard; in the end of the eleventh-/seventeenth-century Iran, Shī'i scholars such as Muḥsin Fayḍ Kāshānī (d. 1091/1680–1681) and Quṭb al-Dīn Ashkiwarī would eventually adopt his harmonization between Shī'ism, Sufism, and philosophy.

Ibn Abī Jumhūr was also a traditionist, and his *'Awālī al-la'ālī l-'azīziyya fī l-aḥādīth al-dīniyya*, achieved in 897/1491 in Mashhad, became a classical work in the field of Shī'i *ḥadīth*. As explained in its introduction, all the quotations of the book go back to al-'Allāma al-Ḥillī, an authoritative scholar of the Mongol period. In its turn, the work was quoted by many Shī'i thinkers in the following centuries, among them Fayḍ Kāshānī in his mystic-philosophical *opus* entitled *Kalimāt maknūna* ("Concealed Words"). However, the *'Awālī al-la'ālī* was particularly censured for comprising traditions from Sunni sources, or of "mystical fragrance," or peculiar to "extremist" Shī'ism (*ghuluww*) (Majlisī 1957, Vol. 0, pp. 183–184; Mar'ashī Najafī 2013, p. 4). This panel of accusations, although seemingly inconsistent, reveals that Ibn Abī Jumhūr was assuming both a radical Shī'i affiliation and an ecumenical trend by which he aimed not only to reconcile Shī'is and Sufis but also to bring up the positions of Shī'is and Sunnis.

As a result, Shī'i scholars of Safavid and Qājār Iran adopted two contrasted attitudes toward Ibn Abī Jumhūr. On the one hand, his works were held in esteem by thinkers with philosophical and mystical leanings, such as Ashkiwarī and Fayḍ Kāshānī. On the other hand, he was blamed to be a Sufi, a "[Shī'a] extremist" (*ghālī*), a "philosopher," or a "traditionalist" (*akhbārī*), by influent theologians, historians, and traditionists, such as al-Ḥurr al-'Āmilī (d. 1104/1692), Muḥammad Bāqir Majlisī (d. 1111/1699), and his pupil Mīrzā Afandī (d. 1130/1718) (Mar'ashī Najafī 2013, pp. 4–5; al-Ḥurr 2011, p. 32; al-Amīn 1986, Vol. 9, p. 434). It is noteworthy that he was not so much criticized for his *Mujlī* than for

his *'Awālī al-la'ālī*, certainly because the former, if more inclined to syncretism and containing the most esoteric *ḥadīths* attributed to Imām 'Alī, is a scholastic work addressed to specialists in philosophy, while the latter belongs to the religious science of *ḥadīths*, in which heterodoxy is regarded to be more pernicious. Moreover, Ibn Abī Jumhūr seems to have adopted in his last work, the *Sharḥ al-Bāb al-ḥādī 'ashar*, a much more conventional stance than in his earlier works, probably in order to avoid attacks from his *sharī'a*-minded fellows and students (Schmidtke 2013).

In conclusion, the thought of Ibn Abī Jumhūr is certainly one of the most achieved synthesis between philosophy, Shī'i esotericism, and Sufism, composed in the late Islamic Middle Age. It should not be narrowed down to a preparatory stage for the great synthesis made by Mullā Ṣadrā in the eleventh/seventeenth century (Lawson), since it emerged from a far different sociohistorical context. Prior to the institutionalization of Twelver Shī'i religion and to the repression of Sufism in Iran, Ibn Abī Jumhūr's works reflect a free effort to match together the main spiritual traditions of Islam, in what could be called a "sacred alliance of heterodoxies."

Bibliography

Edited Works of Ibn Abī Jumhūr

- Ibn Abī Jumhūr composed about fifty titles in the fields of theology, philosophy, *ḥadīth*, principles (*uṣūl*) and branches (*furū'*) of law. For a complete list of his writings, published and unpublished, see Schmidtke 2004, Fārmad in *Mujlī*, 76–77, and al-Ghufirānī 2013.
- Ibn Abī Jumhūr al-Aḥsā'i, Muḥammad b. 'Alī. *Mujlī mir'āt al-munjī fī l-kalām wa l-ḥikmatayn wa l-taṣawwuf*, A. al-Shīrāzī (Ed.). Tehran, 1329/1911, republished with an introduction, table of content, and indices by S. Schmidtke, Tehran: Iranian Institute of Philosophy and Institute of Islamic Studies Free University of Berlin, 2008.
- Ibn Abī Jumhūr al-Aḥsā'i, Muḥammad b. 'Alī. *Risāla Zād al-musāfirīn fī uṣūl al-dīn*, in *Rasā'il kalāmiyya wa falsafiyā*, A. al-Kinānī (Ed.). Beirut/Qum: Mu'assasat umm al-qurā li-ihyā' al-turāth, 1414/1993.

New Haven, CT, USA

Abstract

A Muʿtazilite theologian of the school of Abū l-Ḥusayn al-Baṣrī, Ibn al-Malāḥimī wrote works that include intensive discussions and refutations of teachings of the *falāsifa*. Ibn al-Malāḥimī was active in the first half of the sixth/twelfth century in Khwārezm, today a part of Uzbekistan and Turkmenistan. Like in other literature of this period, he used the term *falāsifa* as a reference to the followers of Ibn Sīnā (Avicenna, d. 1037). His concern is with Ibn Sīnā's philosophical system, particularly its teachings on God, His attributes, the pre-eternity of the world, and on the soul. Ibn al-Malāḥimī's most important work in philosophy is his *Tuḥfat al-mutakallimīn* (*Gift to the Kalām-Scholars*), a fully-fledged refutation of Avicennan philosophy. Although Ibn al-Malāḥimī wrote a generation after al-Ġazālī, he does not refer to his *Tahāfut al-falāsifa* and considers him a member of the movement of

falsafa rather than one of its Ashʿarite opponents. Ibn al-Malāḥimī feared that the process of adaptation of Avicennan philosophy among Muslim theologians – and here particularly among the Ashʿarites – would eventually lead to an Aristotelian reformulation of Islamic theology, similar to what happened in Christianity in late antiquity.

Biographical Information

Rukn al-Dīn Maḥmūd ibn ʿAbdallāh Ibn al-Malāḥimī lived in the first half of the twelfth century in Khwārezm, the delta region where the Amu Darya (Oxus) river once flew into the Aral Sea. Khwārezm is today split between Uzbekistan and Turkmenistan. The region was one of the last holdouts of Muʿtazilite theology at a time when that school hardly existed at places other than here and in Yemen. Together with his contemporary and colleague al-Zamakhshārī (d. 1144), who was also from Khwārezm and who wrote an influential Qurʾan commentary, Ibn al-Malāḥimī was the most important Muʿtazilite thinker of the school's late period, after its most productive activity ended during the mid-eleventh century. He presents himself as the torchbearer of Abū l-Ḥusayn al-Baṣrī's theology. Abū l-Ḥusayn al-Baṣrī (d. 1045) was active in Baghdad and had studied theology with the Qāḍī ʿAbd al-Jabbār (d. 1025). A practicing physician, Abū l-Ḥusayn came into contact with Greek learning and in that context may have studied philosophy, which, in turn, may well have triggered the important innovations in his thought (Ibn al-Murṭadā, 118–9, Madelung 2006). Many of his arguments were directed against teachings of the Muʿtazilite school of Abū Hāshim al-Jubbāʾī (d. 933), the so-called Bahshāmiyya, of whom the Qāḍī ʿAbd al-Jabbār was the leading proponent during Abū l-Ḥusayn's lifetime. During the last decades of the eleventh century, a Muʿtazilite physician from Isfahan moved to Khwārazm and introduced Abū l-Ḥusayn's theology there. Ibn al-Malāḥimī may have studied with him.

The little we know about Ibn al-Malāḥimī's life stems from a single, very short entry in a

biographical dictionary of Muʿtazilites (Ibn al-Murṭadā, 119) and from remarks in his own books.

Ibn al-Malāḥimī wrote an abridgment of Abū l-Husayn al-Baṣrī's highly influential work on the methods of Islamic law (Ibn al-Malāḥimī 2011) as well as two important compendia of *kalām*, the very extensive and comprehensive *Kitāb al-Muʿtamad fī uṣūl al-dīn* (*The Firmly Based Book in Theology*) and the shorter *Kitāb al-Fāʾiq fī uṣūl al-dīn* (*The Surpassing Book in Theology*), which was conceived as an abridgment of the former. Only the first quarter of the long work has come down to us (Ibn al-Malāḥimī 2012). The shorter work, however, which was completed in 1137, is fully available (Ibn al-Malāḥimī 2007). These two books were fairly widespread and major theologians such as Fakhr al-Dīn al-Rāzī (d. 1210), who was himself active in Khwārezm, as well as the Shiʿite Muʿtazilite al-ʿAllāma al-Ḥillī (d. 1325) used them (Schmidtke 1991). Ibn al-Malāḥimī's third work of importance is *The Gift to the Mutakallimūn in Their Refutation of the Philosophers* (*Tuḥfat al-mutakallimīn fī l-radd ʿalā l-falāsifa*), which is intended as an invalidation of Aristotelian, or more specific Avicennan philosophy. *Tuḥfat al-mutakallimīn* depends heavily on the section dealing with the teachings of the *falāsifa* in *Kitāb al-Muʿtamad* (Ibn al-Malāḥimī 2012: 683–798). Given that it mentions both earlier works of its author (Ibn al-Malāḥimī 2008, 178, 185), *Tuḥfat* was written between 1137 and Ibn al-Malāḥimī's death in 1141 (Madelung in Ibn al-Malāḥimī 2012, v–ix).

Thought

Ibn al-Malāḥimī's *Tuḥfat al-mutakallimīn* is divided into twenty chapters (singl. *bāb*), addressing positions that Ibn Sīnā had taken and that the author wishes to refute. The book begins with five chapters on the greatest stumbling block for a Muʿtazilite theologian, the pre-eternity of the world. It then moves to the subject of the divine attributes (*ṣifāt*), particularly that of being the designer of the world, and from there to divine actions (*afʿāl*), including moral obligations,

prophecy, and the afterlife. The latter subject leads to a discussion of human psychology (Madelung 2012) and, in the final chapter, to a refutation of the position that revelation has an inner meaning that one must learn from other sources. The structure of Ibn al-Malāḥimī's refutation is dictated by the table of contents of a *kalām* compendium, such as Ibn al-Malāḥimī's *Surpassing Book* (*al-Fāʾiq*). There, a Muslim *mutakallim* first produced arguments for God's existence and determines from that God's essence (*dhāt*), His attributes, and His actions. The five early chapters on the world pre-eternity are indeed devoted to a discussion of the divine essence: Given Ibn Sīnā's view that God's essence is His existence and that He is pure unity, the philosopher denies that God could change from being a noncreator to becoming a creator, which leads to Ibn Sīnā's position that the world must be pre-eternal. Ibn al-Malāḥimī argues in opposition to this that God can change from non-creator to becoming a creator without this affecting His essence. He sees in Ibn Sīnā's position a potent challenge to the Muslim view of a personal God, who engages in interactions with His creatures. Ibn Sīnā's God is a mere principle of creation that cannot react to it. This, Ibn al-Malāḥimī believes, threatens the bedrock of Muslim theology.

In the introduction to *Tuḥfat al-mutakallimīn*, Ibn al-Malāḥimī complains that many of his contemporaries who consider themselves experts of Islamic law began to study the works of the Muslim philosophers. He particularly singles out the Shafīʿite school of law – here meaning the Ashʿarites – but sees this tendency also getting hold among the Hanafites, his own school of law. In fact, “Hanafites” should probably be read as a reference to the Muʿtazilites. Ibn al-Malāḥimī sees Islam in the same position as Christianity in the first centuries of its history. According to a view widespread among Muslims, Christian theologians who had studied Greek philosophy distorted Jesus's original message. Ibn al-Malāḥimī writes that he fears the same will happen to Islam: “The leaders of the Christians sympathized so much with the learning of the Greeks in philosophy that they ended up leaving the religion of Jesus (. . .) on the path of the philosophers

and proposed such things as the three hypostases, the union [of Jesus with God], Jesus becoming a god after he had been human, and other such nonsense” (Ibn al-Malāḥimī 2008, 3). Muslim philosophers such as al-Fārābī and Ibn Sīnā, so Ibn al-Malāḥimī, did indeed “leave the religion of Islam” by following the ways of the ancient philosophers.

Ibn al-Malāḥimī complains about the hubris of the philosophers and their conviction that philosophy is superior to all other studies. He reports a claim made by the *falāsifa*, that philosophy leads people to overcome their religious divisions as it makes them appreciate all religious traditions equally. Philosophers pointed out, for instance, that a Muslim such as Ibn Sīnā participated in philosophy just as the Jew Abū l-Barakāt al-Baḡdādī (d. c. 1165), and a Christian philosopher. That claim, however, is not true, so Ibn al-Malāḥimī. Rather, philosophy makes people misunderstand their religious differences (Ibn al-Malāḥimī 2008, 14). The Muslim *falāsifa* present their teachings as the true Islam and because by his time many of them worked in Islamic jurisprudence (*fiqh*) they were, in Ibn al-Malāḥimī’s opinion, more dangerous than those who attacked Islam from outside. They give the impression that what they teach would bring people closer to Islam. The opposite, however, is true and they are enemies of the prophets whose errors need to be spelled out.

Ibn al-Malāḥimī’s *Tuḥfat al-mutakallimīn* is a head-on confrontation between the teachings of the *falāsifa* – meaning Ibn Sīnā and his followers – with that of “the Muslims,” as he says, a word that here stands for Muʿtazilites. In earlier centuries, the Muʿtazilites had developed their own ontology, based on a theory of powerless atoms, as well as their own explanations of physical change. These theories are highly incompatible with the ontological assumptions of Aristotelianism, which gives Ibn al-Malāḥimī much occasion to voice his disagreement and present the arguments for his school. He thinks Aristotelian ontological assumptions, which manifest themselves in explanations of such phenomena as the human self (*nafs*), are too complicated and introduce elements (here a self-subsisting soul) whose

existence the *falāsifa* cannot prove. Ibn al-Malāḥimī counters this with arguments that he characterizes as intuitive or commonsensical and that invalidate the existence of these elements or render them at least superfluous (Madelung 2012).

Ibn al-Malāḥimī regards Ashʿarite theology as an enemy that needs to be defeated just like the *falāsifa*. His book illustrates how close Ashʿarite teachings were to those of Ibn Sīnā. On moral obligations (*taklīf*), for instance, Ibn Sīnā had taught that human actions are causally determined by factors such as the human’s volition, his or her motives, and other causes, which are themselves determined by causes that all begin in God. For Ibn Sīnā all chains of causes and effects end in God – or rather they begin there – which means God is the ultimate cause of everything. From the point of view of a Muʿtazilite, the Ashʿarites – whom Ibn al-Malāḥimī polemically calls “compulsionists” (*mujbira*) – hold very similar opinions (Ibn al-Malāḥimī 2008, 51). Both groups believe that God is the creator of *all* events in this world and they explicitly include human actions. God would thus pre-determine all human actions and He would also become the source and the creator of good *and* evil in this world, two positions that were unacceptable for any Muʿtazilite. Ibn al-Malāḥimī insists that God is only the source of good and that evil comes into this world through the agency of humans. God does not create human actions and their immediate consequences. Humans also have free will and respond in their decisions to the moral obligations God puts upon them. They act either in accord with these obligations and are rewarded in the afterlife or they violate them and are punished.

Ibn al-Malāḥimī was well-informed about differences among philosophers and in his discussion of their arguments for the world’s pre-eternity, he quotes among other works Proclus (d. 485 CE) as well as John Philoponus’ refutation of him (Ibn al-Malāḥimī 2008, 52–57). One of his main sources, however, is al-Ġazālī’s (d. 1111) *Doctrines of the falāsifa* (*Maqāṣid al-falāsifa*) as well as another of his works where he presents his own opinions on human psychology (al-Ġazālī 1979). Although he never mentions

al-Ġazālī's name in his book, Ibn al-Malāḥimī was well informed about his œuvre. He did not, however, regard him as a predecessor in refuting the *falāsifa* – he claims his is the very first book of this kind (Ibn al-Malāḥimī 2008, 4) – but rather as a *faylasūf* and a follower of Ibn Sīnā. He either did not know or did not accept that al-Ġazālī's *Maqāṣid* was meant as a neutral and uncommitted report of Ibn Sīnā's philosophical system. Even teachings that appear in al-Ġazālī's committed works, such as *The Revival of the Religious Sciences* (*Ihyā' 'ulūm al-dīn*), are here associated with "one of the philosophers" (Ibn al-Malāḥimī 2008, 185–86; Griffel 2016, 449–50). Ibn al-Malāḥimī likely regarded al-Ġazālī as one of those philosophers who meddled it with Islam. He acknowledges, however, that al-Ġazālī at least accepted moral obligations (*taklīf*), and prepared his readers for them, something that other philosophers did not do (Koloğlu 80–81). Still, agreeing with Ibn Sīnā's teachings on the soul and adopting one's understand of the afterlife according, as al-Ġazālī did, was too much for Ibn al-Malāḥimī, who criticizes him for that. Ibn Taymiyya (d. 1328), in fact, includes the name of Ibn al-Malāḥimī in a list of more than a dozen scholars of Islam who were known critics of al-Ġazālī's leanings towards *falsafa* (Ibn Taymiyya 1980, 6:240).

A comparison with al-Ġazālī's *Tahāfut* shows that these two books pursue different strategies of refutation (Griffel 2016, 448–53). Both authors realized that Ibn Sīnā's philosophical system posed a threat to the authority of the theology they had grown up with. Ibn al-Malāḥimī took this challenge as an occasion to defend Mu'tazilism and present the truths of its teachings. Al-Ġazālī, on the other hand, adopted numerous teachings of Ibn Sīnā and appropriated them to the demands of Ash'arite theology. He also pointed out those elements in Ibn Sīnā's system that he thought were unfit to be integrated into Muslim theology. This is one of the tasks of his *Tahāfut*. There, he focuses on the *falāsifa*'s two claims that their sciences are built on demonstrations and are independent from revelation. The demonstrative method also comes up in Ibn al-Malāḥimī and he ridicules the philosophers for assuming their teachings are superior to that of the ordinary

believers or to those of the *mutakallimūn* because they are based on demonstrations. Unlike al-Ġazālī, however, he does not address the demonstrability of the *falāsifa*'s teachings with arguments that aim at refuting this particular claim, which makes his book from a purely philosophical point of view less interesting than the *Tahāfut*.

Ibn al-Samḥ

Cecilia Martini Bonadeo

Dipartimento di Scienze Storiche, Geografiche e dell'Antichità, Università degli Studi di Padova, Padova, Italy

Dipartimento di Filosofia, Università di Padova, Padova, Italy

Abstract

Abū 'Alī Ḥasan b. Sahl b. Ḡālib Ibn al-Samḥ (d.1027) was the Christian disciple of the Jacobite Yaḥyā b. 'Adī and, later on, of the Nestorian Abū l-Faraj Ibn al-Ṭayyib.

He owned a bookstore (*dukkān*) at Bāb al-Ṭāq in Baghdad where, according to Abū Ḥayyān al-Tawḥīdī, he occasionally hosted the debates of the philosophical circle grouped around his teacher Yaḥyā b. 'Adī. Ibn al-Samḥ transmitted the lecture-course of the so-called Baghdad circle on Aristotle's *Rhetoric* and *Physics*.

In the MS Paris, Bibliothèque Nationale, *ar.* 2346, the *Rethoric* in all likelihood was copied from Ibn al-Samḥ's copy for which he collated two defective copies; he consulted also the Syriac translation (Vagelpohl 2008). As we can see from the ms. Leiden, Universiteitsbibliotheek, *or.* 583, the text of Aristotle's *Physics* was redacted by the Mu'tazilī theologian Abū l-Ḥusayn Muḥammad 'Alī b. al-Ṭayyib b. al-Baṣrī (d. 1044), a student of Ibn al-Samḥ, on the basis of Yaḥyā b. 'Adī's autograph copy of Ishāq b. Ḥunayn's translation. The lemmas of the text are completed with a commentary in the form of glosses in the margins, giving a written record of the lecture-course given in Baghdad circle in the year 1004. In these notes one can find the commentaries of Abū Bishr Mattā Ibn Yūnus, Yaḥyā b. 'Adī, Ibn al-Samḥ, and Abū l-Faraj Ibn al-Ṭayyib (Aristūṭālīs 1964–1965). John Philoponus' *Commentary* on the *Physics* is one of the sources of Yaḥyā b. 'Adī's notes and heavily influenced al-Samḥ's commentary, in particular for books III to VI. Ibn al-Samḥ follows John Philoponus' *Commentary* with regard to the scope of physics and its relation with mathematics and the doctrine of causation, while he agreed with Aristotle against Philoponus' criticism of Aristotle's theory of propulsion and against Philoponus' theory of "impetus."

In addition to his "editorial" work, Ibn al-Samḥ is the author of a treatise on the scope of philosophy which has come down to us. It is entitled *Answer [to the question] To Which End do Human Beings Devote Themselves to the Study of Philosophy?* (*Jawāb [‘an mas’alat sā’il]: Mā l-ḡāya allatī yanḥū l-insān naḥwahā bi-l-tafalsuf*; Ibn al-Samḥ (1977). It is an introduction to philosophy which can guide man to perfection; philosophy consists in rational cognition through demonstrative proofs and in the purification of the soul. Through theoretical philosophy, man can obtain sure knowledge (*al-ilm al-yaqīn*) of the first principle which has no equal, i.e. God, called by Ibn al-Samḥ One, First, Pure Good from which other beings flow. The highest form of human happiness consists in achieving this science of divinity. Through practical philosophy, whose goal is the acquisition of virtue, man can be in the best human condition for doing good. The

acquisition of a virtuous character requires a virtuous family and a virtuous society, willingness to acquire the virtues, diligence in practicing them, and the intellectual insight of the good.

Ibn al-Samḥ is the author also of another treatise on the conditions of truth for statements pronounced on the same topic by many people. He stresses the primacy of logical demonstration with respect to tradition (*naql*): in fact the number of witnesses is without consequence for a statement whose validity can be deduced according the criteria of rational deduction. The polemical target of this writing is the truth criteria of the religious tradition in the science of *ḥadīth*. This treatise is entitled *On Statements Which Many People Pronounce [in agreement with each other]* (*Qawl fī l-Akhbar allatī yukhbir bihā kathīrūn*; Dānishpaṣūh, (1970–1971); Bernard-Baladi (1969).

Ibn al-Ṭayyib

Cleophea Ferrari

Institut für Philosophie, Friedrich-Alexander-Universität, Erlangen, Germany

Abstract

Abū l-Faraj ‘Abdallāh ibn al-Ṭayyib’s life in Baghdad marked the end of an era in which he and his fellow scholars cultivated the heritage of ancient Greek philosophy, notably Aristotle’s philosophy. Thanks to Mattā b. Yūnus and Yaḥyā b. ‘Adī, there had arisen a scholarly tradition that flourished over several generations and whose last representative was Ibn al-Ṭayyib himself. These scholars wrote commentaries on Aristotle’s works by studying the Greek commentaries of late classical antiquity, by translating them, and also by writing some based in form and content on ancient Greek models. Ibn al-Ṭayyib was the author of numerous commentaries on philosophy, theology, and medicine and taught at the hospital (al-Māristān al-‘Aḍudī) that had been founded by the Buyid ‘Aḍuddawla. That his writings were intended for teaching purposes is evident from their form and content. The study of philosophy was an integral part of the training of medical doctors. Indeed, medical students were expected to be thoroughly grounded in Aristotle, in addition to having a sound knowledge and understanding of Plato. Accordingly, their studies began with the *Organon*, which at that time also included rhetoric and poetics. They also studied elementary logic, which was especially important in so far as it was held that only through the instrument of logic could a doctor, let alone an ordinary human being, distinguish between the true and the false and thus make correct judgments.

Biographical Information

The Christian Abū l-Faraj ‘Abdallāh ibn al-Ṭayyib al-‘Irāqī held various high positions in the

Nestorian Church of Mesopotamia, one of them as Patriarchal Secretary (*kātib al-Jāthalīq*) to the Nestorian Catholic Bishop Yūḥannā b. Nāzūk (1012–1022). He was also a doctor at the hospital (al-Māristān al-‘Aḍudī) founded by the Buyid ‘Aḍuddawla. Owing to his numerous commentaries on philosophy, theology, and medicine, his influence was varied and extensive. He died in 1043 CE and was buried in the chapel of the ancient monastery, Dair Durtā, on the river Tigris.

Ibn al-Ṭayyib’s Thought and Philosophy

In his commentaries on the works of Aristotle, Hippocrates, and Galen, as well as on Porphyry’s *Isagoge*, Ibn al-Ṭayyib adheres closely to ancient Greek models. Judging by their form and content, those of his writings that have been handed down were intended for teaching purposes, whereby the author undertook to combine them into an encyclopedic body of knowledge, usefully broken down into specific themes and topics. He is concerned with four main areas of scholarship: Aristotle’s philosophy, the natural sciences, medicine, and Christian theology. He also wrote short treatises on ethics and a paraphrase of Plato’s *Leges*. The curriculum began with the *Categories* and with Porphyry’s introduction to it, entitled the *Isagoge*. According to biobibliographical sources, Ibn al-Ṭayyib seems to have written a commentary on the entire *Organon*, although only the commentary on the *Categories*, a summary of the commentary on the *Posterior Analytics*, and a commentary on the *Isagoge* have been handed down. Through his commentary on the *Categories*, we can get a clear idea of his scholarly methods and of his relationship to his ancient Greek models. Indeed, his text is remarkable for the fact that it sticks closely in form and content to the structures of the commentaries written by the school of Olympiodorus. Yet, not only does he adhere to the ancient Greek commentaries with respect to form, but there are parallels to be noted with respect to content also. It is in these ways that most of the questions raised by the ancient Greek commentators are to be found in our Arab author. And though his writings were not altogether new

or original, there are new and original ideas to be found in them here and there. Ibn al-Ṭayyib's works should not be classified as mere pale imitations of these models. Certainly in the systematization of content, he goes further than his models, attempting as he does to solve every problem that arises within a text. For example, he explains Aristotle exclusively through Aristotle himself. His interpretation of the text he is commenting on is, therefore, always very faithful to its author. It was never his intention to criticize the content. Rather, his aim was to create an Aristotelian system whereby all the contexts of a logical and natural tenet could be explained. His interpretation of Aristotle's texts is stamped by the Neoplatonic tradition of the Aristotelian commentators of late classical antiquity (Porphyry, Ammonius, Olympiodorus, Simplicius, Philoponus, and Elias), all of whom, as far as we can judge from those of his works that have been handed down, he adheres to closely. In his numerous commentaries on theology and medicine, too, he endeavors to bring his entire scholarship to bear on a particular subject at the same time as he is elucidating it. Only part of Ibn al-Ṭayyib's commentaries on Aristotle's philosophy mentioned in the biobibliographical sources has been preserved. Some important commentaries, including the long commentary on Aristotle's *Metaphysics* mentioned by Ibn al-Ṭayyib's pupil, Ibn Buṭlān (Ibn Abī Uṣaybi'a 1882–1884: 240–243), have not been handed down (Ferrari 2006: 20–27). Since Aristotelian logic was fundamental to medical studies in Ibn al-Ṭayyib's day, it is easy to understand why it should have played a prominent role in his commentaries. Still, only a small part of his commentaries on the *Organon* has been preserved. In addition to this, however, his commentary on Porphyry's *Isagoge*, which is based on the same pattern as the commentary on the *Categories* is extant. But whereas the *Isagoge* is meant to serve as a kind of springboard to Aristotelian logic, the detailed commentary on the *Categories*, on the other hand, is to be seen as an appropriate basis for further study of Aristotle's philosophy. Although no other commentaries on Aristotle's logic have been preserved, we nevertheless find that an epitome of the commentary on the

Posterior Analytics, corresponding in structure and content to the commentaries on the *Categories*, has been handed down, as well as an epitome of the commentary on the *Categories*. During his studies on Aristotle's entire work, Ibn al-Ṭayyib also wrote a commentary on Aristotle's *Physics*, which exists in the form of lecture notes taken down by Abū l-Ḥusayn al-Baṣrī (d. 436/1044), who, from a lecture given by Ibn as-Samḥ, compiled the notes of various commentators (especially those of John Philoponus). Thus, from Book VI 5 onward, Abū l-Ḥusayn al-Baṣrī falls back on Ibn al-Ṭayyib's statements (Lettinck 1994: 459–472, 514, 527, 564–593). But here, we usually have to do with summaries of Aristotelian arguments and only seldom with discursive writing. This is especially true when Ibn al-Ṭayyib deals with the First Mover, since he maintains, in contrast with Aristotle, that movement must have begun through an act of creation (Lettinck 1994: 564). This view of Ibn al-Ṭayyib is doubtless to be traced to his Christian background. He also wrote a commentary on Aristotle's writings about animals. This commentary is, however, known not in Arabic, but in Hebrew, and exerted a considerable influence, especially in medieval Spain. For this extensive commentary (*tafsīr*), Ibn al-Ṭayyib evidently made use of Ḥunayn b. Ishāq's revised version of the *Historia animalium* (Zonta 1991: 243). Only an eclectic compilation of questions on Aristotle's *Historia animalium* has been handed down in Arabic. Also attributed to Ibn al-Ṭayyib is a short lecture on Aristotle's economic theories, though its authorship is just as uncertain as is the writing on Plato's *Leges*. There has also been a dispute as to whether this text is in fact based not on Fārābī's paraphrase of the *Leges* but rather on a common third source, possibly Galen's *Synopsis of Plato's Dialogues*. Ibn al-Ṭayyib also made translations of works such as the pseudo-Aristotelian *De virtutibus*, which he rendered from Syriac into Arabic. Indeed, from this translation we may infer that he had a good command of Syriac. Whether his knowledge of ancient Greek was comparable cannot be said for certain, even though some competence in this language has definitely been ascribed to him. He left his most visible traces in medieval medicine. His most

famous pupil was, in fact, the medical doctor, al-Mukhtār ibn al-Ḥasan ibn ‘Abdūn ibn Buṭlān, who was especially well known for his work on hygiene, dietetics, and medical ethics. Noteworthy in this connection is the polemics that took place in Cairo between him and ‘Alī ibn Riḍwān (d. 453/1061 or 460/1068) as to whether a medical student should be trained only by means of books or whether he should also have a teacher. It was a polemics in which Ibn Buṭlān prudently and sensibly defended the role of the teacher. Ibn al-Ṭayyib also wrote commentaries on Hippocrates’ many writings, though he is especially important for the reception of Galen’s works. Thus, he wrote commentaries on the entire *Summaria Alexandrinorum*, namely, the entire output of Galen’s œuvre in 16 volumes, which had been compiled by various Alexandrian medical doctors. One of his treatises of relevance to medical theory that has been handed down is the one on natural forces (*Risāla fī l-Quwā al-ṭabīyā*), which is also concerned with Galen’s theory of natural forces. Ibn Sīnā wrote a rebuttal of this work, and it is noteworthy that this text and Ibn al-Ṭayyib’s treatise have often been handed down together. As a Christian theologian and church dignitary, he produced a number of theological works. Among them is to be included probably the greatest exegetical collections of Christian Arabic literature, namely, a commentary on the entire Bible entitled *The Paradise of Christianity* (*Firdaws al-naṣrānīya*). He also wrote commentaries on the Psalms and the Gospels as well as various treatises on dogmatic and ethical topics. Through his influence on philosophy and medicine, Ibn al-Ṭayyib was one of the last proponents of an academic tradition whose banner stood for the cultivation and maintenance of the ancient Greek heritage. It is particularly with respect to Galen’s reception that he occupies an important place in Islamic as well as Christian medieval medicine (Ullmann 1970: 157). He enjoyed a great reputation among his contemporaries and in biobibliographical literature as an erudite commentator, though, thanks to Ibn Sīnā, he also got caught in the cross fire of criticism.

Ibn 'Arabī, Abū Bakr Muḥammad Muḥyiddīn

Rafael Ramón Guerrero

Facultad de Filosofía, Universidad Complutense de Madrid, Madrid, Spain

Abstract

Ibn 'Arabī belongs to a kind of mysticism or Sufism that can be considered esoteric: he seeks mystical experiences and is strongly

influenced by Neoplatonism. He claimed that the experiential and intuitive knowledge he possessed came directly from God. The use of philosophical doctrines and terminology makes his work of great interest to philosophers. Among his doctrines, the most important are the transcendental unicity of being and the perfect man, who plays a central role in creation.

Born in Murcia (Spain) in 1165, Abū Bakr Muḥammad ibn 'Arabī is also known by his various epithets: “The Master of Masters,” “Sultan of the Gnostics,” and “Reviver of Religion.” He lived in Seville, where he received his education and was influenced by two great women mystics. In Cordoba, he met Ibn Rushd, an encounter that represents the meeting of two great figures in Islam that personified different paths to the Truth: the Gnosis and reason. He traveled throughout North Africa and the Near East: Cairo, Mecca, Konya, Baghdad, Aleppo, and Damascus, where he died in 1240. He wrote about 350 works, which range from brief treatises to his great book *The Meccan Illuminations*, containing 560 chapters dealing with different sacred sciences and his own spiritual experiences. Another of his most widely read works is *The Bezels of Wisdom*, in which, over 26 chapters, he expounds the fundamental doctrines of Islamic esoterism. *The Interpreter of Desires* is also famous, a poetic text centered on love and desire. All of his work is difficult to read and hard to understand, as it is written in his own style of language using very technical vocabulary, based on that used in the earliest Sufi texts. The reader must learn not only the exact meaning of his words but also the related nuances and images. This is a complex symbolic language that requires deciphering.

His constant evocation of the meeting with the prophets, his continual affirmation that he is conversing with the saints of the past, his claim to a special divine inspiration through an angel or the prophet Muḥammad, and his incessant recourse to

the so-called evidence for the invisible earned him charges of unorthodoxy and, even, of being a satanic spirit. Seen as a pantheist by some, others have emphasized the eminently spiritual character of his thought. Through him, Islamic esoterism provided the only doctrines that could guarantee the survival of the spiritual tradition among those who ran the risk of going astray due to incorrect reasoning.

He has been considered as a "philosopher" like any other, precisely because he formulated a complete metaphysical and cosmological, psychological and anthropological doctrine, which in principle seems to signal a break with the Sufi tradition existing up until that point. However, he adopted a clear position against philosophy of Greek origin and even stated that the science of the philosophers is totally vain. He rejected reflection because it causes confusion and lack of truthfulness. He also maintained that reflection is a veil, debated by some, but that is not negated by any of those who follow the Path; only those who practice speculative reflection and reasoning by induction claim otherwise. It is very rare that philosophers experience spiritual states; if and when these do occur, they are similar to the introspection and contemplation of the mystics. The only true philosopher, the one worthy of the name "wise," a term, which for him is synonymous with Gnostic, is the one who seeks to perfect his knowledge through contemplation and spiritual experience. The rest, who use only their intellects, will never even perceive more than a tiny part of the truth. The truth has two aspects, the manifest and the concealed. There is a truth that is reached by following a new path; not that of human reason, but that of the heart, the true organ of mystical perception.

Ibn 'Arabī expounded the doctrine of Being and its manifestations more gnostically than philosophically in the usual sense of the term. He talked about Divine Essence, the Names and Qualities, theophany, and other issues of this kind, but he did not use the language of the Islamic philosophers. His metaphysics transcends ontology: he starts at the Beginning, which is above Being, of which Being is the first

"decision." His doctrine of necessity included an exposition of the meaning of the term "existence" understood as Being, although he approached the problem from a different angle with respect to that of the philosophers. He was the first to formulate the doctrine of the unicity of existence or transcendental unicity of being. This means that as God is totally transcendent in relation to the universe, then the universe is not totally separate from Him. Reality cannot be radically different from Absolute Reality; if this was so, it would imply the association of other beings with God, meaning polytheism and the negation of divine unity. The Essence of God forms a unicity that spans complementary and opposite terms. He is the center in which all oppositions meet, and it transcends all the contradictions involved in multiplicity. In Him, there is a kind of "coincidence of opposites," which cannot be reduced to the categories of reason. God is at once exterior and interior, One and multiple, first and last, Creator and creature, eternal and temporary, necessary and contingent, lover and beloved, intelligent and intelligible. All of these conflicting divine attributes form a single reality. This thesis has led some to view it as pantheistic. However, Ibn 'Arabī does not maintain that God should be known in His essential reality, but only through his divine names, which are reflected in creation, but not included in it. He therefore denies that the divine essence can be assimilated to the essence of creation and that the divine transcendence is preserved in this way.

The perfect man, the reason for the world's existence, is the full image of divine reality and contains within him all the possibilities of the universe: he is a microcosm, and, on knowing himself, he knows God. This man is the prototype of creation, because human perfection is linked to the divine image. He is a being which does not need adornment or special characteristics to be honored and respected, because he is God's representative on earth. No other identity is needed for men to consider each other as brothers. One loves all creatures because one loves God. If He is the creator, everything created by him is worthy of love.

The human soul is part of the universal soul, represented as matter, and residing in the human body. Understanding the unity of the soul and body is only possible through mysticism, which is the path created by God for humans to approach Him. For this reason, the mystic's purpose is to unite with the divine, an act, which is the result of the love that divine beauty stirs within humans. This union does not imply an end or annihilation of existence, rather an understanding of human existence as a ray of divine Being not possessed by other things. Most of those who have experienced the divine pressure maintained that the end of existence was a precondition for attaining knowledge of God, which is incorrect. Knowledge of God does not presuppose the end of existence, because things do not exist properly speaking, and that which does not exist cannot cease to exist: an end of existence implies a defense of existence, which equals polytheism. So if one knows that one lacks existence and end, one knows God; if one does not know this, one cannot know Him. This state of union is the supreme goal of the Gnostic or Sufi, the result of spiritual practice culminating in prayer from the heart.

Ibn 'Arabī's influence on Islamic spirituality has been great, reaching many Sufi brotherhoods. Thanks to him, there was a reconciliation between Sufism and the doctrine of Imami Shī'ism, which was against Sufi practice because of the conviction that Sufism usurped the privilege of union with God and the knowledge of divine secrets, privileges that were reserved for the Imam. However, his influence in the European Latin West was negligible.

Centre National de la Recherche Scientifique,
Villejuif, France

Abstract

Ibn Bājja was one of the main representatives of the *falsafa* in the Muslim West between the eleventh and the twelfth centuries. He was the

precursor of Averroes, on whom he had a decisive, if indirect influence. Known in the Latin world under the name of Avempace, he wrote several commentaries on Aristotelian writings of logic and natural philosophy, although his knowledge of them does not rest on a direct study of the works of Aristotle, but rather on Graeco-Arabic abbreviations or comments by Alexander of Aphrodisias, Themistius, Philoponus, etc. Toward the end of his life he focused on ethics and political philosophy: in the *Regimen of the Solitary*, he maintained that the philosopher should isolate himself intellectually from the corrupted community, in order to attain the ultimate happiness of theoretical life; in another short writing, *The Conjunction of Intellect with Man*, he maintained that this ultimate happiness consists in the highest perfection of the human intellect.

Life

Abū Bakr Muḥammad ibn Yaḥyā ibn al-Šā'ig ibn Bājja was born in Zaragoza, in all likelihood from a family of craftsmen; the most authoritative biographers place his birth between 1077 and 1082. His teachers in philosophy are unknown, but one can safely assume that his studies were influenced by the intense philosophical activity that was then conducted in the Jewish communities of Zaragoza. Before 1109, when the Banū Hūd dynasty ruling Zaragoza was defeated by the Almoravids, it was reported by Ibn al-Sīd al-Baṭalyūsī, with whom he was involved in a dispute, that Ibn Bājja was a young and extremely talented teacher of logic with a devoted group of disciples. From 1110 to 1117 (?), he held the office of vizier to the new Almoravid governor of Zaragoza, Ibn Tafālwīt. During this period, he was sent as an ambassador to the former ruler of Zaragoza deposed by the Almoravids. He was there imprisoned as a traitor, and only narrowly escaped execution. After the conquest of his native city by the Christians in 1118, Ibn Bājja lived in different cities in southern Spain and North Africa, for example, Almeria, Granada, Oran, and Fes. We know from one of his letters that he was

imprisoned a second time during this period. He wrote several musical poems, and has therefore been regarded as the inventor of a poetic genre that became considerably widespread, namely the *muwashshah*. He traveled to Seville in 1135, where he revised the transcription of his works made by his compatriot and disciple, 'Alī ibn al-Imām, who became lieutenant of the city of Seville and vizier to the Almoravid's governor of Granada. This very close friendship inspired Ibn Bājja to dedicate several of his later works to 'Alī ibn al-Imām. After the latter's departure to Egypt, Ibn Bājja intended to join him, but he was assassinated in Fes in 1139, possibly poisoned by his rival, the famous physician Ibn Zuhr (Avenzoar).

The Earlier Works

In a letter to his friend Abū Ja'far Yūsuf ibn Ḥasdāy, studied by J. al-'Alawī, Avempace describes his scientific career. He first studied mathematics, music, and astronomy. He then became interested in logic, and later, again in the physical sciences. In the last period of his life, not yet begun at the time of writing the letter, he wrote a series of works, culminating with *The Regimen of the Solitary* (*Tadbīr al-mutawahḥhid*), which had an enormous impact on posterity. Most of the works from the first period of his life have not survived, but we do know that he wrote a commentary on al-Fārābī's *The Major Book of Music*. We also know of a short writing on the relations between the humors of the body, the strings of the lute, and the melodies of the spheres. The letter to Ibn Ḥasdāy alludes to criticism of the astronomer al-Zarqālī (Arzachel, d. 1087) about the calculation of the apogee of Mercury. Other texts allude to research on the *Conics* of Apollonius of Perga.

Later on, he focused on the study of logic, which was studied in al-Andalus on the basis of the logical works by al-Fārābī. Several writings from this period of Ibn Bājja's lifetime have been preserved: some notes on the *Five Chapters* (*al-Fuṣūl al-khamsa*) by al-Fārābī (a small propaedeutic treatise), as well as on the Farabian summary of Porphyry's *Isagoge*, and on the

Farabian commentaries on the *Categories*, *De interpretatione*, *Prior Analytics*, and *Posterior Analytics*. Although these notes appear more like a collection of glosses than as a full-fledged treatise on logic, elements of systematicity emerge, however, highlighted by a series of successive divisions that define the status of the various branches of logic with respect to other philosophical disciplines. The first of these is the division, within the field of language, between *lafẓ* (meaning) and *ma'nā* (concept, "intention," pl. *ma'ānī*), which alone is the proper subject of logic. The *ma'ānī* can in turn be divided into singulars and universals, which allows the setting apart of disciplines such as rhetoric and poetic – which attribute a universal predicate to a singular subject – from philosophy, dialectics, and sophistry, which, notwithstanding the diversity of the nature of their premises, predicate the universal of the universal. The latter is itself either simple or compound, such as the definitions, which consist of genera and differences. The science of definitions is thus an understanding of a compound universal, while the science of simple universals is introduced by the *Categories* (*Maqūlāt*). To reassemble universals (or singulars) into complex predications, and further into syllogisms, gives rise to the various sciences, depending on the status of the syllogisms used therein.

Just as with logic, most of Ibn Bājja's writings of physics do not rest on a direct study of the works of Aristotle, but rather on Graeco-Arabic abbreviations or commentaries of Alexander of Aphrodisias, Themistius, Philoponus, etc.; he uses paraphrases of the *Physics* and the *Meteorology* as well as of the *De generatione et corruptione*. The writings of Ibn Bājja on the physical sciences did become important sources for the early writings of Averroes and his *Compendia* of natural philosophy. The commentary on the *Physics* presents some corrections and moderated critiques of Aristotle's dynamics. He for example considers it necessary to posit a cause for unnatural motion, in addition to the movement imparted by the originator of the motion: this cause must be an immaterial kinetic force inherent in the moved object. The theory of falling bodies that Ibn Bājja formulates is based on his reading of

the Arabic Philoponus, and allows for the explanation of how a motion having a finite speed can take place in an environment offering no resistance, as in the case of the celestial bodies, thus leading the way to a dynamic model applicable to both the sublunary and the celestial world. These developments, endorsed by Averroes in his *Great Commentary on the Physics*, might have influenced John Buridan, whose model was the starting point of Galileo's discoveries.

Ibn Bājja's commentary on the *De generatione et corruptione* follows roughly the order of the exposition of Aristotle's text, but some conceptual innovations are noteworthy, for example, the fact that the commentary pivots around the distinction – not explicitly mentioned by Aristotle – between the generation of the four simple bodies (*kawn al-basā'it*) from each other, and the generation of composite bodies (*kawn al-murakkabāt*). This distinction elicits the foundation of the hierarchy of natural beings (i.e., simple body, homeomer composites, anhomeomer organs, animal, and human) which is the foundation and guiding principle of Ibn Bājja's physics, linking together the latter and the science of the soul.

Ibn Bājja frequently cites the Arabic version of the *Nicomachean Ethics* and a commentary on it by Porphyry (in twelve instead of ten books, as in Aristotle's original work) that is mentioned in the Arabic sources. A small epistle, possibly spurious, also undertakes to defend al-Fārābī against the accusation of having, in his own lost commentary on *Ethics*, denied the possibility of the union of humans with the separated Intellect. Ibn Bājja also composed a commentary on Pseudo-Aristotle's *De plantis*. An important role is attributed to the *Book of Animals* (*Kitāb al-Ḥayawān*), the Arabic summary of the three main zoological treatises of Aristotle, of which only the *De generatione animalium* and the *De partibus animalium* are commented upon in Ibn Bājja's own *Kitāb al-Ḥayawān*. Zoology is not a peripheral science of lesser importance, but a higher part of physics, which serves as an introduction to the science of the human soul and intellect. It is particularly Aristotle's account of *De gen. an.* II, 3 (736a35-b15), on the successive appearance in humans of the faculties imprinted in the living soul, which for

Ibn Bājja provides a model for hierarchically arranging the natural forms realized on lower substrates, that then organize themselves in a continuous way, from the simple elementary forms to the forms of the living beings and eventually to the intellect. Of particular importance in the commentary on *De animalibus* is the comparison between natural and artifactual forms, by which Ibn Bājja shows how the formative power (*vis formativa*), which gives form to living beings, cumulates the qualities of the artifactual forms – that depend upon an intelligence extrinsic to the created object – and those of the substantial and intrinsic natural form. The design of the hierarchy of forms implemented in Ibn Bājja's *Kitāb al-Ḥayawān* also serves as a guide to his *Book on the Soul* (unfinished), which, beginning from the cognition of the forms of simple bodies, studies their composition in complex bodies and the successive combinations that lead to the existence of living beings with a soul. He borrows this from the *De anima* by Alexander of Aphrodisias, rather than from the work of Aristotle, to which Ibn Bājja does not refer directly.

The Works on Ethics, Politics, and Noetics

In addition to several short works, many of which were published by J. al-'Alawī (*Rasā'il falsafīyya li-Abī Bakr ibn Bājja*: see the Bibliography), three major texts (all edited by M. Fakhry and more recently by Ch. Genequand: see the Bibliography) can be placed in the last period of Ibn Bājja's life. At this time, some interconnected ethical, political, and intellectual concerns surpassed the study of physics. The order of the composition of these works are *The Regimen of the Solitary* (*Tadbīr al-mutawahhid*), *The Letter of Farewell* (*Risalat al-Wadā'*), a spiritual guide for his friend 'Alī ibn al-Imām on his departure for Egypt, and an epistle entitled *Conjunction of the Intellect with Man* (*Ittiṣāl al-'aql bi-l-insān*).

The Regimen of the Solitary is subdivided into two parts, respectively devoted to human actions and to "spiritual forms." This is preceded by a discussion of clearly political import about the

place of the philosopher in the state. Ibn Bājja uses the same analogy throughout the work between the political governance or "regimen," the personal governance, and "medicine," corresponding to the health of the political body, the health of the soul, and that of the body. Just as there is only one perfect balance between the humors of the body, subject to any number of undetermined disorders, there can be only one model of a perfect state, and many deviations from this standard. The imperfection of the societies causes almost necessarily the imperfections of its members, which are determined by their environment, except for a small number of superior humans, who can acquire their perfection independently of any society. The duty of these individuals, also in the interest of the imperfect society they inhabit, is to maintain their impermeability to the vicious standards of the society, and to restrict their dealings with these societies to the maximum, by taking advantage of resources offered to them when necessary: something which would not be the case, if the philosopher lived in a virtuous society. It is in this way that he develops the conditions of the perfection of philosophy, and possibly the improvement of the state, since only the philosopher is capable of reforming the vicious state and he is only able to guard himself against the corruption by taking himself away. Scholars differ on what this "aleness" advocated by Ibn Bājja actually means, that is, strict individualism or political activism.

The regimen followed by the philosopher is obviously a spiritual one: Ibn Bājja hence establishes a typology of human actions related to the "spiritual forms" (*ṣuwar rūḥāniyya*), because all acts accomplished by a human being are necessarily related to some form perceived by the soul. The actions are sorted hierarchically according to their relation to the body: to the hierarchy of acts corresponds that of the spiritual forms. This notion encompasses for Ibn Bājja forms of individual beings that are produced by sense perception and imagination, and are placed in the pneuma surrounding the heart and located in the brain (individual spiritual forms), abstract universal concepts realized in the human intellect, and the extramental forms that are incorporeal,

intelligible, universal, and separated (universal spiritual forms).

All human actions are accompanied by the apprehension of a form by a faculty. Hence “eating,” “drinking,” and “getting dressed” involve the existence of bodily forms. An act of desire involves forms perceived and imagined, and an act of thinking involves forms enhanced to the level of intellect. Since acts are as good as the “spiritual forms” that accompany them, the noblest acts of a human being are his thoughts, and they culminate in the apprehension of an intelligible reality entirely separate from matter: such an apprehension constitutes the ultimate happiness (*sa'āda quṣwā*) of a human being.

In *The Conjunction of the Intellect with Man*, Ibn Bājja undertakes to prove apodictically the possibility of such a union of the human being with the separated Intellect. Having stated that the intellect can be either potential or actual, and that the forms imagined by the human being – that are individual entities – constitute the potential intellect of an individual human being, Ibn Bājja proceeds to claim that “intellect” means in fact two things: the potentiality to become intelligible that belongs to the various imagined forms, and the intelligence that is the true essence of the human being. The latter is a necessarily universal form; hence, it is separate, and by the same token unique. As a consequence, the human being who has reached union (*ittiṣāl*) with this separate form becomes necessarily “one.” The essence of a human being is, however, distributed across a plurality of individuals, in which the intellect, which is the essence of the human being, spreads itself and particularizes itself, giving rise to instantiations where the intelligible reality is present in various degrees of particularity and materiality. This is why the human souls conceive in themselves spiritual forms that are particular. The form of a given extramental reality is individual, and it is as an individual reality that is first perceived, and then imagined. Thus, the particularization concerns the intelligible forms of the material beings received in the intellect: even though they are not themselves material, they are nevertheless related to the imagined individual forms of which they are the intelligible

counterparts. In the process of production of the intelligible form out of the imagination of a given material object, the thinking intellect does not already coincide with the intelligible form. The intellection of a thing in an individual human intellect is distinct from the intellection of the same thing in another individual, because these two intelligible forms are related to two imagined forms different from one another, located as they are in the imaginative faculty of different human individuals. However, the relative individuality of the intelligibles merges in the intellection of the intelligible form, which is one for all humans, totally separate, and counts as the foundation for the intelligibility of all things. The actual perfection of the human being consists of this ultimate act of intellection by which he reaches his true essence.

Ibn Farīgūn

Hans Hinrich Biesterfeldt

Seminar für Orientalistik, Bochum University,
Bochum, Germany

Abstract

Ibn Farīgūn, a little-known author of a conspectus of the fields of knowledge, was a direct or, more probably, an indirect pupil of Abū Zayd al-Balkhī (d. 934) and dedicated his work to the local ruler of a province in north-eastern Iran who died in 955. These scanty data situate the author in the tradition of the “Eastern” school of al-Kindī to which belong Ibn Farīgūn’s teacher al-Balkhī, al-Sarakhsī (d. 899), and al-‘Āmirī (d. 992). Ibn Farīgūn’s “encyclopedia,” called *Jawāmi‘ al-‘ulūm*, appears to be a handbook for the *kātib*, the state secretary, meant to furnish him with the catchwords and the internal structure of all kinds of theoretical disciplines and professional skills. Some sections of his work permit comparison with contemporary “mirrors for princes.” The fields of knowledge are, in the order of their appearance, the following: Arabic grammar (mainly parts of speech and morphology), various departments of state officials, statecraft and warfare, Islamic theology and religious duties, knowledge as such (*‘ilm*) and its forms of transmission, and the occult sciences. Almost all these subjects are presented in the peculiar form of the so-called *tashjīr*, that is, “trees,” which resemble the *arbor porphyriana* and aim at visualizing the relation between a given category, or general term, and its various species, or aspects. The section on the parts of philosophy (contained in the chapter on *‘ilm*) clearly reflects the order developed by the Alexandrian commentators on Aristotle’s works and mediated by al-Kindī’s ideas, to be traced also in Ibn Farīgūn’s quasi-identification of the object of, and the logical method of inquiry into, metaphysics and Islamic theology.

The three known facts about Ibn Farīgūn’s life and work are that he moved in the circle of the poly-histor Abū Zayd al-Balkhī (d. 934) and that he is the author of a conspectus of the fields of knowledge, called *Jawāmi‘ al-‘ulūm*, which he dedicated to the ruler of Chaghāniyān (a region north of the river Oxus), the Muḥtājīd Abū ‘Alī Aḥmad b. Muḥammad b. al-Muẓaffar (d. 955). These scanty data locate Ibn Farīgūn in the fertile tradition of the “Eastern” pupils of al-Kindī, along with his teacher Abū Zayd, Aḥmad b. al-Ṭayyib al-Sarakhsī, and Abū l-Ḥasan al-‘Āmirī, whose common feature is an effort in combining (a) Arabic-Islamic disciplines, (b) certain traits of Iranian statecraft and ethics, and (c) the Hellenistic philosophical and scientific tradition, not least its models of the classifications of knowledge, initiated by Aristotle, developed by his commentators, and refined to an unprecedented degree by Islamic scholarship.

As for Ibn Farīgūn’s identity, there is no trace of him in the rich Arabic biobibliographical literature; even his given name which appears on the three known manuscripts of his *Jawāmi‘* remains unclear. It has been suggested that he was a scion of the Āl-i Farīgūn, rulers of the district of Jūzjān in northern Afghanistan and tributaries of the Sāmānids, and that he may be identical with the anonymous author of the geographical work *Ḥudūd al-‘ālam*, written in Persian. Real evidence, however, can only be gleaned from his *unus liber* itself, but then this contains no explicit quotations from earlier authors, nor is it quoted in later works. This is due, to some degree, to its quite idiosyncratic arrangement, the so-called *tashjīr*, “arborization, ramification”: almost all the material, the fields of knowledge, the various crafts and professional functions, etc., is arranged in tree diagrams, the “trunk” representing the primary term and the branches and twigs, done in black or red ink, leading to secondary and tertiary terms. Thus, we find in the top right corner of p. 144 of the facsimile edition (= p. 255–257 ed. Janābī) a sketch, classifying philosophy as follows (for practical reasons, the *tashjīr* visualization is tentatively changed to numerical notation):

Philosophy [is divided into]:

1. Praxis
 - 1.1. Politics
 - 1.2. Economics
 - 1.3. Ethics
2. Theory
 - 2.1. Metaphysics (*ilāhī*) investigating the *intelligibilia*
 - 2.1.1. Mathematics (*ta'limī*) concerned with imaginary things (*ashyā' wahmiyya*)
 - 2.1.2. Mathematics (*riyādī*) investigating imaginary things [a doublet of 2.1.1.?] as to their quantity and quality [...]
 - 2.1.2.1. Arithmetic, a simple science [...]
 - 2.1.2.2. Geometry, composed in the first order, since 2.1.2.1. is employed in it
 - 2.1.2.3. Astronomy, composed in the second order, since 2.1.2.1. and 2.1.2.2. are employed in it
 - 2.1.2.4. Music, composed in the third order, since 2.1.2.1.–3. are employed in it
 - 2.2. Natural sciences
 - 2.2.1. Medicine [...]
 - 2.2.2. Animals
 - 2.2.3. Plants
 - 2.2.4. Mechanics (?) [...]

This outline of the philosophical sciences is clearly that of the Alexandrian commentaries on Aristotle's writings; the interesting idea of the growing complexity of the mathematical sciences may well have its roots in al-Kindī's system as presented in his *Letter on the Number of Aristotle's Books*, perhaps transmitted by al-Balkhī who is credited with a work on the classification of the sciences; the extensive subdivisions of Medicine may again be due to al-Balkhī who composed a monograph on the subject or to Ibn Farīgūn's own predilection whose system of the natural sciences as such

seems quite *sui generis*. On the following page (145 of the facsimile edition = p 258 f. ed. Janābī), the author classifies and discusses at length the contents and purpose of metaphysics (cf. above, 2.1.), which he sees as a culmination of all philosophical sciences, because (a) it investigates the cause of things (and not the caused things); (b) its object is the ultimate goal of all knowledge, God's Lordship; and (c) only the faculty of the intellect is employed (and not faculties concerned with material or imaginary objects). An investigation of this kind will lead to the understanding of the Creator's wisdom which, from His oneness, generates the intellect, the soul, and nature. This Neoplatonic order of emanation and the implicit complementarity, if not identity, of the object and the logical method of metaphysics and Islamic theology (*ṣinā'at al-kalām*, classified on p. 136 of the facsimile edition = p. 242 ed. Janābī) are central elements of the tradition of al-Kindī and show "a trend in the earliest philosophical school in Islam, perhaps existing already in the last phase of antiquity, to emphasize the theological aspect of Aristotle's *Metaphysics* at the expense of that dealing with the first philosophy, being-as-such" (Gutas 1988: 249).

The general sequence of the *Jawāmi'* is not easy to establish. Two substantial blocks appear to frame the whole work: the introductory chapter treats Arabic grammar, particularly in the form of morphological tables, implicitly stating the key character of language for all information to follow, and the final chapter classifies – in remarkable detail – the occult sciences, that is, "those fields of knowledge that are subject to controversy on whether they are really that, or rather fraud, trickery, and means to make a profit." Between these two blocks, the order of disciplines is roughly as follows: (1) the professional skills and virtues of the various types of secretary at court (*kātib*); (2) ethics and virtues, particularly of the good ruler; (3) statecraft and warfare; (4) Islamic theology (*kalām*) and religious duties; and, as a kind of climax, (5) sources of knowledge and forms and methods of its transmission, from which the above excerpts are taken.

Passages such as those discussed above and the frequent use of technical, or epistemological,

catchwords such as “form” and “matter,” “genus” and “species,” “idea” and “expression,” and “quality” and “quantity” should not divert from the fact that the *Jawāmi‘* does not aim to be a philosophical system of the sciences. They share with al-Khwārazmī’s *Maḥṣūḥ al-‘ulūm* the focus on technical terms; they show isolated parallels with concepts of al-Kindī, Abū Zayd al-Balkhī (in statecraft), and al-‘Āmirī (in the classification of genres of communication); but they lack the systematic distinction between indigenous Islamic and foreign, Hellenistic, sciences. This distinction governs the *Maḥṣūḥ* and al-‘Āmirī’s improvised classification in his *I‘lām* and, above all, al-Fārābī’s *Iḥṣā’ al-‘ulūm*, which finally – before the epochal advent of Avicenna’s encyclopedic designs – constitutes a truly systematic attempt at integrating the Aristotelian and the Islamic traditions. To all appearances, Ibn Farīgūn’s *Jawāmi‘* is a handbook for the state secretary interested in the catchwords of all kinds of disciplines and professional skills, with a penchant for philosophical categories and a – in a sense both practical and philosophical – quest for systematization.

