The emergence of treatises on syncategorematic terms in the Middle Ages has greatly contributed to the growth and development of medieval analyses of ambiguities. It also helped people gain a better understanding of the distinction between material and formal elements of language; discussions of the syncategorematic word *si*, for example, include reflections on the nature of inference (*consequentia*). However, it was not only language itself the medievals were interested in: an author’s views on the function and application of specific *syncategoremata* in propositions can help us shed light on their position regarding ontological matters as well. For example, discussions of the *syncategorema* “to be” and “not” reveal differences of opinion regarding what kind of entities propositions are expressions of; the notion of being itself is under discussion in analyses of *sophismata* like “only one is” (*tantum unum est*); authors also have

different views about what kinds of “things” are to be reckoned as necessary and (im)possible, as is demonstrated in the way they deal with propositions containing the expression “of necessity” (*necessario*), as well as in their accounts of the logical rule “from the impossible anything follows.” Much of this kind of material can help us decide whether an author should be considered a realist or a conceptualist. Finally, expositions of propositions containing the verbs “begins” (*incipit*) and “ceases” (*desinit*) show what an author has to say about the notions of time and motion (Braakhuis 1979, 1999; Spruyt 1989, 1992, 1994).

Abstract

‘Alī b. Muḥammad b. al-‘Abbās al-Tawḥīdī (Abū Ḥayyān), an essayist and a stylist, was one of the main witnesses of the intellectual activity of eleventh-century Baghdad and Rayy during the Buyid period. He was one of the most talented prose-writers in the history of Arabic literature and worked as an erudite courtier and a copyist in the main intellectual circles of his time (Abū al-Faḍl ibn al-‘Amīd, Ibn ‘Abbād, Ibn Sa’dān). He was close to the philosopher Abū Sulaymān al-Sijistānī.

There is no agreement on the birthplace of al-Tawḥīdī, and nowhere is an exact date given for his birth. From a remark he makes on his being close to 90 years old in his *Epistle to the Qāḍī Abū Sahl*, written in 400/1008, it has been determined that he was born between 310/922 and 320/932, but according to al-Shālījī (introduction to al-Tawḥīdī, *al-Risāla al-Baḡdādiyya* [*The Baghdad Epistle*]), the phrase “ninety and so” should

be corrected into “seventy and so” and his birthdate should be put around 320–330/932–941. Although the biographers do not show any agreement on his birthplace (given as Wasit, Shiraz, or Nishapur), he seems to have been raised in Baghdad, if we are to follow the *Risāla al-Baḡdādiyya*, where he demonstrates his perfect intimacy with the most colloquial vocabulary of this city. The *Risāla al-Baḡdādiyya* has been neglected by contemporary researchers though it is expressly attributed to al-Tawḥīdī by Yāqūt, as noted by Muḥyī al-Dīn (1949). The *Risāla* has been recently reedited by ‘Abbūd al-Shālījī, who brings several parallels between the text and other works of al-Tawḥīdī, confirming his authorship (see al-Tawḥīdī, *al-Risāla al-Baḡdādiyya*, introd. pp. 9–10).

Some classical writers like Yāqūt would like to see in al-Tawḥīdī a Persian, but this should be excluded as Tawḥīdī himself claims that he could not understand Persian, when it was used once in a *majlīs* (learned meeting) by Ibn ‘Abbād (see Bergé 1990:115–116, quoting *Akhlāq*, 306 and *Imtā’*, I, 77). Nevertheless, it seems he died in the Iranian city of Shiraz, which was famous for its Sufi congregations and shrines and where he seems to have spent the last part of his life, maybe in the entourage of the vizier in Shiraz of Ṣamsām al-Dawla, Abū l-Qāsim al-Mudlījī (vizier in 382–383/992–993), for whom he composed the lost *Muḥaḍarāt wa-l-munāẓarāt* (*Lessons and Disputes*) (extracts in Yāqūt, listed by S. M. Stern, *EF*², p. 127a).

Abū Ḥayyān al-Tawḥīdī received a traditional education in the classical fields of grammar, theology, and Islamic jurisprudence. He studied theology with the Shafī'ī scholars Abū Ḥāmid al-Marwarrudhī (m. 362/972) and Abū Bakr al-Shāshī (d. 365/975), and grammar and logics with the Mu'tazilite grammarian Abū Sa'īd al-Šīrāfi ibn al-Marzubān (d. 367/977), a disciple of al-Jubbā'ī, and 'Alī ibn 'Isā al-Rummānī (d. 384/994), who was also a well-versed *mutakallim*. In Sufism, al-Tawḥīdī was a disciple of the Baghdad master Abū Ja'far al-Khuldī (d. 348/959), who had been initiated by the famous Sufi al-Junayd (see Ibn al-Nadīm, *al-Fihrist*, p. 183). One of al-Tawḥīdī's preserved works, the *Ishārāt al-Ilāhiyya* (*The Divine Hints*), a collection of personal prayers (*du'āt*) and lamentations that still awaits to be studied, shows his genuine Sufi leaning.

Al-Tawḥīdī moved to different cities and was in Mecca (353/964), then settled in Rayy at the court of Abū al-Faḍl ibn al-'Amīd (d. 360/970) the vizier of the Buyid prince 'Aḍud al-Dawla. He returned to Baghdad after the death of his patron and attended there a lecture by Yaḥyā ibn 'Adī in 361/971. He was not able to secure the protection of Abū l-Faḍl's son, Abū l-Faṭḥ ibn al-'Amīd, who succeeded his father and remained vizier for only two years before being killed. Al-Tawḥīdī endured from 367/977 the patronage of Abū al-Faṭḥ's successor, the former secretary Ibn 'Abbād, as he bitterly complained later on in his *Akhlaq* (or *Dhamm*, or *Mathālib*) *al-wazīrayn* (*The Manners of the Two Viziers*). Ibn 'Abbād, who had been given the vizierate of Mu'ayyid al-Dawla, is portrayed in detail as a *parvenu* keeping the appearance of an intellectual who did not hesitate to write on theological matters while being actually a conceited libertine. Al-Tawḥīdī became famous for the ingenuity of his curses toward Šāḥib ibn 'Abbād (as well as against Abū al-Faḍl ibn al-'Amīd, also portrayed in the book but not as much scorned as Ibn 'Abbād), using a range of sexual metaphors in describing the licentious vizier. His blunt language, probably unbearable to the ears of a number of religious scholars, earned him the title of heretic in most medieval biographies (to the exception of Yāqūt, who shows some enthusiasm and quotes him at

length). *The Manners of the Two Viziers* was so offensive that it was certainly edited only after the death of Ibn 'Abbād in 386/995.

At an epoch when the philosophical school of Baghdad had reached its apogee, al-Tawḥīdī naturally completed his education by attending the circles of two of the main philosophers of his time: Yaḥyā ibn 'Adī (d. 364/974) and Abū Sulaymān al-Sijistānī (d. after 391/1000). There he was an active participant in the reception process of the classical heritage that had been transmitted by such luminaries as al-Kindī and Ḥunayn b. Ishāq. He copied the lessons of al-Sijistānī in 371/981, and these notes form part of the raw-material behind his *Muqābasāt* [*Enlightments*], the compilation of which had started in 360/970 and was achieved only after the death of Abū Sulaymān al-Sijistānī, which took place after 391/1000. At an unknown date, he exchanged a correspondence with the Imami (twelver Shī'ite) philosopher Miskawayh, who was acting as the treasure secretary of 'Aḍud al-Dawla and as the director of his library. It was published under the title *al-Hawāmil wa-l-shawāmil* [*Open (Questions) and Explicit (Answers)*]. Al-Tawḥīdī addressed to Miskawayh 175 questions on various topics such as linguistics, ethics, and philosophy, often with some strong religious or sociological connotations. This work may have been composed in Rayy with al-Tawḥīdī trying to gain the favorable influence of Miskawayh while serving him as *faire-valoir*. During one of his stays at Rayy, probably at the court of Ibn al-'Amīd, al-Tawḥīdī listened to a discussion of Abū l-Ḥasan al-'Amirī on ethical matters and metaphysics (see Muḥyī al-Dīn 1949:173).

Al-Tawḥīdī's interest in philosophy, which has been seen as part of his versatile character, should be seen in the context of his classical theological background since the debates of the theologians were either rooted in or echoed by contemporary philosophical discussions. As A. Amīn and S. A. Ṣaqr put it (al-Tawḥīdī, *al-Hawāmil wa-l-shawāmil* [*Open (Questions) and Explicit (Answers)*], introd. waw): "Abū Ḥayyān was a philosopher with the philosophers, a theologian with the theologians, a linguist with the linguists and a sufi with the sufis." For 'A. R. Muḥyī

al-Dīn, he came to philosophy as a man of letters, a witness of his age, and because of the personalities he became acquainted with (Muḥyī al-Dīn 1949:175). For W. al-Qāḍī, who studied al-Tawḥīdī's thought and edited two of his works, his system rests on three fundamental values: religion, learning, and morality, to which must be added the additional, yet basic, value of reason (see al-Qāḍī 1970).

Al-Tawḥīdī's Sunnism (see al-Qāḍī 2003) may have been a cause of his frictions with Ibn 'Abbad (contrast Miskawayh's most "Shī'ite" short treatise, the *Fawz al-asḡar*, or *Small [Book] of Salvation*). Refusing the pure game of appearances at the courts, he vigorously attacked his former employers on their morals as well as on subtle theological issues in the case of Ibn 'Abbād, who claimed to be an accomplished scholar as well as an Imāmī and a Mu'tazilite (see Yafūt 2003, who insists on the different Mu'tazilite currents at the time as a key to understand al-Tawḥīdī's position). Another of his lost works was devoted to the great stylist of Arabic prose al-Jāḥiẓ, himself a Mu'tazilite (extracts of the *Taqrīẓ al-Jāḥiẓ [Praise of Jāḥiẓ]* listed by S. M. Stern in *EL*², p. 127), who was certainly a literary model for al-Tawḥīdī.

Later on, he became the boon-companion of Ibn Sa'dān, vizier of 'Aḍud al-Dawla's successor Ṣamṣām al-Dawla from 373/983 until 375/985. Al-Tawḥīdī had been introduced to Ibn Sa'dān by the geometer Abū al-Wafā' al-Būzajānī (d. 376/986), one of the last translators of Greek geometry and a commentator of Euclides, Diophantes, and Ptolemy (see Yāqūt, XV, 7) and by the philosopher Zayd ibn Rifā', who was suspected of belonging to the Brethren of Purity. For a time, on the initiative of al-Būzajānī, Abū Ḥayyān worked at the Baghdad hospital, which had been established by 'Aḍud al-Dawla in 372/982. The circle of Ibn Sa'dān was composed of the Christian philosopher Ibn Zur'a – who had translated Aristotle and Nicolaus of Damascus – of al-Būzajānī, Miskawayh, of the secretaries Ibn 'Ubayd, Abū l-Qāsim al-Ahwāzī, and the future vizier Abū Sa'd Bahrām b. Ardashīr. It was a place of intellectual discussion and intense scholarly activity. The *Imtā' wa-l-mu'ānasa (Enjoyment and Familiarity)*, composed by

al-Tawḥīdī at the request of Ibn Sa'dān, reports many of the debates held between the scholars. Several of the philosophical questions discussed are also listed (see e.g., *Imtā'*, III, 106–108 where the vizier asks questions on the soul, its perfection, the spirit, humanity, nature, intellect, resurrection, the souls of the animals ...). Another treatise the *Risāla fī l-ṣadāqa wa-l-ṣadīq (On Friendship)*, one of his later works, was achieved by al-Tawḥīdī in 400/1009 and dedicated to Ibn Sa'dān. It contains several allusions to the circle "that was unrivalled in Iraq," writes al-Tawḥīdī.

In philosophy, Abū Ḥayyān considered Abū Sulaymān al-Sijistānī as his true mentor. The way of life al-Sijistānī was following, and the discussions on the ethical behavior of "the Ancients," were for al-Tawḥīdī the only philosophical way worth being followed. He showed aversion for dialectics (*jadal*) and seems to have followed a personal mystical path that led him to write an important, though neglected, Sufi masterpiece, the *Ishārāt al-Ilāhiyya*. Abū Ḥayyān al-Tawḥīdī was one of the greatest literary personalities of the Buyid period and of the whole history of Arabic literature. He represents a certain apogee of the *adīb*-model (both a man of letters and a humanist) deeply influenced by Greek *paideia*. But he was a direct witness of the attacks the humanism had started to suffer, that would lead to its partial recuperation by some theologically oriented circles, and to a final *coup de grâce*.

Terms, Properties of

Egbert Bos

Philosophy, University of Leiden, Leiden, The Netherlands

Abstract

In the theory of the properties of terms, the medievals investigated the semantical properties of words used in a proposition. According to them, terms not only had signification, a kind of essence, but also referred in a context (notably a proposition) to different things (substances or accident, concepts or words). Several properties are distinguished, the most prominent of which are supposition, copulation, appellation, ampliation, and restriction. Individual logicians defined these notions in different ways.

The theory had its origins in the twelfth century and developed until late in the fourteenth century. In the twelfth century our sources are several anonymous tracts. In the thirteenth century, Peter of Spain, William of Sherwood, Lambert of Auxerre, and Roger Bacon were the most prominent masters. In the fourteenth century, William of Ockham and John Buridan were very influential.

Introduction

The theory of the properties of terms is one of the important innovations of medieval semantics. It

emerged in the twelfth century, and it developed until far into the fifteenth century. Even in the postmedieval period, interesting, though less creative, traces of this theory can be found. The medievals themselves did not consider the theory as something new. In their view it only explained what was implicit in Aristotle's logic. However, from our modern point of view, the theory is original.

The theory concerns the semantic properties of terms. It attempts to analyze the presuppositions of natural language, and deals with the meaning of a term mostly when it is used in a proposition. The theory is about what terms stand for, and their relation to other terms within a certain context.

The expression “properties of terms” reminds one of the properties of natural things. The medievals considered this an apt comparison. As they themselves often say, things are composed of form and matter, which constitute their substance. The most important component of a substance, such as a man, is the form, i.e., humanity. A substance possesses properties, for instance, a stone's property moving downward. In the same way a term can be said to possess form and matter. The form of the term is the signification, for instance, “horse-ness” of “horse”; its matter is its actual occurrence in, for instance, a proposition. In this proposition, a term having a signification stands for something. This is the property of supposition.

The form of a concrete individual thing is stable, but its matter can change. Likewise, the form of a term, its signification, is stable; that to what it stands for, can change. The things for which a term like “man” stands in the proposition “a man runs” are different from those to which the same term “man” stands for in “some men were not running,” or from that “man” stands for in “man is a three letter word.” But some authors, such as Peter of Spain and Buridan, seem to claim that “man” supposits for all men in any proposition, but propositions are verified by different quantities of men, according to the syncategoremata.

In medieval semantics the notion of signification is used in two ways: primarily for a kind of nucleus or what a term essentially means, secondarily for the things a term stands for. The ways in

which a term, which already possesses the primary kind of signification, stands for other things (be they material things or concepts), vary. The things denoted may be, and often are, things in the outside world, such as an individual man or horse, but they may also be things in the mind, for instance, the concept of “man” or that of “horse,” or even the terms “man” or “horse” themselves in their material occurrence, for instance “man” in “man is a noun” or in “man has three letters.”

Problems

The medieval theory of the properties of terms is complicated and, unfortunately, it is not always clear what it involves (Spade 2000).

As to the historical development of the theory, it is still unclear whether we can distinguish specific traditions in different parts of Europe. More concretely, the question is whether there is a split between the traditions in Paris and in Oxford, the traditional centers of study in the Middle Ages. Is the development continuous, or is there a break, in particular in the last quarter of the thirteenth century, during which modism (a kind of universal grammar) was prominent, at least in Paris?

As to the contents of the theory, we are also left with systematical questions. Which exactly are the properties of terms? To which level of language or to which kinds of terms do they belong? Traditionally three levels of language are distinguished: spoken, written, and mental language (the latter are concepts in the mind as part of a mental language). The question is, for instance, whether mental terms possess properties. Further, do only subject terms possess the properties, or predicate terms as well? Does the theory of the properties, especially supposition theory, form a single theory? If not, was it at least initially a single theory? Can it be compared with modern semantics, in which formalization plays a part? If so, to what extent, and in the semantics of which authors?

In this entry I shall concentrate on the most prominent properties of the terms, and discuss them within the context of individual theories. I shall discuss the properties within the framework

of the rest of the semantics of a specific theory or a period or logician. I prefer this approach above the one in which an individual property, such as supposition, is discussed in connection with the same notion as interpreted by other logicians, and in which the relation between the properties is not made clear. I hope the reader will be presented with material to interpret texts of a specific period or of a particular author.

The most prominent properties of terms are (1) signification (*significatio*; this notion should be taken in contrast to the other properties); (2) supposition (*suppositio*); (3) copulation (*copulatio*); (4) ampliatio (*ampliatio*); (5) restriction (*restrictio*); and (6) appellation (*appellatio*). Relation (*relatio*), remotion (*remotio*), and alienation (*alienatio*) are also discussed in tracts as properties, but these will not be dealt with here. Neither shall we discuss the divisions of supposition, except for a few interesting aspects.

The definition of each property varies among logicians. The definitions of supposition, copulation, etc., are connected with the definition of signification, just as the conception of material properties of an individual thing varies with the conception of its form.

History

In the twelfth century we find some important sources for the theory in the form of anonymous tracts, notably the *Fallacie Parvipontane*, the *Cum sit nostra*, the *Ut dicit*, and the *Introductiones Parisienses*.

In the thirteenth century, the author we usually refer to as Peter of Spain, but whose identity is not yet fixed, wrote a textbook called *Tractatus*, which became very popular. The book was especially influential in Paris and in the continent. In England, William of Sherwood and Roger Bacon were active. They have some common characteristics (it may be noted that William was also active in Paris, and that Roger was influenced by, and reacted to continental doctrines): both studied and/or worked in Paris. In the late thirteenth century modism occupied a prominent place, and even seemed to suppress logic, at least in Paris.

In the fourteenth century William of Ockham's logic was well known. He was primarily active in England. On the continent, John Buridan was a prominent master. He placed Ockham's logic in the background.

The overall history of the theory of the properties of terms is not yet written, especially because many tracts still await an edition. Many historical and systematical questions such as the one mentioned above still need to be solved.

The Early Period

Aristotle considered the relationships between language, thought and reality in his logical works, for example in his *De interpretatione*, *Sophistical Refutations*, and his *Topics*. In the *De interpretatione*, he deals with propositions, the constituents of syllogisms, in the *Sophistical Refutations* he examined the ways in which someone can be deceived by a certain way of speech or writing used by his opponent. In his *Topics* Aristotle explained on what kind of grounds an argument could be based. These works became known in Latin in western Europe around 1150, and were especially influential on medieval semantics.

Not only logic, but grammar also had language as its object. The authoritative works on grammar were those by Donatus (IVth c.) and Priscian (VIth c.). From these authors the medievals learned the notions of "paronymy," or "denominatives" (for instance, "white" from "whiteness"), "homonymy" or "equivocation" (but equivocation is also a fallacy in the *Sophistical Refutations*) (for instance, in the case of "man," when "man is a kind" is said in contradistinction to "man" in "man is white"), and "univocation" (meaning of terms having a single definition, for instance "horse").

Further, they learned from the grammarians the notion of imposition, i.e., the way in which terms have been given meaning by being applied to things. Priscian taught that names have the function of signifying substance together with quality. In general, his grammar was semantically oriented.

Initially, logic and grammar could hardly be separated. From the eleventh century onward, the

gap between logic and grammar widened. In general, one can say that the medievals distinguished very well between these two sciences.

Signification was the basic notion. In the earlier period, we see different definitions. In the *Introductiones ad logicam*, for instance, "signification" is identified with the presentation of some form to the intellect (De Rijk 1967a), or, in the *Introductiones Parisienses* as "that which is principally given by a term for understanding" (De Rijk 1967b).

Signification was distinguished in primary and secondary. For instance, in Anselm of Canterbury's *De grammatico* (1033–1109), one finds a distinction between *significare per se*, i.e., the signification of a form and *significare per aliud*, which was also called *appellare*; in the latter case, the thing signified was meant (Gombocz 1992). This opposition comes back in various forms.

The early development of the notion of signification and the other properties can be followed in, for instance, the *Introductiones Parisienses* (De Rijk 1967b). After the definition of signification just given, the author defines the other properties of terms. *Supposition* is a property of a word, he says, because it signifies in the way of a substantive or as something existing, like a substantive term does. It is attributed both to the subject term and the predicate term. *Copulation* is a property of an adjective. *Appellation* is, according to him and as is usually said, the present belonging of something with another thing, or a property of a term because it signifies present things. Therefore, a word like "Antichrist" (an individual who is not alive now, though he will live in the future, according to faith) does not have appellation, though it has supposition and signification.

The *Introductiones Parisienses* contains accounts that bear resemblance to later tracts, though the definitions used are different. For instance, in an affirmative proposition in which a common term is subject, and the verb is of the present tense, the supposition is only for things of the present, for instance, of "man" in "a man can run," and of "daisy" in "a daisy is considered to be a beautiful flower." Further, the anonymous

already seems to know the property of *ampliation* of a term, for instance, of “man” in “all man were.” Here “man” supposits for men in the present and in the past. In ampliation the extension of what the term stands for is widened.

In the *Cum sit nostra*, the property *supposition* is defined as the signification of an utterance that can function as the subject in a proposition (*sermo subicibilis*), as opposed to a predicate (De Rijk 1967b). Supposition here is ascribed to a subject term. It differs from signification, he says, for supposition means “to bring its content under other thing.”

Supposition may be univocal or equivocal, he adds, depending on the term. “Man” is a univocal word, and “dog” is equivocal (it may stand for a barking animal, or a seadog, or a star). Univocal supposition is primary.

Supposition is further divided into simple and personal. Simple supposition is when a common term supposits for a common form, for instance in “man is the worthiest of all creatures.” Here the term stands for something common, which is on the one hand not exactly the form of a man, but on the other hand neither a logical notion, like “species.” This proposition is difficult to interpret and was frequently debated in the Middle Ages.

The anonymous asks what kind of supposition “man” has in “man is a species.” It is not a simple supposition, he says, like many would say in the thirteenth and fourteenth centuries. He interprets it as *discrete* supposition, in the sense that “man” is the proper name of something incorporeal, viz., a logical notion.

Personal supposition is, he says, the supposition for something inferior, for instance “man” in “a man runs.” Here “man” supposits for this man and for that man (he explains it as if there is ampliation).

Appellation is defined as signification, without time, of a predicable term; “without time,” he says, to distinguish this property from that of a verb. He immediately adds another formulation, viz., that appellation is a property of a common term as far as it is compared with the singular things under it. He gives an example: “man is an animal” in which the subject term “man” is compared with the singulars under it. In the alternative

formula, appellation apparently also belongs to a subject term.

Another property to be discussed is *restriction*. The anonymous says that in “a white man runs,” “man,” a common term, is restricted. In “all men can be,” “man” is amplified, however. The difference with the *Questiones Parisienses* is clear in this respect.

The final property is *copulation*. In the *Cum sit nostra*, copulation is restricted to a verb. In the *Introductiones Parisienses*, it is connected to an adjective.

From this discussion, it is clear that there are differences between an English tract (viz., the *Cum sit nostra*) and a continental one, viz., the *Introductiones Parisienses*. De Rijk assumed a Paris–Oxford split (Peter of Spain 1972). To what extent this is correct and for which period are matters still open to discussion. It is generally conceded that apart from displaying differences, the two traditions also have a common ground and have influenced each other (De Libera 1982).

We may conclude that appellation is the notion that obtained prominence above and before supposition. The grammarians originally used it as the property according to which a term denotes all the things under it. In a proposition it was made clear which things the term for which the term stands. Originally appellation is the central notion, not supposition. This is especially evident in the *Fallacie Parvipontane*.

Peter of Spain (Thirteenth Century)

Peter of Spain is the author of the most famous of all medieval handbooks on logic and semantics. He composed his *Tractatus*, later called *Summule logicales*, in around 1235 (Peter of Spain 1972). Until recently, Peter was thought to be the later pope John XXI, but this is no longer accepted (Spruit 2000). His exact identity is not certain.

According to Peter, *signification* has an extensional and an intentional side. He defines it as the presentation of something by way of a conventional word.

The counterpart of signification is supposition and copulation. Peter defines *supposition* as the

acceptance of a substantival term for something. In the proposition “a man runs,” “man” supposits, e.g., Socrates. Peter’s use of “acceptance” is remarkable. Supposition is here less a property of a term than a term as far as it is understood by someone. Supposition is equally related to existing and nonexisting things. Roger Bacon, who will be discussed below, takes a different position with respect to reference to nonexistent things or empty classes, as we shall see.

Peter makes a division of supposition. He divides it into common and discrete (i.e., when a term stands for an individual). Common supposition is subdivided into natural and accidental. Accidental supposition is further divided into simple and personal. The notions of natural, personal, and simple supposition Peter discusses also feature in the tradition, although differently defined.

Natural supposition is the natural capacity of a term to have supposition for all actual and possible individuals belonging to the universal term, e.g., “flower.” It owes this capacity to its signification. According to this aspect, the term is able to supposit for things, within or without a context, within or without a proposition. So natural supposition is a kind of extensional counterpart of signification. The latter is independent from any usage. The notion of natural supposition is clearly an extension of his semantics. It resembles Sherwood’s habitual supposition, which I shall explain below.

Simple supposition belongs to a general term, Peter says. An example in subject position is “man is a species”; however, it can also occur with a term in predicate position, e.g., “man is an animal,” where “animal” has simple supposition. Another example is “of all contraries is the same discipline.” “Discipline” is in predicate position and has simple supposition. The next kind of occurrence Peter distinguishes is when a term (“man”) immediately follows an exceptive word, e.g., “every animal except man is irrational.” Here there is no descent to “this man.” It is clear that simple supposition is ambiguous: it refers to both a logical notion and to a kind of reality, for instance, animality.

Peter defines *personal supposition* as the acceptance of a common term for its inferiors, for instance of a man in “a man runs.”

Peter clearly distinguishes between supposition and making a proposition true. For in “a man runs,” “man” has personal and determinate supposition, i.e., an indefinite term or a term to which a sign such as “some” is added (“some man runs”) supposits for every man, both running and not running. Still, the proposition is true when only a single man runs. Although the term “man” supposits for men both running and not running, the proposition is true for a single running man. We may conclude that Peter’s notion of supposition is wide: it includes nonexisting things.

Copulation is the acceptance of an adjectival term for something. Peter does not devote more words to it.

Ampliation is also acknowledged as a property of a term; it is discussed in Peter’s short tract IX. Together with restriction, it is taken as a further refinement of personal supposition. Ampliation is the extension of a common term from a smaller range to a wider, for instance in (Peter’s example) “a man can be the Antichrist,” “man” supposits not only for men that are, but also for men that can be. Such an ampliation occurs, Peter says, when a common noun is used in combination with a verb such as “can,” or with an adjectival noun like “possible,” as in “that a man is the Antichrist is possible,” or with an adverb like “of necessity” in “man of necessity is an animal,” where “man” is amplified to have supposition for the present and the future (note that Peter does not mention the past, to which ampliation does not seem to be possible according to him). Specific expressions possess ampliative force, such as “can,” “necessity,” not just any noun or adverb.

Restriction is defined as the limitation of a common term from a wider to a smaller range of supposition. It occurs in virtue of an adjectival noun, for instance, in “white man,” where “man” is restricted in its supposition (note that Peter does not give a proposition with a copula). It can also occur in virtue of a verb, for instance in “man runs”; or it occurs in virtue of a participle, for instance, “man” in “a running man disputes,” or, finally, it can occur in virtue of what he calls an “implication,” for instance, of “man” in “man who is white, runs.”

In this tract, Peter adds the interesting comment that there is a difference between strict logic and common usage, for instance, when we say “nothing is in the box.” There is something in the box, viz., air. The same applies to “the queen arrives” said in the Netherlands. Here “queen” is restricted by usage to Queen Beatrix of the Netherlands.

Peter hardly devotes any attention to *appellation*. He defines it as the acceptance of a common term for an existing thing. He wishes to exclude terms like “Cesar,” “Antichrist,” and “chimera.” Appellation has been moved to the background. It is a kind of restricted supposition, in a proposition with a verb in the present tense, and it has become a secondary notion. As such it is a counterpart of supposition.

William of Sherwood (1200/1210–1266/1272)

Independent from Peter’s *Tractatus*, William of Sherwood composed his *Introductiones ad logicam* about 1230–1240, before he devoted himself to theological studies (William of Sherwood 1995). Peter of Spain’s *Tractatus* consists of separate treatises discussing the different subjects of logic, such as the properties of terms; William conceived his theory as a whole.

His definitions of the properties of terms, signification included, differ from those of Peter. William defines it as a presentation of a form to the intellect. On the basis of signification there is supposition, copulation, and appellation.

According to Sherwood, *signification* means that something is presented to the understanding. What is presented is a form, a universal nature. His definition of signification can be called “intensional.”

Sherwood defines *supposition* as the ordering of some thought under another thought. His definition of supposition is different from that of Peter of Spain, who defined it as “acceptance.” Sherwood does not use “supponere” in the sense of “supponere pro.” His definition concerns actual supposition (not habitual supposition, which I shall discuss below), when a predicate is joined

to a subject. It reminds us of earlier grammatical theories.

Supposition is divided into material and formal. Material is when a word supposits for an expression as such, or for the word in combination with its signification, as he says (for instance, “man” in “man is monosyllabic”).

Formal supposition is when a word supposits for its significate. It is subdivided into simple and personal. Simple supposition is when a word “supposits for its significate, and significatively.” This formula is also used by Ockham, but with this important difference that in his intensionalistic semantics Sherwood interprets the supposition of “man” in “man is a species” as simple supposition, but explains that the term supposits for its significate. Sherwood adds that personal supposition is when a term “supposits its significate,” that is, for some thing, for instance, “man” in “a man runs.”

The primary notion in Sherwood’s semantics is appellation. He defines it as the property according to which the meaning of a term can be said of something by way of the verb “is.” So appellation is connected with the present tense. It may be amplified or restricted. This use of appellation reminds us of the grammarians. Supposition is secondary, and is taken in a grammatical sense, like “putting as a grammatical subject.” It should be added that Sherwood takes “to supposit” transitively, and not intransitively (in the sense of “to supposit for,” as in, e.g., John Buridan).

The other two properties he discusses are *copulation* and *appellation*. He distinguishes between actual and habitual copulation. *Actual copulation* is a property of a term as predicate. *Appellation* is the property of a term when it denotes individual existing things that are present at the moment when the proposition is uttered.

William’s theory is characteristic in that, according to him, supposition stands for things in the present, and therefore takes the function of appellation. If one refers to other things, this is by way of adjuncts being added to a noun. Sherwood defines appellation as an extensionalistic counterpart of signification. In signification the extensionalistic aspect is *implied*, and appellation brings it to the fore (De Rijk 1982).

William distinguishes between *habitual and actual supposition* and, similarly, between *habitual and actual copulation*. Habitual supposition resembles Peter of Spain's natural supposition. Though it is called "supposition," it bears resemblance to signification. Habitual supposition is defined as belonging to a term as far as it can fulfill the function of subject term in a proposition. This habitual supposition is the signification of existing things in a context. But William does not say that this is a proposition. But what exactly is it?

De Rijk distinguishes between a depth structure of a term (its signification) and a surface structure (habitual supposition). Though this kind of supposition resembles Peter of Spain's natural supposition, the point of difference is that in Sherwood the term stands for presently existing things. Habitual copulation is also a kind of signification, by which something is characterized as property (De Rijk 1982).

Roger Bacon (c. 1214–1292/1294)

Roger Bacon is especially interested in language as it is used. He realizes that meanings of words can vary according to new impositions, which are given by men. A conventional sign has as its immediate significate something in the outside world. The concept is only a natural sign in the sense of an index, secondarily signified.

In his *Summulae dialectices* (an early, but mature work, dating c. 1250; later works are his *De signis* and *Compendium studii theologiae*) Bacon discusses the properties of terms, of which he names three: supposition, appellation, and copulation (De Libera 1982).

He defines *signification*: it is the property of a word, or term, on account of itself, and not in relation to any other term. Therefore, he says, a term has signification both inside and outside a proposition.

Supposition is taken in many ways, Roger says. He defines it as a property of a subject term, in as far as it supposits for something else and is subject in a proposition. The term must be actually used in such a proposition.

Supposition is divided into simple and personal. *Simple supposition* is when a term does not stand for its inferior, but for the word. He takes it more or less in the same way as Peter of Spain, that is, when a term "man" stands for a word itself (man is a word), for man as the worthiest of creatures, for a meaningful word ("man is a noun"), for man as monosyllabic, and for man as a species ("man is a universal").

Personal supposition is when a term stands for its inferiors, such as "man" in "man runs." This means that "man" supposits for present man, and it implies that the verb "runs" does not exercise influence on the supposition.

Roger presents two views on *appellation*: some say that a term of itself appellates present things as appellated, past and future things and is common to beings and nonbeings (this gives room for a semantics of empty classes, for instance, of "Cesar" in "Cesar is a man"). Others say that a term only applies to present things, and is not common to being and nonbeing, or past, present, and future, according to Aristotle.

Roger notes that the first view is the common one. He investigates and rejects it. This view comes close to the one advocated in the *Cum sit nostra*, and to what Sherwood labels as the "improper account." Roger chooses the second view, which is close to Sherwood's "proper account." Bacon's characteristic claim is that a term cannot be common to being and nonbeing. If it stands for things that are not present, this is due to equivocation; then it is amplified. One might say that he does do justice to predication with regard to empty classes.

Appellation is a property of both subject and predicate terms. He attacks the concept of appellation for all possible referents. This reminds us of the Parisian notion of natural supposition, like we have seen. Due to his strict conception of supposition Bacon does not need restriction. Supposition itself is limited. He opposes conceptions of supposition that include more than present referents, for instance in the way Peter of Spain does.

Lastly, Roger discusses *copulation*. However, he can be brief, because there is no difficulty, he says. Adjectives, verbs, and adverbs that signify something predicable, have copulation.

“Copulation” means that the meaning (*res significata*) of a term is joined to another term as “adjacent inclination.” It is an adjectival mode of signification, in which something is meant as a property. Copulation has lost its function as a property of terms in this period. Supposition takes over its role. This could be regretted, for logically an adjectival term plays a different role than a substantival term (Jacobi 1992).

William of Ockham (c. 1285–1348)

To understand Ockham’s semantics, one should be aware of his ontological presuppositions. Reality consists of individual substances and individual properties. Mental concepts are important as guides for interpreting conventional signs. This is, in short, Ockham’s nominalism.

The concepts themselves are constructions of the mind, produced by abstraction following the direct cognition of individual things, existing inside or outside the knower. He opposes any form of reification of names in logic and grammar. Words signify what they signify in different ways. His semantics is connected with his theory of knowledge.

The mental concepts are signs. Signs have become the central notion in fourteenth-century logic. In comparison with Peter of Spain and William of Sherwood, Ockham is much more interested in signification. Logic is about signs, and Ockham clearly distinguishes logic from, e.g., physics, a “real” science. “Real science” is about concepts related to things (the medievals called these “first intentions”); logic is a “rational” science and about second intentions (which are concepts denoting concepts, so concepts on a higher level).

Concepts are fundamental in order to be able to talk and write successfully. These are for all men the same, French or English, and are a kind of universal language, having a sort of universal grammar.

Language is essential in Ockham’s philosophy for Ockham, because thought is performed in

language (mental, spoken, or written). *Signification* is a central notion for Ockham, referring to Augustine. It is defined in the first part of his *Summa logicae* (Guillelmi de Ockham *Summa logicae*, 1972). In chap. 26–37 he gives a kind of philosophical dictionary, which students should learn in the pursuit of truth.

Ockham takes *signification* in many ways. He favors the second sense. Signification is not linked to the present, like Bacon said, and is not influenced by change or destruction of something. This mode of signification shows an omnitemporal range. Signification can be called “omnitemporal denotation.” He takes it extensionally.

The key word in Ockham’s semantics is *supposition*. It is a property by virtue of which a term, be it a subject or predicate term, stands for something. A propositional context is required for this two-name theory of reference. Prior to its having supposition, a term has signification. A general term signifies all those things of which it can be truly said (Read 2006).

Ockham distinguishes between three kinds of supposition: personal, simple, or material. Personal supposition (which together with simple supposition is called formal supposition, just like in Sherwood) is primary. In this way, a term supposits for its significate. For example, in “every man is an animal,” “man” supposits for things in the outside world, of which it is true to say that it is an animal. In “every vocal noun is a part of speech,” “noun” supposits for words. In “every species is a universal,” “species” supposits for particular species, for instance *horse*. A term may also supposit for imaginable things. Ockham does not give an example; perhaps he only means that the list is not complete.

Simple supposition occurs when a term supposits for an intention in the mind, e.g., in “man is a species”; here “man” supposits for the logical construct “man.” Material supposition is said to occur when a term supposits for a spoken or written word and is not taken significatively, e.g., in “man is a noun,” “man” supposits for the material or written entity. Whether material

supposition also occurs on the mental level is still a matter of discussion among scholars. It seems to be the case in some respects, and that means that there is equivocity in mental language. Ockham rejects *ampliation*.

There are several problems connected with this division. Firstly, one should note that, according to Ockham, personal supposition is primary. It is what is called “in virtue of speech” that every term in a proposition should be taken according to this kind of supposition. When a term is taken in personal supposition, it stands for things it signifies naturally, e.g., “man” signifies individual men, “noun” signifies words, etc. Ockham expresses this as follows: “every man is an animal, therefore this man is an animal and that man is an animal,” etc. Thus there is no reference to some distributive entity in the sense of Plato, which does not exist. In this analysis, the antecedent is extensionally equivalent with the consequent.

Ockham explicitly says that in personal supposition a term does not stand for a thing, but to its *significate*. Here he criticizes Sherwood, it seems, who speaks about the signification of things. In simple supposition a term does not stand for its significate, Ockham says. He criticizes among others Peter of Spain. According to Ockham, a term having simple supposition supposits for an act of the mind. This corresponds to his conception of universals.

Simple supposition seems to be connected with material supposition rather than to personal supposition. This last form does not seem to belong to the same genus.

Ockham also deals with the expression “man” in “man is the worthiest of creatures.” Some realist philosophers taught that “man” here has simple supposition, for it is false, they say, that this man or that man is the most worthy among creatures. The proposition is therefore false, Ockham says, when “man” is taken in personal supposition. However, one should pay attention to the author’s intention in that he clearly wanted to distinguish man from all other corporeal creatures. One should therefore not take every proposition “in virtue of speech” as Ockham sees it. He is not a radical empiricist.

John Buridan (c. 1292–1362)

Important though he is as a logician, Ockham was not very influential on the continent. It could be said that in the fourteenth century John Buridan dominated semantics on the continent, especially in Paris. His tract on suppositions, part of his *Summulae*, was very influential in Europe (John Buridan 1998).

Like Ockham, Buridan is a nominalist. He acknowledges only individual substances and individual accidents, both existing on themselves. How these two kinds form a unity does not seem to be his main concern. His interest is in semantics, and traditional metaphysical questions are solved semantically.

A human being possesses the power to express a word (spoken or written) according to the institution given in order to make his thoughts clear. Buridan is especially interested in the conventional level, and takes that more seriously than any of his predecessors. For instance, to the single word “chimera” correspond three different concepts, viz., those of goat, stag, and lion.

Signification is primarily a property of conventional signs. These are labels of concepts and can be replaced at will. Concepts determine the truth of a proposition, so they have objective value, but Buridan interprets them as the way in which man approaches reality. Man is not an objective, calculating being who automatically reproduces truth, but one who speaks or writes true, or false, propositions depending on the way under which he understands reality.

Buridan develops his theory on the properties of terms in the framework of his commentary on Peter of Spain. It should be noted that this text of Peter’s is not the original one, and Buridan does not follow it slavishly. Every now and then he seems to be annoyed with it.

Supposition can be divided into personal and material, thus into two kinds, not three, as is traditionally the case. Personal supposition is when a subject or predicate has supposition in a proposition for its ultimate significate(s), for instance, the term “man” – not the term

“chimera,” because this does not possess a single ultimate significate in reality.

Material supposition is when a term has supposition for itself, or for a like term, or for a concept (which is called its immediate significate), according to which it is imposed to signify. For instance, the term “man” in “man is monosyllabic,” and “man” in “man is a species.”

In Buridan’s material supposition, simple supposition is included. He is well aware that some adopt the property of simple supposition, for instance of “man” in “man is a species.” He rejects it, however, and adds that Aristotle had already done so. Buridan calls both cases “material supposition,” in line with his ontology. Simple supposition suggests the existence of universals outside the mind, and this kind does not exist, other than the “ancients” say. Universals are just concepts, by which the mind conceives more than one thing in an indifferent way.

Buridan defines the notion of *natural supposition* in another way than Peter of Spain does. Natural supposition is, for instance, of “thunder” in “thunder is a sound in the cloud.” The term stands for all occurrences of thunder in the past, present, future, and possible tense. Taken this way, it is a scientific proposition.

Other properties of terms Buridan acknowledges are appellation, ampliation, and restriction, not copulation, a property that does not play a part any more. *Appellation* is the property of a term according to which a term put in a proposition appellates its form, i.e., those things which the term connotes, and it appellates them as adjacent, either in the present, or in the past, or in the future, or in possibility. Buridan gives an example: “The just devil runs.” He analyses it as follows: the subject of this proposition (“just devil,” i.e., this complex term) does not supposit for anything. Still, “just” appellates justice, as adjacent to the devil for which the term “devil” would have supposition if it would be the subject or the predicate of the proposition.

There is an interesting case of appellation in propositions with a verb denoting an inner act of the mind, such as “to know,” “to promise.” The famous example is “I know the one coming” (*cognosco venientem*). The term “coming” appellates “to come.” The proposition expresses that

I know the one only as far as he is coming. Still, he may be my father, whom I know very well, but at that moment I do not know that he is the one coming. In this case, “you know the one coming” is false, though in fact it is your father. If one says, “the coming one, you know,” in which the substantial adjective is put before the verb, the proposition is true. According to that word order, the aspect of coming does not fall under the scope of the verb “to know,” and is not necessary for the truth of the proposition.

Ampliation is the widening of the supposition of a term, e.g., “A” in “A will run” which means, Buridan says that “what is or will be A, will run.” It is amplified beyond its “status,” Buridan says. By “status” he means the condition by which a term signifies all its significates in the present.

Restriction is also a property of a term, e.g., of “man” in “every white man will run.” Here “man” is restricted within its status, and stands for all men in the present and future, due to the verb in the future, but is restricted to white men.

Thābit ibn Qurra

David C. Reisman

Department of Classics and Mediterranean Studies, University of Illinois at Chicago, Chicago, IL, USA

Abstract

Thābit ibn Qurra (836–901) was an influential figure in the Kindī Circle, a group of scholars who popularized the classical, scientific, and philosophical texts in Muslim society under the reign of the early ‘Abbāsīd dynasty. He is primarily known for his translations, commentaries, and expositions in astronomy and the exact mathematical disciplines, but he figures also in the Neoplatonic interpretation of Aristotelian philosophy.

Thābit ibn Qurra (836–901), astronomer, mathematician, and philosopher, worked at the Islamic ‘Abbāsīd court during the classical stage in medieval Muslim intellectual history. He was a major figure in the so-called Kindī Circle and so participated in the project in which the philosopher al-Kindī (d. after 870) sought to popularize the philosophical and scientific works which the Muslim world inherited from the Greeks as part of the Graeco–Arabic translation movement. Of Ṣābīan origin and thus of this partially pagan but certainly scholarly community of Ḥarrān, Thābit was well-prepared to start his career with knowledge of the important languages (Greek, Syriac, and Arabic) that were the main tools of the translation movement and of the scholarly discussions that took as fundamental, philosophical and scientific principles, those of the pre-Islamic Aristotelian and the subsequent Neoplatonic commentary tradition (of both pagan and Christian Greek Near Eastern communities).

In the field of philosophy, Thābit's familiarity with the Aristotelian corpus is evident from his compendia and abridgments of parts of the Aristotelian logical *Organon* (*Categoriae*, *De interpretatione*, *Analytica priora*). Indicative of

his philosophical studies is an acute presentation of Aristotle's *Metaphysics* and his translation (or reportedly "correction") of Themistius' paraphrase of Aristotle's work. One work, his *Concise Exposition of Aristotle's Metaphysics*, gives us indication of Thābit's intellectual allegiances and achievements. In this work, the concentration of attention is directed toward the "theological" core (the *metaphysica specialis*) of Chaps. 6–9 in the book *Lambda* and the content concerned with a type of reconciliation of its doctrines and Islamic (or at least monotheistic) tenets. Examples of this effort is to be seen in his attribution of will to the vague and pagan articulated "First Principle" and his Islamic-inspired choice of the term *tawhīd* to describe its "unicity." As a result of these pieces of evidence, we can conclude that Thābit ascribed to the "theologizing" interpretation that was very important to the success of the Kindī cycle of works in medieval Islamic intellectual circles. The overall content of this most important philosophical work ascribed to Thābit displays an original and percipient understanding of Aristotelian doctrine. While clarifying Aristotle's position on the two subjects of the First Mover being the cause of corporeal substance's existence and the First Principle being cause of the universe's existence from eternity, Thābit is quite skilled at introducing and providing solutions for the logical consequences of Aristotle's arguments. The structure of the work also evinces Thābit's expert knowledge of Neoplatonic commentaries; this is especially evident in his prolegomenon's inclusion of the points of information expected in the earlier works.

While Thābit displays an appreciation for the ancient philosophical tradition as well as acumen applied to its problems, he was and is best-known for his work in astronomy (and its attendant fields of astrology and mathematics). In astronomy he not only clarified many aspects of the heritage of Ptolemy, but also contributed original thought that would lead eventually to the common perception of astronomy as an exact science. These contributions included a new empiricist approach to astronomical data and at the same time a "mathematizing" trend in astronomical research by the use of geometrical models. His thought in

the field of mathematics is displayed in a textual dialogue with his contemporary ʿĪsā b. Usayyid. Three issues were addressed. In one, Thābit propounded the Neoplatonic doctrine that numbers have an existence separable from numbered things. In another, he defended the view that infinite numbers actually exist. This research into finitude and infinitude were to be of some importance to the Muslim philosophical tradition, particularly when applied to the question of divine knowledge of universals (the topic of the third question) as well as discussions on the post-mortem existence of particularized or individuated human souls. This correspondence is to be included in the vast mathematical corpus composed by Thābit which includes treatises on geometry (planes and their terminations; the study of planes in relation to discrete substances; the magnitudes of pure figure) as well as mathematics proper (treatises on discrete numeration, etc.).

Thābit's intellectual heritage was of profound importance to developments in the medieval Arabic fields of philosophy and the exact sciences. His penchant for the Platonic tradition was perhaps the most influential trend in determining what of the Platonic corpus would be translated and how its implications for the relevant fields of research would be addressed. His approach to those fields would have major implications for the development of philosophy and the exact sciences at least until the later medieval age.

Themistius, Arabic

Elisa Coda
Istituto Italiano di Scienze Umane, Palazzo
Strozzi, Florence, Italy

Abstract

From the sixth century onward, some of Themistius' works were translated into semitic languages. Lost in Greek, some of Themistius' works have come down to us, either in part or

in their entirety, through Arabic (or Hebrew) translations. The Arabic bio-bibliographical sources mention a great amount of his texts. Arabic readers got acquainted, to different degrees, with the Arabic or the Syriac version of his *Paraphrases* of Aristotle's *Prior* and *Posterior Analytics*, *Categories*, *Topics*, *On Generation and Corruption*, *Physics*, *On the Soul*, of Book *Lambda* of the *Metaphysics*, *On the Heavens*, *Poetics*, *Ethics* and of some of Aristotle's zoological works. Only few of these Arabic translations have come down to us. However, fragments of these texts are transmitted through Averroes and a few other Arabic authors. Several of these Arabic versions were in turn translated into Hebrew in the thirteenth century. Part of Themistius' *Paraphrase* of the *Prior Analytics* has come down to us in Hebrew. Moreover, the Hebrew translations of his *Paraphrases* of Book *Lambda* of Aristotle's *Metaphysics* and of Aristotle's *On the Heavens* are extant in their entirety. Both of them are extant also in Latin translations made from the Hebrew in the sixteenth century. Among his works preserved in Arabic, there are also a discourse on *Government* and a treatise on logic, namely, the *Treatise in Response to Maxim on the Reduction of the Second and Third Figures of the Syllogism to the First One*, both lost in Greek. In addition, the ps-al-Kindī's *On how to Dispel Sorrow*, preserved in Arabic, has been traced back to a lost work by Themistius. Finally, some passages that are not related to his or that determined work are also attributed to Themistius by a number of Arab and Jewish authors.

Themistius' Paraphrases Extant in Greek

Themistius (c. 317–387 CE) was a Greek rhetorician and commentator, who wrote extensively on the Aristotelian *corpus*, embedding in his paraphrases materials from more ancient authors, chiefly from Alexander of Aphrodisias. Themistius describes the origin and the aim of his philosophical production in different ways: his paraphrases contain what Themistius learned

from and inherited by his teachers (*Oration* 23,294d–295a); Themistius wrote paraphrases as a result of his official activity as teacher (*CAG* V/1: 1,7–10; *CAG* V/3: 1,1–5).

Themistius' *Paraphrases* of Aristotle's works which have come down to us in the Greek original are those of the *Posterior Analytics* (*CAG* V/1), *Physics* (*CAG* V/2), and of *On the Soul* (*CAG* V/3).