Ibn Ḥazm of Cordoba

Rafael Ramón Guerrero

Facultad de Filosofía, Universidad Complutense de Madrid, Madrid, Spain

Abstract

Ibn Ḥazm is one of the first thinkers from al-Andalus whose numerous books have been preserved. By reading his texts, one can deduce that he was a man of letters: poet, theologian, jurist, polemicist, historian of ideas, and even philosopher. It is not possible to find in his texts any commentaries to the works of Greek philosophers, nor a complete system of thought. However, he is worth a place on the history of philosophical thought due to the presence of enough metaphysical, cosmological, gnoseological, psychological, ethic, and political elements on his texts, besides his knowledge of Aristotle's logic.

Biography

Abū Muḥammad ʿAlī b. Aḥmad b. Saʿīd b. Ḥazm was born, according to himself, in Cordoba, in the suburb of *Munyat al-Mugīra*, on the last day of the month of *Ramaḍān* in the year 384 of Hegira – which corresponds to the 7th of November of 994. He claimed to be a descendant of a Persian man linked to the first Umayyad caliphs; however, he is of Muladi origin – that is, he descended from converted Christians to Islam. Thanks to the position that his father had in the court of Cordoba under the Caliphs, he had access to the knowledge of his epoch by studying the Koran and the Islamic religious sciences. He also attended

courses and meetings in which religious and scientific topics were discussed, and this is how he achieved a solid education. After the riots that started in 1008 – which ended up in the *fitna* or civil war – Ibn Ḥazm's family lost the favor they had with the Cordovan court. His father died in 1012 and he found himself forced to leave Cordoba. He settled down in Almería where, later, he fell from grace: he was arrested and sent into exile. He settled down in Valencia and in Xàtiva, where he wrote *Ṭawq al-ḥamāma* around the year 1022. In 1023 ʿAbd al-Raḥmān V, an educated man, was elected caliph and named Ibn Ḥazm as vizier, acknowledging his fight in favor of the Umayyad. In January 1024, the caliph was killed and Ibn Ḥazm was imprisoned again. One year and a half later, he was freed, and he decided to withdraw from any political activity and devoted himself to studying. He adopted then the legal ritual *ẓāhirī* and abandoned the one that was predominant in al-Andalus, the *Mālikī* ritual. This fact resulted in him having many difficulties with the political and religious powers. After the definitive fall of the caliphate, on the 30th of November, 1031, Ibn Ḥazm went all over different Taifa kingdoms where he was welcomed at the beginning but rejected at the end due to his criticism to power. The King of Seville, Al-Muʿtaḍid, ordered all his works to be burnt in public, and Ibn Ḥazm answered to this measure with a famous poem that reads as follows:

“Though you may burn the paper, you cannot burn what the paper bears; / which is kept safe within my spirit in spite you / and goes with me wheresoever my feet lead me. / Wherever I rest, there too rests my science, / and it shall be buried with me in my tomb the day I die.”

During this period, he wrote a great part of his works. At an unknown date, he went back to his family's house in Munt Lishām, in Niebla, in the district of Huelva, where he died, according to his son Abū Rāfiʿ al-Faḍl, on the 28th of *shaʿbān* of the year 456, which corresponds to the 15th of August of 1064.

This same son gave account of the enormous literary production of his father in a report in which he stated that his works on law, *ḥadīth*,

religious foundations, doctrines and sects, history, genealogy, *adab* books, and controversy reached around 400 volumes – only knowing nowadays 150 out of them. The reading of these works demonstrates the extensive knowledge that he had on various fields as well as on the works of different authors on almost every field of knowledge, as his *Risāla fī faḍl al-Andalus* (*Treatise on the Merits of al-Andalus*) reveals. Being a deeply religious person, he addressed his critics against all religious deviations and against the leaders' indifference.

He also knew some ideas put forward by the first Arab philosopher, al-Kindī, whose metaphysics he criticizes in his *al-Radd 'alā l-Kindī al-faylasūf* (*Refutation of the Philosopher al-Kindī*). To the education he acquired is added knowledge by oral tradition of nonpublic theories as well as information on Jewish and Cristian religions and the diverse Islamic sects, as shown by his great work *Kitāb al-Fiṣal fī l-milāl wa-l-ahwā' wa-niḥal* (*Book of Critical Examination concerning Religions, Sects and Denominations*).

Sciences

Since he was a religious man, his works reveal his strong belief in God and conviction that Islam was the only true religion. However, being a man of letters in the broadest sense of the word, he clearly saw the value that knowledge had for the integral development of humans, as well as the interdependence between the different disciplines on this field. He understands that science has two aspects which complement one another: the spiritual aspect, which is linked to revelation, and the solely scientific aspect, which is linked to reason. Only by acknowledging both aspects, the sense of science can be understood as the whole of human experience. In his *Risālat al-tawqīf 'alā shāri' al-najāt bi-ikhtisār al-ṭarīq* (*Treatise for setting up the Way of Salvation in a brief Manner*), he wonders if this path goes through the sciences of the ancients, as philosophers pretend, or through the faith in prophetic revelation, as theologians support. He claims the temporary

utility of the sciences of the ancients – which are philosophy and logic – which were taught by Plato, his disciple Aristotle, Alexander, and whoever followed their steps. These are valid sciences as long as they provide with knowledge about the universe and everything within it. The evidence to reach truth is established through logic, which is one of these sciences; therefore, this is a very useful knowledge in order to determine the realities of things. He also includes mathematics, geometry, medicine, and astronomy among these sciences, being all demonstrative sciences very useful for humanity and, even, for religion. Regarding judiciary astrology, it is a vain and useless science because it lacks any kind of demonstrative evidence. He then explains the advantages of that which has been revealed to prophets: it is a knowledge that is used to correct the habits of the soul, to avoid injustice and violence against human life, and, in short, to save the soul. The prophecy promotes the healing of the soul having, therefore prevailing over the healing of the body. It is then impossible for philosophy to improve the character of the soul if it does not rely on prophecy. After, he presents the truths that the revelation has brought to light and that the reason verifies. These are issues related to theoretical philosophy: the created character of the universe, the fact that it has a beginning and an end, and the fact that space and time are finite.

Among the truths that are known by revelation and recognized by reason, there is language, which is necessary for teaching because no science can exist without teaching. This reference to language leads him to the affirmation that language has a divine origin, as claimed in several of his works such in his *al-Taqrīb li-ḥadd al-manṭiq* (*Introduction defining Logic*). In this work, not only he refers again to language as a gift of God, but he also exalts the merits of logic. He also offers a summary of sciences in a classification that, according to him, differs from that one given by philosophers. The sciences that are practiced by people are the following: the sciences of the Koran, traditions, doctrines, legal ruling, logic, grammar, lexicography, poetry,

history, medicine, mathematics, geometry, and astronomy, and, as a result of all these, the science of interpretation and rhetoric is added.

In the succinct description that he gives of all of them, he points to the merits of each of them, the relation between them, their objectives, and their diffusion. In *Risālat al-talkhīs li-wujūh al-takhliṣ* (*Abridgement dealing with the various Aspects of Salvation*), he goes back to the issue of sciences, he suggests a course of study, and he considers that devoting oneself to teaching is the best activity in life together with the practice of justice and striving (*jihād*) in the path of God. Even though that course tends to exalt religious education, it contains various secular sciences. He suggests the memorization of the whole Koran or of a great part of it, the study of the seven Koranic readings, the traditions, the grammar, and the lexicography, since all these sciences concern all Muslims. To these sciences, he adds the knowledge of poetry, mathematics, medicine, opinion books, and other topics. These and other purposes should be carried out to achieve salvation and the improvement of the moral character, but not to achieve leadership and prestige.

Finally in his work specifically dedicated to the classification of sciences, *Risālat marātib al-ʿulūm* (*Treatise on the Categories of the Sciences*), he organizes the knowledge established in al-Andalus at the beginning of the eleventh century. For him, science is a universal knowledge, and, therefore, it must contain both theological and philosophical knowledge, since its origin is God. Among all the human sciences, he gives a special value to logic and to language: to the first one because it helps to differentiate what is certain from what is probable and to the second because it is used to specify and to clarify the wording from the Sacred Book, the Koran. These are two sciences that are related to the theological knowledge: one represents the summit of human wisdom and the other should deserve, strictly speaking, humans' attention. By combining a rigorous scientific method with religious criteria, he was able to admit that all secular sciences, even the most precise and veracious ones such as mathematics and logic, are only useful as auxiliary and propaedeutic sciences in order to get to

knowledge and to the practice of the revealed science. Human sciences help and prepare humans on their investigation of truth. All of them cooperate so that humans can reach salvation, and they are sciences that have a universal value for all the peoples. His evaluation of sciences did not mean a rejection of reason but a recognition of its importance. He adopted a balanced position in order to solve the differences between those who supported revelation as the only value criteria and those who supported reason as something exclusive and excluding of all religious feelings. Human reason is too limited; only revelation can show those truths that reason is unable to access. Reason, by itself, cannot produce any religious value judgment over things, since it is incapable of establishing or constructing truth; its only purpose is to identify it.

Logic

In the *Taqrīb*, the author wishes to establish a rule or criterion that would be valid for all the sciences: "As for the science of logic, expounded in this book: it is the criterion for all the sciences." Logic is the result of the gift given to humans by God, which makes humans superior to animals: reason and the ability to understand. Because logic is universal, it can be applied to the natural world and religious affairs. It is this last statement that makes this text by Ibn Ḥazm original: it is an introduction to logic using accessible vocabulary, in a simple and familiar style that can be understood by everyone, using legal examples that show how this can be applied to the religious sciences. This was a new, innovative method. This method was the cause of some scandal in certain circles.

The work begins with a prologue in which, after setting out the most important gifts humankind has received from God, reason and language, he criticizes those who maintain that logic is not necessary merely because the pious tradition of Islam did not consider it as such. His response is clear: none of the pious ancestors had need of grammar either; however no one would question its utility, since, due to the spread of ignorance, it

became necessary to rid the Arabic language of ambiguity to ensure that the Word of God was properly understood. The same could be said of law: previously, no legal books existed, and now they are indispensable. Consequently, logic is necessary for four reasons: for the existence of things, because it contributes to their explanation; for the perception of these things by the intellect, because logic helps to give them form and discern them by the mind; for the existence of spoken language, which makes it possible for the speaker and the listener to communicate, that which is held in the mind of the speaker being transmitted to the mind of the listener; and, lastly, for the existence of signs, of which the most important is writing, which allows communication between two people separated by distance and time.

Some scholars wrote books to classify the ways in which things can be denoted, establishing definitions in order to make them easier to understand. Among these was Aristotle, author of eight books which establish the definitions of logic, making these works invaluable. People's responses to these works can be divided into four groups: those who believe they hold the seed of non-belief and further the cause of heresy; those who maintain that they contain incomprehensible and rambling ideas; those who read them with unstable understanding, twisted desires, or through eyes full of contempt; and those able to examine them with a calm mind, pure reflection, and clear understanding. The oneness of God is confirmed in the latter group, as they are witness to the division of things and the footprints left in them by God; they see in these books both a pious companion and a true refuge. The cause of so much disparity of opinion on Aristotle's books on logic lies in the complexity of the translation and in the use of infrequent terms used in very limited contexts. Ibn Ḥazm's intention is, therefore, to use simple terms that are easily understood. These books are like powerful medicine, beneficial for those with a sound and healthy disposition but harmful to those with a weak and sickly constitution.

The Cordovan thinker therefore sets out to remedy the difficulties involved in reading the Greeks' books on logic. This treatise was written

to clarify everything which made them difficult: "Whoever reads this book will know that these books [on logic] are not only useful for one science, but for all sciences. It is also highly useful for the Book of Almighty God, for the traditions of the Prophet and the fatwas on the licit and the illicit, that which is obligatory and that which is tolerated."

After the prologue, he presents Porphyry's *Isagoge* or introduction to logic followed by Aristotle's *Organon* together with *the Rhetoric* and *the Poetics* – according to Greek tradition accepted in the Arab world – and offers a summarized view of all of them. It looks like the source of his exposition is not Aristotle's and Porphyry's books, since, by simply comparing the vocabulary present on the texts translated into Arab and on Ibn Ḥazm's work, one can see a remarkable difference. It is possible that his sources were the authors from al-Andalus which had already written about logic. This deduction can be made by analyzing the pages in which he describes the category of "substance," since the poverty they present in content reveals his unfamiliarity with Aristotle's texts.

The same assumption can be made after reading the lines he dedicates to *the Rhetoric*. On the one hand, because he uses the term *balāga* in the expression '*ilm al-balāga*, which designates one of the Islamic sciences – the one that is related to eloquence and the explanation of the inimitable character of the Koran – therefore, it seems to be an "Islamic" motivated rhetoric compared to the use of the term *khatāba*, which is used in philosophy to refer to Aristotle's *Rhetoric*. On the other hand, Ibn Ḥazm devotes to the *Rhetoric*.

Religion

His interest in religion led him to give maximum importance to religious sciences, which hold the highest position on his ranking. Human sciences are just propaedeutic and auxiliary to get to knowledge and to the practice of revelation. The science that holds the highest position in sciences is the Law of Islam, which is divided into four: the science of the Koran, the science of traditions, the

science of law, and the science of theology. They all express the will of God.

Ibn Ḥazm incorporated then the science of theology to the *ẓāhirī* doctrine, which was fundamentally a legal school. However, the theology that he elaborated had little to do with a speculative one, since he had supported the impossibility of considering the essence, the nature, and the attributes of God. Additionally, his concern for religion led him to compose his great work *Kitāb al-Fiṣal*, in which he analyzes the different well-known religions and the religious movements or sects that existed in Islam.

In this text, he presents the main religious attitudes that existed in humanity toward truth and the eternity of the world. He also establishes ontology problems referring to essence and existence and to substance and accidents, cosmology problems about the world and its creation, and anthropology issues about human freedom, ethical virtue, and love. He considers the skepticism of sophists, the atheism of those philosophers who affirm the eternity of the universe, and the deism of those other philosophers that consider God to be the Creator of the world. He also analyzes the dualism of Manicheans and Zoroastrians, the polytheism of trinitarian Christians, the rationalism of those who deny the prophetic message, the monotheism of Jews, and of those who accept a revelation. He likewise examines religious indifference, vulgar beliefs, and the doctrines of those who are experts in magic and spells. With this, Ibn Ḥazm aims to determine the true conception of Islam. According to him, it is the one that establishes the literal sense of the revealed text dismissing any allegoric or esoteric interpretation which can lead to arbitrariness. Due to this, he gave a significant importance to human language, as stated earlier. Only by considering his position about Muslim revelation, one can understand his interest in grammar and his study of language. The human word can confuse the distinction of the divine Word. Literal meaning is the one that helps to prevent the dangers of that human word. Therefore, it is a work that comprises and solves, from this particular conception of Islam -the *ẓāhirī*-, the main problems posed in this religion.

But this intellectual and religious position did not mean for the author a rejection of reason, as has already been said. Human reason is too limited to understand what is definite in religion, which is that related to God, and therefore humans must limit themselves to knowing how to differentiate confusion from truth, which is a task that belongs to logic. Only revelation can show those truths that reason is unable to know; this, by itself, cannot produce any religious value judgment over things, since it is incapable of establishing or constructing truth; its only purpose is to identify it.

Love and Beauty

Ibn Ḥazm was one of the authors in the Islamic world, among others, that wrote about love, as an answer to Mālikī jurists, for whom talking about love in relation to God was an anthropomorphism. In his most representative work, *Ṭawq al-ḥamāma* (*The Dove's Ring dealing with Love and Lovers*), he reflects on the forms of love and sexual passion by combining prose and poetry in a masterful way. He adopts the literary form of an epistle addressed to a friend, in which Platonic elements are preserved and taken out of the *Kitāb al-zahra* of Muḥammad b. Dāwūd from Ispahan.

Ibn Ḥazm looks for the essence of love by looking into its signals and the paths where it transits and by doing an analysis based on personal data and other people's experiences. He narrates the most complex circumstances related to love with great subtlety and social and psychological penetration: its nature, its forms, and its degrees. Love has a sacred character because it is not condemned by faith nor is it prohibited by law. Therefore, the best type of love is the one that culminates in God. However, love is something innate in humans; it is a particular category in the universal law of attraction present in all beings. It is a unique phenomenon that, nonetheless, has multiple tendencies which depend upon the variety of human desire. Love is both tendency and desire rooted in the very being of human soul for it being an innate impulse. This impulse, out of

which the feeling of love arises, starts when an observer establishes visual contact with the image or shape of another being and perceives it as beautiful. This triggers a feeling of liking and affection in the observer which can go up in rank until provoking delirium or, even, death. Elevating itself to more beautiful shapes in degree, it can provide humans with the greatest of happiness they can aspire to have, a happiness that gives maximum joy, serenity, and stillness to the soul and provides with all perfections at their highest levels and establishes a “renovated life” on human beings. Love, as a tendency, requires knowledge, because there is no desire out of that which is unknown. Authentic love needs, due to the very nature of the soul, to promote knowledge:

“Love is the union between souls on the roots of their superior world, and what we have said verifies it. We know that in this under world soul is covered up with veils and accidents and surrounded by worldly and mundane natures that, even if they do not alter it, they stand in the way between itself and other souls. Therefore, a real union is only possible when the soul is ready and up for it, after acknowledging the existence of something similar and coinciding with itself and after exposing itself to the natural characters which are similar to itself and which were hidden in the beloved object.”

The great purpose of love is the union with the lover, which is the greatest happiness one can get in this world and which is only surpassed by the happiness in Paradise in which one will live eternally in body and soul enjoying the pleasures of love. This love is not passionate or ardent but tender toward the other half. Then, why there is not always a correspondence between the lover and the beloved? Considering it is an attraction to which they are destined to feel, how to explain the attractiveness of the perfect bodies? Ibn Ḥazm answers platonically underlining that this is due to the existing deficiencies in the world of the senses and to the carnal exterior of souls. For him, human beings differ from animals, above all, in their God-conferred capacity to practice virtue and to defeat desire, which is what leads them toward what is wrong and evil. The best determination a person can have to control this

desire is to possess knowledge; this is the only means to overcome the ignorance in which most mortals live. By perceiving beauty, the impulse of love is awakened. For this reason, aesthetic contemplation, the knowledge of beauty, is what provokes that renovation of life, which also means a new ethic, referring to moral actions of individuals.

All his love theory must be understood as an ethic projection regulated by the divine message and the right practice of reason. He presents this ethic in a very personal way, through his own experiences, in his *Risāla fī mudāwāt al-nufūs* (*Treatise on the Therapeutics of Souls*). This epistle is a sort of personal diary in which he wrote down his meditations, observations, and opinions on people and on life in general, which also discloses the life of the author in al-Andalus. In this work, he tries to reflect his attitude toward life and society pointing at the virtues and vice that exist in human life. Good moral conduct is based on a life of balance and tranquility:

“I have thoroughly looked for a purpose of human actions that all humans would judge unanimously as good and that all would yearn for, and I did not find but one: the purpose of avoiding worry.”

He uses his personal experiences also to present his political views on diverse works, especially on his *Kitāb al-siyāsa* (*Book on Politics*), which is only partially preserved. In this book, he explains that the caliphate is the most convenient and legitimate form of government, while any other form of government causes disturbance and confusion. He says the following:

“Since the caliphate is established by God through his Prophet and it is the foundation of religious precepts, people need someone among them to sometimes take the role of Prophet, God bless him and save him. This is because when people fear him, uncontrolled passions cool down, and when people respect him, separated hearts are reconciled. In addition, thanks to his power, the hands that fight against each other calm down and, by venerating him, rebel spirits are subjected. This is because the desire for fight and power naturally present in human beings is such that they only give up on it if there is someone strong enough to stop it and to restrain it.”

Ibn Hindū, Abū l-Faraj

Cecilia Martini Bonadeo

Dipartimento di Filosofia, Università di Padova, Padova, Italy

Abstract

Abū l-Faraj ibn Hindū was a medical scholar and poet who studied philosophy under Abū l-Ḥasan al-ʿĀmirī.

Abū l-Faraj ibn Hindū was a native of Rayy. He studied medicine under the guidance of Ibn Suwār ibn al-Khammār and was a disciple of Abū l-Ḥasan al-ʿĀmirī in philosophy. He died in c. 1029/32. He became well-known as a medical scholar, and a poet. He wrote an introduction to

the study of philosophy entitled *Treatise Encouraging the Study of Philosophy* (*al-Risāla al-mushawwiqa fī l-madkhal ilā l-falsafa*) and was then invited by a reader of his first work to write a second introduction to the study of medicine, entitled *The Key to Medicine and the Students' Guide* (*Miftāḥ al-ṭibb wa minhāj al-ṭullāb*).

Ibn Kammūna, ‘Izz al-Dawla

Cecilia Martini Bonadeo

Dipartimento di Scienze Storiche, Geografiche e dell'Antichità, Università degli Studi di Padova, Padova, Italy

Dipartimento di Filosofia, Università di Padova, Padova, Italy

Abstract

Ibn Kammūna (d. 1284 c.) was a polymath of Jewish origin, whose main works are devoted to philosophy and comparative religion.

A commentator of Avicenna and Suhrawardī, he also compiled the doctrines of Naṣīr al-Dīn al-Ṭūsī, with whom he had a scientific and philosophical correspondence.

‘Izz al-Dawla Sa’d b. Maṣṣūr b. Sa’d al-Ḥasan b. Hibat Allāh ibn Kammūna presumably originated from Baghdad where he spent most of his life. He was born into a Jewish learned family and he must have received an early education in both Hebrew and Jewish literature and Islamic letters. He states that he was self-taught in philosophy. He probably spent some time in Aleppo. According to Ibn al-Fuwaṭī, who met him in 1280–1281 in the Niẓāmiyya *madrassa* of Baghdad, he was well versed not only in philosophy, but also in astronomy, mathematics, and literature, and wrote poetry in Arabic and Persian. There is no evidence that he was a regular teacher in one of the *madrassa*-s of Baghdad, but probably gave informal philosophical lectures. He also corresponded with many scholars of his time such as Naṣīr al-Dīn al-Ṭūsī and Kātibī.

He seems to have been patronized by the family of the *ṣāhib al-dīwān*, Shams al-Dīn al-Juwaynī. After the latter's execution in 1284, Ibn Kammūna moved from Baghdad to the nearby town of Ḥilla. He refuted there because his son was serving as an official in that town, and Ibn Kammūna was in contact with some of the local Shī‘ite scholars. It is assumed in modern scholarship that this move was caused by hostile reaction to Ibn Kammūna's comparison between Judaism, Christianity, and Islam in the *Tanqīḥ al-abḥāth li-l-milal al-thalāth* (*Examination of the Three Faiths*), completed in 1280, but it is more likely to be connected to the execution of his patron. Ibn Kammūna died in Ḥilla short after 1284.

It has been argued that Ibn Kammūna converted to Islam at some stage of his life. However, Pourjavady and Schmidtke (2006) remark that in the *Tanqīḥ al-abḥāth li-l-milal al-thalāth* Ibn Kammūna's loyalty to Judaism is beyond doubt, and that it cannot be decided whether Ibn Kammūna did or did not convert to Islam after the composition of the *Tanqīḥ* (1280) for opportunistic reasons, i.e., to avoid persecution.

As a philosopher, Ibn Kammūna's favorite topic of inquiry was the nature of human soul; he formulated on this issue his main doctrines, such as that of the pre-eternity, immortality, and simplicity of the soul. He wrote several treatises on this topic, three of which are extant: the *Maqāla fī l-taṣdīq bi-anna naḥs al-insān bāqiya abadan* (Treatise on the Pre-eternity of the Human Soul), the *Maqāla fī anna wujūd al-naḥs abadī wa-baqā'ahā sarmadī* (Treatise on the Immortality of the Soul), and the *Maqāla fī anna l-naḥs laysat bi-mizāj al-badan wa lā kā'ina 'an mizāj al-badan* (Treatise on the Simplicity of the Soul). Ibn Kammūna followed Ibn Sīnā in cosmology and metaphysics, and commented the *Ishārāt wa-l-tanbīhāt* (Pointers and Reminders); he was also influenced by Shihāb al-Dīn al-Suhrawardī, the founder of the philosophy of illumination, and commented on the latter's *Talwīḥāt* (Intimations). In addition, Ibn Kammūna was familiar with the writings of Abū Ḥāmid al-Ġazālī and Fakhr al-Dīn al-Rāzī.

The list of Ibn Kammūna's philosophical works, for which the principal source is Ḥājī Khalīfa, includes excerpts from Naṣīr al-Dīn al-Ṭūsī's *Talkhīṣ al-Muḥaṣṣal* (Summary of [al-Rāzī's] Harvest [of the Thought of the Ancients and Moderns]); a comprehensive exposition of thirteenth-century science and philosophy entitled *al-Ḥikma al-jadīda* (The New Wisdom); a short work on philosophy entitled *al-Maṭālib al-muhimma min 'ilm al-ḥikma* (Key Issues in the Science of Wisdom); the short treatise *Talkhīṣ al-ḥikma* (Summary of Wisdom); and the *Kalīmāt wajīza mushtamila 'alā nukat laṭīfa fī l-'ilm wa-l-'amal* (Brief Words Encompassing Some Fine Points of Knowledge and Praxis), a compilation of ethical and moral advices for a ruler, dedicated to one of the sons of the *ṣāhib al-dīwān* al-Juwaynī.

Ibn Kammūna also wrote on comparative religion: the above-mentioned *Tanqīḥ al-abḥāth li-l-milal al-thalāth*, an overview of the polemical arguments for and against Judaism, Christianity, and Islam, and a treatise on the differences between the Rabbanites and Karaites.

Ibn Khaldūn, Abū Zayd ‘Abdarrahmān

Abdesselam Cheddadi
Faculty of Educational Sciences, University
Mohammed V, Rabat, Morocco

Abstract

A historian as well as a sociologist and anthropologist *avant la lettre*, Ibn Khaldūn was one of the most original figures of the medieval Arab culture. His political experience in various courts of the Maghreb and Muslim Spain during the first half of his life, as well as his many travels to the Middle East, provided him with a concrete understanding of the social and political realities of his time. His education was first and foremost religious, legal, and literary, but he also had strong foundations in the Graeco-Arabic philosophical tradition. In his works he raises a new question, namely, how does one write true history exceeding the limits of formal critique of historical information as it was practiced in the Arabic historiographical tradition. The answer he developed involves knowledge of society as well as taking into account all available knowledge as a condition for historical knowledge. He thus felt obliged to invent a “science of the society” in the narrow sense of the word, in which the social and political realities of the Maghreb and the Arab world in medieval times obviously occupy an important place. From this point of view, he deserves the title of “sociologist.” However, his global approach to the civilizations of his time, despite the limited information he had at his disposal, equally makes him a careful “anthropologist,” whose ideas even to

this day retain attention. He was foremost a historian, however, and as such he contributed more than an innovative approach. He had a vision of history based on the internal dynamics of societies and on their universal struggles for dominance, on the scale of the great empires of his time.

Abū Zayd ‘Abdarrahmān ibn Khaldūn was born in Tunis in 1332. According to the information in his *Autobiography*, his family, of Arab Yemeni origin, settled in Spain in the eighth century and emigrated in the thirteenth century to Tunis after a short stay in the Moroccan city, Ceuta. Destined by his aristocratic origins to occupy a high position in state administration, Ibn Khaldūn felt torn, until the age of 36, between his political ambitions and his profound attraction to science. After an eventful first half of his life when he was called to hold high political positions in various courts of the Maghreb and in Muslim Spain, he made a crucial decision to withdraw into the castle of Qal‘at ibn Salāma (near Frenda, in Algeria) to write. During the 4 years he spent in this deserted place, away from the bustle of cities, he wrote the first draft of the most important work of his life, *The Book of Examples*, which includes the famous *Muqaddima* (Introduction) as the first volume. Finally, having fallen seriously ill, and being obliged to leave his retreat to find the documentation he needed for his research, he returned for a few years to his native city, Tunis, before finally leaving for Alexandria, and thereafter for Cairo, where he spent the last 24 years of his life. Shortly before leaving Tunis, he had offered the first version of *The Book of Examples* to the library of the Ḥafṣid Sultan Abū l-‘Abbās. Once in Cairo, the support of the Mamluk king Zāhir al-Barqūq enabled him to obtain a position as a teacher and judge. But he kept these positions a relatively short time, because of jealousy and hatred that aroused against him due to his severity as a judge, his haughty attitude, and commitment to his country of origin, the Maghreb. Also, he led a precarious existence almost entirely dependent on

his royal patron, but he could nevertheless dedicate himself to completing his work, of which he presented a near-final version to his benefactor in 1397. Toward the end of his life, he met the famous conqueror Tamerlane at the gates of Damascus and had many conversations with him that he recounts in his *Autobiography*. He died in Cairo on March 17, 1406.

Ibn Khaldūn proposes two conceptions of history, one focused on society, social activities, and laws determining its evolution, which is the subject of the first volume of *The Book of Examples*, and another, the subject of two other volumes, that covers world history from creation to the time of the author. However, the first, while constituting an autonomous part, is considered a prerequisite for the second to the extent that, in explaining the work and the various mechanisms of society, it allows the reader to better judge the veracity of the historical accounts described therein. This is why Ibn Khaldūn presents this as an introduction – in Arabic, *Muqaddima*. This distinction is important, and by insisting upon a global knowledge of society, it reveals a methodological concern very close to that of the modern social sciences, as well as a philosophy of history, which places the social functioning itself at the core of the historical movements and historical developments.

Ibn Khaldūn’s *Science of Society* though presupposing creation, has a materialistic basis. On the one hand, it relies on the examination of the physical environment, namely the geography and climate in which humans live; on the other, it attempts to explain the social functions through purely human and material factors. The research and analysis it proposes revolve around four main axes, namely (1) the forms of sociability and the social relationships they give rise to; (2) the political life including its forces of domination, and formation of power and state; (3) the economic life including livelihoods, the acquisition of wealth and production; and finally (4) the intellectual and spiritual life, the formation and history of sciences, education and its methods, language and literary creations. At least in their content, these axes cover largely those found in what is known today as cultural anthropology.

Ibn Khaldūn shows that society is divided between two poles, the *badāwa*, or rural lifestyle,

which includes that which is necessary for life, and *hadāra*, or urban lifestyle, which seeks the superfluous and luxury. These two poles are both opposed and complementary, and society constantly oscillates from one to the other following a cyclical evolution. The formation of political power pivoting on the ‘*aṣabiyya*, the social solidarity based on either blood ties or on the links of patronage, is largely responsible for this oscillation that causes great social, political, economic, and cultural upheavals. History is therefore designed as the study of the appearance, development, and disappearance of states and empires that have been able to capture and instrumentalize to their advantage the ‘*aṣabiyya* in order to establish their power.

Ibn Masarra, Muḥammad ibn ‘Abdallāh

Rafael Ramón Guerrero
Facultad de Filosofía, Universidad Complutense de Madrid, Madrid, Spain

Abstract

Despite having been regarded for a long time as the first Andalusian philosopher, it can now be seen, thanks to the ideas contributed by some of his works, that Ibn Masarra's thought

tends more toward mysticism and Gnosticism than pure philosophy. Although he does expound philosophical ideas, these owe more to his cultural context than to a rigorous understanding of the implications of Greek philosophy. In fact, in his two surviving works he attacks the philosophers, pointing out that the path of philosophy strays from that leading to the truth.

Little is known of the life of Muḥammad ibn ‘Abd Allāh ibn Masarra. He was born in Cordoba (Spain) in 883. His father introduced him to Mu‘tazilite and Bāṭinī teachings and initiated him into the ascetic life. He received mystic ideas from some of his teachers, which were reinforced after his pilgrimage to Mecca. On his return to Cordoba he lived as a hermit in the mountains near the city, surrounded by disciples, whom he instructed in secret doctrines. He died in 931 and his teachings soon aroused the suspicion of jurists who obtained a sentence from caliph ‘Abd al-Raḥmān III against his followers. Of the many works attributed to him, only two are known: *Characteristics of Letters* and *On Reflection*. These works reveal a more Gnostic than philosophical Ibn Masarra, with absolutely no dependence on the Pseudo-Empedocles assumptions ascribed to him for many years as the origin of his thought.

The *Characteristics of Letters* can be classed within the tradition of Gnostic texts aimed at the attainment of knowledge of reality and the highest truths through the interpretation of letters. The divine Word is expressed in the Book and unifies the multiplicity of letters and words. Ibn Masarra aims to decipher the mysterious letters that feature in some of the suras in the Qur’ān, because “the learned differ in their interpretations, although the disagreement between them is not because they are unaware of them, nor is it proof that they are unable to understand them.” Humankind has been given two means of knowledge: on one hand, thought, involving reflection about the created world, through which humans can infer and contemplate the unity of God, his power, nobility, and glorification through his names and attributes; and on the other hand, revelation, which God has

given to his Prophet and is collected in the Book, which is the explanation of all things and the sum of both ancient and modern science. Ibn Masarra seems to have been familiar with some philosophical teachings, but he unambiguously expresses the superiority of Muḥammad's prophecy. His interest is in the Qur'ānic letters and he points to the fact that those who study the occult sciences maintain that these letters are the foundation and origin of all things.

In this work there are no explicit references to philosophical positions. It does not contain any doctrine which refers to ideas expounded by philosophers; only some philosophical principles and terms used by them. This is not a philosophical book, rather its contents are closer to Islamic Gnosticism. The divine Essence, the Universal Intellect, the Great Soul, and Nature are the terms used to show the hierarchy of beings. However, these are simply ideas that were circulating around the Islamic world at the time, not the principles of an original philosophical system.

The other work, *On Reflection*, could be seen as philosophical, not merely because of its title, which makes use of a term of the philosophical vocabulary (*i'tibār*), but also because of its initial approach: it appeals to the intellect, to humankind's reason as the highest faculty for discovery which, when used, gives rise to reflection. But Ibn Masarra also clearly points out that the human intellect has its origin in the divine light, indicating a very unusual slant in his thought. He also states that in addition to reflection, revelation also counts as a path to truth. Careful reading of his work shows that the author's intention is far from that of the philosophers: he simply aims to explain the Qur'ānic idea that advises and exhorts humankind to use reason to think about the signs placed in the world by God, to find in them that which is hidden, and to recognize the supreme ruler of the universe and his absolute oneness. He affirms that the universe is a book, whose letters are words read by those who see through the eyes of intellect. This book, which confirms that which has been made known in the revealed Book, must be read and studied. Ibn Masarra refers to knowledge reached by seeing from inside the heart: he mentions the heart's perception, which reveals hidden truths. This is a different kind of wisdom with

respect to the purely philosophical knowledge, a wisdom that is characteristic of those who are close to God: the "saints or friends of God." All of this seems to indicate that the term "reflection" is a different activity from that carried out by philosophers, as can be inferred from the following text: "By this path mentioned in the Book and pointed out by the Messengers is acquired the light that is never extinguished and true inner visions are achieved by which one can approach those who are closest to the Lord, who reach in this world and the next the place worthy of praise, who see through their hearts with their own eyes that which is hidden and who know the science of the Book, whose hearts testify to that which is Truth." He points to another kind of knowledge, that of an inner vision which reveals hidden realities. Humankind should apply its faculties to the study of the universe, because from the lowest to the highest levels, the truth can be discovered through reflection that brings humans' inner life into play. Man confirms revealed testimony, in an action which implies the meeting of the descending path of revelation with the ascending path of thought.

Thinking about the signs of the universe leads to knowledge of divine unity, which "is the ultimate Truth." Philosophers have not reached the Creator through his signs because they have ignored and deviated from this straight path, made arrogant by lies in which there is no light. Prophets, however, have affirmed all of this. Prophecy comes first, descending from the Throne to earth; thought, an activity common to all humans and not the sole preserve of philosophers, ascends from earth to the Throne: there is no difference between them.

Ibn Masarra simply wishes to abide by the Qur'ānic recommendation to make use of the intellect to understand the signs that God has placed in the universe. No (pseudo-)Empedoclean doctrines are to be found, as it was contended in past scholarship, apart from the affirmation of the Soul, the Intellect, and the Creator, which are not solely pseudo-Empedoclean topics, rather common Neoplatonic concepts that had been disseminated throughout the Islamic world. As a result, Ibn Masarra should be considered more as an exponent of esoteric thought, a Gnostic with

philosophical elements, than as a philosopher in the strict sense of the term as it is usually understood.

Ibn Rushd (Averroes), Latin Translations of

Marc Geoffroy

Laboratoire d'Études sur les Monothéismes,
Centre National de la Recherche Scientifique,
Villejuif, France

Abstract

Some of the most important philosophical works by Averroes, or the Commentator, as he was called in the Middle Ages, were translated into Latin. Beginning in the thirteenth century, this flow of translations made available to the Latin scholarship a great amount of Averroes' commentaries on Aristotle. In the fourteenth century, Latin translation were done of the main personal philosophical work by Averroes, the *Tahāfut al-Tahāfut* against al-Ġazālī's critique of philosophy. Later on, in Renaissance Italy, new translations were done of Averroes' commentaries, on the basis of the Hebrew versions, that made available several texts previously ignored. An uninterrupted chain of translations from the Middle Ages to the early modern times, most of them gathered in the epoch-making "Giuntine" editions, show the never-ceasing interest of western scholarship in Averroes' interpretation of Aristotle.

The Thirteenth Century: The Aristotelian Commentaries

During the Middle Ages, most Latin translations of Averroes' works were done between the years 1220 and 1260 by a few scholars in command of

Arabic, who were active either in the milieu of the translators of Toledo, or in Sicily at the court of Frederick II. The most prolific of these translators was Michael Scot, who was born in Scotland in the second half of the twelfth century and died in Sicily between 1234 and 1236. He probably studied at Oxford and Paris; in 1215, he participated in the fourth Lateran Council in the retinue of the Archbishop of Toledo. He stayed in this city, and in 1217 he completed the Latin version of *al-Kitāb fī l-hay'a* (lit. *On Cosmology*, trans. as *De motibus celorum*) by al-Bīṭrūjī (Alpetragius). His translation of the Arabic version of the three zoological treatises of Aristotle (*History of Animals*, *On Generation of Animals*, *The Parts of Animals*), under the common title *De animalibus* (*Kitāb al-Ḥayawān*), perhaps also dates from this period. He stayed in Bologna from 1220, and then became the court astrologer of Frederick II in 1227. Probably before this period, but in any case after 1217, he finished the Latin version of Averroes' Great Commentary on Aristotle's *De caelo*. His translations of the other commentaries of Averroes, which were available in Paris already in 1231, might have been done at the court of Frederick II. The translations stemming from this period are those of Averroes' Great Commentaries on the *Physics*, *De anima*, and *Metaphysics*, of the Middle Commentaries on *On Generation and Corruption* and the *Meteorology*, of which Michael translated only the fourth book, as well as of the paraphrase of the Arabic version of the *Parva naturalia* (all of the short treatises included in the *Parva nat.* bear in the Arabic version the title *Kitāb al-ḥiss wa-l-maḥsūs*, *De sensu et sensato*). The Latin translation done by Michael Scot circulated in two versions: the second one, preserved in a single manuscript in Paris (*versio Parisina*) was probably a quite unfaithful adaptation of Michael's translation. He also translated a collection of five treatises and short writings of Averroes on cosmology, the *De Substantia orbis*. With the sole exception of the commentary on the *De caelo*, the attribution of these versions to Michael Scot is not explicit in the manuscripts, although their circulation – grouped as they are into the same manuscripts – as well as their style

and vocabulary render Michael's authorship most likely.

Another Latin translation of Averroes' Great Commentary on the *Physics* is known, but only partially preserved. It has been attributed with good reasons to Hermann the German. His life is even less known than that of Michael Scot, but he seems to have been associated, at a somewhat later time, to the same circles as his predecessor. Since Roger Bacon calls him *translator Manfredi*, one can assume that he was also appointed at the court of the Hohenstaufens. He became Bishop of Astorga in 1266 and died in 1272. It was in Toledo that he did the translations we credit him with, and in particular that of Averroes' Middle Commentary on the *Nicomachean Ethics*, dating from 1240. According to his own testimony, his Arabic was far from good, and it is assumed that he benefited from the assistance of some Muslim interpreters who explained the texts to him. Hermann was interested in the Graeco-Arabic tradition of Aristotle's *Rhetoric*, and did a partial translation of Averroes' Middle Commentary on it, perhaps in 1256. He also used it for his translation of Aristotle's *Rhetoric*, in which Aristotle's text is alternated with commentaries by al-Fārābī (*Didascalia in rhetoricam*), Avicenna, and in which also Averroes' Middle Commentary is cited. On the other hand, the date of 1256 for his translation of Averroes' Middle Commentary on the *Poetics* is sure.

The remaining works of Averroes about logic were translated by a scholar known as William of Luna, who probably originated in the town of Luna in Spain. After having been in touch with the group of translators in Toledo in the first half of the thirteenth century, he was active at the court of King Manfred between 1258 and 1266. During this period, he did several translations from Arabic, namely five Middle commentaries and paraphrases of Averroes' logical works that had previously and independently been translated from Arabic into Hebrew by Jacob Anatoli in Naples, around 1232. The translations by William of Luna are the following: (a) Averroes' Middle Commentary on Porphyry's *Isagoge*, lost in Arabic; the date of the original work is unknown;

(b) the Middle Commentary on the *Categories*; (c) the Middle Commentary on the *De interpretatione* (edited by Roland Hissette: see the Bibliography); (d) the Middle Commentary on the *Prior Analytics*; and (e) the Middle Commentary on the *Posterior Analytics*. These works might have been sent by King Manfred to the University of Paris near 1263; be this as it may, their circulation was limited.

A dozen medieval manuscripts (see Lacombe, *Aristoteles Latinus*, vol I, pp 107–110) transmit isolated chapters or fragments from Averroes' epitome (*Talkhīṣ*) of the *De animalibus* (containing *The Parts of Animals* and *On Generation of Animals*). One of these manuscripts explicitly attributes the translation to Pedro Gallego (Petrus Gallegus, d. 1267), who was a Franciscan in command of Arabic and counselor to the King of Castile, Alfonso X the Wise. Pedro Gallego also translated Pseudo-Aristotle's *Œconomica* and had a genuine interest in Aristotle's zoological works, as shown by his own paraphrase of the *Historia animalium* (not commented upon by Averroes). The Latin translation is in fact a selection of chapters of Averroes' *Epitome* of the *De animalibus* wisely chosen by Pedro, because it contains many important passages from Averroes' *Epitome*: for example, his discussions of the influence of sperms (corresponding to *On the Generation of Animals* II, 1–4), on male and female features (*On the Generations of Animals* IV, 1), on the brain (*On the Parts of Animals* II, 7), and on the heart (*On the Parts of Animals* III, 4).

In 1278, the Catalan Dominican Raimondo Martí completed his famous work of religious–philosophical polemic entitled *Pugio fidei adversus mauros et judaeos*. This work contains many long quotations from Averroes, and among them the whole epistle entitled *Qualiter possit Deus singula scire*, known in Arabic as *Ḍamīma* (Appendix) on divine knowledge (*al-ʿilm al-ilāhī*); this Latin translation also circulated separately. Finally, a Latin version of the medical encyclopedia *al-Kulliyāt fī l-ṭibb* (*The General Rules of Medicine*) was made in 1255 in Padua by the Jewish scholar Bonacosa.

The Fourteenth Century: The *Destructio destructionis* and Other Personal Works

In the fourteenth century, a version was done (with an incomplete end) of the famous refutation of al-Ġazālī by Averroes, the *Tahāfut al-Tahāfut* (*Destructio destructionis*). It was translated in 1328 by the Jew Calonymos ben Calonymos ben Meir of Arles at the request of King Robert the Wise of Naples, but it had at the time a very limited circulation. Other texts translated in the Middle Ages had so a limited spread, that only recently their existence has been discovered. This is the case of a treatise entitled *De separatione primi principii*, which discusses issues relating to the exegesis of *Physics* VIII, 10, on the movement of the celestial bodies. The Latin version was done in 1334 by Alfonso Dinis in Valladolid (d. 1352), an alleged bastard of the Portuguese royal family. A bishop, a doctor, and a master of theology, Alfonso Dinis was assisted in the translation by Abner of Burgos, a well-known polemicist, a converted Jew, and Sacristan of the cathedral of Burgos. This text is preserved only in the manuscript Oxford, Bodleian Library, *Digby* 236, which also contains a compilation of two treatises by Averroes on the union of the human being with the Agent Intellect, reworked and enlarged with passages taken from al-Fārābī. This compilation bears the title *De perfectione naturali intellectus*, and was anonymously translated into Latin in the fourteenth century, on the basis of a Hebrew text concocted in all likelihood by the Jewish philosopher Maimonides Hillel of Verona (d. 1295). This text, also known under the alternate title *De animae beatitudine*, did not emerge from the shadows until the commentary that the Paduan Averroist Agostino Nifo wrote on it; the commentary, completed in 1492, was published in 1503.

The Renaissance and the Hebrew-to-Latin Translations

The Latin Middle Ages did not know the complete works of Averroes. The Jewish communities,

heirs to a scholarly tradition in which Averroism played a pivotal role, had a more complete corpus at their disposal. Thanks to the new cultural climate of the Renaissance Italy, this heritage gave rise to a second wide movement of translations, that made available to readers several texts previously ignored. With few rare exceptions, the translators were Jews, coming either from various eastern countries or from southern Italy, or again fled to Italy from Spain after the expulsion of their community in 1492. These scholars began to play a leading role in the intellectual life of Italy in the late fifteenth century. The most important of these were (a) Elia del Medigo, a Cretian from Chania (d. 1497): a physician and a philosopher, he taught in Padua and in Florence and did numerous translations on behalf of Pico della Mirandola and Cardinal Domenico Grimani (d. 1523); (b) Calonymos ben David (also known as Maestro Calo Calonymo), a doctor who lived in Naples and Venice in the first half of the sixteenth century; (c) Abraham de Balmes (d. 1523), the most prolific of all these translators: he was from Lecce, Puglia; after having been awarded his doctorate in Arts and Medicine in Naples, he moved to Padua and Venice; he was the physician to Cardinal Grimani, and most of his work was dedicated to him; (d) Jacob Mantino, son of a Jewish family exiled from Tortosa in 1492, and doctor of medicine from the University of Padua; he became the personal physician to Pope Paul III (d. 1549), and taught medicine at the University of Rome between 1539 and 1541. Having accompanied the Ambassador of the Republic of Venice on a mission to Damascus, he died in this city in 1549; (e) Paolo Ricci, or Paulus Israelita (d. 1541), was a converted Jew, and a professor of philosophy and medicine at Pavia; (f) Vitale Nisso, known only by a few translations: this name is mentioned in some editions of the Renaissance and early modern times; (g) Giovanni Francesco Burana (d. after 1523 in Venice), a Christian and professor of logic at Padua. He published several translations of Averroes' logical works. His linguistic skills have been questioned, however, making one suspect that his translations were based on earlier anonymous translations.

The work of these scholars is inseparable from the academic activity at the time. Averroism flourished at the universities of Bologna and Padua. The patronage of humanists of the time, clergy or laity, also played a big role. We must also recall the important role played by the development of printing in making the works of Averroes widely circulate together with the editions of the complete works of Aristotle, that were often printed along with the commentaries by the master of Cordoba. The period saw the mass distribution, by printing, of most of the works translated from the Middle Ages onward, the publishing of new translations, most of them from Hebrew, which were often considered difficult and corrupt, and, finally, the production of new translations, from Hebrew, of works previously unknown in Latin.

The first editing enterprise took place between 1472 and 1475. During this period, the Paduan publisher Laurentius Canozius edited in order Aristotle's *Physics* with Averroes' Great Commentary (translated by Michael Scot), the *De anima* with the Great Commentary (in Michael Scot's translation), *On Generation and Corruption* and the *De caelo* together with the Great Commentary (translated by Michael Scot), the *Metaphysics* together with the Great Commentary (in Michael's translation), the *Meteorology* and the *Parva naturalia* with the Middle Commentary (in Michael's translation), and the *De substantia orbis*, also in Michael's translation.

A little later, the edition of the works of Aristotle with Averroes' commentaries published in Venice (Andreas Torresanus de Asula and Bartholomaeus de Blavis, or de Alexandria, 1483) by Nicoletto Vernia (d. 1499), the teacher of Nifo and of Pomponazzi, adds to the corpus of the "natural" works also Averroes' commentaries on the *Organon*, in the translation of William of Luna. The Middle Commentary on the *Poetics*, in the translation of Hermann the German, had previously been published together with Aristotle's *Rhetoric* and the corresponding compendium by al-Fārābī (Venice, Philippus Petri, 1481). The partial version of Averroes' Middle Commentary on the *Rhetoric*, still in Hermann's translation, was published later, in *Rhetorica Aristotelis* [...]

(Venice, per Georgium Arrivabenum, imp. Octaviani Scoti, 1515).

Many reprints of this corpus, with little or no change, followed in the decades after. In the same period, some new Hebrew–Latin translations appeared separately. Aldus Manutius published in 1497, in Venice, a collection of seven logical questions of Averroes (on the *De interpretatione*, *Prior Analytics*, and *Posterior Analytics*) translated by Elia del Medigo from Hebrew at the request of Pico della Mirandola. These logical questions circulated in Italy in the fourteenth century Hebrew versions by Samuel b. Yehuda b. Meshullam (1320) and Calonymos ben Calonymos. Elia had also published the first translation of the Summary (i.e., the small commentary) of Aristotle's *Meteorology*, and Book I–III of the Middle Commentary on the same work (*In meteorologica Aristotelis* [...]), Venice, Andreas Torresanus, 1488). Both of these works would be included in the Giunta editions of 1550–1552 and 1562 (vol V, f. 487r–400r). The same volume from 1488 also contains the first Latin version, made by Elia del Medigo himself, of the prologue to Book *Lambda* of the *Metaphysics*, which was absent from the medieval Latin translation. In 1489, he produced a translation of Averroes' commentary on Plato's *Republic*, which was later followed by another version, a paraphrase by Jacob Mantino, printed in the Giunta editions of 1550 and 1562 (vol III, f. 334v–372v).

In 1511, an edition appeared in Milan, presenting a translation from Hebrew of Averroes' Middle Commentary on the *De caelo*, by Paolo Ricci (reprinted in the Giunta editions of 1550–1552 and 1562, vol V, f. 272r–336v), together with Ricci's version of the Hebrew–Latin prologue to the Great Commentary on the *Physics* (different from the one which was published after 1472 in Michael Scot's version), and the version of the prologue to the commentary on Book *Lambda* of the *Metaphysics*. The latter was reprinted in the Giunta edition of 1550–1552, which includes a third version of the prologue to *Lambda* by Mantino.

In 1521, Jacob Mantino presented for the first time, in Rome, a complete translation based on a Hebrew model, of the paraphrase of Averroes'

commentary on *De animalibus*. This is reprinted in the Giunta edition of 1550–1552 and 1562 (vol VI, part 2, f. 43v–144r).

The Middle Commentary on the *Physics* exists in two unedited Hebrew–Latin versions. One of these (MS Paris, Bibliothèque Nationale de France, lat. 6507) was conducted in 1500 by a certain Vitalis Dactylomelos, whom some have thought they could identify as the famous Jewish Platonist who inspired Pico della Mirandola, Johanan Alemanno (d. 1504). The other unedited version was due to Abraham de Balmes (MS Vat. lat. 4548). Jacob Mantino undertook to translate the paraphrase of *Physics*, but he was interrupted by death in 1549. The Giunta edition of 1550–1552, reprinted in 1562 (vol IV, f. 434r–456v), includes this translation until the third book, where the work of Mantino was interrupted.

The 11 sections of the summary (*Mukhtaṣar*) of Averroes' logic were translated for the first time into Latin from the Hebrew version by Jacob ben Makhir, completed in 1289. This translation (ed. Giunta, 1562, vol I, part 2b, f. 75r–36r) first published in 1523 (Venice, typ. Ant. De Sabio) was done by Abraham de Balmes (d. 1523). In the same volume of 1523, Abraham also offers a new collection, much more complete, of the logical questions mentioned above; as we have seen, seven questions had been translated by Elia del Medigo, whereas this version includes 18 questions (reprinted in 1550–1552 and then again in the Giunta edition of 1562 [vol I, part 2B, f. 75v–120v pars 2B]). In the same volume Abraham included, also for the first time, the Great Commentary on the *Posterior Analytics* unknown to the Latin Middle Ages, but which had been translated into Hebrew by Calonymos ben Calonymos in 1314. Another version, by Giovanni Francesco Burana, was published for the first time in the Giunta edition of 1550–1552. Finally, a third version, by Jacob Mantino, is found in the Giunta edition of 1562 (partial: Book I, until comm. 149). The synoptic edition of these three versions is contained in the Giunta edition of 1562 (vol I, part 2A, f. 1r–568v). In the 1523 volume mentioned above, Abraham includes also the first translation of the Middle Commentary on the *Topics*, which had not been

available in the Middle Ages. Another partial version (Books I–IV) was made by Mantino and published in 1550 next to Abraham’s version in the Giunta edition (reprinted in the Giunta edition of 1562, vol I, part 3, f. 3r-138r). This applies to the Middle Commentary on the *Sophistical Refutations* as well, which Abraham published in 1523 and which was reprinted in the Giunta editions of 1550 and 1662 (vol I, part 3, f. 139r-176v). Abraham also published in the volume of 1523 his translation of the Middle Commentary on the *Poetics*, which was already known in its medieval version. It is accompanied by another version by Mantino in the Giunta editions of 1550 and 1562 (vol II, f. 217v-228v). The complete translation by Abraham of the Middle Commentary on the *Rhetoric* superseded the partial version of Hermann the German. This complete version was also published in 1523 and reprinted in the Giunta editions of 1550 and 1562 (vol II, f. 69r-156v).

Giovanni Francesco Burana took over the retranslation of two of the Middle Commentaries on the *Organon*, i.e., that on the *Prior Analytics*, published in Venice a year after the death of the translator in 1524 and incorporated in the Giunta editions of 1550–1552 and 1562 (vol I, part 1, f. 1r-168v) and that on the *Posterior Analytics*, which is first found in the Giunta edition of 1550–1552, and then in the one of 1562 (vol I, part 2b, f. 1r-35v). Based on the Arabic–Hebrew version of Jacob Anatoli, Jacob Mantino retranslated the Middle Commentaries on the *Isagoge* and *De interpretatione*. This version, originally published in 1550, was then included in the Giunta edition of 1562 (vol I, part 1, f. 1r-22r).

In 1527, David ben Calonymos makes a new translation, more complete, of Averroes’ *Tahāfut al-Tahāfut* under the title *Destructio destructionis philosophiae Algazelis*, as well as a version of one of Averroes’ Epistles on the union of the Agent Intellect with the human being (*Libellus seu epistola Averrois de connexione intellectus agentis cum homine*), which had already been incorporated, with adaptations, in the treatise *De animae beatitudine*. Finally, the Renaissance translations of the *Colliget* must be mentioned: the partial translation by Symphorien Champier (done within

1537) was superseded by the complete translation by Jacob Mantino (done within 1549).

The work of the Renaissance translators also enriches the corpus of the whole series of summaries or “short commentaries” that the medieval Latins had ignored. The one on the *Physics* was not known in the Middle Ages. In addition to the summaries on logic mentioned above, and to that on the *Meteorology* translated by Elia del Medigo, the short commentary on the *De gen. corr.* was translated and edited by Abraham de Balmes. The version edited in the Giunta edition (vol V, f. 389v-398v) is attributed to Vitale Nisso. The short commentary on the *Metaphysics* was translated by Jacob Mantino in 1524, the one on the *De anima* by Abraham de Balmes. The latter also translated in 1521, for Cardinal Grimani, a theological treatise by Averroes, the *Kitāb al-Kashf ‘an manāhij al-adilla* (*The Clarification of the Methods of the Proofs*), but the translation remained unpublished.

The whole of the collective work represented by the translations of the Renaissance, a work that covers nearly a century, was printed in the editions mentioned above, the so-called Giuntine, created at the instigation of the Tommaso Giunta, one of the Florentine editors Giunta, who settled in Venice. The first edition was published between 1550 and 1552, and a second, further increased, in 1562 (reprint Frankfurt am Main, 1962). It was the largest and most systematic publication that emerged in this period. It gathered the works of Aristotle, including those not commented on by Averroes, as well as some of the personal works of Averroes. In particular, it includes the *Tahāfut al-Tahāfut* (*Destructio destructionis*) in the 1328 translation by Calonymos ben Calonymos (the 1550 edition forms the basis of the modern edition of the Latin text provided by Beatrice Zedler: see the bibliography), as well as Jacob Mantino’s Latin version of the *Kulliyāt fī l-ṭibb* (*Colliget*).

concentration on Aristotle was not happenstance, instead, it reflects Averroes' maturing philosophical outlook. For Averroes, Aristotle's teaching came to represent the pinnacle of philosophical wisdom, and answers to all the most pressing problems in philosophy were to be found in a thorough and careful exploration of what that teaching truly implied. In the course of Averroes' deepening investigations into Aristotelian lore, alternative interpretations were advanced and different traditions of thinking carefully laid side by side, producing a field guide to the Peripatetic tradition, as it was known to an Arabic scholar of the classical period. The resulting body of texts represents a high watermark in Aristotelian synthesis and systematization, even if Averroes failed in the end to resolve satisfactorily all the problems that had accumulated over the centuries.

In addition to his *Aristotelian Commentaries*, *Explications*, and *Compendia* (which, besides Aristotle, encompassed works by Plato, Galen, Ptolemy, and al-Ġazālī), Averroes wrote smaller, independent essays and questions that explored contested issues in Aristotelian teaching; polemical works that argued the religious innocence and intellectual respectability of Peripatetic philosophy, correctly understood; and medical and legal treatises of solid but unspectacular standing. Averroes' reputation was made in Latin Scholasticism and in Jewish circles of learning, while in the Arabic world his works fell mostly by the wayside. Today, his name is evoked in the Arabic world as a rallying-point for a rationalist Islam – a fitting legacy, if not always especially well grounded (modern-day Averroists displaying at best a cursory knowledge of the Commentator's philosophy).

Life

Abstract

Averroes (1126–1198 CE) was the most famous and prolific commentator on Aristotle in all of medieval philosophy: 38 works are extant, at all levels of instruction. This

Averroes, whose full Arabic name was Abū l-Walīd Muḥammad ibn Muḥammad ibn Rushd al-Ḥafid, came from a distinguished family of Andalusian jurists working in the Māliki school

of Islamic law. Averroes studied Islamic jurisprudence and medicine, as well as presumably philosophy, at a time when the Almoravid rulers of the region were being overthrown in a series of violent upheavals, a development that will have had worrying implications for the Rushd family as well. The new ruling dynasty, the Almohads (from *al-muwahḥidūn*, those who profess divine unity), pledged allegiance to the revival movement spearheaded by the Berber Ibn Tūmart, who advocated a fierce religiosity fueled by a minimalist, rationalizing interpretation of Sunni belief. Averroes appears to have drawn inspiration from the rationalist precepts of the Almohad movement, and to have navigated successfully the treacherous ideological and political waters (Urvoy 1991). He was introduced to the Almohad court sometime in the 1150s by Ibn Ṭufayl (1116–1185), the most distinguished Andalusian philosopher of his day as well as court physician to the ruling family, and eventually rose to a position of trust within the court himself.

Averroes was first appointed as *qāḍī* (judge) to Seville in 1169, then Cordoba's chief judge in 1172. It was around these dates that he moved from the composition of scientific compendia (*mukhtaṣar/jam'*) to the more demanding task of summarizing Aristotle in a form that approximates the order of presentation in the original works (*talkhīṣ*). Perhaps emboldened by his success in this venture, Averroes next turned to religious polemics, producing a series of works for which he is most famous in the Islamic world: a *Decisive Treatise* (*al-Faṣl al-maqāl*) outlining his considered opinion on the relation between Law and Wisdom (i.e., the commandments of religion and philosophical endeavor); a *Supplement* (*Damīma*) to the same, further skirting around the question of divine knowledge; an *Exposition of the Sorts of Arguments Found in Religious Creeds* (*al-Kaṣhḥ 'an manāḥij al-adilla fī 'aqā'id al-milla*), which purports to disclose the logical status of the arguments commonly advanced in theology; and the *Incoherence of the Incoherence*, a blow-by-blow refutation of al-Ġazālī's famous *Incoherence of the Philosophers*.

Averroes was influenced by al-Ġazālī from an early date (see Frank 2002). In light of his later criticisms, it is important to emphasize the positive impact al-Ġazālī's project had on the formation of Averroes' own. It was in response to al-Ġazālī's critique of the philosophers that Averroes became convinced that a return to the letter of Aristotle was necessary, and as an extension of al-Ġazālī's stated aim of sorting out the logical status of the Muslim philosophers' arguments that Averroes could subject al-Ġazālī to a similar analysis (and find him coming up short). Averroes agreed with al-Ġazālī on the importance of the demonstrative ideal to the philosophers' claims to possessing not only the truth, but the necessary truth. Where he differed was in his assessment that demonstrative certainty was indeed to be found in Aristotle, if not in his later followers.

In Averroes' eyes, al-Ġazālī's most grievous error was the way in which he had pitched his arguments to the masses, who in Averroes' opinion could never appreciate fully the subtleties of philosophical reasoning. It is revealing that once his own polemical work was complete with the publication of the *Incoherence of the Incoherence*, Averroes for the remainder of his career turned to address a select, scientifically trained audience. The period post-1180, when Averroes again served as *qāḍī* in Seville, saw the publication of five great *Commentaries on Aristotle*, plus two sets of disputed questions. It is in these works that Averroes most fully realizes his program of setting out Aristotelian teaching in demonstrative form, simultaneously taking on all comers and pointing out the numerous ways in which aspects of Aristotle's system rely on others so as to form a tightly interlocking whole.

Through his years of public service, Averroes had gained his share of enemies, especially among the Almoravid traditionalists who still enjoyed a significant presence in Andalusia. In 1194, charges of unbelief were brought against Averroes: for the purposes of the struggle against the northern invaders the Sultan needed the support of the traditionalists, and in an effort to placate them saw fit to sacrifice his personal physician and old friend. Averroes was exiled to

the small town of Lucena for a spell, and although he was reinstated shortly before his death, the experience will have proved dispiriting as well as humiliating. Perhaps the oppressive atmosphere contributed to Averroes' last commentary work, a *Compendium* of Plato's *Republic*, teeming with barely concealed contempt for the present political age (see Butterworth 1992). Averroes died in Marrakesh in December 1198: a mule carried his remains back to his native Cordoba, the burden according to a story balanced by the weight of his philosophical writings.

Cycles of Knowledge

Though his writings included contributions to medicine and legal theory, Averroes is principally remembered for his efforts in two directions: Aristotelian commentary and the public defense of philosophy. As already indicated, the two projects were intertwined. It is because of al-Ġazālī's religiously motivated critique that Averroes sought refuge in a return to Aristotle, and because of his faith in the Aristotelian corpus as the repository of all knowledge and scientific methodology that Averroes could feel confident that theological controversies, too, would find their proper resolution in a thorough investigation of the same. This high opinion of the Peripatetic curriculum Averroes took over from the earlier tradition of *falsafa*. Still, it took several decades for Averroes to come to the view that what was needed was a strict adherence to Aristotle's very words. Even then, a literal understanding of the master was no simple matter (see al-'Alawī 1986).

Averroes' writings on the philosophical curriculum divide into three principal categories, commonly if misleadingly known as the short, middle, and long commentaries. It has sometimes been thought that the three are enumerated in a story related by al-Marrākushī in which the Sultan (very likely Abū Ya'qūb Yūsuf), frustrated by the obliqueness of Aristotle's expression, expressed a wish to Ibn Ṭufayl that somebody should "summarize them and expound their aims, after understanding them thoroughly." Being otherwise occupied himself, Ibn Ṭufayl would then have

delegated the task to Averroes. The overliteral interpretation is fanciful – if anything, Averroes' own comments on the story peg the government-mandated activity to the middle phase of crafting *talākhīṣ* – but the basics of the story ring true. Without institutional backing or encouragement, it is unlikely that Averroes would have set upon or completed such a comprehensive program on top of his other duties. The reasons, however, for the three different layers of exposition are to be sought in internal factors and in Averroes' philosophical development rather than any external remit.

The Compendia (*mukhtaṣar* or [pl.] *jawāmi'*), written at a youthful age, concisely recapitulate the philosophers' teachings in dogmatic form. In stating their aim, Averroes speaks interchangeably about the Peripatetics' "scientific," "demonstrative," or "universal" statements (*al-aqāwīl al-'ilmiyya/burhāniyya/kulliyya*). In practice, the doctrines expounded often reflect the Peripatetic tradition more than they do any text of Aristotle's: in the case of *De anima*, the depth of Averroes' acquaintance with Aristotle's treatise at this stage has been questioned (Druart 1993: 193), while in the case of the *Organon* Averroes explicitly epitomizes al-Fārābī rather than Aristotle (see *Compendium of the Physics*, 8.9–10). Because the Compendia aim solely at providing the reader with what is necessary (*al-darūrī*) to know about the fundamentals (*uṣūl*) of a given discipline – there is a cycle of this description on the *Organon*, another on natural philosophy, individual treatises on the soul and on metaphysics, and to these we may add Averroes' summary of al-Ġazālī's legal treatise *al-Mustasfā* as well – these synopses are short on dialectic, detail, and controversy.

The Explications (*talkhīṣ*) form the largest body of texts. Besides Aristotle's logical, natural, and metaphysical works (the triptych of theoretical philosophy) Averroes wrote on the *Nicomachean Ethics* and on Galen and Ptolemy in this genre. To call the *talākhīṣ* paraphrases in the strict sense would be a misnomer (Gutas 1993: 38–42): much more than rephrasing individual sentences, Averroes in these works sets out to rework the contents of Aristotle's corresponding treatises in systematized form. Still, these works,

in Averroes' own words, explicate the texts in question according to their meaning ('*alā l-ma'nā*'), and in that regard at least the traditional title of Paraphrase is descriptive of the work done.

The *Commentaries* (*tafsīr* or *sharḥ*), the crowning achievement of Averroes' career, follow the lemma-by-lemma model established in late antiquity. Averroes completed five of these commentaries, tackling those works he considered most crucial for the imposing Aristotelian edifice of theoretical knowledge: the *Posterior Analytics*, for scientific methodology, followed by the *Physics*, *On the Heavens*, *On the Soul*, and finally the *Metaphysics*. The quoted Aristotelian texts form an important witness to the Arabic textual tradition: so do the commentaries themselves, which take onboard the bifurcation of *theoria* from *lexis*. Here the full weight of the foregone tradition as it was known to Averroes makes itself felt, as Averroes finds it necessary to grapple not only with those philosophers with whom Aristotle himself wrestled but also with subsequent Peripatetics, chief among them Alexander of Aphrodisias, Themistius, Philoponus, al-Fārābī, Avicenna, and Ibn Bājja. When commenting on the Presocratics, Averroes even finds occasion to censure the speculative theologians (*mutakallimūn*) of his day, whose methodology and thought he finds faulty in much the same way Aristotle had found, for example, the Atomists and the Megarians to be lacking in subtlety and common sense.

Characteristic of Averroes' mature approach is his determination to treat any apparent discrepancy in Aristotelian teaching as resulting either from (a) a misunderstanding concerning the meaning of Aristotle's text or (b) an intrusive and unwelcome piece of innovation on behalf of a later commentator. This not only affords Averroes a measure of distance toward the Peripatetic tradition but also offers him the rudiments of what would later become known as internal criticism (Urvoy 1991: 58–59). Averroes confidently pronounces his judgment on what Aristotle would say, should say, or must have said, sometimes in manifest opposition to what Aristotle actually did say, either in the Arabic text in front of him or the Greek in front of us. Averroes always

has his reasons for such emendations. For him, Aristotle's intentions form a tightly interwoven whole in which nothing remains ungrounded, few things prove superfluous, and nothing whatsoever can be allowed to stand in contradiction to anything stated elsewhere. For all that these commentaries assume a unity of thought in Aristotle, which modern scholars find hard to countenance, they nevertheless bring forth into actuality a compelling systematic Aristotelianism where one only exists in Aristotle's own writings *in potentia* (the phrase is Jonathan Barnes').

To this final phase belong also Averroes' independent treatises and two sets of questions, composed on the model of Alexander of Aphrodisias in order to address apparent inconsistencies and doctrinal lacunae. These treatises commence with the *Sermo de substantia orbis* in 1178 (as in many cases, the original Arabic is lost, but we have Hebrew and Latin versions), and continue right up to a collection of short treatises on Aristotle's syllogistic compiled in 1195. They show that Averroes, for all his protestations concerning Aristotle's infallibility as a guide to the workings of reality, remained intellectually curious to the end of his career, still searching for answers to pressing questions of fundamental importance (see Endress 2004). Also reflecting this, all three types of writing – Compendium, Explication, and Commentary – remained subject to revision by the author. Averroes edited his youthful Compendia to include criticisms of Avicennian positions he himself had held earlier: meanwhile, Ivry (1997: 511–519) has plausibly suggested that work on the long-form Commentaries was an ongoing process spanning several decades, influencing the phrasings adopted in the Explications along the way.

Argument and Assent

Central to Averroes' views regarding the pursuit and transmission of knowledge are the notions of conception (*taṣawwur*) and assent (*taṣdīq*), two concepts that early became part of Arabic Peripatetic teaching. Conception and assent, which typically were introduced as preliminaries to logic,

tie in psychological with logical considerations, thereby effecting a much-needed (from a naturalist point of view) link between ontology, epistemology, and reasoned argument. Briefly, it was thought that every act of assent requires prior conception, but that both conception and assent can be arrived at through various means. Besides apprehending a thing as it is in itself, one may conceive of a thing through its likeness (*mathāl*); similarly, and more importantly from the point of view of logic, besides the demonstrative syllogism one may be moved to assent to a proposition through dialectical or sophistic argumentation, or indeed through rhetorical or poetic persuasion.

This so-called context theory of argument and persuasion, which the Arabic philosophers took over from Alexandrian teaching, served to counterbalance the great weight placed on demonstration (found in science) with a recognition that scientific discourse is after all only one form of communication and may prove inappropriate in some situations, for instance in dealing with people with inadequate scientific training. Under such circumstances, the responsible interlocutor will take into account his or her social context and the intended audience and choose the means of persuasion most likely to have a salutary effect (see Black 1990).

It is the context theory that accounts for Averroes' approach to the public defense of philosophy. Thanks to the context theory, Averroes can regard himself as a faithful follower of the Prophet at the same time that he operates unapologetically as a scientifically minded philosopher. In the *Decisive Treatise*, Averroes puts forward his case in terms of Islamic law (see Mahdi 1984), arguing first that the Qur'an and the Prophetic traditions obligate the pursuit of knowledge, which in turn is best accomplished according to the method of the philosophers, that is, through scientific investigation (from effects to causes) and demonstrative argument (from causes to effects). However, because not all people are capable of attaining such a demanding ideal, the divine Law has also made provisions for the dialectically minded (i.e., the theologians) and the rhetorically persuaded. The latter comprise the greater majority of the populace, who come to

rest securely in a viewpoint through an unreflective acceptance of striking and compelling imagery. In his *Messenger*, Muḥammad, God has provided humanity with the ultimate rhetorician, someone who has been handed images of such rare power that they bring forth immediate recognition of their essential correctness. These religious images reveal the exact same truths, which the demonstrative sciences uncover: after all, "truth does not oppose truth; rather, it agrees and bears witness to it" (*Decisive Treatise*, 9.1–2 Butterworth; see Taylor 2000). Averroes neatly sidesteps the issue of whether the Prophet himself should be regarded as a philosopher, something over which al-Fārābī and Avicenna had notably disagreed. For Averroes, it is enough that the Prophet has at his disposal resources for persuasion, which the philosopher *qua* philosopher is unable to access.

For Averroes, the claims of religion should be taken at face value whenever possible. The likenesses of philosophical conceptions, which these claims encapsulate, are rich enough to stand on their own; besides, the argumentative procedures necessarily involved in any unpacking of allegory or metaphor quickly become so convoluted that untrained people run the risk of losing their way. For this reason, Averroes apologizes for engaging in polemics with al-Ġazālī in the first place; it would have been better for all concerned had he not had to embark on this path (*Incoherence*, 409, 427–429). However, because al-Ġazālī and the Muslim speculative theologians in general had made such a bad hash of attempting to reason dialectically (and also of interpreting the religious metaphors handed down by the prophets: see Averroes' *Exposition*, *passim*), it had become imperative for a genuine philosopher to come forward, set the record straight, and show at the very least that the charges brought by al-Ġazālī against the philosophers did not stick.

Averroes' views on human nature and interaction are undeniably elitist, insofar as he judges the majority of people to be incapable of handling properly philosophical and scientific argumentation. Averroes himself stresses the positive message that all people are called to the truth through the three means of assent (*Decisive Treatise*,

8.2–17 Butterworth), whereas a stricter method would leave happiness entirely out of reach of some people and put others at mortal risk of losing their way. His approach, essentially Fārābīan, sanctions a degree of dissimulation in matters where the philosophical doctrine is on the surface level very far from the popular understanding of the matter – personal immortality provides a suitably infamous example – but it is nevertheless a far cry from the doctrine of double truth for which the Latin Averroists of the thirteenth and sixteenth centuries were notorious.

As might be expected, in his philosophical commentaries, Averroes greatly favors the demonstrative approach, to the point of repeatedly recasting Aristotle's dialectical arguments in natural philosophy as demonstrative proofs. Another indication of the hold the demonstrative ideal had on Averroes is the way he conceives of medicine in the *Kulliyāt* (Lat. *Colliget*). Insofar as medicine aspires to be a science, it, too, has to set about the business of discovering essential causes for essential effects and ignore the contingent circumstances that sometimes prevent such regularities from obtaining. Consequently, Averroes, like Avicenna, conceives of medicine both as a science and as an art; although the latter predominates in the practice of the discipline, as well it should, medicine must for its advancement ultimately rely on the soundness of the former.

Notably, Averroes did not rest easy with the received notion of demonstration as a scientific tool perfectly aligned with Aristotelian syllogistic (proving that he did not take it lightly either, or use it as a smokescreen to mask private doubts about the philosophers' claims to certitude). All the way up to the very late *Questions on Logic*, Averroes pursued the meaning especially of essential predication, a crucial aspect of Aristotelian philosophy of science that proved surprisingly difficult to pin down. In his questions, Averroes introduces a distinction between accidental and essential necessity which ended up influencing Latin discussions. What is noteworthy about Averroes' own treatment of the issue is that while the discussion is of a technical character, its aims are markedly ontological, having to

do with how the syllogistic moods can be deployed in sorting out corporeal reality.

Psychology

Averroes' contributions to natural philosophy are many, as he distilled much of the anterior tradition into his commentaries and produced critical assessments of several key issues. For the purposes of this survey, it is sufficient to concentrate on a single aspect of one key area of study – Averroes' views on psychology and specifically the intellect – as long as it is understood that similarly intricate stories could be told concerning his explorations of many of the contested issues of Aristotelian physics (see now Glasner 2009).

In keeping with Averroes' Aristotelian project, the Commentator's cognitive psychology builds on the notion of abstraction (*tajrīd*), taking on form without the matter. Instead of the higher cognitive functions opening up to a more exalted supernal realm, as al-Kindī's school had intimated, what Averroes envisions is an unfolding of the essential and formal properties of the corporeal reality all about us. This distaste for mystical leanings of any kind marks Averroes out in the post-Avicennian phase of Arabic philosophy. At the same time, Averroes' commitment to the abstractionist view makes acute for him all the associated problems. For instance, Averroes considered the vexed question (since antiquity) of how the sensible form of a thing carries in a medium. Averroes' answer was to evoke the notion of "spiritual intentions," a mechanism that seems to have involved some kind of subtle matter on the lines of either Galenic spirits or the *rūḥ* of Islamic speculative theology.

Averroes' greatest efforts were expended in clarifying the ontological status and epistemological role of the material intellect, a topic on which Averroes changed his mind several times during his career (Davidson 1992; Ivry 1997; Taylor 2009). In the early *Compendium*, the material intellect is tied to the imaginative faculty, making of it a truly individual phenomenon, but also a perishable one. In the *Explication*, and in a separate small treatise discussing the nature of human

conjunction (*ittiṣāl*) with the separate Agent Intellect, Averroes comes closest to hitting upon a formulation that would guarantee personal immortality: here, the individual material intellect develops through its contact with the active (still separate, still impersonal) intellectual principle. Yet it is the position spelled out in the *Commentary*, extant only in the Latin except for some fragments, for which Averroes became notorious. Now, both the Agent and the Material Intellects are separate and eternal principles in which humans come to share temporarily but which enjoy a life of their own; individual immortality no longer figures in any philosophical conception of human life; while the cogitative faculty is entrusted with the task of providing the link between individual intentions and the intellectual acts that are of a truly universal character. Averroes seems to have been moved to this uniquely austere view of intellection through a hard-nosed decision to follow through on some general epistemological and ontological commitments. He acknowledges that the whole question is exceedingly difficult, and indicates that without Aristotle it might never have found its resolution (*Commentary on De anima*, bk. 3, comm. 14).

Cosmology and Metaphysics

Based on the early *Compendium of the Metaphysics* (155–156 Amīn), Averroes originally subscribed to an emanationist cosmology and metaphysics, complete with a Giver of Forms and a staggered procession of the many from the One. al-Gazālī's trenchant criticism seems to have forced a rethink and, beginning with the *Incoherence of the Incoherence*, Averroes rejects one by one several key Avicennian doctrines. Among these are emanation as an explanatory model (see Kogan 1981); Avicenna's metaphysical proof for God's existence; the attendant modal framework of contingency; the way that Avicenna conceives of the relation between the heavens and the immaterial domain; and the way that providence is supposed to flow from this arrangement. As in psychology, Averroes took his project to be that of uncovering the original Aristotelian

teaching, which he believed would happily coincide both with the philosophical truth and with the demands of revealed religion. The results, again similarly to psychology, look more satisfying seen from a Hellenic philosophical point of view than from the standpoint of traditional Islamic orthodoxy.

Already in the *Compendium* (8–11 Amīn), Averroes rejects the notion that existence could be treated as an accident. Mirroring al-Fārābī's criticism of al-Kindī (see Menn 2008), Averroes says that to take existence for a real accident is to mistake a secondary intelligible for a primary one. To speak of being univocally is to talk of "being as truth" (Aristotle, *Met.* 5.7.1017a31–35); but this is a second-order term. Being in the primary sense, meanwhile, falls directly under one of the ten categories and is thus subject to *pros hen* equivocity, just as Aristotle had outlined. Accordingly, the being of beings is in reality indistinguishable from their essence, meaning that Avicenna's essence–existence distinction fails as well. (Later on in the *Commentary* Averroes develops his own interpretation of *Metaphysics* Zeta, arguing that essence is to be equated with form).

These critical remarks give Averroes the necessary tools to address anew coming-to-be in the sublunary realm. Starting with the *Incoherence* (179ff. Bouyges) Averroes sees the doctrine of emanation for the later accretion it is, essentially Platonic in spirit (407 Bouyges), and jettisons it in favor of a theory that sticks to the established four Aristotelian causes and a fully immanent model of sublunary causation. This leads to a rejection of Avicenna's attempts at equating efficient causality (agency) with granting existence, for the reason that this comes too close to the unacceptably arbitrary theology of creation *ex nihilo*. In a famous passage in the *Commentary* (bk. 12, comm. 18, 3:1497–1505 Bouyges) Averroes sets forth his own mature theory of generation, which is the same as Aristotle's, namely that coming-to-be is nothing other than the education into actuality of what potentially exists in the subject, and this either through efficient or final causality or (as is the rule in nature) through both. Placing a great deal of weight on Aristotle's words

to the effect that “man and the sun together generate man” (*Phys.* 2.2.194b13), Averroes traces the lines of generation in natural processes to the chains of parents and offspring, on the one hand (these he nominates accidental causes), and to the push and pull exerted by the various heavenly bodies on the elements, on the other (these he calls essential, seeing as how they fix the occurrence of a given sublunary form within the larger cosmic system: see the *Commentary on the Physics*, bk. 8, comms. 15 and 47; *Incoherence*, 20–23 Bouyges). These two are the only agencies needed to explain coming-to-be and passing-away, meaning that the emanationist framework is superfluous in addition to being open to the charges brought up by al-Ġazālī (cf. *Incoherence*, 184ff. Bouyges).

The celestial rotations, with their need for a mover with infinite power, are sufficient to bridge corporeal reality with what lies beyond it. Thus, Aristotle’s promise of nature pointing beyond itself is fulfilled, and the threat of physics becoming first philosophy is deflected (see *Phys.* 2.7.198a26–31 together with Averroes’ comments *ad loc.*; also *Met.* 6.1 and comments). Avicenna was therefore mistaken in initiating his supposedly metaphysical proof for God’s existence. Since no science is able to demonstrate its own first principles, it is only as an Unmoved Mover that God is scientifically proved to exist. Metaphysics then takes over this notion and further clarifies the immaterial substances’ mode of being and causality.

As regards modal metaphysics, Averroes heaps scorn on Avicenna’s notion of something possible in itself, necessary through another. For Avicenna’s who subscribed to a temporal and statistical interpretation of the modal terms, this is simply a contradiction in terms: the necessary just denotes the eternal, and vice versa (see Kukkonen 2000). Because Averroes takes Avicenna’s concept to refer to the celestial bodies – an interpretation shared by key post-Avicennian thinkers in the East – he perceives it also as doing irrevocable damage to Aristotle’s cosmological proof for an immaterial mover. In an effort to rectify the situation, he goes through the option of treating the heavenly motions as

being contingent in themselves, yet necessary through another (*Commentary on the Metaphysics*, bk. 12, comm. 41, 3:1632–1636 Bouyges), before settling on the view that the whole cosmic system is unequivocally necessary in and of itself (*Questions in Physics*, q. 9).

This is a truly radical view, yet Averroes does not shy away from the implications. The reason the world needs an Unmoved Mover is that every motion requires a mover, and in the case of an eternal motion only an immaterial mover will fit the description. This does not imply any contingency in the world order: to the contrary, it assures its necessary character through and through. Averroes seems to have grasped the fundamentally nonnegotiable nature of Aristotelian essentialism for the functioning of a robust Aristotelian science and to have accepted the consequence that worldly processes of generation and corruption are of a piece in their unassailable character, leaving no space, for example, for miracles. In Averroes’ estimation, Avicenna went several steps too far in accommodating the Ash‘arite theologians’ insistence on divine voluntarism and direct creation (Kogan 1985; Leaman 1988: 42–81). Conventional or sentimental notions of how divinity must relate to the world have no place in a scientific worldview such as the one Averroes is after.

A similar sense of detachment informs Averroes’ understanding of divine knowledge and providence. The Commentator contends that the First Mover knows other things not as universal or particular, but through being the cause of their being (*Commentary on the Metaphysics*, bk. 12, comm. 51; *Decisive Treatise*, 13.8–14.9 Butterworth). It is unclear whether this amounts to anything more than the knowledge a perfectly actual principle potentially has of the varying degrees of potentiality and actuality. Like Alexander before him, Averroes contends that providence can only extend so far as the perpetuation of the species: unlike Alexander, Averroes has a detailed story to show how this occurs, and why it speaks in favor of monotheism. According to the Peripatetic doctrine transmitted through Alexander and al-Kindī’s school, the rotations of the heavenly spheres are responsible for sublunary

cycles of generation and corruption. Averroes seizes the question of how these motions are coordinated and why. Because the higher cannot as a matter of principle care for the lower – all of nature is teleologically oriented and strives for individual perfection – it is inconceivable that the heavenly spheres should actually wish to benefit what lies beneath them. So why do the providential effects nonetheless accrue? Averroes' answer is that the inner hierarchy of the heavenly movers, whose possibility has been established in philosophical psychology (see Taylor 1998), is arranged according to a hierarchy of knowing, and that each of the heavenly intellects has an incomplete share of the full intellectual perfection enjoyed by the First Mover. It is because all of these intellects (in some hard-to-describe fashion) coincide in the First that the motions they produce likewise come together in a harmonious whole. This is the gloss Averroes puts on the Aristotelian dictum that the order of the universe, like the order of the army, is found both in the arrangement of the whole and in its leader, but primarily in the latter (*Commentary on the Metaphysics*, bk. 12, comms. 52 and 58; *Incoherence*, 185–193; see Kukkonen 2002).

Ibn Sabʿīn, ʿAbd al-Ḥaqq

Patrizia Spallino

Facoltà di Scienze della Formazione, Università di Palermo, Palermo, Italy

Abstract

ʿAbd al-Ḥaqq ibn Sabʿīn was born in the Ricote Valley, near Cieza, in the Kingdom of Murcia sometimes between the year 613 and 614 of the Hegira (1216 or 1217 CE). He studied Arabic, Andalusī literature, logic and philosophy, medicine, alchemy, white magic, and the “Science of Names and Letters.” At that time Ibn Khalāṣ was the *qāḍī* of Ceuta. He chose Ibn Sabʿīn to answer the philosophical questions sent by the emperor Frederick II of Hohenstaufen. It has been contended that Ibn Sabʿīn was forced to leave his new hometown after answering the emperor's arguments. What seems more likely, however, is that his Sufi ideas were not very popular with the political chief of the town. The time spent in Maghreb was, nonetheless, lively and productive: Ibn Sabʿīn wrote his most important works and many people shared his ideas. Ibn Sabʿīn was instead rejected in Egypt: his mystical thoughts, based only on some obscure philosophical arguments, were difficult for the Egyptian audience to master. Ibn Sabʿīn fled to Mecca and his settlement in this town lasted several years: in that place he finally found peace and rest. The majority of his biographers believe that Ibn Sabʿīn died in 669 h. (1270 CE).

ʿAbd al-Ḥaqq b. Ibrāhīm b. Muḥammad b. Naṣr al-ʿAkkī al-Mursī, Abū Muḥammad Quṭb al-Dīn

ibn Sabʿīn was born in the Ricote Valley, near Cieza, in the Kingdom of Murcia sometimes between the year 613 and 614 of the Hegira (1216 or 1217 CE.). There is no clear evidence about his birth, because biographers disagree on Ibn Sabʿīn's date of birth and death. Ibn Shākir, for example, asserts that Ibn Sabʿīn died the 20 *shawwāl* of the year 668 of the Hegira, at the age of 55. Therefore, he must have been born in the year 613. Among modern scholars, this theory is embraced by E. Lator, C. M. Hernández, and D. Cabanellas. However, al-Maqqarī was of a different opinion, affirming that Ibn Sabʿīn died in Mecca in the year 669 h., at the age of nearly 50. If so, it may be concluded that Ibn Sabʿīn was born around the year 619 h. Al-Maqqarī also agreed with al-Maqqarī's theory. A third bit of evidence is found in al-Shaʿrānī, who wrote that Ibn Sabʿīn died in 667 h. at the age of 55; consequently he would have been born in the year 612 of the Hegira. Finally, other biographers, such as al-Dhahabī, Ibn Kathīr, al-Fāsī – championed more recently by Amari and Taftāzānī – believe that Ibn Sabʿīn was born in 614 h.

There is, however, general agreement about Ibn Sabʿīn birth's place. He was known as al-Andalusī, al-Mursī, or al-Riqūṭī (i.e., the town of Riqūṭa in the Mursia region). People referred to him also as al-Ishbilī or al-Qaṣṭallānī, after another location in the Andalusian region known as al-Qaṣṭallata; in the East he was known as Qutb al-Dīn. However, his biographers used to refer to him as *Ibn Sabʿīn* ("son" or "who belongs" to the 70). Some sources refer to the fact that Ibn Sabʿīn used to draw a circle next to his own name. In the culture of some religious groups of the Maghreb, the circle (*al-dāra*) was indeed a symbol for the number 70, in Arabic *sabʿīn*. It is believed that the same was done by his followers. For this reason, Ibn Sabʿīn was also known as Ibn Dāra. Moreover, the first letter of Ibn Sabʿīn's name (that is ʿAbd) is the *ʿayn*, which in the Kabala coincides with number 70.

Ibn Sabʿīn was also known as *shaykh al-sabʿīniyya*, the name given to the Sufi *ṭarīqa* that grew up around him. For others he was *al-ʿAkkī*, after the tribes of *ʿAkk al-Ġafiqiyyūn al-Andalusiyyūn* that lived in the area north of

Cordoba and in the surroundings of Seville. Finally, his followers called him "*qurshī*" out of the great consideration that they had for their master. However, Ibn Sabʿīn did not belong to the Quraysh family (i.e., the family of the Prophet Muḥammad) as someone has asserted. Al-Fāsī, one of his biographers, on this matter wrote: "[Ibn Sabʿīn's] companions brought discredit to him when they stupidly maintained in front of the wise men that he [Ibn Sabʿīn] belonged to the "*qurshī*". They made fools of themselves, because it was not as they believed."

Very little is known about Ibn Sabʿīn's family. We know that his father's name was Ibrāhīm b. Muḥammad b. Naṣr b. Muḥammad. He was the local administrator of his town, and he belonged to one of the most prestigious Moroccan families. Also Ibn Sabʿīn's grandfather was an influential person and member of the upper class of his time. Ibn Sabʿīn's brother, Abū Ṭālib, was for a while the ambassador of the prince ʿAbd Allāh b. Hūd to the Pope in Rome, and was sent to resolve a broken agreement between "the king of the Christians" and the Muslims.

Ibn Sabʿīn grew up spoiled in a wealthy environment. He was good looking, of royal aspect and with a noble soul. In his youth, he received the usual literary and scholastic education of the theologians. He studied Arabic, Andalusī literature, logic and philosophy. In religious matters he chose the *sharīʿa* and Sufism. He also studied medicine, alchemy, white magic, and the "Science of Names and Letters" (*ʿilm al-asmāʾ wa-l-ḥurūf*). A tradition holds that Ibn Sabʿīn had three teachers while he was still a young man: Ibn Dahhāq, al-Būnī, and al-Ḥurānī. However, according to their biographical notes none of them could have known Ibn Sabʿīn in life, because he was born after the three masters' deaths. Ibn Dahhāq, also known as Ibn al-Marʿa, lived in Malaga for a long period. He was expert in the Science of *kalām* (apologetic theology), and also a scholar of history, law, and *tafsīr* (Qurʾānic exegesis). He died in 611 h. (1214–1215 CE), exiled in Murcia. Al-Būnī, who taught the "Science of Names and Letters," was born in Bunia, in Algeria, and died in 622 h. (1225 CE). Finally, al-Ḥurānī, who was also al-Būnī's teacher, died in 538 h. (1143 CE).

It seems that Ibn Sabʿīn spent the years of his youth in Andalusia away from entertainments and distractions, being seriously focused on his scientific education. Ibn Sabʿīn's pupil, Yahyā b. Aḥmad, said that his master wrote the *Budd al-ʿarīf* at the age of 15. In 640 h. (1242 CE) Ibn Sabʿīn left Murcia together with a number of pupils. He was probably forced to move after disagreements with the local *fuqahāʾ* (judges, *qāḍī*), who had started to persecute him for his Sufi theories that were considered to be clearly heretical and not in line with the orthodoxy of Islam. Ibn al-Khaṭīb tells that Ibn Sabʿīn passed through Granada with a group of mendicant disciples and ended his journey in the city of Ceuta. There he lived with his followers, teaching them his Sufi *ṭarīqa*. He also married a wealthy woman, who looked after all his needs. She also built a house for him that included a *zāwiya* (a religious and spiritual building erected next to the tomb of a saint) where the philosopher stayed.

At that time Ibn Khalāṣ was the *qāḍī* of Ceuta. He chose Ibn Sabʿīn to answer the philosophical questions sent by the emperor Frederick II of Hohenstaufen. It has been contended that Ibn Sabʿīn was forced to leave his new hometown after answering the emperor's arguments. What seems more likely, however, is that his Sufi ideas were not very popular with the political chief of the town. From Ceuta he went to ʿAdwa, and from there to Bājja (Bugía), where he stayed for a while. The time spent in Maghreb was, nonetheless, lively and productive: Ibn Sabʿīn wrote his most important works, and his ideas were shared by a large number of people. However, his stop in Bājja did not last long because Abū Bakr b. Khalīl al-Sakūnī, head of the *fuqahāʾ* of Tunis, organized a campaign against him. Khalīl al-Sakūnī had accused the Sufi philosopher of impiety, and in 652 h. (1254 d.C.) Ibn Sabʿīn was forced to escape toward the East. He stopped in Cairo, but the North-African *fuqahāʾ* sent a messenger to Egypt to alert the population there against his impiety. This is what Ibn Shākir wrote:

When Ibn Sabʿīn left his country he was thirty, and a group of fellows – which included some elderly people – was with him. After ten days he entered a public bath to clean himself. His fellows went along

to look after him. A worker in the bath started washing Ibn Sabʿīn's feet and, realizing that he was a foreigner, the man asked the country of origin of the traveler. Ibn Sabʿīn replied that he was from Murcia, and then the workman said: 'So you come from the same country as the heretic Ibn Abī Sabʿīn!' Ibn Sabʿīn indicated to his friends to be silent and answered positively to the man's question. Then the bath attendant started to insult the philosopher, and to curse him. Although Ibn Sabʿīn had asked the attendant to concentrate on his job [hoping to] distract [him from] his diatribe, the attendant did not stop insulting the Andalusī philosopher. After a while one of Ibn Sabʿīn's companions could not stop himself from speaking to the man saying: 'Heaven help you! God had chosen to make you a servant of the very man whose feet you are washing. You will be at his service like a boy.' The attendant turning scarlet with shame said: 'I beg God's pardon.'

The sources only vaguely refer to the period spent by Ibn Sabʿīn in Egypt. However, it is certain that the friendly Egyptian environment allowed a flourishing of Sufi schools at the time in which Ibn Sabʿīn visited the country. The Andalusian Sufi was accepted, thanks to the devotion that the Sufi expressed toward the Qurʾān and the Sunna. Nevertheless, Ibn Sabʿīn was rejected even in Egypt: his mystic thoughts, based only on some obscure philosophical arguments, were difficult for the Egyptian people to master. The *shaykh* Quṭb al-Dīn Qaṣṭallānī was among his rivals, and it is believed that he also forced Ibn Sabʿīn's departure from Egypt toward Mecca (652 h.–1254 CE). Ibn Sabʿīn fled to Mecca not only because of the persistent hate that the *fuqahāʾ* showed against him, but also for political reasons. He was in fact accused of being a Shīʿite, a follower of the Fatimids and of the Alids. The presence of the Shīʿite group in Egypt had been strongly opposed since the time of the sultan Ṣalāḥ al-Dīn Ayyubī, and all evidence of Shīʿite doctrine had been persecuted.

Ibn Sabʿīn asked for protection from Abū Numayy Muḥammad I (652–701 h./1254–1301 CE), the Fatimid governor of Mecca. Also the king of Yemen, al-Malik al-Muẓaffar Shams al-Dīn Yūsuf I (642 h./1249 CE–694 h./1294 CE), offered his support. On the other hand, the king of Egypt, al-Zāhir Baybars, who ruled from 658 to 676 h. (1259–1277 CE) detested Ibn

Sabʿīn, according to what the biographer al-Fāṣī reveals. He described in his chronicle that once Baybars, the king of Egypt, had decided to arrest Ibn Sabʿīn's son after hearing some of the father's speeches. Later, when Baybars went to Mecca in 667 h. (1268 CE) for the pilgrimage, he had tried to meet Ibn Sabʿīn, who however avoided the Egyptian king.

Ibn Sabʿīn's settlement in Mecca lasted several years: in that place he had finally found peace and rest. The local governor had a high opinion of him, particularly after Ibn Sabʿīn had treated his wounded head by making a special hat. The Meccan years passed safely, and Ibn Sabʿīn enjoyed all comforts. The Sufi philosopher spent this time writing some important works, and practicing Sufism. Many scholars asked to meet him during their pilgrimage to Mecca. The biographer Ibn Shākir tells that the *shaykh* Ṣaḥī al-Dīn al-Hindī was among the *ʿulamāʾ* that had met Ibn Sabʿīn:

In the year 666 h. I participated in the pilgrimage [to Mecca] and while there I spoke about philosophy to Ibn Sabʿīn. He asked me: 'Should you not live in Mecca?' And I replied: 'Why do you live here?' He answered: 'I have been destined to stay. The king demands that I stay here because of my lineage from the noble Meccans. The king of Yemen follows my teachings, but his vizīr is a *ḥashwīyy*, and he hates me.'

However, the chronicles also portray negative images of Ibn Sabʿīn relating peculiar stories of his time in Mecca. Ibn Kathīr, in one story, tells that once Ibn Sabʿīn referring to some pilgrims going around the *kaʿba* said: "They are like donkeys that go around a pit". He continued saying that the pilgrims would have done better service if they had circled around him instead of going around that holy place. The same biographer related also that the Sufi philosopher had a great influence on Abū Numayy. From the same source it is known that Ibn Sabʿīn spent some time in the cave of the Hira Mountain while he was waiting for revelation (a similar experience happened to the prophet Muḥammad). Ibn Sabʿīn, in fact, believed that the prophecy could be obtained by those who had a pure intellect. It was probably Ibn Sabʿīn's ego that made Ibn Kathīr conclude his account saying that "Ibn Sabʿīn had collected only ignominy both in this world and in the next

world." Other stories tell that Ibn Sabʿīn avoided going to Medina for fear of the emir of the city; or that when the philosopher visited the tomb of the Prophet "blood flowed from him like menstruation." Al-Fāṣī wrote about Ibn Sabʿīn practicing white magic saying that when Ibn Sabʿīn and his friend Abū Numayy used to go out during the night far from the city, men and horses appeared in the valley. Abū Numayy was always frightened by this vision, but this made Ibn Sabʿīn even greater in his eyes. Finally, some other biographers describe Ibn Sabʿīn as a forger. It is told that he used to forge banknotes to supply all his needs. Once he bought a sheep using forged banknotes. When the shepherd realized these were paper and not dinars, he came back to him. He found Ibn Sabʿīn asleep in his tent, but when the shepherd tried to wake him up by shaking his arm, it came off in the shepherd's hand. The man ran away in terror.

In the year 667 h. (1268 CE), Ibn Sabʿīn, forced by the continuous persecutions by the Meccan *fuqahāʾ*, had even planned to migrate to India. But, this idea was never realized. During his last days, Ibn Sabʿīn tried to return to Maghreb using diplomatic efforts. He tried to influence the governor of Mecca, through the sultan Muḥammad al-Mustanṣir bi-llāh of ḥafṣide lineage. He hoped that the sultan of Maghreb would have invited him to return to his homeland. Unfortunately, Ibn Sabʿīn did not succeed in his attempt, and the philosopher remained in Mecca until his death.

As is the case with Ibn Sabʿīn's birth, different dates are proposed also for his death. Al-Shaʿrānī, for example, claimed that Ibn Sabʿīn died in 667 h. (1268 CE). Ibn Shākir wrote instead that he died on the 28th of *shawwāl* of 668 h. (1269 CE); Lator and Cruz Hernández also agreed with him. However, the majority of his biographers – and among those al-Dhahābī, Al-Maqqarī, Amari, Massignon, Taftāzānī, and Brockelmann – believe that Ibn Sabʿīn died in 669 h. (1270 CE). Ibn al-Khaṭīb and al-Ġubrīnī had identified the exact day as the 9th of *shawwāl* of the year 669. Al-Fāṣī has quoted other biographers – of which he does not refer the names – who have identified Ibn Sabʿīn's death on the 18th of *shawwāl* of 669. More

generally, others simply report that Ibn Sabʿīn died at the age of 55.

As for the cause of his death, al-Dhahābī and Ibn Shākir wrote that he committed suicide cutting his wrists. Some of his enemies have commented that if he really had committed suicide, this would be another proof of his impiety, which has already taken him to the Gehenna. According to another version, Ibn Sabʿīn was poisoned by the king of Yemen al-Muẓaffar, who did not approve of his conduct of living. However, the majority of his biographers, with few exceptions, say that Ibn Sabʿīn died by natural death. The theory of his suicide has no foundation, because it is based on the sort of reports (*qīla*) often used by his enemies to bring discredit upon him. In conclusion, the historical sources describe a conflicting image of Ibn Sabʿīn. He has been loved and exalted or, on the contrary, despised and vilified. Ibn al-Khaṭīb, one of his biographers, wrote: "This man aroused different opinions in people, far from any form of moderation. Some people believed he was impious, some others thought he was an excellent man. Ibn Sabʿīn was able to find the extreme in each faction". Ibn Sabʿīn remains one of the most controversial personalities of Andalusian Islam.

The Cultural Environment and Intellectual Development of Ibn Sabʿīn

As can be seen from his biography, the *fuqahāʾ* environment was quite hostile toward Sufism. In general, the history of Islamic spirituality is characterized by a great debate between the Sufi and the *fuqarāʾ* (the poor of God).

Preserving Islamic law from contamination, and supervising spiritual practices were two fundamental aims of the *fuqarāʾ*. They were the official representatives of the *ṭarīqa*, and to them can be credited a number of persecutions against Sufi and rationalist thinkers. The censure was soon turned into action. The Sufis experienced a kind of inquisition, and a number of anathemas were hurled against them because of their beliefs. Several *ṭuruq* reacted with great caution, practicing their spirituality in secret. Although the Sufis

were acknowledged by Muslim communities, they experienced the hostility of some schools of thought, which were based on more rationalistic views (Muʿtazilites and *falāsifa*). The political authorities were another source of pressure. Even if officially the existence of the Sufi *ṭuruq* was allowed, the extremism of the Sufi doctrine kept the Palace alerted. It is in this social and cultural environment that the life and works of Ibn Sabʿīn should be seen. On the one hand, the philosopher experienced the rigidity of certain orthodox views; on the other hand, his way of life was hostile even to some representatives of Sufism.

Ibn Sabʿīn's philosophical studies were based on the works of scholars such as Ibn Bājja, Ibn Ṭufayl, Ibn Rushd, al-Fārābī, Ibn Sīnā. However, he also criticized those authors deeply. In his opinion, his fellow Muslim philosophers had accepted Aristotle's thought, and in particular the theory on soul and intellect, without criticism. Ibn Sabʿīn was himself influenced by the Neoplatonist school of thought and by the *Letters* of the Ikhwān al-Ṣafā'. From reading Ibn Sabʿīn's works, it can be argued that he knew Ibn Masarra, Ibn Qasī, Ibn Barraġān, as well as Ḥallāj and Suhrawardī *al-maqtūl*. However, he believed that the theories of these scholars were not sufficiently well supported to reach spiritual enlightenment. Ibn Sabʿīn was keen on the new arguments that had grown up within Islamic Law, and in his works he was very critical against the Ashʿarites. He was always well informed on the religious schools, both Islamic and not. From his *Risāla al-nūriyya* (*Letter on the Illumination*), we deduce that Ibn Sabʿīn had read the Gospel, that he had some information about the Pope, that he had a certain notion of the Jewish doctrine, Indī, Brahmanic and Persian religious schools. Ibn al-Khaṭīb and Ibn Taymiyya report that Ibn Sabʿīn had acquired *taḥqīq* (his spiritual accomplishment) from Ibn Dahhāq, and that he distinguished himself in the *ṭarīqa shūdhīyya*.

This doctrine was quite peculiar, because it brought together Hellenistic philosophy and Sufism, however several examples lead us to believe that the teaching of al-Shūdhī was not easy to understand. A proof is the fact that in the

silsila (the initiation chain) of the *ṭarīqa sab'īniyya* – traditionally referred to as comprised of Hermes Trismegistus, Socrates, Plato, Aristotle, Alexander the Great, Ibn Sīnā, Ibn Rushd, Suhrawardī – al-Shūdhī is placed among the “slaves of love”. Unfortunately, very few sources are available to recreate the basic elements that represent the core of Ibn Sab'īn's mystic work up to now. As it already has been said, many of his contemporaries did not even bother to refer to his doctrine. What is certain is that his doctrine was known as *al-shūdhīyya* or *al-sab'īniyya*. According to Ibn al-Khaṭīb, those thinkers, unlike other Sufis, did not affirm that everything comes from the One, but they believed that there is nothing else but God: the Creator is the totality of what is shown and of what is hidden. What is characterized by plurality or diversity is nothing else but illusion coming from the knowledge of conscience, because actually there is nothing outside of that. When these illusions will vanish – and therefore the entire world – everything will be the One and the One is God. The expression that summarizes the doctrine of Ibn Sab'īn's *al-waḥdat al-muṭlaqa* (Absolute Unicity) is certainly *Allāhu faqat*, “Only God” or “There is nothing else than the Being, and He is He”.

In the concept of Absolute Unicity, there is no space for the difference of multiplicity, as well for any kind of concept that divides: everything that is divided in parts is the consequence of *wahm*, illusion or imagination; what it is real, *al-Ḥaqq*, is the One. According to the theory of the Absolute Unicity, men are human beings that exist through the emanation of God: an entity that is made of body and spirit and which assembles what is found in the Creation. Human beings are, however, distinct in mass and elite. The mass ignores the reality of the being, it is subject to illusion; the elite, on the contrary, is formed by those who look at the Truth and firmly believe in it.

As it is easy to imagine, these theories were quite far from the orthodox view that divides the essence of the Creator from that of the created. Many mistakes and misunderstandings, in fact, were generated by these theories. Those who followed *al-waḥda al-muṭlaqa* were accused of departing from the *sharī'a* and of invalidating

the duties of the Muslims. However, it seems true that this accusation is not in line with the recommendations that Ibn Sab'īn himself made to his followers. In one of his letters, he asked them to regret their sins, and to perform Good through noble deeds. He also asked them to follow the *sunna*, and to be in agreement with their campaigns. He even wrote that *sharī'a* (The Law) and *ḥaqīqa* (Spiritual Accomplishment) are synonymous.

The destiny of the *ṭarīqa al-sab'īniyya* was no happier. Among Ibn Sab'īn's successors there is al-Shushtarī (born in 610 h.–1212 CE), one of his disciples known for his mystic poems, which he used to sing in the *sūq* playing a small drum (*bendīr*).

L. Massignon refers of a group of mystic authors, that he named “the Sab'īns of Damascus”, among which three of them are better known. The first is the emir Badr al-Dīn Ḥasan Ibn Hūd (633–699 h./1236–1300 CE), belonging to an important Andalusī family; he was the “chief of the Sab'īns of Damascus”, and a friend of Ibn 'Arabī. The second is the *shaykh* al-Kāshānī al-Fargānī, who died in Damascus in 1300 CE; he also was a pupil of Ṣadr al-Dīn al-Qūnawī (606–672 h./1209 to 1210–1274 CE), and commentator of the famous *Tā'īyya* written by the Egyptian mystic writer 'Umar Ibn al-Fāriḍ (576–632 h./1181–1235 CE). The last one is the mystic poet 'Afīf al-Dīn Sulaymān al-Tilimsānī, who arrived in Damascus from the extreme corner of the western world, and met Ibn Sab'īn in Cairo.

The Works and Style of Ibn Sab'īn

The style used by Ibn Sab'īn in his works is quite obscure: the author used symbols and allusions to introduce esoteric meanings behind his arguments. Reading Ibn Sab'īn, it is easy to find Qur'ānic, mystical, or historical references, as well as quotations referring to the Cabala or to metaphysical science. The language is full of expressions that are not easy to translate. Ibn Sab'īn's passion for science and white magic prompted him to use extremely peculiar sentences. Often the logic of his arguments is interrupted by

Sufi concepts that were not always understood by his contemporaries.

In order to fully understand the complexity of Ibn Sabʿīn's writings, the reader is forced to acquire information not only from the classical texts of Islamic culture, but also from the fundamental texts of Jewish, Christian, Persian, and Hellenic thought. On the one hand, the difficulties in understanding Ibn Sabʿīn's style as well as the several accusations of heresies explain the reason why Ibn Sabʿīn's works were not very popular among scholars. On the other hand, Ibn Sabʿīn's aim was not to write popular philosophical works, rather the contrary.

According to his biographers, Ibn Sabʿīn's written production was quite substantial, and it was probably the fruit of his Maghrebian stay. Unfortunately, many of the manuscripts attributed to him have not yet been the object of investigation. However, thanks to the information reported it is possible to list the titles of Ibn Sabʿīn's main works:

1. Mystical and philosophical works

Budd al-ʿarif; Rasāʾil; Al-masāʾil al-ṣiqillīyya ms. Hunt. 534; *Risāla al-faṭḥ al-mushtarik* or *Miftāḥ budd al-ʿarif; Risāla al-iḥāṭa; Fī l-jawhar, Kitāb al-kadd; Risāla al-ʾahad; Risāla al-nūriyya, Risāla al-faqiriyya; Kitāb al-safar; Duʿāʾ ḥarf al-qāf.*

2. Works on ʿilm al-ḥurūf

Kitāb al-daraj; Al-durra al-muḍīʾa wa-l-khaṭīya al-shamsiyya; Lisān al-falak al-nāṭiq ʾan wajh al-ḥaqāʾiq; Risāla fī asrār al-kawākib; Kitāb Idrīs, Lamḥa al-ḥurūf.

Ibn Sīnā (Avicenna), Latin Translations of

Jules Janssens

De Wulf-Mansion Centre, KU Leuven, Leuven, Belgium

Abstract

Several parts of Avicenna’s major philosophical encyclopedia *al-Shifā’* were translated into Latin, mainly in Toledo at the end of the twelfth century and in Burgos at the end of the thirteenth century. In addition, a partial translation of his medical treatise *On Cardiac Drugs* was incorporated into the translation of the *De anima*. Not without philosophical significance was also the translation by Gerard of Cremona of Avicenna’s major medical encyclopedia, that is, *Canon of Medicine*. Finally, Michael Scot offered the translation of an abbreviated version of the *On Animals*. It was only in the Renaissance that the physician Andreas Alpago elaborated the translation of a few minor philosophical treatises. A major event in the Renaissance was the Venice 1508 edition of Avicenna’s *Opera philosophica*. The Avicenna Latinus includes also several pseudepigraphical writings, the attribution of which to Avicenna had sometimes originated in the Latin tradition, but not always. The spread of the Toledan translations had a major impact on the Scholastic thought of the thirteenth century and later on. First the *De anima*, later also the *Metaphysics*, received great attention and influenced in several respects a wide range of thinkers. Although one cannot speak in the proper sense of any real current of Avicennism, one could say that in some sense William of Auvergne incorporates a Latin Avicennism, while different Scholastics adhere to an Avicennized Augustinianism. Gundissalinus and Denys of Ryckel (Dionysius Cartusienensis), in their turn, propose a kind of, respectively, Avicennized Boethianism and Avicennized

Dionysianism. But whatever the case, Avicenna constituted undoubtedly for all Scholastics an important “auctoritas” and through them had an everlasting effect on the history of western thought.

Translations and Editions of Authentic Works (Medieval and Renaissance)

In the second half of the twelfth century, several parts of Avicenna’s major philosophical work *al-Shifā’*, known in the Latin world as *Sufficientia*, that is, the *Preface*, the almost complete *Isagoge* (mostly quoted as *Logica Avicennae*), a chapter of the *Posterior Analytics*, the *Physics* (more precisely books 1 and 2, as well as a small part of book 3 – generally referred to as *Sufficientia*, the title of the whole work), the *Psychology* (*Liber de anima seu sextus de naturalibus*, generally referred to in the later tradition as *Sextus de Naturalibus*), and the *Metaphysics* (*Liber de philosophia prima sive scientia divina*, most of the time evoked as *Metaphysica*) were translated in Toledo into Latin. According to the majority of available manuscripts Avendeuth, which is almost certainly the Latinized form of the name of the Jewish scholar Ibn Da’ūd, made the translation of the *Preface*, the *De anima* and one chapter of the *Isagoge*, that is, Chap. 11, entitled in the majority of the manuscripts *De universalibus*, which corresponds to Chap. 12 of part one of the Arabic text (Di Vincenzo 2012, pp. 441–443). Avendeuth always worked with the assistance of a Latin scholar. In the dedicatory letter, which precedes the translation of the *De anima*, the name of the Latin scholar is specified as Dominicus, who is usually identified with Dominicus Gundissalinus. This latter may have been involved in the translations of the other parts of the *Shifā’* as well, but there is no totally compelling external evidence in this respect. The translation of Chap. 7 of part two of the *Posterior Analytics* is certainly the work of Gundissalinus, once again in collaboration with someone else. It was only conserved in the former’s *De divisione*

philosophiae as *Summa Avicenne de convenientia et de differentia scientiarum*. Thus far there is no evidence that a complete translation of Avicenna’s *Posterior Analytics* existed, as suggested by Grignaschi (1972; Janssens 1999, p. 8, 2013, pp. 243–256). A partial translation of Avicenna’s medical work *al-Adwiya al-qalbiyya*, *De medicinis cordialibus*, also called *De viribus cordis*, figures in all manuscripts of the *De anima*, between Chaps. 4 and 5. Notwithstanding an apparent difference in style, it was almost certainly the work of Gundissalinus and Avendeuth. Of all these translations, the only one that can be precisely dated is that of the *De anima*. Based on the name of the archbishop that is present in the dedicatory formula, that is, Iohannes, it can be fixed between 1152 and 1166.

Once again in Toledo, during approximately the same period, somewhere between 1170 and 1180, Avicenna’s major medical encyclopedia *al-Qānūn fī l-ṭibb*, *Canon Medicinae*, was rendered into Latin. This translation is due to Gerard of Cremona.

Together with these translations of genuine Avicennian texts, the translation of al-Ġazālī’s *Maqāṣid* needs to be mentioned, since this latter work turns out to be a slightly reworked version of Avicenna’s Persian work *Dānesh-Nāmeḥ* (Janssens 2006, VII). This translation also belongs to the Toledo milieu and it resulted from a collaboration, namely, between Gundissalinus and John of Spain.

Either in Spain or in England, Alfred of Shreshill translated near the end of the twelfth or in the beginning of the thirteenth century two chapters of the *Meteorology*, that is, I, 1 (partially) and 5, of *al-Shifā’*. The translation is paraphrastic and is known as *Liber de mineralibus*. It is also designated with the title *De congelatione et conglutinatione lapidum*. It comprises three parts, since it subdivides the first chapter of the Arabic text into two sections. It was believed to be part of Aristotle’s text, although Alfred himself was almost certainly aware of its Avicennian origin. Albert the Great rediscovered its authentic origin (Mandosio and Di Martino 2006, p. 416). Another

chapter of Avicenna's *Meteorology*, that is, II, 6 was anonymously translated into Latin, in all likelihood at approximately the same period. It circulated as the independent treatise *De diluviis*.

Around 1230, Michael Scot translated another part of Avicenna's philosophical encyclopedia *al-Shifā'*, that is, *De animalibus*. Scot's translation is mostly designated as *Abbrevatio Avicennae*. Compared to the original Arabic text, the translation shows both minor and major omissions without offering any explicit indication thereof. Hence, Scot based his translation, dedicated to the Emperor Frederick II, probably on an anonymous Arabic compendium of Avicenna's work (Van Oppenraay 1999).

About 1240 Hermannus Alemannus, in his turn, translated two passages of the *Rhetoric* of *al-Shifā'*, that is, the final part of II, 2 (pp. 73, 7–75 of the Arabic edition) and the second half of IV, 1 (pp. 206, 8–212 of the Arabic edition). He inserted them in his Latin translation of the Arabic version of Aristotle's *Rhetoric*. Worthwhile to note is that he uses both paraphrasing and literal translation (Celli 2012, pp. 486–493).

During the late 1270s, the translation of the *Physics* was continued at Burgos by Johannes Gonsalvus, in collaboration with a certain Salomon: it started where the old translation had abruptly stopped. But also this time, the text was not completely translated: the translators omitted the last four chapters of book 3 as well as the entire book 4. In all likelihood, the same scholars also provided the translation of other natural parts of the *Shifā'*, that is, *De caelo*, *De generatione et corruptione*, *De actionibus et passionibus*, and *Meteorologica*. The inventory catalogue of the Sorbonne of 1338 mentions an anonymous Latin translation of the seventh natural part, that is, *De vegetabilibus* (*The Plants*), but up to now no trace of it has been found.

Very small fragments of Avicenna's *al-Ishārāt wa-l-tanbīhāt*, *Pointers and Reminders*, and *al-Najāt*, *Salvation* are present in Latin translation in Raimundus Marti's *Pugio fidei*, a work he wrote in 1278.

In 1306, Arnold of Villanova made in Barcelona a complete translation of Avicenna's *Treatise on Cardiac Drugs*, *De viribus cordis*.

The first printed editions of Avicennian works are to be dated at the end of the fifteenth century. Regarding philosophical texts, the earliest is that of the *De anima*, published at Venice, c. 1485. Ten years later, once more at Venice, the *Metaphysics* followed, and some 5 years later the *De animalibus* was published. The famous *Opera Philosophica*, including the translations of *Isagoge*, *Physics* (old translation), *De anima*, *De animalibus*, and *Metaphysics* (besides that of two pseudo-Avicennian treatises, that is, *De caelo* and *De substantiis primis et secundis*, and the treatise *De intellectu* attributed explicitly to al-Fatṭrī), were edited by the Augustinian monks at Venice in 1508.

Finally, Andreas Alpago (d. 1522) translated for the first time into Latin several philosophical treatises of Avicenna, that is, *Compendium de anima*, *Libellus de Almahad* (on resurrection), *De definitionibus*, and *De divisione scientiarum*, and moreover, fragments of the *Notes* (*Ta'liqāt*), entitled *Aphorismi de anima* and of an *Answer to Ten Questions Posed by al-Bīrūnī*, entitled *Quaesita accepta ex libello Avicennae de quaesitis*. These translations influenced later authors, as for example John Dee (Burnett 2008, p. 50; Michot 2009), but more research is needed to determine the precise nature of this influence.