Even though most of Themistius' paraphrases are lost in Greek, many quotations of them are extant in the works of Simplicius (c. 490–560 CE), Philoponus (c. 490–570 CE), and a few other ancient authors (Eustratius of Nicaea, *CAG* XXI/1: 11,5–9; Sophonias, *CAG* XXIII/1: 1,11–22; Theodorus Metochites, ed. Mueller: p 95–96). More of the works of Themistius was known to Syriac and Arabic authors than has survived in Greek.

Several information about Themistius' paraphrases available in Byzantium are contained in the *Suda* Lexicon (ed. Adler A.: 690–691) and in Photius' *Bibliotheca* (Cod. 74, ed. Henry R., vol. 2: 154; Benakis 1987, p 352). Modern scholarship maintains that the translation of Boethius' *De differentiis topicis* by Maximus Planudes granted an indirect access to Themistius' *Paraphrase* of Aristotle's *Topics* (Todd 2003:62 and n. 33). From the eleventh century, his paraphrases were several times copied by Greek scribes together with Aristotle's works or sometimes in marginal *scholia*. Besides these copies, several quotations from his paraphrases were also cited in anthologies together with other commentaries (Todd 2003: notes 34–35).

Themistius' philosophical works were quoted and discussed by several Arab (and Jewish) authors, whose writings count – together with the Graeco-Latin translations – as a major source of the knowledge of his paraphrases in medieval Europe. An Arabic translation of his *Paraphrase* of Aristotle's *Posterior Analytics* was the basis of the Latin translation by Gerard of Cremona (c. 1144–1187). Themistius became known in medieval Europe through this Latin translation and from the quotations contained in Arabic sources. Besides the translations and the indirect transmission through Arabic sources, the Latin

West also got acquainted with him from other works. The ps-Augustinian *De decem categoriis* (ed. Minio-Paluello 1965) provided an indirect access to his *Paraphrase* of the *Categories*, lost in Greek. Analogously, the *Paraphrase* of the *Topics* was to a certain extent known in the Latin world through several quotations in Boethius and Cassiodorus. From the thirteenth century onward, some of Themistius' paraphrases started to be translated from Greek original into Latin and commented by Latin authors. The Greek original of his *Paraphrase* of Aristotle's *On the Soul* was translated into Latin by William of Moerbeke in Viterbo, 1267. Moerbeke's Latin translation is extant and edited (*Corpus Latinum Commentariorum in Aristotelem Graecorum*/I 1957). Another Latin translation of this *Paraphrase* was carried out in Venice, 1481, by Ermolao Barbaro the Younger; this translation was also based on the Greek original. Barbaro the Younger's Latin translation has been repeatedly published (Todd 2003), and is edited, too (*CAG Versiones Latinae*/XVIII 1978). Another annotated Latin translation of chapter 3 (paragraphs 4–13) of his *Paraphrase* of Aristotle's *On the Soul* by Ludovico Norgarola was carried out in Verona, s. XVI (c. 1554). Norgarola's Latin translation was based on the Greek original; it has been repeatedly published (Todd 2003). Several versions (s. XVI, 1582–1588) of a Latin translation of his *Paraphrase* by Federico Bonaventura have come down to us and these have been repeatedly published (Todd 2003).

Themistius' *Paraphrase* of Aristotle's *Posterior Analytics* was translated from the Greek into Latin by Ermolao Barbaro the Younger (1454–1493) between 1471 and 1480, in Naples. This translation too is published (Todd 2003). Paolo Orsatto revised and commented Barbaro the Younger's Latin translation of this *Paraphrase*. Orsatto's Latin translation of this text has come down to us undated and incomplete. It is extant in a single manuscript (Milan, Biblioteca Ambrosiana D 129 inf., s. XVI, fols. 34r–60v) (Todd 2003). Ermolao Barbaro the Younger translated from Greek the *Paraphrase* of Aristotle's *Physics*. This has been repeatedly published (Todd 2003).

From the sixteenth century onward, Themistius' *Paraphrases* of the *Posterior Analytics*, *Physics*, and *On the Soul* were several times commented and annotated by Italian Humanists; the commentaries which are available for us are those of Marcantonio Zimara, Ludovico Norgarola, Federico Pendasio, and Federico Bonaventura; scholars also debate on the identity of the author of an anonymous commentary, conventionally called Anonimus ("Anonimus Venetus") (Todd 2003).

Spurious Works

The *Paraphrase* of the *Prior Analytics* (CAG XXIII/3), preserved in Greek and transmitted under the name of Themistius is commonly agreed to be spurious; it is attributed to Sophonias (Rose 1867; Walzer 1963). The *Paraphrase* of parts of Aristotle's *Parva naturalia* (CAG V/6) transmitted under the name of Themistius is also spurious and should be attributed to Sophonias (Wendland 1903). Ermolao Barbaro the Younger translated it into Latin (*In librum de insomniis paraphrasis*, *In librum de divinatione per somnum paraphrasis*, *In librum de memoria et reminiscencia paraphrasis*, and *In librum de somno et vigilia paraphrasis*): these translations have been printed several times (Todd 2003).

Syriac, Arabic, and Hebrew Translations of Themistius' *Paraphrases*

From the sixth to the eighth century, during the early moment of Aristotle's reception into the eastern Christian society, in the Syriac world, several of Themistius' works have been translated into Syriac – an Aramaic dialect, which became soon a major literary language and was used for exegetical and philosophical works. None of the Syriac translations of his paraphrases have come down to us.

After the rise of Islam, between the ninth and the tenth century, several of Themistius' *Paraphrases* have been translated from the Greek original or from previous Syriac translation into

Arabic (Endress 1997; D'Ancona Costa 2002). Several of these Arabic translations were in turn translated into Hebrew in the Middle Ages. Some of the Arabic translations of his works are at present available; others, lost in Arabic, have come down to us in Hebrew. Valuable information about the assimilation of his works into Arabic have also been preserved to us by the Arabic bio-bibliographical sources; some attributions in these sources are, however, dubious (see below).

Prior Analytics

The Greek original of Themistius' *Paraphrase* of the *Prior Analytics* is lost. The Arabic bio-bibliographers mention an Arabic translation of this text by Abu 'Uthman al-Dimashqī (d. c. 900) (*K. al-Fihrist*, Flügel: 249,8; Ibn al-Qifṭī 36). This Arabic translation is however lost, but parts of it are at present available into some *excerpta* translated in Hebrew by Todros Todrosi (fl. around 1330), towards the half of fourteenth century (Zonta 1994; Hasnawi 2002). The Hebrew version of these *excerpta* includes the following passages of his *Paraphrase* on the *An. Pr.*: 24a3–24b20; 24b19–21; 25a1–3; 25a14–16; 27b10–29a18; 30a15–30b7; 32b5–32b23; 37a32–37b11. The text preserved in Hebrew is different from the spurious one attributed to him in Greek. It is considered genuine and is edited (Rosemberg and Manekin 1988).

Posterior Analytics

According to the Arabic bio-bibliographical sources, Abū Bishr Mattā ibn Yūnus (d. 940) translated into Arabic the first and the second books (*K. al-Fihrist*, Flügel: 249,13). Mattā's Arabic translation is no longer extant. An Arabic translation of the *Paraphrase* has served as a basis for the Latin translation by Gerard of Cremona carried out in Toledo. Gerard's Latin translation is edited (O'Donnell 1958).

Themistius developed an original exegesis of Aristotle's enumeration of the four types of inquiry (*Post. An.* 2,1,89b23ff.: τὸ ὅτι, τὸ διότι, εἰ ἔστι, τί ἔστι). He overcame the Aristotelian dichotomy between inquiries about statements and about substances, referring Aristotle's enumeration exclusively to substances. According to

Themistius, one should first inquire “whether a simple thing exist” (εἰ ἔστι) and then “what it is” (ὅτι ἔστι) (CAG V/1: 42,5–14). This interpretation was endorsed by other commentators (Anonymous commentator CAG XIII/3: 547,10–548,9) and it is widespread in medieval Arabic and Latin thought.

Topics

The Greek original of Themistius’ *Paraphrase* of Aristotle’s *Topics* is lost. He himself mentions this work in his *Paraphrase* of the *Posterior Analytics* (CAG V/1: 42,15). The bio-bibliographical sources mention an Arabic translation (K. *al-Fihrist*, Flügel: 249,23; Ibn al-Qifṭī 37). Some fragments are transmitted through Boethius and Averroes (Stump 1974; Brague 1999; Hasnawi 2007).

Categories

Lost in Greek, this work is mentioned by Themistius himself in his *Paraphrase* of the *Physics* (CAG V/2: 4,26). He refers to Aristotle’s *Categories* in his *Paraphrase* of *On the Heavens* (CAG V/4: Hebr. 10,14 and 29; 103,20); the exact source of these passages is unclear. The text is known to Simplicius (CAG VIII: 1,10). The *Fihrist* mentions Themistius among the commentators of this work (K. *al-Fihrist*, Flügel: 248,21).

Physics

The *Fihrist* mentions an Arabic translation of this *Paraphrase* (K. *al-Fihrist*, Flügel: 250,22–23). This *Paraphrase* was known in the circle of Mattā ibn Yūnus (Endress 1977:35). Some occasional references to the opinion of Themistius (according to Stern, not in the form of direct quotation) are reproduced in an MS housed in Leiden (MS Leiden, Wermar 583), which contains the text of the *Physics* as it was studied in the Baghdad school (Stern 1956:40; Lettinck 1994).

On the Soul

In the K. *al-Fihrist*, we are told that Iṣḥāq b. Ḥunayn (d. 911) translated it in its entirety (K. *al-Fihrist*, Flügel: 251,12). Iṣḥāq’s Arabic translation is extant and edited. This translation

counts as an independent witness that helps in improving the Greek text (Lyons 1955, 1973: XIII; Browne 1986). Among the Arab authors who refer to his *Paraphrase* by name are Avicenna, Avempace, and Averroes. Several of their references to him are, however, concerned with minor points. The main influence of his exegesis on the Arabic thought concerns his interpretation of Aristotle’s account on intellect and its implications for the issue of the immortality of the soul. These sources frequently mention his authority in opposition to Alexander of Aphrodisias’ interpretation, in particular, regarding the issue of the immortality of the intellect and that of the nature of the passive and speculative intellects.

Book Lambda of the Metaphysics

The Greek original is lost. The *Fihrist* credits Mattā ibn Yūnus with an Arabic translation of this paraphrase. (K. *al-Fihrist*, Flügel: 251, 29–30). Parts of this Arabic translation are at present extant (chapter 1, a portion from chapter 2, and chapters from 6 to 10) and published (Badawī 1947). The Arabic version of the *Paraphrase* has been in turn translated into Hebrew by Moshe ibn Tibbon (d. c. 1283) in 1255. And again, Tibbon’s Hebrew translation of Themistius’ *Paraphrase* was in turn translated into Latin by Moshe Finzi in 1558. Tibbon’s Hebrew translation is extant and edited together with Finzi’s Latin translation (CAG V/5 1903). At variance with what is said in the *Fihrist* (see above), one of the Arabic MSS (Badawī 1947:329,2) credits Iṣḥāq b. Ḥunayn with the Arabic translation, saying also that Iṣḥāq’s translation has been in turn corrected by Thābit ibn Qurra (d. 901). This attribution is also attested by one of the Hebrew MSS (MS B quoted in Landauer 1903: V). Some scholars agreed with this attribution (Badawī 1947Intro: 16ssq.; Pines 1987).

The edited parts of the Arabic translation (Badawī 1947) are shorter than the corresponding chapters of the Hebrew translation. About the identity of the translator and the relation between the Arabic and the Hebrew versions, two

hypotheses have been advanced: (1) the extant parts of the Arabic translation are an abridgment of the longer text (Badawī 1947; Pines 1987); (2) they trace back to two Greek recensions, which have been translated into Arabic by the same person (discussed in Pines 1981:177 n. 3). The debate on this point is still open (Pines 1981, 1987; Brague 1999). Tibbon's Hebrew version has been used to complement the Arabic one and the two both are translated into French (Brague 1999; Martini 2003:263). Finally, T. Farhat has detected a long quotation in Ibn Taymiyya (Geoffroy 2003:420). The influence of Themistius' *Paraphrase* on the medieval Arabic and Jewish philosophers lays on his interpretation of divine intellection as it is exposed in Book *Lambda* of the *Metaphysics*. Aristotle's God is designated as the First Intellect; following Aristotle's formulation, Themistius asserts that God intelligizes only Himself and nothing that is extraneous to Himself. But, according to him, this means that God intellects all the existents, because they are not extraneous to Him. According to him, Aristotle's God is both the cause of the cosmos and of the *Nomos* (Ar. *nāmūs*, Hebr. *nimmus*) obeyed throughout the cosmos (Pines 1987:189–190), and this allows him to add that God intelligizes the existents because He is their cause and producer. It has been demonstrated that his conception of God was influenced by Plotinus' description of *Nous* (Pines 1981). Among the Arab authors who refer to his exegesis are al-Fārābī, al-Mas'ūdī (c. 893–956, *Kitāb al-tanbīh wa-l-ishrāf*: 163), al-ʿĀmirī (d. c. 992, Badawī 1947:18), Avicenna (*In Metaph. Lambda*, ch. 7:26–27; ch. 9:31; *Shifāʾ*, *Metaph.* VIII 6:358–359, VIII 7:363, IX 2:393); Averroes (*Long comm. of the Metaph.*, ed. Bouyges: 1410, 4–5; 1492,3; 1494; 1635,4–1636,13; *Epitome on the Metaph.*, see references in Brague 1999:28). His interpretation was influent also on the medieval Jewish authors. Among the Jewish authors who refer to his *Paraphrase* or to his interpretation of Aristotelian God are Maimonides (*Guide of the Perplexed* I, 68; I, 69; III, 21), Falaquera (b. c. 1223, *Moreh ham-Moreh* ed. Bisseliches 1837: 76), and Gersonides (*The Wars of the Lord* V, 3, ch. 12).

On the Heavens

The Greek original is lost. Some fragments are transmitted through Simplicius and Philoponus. In the bio-bibliographical sources, we are told that the *Paraphrase* was translated into Arabic, but this Arabic translation is lost. The *Fihrist* (K. *al-Fihrist*, Flügel: 250,30) attributes an Arabic translation, or rather the emendation of a previous Arabic translation to Yahyā ibn ʿAdī (m. 974). According to Ibn al-Sarī (al-Ṣalāḥ, d. c. 1153), Themistius' *Paraphrase* was first translated from Syriac into Arabic by Mattā ibn Yūnus; then, Yahyā ibn ʿAdī revised this translation (ed. Türker: 57,24–58,1 and 68,7–9). The existence of a Syriac translation is a problematical issue still opened. His *Paraphrase* has come down to us in the Hebrew translation of Zeraḥyah ben Yīṭḥāq ben Shealtiel Ḥen (Gracian) ha-Sefardi carried out in Rome in 1284. This Hebrew translation has come down to us and it is edited (CAG V/4 1902; see Zonta 1994). Zeraḥyah's Hebrew translation of Themistius' *Paraphrase* was in turn translated into Latin by Moshe Alatino (d. 1605), between 1568 and 1573. Alatino's Latin translation of Themistius' *Paraphrase* was first published in Venice by Simone Galignano in 1574; both the Hebrew and the Latin versions are edited (CAGV/4 1902). Themistius developed an original interpretation of Aristotle's use of the term "heaven" (the discussion on this definition also refers to a passage of the *Physics* IV, 5,212b7–13). He distinguishes between the outermost sphere and the inner spheres. According to him, the Aristotelian use of the term "heaven" refers to the outermost sphere. Since the outermost sphere does not have anything surrounding it, it has as its place the convex surface of the sphere immediately surrounded by it. Hence, the place of the outermost sphere is an equal and separate limit, but not a surrounding limit. The place of all the other spheres is the limit of the body surrounding them, that is, the concave surface of the spheres which respectively surround them. At variance with the place of the outermost sphere, the place of all the other spheres is a surrounding, equal, and separate limit, and it is what is called an essential place (see also CAG V/2: 120). Several quotations of the *Paraphrase*

of *On the Heavens* are preserved by Averroes (the passages are listed in Carmody 2003:763). The Hebrew is quoted by Yiṣḥaq Abravanel (1437–1508, *She'elot u'Tešuvot le Rabbi Saul Ha-Kohen* 1574, first noted by Steinschneider, *Die Hebräischen Übersetzungen*: 126 n. 127; also mentioned in Zonta 1994:418 n. 65) and by the translator Zerahyah itself, who quotes it (CAG V/4: Hebr. 1,29–2,1) in his own commentary on Maimonides' *Guide* (noted by Ravitzky 'The thought of Zerahyah' 101). It has been shown that the *Paraphrase* influenced Crescas (c. 1340–1410/1411, Wolfson 1971²:396–397, 432–437, 597).

On Generation and Corruption

Themistius refers to this Aristotelian work in his *Paraphrase* of *On the Heavens* several times (CAG V/4: Hebr. 65,32; 140,16sq.; 129,29sq.; 162 9–14); the source of these passages has not been inquired yet.

The bio-bibliographical sources credit Themistius with a *Paraphrase* of Aristotle's *On generation and corruption* (K. *al-Fihrist*, Flügel: 251,6; see also Rashed 2003: 312). This text is lost both in Greek and in Arabic. The existence of this *Paraphrase* by Themistius is disputed by some scholars (Todd 2003:60 n. 12).

Epitome by Themistius of Aristotle's Zoological Works and the Paraphrase of Aristotle's *De sensu et sensato*

In his *Paraphrase* of *On the Heavens* Themistius refers to Aristotle's *De animalibus* (CAG V/4: Hebr. 61,13 and 62,16) and *De motu animalium* (CAG V/4: Hebr. 65,3); the source of these passages is unclear. A *Paraphrase* of Aristotle's zoological writings attributed to Themistius, lost in Greek, has come down to us in Arabic (Badawī 1971). This attribution is challenged (Zimmerman and Brown 1973:323–324; Mattock 1976).

Themistius' *Paraphrase* of Aristotle's *De sensu* is lost in Greek; this work is mentioned by Themistius himself in his *Paraphrase of On the Soul* (CAG V/3: 70,8 and 77,26–27). He refers to Aristotle's *De sensu* in his *Paraphrase of On the Heavens* (CAG V/4: Hebr. 74,9); the source of

these passages has not been enquired yet. The existence of this *Paraphrase* by Themistius is disputed by some scholars.

Poetics

A *Paraphrase* of Aristotle's *Poetics*, lost in Greek, is mentioned in the bio-bibliographical sources (K. *al-Fihrist*, Flügel: 250,5; Ibn al-Qiftī 38); it has been argued that the notice of the *Fihrist* seems to be confirmed by Fārābī (Arberry 1937). The existence of this *Paraphrase* by Themistius is still challenged by some scholars (Todd 2003).

Ethics

The bio-bibliographical sources (K. *al-Fihrist*, Flügel: 252,3; Ibn al-Qiftī 42) credit Themistius with a *Paraphrase* of Aristotle's *Nicomachean Ethics*. An Arabic translation is also mentioned, which is now lost. This attribution is challenged (Walzer 1963; Ghorab 1972).

Other Works

A discourse by Themistius on the virtue (*Peri aretēs*), lost in Greek, is extant in Syriac translation and published (ed. Sachau, *Inedita Syriaca*, 1870 (repr 1968):17–47; also edited by Doneway-Norman 1974, in *Themistii Orationes* with Latin trans. by March R: 7–71; German trans. by Gildemeister-Bücheler (1872) *Rheinisches Museum* 27:438–462). Lost in Greek, it is extant in Syriac and published a discourse by Themistius on friendship (ed. Sachau, *Inedita Syriaca*, 1870:48–75).

The *Fihrist* (K. *al-Fihrist*, Flügel: 253,24–27) credits Abū 'Uthmān al-Dimashqī with the Arabic translation of a discourse by Themistius' *On Government*, lost in Greek. This Arabic translation is extant and published (MS Istanbul, Köprülü I 1608, ed. Cheikho, *al-Mashriq* 18 (1920): 881–889; also edited by Shahid I, in *Themistii Orationes* 73–119; see also Gutas 1975:47).

A work lost in Greek attributed to Themistius, the *Treatise in response to Maxim on the reduction*

of the second and third figures of the syllogism, to the first one (*Māqāla fī-l-radd ‘alā Maqṣīmūs fī tahlīl al-thānī wa-l-thālith ilā al-awwal*), is extant in Arabic. This text is published and translated into French (Badawī 1947, 1968) and lies in the background of some developments by al-Fārābī (Martini Bonadeo 2008).

In addition, a writing by al-Kindī *On How to Dispel Sorrow* has been traced back to a lost work on happiness attributed to Themistius. Kindī’s text is published together with the Italian translation (Ritter and Walzer 1938; Druart 1996; Martini Bonadeo 2008:227–228); however, Themistius’ authorship has been challenged.

Several Arab and Jewish authors credit Themistius with passages that are not related to his or that determined work. Fārābī mentions Themistius’ opinion regarding the date of composition of Archytas’ treatise on *Categories*: according to Fārābī, Themistius said that there were two authors named Archytas, only one of them flourished before Aristotle. Still according to Themistius *apud* al-Fārābī, the Archytas who wrote the treatise on *Categories*, coming after Aristotle, could not be the source of Aristotle’s work (*Kitāb al-alfāz al-musta‘malah fī ‘l-mantiq*, ed. Mahdi 1968:109,7–12; see Zimmerman 1981; Martini Bonadeo 2008).

Al-Sijistānī (c. 913–987 CE) quoted several passages attributed to Themistius, dealing with the definition of happiness (*Muntakhāb Ṣiwān al-ḥikma*, ed. Dunlop 1979:101); this passage is also quoted by al-Tawḥīdī (*R. fī-l-Ṣadāqa wa-l-ṣadīq*, ed. Keilani: 193). The influence of Themistius’ work on friendship has been detected in Miskawayh (s. X–XI, *Tahdhīb al-akhlāq* ed. Tamim: p 139; Rosenthal 1940:402–405).

Theodore Metochites

Börje Bydén

Department of Philosophy, Linguistics and Theory of Science, University of Gothenburg, Gothenburg, Sweden

Abstract

Theodore Metochites (Theodōros Metochitēs, 1270–1332) was a Byzantine statesman, author, philosophical scholar, and patron of the arts. His philosophical works include paraphrases of Aristotle's natural philosophy, an introduction to Ptolemaic astronomy, and a collection of "philosophical and historical" essays. A leitmotif running through the latter as well as his numerous speeches and poems is his insistence on the instability of things in the sensible world. This has ethical consequences: the proper demeanor under these conditions is to rise above the tide of joy and grief by means of unceasing reflection. It also has epistemological consequences: according to Metochites, nothing can be known with certainty outside the field of mathematics. Since we ourselves are part of the sensible world, our intellectual capacity is limited: this is why even the truths of Christianity cannot be the object of knowledge but only of faith. Without doubt, Metochites' reflective practices, arguing pro and contra, and his vaguely skeptical theory of knowledge reinforce each other. He has often been regarded as a prime exponent of Byzantine humanism (although the very

concept has been controversial). Indeed, it may even be tempting to bestow on him the epithet “Renaissance man,” not only on account of his encyclopedism (spanning poetry and prose on the most diverse topics) and his quest for synthesis (trying to combine philosophy and eloquence as well as to integrate the lives of contemplation and of action) but also in view of his criticism of Aristotle, his sympathy for skepticism, his fideism, and his interest in literary self-representation.

Life

Theodore Metochites was born in Constantinople as the son of George Metochites, archdeacon of the Hagia Sophia, and a fervent supporter of the union of the Eastern and Western Churches, agreed upon at the Second Council of Lyons. When, in 1283, the agreement of Lyons was repudiated by the new emperor Andronicus II Palaeologus, George Metochites was exiled and imprisoned; as a consequence, Theodore spent his adolescence in Asia Minor, devoting himself to studies. His extraordinary talents brought him to Andronicus II's attention already in 1290/1291; he was made a Senator in c. 1292, and from c. 1305 he played the role of *mesázōn*, or personal advisor to the emperor. His official duties did not stop him from pursuing his literary and scholarly interests: according to his pupil, the historian Nikephoros Gregoras, he spent his days administering the empire and his nights engrossed in his books. Finally reaching the position of Grand Logothete in 1321, he was removed from power in 1328 by Andronicus III's victory in the civil war; after a brief period of exile, he withdrew to the Chora monastery in north Constantinople, where he died.

Metochites was largely an autodidact. He learned some astronomy from Manuel Bryennius and later passed it on to Gregoras. There is no evidence that he was the teacher of Gregory Palamas, as is sometimes claimed. Besides his literary and scholarly pursuits, he is remembered for having commissioned a splendid refurbishment of the church of the Chora monastery (today the Kariye Museum).

Works

Apart from his letters, all known works by Metochites survive. He wrote 20 poems in dactylic hexameter, 18 orations (*Logoi*), and 3 voluminous works on philosophy, as defined by Metochites and his contemporaries: the *Stoicheiosis astronomike* (1316/1317), the *Paraphrases of Aristotle's Writings on Natural Philosophy* (c. 1320), and a collection of “philosophical and historical” essays, the *Semeioseis gnomikai* (c. 1326).

The *Stoicheiosis astronomike* comprises two volumes. In the first, Metochites sets out the *Handy Tables* of Ptolemy and his commentator Theon and supplements them with theoretical accounts based on Ptolemy's *Almagest*; in the second, he offers an arithmetical and geometrical propaedeutics to the study of astronomy as well as a summary of the whole of the *Almagest*. In the extensive preface, Metochites describes the current state of mathematical and, in particular, astronomical studies in Byzantium and attempts to specify the place of astronomy within the framework of philosophy in general. Being the first serious Greek work in its field for hundreds of years, the *Stoicheiosis astronomike* was a major contribution to the revival of learning in early Palaeologan Byzantium.

The 39 books of *Paraphrases of Aristotle's Writings on Natural Philosophy* were designed to facilitate the understanding of Aristotle's doctrines by reporting them in a plain and straightforward manner and integrating explanatory material from the Greek commentators. They were translated into Latin in the sixteenth century by Gentian Hervet and were then praised for their clarity and conciseness, but made no discernible impact.

Finally, the *Semeioseis gnomikai* was described by Metochites in one of his poems as a picture (or statue) of his mind and a journal of his thoughts, that is, as an intellectual self-portrait. It moves freely, but not randomly, from discussions of classical authors, notably Plato and Aristotle, over ethical, political, and epistemological questions, to meditations on different aspects of Greek and Roman history. Many of these themes are also

touched upon in Metochites' oratory and poetry, but the internal structure of the *Semeioseis gnomikai* strongly indicates that it is no mere commonplace book but was conceived from the outset as a literary whole. Many of the themes are indeed also familiar from one or another of those late antique Platonic philosophers who cultivated a literary – if sometimes inaccessible – style, such as Philo of Alexandria, Plutarch, Maximus of Tyre, and Synesius.

Metochites himself is notorious for his thorny style, especially in his poems and also in some of his prose. Even his own pupil, Gregoras, criticized him for this; he put it down to his teacher's refusal to model himself on any ancient orator. In his *Logos* 13, Metochites defends the ideal of stylistic "forcefulness" (*deinótēs*) which sometimes prescribes complexity rather than clarity. But in *Semeioseis gnomikai* 26, he heavily emphasizes the Platonic opposition between philosophy and rhetoric, contending that it is appropriate for philosophical thoughts to be couched in simple and unadorned language. It seems likely that he is pleading his own cause in both cases. Especially the prose of his *Paraphrases* is plain (and repetitive) to the point of monotony. In the *Semeioseis gnomikai*, he attempted to bridge the dichotomy by combining a philosophical content with natural eloquence: in spite of Gregoras, he seems to have drawn inspiration particularly from Synesius and Plutarch.

Thought

Metochites' parallel careers as an imperial official and a writer conspired to make him extraordinarily sensitive to the traditional dilemma of whether a contemplative or an active life should be preferred. Many of his essays linger on this theme. In fact, he does view the active life in a more favorable light than probably any Byzantine thinker before him; but in the end, he comes down clearly on the side of contemplation, provided that it is chosen for the right reasons. The interest he shows in the choice-and-motive aspects of moral action is unusual in Byzantium and may suggest familiarity with Aristotelian ethics.

In Metochites' opinion, contemplation is the appropriate response to the fact that the realm of human affairs is so fundamentally unstable that we can never be certain of any set of circumstances in our lives, no matter how well we are doing. But through contemplation, we can raise ourselves so high above the vicissitudes of our lives as to be able to deal with this uncertainty; recognizing the bright and the dark sides of every situation will teach us to bear adversity with cheerfulness and success without elation.

These are familiar sentiments, harking back to popular philosophy of all periods. It has often been claimed that the doctrinal influence of such sources as the four abovementioned late antique Platonic philosophers on Metochites is so massive that it threatens to compromise his Christian orthodoxy. Especially, two leading twentieth-century Byzantinists, Hans-Georg Beck (1952:108–110) and Herbert Hunger (1978:52), both regarded his preoccupation with the arbitrary rule of Tyche (or Fortune) in the realm of human affairs as the sign of a fatalism that could only with difficulty be squared with the Christian belief. But this inference seems to be mistaken. It is true that Metochites denies the existence of any apparent justice in the way that prosperity is distributed in the world. Fortune, he says, is absolutely inscrutable to the human mind. But this means, according to him, that it has to be taken on faith, "from the Fathers as well as the Philosophers," that Fortune is ultimately the expression of Providence. Those who base their belief in Providence on their own limited and biased understanding of what is good and just will run the risk of losing it when Fortune turns against them (*Sem.* 28; 53; 66).

The real power behind Metochites' Fortune is therefore not Heimarmene (or Fate), as Beck thought, but Providence. Throughout his work, Metochites takes a consistently fideist attitude toward theology, which allows him to preserve his faith in goodness, justice, and order in the face of apparent evil, injustice, and chaos. In fact, he inveighs strongly against determinism in the realm of human affairs (since such affairs involve chance and free choice) in his *Stoicheiosis astronomike* (1.5). On the other hand, he equally

strongly affirms the causal influence of the motions and aspects of the heavenly bodies on natural processes – taking care, however, to underline the subordination of these motions and aspects to Providence. In *Semeioseis gnomikai* 58, he confronts head-on the question of whether it is better to exist or not to exist. He finds much to be said in favor of the latter alternative; still, hope and faith persuade us that it is better to exist. Faith, because the goodness of existence is dependent on the goodness of the Creator and Upholder's will, and hope, because the pain and trouble of this life can be balanced only by the prospect of eternal bliss in the next life.

By the same token, it can only be, in Metochites' view, on account of our own nature as partly irrational creatures that it is impossible for us to have scientific knowledge of the divine realm, for this realm must be assumed to be free from plurality and change. However, Metochites also holds that scientific knowledge is impossible of the natural realm; and this, he thinks, is due mainly to the fact that natural objects are intrinsically unstable, just like human affairs. He refers to Heraclitus for the doctrine that everything in the sensible world is in flux and to the ancient skeptics for the "not unreasonable" inference that there will always be cogent arguments against any view about anything in this world. He was the first Greek author in hundreds of years to see more than perversity in skepticism: he emphasized its kinship with Socratic *elenchus*.

Metochites' epistemological pessimism as regards the natural realm contributed to lessening his admiration for Aristotle, who was considered first and foremost an authority on logic and natural philosophy. He criticizes the Stagirite for having promised scientific knowledge in fields where it is not to be had, out of intellectual vanity. His criticism is interesting for its focus on human vice; it provides a link in the history of Byzantine anti-Aristotelianism, from Michael Psellos to George Gemistos Plethon, and points forward to Renaissance anti-Aristotelians like Gianfrancesco Pico della Mirandola.

Sandwiched between the epistemologically deficient realms of human affairs and natural objects and the excessive realm of the divine, the

mathematical realm provides the only proper objects for scientific knowledge. According to Metochites, mathematical objects (including, pre-eminently, astronomical ones) are simple and stable; accordingly, our conceptions of them are definitive, which is proved by the unanimous agreement among mathematicians (as opposed to natural philosophers). In his *Poem* 10 (*On Mathematics*), he describes mathematical objects as being only apparently the products of abstraction from sensibles, and actually unconsciously pre-existing in reason (or "mind"), in a way that suggests that he aligned himself with the "projectionism" of Iamblichus and Proclus. If so, he seems to have shared the rationalist epistemology of his contemporaries Choumnos and Barlaam, if only with regard to mathematics.

Theodore Prodromos

Pantelis Golitsis

Department of Philosophy, School of Philosophy and Education, Aristotle University of Thessaloniki, Thessaloniki, Greece

Abstract

Theodore Prodromos (c. 1100–1156/1158 or c. 1170) was mainly active as a poet at the court of Irene Doukaina and John II Komnenos, and his works had important influence on later Byzantine literature. As a man of broad classical culture, Prodromos also dealt with ancient philosophy, especially with Aristotle's *Organon* and Porphyry's *Isagoge*. Although he confined himself to traditional topics in Byzantine philosophy, his critical sense toward ancient authorities, combined with his writing and rhetorical skills, makes his philosophical work a fine example of twelfth-century Byzantine scholarship.

Biography

Theodore Prodromos lived in twelfth-century Constantinople, but the exact dates of his life are unknown (c. 1100–1156/1158 or c. 1170). Similarly, relatively little is known about the events of his life (Kazhdan 1984). In one of his poems, Prodromos reports that he was educated by his

grandfather and uncle, but he elsewhere names as “teachers” his peers Stephen Scylitzes, metropolitan of Trebizond, and Michael Italicos, metropolitan of Philippopolis. His father had wanted him to become a soldier, but his fragile health obliged Prodromos to devote himself to scholarship and writing (Hörandner 1974 XXXVIII, pp. 11–40). He eventually became a poet laureate at the court of Irene Doukaina and, after the latter’s death, at that of her son John II Komnenos (1118–1143), where he mainly composed poetic panegyrics to praise the military victories of the emperor and his noble generals. Prodromos also wrote prose and taught rhetoric and grammar (Zagklas 2011), probably at one of the schools set under the patronage of the patriarchate (Hörandner 1974, pp. 27–28). His career ended with the death of John II. Prodromos retired to the Church of the Holy Apostles, where he was occasionally writing verses for the Byzantine nobility, and died as a monk, having changed his name to Nicholas. As a poet and, more generally, as a man of letters, Prodromos enjoyed great popularity among his contemporaries, and his literary works were widely imitated by later generations (Hörandner 1972). He was a less prolific writer in philosophy, though not necessarily deprived of any influence in later centuries.

Thought

Prodromos’ philosophical work focuses exclusively on logic. His major contribution to this field, at least quantitatively, is his still unpublished (Cacouros 1992) Commentary on the second book of Aristotle’s *Posterior Analytics*. In it, Prodromos overtly criticizes Aristotle for his elliptical style and tries to restore the meaning of the Aristotelian text through various additions and, also, by rearranging the original phrasing (Cacouros 1989, pp. 327–328). The Commentary became a standard work in Byzantine philosophical curricula by the end of thirteenth century (see the Byzantine list of Commentaries on Aristotle published by Hayduck 1885:V) and was later adapted by the eminent Byzantine scholar John

Chortasmenos (c. 1370–1431) to fulfill contemporary educational needs (Cacouros 1995–1996, pp. 347–352). It is not certain, however, that it was originally conceived to serve didactic purposes. In its prologue (Brandis 1836, pp. 241a1–9), Prodromos states that in writing the Commentary, he does not mean to condemn the attempts made by previous exegetes but to test his own skills in such a difficult task. At least once, he is critical of Eustratios of Nicaea, on whose comments Prodromos’ own Commentary is largely based (Cacouros 1989, pp. 333–334). It is perhaps not unlikely that Prodromos was prompted to produce a better commentary than the existing ones by “literary” friends such as Stephen Scylitzes and Michael Italicos.

Another philosophical work by Prodromos, much shorter than the Commentary on the second book of the *Posterior Analytics*, was written at the request of Michael Italicos. It is called *On “Great” and “Small”* (Tannery 1887) and sets out to prove, in quite an original way, that the great and the small are not relatives, as Aristotle has it in the *Categories*, ch. 6, but quantities. Prodromos gives six arguments, mostly based on linguistic points, to support his thesis, and then takes up another six in order to demonstrate, also against Aristotle, that the great and small are contraries (Ierodiakonou 2005, pp. 28–29).

Finally, Prodromos composed a philosophical dialogue in which he combines Plato’s elenctic method with Lucien’s satirical style. The dialogue bears the title *Xenedemos*, or, *Predicables* (Cramer 1836) and sets out to unveil, again on linguistic grounds, the difficulties arising from Porphyry’s doctrine in the *Quinque voces* (*Isagoge*).

Compared to the extensive work of Aristotelian scholars of the preceding generation, like Eustratios and Michael of Ephesus, Prodromos’ overall philosophical work represents a return to traditional philosophical themes in Byzantium, namely, themes from Aristotle’s *Organon* and Porphyry’s *Isagoge*. At the same time, however, it is a fine example of the high-level scholarship of the twelfth century; in Prodromos’ case, broad classical culture, critical assessment of ancient

authorities, and elegant style seem to have assured the survival of his philosophical oeuvre in Byzantium.

Theology Versus Philosophy in the Arab World

Taneli Kukkonen

Department of History, University of Jyväskylä, Jyväskylä, Finland

Abstract

When describing the relationship between theology and philosophy in the medieval Islamic setting it is necessary to start with a few qualifications. First, and most importantly, theology and philosophy were never formally ranked as academic disciplines the way they were in the Catholic universities. Rather, *kalām*, or speculative theology, and *falsafa*, or the continuation of Greek philosophy in an Arabic milieu, developed in parallel, under socioeconomic conditions that overlapped in part (the sponsorship of rulers, the needs and ambitions of the educated classes) yet were largely independent of one another. This already changes significantly the dynamics of the conversation that took place between (1) the advocates of this or that theological creed or methodology, and (2) those who endorsed the philosophical agenda of the late antique school traditions.

Second, one should abstain from treating either theology or philosophy as monolithic entities that would have remained unchanging through centuries of evolution and interaction. The very conception of the enterprise of theology was in flux throughout the classical period of Islamic civilization; and although

practitioners of *falsafa* liked to present their heritage as a unitary body of knowledge with a solid sense of identity and aims, in truth the philosophers' interests, too, varied with the times, ranging from logic and natural philosophy to metaphysics and moral psychology. Jews, Christians, and Muslims (Sunni and Shī'ite) alike practiced both disciplines, which led to further variations in tone and emphasis.

The overall picture is one of increasing cross-pollination. One of the signal developments of later times is how philosophical schemata, principally of the Avicennan variety, begin to influence the very organization of theological tracts. Conversely, the later philosophical tradition speaks more about *ḥikma* (wisdom, *sophia*) than of *falsafa*, marking a stage in the development of Arabic philosophy where grand cosmological schemes and questions of soteriology begin to assume central stage. In this respect it becomes more like natural theology in the Christian sense of the word.

Nonetheless it is true that for a few centuries, at least, relations between authors in the theological and philosophical traditions ranged from the merely inimical to the emphatically hostile, and that this colored the way that histories of Islamic intellectual life were written both within the Islamic world and without. This is to say that although the reality on the ground, as it were, was mostly one of mutual influence and interaction, on the level of rhetoric and polemic there were many who considered it advantageous to present the relation of *kalām* to *falsafa* as being antagonistic – and doubtless some who saw the reality of the situation in this light as well.

Yet this is the final cautionary note we must sound: the representations of *kalām* and *falsafa* that we find in individual authors are always just that, representations. They reflect the way certain historically situated thinkers wished to present the world to their readers, and so their descriptions of the two traditions are always particular to them, not representative of some universal judgment on the part of an entire culture. It is furthermore important to

recognize that besides theology the religious sciences encompassed such disciplines as for instance Islamic jurisprudence (*fiqh*) and the study of the Prophetic traditions (*ḥadīth*). These disciplines were indeed more central to the overall Muslim experience than theology was: and the possible threat that philosophy posed to *their* autonomy and social standing was to many the more serious threat.

Islamic Philosophical Theology

The beginnings of the science of *kalām*, which translates as “speech” and which thus may correspond to *logos* with all the allusions that word carries, are still partly under a shroud (For studies see van Ess 1991–1995; Frank 2005–2008.) Doubtless the growing intellectual needs of the rapidly expanding Muslim community explain much: the explication of the fundamentals of religion (*uṣūl al-dīn*) without recourse either to the ‘Uthmanic codex, the contested Prophetic traditions (*ḥadīth*), or the divergent paths of Islamic law will have been desirable both in the face of increasing doctrinal controversy and in terms of interfaith dialogue and polemic. *Kalām* provided a tool for explicating the Muslim worldview in more refined terms than mere Scriptural exegesis would allow: it provided the basis for an Islamic metaphysics, which in turn served as the foundation for speculation in domains such as natural philosophy and ethics.

It is difficult to imagine this happening without some influence from the overall Levantine intellectual milieu which the Muslims came to inhabit. Still, attempts to trace the origins of this or that *kalām* doctrine or approach to some specific ancient philosophical school (or indeed Christian theology) have all floundered, to the point that in this stage of the research it seems safer to assume that Islamic theology developed largely along independent lines. It is, for instance, highly doubtful that the atomism developed by the Mu‘tazilite theologians, and later the other schools, would have had much to do with either Epicurus or Empedocles, seeing as how no primary sources in translation have been identified and the

influence of second-hand reports must be considered negligible; and at any rate the atomism of the *mutakallimūn* was very much its own creature. The same goes for the theologians' metaphysics, which appropriated the vocabulary of substance and accident (*jawhar*, 'araḍ), but interpreted these terms in a way so far removed from the Greek mainstream that it cannot have arisen out of a corruption or a misunderstanding of Aristotelian ontology (contrary to what some Muslim Peripatetics, and later historians of philosophy, may have liked to think). A third example comes from the supposed influence of the Stoic school, which once was a favorite source of speculation among historians, but has now been widely discredited as a hypothesis, for simple lack of evidence (see Gutas 1994). With Richard Frank, it seems better to affirm the possibility of *kalām* theology being philosophical in approach and method without thereby having to reduce it to Greek philosophy, either by way of influence or through an unflattering comparison.

At least in two areas the influence of the late antique school tradition on early Muslim speculation is nonetheless plain to see. In the first place, the method for theological disputation itself appears to have been an adaptation of Aristotelian dialectic, more or less consciously taken up in early encounters with Christian theologians long since accustomed to its application in theological disputes (see Rissanen 1993). In the second, certain cosmological problems and puzzles, having to do with how the world relates to its transcendent cause, were taken over from late antique debates. Going back to pre-Plotinian Platonism, philosophers and theologians (Jew and Christian) had argued over whether the world was eternal, created out of nothing, or formed out of a pre-existent matter: Muslims discussed these problems not only with great vigor, but with obvious recourse to ancient materials. Notably, the Muslim theologians drew on the works of John Philoponus (d. 574) when developing their proofs for the world necessarily having a limited past, a move that would later set them in opposition to the Arabic Aristotelians. These two early examples of an early, "native," and theological use of Aristotle are reflected in the fact that the two Aristotelian

treatises first picked up for translation into the Arabic were the *Topics* and the *Physics* (We also have a report of a late-eighth-century refutation of Aristotelian theology. Given that this predates the translation both of Aristotle's *Metaphysics* and of the so-called *Theology of Aristotle*, the refutation is likely to have had the *Physics* proof for a Prime Mover as its target).

Islamic Religious Philosophy

The rising Islamicate civilization absorbed into itself many foreign disciplines and intellectual traditions; it is not immediately apparent why it was philosophy (*falsafa*) which came under special scrutiny from the side of the theologians and other self-appointed guardians of Islamic orthodoxy. Indeed, early on, such disciplines as for instance astrology and magic received more attention, and criticizing them provided a way for philosophers to burnish their Islamic credentials; though the speculations of the later Greek philosophers regarding the reality of celestial influence meant that it was typically only the practice and the knowledge-claims of the astrologers that were called into question, and the first "philosopher of the Arabs," Ya'qūb ibn Ishāq al-Kindī (d. c. 870), could still embrace astrology, but only because so still did the upper-class social world in which he moved. Indeed, a favorite trope in the philosophical literature ever since al-Kindī's times was to claim that Islam itself advocated a rational and measured approach to reality, and to recommend philosophy as a straight path toward fulfilling God's command to examine the heavens and the earth and the Prophet's exhortation to seek knowledge (Endress 1990; for a later echo see, e.g., Averroes, *Faṣl al-maqāl*). Thinkers outwardly skeptical or disdainful of revelation were few and far between: Abū Bakr al-Rāzī (d. 925 CE) is very much an outlier in this regard, an example of a passing phase in Islamic courtly life when even outspoken freethinkers were tolerated (Stroumsa 1999).

The explanation for why philosophy was singled out for attention is to be sought in two directions. In the first place, late antique philosophy

was explicitly religious and salvific in orientation, and its overall shape therefore presented a problem to Islamic teaching in a way that the more instrumentally understood arts and sciences did not. Even though the Syriac and Arabic adaptors and translators took pains to excise any traces of polytheism, and even though the theism propounded by Aristotle and his commentators was of a seemingly neutral character, it still occupied essentially the same intellectual space as the teachings of the Prophet and – hardly less important – took away from the work of the theologians themselves. Either one tradition or the other – either the Greek starting-points to explaining the cosmic order and humanity's place in it, or the Prophetic – had to yield to the truth claims made by its opposing number. And even if a harmony was sought, one tradition had to be read on the other's terms, which was enough to set off alarms.

The philosophers' metaphysics and cosmology formed one half of this equation; their perfectionist moral psychology, the other. Whatever the particulars of their metaphysics, the *falāsifa* all conveyed an ordered and interlinked cosmos in which corporeal entities derive from a First Principle or First Cause by means of a series of immaterial and/or celestial hierarchies. This stood in stark contrast to the occasionalist worldview adopted by the theologians, and it would take until the twelfth century before serious attempts at mediation were made. As for the philosophers' psychology and ethics, here the sticking point was the notion that the perfection and destiny of humankind would lie in a life of contemplation, as opposed to the more traditional Islamic virtues of lawful obedience and adoration. The charge that would ring through the centuries was that philosophy taught people to be antinomians, in spirit if not in practice (or vice versa: al-Gazālī's famous criticism went that even though Avicenna proclaimed the philosophers to be the most law-abiding Muslims of all, the philosopher's habit of wine-drinking was enough to show his boast to be vacuous: *Munqidh*, 44).

Both these points could be finessed. Jahm ibn Ṣafwān (d. 746 CE), for instance, who is one of the earliest Islamic theorists to receive serious attention from the doxographers, in his teachings

exhibits many of the hallmarks of late antique Platonism, but is nonetheless able to pass for a *kalāmī* thinker. And Ismā'īlī thought as a whole shows the wealth of conceptual possibilities that lay in merging Neoplatonic cosmology with a distinctly Islamic outlook on revelation and history. More importantly still, the literature that grew around the Sufi movement shows a widespread adoption of Platonic-Aristotelian moral psychology, complete with a tripartite division of the soul and an intellectualist approach to the disclosure of the divine mysteries. (Here, several centuries of similar efforts on the part of Christian spiritual authors will have helped.)

More than any factual disagreement, what finally pushed philosophy beyond the reach of any easy annexation was its proponents' claim to have privileged access to a superior method for achieving certitude and, consonant with this, the means to judge the relative merits of other disciplines. This would mean not only finding a place for Prophetic revelation within philosophy – itself an act of subjugation – but also the liberty to interpret religious propositions in accordance with the dictates of pure reason. This was an affront not only to theologians but to the practitioners of the more traditional religious disciplines of jurisprudence (*fiqh*) and Qur'ānic exegesis.

Such claims are associated above all with Abū Naṣr al-Fārābī (d. 950), the “second teacher” of philosophy after Aristotle, who established Aristotle's theory of demonstration (*burhān*) as the centerpiece to all subsequent philosophizing in the Peripatetic mould. Al-Fārābī's works neatly tie in logic and metaphysics with epistemological and psychological concerns: the world has a certain necessary ordering and its universal features make it accessible to human reason, which in turn makes its representation possible in scientific discourse and its further investigation feasible using the tools of Aristotelian syllogistic. But theologians correctly discerned in all this a necessitarianism that was unpalatable not because it derived cosmic order from a divine principle, but because it presumed to dictate the terms for such an interface between the mundane and divine, and through this to circumscribe the nature of the divine itself.

Philosophers Against Theologians

The conflict between the theologians and the philosophers in Islam is usually presented in terms of the theologians being the aggressors (and typically also anti-rational dogmatists), while the philosophers on this telling of the story get to act the part of innocent defenders of reasonable and peaceful coexistence. In light of these Enlightenment historiographical prejudices it is worth noting how in the historical materials, it is the philosophers who early on settle on a polemical invective against the professional theologians, without any recorded provocation on the part of the latter. From al-Kindī to Avicenna, and from al-Fārābī to twelfth-century Andalusia, nary a philosopher can be found who would have a kind word to say either about *kalām* or about its practitioners.

Al-Kindī initiates this trend with a volley against those who would “peddle in religion even as they lack religion” (*On First Philosophy*, 1:104.5 Abū Rīda). The tone is apologetic in the extreme: al-Kindī presents the philosophical project as being identical with the aims of Islam, though not impinging on it in any way – both aim at understanding the transcendent Truth and in acting in accordance with that Truth – while his unnamed opponents are strangers to the truth (*garba ‘an al-ḥaqq*), in thrall to their vices, and intent upon seizing power. Al-Kindī laments how in his time such wretched people can nonetheless be renowned for their speculative acumen (*naẓar*): one or another theological party is meant, though more than this it is difficult to say.