Pseudo-Avicenna

Probably in the twelfth or early in the thirteenth century an alchemical treatise, entitled *De anima (in arte alchemiae)*, was translated, in all likelihood directly from Arabic into Latin (Moreau 2016, Vol. I, pp. 50–54). The work did not remain unnoticed, maybe because of its (false) attribution to Avicenna: both Vincent of Beauvais and Roger Bacon quoted it. In the Renaissance, it was published at Basel in 1572, although under a different title, that is, *Artis chemicae principes, Avicenna atque Geber*. Another alchemical treatise, entitled *Epistola ad Hasen Regem de re recta*, certainly constitutes a direct translation from an Arabic source. However, the attribution to Avicenna is extremely doubtful (Strohmaier 2002, p. 45). The translation dates to before the middle

of the thirteenth century, since it is quoted by Vincent of Beauvais. It must be emphasized that alchemy, just as medicine, was considered in the Latin Middle Ages as a conveyor of philosophical ideas (Burnett 2005, p. 384).

To Gundissalinus, in collaboration with John of Spain, is attributed the translation of the *Liber celi et mundi*, which turns out to be a paraphrase on Aristotle's *De caelo*. The style of the translation conforms to that of other Toledan translations of the second half of the twelfth century. Initially transmitted as anonymous, it was later believed to be a genuine Aristotelian work and finally, in all likelihood after 1240, it was attributed to Avicenna (Gutman 2003, pp. XVII–XXI). Under the latter's name, it was included in the Renaissance edition of his *Opera philosophica*. Also included in this edition is the treatise *De causis primis et secundis et de fluxu qui consequitur eas*, a Latin work written in the first half of the thirteenth century.

Doctrinal Influences

Concerning the translated parts of the *Shifā'*, it is obvious that the psychological and the metaphysical parts had a major influence. They already play a significant role in the personal works of Gundissalinus, who, as mentioned above, was involved in some of the translations. In these works, the doctrines of Boethius and Avicenna are combined in such a way that one may speak of an Avicennized Boethianism (Fidora 2009, p. 120). But in the first period of its reception, Avicenna's *De anima* was of particular importance (Hasse 2000). It was used by John Blund and Michael Scot. Alexander Nequam and Alfred of Shreshill were also familiar with the work, although the former of the two maybe indirectly. Therefore, it may reasonably be stated that Avicenna's *De anima* circulated outside Toledo, that is, in Paris and in Oxford, at the very beginning of the thirteenth century. Robert Grosseteste also quotes it, although only once. He refers, moreover, to Avicenna's *Metaphysics*, *Physics*, and *Canon*, although in a limited way. A similar remark is valid with respect to Roland of

Cremona, but he takes into account the *Isagoge* while omitting the *Physics*. Moreover, Roland several times mentions "Algazel" together with Avicenna, so that it is obvious that already at his time al-Ġazālī was considered to be a scholar whose thought followed a line similar to Avicenna's. William of Auvergne appears to be the first thinker who not only referred to both Avicenna's *De anima* and *Metaphysics*, but also elaborated a synthesis inspired by Avicennian ideas. He may be considered as a representative of a Latin Avicennism, although this latter designation has to be understood rather vaguely, and certainly not as the expression of a very precise current of thought (Teske 2006, pp. 217–237). John of La Rochelle, in his turn, presented a different kind of synthesis. He dealt with both the *Canon* and the *De anima*. However, he is, above all, the first exponent of an Avicennized Augustinianism, which identifies the agent intellect with God. After 1260, Roger Bacon (in his later works), John Pecham, Roger Marston, and Vital du Four adhered to this kind of Avicennized Augustinianism (Hasse 2000, pp. 203–223).

Around the middle of the thirteenth century, we have to deal with three of the major figures of Scholastic thought: Roger Bacon, Albert the Great, and Thomas Aquinas. Bacon held Avicenna in high esteem, since he qualifies him as *praecipuus imitator et expositor Aristotelis*, notwithstanding his clear rejection of some of Avicenna's ideas. It is a well-known fact that he was familiar with the *Preface* to the *Shifā'* as well as with Scot's translation of the *De animalibus*. Moreover, it is remarkable that in his *Moralis philosophia* he pays special attention to the tenth book of Avicenna's *Metaphysics* to which he attributes an independent title, that is, *Radices moralium*. Albert the Great deals with all Avicennian texts, sometimes accepting the views of Avicenna and other times rejecting them. As one might expect, he uses both the *De anima* and the *Metaphysics* extensively. However, in addition to these works, he appears to be the only Scholastic author who refers in a systematic manner to the translations of the *Isagoge*, the *Physics*, and the *Animals*. His commentaries on these

works exhibit a wide range of more or less literal quotations derived from the different chapters. He also refers to the *Canon*, book 1. Generally speaking, Albert cannot be considered as an Avicennizing thinker, but he is critically dealing with Avicenna's writings in a most exemplary way. With respect to Thomas Aquinas, things become more complicated. He is not very systematic in quoting names; hence, there can always be much greater influence of Avicenna than appears at first glance. Traditionally, scholars put an excessive emphasis on the essence–existence distinction, as if Avicenna only influenced Thomas on this particular, although important, point. In fact, an Avicennian inspiration comes to the fore in other of Thomas' doctrines (Taylor 2014; Steel 2002).

Two late thirteenth-century authors who deserve special attention concerning the reception of Avicenna's thought are Henry of Ghent and Duns Scotus. Henry, in his two major works, that is, the *Quodlibeta* and the *Summa*, quotes Avicenna's *Metaphysics*, and no other works. He does this even in relation to typically psychological problems, as for example, the unity of the soul (Janssens 2006, p. XVI). More specifically, the number of quotations is not great, but they always have a major impact on Henry's thought. Insofar as his major objective consists in offering a real integration of genuine Avicennian ideas within a profound Augustinian framework, he may be characterized as a follower of an Avicennized Augustinianism, although in a way clearly different from that of John of La Rochelle. As to Duns Scotus, Avicenna's conception of metaphysics as being primarily an ontology, not a theology, formed an important source for his own view on metaphysics (Counet 2002). He also paid great attention to other elements of Avicenna's thought, especially in the field of metaphysics, as for instance, Avicenna's notion of the indifference of essences with respect to existence. But he is clearly not representing any kind of Avicennism. Avicenna's *Metaphysics* has eclipsed in this period his *De anima*, although John Pecham, in his *Tractatus de anima*, and Witelo, in his treatise *De natura daemonum*, still make extensive use of the latter work.

From the fourteenth century on, a direct and systematic examination of Avicenna's philosophical writings is at first glance missing. In this respect, one may note that the translations realized at the end of the thirteenth century only reached us in one single manuscript, that is, Vat. Urb. 186. Nevertheless, Avicenna's thought undoubtedly remained influential, but now in an indirect way, that is, through the mediation of the works of the major Scholastics. Their interpretations of Avicenna's doctrines were, however, not always unconditionally accepted. This is well illustrated by an author like Nicholas of Lyra, who rejected Duns Scotus' understanding of Avicenna's theory of the univocity of being (Brown 1991). Of special significance is Francis Exeimenis' use of elements taken from Avicenna's *Metaphysics*, X, in the elaboration of his own political theory (Lindgren 1980). In the fifteenth century, Avicenna constituted a major source of inspiration for Denys of Ryckel. Although Denys does not agree with all of Avicenna's ideas, his system can be qualified as an Avicennized Dionysianism (Emery 1988). In Italy, there was still interest in Avicenna's philosophical writings, especially in circles of physicians, as is demonstrated by a number of most valuable manuscripts of Italian origin and dated between the fourteenth century and the sixteenth century (Siraisi 1987; d'Alverny 1993, p. XVI). This tradition seems to have started already with Pietro d'Abano (d. c. 1316). As a physician, he wrote also a work on astronomy and astrology, that is, *Lucidator dubitabilium astronomiae-astrologiae*, which was largely inspired by several ideas derived from Avicenna's *Metaphysics*. But, above all, Ugo Benzi (fifteenth century), who explicitly presented Avicenna's doctrine of the internal senses as articulated in the *De anima*, and Andrea Cattani (sixteenth century), who many times, even in magical matters, evoked Avicenna's authority, are major examples of this attitude (Zambelli 1985, pp. 203–204). To these names, one has undoubtedly to add that of Andreas Alpago, who translated both medical and philosophical treatises of Avicenna. However, also pure philosophers continued to study Avicenna's works in sixteenth-century Italy. In this respect, one may mention the names of

Marsilio Ficino (Vasoli 2002) and Thomas of Vio (Cajetan).

The influence of the Avicenna Latinus on western philosophy has been extraordinary. Several of Avicenna's ideas received major attention in western thought. Certainly, in the field of ethics, his thought had almost no impact, whereas in physics its influence was limited to few aspects, that is, a realist conception of time and the idea that the elements keep their substantial form when being part of a mixture. As to Avicenna's logic, it played an important role in Albert the Great's elaboration of the doctrine of the three states of the universal, that is, *ante rem*, *in re*, and *post rem* (de Libera 1996, p. 253), which was extremely significant for the later discussions on the specific status of the universal. However, a major direct influence comes to the fore in the disciplines of psychology and metaphysics. With regard to psychology, this was the case with Avicenna's conception of the inner senses, especially those of estimation and imagination, and with his theory of the intellect. Moreover, his treatment of the outer senses, and between them most eminently touch and vision, was highly influential. Finally, the famous Flying Man argument, by which he primarily wanted to demonstrate the existence of soul independently of the body, constituted an important object of critical examination. With regard to metaphysics, Avicenna's famous essence–existence distinction and, related to it, the idea of the indifference of the quiddity with respect to existence had a profound impact on Scholastic thought and through it all later western metaphysical thought. Moreover, his conception of metaphysics as being essentially an ontology, but integrating at once a theology and an archeology, that is, the study of the principles of the sciences, had a deep impact. Nevertheless, other of his metaphysical ideas were strongly rejected. Following Averroes' criticisms, many Scholastics considered that Avicenna had formulated the problematic idea of the accidentality of existence, and accused him also of having confused the numerical and the ontological "one." Probably only Henry of Ghent among the Scholastics seriously questioned the validity of these criticisms. In his view, they result from a mistaken interpretation of Avicenna's genuine thought. Of

course, for all aspects of Avicenna's thought, one finds divergent interpretations among Latin thinkers. In any case, it is obvious that the Latin Scholasticism cannot be fully understood without the input of the Avicenna Latinus and that Avicenna had an enduring influence on late medieval and Renaissance thought.

As shown above, the Latin translations of Avicenna's philosophical treatises received not only the attention of professional philosophers, but also of physicians. Moreover, they were largely quoted by encyclopedists as, for example, Vincent of Beauvais and Henricus Bate, and, in at least one case, one also finds an influence in poetry. Indeed, in Piers Plowman's famous B-text, his idea of the *ymaginatif* can be traced back to Avicenna's *De anima* (Kaulbach 1993).

Finally, it is obvious that the Latin translations of Avicenna (and al-Ġazālī) gave rise to the creation of a new vocabulary. In some cases, for instance, with regard to the notion of *intentio*, this even opened up an entirely new problematic in the history of western philosophy.

Maryland, Baltimore, MD, USA

Abstract

One of the most significant philosophers of the Arabic and Persian East, Avicenna (c. 980–1037) also had an enormous influence upon the Latin West. He combined the various philosophical traditions of his time – ranging from Aristotle and his commentators, through Neoplatonic writings deriving from Plotinus and Proclus, to his immediate Arabic predecessors (particularly al-Fārābī) – and developed his own philosophy. His writings stand out for their originality and comprehensiveness, covering nearly all scientific fields, including logic, natural philosophy, metaphysics, and medicine. In current research, Avicenna is

primarily appreciated for a number of theories, which were specifically influential upon later intellectual history. In the field of logic, they include his considerations regarding the subject matter of logic (second intentions) and his distinction between “conception” (*taṣawwur*) and “assent” (*taṣdīq*), which brings logic considerably closer to epistemology. In the field of psychology, he is renowned for his theories of abstraction and intellectual intuition, as well as for his doctrine of the five internal senses. And lastly, in the field of metaphysics, he is known both for his cosmology, which (by means of his theory of separate intellects) bridges the gap between ontology and noetics, and his famous distinction of essence and existence, which underlies many of his arguments and theories, such as his proof of the existence of God, and theory of universals.

Biographical Information

Abū ‘Alī l-Ḥusayn ibn ‘Abdallāh ibn Sīnā, known as Avicenna in the Latin West, was born c. 980 CE or earlier in Afshana, in the vicinity of Bukhārā (today: Uzbekistan). Some years later, the family moved to Bukhārā, where he received his education, first in the religious sciences of Islam, the Qur’ān, Arabic literature (*adab*) and Islamic jurisprudence, and then in philosophy. Whereas several teachers are mentioned in connection with his Islamic studies, the situation is different with regard to his study of the philosophical disciplines. Although his father went to the trouble of hiring his son a teacher, Avicenna himself insists that he acquired his knowledge in these fields more or less autodidactically.

At this point a remark concerning the biographical information available on Avicenna is in order. Although at first glance we seem to be well-equipped in this regard, as we possess an autobiography recorded by his disciple al-Jūzjānī under his supervision (and later expanded into a biography by the latter), we are faced with the problem that especially the part concerning his education is styled in a programmatic manner, and is designed to defend a certain curriculum

and particular theory of knowledge rather than to depict his upbringing with historical accuracy (Gutas 1988: 149–159). However this may be, according to Avicenna’s account, he studied logic and mathematics partly on his own and partly under the instruction of his teacher, whereas natural philosophy and metaphysics he studied entirely by himself. To these sciences, which correspond neatly with the Peripatetic curriculum, he added medicine, which ranks as an applied science within such an Aristotelian framework.

By the age of eighteen his education was complete and he was already working as a physician for his father’s employer, Nūḥ ibn Manṣūr. Some years later he also attained a position as a political administrator, and he continued to practice these two professions for the rest of his life. In this respect his biography is typical of eastern philosophers, who were customarily employed at princely courts. Although this granted them a relative independence from the religious sphere, it also made them much more dependent upon the goodwill of their employer and subject to the contingencies of political circumstance. It is most likely for this reason that Avicenna changed his employer several times. In 1024 however, he finally settled in Iṣfahān under the employ of ‘Alā’ al-Dawla, whom he accompanied on trips and military campaigns. He died in 1037 during a trip to Hamadhān, where he was buried.

Philosophy

General Remarks

Despite his restless lifestyle, Avicenna produced an enormous philosophical œuvre, of which about 130 titles are today considered authentic. His writings cover all fields of philosophy; however, they particularly excel in the areas of logic, natural philosophy (including psychology), and metaphysics. Apart from numerous short treatises focusing on individual topics, his œuvre consists of comprehensive summas, such as the *Book of the Healing* (*Kitāb al-Shifā’*), *Eastern Philosophy* (*al-Ḥikma al-mashriqiyya*), and *Pointers and Reminders* (*al-Ishārāt wa-l-tanbīhāt*). In addition to philosophy, he is also renowned for his

achievements in the field of medicine, and several of his medical writings have survived (cf. in particular his *Qānūn*, Lat. *Canon medicinae*). Regarding philosophical orientation, Avicenna belongs primarily to the Aristotelian tradition, as is already apparent from his autobiography. Apart from Aristotle himself, his commentators, such as Alexander of Aphrodisias, had a great influence upon Avicenna's thought. His philosophy is however also marked by a strong Neoplatonic strain, as well as by the thoughts of his Arabic predecessors, the first and foremost being al-Fārābī.

His debt to Aristotle finds expression not only in doctrinal features, but also in his division of philosophy and in the structure of his works. In addition to his autobiography we might refer to Avicenna's *On the Division of the Intellectual Sciences* (*Risāla fī aqsām al-'ulūm al-'aqliyya*), where he develops a classification of the sciences that corresponds to the curriculum created by the Alexandrian scholars of late Antiquity. A further piece of evidence is provided by the arrangement of his major philosophical works, particularly his *Book of the Healing*, which is divided into treatises according to the Alexandrian grouping of Aristotle's writings, i.e., it is introduced by an *organon* (embracing reworkings of Porphyry's *Isagoge* and Aristotle's logical writings, *Rhetoric* and *Poetics*), followed by three treatises dedicated to the main parts of theoretical philosophy, namely, natural philosophy, mathematics, and metaphysics. Ethics, by contrast, is entirely absent from his œuvre, and political philosophy treated only in scattered chapters.

With respect to the continuity of Avicenna's thought, there are certainly changes in several of his positions, so that it is impossible to speak of the philosophical system of our author. However, there is no complete rupture which would justify the distinction between an "Aristotelian" and a "mystical" Avicenna, or an "exoteric" and an "esoteric" Avicenna, as has repeatedly been defended by some scholars, such as A.F. Mehren, H. Corbin, or S.H. Nasr. Rather, these changes must be characterized as gradual developments, often provoked by systematic problems detected by Avicenna's students and necessitating his reworking of the concerned

issues, as is the case, e.g., with his theory of intuition and thinking (see Gutas 2001). Furthermore, the differences between his allegedly exoteric Aristotelian works and supposedly esoteric, which is to say, mystical thought, particularly ascribed to his *Eastern Philosophy*, have been shown to be stylistic, and not with regard to content. Those parts of the *Eastern Philosophy* which are extant are in fact in neat doctrinal accordance with Avicenna's most "Aristotelian" work, the *Book of the Healing* (see Gutas 2000).

Since it is impossible in the space of a short article to adequately discuss the intellectual developments of this philosopher, we will instead focus upon Avicenna's *Book of the Healing*, and this for three reasons: first, it is his most comprehensive and detailed summa, covering all branches of philosophy (including logic). Second, it is probably the most accessible of Avicenna's works, both with respect to availability of editions and translations, and with regard to the amount of research done upon it, thereby facilitating its study considerably. Third, of his philosophical works, this is the one that earned the broadest reception, spreading not only throughout the Arabic East, but also through the Latin West, owing to the great impact of its twelfth century translation on medieval thinkers. In this book, we will furthermore concentrate upon certain issues which – in the light of current research – must be considered Avicenna's major achievements. These belong to the fields of (1) logic, (2) psychology, and (3) metaphysics.

Logic

There are several aspects in which logic plays a central role in the thought of Avicenna. According to him, logic is the method necessary for man to proceed from the known to the unknown. Since the attainment of knowledge is, in turn, identified as man's ultimate goal, logic is indispensable for the achievement of perfection. Hence, it functions quite naturally as an instrument in all the philosophical sciences. These general considerations – developed in the introductory chapters of Avicenna's *Isagoge* (*Madkhal*) to the *Healing* – are echoed in his own procedure: he consistently applies logic in his writings, and particularly falls back upon the demonstrative method derived

from Aristotle's *Posterior Analytics* (cf. for example, his *Metaphysics*; Bertolacci 2006: 213–263). In addition, he contributed considerably to the development of logic at a more technical level, most notably in the field of modal logic (Street 2004, 2005).

Apart from these programmatic and technical points, Avicenna also elaborated certain key conceptual considerations within the field of logic. One of these concerns its subject matter, which he identifies as second intentions (*al-ma'ānī l-ma'qūla al-thāniya*, *intentiones secundae*). Without yet using this term (which he only introduces in his *Metaphysics*, I ii:10.17; Lat.:10.73–74), he nonetheless develops the concept in the *Isagoge* (*Isagoge*, II:15.9–16.12; Lat.:2rB–2vA). The concept, as it is explained there, refers to states and accidents of things in conception (*fī l-taṣawwur*). As an explanation for his claim that the things concerned are “in conception,” he points out that things are either known or unknown in relation to our mind. Consequently, in order to attain knowledge about them, it is necessary for us to have knowledge of these states and accidents. “This kind of reflection,” concludes Avicenna, “is called the science of logic,” and its task consists in the examination of the respective states and accidents “inasmuch as they lead to making the unknown known” (*Isagoge*, II:16.10–12; Lat.:2vA; trans. Marmura 1980: 250). Examples of these states and accidents are “being a subject, predication, [...] universality and particularity in predication, essentiality and accidentality in predication” (*Isagoge*, II:15.5–6; Lat.:2rB; trans. Marmura 1980: 247). In sum, second intentions embrace a particular kind of entity, namely states and accidents, both occurring to things in conception and suitable for leading one from the known to the unknown.

In this connection, a further distinction is worth noting. Whereas the subject matter of logic is, as just said, second intentions, the discipline itself is divided into two parts, dealing with *taṣawwur* (*intellectus*) and *taṣdīq* (*credulitas*) respectively (*Isagoge*, III:17.7–17; Lat.:2vA). In accordance with Avicenna's notion of science, these must be the goals of logic. Nevertheless, *taṣawwur*,

according to the explanations of our author, can be best described as a simple conception in one's mind, which is neither true nor false. *Taṣdīq*, by contrast, should be translated as assent, or belief, since it designates an attitude toward a piece of knowledge (and hence presupposes the presence of at least one simple *taṣawwur*). *Taṣdīq*, accordingly, “occurs when there takes place in the mind a relating (*nisba*) of this form (*ṣūra*) to the things themselves as being in accordance with them” (*Isagoge*, III:17.16–17; Lat.:2vA; trans. Sabra 1980: 760). This relating and the resulting attitude can then be expressed in propositions, including simple assertions. Accordingly, only at this stage does the question of truth or falsehood, and hence the question of knowledge in the strict sense of the term (cognition of the causes), come into play. With these characteristics, however, *taṣawwur* and *taṣdīq* are primarily kinds of knowledge in the human mind; in short, they are epistemological notions. Every piece of human knowledge, says Avicenna, is either *taṣawwur* or *taṣdīq* (*Isagoge*, III:17.7–8 and 10–12; Lat.:2vA). Against this background, his conviction that logic must embrace corresponding parts throws a revealing light on his notion of logic: according to him, logic is not just a useful “external” tool we can apply in our attempt to attain knowledge. Rather, it must be identified with thinking or grasping itself, i.e., with what is going on in man's mind when he is actually in the process of acquiring knowledge. In this case, logic as a science, i.e., as the science dealing with *taṣawwur* and *taṣdīq*, is in fact epistemology.

Psychology

These considerations lead us to the question of what precisely cognition is, and hence into the realm of psychology or rather, the theory of the rational soul. The fullest account of this topic can be found in Avicenna's *On the Soul* (*Fī l-naḥs*). It involves two aspects, namely his concept of intuition, and his notion of abstraction, the crucial relationship of which remains a matter of controversy. To discuss these two aspects, some general remarks on Avicenna's concept of the soul are required. First, there is his distinction of supralunar and sub-lunar souls, where the former

belong to the spheres of the planets and stars and are therefore discussed in the context of cosmology (in particular, *Metaphysics*, IX). It is the latter, however, which are at issue here. Sub-lunar souls are of three different kinds, corresponding to the hierarchy of animate beings: plants possess vegetative souls, animals, sensible souls, and humans, rational souls. These kinds of sub-lunar souls are nevertheless related, insofar as the “higher” kind possesses all the faculties of the “lower.” As a result an animal, e.g., is not only gifted with senses such as smell, hearing and vision, but also with vegetative functions, namely, growing, nutrition, and aging. Consequently, any “higher” soul, although it will simply be called a “sensible soul” or “rational soul,” enfoldes not only its “own” faculties but also the “lower” ones. The highest faculty obtainable in the sub-lunar world is the human intellect, and this is precisely the entity which is able to acquire knowledge.

In the fifth book of his *On the Soul*, Avicenna addresses the question of how man can attain knowledge. As mentioned above, he interprets cognition as a movement from the known to the unknown, which however presupposes something known as the starting point of the whole enterprise. This problem is resolved by Avicenna’s theory of the four stages of the human intellect, which he introduces in the first book (*On the Soul*, I v:48–50; Lat.:96.37–99.78; cf. Hasse 1999: 28–40). There he distinguishes between (1) the material intellect (*‘aql hayūlānī*; *intellectus materialis*), (2) the intellect in habit (*‘aql bi-l-malaka*; *intellectus in habitu*), (3) the intellect in effect (*‘aql bi-l-fi’l*; *intellectus in effectu*), and (4) the acquired intellect (*‘aql mustafād*; *intellectus accomodatus*). Accordingly, at a very early stage of life, man’s intellect (which is at that time the material intellect) is endowed with the so-called primary concepts and primary principles (it remains unclear from where these primary intelligibles derive; usually their origin is assumed to be the external active intellect; for this latter, see below). Whereas primary concepts are notions such as the existent, the one, the thing, etc. (i.e., *transcendentalia*), primary principles are first axioms such as “the whole is bigger than its part,” or “ $\neg (p \wedge \neg p)$.” Both these concepts and

principles are required to obtain further concepts, the so-called secondary intelligibles, and to draw conclusions. Once the human intellect has acquired these first concepts and principles, it can begin the process of learning. At this stage, the human intellect is called “intellect in habit,” which merely designates its capacity to acquire further knowledge. The remaining stages – the intellect in effect and the acquired intellect – do not strictly refer to evolutionary phases, but rather to the intellect’s actual state: whether it has already acquired secondary intelligibles (intellect in effect), and whether it actually intelligizes, as well as to what extent it still requires support from the lower faculties of the soul in order to get in contact with the active intellect (acquired intellect).

For man to cognize (i.e., cognition of the causes), he must be able to find syllogisms to verify newly obtained pieces of knowledge. Since the latter, according to Avicenna, form the conclusions of such syllogisms, man’s primary task consists in finding the appropriate middle terms. On the one hand, this model clearly reveals the strong connection between logic and the process of acquiring knowledge mentioned above; it also explains the abundance of logical procedures in Avicenna’s writings. On the other hand it leads us to the core of his theories of intuition and abstraction. To detect the middle terms of syllogisms, our intellects, according to Avicenna, must come into contact with the active intellect mentioned earlier, which is the lowest of the cosmological intellects. This cosmological entity in turn bestows the human intellect with the secondary intelligibles it seeks, a process also described in terms of emanation and influx. It is precisely this form of knowledge acquisition to which Avicenna refers when he speaks of intuition (particularly, *On the Soul*, V vi; Gutas 1988: 159–176).

However this is only one side of the schema introduced above. For since Avicenna interprets the acquisition of knowledge as the detection of the causes of a piece of knowledge, this process must in fact take the conclusion (of a syllogism) as its starting-point and then proceed with the search for a middle term. It is at this point that Avicenna’s theory of abstraction comes into play

(particularly, *On the Soul*, I v:44–45; Lat.:87.19–90.60). In contrast to intuition, this is a bottom-up procedure, which typically begins with sense-data and is accomplished in concert with the five internal senses, which belong to the sensible faculty of the soul. In the human soul, these internal senses (a doctrine that clearly originates with Avicenna) differ from those of animals in that one of them possesses additional capacities. More precisely, whereas both animals and humans share common sense, estimation, imagination (which is, rather different from what the term implies, a mere storage place for “images” of perceived things), and memory, they differ in that the imaginative faculty (the faculty for producing new “images”) in human souls is further endowed with a cogitative function. By virtue of this sense, man is able to compose and divide individual forms or intentions perceived by either the external senses or the estimation, as well as reveal similarities and differences or, more generally, detect the relationships between these forms. In so doing, the cogitative faculty transforms individually perceived forms or intentions into particular forms (i.e., forms abstracted from certain material accidents adhering to individual forms), which must however be sharply distinguished from universal concepts (i.e., completely abstract forms, or universals). Meanwhile, these particular forms are precisely that missing link which man requires at the outset to produce syllogisms and thus attain knowledge.

Hence, despite the ongoing debate regarding the exact nature of the relationship between this “emanative” intuition and “empirical” abstraction, we may read Avicenna as follows: knowledge has as its starting point the sensory perceptible world. From this world are abstracted particular forms or intentions, which in the first instance are simple conceptions. To attain knowledge in the strict sense, we must now find a syllogism. As we already possess the primary concepts and principles, our task thus consists in revealing the necessary middle terms. However, these middle terms, according to Avicenna’s description, are received from the active intellect through influx. Meanwhile, for such an influx to occur, man, by virtue of his cogitative faculty,

must present the particular form mentioned earlier to the active intellect. If the particular form is “exposed in the right way” (i.e., *muqābil*; *recte opposito*; *On the Soul*, V v:235; Lat.:128.61) to the active intellect, then the latter is like a source of light shining upon it, such that the human intellect is able to grasp the corresponding universal form. Hence, taken as a whole, the acquisition of knowledge appears to be the result of the collaboration of two processes. It is characterized by a bottom-up abstraction of particular forms by the human soul, and the top-down emanation of universal concepts by the active intellect, at the interface of which cogitation is located and performs its activity, i.e., abstracting particular forms and exposing them in the correct way. Only at a later stage of human life, when one has already acquired a sufficient number of intelligibles, can one dispense with abstraction and concentrate upon construing syllogisms that consist exclusively of universal concepts (i.e., with the conclusion included).

Metaphysics

Having already broached the subject of the active intellect and supra-lunar souls, some remarks on cosmology are now in order. Whereas the majority of issues discussed so far are clearly indebted to the Aristotelian tradition, this aspect of Avicenna’s philosophy is heavily influenced by his Neoplatonic predecessors as well as by al-Fārābī. Although from a modern point of view this type of speculation might seem strange, it is nevertheless a cornerstone of his thought, as it connects ontology with epistemology and provides the basis from which to argue for the cognizability of the world. It furthermore explains the traditional claim that man strives for knowledge for his specific good, and develops a philosophical standpoint with respect to the afterlife.

Highest in the cosmological hierarchy, according to Avicenna, is the necessary existent (*wājib al-wujūd*), or God, who is unique and simple. This necessary existent, moreover, must be the first cause of all other existing things. However, because the first thing proceeding from the first cause must be one in number (owing to the first principle’s simplicity), it is

impossible to conceive of an act of causation according to which the necessary existent would have immediately created a multiplicitous reality such as we have: “For you have known that from the one inasmuch as it is one, only one proceeds” (*Metaphysics*, IX iv:405; Lat.:481.51–52; trans. Avicenna 2005: 330.2–3). Consequently, its coming into being must be otherwise explained. In this connection, Avicenna falls back upon the cosmological schema al-Fārābī developed in his *Perfect State* (*Mabādi' ārā' ahl al-madīna al-fāḍila*). Accordingly, he interprets the necessary existent as a purely intellectual being, possessing no material attributes. As a result, that which is brought into existence from it is itself a pure intellect, which emerges as the first separate intellect in a whole sequence of separate intellects. For this intellect performs, as it were, three activities: first, it contemplates that necessary being – an action marking the inception of a second separate intellect. Second, it contemplates itself as potential and, third, as necessary, thus effecting the emergence of the outermost celestial sphere (sphere of day and night) and its perfection, which is the first celestial soul.

This process is then repeated: the second separate intellect contemplates both the necessary being and itself (both as potential and necessary), thereby producing a further separate intellect and another celestial sphere (sphere of the fixed stars) with a second celestial soul. The third intellect, in its turn, reflects upon the first cause and itself, and so forth, until we reach the level of the tenth separate intellect “that governs our selves” (*Metaphysics*, IX iv:407; Lat.:484.99; trans. Avicenna 2005: 331.22). There is no essential reason why this process should stop here; however, because to Avicenna and his contemporaries, there are no more than nine celestial spheres (the ninth coming into being parallel to the tenth separate intellect), it evidently does end here. Nevertheless, the tenth separate intellect and the sphere of the moon along with its soul, also have their activities: it is this intellect which is the bestower of the forms of reality (the so-called *wājib al-ṣuwar*, *dator formarum*) and is also the active intellect, and hence the source of the influx of universal concepts (which neatly correspond to

the forms of reality) into the human intellect. Furthermore, it is by virtue of the activities of the cosmological intellects and souls that some men have foreknowledge of future contingents (infused into their imaginative faculty, e.g., through dreams), or an extraordinary capacity for coming into contact with the active intellect and intelligizing (i.e., finding the middle-terms of syllogisms, cf. Avicenna's theory of prophecy).

Despite its comprehensiveness, Avicenna's cosmology has certain implications which bring it into conflict with Islamic doctrine, and which were consequently rejected by the majority of his successors. First, there is the problem that, according to his theory, God, i.e., the necessary existent, does not create reality all at once, but only brings forth the first intellect by means of which all further coming into being is realized. Moreover, this process of coming into being is something which evolves of necessity and is eternal. This however conflicts with the Islamic conviction that God can arbitrarily intervene in his creation, and contradicts the Islamic rejection of the eternity of the world. A further point concerns the relation of body and soul, and the afterlife of man. For, according to Avicenna, the human soul comes into being precisely at the same time as the body to which it corresponds, and remains connected throughout one's lifetime. In contrast to the body, however, the soul does not perish with bodily death but continues to exist. Not so for the body: in Avicenna's theory there is no place for bodily resurrection in the hereafter, which is instead populated exclusively by souls, enduring either pain or happiness, depending upon their former life.

At this point, however, it might be in order to return to an aspect touched upon previously and examine it more closely. This is Avicenna's famous distinction between essence and existence, which underlies the concept of the necessary existent. Although, according to Avicenna, metaphysics culminates in theology and, hence, in an inquiry into the nature of God as first principle, it must be addressed as an ontology. For, according to him, the subject matter of metaphysics is the existent insofar as it is existent (*al-mawjūd min ḥaithu huwa mawjūd*), whereas

its species (the categories), properties (the universal–particular, oneness–multiplicity, the necessary–the possible–the impossible), and ultimate principles and causes (the four Aristotelian causes and God) are the things which are sought (Bertolacci 2006: 111–211). In this connection, the first book of his *Metaphysics* is of particular interest, as it programmatically introduces the subject matter, and discusses its relation to extensionally cognate notions such as the thing, or the necessary – all of which, according to him, are primary concepts. It is in this part of the work that he introduces the distinction between essence and existence, which gained notoriety in the Middle Ages (*Metaphysics*, I v).

The starting point of his considerations is the concept of the existent, which he had already singled out as the subject matter of metaphysics in previous chapters (particularly *Metaphysics*, I ii). Existence (*wujūd*), says Avicenna, may be divided into affirmative existence and proper existence. The latter can be identified with the true nature (*ḥaqīqa*) of things, or their essence (*māhiyya*). Affirmative existence, by contrast, refers to the fact *that* a thing exists. On this basis he turns toward the distinction between thing and existent. Although these notions turn out to be co-extensive, they have different intentions: for if we speak of a thing, explains our author, we wish to emphasize what it is; if we speak of an existent, however, we wish to emphasize that it is. Though he does not specify the term, from the way in which he uses “existent” here, it becomes clear that he is referring to affirmative existence and not to proper existence. Proper existence, or essence, is by contrast involved in his attempt to clarify the proper meaning of “thing.” According to the above, the linguistic expression “thing” emphasizes the “what-ness” (*māhiyya*) of an existent. However, this does not mean that a thing *is* an essence. Rather it means that it is an existent which *has* an essence, or put otherwise: every thing has both an essence and exists: “... each thing has a reality (*ḥaqīqa*) proper to it – namely, its quiddity (*māhiyya*). [...]. The necessary concomitance of the meaning of existence (*ma' nā l-wujūd*) never separates from it at all [...]. If (this) were not the case, it would not be a thing”

(*Metaphysics*, I v:31–32; Lat.:35.63–64 and 36.79–80; trans. Avicenna 2005: 24.25–26 and 25.10–14).

What might appear as a word-game, in reality reflects a peculiarity present in most of Avicenna's writings, namely his careful distinction of an ontological and epistemological perspective of the same phenomena. Accordingly, he sharply distinguishes between the ways in which things can exist and the manner in which these things can be considered (e.g., in the sciences). For things can exist either in extra-mental reality (*fī a 'yān al-ashyā'*) or intra-mentally as concepts (*fī l-taṣawwur*). However they may be considered as particular things partaking of accidents (physics), conceptions of things under abstraction of certain accidents (mathematics), or as things in themselves, that is to say, essences (*māhiyya*), regarded independently of their mode of existence or accidents (metaphysics). These distinctions are crucial not only because of the subtle connection that Avicenna thus establishes between ontology and noetics, but also because they underlie his theory of universals (see particularly *Metaphysics*, V i–ii). For on these grounds he is able to claim that, e.g., “horseness inasmuch as it is horseness” (and therefore as an object of metaphysics) is neither particular nor universal, but one single (and simple) meaning (*ma' nā, intentio*). Hence, it is something to which universality or particularity may attach extrinsically: “For ‘horseness’ has a definition that is in no need of the definition of universality, but is (something) to which universality accidentally occurs” (*Metaphysics*, V i:196; Lat.:228.31–32; trans. Avicenna 2005: 149.19–21). In this connection he leaves no doubt whatsoever that, ontologically speaking, universals such as “horseness” do not exist at all, except along with accidents (e.g., existence, oneness). As such, however, they belong properly to the realm of noetics and hence to the sphere of consideration.

Let us however return to Avicenna's notion of “thing” and his distinction between the ontological and epistemological perspectives. Although the distinctions between thing–existent, and essence–existence are related, they do not precisely correspond (for a different view see Wisnovsky 2005: 105–113): whereas the

linguistic expressions “essence” and “existence” are epistemological notions referring to conceptions that we as “scientists” use to analyze things; “thing” and “existent” are ontological notions referring to things. Both things and existents have an essence and exist; however, as introduced above, we use the linguistic expressions “thing” and “existent” in order to evoke different aspects, namely, the essence of the respective entity in the first instance, and its existence in the second. These fundamental distinctions are at the basis of some of Avicenna’s central concepts, to which we may only allude here: e.g., the distinction between the necessary existent in itself, the necessary existent through another, and the possible existent in itself (which is at the basis of his metaphysical proof of the existence of God); and his determination of the respective subject matters of logic and the theoretical sciences of philosophy.

Concluding Remarks

Considered as a whole, Avicenna’s philosophy is extraordinarily rich and has only begun to be comprehensively explored. The broad synthesis he provided, which brought together all the various philosophical trends of his day, and the new shape he gave to philosophy as a whole, contributed decisively to the central role he was to play henceforth. In the Arabic and Persian world, he inherited a position comparable to that which in the Latin West was held by Aristotle. Though overshadowed by the latter in the Latin world, his influence upon Thomas Aquinas, Henry of Ghent, and Duns Scotus, to name but a few, was substantial. These trends, however, are only some indications of his impact – owing not only to the inherent limitations of a brief article, but also, and perhaps even more so, to the fact that the exploration of Arabic philosophy, and its concrete legacy in both the East and West, is still in its infancy.

Ibn Suwār (Ibn al-Khammār)

Cecilia Martini Bonadeo

Dipartimento di Scienze Storiche, Geografiche e dell'Antichità, Università degli Studi di Padova, Padova, Italy

Dipartimento di Filosofia, Università di Padova, Padova, Italy

Abstract

Ibn Suwār was a Nestorian Christian of the tenth century Baghdad circle, proficient translator from Syriac into Arabic and physician.

Abū l-Khayr al-Ḥasan ibn Suwār ibn Bābā ibn Bahrām ibn al-Khammār was a Nestorian Christian. He was born in Baghdad in 942 and died in 1017. In the MS Paris, Bibliothèque Nationale, ar. 2346, which reproduces Ibn Suwār ibn al-Khammār's copy of Yaḥyā b. 'Adī's autograph of the *Organon*, we find the text of Aristotle's logical works together with the exegesis of the Baghdad teachers in form of scholia. These include Ibn Suwār ibn al-Khammār's ones. He was a proficient translator from Syriac into Arabic and translated Theophrastus' *Meteorologica* and *Questions*, *On Ethics*, the *Book of Allīnūs*, *On the Four Books of Logic* (including *Isagoge*, *Categories*, *De interpretatione*, and *Prior Analytics*), and partially Porphyry's *History of Philosophy*. He wrote many original works on philosophy and philosophical life, Christian theology, ethics, medicine, and meteorology.

He was respected also as a physician: according to 'Alī b. Riḍwān, a well-known physician from Cairo, Ibn Suwār ibn al-Khammār was so respected in this field of knowledge that

sultan Maḥmūd of Ghazna kissed the ground before him to show him his respect. Ibn Abī Uṣaybi'a counts him among the surgeons of the 'Aḍudī hospital in Baghdad. He was the teacher of the Christian Abū l-Faraj ibn al-Ṭayyib and of the Muslim Abū l-Faraj ibn Hindū. In one of his treatises Ibn Sīnā mentions his intention to meet him, but apparently he never realized it. In his old age, Ibn Suwār left Baghdad to Khawārizm and then to Ghazna, where, according to al-Bayhaqī, he converted to Islam after having seen the Prophet in a dream (Kraemer 1986: 124–125).

Ibn Ṭufayl, Abū Bakr (Abubacer)

Dominique Mallet
Département d'Etudes Arabes, Université de
Bordeaux, Bordeaux, France

Abstract

Abū Bakr ibn Ṭufayl al-Qaysī (c. 504/1109–581/1185) was born in Guadix, near Grenada, and died in Marrakesh. He was a physician and belonged to the inner circle of the Almohad prince Abū Y'aqūb Yūsuf (r. 1163–1184). The only complete work still extant by him is a *qiṣṣa*, i.e., a tale, entitled *Risāla Ḥayy b. Yaqzān*.

The tale is introduced by few allusive pages in which the author places his work within the philosophical and literary traditions of Sufism and Arab philosophy.

The story itself is divided into two main parts. In the first one, the author describes how an infant named “Alive, Son of Awake”, grows up in a desert island and progresses solitary into the knowledge, without any help of revelation, starting from the comprehension of the simplest things until he reaches the degree of the absorption into the pure intuition of real being, passing through the discovery of practical arts, physics, astronomy, and theology. The second part is devoted to the encounter between Ḥayy and a wise man, named Asāl, who arrives in the island seeking the inner truth of the Qur'ān. Asāl understands that Ḥayy has discovered what he was himself hoping to learn. Both men decide to emigrate to Asāl's country and to teach its inhabitants the secrets of the true wisdom, but they fail and return to the desert island to spend the rest of their lives in mystical happiness.

What does Ibn Ṭufayl's aim to teach exactly by narrating such a tale? The question is controversial. From the point of view of this article's author, Ibn Ṭufayl's does not want to show that the only possible choice for the wise is solitude, but, on the contrary, that the accomplishment of philosophy is necessarily political. Indeed, Ibn Ṭufayl's treatise could provide *e contrario* evidence of al-Fārābī's theses in political philosophy: Ibn Ṭufayl's plot and its outcome could be read as an illustration of the analysis included in the second part of al-Fārābī's *Book of Letters*.

Very little is known of the life of Ibn Ṭufayl (Abū Bakr Muḥammad b. 'Abd al-Malik b. Muḥammad b. Muḥammad b. Ṭufayl al-Qaysī, c. 504/1109–581/1185). He was born in Guadix, near Grenada, and died in Marrakesh. According to Averroes, whose account was recorded by al-Marrākushī, Ibn Ṭufayl was a physician and belonged to the inner circle of the Almohad prince Abū Y'aqūb Yūsuf (1163–1184) whom he served as a counsellor. Averroes says that Ibn Ṭufayl, who had been charged with the task of writing a commentary on Aristotle, transferred the responsibility to him. The only complete work still

extant by Ibn Ṭufayl is a *qiṣṣa*, a tale embedded within an epistolary frame narrative entitled *Risāla Ḥayy b. Yaqzān*. Léon Gauthier's critical edition of the work was published in Algiers in 1900, and remains the authoritative edition. A second edition was published in Beyrouth in 1936 with an accurate, even elegant, French translation, under the title *Ḥayy Ben Yaqdhān, roman philosophique d'Ibn Thofayl*. The subtitle reveals the influence of the European rationalists and empiricists who welcomed first the Latin translation by Edward Pocock in 1671, and then the English translation from the Arabic by Simon Ockley in 1711. The name given by Ibn Ṭufayl to the main character in his story is *Ḥayy b. Yaqzān*, "Alive, Son of Awake" – borrowed from Avicenna, who had given the name to the allegorical incarnation of the Active Intellect, the last emanating Intellect in charge of the sublunar world. In fact, the characters imagined by Avicenna and Ibn Ṭufayl have nothing in common, apart from their name. Ibn Ṭufayl paid allegiance to Avicenna, as is apparent in the letter that introduces the story, a few subtle and allusive pages in which the author places his work squarely within the philosophical and literary traditions of Sufism and Arabic philosophy and draws up a detailed inventory of his debts to Avicenna, al-Fārābī, Ibn Bājja, and al-Ġazālī.

The tale itself is well constructed and the style is fluent. There are two parts, each carefully subdivided. An infant named Ḥayy arrives in a desert island. Whether he has been abandoned by his mother – a secretly married princess who places her baby in a basket that she then sets afloat – and has been carried to the shores of the island by strong currents and winds, or he was born by spontaneous generation, is a matter of some dispute. The author never provides an answer. When the infant calls for help, a gazelle that has lost her fawn takes care of him until she dies, by which time the child is 7 years old and already knows the meaning of both shame and modesty. He dissects his mother's dead body and understands that she once had a soul and that the soul has departed from her body. He then uses the next 14 years to become a great naturalist and to acquire the practical arts. He spends yet another 7 years becoming

an expert in the physical sciences. His knowledge progresses till he reaches the frontiers of the intelligible world and then, between the ages of 28 and 35, still progressing, he finally arrives at the conclusion that a cause of causes, an author of all things, necessarily exists. Ḥayy now aspires to the intuitive vision of the incommensurable perfection of this being and turns away from the physical world and speculative knowledge in order to devote all of his time to spiritual exercises that lead him in the end to the "disappearance of self awareness, to absorption into the pure intuition of the real being" (*al-fanā' 'an nafsīhi wa-l-ikhhlāṣ fī mushāhadat al-ḥaqq*) and real oneness (*ḥaqīqat al-wuṣūl*). The second (much shorter) part of the narrative tells the story of a man called Asāl who lives on a neighboring island, where the prince, called Salāmān, professes a literal and political understanding of religion. Suspecting that there is a secret meaning to be discovered in the Revelation, Asāl, in his hope to find a desert place to meditate the Qur'ān comes to Ḥayy's island. Asāl soon runs into Ḥayy and learns how to speak to him. Ḥayy then shares with Asāl all his knowledge and explains how did he reach it on his own, until he reached Oneness. Thanks to Ḥayy's teaching, Asāl at last finds what he had been hoping to discover – the inner truth of the Qur'ān. Ḥayy, for his part, can see nothing in Asāl's religion that contradicts his own discoveries. Thus, in the lessons they teach each other, reason and revelation are united. However, in spite of his wisdom, Ḥayy cannot understand why the truths that are so familiar to him are hidden, or why, according to Asāl's religion, they are presented in allegorical form or, finally, why the perishable and unsubstantial things of earthly life are so present in Asāl's religion. He wants to leave for Salāmān's island immediately to instruct its wise men and show them the true meaning of their virtuous religion. A vessel suddenly appears on the horizon and carries the two men to the island of Salāmān. As soon as he lands, Ḥayy begins to teach the best inhabitants the secrets of true wisdom. Although they aspire to goodness and truth, the wise men turn away from their new teacher, preferring "the way of authority" (*tarīq al-rijāl*) to the unveiling of the truth.

Ḥayy realizes that he will not convince them, sees that his efforts are in vain, and understands that the revealed law suits the animal natures of the great majority of those – unencumbered by reason – for whom it is destined. He retracts, apologizes to Salāmān and his companions, recommends that they follow the revealed truth literally, and goes back with Asāl to worship God on the island where he grew up.

What is “the Principal Subject of Ibn Ṭufayl’s Ḥayy ibn Yaqzān”? – such is the title of a major article by George F. Hourani. Is it an attempt to demonstrate that reason is all-powerful? or to demonstrate the importance of experience in the acquisition of knowledge? or perhaps the scope of natural theology? or the superfluity of Revelation? Is it an attempt to demonstrate the continuity between rational speculation and mystical ecstasy? or the unity of philosophy and revealed law? Is it a praise of the solitary life? or, finally, could it be a dismissal of political philosophy? All these interpretations and other less obvious ones have had their proponents. The fact that Ḥayy needs no one’s help to learn so much and that in the end he chooses exile over political life, appears to show that the only possible choice for the wise is solitude! Yet this interpretation leaves a number of aspects of the narrative unexplained. Why, for example, does it not end with Ḥayy’s accession to mystical beatitude? Why does Ḥayy insist on teaching the wisdom he has acquired? Why does Asāl fail to persuade him not to? Why do they both have to experience the vanity of their efforts? And what have they learned in the end, when they return to their point of departure? Paradoxically, it is impossible to answer these questions without placing the treatise within the field of political philosophy. Ḥayy is political by nature: “full of compassion for his fellow men and ardently wishing to save them, he decided to go to them ...”. Asāl too is naturally political: “He hoped that through [Ḥayy ibn Yaqzān], God would direct a few men he knew who were willing to let themselves be guided and who were closer to salvation than others.” The first lesson of this puzzling treatise is that both men make the mistake which al-Fārābī had warned against: they wish to replace religion with philosophy – a mistake that Socrates had already made, or so his

accusers insinuated. The second lesson of the treatise is the cause of the mistake. Because of his solitude, Ḥayy knows nothing of rhetoric, dialectics, or poetics, all of which regulate the relations between the wise and the ignorant in the city, since they are the means by which the wise may address the ignorant, protect themselves from their anger, attempt to alter their opinions and reform their behavior. The accomplishment of philosophy is necessarily political and the exercise of politics is religious. Ḥayy fails twice because he believes his knowledge is complete, whereas, in fact, it is his alone, and he expects it to replace religion. From this point of view, there is a close relation between Ibn Ṭufayl’s letter and al-Fārābī’s political philosophy. Indeed, Ibn Ṭufayl’s treatise provides *e contrario* evidence for al-Fārābī’s theses. The analyses included in the second part of al-Fārābī’s *Book of Letters* are illustrated by Ibn Ṭufayl’s plot and its outcome.

Ibn Ṭumlūs

Anna Akasoy

Oriental Institute, Oxford, UK

Abstract

The Andalusian logician and physician Ibn Ṭumlūs (c. 1150–1156 until 1223 or 1224), about whose biography very little is known, is a rare testimony to the afterlife of Ibn Rushd's philosophy in the Islamic world. His only known substantial philosophical work, the *Introduction to the Art of Logic*, offers a brief account of the intellectual history of al-Andalus. He highlights the importance of logic, which is required for any systematic presentation of ideas. There is nothing in logic, which is opposed to religion. While Ibn Ṭumlūs dismisses al-Ġazālī's logic, which harmonizes the Greek tradition with Islamic scholarship, al-Fārābī receives only moderate

praise, but remains inferior compared to Aristotle. Ibn Ṭumlūs read his works with the help of commentaries, presumably by Ibn Rushd. Ibn Ṭumlūs' failure to mention the name of Ibn Rushd, who was his teacher, has attracted attention as possible evidence for an anti-philosophical *Zeitgeist* in Almohad Spain. The general structure of the *Introduction* follows the model of al-Fārābī, in particular his *Enumeration of the Sciences*. The ten books of the *Organon* according to the Arabic tradition are all represented. While the *Categories* are based on al-Fārābī, Ibn Rushd's *Middle Commentaries* influenced the *Rhetoric* and *Poetics*. Ibn Ṭumlūs detaches rhetoric from its traditional political context and emphasizes its use in medicine and for discussing Islamic ideas. The only medical work of Ibn Ṭumlūs, which is preserved, is a commentary on Avicenna's didactic poem.

Biographical Information

Little is known about the biography of Abū l-Ḥajjāj Yūsuf ibn Muḥammad Ibn Ṭumlūs. Born in c. 1150–1156 in Alcira near Valencia, he became a disciple of Ibn Rushd and probably also studied Islamic sciences and Arabic grammar. He served the Almohad caliph al-Nāṣir (r. 1199–1213) as a physician and died in 1223 or 1224 in Alcira.

Ibn Ṭumlūs' Thought and Philosophy

Ibn Ṭumlūs' only known substantial philosophical work is the *Introduction to the Art of Logic* (*Madkhal li-ṣinā'at al-mantiq*), beginning with a prologue in which Ibn Ṭumlūs presents a brief account of the intellectual history of al-Andalus. While numerous books have been written about the Islamic and ancient sciences, it is only logic which – according to Ibn Ṭumlūs – has not received the attention it deserves. Even though they have no knowledge of it, the “people of his time,” that is, the traditional Muslim scholars, associate logic with heresy, thereby violating their own principles of investigation. Ibn Ṭumlūs

traces this phenomenon back to the establishment of Islam in al-Andalus when the legal scholars monopolized the very concept of science and rejected any form of scholarship, which reached them from the main lands of the Islamic world, only to accept it later. The same happened with al-Ġazālī's books, which became allowed and popular only under Almohad rule. Ibn Ṭumlūs dismisses al-Ġazālī's logic, which adapts the technical terms to an Islamic environment, as inferior to that of al-Fārābī. The works of the latter, however, among which he mentions *The Great Abridgement* (*al-Mukhtaṣar al-kabīr*; see Elamrani-Jamal 1997: 476–481 for this text) are inferior to those of Aristotle. Ibn Ṭumlūs explains that he studied both al-Fārābī and Aristotle with the help of commentaries, presumably those by Ibn Rushd, although he does not mention his name.

Ibn Ṭumlūs proceeds in his preface by saying that nothing in logic is opposed to religion. Following al-Fārābī's *Enumeration of the Sciences* (*Kitāb Ihṣā' al-'ulūm*), Ibn Ṭumlūs compares logic to language and grammar and points out that it is indispensable for reaching sound judgments instead of mere opinions about any subject and for presenting conclusions in a systematic way. It allows us to test potential authorities for their veracity. Ibn Ṭumlūs distinguishes with al-Fārābī eight parts of the logic associated with the individual books of the *Organon*. The three syllogisms include the simple intelligibles (*Categories*), simple statements (*On Interpretation*), and syllogisms (*Prior Analytics*). In addition to these, we find the five disciplines in which the five types of syllogisms are used: demonstrative (*Posterior Analytics*), dialectical (*Topics*), sophistic (*On Sophistical Refutations*), rhetorical (*Rhetoric*), and poetic (*Poetics*).

The preface to the *Introduction* is a rare witness to the intellectual landscape in late Almohad Spain, although none of the philosophical authors hailing from this region is mentioned. In particular, Ibn Ṭumlūs' failure to mention his teacher Ibn Rushd by name has attracted attention. It has been interpreted as reflecting an intellectual climate in late Almohad Spain, which may have turned hostile to philosophy as became obvious in the

banning of philosophical books in 1196. Ibn Rushd himself had been exposed to an inquisitorial prosecution (*miḥna*) and banished for a brief period from the Almohad court in 1197. The description of earlier opposition against “foreign” sciences put up by the traditional scholars of al-Andalus may be simply an account of Ibn Ṭumlūs' own time. However, in his medical work, Ibn Ṭumlūs uses Ibn Rushd's *Colliget* and praises its author as “the most eminent sage and most virtuous scholar” (Ibn Sharīfa 1999: 308). It has been suggested that Ibn Ṭumlūs expected the Andalusians to react to Ibn Rushd in the same way as they had done with previous new tendencies, that is, to reject them first and endorse them later. The interpretation of Ibn Ṭumlūs' attitude to his teacher also affects the dating of the *Introduction*. If the absence of Ibn Rushd's name is considered a reflection of the persecution, it is likely to have been written in the late 1190s. If not, an earlier date is just as plausible.

The main part of Ibn Ṭumlūs' *Introduction* follows the order of the ten books of the *Organon*, adding – in harmony with the Arabic tradition – two to the list above: *Isagoge*, *Categories*, *On Interpretation*, *Prior Analytics*, *Analysis*, *Posterior Analytics*, *On Sophistical Refutations*, *Topics*, *Rhetoric*, and *Poetics*. The *Analysis* (*Kitāb al-Taḥlīl*), an innovation of al-Fārābī, comprises parts of *Prior Analytics* and *Topics*. In terms of length of treatment, particular attention is granted to the *Rhetoric*, which may reflect Ibn Ṭumlūs' personal interest in the subject.

Even though a thorough analysis of the whole text of the *Introduction* and its sources remains a desideratum, preliminary studies have identified al-Fārābī as the main source of the first part. His *Enumeration of the Sciences* was used in the prologue to the *Introduction* (the end, use, object, name, and parts of logic), and in his discussion of the *Categories*, Ibn Ṭumlūs follows closely al-Fārābī's *Book on the Categories* (presumably a part of the text Ibn Ṭumlūs refers to as *al-Mukhtaṣar al-kabīr*). This reflects the high prestige of al-Fārābī's logical works in al-Andalus. Aouad's analysis of the *Rhetoric* has shown that Ibn Ṭumlūs does not use the Arabic translation of Aristotle's text, but paraphrases Ibn

Rushd's corresponding *Middle Commentary* and supplements it with passages from Ibn Rushd's *Short Commentary*, al-Fārābī's *Book on Rhetoric*, and the *Rhetoric* from Avicenna's *Kitāb al-Shifā'* (Aouad 2006: ix). Rather than merely compiling excerpts from these sources, Ibn Ṭumlūs presents his own approach to the *Rhetoric*. The nature of the text is propedeutic, its aim to introduce the reader to the oratorical art and prepare him for the study of further, more detailed texts. While Ibn Ṭumlūs follows by and large the structure of Ibn Rushd's *Middle Commentary*, he sometimes imposes his own principle, namely to proceed from the general to the particular, and introduces further changes in structure (such as the creation of thematic units), which lead to an exposition that is more systematic than previous approaches to the topic (Aouad 2006: xiii). Compared with Ibn Rushd, Ibn Ṭumlūs emphasizes the universal applicability of rhetoric, an art that enables the communication of the results of all practical arts to a general audience. Unlike other texts belonging to the same Arabic tradition of the *Rhetoric*, Ibn Ṭumlūs' *Introduction* does not include a discussion of its political utility, which he regards as beyond the purpose of an introduction. Examples from the political realm, which appear in Ibn Rushd's *Middle Commentary* are omitted by Ibn Ṭumlūs or substituted for medical ones, and in the rare examples he displays a negative view of political life. According to Aouad's analysis, the author thus detached rhetoric from its political context and rather outlines its benefits in medicine when talking to patients or for discussing metaphysical ideas. The Islamic religion, in particular its law and ethics, are also prominent, and Ibn Ṭumlūs identifies various philosophical concepts with parallels in an Islamic context.

A similar relationship to Ibn Rushd's corresponding *Middle Commentary* characterizes the part on the *Poetics* of the *Introduction* in which Ibn Ṭumlūs borrows terms and examples from his teacher, but contributes his own elements. Possibly inspired by the model of Avicenna, Ibn Ṭumlūs gives the example of a poetic syllogism in the second figure, which is formally invalid – being a second-figure syllogism with two affirmative premises and an affirmative

conclusion – which depends on the invalid conversion of a universal affirmative proposition as a universal affirmative. This is a theory not mentioned by al-Fārābī and rejected by Ibn Rushd (Aouad 2004). In this part of the *Introduction* too, Ibn Ṭumlūs expresses a certain reservation regarding human nature, highlighting the pitfalls resulting from an intuitive grasping of apparent meanings.

In a short *quaesitum* preserved only in a Latin translation based on a now lost Hebrew version, Ibn Ṭumlūs addresses a problem of modal syllogistic, which figures in the *Prior Analytics* of his *Introduction* under the heading *Qawl fī l-maqāyīs al-mukhtaliṭa min al-darūriyya wa-l-wujūdiyya* (*About the Syllogisms Which Combine a Necessary and Existent Premise*). He follows Ibn Rushd in his discussion of the third figure with a necessary and an existential (*de inesse*) premise. Both authors suggest that the syllogism can be reduced to the first figure. In the *Prior Analytics* of the *Introduction* Ibn Ṭumlūs mentions another short treatise in which he refutes Avicenna's view that the universal negative *de inesse* proposition does not convert. This treatise has not been preserved.