Al-Fārābī expanded this polemic through establishing a general theory of religions – one that, moreover, set religion into a subordinate relation to philosophy. According to al-Fārābī, any veridical religion presents the essential findings of philosophy in more palatable form, in the shape of likenesses and images which faithfully represent – though they do not adequately capture – the true natures or realities of things (*ḥaqā’iq al-ashyā’*, a formulation already found in al-Kindī). Assent to religious propositions, moreover, is achieved through rhetorical or poetic persuasion, not by means of demonstration or

dialectic: the latter mode of reasoning lies beyond the ken of those who cannot adequately comprehend the nature of scientific premises, that is, the multitude (*al-jumhur*, *al-āmma*: *Attainment of Happiness*, 90 Yāsīn). What this means is that neither the raw notions nor the reasonings presented by religion correspond to reality in any straightforward manner: at best they are simulacra, or likenesses, designed by a teacher to guide people to believe and behave in accordance with a higher truth which they are unable to perceive clearly for themselves (see Mahdi 1972).

The picture al-Fārābī paints of religion is perhaps unflattering, but there is no reason to doubt that he meant it as an enthusiastic, even uplifting, endorsement of how God, providential nature, and the prophets work in concert to secure the maximal degree of happiness for all humankind. An unsettling corollary to al-Fārābī’s theory, however, is that it makes of the *kalām* theologians a profession without a proper function. The true structure of reality is worked out by the philosophers, after all, while the transmission and safe-keeping of the symbols of faith is the province of the religious authorities; but as the latter base themselves on rhetoric and poetics, dialectic no longer has any place in any well-functioning society. On this understanding, the theologians can only be meddlers (or worse, rank amateurs), building sandcastles on contentious premises. Thus we find Ibn Sīnā (the Latin Avicenna, 980–1037), for instance, situating *kalām* reasoning on a line that stretches from dialectic to rank sophistry (Gutas 2005; cf. Marmura 1991–1992); while Ibn Rushd (Averroes, 1126–1198) expends considerable energy on pointing out the precise ways in which the theologians, especially the Ash‘arites, had gone astray in their attempts at legitimate inference – where they had wrongly tried to pass off dialectical, rhetorical, or sophistic arguments as being certain and irrefutable. Averroes even blames the rise in sectarianism on the theologians trying their hand at something they were not equipped to do (*Kashf*, 251 Qāsim; cp. Fārābī, *Attainment*, 50 Yāsīn).

Averroes’ efforts, however, belong to a different era, one in which the quality of the philosophers’ own inferences had been called into

question. His attempts at reversing the flow of the discussion were unsuccessful as, following upon al-Ġazālī's (1058–1111) incisive analysis of the Peripatetic philosophers' premises, few people were willing to accept at face value anymore their claims to demonstrable truth in matters metaphysical. This did not result in any lessening of the influence of philosophy on theology, indeed, the opposite is the case; it is to this paradoxical development that we turn next.

Theologians Against Philosophers

Already before the 1095 CE publication of al-Ġazālī's famous treatise purporting to expose *The Incoherence of the Philosophers*, theologians evidently felt comfortable encountering the philosophers on their home turf. Thus for instance Sahl ibn Faḍl al-Tustarī, an eleventh-century Karaite Jew *mutakallim* much influenced by late Mu'tazilite theology, could quite cleverly criticize the notion associated with Avicenna that existence is a something added (*zā'id*) to essence and to do this, moreover, by way of referring to the Peripatetic tradition. Contrasting Aristotle's *Metaphysics* book *Gamma* with his *Categories*, al-Tustarī concludes that any attempt at treating existence as a univocal notion is doomed to failure (Madelung and Schmidtke 2006:75–107). All this bespeaks an intimate familiarity with philosophical teaching, as does the speed with which theologians rushed to adopt certain Avicennan tenets in the century following upon his death (Yahya Michot has in this connection spoken of a veritable Avicennan pandemic in the sixth/twelfth century; but even this may be putting the temporal markers too late).

Two things change with al-Ġazālī. First, his investigations carried unprecedented legal weight. Al-Ġazālī was not content to criticize the philosophers as a philosopher or even theologian would, instead, donning the cloak of a Shāfi'ite jurist, he issued a legal determination and declared that on three counts the Peripatetic philosophers were to be charged with unbelief (*kufr*). On as many as 17 additional points Avicennan philosophy might count as innovation

and heresy, which was a non-punishable offence: but as long as the philosophers taught the eternity of the world, God's ignorance of particulars, and a purely spiritual interpretation of resurrection, they fell outside the boundaries of Islam as a whole and therefore were deserving of being put to death as apostates (*Tahāfut*, 226–227 Marmura).

Because al-Ġazālī was a widely followed and respected, albeit also controversial, thinker already in his lifetime, this decree received widespread attention, and made it more tricky for subsequent generations of philosophers to claim straightforward allegiance to the Peripatetic-Avicennan stream of *falsafa* (see Griffel 2000). Though one should be careful not to overstate the practical impact of al-Ġazālī's *fatwā*, or the level to which people of a philosophical persuasion were in any way actually persecuted – this was, for one thing, leavened by al-Ġazālī's own subsequent exploration of the limits of religious tolerance, which for him reached far indeed – at a minimum we may note that the three doctrines singled out by al-Ġazālī henceforth became inhospitable terrain for philosophical exploration in Islam. Even theories such as perpetual creation (*ḥudūth azalī*) had to be carefully phrased so as to make clear that eternalism of the offending Aristotelian type did not result thereby.

Second, al-Ġazālī's very public wrestling with philosophy resulted in his appropriating a large amount of philosophical teaching into his own thought, to the point that critics charged him with becoming ensnared in the philosophers' nets: and in this al-Ġazālī was not alone, but instead representative of a wider movement that was well underway by his time. Al-Ġazālī had liked to point out how the philosophers often fell short of their own apodeictic ideal, an approach later radicalized in Ibn Taymiyya's (1263–1328) thoroughgoing nominalism, which denied to the philosophers even the capacity to put forward valid definitions. Yet in the process of developing his criticisms, al-Ġazālī effectively put syllogistic reasoning and scientific demonstration on exactly that pedestal which Fārābī had envisioned for it. In *The Just Balance* al-Ġazālī moreover argued

that the art of valid inference was not the exclusive province of the Greek philosophers, rather, the Messenger of God himself had reasoned syllogistically, and in so doing instructed his people in the same art (Rudolph 2005). Equally as importantly, al-Ġazālī in his autobiography contended that the saints and the Sufis had taught ethics long before the philosophers did (*Munqidh*, 24–25 Salība & Ayyād). This provided a formal justification not only for the longstanding practice of teaching Greek-derived moral psychology in conjunction with Islamic spirituality, but also for appropriating Aristotelian faculty psychology as its theoretical backdrop. Finally, al-Ġazālī's cosmology and metaphysics borrow liberally from Avicenna, even as he insists on putting an Ash'arite spin on these materials: and in this too he was followed by countless theologians who came after. In these three interlocking areas of doctrine, therefore – logic, psychology, and metaphysics – the practice of Islamic theology was transformed by its encounter with Avicenna, even as attitudes toward philosophy hardened on the surface level.

The ways in which all these changes played out are complex and resist easy summarization. Much further study is needed before we have an adequate conception of the developments, especially in the eastern part of the Islamic world. A few examples will have to suffice.

1. Consider first 'Umar al-Suhrawardī (1145–1234), who moved in the highly politicized intellectual circles of the Caliph al-Nāṣir li-Dīn Allāh. Suhrawardī could simultaneously boast of washing the ink out of every copy of Avicenna's *Healing* in Baghdad's libraries, and in his *Exposé of the Infamies of the Philosophers* present as his own a cosmology and epistemology that is plainly of Neoplatonic provenance. In keeping with al-Ġazālī's programme of situating Sufism in a respectable Islamic context, Suhrawardī claimed that his vision had a greater authority than the speculations of the philosophers, since it was divinely inspired and thus came from the same source as the prophetic proclamations (see Ohlander 2008:291–303).
2. Second, when we move from the centers of Muslim learning to its periphery, we may take the example of Maḥmūd ibn Malāḥimī (d. 1141), a Mu'tazilite teacher from a period when that particular school of theology had fallen into disrepute if not yet obscurity. From the sidelines, Malāḥimī can gleefully observe how theologians from the Shāfi'ite and Ḥanafite legal traditions were fast going the way of the Christians, with their Hellenizing (*yūnānī*) tendencies and elaborate metaphysical speculations. These would only serve to lead them further astray from valid rational principles of authentic Muslim origin – a clear recognition on Malāḥimī's part that a displacement of some sort had occurred. Again, this assessment comes coupled with an inability to perceive the extent to which Mu'tazilite teaching itself had become pervaded with philosophical content (Madelung 2007).
3. Third, we have Ibn Khaldūn's famous verdict that the theologians, following in the footsteps of al-Ġazālī, had meddled in philosophy to the point of confusing the two traditions (*Muqaddima*, 3:52, 3:153–154). Ibn Khaldūn's own opinion was that theology should begin from articles of faith as established by tradition; but this again represents a very particular view of *kalām*, and not one that is borne out by the historical materials in all their richness. All in all, the notion that either the theological or the philosophical tradition would have had pure essences, ones whose subsequent contamination should be cause for concern, appears to be an odd and ahistorical claim – although sadly not one to which later historians would have been immune.

Theophrastus, Arabic

Carmela Baffioni

Institute of Ismaili Studies, London, UK

Dipartimento di Studi e Ricerche su Africa e Paesi Arabi Facoltà di Studi Arabo-Islamici e del Mediterraneo, Università degli Studi di Napoli L'Orientale, Naples, Italy

Abstract

Theophrastus, a relative of Aristotle and his successor in the Peripatetic school, is well documented in Arabic sources, particularly with regard to logic. He is known by the Arabs as a translator of and a commentator on

Aristotle and as the author of works, some now lost, on minerals and on general questions. Many of his doctrines in physics, psychology, and metaphysics were developed in Muslim thought. Testimonies refer to his scientific interests, his idea of nature as a mixture of mechanics and teleology, and his apophatic idea of knowledge of God. He introduces ideas about the intellect that were later developed by Averroes. With regard to morals, Theophrastus emphasized qualities that would become the basic features of the ideal philosopher and the ideal ruler in Islam.

Biographical Information

Theophrastus is frequently quoted in Arabic sources, partly because of his presumed relationship to Aristotle – he may have been confused with Speusippus, the son of Aristotle’s sister; the Arabs also refer to him as the son of Aristotle’s brother or of his maternal aunt – and because he was his spiritual successor. The major source for the Arabic Theophrastus is Gutas 1992, which contains all texts, including manuscript sources, in which Theophrastus is named or quoted; sometimes his name is difficult to identify. Gutas describes the main lines of Theophrastus’ thought as known by the Arabs. He is presented as a translator of and a commentator on Aristotle’s *Categories* and *De interpretatione* and of some of Aristotle’s works on physics (cf. Abū l-Faraj ibn al-Ṭayyib, a Nestorian philosopher, physician, and theologian, d. 1043, and known in the Latin world as *Abulfaragius Abdalla Benattibus*).

The philosopher al-Fārābī (d. 950) reports that after the defeat of Cleopatra at Actium in 31 BCE, the Roman emperor Augustus found in the Egyptian libraries manuscripts of Aristotle’s works written in his lifetime and in that of Theophrastus (Gutas 1992:95). Books attributed to Theophrastus include *On the Soul* and *On Meteorology*, *On Sensation*, *On Metaphysics*, and *On the Causes of Plants*, in a single book, and *Natural Questions*. These titles can be recognized in the well-known *De sensu et sensibilibus*, *Metaphysics*, *De causis plantarum*, and *Physicorum opiniones*; whether

the title *On Education*, also in a single book, corresponds to the *Characteres* is uncertain. Several of these works were translated into or commented on in Arabic. A work on Democritus that is related to Theophrastus might be that quoted by Diogenes Laertius (= 68 A 34 Diels-Kranz [*Fragmente der Vorsokratiker* ed.]). An anonymous Latin source (Gutas 1992:439) states that Theophrastus wrote a *Book on Causes* that is no longer extant in Greek but only in Arabic, and that it was translated into Latin by a certain David. Ibn al-Nadīm (tenth century), author of *al-Fihrist*, the “index” of names of authors and works in different fields of knowledge, refers to a book by Theophrastus entitled *On Problems*. Qusṭā b. Lūqā, a physician and translator of the ninth century, is said to have relied on Theophrastus in his *Book on the Difference Between the Spirit and the Soul*.

Aristotle never wrote about minerals and metals – though he states the contrary at the end of Book III of his *Meteorologica* – but Theophrastus wrote a treatise *De lapidibus* and a work on metals, now lost. He also wrote about fossils, corals, petrified plants, and salts in other lost works (Lettinck 1999:301). Writings in Arabic on these matters indicate that these works may have been seminal in the later tradition. The eleventh century scientist al-Bīrūnī refers to Theophrastus’ statement that a container is heavier if filled with lead than if it is filled with gold or silver.

From the *Ṣiwān al-ḥikma* – *The Cupboard of Wisdom*, a history of Greek and Arabic philosophy written by Abū Sulaymān al-Sijistānī al-Manṭiqī (d. c. 985) – we know that on his deathbed Theophrastus reproached nature for giving humanity so short a life.

Thought

Logic

Logic is by far the best-documented section in Gutas’ collection. According to the Arab sources, Theophrastus wrote a commentary on Aristotle’s *Categories* and a *Book on affirmative and negative (propositions)*. Al-Fārābī states that

it was written on the line of Aristotle's *De interpretatione*, where "the things sought" (*al-maṭlūbāt*) were discussed, not syllogistic premises, to distinguish them from "the other opposite pairs" (*sā'ir al-mutaqābilāt*). Numerous testimonies, among them Avicenna (d. 1037) and Averroes (d. 1198), describe Theophrastus' involvement in the clarification of premises in syllogisms, particularly of the nature of absolute and existential premises (Gutas 1992:153–185). Arabic authors also mention Theophrastus' theories about Aristotle's modal syllogisms; al-Fārābī claims that he also studied hypothetical syllogisms, and Averroes reports his interest in Aristotle's topics.

Nature and Natural Phenomena

The eleventh century heresiographer al-Shahrastānī ascribes to Theophrastus, as well as to Aristotle, Plato, Porphyry, and Plutarch, the theory reported by Themistius according to which the nature of the world is a single and general nature, while every species of plant and animal is distinguished by a proper nature. Nature is also seen as the principle of motion and rest in things. It manages everything in the world wisely, even though it has no life, potency, or will. Al-Shahrastānī counts Theophrastus among those who met Plato and reported that he said that the world has a creator.

The *Ṣiwān al-ḥikma* attributes to Theophrastus the theory that heaven is the abode of all the stars and earth the abode of all humans, who are similar to the stars because of their rational souls and intellect. The Arab Galen states that according to Theophrastus rain results from compression and pressure, and that the fine parts of water vanish from ice when it melts leaving the muddy and heavy parts behind. With regard to odors, the Pseudo-Platonic Arabic *Book of Tetralogies* attributes to Theophrastus the idea that bad smells fall because of their density and rise because of their rarity.

God

According to an anonymous Arabic source, Theophrastus believed in the eternal preexistence of God; he thought that God is beyond substance,

that He originated everything, having no originator Himself; that He is not associated with things but is contrary to them; and that He has neither before nor after, nor parts or organs of sense.

Soul

The *Ṣiwān al-ḥikma* reports that according to Theophrastus the soul is able to fly and to alight wherever it wishes, thanks to its "hidden wings" (cf. Plato), and that it observes everything without being observed.

Albert the Great places Theophrastus with Porphyry, Themistius, and Arab thinkers such as Avicenna, al-Ġazālī (d. 1111), and al-Fārābī as a representative of the theory of three different modes of knowledge: (i) the incomplete, (ii) that supported by a "habit" that helps the intellect, and (iii) that which is good by its nature, illuminated by the universal intellect. The *Ṣiwān al-ḥikma* distinguishes between innate understanding, which is compared to the earth, and understanding through listening, which is compared to a seed, and to water that brings out what lies in the depths of the earth.

Intellect

The question of intellect is a major topic in the history of Muslim thought. In Averroes, it underwent substantial transformations in all his works on the soul, and more so in those surviving in Latin translation only. One of the most debated issues is the nature of the so-called material intellect. According to Averroes' *Commentarium magnum in De anima*, Aristotle's opinion that the "material" intellect is neither a body nor a form in the body led Theophrastus and Themistius to believe that it was a substance that could neither be created nor destroyed. The "theoretical" intellect was for Aristotle the result of the composition of the "material" and the "actual" intellect, which is the intellect that abstracts forms in matter in so far as it is joined to the "agent" intellect. Theophrastus and Themistius hence inferred that the "acquired" intellect was the "agent" intellect, sometimes weakened, and sometimes strengthened because of its mixture with the "material" intellect. With regard to the "material" intellect, taken to be a potential substance similar to primal

matter in its reception of forms (cf. Averroes' *De connexione intellectus abstracti cum homine*), Theophrastus remarked that primal matter cannot conceive of or make distinctions, nor can it be said to be an abstract thing. Qualities such as simplicity, abstraction, impassibility, and separation from the body, ascribed by Aristotle to the "material" intellect, cannot be proper to a "preparedness" only. Echoes of this debate were preserved by the thirteenth century Sufi and thinker Ibn Sab'īn in the *Sicilian Questions* addressed to the Emperor Frederick II of Hohenstaufen. Here it is stated that, according to Theophrastus and Themistius, the "material" intellect is eternal and the human intellect is a composition of this "material" (passive) intellect and of an "actual" intellect. They also shared the idea that the "material" intellect survives the death of the body, a theory linked to Plato's opinion that the objects of intellect existing in us are eternal and that learning is recollection.

Morals

The *Šiwān al-ḥikma* ascribes to Theophrastus the saying that control of desire is as difficult as control of anger – that is to say that no good thing is easy to achieve. The eleventh century Egyptian historian and savant, Mubashshir b. Fātik, who was one of the most important collectors of gnomic sayings, recalls that according to Theophrastus, the educated person (*adīb*) is one who speaks of the good qualities of people and conceals the evil. The *Šiwān al-ḥikma* also emphasizes qualities that will become proper to the ideal philosopher in Islam and included among them those of the ruler, whether philosopher or *Imam*, of the "perfect cities" described by al-Fārābī and the Ikhwān al-Šafā'. These include eloquence as separation of truth and lies, generosity, piety, sound judgment, and justice. Al-Fārābī reports that the followers of Theophrastus placed purification of morals at the basis of knowledge because, as Plato said, "whoever is not clean and pure should not approach the clean and pure" (Gutas 1992:295; a similar position is reported by Abū l-Faraj ibn al-Ṭayyib). The more a soul leaves aside worldly pleasures, the more easily it acquires philosophy,

becoming like a lamp luminous in itself, and illuminating others. From this, it can be inferred that it becomes similar to those, including some ancient wise men, who were illuminated by the lamp of prophecy, as al-Shahrastānī says. Again, philosophy is the wealth of the soul, which grants its survival; people must also learn how to make a good use of worldly wealth. A saying reported by the famous physician and translator Ḥunayn b. Isḥāq emphasizes the importance of action over speech.

The tenth century writer al-Mas'ūdī, one of the main, if debatable, sources for Arabic thought, counts Theophrastus among the representatives of the political philosophy (*al-falsafa al-madaniyya*) that began with Socrates and continued with Plato and Aristotle. The *Šiwān al-ḥikma* reports Theophrastus' answer to Alexander the Great about what makes a king's rule good: "When the subjects obey the king and the king acts according to tradition and justice" (Gutas 1992:455). It should be noted that the Arabic words for tradition and justice, *sunna* and *'adl*, correspond to the political and religious rule of the Prophet.

Muslim thinkers of different persuasions shared and developed theories on physics, psychology, and "metaphysics" – "theology" for the Arabs – similar to those attributed to Theophrastus; this could inform inspection of the Greek sources of Muslim philosophy. But the available witnesses testify that Theophrastus had no good opinion of music, unlike many Muslim thinkers who relate to music the ability to influencing moral behavior.

Abstract

Thomas Aquinas was a scholastic theologian active in the thirteenth century, when scholars of the Latin West were assimilating the Aristotelian corpus (rendered into Latin by 1200). These writings and the Islamic-Judeo commentary tradition that accompanied their reception transformed every field of philosophical enquiry and reflected a worldview that led some medieval thinkers to assert that sound philosophical reasoning does on occasion contradict articles of faith and theological doctrine.

Against this, Aquinas argued that faith and reason cannot contradict one another as both are from God. This famous synthesis helped to foster an intellectual culture that allowed for the development of Aristotelian empiricism alongside scholasticism's deeply embedded, Platonic elements. Yet Aquinas was no mere apologist. Just as he produced numerous excellent commentaries on Aristotle, Aquinas likewise developed a metaphysics asserting a distinction between being and essence with respect to all entities save God. Joining to this distinction the medieval doctrine of the convertibility of transgeneric attributes of being (or transcendentals) such as goodness and truth, Aquinas develops a Christian Aristotelianism that informs his epistemology, natural theology, ethics, theory of natural law, philosophical psychology, and semiotics (treated in this entry). Aquinas's proofs that God exists contend that contingent entities (for whom existence and essence are distinct) would not be were it not for the activity of God (the sole necessary entity, the one being for whom existence and essence are identical). Maximally existent, God is therefore maximally good (as goodness and being are convertible). Carrying this over to philosophical psychology, ethics, and natural law theory, Aquinas explains our free actions in terms of an innate desire for happiness, the chief human good, which desire is, at bottom, a desire for the beatific vision, in which the highest possible happiness is obtained. Aquinas's semiotics then seeks to accommodate the meaning of theological discourse to its subject's unique nature.

Biography

Thomas Aquinas (1224/1226–1274) was born to Landulph Count of Aquino and Dame Theodora of the Neapolitan Caracciolo family at their castle in Roccasecca, Italy (then part of the Kingdom of the Two Sicilies). The youngest son, Aquinas, was given as an oblate to the Benedictine abbey

of Monte Cassino in 1230/1231, likely with the aim of his some day acquiring the lucrative abbacy. Owing to renewed strife between Pope Gregory the IX and Emperor Frederick II, Aquinas was moved from Monte Cassino to the University of Naples in 1239, preceding Frederick's capture of the abbey that November. Naples was central to Aquinas's spiritual and intellectual formation. Here he studied Aristotle, Maimonides, Averroes, and Avicenna and was inspired by friars John of San Giuliano and Thomas of Lentini to join the Dominican order around April of 1244. Aquinas's joining a mendicant order upset his family's ambitions, but the friars' foresight placed Aquinas on the road to Rome prior to Theodora's arrival in Naples to dissuade him. Aquinas again eluded his mother at Rome, departing for Bologna just before her arrival. At this point, Theodora organized a group that took Aquinas in the region of Acquapendente, whence he was confined to Castle Roccasecca. Consequent on Aquinas's refusal to change his mind and Innocent IV's disposal of Emperor Frederick (an ally of the Aquino family), Aquinas was returned in 1245 to the Dominicans, who sent him to Paris. Aquinas remained there for about 3 years, likely pursuing his studies of the liberal arts (begun at Naples) and starting work in theology, while serving as an assistant to Albert the Great. In 1248, Aquinas followed Albert to Cologne, where Albert had been sent to aid in establishing a *studium generale*, or house of study designed to train the order's ablest students, mainly to serve as lectors at provincial *studia*, where they would organize disputations and lecture on the Bible and Peter of Lombard's *Sentences*. At Cologne, Aquinas studied philosophy and theology under Albert, and perhaps began lecturing as a biblical bachelor, as required during the first year of one's formation as a master in theology. He also produced literal commentaries on the Bible and perhaps *De principiis naturae* (*On the Principles of Nature*). Aquinas returned to Paris in 1252 to begin the next stage in his formation as a bachelor of the *Sentences*, lecturing and producing his *Scriptum super libros Sententiarum* (*Commentary on the Sentences*), as well as *De ente et essentia* (*On Being and Essence*). In

1256, Aquinas received his license to teach and was appointed regent master at the University of Paris, against the protests of secular masters who resented the growing strength of the mendicant orders. As regent, Aquinas taught, commented on the Bible, and participated in disputations. Other writings from this time include several disputed questions as well as the *Expositio super librum Boethii De trinitate* (Commentary on Boethius' "De Trinitate"). Aquinas left Paris for Italy in 1259, where he spent a decade teaching at various cities and writing (*Summa contra Gentiles* (begun at Paris), *Sententia super De anima* (Commentary on Aristotle's *De anima*), and the first part of the *Summa Theologiae*, among other works). Aquinas ended these travels at Rome in 1265, where he was sent to establish a *studium* and serve as its regent master. In 1268, the order sent for Aquinas to serve an unprecedented second regency at Paris, where his talents were needed to combat secular attacks against the mendicants' rights to teach, and also to check the spread of Latin Averroism (see below), while simultaneously persuading conservative theologians that Aristotelianism need not pose a threat to Christian teaching. Aquinas's staggering output from this period – including *On the Perfecting of the Spiritual Life*, *On the Unicity of Intellect Against the Averroists*, and *On the Eternity of the World* – reflects these concerns. Aquinas left Paris for Naples in 1272 to establish another *studium* and serve as its regent master. In December 1273, while saying mass, he had a religious experience that led him for the most part to cease writing. He purportedly disclosed to his friend and assistant Reginald of Piperno that in light of what had been revealed to him, he deemed his writings to be worth less than straw and now wished to die. In February of 1274, Aquinas suffered an injury journeying to the Council of Lyons. While convalescing with his niece in the castle of Maenza, Aquinas requested that he be moved to the Cistercian abbey at Fossa Nuova, that the Lord might find him in a religious house; he died here on March 2, 1274. Aquinas matured during the flowering of scholasticism. By 1200, Western scholars had rendered nearly all of Aristotle's writings into Latin. This marked a dramatic shift

from the early twelfth century, when the only widely circulated works were Boethius' translations of *Categories* and *De Interpretatione*, Porphyry's *Isagoge* (a brief introduction to *Categories*), and a few other texts from late antiquity (these works comprised what medievals termed the "old logic (*logica vetus*)"). The appearance of the rest of Aristotle's writings precipitated a series of bans, prohibitions, and ultimately condemnations, beginning in 1210, when the Provincial Council of Paris forbade the teaching of Aristotle's natural philosophy by the Parisian arts masters. In 1215, the Papal legate Robert de Courçon upheld the ban and added a prohibition against lecturing on Aristotle's *Metaphysics*; and in 1231, Pope Gregory IX maintained the prohibition and appointed a commission to correct the prohibited books. The prohibition was likewise maintained by Popes Innocent IV and Urban IV; and yet, when Aquinas was finishing his studies as a bachelor of the *Sentences* in Paris, Aristotelian philosophy dominated the scene. The conservative reaction to Aristotle grew from the fear that his work could in some way undermine Christian teachings, which is just what happened in the mid-thirteenth century, when Siger of Brabant and other Parisian arts masters, reading Aristotle in light of the commentaries of Averroes (the Latinized name of the twelfth-century Islamic philosopher Ibn Rushd), interpreted Aristotle in a way that contradicted certain tenets of faith and argued that philosophical insight into the ordinary course of nature does not always agree with revealed truth. Aquinas attacked these Latin Averroists (or Radical Aristotelians) during his second Parisian regency, claiming that they misconstrued Aristotle, particularly concerning certain ramifications of Aristotle's claim that the human intellect is immaterial (*De anima* III.4–5). Siger had concluded that there can exist only one such immaterial intellect, as entities are not multiplied save through matter. Aquinas's aforementioned *On the Unicity of Intellect Against the Averroists* (*De unitate intellectus contra Averroistas*) argues that a careful reading of Aristotle does not support this position. What is important to note is that Siger advanced his claims as true according to philosophy, suggesting that

philosophy and theology could arrive at different truths. Aquinas's aforementioned synthesis of faith and reason contends that this cannot happen. Though reason cannot establish the tenants of faith, Aquinas denies the possibility of valid demonstrations contradicting these teachings (*Summa Theologiae* (ST) Ia.46.2; *Summa contra Gentiles* (SCG) II.32). Even so, Aquinas's efforts at reconciliation were not immediately successful. Three years following his death, Latin Averroism led to the Condemnation of 1277, instigated by the Bishop of Paris, Stephen Tempier, and drafted with the aid of Henry of Ghent. Among the condemned propositions were 19 drawn from Aquinas's writings (in 1325, 2 years after Aquinas's canonization, the Condemnation was repealed to the extent that it touched on his works). After his death, Aquinas's philosophy found support among his fellow Dominicans, and Pope Pius V declared him a Doctor of the Church in 1567, during the period of Second Thomism (dating roughly through the sixteenth and seventeenth centuries), which included thinkers such as Cardinal Cajetan, Domingo de Soto, and John of St. Thomas. Perhaps the most important revival of Aquinas's teachings grew out of Pope Leo XIII's 1879 encyclical *Aeterni Patris*, which recommended Aquinas as "the prince and master of all Scholastic doctors," so as to furnish Catholic intellectuals with sound philosophical and theological principles in the face of modernism. The period following *Aeterni Patris* has seen the foundation of numerous centers of Thomistic study, an interest in Aquinas's thought spreading outside Catholic circles, and, with this, the growth of an intellectual climate generally amenable to the study of medieval philosophy.

Metaphysics and Natural Philosophy

Key to Aquinas's metaphysics is his distinction between essence (*essentia*) and existence (*esse*). *De ente et essentia* (DEE) describes the essence or nature of an entity as the principle on account of which it belongs to a specific natural kind (as humanity is the essence of man) (Chapter 1). Essences (also termed "forms") are either

substantial or accidental. A substantial form is that principle just mentioned by which an entity belongs to some natural kind. Aquinas controversially maintained that individuals possess but one substantial form, regardless of what essential predicates we ascribe them (ST Ia.76.3c; *Sententia super De anima* (In DA) II.1.224). Accidental forms, on the other hand, are modes of being, whose presence or absence does not specify an entity as a member of some kind. Aquinas opposes any Platonist reification of essences, yet insists that essence and existence are distinct principles, with existence making an entity to be in actuality, which is contrasted with being in potentiality. Potentiality belongs to an entity which can be in a certain way but does not currently have that way of being, whereas actuality belongs to what is (*De principiis naturae* (DPN), Chapter 1). Transitions from potentiality to actuality are cases of substantial and accidental change. Substantial change is the generation of one substance following the corruption of another, as when a human becomes a corpse, which is a new type of thing that is human only in an equivocal sense (ST Ia.76.8; SCG IV.81). The matter underlying substantial change is conceived as in potentiality to all forms and thus termed "prime matter" (DPN, Chapter 2). Accidental change, on the other hand, involves a substance taking on or losing an accidental form, without itself being corrupted. Thus, generation absolutely speaking (to substantial form) and generation with qualification (to accidental form) require a being in potentiality (matter), nonbeing in actuality (privation), and an actualizing principle (form) (DPN, Chapter 1). (As regards immaterial entities such as angels, Aquinas allows that the same principle holds, though "matter" is used in a looser sense, to indicate potentiality. Hence, in these cases as well, change involves the movement from potentiality to actuality. See Aquinas's *Disputed Questions on Spiritual Creatures* a.1.) To these principles are added agents and ends (DPN, Chapter 3). Agents are required as no form, whether substantial or accidental, renders itself to be in actuality, as it would then have to preexist itself. Again, agents (even unintelligent agents) are inclined toward ends, though it does not follow

that all agents deliberate. Therefore, strictly speaking, change requires four causes: an agent (efficient cause), matter (material cause), form (formal cause), and an end (final cause). As for privation, as a logically prior antecedent to change, privation remains a principle, but it does not count as a cause in the strong sense that requires a cause to produce an effect. If privation were a cause in this sense, mere lack of form would bring about change.

Also important to Aquinas's metaphysics is the convertibility of the transcendental attributes of being: truth and goodness (*Quaestiones disputatae de veritate* (QDV) 1.1). "Truth" and "goodness," along with "thing," "one," and "something," comprise the five transcendentals: predicates true of all existent things qua existent. (Some scholars would add "beauty" to Aquinas's list. Note that other medieval thinkers settle on other lists, e.g., in addition to "unity," "truth," and "goodness," John Duns Scotus recognizes transcendental disjunctions (e.g., "infinite-finite") and perfections.) Considered absolutely, each being is a thing or something with an essence; and every being is undivided and hence one. In relation to other things, every being is itself and not some other and thus something; and in a sense involving relation to the soul's appetitive and intellectual powers, every being is true and good, good inasmuch as it is desired, and desired to the extent that it is a being in actuality (ST Ia.5.5c), that is, a being in actuality with respect to its specific perfections. Truth, on the other hand, is a mode of being involving a conformity of intellect and object when, in cognizing, intellect receives its object's likeness. Thus, entities are termed "true" in a way similar to that in which food is "healthy," both predicates signifying a mode of being whereby the subject acts on another. In the case of truth, this action results in an isomorphic (or true) conformity of the intellect with its object (QDV 1.4). In the proper and primary sense, though, something is true to the extent that it conforms to God's divine idea of it (QDV 1.4). This latter sense relates to actuality, for things can fall short of divine ideas to the extent that they fail to evidence or actualize the potentialities belonging to their specific kinds. Accordingly, there is a

correspondence between actuality and goodness dependent on God's creative intent. Most properly speaking, a thing is good to the extent that it actualizes the potentialities that God has determined with respect to its species, and hence the better an entity is, the more in actuality it is with respect to these potentialities.

Epistemology

Plato's theory of forms accounts for necessary truths. Whereas Aristotle agrees that we have such truths, he finds the notion of Platonic forms incoherent. In its place, Aristotle hypothesizes the existence of immanent principles or essences by which individuals belong to various natural kinds (see above, q.v. "[Metaphysics and Natural Philosophy](#)"). Knowledge of these essences is had by induction and accounts for necessary truths (see *Posterior Analytics* (An.Post) I.4; *Metaphysics* (Metaph.) XIII, 4–5; and *Commentary on the Posterior Analytics of Aristotle* (In PA) I.1.8, II.20). Aquinas subscribes to Aristotle's account of natural knowledge (i.e., knowledge absent special revelation). Aquinas divides knowledge into two types: (1) certain and (2) probable (In PA *Prooemium*). Certain knowledge comprises (1A) what is absolutely certain (In PA 1.4) and (1B) what is certain for the most part (In PA I.16, 42; II, 12). (1A) pertains to axiomatic systems, e.g., geometry; indemonstrable principles, e.g., the principle (or law) of noncontradiction (In PA I.5); and a limited range of natural phenomena, e.g., eclipses (In PA I.16). (1B) pertains to statistical natural phenomena, where like causes do not always produce like effects, e.g., human generation does not always result in healthy birth outcomes. (2) comprises a variety of epistemic attitudes that correlate with degrees of assent that fall short of certainty, ranging from mere fancy (low) to belief (high) (In PA *Prooemium*). Scientific knowledge (Latin, *scientia*; Greek, *epistēmē*) is the product of a syllogism that either demonstrates the inherence of a property in a subject by a middle term that immediately designates the essence of the subject (An.Post. I.2) or demonstrates a necessary connection between an

essence and a state of affairs by a middle term that indirectly designates the essence (An.Post. I.13). In addition to *scientia*, Aquinas recognizes four other intellectual virtues that are directed to truth: on the one hand, there are the speculative habits of wisdom (which grasps the most universal and primary causes) and understanding (of the principles of *scientia*, had by induction); on the other hand, there are the practical habits of art (concerning production) and prudence (which perfects the agent) (see In PA II.20; Aquinas's *Commentary on the Nicomachean Ethics of Aristotle* (In NE) Book VI; and *Aquinas's Commentary on the Metaphysics of Aristotle* (In M) I.1.34). Aquinas's account of *scientia* seems to be foundationalist, i.e., Aquinas appears to restrict the scope of *scientia* to a small set of propositions known with certainty and those derived from them. Nevertheless, we have seen that Aquinas allows for a variety of epistemic attitudes. Hence Aquinas's account of *scientia* does not exhaust his theory of knowledge; it would be a mistake to label his epistemology foundationalist *tout court*.

Scientia comprises two types: *propter quid* (why) and *quia* (that). *Propter quid scientia* accounts for an effect in terms of the essence or nature of its cause, answering the questions (A) "Why is this so?" and (B) "What is it?," whereas *quia scientia* tells us whether (C) something is the case or (D) exists. (A) and (C) are paired. When we learn that something is the case, we may ask why. Likewise, (B) and (D) are paired. Upon learning that something exists, we may ask what it is. These four questions exhaust the scope of *scientia* (In PA II.1.2).

Propter quid scientia is *scientia* in the strictest sense (An.Post. I.2). Unlike *quia scientia*, *propter quid scientia* works from a direct grasp of the essence of its subject, which is formulated in ascriptions of what Aquinas terms *per se* (through itself) belonging (*kath'hauto* in Aristotle's Greek). Ascriptions of *per se* belonging make up the statements of the scientific syllogism, defined as a syllogism productive of scientific knowledge (*sullogismon epistēmonikon*) (An.Post. I.2).

Like *propter quid scientia*, *scientia quia* is had by a syllogism. As noted, the *quia* grasp of the essence is indirect: either by an effect concomitant

with the activity of the essence-as-cause (e.g., by the phenomenon of motion, Aquinas infers the existence of a first mover, i.e., God (ST Ia.2.3)) or by a remote cause, i.e., a tangential rather than an immediate cause. Aristotle's example is a proof that walls do not breathe because they are not animals. In fact, walls do not breathe because they lack lungs. Though only animals have lungs, not all animals have lungs; hence the immediate cause of not breathing goes unnamed. This latter type of *quia* proof is, as it were, a defective *propter quid* proof, whose defect can be remedied by the inclusion of the immediate cause: "Walls lack lungs. What lacks lungs does not breathe. Hence, walls do not breathe" (In PA I.24). Another example has it that Scythians lack flute players because they lack vines (ibid.). Presumably, vines produce wine, wine merriment, merriment dancing, and dancing the need for music. Again, the immediate cause goes unnamed.

Natural Theology: The Five Ways

Aquinas's Five Ways are *quia* proofs that God exists (ST Ia.2.2). *Propter quid* proofs are ruled out as we lack the requisite *per se* grasp of the subject's essence (on *propter quid* and *quia* proof, see above, q.v. "[Epistemology](#)") (ST Ia.2.1). Likewise, Aquinas rejects Anselm's proof of God's existence, which Aquinas believes would entail *per se* knowledge of God's essence in this life (ibid.). Aquinas's demonstrations (drawn from Aristotle and the Islamic-Judeo tradition of rationalist theology) contend that the existence of God is necessary to account for certain readily observable phenomena (ST Ia.2.3): motion, efficient causality, contingent entities, gradations of perfections, and the seeming end-directedness evidenced by unintelligent things. Each demonstration identifies God as its subject; but the complete rational for these identifications does not emerge until ST Ia.3-12, where Aquinas reflects on the implications of pure actuality, ascribed to God in the First Way (see below).

The First Way observes that things are in motion or moved (the verb *movetur* allows either

rendering). Following Aristotle, Aquinas recognizes three types of mobile change: in quantity, quality, or place (*Sententia super Physicam* V.3). From the general principle that anything in motion is moved by another, Aquinas concludes that there must be a first unmoved mover, for unless there is an exception to this general principle, we could ask for an explanation of every motion in terms of a previous mover ad infinitum, never arriving at a first mover whose activity is ultimately responsible for the existence of the motion under consideration. It is important to be aware that the discussion of previous movers has in mind ontological rather than temporal primacy. Aquinas's example of a staff moved by a hand illustrates that the unfolding effect requires an agent's ongoing activity; thus, the causal series is synchronic or ordered per se, in contrast with a diachronic series ordered per accidens (accidentally), where events are conceived as unfolding independently of their temporally prior antecedents, as one blow of a hammer follows another. Thus, Aquinas's proof culminates with an unmoved mover continually actualizing the potentiality of all other movers (moving or moved), supporting Aquinas's belief that God continually pours forth being into creation (SCG II.30.3).

Aquinas establishes the aforementioned principle that what is moved is moved by another with a description of motion as the reduction of potentiality to actuality, e.g., a stick catching fire. This reduction from potentiality to actuality requires an agent in actuality with respect to the form that is communicated, e.g., a flame. Not every change involves an agent communicating a form that it actually possesses. Alcohol is not itself inebriated. Aquinas's point is that within the cause there is an element in actuality with respect to the property communicated, inasmuch as when in actuality this element produces such and such a property in an appropriately disposed patient. Given an entity's inability to communicate to itself a motion with respect to which it stands in potentiality (i.e., by means of that part of itself that is in potentiality with respect to that motion), the principle that every mover is moved stands, with the aforementioned caveat that an unmoved mover is required to account for there being now any

motion. Moreover, this first mover must be pure actuality; or else its activity would require that of another mover and so on ad infinitum (ST Ia.3.1c).

Like the First Way, Aquinas's Second, Third, and Fourth Ways demonstrate the existence of an entity that is pure actuality, the Second and Third as they conclude with the existence of an uncaused cause, and the Fourth, since it accounts for gradations of perfection in terms of an entity that is "maximally existent (*maxime entia*)."

Recalling Aquinas's distinction between existence and essence (see above, q.v. "[Metaphysics and Natural Philosophy](#)"), we may note that the first four ways imply the identity of existence and essence in God, as any composition of existence and essence requires an accounting that involves potentiality within the composite (ST Ia.3.4c). Finally, as goodness, truth, and being are, for Aquinas, convertible, he elsewhere argues that the first being, who is maximally good, possesses every perfection, thereby securing the identification of the first being with God (ST Ia.4.2; SCG I.28.2).

Semiotics: Theological Discourse

A term's signification (what it brings to mind) derives from experience, which does not equip us with the idea of a wholly simple entity possessed of every perfection. Rather than admit language's inability to properly reference the divine essence, Aquinas regulates the signification of theological discourse through the Aristotelian notion of focal meaning. Aristotle sought an element common to our various uses of the term "being," which can refer to both substances and accidents (Metaph. IV.2, 1003b5-11). Technically, the term is equivocal as it signifies differently in different contexts. Nevertheless, the various significations are related. Employing terminology developed by Pseudo-Augustine, Boethius, and Simplicius in their commentaries on Aristotle's *Categories*, medievals generally claimed that the term "being" is equivocal "by design (*a consilio*)," like the term "healthy" said of both medicine and a patient, rather than equivocal "by chance (*a casu*)," as "bat" said of baseball bats

and various mammals. Equivocal terms of any type are contrasted with univocals, which supposit for (or refer to) disparate individuals conceived under a single concept, as “person” said of Aquinas and Aristotle. Note analogy and univocity are context dependent; for instance, “healthy” when said of two different persons is subordinated to one idea and thereby functions univocally. As concerns the term “being,” Aristotle noted that it is said primarily of substances and in a secondary or derivative sense of accidents (Metaph. IV.2, 1003b5-11). Thus, the various uses of the term are unified through a focal meaning appropriate to the primary analogue, to which the term most properly applies. Following Aristotle’s Greek, this species of equivocation is sometimes referred to as an instance of “*pros hen* (toward one)” equivocation, where the various significations of a designedly equivocal term are distinguished through what the medievals term analogy “of attribution (*per attributionem*),” which involves signification in a “prior and posterior manner (*per prius et posterius*),” with the analogous term referring properly to the primary analogue, and in a derivative or posterior sense to the secondary analogues. In addition to analogy of attribution, medieval thinkers also recognized analogy of proportionality (*proportionalitas*), likewise inherited from Aristotle, where a relation holding between members of a set is clarified through a comparison to another set whose members stand in a similar relationship: thus the sepioid is to the squid, as the spine is to the fish, and the backbone is to land animals (An.Post. II.14, 98a 20–23). In *De veritate*, composed during Aquinas’s first Parisian regency, this species of analogy is used to name God (II.11c), but most scholars agree that Aquinas’s later works favor the use of analogy of attribution. Seeing analogy of attribution at play in theological discourse, Aquinas notes that our notions of the traits we ascribe to God derive from creatures, whose modes of existence furnish the everyday or baseline signification of our language (ST Ia.13.6c). This baseline signification cannot do justice to the intention of the theologian, who understands the ramifications of divine simplicity. Accordingly, God talk must

annex notions of supereminence, causality, and simplicity, recognizing that to ascribe a perfection *F* to the divine essence requires that we understand that God is the cause of *F* in creatures and that God possesses *F* in the highest possible degree, but in a manner that does not violate divine simplicity. The adjustment does not suppose that we can comprehend *F*-ness as it characterizes God, but it allows Aquinas to plot a middle ground between idolatry (the worship of a creature) and a negative theology such as that of the influential twelfth-century Jewish philosopher Moses Maimonides, who claimed that we know of God only what God is not (*Guide for the Perplexed* I.58).

Philosophical Psychology

The human soul is the substantial form of the human being, coming into existence as part of a matter-form composite (DEE, Chapters 2 and 5). The soul (termed “intellect” in its function as the principle of intellectual operation) can grasp the essence of material entities; hence intellect is immaterial, since a particular material configuration would impede such knowledge. Moreover, though knowledge originates with sensation (see below), intellect acquires its concepts through an activity that is proper to it, and thus intellect functions apart from matter and is subsistent, for whatever acts must be in actuality (ST Ia.75.2). Since it subsists, the soul survives the death of the body, undergoing an interim of reward or punishment (SCG IV.91), after which the soul is reunited with its body in the Last Judgment (SCG IV.79, 96). Nonetheless, while separate from its body, the soul lacks the organs necessary for it to perform its proper function, which is to know sensibles. Hence it is contrary to the soul’s nature (*contra naturam*) to subsist in this way (SCG IV.79.10) (cf., In DA III.5.745). As regards cognition, awareness of an extramental essence begins when our external senses transmit impressions of some extramental entity *x* in the form of sensible species, described by Aquinas as immaterial representations of extramental objects (In DA II.24.553). The internal sense dubbed “phantasia”

transforms these sensible species into an internal representation of *x*, termed a “phantasm,” by means of a modification of some bodily organ (ST Ia.85.1c, ad 3). Aquinas’s account suggests that it is through this representation, not the sensible species, that we initially become conscious of extramental entities. Thus far, perception is a physical phenomenon, accounted for by various internal and external organs; but after the generation of a phantasm, the intellect begins its work. First, the aspect termed “active intellect” extracts from the phantasm an intelligible species, which conforms to some aspect of the essence or quiddity of *x* (ST Ia.84.7), but not as the form of any particular entity. Thus an intelligible species prescind from material considerations or physical representations such as are given through the phantasm (ST Ia.85.1, ad 3); nevertheless, as its attending to phantasms is a necessary condition of the active intellect’s production of an intelligible species, the intellect grasps the essence as one that exists in matter. This non-eidetic grasp of the essence or quiddity on account of which an extramental entity falls under certain genera and species is then stored in what is termed the “possible” (or, more loosely, “passive”) intellect, allowing us to retain and hone our concept (ST Ia.79.2, ad 2; 6–7; 85.5c).

Aquinas believes that human beings are free, though they necessarily desire the good. He develops this position in light of a discussion of four types of necessity corresponding to Aristotle’s four causes (ST Ia.82.1). Natural necessity arises from internal material and formal principles. Thus, a substance composed of contraries is necessarily corruptible (material) and the interior angles of a triangle necessarily equal 180° (formal). By contrast, necessity of the end emerges because of something extrinsic, such as food required for living. Finally, necessity with respect to coercion obtains when an action is compelled by some external agent. Only this last type of necessity is incompatible with free will. That we desire the good is a natural necessity, underlying all action of the will in the way that the principle of noncontradiction governs the speculative intellect (ST Ia. IIae.94.2c). Since we

naturally desire the good, we are, on occasion, subject to necessity of the end, because there may be only one way to acquire the good we desire. That this second type of necessity does not preclude free will seems clear enough; we would not ordinarily say that a person who chooses to go on a journey lacks a free will because he must book a flight. However, it may seem that natural necessity robs the will of its freedom. Aquinas’s response emerges in his discussion of intellect and will. Will is an appetitive power, naturally moved by its object, which is happiness (ST Ia.82.1c). Aquinas distinguishes between intellectual and sensitive appetitive powers, classifying the will as intellectual owing to its reliance on intellect, which conceives the good that moves the will (ST Ia.82.3, ad 2). More specifically, the will is moved by particulars conceived as standing under universal types, as one is moved to hatred or desire when conceiving some particular under the type “thief” or “good,” respectively (ST Ia.80.2). The good conceived by intellect is an unmoved mover acting on will through final causality, while the will itself acts as an efficient cause with respect to diverse faculties, setting them in motion to attain the desired end (ST Ia.80.2). Though intellect initially sets will in motion through intellect’s apprehension of a particular under a universal, will’s efficient causality extends to intellect (ST Ia.82.4). Finally, we may note that intellect does not generally present will with only one cognized good; instead, intellect furnishes will with a variety of goods among which will is free to choose (ST Ia.82.2, ad 3). This, coupled with will’s ability to direct the intellect to consider even more goods, or the same goods under different aspects, accounts for freedom of will. Though oriented to the good, when presented with a variety of goods, will is free to choose which to pursue.