In addition to his logical works, Ibn Ṭumlūs wrote a commentary on Avicenna's didactic medical poem *al-Urjūza fī l-ṭibb* (for a list of manuscripts see Puig 2007). He dedicated the commentary to a certain Abū Yaḥyā ibn Abī Ya'qūb Yūsuf ibn Sulaymān, a son of the Almohad Mahdi Ibn Tūmart's companions who – according to Ibn Ṭumlūs – was also held in high esteem by Ibn Rushd. The dedication suggests that the commentary was written between 1179 and 1185 (Elamrani-Jamal 1997: 468–469). Biographies of Ibn Ṭumlūs include fragments of classical love poetry and attribute a book on the Arabic language to him, which is not preserved.

Ibn Zur'a, 'Īsā ibn Ishāq

Cecilia Martini Bonadeo

Dipartimento di Scienze Storiche, Geografiche e dell'Antichità, Università degli Studi di Padova, Padova, Italy

Dipartimento di Filosofia, Università di Padova, Padova, Italy

Abstract

'Īsā ibn Zur'a was a Jacobite Christian of the tenth-century Baghdad. He was a famous translator from Syriac into Arabic of several Aristotelian works of zoology and logic.

Abū 'Alī 'Īsā ibn Ishāq ibn Zur'a was born in Baghdad in 943. He was a Jacobite Christian and studied philosophy and Christian theology under the guide of Yahyā b. 'Adī (d. 974). Even though he did not practice medicine, he was acquainted with some doctors of al-'Aḍudī hospital in Baghdad: Ibn Bakkūs, a translator of medical treatises, Abū l-Ḥusayn Ibn Kaṣkarāyā, and Abū Manṣūr Ṣā'id ibn Bīṣr 'Abdūs. From Abū Ḥayyān al-Tawḥīdī (d.1023), we know that he was a merchant in trade with Byzantium; for this reason, he was

suspected of having plotted intrigues with the Byzantines, and he was judged faulty and lost his properties. He died in Baghdad in 1008. Ibn Zur'a was the most prominent student of Yahyā Ibn 'Adī, and like his teacher, he was a Christian theologian and apologist.

He was also a good translator from Syriac into Arabic of several Aristotelian works. His Arabic translation of the *Sophistici elenchi* (*Kitāb Sūfistīqā naql Abī 'Alī 'Īsā ibn Ishāq Ibn Zur'a min al-suryānī bi-naql Aṭānis min al-yūnānī*) was based on the Syriac version by Athanasius of Balad, and it improved Yahyā Ibn 'Adī's earlier Arabic translation with additional Syriac material by Theophilus of Edessa. In the MS Paris, Bibliothèque Nationale, ar. 2346, the *Sophistici elenchi* in all likelihood are copied from Ibn al-Samḥ's copy of 'Īsā ibn Zur'a's autograph. Ibn Zur'a attributed to this Aristotelian treatise a very important role in the debate between philosophy and theology (Badawī 'Abd al-Raḥmān. [1980]; 'Īsā ibn Ishāq ibn Zur'a. [1994]).

In the *Fihrist* Ibn al-Nadīm (d. 990) writes that Yahyā Ibn 'Adī composed an epitome of Nicolaus Damascenus' *Book of Animals* (*Kitāb al-Ḥayawān*) and that 'Īsā ibn Zur'a begun to translate it (*Fihrist*, 251. 23 Flügel). Then Ibn al-Nadīm credits him also with the translation of *Five treatises* from Nicolaus' book *On Aristotle's Philosophy* and the translation of Aristotle's *Book of Animals* (*Kitāb al-Ḥayawān*). Ibn al-Nadīm mentions also a version by 'Īsā ibn Zur'a of an anonymous work on ethics (*Maqāla fī l-Akhlāq*). It may refer to the Arabic original version of the *Summa Alexandrinorum*, which came down to us only in Latin. According to Ibn Zur'a, ethical thought – as described by Plato and Aristotle – reaches perfection in Christian ethics. The positive law of religion is, in fact, an instrument to guide on the right way those who are unable to deduce the good according to the law of reason: the Mosaic law proposed a law of equality or justice, which was replaced by Christ's overflowing of grace. Further Arabic versions of ancient works attested by Ibn al-Nadīm are the

following: the version of the commentary by Proclus on Plato's *Phaedo*, of the commentaries by John Philoponus (or *John of Alexandria*?) of the versions of Galen's *To Glaucon*, of *The Elements according to Hippocrates*, of the *Anatomical procedures*, and of *The Function of the Parts of the Body*. In the manuscript Cairo, Dār al-kutub, Taymūr ahlāq 290, the Arabic version of Themistius' *Letter to Julian on Governance* is attributed to Ibn Zur'a, while in the manuscript Istanbul, Köprülü, it is attributed to Abū 'Uṭmān al-Dimashqī (d. after 914; Cheikho, L. [1920–1923]; Shahid, I. [1974]).

Ibn Zur'a was also the author of philosophical treatises, among which the one entitled *A Demonstration Exonerating Those Who Cultivate the Sciences of Logic and Philosophy from being Considered Irreligious* (*Maqāla yubayyin fihā barā'at al-nāzirīn fī l-manṭiq wa-l-falsafa mimmā yu'rafūna min fasād al-dīn*) quoted by al-Bayhaqī. Religion law and rational sciences cannot be considered in conflict: religion itself tries to avoid fallacies. So, to demonstrate the truth of religion, miracles are not enough; reason is required. In particular logic is the tool to distinguish the possible from the impossible according to the laws of nature and hence to recognize when the divine miracle occurs (Rescher, N. [1963]; Haddad, C. [1971]). Another treatise is *The Aims of Aristotelian Logic* (*Āgrād Aristūṭālīs al-manṭiqiyya*), an epitome of the *Organon* where Ibn Zur'a uses the eight Alexandrian *kephalaia* and in particular epitomizes Porphyry's *Isagoge*, Aristotle's *De Interpretatione*, and Aristotle's *Prior and Posterior Analytics* ('Īsā ibn Ishāq ibn Zur'a. [1994]). The list of Ibn Zur'a's works reported in the *Fihrist* counts other original works: an abridgment of an allegedly Aristotelian treatise on the inhabited parts of the earth entitled *Epitome of Aristotle's Book on the Oikumene* (*Ikhtisār kitāb al-Ma'mūr min al-arḍ*) and an interpretation of a part of Aristotle's *De caelo* III 5, 306b3-8, concerning regular polyhedra. Ibn Abī Uṣaybi'a records a treatise, no longer extant, entitled *On the Reason why the Stars [as opposed to the spheres] are Luminous, even though both they and the spheres that carry them consist of the same simple substance* (*Kitāb fī 'Illat istinārat*

al-kawākib ma'a annahā wa-l-kurāt al-ḥāmila lahā min jawhar wāḥid basīṭ).

Ibn Zur'a was also a Christian theologian and apologist. He wrote the treatise *On the Concept 'Father' and on Its Being Composite [Dream Concerning the Intellect]* (*Maqāla fī Ma'nā l-ab wa-annah murakkab [Ru'yā fī amr al-'aql]*; Sbath, P. [1929]; Haddad, C. [1971]; Starr, P. J. [2000]), where he states to have seen his teacher, Yaḥyā Ibn 'Adī, in a dream, and his teacher invited Ibn Zur'a to write on this topic. According to Ibn Zur'a, the hypostases of the Christian Trinity can be interpreted, on the teaching of Yaḥyā Ibn 'Adī, as Intellect, intellecting, and intelligible (*'aql*, *'āqil*, *ma'qūl*). Another of Ibn Zur'a's treatises in defense of Christian doctrine is entitled *On Topic about Which He had been Asked by a Friend* (*Risāla šannaḥāh fī ma'ānī sa'alahu 'anhā ba'ḍ iḥwānihi*), and it concerns the unicity of the Creator and the Trinity of the divine attributes (*ṣiḥāt*), which can be established by logical necessity (Sbath, P. [1929]). According to Ibn Zur'a, who was inspired by the Islamic kalām, the hypostases of the Trinity are attributes of the divine essence and states (*aḥwāl*) – or essentially concomitant accident – of the divine substance. He employs also in this writing the intellect analogy for Trinity: the Father is composed from the substance of the divine essence and the fatherhood, i.e., the power of intellectual representation. Ibn Zur'a justifies the symbolic expression that occurs in Christian Doctrine and states that any attribute that the mankind predicates of the divine being (e.g., the traditional epithets of benevolent, wise, and powerful to indicate the Father, the Son, and the Holy Spirit, but even the intellect analogy) is limited according to human reason and language and cannot be completely appropriate. Ibn Zur'a wrote other treatises on Christian Dogmatics and Apologetics such as the *On the Four Scientific Questions applied to the Union [of the Three hypostases] in which the Christians believe* (*Maqāla fī l-Mabāḥiṭ al-arba'a 'an al-ittiḥād alladhī yaqūlu bihi l-naṣārā*) where he uses the four types of inquiry of the Alexandrian commentary tradition “whether,” “what,” “which,” “why,” for the union of two essences in Christ, and he presents the various doctrines of Nestorians,

Melkites, and Jacobites (Starr, P. J. [2000]); the *Epistle to the Jew Bišr ibn Pinḥās* (*Maqāla 'amilahā ilā Bishr ibn Pinḥās*) to convince the Jew of the truth of the Christian doctrine (Starr, P. J. [2000]); the *Reply to the Refutation of the Christian Doctrine in the Book Awā'il al-adilla di Abū l-Qāsim 'Abd Allāh ibn Aḥmad al-Balkhī*, (*al-Ijāba 'an radd Abī l-Qāsim 'Abd Allāh ibn Aḥmad al-Balkhī 'alā l-naṣārā fī kitābihi al-musammā Awā'il al-adilla*) one of the most important Mu'tazilī in Ibn Zur'a's age; and the *Answer to 12 Questions from Abū Ḥakīm Yūsuf Ibn al-Buḥayrī*.

Ikhwān al-Ṣafā', Encyclopedia of

Carmela Baffioni

Institute of Ismaili Studies, London, UK

Dipartimento di Studi e Ricerche su Africa e Paesi Arabi Facoltà di Studi Arabo-Islamici e del Mediterraneo, Università degli Studi di Napoli L'Orientale, Naples, Italy

Abstract

“Ikhwān al-Ṣafā'” – the “Brethren of Purity” – is the name of a philosophical brotherhood that produced in the tenth century the most complete medieval encyclopedia of sciences, at least two centuries before the best-known encyclopedias in the Latin world. It is a collection of 52 treatises or epistles in Arabic, divided into 4 sections – introduction and the natural, psycho-rational, and metaphysical-theological sciences; 2 additional Epistles, the “Comprehensive” (*Risāla al-Jāmi'a*) and the “Supercomprehensive” (*Risāla Jāmi'at al-jāmi'a*), complete the work, which assembles all the available knowledge of the sciences, philosophy of Greek origin, and religious and gnostic Muslim doctrines. The Ikhwān al-Ṣafā' are linked to Shī'ism and often associated with an Ismā'īlī milieu. The treatises are based on a wide variety of materials but focus on Greek philosophy and science. The Epistles, which are addressed to disciples at an early stage of their apprenticeship, contain a core of technical teachings and a conclusion regarding their inner meaning. The first topics addressed are arithmetic, geometry, astronomy, geography, music, and logic. The overall epistemological framework is sketched in a special treatise; utilitarian activities are addressed in a complementary epistle. As a consequence of the eclectic character of the whole work, the first seven treatises of the second section, which are devoted to the natural sciences, follow Aristotle's works on physics; but the treatise on nature introduces a Neoplatonic conception to explain the religious tenets of creationism from the philosophical point of view. The

encyclopedia deals with the major Muslim religious issues, and Qur'ānic quotations often support ancient doctrines. Overall, the work represents a solution to the problem of reconciling reason and faith. The political vision developed in it may identify the authors as supporters of a strictly 'Alid conception of the Imamate.

Biographical Information on the Authors

The Ikhwān al-Ṣafā' – the “Brethren of Purity” – are the authors of the most complete medieval encyclopedia of sciences, at least two centuries before the best-known encyclopedias in the Latin world by Alexander Neckam, Thomas de Cantimpré, Vincent de Beauvais, and Bartholomaeus Anglicus. It is a collection of 52 treatises or epistles in Arabic, divided into 4 sections – propaedeutical, natural, psycho-rational, and metaphysical-theological sciences; 2 additional Epistles, the “Comprehensive” and the “Supercomprehensive,” complete the work.

The literary scholar Abū Ḥayyān al-Tawḥīdī (d. 1023), following his master Abū Sulaymān al-Sijistānī al-Mantiqī (d. 985 c.), and the Mu'tazilite theologian 'Abd al-Jabbār al-Hamadhānī (d. 1025) identify as the authors of the encyclopedia the *qāḍī* (“judge”) Abū l-Ḥasan al-Zanjānī and his friends Abū Sulaymān al-Bustī, called al-Maqḍīsī, Abū Aḥmad al-Nahrajūrī and al-'Awfī, all from Baṣra and linked to the Chancellery secretary Zayd b. Rifā'a. According to Ignaz Goldziher, their common denomination as Ikhwān al-Ṣafā' could have been borrowed from the famous Indo-Persian collection of fables *Kalila wa-Dimna* to indicate a group of loyal friends. The most convincing hypothesis, however, relates it to the contents and goals of the encyclopedia – knowledge as a means of purification and salvation. Perhaps, their name is a pseudonym hiding their true identity (Poonawala 2015, p. 264 and 272).

The abovementioned sources locate the *Rasā'il* at the second half of the tenth century. Recent studies on the correct date of the introduction of the encyclopedia in al-Andalus, however – on the

line of a seminal article by Fierro (1996) – have radically changed this view. As ascertained by de Callatāy (2013), Kacimi (2014a, b), de Callatāy, and Moureau (2015), the personage in question would be Maslama al-Qūrtubī (d. 964), previously confused with the scientist Maslama al-Majrīfī (d. 1007; however, the one who introduced in Spain the work as a whole is still to be considered to be Abu al-Ḥakam al-Kirmānī, d. 1066). Because of this new discovery, the timing of the *Rasā'il* has been anticipated of several decades at least. Maslama al-Qūrtubī has been recognized as the author of *Rutbat al-ḥakīm* (*The level of the wise man*) and *Ghāyat al-ḥakīm* (*The goal of the wise man*; this work being known in Latin as *Picatrix*), two important works on occult sciences that are now both to be reported to the first half of the tenth century. Scholars have also emphasized the impact of the Ikhwānian encyclopedia on *Rutba* and *Ghāya*, and it was even hypothesized Maslama to be one of the authors of the epistles (Carusi 2000). In the light of this new chronology, de Callatāy 2014 examines the possible influence of the Ikhwān on Ibn Masarra (d. 931), a much debated thought, considering several issues all related to cosmology. Ibn Masarra is reported to the Andalusī *bāṭinī* context of the first half of the tenth century; hence, the hypothesis of him as a follower of the so-called pseudo-Empedocles is confirmed to be a “blind alley.” If the epistles were circulating in al-Andalus already before 950 CE, and their compilation must have begun some time before in the East, another consequence is that the Ikhwān influenced al-Fārābī and not vice versa, as believed so far (Hamdani 2011).

Depending on the hypothesis of an Ismā'īlī affiliation of the authors, however, it is also assumed that the encyclopedia was assembled between CE 870 and about CE 950. Their link with the Shī'a is widely recognized. The history of early Islam and politics are also approached from a Shī'ite perspective. In spite of scattered negative references to the “hidden” Imam (at different periods of its history, the Shī'a introduced the idea of an Imam in concealment who, though withdrawn by God from the eyes of men, continues to live miraculously on earth to fulfill the

essential functions of the Imamate), several Ismāʿīlī elements can be found, for example, the hierarchical structure of the universe and of “teaching,” references to septenary cycles, and the distinction between the elect and the masses. But some non-Ismāʿīlī ideas such as the invitation to celibacy proper to Sufism and the mention of feasts linked to Ṣābian rituals are also recognizable in the encyclopedia. Various scholars (such as Corbin, Marquet, and Baffioni) have related them to Ismāʿīlism, the radical branch of Shīʿism. Recently, a possible Ismāʿīlī commitment of the Ikhwān has been documented in onto-cosmology (Baffioni 2010–2011, 2011a, 2013a, c, 2014a, 2016b) and politics (Baffioni 2011b). The manuscripts examined for the new edition of the encyclopedia launched by the Institute of Ismaili Studies, London, have revealed the intervention of copyists of Ismāʿīlī persuasion (Baffioni 2016a). Some scholars (Marquet, Hamdani) bring the Ikhwān to the Fāṭimid or pre-Fāṭimid milieu, against Stern’s and Madelung’s older opinions that identified them with Qarmats (Poonawala 2015, p. 280 and 287, n 61).

Besides the attribution to Maslama al-Majrīṭī, the tradition ascribes the *Comprehensive* and *Supercomprehensive* Epistles to Aḥmad, the second of the three “veiled” Imams who came between Muḥammad b. Ismāʿīlī, the appointed successor of Jaʿfar al-Ṣādiq according to the Shīʿa, and ʿAbdallāh/ʿUbaydallāh al-Mahdī (d. 934), the founder of the Fāṭimid dynasty in 909. While one cannot deny formal and substantial relationship between the encyclopedia and the *Comprehensive* Epistle, the *Supercomprehensive* Epistle is never cited in the *Rasāʾil*, and it has been recognized by Kacimi (2015, p. 331) as the result of the Islamization of the Ikhwānian corpus.

But the questions of the identity and ideology of the Ikhwān al-Ṣafāʾ still remain unsolved. In recent times, Kacimi 2016 has come back to the relationship between the Ikhwān and the Sufi thought.

In 1150, the Sunni caliph al-Mustanjid sent the work to be burnt. Yet it survived and was translated into Persian and Turkish. Ismāʿīlīs have quoted extensively from the encyclopedia since the twelfth century, but testimonies from the

eleventh century such as that of the Persian philosopher and writer Nāṣir-i Khusraw, who copied large parts of the encyclopedia, have recently been identified as proof of much earlier diffusion of the work in Ismāʿīlī circles and hence of the Ismāʿīlī commitment of the authors.

A new hypothesis on the real author of the *Rasāʾil* has been formulated in Guillaume de Vault d’Arcy’s doctoral dissertation (discussed in 2016 at the Sorbonne University), titled *Les Épîtres des Frères en Pureté (Rasāʾil Iḥwān aṣ-ṣafā) une pensée de la totalité. Etablissement de la paternité historique et commentaire philosophique de l’ouvrage*, in 2 vols. The author tries to demonstrate that Aḥmad b. al-Ṭayyib al-Sarakhsī composed the whole encyclopedia in about 894 CE, grounding himself on the works of the Ikhwān, “héritage social du ‘cercle d’al-Kindī’.” This hypothesis should substitute, in its authors’ intention, every other previous hypothesis about the authorship and the commitment of the encyclopedia.

Rather than continuing on the line of minimizing the direct impact of the encyclopedia on the Latin Middle Ages in favor of an indirect influence, recent studies (Cordonnier 2012) have demonstrated the presence of the *Rasāʾil* in Zaragoza during the twelfth century. Manuscript research has brought new data in this field as well. MS *Parisinus Arabicus* 213 (beginning of the seventeenth century) includes passages deriving from Epistle 26 *On Man as Microcosm* and Epistle 18 *On Meteorology*.

Scholars have tried to show the actuality of the Ikhwān’s thought in the contemporary world vision, hoping that the holistic perspective of the encyclopedia is shared again, for the sake of mankind and of nature (Quintern 2011; Darraz 2012).

Thought

The encyclopedia of the Ikhwān al-Ṣafāʾ in the form we have now opens the mature stage of Muslim philosophy, the tenth and eleventh centuries. Foreign sciences are no longer a collection of subjects valuable in themselves – though modified according to the needs of the new faith, as in the

scientific writings of the “first Arabic philosopher,” Abū Ya‘qūb al-Kindī (d. 870 c.) – but an organic whole that constitutes a unitary introduction to supreme knowledge, that of God.

The treatises are based on very heterogeneous materials: Babylonian, Indian, and Iranian astrology, Indian and Persian narrative, biblical quotations and cabbalistic influences, references to the New Testament, and Christian gnosis. Most attention is paid to Greek philosophy and science. In some cases, the Ikhwān al-Ṣafā' have preserved the only Arabic fragments of Greek authors known to us, such as the story of Giges from Plato's *Republic* in Epistle 52 *On Magic*.

The ultimate goal of knowledge – the attainment of happiness that coincides with divine knowledge – is never forgotten. Purification following the abandonment of worldly pleasures cannot be attained only through esoteric religious experience but also through reason. Qur'ānic quotations often support ancient doctrines, and the encyclopedia deals with the major religious issues of Muslim faith: the unity, uniqueness, and attributes of God, the origin of the world, angels, human destiny, good and evil, theodicy, and resurrection. The Ikhwān al-Ṣafā' seem to consider prophetic messages, both esoteric and exoteric, as the second necessary means of human salvation and happiness. Hence, the science of the esoteric interpretation of the Qur'ān is emphasized as the highest divine gift.

Each Epistle states its aim; all contain a core of technical teachings and a conclusion regarding their inner meaning. Doctrines are clearly expounded, with repetitions as required by the didactic function of the treatises, which frequently urge the “beginners” to research knowledge in order to be awakened “from the sleep of matter and the negligence of ignorance” and to pray for “the assistance (*ta'yid*) of a spirit coming by God.”

The first topics addressed are arithmetic, geometry, astronomy, geography, and music. The main sources are Euclid, Nicomachus, Archimedes, Ptolemy, and the Pythagoreans. In the first section, the Ikhwān al-Ṣafā' also deal with the “universal” form of language – logic – on the basis of the contents of the first five books of the *Organon*

according to the Hellenistic asset (Porphyry's *Isagoge* and Aristotle's *Categories*, *De interpretatione*, *Prior* and *Posterior Analytics*). Their epistemological vision is sketched in a treatise devoted to the theoretical arts. In the complementary treatise on the practical arts, utilitarian activities are approached: these were held in high esteem in Ismā'īlism, which reinforces the hypothesis of the Ismā'īlī commitment of the Ikhwān al-Ṣafā'. Epistle 9 describes the ideal of the wise man, with Sufi positions emphasized: moral behavior – a “pure heart” – is the *conditio sine qua non* of perfect attainment of knowledge.

The eclectic character of the whole is even more evident in the other three sections. In the second section, Epistles 15–22 follow the Hellenistic arrangement of Aristotle's physical works from *Physics* to *Meteorology*. The treatises also reflect the influence of works on mineralogy, botany, and agriculture. Although the Aristotelian zoological *corpus* reached Islam, Epistle 22 *On Animals* places the subject in a metaphysical dispute on the superiority of man over animals. Epistle 20 *On Nature*, on the other hand, deviates from Aristotelianism by introducing a Neoplatonic conception of nature and an angelology.

The Ikhwān al-Ṣafā' never mention Plotinus explicitly, but the “conceptual” reading of creationism is Neoplatonic emanationism merged with neo-Pythagoreanism. The third section opens with two treatises representing the whole of reality from a numerological perspective, which demonstrates that the “Pure Brethren” are true Muslim Pythagoreans, to prove that the cosmos is organized according to quantitative models. The world is at the same time wholly dependent on God, Who is the principle of everything as the number one is the root of each number and not a number itself. The world is considered as emanated from God through the intermediary of the two first emanated entities, the Active Intellect and the Universal Soul. The knowledge of the whole encyclopedia leads step by step to the knowledge of God.

Another important feature of the encyclopedia is the conception of man as a microcosm and as the most perfect of the beings in the sublunar world, the link between earth and heaven.

The twofold approach to the issue of the attainment of human salvation and happiness fully legitimizes the ancient sciences, considered by orthodox theologians to be vehicles of heresy and even atheism. So the encyclopedia represents a possible solution to the problem of reconciling reason and faith, philosophy and religion.

The political vision of the Ikhwān al-Ṣafāʾ could clarify their ideological commitment. They consider the debate on the identity of the messenger's deputy as the main cause of division in the *umma* (the Muslim community) until their time. The Ikhwān al-Ṣafāʾ do not state clearly their idea as to who the deputy should be, but a political target of one of the authors might have been the ninth-century 'Abbāsīd caliph al-Ma'mūn. Hence the Ikhwān al-Ṣafāʾ could be identified with the supporters of a 'Alid conception of the imamate, according to which the family of the Prophet in the strict sense only are the guarantors of the true tradition concerning succession in the caliphate. A "perfect city" (*al-madīna al-fāḍila*) is featured by the Ikhwān al-Ṣafāʾ, less known but not less worthy than that proposed by their contemporary al-Fārābī, in which mutual love is the basis and the ultimate goal of the community. The authors often foreshadow the defeat of "evil dynasties": even though their presentation of such a city does not help us to ascertain whether they had in mind a spiritual rule or a true government such as that of the Fāṭimid caliph (Hamdani 1999, p. 81), scholars have supposed that the Ikhwān al-Ṣafāʾ foretold the fall of the 'Abbāsids (Tibawi 1955, p. 37) or were opponents of the Buyid regime (Farhan 1999, pp. 30–31). Their political vision also explains their sharp words against wars of religion.

Abstract

In the Latin West, the concept of impetus was fully developed in the fourteenth century. John Buridan was the first to use this term in order to describe the projectile motion, the free fall, and the motion of the heavenly spheres. The discussion started with Aristotelian theory of projectile motion presented in his *Physics*. Aristotle claims that each violent motion, such as projectile one and freely falling body, need a constant presence of a mover, and therefore when a mobile is no more in touch with its mover, a medium takes its role. Later, Greek and Arabic commentators of Aristotle noticed that a medium resists rather than promotes motion. Thus, they offer an alternative theory, that a mobile is moved thanks to a force impressed by the mover. This theory was developed in the Middle Ages, and finally it became a kind of an "official" technical concept of medieval mechanics. The medieval different concepts of impetus finally lead to formulate proper definitions of violent and natural motions and to replace the whole Aristotelian system. Although ontologically different, impetus is analogous to Galileo's early use of *impeto* and Newton's "quantity of motion."

From antiquity, the motion of projectile was one of the main points of criticism of Aristotelian theory of motion. On the ground of Aristotle's theory, such motion was difficult to explain, for a projectile motion, as a violent one, demanded a distinct mover which continuously has to be in contact with the thing moved. In Book Seven of the *Physics*, Aristotle (384–322 BCE) formulated two principles concerning the cause of violent motion: first, that “anything which is moved is moved by something,” and, second, that “a ‘proximate’ mover . . . is correlative to what it moves.” To explain a continuity of projectile motion, Aristotle supposed that the original force transmitted the power of motion to the air. In his Book Eight of the *Physics*, he described two theories. The first, so-called theory of *antiperistasis* (in the sixth century CE developed by Simplicius), which he probably took from Plato (*Timaeus*, 79–80), that is, of mutual replacement of the air by the projectile so that the air comes around behind to push the mobile, is rejected by Aristotle. The second theory is his own solution and states that the air is not only moved by the original mover but it also receives a power or force to act as a mover; this power is transmitted to the next air, which acts as a mover. Thus, a projectile is successively pushed in the direction, which the original motor intended. When the transmission ceases, the projectile falls down. In antiquity, Hipparchus (second century BCE) rejected Aristotelian assertion that it was the air that provided the motive force responsible for violent motion of a body. The next step was taken by John Philoponus (sixth century CE), who, on the grounds of both reason and experiment, was looking for an alternative explanation. He concluded that there must be an incorporeal motive force that is absorbed by the projectile and causes its motion until it is spent by resistance. The concept of incorporeal force explains also natural motion such as free fall of a body and the motion of the heavens. In Philoponus' opinion, gravity and levity are forces impressed by the Creator; God also impressed an incorporeal force in the spheres of the heavens moving them ever since. Philoponus, however, never fully developed the reason why it should be as he thought; it seemed to him an elementary fact.

Philoponus' commentary on the *Physics* survived only in parts and was probably translated into Latin in the sixteenth century. But his views seem to be of considerable influence among the Arabic commentators of Aristotle, who probably knew at least some of Philoponus' remarks in Book Four. They used the theory in critiques of Aristotle's account of motion. To describe the violent motion, al-Fārābī (c. 870–950) uses the term *mail qasrī* as a substitute for impressed force. The famous physician and philosopher Avicenna (980–1037) discussed the problem of motion in his *Kitāb-al-Shifā'* (*Book of the Healing of the Soul*, which is his commentary on the works of Aristotle). He rejected both ancient Greek theories and also that of Philoponus. Avicenna supported a theory of a *mail* - an inclination, which is transferred by the original projector to the projectile. This inclination, however, is not a force itself but rather an instrument of the force of the mover to communicate its action to the thing moved. The *mail* is something permanent but destructible. Avicenna distinguished a “natural *mail*” (*mail tabī'ī*), which is the cause of natural motion of falling bodies and a “violent *mail*” (*mail qasrī*), the cause of projectile motion. If there were no resistance to the *mail*, for example, in a void, it would persist infinitely like the motion it generates. Abu'l-Barakāt (d. c. 1164) modified Avicenna's theory and stated that the *mail qasrī* is self-expending, so there could be a violent motion in a void, which would come to an end without external resistance.

Although none of the aforementioned ideas appeared in translation in Latin West, thirteenth century authors considered the impetus theory and they either rejected it as contrary to Aristotle's learning or supported it as much more satisfactory solution of the problem of projectile motion. Roger Bacon (c. 1214–1292) rejected the influence of the power of the projector in projectile, since there would be no contact of the mover and the moved, which is necessary for motion. On the other hand, Richard Rufus of Cornwall (d. c. 1260) suggested that the projector makes an “impression” on the projectile proportional to the weight of the object. Thomas Aquinas presented both solutions of the problem: in his

Physics and *De caelo* he supported Aristotelian explanation, while in his *Quaestiones disputatae* he seriously considered the influence of an agent by means of an instrument.

In the fourteenth century, thinkers developed two theories of impetus explaining the projectile motions, acceleration of falling bodies, and the uniform motions of celestial bodies. The first theory suggests that impetus is a self-expending force; the second one states that it is permanent. In his commentary on the *Sentences*, Franciscus de Marchia (d. c. 1344) used the first concept of impetus as an illustration for the continued action of the sacraments. In his opinion the motion of a projectile is continued by an exhaustible “force left behind” (a *virtus derelicta*) in the projectile. The same kind of force is impressed by intelligences in the heavens, which would continue their motion for some time. Also Nicholas Oresme, (c. 1320–1382), who used the concept of impetus mostly in a context of free fall, asserted that it does not have a permanent nature and it arises from initial acceleration and then acts further to accelerate the speed. The theory of permanent impetus was elaborated by John Buridan (d. 1361) and accepted by other Parisian masters like Albert of Saxony (c. 1316–1390) and Marsilius of Inghen (c. 1340–1396). In their opinion impetus is a not self-expending quality, and it can be only diminished by resistance. In the case of projectile motion impetus is the same as the force impressed by the mover, and its quantity depends on a primary matter. If there is more matter, a greater force can be impressed. In a case of free fall, impetus is a cause of acceleration of a heavy body. In the case of motion of celestial bodies, impetus is the force impressed by God, which causes their everlasting circular motion. This concept of impetus helps to describe all types of motion: terrestrial, violent, and natural motion of heavy bodies as well as motion of celestial, nonmaterial bodies. The two Aristotelian principles of motion, however, remain untouched: a thing moved demands a constant action of the mover.

In the sixteenth century, many authors, especially the Italians, accepted an impressed force as a cause of the continuation of projectile motion. In the discussions the concept of impetus was

clarified and led Giovanni Battista Benedetti (1530–1590) to assert that a body moved by an impressed force would move on a rectilinear, not a curved line. Benedetti accepted that the increase of speed in motion is the result of a continual action of the force, although he concluded that impetus decreases continuously. Galileo Galilei (1564–1642) in his *Two New Sciences* (1638) finally approached the modern conception of momentum. He characterized impetus as an effect and measure of motion and treated as a function of weight and speed. Also René Descartes (1596–1650) defined “quantity of motion” or momentum as the product of quantity of matter and speed. The final step was taken by Isaac Newton (1642–1727), who in his *Principia* (1687) formulated the modern conception of impetus understood as kinetic energy, that is, as the energy of an inertial mass in motion and of momentum as the product of inertia mass and velocity leaving medieval theories behind.

Induction

Christophe Grellard
Philosophy, University of Paris I Panthéon-Sorbonne, Paris, France

Abstract

Induction is a form of non-demonstrative reasoning which proceeds by enumerations of singular cases in order to form a universal proposition which subsumes all of these cases. The problem of induction as a scientific method lies in the jump from the particular to the universal. The problem can be distinguished threefold. (1) What is the logical form of such an argument? (How many observations are needed? If the enumeration is not complete, how is this incompleteness supplemented?) (2) Upon what does the nomological regularity rest that is the basis of the inductive approach? (3) What type of certainty can provide a rationale for induction if it cannot claim to be necessary?

The medieval reflection on the status of induction inherits the Aristotelian definition of induction as a progression from the individual to the universal (*Topics* I, 12; *Prior Analytics*, II, 21–22; *Posterior Analytics*, II, 19). Induction is a reasoning that goes from what is most known, the most known for us, to what is more known in itself, by uncovering the properties of things. Aristotle

does not directly raise the issue of justification of induction, but he makes it possible indirectly by distinguishing a complete induction from an incomplete induction. The complete induction described in the *Prior Analytics* proceeds from an exhaustive enumeration of the particular cases and allows a reduction of induction to a syllogistic form. This will be constantly reaffirmed in the Middle Ages: to make an evident induction, it must be reduced to a syllogism. However, such a reduction is not possible when the complete count of cases exceeds our capacity, as in the enumeration of individuals in the sublunary world.

A first medieval solution to this problem, a solution greatly influenced by Neoplatonism, is found in Robert Grosseteste's commentary on the *Posterior Analytics*. The conjunction of repeated observations, and of the work of memory on these observations enables reason to form a universal proposition from the singulars to the extent that such a process is backed by a theory of divine illumination (inspired by St. Augustine)—what is known in potency, wrapped in the sensible is unveiled and known in actuality (see his *Commentary on the Posterior Analytics*, II, 6, p. 403ss). All sensible knowledge is tentative and fallible as long as it has not been guaranteed and transformed by the inner light (see *De veritate*, p. 142). Induction is therefore an important element of science insofar as it can awaken the soul.

The second solution incorporates the distinction between power and act, but freed from its Platonic baggage. Hence, Thomas Aquinas places the theory of the universal potency in individual things, at the basis of induction (see *Exposition of the Posterior Analytics*, I, lect. 62 & II, lect. 20). Induction is extended to a form of intellectual abstraction. This process of observing the universal in the particulars is a grasping of a universal content in the particulars. There is thus in the individual a set of properties that are tendencies or inclinations and that tend to produce certain effects.

Duns Scotus is critical of this type of solution that defends the apodictic dimension of the inductive generalization with its foundation in the universality of natural species and genera in that

induction only uncovers a nature common to all experienced singulars. To base induction on the presence of a common nature which inheres in the singulars largely begs the question insofar as such a nature can be known by induction on these singulars. Therefore, this solution does not solve one of the main difficulties linked to induction, namely to guarantee that the singulars that have not been experienced behave the same way as those who already have (see *Questions on the Metaphysics*, I, q. 4).

Duns Scotus considers the case of experimental knowledge and induction as part of a broader debate about the certainty of knowledge (see *Commentary on the Sentences*, I, d. 3, p. 1, q. 4). Inductive knowledge is clearly based on two parameters: (a) the frequency of an event and (b) the addition of a causal principle. The challenge of these two parameters is to ensure that if a repeated experience reveals a constant reaction on the part of the natural agents, then one can conclude with infallible certainty that the effect is specific to this agent and that it will always produce the same effect. The problem is to immediately supplement the incompleteness of observation, and thus preserve the dual conditions of science that are subjective certainty (the firmness) and evidentness (the exclusion of error). The transition from the simple frequency of something empirically confirmed to the universality and the necessity required by science depends on a causal principle, known *per se* according to Duns Scotus, and which states that the effect that follows from a non-free cause often is the natural effect of this cause. The strategy of justification of induction is based on a conception of epistemic justification whereby the principles known by the intellect itself provide the foundation and guarantee for the whole system of our knowledge, including the sensitive. Indeed, what matters in this new version of the theory of induction is that the causal principle is presented as an analytic principle known to be evident by the intellect when it grasps the nominal definitions of the concepts of cause and effect. Induction is thus based on a set of observational premises, to which it adds a necessary premise, known *per se*, namely the causal principle. Duns Scotus nevertheless insists on the necessity to repeat the observations and to

vary the circumstances in order to identify the concomitance between a nature and an accident. However, what permits the jump from the concomitance to the natural causal law is that the causal principle is a principle known *per se*. By definition, a natural cause produces a single effect and will always do so. The frequency hence allows the application of the principle of causality. The certainty of the intellect thus stems, on the one hand, from the consideration of a part of a non-free cause, and, on the other, from a consideration of a part of the effect. The concept of frequency permits the exclusion of any cases of hazardous causalities. An induction that concludes from the start of several effects passed from the repetition of these effects to the future draws its certainty from the causal principle which guarantees the uniformity of nature. Reduced to its skeleton, the approach to induction proposed by Duns Scotus is: (1) let p be the report of the observation O at time t , then “ x is with y at t ”; (2) let p_1 , p_2 , and p_n be the report of O at $t + 1$, $t + 2$, $t + n$, then “ x is with y at $t + 1$,” “ x is with y at $t + 2$,” and “ x is with y at $t + n$ ”; (3) the conjunction of p_1 , p_2 , and p_n permits of a deduction in a uniform manner of x and y at all times; (4) the application of the causal principle to “ x with y is at $t + n$ ” permits of a deduction in a necessary manner to “ x is always with y ,” therefore; (5) “it is necessary that x is always with y ” is a law of nature. Duns Scotus stresses that induction provides the lowest degree of scientific knowledge, even if it is evident and infallible. Indeed, induction rests on a necessary premise (the principle of causality) and one contingent principle (the repeated observation of similar events). Only a syllogistic reduction would necessitate induction, that is to say, the transition from knowledge *quia* to knowledge *propter quid*. Since it is impossible to demonstrate *a priori* that such a property belongs to such a subject, induction does not give us knowledge of the fact, but only its possibility.

Scotus’ position gives rise to a larger question about the concept of causality, and is object to two types of criticism. One can distinguish a critique on the level of logic, about the status of causal inferences, and another on the level of epistemology about the justification of scientific statements. This double critique is put forward by Nicholas of

Autrecourt. In fact, Nicholas ascertains the impossibility of inductive reasoning to establish the evidentness. For sensible knowledge to be evident it should be based on a complete appearance of the thing. However, since an immediate experience does not provide us with a complete appearance about the singulars, an induction seeking to grasp a universal, a whole, which is necessarily not known, is only known partially due to the limits of our senses and cannot meet the criteria of an evident perception. Nicholas of Autrecourt strengthens this dimension of probability of induction by showing that the principle of causality does not compensate for the incompleteness of the enumeration. It addresses on this occasion the question of prediction. Nicholas criticizes the idea that repetition of an event is sufficient for us to ensure its evidence in the future (see *Exigit ordo*, p. 119). If I have repeatedly observed that the administration of rhubarb can purge bile, then may I conclude that the proposition “rhubarb treats bile” is a scientifically valid principle at any time and any place? From an empirical point of view, we, first of all, have no evident perception of the causes nor, secondly, about the fact of causation. In fact, enumeration of the causes is impossible, so we do not avail ourselves of a complete appearance. It is theoretically impossible, then, to ensure that no unknown cause has not acted upon the phenomenon observed. Most importantly, we have no clear perception of a necessary connection between cause and effect, we perceive a rapport of spatiotemporal contiguity between two things, but nothing entitles us to say it will always happen in any situation. We therefore perceive no causal necessity, but only conjunctions of events that repeat themselves. From this the critique follows logically by showing that the necessity is not deductive. Indeed, for Nicholas A and B are two absolute things, different, and in no way does one signify the inclusion in the other, which is a necessary condition of the validity of an inference. We can, if we want to add a premise for this reason that “the course of nature is uniform or not suspended,” or that “the cause is not prevented.” These are premises, which guarantee induction against extraordinary situations as a divine deception and Nicholas accepts them as probable, but they do nothing to solve the problem

of induction. All we can claim to have is a *habitus conjecturativus*, a disposition to speculate on the future based upon the observation of several similar past events: the repetition of the same event produces a habit and expectations of the future. What is meant by the concept of *habitus conjecturativus*? Without a doubt we have a natural tendency to engage in inductive generalizations. The *habitus conjecturativus* then combines the result to an idea. This is the principle of induction.

juridical procedure in comparison to other forms of procedure: *accusatio* and *denuntiatio*. The entry then describes the use of the procedure in episcopal law courts that tried clerics and others charged with an ecclesiastical crime, its value in overcoming formidable rules favoring clerical defendants, and its prominence in the Fourth Lateran Council of 1215 and subsequent influence on secular courts as well. It then moves on to the history of the criminal prosecution of heresy, the emergence of the Mendicant Orders and the pastoral concerns for penance, the papal commissioning of Dominicans as inquisitors of heretical depravity (*inquisitio hereticae pravitatis*) in the 1230s.

The earliest inquisitors followed the *ordo iudiciarius*, the formal legal procedure of canon and civil law (*ius commune*) that was developed through the twelfth century, but they also added variations when special circumstances warranted them. There is a description of an inquisitorial trial for heresy and a consideration of the emergence of a technology and instructional guidebooks for inquisitors. The entry concludes with a discussion of the relatively limited use of inquisitors of heretical depravity in matters touching professionally privileged corporate groups like faculties of theology and universities and the adoption of inquisitions of heretical depravity in early modern states.

Inquisition, from the Latin substantive *inquisitio* (pl. *inquisitiones*, from *quaerere* “search,” and by extension “inquiry,” “investigation” – in a Roman legal sense, “a search for proofs”), functioned in medieval Latin in one general and several particular senses. It might mean a general inquiry commanded by someone in power in response to information, complaint, *clamor*, or appeal; e.g., Charlemagne’s charges to clerical and lay investigators, *missi dominici*, to investigate regional irregularities in his empire or to bishops charged with searching out residual pagan practices or clerical misbehavior. William the Conqueror designated the investigations of property rights that resulted in Domesday Book

Inquisition

Edward M. Peters
Department of History School of Arts and Sciences, Emeritus University of Pennsylvania, Philadelphia, PA, USA

Abstract

The entry begins with a consideration of the different general and particular meanings of the term *inquisition*, first focusing on its sense as a term of legal procedure in the late twelfth century and its later specialized meaning in the criminal prosecution of heresy. The entry continues with a brief history of the

as *inquisitiones*. Several twelfth-century popes instructed bishops to carry out an *inquisitio veritatis*, “inquiry as to the truth,” of various disputed legal matters, including doctrinal dissent, within their dioceses. Bishops had always been responsible for the spiritual life of their dioceses, charged with the responsibility for personal visitations on a regular schedule, and they were judges ordinary for serious ecclesiastical offenses and in some cases secular ones as well. Their visitations and formal inquiries were two vehicles for obtaining information and initiating further hearings, in most cases responding to *clamor*, public denunciation. Such episcopal inquiries and the later and more precise inquisition of heretical depravity were later justified by citing God’s response to the outcry against Sodom and Gomorrah in Genesis 18: 21 and the parable of the rich man who sought an accounting from his steward in Luke 16: 1–7. God’s inquest in Eden (Genesis 3: 8–13) was frequently cited by jurists and apologists in the same context.

The most widely known particular sense of the word designates a form of legal procedure of a kind followed in some instances in Roman law in which a single magistrate responding to a public complaint in certain matters handled an entire case from initial investigation to final judgment. But the practice largely ceased in the West after the sixth century, surviving only in occasional ecclesiastical circumstances, notably church councils and in matters touching the ruler’s person, obligations, and property.

One of the outcomes of Carolingian ecclesiastical vigilance in the eighth and ninth centuries (750–950) was the protected legal status of the clergy, laid out in a number of canon law collections (all of them local in origin and limited in authority), the most famous of which was the ninth-century partially forged collection of disciplinary texts known as Pseudo-Isidore. Such canonical collections, as well as the actions of church councils and episcopal visitations, created a more or less common ecclesiastical procedural culture in western Europe before the emergence of learned law, the *Ius commune*, in the twelfth century. That culture distinguished between lay persons and clergy, generally regarded the

operation of law as a form of dispute settlement that was based on several forms of action: *denunciatio/compurgatio* and *accusatio*. The former was based on Matthew 18:15 and required a *denunciatio evangelica*, a denunciation by local laymen of good reputation – synodal witnesses – that was intended to lead the person denounced to penance and what was called “charitable correction” of his spiritual fault. Its purpose was the reintegration of the accused into society. It also often entailed compurgation – the testimony by respectable witnesses to the character of the accused. The other was *accusatio*, in which a party claiming injury or damage had to accuse the person responsible before a competent local court, prosecute his own case, and, if he failed, to suffer the same penalties that the accused would have received. The *accusatio* process might also entail the judicial combat or the ordeal. Both procedures generally satisfied the relatively limited legal needs of an agro-literate, small-scale warrior/peasant society.

The beginnings of the transformation of that society in the late tenth- and eleventh-century reform movement led to a more precisely articulated community, a sharper distinction between laity and clergy, and the gradual centralizing of ecclesiastical authority in the papal office. Reformers also identified two clerical faults – sexual activity on the part of clergy and misuse of ecclesiastical property by clergy and laity – that they designated and misnamed as heresies – Nicolaitism and Simony. Their term *haeresis* was drawn from much earlier heresiological texts from the second through the eighth centuries, and their use of it also began to be applied to various movements among both clergy and laity that had begun as rejections of and demands for further reform and had turned into dissent from increasingly articulated theological doctrines. Such dissent was handled by the traditional methods of local episcopal synods or provincial or general church councils, appeals to the popes, or voluntary self-censorship. But in cases of wider diffusion of dissent traditional methods proved cumbersome and often encountered widespread opposition. Individual bishops themselves adopted varying attitudes and policies toward

such dissent, never consistently and often inefficiently, ignorantly, or indifferently. Even the most widely used and most influential collection of classical canon law, the two recensions of the *Decretum* of Gratian (1139–1140, 1140–1150) although they said much about heresy, said little of the criminal prosecution of heretics.

Although several well-attended church councils in the early twelfth century (Second Lateran, 1139; Reims, 1157, and Tours, 1163) identified and denounced several devotional movements as heresies and declared their adherents excommunicated and their property confiscated, much depended on individual regions and the energy and interests of their ecclesiastical and lay rulers. The popes' chief early response was to launch preaching missions into areas said to contain heretics and to urge secular authorities to aid in their discovery and disciplining.

The new problem of criminous clergy and lay dissent required a new form of imposing ecclesiastical discipline, since the older forms proved more and more cumbersome in effecting clerical reform. That new form was the inquisitorial procedure developed in the twelfth century and finalized in the thirteenth. The procedure was re-established initially by papal decision in canon law in episcopal courts around the turn of the thirteenth century, primarily for the trials of clerics charged with serious offenses. Its primary engineer was Pope Innocent III (1198–1216), a graduate of the new theology schools at Paris and a prelate with considerable experience of the law. In December 1199, Innocent issued the decretal *Licet Heli* which is, with several other Innocentian decretals of the period 1199–1207, considered the starting-point for the extensive adoption of *inquisitio* procedure in ecclesiastical courts. It was greatly elaborated upon by the same pope in canon 8 of the Fourth Lateran Council of 1215, *Qualiter et quando*. Initially devised as a solution to the procedural difficulties of prosecuting criminous clergy, the *inquisitio* procedure gradually spread to secular courts.

Inquisitio procedure came to predominate in ecclesiastical courts, but it also gradually reduced, but did not eliminate in secular law, the main

earlier form, that of *accusatio* with its attendant ordeals, trials by combat, and dispute settlement. *Inquisitio* procedure, on the other hand, was in the hands of a judge (a bishop or someone appointed by episcopal or papal authority or papal legatine authority) from the beginning of a case until the end. From the bishop's responsibility to determine whether or not a crime had been committed to the final verdict and sentencing of a convicted offender, the judge governed the course of the search for evidence and the trial. The notoriety of the offense (*clamosa insinuatio*) or the ill-fame of the accused (*mala fama*) was said to act in place of the accuser. In addition, the importance of witnesses, written documents, more frequent auricular confession, and the theology of penance had grown considerably in importance during the twelfth century. In addition, the accumulation of a literature of criminal procedure had grown up in the twelfth century and was consulted in the *ordo iudiciarius*, a body of procedural rules that had grown up through the twelfth century that greatly helped to standardize both canon and secular law over the course of the twelfth and thirteenth centuries. The trial of a cleric by inquisitorial procedure could now be more deliberate, better organized and unequivocally decided according to the recently formulated *ordo iudiciarius*, descriptions of proper judicial procedure from the beginning of a trial to the final disposition of a case. The *ordo iudiciarius* itself had already been insisted on in ecclesiastical proceedings by Alexander III (r. 1159–1181) and later twelfth-century canonists. Innocent III emphasized the importance of the *inquisitio* procedure and the responsibilities of episcopal visitation in the eighth canon of the Fourth Lateran Council of 1215, *Qualiter et quando*. He also supported canon 8 by two other canons: canon 18 prohibited clerics from participating in the judicial ritual of ordeal, and canon 38 required the ecclesiastical judge to retain a scribe whose written record of every trial could be accurately reviewed upon appeal. The council also required all baptized Christians to make annual confession of their sins (canon 21) to their parish priest. By reintroducing and then standardizing inquisitorial procedure in criminal cases involving

clerics, Innocent III contributed a new component to criminal legal procedure that eventually went far beyond the disciplining of erring clergy and was adopted widely by many secular courts. Innocent III's institution of the *inquisitio* procedure was intended to facilitate such prosecutions when other forms proved inadequate or, as in the case of the ordeal, became virtually prohibited. The *inquisitio* procedure was also largely adopted by secular criminal procedure by the fourteenth century. The legal reforms of Innocent III reflect both the emergence of the legal theory of papal *plenitudo potestatis* and the later doctrine that disobedience to papal authority was itself a serious crime, indeed, heresy.

A second particular term, derived from and often confused with the first, *inquisitio haereticae pravitatis*, "the inquiry into heretical depravity," and its agent, the "inquisitor of heretical depravity," came into existence by papal command during the second quarter of the thirteenth century during the pontificate of Gregory IX (1227–1241) to regulate the criminal prosecution of heresy by appointing papal judges delegate or sub-delegate using the *inquisitio* legal procedure to seek out heretics in particular regions for particular periods, thus adding a papally-commissioned official to the existing cadre of episcopal officials and sometimes to the staffs of papal legates to whom they might be attached. Such specialized judicial officials had no greater power than the bishop or legate they served, but their specific focus and, eventually, their greater experience in their specialty meant that they often took the matter of heresy out of the hands of episcopal or legatine officials.

The *inquisitio haereticae pravitatis* is most usefully considered both in terms of the history of ecclesiastical legal procedure and in those of the history of the criminal prosecution of heresy, since focusing exclusively on the latter has often led scholars to neglect its original rootedness in the former.

The extensive literature on heresy in the early church and in the criminal laws of the later Roman Empire were revived in the disputes of the eleventh- and early twelfth-century reform movement, and the term *haeresis* was applied to the

most prominent instances of clerical misconduct, Simony and Nicolaitism – respectively the lay bestowal of ecclesiastical office or property or the buying and selling of ecclesiastical office or property, and clerical marriage. The term "heresy" then began to be applied to various movements among the clergy and laity that appeared to dissent from increasingly articulated theological doctrines. In the cases of such academic thinkers as Berengar of Tours, Peter Abelard, or Gilbert of Poitiers, such dissent, which usually reached only small and learned publics and was often highly technical, was handled by local episcopal synods or provincial or general church councils, papal appeals, local ecclesiastical superiors, or voluntary self-censorship. But in the case of movements of any wider diffusion conventional methods of ecclesiastical prosecution proved cumbersome and often encountered widespread opposition. Individual bishops themselves adopted varying attitudes and policies toward such dissent, never consistently and often inefficiently or indifferently. Although several church councils in the early twelfth century (Second Lateran, 1139; Reims, 1157, and Tours, 1163) identified and denounced different devotional movements as heresies and declared their adherents excommunicated and their property confiscated, the popes' chief response was to launch preaching missions into areas thought to contain heretics and to urge secular authorities to aid in their discovery and prosecution. Even the most widely used collection of systematic canon law, the two recensions of the *Decretum* of Gratian (1139–1140 and 1140–1150) said much about heresy, but little about the criminal prosecution of heretics.

Only during the pontificate of Alexander III (1159–1181) did popes begin to urge regular episcopal visitations within ecclesiastical provinces and dioceses to inquire after heretics and employ the *ordo iudiciarius*. The Third Lateran Council of 1179 (c. 27) laid out stiff penalties for heretics and their supporters as well as urging the secular powers to prosecute them to the fullest. In 1184 Pope Lucius III (1181–1185) issued the decretal *Ad abolendam*, legally defining heretics, characterizing different groups of heretics, specifying penalties for clerics and laity convicted of heresy,

condemning negligent prelates, repeating Alexander III's call for regular episcopal visitations to places where heresy had been reported, and spelling out the necessity of lay rulers to assist in the extirpation of heresy. The widened scope of concern for heresy led in 1199 to another decretal of Innocent III, *Vergentis in senium*, which identified heresy as treason to God, and therefore a public crime. In his decretal *Cum ex officii nostri* of 1207 Innocent III precisely specified the criminal punishments for convicted heretics. The appearance of *Vergentis* in the same year as Innocent's *Licet Heli* indicates that methods of legal procedure and the criminal characterization of heresy were moving on tracks that might soon converge. The treatment of both topics in the canons of the Fourth Lateran Council of 1215 (cc. 3, 8, 18, 21, 38) drew them even closer.

The Council was held during the course of the Albigensian Crusade (1208–1229), a military enterprise in Languedoc commissioned by Innocent III, directed against Christians, and furnished with all the privileges that had been given for crusades in the east. The Crusade was followed by the triumphalist Council of Toulouse in 1229 and the Council of Bourges in 1235, whose canons ordered that in certain places one priest and three laymen were to inquire diligently concerning heretics in hiding, that secular lords do the same, that repentant heretics wear distinguishing crosses, that no layperson possess any text of scripture except for the Psalter, the Holy Office, and the Hours of the Virgin, as well as other disciplinary measures. The measures of this and later councils and popes were taken to conserve a now-articulated system of belief and behavior across Latin Christian Europe. Conciliar legislation of this kind was paralleled by the legislation of secular rulers, notably the king-emperor Frederick II, whose legislation between 1220 and 1239 was the first substantial secular legislation of its kind since the later Roman Empire. It was quickly followed by the statute of Annibaldi, the Senator of Rome, in 1231.

The pastoral and disciplinary functions of councils were significantly strengthened by the establishment of the Mendicant Orders – the Order of Preachers (founded by St. Dominic)

and the Order of Friars Minor (founded by St. Francis of Assisi) – in the years just after the Fourth Lateran Council, their approval by popes Innocent III and Honorius III (1216–1227), and their direct and loyal subjection to the popes and the curia by means of Cardinal-Protectors. The Order of Preachers in particular devoted itself to enthusiastic preaching in Languedoc, insisting that its preachers be well trained (as they were also in hearing confessions, since most of them entered the Order from university circles) and eventually organized under an elected Master who governed the order with an annual General Chapter, consisting of the priors of the provinces into which the Order was divided. The articulated organization and intellectual discipline of the Order of Preachers, as well as their humble material way of life, their effective preaching techniques, their mobility, and their lack of local ties or sympathies made them far more effective preachers against heresy than their twelfth-century monastic (usually Cistercian) predecessors. In the wake of the Fourth Lateran Council, the Albigensian Crusade, and the heightened ecclesiastical concerns about heresy in the Languedoc and elsewhere, Pope Gregory IX found yet another use for the new Orders.

In 1227 he commissioned a Dominican of Cologne, Conrad of Marburg, with two colleagues to investigate heretics in the Middle Rhine region. In 1231 he did the same with the prior and brothers of the Dominican convents in Regensburg, Friesach, and Strasbourg, and in 1233 he commissioned Robert le Bougre to act in the same role in the kingdom of France. In the same year Gregory IX wrote to the provincial priors of the Dominican Order commanding them to select appropriate brothers to be sent to Languedoc in order to assist episcopal inquisitions. He simultaneously wrote to the bishops of Bourges, Bordeaux, Narbonne, and Auch that he was sending friars preachers to assist them in discovering and extirpating heresy from their dioceses. This territorial mandate was continued by assignments of later inquisitors that centered their activities on dioceses, provinces, cities, and kingdoms. The first inquisitors of heretical depravity entered Languedoc in 1234.

Because their brief was narrow and specific and their training largely theological, the early inquisitors were constrained by the legal procedures used in episcopal courts, that is, the standard procedural rules of the *ordo iudiciarius*, often obtaining professional advice from jurists. Local bishops and papal legates also pressed secular magistrates to cooperate with the inquisitors. But the inquisitors' special mandate, the seriousness of the offences with which they dealt, and procedural problems raised by crimes of thought led to several variations on conventional procedure.

When inquisitors and their assistants entered an area, they summoned the population to an assembly at which they read aloud their official credentials, preached a sermon on the dangers of heresy and the obligation of all Christians to discover and denounce it, and announced a period of grace (a legal innovation by the inquisitors of heretical depravity), usually 2–4 weeks, during which any heretics or sympathizers might confess voluntarily and receive a light penance. Others were urged to identify those they suspected of heresy. At the same time, the inquisitors received reports of concealed heretics, searched for witnesses, and began gathering evidence against those accused. This part of the procedure later came to be called the *inquisitio generalis*. At the end of the period of grace, those accused of heresy were arrested and the charges against them read and explained. They were imprisoned, and their interrogations begun on the basis of evidence collected so far. The accused were also forced to enter a plea and to swear an oath to testify truthfully concerning themselves and others, thus risking a charge of perjury if they were found to have lied under oath. The accused were required to be present during the proceedings. If they were not present, their absence was either permitted or condemned as contumacious. All proceedings were recorded in writing – in Latin, although the local vernacular was used in the hearings. This part of the procedure was later termed the *inquisitio specialis*.

Since the use of torture had come in the *ordo iudiciarius* to be a legal instrument of the *inquisitio* procedure when other evidence proved

insufficient for conviction, torture could also be employed in certain instances in cases of heresy, although there was considerable sensitivity to the problem of torture and often criticism of its too frequent use. Torture was first permitted in trials for heresy (although not administered by clerics) by the decretal *Ad extirpanda* issued by Pope Innocent IV (1243–1254) in 1252. Inquisitors who participated in torture sessions were permitted to dispense each other in the later decretal *Ut negotium* of Pope Alexander IV (1254–1261) in 1256.

At the end of their stay in a particular place, the inquisitors pronounced sentences at a public meeting with a sermon and saw to the administration of punishments – most frequently the penitential wearing of yellow crosses, expiatory pilgrimages, fines, or some form of imprisonment (inquisitorial prisons were the earliest form of punitive imprisonment in Europe), but occasionally death for relapsed heretics, which entailed their being “relaxed” to the “secular arm,” since clerics were prohibited from shedding blood. Throughout the entire process, it is clear that the success or failure of a particular mission depended greatly on the degree of local cooperation it received, from that of the local bishop to that of the secular authorities. Local resistance often proved extremely effective when such cooperation was not forthcoming. Individual inquisitors might be insulted, assaulted, murdered, or dismissed. A spectacular instance of such resistance is the case of the Franciscan Bernard Délicieux in Languedoc between 1299 and 1306, but there were also many others. Unwary inquisitors might also be manipulated by local interests against local enemies.