Ethics and Natural Law

Moral philosophy has three branches: ethical, domestic, and political (In NE I.1.6). What we should and should not do is ultimately determined

with reference to the chief human good (ST Ia. IIae.1.6), which we have seen is happiness (ST Ia.82.1c). Following Aristotle, Aquinas accepts that what functions well is good, and thus a human who functions well will be a good human or a human who has acquired the human good. The human good is happiness, so a human who functions well will be happy (In NE I.10.128). That human beings have a function, Aquinas accepts on several grounds, including the belief that it would be absurd to suppose something ordained by divine intelligence should lack a purpose (In NE I.10.121). Our function is what makes us unique vis-à-vis other animals, namely, our rationality (In NE I.10.126). To function well requires possession of the appropriate virtue; thus, the virtue of a knife is sharpness as the function of the knife is to cut. Hence successful moral reasoning involves several factors, since the intellect is divided in terms of practical and speculative applications, to which there correspond various intellectual virtues. However, we have seen that human beings are likewise motivated by intellectual and sensitive appetitive faculties, whose proper functioning requires moral virtues, whose role is to ensure that what we desire is conducive to our overall good. The moral virtues depend on reason if they are to show themselves in activity conducive to our well-being, for without the intellectual virtues of prudence (which grasps means to ends), and understanding (which supplies the deliberations of prudence with the requisite first principles) (among other places, see In NE VI), the mere possession of appropriate desire would be insufficient to ensure our welfare (ST Ia.IIae.58.4, ad 3). Thus the activity of the appetitive faculties that these virtues perfect may be termed rational in a broader sense, inasmuch as these faculties can obey the regulation of reason in the manner that a child obeys her parents or a youth the counsel of wise friends (In NE I.20.240). Conversely, as prudence is right reason about what should be done, it depends on the rectitude of our appetites as concerns the desired end, and thus prudence (a virtue of the practical intellect) depends on the moral virtues, which dispose us toward the proper end

(ST Ia. IIae.57.4c). Morality consequently supposes the exercise of deliberation and volition in accord with the intellectual and moral virtues, respectively. While it is true that happiness is our chief end, our ultimate happiness is not found in this life. Rather the greatest human happiness will come only in the beatific vision, “for man and other rational creatures attain to their last end by knowing and loving God” (ST Ia. IIae.8.2c) (cf., ST Ia.IIae.3.8c). Attainment of our ultimate end requires the supernatural virtues of faith, hope, and charity, which are acquired through grace (ST Ia. IIae.1–46). Nonetheless, Aquinas believes that our lives on earth can afford a measure of happiness; indeed, our inclination to pursue that happiness serves as the first principle of morality underpinning God’s natural law. Natural law is the eternal law ruling creation as subject to God’s providence, imprinted on creatures in the form of proper inclinations (ST Ia.IIae.91.2c). The first precept of natural law is that we should seek good and shun evil, the moral equivalent of the principle of noncontradiction (ST Ia. IIae.94.2c). What humans pursue and avoid is determined by their nature as rational, animate substances, which, among other things, inclines them to preserve their own being, mate and raise offspring, and live together in peaceable society. To the extent we are aware of and follow these desires in an appropriate manner, we follow natural law, and this brings us happiness.

Thomas Aquinas, Political Thought

Holly Hamilton-Bleakley
Brampton, UK

Abstract

Thomas Aquinas (1224/1225–1274) is considered to be one of the greatest thinkers in the history of philosophy, and is most famous for his attempts to interpret and expound Aristotelian philosophy within a Christian framework. His political philosophy thoroughly reflects this Christian Aristotelianism, where man has an end designated by God, operating through nature, and the ultimate purpose of political institutions is to enable man to reach this end. Breaking with the traditional Augustinian view of political institutions as a result of man's sinfulness, Aquinas argued that man was by nature a political animal, both because he had natural impulses to gather with others of his kind and discuss political concepts such as justice and right, and because political institutions could best create the conditions that man needed to reach his end of a life of virtue. Because politics is vested with the purpose of man's moral development, political freedom for Aquinas therefore becomes associated with the regime which leads man to his own good – that is, to a life of rational, virtuous action.

Thomas Aquinas (1224/1225–1274) was an Italian theologian and philosopher, and is regarded

not only as the most famous figure in medieval thought, but also as one of the greatest philosophers of all time. He lived and worked at a turning point in the history of philosophy, when the Aristotelian *corpus* became available to the Latin west. Under his teacher, Albert the Great, Aquinas was among the first in his generation to be thoroughly schooled in Aristotelian philosophy. Although Aristotle's philosophy was regarded as suspect by many at the time, Aquinas made it his life's ambition to integrate Aristotelian philosophy into Christian theology. This article will discuss Aquinas' political thought, which has its deepest inspiration and orientation in Aristotle, most especially in the way in which it asserts political existence as essential for enabling man to access the goods necessary for him to live a fully human life: namely, virtue and freedom.

Aquinas was born in 1224 or 1225, near Naples. After beginning his studies in Naples in the liberal arts in 1239, he was sent by the Dominican Order to study theology at the University of Paris, arriving there in 1245. Here he met Albert the Great, who was passionate about absorbing the new Aristotelian corpus. He followed Albert to Germany, and studied under him from 1248 to 1252. Aquinas returned to Paris in 1252 and completed his commentary on the *Sentences* of Peter Lombard in 1256, after which he held one of two Dominican chairs in theology. His most important works were accomplished later in his life: from 1265 to 1270, he wrote the *Prima pars* and *Prima secundae* of his *Summa theologiae*, and in the last five years of his life he wrote most of his Aristotelian commentaries, as well as the *Secunda secundae* and (the unfinished) *Tertia pars* of the *Summa*. The discussion here of Aquinas' political thought draws from his commentaries on Aristotle's *Nicomachean Ethics* (*Sententia libri ethicorum*, referred to as *SLE*) and *Politics* (*Sententia libri politicorum*, referred to as *SLP*), his treatment of law and the virtues in the *Summa theologiae* (*ST*), and his *De regimine principum* (*DRP*), a short work dedicated to the King of Cyprus written in the late 1260s.

Aquinas' political thought has to be approached *via* his interpretation of Aristotle's political thought, but perhaps more especially,

Aristotle's moral thought. First of all, the Aristotelian *corpus*, specifically the *Nicomachean Ethics* and the *Politics*, provided a new language with which philosophers could discuss political concepts. In his *Politics*, Aristotle had asserted that man was by nature a political animal. Using William of Moerbeke's Latin translation of the *Politics*, Aquinas made the term *animal sociale et politicum*, or *animal civile* central to his political thought as a description of what man was by nature (*SLP*, Book I, ch. 1/b, lines 69–154).

Following Aristotle, Aquinas argued that it was natural for man, more than for any other animal, to live sociably with others of his kind. This is because man has physical, intellectual, and moral needs which can only be filled within a social context (*DRP*, p. 3). For other animals, nature has equipped them with the physical attributes necessary for protection and the enhancement of their survival, such as a natural coat of hair, very sharp teeth, horns, claws, etc. Man, on the other hand, has reason, by which he can plan how to go about reaching both his physical and spiritual ends. Yet, man's individual reason cannot provide him with all the guidance he needs when one considers all that is necessary for human life. Thus, nature dictates that man live in association with other men so that he can benefit from the knowledge and resources of a community. Furthermore, man has the power of speech, which demonstrates not only his need to communicate with others, but also his ability to discuss and deliberate with others about what is right and wrong, just and unjust. This is a further indication of not only his social nature, but of his political nature. Social nature and political nature for Aquinas are inextricably linked, for there cannot be society without a presiding political authority to ensure the common good and unify the community.

Adopting the language, and therefore the concept of man as political by nature, was enough to make a decisive break with the prevailing Augustinian idea of political institutions as a result of man's sinful nature. That man was by nature a "social" being was a concept already firmly entrenched in the Latin west, due to the ideas of both Cicero and the Church fathers, especially

Augustine. However, for Augustine, the archetypal natural society of man was the community of saints in heaven, where men were equals and no man had dominion over another; this, indeed, would have been the organization of man in the state of innocence (Markus 1970:223). Political institutions, by contrast, because they were by definition coercive, were characterized by the dominion of man over man, in the same way that a master has dominion over his slaves. They came into being only in the post-lapsarian world of sin.

For Aquinas, political institutions are indeed by definition coercive, and they are characterized by the dominion of man over man. However, this dominion is not that of master and slave, but one of a master over free men, where the master rules the men in a way that benefits their own ends, rather than rule them for the master's own benefit, as a slave is ruled (*ST*, 1a, qu. 96, art. 4). Furthermore, this dominion would have existed in the state of innocence, for two reasons. First, because in that state, as now, man would have lived a social existence, and, as we have seen, there can be no social life unless there is a political authority to enable the community to remain intact. Second, because in that state, as now, there would have been a natural inequality among men. Men were free agents in the state of innocence; thus, some would have advanced further than others in righteousness. These men, then, should exercise their gifts and be in authority over the rest, and it is after the order of nature that they do so (*ST*, 1a, qu. 96, art. 3). Thus, political institutions, like the family, are a natural part of our human existence; they would have existed if there had been no sin.

This begs the question, however, of what it means for something to be "natural." Aquinas' challenge to Augustine's notion of politics incorporated an idea of natural as what would have been compatible with man in his pre-lapsarian state. While this is part of what Aquinas understands by "nature," the essence of his understanding of what is natural comes from Aristotelian teleology.

Aristotle's account of teleology is based on the idea that certain things come-to-be and exist "by nature." Those things that exist by nature have

their own specific end, dictated by their form, and they change for the sake of that end through their natural impulses. The attainment of their end signifies the completion of their development. Nature is therefore a cause, and what is "natural" is whatever exists in the way that it does because it has an "innate impulse" to become that way (Miller 1995:37). In this sense, man is by nature a political animal – and political institutions are natural – because man has natural impulses to gather with other humans, and the end toward which human association impels itself is the political organization of the city.

Yet, natural impulses in humans are much less deterministic in ensuring the accomplishment of a designated end than in other natural beings (Salkever 1990:69). Aquinas argues that the natural impulse to be in society does not seem to be enough to sustain social existence. The art of rulership is needed to complete nature by building upon the natural impulses of individual men to create a community, and this function is one way in which the ruler features prominently in Aquinas' political thought. Aquinas argues that men, as individuals, pursue their own interests, and that this behavior is ultimately destructive of social life, as "the particular interest and the common good are not identical" (*DRP*, p. 5). In order for the city to exist, "there must be some principle productive of the good of man." The ruler is this separate "principle" – the formal cause of the city, imposing the form of the common good upon the matter of individual men, who have gathered together by natural impulses. He does this specifically in his role as lawgiver, as it is through his laws that he directs men toward the common good.

The ruler's role as the formal cause of the city is reinforced as he is compared both to God as the creator and formal cause of the world, and to the soul as the formal cause of the body (*DRP*, p. 69). God's function as creator was not only to create things themselves, but also included the "orderly distribution" of all things throughout the universe. By the same token, the soul, as the actuality of a living thing, is what makes a whole out of thing's various parts by ordering those parts in a function that is above their individual functions. Hence, as

the formal cause of the city, the ruler creates an integral whole – a unity – out of an array of individual men by ordering them toward the common good.

In light of comparing the ruler with God and with the soul, it follows that Aquinas sees that the best way to create unity in the city is through a government carried out by one person (*DRP*, pp. 11–13). Although there has been much discussion about Aquinas' position on the "mixed constitution" (see for instance Blythe), which for reasons of space I cannot discuss here, the point of the matter is that he believes the best constitution under which man can live is a monarchy.

Thus, Aquinas sees the city as natural for man because he has natural impulses toward it, although those impulses are not enough to sustain it. However, Aquinas considers the city as natural for man in a further, fundamentally important way, for what is natural is not only what comes to be through natural impulse, but also any "condition" necessary for the fulfillment of man's own end given to him by nature, the attainment of which ensures his complete development as a human being (Hamilton-Bleakley 1999:589).

This end is to attain a character such that one consistently acts according to the dictates of reason – that is, it is to develop the intellectual and moral virtues. For Aquinas, to act according to reason is to act in a way that is uniquely human. Man differs from irrational creatures in that he is the master, *dominus*, of what he does (*ST*, 1a2ae, qu. 1, art. 2). He is *dominus* of his actions through a faculty which includes both his reason and his will – it is rational desire, a "deliberate willing." Man is *dominus* of his actions when he uses his reason to determine what goal he will move toward, as well as uses his will to put himself in motion toward that goal, rather than "being moved" by something else. In this way, as a rational being he is his own cause – *sui causa est* – and thus considered free. The man who carries out this action unique to humans in the best way possible is the virtuous man.

However, once again, man is separate from all other natural beings in that he is much less determined through impulse to reach his end designated by nature. For Aquinas, man does have a

kind of impulse toward his end, what he calls a *naturalis inclinatio* for virtuous action (*ST*, 1a2ae, qu. 63, art. 1). It is identified with man's natural understanding of general principles of right and wrong (*synderesis*), as well as with man's natural appetite for the good – which is a general, universal tendency toward the good – both of which are the basis of Aquinas' natural law. Yet, this natural inclination is only the beginning (*inchoatio*), or seeds (*seminalia*) of virtue – what Aquinas calls "natural" virtue (*SLE*, vol. 2, Book 6, ch. 11, lines 20–40). In order for man to attain true virtue – that is, "moral" virtue – and thus reach his end, he must develop the virtue of prudence, or practical wisdom, which is the ability to understand how to apply general moral principles of reason in a particular situation (*ST*, 2a2ae, qu. 47, art. 3). The most important of all the practical virtues, prudence is the quality whereby a man rules himself toward the good. Prudence will ensure that man acts rightly on a consistent basis, and this repeated right action will develop his natural inclinations into virtuous habits in his character.

However, there is a reciprocal relationship between prudence and moral virtue: prudence guides the appetite toward the moral virtues, but a man needs properly habituated appetites in order for prudence to function properly (*ST*, 1a2ae, qu. 58, arts. 4 and 5). Hence, man needs an external guide to help him develop both his prudence and his moral virtue, and this guide comes from the law issued by political institutions (*ST*, 1a2ae, qu. 95, art. 1). For Aquinas, the ruler is to ensure that the actions of his subjects are good, by enacting laws and attaching rewards and punishments which "dissuade men from evil-doing" and "induce them to do good" (*DRP*, p. 83). The repeated right action demanded by the law forms virtuous habits in the subject's appetites, and the law is a model of reason for the subject to emulate as he develops his prudence. In this way, political rule is natural to man, because it creates conditions necessary for the fulfillment of human nature.

Not only is the city the place where the virtues are developed, it is also the place where they are exercised to their fullest extent, by both ruler and subject, and in this way the city is, again, essential

to a well-lived human life. Prudence and justice are singled out by Aquinas as the most important civic virtues for the ruler and the subject. As we have seen, prudence in general is the virtue whereby man rules and commands himself toward the good. Political rulership, however, is prudence on a larger scale, in that it is concerned with actions that will bring about the common good, not just the good of the individual. Furthermore, if prudence in the individual is the ability to act virtuously in a particular situation, prudence on a larger scale must include the ability to guide members of the community, through law, in their actions, so that they might develop into virtuous human beings. For Aquinas, then, the prudence possessed by the ruler, or what he calls *regnative* or *legislative prudence*, is the most perfect species of prudence (*ST*, 2a2ae, qu. 50, art. 1).

The moral virtue of justice, too, most properly belongs to the ruler (*ST*, 2a2ae, qu. 58, art. 6). Particular justice orders one rightly toward the good of another individual person. But general or legal justice has as its object the common good, and it directs the activity of all the other moral virtues beyond their own proper ends by setting them toward the further end of the common good. In this sense it is the sovereign moral virtue, essentially distinct from the rest of the moral virtues – although, as a moral virtue it still needs the direction of prudence to function properly. The ruler exercises his legal justice (together with his legislative prudence) by enacting laws which enable his subjects to see beyond their own ends and act for purpose of the common good.

His laws do more than this, however: they allow his subjects to “develop the motivation” to act for the common good. In this way, his laws enable his subjects to develop “and exercise” a kind of legal justice as well, where they experience the attachment to the common good which is morally perfecting (Weithman 1992:371). Aquinas does not see the act of obeying the law as one where the subject is merely forced – or moved upon – to behave in a certain way. Instead, virtue is exercised through political obedience: subjects who obey the law willingly have within themselves a righteousness which allows them to

“move themselves” toward the common good (*ST*, 2a2ae, qu. 50, art. 2). As we saw earlier, moving oneself toward a particular end is the mark of a rational, and therefore virtuous man. Moving oneself in obeying the law is the mark of a man who possesses not only a kind of legal justice, but also the virtue of political prudence – the species of prudence specific to subjects who rule and direct themselves toward the common good. Thus, the laws of the city provide the unique circumstances necessary for subjects to live a fully virtuous life.

Having discussed the two ways in which Aquinas sees political rule as natural to man – because it is a result of natural impulse, and because it is necessary for the fulfillment of human nature – we must recall that the “naturalness” of political rule is dependent upon its “rightness.” Despotic or tyrannical rule, akin to the dominion a master has over a slave, is not natural. Indeed, we have seen that Aquinas uses freedom as a characteristic which distinguishes the dominion natural to man from that which is not. We have also seen that Aquinas defines the free man as he who is ruled and directed toward his own proper good. As man’s proper good is to become virtuous, subjects can be free only if they are asked to obey laws which encourage virtuous action.

Crucially, then, for Aquinas freedom can only be accomplished in subjection – in subjection to reason, that is, to law (Hamilton-Bleakley 1999:599). Freedom for the individual is not defined as the absence of natural impulse, or as the absence of law – spaces where neither nature nor the state has a claim – but as the pursuing and embracing of the end which nature has specifically given to man. Aquinas’ idea of freedom is the ability to use and act in accordance with one’s reason. Because Aquinas sees the government which guides men according to their own good as the government fitting for free men, he therefore defines political freedom within the framework of his distinctive notion of individual freedom. If man is free only when he is living a virtuous life, then it is clear that freedom is found with coercive, but proper, rule – that is, rational law, backed by coercive sanction. Men must be in the city to be fully human and so to be truly free.

In linking political society – and political freedom – so closely with man’s moral attainment, Aquinas differs not only from the Augustinian view of the state as unable to foster any meaningful development or exercise of virtue, but also from the position of contemporary liberalism that governments can be neutral with “regard to nearly all human goods, normative goals and virtues.” The ubiquity of this doctrine may make Aquinas’ political “perfectionism” difficult to countenance today. Yet, this perfectionism comes out of a magisterial attempt to link man’s deepest needs and impulses with his highest goals, and brings with it an honesty about what conditions man needs if he is to flourish. Man’s end is a normative one, and political society, rather than ignoring this fact, must instead embrace it, and accept responsibility for its achievement.

Thomas Bradwardine

Stephen E. Lahey

Institute of Medieval Philosophy and Theology,
Boston College, Chestnut Hill, MA, USA
Department of Classics and Religious Studies,
University of Nebraska, Lincoln, NE, USA

Abstract

Thomas Bradwardine (c. 1300–1349), Merton theologian and Archbishop of Canterbury, famous both for his innovative treatises on physics and mathematics and for his vigorous attack on what he perceived as a revival of Pelagianism in Ockham’s thought regarding divine foreknowledge and future contingents. Bradwardine was one of the “Calculators” of Merton College, philosophers who emphasized the need to incorporate mathematically precise reasoning into problems associated with Aristotelian physics. His treatment of the relation of variation in the velocities of moving objects to variation in the force and resistance affecting velocity led him to postulate the need for geometric, rather than arithmetic, ratios in

understanding kinematics, which would eventually develop into logarithmic mathematics. Bradwardine became interested in formal theology when investigating Ockham's account of how God knows created actions as contingencies. His *De causa Dei* is a compendious refutation of every imaginable species of reasoning that denies God certain, necessary knowledge of all created action, representing the high watermark of Augustinian determinism in pre-Reformation Western theology. Unless further manuscript discoveries are made, particularly of his commentary on the *Sentences*, it is unlikely that Bradwardine's theological position can be connected to his earlier mathematically oriented thinking. Bradwardine was a member of the influential circle of thinkers associated with the Bishop Richard de Bury of Durham and was closely associated with Edward III; Black Death limited the duration of his occupation of the see of Canterbury to little more than a month.

Thomas Bradwardine (c. 1300–1349) began his career as a theologian and natural philosopher at Merton college in the 1320s, and began service to Edward III in 1339 as a royal chaplain. He was elected Archbishop of Canterbury in August 1348, but because the election had bypassed Edward's permission, he had to stand aside and allow John Ufford to occupy the see at Canterbury. When Ufford died later that year, Bradwardine was elected again, and Edward appears to have allowed his chaplain to become Archbishop in July of 1349. Black Death had been devastating English society for several months, and it claimed Bradwardine only 38 days after his accession. Despite the fact that he likely had left Oxford toward the end of the 1330s, the immediate effects of his presence were felt well into the 1360s and 1370s, when Wyclif was active. Bradwardine was a member of the circle of Richard de Bury, Bishop of Durham, which was an influential group of scholars including Walter Burley, Richard Fitzralph, Robert Holcot, Walter Chatton, and Richard Kilvington.

Bradwardine's extant works are generally divided into two distinct groups: the mathematical/physical treatises associated with his time at Merton college, and two theological works concerning the problem of God's eternal knowledge and human freedom. The former group includes the treatises associated with the *Geometria speculativa*, *Arithmetica speculativa* (a textbook based on Boethius' *Arithmetica*), *De continuo* (a refutation of spatiotemporal atomism), *Ars memorativa*, *Insolubilia*, *De fallaciis*, and two sets of *Quaestiones* regarding problems in physics. The latter group includes *De futuris contingentibus* and *De causa Dei contra Pelagium*, as well as *Sermo Epinicius*, preached before Edward III following the battle of Nevill's Cross in 1346. His commentary on the *Sentences* survives in fragmentary form, as yet unpublished. A number of other works associated with Bradwardine remain in manuscript, awaiting further analysis.

Mathematics and Physics

"Mathematics," Bradwardine wrote, "is the revelatrix of truth, has brought to life every hidden secret, and carries the key to all subtle letters." Bradwardine's *Geometria speculativa* shows his fascination with the foundations of geometric and mathematical theory, containing treatises on stellated polygons, isoperimetric figures, and solid geometry, each development of medieval commentaries on ancient mathematics, and his *De proportionibus*, his most important contribution to medieval scientific reasoning. *De proportionibus* attempts to improve Aristotelian mechanics by addressing mathematical inconsistencies that had begun to trouble medieval natural philosophers. The Mertonians William Heytesbury, Richard Swineshead, and John Dumbleton would make use of Bradwardine's study of the relations of quantities in their own speculative physics, as would Galileo in the seventeenth century. Particularly significant in the treatise is Bradwardine's attempt to explain the relation of variation in the velocities of a moving

thing to variation in the forces and resistances that affect velocity. The traditional understanding in Aristotelian physics relied on the axiom that motion occurs only when the motive force is greater than the resistance offered, so that velocity is explained as proportionate to the ratio of force to resistance. Bradwardine reasoned that if we begin with a motion in which the force is greater than the resistance, and if we continually double the resistance while holding the force constant, at some point the resistance will be greater than the force. The problem lies in the axiom of velocity being proportionate to the ratio of force to resistance; as the velocity decreases in proportion to the increase of resistance, there will still be a velocity assignable at the point that resistance is greater than force. This would mean there would be a measurable, albeit tiny, velocity assignable to a stationary object. Better, Bradwardine argued, to recognize that velocities vary arithmetically, while the ratios of force to resistance vary geometrically. The immediate significance of this realization of the need for geometric ratios in measuring velocity was the need for a more advanced mathematics that had been applied in kinematics. It had been thought that calculations based on the direct proportionality of quantities would serve, but Bradwardine's discovery demanded a return to ancient mathematics, where he recognized the basis for logarithmic reasoning. It quickly became apparent that the use of Bradwardine's logarithmic function in expressing the quantity defined by the relation of two other quantities was of great value not only in kinematics, but in a wide range of questions regarding quantitative and qualitative change. The formal method of logarithms would not appear until John Napier's work in 1614 provided the mathematical foundation for their uniform and widespread application in calculation.

De Causa Dei

William Ockham had argued that statements of the form "X will occur at Time N" have a truth value contingent upon what will happen in the future, so knowing them must be a different sort of knowledge than knowing statements about the present or the past, for which the truth value is

already clear. Since this is a natural fact about such future contingent statements, God's knowledge, too, must be that "X will occur at Time N" is true contingent upon X's occurrence. The difference between our fallible and uncertain knowing and God's infallible and perfect knowledge is that, while for us knowing X or knowing not X involves reasoned recognition of the opposition of X and not X, and the steps involved in resolving which of the two opposites are the case, for God, knowing X or knowing not X entails no reasoned recognition of the opposition, and no reasoned resolution of whether X or not X is the case. Ockham's resolution of the puzzle was not necessarily a departure from earlier thinkers like Grosseteste or Peter Lombard, but his nuanced treatment of the relation of God's eternal knowledge and the contingency of created action suggested that we might be able to earn salvation on our own merit, without grace. In short, it was possible to interpret Ockham's approach as countenancing elements of Pelagianism. Bradwardine began to address the problem in the 1320s, in his *Sentence* commentary, and in *De futuris contingentibus*. Bradwardine's interest in the subject developed, and after he had become a member of Bury's circle, he compiled *De causa Dei*, a polemic refutation of "the Pelagians." This massive work is not constructed along a recognizably scholastic model, but appears instead to be a *Summa* encompassing all that Bradwardine understood to be involved in explaining grace, merit, human salvation, and God's knowing and willing. Each topic Bradwardine addresses finds its way back to God's unmediated causal influence over creation. At the heart of Bradwardine's theology is the fundamental truth that nothing occurs that is not willed by God. On the face of it, this seems so deterministic as to be fatalist. If all that happens is in accord with God's will, then the revealed certainty that some will be damned and others saved amounts to double predestination. Bradwardine's position was not so extreme. Even if God is coagent in every created action, including the evil that men do, He is neither responsible for evil nor is His foreknowledge the cause of man's damnation.

Bradwardine's position that God is co-agent in all human actions rules out Pelagianism, but it

also demands an account of how we, not God, are responsible for evil. This is particularly a problem if (a) God necessarily knows all that will occur in creation; (b) necessarily, all that God knows will occur, will occur; and (c) God's will and knowing are identical, then if God knows that a thing will occur, God necessarily wills that it occur. Bradwardine felt that *necessitas consequentis*, or absolute necessity, is commensurate with God's foreknowledge without leading to a fatalistic determinism. Talk of God knowing a thing before it happens, or of a thing being necessary because God knows it ahead of time, is confused. God is eternal, and eternity is not a mode in which "before" or "ahead of time" applies. Hence, if God eternally wills that man act freely in time, the freedom of human action is not limited by the necessity of the divine willing. Bradwardine balances God's eternal foreknowledge and human freedom by distinguishing between kinds of antecedent necessity. Bradwardine argues that some antecedent necessity is wholly absolute, but some is relative. Relative antecedent necessity can describe the secondary cause of an event, or it can describe the first cause. Peter may be free to choose to sin through an antecedent necessity relative by virtue of his being a member of the human species (a secondary cause of Peter's existence), or by virtue of God's willing (the primary cause of all created act). Peter's choice may be partially determined by being a member of the human species, but his biological form does not compel his choice. God's will is compulsory by virtue of its being the sufficient cause of every effect in creation, including human willing. Bradwardine believes he has preserved God's eternal foreknowledge by making relative antecedent necessity commensurate with *necessitas consequentis*. The statement "If God knows that man would sin, then man's sinning is necessary" is true, but escapes fatalism by decreeing that man's sinning is free by virtue of God's willing it to be so.

Relating the two sets of Bradwardine's bodies of work has been a matter of disagreement. Until recently, the theologically oriented analysis of *De causa Dei* has been understood to be a significant departure from Bradwardine's earlier work catalyzed by personal epiphany, an approach that allows

the reader the freedom to disregard the treatises on mathematics and kinematics. Dolnikowski has argued that at least one commonality, namely time, unites the two bodies of work. By understanding the medium of time as the focus of his study of velocity and the mathematics by which we measure movement through it, and applying it to the relation of extratemporal divine understanding of events occurring within it, she argues, we are much better able to understand the continuity of Bradwardine's philosophical theology.

Thomas Ebendorfer of Hasselbach

Ioana Curut

THESIS-Project, IRHT-Paris, Center for Ancient and Medieval Philosophy, Babeş-Bolyai University, Cluj-Napoca, Romania

Abstract

Thomas Ebendorfer of Hasselbach (August 10, 1388 – January 12, 1464) was a secular theologian, diplomat, chronicler, preacher, professor, and rector of the University of Vienna. He was an extremely prolific writer and his works include: historical writings, biblical and

philosophical commentaries, theological writings, sermons, speeches, letters, and other diplomatic documents. His commentary on the *Sentences*, his major work of philosophy which remains largely unpublished, follows the path initiated at the end of the fourteenth century by Nicholas of Dinkelsbühl, in the effort of accommodating Parisian theology and philosophy to the Viennese intellectual milieu. However, Ebendorfer's thought departs from the previous "Vienna Group Commentary" in significant ways.

Life

Thomas Ebendorfer was born in 1388, in the small village of Haselbach (Hallepach or Heiselbah) in Lower Austria. Ebendorfer had an eventful life and, as a member of the secular clergy, he was involved in various types of activities. A reconstruction of Ebendorfer's educational background is facilitated by the information provided by the registers of the Viennese University (for the Faculty of Arts, see AFA 1968, and for the Faculty of Theology, see ATF 1978). In 1406/1407, he began his studies at the Faculty of Arts within the Viennese University and incepted as Master of Arts in 1412. Soon he started studying theology at the same University and completed his bachelor lectures as biblical *cursor* during the biennium 1416–1418. He continued as *sententiarius* in 1420–1421. He responded, among others, under Peter Reicher of Pirchenwart in or after 1426, as a prerequisite for the licensing and inception in theology (see Courtenay 2011, p. 393). He was licensed in Theology not long after January 1428 and incepted in the same year. Ebendorfer had different administrative duties within the University: *librarius* in 1418, *thesaurarius* in 1419, *coadiutor* of the dean of the Faculty of Arts; he also served multiple times as a dean of the Faculty of Arts (1419, 1422) and of the Faculty of Theology (more than ten times, starting with 1428); more importantly, he was rector of the University of Vienna three times (1423, 1429, and 1445). In 1427, he became canon of St. Stephan from Vienna.

Throughout his life, Ebendorfer's concern for his country and for the University of Vienna seems to have been greater than that for the Church, which witnessed a major crisis at the time. Outside the University, he played an important role in supporting the interests and the welfare of the University. For instance, in 1451–1452, Ebendorfer made journeys to Naples and Rome, where he met Pope Nicholas V and obtained from him privileges for the University. He was involved in many diplomatic activities, especially in conciliar embassies serving under the Holy Roman Emperor Frederick III. When Ebendorfer was already one of the most respected professors of theology at Vienna, he was appointed head of a delegation sent by the University to participate at the Council of Basel (during 1432–1434). By that time, the University of Vienna had a strong conciliarist tradition, and its representatives to the Council of Constance (1414–1418), Nicholas of Dinkelsbühl and Peter Czech of Pulkau, had both been Ebendorfer's teachers.

In 1433, he was part of the delegation sent by the Council to Prague in order to negotiate with the Hussites, who sought to impose Utraquism, i. e., communion in both kinds to lay believers, but the negotiation attempts did not lead to any result. From 1440 to 1444, Ebendorfer participated at several imperial diets and spoke on behalf of Frederick III at Frankfurt, Nuremberg, and Basel. In 1441, he went to Mainz as spokesman of the emperor's envoys, where he proposed the formation of a new council for resolving the church conflict. The plan was accepted by Charles VII of France but rejected by the pope Eugenius IV and the German princes. Around the same time Ebendorfer quit his diplomatic position, he started composing historiographical works, at Frederick's orders (see below).

Ebendorfer personally knew Cusanus, who was also present at the Council of Basel, and he also probably studied Cusa's *De concordantia catholica*, a treatise in which the author stressed the importance of councils in acquiring reform and harmony between church and empire. But unlike Cusanus, who later changed his position and became a supporter of the papacy, Ebendorfer never renounced his endorsement for the council

authority. Even after 1442, when the University started to dissociate from the conciliarist movement, Ebendorfer remained a defender of the idea of conciliarism. His consistent support in this area, among other circumstances, eventually led to a separation between him and Frederick III, who began distrusting his former political adviser and ultimately sided with Eugenius IV.

Ebendorfer had also been a parish priest of Perchtoldsdorf (see the detailed contributions in Seidl 1988) and of Falkenstein, near Vienna. His many sermons deriving from his local preaching were well known and assured him a reputation in southern Germany (on his sermons, see below). He spent the last years of his life in Vienna, where he died on January 12, 1464, in the same year as Nicholas of Cusa and Pope Pius II.

Works and Thought

Ebendorfer's large corpus of writings, numbering hundreds of texts, is overwhelming and still awaits a full evaluation. His works pertain to various genres: historical writings, biblical and philosophical commentaries, theological writings, sermons, speeches, letters, and other diplomatic documents. Several of Ebendorfer's Latin sermons were printed in Strasbourg in 1478 (see also Walsh 2000) and were partially translated into vernacular (see Kämmerer 2005).

Much of Ebendorfer's prolific historical writings have been edited within the series of *Monumenta Germaniae Historica: Diarium sive Tractatus cum Boemis*, dating from 1433 to 1436, which is a window into the negotiations between the councilors and the Hussites; *Chronica regum Romanorum*, which is an imperial history from the period of the Assyrian empire to the time of Frederick III; *Chronica Austriae*, which is a detailed history of Austria from its fabulous origins until 1463, and an important source for the Hussite revolution, in particular; *Tractatus de schismatibus*, where the author, according to Zimmerman, puts forward a profoundly religious conception of history, deploring the dark consequences of the schism; *Chronica pontificum Romanorum*, a papal history; *Catalogus*

praesulum Laureacensium et Pataviensium, a catalogue of the bishops of Lorch-Passau; *Historia Jerusalemiana* (or *De duobus passagiis christianorum principum*), written during 1453–1456, which is a history of the first and third crusade, based in part on the chronicle of Robert of Rheims.

Ebendorfer's philosophical and theological works still await critical editions and study in order to assess the importance and influence he had in Vienna, especially as a professor of theology. His commentary on Peter Lombard's *Sentences* has come down to us in several autograph manuscripts but remains largely unpublished. Among other unedited works, Ebendorfer also composed an commentary on Aristotle's *Ethics* I–V, dating from 1423, and a multivolume commentary on Isaiah, which he began in 1428. His importance as *magister* can be grasped through the words that belong to a later handwriting on one of the many manuscripts which have been donated by Ebendorfer himself: “egregius ac venerabilis vir et dominus olim magister Thomas de Haselpach, artium et theologiae professor eximius.” (ms. Wien, ÖNB 4369, fol. i) Ebendorfer's private library is a large collection of manuscripts, ranging from biblical texts to commentaries of major theologians of the thirteenth century (Bonaventure, Thomas Aquinas, Duns Scotus, Henry of Ghent, Peter of Tarentaise, William of Moerbeke). For a general list of both his works, and those pertaining to his private collection, see Lhotsky (1957, pp. 59–112).

Commentary on the *Sentences*

By studying Ebendorfer's all four *principia*, Courtenay has indicated that Ebendorfer lectured on the *Sentences* in an unusual order: Book II, III, IV, and I (see Courtenay 2015, p. 286). His commentary on Book II is found in the manuscript of the Österreichische Nationalbibliothek 4393 (ff. 9v–44r), and it is followed by a “Vienna Group Commentary” on the same Book (ff. 49r–252r), annotated by Ebendorfer (on the notion of the “Vienna Group Commentary,”

see Brînzei and Schabel 2015, pp. 198–218). Ebendorfer's own commentary, composed of thirteen short questions, seems to have been written to complement the other one (that he probably read as a *sententiarus*), since it is much shorter and it covers several distinctions which the latter lacks (such as distinctions 3–7, 9, 12–13, and others). The longest question from Ebendorfer's commentary on Book II is the one regarding the creation of the world and another philosophical question treats the issue of informed matter. He also discusses angelological themes, and even develops a question on Lucifer (18v–20r). Regarding Ebendorfer's commentary on Book III, manuscript ÖNB 4590 presents the same structure as the aforementioned one, and is indicative of the same practice, while most of his questions, out of a total of six (ff. 8v–22v), address issues of Christology. In manuscript ÖNB 4369, Ebendorfer characterizes his commentary as a *supplementum* (203r–223v) to the subsequent lecture on Book IV which he annotates in the margin (224r–405v). His *supplementum* to Book IV consists of seven questions on various sub-topics, starting with a question dealing with the problem of the communion under both kinds (*sub utraque specie*), which was a pressing issue of his time (see above).

Ebendorfer read Book I in the first half of 1421. Brînzei and Schabel have pointed out that Ebendorfer's commentary on the first book, dated to 1427, is to be found in the Viennese autograph manuscript ÖNB 4387 (see Brînzei and Schabel 2015). The two researchers have shown that the commentary on Book I found in ÖNB 4369 is merely Ebendorfer's personal and annotated copy of another *Sentences* commentary, attributed to George Wetzels of Horaw, who lectured during 1412–1414 (see Brînzei and Schabel 2015, p. 211, and see also Schabel's edition of the second article of distinctions 40–41, dealing with the topic of predestination, in Brînzei and Schabel 2019). The same relationship between the two texts is also confirmed by our edition of the second question of the Prologue, dealing with the question whether theology is practical or speculative, as found in commentaries on the *Sentences* pertaining to various Viennese

University theologians (see the diplomatic edition in Curuț 2017).

Concerning Ebendorfer's doctrinal inclusion in the so-called Viennese Group Commentary, much work needs to be done in order to fully evaluate the originality of his thought, but recent investigations suggest a positive answer. Regarding the main question of the nature of theology, Ebendorfer is indeed visibly indebted to the Viennese traditional manner of conceiving theology as a practical science, which started with Nicholas of Dinkelsbühl, who followed the path of Gregory of Rimini. Between the two major alternative models for theology, speculative and practical, dating back to Thomas Aquinas and Bonaventure, respectively, the latter model has proven itself to be more influential, given not only its adaptation by many Viennese theologians, but also given Luther's later rejection of speculative theology, for whom true theology was practical.

However, regarding the topic of the subject of theology, Ebendorfer shows a significant departure from the previous Viennese positions which argued, again in the wake of Rimini, that the subject of theology is God under a limited aspect, namely as glorifier (*glorificator*), an opinion which can be traced back to Giles of Rome. In one of his marginal annotations to the second question of his copy of Horaw's Prologue (ÖNB 4369, 12r–21r), Ebendorfer defended the view according to which God is the subject of theology not in a strict sense but as considered absolutely (see Curuț 2017). We find Ebendorfer's same idea further developed in his later and more detailed treatment from his Prologue in manuscript ÖNB 4387 (fols. 3v–23r). Here, we see that his discussion of the subject of theology is heavily based on James of Eltville, a famous Cistercian of the fourteenth century, who borrowed in turn from James of Metz a threefold distinction between the ways in which God can be the subject of theology considered *absolute*. But while Eltville and Metz both agreed on understanding God as the absolute subject in a third way (i.e., as a substance lacking in accidents), Ebendorfer disagrees with their solution, arguing instead for understanding God as an absolute subject in the second way, namely

as a formal subject according to what is common to all of his attributes, just as the universal whole is common to all of his subjective parts. Thus, Ebendorfer's approach is particularly interesting, suggesting that his method of implicitly copying another text does not necessarily imply sharing the same doctrinal view and that his use of Eltville's text is also sometimes a formal one (on Eltville's influence on Ebendorfer, see Brînzei and Curuț 2018).

Ebendorfer's approach from his *Sentences* commentary is eclectic, hence the difficulty of ascribing it to a particular school of thought. For instance, in his prologue from ÖNB 4387, after putting forth a *conclusio responsalis*, stating that theology as a whole (*totalis theologia*) is a practical science, Ebendorfer ascribes this position to Scotus, Auriol, and Rimini. In another place from his prologue, he adds to one of his conclusions concerning the subject of theology (borrowed from Eltville's text) that it also expresses the intention of Thomas Aquinas, Peter of Tarentaise, and Duns Scotus. In the effort of detaching himself from the Viennese practice of composing a Group commentary, Ebendorfer not only argues for different doctrinal conclusions but also seems to aim at harmonizing different authorities. Although his commentary is to some degree influenced by Gregory of Rimini, often due to the influence of the texts pertaining to previous Viennese *sententiarii*, Ebendorfer also draws upon Thomas Aquinas, William Ockham, Duns Scotus, Peter Auriol, Landulph Caracciolo, Durand of St. Pourçain, Richard of Middleton, among other lesser known sources.

Despite having strong theological overtones, his commentary is still of philosophical interest. For example, in discussing distinction 35 of Book I, concerned with divine knowledge, Ebendorfer espoused a position according to which it can be successfully concluded by natural reason that God knows himself and everything else, both good and evil, and that God knows the creatures *in particulari et distincte* (ÖNB 4387, f. 243v). By adopting what is in fact Aquinas' stance on the matter, which Ebendorfer copies verbatim, he even reports Maimonides' opinion, namely that the

natural order of things reveal that they are purposely directed to an end, but in order for that end to direct all things to itself, it must know them in particular; thus God, who created every creature, knows every creature distinctly. A survey of this question reveals that, apart from Aquinas, Ebendorfer also had on his table the works of Giles of Rome, Durandus, Peter Auriol, Thomas Bradwardine, Gregory of Rimini, Alphonsus Toletanus, and others. Both of Ebendorfer's prologues to his *Sentences* commentary (from ÖNB 4369 and 4387) are currently being edited.

Thomas of Sutton

Gyula Klima

Department of Philosophy, Fordham University,
New York, NY, USA

Abstract

Thomas of Sutton (Thomas Anglicus) O.P. (c. 1250–1315) was an early defender of Aquinas' doctrine at Oxford, where he spent most of his career engaged in debates with the greatest opponents of Aquinas' tenets, such as Duns Scotus and Henry of Ghent.

Thomas of Sutton, an Oxford Dominican around the turn of the thirteenth and fourteenth centuries, was one of the earliest defenders of Aquinas' doctrine, when it was still regarded as innovative and highly controversial.

The earliest definite information we have about his life is that he was ordained deacon at Blythe (York) in 1274, from which we may guess that he was born around 1250. He became a friar at the Oxford convent by 1282, before which he had probably been a fellow of Merton College. It was also before entering the order that he wrote two short treatises defending the Thomistic position of the unity of substantial forms: *Contra pluralitatem formarum* and *De productione formae substantialis*. At Oxford, he was in close contact with two fellow Dominicans, Richard Knapwell and William Hothum, who were also busy defending Thomistic positions. Sutton incepted as master sometime between 1291 and 1300, and lectured at Oxford till his death after 1315.

Sutton's most significant works are his *Quaestiones ordinariae* and four sets of *Quodlibeta*, both existing in modern critical editions. But his smaller works were also influential and presented such authentic defenses of Aquinas' positions that some of them were attributed to Aquinas himself. However, all this is not to say that Sutton's work lacks originality. But his originality does not lie in proposing new, innovative positions. Rather, the most valuable aspect of his contribution is his ability to reduce disagreements over conclusions to subtle differences of interpretation of an apparently shared, common stock of principles, yielding a more profound understanding of these principles, as well as of the Thomistic positions themselves. Perhaps, this is the most transparent in Sutton's ability to reduce the differences over the issue of the plurality of substantial forms to different interpretations of metaphysical principles he shares with his opponent, Henry of Ghent, concerning the relationships between essence and existence in creatures, and the idea of creaturely participation in divine being. But similar observations would apply to Sutton's rejection of both Henry's and Scotus' conception of individuation, in favor of a Thomistic position, identifying the principle of individuation with designated matter, or to his subtle arguments concerning the central Thomistic thesis of the real distinction between the essence and existence of creatures, and the identity thereof in God.

Thomas of Vio (Cajetan)

Benjamin Hill

Department of Philosophy, The University of Western Ontario, London, ON, Canada

Abstract

Thomas de Vio, also known as Thomas Cajetan, was one of the most important figures in the Thomist revival of the sixteenth century and in the development of Neo-Thomism in the late nineteenth and early twentieth Centuries. His lasting contributions were as a commentator on Thomas Aquinas's thought. He wrote an important commentary on Thomas's *On Being and Essence*, as well as the first commentary on the *Summa theologiae*. His commentaries have often been printed in editions of Thomas's works, including the influential Leonine edition, and many read and understand Thomas's writings through Cajetan's lens. Cajetan's systematization of Thomas's conception of analogical terms (*The Analogy of Names*) has also proved influential, even though many scholars consider it not actually reflective of Thomas's views and even as confused. Although Cajetan considered himself a Thomist and his philosophical reflections largely took the form of commentaries on Thomas Aquinas and Aristotle, he offered a number of novel, even anti-Thomist, positions. Included among these are his acceptance of a mitigated Averroism regarding our knowledge of the immortality of our personal souls, his analysis of analogical terms, and his conception of being (*esse*).

Thomas de Vio was born as Jacopo Vio in Gaeta in February 1468. He entered the Dominican

order in 1484 and adopted the name Tommaso out of respect for St. Thomas Aquinas, with whom he believed he had a special affinity because he was born only 40 km from Thomas's birthplace. He began his university studies in 1488, first at Naples and then at Bologna. In 1491 he moved to Padua where he was awarded a Master's in Theology in 1494. In 1493, he had begun lecturing on Peter Lombard's *Sentences*, and soon he was appointed to the chair of Thomist metaphysics in Padua, replacing Valentino da Camerino, who had recently resigned. At the time, Padua was a hotbed of an Averroist and naturalistic brand of Aristotelianism, which was to leave a discernable mark on Cajetan's thinking, as will be seen below.

It was during his year as professor of Thomist metaphysics in Padua that Cajetan lectured on Thomas Aquinas's *On Being and Essence*, which formed the basis for his commentary on it (1496). After this, Cajetan taught at various places across northern Italy, most notably Pavia and Milan. During this period of teaching, he composed several commentaries on Aristotle and Porphyry, as well as the anti-Averroist work *On the Infinity of the First Mover* (published in his *Opuscula omnia* in 1506). His famous treatise, *The Analogy of Names* (1498), also dates from this period, and it was around this time that he began working on his commentary Thomas Aquinas's *Summa theologiae* (published 1508–1523), the first ever complete commentary on the *Summa*.

In 1501, Cajetan was transferred to Rome to begin his long and distinguished career as a Dominican administrator and Church official. He was, by all accounts, an effective administrator. He was elevated to Master General of the Dominican order in 1508 and held that post for 10 years. During this period of his life, his intellectual activities turned toward ethical and ecclesiastical questions. A staunch advocate of papal authority, he is believed by many to have been largely responsible for the final breakup of the conciliar movement and the reassertion of the primacy of papal power. Those interested in political and moral philosophy will find his works from this period, when he was acting as a Church administrator, most interesting. Cajetan also played a significant role in organizing and orchestrating the Fifth Lateran Council

(1512–1517); the decree *Apostolici regiminis*, issued in the eighth session, is famous among philosophers for causing Pietro Pomponazzi much trouble and for being cited by Descartes in his dedicatory letter to the Sorbonne, which was included in the first edition of his *Meditations*. Interestingly, Cajetan did not agree with the decree's injunction that all Christian philosophers should teach that the soul is naturally immortal and refute arguments that it is not. He cast one of the two votes (out of 130) against this clause, which was indicative of the doubts he harbored that the soul's immortality was demonstrable by natural reason. During this period, he also continued working on his commentary on the *Summa*.

Cajetan was made a cardinal in 1517 and in 1518 was dispatched to Germany as the papal legate. He became embroiled in Pope Leo X's fight against Charles V's election as Holy Roman Emperor; but he was also charged with examining Luther and determining whether heresy proceedings against him ought to continue. Cajetan carefully studied Luther's writings before they met in Augsburg on October 12–14, 1518. He identified two errors in Luther and urged him to recant. The first concerned the sufficiency of faith for absolution and the second the basis for the Church's granting of indulgences. Luther, however, would not budge, and Cajetan had little choice but to recommend that the heresy proceeding against him should continue. When Cajetan returned to Rome in 1520, he helped to draw up the Church's official condemnations against Luther.

The remainder of Cajetan's life was dominated by battles against the Reformers and biblical exegesis. Between 1525 and his death in 1534 in Rome, he wrote against Zwingli, Luther, Melancthon, and Henry the VIII's attempts to have his marriage annulled. But most his intellectual efforts were funneled into biblical exposition. Although his exegesis was largely traditional in tone and content, he was concerned to avail himself of the latest fruits of the humanists' new philological and translational labors.

The philosophical impact of Cajetan's work was significant. It dominated Dominican, and to a large extent Catholic, thinking throughout the sixteenth

and seventeenth centuries. It was quite common for his commentary to be printed and bound with editions of Thomas Aquinas's *Summa* (and the same goes for other works by Thomas). Therefore, many people reading and studying Thomas's writings in Italy and Northern Europe during this period saw him through the lens of Cajetan. Indeed, it is said that during the Council of Trent, which established the Catholic Counter-Reformation, a copy of Thomas's works always sat on the table, and it is likely that this copy also contained Cajetan's commentary. Another indication of Cajetan's prominence lay in the hostility that non-Dominicans, like the Spanish Jesuit Francisco Suárez, showed for his work. Cajetan ranks along Durandus as the philosopher Suárez most frequently and most pointedly targeted in his *Metaphysical Disputations*. Finally, Cajetan's thought also exerted a significant influence on the Neo-Thomist movement of the late nineteenth and early twentieth centuries. The Leonine edition of Thomas Aquinas included Cajetan's commentaries, for instance. And for many of the Neo-Thomists, Cajetan was not only a reliable commentator on Thomas but also the first and foremost among them.

As a thinker, Cajetan was neither a dogmatist nor a reactionary. He tended to be conventional, if not somewhat conservative, but was largely a sympathetic and thoughtful intellectual who was not afraid to engage with and even adopt new ideas when the arguments required them. As a result, he is rightly considered a Thomist, even though there are several notable points on which his thoughts differ considerably from those of Thomas Aquinas. Sometimes these differences are due to expansions or developments of Thomas's ideas; other times, they are due to rejections and alterations of his ideas. Three differences are discussed below.

Like Thomas Aquinas, Cajetan was not an Averroist and wrote extensively against Averroism. Even so, several Averroist ideas worked their way into his thinking, especially regarding the difficult doctrine of the immortality of the individual soul. The position of Renaissance Averroism regarding the soul involved a nexus of issues. But at its core lay the denial of the personal immortality of the soul.

This denial, however, could be construed in several senses: ontological, epistemological, and interpretative ones. More extreme Averroists defended the thesis in an ontological sense. But even this could manifest itself in a variety of ways.

- That there exists only one intellect.
- That the one intellect is impersonal and immortal.
- That the intellect is not a substantial form.
- That the human intellect is only a bodily power.
- That the human intellect is naturally mortal.
- That the human intellect is naturally mortal but supernaturally immortal.
- That the human intellect is in some (proper) sense naturally mortal and in some (improper) sense naturally immortal.
- And so on.

Given such a variety of characterizations of the ontological sense of Averroism, anti-Averroists needed to address a wide variety of topics. First, they needed to defend the plurality of intellective souls. Second, they needed to defend the immortality of the many intellective souls. It was not necessary to establish that the intellective soul was immaterial in order to defend its immortality, although that was one way to do it. It was considered sufficient to defend Aristotle's thesis that the intellect had at least one power that did not require a corporeal organ. Finally, anti-Averroists needed to defend the claim that the immortality of the many intellective souls was natural to the soul.

Less extreme Averroists might contend that the thesis should be understood only in an epistemological sense. Thus, rather than asserting that the personal soul is not immortal, they would maintain that somethings about soul can be naturally demonstrated, but not its immortality. Thus, these more moderate Averroists might hold merely:

- That natural reason demonstrates that there exists only one intellect.
- That natural reason demonstrates that the one intellect is impersonal and immortal.
- That natural reason demonstrates that the intellect is not a substantial form.

- That natural reason demonstrates that the human intellect is only a bodily power.
- That natural reason demonstrates that the human intellect is naturally mortal.
- That natural reason demonstrates that the intellect is naturally mortal but only supernaturally immortal.
- That natural reason demonstrates that the human intellect is in some (proper) sense naturally mortal and in some (improper) sense naturally immortal.
- That it is not demonstrable that there is not only one intellect.
- That it is not demonstrable that there is not a single, impersonal and immortal intellect.
- That it is not demonstrable that the intellect is a substantial form.
- That it is not demonstrable that the human intellect is not merely a bodily power.
- That it is not demonstrable that the human intellect is not naturally mortal.
- That it is not demonstrable that the human intellect is not naturally mortal and only supernaturally immortal.
- That it is not demonstrable that the human intellect is in some (proper) sense naturally mortal and in some (improper) sense naturally immortal.
- And so on.

The reasons for resisting the assertion of any of the ontological senses of the Averroist thesis, even though natural reason demonstrates them, would have been largely theological: reason teaches *p* but faith (or the Church) teaches *not-p*, and assent ought to be regulated by faith or the Church whenever reason and faith conflict. To counter this more moderate epistemological version of Averroism, anti-Averroists needed to show that natural reason does not demonstrate any of the ontological senses of the Averroist thesis and, moreover, that their opposites are, in fact, demonstrable. This concern can be seen in the Fifth Lateran's Council's *Apostolici regiminis* decree that all Christian philosophers (and not only theologians) must prove the demonstrableness of the Church's teaching regarding the natural immortality of the personal soul.

Finally, an even more moderate Averroism entailed maintaining merely that Aristotle taught the Averroist thesis in any of the above ontological or epistemological senses. This was a time when the authority of Aristotle was still quite significant, and to claim that “Aristotle hath said it” was tantamount to claiming that natural reason unaided by revelation established it. Thus, Averroism in this weakest of senses was often seen as compatible with Averroism in the epistemological sense, if not equivalent, in the end, to Averroism in the epistemological sense.

The central claim in this debate over Averroism concerned the relationship between abstract thought and phantasms. If phantasms were necessary for abstract thought, as Aristotle suggested (Aristotle 1984), then it is impossible to conceive of an intellective power that does not make use of a corporeal organ. This follows because phantasms were widely acknowledged to be corporeal, or at least corporeally based, images and the best – indeed the only – candidate for a cognitive power that does not obviously involve a corporeal organ was abstract thought. This was the point around which Pomponazzi’s infamous defense of Averroism revolved.

During the controversy generated by Pomponazzi, some Dominicans (e.g., Francesco Silverstri, Bartolomeo Spina, and Crisotomo Javelli) blamed Cajetan for enabling Pomponazzi’s arguments. Cajetan did indeed adopt positions that were very similar to Pomponazzi’s. He accepted the claim that if cognition were not possible without phantasms, immortality would be impossible. He maintained, furthermore, that the intellect was in some sense naturally mortal and in some sense naturally immortal. He maintained that it was naturally mortal because it was a material form, which is in the body as a subject and consequently has its being bound up with the body’s; but he maintained that it was also naturally immortal because it was not a form educed from matter and consequently was able to operate independently of the body. This might seem like a small move, but because it was a move in a Platonic direction that give the human soul an angelic-like existence, it is an interesting precursor to the late sixteenth-century Jesuit teachings on the human

soul as separable substances and to the Cartesian doctrine of real distinctness. It should be noted that this position does not itself constitute a form of epistemological Averroism, even though it sounds a good deal like it, because it does not state that the soul is immortal only in some improper sense or that it is mortal properly speaking.

Cajetan’s slide toward a weak, epistemological form of Averroism revolves around the strand of mysticism that pervades his thinking about soul’s immortality. As early as his *Commentary on Aristotle’s De anima* (1509), he accepted the Averroist interpretation of Aristotle because of *De anima* III.7, which, as explained above, was a form of interpretative Averroism that easily slid into epistemological Averroism. Doubts about the proofs of the soul’s natural immortality based on its immateriality seemed to nag Cajetan. Mention has already been made of his opposition to the teaching prescription in the Fifth Lateran Council’s *Apostolici regiminis*, which cannot be ascribed to anything other than such nagging doubts. These nagging doubts seemed to culminate late in his life when he declared the soul’s immortality to be a mystery and an article of faith analogous to the Trinity and the Incarnation, which clearly placed him among those who believe that the soul’s natural immortality is not rationally demonstrable.

Cajetan’s second point of divergence from the teachings of Thomas Aquinas concerned his understanding of being (*esse*). Cajetan argued that the being of essence (*esse essentiae* or *esse quidditativum*) was really distinct from the being of actual existence (*esse existentiae actualis* or just *esse existentiae*) rather than merely conceptually distinct. Both were necessary but independent components of creatures, angelic and mundane alike. Cajetan’s understanding of John Capreolus’s double meaning of *esse* appears to have deeply influenced Cajetan’s development of this distinction. His motivation for defending the reality of the distinction between the being of essence and the being of existence seems to have been Thomas Aquinas’s paradox about the duality of being: being appears to have both an essential and an accidental character. *Ens*, according to Thomas, is

not included in the genus of substance and all things, except God, are beings by virtue of having *ens* added to their natures – being thus seems to be accidental. Yet in adding *ens* to a nature, no new or additional nature is added to the nature – *ens* is, properly speaking, constituted by nothing other than the essence to which it is added. Furthermore, God himself is his own existence (*ipsum esse subsistens*), in Thomas's view; his essence is his existence. So, existence appears to have the character of an essence, too. The tension lies in the character of a created essence – potentiality to exist is the difference between a created essence and the divine essence (which exists of necessity), yet a potentiality is itself something with a level or degree of being, which suggests that, like God, created essences necessarily have being of itself.

By developing his distinction between *esse essentiae* and *esse existentiae actualis*, Cajetan was able to walk a middle path to resolve this tension. In the ordinary case of material creatures, matter and form combine to produce the nature that has *esse essentiae*; in the case of angels and intellectual souls, God's creation of the simple nature endows it with *esse essentiae*. This nature is a complete entity capable of receiving another type of being, *esse existentiae actualis*, which is the actualization of the potentiality created with the creaturely form. The key, however, is that no new thing is produced when a nature is given *esse existentiae actualis*. The entity that is the nature and that possesses *esse essentiae* has being already, but when it receives existence, it becomes a creature existing in the world of substance because it is given a new property. But in receiving existence, it was not receiving any new nature and was not being transformed in any way into a new kind of thing – it was simply receiving a new way of being and, as a result, it was being perfected in that its potentiality was being actualized. Thus, *esse existentiae actualis* is the being that properly speaking belongs to the category of substance; it is the being that marks things existing within creation. But *esse essentiae*, on the other hand, is the being that arises within each of the categories, the *id quod est* of a thing or entity, whether substantial or not. The upshot of Cajetan's view here is that essences have a kind of

metaphysical priority over existence in the realm of being, and that even though in actual existence a thing is metaphysically constituted only by its essence, its actual existence descends onto it through its efficient cause. In this way, Cajetan is able to make sense of how there is something essential and something accidental about the character of being. Cajetan's position on this very abstruse topic is subtle; nevertheless, it deserves to be taken seriously, not only as a way of resolving Thomas Aquinas's paradox but also as an answer in its own right regarding the real metaphysics of existence and being.

Cajetan's third and most significant, as well as influential, divergence from Thomas Aquinas concerns his analysis of analogical terms. A doctrine of analogy was the medieval means for addressing questions about polysemous words, that is, words which, despite having different meanings, are nonequivocal because those meanings are suitably related and share a common etymology. Cajetan's short work, *The Analogy of Names* (*De nominum analogia*), was quite influential both in the sixteenth century and during the Neo-Thomist revival of the late nineteenth and early twentieth centuries (unfortunately so, according to Cajetan's critics: compare McNerny 1992 and Ashworth 2008 with the glowing Forward and Introduction by Koren and Bushinski in Cajetan 1959). Regardless of how faithful it is to Thomas Aquinas's scattered comments about analogical terms, it is indisputable that *The Analogy of Names* was a milestone in the evolution of philosophical thought regarding analogy.

Cajetan structured his analysis around a three-fold division of analogical names. First, he presented the analogy of inequality. This occurs when there is a common word for the analogous things and that common word is supported by a common notion, but the two analogous things partake in the nature corresponding to that notion unequally. The example used was the word "body" applied to the corruptible, terrestrial bodies and to the incorruptible, heavenly bodies. Both types of objects are rightly called bodies because they exist in three-dimensional space, but they partake of this corporeality unequally, since terrestrial bodies are corruptible because their

corporeality is constituted by their materiality whereas heavenly bodies, because they are not composed of matter, do not have corruptible corporeal natures. This sort of polysemy, Cajetan believed, applied to all genus terms, not just “body.” But this sort of analogy he dismissed as unimportant and improper.

The second sort of analogical term was the analogy of attribution. This occurs when there is a common word and the common word is supported by a common notion, but the analogous things are differently related to the common notion. “Health” was the example offered here. When applied to a human, it is applied most properly because it denotes a perfection obtaining within the human (the proper state of humoral balance). But when applied to medicine or urine, it is applied analogically, because even though both implicated the same notion of health as in the proper case, they implicated it not by denoting the perfection of health within their subjects but because their subjects “cause” health (medicine) or “signify” health (urine). Only the attribution of health to the human involves an intrinsic denomination; the other two analogous cases are analogous precisely because they involve an extrinsic denomination, that is, they denominate health not per se but because of the interplay between them and other things beyond them.

The third sort of analogical term, according to Cajetan, was the analogy of proportionality. This he subdivided further into metaphoric and proper senses of proportionality. Strictly speaking, only the later subdivision involved analogical terms in any genuine or proper sense. In this case, the analogical word and the notion supporting it are the same, yet their differences are their proportionalities. Cajetan’s thinking here is rooted in the mathematical understanding of proportionality. While the precise nature of what he had in mind is subject to debate, it does seem to require at least that an actual similarity should obtain between analogous things. In other words, the things denominated by the analogical terms both have to contain formally the analogical property to some degree.

Current critics have not been kind to Cajetan’s analysis of analogy. It has been attacked as an

inauthentic interpretation of Thomas Aquinas’s thinking about analogy. It has also been attacked as a representative example of the medieval tradition of thinking about analogy; but it has been attacked more fervently as a flawed and confused account.

Thomas de Vio (Cajetan) was an influential commentator on Thomas Aquinas, Aristotle, and Porphyry, as well as a significant thinker and philosopher in his own right. Understanding his distinctive contributions to logic and metaphysics is crucial to understanding the so-called Second and Third Thomisms, that is, the Thomist revival of the sixteenth century and the Neo-Thomist movement of the late nineteenth and early twentieth centuries.

Thomas Wylton

Cecilia Trifogli

Philosophy Faculty, All Souls College, University of Oxford, Oxford, UK

Abstract

Thomas Wylton was an English philosopher and theologian who was first active as a Master of Arts at Oxford (c. 1288–1304) and then at the Faculty of Theology of Paris (c. 1304–1322). His major extant works are a commentary on Aristotle's *De anima*, a commentary on Aristotle's *Physics*, and a *Quodlibet*. Wylton is a major exponent of Latin Averroism. He defends Averroes view on the material intellect, arguing that Averroes does not posit the material intellect as a substance separate from man but as the substantial form of man. He also maintains that Averroes can account for the union between intellect and man better than the Catholics. Wylton's interpretation of Averroes had a strong influence on John of Jandun. Although a comprehensive picture of Wylton's philosophical and theological thought has not yet been drawn, it has clearly

emerged that Wylton's ontology is strongly realist and influenced in part by that of Scotus. For example, Wylton maintains not only that a relation is a thing distinct from the *relata* but also that the distinction between the two *relata* and their existence are not necessary for the reality of the relation between them. Furthermore, he holds that it is necessary to posit successive things (typically, motion and time) as distinct from permanent things. Like Scotus, he maintains that divine attributes are formally distinct.

Thomas Wylton was Fellow of Merton College from about 1288 until 1301 and Master of Arts at Oxford until 1304. He then went to Paris to study theology and became master there in 1312. He taught theology in Paris probably until 1322. He was appointed chancellor of St Paul's Cathedral in London in 1320, although it is likely that he took this position only in 1322. The position of Chancellor was vacated in 1327, so Wylton must have died by that date.

Three major works by Wylton are extant: a question-style commentary on *De anima*, a question-style commentary on the *Physics*, and a *Quodlibet*. The two Aristotelian commentaries were most probably written by Wylton as Master of Arts in Oxford. The *Quodlibet* was most probably disputed in Paris in Advent 1315. In addition to these, we have several questions by Wylton on a large variety of philosophical and theological topics. Wylton also wrote a commentary on the *Sentences*, which has not yet been identified.

Wylton was a prominent and influential figure as a Master of theology at Paris. He had disputes with the most important among his contemporaries over a variety of controversial issues. For example, he debated with Peter Auriol on the nature of relations, on the problem of the infinite power of God, and on the nature of theology and virtue; with William Alnwick on the issue of the eternity of the world; with Henry of Harclay on the infinite; with Guy Terrena on the nature of the beatific act and on the problem of final causality; with Durand of St. Pourçain on the nature of

intellection. Wylton's treatment of future contingents had a strong influence on John Baconthorpe.

Wylton first became known to historians of medieval philosophy especially for being a major exponent of Parisian Averroism. In his *Quaestio disputata de anima intellectiva*, Wylton discusses the following problem about the catholic opinion on the intellective soul: on the assumption that the intellective soul is subsisting, created but incorruptible, and numerically distinct in distinct men, as the Catholics posit, can one establish with natural necessary arguments that the intellective soul is the form of the human body? The Catholic opinion does posit that the intellective soul is the form of the human body. Wylton accepts that the Catholic opinion is true but he also declares that he accepts its truth only by faith without being able to provide natural necessary arguments in favor of it. The problem with the Catholic opinion is the traditional one of the unity of body and soul, namely, that the intellective soul does not seem to be so intrinsically linked to the human body as it would be required by its status of substantial form of that body. In discussing this problem, Wylton compares the Catholic conception of the intellective soul and Averroes' conception of the material intellect and maintains that Averroes can offer an account of the union between intellect and body more satisfactory than that of the Catholics. Wylton defends this bold claim by offering an interpretation of Averroes' view according to which the ontological status of the material intellect of Averroes is essentially the same as that of the intellective soul of the Catholics: also the material intellect, as the intellective soul, is the (substantial) subsisting form of the human body and thus an intrinsic formal component of man. With this interpretation, Wylton departs from the common opinion about Averroes' view that posits that for Averroes the material intellect is a substance separate from man, while the only intrinsic components of man are the body and the sensitive soul and that man thinks in virtue of the union of the material intellect with man, which takes place through the phantasms present in man. In Wylton's view, this common opinion must be rejected because it makes Averroes' view contradictory. Wylton's

interpretation, however, is apparently in contrast with the major thesis of Averroes about the intellect that there is only one material intellect for all men. Wylton's claim that the material intellect is the substantial form of man combined with the thesis of the unity of the intellect implies that all men share the same substantial form. But this is a conclusion that not everyone is ready to accept. For it seems to imply realism about universals: the existence of universal natures as common components to individuals of the same kind. Wylton, however, is a realist about universals and formulates a realist solution to the one-many problem that arises from the unity of the intellect and ascribes this solution to Averroes. For Wylton, in positing that there is only one material intellect for all men, Averroes also makes the realist assumption that there is only one human nature in all men. Since the material intellect primarily is a perfection of human nature and only derivatively of this or that individual man, the unity of the intellect is not incompatible with its status of substantial form of man. Wylton uses this interpretation to substantiate his claim that Averroes can defend the unity between intellect and body better than the Catholics. His main point is that the intellective soul of the Catholics is separable, while the material intellect of Averroes is inseparable. In the Catholic view, the intellective soul of Socrates is primarily a perfection of Socrates and despite that, it exists as separate from Socrates after Socrates' death. The material intellect of Averroes, however, is not primarily a perfection of Socrates but of human nature, and the material intellect is not separable from human nature: human nature, unlike Socrates, is eternal as the material intellect is. Wylton's defense of Averroes had a strong impact on John of Jandun, the most eminent exponent of Latin Averroism.

Recent studies have shed light on other aspects of Wylton's thought, above all his realist ontological orientation. Investigations into his physical theories have revealed his realist opposition to Averroes concerning the ontological status of motion and of time. Wylton argues that motion and time are two distinct successive things, not reducible to permanent things. In particular, motion is a thing inhering in the mobile substance

during its change and distinct from the mobile substance itself and the formal determinations acquired and lost by it during a change; time is a quantity inhering in motion and in no way dependent on the human soul. Some of Wylton's views in natural philosophy have remarkable similarities with those of Walter Burley, who names Wylton as his master. Wylton's strong realism also appears in his view about relations. He holds that a relation is a real thing distinct from the things related (*relata*), for example, the relation of similarity with respect to whiteness between two white things is a thing distinct from the two white things and their whitenesses. He even maintains that the extramental existence and the distinction of the *relata* are not necessary conditions for the extramental reality of a relation. For example, in his view, the relation of lordship is real, but the *relata* are one and the same, that is, a creature. Furthermore, matter has real relation to nonexistent forms. Similarly, the relation of final causality between a final cause and its effect is real despite the fact that the final cause does not exist when this relation holds. Some aspects of Scotus' ontology had an influence on Wylton. For example, following Scotus, Wylton maintains that divine attributes are formally distinct. Wylton appears to be an original and complex philosopher, although a comprehensive picture of Wylton's philosophical and theological thought has not yet been drawn.

Thomism

Isabel Iribarren

Department of Catholic Theology, Strasbourg University, Strasbourg, France

Abstract

In a broad sense, Thomism denotes a form of philosophical and theological thought which draws its main inspiration from the teaching of Thomas Aquinas. Despite differences in context and emphasis, all forms of Thomism purport to follow Aquinas's doctrine in its principles or main conclusions. In its original scholastic form, Thomism represented the magisterial solution determined by Aquinas, whose adherents were normally, but not always, members of the Dominican order. The development of Thomism from the end of the thirteenth to the end of the sixteenth century can be traced in four main stages: (1) a first stage, roughly from Aquinas's death in 1274 to the end of the thirteenth century, is marked by the *Correctoria* controversy, as Dominicans undertook the defense of Thomist teaching in face of external opposition arising from Church authorities and the Franciscan order. (2) On a second stage, from the beginning of the fourteenth century to Aquinas's canonization in 1323, Thomist teaching is declared the official doctrine of the Dominican order in an effort to dissipate internal opposition and reaffirm its doctrinal credibility after the 1277 condemnation. Although Thomism is still a matter of interpretation, it is during this period that it begins to be established as a distinct philosophy. (3) On a third stage, from Aquinas's full rehabilitation in 1325 to the end of the fourteenth century, Thomist doctrine gains in normative value. Although opposition still persists, it purports to act as a theological authority within the Church at large. (4) Finally, after a period of relative recession as a result of Dominican unpopularity during the Immaculate Conception controversy, the fifteenth century witnesses a gradual revival of Thomism

extending well into the sixteenth. Commentaries on the *Summa* proliferate; Thomism becomes increasingly systematized and divorced from the dialectical character it owed to its scholastic origins.

Corpus of the Article

In a broad sense, Thomism denotes a form of philosophical and theological thought which draws its main inspiration from the teaching of Thomas Aquinas. Despite differences in historical context and philosophical emphasis, all forms of Thomism purport to follow Aquinas's teaching in its principles, methodology, and conclusions in order to defend, develop, or comment on it. In its original form, Aquinas's teaching is embedded in a specific institutional milieu determined on the one hand by the University and on the other by the Dominican order. The schools modeled Thomism in a twofold way: through the reception of classical philosophy, especially Neoplatonism and Aristotle, and through their methodology, exemplified in the scholastic exercise of dialectical inquiry of authoritative sources toward the solution of doctrinal questions. In this context, Thomism represents the solution determined by Aquinas in opposition to other possible solutions advanced by other masters. Its adherents were normally, but not always, members of the Dominican order. Their institutional affiliation to Aquinas's doctrine did not exclude a selective use of Thomist sources, conflicting interpretations, or in some cases even the influence of rival forms of scholasticism, such as that represented by Duns Scotus.

The reception of Aquinas's teaching throughout the Middle Ages was thus subject to differences in emphasis and orientation which escape a systematic development. What follows is an attempt to trace the historical evolution of Aquinas's doctrine taking into account its multiple, and sometimes conflicting, expressions. The chief features of Thomist philosophy will be presented as they are brought to the foreground of the debate at each stage of its evolution.

The development of Thomism during the period running from the end of the thirteenth to the end of the sixteenth century can be traced in four main stages: (1) a first stage, roughly from Aquinas's death in 1274 to the end of the thirteenth century, is marked by the Dominican defense of Thomist teaching in face of external opposition arising from Church authorities and the Franciscan order; (2) on a second stage, from the beginning of the fourteenth century to Aquinas's canonization in 1323, Thomist teaching is increasingly institutionalized as it is declared the official doctrine of the Dominican order in an effort to dissipate internal opposition and reaffirm its doctrinal credibility after the 1277 condemnation; (3) on a third stage, from Aquinas's full rehabilitation in 1325 to the end of the fourteenth century, Thomist doctrine is promoted as a theological authority, despite the persistence of opposition in some quarters; (4) finally, after a period of relative recession as a result of Dominican unpopularity during the Immaculate Conception controversy, the fifteenth century witnesses a gradual revival of Thomism extending well into the sixteenth. Thomism becomes increasingly systematized and divorced from the dialectical character it owed to its scholastic origins.

1. A first manifestation of Thomism takes place toward the end of the 1270s and all throughout the 1280s, as a group of Oxford and Paris Dominicans rally in defense of the teachings of Thomas Aquinas. The ensuing controversy formed part of a wider conflict concerning the reception of Aristotle's natural philosophy, which had culminated in the 1277 condemnation issued by the bishop of Paris Stephen Tempier. Bishop Tempier and his commission of theologians were responding to a wave of "radical Aristotelianism" at the University of Paris, in which some philosophers (notably Siger of Brabant and Boethius of Dacia) were boasting an autonomous use of natural reason and propagating views not dissimilar to those of Averroes, Aristotle's Arabic commentator. Although not directly targeted, Aquinas's

teaching was indirectly compromised insofar as a number of the condemned errors bore manifest affinity with Thomist theses.

Soon after the condemnation, on 18 March 1277, Robert Kilwardby, archbishop of Canterbury and a Dominican, issued a prohibition at Oxford involving 30 suspect propositions in the domains of logic, grammar, and natural philosophy. The latter included the Thomist thesis of the unicity of the substantial form, only implicit in Tempier's condemnation. Against the established explanation of the gradual composition of the embryo, Aquinas's thesis advanced an interpretation of Aristotle's hylomorphic theory, whereby the generation of a substance takes place by the disappearance of a previous form and the succession of a radically new substantial form. In this view, it is not possible for a composite substance to coexist with other forms, on the principle that the *existence* of one composite is due to the presence of one *form*. Underlying this position is Aquinas's belief that in all corporeal beings, apart from composition of matter and form, there is composition of essence and existence (*esse*). *Esse* actualizes only one form, such that the composition of *esse* with several forms would necessarily entail several substantial forms and hence a plurality of actually existing beings. Consequently, in human beings, the vegetative and the sensitive souls must disappear at the arrival of the intellectual soul, divinely infused. Aquinas's ontology is thus incompatible with any model requiring the presence of previous forms within the composite. In this light, rather than an anti-Thomist bias, Kilwardby's intervention manifests the reaction of the scientific establishment, still attached to the old physics of the elements away from the new challenges of Aristotelian ontology.

Otherwise for the Franciscans, William of la Mare and John Pecham, for whom Aquinas's theory entailed serious theological dangers to, do notably with the numerical identity of Christ's body living and dead. Indeed, if the body is what it is wholly by virtue of the soul and matter has no disposition of its own, then, at the separation of body and soul, Christ's dead body would cease to

be identified with his living body. At the sight of such problems, William felt encouraged to issue a "corrective" of Aquinas's teaching. Composed toward 1278, the *Correctorium fratris Thomae* presents a list of 118 "erroneous and dangerous" propositions extracted from Aquinas's works. Among them, some 13 had already been condemned by Tempier in 1277 – a parallel which William hastens to point out in order to strengthen his case. William's *Correctorium* was endorsed by the 1282 Franciscan general chapter in Strasbourg, thus becoming the order's official view of Aquinas's doctrine. A further attack took place in 1286, launched by Kilwardby's successor to the archbishopric of Canterbury, the Franciscan John Pecham. An old adversary of Aquinas, Pecham ratified his predecessor's prohibition, this time *condemning* the 30 propositions that some Oxford masters, notably the young Dominican Richard Knapwell, had allegedly maintained in disobedience to Kilwardby's censure. This second assault, coming from the rival order and with all the ideological weight this involved, awakened a concerted movement within the Dominican order in defense of their most famous doctor.

The Dominican reaction manifested itself in two forms. On the one hand, in the legislation issued at subsequent general chapters, encouraging the support, defense, and promotion of Aquinas's doctrine (notably the capitular legislations of 1278, 1279, and 1286). Dominican defense was also expressed in literary form in a series of treatises devoted to the unicity of form theory and in the composition of polemical writings sarcastically entitled *Correctoria corruptorii*, in allusion to William's first attack. Young Dominicans, such as Thomas of Sutton, Richard Knapwell and Robert Orford at Oxford, and John of Paris and Giles of Lessines at Paris, devoted themselves to the defense of Aquinas's innovative theses, particularly the doctrine of the unicity of the substantial form, but also the related theses of the pure potentiality of matter, the spirituality of separate substances, the individuation by matter, and the real distinction between essence and existence. Non-Dominican masters were also involved in the controversy: the well-known

Augustinian theologian, Giles of Rome, suffered on his own count for having supported the Thomist theses, while the secular master Godfrey of Fontaines took his part in defending the credibility and intellectual competence of Aquinas.

For all its zeal, the allegiance to Aquinas's theses revealed by these early disputes does not seem to have gone beyond a literal affiliation to a particular way of "determining" a question which at best resulted in lucid clarifications of important theories. Moreover, not all Dominicans welcomed Aquinas's innovations (recall Kilwardby), and even if some of them had acted in the defensive, they seem to have been prompted mostly by *esprit de corps*. A case in point is William of Huthum, one of the earliest defenders of Aquinas and certainly the most prominent figure among them (he was provincial of the order in England in 1282 and again in 1290). Although William remained skeptical about the theological value of the unicity of form theory, presumably prompted by the need to safeguard his order's doctrinal reputation, he nevertheless pleaded a degree of intellectual freedom in matters which remained open to inquiry.

2. Fourteenth-century Thomism is characterized on the one hand by the increasing institutionalization of Aquinas's teaching within the Dominican order and on the other by the Dominican effort to reestablish its credibility after the 1277 condemnation. Aquinas's teaching became established as the order's official doctrinal line in 1309. Conformity with Thomist doctrine was reinforced in 1313 at the general chapter in Metz, promoting Thomism as the "common opinion," and again in 1316, encouraging tighter control of the content of lectures and writings issued within the order. These directives were in all likelihood issued in order to fight internal dissidence represented notably in the writings of James of Metz and Durand of St Pourçain. Heading the order's endeavor to enforce doctrinal uniformity in accordance to Aquinas's teaching were Hervaeus Natalis (d. 1323), master general of the order from 1318, and John of Naples, an active campaigner for Aquinas's canonization.

Apart from producing a defense of Aquinas's doctrine (*Defensio doctrinae fratris Thomae*, between 1307 and 1309), Hervaeus took personal care in correcting all forms of deviation (examples are his *Correctiones super dicta Durandi in Quol. Aven. I*, 1315 and *Responsio ad Jacobum Metensem*, 1310). With Hervaeus, John of Naples took a leading part in the commission examining Durand's work. A conscientious Thomist from his early years as master, John's efforts to reestablish Aquinas's doctrinal credibility are exemplified by a quodlibetal question concerning the canonical value of Tempier's 1277 condemnation (*Quodl. 6, 2: Utrum licite possit doceri Parisius doctrina fratris Thomae quoad omnes conclusiones ejus*). Other leading Dominicans who were active in the promotion of Aquinas's teaching at the time were Pierre de la Palud, John of Lausanne, and Gerard of Bologna.

Although their Thomism did not manifest itself in literal adherence to Aquinas's teaching, the concerted activity of Dominicans like Hervaeus and John of Naples was decisive for the development of Thomism into an established philosophy. The promotion of Thomism followed a twofold strategy: on the one hand, it attempted to assimilate Aquinas's doctrine to the "common opinion"; on the other, it sought to affiliate it to a classical philosophical tradition – mainly Neoplatonist and Aristotelian in origin – deemed integral to the good exercise of theology. On the first count, Franciscan intellectual achievements had much to contribute as Hervaeus ostensibly borrowed from Scotist insights (notably the notion of "formal distinction"). John, for his part, proposed enhanced interpretations of Aquinas's theses as he sought to chase away internal contradictions. By filing down ambiguities and incorporating alien insights, second-generation Thomists were endeavoring to invest Aquinas's teaching with the coherence and soundness that could merit the relative approval accorded to the common opinion. In this sense, it is no mean homage to the success of Thomism that Dante, writing his *Comedy* at around the same time, should have drawn

significant inspiration from Thomist teaching, to the point of attributing to Aquinas a privileged place in his Paradise.

On the second count, second-generation Thomists rallied themselves in the defense of those theses, of Neoplatonist and Aristotelian affinity, which seemed particularly exposed to the 1277 condemnation and its doctrinal priorities. The unifying strand in Tempier's otherwise unsystematic syllabus appeared to be the emphasis on God's absolute power, the notion of God as absolutely free and as infinitely superior to his creation. Yet, central Thomist tenets, notably the veto on multiplying angels within one and the same species on account of their immateriality, appeared to subordinate God's power to the natural laws of his creation. This impression was only reinforced by Aquinas's metaphysics of participation and the connected theory of the analogy of being, which purported to establish an essential continuity between the natural and the supernatural order. The Thomist understanding of universals and the resulting explanation of cognition as a process of abstraction appeared as yet another expression of a view which downplayed the plurality and contingency of creation in favor of its reduction to a set of rational principles. Moreover, Aquinas's conviction on the pertinence and salutary role of reason in the explanation of the natural order was easily affiliated, failing a more nuanced analysis, to the doctrine of the "double truth" and the radical separation of philosophy and theology. Finally, the Thomist emphasis on the intellect as controlling faculty over the will, an emphasis which informed Aquinas's explanation of moral action, contributed to the general impression of Thomist doctrine as running counter to the philosophical – mainly Franciscan – tendency imposing itself at the time which rather placed the accent on the will, on God's infinity, and on the contingency of creation. An illustrative example of the contrast between the Thomist outlook, much attached to Aristotelian philosophy, and the fourteenth-century emerging view is the much debated issue of sacramental causality. Governed by the Aristotelian thesis whereby the cause is efficacious by virtue of an infused quality inherent in it, Thomists maintained that the sacrament

produces its effect on account of a superadded virtue which is infused at the moment of the institution of the sacrament and which "disposes" the soul to receiving grace. In contrast to this view, Franciscan theologians and some non-Thomist Dominicans advanced a "contractual" explanation of causality whereby the efficacy of the sacrament rests on the "pact" *voluntarily* established between man and God at the institution of the sacrament. But Thomists' heavy reliance on Aristotle's view of causality and inherent value led them to dismiss contractual causality as tantamount to denying true causality to the sacraments and reduce them to nothing more than mere signs.

Still suffering the consequences of the 1277 condemnation, fourteenth-century Thomists would endeavor to disengage Aquinas's teaching from all kinds of philosophical necessitarianism while at the same time reassert the benefits of classical philosophy in the explanation of theological truths. Aquinas's later sobriquet of *Doctor angelicus* is highly illustrative of the kind of philosophical and theological tradition Thomists were keen to safeguard: with angels at its center as "mediating intelligences," the Thomist worldview would guarantee the essential continuity of the natural with the supernatural order and the intelligibility of God's plan.

Ecclesiastical intervention came in handy, as the doctrinal promotion of Thomism was crowned in 1323 with Aquinas's canonization by Pope John XXII. A first biography of Aquinas was written by William of Tocco for the occasion, while the pope commissioned the transcription of the *Summa* for the pontifical library. Aquinas's work was praised as a "miracle of doctrine," for the Dominican doctor had performed "as many miracles as he had written articles." Despite the repercussions of the 1277 condemnation, Aquinas's canonization revealed the papacy's strong reliance on the doctrinal uniformity of Thomism, deemed to bring stability at a time when the church was troubled by the quarrels over apostolic poverty with the Franciscans.

3. A direct consequence of Aquinas's canonization was his full rehabilitation in 1325, as the concerted action of the University of Paris and

Bishop Stephen Bourret brought about the official revocation of the 1277 condemnation “insofar as it touched on Aquinas’s doctrines.” That the condemnation was not revoked as a whole was all the more revealing of Aquinas’s selected status as a theological authority. Illustrative of this new stage of Thomist “orthodoxy” is the appearance of one last tract against Durand of St Pourçain, probably prompted by the persistence of his influence within the order. Written around the time the veto on Aquinas’s teaching was lifted and shortly after the canonization, Durandellus’s *Evidentiae contra Durandum* (1325) reflects the influence which the canonization exerted on the expansion and authority of Thomist teaching. The purpose of the *Evidentiae* is not so much to engage in criticism of Dominican dissidence but to present evidence of the soundness of Thomism by using Durand’s discredited theses as a critical vehicle. Whereas Hervaeus’s Thomism showed the resilience of times of controversy, the Thomist elements in the *Evidentiae* are presented in a way more suitable for commentary than interpretation. Durandellus makes a normative use of the Thomist corpus, as he adduces quotations from Aquinas’s works for the sake of proof in his arguments against Durand. The value of the *Evidentiae* thus resides in its being probably the first example we possess of Aquinas’s writings being treated as a *locus theologicus*, as obliged theological reference.

The rapid headway of Thomism did not exclude criticism from other quarters. The Immaculate Conception controversy is a case in point, as it saw the Dominicans temporarily expelled from the University of Paris. Following Aquinas’s teaching and in opposition to Franciscans, who followed Duns Scotus and most of the University establishment, Thomists maintained that Mary was conceived in the natural way and that as such she was not exempt from the transmission of original sin. Guiding the Thomist view was the need to safeguard the truth and the value of Christ’s universal redemption. The problem presented by a Thomist minority was not only

doctrinal but also institutional: since his canonization, Aquinas’s teaching had acquired normative value, and his opinion was supposed to call for obedience not only within the Dominican order but also within the Church at large. The doctrinal tension between Thomism and the University establishment is well illustrated by the case of the Spanish Dominican John Montson. In his inaugural lecture at Paris in 1387, Montson declared that Mary was conceived in sin and that the contrary view was heretical. Montson’s audacity deeply offended the magisterial opinion, which had reached a consensus in favor of the immaculist view. Far from retracting, Montson claimed Aquinas’s authority in order to justify his view. He was subsequently censured by the University and excommunicated by the bishop of Paris who, capitalizing on Montson’s blunder, prohibited any preaching or teaching against the immaculist view. The affair transcended University jurisdiction as Montson decided to bring his case to the Avignon pope, Clement VII. The pope readily supported Montson’s appeal, but the University delegation finally succeeded in obtaining Montson’s condemnation. Revealing of Aquinas’s theological ascendancy at Paris, the University’s authorities hastened to add that Montson’s condemnation was brought about “without prejudice to the reverence owed to saint Thomas and his doctrine.” For it is not the soundness of Aquinas’s doctrine which they have condemned and reproved but Montson’s “distortion of it by altering its sense towards the contradiction of faith” (*Chartularium*, II pp. 497–98). Thomism had fallen victim to the political paradoxes of the Schism: while the University was keen to safeguard the authority of the Common Doctor as a way to reinforce its own magisterial authority, the Avignonese pope, at the mercy of French priorities, was compelled to condemn the Dominican destabilizer. The controversy was finally settled in 1439, when the Council of Basle affirmed the belief in the Immaculate Conception as pious opinion and in accordance with the Catholic faith. Although he was unable to present his case at the Council, the Spanish Dominican John of Torquemada had prepared a treatise on the matter arguing in favor of the Thomist thesis. In his hands,

Thomism was intended to serve as a stronghold for the pontifical faction against Conciliar views. Other unyielding Thomists continued to teach against the Immaculate Conception throughout the fifteenth and the beginning of the sixteenth century. A notable example is Vincent Bandelli, a Dominican from Lombardy and master general of the order in 1501. It is an eloquent comment not only to the normative weight Thomism had acquired within the order, but also to Dominicans' strong institutional attachment to Aquinas, that most of them continued to teach against the Immaculate Conception despite the University's official requirement to defend it and the Church's proclamation of its feast day in 1476.

4. At the beginning of the fifteenth century, with the Immaculate Conception controversy still impairing Dominican doctrinal credibility, the work of John Capreolus (c. 1380–1444), a native of Languedoc, was decisive in reviving the authority of Thomism. Written in four volumes, John's *Defensiones theologiae Divi Thomae* (1409–1432), constitutes a comprehensive defense of Thomism against critics from all quarters: Tempier's 1277 syllabus, William of la Mare, Henry of Ghent, Godfrey of Fontaines, Duns Scot, Peter Auriol, Durand of St Pourçain, William of Ockham, and Gregory of Rimini, to mention only the most notable. In responding to each objection, John offers a lucid interpretation of Aquinas's teaching as he both attempts to harmonize conflicting texts and reassesses alternative interpretations from previous Thomists such as Hervaeus Natalis and John of Naples. Among the vast material he considers, John devotes particular attention to Nominalism, especially the way in which this view was expressed in terministic logic. Not in vain called the "Prince of Thomists," John's seminal work sets the precedents for the great age of commentaries on Aquinas's *Summa* in the sixteenth century. Indeed, though Peter Lombard's *Sentences* remained the official text at University and in Dominican schools, Aquinas's *Summa* was gradually taking its place as the main theological reference.

Testifying to this is the flow of abbreviations, concordances, and indices of Aquinas's works composed at the time, as well as epitomes or compendia summarizing his thought for study purposes. The Thomist corpus was thus gradually coming to embody an intellectual tradition whose transmission had to be guaranteed. In this tradition, literal adherence to Aquinas's writings set the standards for true doctrine and philosophical soundness.

Marking the revival of scholasticism in the sixteenth century is Cajetan's (Thomas de Vio, 1469–1534) monumental commentary on Aquinas's *Summa*, composed between 1507 and 1522. Despite some divergences (he remains skeptical about Aquinas's demonstration of the immortality of the soul), Cajetan's commentary remains to this day a classical reference for Thomist scholars. Written precisely at the time when Luther was developing his theological ideas on justification, Cajetan's Thomism gains in topical significance if we take into account that he played an important part in mediating with Luther. Cajetan's embassy was bolstered a few years later by the Council of Trent (1545–1563), recognizing the substance of Thomist teaching as an expression of true doctrine. In 1567, 3 years after the Council's last session, Pius V promoted Aquinas to the rank of Doctor of the Church and ordered the first complete printed edition of his works.

Another famous commentator of Aquinas's *Summa* around the same period is John of St Thomas (1589–1644), a Spanish Dominican who, as his name intended to show, devoted himself to safeguarding the guiding principles and main conclusions of Aquinas's thought against more syncretistic forms of commentary, such as that practiced by the Spanish Jesuit Francisco Suárez (1548–1617). Suárez's first work, *De Verbo Incarnato* (1590), is a commentary on Aquinas's view of Redemption as it appears expounded in the third part of the *Summa*. Suárez attempts to reconcile the Thomist view with Duns Scotus's position, according to which the final cause of the Incarnation is not Redemption, as Aquinas sees it, but the manifestation of the perfection of God's creation. On this view, the

Incarnation would then have taken place even without the Fall. With Suárez, the tradition of interpretation of Aquinas's works begins to evolve into a vast philosophical synthesis which is more accurately described as Aristotelico-Thomistic. An illustrative example is his *Disputationes Metaphysicae*, in which he attempts to integrate Aristotle's teaching with that of Aquinas into a coherent body of knowledge. In contrast to the traditional scholastic commentaries, the aim is not to gloss Aristotle's work but rather to offer a systematic treatment independent of the letter and adapted to contemporary theologians. But reliance on Aquinas's work did not always go hand in hand with fidelity to his teaching, as Suárez was brought to question the Thomist view on grace and its relation to human freedom in a famous controversy which opposed Jesuits to Dominicans. Following the Molinist line (after the Jesuit theologian Luis de Molina) and hoping in that way to safeguard human free will, Suárez claims that what renders grace efficacious is not the divine gift itself, as Thomists maintain, but God's foreknowledge that man will freely cooperate with this gift in certain circumstances. This view was widely adopted by Jesuits and became the prevalent non-Thomist position on the issue.

The period immediately following Suárez witnesses the development of the *Summa* commentary into a literary genre in its own right. The *Cursus theologicus*, composed by the Carmelites of Salamanca between 1631 and 1701, is a noteworthy example. This monumental commentary on Aquinas's *Summa* was completed with the aim of forming a comprehensive corpus of sound theological teaching. The Salmanticenses' treatment of Thomism, one which reflects not institutional affiliation but a systematic philosophical approach, is revealing of the status Thomism had acquired at this time as a coherent body of doctrine setting the standard for the solution to major philosophical and theological questions. It is on this platform that the nineteenth-century Church will resort to Thomist doctrine as the official Catholic response to modern philosophy. The founding charter of Neo-Thomism, Leo XIII's bull *Aeternis Patris* (1879), thus inaugurates a

new epoch in the history of Thomism, one unsuspected by medieval minds.

Thomism, Byzantine

John A. Demetracopoulos

Department of Education, University of Patras,
Patras, Greece

Abstract

Shortly after Thomas Aquinas' death, his thought spread not only in Europe but also in the Christian East. This transmission was a side effect (or even part) of the missionary activity of the Dominicans in the East. From the beginning (c. 1300) up to the end of Byzantine Thomism, Aquinas was almost exclusively noted for his arguments on behalf of the *Filioque*. Yet Demetrios Kydones' translation of the *Summa contra Gentiles* in 1354 and Demetrios and Prochoros Kydones' translation of the *Summa theologiae* in the few subsequent years showed to the Byzantines that the range and the quality of Aquinas' thought were wider and higher than the Latins' use of his arguments in the discussions between the Roman See and the Byzantine Church allowed them to recognize. The reaction by the earliest Byzantine readers of Aquinas (Demetrios Kydones himself, John VI Kantakouzenos, and Neilos

Kabasilas) bears marks of a “culture shock.” Byzantines were particularly impressed by the apologetic skills of Aquinas, which they put in the service of their own discussions with Islam. Probably in this context, Demetrios Kydones translated Aquinas’ *De rationibus fidei* and *De articulis fidei*, too. At the purely philosophical level, Aquinas promoted Byzantine Aristotelianism. This was used by Nicholas Kabasilas in order to combat Gregory Palamas’ repudiation of human knowledge and by Prochoros Kydones in order to combat Gregory Palamas’ distinction between God’s “essence” and “energies.” It was also fervently embraced by George Scholarios (Gennadios II) in order to defeat George Gemistos’ (Plethon) paganism. Scholarios also contributed to the Byzantines’ knowledge of Aquinas’ commentaries on Aristotle’s writings by translating some of them (on the *De interpretatione*, *Posterior Analytics*, *De anima*, *Physics*, and *Metaphysics*) into Greek.

Historical and Literary Facts

Byzantine Thomism, that is, the Greek translation, spread, and influence of several important writings of Thomas Aquinas (1225–1274) on Late Byzantine theological and philosophical thought (fourteenth to fifteenth century), forms the most important part of the spread of Aquinas’ thought in the Christian East. It is divided into three phases.

From the Beginning of the Byzantines’ Acquaintance with Aquinas (c. 1300) Up to Demetrios Kydones’ Translation (1354) of the *Summa contra Gentiles*

This phase is obscure, because of the scarcity of the relevant evidence. The origins of Byzantine Thomism are connected with the history of the missionary activity of the Dominican friars in Byzantium from the last decades of the thirteenth century onward. In late 1299, the Dominican Guillaume Bernard de Gaillac arrived at Constantinople, where he learnt Greek and translated (not

earlier than 1305) into Greek some parts of Thomas’ works (probably *Summa theologiae* I, qu. 36, art. 2–4 and *Summa contra Gentiles* IV, 24–25, which touch upon the *Filioque*). A report of the Latins’ arguments for the *Filioque* by Manuel Moschopoulos (c. 1265–c. 1316) probably reflects this translation. In 1307, Guillaume and his company, expelled by the emperor Andronikos II (1282–1328), moved to Pera (by then a Genovese colony near the capital city of the Byzantine state); there, their convent became a channel of transmission of Scholastic theology, especially that of Aquinas, in Byzantium. Most probably, it was a member of this convent, Philip de Bindo Incontri (or Philip of Pera), who taught Demetrios Kydones (c. 1324–1397) Latin, by using Aquinas’ *Summa contra Gentiles* as a means of practicing translation from Latin into Greek.

From 1354 to the end of the Fourteenth Century

Within less than a year, Demetrios Kydones produced a translation of the entire *Summa contra Gentiles*. The first readers of the translation, namely, the emperor, John VI Kantakouzenos and Kydones’ former teacher, Neilos Kabasilas, were startled by the apologetic skills of Aquinas. Soon afterward, Demetrios converted to Catholicism (1357) and, in collaboration with his younger brother Prochoros (c. 1330–c. 1371), carried out a translation of the *Summa theologiae*. He also translated Thomas’ *De rationibus fidei contra Saracenos, Graecos et Armenos ad cantorem Antiochenum*, and *De articulis fidei et Ecclesiae sacramentis ad archiepiscopum Panormitanum* (which were rendered into Greek for the second time by some other translators), as well as Chaps. 53–54 of Bernardus Guidonis’ (c. 1261–1331) *Vita sancti Thomae Aquinatis*, where a list of Aquinas’ writings is contained. In addition, Prochoros translated the *De potentia* and the *De spiritualibus creaturis*, the Prologue of Thomas’ *Commentary* on Aristotle’s *Metaphysics*, and some questions of the first book of Thomas’ *Commentary on the “Sentences.”*

From the Third to the Sixth Decade of the Fifteenth Century

Another Latin-learned scholar, George Scholarios (Gennadios II) (c. 1400–1472 or shortly after), translated some other Thomistic works: the *De ente et essentia* (along with Armandus of Bellovisu's *Commentary* on it), the *Commentary on Aristotle's "De interpretatione,"* the *Commentary on Aristotle's "De anima,"* part of the *Commentary on Aristotle's "Physics,"* and Ps.-Thomas' *De fallaciis*. Scholarios' versions of Aquinas' *Commentary on Aristotle's "Posterior Analytics"* and *Metaphysics* are not extant. Besides, he elaborated, for personal use, a compendium of Demetrios Kydones' translation of the *Summa contra Gentiles* and of the I^a, I^a II^{ae}, and II^a II^{ae} of the *Summa theologiae* (as well as two *Florilegia Thomistica*), which he constantly used in his writings instead of having recourse to the full texts themselves.

Influence on Speculative Thought

Byzantine authors who benefited from the fact that some of Aquinas' writings became available in Greek are to be found not only among the pro-Latin circles (Demetrios Kydones, Manuel Kalekas, Bessarion, Andreas Chrysoberges, etc.) and among the circles of open-minded thinkers (such as Nicholas Kabasilas) who did not exhibit any hostility to the "Latins"; even professed anti-Latin authors (such as John VI Kantakouzenos, Joseph Bryennios, Makarios Makres, Manuel II Palaiologos, Markos Eugenikos, and Scholarios) did not deprive themselves of reading Aquinas (among other Christian Latin authors translated into Greek) and borrowing from him whatever they regarded useful. Even George Gemistos (Plethon) (c. 1360–1452 or 1454), a professedly anti-Christian author who, like most of his contemporary intellectuals, did not know Latin, was heavily influenced by the *Summae*; he not only integrated into his own writings some important Thomistic doctrines and arguments; he also composed a *florilegium of extracta* from the *Summae* for his own use, which testify to a careful reading of these works. In addition, his disciple with the

eclectic and independent mind, Cardinal Bessarion (1403–1472), elaborated an abridgment of the first seven "quaestiones" of the I^a II^{ae} and used extensively Aquinas' interpretation and Christian evaluation of Aristotle in Bk. III of his celebrated *In calumniatorem Platonis*.