At the end of a visitation, an inquisitor might be sent to another place to do the same thing, or he might be relieved of the role of inquisitor entirely, since his original commission had been specific to a time and place, dependent on the charge of a living pope, and expiring on the death of that pope. In the decretal *Turbato corde* of 1267, however, Pope Clement IV (1265–1268) created permanent inquisitor status. Clement IV had earlier, as a prominent lay jurist, compiled a treatise on procedural questions, a *consilium*, of 1235–1243,

which had a long influence on inquisitorial procedure.

In the decades following 1234, the work of the inquisitors of heretical depravity became increasingly specialized and, with considerable regional variations, standardized. In some instances – e.g., the period of grace cited above – their procedures began to diverge from those of the *ordo iudiciarius*. Juristic thought had always allowed for exceptions to the *ordo iudiciarius* in cases of particularly heinous or notorious offenses. If an inquisitor thought that witnesses were in personal danger, for example, he withheld the witnesses' names from the accused. In some instances, testimony from otherwise tainted witnesses was accepted. Because the accused were required to testify "concerning themselves and others," they were bound by oath to denounce fellow heretics. In the case of the conviction of relapsed heretics, legal counsel was routinely denied. Not only the seriousness of the offense of heresy, but also the mandate to correct it where possible drove many of these variations. The pastoral role of the inquisitors of heretical depravity was essentially one of conversion: ideally, the heretic should be identified, instructed as to his or her error, experience contrition, make confession, abjure error, and perform suitable penance – that is, return to the Church. Those who refused outright to be instructed or, having abjured, relapsed into heresy, were to be abruptly cut off from the community, lest divine wrath descend upon it.

Besides variations on conventional legal procedure, the inquisitors also developed distinctive and effective means of recording and controlling information. Records of testimony and trials were carefully preserved, recopied, and centralized, permitting later analysis and comparing names encountered in other contexts – creating, in short, a regional data-bank of information in conveniently retrievable form, including alphabetization, that could be consulted and employed in later investigations. Specialized forms of citation, sample interrogatories of witnesses and accused, forms of oath, methods of summons, and forms of reconciliation and penance soon developed. In 1248 or 1249 Pope Innocent IV (1243–1254) ordered the inquisitors of Narbonne,

Bernard de Caux, and Jean de St. Pierre, to prepare a guidebook of inquisitorial procedure and models of standard forms for the assistance of other inquisitors solicited by a pope. Their work, the *Processus inquisitionis*, was the first of many manuals of inquisitorial procedure, the most notable of which are those of Bernard Gui, the *Practica inquisitionis heretice pravitatis* of c.1323 and the immense manual of Nicolau Eymeric of 1376, the *Directorium Inquisitorum*, the first such work to be printed.

Regardless of the emergence and definition of the *inquisitio hereticae pravitatis* and the *inquisitor hereticae pravitatis* with a staff and other associates as a specialized office and professional career, there was never a central administrative or supervisory institution in Rome or anywhere else – there was no "medieval Inquisition" in the sense that institutional inquisitions appeared in Spain in 1478 and Rome in 1542. There were only inquisitors whose area of responsibility might be an entire kingdom like France or an immense metropolitan province like Mainz, in which there were two inquisitorial provinces, or a city-republic like Florence. There were inquisitors who were enormously conscientious like Bernard Gui and Eymeric, and there were inquisitors who also had distinguished careers outside of their office of *inquisitor* proper – also like Gui. Groups of inquisitors came out of a common Dominican or Franciscan educational cohort and worked within a Dominican or Franciscan ecclesiological network, although eventually even within the Mendicant Orders inquisitors of heretical depravity were often regarded as specialists and not always in accord with the other pastoral functions of the orders.

The surviving records of the early inquisitors of heretical depravity are relatively slender and local – sometimes at the time or later deliberately destroyed by inquisitors or their enemies, sometimes simply lost or thrown out. The largest single record of the early period is that of the inquisition carried out at Narbonne by Bernard de Caux and Jean de St. Pierre, later the basis for their primitive manual for inquisitors. The best known records are those conducted in the diocese of Pamiers, particularly in the village of Montailou, between

1318 and 1325 by its bishop, Jacques Fournier (later Pope Benedict XII), or the two trials of Joan of Arc in 1429–1431. Thus, a comprehensive history of medieval inquisitions of heretical depravity must always be partial and localized.

Jacques Fournier was also consulted by Pope John XXII (1316–1334) in the cases of suspect teaching by Meister Eckhardt, William of Ockham, and Peter Olivi and went on to become Pope Benedict XII (1334–1342). His role in these affairs at the papal court reveals another feature of thirteenth- and fourteenth-century ecclesiastical discipline: the emergence of self-policing, semi-autonomous institutions that were capable of dealing with dissent internally because of the specialized character of their work. Such were faculties within universities (particularly theology faculties) and universities as corporate entities. Such also were the mendicant orders. Since the later twelfth century, faculties of theology had become professionalized and corporatized. Initially, they were not the publics for which inquisitors of heretical depravity had first been constituted.

On occasion, however, disputed positions within the schools might be preached outside them. Such was the case with a group of scholar-preachers around Paris, followers of Master Amalric of Bène, who were condemned at a council in Paris in 1210 and burned at the stake in the same year. Later interventions in intra-university disputes usually took place on the authority of the bishop (as at Paris in 1277) or his chancellor, or in the cases of individual thinkers like Ockham or Olivi a special papal commission. The professional self-awareness of thirteenth- and fourteenth-century academics was often scornful of the qualifications of inquisitors to deal with highly technical and philosophical matters. Until the fifteenth century, internal university discipline, episcopal commissions, and papal authority were used more frequently in the affairs of the learned than inquisitors of heretical depravity.

By the late fifteenth century, inquisitions of heretical depravity had acquired a long history and proved able, in a new age of state control, to become the institutions that continued in many parts of Europe and the Americas until the nineteenth century.

Insolubles

Mikko Yrjönsuuri

Department of Social Sciences and Philosophy,
University of Jyväskylä, Jyväskylä, Finland

Abstract

Medieval discussions of insolubles, or the Liar's paradox and its cognates were put in a practical context. The paradigm case was thus Socrates saying "Socrates says something false." A plurality of different versions of the self-referential paradoxes were developed and discussed. Medieval authors presented many different solutions, and many of them seem to have been discussed with an implicit or even explicit recognition that the solution is not satisfactory. Thomas Bradwardine composed the best worked out medieval solution in the early 1320s, and John Buridan's solution, which develops Bradwardine's idea further had the most lasting influence into the Renaissance. In both of these solutions, the basic idea is that when Socrates says "Socrates says something false," the sentence signifies its own truth in addition to signifying its own falsehood. Thus, what Socrates says is inconsistent and can be judged to be unambiguously false, while other people around can truthfully assert their own tokens of the sentence "Socrates says something false."

Early Solutions

In the Middle Ages, the Liar paradox (e.g., "this sentence is false") and its cognates were known as the insolubles (*insolubilia*), with some authors explicitly admitting that no solution is

forthcoming. It is not known how the discussion entered Latin medieval thought, but occasional late ancient and Arabic analysis of the problems involved in self-referential paradoxes are known, although they are not at very high level of sophistication. Aristotle mentions in his *Sophistical Refutations* (180a27–180b7) a person who swears that he will break his oath, but it seems very improbable that this text would have been the historical origin of the medieval discussion of the paradox. It was, nevertheless, often mentioned in the discussions.

Insolubles were usually presented as sentences uttered in some supposed context, calling for an evaluation. The paradigmatic example was “Socrates says something false” assumed to be uttered by Socrates in a situation where he utters nothing else. Other versions were also produced, and often in ways that differ in interesting logical ways. For example, imagine a situation where A says that “What B says is false,” while B says “What A says is true.”

One early solution to the basic paradox was to claim that Socrates somehow fails to formulate a proposition carrying a truth value. In the version of the solution, given in the anonymous *Insolubilia monacensia*, it is simply claimed that despite uttering something, Socrates says nothing. The idea relies somehow on making a distinction between asserting and uttering, which are to be conceived as two elements of making a claim successfully. In the insoluble case, the two elements do not work properly together. One should thus respond “you are not saying anything.” The solution was called cancellation (*cassatio*).

According to the solution known as the theory of “*transcasus*,” the insoluble sentence fails to refer to itself, and instead refers to something else. For example, the claim “Socrates says something false” as said by Socrates turns out to refer to something he said immediately before the sentence. An associated theory makes a distinction between exercised act and signified act, thus making it possible to undo the self-referential relation. John Duns Scotus gave this solution to the paradox.

A more general kind of solution was to prohibit self-reference from language, claiming either that

no expression in a language is able to refer to itself, or more specifically that the semantic predicates “true” and “false” cannot refer to the wholes they are parts of. As an obvious objection, medieval logicians considered the above-mentioned case where A says that B speaks the truth while B says that A lies. The reference here is not self-reflexive, but circular, and it seems completely arbitrary to simply prohibit such structures. William Ockham resorts to a version of this solution in his *Summa logicae*.

The Sentence Signifying Its Own Truth

Thomas Bradwardine formulated the most ingenious and influential medieval solution of the paradox. He applied token-based semantics, claiming that what Socrates says (when he says “Socrates says something false”) is false, but an outsider uttering the same sentence would speak the truth. The controversial part of Bradwardine’s solution was his claim that when put forward by Socrates, the insoluble sentence signifies and asserts its own truth – and is false for that reason.

After Bradwardine, logicians closely scrutinized the relation of a proposition with the claim that the proposition is true. Do propositions signify their own truth? Is truth a thing such that it can be signified, as Richard Kilvington asks? Bradwardine’s claim was that the truth of the sentence is signified only in special cases like in the insolubles, and Heytesbury developed the solution with the idea that one should never specify what the rejected insoluble sentence exactly signifies. As Heytesbury admits this really amounts only to advice how to deal with the paradox in an actual disputation; it is not a genuine solution. According to Heytesbury, no genuine solution has been found nor is any forthcoming. Interestingly enough, he did not seem to think that this would amount to a major problem to any logical system.

John Buridan extended Bradwardine’s theory by claiming that all propositions assert their own truth, and offered a logically very elaborate solution to the insolubles without some of Bradwardine’s problems, although it remains

obscure how exactly the claim that all sentences assert their own truth should be understood. Given the later fame of Buridan's logic, it is natural that his high-quality solution was well-known later in the Renaissance, finding its way even to Miguel Cervantes' *Don Quijote*.

Intension and Remission of Forms

Elżbieta Jung

Department of Philosophy, University of Łódź,
Łódź, Poland

Abstract

From the time of Aristotle until the time of the Enlightenment, intension and remission of forms was mostly considered as a problem of change of a specific type of accidental forms (qualities). The problem appeared in various disciplines such as theology (the infusion of charity), philosophy of nature (changes in qualities), medicine (the problem of proportion of elements in the body and the compounding of drug effects), optics (the intensification of light), and methodology and mathematics (the representation of change). During the fourteenth century, the intension and remission of forms became one of the central issues of philosophical debate. Various theories offered by a group of Oxonian thinkers, the so-called Oxford Calculators, contributed to the development of mathematical physics. The most elaborate and influential theory of geometrical representation of the configurations of qualities and motion, however, was presented, by the French natural philosopher – Nicholas Oresme.

Like many other issues pondered over in the Middle Ages, the question of intension and remission of forms may also be traced back to Aristotle.

Although he himself did not pay much attention to the problem, he raised the question whether such a virtue as justice or such a condition as health admits of more and less. In *Categories* (8.10b26–30), Aristotle says, “qualification admits more and less; for one thing is called more pale or less pale than another, and more just than another. Moreover, it itself sustains increase (for what is pale can still become paler) – not in all cases though, but in most.” He does not specify whether one justice is justice more than another or whether one person is more just than another, that is, has more justice than another one. In other words, Aristotle does not decide whether a form (quality) increases or decreases in intensity or whether the subject, in which qualities inhere, is more or less qualified by different forms existing in it successively. On the other hand, in his *Physics* (5.2.226b) Aristotle defines alteration as a change or motion, which occurs between two extremes, that is, between two different intensities of the same quality. This particular paragraph from Aristotle’s *Physics* was a starting point for intense discussions in the fourteenth century, when such terms as “latitude” and “degree” of forms played the main role.

The topic of intension and remission of forms first appeared in Latin West thanks to commentaries on *Categories* written by Neoplatonists – Porphyry and Boethius. In the thirteenth century, a commentary by another Neoplatonist – Simplicius, was introduced to the Latin speakers (Thomas Aquinas made a broad use of the Latin translation of Simplicius’ commentary). The Neoplatonists were of the opinion that it was the subject and not the quality that admits of more or less and that qualities do not differ with respect to more or less.

An additional problem, which was raised later, concerned the possible changes of elementary forms of simple bodies: earth, water, air, and fire. While substantial forms such as the rational soul of a human being cannot admit more and less, because one human being cannot be more human than another, primary qualities of elements, that is, heat and cold and humidity and dryness can admit more and less. The adherents of this opinion were Arabic philosophers – al-Kindī

and Avicenna. While Aristotle believed that an elementary form (a quality) of a simple body is always in its maximum degree, that is, fire is the hottest and earth is the coldest, Avicenna thought that an element’s qualities can vary within a latitude, so they do not have to be in a maximum degree of a quality. Avicenna’s conception is closely linked to Galen’s medical theory. Galen, in his *Microtegni* Book II, was the first to introduce the term “latitude” to explain the states of health and illness. The latitude of health can be divided into three parts: the latitude of health, the latitude of neither health nor sickness, and the latitude of sickness. Thus, as Edith Sylla claims (Sylla 1973: 227–228), the latitude of health can be represented by a line divided into three parts, with two extremes, one of the optimal state of health and the other of a serious illness, the middle part being neutral. Avicenna used the concept of “latitude” to introduce an idea of the human *complexio*, which is not a result of a proportion of elements in a body, but the result of intensities of variable qualities of elements. Averroes was in accord with Avicenna with regard to the theory of *complexio*, but rejected the idea that elementary bodies can have varying degrees of qualities. Averroes was convinced that whenever water is heated part of it is changed into air, because opposing qualities can coexist in the same subject (admixture theory).

In the twelfth century, the predominant view was based on the Aristotelian definition of substantial forms and held that the form is a simple and invariable essence of a substance. This view was represented, for instance, by the anonymous author of the *Liber de sex principiis* and by Peter Abelard. What admits more or less are qualities, which should be described as more or less “pure,” for example, more or less white. Abelard claims that only habits and dispositions treated as accidents can admit more or less and can be compared. The essential parts of substances like, for example, human rationality or risibility, are not comparable and they cannot undergo intension or remission. The only motion which can be described as intense or remiss is the motion of alteration, since it occurs between two extremes, for example, between more and less white or

between white and black. Peter Lombard introduced the problem of intension and remission of forms into the theological context. In his *Sentences* (lib. I, dist. 17, cap. 5), he raised the question whether charity of man increases or decreases. Lombard limits himself to a short statement that the Holy Spirit, that is, charity as such (*in se*), is immutable and does not admit of more or less, but in an individual human being (*in homine*) a charity can increase or decrease. Hence intension and remission depends on varying dispositions of a subject.

The thirteenth century saw a significant growth of interest in the problem of intension and remission. For Thomas Aquinas charity is a quality or an accident, and

its being has to be in something. So that an essential increase of charity means nothing else but that it is yet more in its subject (...) Hence charity increases essentially, not by beginning anew, or ceasing to be in its subject, (...) but by beginning to be more and more in its subject... (*Summa theologiae* II-II, q. 24, art. 4).

In Thomas' opinion, intension and remission can be examined from a point of view either of a specific form or the subject in which qualities inhere. Only corporal qualities, which are divisible in their essence, like health or motion can undergo intension and remission in their forms. Those qualities increase by the addition of parts. The indivisible qualities, like color or heat can undergo intension and remission only with respect to their subject. They do not increase by addition of parts, but by "the varying participation of a subject in a given, unchanged quality" (*Summa theologiae* I-II, q. 52, art. 1, 2). Therefore, intensive increase in quality results from the disposition of a subject for a species of a quality. This theory was also held by Giles of Rome.

Henry of Ghent presents a contrary opinion. He claims that intensive increase of a qualitative form takes place in its specific form (with no reference to its subject), which is not simple but a divisible extension (latitude). The quality has different intensive parts (degrees). Since any lesser degree contains potentially all greater degrees (except a maximum degree), the actual intension of quality is caused by an extraction of a

new part from potentiality to act. Henry asserts that a quality has a potentiality for change "in virtue of its nature and essence," and not in the subject it belongs to.

The third opinion is associated with Godfrey of Fontaines. His theory is labeled as the "succession of forms theory" or recently as the "replacement theory" (Dumont 2009: 41). Godfrey believes, against Aquinas and Ghent, that all specific forms are indivisible and invariable, and as such they cannot change in degree. Consequently, they cannot admit more or less in themselves. Since individual forms are numerically distinct, they are successively replaced in the subject.

The fourth theory was an addition theory, usually connected with the name of John Duns Scotus. In the opinion of M. Clagett (Clagett 1950: 136) it was Richard Middleton who influenced Scotus' addition theory. Middleton claims that intensity or quantity of force (which he calls a virtual quantity of power) can be increased by addition in a manner similar to increase in quantity of mass (which he calls corporal quantity). Thus Middleton is convinced that the addition of one degree of a quantity of force to a preexisting one produces something greater in force. Scotus holds that any degree of a quality contains, as its homogeneous parts, lower degrees. Therefore, a change in degree can be explained by addition or subtraction of homogeneous parts of a quality. For example, if something gets hotter without gaining any additional extended parts, then the increase in heat is caused by addition of degrees of heat. The unquestionable value of Scotus' theory is its quantitative account of qualities, since some sort of numerical value can be assigned to qualitative intensities.

In the fourteenth century there were three dominant theories explaining the problem: admixture, succession, and addition ones. The last of them had many adherents, such as William of Ockham, Joannes de Bassolis, Henry of Harclay, Peter Auriol, John Baconthorpe, Thomas Wylton, and Gregory of Rimini.

The main admirer of the succession theory was Walter Burley. According to Burley, there are two types of forms: indivisible (e.g., the maximum degree of hot, 3 ft in length), and divisible ones,

which have latitude of degrees (e.g., heat and cold, whiteness and blackness). The former are destroyed by any change of degree, while the latter remain in the same species even if their degrees change. Burley's succession theory is founded on an analogy between motion of alteration and local motion. In local motion – says Burley – the moved body occupies a different place in any instant of time; in motion of alteration, a totally new and indivisible degree of form is induced in each moment and the whole preceding form is destroyed. Thus the whole process of intension or remission can be described as replacement of successive forms. In such a process, a whole series of new, distinct forms is involved. Since any change of degree causes a change in an individual existing quality, latitude of degrees is relevant only to species of forms and not to an individual form. “The latitude itself” – as Sylla points out (Sylla 1973: 234) – “while it describes the range within which the degrees of the species may fall, has no separate existence aside from the individuals of the species.”

The succession theory has much in common with the addition theory; both, like Aquinas' theory, accept the notion that it is not an individual quality that increases or decreases intensively, but a subject in which qualities inhere is qualified more or less thanks to the latitude of a specific qualitative form. Both theories also take a Scotist view that a change of the degree of a quality leads to a change of an individual quality. The addition theory has also something in common with the admixture theory, namely, they both accept the notion that qualitative forms are intensively divisible.

In the fourteenth century, the admixture theory was held by Michael of Massa, Walter Charlton, John Buridan, and Roger Swineshead, one of the Oxford Calculators, among others. Swineshead maintains that two contrary qualities of the same pair, like coldness and heat, can exist simultaneously with various intensity in the same subject. The sum of degrees of intensity of both qualities, however, must be constant. Thus in the qualitative change such as heating, when heat increases, coldness simultaneously decreases in the same degree. A qualitative change is then a process of “freeing

from admixture” of the opposite quality. While explaining his theory, Roger makes a broad use of the concept of abstract latitudes for measuring alteration and local motion. He talks about latitude of quality and latitudes of motion of alteration of different types which, in modern terms, correspond to latitude of acceleration and deceleration.

Most of the Oxford Calculators, such as Thomas Bradwardine, William Heytesbury, John Dumbleton, and Richard Swineshead were enthusiasts of the addition theory. John Dumbleton and Richard Swineshead broadly discussed issues of possible “measurement” of such a quality as speed in different types of motion by using a conception of latitudes and degrees significantly different from those employed by earlier Oxford Calculators. In the addition theory, qualities may be treated quantitatively, so the fundamental question was how to measure the alteration in the intensity of qualitative forms or the alteration of speed in local motion. Dumbleton and Swineshead believe that latitude and degree are identical and that they are both divisible. In their opinion, any degree of a quality contains all the more remiss degrees. For both philosophers, a latitude is a homogenous continuum, which can be presented as a line, on which the only differences are differences in length. This theory provides – as Sylla points out – “a better physical basis for quantification of qualities because the latitude corresponds to the intensity or degree of a quality at a point of the body or in an instant of time and not only to some variation of the quality over its extension or over time. (...) The latitude of velocity is imagined as a line (...). Equal parts of the latitude of velocity correspond to equal differences of velocity” (Sylla 1973: 263).

The theory of latitude of forms was fully developed by Nicholas Oresme, for whom latitudes are an intensive measure of particular qualities. Oresme's configuration theory allows him to build a representation of different types of qualitative changes by geometrical figures. He distinguishes between the *longitudo* which represents time, and *latitudo* which represents speed of motion. When units measuring the *longitudo* and *latitudo* vary, they form figures of different shapes. He shows that geometrical properties of such

figures correspond to a property of the form itself when the property remains constant, while the units measuring the *longitudo* and *latitudo* vary.

Although Oresme's achievement in quantification of qualitative changes is undeniable, it is not the result of his acceptance of the addition theory. Oresme develops his own theory of intension and remission of forms, which Kirschner calls the "succession-of-*conditiones*-theory" (Kirschner 2000: 274). According to this theory, in every moment of intension or remission there is a new *tale esse*, that is, a new condition or mode of a substance, which is called a quality. The quantity of the substance is its *tantum esse*, that is, a mode of being so and so large. In the process of intension or remission, a substance has a new *tale esse* in every moment, but not a new accidental form, as Burley held. Oresme claims that since a substance has a different mode in every moment, it cannot be properly said that the quality is intensified. Such an expression is used only for the sake of brevity of speech.

Recent research shows that contrary to the claims of many earlier historians of science, many different theories, besides the addition theory, led to the development of a system for measuring and quantifying qualities and motions of alteration and local motion in the fourteenth century. There is no doubt that Oxford Calculators' and Oresme's theories of quantitative approach to qualities, such as the Mean Speed Theorem, gave an impulse for the proper theories of motion, which were the significant accomplishments of seventeenth-century natural philosophers, such as Descartes or Galileo. The Mean Speed Theorem states that a uniformly accelerated motion corresponds to its mean degree of speed, which means that a given latitude of motion uniformly gained in a given time always makes a mobile traverse a space equal to that which would be traversed if the body moved with the middle degree of the latitude for the whole time. The first, arithmetical, proof of this theorem was presented by William Heytesbury. The most original geometrical proof and elaborated application of the mean-degree measure of speed in motion was formulated by Oresme. The theorem was later used by Galileo in his proof of the theory of

accelerate motion. The problem of intension and remission of forms was extensively debated in the fifteenth and sixteenth centuries in many fields of scientific inquiry. Funkenstein sees also an influence of *latitudo formarum* notion on Leibniz and Kant (Funkenstein 1986: 352).

Intention, Primary and Secondary

Fabrizio Amerini

Department of Philosophy, University of Parma,
Parma, Italy

Abstract

The term “intention” was introduced into the philosophical vocabulary, with the meaning we nowadays attribute to it, during the twelfth century as the term used to translate each of two Arabic words. In most cases, medieval philosophers use “intention” as synonymous with “concept,” so that the answer that a philosopher gives to the question of an intention's ontological status follows from his resolution of the nature of a concept. Some philosophers take intentions as distinct from the acts of cognition that originate them, while some others prefer to equate intentions to those

acts. The distinction between first and second intentions traces back to Avicenna, who speaks of logic as a science dealing with second intentions as applied to first intentions. Roughly speaking, first intentions are concepts of extra-mental things (for example, man), while second intentions are concepts of concepts (for example, species). During the thirteenth century, such a distinction is paired up with the grammatical distinction between names of first and second imposition (such as “man” and “name,” respectively), which has its roots in Priscian, while later on the distinction between first and second intentions overlaps with that between abstract and concrete intentions. By “concrete intentions” most medieval philosophers refer to things qua cognized, while by “abstract intentions” they either refer to the mind's cognitive acts of cognizing things or to the cognitive relation things bear to the mind. Thus, at the beginning of fourteenth century the picture is more complicated and raises different questions according to whether first or second intentions are discussed. High medieval philosophers focus on these different kinds of intentions and deal with two major issues: first, the foundation of first and second intentions and second, the order of causality and predication holding between first and second intentions.

The concrete term “intention” (intentio) makes its appearance in the western philosophy, with the philosophical meaning we nowadays attribute to it, during the twelfth century, as translating each of two Arabic words (ma‘na, ma‘qul). The abstract term “intentionality,” instead, is employed only at the end of thirteenth century. At the beginning of fourteenth century, we encounter the first treatises expressly devoted to intentions (Treatises on First and Second Intentions), such as those of the Dominican Theologian Hervaeus Natalis (c. 1315) and the Franciscan Theologian Gerard Odonis (c. 1320).

Most medieval philosophers use the term “intention” simply as synonymous with the term “concept,” while they use “intentionality”

to indicate the symmetrical or asymmetrical relationship that the mind, immediately or through an intention, bears to the external world. Generally speaking, an intention is seen as the conceptual content that can be associated with a thing. Two intentions can be derived from two things or even from one and the same thing, just like from Socrates we can extract the specific intention of “man” and the generic intention of “animal.” In this latter case, many philosophers, following in particular a suggestion of Henry of Ghent, speak of intentions as items that are intentionally distinct from each other.

Every intention exhibits a special mode of being called intentional being (*esse intentionale*) and such being indicates the mode of existence in the mind of an intention. Expressions synonymous with “intentional being” are “incorporeal, immaterial, apparent, objective, or spiritual being.” The relationship that the mind bears to an external thing is seen as that in virtue of which that thing may be characterized as an intention and therefore be endowed with intentional being in the mind. This means that intentional being expresses an accidental mode of being of the thing, since a thing, such as a man, becomes an intention only when it relates to the mind, and to be related to the mind obviously is accidental to a man’s essence. Primarily, by “intentional being” some medieval philosophers therefore want to indicate the mode of being of a thing, which exists as a concept in the mind. But, secondarily, “intentional being” is also used to indicate a mode of being, which is of intentional kind. In this sense, a thing’s intentional being is the being of a thing that is able to refer to something else (i.e., “being intentional”). According to this second meaning, not only mental items such as concepts, but also extramental items such as pictures, images, natural signs, and any other thing that can refer to something else can be said to have intentional being. Confining our attention to mental cases alone, though, the identification between intentions and concepts entails that the answer that a philosopher gives to the ontological status of intentions follows from his response to the ontological status of concepts.

Until now we have spoken of things that become intentions, but not all medieval philosophers agree on that a concept is a thing qua cognized, that is, a thing qua related to the mind. Since medieval philosophers elaborated fundamentally three ways of accounting for a concept, that is, (i) as something identical to the act of cognition, (ii) as something different from the act of cognition and existing ‘subjectively’ in the mind, and (iii) as something different from the act of cognition but existing ‘objectively’ in the mind – it follows that we would encounter fundamentally three ways of accounting for an intention. Thus, some medieval philosophers prefer to describe an intention as the act of cognizing rather than as a cognized thing or as a concept representing a thing.

After Aquinas, intentions are usually divided into first and second intentions. This distinction can be traced back to Avicenna, who speaks of logic as a science dealing with second intentions as applied to first intentions. Roughly speaking, a first intention is the concept of an extramental thing, event, or state of affairs, while a second intention is the concept of a concept. The concept of “man” is a typical example of a first intention, while the concept of “species” an example of a second intention. This distinction is usually associated with the grammatical distinction of names into names of first and second imposition, which harkens back to Priscian. A name of first imposition is a name that designates an extralinguistic item, while a name of second imposition is a name that designates another linguistic item. The term “man,” for instance, is a name of first imposition, while the term “name” is a name of second imposition. These distinctions, between first and second intentions, on the one hand, and between names of first and second impositions, on the other, do not perfectly overlap, and when medieval philosophers approach directly the problem of the epistemic value of intentions, they tend to abandon the grammatical distinction. The first/second intention distinction does not occur explicitly before Aquinas nor even in Aquinas, who simply speaks of things cognized in the first instance (*prima intellecta*) and things cognized

in the second instance (*secunda intellecta*). Things primarily cognized are extramental things, such as a man, while things secondarily cognized are mental things, such as the concept of “man.” When the mind reflects on its cognition and the elements involved in it, the mind discovers some intentional properties such as being universal, being a species, and so on – which result from the acts by means of which the mind compares a cognized thing to other cognized things or to the things outside the mind – and then the mind attaches such intentional properties to the firstly cognized things. Intentional properties are therefore accidental to the essence of cognized things (Questions on God’s Potency, 7.9; *De ente et essentia*, 3). Later philosophers inherit Aquinas’ explanation, although it is variously modified according to whether a philosopher is more inclined to refer the first/second intention distinction (A) to things firstly and secondly cognized or (B) to acts of cognition, and, in this latter case, (B1) to acts of cognition of the same kind or (B2) to different kinds of acts of cognition. John Duns Scotus, Hervaeus Natalis, and Peter Auriol, for instance, endorse (A), while Durand of St. Pourçain and William Ockham opt for (B2) by interpreting the first/second intention distinction in terms of the distinction between a direct and a reflexive act of cognition (*actus rectus/reflexus*). Simon of Faversham and Radulphus Brito, who flourished at the end of thirteenth century, finally opt for (B1) by relating such a distinction to that between an absolute and a relative direct act of cognition (*actus absolutus/respectivus*). In the later Middle Ages one may encounter many sophisticated variants of this schema (particularly significant is that of John Buridan), but all of them follow the basic choice that a philosopher makes concerning the ontological status of an intention. Two points nonetheless stay unchanged across time. First, philosophers agree that first intentions have a mind-independent foundation to a certain degree, while second intentions (regardless of how they are explained) have a mind-dependent foundation. Second, they also agree that second intentions can be predicated of first intentions (for instance,

when stating “man is a species”) and such a predication gives rise, for most philosophers, to a denominative proposition.

Toward the end of thirteenth century the distinction between first and second intentions is combined with another distinction, that is, that between concrete (or material) and abstract (or formal) intentions. Their intersection generates four classes of intentions:

1. Concrete first intentions
2. Abstract first intentions
3. Concrete second intentions
4. Abstract second intentions

Not all philosophers think of such a classification as possible or needed. Some of them argue that no abstract intention must be introduced. Philosophers who allow for such a classification explain it in different ways. Hervaeus Natalis, for example, in his extensive treatise on second intentions records that the dominant philosophical position at the beginning of fourteenth century identifies every concrete intention with the thing cognized, abstract first intentions with the acts of absolute cognition of a thing and abstract second intentions with the acts of relative or comparative cognition of things. Hervaeus, however, prefers a different explanation. According to him, a concrete first intention is the thing primarily cognized, for example an external individual man. An abstract first intention is the symmetrical relation of intentionality that an individual man bears to the mind and the mind to that man. In virtue of such a relation, an external man can be called a first intention. Such a relation coincides with a mind’s specific mode of cognizing and a man’s specific mode of being cognized, namely, that expressed by the term “universality.” A concrete second intention is the same thing as secondarily cognized, for example, the cognized man. An abstract second intention is in turn the symmetrical relation of intentionality that the cognized man bears to the mind and the mind to the cognized man. In virtue of such a relation, a cognized man can be called a second intention. Such a relation again coincides with a mind’s specific mode of

cognizing and a cognized man's specific mode of being further cognized, namely, that expressed by the term "species." This machinery can be extended on indefinitely. In short, for Hervaeus, both an abstract first and second intention designates a mind–world bidirectional relation which is formally expressed by the general term "intentionality." Concrete first and second intentions instead designate things qua primarily or secondarily cognized; or, with respect to the cognizing mind, degrees of increasingly abstract conceivability of an external thing.

Such machinery raised considerable criticism. Peter Auriol and Gerard Odonis, among others, cast many doubts about the need for postulating a world-to-mind direction of intentionality in order to account for the thing's property of being an intention. Moreover, they disputed the possibility of distinguishing the property of being an intention or of being universal from the cognized thing itself. Discussions about first and second intentions do not end with Auriol's and Odonis' criticism of Hervaeus' explanation of intentionality, but continue throughout all the later Middle Ages, becoming more and more elaborate. Scotus, Hervaeus, Ockham, and Auriol are the main sources for understanding the fifteenth- and seventeenth-century treatments of first and second intentions.

Intentionality

Fabrizio Amerini

Department of Philosophy, University of Parma, Parma, Italy

Department of Humanities, Social Sciences and Cultural Industries, University of Parma, Parma, Italy

Abstract

Only during the thirteenth century, were the word “intentionality” and its cognates employed with the philosophical meaning that we nowadays attribute to them. At the beginning of the fourteenth century, moreover, we encounter the first treatises expressly devoted to intentionality. As the Latin etymology of the word indicates (in-tendere), by “intentionality” medieval philosophers mean to express the idea of a directedness or tendency of our mind toward a target. During the Middle Ages, the term was used to characterize the directness of both the mind and the will, although, across time, the term has taken on different meanings and its use has been restricted to the epistemic side alone. In the Middle Ages, intentionality is strictly connected to the explanation of the process of intellectual cognition and concept formation. Since medieval philosophers distinguish between first and second intentions (roughly, concepts of things and concepts of concepts), two major topics have been associated with intentionality: first, the explanation of the nature, the formation, and the foundation of natural-kind concepts, from which the question of the existence of intentional or intramental objects stems, and, second, the predication of intentional or second-order properties with respect to first-order concepts. Generally speaking, the different medieval treatments of intentionality depend on whether a philosopher is more inclined to regard the mind’s intentionality as a special kind of action or rather as a kind of relation from which issue different

accounts of the mode of intentional inexistence. In the late Middle Ages, the theory of intentionality is seen as the clue to solve the question of universals.

In an often-quoted text of his *Psychology from an Empirical Standpoint*, Franz Brentano summarizes the features that are traditionally associated with intentionality as follows:

every mental phenomenon is characterized by what the Scholastics of the Middle Ages called the intentional (or mental) inexistence of an object, and what we might call, though not wholly unambiguously, reference to a content, direction toward an object (which is not to be understood here as meaning a thing), or immanent objectivity. Every mental phenomenon includes something as object within itself, although they do not do so in the same way. . . . This intentional inexistence is characteristic exclusively of mental phenomena. No physical phenomenon exhibits anything like it. We can, therefore, define mental phenomena by saying that they are those phenomena which contain an object intentionally within themselves. (Brentano 1973: 88–89)

Brentano's words correctly pick out some major features of medieval accounts of intentionality. On the one hand, although most medieval philosophers endorse the Aristotelian way of explaining knowledge as a process of "passive reception" of an external thing's form, they consider nonetheless intentionality as the distinctive mark of the mental. In fact, as the Latin etymology of the word shows (in-tendere, or intus-tendere, according to the etymology proposed by Henry of Ghent in his *Quodlibet* 5.6), they use the terms "intention" (intentio) and "intentionality" (intentionalitas) to characterize a particular "activity" of both the mind and the will; since cognitive and volitional operations are usually regarded as the only two operations properly pertaining to the human soul, intentionality turns to be seen as a fundamental and primitively active capacity of our soul. On the other hand, the term across time took on different meanings and, as Brentano opportunely pointed out, was employed to refer to at least three items: (1) first, to the mind's or will's act of attending or pointing toward a thing, (2) to the thing toward which the mind or the will is actually turned, and (3) to the mode of being (i.e., intentional, spiritual,

or objective being) that the thing acquires when it actually relates to the mind or the will actually pointing to it; such a mode of being coincides with the thing's acquired capacity to represent or to refer to something else. Leaving aside the use of the word "intention" in ethical or pragmatic contexts, medieval discussions of intentionality mainly focus on these three aspects with respect to knowledge. Nonconceptual mental states usually are not taken into account (for the reasons illustrated in King 2007). Nor can one find some extensive discussion of intentionality as applied to conventional language, natural signs, physical information devices, or nonhuman contexts, in which contemporary philosophers instead show to have a particular theoretical interest. Since medieval discussions of intentionality focus especially on the explanation of the nature of intellectual cognition, the preferred way of approaching intentionality is metaphysical and epistemic rather than logic or linguistic, for intentionality investigations are made by way of an accurate analysis of the elements involved in the phenomenon of knowledge. This can be regarded as a fundamental difference from contemporary discussions of intentionality in analytic philosophy, where instead there is a certain tendency to approach intentionality in terms of philosophy of language. In general, medieval discussions are more sympathetic with discussions as developed in the phenomenological tradition. Nonetheless, in the Middle Ages as well, discussions of intentionality can emerge from logical or linguistic contexts, especially from those dealing with the practice of sophisms.

The story of intentionality in Latin medieval philosophy begins with Augustine. In Book XI and XV of *On the Trinity*, an often-quoted text, Augustine qualifies the meaning of "intention" by connecting the ordinary notion of intention to the analysis of knowledge. On the one hand, Augustine equates intentions to the inner words that are uttered by the mind at the end of the process of cognition; such inner words are said not to belong to any historical language but to be natural and common to all men. On the other hand, Augustine takes "intention" as indicating the active capacity of every faculty of the soul to direct itself toward a

thing. Augustine compares such a capacity to the role played by the Holy Spirit in mediating between the Father and the Son, while the inner word is compared to the Divine Word. Three points of Augustine's account have influenced medieval discussions. First, medieval philosophers maintain the tendency to describe the process of human cognition as mirroring the divine process of cognition or emanation, and this parallelism plays a decisive role when they explain the ontological status of the mental word and the structure of human thought. Second, Augustine connects intentions to concepts and such a connection is pivotal for the accounts of intentionality that follow. In order to understand what an intention is and how it works, it is necessary to understand what a concept is and how it works. Third, Augustine requires that both perception and cognition be a certain type of activity, and such an activity appears to be the hallmark of any cognitive state of the human soul: when we see or cognize, for instance, we always see or cognize something, and when we think, we always think about something.

The identification between intention and conception enables medieval philosophers to attempt a reconciliation of Augustine's views with some other sources. Three sources in particular are worth mentioning here. The first source is given by the starting lines of Aristotle's *On Interpretation*, transmitted to medieval philosophers by Boethius' translation and commentaries. Aristotle states that written and uttered words are a symbol (in Boethius' translation, a note) of soul's affections and these latter are said to be likeness of external things and common to all men. According to the standard interpretation of this text, while mental items (affections, i.e., concepts) are endowed naturally with an intentional value and hence turn out to be able to refer directly and immediately (or primarily) to external things, written and uttered words are endowed with an intentional value only in consequence of the relation they bear to their mental supports; therefore, they can refer to external things only in an indirect and mediate (or secondary) way. The second source is Aristotle's *On the Soul*, which began to circulate in the Latin West in the second half of the

twelfth century. Of particular significance for the topic of intentionality, is the treatment of the machinery of abstraction that Aristotle gives in the third book. Medieval philosophers usually condense this source by citing Aristotle's dictum that it is not the stone but the species of stone that is present to the mind. Such a dictum seems to relate the explanation of the nature of intentionality to representationalism in epistemology. Finally, the third source is the account of essence that Avicenna elaborated in the metaphysical section of his *Book of Healing*. According to Avicenna, the essence of any object of ordinary experience is "indifferent" to the property of being singular and being universal. Such an essence becomes singular once it is realized outside the mind, while it becomes universal once it is realized in the mind. What is relevant for the topic of intentionality is the idea that it is one and the same essence that passes from outside to inside the mind through the process of abstraction. Avicenna's account of essence seems to make the nature of intentionality more compatible with direct realism in epistemology.

Besides Aristotle and Augustine, Avicenna plays a decisive role in shaping the medievals' understanding of intentionality. Avicenna takes two fundamental steps. First, he more strongly relates the term "intention" to the conceptual content that can be associated with a thing and characterizes as intentionally distinct those intentions that express two conceptual contents that can be associated with one and the same thing. Second, Avicenna introduces the crucial distinction between first and second intentions. Roughly speaking, first intentions are concepts of external things, while second intentions are concepts of concepts. The concept of "man" is a typical example of first intention, the concept of "species," an example of second intention. From such a distinction, medieval discussions of intentionality follow different paths according to whether philosophers deal with first or second intentions. In the first case, to account for intentionality amounts to accounting for the formation, the foundation, and the function of natural-kind concepts. In the second case, two other points of speculation are introduced, namely, that of the foundation of

second-order concepts and that of the explanation of the mechanisms of intentional predication, which occurs when second intentions are predicated of first intentions. Viewed in a different light, such a distinction leads Avicenna to change the standard way of looking at logic. Avicenna defines logic as the science dealing with second intentions as applied to first intentions. In this way, he stresses the conceptual and properly mental-focused nature of logic. On Avicenna's doctrine, the object of logic is no longer the syllogism but the being of reason (*ens rationis*), that is, the class of the concepts of concepts, such as "species" or "universal," and of second-order or intentional predications, such as "man is a species" or "man is universal."

Given such presuppositions, it turns out to be particularly difficult to isolate in the Middle Ages, before the appearance of specialized treatises, a distinct area of discussion expressly reserved to intentionality. On the one hand, intuitions and considerations about intentionality mainly emerge from the analysis of the mechanisms of cognition, as we said. Thus, commentaries on the soul are the privileged sources. But on the other hand, in other, disparate contexts one can find interesting developments of the notion of (mental) existence: for example, in those discussions concerning the Anselmian "ontological" argument for proving the existence of God (on which see King 1984); in the logical and sophistical discussions of non-existent objects (like the chimera), negative properties, and states of affairs; and in the theological discussions about God's omnipotence or in those concerning the meaning of "person" or the metaphysical status of the light. The treatises on first and second intentions of the fourteenth century try to bring together such scattered considerations, by giving a unified and all-inclusive explanation of the phenomenon of intentionality. In many respects, medieval discussions of intentionality are indistinguishable from discussions concerning knowledge. But the distinction between first and second intentions permits the identification of the hallmark of the medieval discussions of intentionality. It relies upon second intentions and consists in a double understanding: first, that of the mechanisms by way of which our mind arrives at

attaching to an external thing some philosophically significant intentional properties (such as being an intention, being universal, being a species, and the like) and second, that of the mechanisms of intentional predication. At the end of the day, the main question raised by medieval discussions of intentionality seems to be as follows: how can the mechanisms of predication that Aristotle describes in the *Categories* be applied to the sphere of the mental in order to account for both intentional properties and mental predication?

Medieval philosophers' answers to this question can be distributed into two general groups according to whether a philosopher is more willing to think that the operation of cognition belongs to the category of Action or to the category of Relation. Take for instance the concrete case of the cognition of a table.

(A) If one classifies the cognition of an external table among actions, she can regard the intention of table as the same as the act of cognizing that table or as different from such an act and posterior to it. (A1) In the first case, the intention of table is reduced to the act of cognizing that table and cognition is seen as a special case of immanent or intransitive action, since it completely achieves itself in cognizing that table without producing anything else. (A2) In the second case, instead, cognition can be seen as a sort of transitive action, consequently the intention of table is open to be treated in a twofold way: either (A2.1) as something produced by the act of cognizing and existing "subjectively" in the mind, that is, according to a psychological mode of being, such as that of a trace or a modification (which usually is classified into the category of Quality) left on the mind by the act of cognizing, or (A2.2) as an item existing "objectively" in the mind, that is, according to a special kind of intramental existence or mental inexistence (this item is normally called "object," *obiectum*, and is understood as the mental correlate or the immanent content of a concept, *conceptus*). In this final case, she can further regard the table provided with an objective existence either (A2.2.1) as a mental replacement of the external table or (A2.2.2) as the external table itself endowed with a new mode of existence.

By contrast, if one opts for counting the cognition of a table among relations, she has two possibilities: either (B1) she can describe cognition as an asymmetrical relation, only involving what contemporary philosophers of mind call a mind-to-world direction of fit, or (B2) she can describe it as a symmetrical relation, involving both mind-to-world and world-to-mind directions of fit. In the first case, she does not depart too much from those who advocate the action theory. But the second case seems to fit much better with the standard medieval theory of relations, since according to such a theory every relation must be explained as the conjunction of a relation and its converse relation. Thus, if we cognitively relate to a table, there must be a relation that goes from us to the table and a converse relation that goes from the table to us. In virtue of the first relation, we can be said to be cognizing that table, while in virtue of the second relation, the table can be said to be cognized by us. With respect to this twofold direction, supporters of B2 hold that the mind-to-world direction of fit is a real relation, while the world-to-mind direction of fit is a relation of reason (which sounds as very close to what Brentano called a “quasi-relation”). On this proposal, a table can be said to be an intention or to be intended in virtue of the relation of intentionality (or being passively cognized) that it bears to our mind, while our mind can be said to be intending that table in virtue of the relation of cognition (or being actively cognizing) that it bears to the table.

These different proposals entail different degrees of metaphysical involvement. Who adopts B2 or A2.2 usually is more tolerant with internalism and hence more disposed to postulating the existence of a third type of objects, such as the universal table or the table qua cognized (called *res intellecta* or *res ut intellecta*). A supporter of B2 thinks that it is necessary to do so in order to preserve both the generality and the continuity of cognition across time. Nonetheless she is careful in avoiding any ontological commitment of a Platonic kind, for she denies that the table qua cognized is something essentially universal and hence essentially different from the external singular table (which is labeled as *res*

extra or *res ut existens*). The table in the mind is exactly the same nature of table exhibited by the extramental singular table; but now the table is in such a condition (i.e., abstracted from singularity and depurated of matter) as the mind can attach to it the properties of being universal, being an intention, being a species, and the like, all of which remain therefore accidental to a table’s essence. This postulation permits accounting for universal predication in a proper way and reconciling strong epistemological realism with a certain metaphysical parsimony. The domain of what can be thought is normally more extended than the domain of what can exist; nonetheless whatever can be thought can be said to be real insofar as it meets two conditions: (1) first, it is able to end an act of cognizing or thinking, and (2) second, it can be considered as distinct from the psychological act of its cognition or thought, since the act goes out of existence once it is over, while the cognized or thought thing gets maintained. Accordingly, not only extramental real objects but also negations and fictions can be said to be epistemologically real.

The advocates of B1 or A1-A2.1, by contrast, consider such an explanation metaphysically too heavy and incapable of avoiding any duplication of the objects of thought, especially when acts of cognizing bear on singular extramental things. At the same time, they think that it is possible to preserve equally well all the conditions required for universal cognition and predication by referring to items only existing subjectively in the mind, items such as acts of cognition, the mind’s qualitative modifications, and habits tasked with storing knowledge. In general, supporters of this line are more willing to endorse an externalist account of intentionality.

In the Middle Ages, the majority of philosophers seem to be oriented toward externalist explanations of intentionality. Thomas Aquinas, for instance, although he does not pay much attention to intentionality, in an often-quoted passage of his *Questions on Potency* (7.9) connects acts of first and second intention to direct and reflexive acts of cognition. By an act of cognition of first intention, the mind gets acquainted with the external world, while by an act of cognition of second

intention, the mind reflects on its own cognition. Aquinas' position is nuanced, for he does not go into any detail concerning the machinery of intentionality. This is the reason why scholars still disagree on Aquinas' final word, if any, on the nature of intentionality (see Brower-Toland 2008). In any case, the connection established by Aquinas between kinds of intentions and kinds of acts of knowledge becomes standard in the generation after Aquinas, and it is stressed in different ways. Peter of Auvergne, Simon of Faversham, and Radulphus Brito, for example, clearly endorse the explanation of intentionality as a mind-to-world direction of fit, although the philosophers of the generation after Aquinas tend to complicate the picture insofar as they cross the first/second intention distinction with the concrete/abstract intention distinction. (For details on this, see the entry *Intention, Primary and Secondary* in this volume). During the fourteenth century, some thinkers such as Durand of Saint-Pourçain, Walter Chatton, and William Ockham once more stress the reduction of intentionality to the mind's active attending toward an extramental thing while rejecting the idea that there can exist in the mind things endowed with objective or intentional existence. Ockham, in a special way, puts particular emphasis on accounting for intentions as natural signs of the mind, that is, as natural acts that the mind, causally stimulated by the external singular thing with which it is faced, spontaneously emits in order to variously refer back to that thing, and explicitly calls intentions to serve the function of atomic or molecular components of mental language. But some other thinkers, following the general systematization given to this matter by Henry of Ghent and John Duns Scotus, and expanding on a suggestion of Aquinas (*Summa theologiae*, 1.85.2.ad 2), opt for a more internalist interpretation of intentionality. The most significant example of this attitude is given by Hervaeus Natalis. Hervaeus' main idea is that when we are to explain a complex mental state (for instance, the knowledge that a table exists) or a simple mental concept (for instance, the concept of a table), we must distinguish two things: (1) first, the propositional or simple content of an act from the act itself and (2) second, the underlying

subject of the intentional properties from the intentional properties themselves. Since by "intentionality" Hervaeus means the relationship that an extramental thing bears to the mind actually cognizing that thing, it is such a relation that enables the mind to attach to the thing the passive property of being cognized, that is, of being objectively existing in the mind or being an intention. The relationship that the mind bears to the table is not sufficient for attaching such a property to the thing. Predications such as "table is an intention," therefore, are assessed as cases of denominative predication. According to Hervaeus, no duplication of objects is entailed at all by the ordinary process of intellectual cognition of extramental things. When the mind turns to a singular table, the external table is the primary target of its act of pointing to, but it is only the starting point of the intentional process. Every intentional process ends with a universal concept, which primarily refers to a universal object, and such a universal object, which can exist only in the mind, is what is primarily correlated to an act of cognition stemming from an external thing. Thus, it is not unreasonable for Hervaeus to say that when we cognize or think of a table, we are actually cognizing or thinking of something mind-dependent about something mind-independent, that is, we are thinking of a table about a singular table or we are knowing that the singular table is a table.

Things are obviously more complicated in the case of complex mental states such as beliefs, false cognitions, and thoughts of fictitious, abstract, or nonexistent beings. Hervaeus' theory of intentionality does not seem to work in such cases, and this is the reason why this and similar explanations were strongly attacked by many philosophers, such as Peter Auriol, Gerard Odonis, and William Alnwick. They tried to mitigate the strong internalism entailed by proposals such as that of Hervaeus by proving first that in the case of singular thoughts, considered by Hervaeus simply as mental objects obtained by reasoning from universal objects, the mind gets directly in touch with the world; second that, following Scotus' doctrine, in the case of universal thoughts, there is no ground for distinguishing in a sharp way the underlying nature (e.g., table) from the intentional

properties (e.g., being universal); and third that the relation of active cognizing is a sufficient condition for attaching the property of being an intention to a cognized thing.

Medieval discussions of intentionality do not end here, but continue during all the fourteenth century by assuming many other forms. John Buridan, for instance, tends to modify the understanding of what a second intention is according to a more linguistic pattern. But the basic issues and the vocabulary stay unchanged. The medieval legacy to contemporary discussions is the three-fold intentionality thesis relaunched by Brentano toward the end of the eighteenth century.

Internal Senses

Pekka Kärkkäinen

Faculty of Theology, University of Helsinki,
Helsinki, Finland

Abstract

The internal senses are a class of cognitive faculties that were posited to exist between external sense perception and the intellectual soul. The notion of internal senses was developed in the Arabic philosophy of the Middle Ages on the basis of certain ancient philosophical ideas. The classical list of five internal senses was provided by Avicenna: common sense, retentive imagination, compositive imagination, estimative power, and memory. He also localized these faculties in the three ventricles of the brain. According to Avicenna, the function of common sense is to receive and relate the perceptions of the external senses. The retentive imagination stores the forms of these perceptions, and the compositive imagination processes these forms. Furthermore, estimative power grasps the “intentions” of the perceived objects, such as hostility or pleasantness, which the external senses do not perceive. The intentions are finally stored in memory. Averroes’ position was critical of Avicenna’s view, and both accounts had a remarkable influence in medieval Latin philosophy. Avicenna’s view dominated throughout the Middle Ages, although it was challenged and modified with help of other authorities. Albert the Great adhered to Avicenna in general outline but incorporated some of the views of Averroes, John Damascene, and Qusṭ; ibn Lūqā. Thomas Aquinas followed the same

lines but further modified the view. There were also constantly differing positions concerning whether the brain or the heart is the primary organ of the internal senses. Peter John Olivi and John Duns Scotus presented a novel reading of the estimative function, which gave up the Avicennian notion of intentions as the objects of the estimative faculty. John Buridan reduced the number of internal senses to two: common sense and memory. His view was adopted by some later authors but rejected by others.

The notion of internal senses emerged in medieval philosophy to describe a class of cognitive functions that did not belong to the realm of external perception in the strict sense but at the same time could not be attributed to the intellectual soul. These included functions that were thought to be closely connected to corporeal organs, such as imagination and dreaming, and some post-sensory cognitive capacities, which are found in animals, such as instinctual responses and rudimentary capabilities of reasoning.

In ancient philosophy, there were some precursors of the notion of the internal senses. In the late fourth century, Nemesius of Emesa located the organs of some mental faculties in distinct ventricles of the brain. During the fifth century, Augustine used the expression “internal sense” and also noted that some contemporary medical writers located cognitive functions to the ventricles of the brain. Augustine did not, however, mention the internal senses in connection with the brain. Augustine’s localization of the different faculties does not resemble later localizations. To the contrary, Nemesius’ account persisted in medieval discussions: partly because the work was falsely attributed to church father Gregory of Nyssa and partly through long citations in John Damascene’s *De fide orthodoxa*. Both Augustine and Nemesius seem to be influenced by the Galenist medical tradition.

The concept of internal senses appears in a developed form in medieval Arabic philosophy. The classical formulation of the theory is found in Avicenna’s *De anima*, where the author divides the cognitive faculties of the sensory soul into five

external and five internal senses. Each internal sense has its own organ in different parts of the cerebral ventricles.

Avicenna's account remained influential until early modern times, as his *De anima* and *Canon of Medicine* were continuously read but also criticized and modified by later authors. Avicenna posited two faculties in the foremost ventricle: common sense and retentive imagination. The function of common sense is to unify the sensations, which it receives from the external senses. Later Latin authors also added the perception that one perceives to the functions of the common sense. Retentive or formative imagination retains the sensory forms that common sense receives.

The middle ventricle hosts two faculties. The first of these, compositive imagination, also deals with imagination, but its function is not to store the forms but rather actively process them by combining and dividing. This faculty is, according to Avicenna, different in humans than in other animals. Another faculty in the middle ventricle is estimative power. It grasps qualities that are not perceived by the external senses, such as hostility or pleasantness. Avicenna calls these qualities "intentions." Furthermore, estimation is responsible for incidental perception, as in the case when an animal recognizes that a yellow thing is also sweet. There are also other functions, which Avicenna seems to attribute to estimation, some of which are unique to human beings, who also possess this faculty. Estimation seems to be for Avicenna the highest faculty of the sensory soul with a capability of judgment, which in human beings leads to a potential conflict with the judgment of reason. The intentions apprehended by estimation are stored in the rear ventricle of the brain, which is the seat of the fifth internal sense, sensory memory.

Avicenna's classification of these five post-sensory faculties rests on three principles: firstly, there are specific faculties devoted to sensible forms (common sense and imagination) and intentions (estimation and memory); secondly, there are different faculties for receiving (common sense and estimation) and for storing (imagination and memory) both kinds of objects; and finally, there must be a distinct faculty for

active processing of the objects, which is for sensible forms the compositive imagination.

The first major revision of the Avicennian system of the internal senses was carried out by Averroes. In particular, Averroes considered the faculty of estimation as superfluous. According to him, animal behavior can be explained by the Aristotelian notion of imagination, and he attributed human estimative functions to the faculty he called cogitation. He also fused the two Avicennian faculties of imagination into one. The result was a reduction of human internal senses to four: common sense, imagination, cogitative faculty, and memory.

The cogitative faculty differs from Avicenna's faculty of estimation in that it does not grasp the intentions, but rather actively abstracts them from the sensible forms and presents them to the memory. Moreover, Averroes does not describe intentions as bearing affectual connotations as Avicenna did, but rather they represent the individual objects as individuals. The abstraction of intentions presupposes for Averroes a close relationship of cogitation to the intellect. Memory is then the faculty responsible for both reception and the storage of intentions abstracted by cogitation.

It is not clear whether Averroes considered common sense an internal sense at all or rather as one of the external senses. Unlike Avicenna, he considered the Aristotelian common sensibles as its proper objects.

Before the breakthrough of Avicennian ideas, many Latin authors discussed imagination and other cognitive faculties distinct from but closely related to sense perception. In addition to Augustine, Nemesius, and John Damascene, they were influenced by Boethius, the medical compendium *Pantegni* and by Qusṭ; ibn Lūqā's *On the Difference Between Spirit and the Soul*.

After becoming available, Avicenna's classification of the internal senses was consequently repeated by several authors such as Dominicus Gundissalinus (the translator of Avicenna), John Blund, John of La Rochelle, and Peter of Spain. There are also several early thirteenth century authors who provided different kinds of accounts of the number and functions of the internal senses.

Albert the Great included a thorough discussion on the internal senses in his works on natural philosophy, which are based on Avicenna but also incorporated other views such as those of Averroes. In particular, his view of the objects of the estimative faculty combines Avicennian conception with Averroes' notion of incidental perception and individuality. Albert also tries to harmonize Avicenna's localizations of the internal senses with John Damascene and Qusṭa ibn Lūqā, unlike his contemporary John of La Rochelle, who clearly distinguishes different views. A similar harmonizing tendency appears later in the tradition of the Augustinian Hermits represented by Giles of Rome and Alfonso Vargas, who discussed the problem of the conflicting localizations of Avicenna and Augustine.

Although Albert changed some of his views between the earlier *Summa de creaturis* and later *De anima*, he developed certain insights that persisted through both works. One was the view of compositive imagination and estimation as animal counterparts of speculative and practical intellects. Albert's influence on later natural philosophers was strong, and also his views on internal senses were more or less endorsed by numerous writers.

Another influential figure in the later discussion was Thomas Aquinas. Aquinas adopted the general Avicennian framework as his teacher Albert had done, but he further modified it by incorporating some additional elements from Averroes. Aquinas considers the system of the internal senses from the viewpoint of the teleology of nature, so that their specific functions in the whole are derived from the need of animal to maintain its life. Aquinas does not reject the Avicennian estimative faculty, but attributes it only to animals. Like Averroes, he posits a cogitative power in humans and rejects a separate faculty of compositive imagination. For Aquinas, estimation is a faculty responsible for the self-preservation of animals. Estimative judgment is more than a mere apprehension of the agreeable or repulsive features of the objects: sheep do not flee from wolves because they are repulsive, but since they are their natural predators. Aquinas finds it particularly important that animal estimations are

based on instinctual reactions, whereas human cogitation judges intentions by collation, inquiry, and deliberation, analogous to the operations of the intellect. Cogitation, which Aquinas calls *ratio particularis*, differs from the intellect mainly in its ability to handle only individual intentions, while the intellect operates with universal concepts.