This is a list of concrete cases of Thomas' influence on Late Byzantine philosophical thought:

1. Producing numbered arguments both for and against a statement on any topic, imitating the structure of Aquinas' "articuli." Some authors compounded some of their works after this pattern (see, e.g., Nicholas Kabasilas' *De rationis valore* and *Contra Pyrrhonem* and George Scholarios' *Against the Impasses Ignorantly Imputed by Plethon to Aristotle*).
2. Anti-Palamite ethical Aristotelianism. Against Gregory Palamas' repudiation of secular knowledge and philosophical thinking, Nicholas Kabasilas, based both on Aristotle's ethical writings and on Aquinas' *Summa theologiae*, defended human "reason" as a means of attaining truth and acting morally, that is, as a means of "perfection."
3. Anti-Palamite defense of the unity of God. Prochoros Kydones (*On the Essence and Energy of God*), John Kyparissiotis (c. 1310?–post-1377; *That It Is Impossible to Find The Difference Between Essence and Operation in the Case of God; An Introductory Exposition of Some Fundamental Theological Statements*), Manuel Calekas (mid-fourteenth century–1410; *On Essence and Energy; Principles of the Catholic Faith*), and Bessarion (*A Reply to the "Chapters" of Mark Eugenikos*) rejected the high degree of reality attributed by Gregory Palamas to the distinction between God's "essence" and "energies" by using, inter alia, Aquinas' doctrine of the coincidence of the absolute properties of God ("being-x") with His being (*esse*).
4. Thomistic Palamism. Several defenders of the aforesaid Palamite distinction, such as John VI Kantakouzenos (c. 1892–1393; *Third Letter to the Catholic Archbishop of Constantinople*

Paul), Manuel II Palaiologos (1350–1425; *On the Procession of the Holy Spirit*), and Mark Eugenikos (1394–1445; *On the Non-Composite Character of the Distinction between God's Essence and Energies*), described it as drawn ex parte subjecti by using the term *epinoia*, which, in Demetrios Kydones' translation of the *Summa contra Gentiles*, renders the Latin *intelligentia* and *intentio*. George Scholarios (*Against the Followers of Akindynos; On the Way God's Energies Are Distinguished From Each Other as Well as From God's Essence, to Which They Belong and in Which They Abide*; cf. his excursus within his translation of Armandus of Bellovisu's *Commentary* on Aquinas' *De ente et essentia*) offered the highest philosophical elaboration to this trend; according to him, Aquinas' *analogia entis* implies that the "divine names" not only differ really from each other according to their definition but also correspond to some "forms" actually existing in God, though in such a way that God's infinity renders their plurality harmless for His simplicity.

5. George Scholarios defended the rationality of Christian faith against Plethon's pagan attack on it by means of Aquinas' Christian Aristotelianism. Scholarios' counterattack regarded especially Plethon's doctrines of the plurality of divine beings as well as of "fate." Scholarios defended the Christian doctrines of one God and His Providence, which makes room for free will.

Time

Peter Adamson¹ and Cecilia Trifogli²

¹Philosophy Department, LMU Munich, Munich, Germany

²Philosophy Faculty, All Souls College, University of Oxford, Oxford, UK

Abstract

In both the Arabic and Latin traditions, medieval philosophers discussed time largely by responding to Aristotle's *Physics*. Though there are exceptions, like Abū Bakr al-Rāzī, most medieval philosophers agree with Aristotle's account and try to solve problems and objections that can be raised about it. Several such problems appear in both the Latin and Arabic traditions. For instance, how does time relate to eternity, and is eternity, properly speaking, timeless? Again, Aristotle relates time to motion; but can time in fact be understood as something real distinct from motion? If so, time and motion are two distinct extra-

mental things; if not, there is only a conceptual distinction between the two, so that they are essentially one and the same extra-mental thing viewed in different ways. Like motion, time is successive, and another problem that arises in both Arabic and Latin is how something can exist when its parts do not coexist simultaneously. Finally, Aristotle's assumption that there is only one time is seen as problematic, because of the ontological status of the attribute of motion that Aristotle identifies as time. In thirteenth-century Latin philosophy, various solutions are adopted to save the unity of time, the most influential being that of Averroes.

In Plato's *Timaeus* (37d), time is described as a “moving image of eternity.” In Aristotle's *Physics*, it is described as the “number” or “measure” of motion and rest (220a24–5, 221b7–8). These two definitions already suggest the major themes encountered in medieval theories of time. Plato's contrast of time to eternity stands behind an influential late ancient view, found in Plotinus (see especially *Enneads* III.7), according to which eternity properly speaking is not infinite time, but rather timelessness. The idea of eternity as timelessness becomes a way of understanding God's eternity and already plays a role in late antique Christianity with Augustine (*Confessions*, Book XI) and Boethius (*Consolation of Philosophy*, Book V). On the other hand, late ancient Platonists like Plotinus did think the physical cosmos is everlasting, though not “eternal” in the sense of “timeless.” They also believed this was the view of Plato himself, which allowed them to find agreement between Plato and Aristotle. Aristotle argued explicitly in the *Physics* and *On the Heavens* that motion is eternal. Because time is the measure of motion, it follows that time is endless.

Already before the medieval period, there were dissenters from Aristotle's picture of a God who causes everlasting motion, which is then measured by everlasting time. The most prominent critic was the Christian Philoponus, who argued against the Neoplatonist consensus that read Plato as endorsing the world's eternity. While this dispute did concern the nature of divine action, it also

involved more detailed questions about the nature of time. For instance, Aristotle had argued that the instant or “now” (*to nun*) is not really a constitutive part of time. Rather, time, like spatial extension, is divisible into indefinitely small continuous parts, whereas the instant has no extension at all. It is not a part of time, but a division between two extended parts of time: for example, the present instant is a division between the past and future. If this is right, then there can be no first “instant” for the world, because there would be no past from which to divide off the future time. Philoponus thus pointed out that Aristotle’s definition of the instant begs the question against proponents of the world’s temporal createdness. Aside from this question of creation, Aristotle’s conception of time and the instant seemed to pose other problems. For example, Augustine worries that if the present instant is unextended, and only that which is present exists “now,” then extended time will never exist.

These ancient discussions set the agenda for discussions of time in the Arabic tradition. Al-Kindī (d. c. 873) cites Aristotle’s definition of time in the midst of a discussion of whether the world is eternal (in the sense of everlasting). He accepts this definition but argues that it can be used as part of an argument *against* the world’s eternity. For time measures motion, and motion belongs to body. But every body is finite in quantity, and it is impossible for an infinite motion, and hence infinite time, to belong to a quantitatively finite thing. Al-Kindī is here exploiting not only the Aristotelian doctrine that time depends ultimately on body but also Aristotle’s denial of actual infinity. Al-Kindī follows Philoponus by further arguing that an infinity of past time would be an actual infinity and not a potential infinity as Aristotle had held. His main concern throughout these arguments, which appear in the second section of *On First Philosophy*, would seem to be ensuring that only God can be in any sense actually infinite. But al-Kindī probably holds that God was timeless and not everlasting, for he says in passing that God is the “cause of time.”

The slightly later Jewish philosopher Saadia Gaon (d. 942) uses similar arguments, also under

the influence of Philoponus, in his own discussion of the eternity of the world. But around the same time, a very different approach is taken by the doctor and philosopher Abū Bakr al-Rāzī (d. 925). As far as we can make out from the later sources that report al-Rāzī’s view, he recognizes not one, but two, sorts of time, which might be called “absolute” and “relative.” These are parallel to two sorts of space or more accurately “place.” Absolute place, which is compared to an empty vessel, is what bodies come to occupy when God forms the world. Relative place is like Aristotelian place: the confines of a determinate body that is already located in absolute space. Similarly, absolute time (which some sources reporting al-Rāzī’s doctrine refer to as “eternity”) is infinite, whereas the time relative to a given body or motion is what numbers its finite temporal career. This doctrine seems to be a correction of Aristotle: while “relative” time does supervene on the motions of bodies, al-Rāzī argues, “non-relative” time must first be present in order that motions may occur within it. Just as empty place or space is conceptually prior to the body that occupies it, so absolute time could exist even if there were no motion at all. He therefore makes time and place two of the five principles that must exist in order for a world to be generated. Notice that absolute time does not seem to be comparable to the Neoplatonists’ timeless eternity, of which relative time would be an image. Rather, absolute time is a fundamental part of the framework of the created universe. Al-Rāzī’s “correction” of Aristotle would solve several other problems associated with the supervenient conception of time. For instance, we need no longer worry about which motion, if any, is privileged in producing a single time that would coordinate all motions. (Alexander of Aphrodisias had proposed that the outermost celestial sphere should play this role, since its motion is fastest.) As we will see, this question of whether there is only one time was also taken up in the Latin tradition.

Where al-Rāzī subsumes Aristotle’s conception of relative time within a non-Aristotelian conception of absolute time, Avicenna (d. 1037) accepts the Aristotelian doctrine. But he also extends it in various ways. He agrees with the

Aristotelian position that time is indefinitely divisible and in this respect analogous to spatial extension. Time is disanalogous to spatial extension, however, in that the parts of time cannot exist together: this gives time its distinctive “before and after” character. He also agrees with Aristotle that the instant or “now” is a durationless division in the temporal continuum, rather than a kind of “time atom,” as may have been suggested by some atomist accounts in Islamic theology (*kalām*). Avicenna furthermore builds on Aristotle’s arguments against the first moment of time, as follows. If the world “begins,” this implies a “beforeness,” which cannot be reduced to the mere fact that without God’s creation the world does not exist: nonexistence could as easily come after the world ceases to exist. Rather, genuinely temporal “beforeness” is conceptually required for anything to begin. So, beginning implies prior time.

In his *Incoherence of the Philosophers*, al-Ġazālī (d. 1111) strenuously objects to Avicenna’s depiction of the universe as the eternal and necessary effect of God. It is not the eternity of the world as such that bothers al-Ġazālī; rather, he defends the possibility of the world’s beginning in order to uphold God’s complete freedom with respect to creation. While al-Ġazālī is happy to say with al-Kindī that time simply comes into existence when God creates the world, he also thinks that God could create a temporally bounded world after an infinity of “empty” time, if He so chose. Even if God’s will is itself eternal, God could eternally will that something happen at a predetermined later moment. Al-Ġazālī considers the objection that God, being perfectly rational, would not be able to choose between two equally good moments at which to create the world. After all, before the world exists, any two moments are indistinguishable, so God would have to choose the moment for the world’s creation arbitrarily. Al-Ġazālī retorts that such arbitrary choices are paradigm instances of freedom. In an inversion of the Aristotelians’ familiar analogies between space and time, he points out that nontemporal features of the physical cosmos must also be chosen arbitrarily. For instance, it would not make any difference if the cosmos were slightly smaller

or if the heavenly spheres rotated in the opposite direction.

An even more fundamental response to Avicenna comes from another Ash‘arite theologian, Fakhr al-Dīn al-Rāzī (d.1210), not to be confused with the aforementioned Abū Bakr al-Rāzī, whose view seems to be echoed here. He argues that time is not, as Aristotle and Avicenna had argued, the measure of motion. Nor does it measure existence, as proposed by another influential post-Avicennan thinker, Abū l-Barākāt al-Baghdādī (d.1160s). Instead, time is self-subsistent and in itself provides a framework of priority and posteriority within which motions and other events can occur. To prove the reality of time, Fakhr al-Dīn appeals to an older theological theory according to which God institutes time to help coordinate events, so that we can for instance say “I will come to you when the sun rises.” Against dependence theories like those of Avicenna and al-Baghdādī, he points out that the time of two motions, or of two existences, can be simultaneous and an independent second-order time would be needed to coordinate these two first-order times.

In the Latin tradition, the most articulated speculations about time take place within the conceptual background of Aristotle’s philosophy of time. The *Physics*, the work containing the *ex professo* treatment of time by Aristotle (Book IV, 10–14), is first translated into Latin in the second quarter of the twelfth century and starts to circulate widely around the middle of the thirteenth century. The most eminent philosophers of the thirteenth and fourteenth centuries write commentaries on the *Physics* – e.g., Robert Grosseteste, Roger Bacon, Albert the Great, Thomas Aquinas, Giles of Rome, William of Ockham, Walter Burley, John Buridan, and John of Jandun. The *Physics* commentaries are the standard sources for the medieval reception of Aristotle’s theory of time, but important discussions are also found in theological works. While medieval Latin philosophers generally accept the main ideas of Aristotle’s theory, they also feel that it contains some open problems, which then become matter of debate. The main controversial issues are (1) the existence of time,

(2) the extra-mental reality of time and the relation of time to motion, and (3) the unity of time.

1. Aristotle presents an argument against the existence of time and leaves it without an explicit solution (*Physics* IV.10). The argument concludes that time does not exist, starting from the premise that no part of time exists. The parts of time are the past and the future, and neither the past nor the future exists. Only the present exists, but the present is an indivisible instant and not a part of time. It is clear that the argument relies on the following criterion of existence: for a divisible thing to exist, some of its parts must exist now or simultaneously (*simul*). In the Latin tradition, those things that satisfy this criterion of existence are called permanent entities (*permanentia*). A paradigm example of a permanent thing is a material substance. Thus, Aristotle's argument raises the question of whether permanent entities are the only class of existing things. The standard answer to this question is negative. The other relevant class of existing things is that of successive entities (*successiva*), which include not only time but also motion. Unlike permanent entities, successive entities are characterized by temporally extended parts, i.e., parts that do not exist simultaneously but follow one another in time. Medieval Latin philosophers not only point out that Aristotle's argument is not conclusive against the existence of time because it is based on a criterion of existence valid only for permanent things but also try to define a criterion for the existence of successive entities. There are two main solutions to this problem. (1) One posits that the existence of time is guaranteed by the existence of the present instant – similarly, the existence of a motion is guaranteed by the existence of its instantaneous present element (the *mutatum esse*). Although the instant is not a part of time but an indivisible element of it, it has two other properties that explain its role in the existence of time. One is that the instant is the common boundary at which the past and the future join; the other is that the instant is a persisting element in time flowing from the past to the future. (2) The other solution envisages a distinct mode of existence for motion and time taken as wholes, different from that of permanent entities. In one formulation of this distinction, the being of a successive thing is in fieri (in becoming), while that of permanent entities is in *factum esse* (in completed being). The distinction between permanent and successive entities is generally taken as primitive.
2. While the existence of motion and time as successive entities is variously explained but commonly accepted, a much more controversial issue is that of the relation between motion and time. The question is what kind of attribute of motion time is. Is time a real, that is, extra-mental, attribute of motion or a mind-dependent attribute resulting from our activity of measuring the duration of a motion? On another formulation, the question is whether there is a real distinction between time and motion, so that time and motion are two distinct extra-mental things, or rather only a conceptual distinction between the two, so that they are essentially one and the same extra-mental thing viewed in different ways. Aristotle himself raises this question, when he asks whether the existence of time depends on the human soul (*Physics* IV.14). He argues that time does not exist without the soul because time is a number and the existence of number depends on the soul, because it depends on the mental operation of counting. Aristotle's dependence claim was accepted and expanded by the Arabic commentator Averroes. He maintains that only motion exists outside the soul, in extra-mental reality, whereas time exists in the soul. He specifies that the relevant collection of which time is a number is that of the before and after in a motion (i.e., the collection of successive phases in a motion): time exists as a result of the action of the soul of numbering, i.e., discerning, the before and after in a motion.

Averroes' basic idea that time exists in the soul clearly expresses a reductive view of time that posits that in extra-mental reality there are

not two distinct things corresponding to time and motion respectively. Many thirteenth- and fourteenth-century Latin philosophers share Averroes' reductive view. An eminent example is William of Ockham, who claims that time is not an extra-mental thing distinct from motion. On the contrary, every extra-mental thing signified by the name "time" is also signified by the name "motion." Ockham specifies, however, that the names "motion" and "time" are not synonymous because they have different nominal definitions. In addition to the extra-mental things signified by the name "motion," the name "time" co-signifies the human soul that numbers the successive phases of a motion. Accordingly, for Ockham as for Averroes, what makes the difference between the notions of motion and time is the reference to a mental activity.

There was, however, also strong opposition to Averroes' reductive view. Many thirteenth-century commentators – for example, Roger Bacon, Albert the Great, William of Clifford, and many other anonymous English commentators – think that the claim that the existence of time depends on the soul is basically wrong. They argue that this claim derives from mistaken assumptions about the ontological status of number and that it conflicts with other basic properties that Aristotle ascribes to time. The thirteenth-century realists, however, while advocating that time is an extra-mental thing distinct from motion, do not provide very good arguments for this real distinction. Some fourteenth-century realists are more successful in this respect. For example, Walter Burley, Ockham's most influential opponent, argues that one needs to posit time as an extra-mental thing distinct from motion in order to account for the succession of past and future phases of a motion. His idea is that past and future and more generally temporal succession are found both in time and in every motion, but they belong to time primarily and to motion only secondarily, that is, in virtue of time. Thus what makes one phase of a motion past and another future is that one is in past time and the other in future time.

regarded as highly problematic because of the ontological status that Aristotle ascribes to time. Time is an attribute of motion so that motion is the subject of time; since there are many motions, it seems to follow that there are many times, as many as there are motions, given the principle that the identity and diversity of an attribute depends on that of its subject. The most influential position on the unity of time is that of Averroes. The Arabic commentator saves the unity of time by restricting the subject of time to one motion, the first motion. In his view, time is an accident of the first motion alone, although it functions as a non-inhering measure for all the other motions. Averroes' solution is adopted with some modifications by the major thirteenth-century philosophers, e.g., Albert the Great, Thomas Aquinas, and Giles of Rome. Alternative solutions, however, are also proposed. Bonaventure tries to explain the unity of time on the basis of the unity of matter, which is the principle of every motion: it is because there is just one matter underlying every motion that there is also just one time. Roger Bacon and Richard Rufus of Cornwall argue that all simultaneous motions, *qua* simultaneous, are indistinct and in some sense one, so that they form just one subject for time. Accordingly, since time belongs to all simultaneous motions insofar as they are simultaneous and hence one, the time of simultaneous motions is one. In the fourteenth century, the idea that there are many times is accepted. For example, Walter Burley posits that time is a successive quantity that every motion necessarily has so that there are necessarily many times as there are many motions, although he admits that only the first time, the time inhering in the first motion, has a privileged role in measuring the duration of all the other motions.

Toleration

Cary J. Nederman

Department of Political Science,
Texas A & M University,
College Station, TX, USA

Abstract

Although the idea of toleration (understood as forbearance of beliefs and practices different from one's own) is often supposed to be of modern invention, there were many medieval authors who proposed philosophical grounds for it. Broadly speaking, these medieval doctrines of tolerance may be classified according to a fourfold scheme: skepticism, functionalism, nationalism, and mysticism. Each of the medieval paths to toleration depended upon distinct philosophical principles, but all of them led to the conclusion that differing views about theological and religious truths could be permitted and discussed.

Toleration (or its cognate, tolerance) denotes the readiness of an individual or a community to permit the presence and/or expression of ideas, beliefs and practices differing from what is accepted by that individual or by the dominant part of the community. Tolerance demands forbearance only; it does not require approval or endorsement of the tolerated ideas, beliefs, and practices. A tolerant person respects differences between him/herself and other people; a tolerant community respects differences between groups and/or among individuals within the social totality. Toleration is thus antithetical to the persecution or repression (systematic or individualized) of ideas, beliefs, and practices that differ from one's own. Indeed, a tolerant person or society will protect the ability of such ideas, beliefs, and practices to persist even while acknowledging disagreement with them.

There is a widespread perception that the Middle Ages was not a time during which

toleration could be advocated, let alone flourish, due to the supposedly monolithic character of Roman Christianity. It is commonly supposed that medieval Europe was a “persecuting society,” systematically stamping out all forms of heresy and deviation (Moore 2006). Yet, as with so many generalizations about the Middle Ages, this one does not fully match the evidence. The research of political, ecclesiastical, and social historians has demonstrated repeatedly how tolerant practices and beliefs existed side-by-side with persecutorial urges: laypeople and churchmen alike pursued policies that protected suspected heretics, dissenters, and sexual and social “deviants” (Nederman and Laursen 1996; Bejczy 1997; Laursen and Nederman 1998; Laursen 1999). In turn, medieval authors of a philosophical bent adopted a range of intellectual frameworks that generated principles of tolerance. Specifically, it is possible to identify at least four strands of thought during the Middle Ages that endorsed robust accounts of toleration. These may be labeled skepticism, functionalism, nationalism, and mysticism.

It may be surprising to discover that a number of Latin thinkers – including John of Salisbury (1115/20–1180) and William of Ockham (c. 1285–1349) – self-consciously embraced versions of skeptical thought. John declared himself to be a proponent of the Ciceronian “New Academy,” which had promoted a moderately skeptical methodology of probabilism in matters of the truth. While John admitted that some matters were beyond doubt – the existence of God, for instance – he nonetheless advocated debate over a wide range of theological, metaphysical, and moral questions. For John, the human mind’s imperfection meant that rash enthusiasm for certain answers was bound to yield dogmatism rather than true understanding. Hence, he insisted that individuals should to reserve to themselves a wide freedom of judgment in the examination of truth, such that each by his right (*suo jure*) may defend whatever seems to him most probable. John even describes the process by which such probable truths are examined in as “the clash of ideas.” In sum, he offers a theory of toleration, based on his

readiness to accept that many knowledge claims are subject to legitimate doubt, that is not too far removed from the probabilism of another English philosopher also named John – John Stuart Mill.

In contrast with John, William of Ockham did not look back to ancient skepticism as a source of inspiration. Yet Ockham still advocated a method of philosophical and theological analysis that required suspension of coercive judgment in matters concerning heretical belief (Shogimen 2001). In William’s view, the onus for demonstrating that an individual’s belief stands in error pertains to the person who performs the correction. If an individual who upholds such supposed error clings to it because he does not grasp the manner of his own mistake, it is unwarranted for clerical authorities to punish him. In part, this is because prelates themselves are often ignorant and fallible in matters of faith. But more importantly, Ockham maintains that the only reason one may legitimately employ coercion is to correct a person who explicitly admits that his position is erroneous and still refuses to surrender it. The individual who cannot or does not acknowledge that he is in error because he does not accept the reasoning presented to him must be accorded patient forbearance, not persecuted. To do the latter is to misuse the corrective power granted to the church, according to Ockham.

A second strand of toleration theory arises from the emergence during the European Middle Ages of greater acceptance of the worthiness of guarding the bodily welfare of human beings than one finds in either ancient pagan or early Christian society. The dignity of labor, the morality of commerce, and the protection of the poor from extreme deprivation formed key themes of political, economic, and theological writings after about 1100. In turn, these ideas support the claim that respect must be accorded to all of the parts of society that contribute to the temporal maintenance of the community, a teaching that yielded a widespread functionalist approach to political order. Such functionalism might provide the foundations for a case on behalf of toleration, as in the writings of Marsiglio of Padua (1275/80–1342/43). According to Marsiglio, the material welfare and harmony of society was the

chief goal of the political community; and this was best achieved when all of the goods and services necessary for bodily human existence were exchanged in orderly fashion. Thus, those who adopted supposedly heretical views in matters of faith, while they could be detached from the spiritual community of the church, ought not to be excluded thereby from interactions with fellow citizens involving purely earthly needs. It remained beyond the power of clerics, in Marsiglio's view, to regulate the social and economic exchanges that were required or useful for maintaining the corporeal existence of the orthodox and the heterodox alike. Rather, only the temporal community as a whole enjoyed competence to determine how temporal human conducted should be governed. Religious dispute per se constituted an inappropriate basis for determining who deserved to be excluded from or punished by secular society.

Another theoretical framework that cradled a policy of toleration during the Latin Middle Ages was the growing acceptance of the divinely inspired naturalness of human diversity. In earlier Christian times, thinkers such as St. Augustine had castigated the signs of human difference – for example, the plurality of languages – by proclaiming them to be a token of God's punishment of mankind's wickedness. By contrast, many medieval Latin thinkers (under the influence of Aristotelian science as well as the realities of European sociopolitical organization) came to view differences of identity stemming from region or place of birth – denoted by terms such as *natio* and *gens* – as a wholly natural phenomenon, consonant with the divine plan for salvation. Diversity of climate, terrain, and physical resources quite reasonably produce divergent qualities of character, temperament, and social organization. These are not to be reviled or suppressed but respected as a feature of the wondrous pluralism of God's creation. Around 1400, Christine de Pizan (1365–1430) found in nationalism the building blocks of a cosmopolitan communalism that she employed to argue for tolerance as a by-product of organic political order (Forhan 2002). By the time Nicholas of Cusa (1401–1464) wrote *De pace fidei* in the

middle of the fifteenth century, “national” distinctions could be seen to support “a variety of rites” that nevertheless did not contradict the universal truths of religion. Indeed, Nicholas subscribed to the position that God would be worshipped more devoutly if each nation took local pride in the unique qualities of its own worship. That later expressions of nationalism have signaled chauvinism and intolerance should not deter us from recognizing that nationality and national self-consciousness can be a source of tolerant ideas as well. Inasmuch as human beings find reasons to value forms of natural diversity – whether those reasons are religious (as in the Middle Ages), aesthetic, or biological – the possibility of “nationalism” as a positive stimulus to tolerance exists.

Finally, the mystical dimensions of religious experience have often yielded the basis for the principled defense of toleration. Gustav Mensching argued for the presence of an “intrinsic,” as distinct from a “political” or a “rationalistic,” conception of tolerance located in the teachings of mystical religions (Mensching 1971). Mensching's main insight was that many mystics recognize the immanence and omnipresence of God in Being and thus assert the requirement that all that is must be respected and given its due, because in that way the Divine itself is worshiped. Mysticism posits truth, but a truth that is all-embracing and that may, in extreme cases, embrace all creation as ready for salvation. In Pseudo-Dionysius the Areopagite, for instance, the stages of mystical experience lead to the encounter with God in all things, which in turn are recognized to be God's appearances (*theophanias*). The journey to mystical insight entails a readiness to forbear differing or dissenting visions, since these, too, reflect elements of the divine cosmology. Such doctrines may be encountered throughout the Western Christian tradition (John Scotus Eriugena, Meister Eckhart, Jacob Boehme). Indeed, perhaps among the various possible foundations for toleration, mysticism had been the most widely embraced and propounded in the Middle Ages.

As should be evident, many of the intellectual and religious traditions typical of medieval

European thought provided building blocks for vital theories of toleration. The perception that the Christian Church was successful in the systematic suppression of ideas that did not conform to a narrow and unitary vision of orthodox is the product of ignorance. Indeed, figures whose doctrinal purity was beyond approach – for example, John of Salisbury, who was elevated to bishop of Chartres, and Nicholas of Cusa, a Roman cardinal who very nearly became pope – were among the most adamant advocates of tolerance during the Middle Ages. Defenses of toleration toward differences in human thought and belief were not, then, marginal, but a central feature of medieval philosophy as well as theology.

Translations from Greek into Arabic

Cristina D'Ancona

Dipartimento di Filosofia, Università di Pisa, Pisa, Italy

Abstract

The Greek philosophical heritage has been transmitted uninterruptedly from late Antiquity onward in languages other than Greek: first, into Latin (from the fourth century CE onward), then, into Syriac and Armenian (respectively, from the sixth century to the tenth, and from the sixth century to the seventh), then again into Arabic, from the eighth century to the tenth. The earliest Graeco-Arabic translations of philosophical texts date from the Umayyad era, but the main stream belongs to the first two centuries of the 'Abbāsid Caliphate, and can be subdivided into three stages: first, some Aristotelian, Peripatetic, and Neoplatonic writings were translated, that set the agenda for Arabic-Islamic philosophy; then came the translation of the Aristotelian corpus almost in its entirety, accompanied by some commentaries and other works by Alexander of Aphrodisias, Porphyry, Themistius, and Philoponus; then again, in the second half of the tenth century, earlier Graeco-Syriac versions were translated into Arabic and earlier Arabic translations were revised; further commentaries on Aristotle were translated. Clearly recognized by Muslim

scholars of the classical age as ancient and non-Islamic in its origin, *falsafa* – the loan word for φιλοσοφία – became soon an intellectual option facing others in the cultivated Muslim milieus.

The Stages of the Reception of Greek Philosophical Works

Once settled in Damascus, the first capital of the Islamic empire, the Umayyads (r. 661–750) developed a courtly civilization that, starting from the practical needs of a chancellery (*diwān*) written in Persian (*al-fārsiyya*) or in Byzantine Greek (*al-rūmiyya*) – the languages of the conquered countries – evolved soon toward the first assimilation of non-Islamic literature. In his *Kitāb al-Fihrist* (*Book of the Catalogue*: see Appendix) Ibn al-Nadīm records that the founder of the Umayyad dynasty Mu‘awiyya (r. 661–680), in his fondness for the sciences and especially for alchemy – called “the Art, *al-ṣina‘a*” – ordered a group of Greek philosophers from Egypt to translate for him the books on this subject matter from classical Greek (*al-yūnānī*) and Coptic. According to Ibn al-Nadīm, “This was the first translation in Islam from one language into another” (*K. al-Fihrist*, p. 242.8–242.11 Flügel, trans Dodge 1970:581). Among the topics that attracted the interest of the learned audience at the Caliphal court, stands out the encyclopedic literature best exemplified by the “mirrors for princes” (on this literary genre see O’Meara and Shamp 2006). Sālim Abū l-‘Alā’, secretary to the Caliph Hishām b. ‘Abd al-Mālik (r. 724–743) patronized the translation of a collection of pseudo-Aristotelian letters on government (Grignaschi 1965–1966; Gutas 2006) that forms the core of the *Sirr al-asrār*, or *Secretum secretorum* (survey: Zonta 2003b; see also Grignaschi 1967, 1976; Manzalaoui 1974; van Bladel 2007; Maróth 2006 (review: Gutas 2009)). Cosmology and ethics, two of the topics touched upon in the “mirrors for princes,” seem to have attracted the interest of the Umayyad court: the earliest Arabic translation of two pseudo-Aristotelian writings on these matters, *De mundo*

and *De virtutibus et vitiis*, can be traced back to this period (see respectively the survey by Raven 2003 and Cacouros 2003).

With the so-called ‘Abbāsīd Revolution (on the ‘Abbāsids see Young et al. 1990; Kennedy 2004) and the new interpretation of Islam which took the upper hand after the defeat of the Umayyads (750 CE), and was in a sense symbolized by the foundation of the new capital Baghdad (764 CE), the interest in Greek science and philosophy increased in the cultivated Muslim milieus. The first translations of the ‘Abbāsīd era stem, once again, from the Aristotelian tradition: a secretary to the Caliph al-Manṣūr (r. 754–775), Ibn al-Muqaffā‘ (d. 756), either translated a compendium of logical writings, or even compiled it. This work contains a summary of Porphyry’s *Isagoge*, and Aristotle’s *Cat.*, *De int.*, and *An. Pr.* (edition: Dānishpazūh 1978). The authorship of Ibn al-Muqaffā‘ has been challenged, however, and this work has been attributed to his son, Muḥammad ibn ‘Abdallāh al-Muqaffā‘, who was active under the reign of al-Ma’mūn (Gabrieli 1932; Kraus 1934; on the contrary, Dānishpazūh 1978; Elamrani Jamal 1989 accept the father’s authorship). Whatever the case, the earliest circulation of Aristotelian works is reminiscent of the late Ancient pattern that consisted of opening the *Organon* with Porphyry’s *Isagoge*, a pattern apparent also in the Syriac logical tradition (see Hugonnard-Roche 1989). The so-called enlarged *Organon* of late Antiquity included also the *Rhetoric* and *Poetics*, and it comes as no surprise that the earliest Arabic translation of the *Rhetoric* seems to date from this era (Aouad 1989c). The *Kitāb al-Fihrist* (p. 249.18 Flügel, henceforth F) mentions also a translation of the *Topics*, made for the Caliph al-Mahdī (r. 775–785) by the Nestorian Patriarch Timothy I (Brock 1999; Berti 2009). The Christian learned communities of Syria, heirs to the Neoplatonized Aristotelianism of late antique Alexandria, did continue even after the Muslim conquest to translate and comment upon Greek secular works, especially in the field of Aristotelian logic: a fact that explains both the continuity between the Syriac and Arabic reception of the *Organon*, and the never-ceasing contribution given by the Christians of Syria to the

translations of scientific and philosophical works. In the ‘Abbāsid era their contribution was decisive, as exemplified by the names of Ḥunayn b. Ishāq and his son Ishāq b. Ḥunayn (see below). Besides the logical writings, also the *Physics* was allegedly translated in the first decades of the ‘Abbāsid Caliphate: the *K. al-Fihrist* (p. 244.5–244.6 F) records a translation, now lost, made for Hārūn al-Rashīd (r. 786–809). However, it was under the reign of al-Ma’mūn (r. 813–833) that the translations from Greek into Arabic became a relevant cultural phenomenon in urban Islamic society. A fierce supremacist of the Caliphate over the religious authorities (see Sourdel 1962; Crone and Hinds 1986; Cooperson 2005), al-Ma’mūn sided with the Mu’tazilite doctrine of the created Qur’ān, and initiated the *miḥna* (inquisition) in order to impose this doctrine; the definition of the Qur’ān as the *created* speech of God counted as the premise to the idea that the sacred Book was open to interpretation, especially for its antropomorphic descriptions of God’s nature and deeds. The elite of the learned men surrounding the Caliph, and the Caliph himself, would have extracted from these descriptions the *tawḥīd* – the doctrine of divine Uniqueness – in its purest form, reaching the idea of God as that transcendent One whose attributes are nothing if not images of a perfectly simple and immaterial principle, and whose deeds are nothing if not rationality and justice. Theories of this sort seem to form the theological background of what is nowadays called the “translation movement” (Gutas 1998). The Caliph himself features in the ancient sources as having instigated the translations from Greek: a dream, mentioned in various sources, stages Aristotle answering the questions addressed to him by al-Ma’mūn; Ibn al-Nadīm, one of these sources, tells in as many words that “this dream was one of the most definite reasons for the output of books” (p. 243.9 F, trans Dodge 1970:584). There is no scholarly consensus about the ultimate reasons for this forgery and its various versions (different interpretations have been advanced by Gutas 1998, 1999; van Koningsveld 1998), but the commitment of the Caliphal court to the assimilation of foreign sciences is beyond doubt, as shown *inter alia* by the fact that the

Caliphs al-Ma’mūn and al-Mu’taṣim are among the addressees of the works of al-Kindī, the first *ḥaylasūf* (φιλόσοφος). The latter was appointed tutor to Aḥmad, a son of al-Ma’mūn’s successor al-Mu’taṣim, and directed a circle of scholars and translators (see the entry on al-Kindī in this volume). Even though the princely library, the famous *Bayt al-ḥikma*, is no longer viewed as an academy for translations (see Pinto 1928; Eche 1967; Balty-Guesdon 1992; Micheau 1997; Gutas 1998, reflecting different interpretations), the sum of various bits of information elicits the view that the milieu in which both the translations and *falsafa* arose was the ‘Abbāsid elite of the first decades of the ninth century: for a comprehensive view, see the all-embracing survey by Endress (1987 and 1992, 1997).

The translations done in the first decades of the ninth century, mostly – even though not exclusively – on the demand of al-Kindī, include works by Plato, Aristotle, Theophrastus, the Pseudo-Plutarch (i.e., Aetius), Nicomachus of Gerasa, Alexander of Aphrodisias, Plotinus, Proclus, John Philoponus, and Olympiodorus. As shown by Endress (1973), these translations share in the same syntactical and terminological features, and at times also in the same doctrinal adaptations of the original texts: a fact that has allowed Endress (1987 and 1992, 1997) to single out the existence of a group of translators and scholars gathered around al-Kindī. The translations of the so-called circle of al-Kindī (or belonging more in general to this stage) are the following.

Plato (*Tim.*, *Symp.*, *Phaed.*, *Resp.*)

The *K. al-Fihrist* (p. 246.15–246.16 F) mentions a translation of the *Timaeus* done by Ibn al-Biṭrīq, one of the translators of the “circle of al-Kindī.” In addition to the *Timaeus*, also the *Symposium*, *Phaedo*, and *Republic* were known to a certain extent: since two of them appear in the writings of al-Kindī himself, who had no Greek, this means that a translation of at least parts of these dialogues had been done, unless Kindī’s borrowings stem from a doxographical source. As for the *Symposium*, the section 178 A–212 C, that is, the speeches about love, is echoed in Kindī’s epistle *The Agreement of the Philosophers*

Regarding the Signs of Passionate Love, lost to us but quoted by Ibn Bakhtīshū, a physician of the eleventh century (Klein-Franke 1973; Gutas 1988). As for the *Republic*, al-Kindī was acquainted with the myth of Er (X, 614A–621D), whose reworking appears in his *Qawl fī l-naḥs al-mukhtaṣar min kitāb Aristū wa-Aḥlātūn wa-sā'ir al-falāsifa*, p. 279.3–279.13 Abū Rīda (see Furlani 1922; Walzer 1937; Genequand 1987–1988; Endress 1994). Finally, the pseudo-Aristotelian *Kitāb al-tuffāḥa* (*Liber de pomo*), that can be traced back if not to al-Kindī (as surmised by Atiyeh 1966:158–159) at least to his milieu, presupposes that its author was acquainted with the *Phaedo* (Bielawski 1974; Aouad 1989a).

Aristotle (*An. Pr.*, *Soph. el.*, *Phys.*, *De caelo*, *Meteor.*, *De gen. an.*, *De part. an.*, *Parva nat.*, *Metaph.*, *Paraphrasis of the De anima*)

The translation of the *Prior Analytics* by Ibn al-Biṭrīq is neither extant nor even mentioned in the *K. al-Fihrist*, but Ibn Suwār alludes once to it in his “edition” of the *Organon* (see Endress 1997:58; and, for the so-called edition of the *Organon*, see the entry on Ibn Suwār in this volume). The *K. al-Fihrist* records a translation of the *Sophistici elenchi* done by ‘Abd al-Masīḥ ibn Nā‘ima al-Ḥimṣī, one of the translators of the “circle of al-Kindī” (p. 249.26–249.28 F; on the details about this translation, see Hugonnard-Roche 1989:526–528). To this early Aristotelian corpus in Arabic belongs also the *Physics*, which according to the *K. al-Fihrist* (p. 250.13–250.15 F) was translated by Qusṭā ibn Lūqā (see Gabrieli 1912), together with Philoponus’ and Alexander’s commentaries (see below for details). Other Aristotelian works translated by scholars of the entourage of al-Kindī include the *De caelo* and the *Meteorologica* (*De caelo*: trans. Ibn al-Biṭrīq, mentioned in the *K. al-Fihrist*, p. 250.28 F; this translation is edited by Badawī 1961; see Endress 1966, 1995a; Hugonnard-Roche 2003a; *Meteorologica*: ed. Schoonheim 2000; see also Schoonheim 2003). The *De generatione animalium* and *De partibus animalium*, gathered under the general heading *Kitāb al-Ḥayawān* (*Book on Animals*), were translated by Ibn

al-Biṭrīq (*K. al-Fihrist*, p. 251.26 F; both translations are edited: *De gen. an.*, Brugman and Drossaart Lulofs 1971; Kruk 2003:329, challenges Ibn al-Biṭrīq’s authorship; *De part. an.*, Kruk 1979; see also Kruk 2003). The *Parva naturalia* were translated under the heading *Kitāb al-ḥiss wa-l-maḥsūs* (*De sensu et sensato*), but the translation includes also other pieces of the *Parva nat.* (see Daiber 1997:36–41; the edition, by R. Hansberger, is forthcoming). As for the *Metaphysics*, the *K. al-Fihrist* (p. 251.27–251.28 F) affirms that the translation was done by a certain Uṣṭāth for al-Kindī. This early translation has partly come down to us, thanks to Averroes’ Great Commentary (edition: Bouyges 1938–1952; surveys on the various translations of the *Metaphysics*: Peters 1968; Martin 1989; Martini Bonadeo 2003). In addition to Aristotle’s own works, also a paraphrasis of the *De anima* was translated by Ibn al-Biṭrīq (or “abbreviated,” according to the *K. al-Fihrist*, p. 251.16 F). The Greek original is lost, but the editor, R. Arnzen, has convincingly pointed to a Byzantine compilation drawing mostly from Philoponus’ commentary on the *De anima* (Arnzen 1998:80–139). This paraphrase is clearly acknowledged as being a commentary (*talkhīṣ*, p. 251.15 F), not Aristotle’s own work. In other cases, however, texts by philosophers no less different from Aristotle than Plotinus and Proclus have been attributed to Aristotle himself: these pseudepigrapha come from the “circle of al-Kindī” (see below, “Plotinus” and “Proclus”).

Aetius

The *Placita philosophorum* (Συναγωγή τῶν ἄρεσκόντων) of the Pseudo-Plutarch, an abridgment of the so-called *Vetusta placita* by Aetius (first century BCE to first century CE), were translated by Qusṭā ibn Lūqā. This work counts as the main source for the circulation in the Arabic-speaking world of the Greek cosmological doctrines from the Presocratics to Stoicism (edition: Daiber 1980; see also Daiber 1994; Gutas 1994).

Nicomachus of Gerasa

The Arabic translation of the *Introduction to Arithmetic* by the Bishop of Mosul Ḥabīb ibn Biḥrīz was reworked by al-Kindī himself (Endress 1997:55).

Alexander of Aphrodisias

The first writings of Alexander translated into Arabic were some of his personal works, and two commentaries lost in Greek: on the *Physics*, and on the *De gen. et corr.* We are told in the *K. al-Fihrist* that Qusṭā ibn Lūqā, the translator of the *Placita philosophorum* (see above, “Aetius”) translated the first book of Alexander’s commentary on the *De gen. corr.* (p. 251.4 F); as for the commentary on the *Physics*, Qusṭā ibn Lūqā translated Aristotle’s text “with Alexander of Aphrodisias’ commentary” as for the “fourth book,” which is said to contain further subdivisions; Ibn al-Nadīm mentions also books V and VII, still under the heading of Aristotle’s text with Alexander’s commentary (see Lettinck 1994:3). Within the “circle of al-Kindī,” some of the so-called *Quaestiones* were translated, mostly of cosmological nature (see Fazzo and Wiesner 1993). In the Istanbul MS that contains the collection under scrutiny, Alexander’s *Quaest.* have been transmitted together with some propositions of Proclus’ *Elements of Theology*, under the general heading “What Alexander extracted from Aristotle’s book called *Theology*” (see van Ess 1966; Endress 1973). The Istanbul MS contains also two writings whose Greek antecedent is lost, and whose linguistic and doctrinal features are akin to the other translations of the “circle of al-Kindī”: *On Providence* and *On the Regimen of the Heavens* (both edited by Ruland 1976). Another cosmological writing is attributed to Alexander, which shares the features of this group of translations: a treatise (unknown in Greek) *On the First Cause, Its Effects and the Latter’s Movements* (edition: Endress 2002). Finally, the translation of Alexander’s question *On Colours*, while attributed to Ishāq b. Hunayn, has been connected to the productions of the “circle of al-Kindī” (edition: Gätje 1967).

Hippolytus of Rome

Hippolytus’ *Refutatio omnium heresium* lies in the background of the *Kitāb Amūniyyus fī ārā’ al-falāsifa* (Ammonius’ *Book on the Opinions of the Philosophers*). As shown by the editor of the Arabic text, U. Rudolph, Hippolytus’ survey of the Greek philosophical doctrines has been

adapted to the theological debates of ninth-century Baghdad; this adapted doxographical survey has been attributed to Ammonius, the commentator of Aristotle of sixth-century Alexandria (edition: Rudolph 1989).

Plotinus

The so-called *Theology of Aristotle*, in fact a substantially reworked translation of *Enneads* IV–VI, counts in a sense as the pivot of this group of translations: in fact, the information given at the beginning of the text permits dating the translation and locating it precisely within the context of the “circle of al-Kindī.” The names of the translator and of the revisor of the translation are indicated: ‘Abd al-Masīḥ ibn Nā’ima al-Ḥimṣī, the translator; al-Kindī himself, the revisor; also the addressee of the revision is named: Aḥmad, son of the Caliph al-Mu’taṣim. The translation was then done during the reign of the latter, in the forties of the ninth century (for more details see the entry on Plotinus, Arabic in this volume).

Proclus

The epoch-making book by Endress (1973) has shown that the translation of Proclus’ *Elements of Theology*, out of which the famous *Liber de causis* was created, was done within the “circle of al-Kindī.” To this early stage of the Graeco-Arabic transmission belongs also the earliest translation of the *Eighteen Arguments Against the Christians on the Eternity of the World* (for more details see the entry on Proclus, Arabic in this volume).

John Philoponus

The *De aeternitate mundi contra Proclum* (i.e., Philoponus’ reply to Proclus’ *Arguments* just mentioned) was known to al-Kindī, as shown by Davidson (1987). However, an Arabic translation of this work had not yet been found, when Davidson wrote his book; Hasnaoui (1994) has shown that parts of the *De aet. mundi* in Arabic circulated under the name of Alexander of Aphrodisias. In addition to this, the *K. al-Fihrist* records Philoponus’ commentary on the *Physics*, translated partly by Ibn Nā’ima al-Ḥimṣī (books V–VIII), and partly by Qusṭā ibn Lūqā (books

I–IV, *K. al-Fihrist*, 250.18–250.20 F: see the entry on Philoponus, Arabic in this volume).

Olympiodorus

According to the *K. al-Fihrist* (p. 251.5 F), a commentary on the *De gen. corr.* (unknown in Greek) was translated by Uṣṭāth, the translator of the *Metaphysics*.

Another set of translations of philosophical works, different in style and focused on Aristotle and his commentators, was produced by Ḥunayn b. Ishāq and his associates. A quasi-contemporary of al-Kindī, Ḥunayn b. Ishāq (d. 873) was a Christian Nestorian, a physician and scientist (see Bergsträsser 1913, 1925; Gabrieli 1924; Meyerhof 1926; Haddad 1974; Strohmaier 1990). Together with his son Ishāq b. Ḥunayn (d. 911) and several translators associated with them in various ways (see Meyerhof 1926:702–713) Ḥunayn b. Ishāq produced a new set of translations. Since his mother tongue was Syriac, some of these translations were into Syriac, and others into Arabic; often a work originally translated into Syriac was retranslated into Arabic, either in this same period – typically, a Syriac translation made by Ḥunayn was rendered into Arabic by his son Ishāq – or even later on, in the second half of the tenth century. As a rule, the Syriac versions mentioned in the bio-bibliographical sources are lost, whereas the Arabic translations made out of them have come down to us. The learned al-Ṣafādī (d. 1363: see Rosenthal in *EP*², VIII, cols 783–785) contrasts the word for word method of the early translations with the understanding of the sentence as a whole, typical of the translations of Ḥunayn and his associates (English trans of al-Ṣafādī’s passage by Rosenthal 1975:17). This remark counts as a witness of changing attitudes in the translation technique, that can be viewed partly as an internal evolution – comparable to the change from the *verbum de verbo* pattern of the Latin medieval translations to the Humanist rendering – partly as a reaction, on the part of scientists and scholars involved in the process of the assimilation of Greek learning, to the harsh criticisms against the new literary genre of the philosophical treatise, raised by belletrists like the famous al-Jāhīz (d. 868) or Ibn Qutayba

(d. 890). Another element should be added to the picture of a changing landscape, if compared with al-Ma’mūn’s times: under al-Mutawakkil (r. 847–861), the Caliphate officially disavowed the Mu’tazilite doctrine and put an end to the *miḥna*, reinstating the doctrine of the *increated* Qur’ān as the official creed of the state (see Madelung 1974).

The translations produced by Ḥunayn and his associates include other works by Plato and especially Aristotle; Theophrastus; Galen; other works by Alexander of Aphrodisias; Porphyry; perhaps Iamblichus, and Themistius; finally, other works by Proclus, John Philoponus, and Olympiodorus.

Plato (*Tim.*, *Leges*, *Resp.* [?], *Soph.* [?])

As we have seen before, a translation of the *Timaeus* had been done by Ibn al-Bīṭrīq, and Ibn al-Nadīm affirms that either Ḥunayn made another translation, or he revised Ibn al-Bīṭrīq’s one (p. 246.15–246.16 F). Neither has come down to us. Ḥunayn is credited also with the translation of the *Laws* (p. 246.5–246.6 F), but this translation is no longer extant: traces of it survive in al-Bīrūnī’s *India* (Gabrieli 1947). There is no scholarly consensus about al-Fārābī’s acquaintance with it: according to some, his compendium of the *Laws* (edition: Gabrieli 1952) was made on the basis of this translation, whereas other scholars think that al-Fārābī made use of the Arabic version of an epitome, possibly by Galen (see Parens 1995; Gutas 1997; Druart 1998; Harvey 2003). If one has to trust the *K. al-Fihrist*, Ḥunayn commented upon the *Republic* (p. 246.5 F), but no further details are given. A translation of the *Republic*, be it partial or integral, should have existed, because the Ikhwān al-Ṣafā’ and possibly al-Āmirī are acquainted with it; in addition, Averroes commented upon it (see the entry on Plato, Arabic in this volume). Finally, the *K. al-Fihrist* credits Ishāq with the translation of a dialogue that might be the *Sophist* (the Arabic skeleton points to that), accompanied by a commentary of an author whose name might be read “al-Imqīdūrus” (Olympiodorus? Be this as it may, a commentary by Olympiodorus on the *Sophist* is unknown in Greek).

Aristotle (*Cat.*, *De int.*, *An. pr.*, *An. po.*, *Top.*, *Phys.*, *De caelo*, *Meteor.*, *De gen. corr.*, *De an.*, *Metaph.*, *Eth. Nic.*)

The translation of the *Categories* is attributed to Ḥunayn in the *K. al-Fihrist* (p. 248.20 F), but in the Paris MS that contains the Arabic *Organon* (see Hugonnard-Roche 1993) it is attributed to Ishāq (edition: Badawī 1980; see Elamrani Jamal 1989:510–512). The *De interpretatione* is an example of the translations into Syriac and Arabic mentioned above: it was translated by Ḥunayn into Syriac and by Ishāq into Arabic (p. 249.1 F; edition: Badawī 1980; see Hugonnard-Roche 1989:513–515). The *Prior Analytics* too were translated into Syriac, partly by Ḥunayn, partly by Ishāq (p. 249.6 F), but what has come down to us in the Paris MS mentioned above is the Arabic version of a certain Tadhārī (Theodorus), a scholar of the circle of Ḥunayn. As for the *Posterior Analytics*, the *K. al-Fihrist* (p. 249.11–249.12 F) mentions a translation into Syriac by Ḥunayn (partial) and Ishāq (complete), adding that this translation – lost to us – was the basis for the Arabic translation by Abū Bishr Mattā ibn Yūnus (edition: Badawī 1980; for the translations of Abū Bishr Mattā, see below). The same is true for the *Topics*: the Syriac translation by Ḥunayn, mentioned in the *K. al-Fihrist* (p. 249.15 F) did not survive, whereas the Arabic version made by two translators of this circle (Abū ‘Uthmān al-Dimashqī and Ibrāhīm ibn ‘Abdallāh) has come down to us (edition: Badawī 1980). Ishāq translated into Arabic the *Physics* (edition: Badawī 1984), and Ḥunayn, according to the testimony of the *K. al-Fihrist* (p. 250.28–250.29 F), corrected the translation of the *De caelo* by Yaḥyā ibn al-Bīṭrīq. Ḥunayn also wrote a summary of the *Meteorology* (edition: Daiber 1975). The *De gen. corr.*, allegedly translated into Arabic in this period (see Rashed 2003), has come down to us only in part, together with Alexander’s commentary (translated by Abū Bishr Mattā: see below). As for the *De anima*, the translation that has come down to us (edition: Badawī 1954) is attributed to Ishāq, but it has convincingly been argued that it is not by him (see the *status quaestionis* by Elamrani Jamal 2003). Ishāq is credited also with a version of the *Metaphysics* (p. 251.26 F), which might be

either a fresh translation, or a revision of Uṣṭāth’s (there is no scholarly consensus on this point; see Mattock 1989; Martin 1989; Martini Bonadeo 2002, 2003; Bertolacci 2006). To this period belongs also the *Concise Exposition of Aristotle’s Metaphysics* by the astronomer, mathematician and philosopher Thābit ibn Qurra, actually focused only on chapters 6–9 of Book *Lambda* (edition: Reisman and Bertolacci 2009). Finally, the *K. al-Fihrist* (p. 252.2F) credits Ishāq with the translation of the *Nicomachean Ethics* (edition: Badawī 1978; Akasoy and Fidora 2005).

Theophrastus

To this period belongs the translation of the *De causis plantarum* and *De sensu et sensato* (*K. al-Fihrist*, p. 252.8–252.9F). Both translations are attributed to Ibrāhīm ibn Bakkūs (Rashed 2003:306–312; see the entry on Theophrastus, Arabic in this volume). Albeit attributed to Yaḥyā ibn ‘Adī in the *K. al-Fihrist* (see below), the manuscript tradition credits Ishāq b. Ḥunayn with the translation: see Alon (1985) and Gutas (2010).

Tabula Cebetis

This Neopythagorean writing (c. first-century BCE) was possibly translated in this period, because Miskawayh (d. 1030) made use of it: see Rosenthal (1978).

Nicolaus Damascenus

A compendium of Aristotle’s philosophy (edition: Drossaart Lulofs 1965) was translated into Syriac by Ḥunayn (Nicolaus Damascenus’ authorship of this work, unknown in Greek, has been challenged by Fazzo 2008). The *De plantis* was translated by Ḥunayn (edition: Drossaart Lulofs and Poortman 1989).

Galen (Philosophical Works)

As stated by Ḥunayn himself in the *Epistle* he wrote on his translations of Galen’s works (edition: Bergsträsser 1925), he translated into Syriac and Arabic a great amount of writings by Galen, mostly on medicine. As for the philosophical works, Ḥunayn translated the *De moribus* (see Klein-Franke 1979), and the Compendium of the

Timaeus (lost in Greek). According to its editors, P. Kraus and R. Walzer, Ḥunayn's translation was into Syriac, and the Arabic version that has come down to us (edition: Kraus and Walzer 1951) was made by one of Ḥunayn's pupils, 'Īsā b. Yaḥyā b. Ibrāhīm (Kraus and Walzer 1951:18–22). Ḥunayn himself says in his *Epistle* (p. 51.5–51.9 Bergsträsser) that he translated Galen's writing about the immobility of the First Mover (lost in Greek but mentioned in Galen's *De libris propriis*), first into Arabic, and then into Syriac; then again, the Syriac version was translated into Arabic (by the same 'Īsā b. Yaḥyā b. Ibrāhīm mentioned above), because Ḥunayn's Arabic version had been lost.

Alexander of Aphrodisias

As we saw before, the writings by Alexander translated within the circle of al-Kindī were mostly devoted to cosmological topics. To Ḥunayn and his school we owe the translation of two writings on soul and its faculties, whose impact on subsequent Arabic philosophy has been momentous: the short *De intellectu*, translated by Ishāq (edition: Finnegan 1956; Badawī 1971), and the *De anima*, lost in Arabic, but partly preserved in Hebrew (translated into German by M. Steinschneider together with I. Bruns' edition of the Greek text, *Suppl. Ar.* II.1, 1887). Other personal works by Alexander can be traced back to this period: a couple of short writings on sense perception; several *Questions*, a treatise on the *differentia specifica*, another treatise on time (lost in Greek), and the treatise *On the Principles of the Universe* mentioned above (see Goulet and Aouad 1989). Among the commentaries, Ḥunayn translated into Syriac Alexander's *On the Metaphysics*, at least as far as Book *Lambda* is concerned: this translation is lost to us, but in his own Long Commentary on the *Metaphysics* Averroes quotes several passages from the Arabic translation, made by Abū Bishr Mattā on the basis of Ḥunayn's Syriac version (*K. al-Fihrist*, p. 251.29 F; edition of the Arabic fragments: Freudenthal 1885; on the translation by Abū Bishr Mattā, see below). Thanks to the quotations in Averroes' commentary, parts of Alexander's genuine exegesis of Book *Lambda* can be

recovered (it should be recalled that only books *Alpha* to *Delta* are by Alexander, in the Greek text transmitted under his name). To Ishāq the *K. al-Fihrist* (p. 249.24 F) attributes also the translation of Alexander's commentary on the *Topics*.

Porphry

Abū 'Uthmān al-Dimashqī, the translator of the *Topics*, translated also the *Isagoge* (edition: Badawī 1980). A translation of Porphyry's commentary on the *Categories* is mentioned in the *K. al-Fihrist* (p. 248.20 F), as well as that of the commentaries on the *Physics* (p. 250.21–250.22 F) and the *Nicomachean Ethics*, made by Ishāq (p. 252.2 F). The three works are lost in Greek (see the entry on Porphyry, Arabic in this volume).

Iamblichus (?)

A commentary on the *Golden Verses*, unknown in Greek, is attributed to Iamblichus in the Arabic tradition; the Arabic translation can be traced back to this period (edition: Daiber 1995).

Themistius

Ishāq b. Ḥunayn translated Themistius' paraphrase of the *De anima* (edition: Lyons 1973). An epistle on government in Arabic translation is extant (edition: Salīm Sālim 1970), as well as a treatise, unknown in Greek, on the reduction of the syllogistic figures (edition: Badawī 1947). Finally, Ibn al-Nadīm mentions a commentary (*tafsīr*) by Themistius on the *Nicomachean Ethics* (*K. al-akhlāq*), in Syriac, extant in the "manuscript" of Ishāq (see the entry on Themistius, Arabic in this volume).

Proclus

The *Eighteen Arguments Against the Christians on the Eternity of the World* were translated again by Ishāq. Nine of them have been found (edition: Badawī 1955), including the first argument, lost in Greek (see Anawati 1956; Badawī 1968:72–73). To this period might be traced back tentatively also the translation of two other writings by Proclus, lost in Greek: the monograph *On the Immortality of the Soul*, and the final part of the commentary on the *Timaeus* (see the entry on Proclus, Arabic in this volume).

John Philoponus

Two writings lost in Greek – one of them fragmentarily transmitted in Greek, while the other is unknown – have been translated in this period. The first writing is a treatise against Aristotle's doctrine of the eternity of the cosmos, whose Greek fragments are preserved through Simplicius' quotations (see Wildberg 1987) and whose Arabic version is edited (Mahdi 1972); the second is a short treatise on the contingent nature of the physical world (edition: Troupeau 1984) (see the entry on Philoponus, Arabic in this volume).

Olympiodorus

A commentary on Aristotle's *Meteorologica* attributed to "Olympiodorus" in a MS housed in Tashkent (edition: Badawī 1971) was translated by Ḥunayn and corrected by Ishāq. This is the information given in the Tashkent MS, but in the *K. al-Fihrist* the translation is attributed to Abū Bishr Mattā ibn Yūnus (see below). Be this as it may, the work edited by Badawī is different from Olympiodorus' commentary which is extant in Greek.

The Last Stream

The last stream of translations of Greek philosophical works can be located toward the middle of the tenth century, and took place in an intellectual climate different from that of the early 'Abbāsīd Caliphate on several counts. First, the broader context of Muslim urban society, especially in the capital Baghdad, had changed: even though the 'Abbāsīds were officially still in power, their leadership was on the decline and the empire was de facto dismembered: in 945, a new dynasty entered Baghdad from northern Iran, the Buyids, of Shī'ite allegiance (see Kraemer 1992). Second, the Ash'arite *kalām* (named after Abū Ḥasan al-Ash'arite, d. 935) had supplanted Mu'tazilism in Sunni theology (see the entry *Kalām* in this volume), establishing the tenet that God's nature and decrees cannot be scrutinized by man's reason, to the point that the Ash'arite theologians (*mutakallimūn*) maintained that God could without contradiction punish those who did obey all his commands. Third, the various

linguistic and religious sciences, mostly grammar and law (not to mention the *ḥadīth* literature) had reached such a high level of refinement, that their specialists considered the foreign sciences and their literary genre – the philosophical treatise – as intruders whose pretensions were not supported by an adequate command of true knowledge. This is apparent in the famous argument that occurred at the court of the Buyid vizier Ibn al-Furāt, between Abū Bishr Mattā (d. 940), the head of the Aristotelian circle of Baghdad, and Abū Sa'īd al-Sīrāfī (d. 979), the most illustrious belletrist of his time and the commentator of Sibawayh's *Kitāb*, the authoritative textbook of Arabic grammar. The focus of the argument was about the claim for the universality of Aristotelian logic on the one hand, and the impossibility to go beyond the limits of every natural language, on the other. Should logic prevail over grammar, as contended by Abū Bishr Mattā, translations would be possible and welcomed; should the linguistic boundaries be insurmountable, as contended by Abū Sa'īd al-Sīrāfī, the assimilation of Greek thought would be pointless (see Elamrani Jamal 1983; Endress 1986; Ouyang 1997:23–54). The literate and philosopher al-Tawḥīdī, to whom we owe the record of the dispute, depicts Abū Sa'īd al-Sīrāfī as gaining the upper hand, and it has convincingly been argued that al-Fārābī's philosophy of language, as well as his endeavor to build up a systematic structure of knowledge, counts as an attempt at providing the philosophic community with an adequate reply to this defeat (see Martini Bonadeo 2008). To this picture another element should be added, namely the increasing concentration of the philosophical studies on the interpretation of the Aristotelian corpus. The Baghdad philosophers devoted themselves to the scholastic practice of searching and studying ancient commentaries, analyzing Aristotle's texts and commenting upon them. Two outstanding examples of this practice are the "Organon of Baghdad" (see Hugonnard-Roche 1993) and a MS of Aristotle's *Physics* housed in Leiden that, like the "Organon of Baghdad," bears the traces of a detailed analysis based on both Greek and Arabic commentaries (see Giannakis 1993).

The translations produced by the Baghdad Aristotelians of the tenth century include, in addition to a single work by Plato and several works by Aristotle, writings by Theophrastus, Nicolaus Damascenus, Alexander of Aphrodisias, Themistius, possibly Proclus, Simplicius, and Olympiodorus.

Plato

Yaḥyā ibn ‘Adī is credited in the *K. al-Fihrist* (p. 246.5 F) with the translation of Plato’s *Laws*. This translation is lost.

Aristotle (*An. po.*, *Soph. el.*, *Topics*, *Rhetoric*, *Poetics*, *De caelo*, *De gen. et corr.*, *De sensu et sensato*, *Book Lambda of the Metaphysics with some commentaries*)

As we have seen before, Ḥunayn b. Isḥāq translated into Syriac the *Posterior Analytics*: on the basis of this translation, Abū Bishr Mattā produced the Arabic version that has come down to us (edition: Badawī 1980). In addition to the old translation of the *Sophistici elenchi* done by ‘Abd al-Masīḥ ibn Nā‘ima al-Ḥimṣī within the “circle of al-Kindī” (see above), two other Arabic versions of this Aristotelian work are extant, that can be traced back to the circle of Baghdad directed by Abū Bishr Mattā. The information given by Ibn al-Nadīm in the *K. al-Fihrist* does not match the account provided by Ibn Suwār, the “editor” of the so-called *Organon* of Baghdad (see the details in Hugonnard-Roche 1989:526–528; see also the entry on Ibn Suwār in this volume). For the purposes of the present survey, it will suffice to say that both Abū Bishr Mattā and Yaḥyā ibn ‘Adī did deal with the *Soph. el.*, either by translating it or by correcting previous translations. As for the *Topics*, Yaḥyā ibn ‘Adī made an Arabic version on the basis of Isḥāq’s Syriac text: this translation, mentioned in the *K. al-Fihrist* (p. 249.15–249.16 F), is quoted in the marginal notes of the “*Organon* of Baghdad” (see Endress 1977:26). A pupil of Yaḥyā ibn ‘Adī, Ibn al-Samḥ (see the entry on Ibn al-Samḥ in this volume) corrected the old version of the *Rhetoric*, dating from the early ‘Abbāsīd age (edition: Lyons 1982; see Aouad 1989c:457). Abū Bishr Mattā translated into Arabic the *Poetics*, possibly from the Syriac version

made by Ḥunayn: this translation is edited (Tkatsch 1928), and the mention of a translation by Yaḥyā ibn ‘Adī in the *K. al-Fihrist* (p. 250.4–250.5 F) possibly points to Yaḥyā’s correction of Abū Bishr Mattā’s translation (Hugonnard-Roche 2003b:211). A partial translation of the *De caelo* is attributed to Abū Bishr Mattā (p. 250.29 F). As we have seen before, Ḥunayn corrected the old version by Ibn al-Biṭrīq, and one of the three Arabic translations that are extant in the MSS might be the correction, either by Ḥunayn or by Abū Bishr Mattā, of the old version (one of the three versions is edited: Badawī 1961). The reference work on the Arabic *De caelo* is Endress (1966); see also the up-to-date *status quaestionis* by Hugonnard-Roche (2003a). Abū Bishr Mattā is credited also with the translation of the *De gen. corr.* (p. 251.4 F), but this information might point to the lemmas of the commentary by Alexander of Aphrodisias (see below, and Rashed 2003:305). As for the *De sensu et sensato*, the wording of Ibn al-Nadīm is controversial and points either to Abū Bishr Mattā, or to another translator, Abū ‘Amr al-Ṭabarī, a pupil of Yaḥyā ibn ‘Adī (see Hasnaoui 1996). Abū Bishr Mattā was particularly interested in Book *Lambda* of Aristotle’s *Metaphysics*: the *K. al-Fihrist* credits him with the translation of this book, accompanied by the commentaries of Alexander of Aphrodisias and Themistius (p. 251.28–251.30; see below). Among the pseudo-Aristotelian works translated by the scholars of this group, there is the Arabic version from Syriac of the *De virt. et vit.* (edition: Kellermann-Rost 1961) and *Economics* (see Zonta 2003a:249), as well as the Arabic version of a compendium of the *Nicomachean Ethics*, known as *Summa Alexandrinorum* (see Dunlop 1974, 1976).

Theophrastus

The *K. al-Fihrist* attributes to Yaḥyā ibn ‘Adī the translation of the *Metaphysics* (p. 252.11 F; edition: Alon 1985; Gutas 2010). According to Endress (1974:498), the translation from Syriac into Arabic of the *Signs of High* (*K. al-Āthār al-‘ulwiyya*), attributed to Ibn Suwār in the *K. al-Fihrist* (p. 265.9 F) points to Theophrastus’

Meteorology; on the Syriac and Arabic versions of this work, see Daiber (1992).

Nicolaus Damascenus

The *K. al-Fihrist* (p. 264.26 F) credits ‘Īsā ibn Zur‘a, one of the pupils of Yaḥyā ibn ‘Adī, with the Arabic translation of the Syriac version of the compendium of Aristotle’s philosophy (see the entry on Ibn Zur‘a in this volume).

Alexander of Aphrodisias

Yaḥyā ibn ‘Adī was acquainted with Alexander’s commentary on the *Categories*. This work is lost in Greek, but Ibn al-Nadīm says in the *K. al-Fihrist* (p. 248.23–248.25) that Yaḥyā ibn ‘Adī suspected that a commentary ascribed to Iamblichus was in fact by Alexander, because of the expression “Alexander said” he read in it. In addition, Ibn al-Nadīm reports a saying by Abū Sulaymān al-Sijistānī, a pupil of Yaḥyā ibn ‘Adī, according to whom the latter translated the *Categories* together with Alexander’s commentary, a work of three hundred leaves. This passage in the *K. al-Fihrist* is somehow controversial (see the note by A. Müller to the edition Flügel, vol II, p. 114, and the different renderings by Endress 1977:25; Gutas 2007:22). The *K. al-Fihrist* (p. 250.7 F) credits Abū Rawḥ al-Ṣābī with the translation of Alexander’s commentary on the *Physics*, lost in Greek: Yaḥyā ibn ‘Adī corrected this translation. Also, a translation by Abū Bishr Mattā of part of the first book of Alexander’s commentary on the *De caelo* (lost in Greek) is mentioned in the *K. al-Fihrist* (p. 250.29–250.30 F); a correction by Yaḥyā ibn ‘Adī is mentioned (p. 264.1–264.2 F; see Hugonnard-Roche 2003a:287). Another commentary by Alexander of Aphrodisias lost in Greek, but known to the Baghdad Aristotelians, was that on the *De gen. et corr.* It was allegedly translated by Abū Bishr Mattā in its entirety, whereas the ancient translation by Qusṭā ibn Lūqā was limited to the first book (*K. al-Fihrist*, p. 251.4 F; see above for the translation by Qusṭā ibn Lūqā). Mattā’s translation has not come down to us; however, parts of Alexander’s commentary on the *De gen. et corr.* have been recovered in Arabic translation, and the

terminology and style point to him, both for Aristotle’s lemmas and Alexander’s commentary (see Serra 1997; Gannagé 2005). As we have seen before, Alexander’s commentary on Book *Lambda* of the *Metaphysics* was translated into Syriac by Hunayn b. Ishāq; this translation was in turn translated into Arabic by Abū Bishr Mattā (see above for details). Finally, Alexander’s *De providentia*, lost in Greek and translated for the first time within the circle of al-Kindī, was translated again by Abū Bishr Mattā (edition: Ruland 1976; see also Thillet 2003).

Themistius

Abū Bishr Mattā translated Themistius’ paraphrase of the *An. po.* (*K. al-Fihrist*, p. 251.28 F; the Arabic version is lost, but it was known to Averroes and formed the basis of the medieval Latin translation). Abū Bishr Mattā also translated the paraphrase of the *De caelo*, lost in Greek (p. 250.30 F), as well as that of Book *Lambda*, lost in Greek too (French translation: Brague 1999). Also the paraphrase of the *Physics* was known: a Syriac translation is mentioned (*K. al-Fihrist*, p. 250.22–250.23 F), and Themistius’ exegeses are recorded here and there in the Leiden MS of the *Physics* (see above). (For all this, see the entry on Themistius, Arabic in this volume.)

Proclus

Yaḥyā ibn ‘Adī was acquainted with Proclus’ *De decem dub. circa providentiam* (see Endress 1973:30). Even though this does not imply that he provided a translation, Yaḥyā’s quotations are worth noting as a witness of some sort of circulation in the Arab-speaking world of this work, which is lost in Greek. Later on, a scholar belonging to this current of thought, Abū l-Faraj ibn al-Ṭayyib (see the entry on Ibn al-Ṭayyib in this volume) dealt with a commentary on the *Golden Verses*, allegedly by Proclus (see Linley 1984), as well as with the *Tabula Cebetis* (see above).

Pseudo-Dionysius the Areopagite

An Arabic translation of the pseudo-Dionysian corpus was done in the eleventh century (see Treiger 2005).

Simplicius

The translation of the commentary on the *Categories* is mentioned (*K. al-Fihrist*, p. 248.21–248.22 F) in a somehow confused relationship with the work of a certain “Theon,” which is said to be extant in Syriac and Arabic (see Gutas 2007:22).

Olympiodorus

The *K. al-Fihrist* (p. 251.5 F) credits Abū Bishr Mattā with the translation of Olympiodorus’ commentaries on the *De gen. et corr.* (p. 251.5 F) and *Meteorologica* (p. 251.8 F).

The Works Translated: An Overview

The knowledge of Presocratic philosophy has been only indirect in the Arab world: the doctrines of the early cosmologists were known through the doxographies of the Hellenistic and Imperial ages, whereas the “Pythagorean” doctrines were known either through the Neopythagorean writings like the *Tabula cebetis*, or through the Neoplatonic accounts, often presenting Pythagoras as a forerunner of the doctrines held in late Platonism. The knowledge of Plato’s doctrines was based more on accounts by later philosophers, on surveys, and on spurious collections of “sayings,” than on a direct acquaintance with the corpus of the dialogues. Still, some of them were known to a certain extent: *Timaeus*, *Symposium*, *Phaedo*, *Republic*, *Leges*. As for Aristotle, the entire corpus was known, with the exception of the *Politics* and the *Constitution of the Athenians*. Among the pseudo-epigrapha, a prominent place is due to the pseudo-*Theology of Aristotle*, produced within the “circle of al-Kindī” out of Plotinus’ *Enneads*, and to the *Liber de causis*, produced within the same circle out of Proclus’ *Elements of Theology*. The early school of Aristotle was also known to a certain extent: some Theophrastus was translated, and his teaching was also indirectly known through the translation of Aetius’ *Placita philosophorum*, which ultimately traces back to Theophrastus’ collection of the Φυσικῶν δόξαι. Also the Aristotelianism before Alexander of Aphrodisias had some sort of circulation in Syriac and Arabic,

through Nicolaus Damascenus. The philosophy of the Imperial age was widely known, both in Syriac and Arabic: the doxographical traditions, some Plutarch of Chaeronea (in Syriac), Galen, Nicomachus of Gerasa, and Alexander of Aphrodisias – the latter significantly moulding the reception of Aristotle’s own works – feature in all the stages of the assimilation of Greek learning. A pivotal role was played by Neoplatonism, both in setting the agenda of the Arabic–Islamic philosophy and in shaping the main frame of *falsafa* as a systematic knowledge, through the reception of the late Ancient scholastic pattern. Plotinus’ and Proclus’ doctrines gained wide currency under Aristotle’s name (see Rosenthal 1974); Porphyry, Iamblichus, Themistius, Philoponus, Simplicius, and Olympiodorus circulated among the learned interested in the Greek philosophical heritage.

Appendix: The *Kitāb al-Fihrist*

The first of a series of Arab bio-bibliographies that reach out to the seventeenth century, the *Kitāb al-Fihrist* is an outstanding testimony of the intellectual life in tenth century Baghdad. Its author, Abū l-Faraj Muḥammad ibn Ishāq al-Warraḡ al-Baḡdādī ibn al-Nadīm al-Mawṣilī (d. 990), known as Ibn al-Nadīm (“son of the boon companion”) and boon companion himself, was in touch with scholars in the capital and abroad: among them, the belletrist al-Marzubānī (d. 994), Abū Sulaymān al-Sijistānī, Yaḥyā ibn ‘Adī, and Ibn Suwār. Starting from the catalog of his father’s bookshop (see Endress 1987:451 for al-Tawḥīdī’s account of the bookshop quarter in Baghdad), Ibn al-Nadīm restlessly searched for information about books and learned men both of the past and of his own time, visiting Bassora, Kufa, Mosul and possibly Aleppo, so that his *Catalogue* became “an encyclopaedia of medieval Islamic culture” (Dodge 1970:xix). Of Shī‘ite allegiance (see Stewart 2009), Ibn al-Nadīm organized his work according to a systematic account of the sciences, including language and the Holy Scriptures (the Torah, the Gospel, other holy books, and the Qur’ān: chapter I); grammar (the schools of Bassora and Kufa: chapter II); history, genealogy, government literature, court literature (chapter III); poetry (pre-Islam and Umayyad

poetry; poetry of the ‘Abbāsīd age: chapter IV); religious sects (Mu‘tazilites, Shī‘ites, and other: chapter V); Law (Sunni schools of law, legal authorities of the Shī‘a: chapter VI); *falsafa* (Greek philosophers, Arab philosophers, mathematics and astronomy, medicine: chapter VII); stories and fables (chapter VIII); non-Islamic sects and religions (the Ṣābians, Manicheism, other sects, religions and further information on India and China: chapter IX). An autograph of this monumental work was housed in the Caliph’s library at Baghdad: the famous geographer and biographer Yāqūt (d. 1229) claims he made use of the *K. al-Fihrist* in the handwriting of Ibn al-Nadīm himself, shortly before the Mongol sacking of Baghdad (1258), that put an end to the ‘Abbāsīd Caliphate. In the sacking, the library was destroyed, and the autograph of the *K. al-Fihrist* with it. Luckily, other copies survived elsewhere. Other biobibliographical surveys, working on the basis of the *K. al-Fihrist* throughout the centuries, have added further materials to it: the *History of the Learned Men* (*Ta’rikh al-ḥukamā’*) by Ibn al-Qifṭī (d. 1248), the *Sources of Information on the Classes of Physicians* (*‘Uyūn al-anbā’ fī ṭabaqāt al-aṭibbā’*) by Ibn Abī Uṣaybi‘a (d. 1270), and the *Clarification of the Doubts About the Names of Books and Subdivisions* (*Kashf al-Zunūn ‘an asāmī l-kutub wa-l-funūn*) by Ḥajjī Khalīfa (Katib Celebi, d. 1658), that in its turn served as a basis for d’Herbélot’s *Bibliothèque orientale* (1697). Edited in 1881 on the basis of the defective MSS housed in Paris, Istanbul, Vienna and Leiden by Gustav Flügel, and in 1971 by Rīḍa Tajaddud on the basis of other, more complete MSS (Dublin and Istanbul), the *K. al-Fihrist* has been translated into English by Bayard Dodge in 1970.

Translations from Greek into Syriac

Emiliano Fiori

Vrije Universiteit Amsterdam, Leiden, The Netherlands

Abstract

As for the philosophical and scientific texts are concerned, we can observe three periods of the translation activity from Greek into Syriac: the first (second–fifth century) is characterized by the interest in popular philosophy of ethical content and gnomic form; in the second, (sixth century) the translations focus on the Aristotelian logic and physics; the third one (seventh–ninth century) is still focused on Aristotle but is marked by a change in the translation style, from a more periphrastic to a

more literal one. Short information about the key figures (Sergius of Resh‘aynā, Athanasius of Baladh, James of Edessa, George of the Arabs, and Ḥunayn b. Ishāq) is given.

As it is impossible to outline a complete overview of the Syriac translation activity throughout the centuries, we will limit ourselves to the philosophical texts and to some scientific literature, excluding the biblical, patristic, or narrative texts.

First Period: The So-Called Popular Philosophy

Greek philosophy had its first impact on Syriac culture already by the second century, in the form of little texts, often of gnomic form and ethical content, and often transmitted in little collections (see Bettio 2003; Brock 2003). It is commonly believed that they were composed by and for a cultivated and not necessarily Christian milieu, a urban – mainly Edessene – audience located in Mesopotamia between the second and the fifth century, although it is impossible to reach a more detailed description of the circumstances of these earlier translations. To this period belong the translations of some Pythagorean sayings (Levi della Vida 1910; Possekel 1998), of collections of sentences by the Pseudo-Menander (Bettio 2003) and by a Pseudo-Plato, of a “Socratic” dialogue, of two of Plutarch’s *moralia*, and of one of Isocrates’ orations. Works by Lucian of Samosata and by the fourth century rhetor Themistius are also preserved (all the texts above edited in De Lagarde 1858; Sachau 1870).

Second Period

Philosophy made its real entrance in the Syriac-speaking cultivated world only at the beginning of the sixth century, with the first translations of Aristotle’s logical and physical works (overview in Brock 1993) along with commentaries on them. Plato was never translated into Syriac. The *Categories* were translated (Gottheil 1892–1893; see

the study of all the extant Syriac versions by Georr 1948), presumably in the first half of the century, by an anonymous translator, and have been commented at length by Sergius of Resh‘aynā (d. 536), who nevertheless did not know the translation just mentioned. Porphyry’s *Isagoge* as well was translated by an anonymous author in the first half of the sixth century (Freimann 1897; Brock 1988). The same Sergius wrote a short introduction to the whole logical œuvre of Aristotle (partial translation in Hugonnard-Roche 2004). He also translated two other works of the Aristotelian tradition: the pseudo-Aristotelian treatise *De mundo* (De Lagarde 1858; Ryssel 1880–1881), and perhaps Alexander of Aphrodisias’ *On the Principles of the Universe*. Sergius is most of all famous for his translation into Syriac of the pseudo-Dionysian *Corpus*, and for having introduced Galen into Syriac: the ninth-century doctor and translator Ḥunayn b. Ishāq informs us that he had translated some 30 works of Galen’s: four fragments, three of which attributed to him by Sachau (1870), have come down to us: from the *Ars medica*, from the *De alimentorum facultatibus*, and from the *De simplicium medicamentorum temperamentis et facultatibus*. A short treatise on the influence of the moon, based on the *De diebus decretoriis* was edited by Merx (1885).

Two other logical texts from the *Organon* are preserved in anonymous translations: the *De interpretatione* (for the text see Hoffmann 1869) and the *Prior Analytics* until I, 7: for these works, scholars could not give a precise date, so that at present it is not possible to determine their context. We also have a version of Theophrastus’ *Metereology* (Daiber 1992; Wagner and Steinmetz 1964).

Third Period

Between the seventh and the eighth century, after the Muslim conquest, the West Syrian monastic cenacle of Qenneshre, on the western bank of the Euphrates, produced a great amount of philosophical and scientific work, both in the form of

translations and commentaries. It is in these works that we can clearly detect the main change of the Syriac translation technique analyzed by Brock (1979, 1983, 2004): from a periphrastic style to a more literal one, with a much more abundant presence of Greek borrowings in the new translations (for Greek loanwords in Syriac, see Brock 1975, 1996; Schall 1960).

The initiator of Qenneshre's flourishing period was Severus Sebokht (d. 666/7). He is well-known for a wide scientific production, but not for translations. His main disciples and successors were Athanasius of Baladh (d. 687), James of Edessa (d. 708), and George of the Arabs (d. 724). Athanasius revised in 645 the first anonymous translation of the *Isagoge*, edited by Freimann (1897); other translations by him of Aristotelian texts are lost, but we know that he translated the *Prior* and the *Posterior Analytics*, the *Topics* and the *Sophistici elenchi*: that is to say that he is the only Syriac scholar of the first millennium who, as far as we know, translated the entire *Organon* which, as an heritage of the Alexandrian commentary tradition, was neither usually translated nor commented upon beyond the *Prior Analytics*. James of Edessa, for example, did not go beyond the *An.pr.*; he revised the sixth-century anonymous translation of the *Categories* (Schüler 1897), translated the *De interpretatione* (even if this translation is attributed to the sixth century Syriac philosopher Probus in the manuscript which transmits it), and the *Prior Analytics*. George of the Arabs translated the same three works in a more literal way (Furlani 1925). In the same monastery a certain Phokas substantially revised Sergius' version of the Dionysian *Corpus*, which he translated together with John of Scythopolis' *scholia* (Van Esbroeck 1997). After George, almost nothing has survived of the Syriac translations. The most important translator, both into Syriac and Arabic, under the 'Abbāsids is H-unayn b. Iṣḥāq (ninth century), but it is difficult to single out any fragments of his Syriac translations. We know about them from a letter that he wrote in 856, where he displays the list of his Syriac translations of Galen's works. He retranslated many of Galen's works into Syriac,

because of his severe judgment on many of Sergius' translations (Brock 2004). We know that he also produced new versions of the *Categories* and the *De interpretatione*, but they are no longer extant.

To the third era of the Syriac translations probably belongs also the version of Nemesis of Emesa's *De natura hominis*, which is known only from fragments quoted by eighth and ninth century authors, and for linguistic reasons should not be dated before the seventh century.

Trinitarian Logic

Simo Knuuttila

Helsinki Collegium for Advanced Studies,
University of Helsinki, Helsinki, Finland

Abstract

Two Trinitarian fallacies were discussed or at least mentioned by practically all theologians and logicians from John Duns Scotus to the sixteenth century. One of these was an expository syllogism: This God is the Father; this God is the Son; therefore, the Father is the Son. This was regarded as a fallacy because the premises were *prima facie* true and the conclusion false. There was another similar example in which the corresponding premises were universal propositions arranged in accordance with the first mood of the first figure, the so-called Barbara. The reason for the extreme popularity of these two examples was that they were associated with two basic principles of syllogistic logic. Some theologians argued that Trinitarian problems showed that a special *logica fidei* was needed to improve the traditional logic, which was not universally valid. The more influential approach was the view that these and some analogous examples of Platonic ideas and their instantiations demonstrated how the fine structure of syllogistic premises should be explicated in order to avoid logical difficulties. It was thought that when this was done, the logical problems in arguments involving Trinitarian premises disappeared. Medieval logicians found an analysis which became very influential; the theological background of this innovation explains why logicians continued to quote the above fallacies in discussing the principles of logic. The basis of the new analysis was Abelard's suggestion that the copula of an affirmative proposition indicates that the terms apply to the same logical subject – this is the kernel of the identity theory of

predication, the details of which were particularly developed in discussing the kinds of sameness relevant in explaining how Trinitarian persons, being distinct from each other, are the same as one and the same God.

In dealing with the question of how predication should be understood in logic, Peter Abelard regarded the so-called identity theory as one possibility, the copula of a sentence like “An A is B” indicating that the terms “A” and “B” are said of the same subject. He applied this non-Aristotelian idea to the analysis of Trinitarian problem cases. Two of these were dealt with by practically all medieval and early modern logicians. The first was the so-called expository syllogism:

- (A) The divine essence is the Father
The divine essence is the Son;
therefore, the Son is the Father.

This was regarded as a fallacy because the premises were seemingly true and the conclusion false. There was another similar example in which the corresponding premises were universal propositions arranged in accordance with the first mood of the first figure syllogism:

- (B) Every divine essence is the Father
Every Son is the divine essence;
therefore, every Son is the Father.

In his discussion of an example similar to (A), Abelard states that the standard logical reading of “The divine essence is the Father” is that that which is the divine essence is the Father. This extensional sameness Abelard calls *idem quod* sameness or the sameness of being (*identitas essentiae*). The conclusion is not logically problematic when it is understood in this way; the same is both the Father and the Son. It would be problematic only when read in the sense of intensional sameness which Abelard calls *idem qui* sameness or sameness of property (*identitas proprietatis*), the Father and the Son being simply the same, without any difference.

Abelard’s nontheological examples of extensional singular sameness show similarities with

those employed in contemporary discussions of the question of material constitution. In Abelard’s terminology, when *a* and *b* are essentially identical, they are numerically the same particular being. Things can be the same in this way without exhibiting all the same properties or attributes. Referring to a waxen image, Abelard says that the lump of wax and the waxen image are essentially the same, even though they have different properties; for example, the image is made from wax but the lump of wax is not. Abelard did not develop any metaphysics of the Trinity on the basis of this and similar examples, which were meant to demonstrate the distinction between various notions of identity. Regarding God as metaphysically simple, without any complexities associated with the possession of parts, forms, or properties, Abelard preferred to speak about Trinitarian persons as different on the basis of what was proper to them, believing that he had found a powerful logical analysis of Trinitarian propositions which showed that, while metaphysically problematic, they did not give rise to any obvious logical inconsistency. The idea of numerical or essential sameness of things with different properties was the influential part of Abelard’s theory and came to be employed in various ways in medieval theology.

The reason for the extreme popularity of the two Trinitarian fallacies mentioned above was that they were associated with two basic principles of syllogistic logic. The validity of the first figure syllogistic moods was explained by the *dici de omni et nullo* in the thirteenth-century logic. These immediately evident principles expressed the transitivity of inclusion in first figure moods and were seemingly denied in (B). The expository syllogism as it was used and formulated by Ockham and Buridan was a syllogistic mood with singular premises. While some authors regarded the expository syllogism as another immediately evident principle, there were others who wanted to reduce it to the *dici de omni et nullo*. (A), an alleged violation of a valid expository syllogism, became part of this controversy.

Some fourteenth-century theologians argued that (A) and (B) show that a special *logica fidei* is needed to improve the traditional logic, which is not universally valid. The more influential approach was that these examples suggested how the fine structure of syllogistic premises should be explicated in order to make logic universally valid. It was argued that the logical problems with Trinitarian and some analogous Christological premises largely disappeared when this was done.

William Ockham argued that since the middle term of an expository syllogism could not be one and three, the expository syllogism should not be applied to Trinitarian examples with a middle term that signified the essence. Ockham's position was that theological doctrines associated with the Trinity or the Hypostatic Union involved concepts, the meaning of which was not sufficiently clear to humans who, for this reason, should not apply logic to these doctrines, except in certain unproblematic cases. This did not restrict the universal validity of logic in his view.

While Ockham's position found some followers, Adam Wodeham's approach became more influential. He argued that singular propositions should be universalized in logic and consequently reduced the expository syllogism to the *dici de omni et nullo*. As for (B), he stated that the universal premise should be read as "Anything which is A is B." "Every A is B" is ambiguous because it may be taken to mean that A as a single common nature is numerically the same as those which are B. This is not a "sufficiently universal" syllogistic proposition that meets the requirements of the *dici de omni et nullo*, as the phrase "which is A" explains. "Every essence is the Father" is true on the former reading but false on the latter, since the persons, while numerically the same as the essence, are numerically distinct from each other. Singular theological propositions should be universalized in this way in expository syllogisms. This solved most of the logical problems, since universalized doctrinal formulations were often false because of the intransitivity of the numerical identity in the Trinity of three incommunicable supposita (persons) each of these numerically the same as the communicable essence. Ockham mentioned the same analysis

of universal premises, but as distinct from Wodeham, he did not reduce expository syllogism to the *dici de omni et nullo*.

Wodeham's analysis was based on the identity theory of predication, which became usual among fourteenth-century logicians. In explicating the basic logical form of a logical premise, Wodeham paid attention to the additional problem that among things of which A is correctly said there may be things which the term A supposits for as well as things which are numerically same as these, although A does not supposit for them; therefore "which is A" should be understood as "which is the same as that which is A" and similarly with the predicate term. In order to avoid the impression that these are merely ad hoc theological considerations, Wodeham argues that similar ideas could be applied to the Platonic ontology of real common entities.

Some elements of this analysis of (A) and (B) were often mentioned in late medieval and early modern logical treatises as examples of how singular and universal propositions should be explicated in logic. These matters were also discussed by Leibniz. The new formulations were often associated with the identity theory of predication which Paul of Venice later referred to as *praedicatio identica*, but this expression had other meanings as well, for example, in John Duns Scotus who applied it to sameness without formal identity in the Trinity.

Abstract

The teaching that there are three persons in God is a fundamental Christian doctrine. It is taught in the Scriptures, especially, but not exclusively, in John's Gospel, where we learn

that the Word who is God became flesh and where Christ, the Word-made-flesh, speaks of sending "to you from the Father the Spirit of truth who comes from the Father." Early Church councils established the basic doctrine that the three persons of the Father, the Son, and the Holy Spirit are one substance. Later theologians, especially Sts. Augustine and Thomas Aquinas, attempted to find and explore analogies that might bring greater understanding to this central article of the Christian Creed.

The term "Trinity" is the theological expression for one of the chief mysteries of the Christian faith. It refers to the three persons that are united in the one God. "Trinity" could be considered a summary expression for "three-in-one." The thirteenth-century theologian Thomas Aquinas spoke of some truths of the Christian faith as natural and some as supernatural. The former are truths that can be discovered by human reason and in fact have been discovered by some philosophers who have examined reality more deeply. Such thinkers have proved the existence of God and argued that God is one, and attempted to demonstrate other necessary attributes that could be predicated rightly of God. Supernatural truths are beliefs that are not discoverable by human efforts but are only known through God's biblical revelation. Examples of supernatural truths are the Incarnation (that God became man, uniting Himself to a human nature in the person of Jesus Christ) and the Trinity (that God, though one God, is three persons – Father, Son, and Holy Spirit.).

The "three-in-one" character of God is taught in the Christian scriptures and is affirmed by the earliest Apostolic Fathers. However, the main focus of authors of the early Apostolic age, such as Clement of Rome and Ignatius of Antioch, was on Christ himself, not on wrestling with problems of how Christ as the Son of God related to his heavenly Father. Such questions arose with the next generation of the Fathers, the Apologists, who had to confront the many unsatisfactory attempts at reconciling the New Testament revelation of Christ as the Son of God and the inherited

view that God is one. One faulty type of explanation is found in the modalism of Sabellius and Praxeas. For Sabellius, God is one, but he manifests himself in different ways in the story of man's redemption and salvation. For Praxeas, there is one God who exists in such a way that when Christ suffered it was the Father, who alone is God, that suffered. Another unsuccessful effort to reconcile the divinity of Christ with the oneness of God is found in subordinationist explanation that portrayed God the Father as a monarch at the expense of Christ's true divinity. The Word "through whom all things were made" and the Word who "was made flesh," according to John's Gospel, is not for subordinationists an eternal Word, but is tied to the temporal and contingent character of creation and the Incarnation.

The challenge to Patristic Apologists was to find more faithful ways of reconciling the unicity of God and the divinity of Christ. In the Latin world, Tertullian, in chapter II of his treatise *Against Praxeas*, attacked him for "thinking that one cannot believe in One Only God in any other way than by saying that the Father, the Son, and the Holy Spirit are the very selfsame Person." Tertullian puts his own position in positive terms by appealing to the rule of faith: "All are of One by unity of substance; while the mystery of the dispensation is still guarded, which distributes the Unity into a Trinity, placing in their order the three persons: the Father, the Son, and Holy Spirit." With Tertullian we find the vocabulary of *Trinity*, *substance*, and *person*, key terms in later doctrinal discussions of the triune God. However, the precise meaning of a term like "substance" is lacking in Tertullian's works and would need later clarification. In the Greek world, St. Justin, in his *Dialogue with Trypho*, not only declared that Christ was the Son of God in the sense of the eternal Son of God; but also tried to explain how this was the case. In this effort he was followed by Athenagoras and also by Theophilus, who, in his *Letter to Autolycus* (II, 22) offered the following analogy: "For before anything came into being He had Him" (i.e., the *Logos*) as counselor, being His own mind and thought.

Other Fathers searched for greater understanding of the inner relationship of the Father and the Son by pursuing clues in the words of Christ himself. Christ

had spoken of coming forth or proceeding from the Father (John 8:42). He also spoke of sending "to you from the Father, the Spirit of truth who comes from the Father" (John 15:24). In efforts to grasp the meaning of these expressions of "coming forth" and "coming from" later Greek and Latin Fathers examined how they might better understand a divine coming forth or procession. When we hear the words "father" and "son" we might well imagine that in some way a son comes from or proceeds from his father. Still, a human father and his son are distinct substances. How can we understand that the divine Son proceeds from the Father and yet is the same substance as the Father? Origen, in his *On the Principles* (I, 2, 4), was well aware of the limits of our analogies concerning God's inner nature. Still he attempted to portray in some small way the nature of the generation of the Son:

► For we must of necessity hold that there is something exceptional and worthy of God which does not admit of any comparison at all, not merely in things, but which cannot even be conceived by thought or discovered by perception, so that a human mind should be able to apprehend how the unbegotten God is made the Father of the only-begotten Son: because His generation is as eternal and everlasting as the brilliancy which is produced from the sun. For it is not by receiving the breath of life that He is made a Son, by any outward act, but by His own nature.

Elsewhere, Origen speaks of the Father, Son, and Holy Spirit as three *hypostases* or "persons" and affirms that they are *homoousios* or "of the same substance." Despite these contributions of Origen, there were also ambiguities in other parts of his writings. He referred to the Father as God (*ho theos*) and the Son as a second God (*deuteros theos*). He also spoke of the Son as God insofar as He contemplates the Father, but that he is no longer God when he ceases to gaze at the Father. Some of these observations fed the subordinationist theses of Arius, who declared that there was a time when the *Logos* did not exist, thus making Him a demi-god between the Father and the created world. Despite the ambiguities of

Origen's position, the First Nicean Council borrowed Origen's term *homoousios*, that is "of the same substance," to underscore the truly divine nature of the Son. The conciliar Creed thus declares that the Son "is begotten, not made, one in being with the Father."

Debate did not end at this point, especially over *homoousios*: some asked if "of the same substance" or "one in being" referred to a numerical sameness or oneness or a generic similarity. St. Athanasius fought the subordinationists who portrayed the Holy Spirit as holding a rank inferior to the Father and the Son. Basing themselves on the assumption that the mission of the Holy Spirit in the economy of salvation is to sanctify, the post-Nicean subordinationists argued that the Spirit was only a creature bringing salvation to men. Athanasius pushed further, declaring that the Spirit's role in salvation was to bring both sanctification and deification to men, and that He could not bring deification unless He were God. Still, Athanasius was not clear on the distinction between *ousia* (substance) and *hypostasis* (person). It was the Cappadocian Fathers, Sts. Basil, Gregory of Nyssa, and Gregory of Nazianzen, who distinguished clearly the unique divine *ousia* or substance and the three *hypostases* or persons, by insisting on the real distinction between the three persons. Thereafter, the Nicean declaration concerning *homoousios* ("of the same substance") gained greater currency, and at the second ecumenical council, held at Constantinople in 381, the application of the basic dogma concerning the Father and the Son was extended to the Holy Spirit.

The "three-in-one" formulation of these councils established the basic doctrine of the Christian Church: the three persons of the Father, Son, and Holy Spirit are one substance. Beyond their role in establishing this basic doctrine, the Cappadocian Fathers also developed a theology for defending and bringing greater understanding of its truth. St. Basil attempted to provide an explanation for the distinction of persons by presenting actions by which each person was God: "paternity," "filiation," and "sanctification." Gregory of Nazianzen described the three persons by using the verbal forms: "being unbegotten," "being begotten," and "proceeding." St. Augustine, following Sts.

Hilary and Ambrose in the Latin world, likewise developed a rich theology of the Trinity, especially in his work entitled *The Trinity*. The first part of this book provides the Scriptural bases for the doctrine of the Trinity. The second part presents the official Christian teaching and refutes the heresies that oppose this teaching. After establishing these points, Augustine then attempts to find analogies to foster our understanding of this teaching, mainly concentrating on the words of Genesis 1:26, which portrays man as created in the image of God. If man is an image of God, it must be in his soul that he can be an image of such a spiritual being. For Augustine, this image is found in man's memory, intelligence, and will, and as he examines them, he arrives at the knowledge of his unique soul that through memory remembers, through intelligence knows and through will loves. Augustine thereby comes to a rich knowledge of his multifaceted self; but at a still deeper level he also comes to realize that these acts tell us something of the source and foundation of his soul and its three activities: the Father, the Son, and the Holy Spirit of whom he is but an image.

St. Thomas Aquinas, in the thirteenth century, attempted to deepen and unite many of Augustine's insights that were based on man's interior life into a more ontological synthesis. He brought out the difference between divine processions and human processions by trying to explain the difference between a transient procession (where a distinct substance comes forth) and an immanent procession (where a different Person, the Son, comes forth, who is yet identical in substance with the Father). In the human world, when we think of a father as a father and the son as a son, we know that we are thinking of them not just as men (something absolute in themselves), but we are also thinking of them as related to one another. Technically speaking, we would say that "father" and "son" express relations. Yet, normally, such relations exist between things that are in themselves absolute distinct substances. The challenge to Christian theologians like Aquinas, in their efforts to offer some limited understanding of how the Father as Father, the Son as Son, and the Holy Spirit as proceeding from the Father

and the Son or from the Father through the Son are all the one God, is to explain how relations in the triune God are not accidental relations between distinct substances but subsistent relations, that is, relations of such a character that it is by being the Father that the Father is God and by being the Son that the Son is the same God, and it is in being the Holy Spirit that the Holy Spirit is God. These theological approaches of Augustine and Aquinas, like those of Basil and Gregory of Nazianzen, were the chief analogical routes followed by medieval theologians to bring some understanding to the teaching of the Church that God is “three-in-one.”