As soon as the form of disputed questions became established in the *De anima* commentaries, the discussion on internal senses usually concerned a couple of questions of the second book. The theme was occasionally dealt with also in the *Sentences* commentaries. In the late thirteenth century and early fourteenth century, Peter John Olivi and John Duns Scotus brought new insights into the discussion on estimative power in their *Sentences* commentaries. Their view was that no intentions exist as separate objects of estimative power, but that estimative judgments are activated by certain combinations of perceptual properties, which are in a particular relation (e.g., offensive or convenient) to the perceiver. Furthermore, Olivi did not consider estimation as a separate faculty, since according to him, there is only one internal sense, the common sense, and the acts traditionally attributed to other internal senses can be explained as functions of that faculty.

John of Jandun, who was active in early fourteenth century, developed his understanding of the internal senses based on Avicenna, Averroes, and Albert the Great. Unlike many earlier writers, Averroes was particularly important for his thought, which in many respects, however, was based on Albert's mostly Avicennian framework. During the same period, Walter Burley was focusing on the principles of various traditional classifications. This led Burley to incorporate a fourfold division (with only one faculty of imagination) of the internal senses into the traditional Avicennian fivefold division and to combine this with the Avicennian–Averroistic idea of abstraction.

John Buridan, however, preferred a classification where there are only two faculties: common sense and memory. The former is responsible for processing and the latter for storing both forms and intentions. The rest of the internal senses are

merely names for certain functions of these two senses. According to Buridan, they have two corresponding organs in the brain: the organ of common sense in the forebrain and the organ of memory between the last two cerebral ventricles in the hindbrain. Moreover, Buridan stressed that the primary organ of common sense is the heart (which he understood to be Aristotle's position) and consequently explained the apparent contradiction with the idea of cerebral organs by suggesting that there are special nerves connecting the two cerebral organs with the heart. He thought that his explanation was able to incorporate the various traditional views and sufficiently explain the diverse phenomena connected to these faculties.

Many late fourteenth century *De anima* commentaries were in their general outline heavily influenced by Buridan. This did not, however, always show up in their discussions of internal senses. Several authors did not share Buridan's heart-centered view, but located the internal senses in the brain. Neither did they all share Buridan's reduction of the internal senses into common sense and memory. For example, Nicholas Oresme spoke about four or five internal senses, attributing cogitative power to humans and estimation only to animals. He based the fourfold division on the argument that there must be different faculties for forms and intentions and explicitly rejects the twofold classification with reference to the traditional Galenic observation that injuries to the rear part of the brain affect only memory, not imagination.

Peter of Ailly discusses the internal senses in his *Tractatus de anima* using both Buridan and a compendium called *Summa naturalium* written by Albert of Orlamünde as his sources. Peter distinguishes five internal senses, but no longer follows the Avicennian scheme, which sharply distinguishes between the faculties that deal with forms and those that handle intentions. Consequently he agrees with Buridan that memory stores both forms and intentions. Furthermore, as regards the problem of heart versus brain, he agrees with Buridan but localizes the cerebral organs of the individual internal senses in the ventricles of the brain. Still later, at the end of

the fourteenth century, Henry Totting of Oyta presents the internal senses in a manner that closely follows Buridan.

During the fifteenth century, new interest was aroused in Aquinas' philosophy and consequently even in his view of the internal senses. In his commentary on *De anima*, for example, Henry of Gorkum presents the same fourfold division and same principles as Aquinas in the *Summa theologiae*. Similar to Aquinas, Henry shows only minor interest in the problem of the physiological location of the internal senses but thinks that their organs are situated primarily in the brain. He explains the role of the heart using the expressions of the Avicennian–Averroistic medical tradition and describes the heart as the origin of sensory functions, with perceptions actually taking place in the brain.

Intuitive and Abstractive Cognition

Joël Biard

Centre d’Etudes Supérieures de la Renaissance,
Université de Tours, Tours, France

Abstract

The theory of intuitive and abstractive cognition was developed by John Duns Scotus in the late thirteenth century, and it dominated the discussion about cognition from the fourteenth to the sixteenth century. The theory was changed and debated by the major philosophers of the time including William of Ockham, Peter Auriol, Gregory of Rimini, and Peter of Ailly.

The theory of intuitive and abstractive cognition is not simply a rehashing of the problem of abstraction, as it developed in the Middle Ages. In line with the texts of Aristotle and Alexander of Aphrodisias, abstraction was the process of separation of a form. It was either the gathering of similarities to constitute a universal concept or the extraction, the stripping off of the material and singular conditions of the form. In these cases, abstraction was based on the act of the intellect, which is the only faculty able to grasp the abstracted or universal form, whereas the senses grasp the singular together with all its concrete and material conditions. The Peripatetic saying that only the intellect knows the universal does not necessarily mean that it has no access to

the singular, since the form could be present in a certain mode of being in the individual substance itself. But it was difficult to hold that the intellect knows directly the singular as such. Faith certainly implies that the divine intellect knows the singulars directly, at least in the case of humans since some are to be saved while others damned. But it was generally thought that this capacity is restricted to the divine intellect. In the thirteenth century, as far as human cognition is concerned, there were conflicting views between those that supported the view that intellection is exclusively of universals such as Robert Grosseteste, Alexander of Hales, and Albert the Great and those, notably Thomas Aquinas, that supported the view that intellection is indirectly of singulars, in a dematerialized form, but proper to the singular.

The theory of intuitive and abstractive cognition, on the other hand, is linked to the emergence of the idea that a singular can be grasped directly by the intellect itself. It was in the Franciscan, anti-Thomist, tradition that this theory was developed. Perhaps the theory of perception developed in the *Perspectiva* of Roger Bacon contributes to change the idea of the direct cognition of an object. In the *Correctorium fratris Thome* of William de la Mare, which was adopted in 1282 as an official position of the Franciscan order, Aquinas was criticized for having maintained that the intellect does not cognize singulars. Without a doubt, this is a simplification. But what is at stake is the possibility of a direct cognition of the singular. And it is from such a direct cognition that the idea of intuition or intuitive cognition is formed. In this sense, the theory is not truly formed until the last quarter of the thirteenth century and finds its canonical expression in Duns Scotus before becoming a central component of theories of cognition from the fourteenth until the sixteenth century.

The idea of intuition refers to vision. Since Augustine, the idea of vision has been applied not only to sensible vision, and not only to the inner vision of an image, but also to thought. Augustine generally used the term *visio* in this sense, but he introduces the verb *intueri* to describe the act of grasping the eternal reasons and calls *intuitus* this immediate act of the mind

(*De trinitate*, IX, vi, 9–11). The verb *intueri* and the adverb *intuitive* were first used in conjunction with singular cognition by Matthew of Aquasparta. We find them again used by Vital du Four, John Duns Scotus, and William of Ockham. The Augustinian origin is reinforced by the theory of vision, as it was received from the optics of Alhazen, where certain and direct vision by a straight ray is named *intuitio*.

As is well known, it was Duns Scotus that develops the standard theory of intuitive and abstractive cognition. The most explicit text is the *Quodlibetal Questions*. In question 6, Scotus is led to examine the beatific vision. He then examines the capacities of the human intellect itself. It is hence in his treatment of the intellect in relation to the beatific vision that he distinguishes two simple acts of apprehension (*Quaestiones quodlibetales*, VI, §§. 18–20). The essential distinguishing criterion takes into account the existence or nonexistence of the object. The first type of act is, in fact, indifferent to the object's existence or nonexistence or rather the presence or absence of the object. Scotus justifies the acceptance of such an act by our internal experience. He evokes the intellection of a universal, which is indifferent to its existence in a suppositum, and what happens in science, in which we know the conclusion of a demonstration, whether the signified objects either exist or not. This act is called "abstractive." One might ask why? The answer is because it abstracts from something, namely, primarily from the existence or nonexistence of the thing. Scotus, however, immediately changes this characterization by highlighting the indifference with respect to the presence or absence of the thing, since one thing can exist while being absent. The context of this description of the acts of cognition, namely, the question of the beatific vision, is important, since it implies a "face-to-face" vision. But it is here extended to a mode of cognition, generally characterized.

To this first type of simple act of the intellect, Scotus contrasts another one that relies uniquely on the object as present and existing. He admits that we do not experience this with much certainty, but he justifies it with reasoning. We can draw an

analogy with sense, since it grasps a present object, and that act is implicitly considered a greater perfection. Hence, the intellect would be less perfect than the sense if it did not grasp the object in itself, but only in a derived image.

There are several other expositions of this theory in Scotus' works, but none of them changes this pattern. Certain passages emphasize more than others the fact that an intuitive cognition grasps the thing as it is in itself, *in se*, while abstractive cognition captures only a *similitudo* or a species (*Reportata parisiensa*). This way of presenting the contrast will find its way into many texts of the fourteenth century, as we shall see.

One issue raised by some of Scotus' texts is whether or not we truly have an intuitive cognition in this life or if it is a capacity of our intellect that is only realized after death. A text from the *Questions on the Metaphysics* (Book II, q. 3) seems to exclude it from this life. However, a text of the *Quodlibetal Questions* does not deny this possibility. Scotus says only that we do not experience it with certainty, and in the *Opus oxoniense* (dist. 3, q. IX), he says that we do have an intuitive cognition *pro statu isto*.

An objection that will be dealt with by Scotus' successors is caused by the fact that on his view, two distinct acts can have the same object. But on Scotus' theory of cognition, we can say that the same object is known by different formal reasons.

On the model of an intuitive cognition as a vision face to face, it is necessary that its object exists and is present. Yet from another point of view, it is important for Scotus to differentiate what actually exists, on the one hand, from what is simply possible (and therefore may not even exist) or what is necessary and what can perhaps be thought independently of its actuality. Scotus, therefore, introduces a surprising distinction, which was taken over by his successors, between a perfect intuitive cognition, which presents something real and given to the intellect, and an imperfect intuitive cognition. The latter type accounts for memory as well as for vision of the future in the case of prophetic vision.

The theory of intuitive and abstractive cognition is found in most theologians of the fourteenth century. Peter Auriol begins with the definition of

intuitive cognition as the cognition of a thing as present, whereas abstractive cognition is of the thing as absent. But he inserts this distinction in his analysis of experience and optical illusions. I can not only judge but also see something other than this. Hence, we must distinguish what he calls *esse apparens* from real being. *Esse apparens* is not as an intermediary entity, as William of Ockham believed or pretended to read into Auriol, but the very appearance of the thing to my intellect. The difference that arises in some cases (illusions) between this apparent or intentional being and real or subjective being leads one to think that my intellectual act terminates at this *esse apparens*. Consequently, an intuitive cognition terminates at the being as it appears. The difference is reformulated by highlighting the direct character of an intuitive cognition that makes the object appear as present in its *presentialitas*.

However, it was mainly Ockham's theory that stimulated discussion due to the modifications it introduces into Scotus' theory. William of Ockham is concerned with ensuring the epistemological realism of his theory of cognition, criticizing Auriol's theory, which he perceives as a skeptical threat. Intuitive cognition is the starting point for all intellectual activities, not by a process of drawing out a form, but through a series of acts, which, ultimately, depend on direct contact with the thing itself. This – at least in the mature theory where the concept is viewed as an act of intellection – causes the rise of the concept in the intellect, which in turn is viewed as a natural sign. Such a concept is at first singular, but it may be followed by a concept that abstracts either from the existence of the thing or from a particular feature, in order to form a universal concept, through a confused apprehension of a plurality of things bearing a certain resemblance. Ockham often insists on the fact that intuitive and abstractive cognitions do not differ in their objects and that both terminate in the same thing. Furthermore, things do not have different formalities (*formalitates*) within them that could be objects of different intellections, since Ockham only admits of real distinctions. These two acts are independent of one another, although in our actual state one presupposes the other.

It is clear that in Scotus, these cognitions are simple acts prior to any judgment. In a way this is still the case with Ockham, but the Ockhamist definition shifts to a characterization that bases this distinction on the types of judgments that these different acts allow.

Abstractive cognition has several meanings. In one sense, it means a cognition, which, given that it abstracts from certain traits of the thing, may be suitable for many singulars. In this sense, therefore, cognition allows for the formation of universal concepts through a joint apprehension of a plurality of singular things. But it is not this sense that identifies the abstraction to the universal, which is the most important here. In another sense, “we understand an abstractive cognition in the way in which it abstracts from existence or non-existence, and from other conditions that, in a contingent manner, happen to a thing or are predicated of it.” Up to this point, we are close to Scotus. But the main thing is that, on that basis, two relations to the thing are characterized, and these descriptions are immediately connected with the types of judgments possible. These are Ockham’s proper definition of intuitive and abstractive cognition. An intuitive cognition of a thing is a cognition such that, by it, I can know if the thing exists or not. In other words, the intellect, which perfectly captures these terms or signs, and also what they signify, is forced to assent to a proposition stating that the thing exists, if it exists. Consequently, such a cognition will also allow with certainty the formulation of judgments about contingent truths. Conversely, abstractive cognition is that by which I cannot judge whether an object exists or not and that does not permit me to have knowledge about contingent truths.

Ockham’s theory thus departs from Scotus’ position, although it depends on it, since the presence or absence of the thing is not the primary criterion for the definition of these two kinds of cognitions. Ockham pushes to the breaking point the idea that the very nature of the act alone should be the criterion, and these acts then are the basis of these two different types of judgments.

Ockham’s theory serves as a point of reference throughout the fourteenth century. However, it encountered resistance. Thus, in his *Lectures on*

the Sentences (Book I, dist. 3, q. 3, art. 1), Gregory of Rimini stays close to the Scotist view but develops it in several directions. First, he applies the distinction between intuitive and abstractive cognition as well to sensitive as to intellectual cognition. Although Scotus used the comparison with the senses, the problem was raised by him in the context of the beatific vision, which concerns the intellect alone. Gregory of Rimini defines an intuitive cognition as that by which “something is formally known in itself” and an abstractive cognition as that by which “something is formally known through some representation.” But he goes on to explicitly distinguish the real existence from the type of presence required here. An intuitive cognition does not have as a criterion that the object actually exists in reality or not; the difference is between the immediate presence of the thing and the presence of a representative intermediary. Consequently, an abstractive cognition does not abstract from real existence, but from what is named “the objective presence of the known thing.” In an intuitive cognition, it is the thing that is present “objectively” (*obiective*), that is, as something in front of the intellect and facing it directly – whether it exists, or that our cognition, by a natural or divine power, ends at an object that does not exist at all. Abstractive cognition, on the other hand, abstracts from such an “objective presence” and ends immediately at a “representation.”

These ideas are reflected in Peter of Ailly. In his *Commentary on the Sentences*, he begins by literally following Ockham’s presentation, claiming that an abstractive cognition does not allow me to judge whether something exists when it exists or does not exist, when it does not exist. But further, he insists on the fact that abstractive cognition gives us the object “in a representation” thereby restating, via Gregory of Rimini, certain Scotistic formulations. In the *Commentary on the Sentences* as well as in the *Treatise on the Soul*, the most appropriate formulation seems to be that “an intuitive cognition is a simple cognition by which some thing is formally known in itself in an immediate way, while an abstractive cognition is a simple cognition by which something is formally known by means of a representation.” Hence, abstractive cognition

does not, properly speaking, set aside the existence of the thing, but its *praesentialitas obiectiva*. The thing is not facing it as an object (i.e., what is placed in front of the intellect), but as “means” that is representative of this thing (either an image or another type of sign). Conversely, in the intuitive cognition, “the thing itself is the object for the cognizer, as immediately present to him.”

The modification that William of Ockham made to the definition of an intuitive cognition led him to formulate the hypothesis of an intuitive cognition of a nonexistent thing. This thesis has perplexed contemporaries, but it has also been overestimated and overly interpreted by many commentators. Ockham’s concern is mainly about the separation of the act, analyzed in itself and in its relations to other acts, from the thing at which it terminates. This real distinction implies that, perhaps not in the course of nature, at least according to the absolute power of God, we can conceive of one without the other, as is the case with all truly distinct things. This argument does not ruin in any way the fact that, in the ordained power of God, intuitive cognition supposes the presence of the thing. Moreover, his own definition has the consequence that has not always been emphasized (see *Quodlibet* V, q. 5) that if an intuitive cognition enables me to judge that something exists when it exists or does not exist when it does not exist, then in the supernatural case of an intuitive cognition of the nonexistent, I should judge that this thing does not exist! Of course, this is hardly conceivable in the normal course of events, but in any case, there would be no deception here, certainly not divine deception.

This hypothesis of an intuitive cognition of nonexistent objects, *de potentia absoluta*, was widely accepted after Ockham, though differently used. It demonstrates the widespread influence of the Ockhamist theses. Gregory of Rimini and Peter of Ailly both repeat it, without opening the door to skepticism. Indeed, Walter Chatton tried to infer skeptical consequences of Ockham’s theory: God could produce such a representation that I should formulate an existential judgment, in the absence of the thing. But for Ockham, this would be a belief, not an intuitive cognition. In

any case, it is true that this idea would supply some of Ockham’s successors (like Walter Chatton, Adam Wodeham, Richard Fitzralph, John Rodington in Oxford, and Peter of Ailly in Paris) with the hypothesis of Divine deception. This hypothesis had not been developed by itself, nor as a simple radicalization of demonic deceptions, but as part of a broader debate on the discussion of the relation of divine power to the course of nature, including what the natural process of cognition is concerned with. It does not in any way lead to a renouncement of epistemological realism. It was part of a development of certain conceptual tools and arguments allowing for a new way to think about the status of a concept and its object, as well as about the concept of evidence. In less than a century, the theory of intuitive and abstractive cognition challenged the traditional Aristotelian theory of abstraction, as well as the theory of divine illumination, and became one of the major elements in the transformation of the medieval theory of cognition.

Isaac Israeli

Marienza Benedetto

Dipartimento di Studi Umanistici, Università degli Studi di Bari, Bari, Italy

Dipartimento di Scienze Filosofiche, Università degli Studi di Bari, Bari, Italy

Abstract

With Ishāq ibn Sulaymān al-Israēli, generally known as Isaac Israeli, the philosophical season of the Jewish Middle Ages begins. Integrating, in Jewish thought, philosophical ideas drawn from Greek and Arabic sources, Isaac Israeli gives us the first, albeit not very original, testimony of Jewish Neoplatonism.

Biographical Information

We have only indirect information about Isaac Israeli's life. The main sources are an Arab Andalusian biographer active in the second half of the tenth century, Abū Dāwūd Ibn Giulgiul, in his *Generations of the Physicians*, and, in the mid-eleventh century, Šā'id of Toledo, in his *Generations of the Nations*. Although the exact dates of his life remain unclear, we tend to assume that Isaac Israeli lived between 850 and 950 AD circa. ("an age of over a hundred," as we read in the biography by Giulgiul). He was a Jewish eye doctor born in Egypt, who emigrated to Qayrawān (in Tunisia) and entered the service of the local emir, Ziyādāt Allāh, and then his successor, 'Ubayd Allāh (founder of the Fatimid Ishmaelite dynasty), as their doctor.

Likewise, we still know little of how Israeli's philosophical formation came about. However, the influence of al-Kindī's original writings, as well as those of his circle, especially a Neoplatonic Arabic source of *The Theology of Aristotle* (the so-called Ibn Ḥasday's Neoplatonist), is undoubted: in Israeli there is basically the same synthesis as found earlier in al-Kindī's school between Platonic, Aristotelian, and strictly theological elements.

Originally written in Arabic, Israeli's treatises can be divided into two categories, which had different impacts. The medical treatises – of which are extant the *Book of Foodstuffs and Drugs*, the *Book of Fevers*, and the *Book of Urine* – were very popular throughout the Middle Ages in the Jewish world, as well as in Islamic and Christian circles. Recognizing their value, Israeli himself is supposed to have said that his memory would survive better through these books than through his progeny.

His reputation as a philosopher, on the other hand, was less widespread: Jewish philosophers made limited use of his philosophical writings, perhaps because in a well-known letter to Samuel ibn Tibbon (in which a veritable “canon” of the *authoritates* of Jewish thought is established), Maimonides held that he was “only a doctor.” Nevertheless, Israeli probably redacted his philosophical treatises in order to divulge Greco-Arab doctrines among the Jewish public. The following treatises are conserved:

- The *Kitāb al-Hudūd*, the *Book of Definitions*, extant both in an incomplete copy of the original Arabic text, and, in a complete version, in medieval Latin and Hebrew translations (transcribed, respectively, by Gherard of Cremona and Nissim ben Shelomoh), is a kind of philosophical dictionary that collects 57 terms from epistemology, logic, metaphysics, psychology, and theology. What is striking at this regard is that the work circulated in the Latin West as the ultimate source of the famous “*veritas est adaequatio rei et intellectus*,” of which Israeli did not make any mention.
- The *Kitāb al-Giawāhir*, the *Book of Substances*, of which large fragments of the Arabic text are extant, is a cosmological-metaphysical treatise inspired by *Aristotle's Theology*.
- *Sefer ha-ruah weha-nefesh*, the *Book on the Spirit and the Soul*, preserved in two Hebrew versions and only in a fragment of the Arabic original, is full of biblical references, as it combines philosophical doctrines of the soul with Jewish scriptural proof (regarding the belief in rewards and punishments of the soul).
- *Kitāb al-Uṣṭuṣāt*, the *Book on the Elements*, which like most of the other philosophical works exists in Hebrew and Latin translations, is a treatise on the quality and quantity of the elements, evidently based on Aristotle.
- *Pereq ha-yesodot*, the *Chapter on the Elements*, of which a single Hebrew manuscript exists (at the Biblioteca Comunale of Mantua), was once erroneously ascribed to Aristotle.

Thought

Following a practice characteristic of medieval Arab, and later Jewish, Neoplatonists, in the best known of all his philosophical works, the *Book of Definitions*, Isaac Israeli proposes a reading of philosophy that combines Platonic and Aristotelian themes. The starting point is represented by the four philosophical questions introduced by Aristotle in his *Posterior Analytics* to define things: whether, what, which, and why, i.e., existence, quiddity, quality, and quantity. Philosophy – Israeli explains – is not included in a genus from which its definition could be composed: having no answer to the question “what,” we are only in the condition to describe philosophy through its name, property, and effect. The result is that philosophy is respectively the love of wisdom, the assimilation to the works of the Creator (i.e., to acquire the true knowledge of things and to do what corresponds to the truth), and man's knowledge of himself (by knowing himself in both his spirituality and corporeality, man knows the macrocosm in its spiritual and corporeal substance).

Yet apart from this aspect, which represents only a general introduction to Israeli's work, what actually characterizes his thought? There follows the definitions of the substances that are arranged between God (or God's perfection) and the imperfect lower world according to less and less pure ranks. In Israeli's hierarchically ordered universe – later repropounded with the same structure and the same terms in the *Fountain of Life* by Avicbron, who undoubtedly knew Israeli's work – God creates *ex nihilo* two simple

substances, matter and form, and if primary matter is described as the substratum of diversity or as the truly first genus, the first form is what, imprinting itself on this matter, establishes the nature of the intellect. From the intellect, which Israeli defines as the totality of forms, emanates the world of souls (the rational soul, the animal soul, and the vegetative soul) and so, in descending order, the world of the spheres and the sublunary world, with the four elements and their compounds. The reason for the differences between the various substances is that the light originating in the supernal world gradually diminishes, as it passes downward through the degrees of the emanation. In short, the further this light is from its source, the more it darkens and thickens, but without disappearing (if this were not so, the substantial unity and continuity of the universe would be compromised), and the more the substances are imperfect. As it is not difficult to see, what changes is not only the quality of the light, and consequently the nature of the substances, but also the manner in which the cosmological process occurs. The distinction is, succinctly, between:

- *Creatio ex nihilo* or innovation – the action with which God makes existent the first two simple substances from the nonexistent
- Emanation, which concerns the hypostases in the spiritual world (every substance flows from “the splendor and the brilliance” of the one that came before)
- Natural causality: the passing of corporeal substances from privation to existence

The theological motive behind this threefold distinction is quite obvious: introducing the concept of creation into the framework of an emanationist metaphysics, and the necessary procession that it implies, Isaac Israeli preserves God’s power, will, and wisdom.

Isidore of Seville

Sandro D'Onofrio

Modern Romance Languages and Literatures,
SUNY at Buffalo, Amherst, NY, USA

Abstract

Isidore of Seville was a teacher of liberal arts at the beginning of the Dark Ages, who was primarily known by his encyclopedic knowledge and his famous scholarly texts. Isidore tried fervently to fit all the secular knowledge available in his time into a Christian worldview, often with a great dose of eclecticism and hardly any criticism. Nevertheless, he provided the system educational of his day with classic and scientific knowledge and preserved this information for future medieval authors.

Isidore (c. 560–636), bishop of Seville, currently Patron Saint of the Internet, and primarily known as the author of *The Etymologies*, was an isolated thinker at the beginning of the Dark Ages. This historical setting bestowed upon Isidore the title of “the last candle” of classical wisdom. However, he can be evaluated in two different ways: as an erudite among the intellectual poverty where he lived, or as part of a decadent tradition in philosophy. The encyclopedic knowledge embodied in his works, such as *The Etymologies* or *De natura rerum*, cannot be denied. Yet, as a member of a ruined academic system, his job consisted here and there of restating, recapitulating, and sometimes simply transliterating both data and theories that lacked research and originality; further, there are no proper sources, explicit quotes, or clear references of the cited authors.

It would be unfair to judge this brilliant intellect outside the historical circumstances which led him to produce this kind of work, because Isidore also represents the survival of classical culture among the unreceptive and strict Christian civilization which destroyed the School of Alexandria and also the Athenian Academy. In this respect, his work is actually remarkable, especially if we

take into account the fact that there was no scientific community or current study of nature. Despite the lack of originality and the abundant eclecticism, his work was invaluable for forthcoming generations, because it preserved the classical impetus of Greek science and philosophy for later innovative times.

But Isidore did more than that. He was a Christian thinker, and his main objective was to conciliate Catholic theology with secular science. The issue, however, was not that secular knowledge had to be Christianized: it was that secular knowledge had to be understood within the framework of the revealed “Christian knowledge,” and thus fitted into the true scheme of the cosmos; the “pursuit of knowledge in itself” was abandoned in deference to this authoritative knowledge, which was sincerely believed to be true knowledge. Hence, his *The Differences* and *The Synonyms* were not only devoted to clarifying the meaning of the words, but also to elucidating many theological issues. All in all, the idea was to describe not an objective world, but the Christian world.

Because he never made explicit his own theory about language, Isidore is considered to be a compiler and transmitter as compared with original thinkers around his era, such as Boethius or Erigena. But, for Isidore, science consisted of recollection, discussion, and explanation of the given knowledge. Just like the last encyclopedists of the Roman Empire, Varro and the elder Piny, he only attempted to expose thoroughly all current knowledge, in order to offer scholars a manual for instruction. Hence, as was customary at the time, Isidore’s production is devoted to portraying ancient wisdom and, thus, says little about his own period. In *The Etymologies*, for instance, he deals first with the liberal arts and then goes on to expose everything that was considered to be science or knowledge in his time, from medicine and law, through natural history and human geography. Understandably, it was in his own time that *The Etymologies* was really appreciated as an instrument of instruction for monastic and ecclesiastic education, as the thousands of copies that existed throughout Europe give evidence.

Despite the fact that *The Etymologies* lacks the critical commentaries and theoretical innovation that characterize the later Middle Ages, the general idea that guided it can be found in the *Summae*: a comprehensive account of secular knowledge enlightened by a Christian understanding. Thus, philosophical activity remained imbibed, to a certain extent, in dialectics, grammar, and rhetoric. The main subject of Isidore's research was the field of grammar: he was a *grammaticus*, in the sense of the *Trivium*'s teachers. With the apparent purpose of defining words correctly, Isidore followed the grammarian tradition developed from the Hellenic period as to Donatus and Priscian; but his linguistic analysis and the peculiar definitions do not correspond to what we would expect in relation to our modern understanding of linguistics and etymology. He did not intend to give historical and accurate meanings of the words; instead, he prescribed what they should mean. In a world in which philosophical problems were reduced to dialectics, in which peace or war, death or life, relied on the rhetoric of ambassadors and diplomats, the grammarian played a central role. Yet, a grammarian's activity takes place on a different field, namely, theology and natural science. The grammarian, as Isidore proved, was the "science man," the teacher, and the arbiter: he could explain what the words stand for. Provided that an erroneous interpretation of the world implied wrong terminology, heresies and wars followed from the words. The task of the grammarian consists in giving the true meaning of a word. In this fashion, Isidore began the tradition of rooting the meaning of words in reality, the *significatio*, as can be later appreciated in the terminist logicians and speculative grammarians of the high Middle Ages.

The frame of mind behind Isidore's production portrays the medieval condition of *Philosophia anchilla theologiae*, which opened the scholastic outlines of the later Middle Ages. There is no doubt that for him all secular knowledge could be explained inside the framework of Christian theology; indeed, this knowledge helped to construct the Catholic understanding of the world. As

a consequence, by accepting secular science, Isidore's scholastic point of view is actually closer to Anselm's rather than to Augustine's, even though his activity was more theological than dialectical. Along with his grammatical accounts of religious thought, we find the *Liber numerorum*, the *Allegorie*, and the *Sententiae*, in which he also used the tools of language for Biblical exegesis. In the enormous desolation of ideas that reigned in the seventh century, Isidore of Seville was definitely more than a candle: rather he was a torch.

Ismā'īlī Philosophical Tradition

Daniel De Smet

Laboratoire d'Etudes sur les Monothéismes
(CERL), CNRS, Villejuif, France

Abstract

Neoplatonic philosophy was introduced into Ismā'īlism, a major branch of Shī'ite Islam, as early as the beginning of the tenth century. Relying not only on the Arabic paraphrases of Plotinus (the so-called *Theology of Aristotle*) and Proclus (the *Liber de causis*), but also on Arabic philosophers such as al-Kindī and al-Fārābī, Ismā'īlī Neoplatonism has as its main concern the understanding of revelation through philosophical reflection and to establish religious doctrines on a rational basis. Although Abū Ya'qūb al-Sijistānī, the main representative of the so-called “Persian School” (tenth century), and al-Kirmānī, the most important Ismā'īlī philosopher of the Fatimid period in Egypt (eleventh century), have developed quite different systems, based, respectively, on the *Neoplatonica Arabica* and on al-Fārābī, they both try to harmonize the teachings of the Prophets and the Imams with an interpretation of Plato and Aristotle going back to late Antiquity. They established a close link between cosmology and noetics, in order to provide a rational foundation for the soteriological function of the Imam. As a part of the Universal Soul fallen into the material world, human soul has to be delivered from the body in which she is kept captive by the actualization of her intellectual faculty. To this end, she needs the instruction of the Prophets and the Imams, the incorporations of the cosmic Agent Intellect.

From the tenth century onward, Ismā'īlism, a major branch of Shī'ite Islam, developed a

specific form of Neoplatonic philosophy (known as “Ismā'īlī Neoplatonism”) in order to harmonize the teachings of the Prophets and the Imams – as they are reflected for instance in the Qur'ān – with an interpretation of Plato and Aristotle going back to late Antiquity. Moreover, out of the same concern to understand revelation through rational reflection and to establish religious doctrines on a rational basis, Ismā'īlīs also adopted and assimilated a set of notions and concepts from *falsafa*, the philosophical tradition in the Muslim world. After the foundation of Cairo in 969, the Ismā'īlī dynasty of the Fatimids, competing with the Sunni ‘Abbāsids of Baghdad, attracted to their new capital philosophers, theologians, and scientists; libraries, hospitals, and observatories were founded, for instance the “House of Wisdom” (*Dār al-‘ilm*) devoted to the study of sciences and philosophy.

The main sources of Ismā'īlī philosophy are the Arabic paraphrases of Plotinus (the so-called *Theology of Aristotle*) and Proclus (the *Liber de causis*), several Neoplatonic works written in Arabic (such as the *Doxography of Pseudo-Ammonius*), and texts attributed by the Arabic tradition to Empedocles (the Pseudo-Empedocles). Also, Ismā'īlī philosophers living in Iran and Transoxiana in the tenth century belonged to the same intellectual milieu as certain disciples of al-Kindī, such as Abū Zayd al-Balkhī, Ibn Farīgūn, Abū l-Ḥasan al-‘Āmirī, Abū Sulaymān al-Sijistānī, and Abū Ḥayyān al-Tawḥīdī. In the eleventh century, Ismā'īlī thought was influenced by the “Epistles of the Pure Brethren” (*Rasā'il Ikhwān al-Ṣafā'*) and by *falāsifa* such as al-Fārābī. Moreover, Ismā'īlī Neoplatonism shows many similarities with contemporary Jewish Neoplatonism, in particular with Isaac Israeli, both traditions using the same philosophical sources.

Neoplatonic philosophy was probably introduced into Ismā'īlism by Muḥammad al-Nasāfī (d. c. 943), who formed with Abū Tammām, Abū Ḥātim al-Rāzī (d. 934), and Abū Ya'qūb al-Sijistānī (d. c. 971), the so-called “Persian School.” These Ismā'īlī thinkers worked in Iran and Transoxiana.

The best-known member of this “Persian School” is Abū Ya‘qūb al-Sijistānī, whose main philosophical works are the *Book of the Wellsprings* (*Kitāb al-Yanābī’*), the *Unveiling of the Hidden* (*Kashf al-mahjūb*), and the *Book of the Keys* (*Kitāb al-Maqālīd*, still unpublished). Each of these works is built upon a triadic scheme, consisting of the three Plotinian hypostases of Intellect, Soul, and Nature. Plotinus’ first hypostasis, the One, is situated outside the system of the universe, and al-Sijistānī stresses its absolute transcendence: it is not a being, nor a substance, nor a cause, nor an essence; but at the same time it is not a non-being, nor a non-substance, nor a non-cause, nor a non-essence. Therefore, every attribute and its negation must be denied from the One (negative theology): only by means of a double negation the Ultimate Reality can be referred to. By his Word (*kalima*) or Command (*amr*), the transcendent One creates (*abda’a*) the Intellect; out of the Intellect emanates (*inba’atha*) the Soul, which generates (*kawwana*) the sensible world. Al-Sijistānī distinguishes, indeed, three modes of production: *ibdā’*, which occurs out of any time; *inbi’āth*, which produces time by the movement of the Soul; *takwīn*, which takes place in time. While Intellect, as the first created being, is eternal, perfect in act, and free of any movement, the Soul is perfect only in potency. This imperfection generates a double movement in the Soul: she aspires to attain the Intellect, the grasping of which enables her to become perfect in act; but at the same time, due to her imperfection, she is attracted downward to the physical world. Al-Sijistānī’s ample reflections on the Plotinian concept of the two sides of the Soul influenced *falāsifa* such as Avicenna (Ibn Sīnā). The Soul’s inclination toward matter causes the generation of the physical world and the fragmentation of the Soul into a multitude of parts mixed up with matter. These are the human souls: parts of the Universal Soul fallen into the corporeal world. The way down is paralleled with an upward one, leading human souls back to their celestial origin, along with the reversal of the entire creation toward its source, in accordance with the Neoplatonic cycle of *processio* and *reditus*. This way back necessitates the mediation

of the Prophets and the Imams, as earthly manifestations of the Intellect, whose instruction (*ta’līm*) actualizes the human potential intellect, a necessary condition for the survival of the soul outside the body and her final return to the intelligible world.

The most important Ismā’īlī philosopher of the Fatimid period, Ḥamīd al-Dīn al-Kirmānī, spent part of his life in Cairo, in the entourage of caliph al-Ḥākim. He finished his main work, the *Book of the Repose of the Intellect* (*Kitāb Rāḥat al-‘Aql*) in 1021, probably shortly before his death.

Conceived as a spiritual city, divided into seven “walls” (*aswār*) surrounding 56 “cross-roads” (*mashāri’*), the *Rāḥat al-‘Aql* develops a system of the universe based on the number ten. A perfect harmony reigns between the three “worlds” of which the universe is composed: the ten separated Intellects of the intelligible world, the ten celestial spheres governing the physical world, and the ten ranks of the *da’wa* – the organization of the Ismā’īlī community – which form the world of religion. The transcendent and unknown Creator (*Mubdī’*) remains outside the universe. Al-Kirmānī describes him in the same terms as al-Sijistānī, stressing even more his transcendence. For al-Kirmānī, even the Intellect, the first created being, has no direct contact with its Creator, who remains outside the reach of his creatures for ever. Although he describes the Intellect in terms very close to the Ismā’īlī Neoplatonism of his predecessors, al-Kirmānī introduces a lot of concepts that he borrowed from al-Fārābī’s *Principles of the Opinions of the Inhabitants of the Perfect State* (*Mabādi’ ārā’ ahl al-madīna al-fāḍila*). So he takes over al-Fārābī’s conception of the First Being as a self-thinking intellect, but he applies it to the Intellect, the first created being, thus introducing an ontological shift with respect to the First Principle of the *falāsifa*. Al-Kirmānī’s Intellect, although a created being, is to be identified with the God of the Qur’ān, of which it even bears the name: *Allāh*. Containing in its essence all the “forms” and being the “cause of causes” (*‘illat al-‘ilal*), the Intellect is the principle of emanation (*inbi’āth*) of all subsequent beings. However, this emanation does not produce the Plotinian entities (Soul and Nature), as was the

case in tenth-century Ismā'īlism, but rather al-Fārābī's separated Intellects. In fact, al-Kirmānī introduced the Fārābian cosmology into Ismā'īlism; at the same moment, Avicenna gave it its classical form in his *Kitāb al-Shifā'*. Although relying directly on al-Fārābī, the scheme of emanation described by al-Kirmānī conserves some traces of the former Plotinian triad. The Intellect, as far as it is a thinking intellect ('*aql 'āqil*'), produces an Intellect in act (the first emanated being, *al-munba'ath al-awwal*), the source of the emanation of seven other Intellects in act; but as far as it is an intellect thought by itself ('*aql ma'qūl*'), it produces an Intellect in potency, composed of matter and form. This is the tenth and last Intellect: the demiurge, who forms the sublunary world in accordance with the patterns it receives from the first Intellect, through the eight Intellects in act. The first Intellect (or first created being), the second Intellect in act (or first emanated being), and the tenth Intellect in potency correspond, respectively, to the three hypostases of earlier Ismā'īlī Neoplatonism: Intellect, Soul, and Nature. Al-Kirmānī's theory of knowledge seems also very close to al-Fārābī's, as he borrows from him the main technical terms: the potential intellect (*al-'aql bi-l-qūwa*), the material intellect (*al-'aql al-hayūlānī*), the intellect in act (*al-'aql bi-l-fi'l*), the acquired intellect (*al-'aql al-mustafād*), and the active intellect (*al-'aql al-fa'āl*). Following al-Fārābī, al-Kirmānī identifies the Agent Intellect with the tenth Intellect and assigns it, along with its main role in the creation of the physical world, both a noetical and a soteriological function, as far as it is the principle of the actualization of the rational faculty in man and, in consequence, the principle of his eternal happiness and survival. However, concerning the nature and activity of the Agent Intellect, al-Kirmānī, as an Ismā'īlī, departs widely from the *ḥaylasūf* al-Fārābī, by claiming that it exercises its action only through the instruction (*ta'līm*) of the Prophets and the Imams. At difference with the rational faculty of ordinary men, the Intellect of the Prophets and the Imams is perfect and always in act, without needing to pass from potency to actuality. They might therefore be considered as incorporations of the Agent

Intellect, a dangerous heterodox statement; hence, al-Kirmānī cautiously only hints at in his *Rāḥat al-'Aql*.

Jacques Almain

Thomas M. Izbicki
Alexander Library, Rutgers State University of
New Jersey, New Brunswick, NJ, USA

Abstract

Jacques Almain was one of the most prominent exponents of conciliarism in the early sixteenth century. He studied the arts and theology at the University of Paris, receiving his doctorate in 1512. Almain wrote extensively on issues of philosophy and ethics. When the Council of Pisa met in 1512, it tried to depose Pope Julius II (1503–1513); and when Cajetan attacked the council on the pope's behalf, the university chose Almain to reply. His arguments were grounded in the belief that the church was able to act in its own defense, even against its visible head, the pope. Cajetan replied, but Almain did not live to respond in turn. He died unexpectedly in 1515. John Mair, his teacher, answered Cajetan instead, advocating conciliar supremacy in the church.

Life

Jacques Almain (c. 1480–1515) attained considerable prominence during his brief academic career. He was particularly important for his critique of papal claims to sovereignty over the church.

Born c. 1480 in the diocese of Sens, Almain probably studied the arts at the Collège de Montaigu of the University of Paris. During the years 1503–1512, he taught the arts at the Collège de Montaigu, Collège Sainte-Barbe, and Collège de Coqueret. In January 1503, Jan Standonck appealed to the Parlement of Paris to prevent Almain from moving his teaching away from Collège de Montaigu. Almain served as rector of the university in 1507 and as proctor of the French nation the following year, but he vainly sought a good benefice in the same period. During these years, Almain published works on logic, physics, and moral philosophy. Of these, the *Moralia* attained the widest diffusion.

Beginning in 1508, Almain studied theology with John Mair (1501–1518, 1525–1531) at the Collège de Navarre. He was a *boursier* in theology in 1508 at the college, but he still sought vainly to obtain a benefice. On January 26, 1512, Almain received the license in theology, ranking second among 23 students promoted. He was made a doctor of theology on March 31 of that year, but he was admitted to the consortium of the Faculty of Theology only after apologizing for not being fulsome enough in his gratitude to the senior doctors of sacred science. He taught theology and participated in the affairs of the faculty until his premature death at Auvillar in the south of France, where he was visiting Jean de la Mare, bishop of Condom. Almain died poor, but he was praised by former pupils and by printers as they circulated his writings.

Almain attained prominence in 1512 as the university intervened in the fight between Pope Julius II (1503–1513) and three dissident cardinals. These cardinals, with the support of King Louis XII of France and the Emperor Maximilian, summoned a council to meet at Pisa in 1511. Pope Julius responded with a council of his own, summoned to meet at the Lateran basilica in 1512, and with a propaganda offensive. The most noted critique of the Council of Pisa and its pretensions was *On the Comparison of the Power of Pope and Council* by the Dominican theologian Thomas of Vio, known as Cajetan. The University of Paris, by royal command, intervened on the council's behalf, choosing Almain as its spokesman. He may have been chosen because he had addressed, among other things, the power of the pope and of the council in a question disputed at Vespers in March of 1512, during the promotion of Louis Ber to the doctorate in theology. Almain's answer to Cajetan's tract, his *Book on the Authority of the Church*, appeared later in 1512. Cajetan answered with his *Apology* in 1514. Almain died without replying, but Mair, long after the failure of the Council of Pisa, defended his pupil's opinions in a section of his commentary on the Gospel of Matthew (1518). This response by Mair is contemporaneous with the posthumous publication of several of Almain's works.

Although, unlike Mair, Almain had no outstanding pupils, his reputation outlived him. The Gallicans invoked him, along with John Gerson and other luminaries, in critiques of papal pretensions. The *Book on the Authority of the Church*, the *Question at Vespers*, and a critique of the *Eight Questions of the Power of the Pope* by William of Ockham were diffused in the appendices to editions of Gerson by Edmond Richer and Louis Ellies du Pin. Apologists for the French monarchy, like Bishop Bossuet, and English polemicists of the Tudor and Stuart periods used Almain's authority in their criticisms of Rome.

Teachings

Jacques Almain's teachings have not all received equally serious attention. His thought on political and ecclesiastical power has been studied

extensively, and some attention has been given to his *Moralia*. Less attention has been given to the more abstract writings, especially the *Embammata phisicalia*, a discussion of propositions based on the first and third books of Aristotle's *Physics*. One notes Almain's willingness to criticize the great names of the past. He can be found occasionally disagreeing with or qualifying the opinions of John Duns Scotus, William of Ockham, and Robert Holcot, even while basing his lectures on the *Sentences* upon them. Moreover, he rejected the teachings of Marsilius of Padua, who had denied the coercive power of the clergy. Almain was eclectic in his use of sources. He drew, among others, upon Thomas Aquinas, especially in his political writings.

Almain embraced, without detailed discussion or definition, the distinction between the absolute and ordained power of God. He used the distinction when discussing the theology of justification. Francis Oakley suggests that Almain leaned toward an "operationalized" understanding of the absolute power, contrasting what is possible by God's absolute power with what happens "regularly and by the ordained power...excluding a miracle." Almain, following Holcot, thought that God's foretelling of events was contingent, that is, able to turn out differently, but the believer could attain merit by trusting God's pronouncements as received. The present "dispensation" permitted faith to be meritorious through conformity to God's will, even under such circumstances. This made reward arbitrary – and punishment as well – in Almain's theology.

Almain's moral thought was rooted in Aristotelian ethics. He taught that virtue was a mean between extremes. He did, however, limit this to the virtues acquired by human effort, assigning the acquisition of the theological virtues, especially charity, to the spiritual realm, in which they were inspired by the Holy Spirit. His *Moralia* was popular, going through multiple editions. It was criticized, however, by Juan Luis Vives, who claimed that reading a single page of Seneca or Plutarch would instill a stronger desire to be virtuous than would digesting the whole of Almain's *Moralia*.

The political thought of Almain was also rooted in Aristotelian doctrine. It required obedience to duly constituted authority, sacred, or secular, but it placed limits on the exercise of power

by pope or prince. Law, whether natural or positive, as Almain described it in *De paenitentia*, derived from a legislator. Human positive law was enacted for the common good, and it could vary with changed circumstances. Positive law could not abrogate the natural rights of communities, although it could bind the unwilling individual. Thus natural law permitted any community, including a kingdom or the church, to act in its own defense against a bad ruler. Almain's argument drew parallels between a kingdom acting in self-defense by resisting a bad king and the church acting through a council against an erring pope. Cajetan was quick to deny this parallelism, arguing that Christ founded the church (but not lay regimes) as a monarchy. Both sides of this controversy survived the original controversialists.

James of Metz

Russell L. Friedman
Institute of Philosophy, De Wulf-Mansion Centre
for Ancient, Medieval and Renaissance
Philosophy, Katholieke Universiteit Leuven,
Leuven, Belgium

Abstract

James of Metz was a Dominican theologian active in the years surrounding 1300. His thought as found in various versions of his mostly unedited *Sentences* commentary is

eclectic, showing the influence of Godfrey of Fontaines and Henry of Ghent among others. On certain issues he breaks with the ideas of Thomas Aquinas, for which he was criticized by Dominican contemporaries. On the other hand, James had a discernible impact on slightly younger theologians, like Durand of St. Pourçain, and evidence of his influence can still be found late in the fourteenth century.

James of Metz was a Dominican theologian active around 1300. Despite a substantial amount of research over the last century into James and his works, until very recently we could say very little with any degree of surety about them. This is beginning to change. In a recent article, comprising a comprehensive reading of James' only surviving work, his unedited commentary on the *Sentences* of Peter Lombard, Chris Schabel has set the research onto a more firm footing (Schabel [forthcoming](#)). Thus, although we still do not know when James died or whether he ever became master of theology, Schabel gives us good reasons to accept that James was from Flanders, entered the Dominican Order at its convent in Metz (hence his name), and lectured on the *Sentences* twice, first at the order's *studium* in Reims in 1298–1299, and then in Paris in 1300–1301. There are 12 manuscripts that are known to contain James' *Sentences* commentary in whole or in part, but they contain a number of different versions, the relations between which have long eluded clear scholarly analysis. Schabel goes a long way toward sorting out the complex nature of the different versions of James' *Sentences* commentaries. Thus, for books II–IV of James' commentary, we can be certain that there were two versions, the one a *reportatio* (i.e., detailed lecture notes taken by a designated student *reportator*) of the Reims lectures, the other a text made either in preparation for or on the basis of the Paris lectures; nevertheless, for large parts of books II–IV a critical edition could be made with one basic Latin text, due to a combination of (a) the two versions being roughly identical or (b) the surviving manuscripts carrying exclusively the one or other of the versions. For book I the situation is more complicated, both

because in many places the two versions are significantly different and because in addition to these two basic versions there exist a series of “additions” (*additiones*) to book I, which seem to be the beginnings of yet another revision by James to his commentary. A critical edition of James' entire *Sentences* commentary might require some 1000 pages of text.

As the 12 manuscript copies of it would attest, James' *Sentences* commentary had some readers, especially in his own day. Thus, a short treatise exists that replies from a Thomistic point of view to many aspects of James' thought as found in his commentaries on I, II, and IV *Sentences*; this treatise was probably written in the first decade of the fourteenth century, although Olszewski has drawn into question earlier literature's attribution of it to Hervaeus Natalis (the text is found in MS Le Mans 231, ff. 150ra–175rb; see on it, e.g., Köhler [1971](#): 2–3, 9; Olszewski [2010](#): 314–315; Schabel [2014](#): 38–39, 46–47). Moreover, it has been demonstrated that James influenced several early fourteenth-century Dominican theologians (cf. e.g., Hödl [1956](#): 12, 135ff, 163ff, 257–260; Plotnik [1970](#): 56; Köhler [1971](#): 205–208; Bakker [1999](#): vol 1, 102–103, 221–223; Olszewski [2010](#): 16–17, 273–331). Most significantly, on quite a number of philosophical and theological issues he had a clear impact on his more famous confrere, Durand of St. Pourçain, although there is no evidence that James was ever Durand's official teacher (*pace* Koch [1929](#)). Precisely because James was involved in the early fourteenth-century controversy surrounding the place of Thomas Aquinas and Thomism in the Dominican Order, his thought has received a good deal of attention from modern researchers, in spite of the textual difficulties associated with studying it. Indeed, modern scholarship has shown that James was no doctrinaire anti-Thomist, with James keeping very close to Aquinas' view on several topics, like predestination and the analogical predication between God and creatures (Decker [1967](#): 229–243, 116–124); on the eternity of the world, James not only defends the possibility of an eternal world, unusually for his day he makes in his treatment sophisticated use of Aquinas' opusculum *De aeternitate mundi* (Peck and Schabel

2015; Ullrich 1966: 102–158). Throughout his commentary on III *Sentences*, James relies heavily on Aquinas (Schabel forthcoming, section 4.2). Nevertheless, on many philosophical and theological issues James did part ways with Thomas Aquinas, and for this reason it is probably best to characterize James as an eclectic thinker, influenced by Henry of Ghent, Peter of Auvergne, and Godfrey of Fontaines, among others. Thus, with regard to the category of relation, James, clearly under the influence of Henry of Ghent, held that a relation is not an accident with its own being that inheres in its foundation, but rather is merely a way that its foundation exists (a *modus essendi*); a relation, then, takes all of its being from its foundation and does not enter into composition with it (Decker 1967: 438–460). James also rejected Aquinas' position that matter or quantity is the principle of individuation, maintaining instead that this principle is the individual's form (Ullrich 1966: 266–271; Köhler 1971: 226–251, with text editions 515–522). On the subject of God's knowledge of future contingents, James explicitly rejected the Thomist solution relying on the presence of the future to God in his eternity, James opting instead for a solution based on God's perfect knowledge of all secondary causes, a solution reminiscent of Franciscan opponents of Aquinas like William de la Mare (Schabel 2014). On the topic of the latitude (intensification and remission) of forms, James was one of the very few medieval thinkers to adhere to Godfrey of Fontaines' "succession of forms" theory (Schabel forthcoming; Solère forthcoming). In his cognitive theory, James held that a concept is the intellectual act, and not the product of that act as Aquinas had held (Decker 1967: 531–536; see also the study of angelic cognition in Ullrich 1966: 306–354). Moreover, in his theory of scientific knowledge, James lays a great deal of emphasis upon scientific knowledge being evident knowledge, here diverging significantly from the more Aristotelian emphasis upon scientific knowledge being knowledge of the cause or knowledge attained through syllogistic deduction. Linked with this, James holds that scientific knowledge is undergirded by "evidence of the thing in itself" (*evidentia rei in se*), privileging

thereby direct, empirical knowledge of singular things and events over indirect knowledge through causes or inference. Although James himself does not appeal to the distinction between intuitive and abstractive cognition, clearly his thought is leaning in that direction (Köhler 1974). While it is difficult to know whether James had much of a direct impact after the early fourteenth century, it can be shown that when dealing with divine foreknowledge the Cistercian James of Eltville, who read the *Sentences* at Paris in 1369–1370, quoted verbatim from James of Metz's treatment of the same issue (Schabel 2014: 47–48). All of this would seem to indicate that more study, and especially more text editing, is required before we have a clear picture of this significant figure's ideas and their role in the Scholastic discussion of the fourteenth century and later.

James of Viterbo

R. W. Dyson

Department of Government and International Affairs, Center for Medieval and Renaissance Studies, University of Durham, Durham, UK

Abstract

Bl. James of Viterbo, successively Archbishop of Benevento (1302) and Naples (1302–1307/1308), was a distinguished teacher, philosopher, and biblical scholar. He is now chiefly remembered for his treatise *De regimine Christiano*: a contribution, on the papal side, to the great conflict of 1301–1303 between Pope Boniface VIII and Philip, the Fair of France.

James of Viterbo (c. 1255–1307/1308), (Jacobus de Viterbio; Giacomo da Viterbo), surnamed Cappocci, was a member of the Augustinian Order of Hermits and a younger contemporary of Giles of Rome, by whom he was probably taught at the University of Paris. He succeeded Giles as Augustinian regent-master at Paris in 1293 and

remained there until he resigned in 1300 to take up a senior appointment in the order. On September 3, 1302 he became Archbishop of Benevento; three months later (December 12), at the request of King Charles II, he was transferred to the archbishopric of Naples. James was formally beatified by Pope Pius X on June 14, 1911, though he seems to have been known as *Beatus* for some time before that. He is known also by the scholastic honorifics of *Doctor graciosus*, *Doctor inventivus*, and *Doctor speculativus*.

James enjoyed a considerable reputation as a teacher and scriptural commentator, but his work has for the most part been neglected by scholars and much of it remains unpublished. He is remembered chiefly as the author of the treatise *De regimine Christiano*. The misleading description of this work as “*le plus ancien traité de l’église*” has been repeated often since it was coined by H.-X. Arquillière in 1926. Written at the height of the great conflict between Boniface VIII and Philip the Fair of France, *De regimine Christiano* is a spirited contribution to a contemporary political controversy. Its purpose is to promote a theory of papal *plenitudo potestatis* every bit as uncompromising as that advanced in Giles of Rome’s slightly earlier *De ecclesiastica potestate*, by which James is to an extent influenced. Very briefly stated, the argument of *De regimine Christiano* is as follows.

There are two chief powers in the world: royal and priestly. Elaborating to an extent on this Gelasian orthodoxy, James observes that royal power is in its essence a *potestas iurisdictionis*: a power to pronounce judgment. Priestly power, on the other hand, is the power to teach and administer the sacraments; as such, it does not include a power of judgment. By this rather remarkable *captatio benevolentiae*, James appears to concede to royalist opponents that there is a sense in which princes are indeed more powerful than priests. But there are, he goes on, two kinds or manifestations of royal power: *potestas regia temporalis* and *potestas regia spiritualis*. The former, the power to judge temporal things, belongs to kings; the latter, the power to judge spiritual things, to priests, and especially to the supreme pontiff. In its most obvious everyday occurrence, *potestas*

regia spiritualis is the jurisdictional power that the priest exercises in the confessional. But just as spiritual things are metaphysically higher than temporal things, so the power of spiritual judgment is superior to that of temporal judgment. Moreover, since all temporal things must be ordered to spiritual ends and must serve them, *potestas regia temporalis* is as it were contained within *potestas regia spiritualis*. The holder of the latter is, in effect, also the holder of the former, just as the art of architecture has authority over all the lesser arts that contribute to the completion of a building. It follows that the jurisdiction of the church, and especially of the supreme pontiff, extends to temporal as well as spiritual cases, and that kings, though ordinarily entrusted with a large measure of power, are ultimately subordinate to the church and answerable to the vicar of Christ.

De regimine Christiano repays detailed study by those interested in the perennial medieval literary disputes between *regnum* and *sacerdotium*. James’ argument is more elaborate and well crafted than a summary of it can allow it to seem, and he reaches predictable conclusions by means that are subtle and ingenious. Bringing together elements of Gelasian dualism, “political Augustinianism” and Aristotelian teleology, James makes the most comprehensive claims for papal supremacy in temporals while simultaneously appearing to give ample scope and consideration to the rights of kings. In this latter respect, *De regimine Christiano* strikes the reader as less harsh and more plausible than Giles of Rome’s *De ecclesiastica potestate*. Indeed, James is in some ways politely but clearly critical of Giles; it has to be said also that he writes a far less prolix and wearisome style. *De regimine Christiano* is an impressive contribution to the publicist literature produced in support of the papacy during the fateful years leading up to the “Babylonish captivity” in Avignon.

Jean Regis

Andrei Marinca
 THESIS-Project, IRHT, Paris, France
 Center for Ancient and Medieval Philosophy,
 Babeş-Bolyai University, Cluj-Napoca, Romania

Abstract

Jean Regis was a Franciscan theologian active at the Parisian Faculty of Theology in the early

1370s. We know that his lectures on Peter Lombard's *Sentences* started in 1369 and that he was licensed in theology in 1375–1375 (Glorieux, *Recherches de théologie ancienne et médiévale* 18:128–139, 1951). The *Chartularium* of the University of Paris informs us that on the 3rd of September 1375, Regis was questioned as regent master about the affair regarding the French translations of Marsilio of Padua and John of Jandun (*Chartularium*, III, p. 225–227). Regis is a lesser known historical figure, due to scarcity of information about his life and to his apparent lack of influence on posterity. The post-1370 *Sentences* commentaries edited so far never mention him, and ironically his own commentary was previously misattributed to Jean Gerson (Longspré 1930; Combes, *Archives d'histoire doctrinale et littéraire du Moyen Âge* 12:365–385, 1939). The confusion was cleared out eventually, giving way to the proper study of Jean Regis (Glorieux, *Recherches de théologie ancienne et médiévale* 18:128–139, 1951). Since the identification of his commentary, along with his principal questions, in Cod. Paris, Bibliothèque nationale de France, lat. 15156, the research conducted on Regis' thought mainly dealt with his indebtedness to Nicholas of Autrecourt (Brânzei, Epilogue: *Sentences* commentaries in Paris around 1369. In: Brânzei M, Schabel C (eds.) *Philosophical psychology in late medieval commentaries on Peter Lombard's Sentences*. Actes of the XIVth annual symposium of the S.I.E.P.M. Nijmegen 28–30 Octobre 2009. Turnhout: Brepols, forthcoming) or as a part of the doctrinal developments regarding the Eucharistic presence in the later fourteenth century (Bakker, *La raison et le miracle. Les doctrines eucharistiques* (c. 1250–c. 1400). Contribution à l'étude des rapports entre philosophie et théologie. Selbstverl, Nijmegen, pp 227–231, 1999).

Regis asks 31 questions, 13 for Book I, 11 for Book II, 3 for Book III, and IV for Book IV (for a question list, see Combes, *Archives d'histoire doctrinale et littéraire du Moyen Âge* 12:365–385, 1939). His commentary exhibits common traits with *Sentences*

commentaries produced around the same time, as well as its peculiarities that separate it from those other theological productions. For example, Regis places an accent on the first book and the second book, without completely neglecting the third and the fourth. Such an emphasis on the first two books is a general tendency of the later fourteenth-century *Sentences* commentaries (Bakker, P. J. J. M., Schabel C. 2002). Regis' text is relatively small, given that it is comprised of 31 questions of the total length of 120 folios. Compared to other commentaries composed about the same period, it is quite peculiar in his lack of almost any explicit quotations of scholastic theologians, especially of those more recent than the early fourteenth century. Consequently, this absence of citations burdens the task of identifying Regis' influences.

More indicative of Regis' intellectual ambience are his principal questions, which were preserved at the beginning of his commentary. In fact, it is only through Regis' testimony from his *principia* that we know the date when several students incepted as bachelors in theology: Richard of Beaumont, Francois Christophori, Jean Textor, James of Eltville Ocist, Onofrius of Florence OESA, Jean Corbechon OESA, and Jean de Diadona (Regis also mentions a Dominican, yet he fails to write his name). These documents are all the more important since Regis engages in lively debates with these bachelors, thus recording their opinions and arguments, which would have been otherwise lost for us, given that for most of their *Sentences* commentaries are lost or have not been identified. A critical edition and study of Jean Regis' principal questions is in preparation by Monica Brinzei.

Regis seems to have been interested in epistemological themes, judging from the content of the Prologue and from some of the questions he addresses in the first book of his commentary. For instance, in the third question from Book I, he asks whether it is *per se notum* that is absolutely necessary that there is one God (Utrum per se notum sit unum Deum esse simpliciter necesse esse). In the second book,

Regis deals with problems of causality, eternity, movement of angels, and cosmology. The longest question from the entire commentary is in the third book, and it is concerned whether the Virgin Mary had a sinless nature from birth (f. 154v–163r). The fewest questions are located in the fourth book, where Regis treats the issues of baptism, Eucharist, indulgence, and Christ's reparation, respectively. The complexity of his *Sentences* commentary calls for further investigation. For now, in lack of a complete edition of his work, I will offer a sketch of his sole question on Peter Lombard's Prologue.

Regardless of its low impact on scholastic thought, Regis' commentary provides a useful insight into the Parisian intellectual milieu of the 1370s, a yet insufficiently covered period in the historiography of medieval philosophy. Although derivative of other authors' ideas, Regis' thought is quite interesting in its own right. His first question, in which Regis addresses the problem of compatibility between theological knowledge and the merit of faith, is divided into three main articles: the first article reveals a keen interest in epistemology, especially regarding the concept of evidence; in the second, Regis unfolds a discussion about the nature of theological discourse, while he dedicates the third article to determine whether evident knowledge of theological truth is compatible with faith.

Epistemology

According to Regis, evident knowledge is manifold, for he distinguishes between three kinds of evidence: the evidence of *per se notae* propositions, the evidence obtained through demonstration, and the evidence of contingent truths. In order to illustrate the last kind of evidence, Regis drew from Augustine's *De Trinitate*. In Book XV of treatise, Augustine dismantles the arguments of the skeptics with regard to the impossibility of knowledge, showing that there are perceptions that one cannot ever doubt, namely, "I know that I live" (*De Trinitate*, 15, 12). It is notable that, following Augustine, Regis falls

in line with the other fourteenth-century theologians who employed the Augustine passage to expand the sphere of evident knowledge by encompassing some contingent truths (Brânzei 2008).

Another influence on Regis' thought, that deserves further investigation, is Nicholas of Autrecourt's and, more notably, Autrecourt's *socius* and addressee of his letters, Bernard of Arezzo. Regis adopts from Autrecourt the thesis that any evident consequence is reducible to the principle of noncontradiction, or the first principle (*primum principium*). For Autrecourt, the evidentness of any valid reasoning is grounded in the first principle, so that a consequence is evident only if what its consequent signifies is partially or totally identical with what the antecedent signifies. Such a theoretical constraint imparted on the validity of inferences is Autrecourt's basis for his critique of Aristotelian ontology, which according to Autrecourt does not pass the test of evidence, since it infers the existence of one thing from an entirely different one, i.e., the existence of substances from the existence of accidents. Following Autrecourt's logical criteria, such a consequence is not evidently valid, because substance and accident do not have an identical meaning; as a corollary, it does not entail a contradiction if one exists and the other does not. While Autrecourt's use of the principle of noncontradiction has disruptive effects on Aristotle's metaphysics and natural philosophy, Regis' use of it is more modest in scope: the Franciscan author wants to prove that many of the necessary truths, such as mathematical axioms, are demonstrable by being reducible to the first principle.

The point of disagreement between Regis and Autrecourt is the latter's thesis that it is impossible to infer the existence of one thing from the existence of completely different thing, since the existence of one and nonbeing of the other does not entail a contradiction. The formulation of this thesis and what follows from it was the bone of contention between Autrecourt and Bernard in the second letter that Autrecourt addressed to the Franciscan. Bernard's response to Autrecourt, noted by Regis, raises the objection that the

existence of a thing is evidently deducible from another, since the negation of one while the remainder persists contains nevertheless a virtual contradiction (*contradictio virtualis*), i.e., a kind of contradiction from which a formal one could be inferred (II, 12). Although Autrecourt does not expand on the concept of virtual contradiction, his rejection of Bernard's distinction between formal and virtual contradiction suggests that the latter is proved by deducing one or more consequents from both propositions of a consequence, until they will be proved to entail a formal contradiction (II, 14). While Autrecourt dismisses the distinction as ineffective, Regis goes on to support it by stating that are some middle terms that can reveal a formal contradiction when one of the terms of a relation is denied; for example, the terms "cause" and "effect" have the common middle term, "correlative being," so if one does not exist, neither the other. Thus, in the case of cause and effect, although they are different realities, the affirmation of one and the negation of the remainder would still give rise to a formal contradiction. We do not know whether or how Bernard responded to Autrecourt's counterargument, because none of his writings are extant, but if Regis somehow follows Bernard here, we might get an idea about Bernard's line of reasoning.

The Theological Discourse and Its Relation to Faith

The second article is influenced by the Cistercian Gottschalk of Nepomuk conception of theology. Regis' copious borrowings from Nepomuk's *Sentences* commentary attest a relaxation of doctrinal barriers between the mendicant orders at Paris in the second half of the fourteenth century. The main thesis of Regis' second article is almost verbatim extracted from Nepomuk's commentary, and it states that the conclusions of theological discourse are to be inferred only from the propositions of the Bible, a thesis that is reminiscent of Rimini's model of deductive theology. Developing a carefully constructed criticism of Petrus Aureoli's conception of theology as a declarative habit, Rimini depicts theology as a *habitus*

essentially confined to the interpreting of Scripture. Rimini's view on theology was therefore adopted and expanded upon by numerous university theologians, one of them being the Cistercian Gottschalk of Nepomuk, who read the *Sentences* at Paris in the academic year 1366–1367. In the case of Regis, the influence of Rimini is mediated by Gottschalk, but undoubtedly present.

Finally, the Franciscan heritage is also present in Regis' treatment. In the last article of his question, in which Regis discusses the compatibility between faith and theological knowledge, he makes a selection of passages from the *Sentences* commentary of Peter of Navarre, a Franciscan Scotist theologian who was active at Barcelona around 1322. Regis uses Navarre's questions on Peter Lombard's Prologue in order to determine his own question in favor of a full compatibility between evident knowledge of theological truth and the merit of faith. Another thread of Regis' question, linked with the earlier themes, deals with the role of the will in producing assent toward articles of faith. It seems that Regis' concern with the roles of the will and the intellect in producing belief is linked with the earlier debates from the fourteenth century that addressed the part of will as the foundation of faith. While Ockham considered the will as the sole cause of religious assent, Holcot defended the opposite view, according to which belief in the articles of faith have a rational grounding in the intellect. Although not explicitly, it appears that Regis sides with Holcot in this aspect.

Jerome of Prague

Ota Pavlíček

Institute of Philosophy of the Czech Academy of Sciences, Prague, Czech Republic

Abstract

Jerome of Prague (ca. 1378–30 May 1416) was a Czech philosopher at the forefront of a group of Bohemian masters in the University of

Prague who favorably received parts of the realist thought of the Oxford philosopher and theologian John Wyclif. After bachelor degree studies in Prague, Jerome received his master's degree in Paris in 1405. In 1406 he was accepted as a master at the universities of Cologne and Heidelberg: his stays at these universities were short lived, however, because he was regarded as excessively opinionated. From 1407, Jerome was among the Bohemian masters at the University of Prague, where he was involved in issuing the Decree of Kutná Hora, which favored the Bohemian nation above the three German nations. This action led to the departure of the German students and masters from Prague and the strengthening of other Central European universities. Jerome aroused indignation because of his adoption of realist opinions based on Wyclif's thought and his defense of Wyclif. As a consequence, he was put on trial for heresy in Vienna, from which he fled: he was excommunicated in his absence in 1411. In the last years of his life, Jerome traveled to Poland and Lithuania as a diplomatic representative of Bohemian nobles. In 1414, he decided to defend Jan Hus at the Council of Constance; however, he was taken into custody, tried, and sentenced to death as a heretic. Jerome was burned at the stake on 30 May 1416 and became a martyr to the reformation of the church. His realist thought is notable for his philosophical interpretation of certain theological topics and for his promotion of these topics in the faculty of arts. His main inspirations were Augustine, John Wyclif, Plato's *Timaeus*, and Calcidius' commentary on the *Timaeus*.

Biography

It is generally agreed that Jerome of Prague was born in Prague between 1370 and 1380, and, based on his promotion to bachelor degree status in 1398 and on his later statements, he was probably born around 1378. It is highly likely that both his parents were Czech because during his later studies he was apparently awarded a scholarship,

established by Vojtěch Raňkův of Ježov (Adalbertus Ranconis de Ericinio), which was reserved for students who had two Czech parents. With the help of this scholarship, Jerome set out for Oxford in 1399, where he may have resided in Beam Hall or White Hall. The purpose of his journey was Jerome's desire to learn and also the interest of Czech university masters in the treatises of John Wyclif. In England, he also started to keep a notebook in which he continually recorded texts and authorities that might be cited in support of his views on the reality of universals. In March 1401 at the latest, Jerome returned to Bohemia, bringing with him copies of several of Wyclif's works, especially the *Dialogus* and the *Trialogus* (Šmahel 1970, 2010; Pavlíček 2017).

We know little about the course of Jerome's life between his return to Bohemia and April 1404. When, however, he was charged at the Council of Constance with defending the articles ascribed to Wyclif when they were condemned in his home city, he responded that at that time he was in Jerusalem. Wyclif's articles were condemned in Prague in 1403 as well as in 1408, so it is not clear when Jerome's possible visit to Jerusalem took place (Bartoš 1961; Šmahel 2010). In 1404 we find Jerome in Paris, where he matriculated in April as a bachelor in the faculty of arts, and as a member of the university's English nation. He obtained the degree of master of arts in 1405 (Šmahel 2010). In Paris, he studied, among other subjects, Wyclif's treatises on logic, and dispatched additional books to Prague (Klicman 1898). His stay there, during which he allegedly questioned the condemnation of Wyclif as a heretic, and praised him and presented opinions based on Wyclif's thought, ended with a disputation that so scandalized his audience that he was summoned before Jean Gerson, the university chancellor. Jerome avoided the encounter and instead set out on a journey to Cologne (Kałuža 1985; Herold 1995). There, he matriculated as a "respected master" in March 1406. As late as 1425, however, the local masters still remembered Jerome's stay at the university, when – at the request of the imperial electors – they explicitly condemned his teaching; their representatives were also present at the Council of Constance,

where they accused him of heresy (Herold 1989). Jerome's time in Cologne was clearly very turbulent, and he was again virtually forced to flee, this time to Heidelberg. He matriculated there as a master in April 1406, and participated in a disputation at which he performed "inappropriately and offensively." Because he refused to recant his views, his university membership was suspended, and an accusation against him of accepting four heretical or offensive articles was submitted to Matthew of Cracow, the Bishop of Worms. Rather than recant, Jerome fled once more, this time to Prague, where he arrived toward the end of 1406. Here, too, after meeting the university requirements, he was admitted as a master to the faculty of arts (Šmahel 2007).

In Prague, Jerome joined the struggle for the privileges of the Bohemian nation against the other three German nations and promoted philosophical thought based on John Wyclif's treatises. In 1409, he participated in the Prague disputation *de quolibet* of Matthias of Knin. On this occasion, he delivered the *Recommendatio artium liberalium*, in which he declared his allegiance to King Wenceslaus IV and defended the Czech nation, contributing to discussions on various aspects of Czech nationality. He also promoted the study of Wyclif's treatises and called on students to search for the vein of truth in Wyclif's writings. Partly thanks to his efforts, Wenceslaus IV was won over to the side of the Czech masters. The results of the struggle included the issuing of the so-called Decree of Kutná Hora in 1409. This edict assigned three votes to the Bohemian nation and only one to the three German nations, which led to the departure of the German students and masters from Prague. Afterward, Jerome began diplomatic travels. In 1410 he was in Buda, where he delivered an oration before King Sigismund. He then appeared in Vienna, where he was detained and subjected to a heresy trial. He managed to escape a heavy penalty by flight, but he was excommunicated for not appearing at his trial. Subsequently, we know that he was in Prague, where, in 1412, he participated in the quodlibetal debate of Michal of Malenice. More importantly, he contributed to the protests against the selling of indulgences in Bohemia in 1412 by organizing

student demonstrations in Prague. In 1411–1413 Jerome made at least one journey to Poland, where he was received at the court of King Wladislav Jagello in Cracow, and then at the court of the Lithuanian Duke Vitold in White Russia. According to Jerome's own words, Vitold wanted to know if it was indispensable to rebaptize his subjects, who were Orthodox Christians and were converting to the Roman Catholic church. Jerome advised him that it was not necessary for them to be rebaptized and that it was sufficient to instruct them about the Roman faith (Šmahel 2010).

Jerome's last journey led him to Constance, where he was preceded by the church reformer John Hus, who was defending his teaching before the conciliar convocation. Jerome appeared in Constance on April 4, 1415, but temporarily resided in nearby Überlingen. As early as April 7, declarations were posted around Constance in which Jerome asserted the illegitimacy of Hus' imprisonment and also requested a certificate of safe conduct and a public hearing. This effort was considered to be impertinent, and Jerome attempted to flee back to Bohemia on March 9. Detained near the Bohemian borders, however, he was returned to Constance on May 23, 1415. There he encountered enemies dating back to his student days. He was imprisoned, and on September 23, 1415, he distanced himself from Hus (executed in Constance in July 1415) and from Wyclif (posthumously condemned by the Council in May 1415) by declaring their articles to be heretical. When, however, Gerson delivered his oration *On Recantation in the Matters of Faith*, it dawned on Jerome that, although he had avoided the pyre, instead of liberty he had won a lifetime of imprisonment. Therefore, when summoned before the Council on May 23 and 26, 1416, he delivered an exceptionally powerful speech that dazzled even the Florentine humanist Poggio Bracciolini. In his statement, Jerome regretted his recantation, which had mostly harmed his own conscience, and revoked all the accusations he had leveled against Hus and Wyclif. Consequently, the Council at its twenty-first session on May 30, 1416, declared Jerome a heretic, excommunicated him, and handed him

over to the secular authorities, who proceeded to execute him without delay (Šmahel 2010; Fudge 2016).

Thought

Writings and Their Sources

Jerome's known and extant writings consist mainly of seven *quaestiones*, which he presented at the faculty of arts, six of them in Prague and one in Heidelberg. Doctrinally related to these *quaestiones* is his *Shield of Faith*, a triangular figure accompanied by a commentary, and part of a debate between him and Blasius Lupus that began at the 1409 Prague quodlibetal disputation. His *Recommendatio artium liberalium* comes from the same disputation. There are two further treatises connected to Jerome, although his authorship is not certain: the *Collecta de probationibus propositionum*, based largely on the logical treatises of Wyclif and Johannes Tarteys, and a preparation for a discussion of Jerome's *Quaestio de mundo archetypo*.

To understand the background to Jerome's thought and his method of work, it is vital to consider the sources he used when composing his writings. The most significant role belongs to the writings of Wyclif, above all his treatises *De dominio Divino*, *De ideis*, *De materia et forma*, *De universalibus*, and partly also his logical tracts and the treatise *Triologus*, from which Jerome carefully selected passages and combined them with other sources and his own interpretations. The most important among these are Calcidius' translation of and commentary on Plato's *Timaeus* and, particularly on the topic of the divine ideas, St. Augustine. It is noteworthy that Jerome borrowed some of the authorities and arguments he used from other authors, especially Wyclif, but also Robert Alyngton and others (Šmahel 2010; Šmahel and Silagi 2010; Pavlíček 2017, 2018a).

Shield of Faith

Of Jerome's writings, his *Shield of Faith* (Fig. 1) is extant in the largest number of his manuscripts and can thus be regarded as his most famous work. It is a pictorial interpretation of Ephesians 6.16, based on an older tradition of representing God and the Trinity with which Jerome became

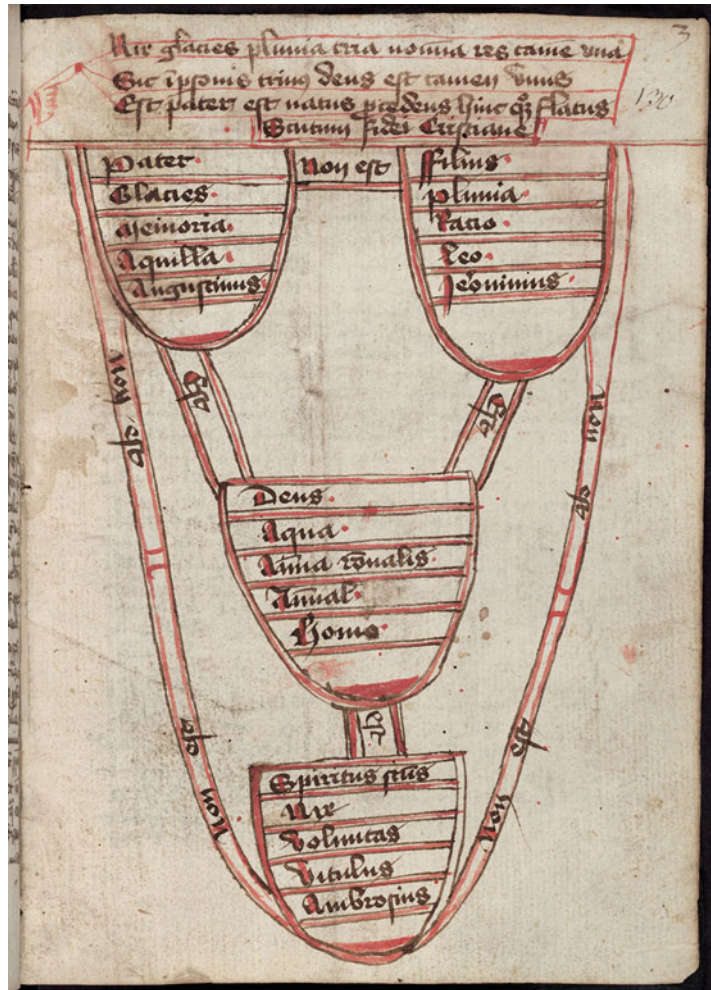

acquainted during his journey to England. The shape of the figure is close to that of an inverted isosceles triangle. Triads of terms are inscribed within the angles, and a concept common to them all is placed in the middle. The terms Father – Son – Holy Spirit are inscribed sequentially in the left angle, the right angle, and the lower angle of the triangle, and the word God is written in the middle. On the sides between the angles we find written "is not," and "is" is written on the lines connecting the angles to the center of the triangle. Concepts from the realm of the sensible world are placed in rows in the relevant places under the concepts connected to God and the Persons of the Trinity. A common term is found at the center and subordinate terms in the corners: for example, the triad memory – reason – will and the common term "rational soul," or the triad Augustine – Jerome – Ambrose and the common term "human." In his commentary on the figure, Jerome explains that there are close similarities between the relationships in the Trinity and those in the created triads. Similar to the way three Persons convene in the Godhead, although being mutually different, certain created entities that are mutually different convene, according to Jerome, in a common created entity. It follows, for Jerome, that this arrangement of created entities flows ("manat") from the arrangement of the Trinity. In one of his recantations in Constance, he said that he used the *Shield of Faith* to illustrate and support his opinion about the reality of universals when teaching young students: just as the divine Persons are one God, so, too, created singulars share a common universal. Although the topic of the created arrangement of created entities in a common entity based on uncreated arrangement of the Trinity links Jerome to the tradition of finding *vestigia Trinitatis* in the created world, the comparison between God and a universal is related to Peter Lombard's *Sentences*, book I, dist. 19, where Peter and the commentators on his *Sentences* dealt with precisely this topic (Šmahel 2003; Pavlíček 2014a, b, 2018a).

God and the Divine Ideas

The multiplicity of divine ideas which, understood altogether, represent the archetypal intelligible world of the divine mind is one of the most

Jerome of Prague,

 Czech Republic

important elements of Jerome's thought. He maintained that the ideas which are the highest universals in the divine mind are essentially God, but they differ by means of a formal distinction. As the highest degree of being of every created and creatable thing, they precede potential being and the being in actual existence. This motif is linked to Jerome's view of the hierarchy of being, at the peak of which is situated God along with his ideas.

Jerome stressed that divine ideas are a necessary condition for wisdom, a claim he supported by referring to Plato (whom he calls "the king of pagan philosophers") and by citing passages from Aristotle and St. Augustine. As wisdom, according to Aristotle, is based on understanding first causes or principles, and because the ideas are

the first causes and principles of all created or creatable entities, no one can claim to understand something without knowledge of the ideas. Jerome also emphasized that Augustine, in his *Quaestio de ideis*, maintained that there is so much power in the ideas that no one can be wise without knowing them. As a follow-up, Jerome argued, on the basis of an etymological analysis of the Greek word "philosophus," that every philosopher, as a lover of wisdom, must be acquainted with the ideas. For this reason, the ideas are an appropriate topic for every true member of the faculty of arts and, in particular, for realist metaphysicians, to whom Jerome implicitly claimed allegiance. His contextualizing note, stating that the faculty of theology should not usurp the topic of ideas to the detriment of the faculty of arts,

reveals that at some medieval universities divine ideas were not regarded as a pertinent topic for the faculty of arts (Pavlíček 2018b).

In Jerome's view, divine ideas understood as divine reasons are a prerequisite for the divine wisdom. Drawing on Augustine's *Retractationes*, he says that God created the universe on the basis of the intelligible world. Denying this opinion is equivalent to asserting that God acted thoughtlessly and did not know what he was doing, or that God created the universe either foolishly or accidentally. Because, however, God acts rationally, which is not possible without reasons, the divine mind has to include reasons by which God causes the universe. These reasons must be numerous because the species of human and the species of horse cannot be caused by the same reason and, thus, the number of eternal divine reasons corresponds to the number of species of created entities. Jerome's argument for the multiplicity of divine ideas understood as divine reasons comes once again from Augustine, this time from his *Quaestio de ideis*, although Jerome speaks about species and not individuals as Augustine had done (Herold 1989, 1990, 1995; Kałuža 1994, 1997; Pavlíček 2018a).

Theory of Creation

As just described, divine ideas have a crucial role in Jerome's theory of creation. In this role, he refers to the uncreated eternal ideas by many different terms, e.g.: co-causes, legitimate causes, or examples according to which God creates everything he creates outside his mind. Basing his views mainly on Augustine, the Bible, Calcidius, Plato, and Wyclif, Jerome maintained that, in the first instant of time, God created all temporal things; however, they were not created in their proper actual existence, but in their secondary causes, in genera and species, or in seminal reasons. In another *quaestio*, Jerome says that, in the first instant of time, God created the universal material nature (*universa natura corporea*), of which he formed one part in heaven and the other on the earth. Although the universal nature corresponds to the material essence that was created in the first instant of time by means of *creatio* solely on the basis of God's ideas, the formation of this

essence proceeds by means of *generatio* and requires the essence as its subject. In this context and as an allusion to the eternity of the universe maintained by Aristotle, Jerome argues that, in contrast to the eternal world of ideas, the created universe is not eternal.

The material essence before its formation corresponds, in Jerome's thought, to prime matter which contains the ability to receive any substantial or accidental form. The reception of forms gives rise to a compound, that is, a thing in its actual existence. Jerome maintained that the initial formation of prime matter corresponds to the production of the four elements in their pure quality. It is on the basis of these elements that more complex entities come into existence. Although God created prime matter, it cannot be annihilated, because, according to Jerome, it is proper for God to proceed by making what is better, whereas annihilation does not include any goodness. God's omnipotence consists in the power of freely making or not making, and not in the power of creating and destroying. Jerome offers another view on prime matter when considering the universe's essential ordering. In this context, the created universal essence corresponds to the analogical being, which is the first and most universal created entity. As all other entities participate in this most universal being, it contains everything else and is the highest created being on the essential scale. The theory of creation is a topic that connects other parts of Jerome's realist thought (Kałuža 1994, 1997; Pavlíček 2017, 2018a).

Created Universe: Harmony, Real Universals, Science, and Logic

Jerome was persuaded of the harmony of the sensible world, which is based on the harmonious arrangement of ideas in the divine mind. One of his arguments for created harmony is his account of the sufficiency of categories, that is, his division of Aristotle's categories, which he borrowed from Robert Alyngton. In this view, each of the nine accidents understood as the highest universals inheres in the substance in three possible ways (the way of form; the way of matter; the way of matter and form) and in

three possible modes (from inside; from outside; from inside and outside). Because each of the nine accidents has its own unique combination of the way and the mode of inherence, Jerome concluded that this inherence represents their “most beautiful harmony” and that therefore, for the harmony of the sensible world, it is necessary that universals really exist (Pavlíček 2011).

As a realist philosopher strongly influenced by the realism of John Wyclif, Jerome maintained the real existence of created universals (genera and species), which, in his view, were really and essentially identical with singulars, on the one hand, and which differed by means of a formal distinction, on the other. At the same time, superordinate universals are understood as causes of subordinate entities and as their inner principles and components, which precede the subordinate entities through their natural priority. Thus, the existence of the subordinate entities is conditioned by the existence of the superordinate entities. One of Jerome’s interesting arguments in support of universals comes in an exegesis of the biblical account of creation. Although creation in the first instant of time corresponds to Genesis 1.1, a later passage, Genesis 1.21–25, which speaks about the production of living creatures in genera and species, testifies, according to Jerome, to the reality of universals. He stressed that those who hold that universals do not exist before they are produced by the human mind go against infallible Scripture. If this were the case, it would mean that, according to the Bible, God created living beings in human concepts or terms: in other words, that God did not create any real extra-mental living beings. Jerome concludes that holding such a position is a sign of madness (Pavlíček 2014b, 2018a).

Several important aspects are connected to Jerome’s doctrine of universals, one of which is his theory of real (scientific) knowledge. In his realist interpretation of several of Aristotle’s claims, such as that knowledge is only of the universal and that [real] things do not exist in human souls, Jerome claimed that real knowledge of universals is conditioned by the existence of knowable universals, which are real

things, independent of any operation of human reason. He uses this argument to mount one of his criticisms of nominalism. If the nominalists say that universals exist only as terms or concepts, they have to admit that human knowledge is restricted to terms and concepts, which is wrong, as is nominalism itself. This criticism linked Jerome to other realist scholars, including Walter Burley and Heymeric of Camp, who argued that the nominalist approach to universals leads to the impossibility of real knowledge. In this context, Jerome used one of his mocking comparisons: the doctors of signs, that is, the nominalists, who believe that they can base knowledge on concepts, are similar to a hunter who intends to go hunting with dogs painted on a piece of paper (Pavlíček 2018a).

Another important standpoint connected to Jerome’s realism is his approach to logic. Basing himself on Wyclif’s treatise *On universals*, Jerome divided predication into two main types: (1) predication of a term about a term and (2) real predication. According to Jerome, nominalism is limited to the first type of predication, which, however, is not a predication in the proper sense, but only a predication derived from the second type. In the case of real predication, every universal *in actu* is predicated of subordinated entities *in natura*. The expression of real predication is a real proposition of which the truth-value consists in the relationships between the primary significates, which are the real subject and the real predicate. For example, in the case of a proposition “man is [an] animal,” the propositional truth-value does not lie in the spoken or written words, but in the primary significate which is a real thing – the real universal human (or human nature), which belongs to the genera of animals. Propositions based on signs are based on real propositions, just as a painted man is based on a real man. Thus, Jerome’s main type of proposition corresponds to real things, on which real logic is also based. Because real universals are a necessary condition for real logic, Jerome concludes that whoever says that universals are mere signs is a heretic in dialectic, a judgment that he borrowed from Anselm of Canterbury (Kažuza 1997; Pavlíček 2018a).

Use of the Bible

Throughout his life, Jerome of Prague recorded important authorities and arguments – encountered in his studies at Oxford, Paris, and elsewhere – in a notebook especially acquired for that purpose. The texts he selected reveal a remarkable variety of references to both ancient and medieval authors. If we consult the index of Jerome's writings and compare the number of references to Aristotle and the Bible, we find, on the one hand, that Jerome was far from the later Reformation principle of "sola Scriptura," and, on the other hand, that Scripture occupied an appreciable role in Jerome's writings, in which he sought to demonstrate that his ideas rested on scriptural authority, although he never studied at a faculty of theology where students were taught biblical exegesis.

According to Jerome's own words in his speech *Recommendatio artium liberalium*, Scripture occupied the highest place among authorities, and thus its role was irreplaceable in the strategy of his argumentation. In the *Recommendatio* he explicitly affirmed that it would be foolish to adhere to everything that he read in the books of Wyclif and other doctors and to hold it as firmly as his Christian faith. According to him, on the other hand, if the Bible states that something is so, then it is the truth. This position is in harmony with his assertion in another treatise that Scripture is infallible. Given that Jerome supports his doctrinal standpoints with biblical authority, it follows from these passages that he was convinced of the harmony between those standpoints and the objective meaning of Scripture.

It is also remarkable that, when mentioning the authors of the biblical books, Jerome referred to them as philosophers. With regard to the divine ideas, the author of the book Sirach becomes "an ancient Hebrew philosopher," John the Evangelist enjoys "the authority of a heavenly metaphysician," and the Apostle Paul is "a heavenly philosopher." While discussing the creation of the world, Jerome describes Moses as "the wisest philosopher of the Hebrews"; elsewhere, in connection with his realist interpretation of Genesis 1:24, he calls Moses "an extraordinary philosopher"; and, in connection with the analogical

predication of good to created things, he refers to the Evangelist Luke as "a philosopher." It is probable that by designating biblical authors as philosophers Jerome intended to highlight the philosophical dimension of certain theological topics in Scripture, such as the creation of the universe. The background to this position might have been his effort to defend the right of philosophers to discuss these topics in the context of the faculty of arts. This conjecture would correspond to Jerome's claim that it was appropriate for divine ideas to be discussed not only in the faculty of theology but also in the faculty of arts (Pavliček 2015, 2018a, b).

Jesuit Political Thought

Harro Höpfl

Essex Business School, University of Essex,
Colchester, UK

Abstract

The Society of Jesus has always been a highly “political” religious order. The context for its political thought was its engagement with higher-level education, its antiheretical, pastoral, and missionary activities, and its close relationships with secular rulers. Although there was no single, cohesive, or exclusively Jesuit political doctrine its members shared some premises: the (Thomist) premise that reason and revelation are complementary; that prudence is a pre-eminent virtue in all practical activity; and that the principles of good order (organization) are the same for church, polity, and any other “body” or corporation (including the Society itself). Inferences could therefore be drawn from reason to revelation and from one kind of body to another. Reason and revelation concurred that the polity requires coordination of individuals to the common good by coercive authority, and therefore hierarchy and

headship, although that headship need not be monarchical. However, like most of their contemporaries, Jesuits regarded monarchy as the best form of government. Although authority as such is natural and necessary, the element of consent is the political community's freedom to choose its own form of government. The alterability of most laws implies an "absolute" ruler. However, the authority of any ruler or regime is limited by fundamental laws, natural and divine law, and the natural and legal rights of subjects, as well as the right or threat of tyrannicide. The Society's anti-heretical activities were centered on defending the ultimate authority of the papacy over the church, especially as supreme arbiter of controversies about faith and morals. Jesuit theologians defended the papal "indirect power" to intervene in secular government where the salvation of souls was involved. This could threaten the independent authority of secular rulers. However, the Society was normally highly sympathetic to the position of secular rulers; indeed Jesuit theologians and controversialists made substantial concessions to "reason of state."

Almost from the establishment of the Society of Jesus (1540), Jesuits have been involved with things political. The Society's founders, preeminent among them Ignatius Loyola, had not intended this. However, their placing the Society at the papacy's disposal, the remarkable gifts and educational attainments of its members, and its adaptability meant that even in the lifetime of the founding fathers (Ignatius died in 1563, Lainez his successor as superior general in 1565, and Salmerón, the last surviving founder, in 1586), its activities came to center on secondary- and tertiary-level education and antiheretical engagements, as well as retaining the original focus on foreign and domestic missions, and spiritual guidance. For all these activities, the Society needed patrons among prelates and secular rulers to fund and protect it, and in dealing with them it acquired a vast collective political experience, as well as political enemies. Its various engagements also demanded theoretical reflection about politics.

The Place of Politics in the Jesuit Curriculum

There was no exclusively or peculiarly Jesuit political doctrine, still less a collective political theory. The *Ratio studiorum* of 1599, the Society's definitive curriculum for its entire educational establishment, did not mention the study of politics or even history. Thomism, which the *Ratio studiorum* made the touchstone of orthodoxy for the Society, did, however, have a place for reflection about *respublica* in the *de regimine principum* (mirrors for princes) tradition, and the parts of moral philosophy and theology (*ethica*) concerned with justice, law and right, and *dominium* (*de iustitia et iure*). Casuistry, the practical and speculative elaboration of the Society's specialism of the confessional, also treated some political matters. Moreover, "controversial theology," the Society's distinctive curricular innovation, centered on ecclesiology, and hence required consideration of the relationship between the church and the polity. In addition, Jesuits made notable contributions to "reason of state." Finally, the Society's activities and doctrines that were (sometimes gratuitously) attributed to it demanded political defences. Because of the approaches adopted by Jesuits, these genres and discussions did not remain entirely dispersed, but neither were they combined into a cohesive discipline, unlike the Protestant academies in the Holy Roman Empire and the Netherlands in the early seventeenth century, in which "politics" became a curricular topic. Adam Contzen S.J. did, however, produce an exemplary Catholic version of this kind of study, his *Politicorum libri decem* (Contzen 1621).

The Premises of Jesuit Political Thought

Jesuits generally (like their Thomist predecessors and teachers) predicated their political reflection on two fundamental premises. The first was the complementarity of reason and revelation, so that although revelation might transcend what reason alone could attain to, it never contradicted it. "Reason" was a catchall term that meant reasonableness or common sense, the authority of

secular philosophers (in ethics and politics Aristotle and Cicero, in particular) and of Roman law, or inference from premises to conclusions, whether these premises were necessary truths, because they were true by definition or self-evident, or contingent and dependent on experience and prudence. Revelation meant not only Scripture, but also “positive theology”, which means the teachings of the church fathers, general councils of the church and authoritative theologians, and papal doctrinal pronouncements. These together were described generically as “tradition(s).”

Jesuits also derived from the “schools” (the medieval universities) the syllogistic ideal: reasoning should be from general principles (as major premises), through minor premises, to conclusions as certain and compelling as the principles from which they were derived. The active life that the Society emphatically embraced, even though many of its members were noted contemplatives, aimed at the practical realization of virtue and *pietas*. Here the certainty of the demonstrative sciences (including theology, although it took its first principles from revelation) was not always possible, however much moral theology and casuistry tried to narrow down the areas of uncertainty. General and incontrovertible principles of morality (such as that man ought to pursue the good and eschew what is evil; or that the greater evil is to be avoided), or natural right (or law) principles such as to harm no one, to give to each their due and to keep promises, were insufficient to guide conduct. What mattered was clarity about the means to the good, and about which goods to choose and evils to avoid, in particular circumstances. For this, the indispensable requirement was prudence, a virtue Jesuits greatly valued both in their own order and in politics, though not (as Aristotle had done) as the principal virtue: for Jesuits it could not outrank justice among the practical virtues, let alone the theological virtues of faith, hope, and charity.

did not contradict revelation, not only in the conduct of practical life, but also in order to elucidate matters of faith and doctrine: the reformers could not endorse either of these positions without qualification. The most important of the principles relevant to the *respublica civilis*, the “commonwealth” (subsequently “state”) were a set of beliefs about good order so attuned to the common sense of the time and the philosophical orthodoxy over the ages that they were regarded as certain. Ignatius himself made clear, however, that the principles applied equally to the Society of Jesus, the church as a whole, the family, an army, or any other corporate association, private or public. The civil polity, like them, is not a mere aggregate but an “order” or “body,” with parts or “members” coordinated into a whole whose purposes override those of the parts. Subordination of individual utility to the common good is not natural to fallen man, whereas animal collectivities such as ant colonies and bee hives manage it effortlessly. It requires coordination and direction, and therefore rules or laws. Rules alone are, however, not enough, given their generality, the variability of circumstances, and because subjects do not always obey them. Coercive authority, and therefore hierarchy, relationships of super- and sub-ordination, command and obedience, are also needed. Authority and the hierarchy it entails are “natural” to the human condition, in the sense of being an unconditional requirement of the social existence natural to human beings. In addition, because God wills the preservation of the human race, he wills the necessary means that end demands. In that sense, and in no other, secular authority is by divine right. The same conclusion is confirmed by revelation, which teaches obedience to authority in the favorite proof-text of the age, *Romans 13*, and also *I Peter 2*, by salvation history, and by inference from the fourth commandment to honor one’s father and mother.

The Principles of Order

Given these presuppositions, it was right and proper to use “reason,” and to appropriate the findings of wise and prudent pagans where they

The Authority of Specific Rulers and Regimes

Learning from Aquinas, either directly or through their Dominican teachers, notably Caietan, Vitoria, and Soto, Jesuit theologians, however,

recognized that theoretical cogency demanded a more precise account. Authority is necessary and natural, and coercive authority is necessary for fallen human nature. However, it does not follow that any particular political office or regime is natural or necessary. Again, hierarchy certainly entails headship; in the sixteenth century an acephalous association of human beings was inconceivable. Moreover, Jesuits collectively had no doubt that monarchy was the best form of government in any association (it was exemplified in their own), and normally wrote of government as *principatus* and of rulers as princes. However, they recognized the legitimacy of other, non-monarchical forms of headship. What is more, it is not God that has designated (say) France or England as monarchies, nor has he appointed a particular person or dynasty to occupy their thrones. Jesuit theologians, therefore, regarded the doctrine of the “divine (hereditary) right of kings” as simply erroneous, and for a time, following the lead of the papacy, some Jesuits denied the right of Henri of Navarre (subsequently, as Henri IV, a notable patron of the Society) and James VI of Scotland – whose partisans asserted divine right – to succeed to the French and English thrones, respectively.

“Absolute” Authority

A more precise statement of the position (in Molina or Suárez for example) was that civil Society and political authority were coeval, and it was for each civil Society or “people” to determine its particular form of government. Whether, once a form of government was established, a people or its representatives might change it unilaterally was disputed. The relationship between officeholders and the collectivity of their subjects was often construed as a contract, treaty, or agreement (for example, philosophically by Suárez, polemically by Persons and Mariana), usually a pact made in some conjectural “primordial” past. Rulers could not unilaterally alter its terms, namely the laws specifying the manner and scope of their empowerment (*leges regiae*, latterly “fundamental laws”). It was, however, clear that

most laws were, in principle, alterable. Whoever was entitled to change the laws was by definition “absolute” (*legibus solutus*, absolved from obedience to law); Roman law and Jesuit working assumptions meant that this was likely to be a single ruler, a *princeps legibus solutus*. “Absolute” did not, of course, mean unlimited or unconditional authority.

Tyranny and Tyrannicide

Rulers could be tyrants, misusing their power to create disorder. Academic tradition distinguished tyrants into rulers with legitimate titles who behaved tyrannically (*tyrannus ab exercitu*) and usurpers (*tyrannus absque titulo*). The hard line often adopted for preaching and catechetical purposes was that both sorts were divine punishment for sins, and the remedies were humility and suffering. Strictly, however, an usurper was not a ruler at all, but an aggressor who in principle might be resisted by anyone, according to the natural right of self-defence. However, Jesuit moral thought was consequentialist, and it was therefore relevant that most legitimate regimes had begun in usurpation or conquest, and that some sort of rule was better than none. With legitimate rulers behaving tyrannically, there was a “presumption in favour of authority”: such a ruler is still a ruler, and private individuals have no authority to judge or to punish their superiors. However, especially given contractualist assumptions, tyranny arguably causes the reversion of authority back to the commonwealth (or “the people”) from which it originates. The people collectively *is* the ruler’s superior and may therefore judge and punish him. An efficient tyrant would obviously prevent the meeting of bodies representing the commonwealth to eliminate such a possibility. In that event, anyone killing a usurper was arguably carrying out the presumptive sentence of the commonwealth. The anarchic potential of this doctrine was evident, especially given the assassinations of Henri III and Henri IV of France. A further orthodox argument, though there was no recent successful instance of its implementation, was that popes had the authority

to judge and to depose rulers, and had in the past done so (paradigmatically Zacharias' supposed deposition of Childeric); that excommunicated rulers were *eo ipso* deprived of their office; and that unless the popes had declared otherwise, anyone might carry out their sentence. However, Bellarmine, Suárez and Becanus, in the context of Oath of Allegiance Controversy with James I/VI pointed out that excommunication does not entail deposition, and deposition is not the same as a death sentence, least of all one to be executed by private individuals. As such, however, tyrannicide was a traditional scholastic doctrine. It was very equivocally endorsed by Juan de Mariana, with no mention of any papal role, and as a warning to princes rather than as something he advocated, in a treatise of 1599 written for the future Philip III, which aroused no controversy in Spain, but was condemned by the Paris *parlement* and the Sorbonne. Mariana's Jesuit defenders further attenuated it. Nevertheless, the doctrine was imputed to the whole Society by its enemies.

The Papal *Potestas indirecta*

The papal power to depose secular rulers was an extreme extrapolation of a doctrine that as such was regarded as simple orthodoxy by the Society's leading theologians (though many Catholics resisted it), the so-called "indirect authority" of the papacy in temporal matters (*potestas indirecta in temporalibus*). This meant the papacy's right to intervene, with coercive means if necessary, in secular government when the salvation of souls required it. The doctrine brought into peculiarly sharp focus the intractable difficulties of the idea of a polity of Christians, subject not only to their secular rulers but also to a non-territorial, hierarchical church. The range of possible resolutions to this perplexity was familiar from the medieval "two swords," *sacerdotium/imperium* controversies. The Peace of Augsburg (1555) that ended the wars in the Holy Roman Empire between the emperor and the Protestants had (without using the expression) made *cuius regio eius religio* (the religion of the rulers determines the religion of the subject) the rule for the

whole of the Holy Roman Empire. The Tridentine church, and the Jesuits as its spearhead, rejected this settlement and the territorialization and denominationalization of Christianity it implied.

The Church and the State

The "controversial theology" of the relationship between the church and secular authority, was honed to a fine edge by decades of confrontation between Jesuits, notably Gregorio de Valentia, Robert Bellarmine and later Francois Verron, and the "heretics of our time." In outline, the Jesuit (and Tridentine) argument was that: the complementarity of reason and revelation entailed that to be a real body, the "church militant," the collectivity of all living Christians, must have the same properties as any other body, corporation or order. It must be not only entirely "visible" (contrary to the Reformers), but it must also have a supreme "arbiter of disputes" concerning faith and morals. Christ cannot have left the church destitute of the means necessary to ensure the salvation of Christians. The failure of the heretics to agree even on essentials was due entirely to their rejection of the headship of Rome, attempting to establish a text in its place (*sola scriptura*). However, no text can interpret itself, there was a church before the Scriptures were written, and the scriptural canon (that is, what was authentically part of the Scriptures) was determined by the church and not vice versa. The church is, therefore, itself in every sense a "commonwealth," the *respublica Christiana*, requiring a visible head with supreme authority, *summa* (or *plena*) *potestas* and an order of super- and sub-ordination like any other *respublica*. A monarchical headship, as well as being naturally the best form, was instituted by Christ and conferred on the successors of St Peter, the Vicar of Rome. The role of general councils here remained ambiguous, although the Councils of Constance and Trent had been critical for the church's reformation and restoration. All the same, general councils could only be rare events, and for most purposes the papacy was the supreme head and arbiter of controversies.

Jesuits argued that the *potestas indirecta* was a “mediating” position between denying the papacy any authority in temporal matters, and assigning it supreme authority as *princeps mundi*, with secular rulers as its ministers. The latter idea was laughable, and arguably heretical (even though medieval hierocrats, including popes, had maintained it), in that it made rightful political authority dependent on grace or faith, whereas it depends on nature and (in some sense) consent, and exists among pagans, heretics, and schismatics. The *potestas indirecta*, so Jesuits argued, preserved the rightful independence of secular rulers in secular matters, while acknowledging the rightful authority of the church in what concerns the spiritual welfare of Christians. However, because it was the papacy that itself judged whether it should exercise its indirect power, its opponents complained that it conceded authority to secular rulers in form, while denying it in substance. The argument in any event relied on a distinction between temporal or secular matters (now being called “matters of state”), and spiritual or – even more equivocally – ecclesiastical matters that proved unworkable. Venice’s claim to political jurisdiction over clerics and ecclesiastical property (resulting in a papal Interdict of 1606–1607 and the expulsion of the Jesuits from Venice), the censorship of publications (over which the church claimed authority with its various *Indexes*), the scope of the obedience rulers could legitimately demand of their subjects (the bull *Regnans* of 1570 excommunicating Elizabeth of England and absolving subjects from their allegiance, the Oath of Allegiance controversy with James I/IV) were all both “spiritual” and “temporal” issues.

Reason of State

In general, however, Jesuit political thinking was highly sympathetic to the difficulties attending the ruler’s office, in part no doubt because many senior Jesuits were confessors of princes. This is seen in the response of many Jesuit writers to “reason of state.” Although they denounced “Machiavellian” political practices as likely to

incur divine wrath, they too reasoned in terms of the demands of political success, rather than simply stipulating inflexible moral principles, and found ways of qualifying many moral imperatives binding on private persons, when the preservation or enhancement of the ruler’s position or the good of his subjects demanded it. For example, although they regarded religious toleration as both immoral and bad politics, associating it with “Machiavellian” debasement of religion into a mere instrument of statecraft, they allowed it if attempting to enforce religious uniformity undermined a ruler’s position, or as a *faute de mieux* to allow the survival of Catholic minorities in “heretical” countries. They equally allowed rulers to be concerned with their magnificence and reputation, to practice secrecy and deception short of outright lying, and to take emergency measures in violation of strict legality.

Natural Law and Natural Rights

Because Thomism recognized the autonomous authority of reason, a good deal of Jesuit thinking about morality could be in largely secular terms, for natural law (which is the substance of such argument) does not even presuppose the existence of God, but is predicated upon “the nature of things”; that is, the conditions and requirements of human social existence. Subscription to natural law is a precondition for a law to bind in conscience, and it thus imposes limitations on the power of rulers, including prelates. Moreover, although the law of nations (*ius gentium*) had been opaquely related to natural law ever since Roman law, it was clear that there was some relationship (worked out with great sophistication by Suarez), and this too restricted the authority of rulers and their freedom of action, at least in principle. Again, natural law (generically *ius naturale*) reasoning did not distinguish sharply between law and rights, and liberty and equality were held to be natural rights, right by nature (in that no one is naturally the slave of anyone else). This allowed some Jesuits to assume the mantle of Bartolomé de las Casas as protectors

of the “Indians,” and opponents of slavery. The natural right of self-defence, and of due process, could justify both disobedience to persons in authority and defiance of law, for example the laws of property in times of dearth or starvation, or the authority of “heretics” and their laws prohibiting Catholic worship and publication. Jesuits (as has been seen) normally accommodated themselves easily to prevailing custom and practice, but equally have always exhibited a streak of radicalism. Thus, although Jesuit theologians (notably Martin del Rio) were counted among the most important proponents of witch-hunting, virulent at this time, it was also Jesuits (especially Friedrich von Spee and Adam Tanner) who at great personal risk opposed the practice.

Jodocus Trutfetter

Pekka Kärkkäinen

Faculty of Theology, University of Helsinki,
Helsinki, Finland

Abstract

Jodocus Trutfetter (also Trutvetter) was a philosopher and theologian of the *via moderna*, at the University of Erfurt, in the late fifteenth and early sixteenth centuries. His main works include a textbook on logic, the *Summule totius logice*, and another on natural philosophy, the *Summa in totam physicen*. As a proponent of the *via moderna*, Trutfetter stressed the importance of taking both ancient and modern authorities into account. In questions concerning universals, categories, and psychology, his views were close to those of John Buridan. On the relationship between theology and philosophy, he shared, for the most part, William of Ockham's position.

Jodocus Trutfetter, known as *Doctor Isennachensis* after his hometown Eisenach, matriculated at the University of Erfurt in the winter semester of 1476. In the spring of 1478, he became a Bachelor of Arts and then in 1484 a Master. He taught as a Master in the faculty of arts and was promoted Licentiate of Theology in 1493, after which he was elected for the first time as the dean of the faculty. Trutfetter held many in the academic life. In 1501, he became a member of the college of jurists and dean of the faculty of law and in the same year was elected as rector of the university. In 1504, he received a Doctorate in Theology. Between 1506 and 1510, he taught at the recently founded University of Wittenberg but returned to Erfurt where he taught theology and philosophy until his death in 1519.

Trutfetter's logical treatises are among the most important works of the late *via moderna* in Germany. He published his major work, the *Summule totius logice*, in 1501 and supplemented it with commentaries on Peter of Spain's

Summulae and other texts used in the teaching of logic. In 1514, Trutfetter also published an extensive textbook on natural philosophy entitled *Summa in totam physicen*.

As did all the secular masters and doctors at the University of Erfurt at that time, Trutfetter identified himself with the *via moderna* school. For him, this led to supporting some distinctive doctrinal notions as well as to a certain attitude toward authoritative writers. Among these doctrinal standpoints, the most prominent were (1) the denial of universality in the entities of the extramental world, that is, the view that universals are only universal concepts in the mind; (2) the view that all entities in the extramental world are included in the categories of substance and accident – other Aristotelian categories being based on the properties of the concepts – and (3) the view that the human soul is one intellectual form with no real distinction existing between the faculties of the soul or between the faculties and the essence of the soul. Trutfetter did, however, accept some positions of other schools. For example, he was ready to tolerate different views on universals, insofar as they did not imply a real communicability of universal natures, which according to him implied doctrinal heresy.

As a proponent of the *via moderna* Trutfetter argued for equal use of both old and more recent authorities. At the beginning of his major work on logic, he expressed his opposition to philosophers who relied only on older and saintly authors, by which he probably meant contemporary Thomist and Scotist philosophers. Although he himself based his works on writers like William of Ockham, John Buridan, Gregory of Rimini, Peter of Ailly, Marsilius of Inghen, and Gabriel Biel, he also referred to a number of authors from all periods down to his own times, without excluding some of the most important Thomists and Scotists of the fifteenth century.

In his major works, Trutfetter discusses individual topics by introducing the views of a variety of medieval authors on the question at hand and then providing his own solution, which most of the time conforms to the common view of the *via moderna*, as he understood it. He was well informed about the decrees issued by the Fifth Lateran Council in

1513 and provided an application of the council's recommendations concerning the teaching of theological truths in natural philosophy in his compendium of natural philosophy. In order to explain the phenomenon of the rainbow, Trutfetter used Theodor of Freiberg's advanced theory, which was not well known at that time.

Trutfetter's philosophy has not been thoroughly studied, and therefore it is possible to present only some aspects of his thought. Logic for Trutfetter is, in a very strong sense, a science of signs. At the beginning of his *Epitome seu breviarium logicae*, he quotes Augustine's dictum that all knowledge considers either things or signs. Logic is about the signs used in propositions. It does not convey knowledge of the extramental world but is still a necessary prerequisite for such knowledge in the natural sciences. Consequently, none of the Aristotelian categories denote diverse kinds of beings in the extramental world. The terms belonging to various categories all signify substances and qualities, but the categorial diversity is based on different connotations of the terms. A wide range of terms is therefore included among the connotative terms. Some connotative terms also have the peculiar property of *appellatio formae*.

Following John Gerson, Trutfetter argues against philosophers who in his nominalist view neglect a semantic analysis of terms and rush into positing many classes of entities in the extramental world, which could be sufficiently explained by distinctions in the mental concepts about these beings. If one looks at Trutfetter's discussions on movement or the soul, one notices that he, in fact, carries out a careful semantic analysis before presenting definitions of these key concepts of natural philosophy. Despite these metaphysical and methodological views, his discussion of the actual issues in natural philosophy does not always sharply contrast with the views of Thomist and Scotist writers.

The question of the relationship between philosophy and theology arises in Trutfetter's remarks on the immortality of the soul. He notes that the Christian view of immortality is expressed even in some of the writings of the ancient pagan philosophers, but he is clearly suspicious of Aristotle's view of the matter. In this context he mentions the problem of

harmonizing the view of the immortality of individual souls with Aristotelian doctrines of the eternity of the world and the denial of actual infinity. For Trutfetter, immortality is in the first place a truth of faith, and he did not consider purely philosophical arguments either for or against it very convincing. He even mentions Scotus' and Ockham's criticism of Thomas Aquinas' proofs. When applying the decree of the Fifth Lateran Council on immortality, Trutfetter did not so much defend the doctrine with proofs as refute the contrary views.

Johannes Brammart

Alexandra Anisie

Center for Ancient and Medieval Philosophy,
Babes-Bolyai University, Cluj-Napoca, Romania

Abstract

Johannes Brammart was a member of the Carmelite order, trained in theology at the University of Paris, who became one of the founders and first masters of theology of the University of Cologne. His work has been very little studied, and his commentary on the Sentences of Peter Lombard has not yet been edited. This entry will focus on two of the topics discussed in the prologue of his commentary on the first book of the Sentences: the problem of beatific vision and the object of science and belief.

Biography

Johannes Brammart was born in the city of Aachen and began his theological training in Cologne, at the studium generale of the Carmelite order, which sent him to Paris to continue his

studies in 1378. His year as bachelor commenting on the Sentences happened to be in the time of the Papal Schism. As a consequence of the conflict with the Clementine Carmelites who dominated the Paris school at the time, the German Carmelites, who supported Pope Urban IV, were forced to leave Paris and move to Bologna. He was scheduled to lecture on the Sentence during the year 1381–1382, but we do not know with certainty whether he was able to complete his lecture in Paris before he left or he had to finish it in Bologna. Either way, in 1384 he was a master of theology. He began his teaching career at the University of Bologna, and from 1384 to 1404, he served as the provincial superior of the lower German province. In 1388, when he had already taught at the Carmelite studium generale for a number of years, he played an important role in the founding of the University of Cologne and became one of its first masters of theology (Lickteig 1981: 148–150; 171; 200; 224; 229).

Johannes Brammart composed a commentary on the Sentences of Peter Lombard, and he is also mentioned as the author of a number of sermons and theological questions, most likely written during his activity as a master of theology at Cologne. From his commentary on the Sentences, only Books I and IV were conserved (Stegmüller 1947: 196–197).

The Prologue and Principium of Brammart's Commentary to the first book of the Sentences

Brammart's commentary to Book I opens, as customary, with a sermon in praise of Peter Lombard and the Book of the Sentences, followed by the discussion of a theological question (*quaestio collativa*) on a topic that the sermon had already called attention to. The sermon was usually constructed around a biblical passage that was somehow alluding to the name of the bachelor, and Brammart's makes no exception. The biblical passage he chooses, *verbum domini super Iohannem* (the word of God came unto John), mentions his first name, Iohannes, and announces the topic of his sermon: the role of the

divine word in the beatific experience of the human intellect. Typically, the discussion of the theological question was a chance for bachelors to address the arguments of the colleagues who had spoken before them and to defend their own position from the counterarguments that had been brought against them. Brammart's question is different in this respect because, as the Carmelite bachelor, he was the first to speak and therefore could not discuss the arguments of others.

Brammart's introductory question addresses a number of issues of great importance in fourteenth-century theological and philosophical debates: the role of intelligible species in human cognition; abstractive and intuitive knowledge; the representation of created things in the divine mind; God's knowledge of possible futures; the production of the Son as a Word by the divine mind; the nature and source of the "word" by means of which the human mind knows the divine essence.

Brammart on Mediated Knowledge and the Beatific Vision

Brammart's main challenge is to explain beatific vision in the context of a theory that understands rational knowledge as mediated by signs. The Constitution issued by Pope Benedict XII in 1336 and the Determinations of the Council of Vienne promulgated in 1317 provided a number of important principles that no discussion of the beatific vision could disregard: beatific vision had to be understood as an intuitive, face-to-face vision of the divine essence; no intellectual being could obtain beatitude on its own, but required the light of glory (Denzinger 1911: 208; 216–217). These criteria posed a number of difficulties for a theologian who understood the contact of the human mind with the exterior reality as possible only through the mediation of signs or mental species.

Brammart argues that all rational knowledge is mediated by intelligible species and distinguishes the species from the actual knowledge. The species are caused by the exterior objects

acting upon a faculty and are the representations of these objects as retained in memory. The act of knowledge is generated from the memory species by means of a change or a movement caused by the memory species in the knowing faculty, which brings it from potentiality to actuality.

On the other hand, in order to be able to explain that a change occurs, there has to be a distinction between the faculty and the form that brings it to actuality, according to the Aristotelian model in which the process of knowledge involves an entity in a state of potentiality – the faculty – and an active principle (*De anima* 417a17). In the case of sensation, the active principle is the exterior object, but in the case of intellectual knowledge, Aristotle says that the object is universal and somehow within the soul (417b19). Brammart doesn't deal with the problem of universals here, but he does point out, in the context of rational knowledge, that the faculty's change from potentiality to actuality doesn't happen as a result of the mind receiving something new, but by means of something it already has, which is the memory species. It is an altogether internal process.

Along the same lines, Brammart wants to show that the human mind is a more important cause of knowledge than the extramental reality. Like Ockham and Auriol, he argues that even an act of intuitive knowledge (which is the closest and the most direct contact of the human mind with the extramental thing) can occur without the object being present or even existing. Brammart, like Ockham, mentions that this is only a logical possibility, pertaining to God's absolute power (*de potentia Dei absoluta*), which means it doesn't actually happen, but it shows that the relation between the presence of the extramental object and intuitive knowledge is contingent, not necessary (Courtenay 1985: 255). Ockham's purpose is to protect the immutability of scientific knowledge by isolating it from the changeable objects in the physical word (Tachau 1988: 121) by diminishing the causal role of the object and presenting the act of knowledge as an internal product of the human mind.

One of the consequences of the distance imposed by this model between the object and the cognitive act is that the certitude of knowledge

can no longer be guaranteed. But for Brammart, in the context of beatific vision, it posed an additional problem: viewing the act of intellectual knowledge as an “internal” product of the human mind could be seen as incompatible with the aforementioned determination of the Council of Vienne, which qualified as heretic of any implication that the created mind could be blessed in itself without the bestowal of the light of glory. Brammart had to explain the causal role of the divine essence in order to find a way to compensate for the distance imposed by this model between the object and the act of knowledge and to find a place in it for the light of glory.