Truth, Theories of

Catarina Dutilh Novaes

ILLC and Department of Philosophy, University of Amsterdam, Amsterdam, The Netherlands

Abstract

This entry surveys five influential medieval theories of truth, paying particular attention to the bearers of truth within each theory as well as to their emphasis, whether metaphysical or semantic. (1) Anselm's notion of truth is characterized by the concept of rectitude: something is true if it is/does what it ought to be/do, that is, if it conforms to God's design for it (2) Abelard's theory of truth revolves around the notion of the *dicta* of propositions, i.e., what is said by propositions. *Dicta* are the actual truth-bearers for Abelard. (3) Thomas Aquinas defends an approach to truth based on the notion of adequation of intellect and object. The fit can occur in both directions: an object can conform to the concept of it in its creator's intellect, and a concept can conform to the object insofar as it represents it accurately in the knower's intellect. (4) Theories of truth based on the concept of supposition provide recursive definitions of the truth of propositions based on the supposition of their terms, and reject any metaphysical import concerning the notion of truth. (5) Theories of truth emerging from fourteenth century treatises on *insolubilia* start out with a fundamentally Aristotelian definition of a true proposition as a proposition signifying as things are, which is then modified so as to introduce quantification over the signification of a proposition.

The notion of truth was of crucial importance for medieval philosophers, as could be expected given their keen interest in logic and semantics, on the one hand, and in metaphysics and philosophical theology on the other. (Naturally, there is a strong medieval tradition dealing with a biblical

notion of truth. Here, however, we will focus on philosophically inclined theories of truth, even though the line between theology and philosophy is a very thin one in the medieval context.) But to attain an accurate understanding of medieval theories of truth, it is important to realize that the class of such theories is more heterogeneous than the class formed by modern theories of truth. For example, we philosophers of the early twenty-first century (in particular those working within the analytic tradition) are accustomed to viewing truth essentially as an attribute of complex linguistic entities. Now, when examining medieval theories of truth, the modern philosopher may be surprised by the wide variety of entities that can receive the attribute “true” – truth-bearers for short: propositions (in the Latin sense of *propositio*, i.e., roughly what is now known as a declarative sentence, a statement, but which can be spoken, written, or mental), as to be expected, but also objects, mental judgments, actions, and even God.

A general characteristic of these theories (in fact, of medieval logical theories in general) is the influential position occupied by the Aristotelian corpus, in particular discussions from the *Categories* and *De interpretatione* (in first instance) and the *Metaphysics* (which only became widely read halfway the thirteenth century, see Dod 1982). Also influential was the neoplatonic-Augustinian conception of truth which equated truth to being: “The true is that which is” (Augustine, *Soliloquia* II, 5, quoted in Aertsen 1992:160). These two radically different sources of inspiration may explain the heterogeneity of medieval theories of truth, which will be illustrated here by the analysis of five representative medieval approaches to truth.

To help us understand the different theories in their diversity, a few distinctions may come in handy. First, among the different medieval theories, one encounters two basic kinds of entities to which truth is attributed – two kinds of truth-bearers: linguistic and mental entities, and objects in extra-mental reality. Indeed, the attribution of truth to objects is one of the distinctive features of some medieval theories of truth (known as objectual (Künne 2003:3.1.2) or ontological

(Wippel 1989:295) truth in the literature). But all medieval theories recognize spoken, written, and mental propositions and judgments as bearers of truth as well (known as propositional (Künne 2003:3.1.2) or logical (Wippel 1989:295) truth in the literature).

Secondly, let us distinguish between metaphysical and semantic approaches to truth, a distinction pertaining to *emphasis*. The metaphysical approach is characterized by the focus upon the properties and states of things that make truth-bearers true. By contrast, the semantic approach is characterized by minimal or no focus on what must obtain in reality for an entity to be deemed true; rather, semantic theories of truth concentrate on properties of the linguistic entity in question, in particular its signification or the supposition of its terms, in order to determine its truth-value. In other words, what makes a proposition true within the semantic approach are primarily properties of the proposition itself, and not the state of things in reality.

Notice that one should not conflate the metaphysical approach with correspondence theories of truth, which are characterized by the idea that truth is a relational property involving a relation (often of likeness) of a given entity to some portion of reality. Indeed, there are semantic theories of truth that are also fundamentally based on correspondence. To illustrate the difference between metaphysical and semantic approaches, consider two correspondentist definitions of the truth of propositions:

1. A proposition is true iff things are as it signifies them to be.
2. A proposition is true iff it signifies things to be as they are.

In (1), the truth of a proposition depends on properties of things, and its signification is, as it were, taken for granted (it is not under scrutiny); therefore, (1) characterizes a metaphysical approach to truth. By contrast, in (2) the truth of a proposition depends on a feature of the proposition itself, its signification, and the state of things is in turn taken for granted; (2) is thus a semantic definition of truth.

But, to be sure, not all medieval theories of truth are based on correspondence; those articulated on the basis of the notion of supposition, for example, are not. In the latter case, truth is not a relational property but rather a monadic property of truth-bearers.

Notice also that, with respect to the first distinction, a semantic theory of truth will only have linguistic entities as its truth-bearers. A metaphysical theory of truth may recognize nonlinguistic as well as linguistic entities as its truth-bearers; but a theory of truth whose truth-bearers are exclusively propositions, but which focuses on what must obtain in reality for propositions to be true and not on their semantic properties is also, according to this distinction, a metaphysical theory of truth (in what follows, I do not treat such theories, but one could find examples thereof among fourteenth-century realists such as Walter Burley and John Wycliff; see Cesalli 2007). It is not the nature of truth-bearers that makes a theory semantic or metaphysical, but rather the nature of their causes of truth, i.e., whether semantic or metaphysical facts.

Anselm of Canterbury

Anselm's theory of truth, presented chiefly in his *De veritate*, illustrates remarkably well the heterogeneity of medieval theories of truth. Anselm analyzes the notion of truth under several different facets, as applying to different kinds of entities; but ultimately, only God is the real Truth for Anselm, and all other truths emanate from Him. As such, his theory is representative of the neoplatonic-Augustinian approach, which emphasizes the truth existing in things but ultimately emanating from God (see Hopkins (2003:148) for the influence of Augustine over Anselm's notion of truth).

The core of his conception of truth is the notion of rectitude (see Visser and Williams 2004); something is true if it does what it ought to do, that is, if it conforms to God's design for it. As such, it can apply to literally all of God's creation: a friend is a true friend if she does what

a friend is expected to do (to be supportive, loyal, etc.); an action is a true action if it fulfils its purpose; and so forth. Anselm's notion can be schematically formulated as follows: an entity A is true iff it corresponds to God's concept of A. Notice that truth is a relational property for Anselm, but the second *relatum* is not a portion of reality as in standard correspondence theories of truth; rather, it is a divine concept, while the first *relatum* (the truth-bearer) is any object of God's creation, linguistic as well as non-linguistic entities.

In *De veritate*, which is written in the form of a dialogue between Teacher and Student, Anselm starts by examining the truth of propositions, as this is (he recognizes) the most commonsensical use of the notion of truth (chap. 2). He presents what we could call a correspondence notion of truth for propositions: they are true if they state that what-is is and that what-is-not is not (a terminology borrowed from Visser and Williams 2004); but for Anselm this position is not a primary thesis. It is derived from the notion of truth as rectitude applied to a fundamental aspect of propositions: their purpose is to state that what-is is and that what-is-not is not, and therefore if they fulfill this purpose (if they do their job), then they are true. The same holds with respect to thoughts: "for the power of thinking that something is or is not was given to us in order that we might think that what-is is and what-is-not is not." (*De ver.* 3). Similarly, truth with respect to will (*De ver.* 4) and actions (*De ver.* 5) is defined as rectitude, as willing and doing what one ought to.

As for the truth in the being of things (*De ver.* 7), Anselm's conception of truth is clearly teleological. Every entity in God's creation has a purpose according to His design, and if it fulfills this purpose, then it is true. But given God's omnipotence, all things are (presumably) as He intends them to be, and thus "whatever is, is right" (Visser and Williams 2004:211). Here it becomes patent that, according to Anselm (following Augustine), truth equals to being.

And thus, just as much as God is the cause of all being, all truth comes from God and He is the supreme Truth. However, rectitude does

not apply to Him in the same way as it applies to His creation, since He “owes nothing to anything.” In other words (and this is something of a paradox, which Anselm deals with in *De ver.* 13), truth properly speaking pertains only to God, even though truth in God does not correspond to rectitude, as it does in His creation.

One of the upshots of Anselm’s conception of truth is that he is able to account, in a unified way, for uses of the predicate “true” that are often neglected by more restrictive theories of truth, such as in “true friend,” “true world,” etc. This also reveals the essentially metaphysical character of Anselm’s theory: what makes something true are properties and states of things (the very things which are said to be true, insofar as they conform to God’s design for them), and not semantic properties of linguistic entities (even when propositions are truth-bearers).

Peter Abelard

Contrasting with Anselm’s patently metaphysical approach to truth, Abelard’s is resolutely semantic: he focuses on a semantic property of propositions, namely the content they express. (Abelard will of course often use the term “truth” in his theological writings as well, but we will not deal with this material here.) His approach is representative of approaches to truth inspired by the *logica vetus* material (on the *Logica vetus* vs. *Logica modernorum* distinction, see entry on Logic in this volume); he develops it in different parts of his *Logica* “*ingredientibus*,” in particular in the parts corresponding to his commentaries on Aristotle’s *De interpretatione* and on Boethius’ *De topicis differentiis* (Abelard’s considerations on truth are in fact scattered throughout his writings and thus not systematically presented). Abelard’s discussions of the concept of truth are embedded in his general analysis of the semantics of propositions. Indeed, one of the most debated but still mysterious aspects of Abelard’s semantics, the famous *dicta* (the contents of propositions), is at the heart of the issue of truth.

Abelard’s very criterion of what is to count as a proposition (following Boethius and Aristotle) is

based on the concept(s) of truth (and falsity): a proposition is what signifies the true or the false (*significare verum vel falsum*) (*LI De in.* 3.01.100). Notice that, according to this definition, a proposition is not true or false, but it *signifies* the true or the false. This implies that, for Abelard, propositions are not the primary truth-bearers, but rather that they signify something which in turn is a truth-bearer properly speaking. What would that be? Abelard states that truth and falsity can be understood in three ways: as applying to statements (propositions); as applying to the understanding provoked by a statement; and as applying to what is said to be the case by a statement, its *dictum* (*LI Top.* 225, 22–29). He then goes on to argue that understandings cannot be truth-bearers properly speaking because incomplete expressions may have the same understandings as complete statements (for example, “A man runs” and “A running man” share the same understanding), but incomplete expressions cannot signify the true or the false, since they are not propositions (see Jacobi et al. 1996:32).

That this is so also transpires from Abelard’s analysis of what differentiates propositions from other (complete) speech-acts such as questions, orders, wishes, etc. These different expressions can have the same intelligible content, but only propositions signify the true or the false, because only they consist in an evaluative judgment concerning truth and falsity (*LI De in.* 3.01.100). Indeed, according to Abelard, a proposition P corresponds to the assertion that P is true (cf. Jacobi 2004:146); in other words, he may be seen as maintaining the schema “ $P \Leftrightarrow$ It is true that P.” In Latin, such impersonal propositions (the right-hand side of the schema) are usually formulated with the “accusative-infinitive” nominalized form of the embedded proposition (for example, *Verum est Socratem currere*). The nominalized form asserts precisely the content of the proposition, that is, its *dictum*. A *dictum* is “that which is said by the proposition” (*LI De in.* 3.04.26), that is, its content plus the assertion that what it signifies does obtain in reality. Therefore, for Abelard, *dicta* are the ultimate bearers of truth and falsity, since it is to them that the terms “true” and “false” are related by means of such propositions

of the form “It is true that P.” Propositions are true or false derivatively, insofar as they state true or false *dicta* (cf. Nuchelmans 1973:9.4.3). Abelard’s notion of truth is thus essentially semantic: it is a semantic property of a proposition, i.e., the *dictum*/content that it expresses, that makes it true or false.

Notice that this view implies a deflationist notion of truth: to assert the truth of a proposition is equivalent to simply asserting the proposition itself. From the truth of a proposition one cannot draw major metaphysical conclusions: if “a man is white” is true, one can merely conclude that there is a thing which is a man and is also white (*LI Cat.* 59–60) (see also King 2004:4). But Abelard can also be seen as holding a correspondence theory of truth when he glosses the sentence “It is true that Socrates is a man and not a stone” as “It is the case in reality (*in re*) that [Socrates] is a man and not a stone” (*LI De in.* 3.04.26) (see also *LI De in.* 3.01.100).

In short, the distinguishing characteristic of Abelard’s theory of truth is the crucial role played by *dicta*. But *dicta* are neither linguistic entities nor real things in reality, and thus Abelard’s truth-bearers seem to fit neither of the two main kinds of truth-bearers mentioned above. Some (e.g., Nuchelmans 1973:9.4.2) view Abelard’s *dicta* as states of affairs; others (e.g., King 2004:4) take literally his claim that *dicta* are nothing at all. They stand to propositions in the same relation as things to their names, and yet they are not actual things. But the fact that their ontological status is debatable must not overshadow their central role in Abelard’s theory of truth and his semantics in general.

Thomas Aquinas

Aquinas’ main discussions of the notion of truth are to be found in his commentary to Peter Lombard’s *Sentences*, in his *Quaestiones disputatae de veritate* and in his *Summa theologiae* (*ST*) I^a, question 16 (for the sake of coherence, here we shall focus on this latter text; for the different stages of development of Aquinas’ notion of truth, see Wippel 1989). His concept of truth can

be seen as reconciling two important trends (see Wippel 1989:295 and Aertsen 1992), the neoplatonic-Augustinian conception attributing truth to things, and the Aristotelian conception (stemming from the *Metaphysics*) that attributes truth to the intellect and emphasizes truth as likeness.

Aquinas’ notion of truth is based on the concept of *adequatio*: truth is adequation of intellect and object. The etymology of adequation is related to that of equal, and indeed the idea here is that of quasi-equality between intellect and object. Adequation in this sense corresponds to identity of forms: truth occurs when the object and the concept in question share the same form. Truth is thus again viewed as a relational property, as in modern correspondence theories of truth, but this time it involves concepts and objects instead of propositions and facts as its *relata*. Aquinas does discuss the truth of propositions as well (in *ST* I^a q. 16 a. 8 ad 3), but their truth is derivative from truth in the intellect.

This relation of adequation is established by an act of the intellect, and can be established in two directions: an object is true if it conforms to the relevant concept, whereas a concept is true if it conforms to the relevant object (see Künne 2003:104). (Notice that, for Anselm, only the direction of adequation from object to (divine) concept characterizes the notion of truth.) These two directions are exactly what Aquinas needs to reconcile the two radically different approaches to truth that he takes as his starting point, namely truth of the intellect and truth of a thing; see Aertsen (1992:163/4).

Aquinas maintains that “truth resides primarily in the intellect, and secondarily in things according as they are related to the intellect as their principle” (*ST* I^a q. 16 a. 1 co.), so concepts are in fact the primary bearers of truth for him. An object can be said to be true by analogy, insofar as it is related to a true concept (i.e., one that conforms to the object); but an object is also true if it conforms to the design of the intellect behind its creation. Natural things are true insofar as they conform to the forms they have in the divine intellect. Similarly, artifacts are true if conformity occurs with the form they have (the original

concept) in a human intellect (such as the relation of the plan of a house made by an architect and the house actually built). In both directions, properties of things define the truth of an entity (be it a concept or an object); Aquinas' notion of truth is thus fundamentally metaphysical. Moreover, Aquinas develops his notion of truth against the background of his doctrine of transcendentals (see entry in this on Transcendentals): truth and being are ultimately convertible (Aertsen 1992: sect. 6).

There are two kinds of truths, the immutable truth of God and the finite truth of humans (*ST* cf. I^a q. 16 a. 8 co.). In the case of the finite truth of humans, the truth of concepts insofar as they represent objects corresponds to the direction of adequation from concepts to objects. By means of an act of predication (composition, in case of an affirmation, or division, in the case of a negation), a certain property is attributed to an object by the intellect; if the object is indeed such-and-such, then the concept representing it can be said to be true: "the being of the thing, not its truth, is the cause of truth in the intellect" (*ST* I^a q. 16 a. 1 ad 3). This kind of truth is referred to by Aquinas as accidental truth (*per accidens*), which is the truth pertaining to the knower who knows an object but upon whom the object does not depend (see Aertsen 1992:162). It is opposed to the essential truth (*per se*) of the divine intellect that designs and represents all natural things (since God is their creator) and of the human intellect with respect to artifacts (cf. *ST* I^a q. 16 a. 1 co.). Obviously, given God's perfection, adequation of concepts in the divine intellect to things in an accidental way simply does not occur. Only essential truth pertains to the divine intellect, and accidental truth is proper to finite human knowers.

Indeed, God is ultimately Truth itself for Aquinas (I^a q. 16 a. 5 co.): truth is adequation of intellect and being, and in God this adequation occurs "to the greatest degree." In God there is total coincidence of intellect and being, as the forms present in the divine intellect are the very causes of the forms present in each object of His creation. "His being is not only conformed to His intellect, but it is the very act of His intellect; and His act of understanding is the measure and cause of every other being and of every other intellect".

Theories of Truth Based on the Notion of Supposition

Contrasting with Aquinas' metaphysical approach to truth and stemming from entirely different sources, the thirteenth century witnessed, within the terminist tradition (represented by Peter of Spain, William of Sherwood, etc.), the emergence of a new and subsequently very influential approach to truth founded on the notion of supposition. It is perhaps the best example in the history of philosophy of a theory of truth that is genuinely not based on correspondence.

The notion of supposition was developed within the general framework of medieval properties of terms (see Read (2006) and the entry on Supposition Theory in this volume). In the thirteenth century, supposition was one among other equally important properties of terms, but in the fourteenth century it came to occupy a privileged position. In particular, it was used for the analysis of the truth-conditions of the basic types of categorical propositions (the A, E, I, and O Aristotelian logical forms). This approach had among its proponents Ockham (in the first chapters of the second part of his *Summa logicae*) and Buridan (e.g. in the first chapters of his *Treatise on Consequences*). Its main idea is that an affirmative proposition is true iff there is identity between the *supposita* of the subject and of the predicate, while a negative proposition is true if this does not occur (the *supposita* are the entities which a given term in a proposition supposits or stands for). But this general principle must be refined by means of truth-conditional clauses for propositions of different logical categories:

- "Every A is B" is true iff "the predicate supposits for all those things that the subject supposits for, so that it is truly predicated of them" (Ockham 1998:96).
- "No A is B" is true if the predicate supposits for none of the things that the subject supposits for, or if the subject does not supposit for anything.
- "Some A is B" is true iff "the subject and predicate supposit for some same thing" (Ockham 1998:92).

- “Some A is not B” is true if “the subject supposits for something that the predicate does not supposit for” (Ockham 1998:92), or if the subject does not supposit for anything.

Notice that negative propositions have two causes of truth, as Ockham puts it: either if there is no co-supposition of their terms in the appropriate case (universal or particular), or if the subject does not supposit for anything at all, then the proposition is true, since in the latter case the absence of co-supposition obtains trivially. Moreover, the same procedure can be applied *mutatis mutandis* to propositions whose verb is tensed or accompanied by a modality (see chaps. 7, 9, and 10 of part II of Ockham’s *Summa logicae*).

These definitions can also be formulated as recursive definitions of truth-conditions on the basis of the truth of more fundamental propositions, namely, singular propositions whose subject is a demonstrative and whose predicate is one of the terms of the proposition whose truth-conditions are being established. This is because for a term A to supposit for something amounts to the truth of a singular proposition “This is A,” where “This” supposits for the thing in question, and so does “A”.

A problem for Ockham’s account is the threat of circularity: while the truth of propositions, including singular propositions with demonstratives as their subjects, is defined in terms of the supposition of their terms in the first chapters of part II of the *Summa logicae*, elsewhere the supposition of terms is in turn defined in terms of the truth of such singular propositions. It is clear that one of the two notions, either supposition or the truth of singular demonstrative propositions, must be taken as primitive if the theory is to avoid circularity.

Besides the technical aspect of formulating precise truth-conditions for different logical forms of propositions, Ockham’s theory of truth is also a rejection of a metaphysical approach in favor of a semantic approach to truth (see Perler 1992: chaps 1 and 2, Moody 1953: chap. III and Dutilh Novaes forthcoming). The fundamental cause of truth of propositions is a semantic property of their terms, namely their supposition, and

not actual properties of the objects in question. Ockham stresses this idea in several passages, for example in.

- Thus, for the truth of ‘This is an angel’ it is not required that the common term ‘angel’ be really identical with what is posited as the subject, or that it be really in that subject, or anything of this sort. Rather, it is sufficient and necessary that the subject and predicate supposit for the same thing (Ockham 1998:86).

Another significant aspect of Ockham’s account of truth is that truth-bearers are the actually formed propositions of a language, be they spoken, written, or mental; he (as well as Buridan) is what we could call an inscriptionalist with respect to truth-bearers. Truth is a monadic predicate attributed to them, and this attribution is formulated with the special *dictum* construction: a proposition whose subject is the nominalized form of the proposition to which truth is attributed (terms in the accusative case and verb in the infinitive mode) and the predicate is the term for true, “*verum*” – for example, *Socratem esse hominem est verum*. So truth is nothing more than a predicate of propositions, namely those that are true, and this in turn depends solely on the supposition of their terms.

In sum, theories of truth based on the concept of supposition, Ockham’s in particular, have the distinctive trait of rejecting metaphysical foundations for truth; the burden here is to be borne exclusively by semantic properties. Moreover, in contrast with Anselm and Aquinas, truth is attributed exclusively to complex linguistic and, more importantly, mental entities. Indeed, the primary bearers of truth-value for Ockham as well as for Buridan are mental propositions; spoken and written propositions are only derivatively true, insofar as they are related to true mental propositions.

Semantic Theories of Truth in the Fourteenth Century: *Insolubilia*

Developing parallel to, and sometimes overlapping with, uses of the notion of supposition in

accounts of truth, there is a very rich tradition of theories of truth in the fourteenth century to be found in treatises on *Insolubilia*, that is, treatises on paradoxes. They are semantic correspondence theories of truth, and thus illustrate that correspondence theories of truth need not be metaphysical (in the sense presented here).

A watershed is widely recognized to be Thomas Bradwardine's treatise, written in the first half of the 1320s. Until then, the most popular solutions to such paradoxes had little to offer as theories of truth: the *restringentes* approach, for example, consisted only in a ban or restriction to self-reference in general, and for propositions containing the predicate "true" in particular. By contrast, the apparatus presented by Bradwardine in his *Insolubilia* is the germinal state of a full-fledged theory of truth. Bradwardine's starting point is the Aristotelian formula *propositio vera est oratio significans sicut est*, that is, a correspondence view on truth with a semantic emphasis on the signification of the proposition – the second *relatum* of the relation of correspondence is minimally referred to as *sicut est* with no further elaboration on what must obtain in reality for a proposition to be true. The truth of a proposition depends primarily on its signification, not on how things are.

In order to prove that Liar propositions and other paradoxical propositions are false, Bradwardine modifies this formula and posits that "A true proposition is an utterance signifying only [*tantum*] as things are" (first definition in chap. 6, 6.2 in Read's edition and translation). He then goes on to prove that a Liar proposition says (at least) two things, namely, that it is false and that it is true. Since both things cannot obtain, he concludes that a Liar proposition does not signify *only* as things are; it signifies partially as things are (that it is false), but since it also signifies something that does not obtain (that it is true), it is not a true proposition (see Read 2002).

This definition of truth implies a few important assumptions: propositions may (in fact typically do) signify several things, and true propositions are only those whose total signification obtains, that is, if each and every thing that a proposition signifies is the case. It is thus what we could call a

quantificational definition of truth, and truth is associated with universal quantification (see Dutilh Novaes 2008). Accordingly, a proposition is false if it fails to comply with the peak of success associated with a true proposition, that is, if at least one of the things it says is false. Therefore, while truth is associated with universal quantification, falsity is associated with existential quantification.

A variation of this approach to truth can be found in Buridan's treatment of insolubles. While his main theory of truth is based on the concept of supposition, following the same lines of Ockham's theory, Buridan recognizes that, in the case of Liar propositions, the co-suppositional criterion is not sufficient to determine their truth-value (cf. *Sophismata* ch. 8, 7th sophism). In such cases, not only the proposition itself must satisfy the co-suppositional criterion to be true, but also all of its implications. But since Buridan thinks that all propositions virtually imply their own truth, Liar propositions imply that they are true and that they are not true, and thus cannot satisfy the criterion for truth and are simply false (see Read 2002, Klima 2004 and Dutilh Novaes forthcoming for details).

In Albert of Saxony, writing shortly after Buridan, one finds a hybrid of the quantificational and the supposition approaches to truth. Albert's first definition is a reformulation of Bradwardine's definition of truth: "A true proposition is one which, in whatever way [*qualitercumque*] it signifies, so it is" (in Pozzi 1978:316). It replaces the term *tantum* in Bradwardine's definition by one which is even more explicit with respect to the universal quantification implied in the definition, *qualitercumque* (also to be found in Buridan's treatise on consequences (TC) to define the truth and the modality of propositions; however, he adds that this is just a way of speaking (TC, 21), a shorthand way to refer to the different truth-conditions of propositions on the basis of the supposition of their terms, which he discusses earlier in the text.). Albert then goes on to add a few theses equating the truth or falsity of propositions to the co-supposition (or lack thereof) of their terms. From these definitions and suppositions he then draws the conclusion (third thesis)

that all propositions signify their own truth. So with Albert (as with Buridan) we have something of a forerunner of one of the directions of the Tarskian T-convention: here the relation between a proposition and the assertion of its truth is that of signification, while with Buridan it is a relation of (virtual) implication.

Conclusion

At the end of the fourteenth century, Paul of Venice composed a treatise on the truth and falsity of propositions (*Tractatus de veritate et falsitate propositionis*) that summarizes (by means of a long list of alternative definitions of truth) the two main approaches to truth in the fourteenth century, the one based on supposition and the one based on the signification of propositions. (Another interesting fourteenth-century approach to truth, not discussed here for reasons of space, can be found in the tradition of the theories of *probationes terminorum*, exemplified by Richard Billingham's *Speculum puerorum*.) It is significant that, while in the first half of the fourteenth century one does not find treatises explicitly on the truth of propositions (discussions on truth were then to be found in treatises on the properties of terms and on insolubles), toward the end of the century such treatises started to appear. Also significant is that in the fourteenth century one does not encounter the attribution of truth to non-linguistic objects, as with Anselm and Aquinas. Truth is then seen as an attribute exclusively of propositions (written, spoken, or mental), and the titles of such treatises invariably feature the genitive *propositionis* applied to *De veritate* (while both Anselm and Aquinas wrote treatises entitled “*De veritate*” tout court).

al-Ṭūsī, Naṣīr al-Dīn

Ivana Panzeca

University of Barcelona, Barcelona, Spain

Abstract

Naṣīr al-Dīn Muḥammad ibn Muḥammad al-Ṭūsī was born in 1201 in Ṭūs, in Khorasan, within a family of Twelver Shī'ite allegiance. Philosopher, theologian, and author of about 150 works, he was considered a “third master,” after Aristotle and al-Fārābī. He was educated in Ṭūs and then he completed his education in

Nīshāpūr, a highly reputed cultural center of his times, in Iraq and in Mosul. His studies included Arabic, logic, metaphysics, mathematics, medicine, law, religion, and natural sciences. Because of the Mongol invasion, he took refuge in Qūhistān's fortresses, under the protection of the governor Naṣīr al-Dīn Muḥtashim. He then rapidly converted to the Ismā'īlī faith and completed his main philosophical treatises, among which was his commentary to Avicenna's *Ishārāt*.

After Alamūt's fall, Ṭūsī became vizier of Hūlāgū, the Mongol commander. Thanks to Hūlāgū's patronage, Ṭūsī established in Maragha the largest astronomical observatory of the times. He died in Baghdad in 1274 and was buried next to the seventh Shī'ite Imam in a site near the city.

Naṣīr al-Dīn al-Ṭūsī is considered one of the most important figures of Islamic thinking. He was one of the most prolific scholars of the thirteenth century, and left his mark on most literary and scientific disciplines.

al-Ṭūsī, Naṣīr al-Dīn (Ṭūs 1201- Baghdad 1274)

Naṣīr al-Dīn al-Ṭūsī, also known as *khwāja*, is one of the most important figures in Islamic intellectual history. A philosopher, theologian, mathematician, and astronomer, he was honored with the title of "third teacher," after Aristotle and al-Fārābī.

He was educated at Ṭūs, in Khorasan, by his father, Muḥammad ibn al-Ḥasan, a famous jurist of the Twelve Imam school of Shī'ism, with whom he was initiated in religious and intellectual sciences. Ṭūsī devoted himself to the study of Arabic language and grammar, to the reading of the Qur'ān to *ḥadīth*, and Shī'ite jurisprudence. With his maternal uncle he studied logic, natural philosophy, and metaphysics, and during the same period he was also taught algebra and geometry. Between 1213 and 1221, to complete his training, he moved to Nīshāpūr, where he earned an excellent reputation as a scholar. His most important teachers were Farīd al-Dīn al-Dāmād, with whom

he studied the philosophy of Avicenna, and Quṭb al-Dīn al-Miṣrī, a disciple of Fakhr al-Dīn al-Rāzī, with whom he studied medicine. Subsequently, Ṭūsī went to Irāq and studied jurisprudence with the Shī'ite scholar Mu'īn al-Dīn Sālim ibn Badrān al-Māzinī; later on, he studied at Mosul with Kamāl al-Dīn ibn Yūnus, with whom he improved his mathematical knowledge. Because of the Mongol invasion, which occurred while Ṭūsī was completing his studies, he was forced to accept an invitation from the Ismā'īlī governor of Qūhistān, Naṣīr al-Dīn 'Abd al-Raḥīm ibn Abī Maṣṣūr (or Naṣīr al-Dīn Muḥtashim), who presided over the business of the community of the Nizarites. Ṭūsī moved to the Ismā'īlī court, in Sartakht, in one of the mountain fortresses in Qūhistān, around 1232–1233. He mentions Naṣīr al-Dīn 'Abd al-Raḥīm as a benevolent governor, at whose court many learned men took refuge. There Ṭūsī received great honors, though the difficult situation prevented him from traveling.

In about 1234, he was called to the court of the Ismā'īlī prince 'Alā al-Dīn Muḥammad, who had heard of his fame as a scholar. Accompanied by Naṣīr al-Dīn 'Abd al-Raḥīm, Ṭūsī went to the fortress of Maymūn Diz; it was in those years that he turned to the Ismā'īlī faith. Although the period that he spent at the courts was intellectually fruitful, Ṭūsī did not fully enjoy his situation, and in the last pages of his commentary on Avicenna's *Ishārāt*, titled *Sharkh al-Ishārāt*, he recounts the difficulties in which he was forced to write his works. During the 20 years he spent in the various courts, Ṭūsī wrote some of his most important texts on ethics, logic, sciences, and mathematics. Among the works commissioned by Naṣīr al-Dīn 'Abd al-Raḥīm he did a translation into Persian of 'Ayn al-Quyāt al-Hamadānī's *Zubdat al-ḥaqā'iq*, and a Persian translation with comments on the *Kitāb al-tahāra* by Abū 'Alī Aḥmad Miskawayh al-Rāzī, titled *Akhlāq-i Nāsirī*. Moreover, for his master's son, Mu'īn al-Dīn, he wrote the *Risāla al-Mu'iniyya* on astronomy, with a Persian commentary. The *Akhlāq-i Muḥtashamī*, the *Asās al-iqtibās*, his pioneering work of Avicennian logic in Persian, and his famous commentary on Avicenna's *Ishārāt wa-l-tanbīhāt* date also from this period.

In 1246, after completing the original version of *Akhlāq-i Nāṣiri*, Ṭūsī wrote an autobiography titled *Sayr wa-sulūk*, in which he described his education and how he came to profess Ismāʿīlī esoteric philosophy. In this period, Ṭūsī was living in Alamūt, the fortress of the Assassins. The attribution of some Ismāʿīlī texts has been the object of much scholarly controversy, though the paternity of *Rawḍat al-taslīm* (commonly called *Taṣawwurāt*), the greatest Ismāʿīlī work of the late Alamūt period, has been ascertained.

During Ṭūsī's stay in Qūhistān, the Mongol commander Hūlāgū was sent by his brother Maṅgū Khān to defeat the Ismāʿīlīs. In 1255, Hūlāgū invaded Persia and in 1256 he defeated the Ismāʿīlī governor Rukn al-Dīn Khurshā, conquering the Alamūt fort. Ṭūsī's role in persuading the Ismāʿīlī governor to surrender pacifically to Hūlāgū made him particularly noble in the eyes of the Mongol warrior. Since then, the philosopher was at the service of the great Mongol commander. It is not clear whether Ṭūsī betrayed the Ismāʿīlī cause or used his role to save the texts at the Alamūt library before the Mongol invasion.

In 1257 Ṭūsī left Qazwīn in the retinue of Hūlāgū to go first to Hamadān and then, in 1258, to Baghdad. Ṭūsī followed Hūlāgū during his expeditions and probably played an active role in the surrender of the 'Abbāsīd Caliph. During the conquest of Baghdad, it is recounted that Ṭūsī succeeded in saving the lives of many Muslim scholars who resided in the city.

Ṭūsī remained in Baghdad with Hūlāgū, helped him to consolidate his power, and convinced him, thanks to the commander's interest in astronomy, to build an observatory at Maragha. The observatory welcomed many scientists, and adjacent to it a library was also built, housing thousand of volumes. In those years Ṭūsī went to Ḥilla, the great Shīʿite teaching center in Iraq, where he met the famous Shīʿite jurist Muḥaqqiq-i Ḥillī and other important theologians and jurists. Then he traveled to Khorasan, where the great philosopher Quṭb al-Dīn al-Shīrāzī joined him.

After Hūlāgū's death, Ṭūsī became a vizier and probably also the personal physician of Hūlāgū's son, Abaqā' Khan, the new Mongol leader. In

1273, during an official journey of Abaqā' Khan to Baghdad, Ṭūsī fell ill and died in 1274. His body was buried at Kāzīmāyn, near the grave of the seventh Shīʿite Imam, Musā al-Kāẓim.

There has been a long debate about whether Ṭūsī became an Ismāʿīlī for reasons of patronage. Twelver Shīʿite authors reject any Ismāʿīlī connection for Ṭūsī, other scholars have indeed postulated the possibility of Ṭūsī's Ismāʿīlī faith and some have condemned him.

A Philosopher and a Theologian

Ṭūsī's most representative philosophical text in defense of the Peripatetic tradition is the commentary on Avicenna's *Ishārāt*, completed in 1246 and written at the request of the Ismāʿīlī governor Naṣīr al-Dīn 'Abd al-Raḥīm. Ṭūsī's main purpose is to present Avicenna's principal philosophical theories and to defend them against Fakhr al-Dīn al-Rāzī's criticisms. At times, Ṭūsī takes a stand against Avicenna, defending positions similar to those of Suhrawardī, Abū l-Barakāt al-Baḡdādī, and some of the Muslim theologians. Some divergences between Ṭūsī and Avicenna concern the nature of God's knowledge, the number of the spheres, the independent existence of the intellect, the pre-eternity of the physical world, the nature of the body, and the nature of faith. The text, rather than an exposition of his own thought, is a clarifying exegesis of Peripatetic philosophy and was commented on by 'Allāma al-Ḥillī, Quṭb al-Dīn Muḥammad al-Rāzī, Ṣāḥib al-Dīn Ḥusayn al-Hamadānī, Aqā Ḥusayn Khwānsārī, and others. A significant passage concerns the discussion of a mystical tale by Avicenna, *Salāmān and Absāl*.

Ṭūsī's most important logical text, finished in 1244, is *Asās al-iqtibās*, written in Persian and on the lines of Avicenna's *K. al-Shifā'*. A contemporary of Ṭūsī, Rukn al-Dīn Muḥammad ibn 'Alī al-Fārsī al-Astarābādī, translated it into Arabic. *Asās al-iqtibās* has been defined the most significant contribution to writings on logic in the thirteenth century. The philosopher wrote other logical texts, among them *Tajrīd al-manṭiq* in Arabic, commented on by 'Allāma Ḥillī.

Ṭūsī's ontology, from which his theology emerges, is mainly grounded in that of Avicenna: every being is necessary or contingent; if it is necessary it cannot not be, that is, it is "Necessary Being" (*wājib al-wujūd*). *Tajrīd al-'aqā'id*, also known as *Tajrīd al-i'tiqād*, is Ṭūsī's fundamental theological work. The text deals with the general principles of Shī'ite theology, the Principle and its attributes, the prophecy, the Imamate, and the resurrection. *Tajrīd al-i'tiqād* became the reference text of Shī'ism for many generations and was commented on many times.

I'tiqādiyya is a short treatise on the principal Shī'ite dogmas and concerns what believers deem indubitable. A faithful Shī'ite first of all believes that there is no other god than God and that Muḥammad is his messenger. Further, the believer has to accept the divine attributes and to believe in the Day of Judgment and in Heaven. All these principles are found in the Qur'ān, and therefore need no proof. Other theological texts have been attributed to Ṭūsī: *al-I'tiqādāt*, *Ithbāt-i wājib*, and *al-Fuṣūl al-nāṣiriyya*. The latter two were written in Persian for a readership that did not know Arabic. Ṭūsī also wrote other shorter theological texts, among them *Ithbāt waḥdat Allāh jalla jalāluhu*, on the oneness of God. The Principle is one, it cannot be many and cannot be contingent, because every contingent being possesses a cause.

Ṭūsī's ethical writings are mainly based on two sources, the Greek one and the pre-Islamic Persian one, as well as drawing on the Qur'ān and the *ḥadīth* sources. Ṭūsī's two most significant ethical texts are *Akhāq-i muḥtashamī* and *Akhlāq-i naṣirī*. The sources of the first are Aristotle's *Nicomachean Ethics* and al-Fārābī's *al-Madīna al-fāḍila*, as well as the pre-Islamic sources, but the main text on which Ṭūsī drew was undoubtedly the *Tahdhīb al-akhlāq* by Miskawayh. *Akhāq-i muḥtashamī* was written in honor of Naṣīr al-Dīn 'Abd al-Raḥīm, who decided the outlines of the work and planned its general scheme. Originally, Naṣīr al-Dīn himself intended to write it, but administrative commitments prevented him from doing so. The purpose of the text is to define some ethical principles that can be followed by every upright and just person, and it is divided into 40 chapters containing quotations

from the Qur'ān and sayings of the Prophet and Shī'ite Imams. The text deals with religion, the need for knowledge of God, and the topics related to ethical behavior. Ṭūsī also devotes a chapter to denunciation of the lower world and all its material aims. Every chapter ends with quotations attributed to various Greek philosophers.

The other important ethical text by Ṭūsī is *Akhlāq-i naṣirī*. The first part of it was written when the philosopher was still at the court of Naṣīr al-Dīn 'Abd al-Raḥīm. When the Ismā'īlīs were defeated by the Mongols and Ṭūsī went into Hülāgū's service, he revised the text, changed the introduction and the conclusions, and eliminated all Ismā'īlīs references. Some scholars account for Ṭūsī's choice by attributing it to purely political circumstances. The text consists of an introduction, three treatises, and a conclusion. The introduction enumerates the divisions of philosophy that Islam had adopted from Aristotle. Philosophy is divided into two categories: theoretical and practical, and the first one includes three parts: metaphysics, mathematics, and natural sciences. Metaphysics consists of the science of divinity and the first philosophy. It pertains to the knowledge of God, intellects, souls, theology, and deals with the general principles that govern the universe. God is independent of logical proofs, He is necessary and His existence is postulated, not proved, because proof implies comprehension of the thing to be proved.

Ṭūsī in his *Taṣawwurāt* criticizes the doctrine of *creatio ex nihilo*, and agrees with Avicenna that from one proceeds only one, as well as with the emanation of the world. However, in a later work, *Fuṣūl*, Ṭūsī supports the doctrine of *creatio ex nihilo* and attacks the foundations of emanation, because the reflection of the first Intellect already implies plurality, and this in turn implies the ontological difference between God and the first Intellect.

The section of the *Akhlāq-i naṣirī* on mathematics is divided into four parts: geometry, arithmetic, astronomy, and music. Natural sciences are divided into eight parts and deal with the knowledge of time, space, movement, the infinite, the elements, the earth and climate, botany, biology, mineralogy, and psychology. Among the minor

subdivisions of the sciences there are also medicine, astronomy, and agriculture. Ṭūsī attributes an independent status to logic within theoretical philosophy: logic is considered as a science and an instrument for acquiring other forms of knowledge.

Akhlāq-i naṣīrī's practical philosophy deals with the things that concern human beings as individuals and things that concern human beings as members of a society, and includes ethics, domestic politics, and foreign politics. Ethics is divided into two sections: principles and objectives. The fundamental subject of the first part is the human soul, from which good and wicked deeds originate. The second chapter deals with the subject of proving the existence of the soul, its substantiality, its simplicity, and incorporeality. The soul is also defined as rational: it survives the death of the body, considered only as an instrument; body is divided into vegetable, animal, and human, and each of these has its respective powers. Only the human soul has the rational power. The seventh and last chapter of this section is devoted to the definitions of good and happiness as ultimate objectives of the human soul. Ṭūsī refers to Pythagoras, Socrates, Plato, Aristotle, Porphyry, and Avicenna.

In the second section of the *Akhlāq-i naṣīrī*'s ethics, Ṭūsī discusses the objectives of this branch of philosophy and affirms that the disposition of an individual can be modified through education. Three types of virtue exist that man can attain, each corresponding to one of the three souls. From the rational soul derive knowledge and philosophy; from the wild soul, patience and courage; from the animal soul, pity and magnanimity. When these virtues are integrated, the fourth virtue is attained, justice. Following Aristotle's distinction in the soul, Ṭūsī deduces justice from practical reason, but unlike Aristotle, he ranks benevolence higher than justice and love higher than benevolence. The causes of moral disease are the following: excess, defect, perversion of reason, anger, or desire. The last stage of happiness attained by man is of three types: spiritual, physical, and collective. Love and friendship constitute the vital principles of Ṭūsī's moral theory.

In a later work, *Awṣāf al-ashrāf*, he writes of asceticism as a stage in mystical life and classifies mysticism into six progressive stages. Among Ṭūsī's writings on ethics there is also a translation of al-Muqaffa's *al-Adab al-wajiz li-l-walad al-ṣagīr*, an admonitory text devoted to his children, regarding the need to obey God.

Akhlāq-i naṣīrī's politics consists of domestic science and national politics. The first part is based on Avicenna's interpretation of Aristotle's *Oeconomica* and is divided into five chapters. Ṭūsī begins the treatise by stressing the importance of the family and defines a good home as a perfect relationship existing between husband and wife, parents and children, master and servant. Subsequently, the author deals with the career, the financial part, and the role of the wife, who safeguards wealth and procreates. In the chapter on the upbringing of children he stresses that young girls should not learn to read and write, but rather should learn to act in a praiseworthy way and become good wives and mothers. The last chapter deals with the way to behave toward servants and slaves, considered extensions of man's arms and eyes; he lists three categories of them. The final part is devoted to the character stereotypes of the Arabs, Persians, and Turks.

The section on the politics of cities, divided into eight chapters, argues that human society requires civilization. Administration of justice is the function of a government, which must be headed by a just king, the vicegerent of God upon earth. The third chapter of politics deals with the two kinds of human society: utopia and the anti-utopia. Utopia is one, but there are three kinds of anti-utopia: the city of the ignorants, the city of the corrupt, and the city of the misguided. The last chapters are devoted to friendship, and to the principles of the relationship with members of various social classes and groups. The conclusion of the book consists of a series of short aphorisms that Ṭūsī attributes to Plato.

In the treatise on poetics, *Mi'yār al-ash'ār*, the nature of poetry and metrics is examined. Poetry is identified as discourse (*kalām*) that is at the same time imaginative and rhythmic. Imagination is a constitutive part of it and is defined as the power of words to influence the soul, while rhythm is a

unique configuration of movements and pauses and is considered instrumental. In poetics, Ṭūsī also discusses the difference between Arabic and Persian prosody.

There are also some Persian and Arabic letters that Ṭūsī exchanged with Ṣadr al-Dīn al-Qūnawī. He expressed his great admiration for Ṭūsī and his desire to have regular correspondence with him. Qūnawī sent a copy of one of his writings and asked Ṭūsī to read and comment the result of his discussions with some of his philosopher friends.

Although the majority of Ṭūsī's writings are in Arabic, a significant number were written in Persian. He wrote in Persian on theoretical and practical philosophy, astronomy, mathematics, natural sciences, poetics, and history. Like Avicenna, Ṭūsī persianized the Arabic prose by assimilating it into a fluent Persian diction, following the model of Suhrawardī.

He encouraged others to write in this language. His disciple Quṭb al-Dīn al-Shīrāzī wrote in Persian his *Durra al-tāj*, an encyclopedic summary of philosophical and theological topics.

A Mathematician and an Astronomer

Ṭūsī's production also embraced all the mathematical sciences of antiquity: arithmetic, geometry, astronomy, astrology, and optics.

His innovation concern the rewriting of some Arabic masterpieces. Ṭūsī rewrote them on the basis of the most ancient translations, choosing the terms best suited to rendering the meaning more comprehensible. He avoided repetitions of some concepts, elaborated them using contemporary terms, and explained them. These recensions became hybrids and were identified with the name of *taḥārīr*. Ṭūsī dealt with all the translated texts that were available to him and revised the Arabic translations of Euclid, Aristarchus, Theodosius, Apollonius, Archimedes, Menelaus, Ptolemy, and many others.

Ṭūsī's main contribution to the mathematical sciences was in trigonometry. In his *Shakl al-qitā'*, on the basis of the works of Abū l-Wafā', Maṣṣūr ibn 'Irāq and al-Bīrūnī, Ṭūsī developed trigonometry without using Menelaus'

theorem or astronomy. For the first time he gave the field of trigonometry an independent identity, deciding to devote a special treatise to the innovations that he had met in his various recensions and offering a complete picture of the subject.

In his *Jawāmi' al-ḥisāb*, completed in 1246, he described the arithmetical operations in a simple way accessible to a wide audience, combining the Greek method with the Indian one. He introduced a new method for the extraction of roots, a method that had been used by Chinese mathematicians, but was new to him. A part of *Jawāmi' al-ḥisāb* is devoted to what he called "the arithmetic of the astrologers." In the section, he explained that arithmetical operations could be used on sexagesimal entities such as signs, degrees, minutes, and seconds.

In the field of geometry, Ṭūsī followed al-Khayyām and in his *al-Risāla al-shafi'iyya* he examined Euclid's fifth postulation, proving that the theory was a failure.

Ṭūsī's astronomic production encompassed all forms of knowledge of his day. When he dealt with the recension of the *Almagest* in 1247, Ṭūsī denounced the Ptolemaic theory of latitudinal movement of the planets and introduced a form of mathematical theorem, known as the "Ṭūsī couple." The "couple" produces a linear movement as a result of the two circular movements.

In about 1260, he wrote the famous *Tadhkira*, in which he improved the research he had previously done. In a chapter in the text he proved the theorem of the "couple" and for the first time a solution was expounded for the movement of the planets. This theory could be extended beyond the latitudinal theory of planets preserving uniform circular motion, and it became the fundamental heritage for later astronomers in the Islamic world.

Hūlāgū's generosity and interest allowed Ṭūsī to devote himself for 30 years to the study of astronomy and to build the famous observatory at Maragha. The most important and best-known work that was produced by the leading lights at the observatory was *Zīj-i ilkhānī*, originally written in Persian and then translated into Arabic and other languages. Parts of the text were also translated into Byzantine Greek during the thirteenth and fourteenth centuries.

In the field of mineralogy, Ṭūsī wrote the *Tanksūkh-nāma* in Persian, based on Islamic sources such as the works of Jābir ibn Ḥayyān, al-Kindī, Muḥammad ibn Zakariyyā' al-Rāzī, 'Uṭārid ibn Muḥammad, and al-Bīrūnī. The text deals with the four elements and their combinations and a fifth quality is introduced, called temperament or turn of mind, which can accept the forms of the different species. The text also deals with the theories of vapors, sunrays, colors, precious stones, metals, and perfumes.

Ṭūsī also wrote some works on medicine, along the lines laid down by Avicenna. Among other works, he wrote the *Qawānīn al-ṭibb* and a commentary on Avicenna's *Canon*. Ṭūsī's medical point of view was mainly philosophical and his main contribution concerned psychosomatic medicine, which he discusses in his ethical writings, above all in *Akhlāq-i naṣīrī*.

Ṭūsī's scientific and philosophical contribution was formidable and innovative. Thanks to him, Maragha became the principal center of production of the "new astronomy." Unfortunately, many texts by Ṭūsī have not yet been edited and therefore are not accessible to contemporary scholarship.

Tyranny

Cary J. Nederman

Department of Political Science, Texas

A & M University, College Station, TX, USA

Abstract

Tyrannical government posed an important problem for political philosophers throughout the Middle Ages. The concept of tyranny was an invention of ancient Greece, but the terminology was passed along via Roman sources and Latin translations to medieval thinkers, who developed an extensive analysis and critique of tyrannical rule. However, not all authors wholly condemned the tyrant. Some argued that tyranny was an appropriate form of government in cases where a populace was otherwise incapable of accepting virtuous rulers. Thus, tyranny proved to be a somewhat elastic concept.

Tyranny – the corrupt form of rule by a single man – and how to respond to it formed prominent theme of pre-Christian Greco-Roman political thought. Moreover, discussions of tyrannical government abounded during the Latin Middle Ages. Two sources were especially important in the process of transmission from pagan antiquity to the medieval West. One of them, St. Gregory the Great (Pope Gregory I, c. 540–604), in his *Moralia*, explained tyranny as a term that could potentially apply to any person who pridefully exercised power. Gregory is quite clear that tyranny is a consequence of the condition of one's soul, pertaining to one's relationship to God. The political or public figure, to whom the word "tyrant" is usually applied, is but a single species of a genus of human beings who seek power in order to oppress their fellows. Gregory also asserts that political tyrants, no less than kings, possess their authority at the command of God and perform a divine function, punishing a people for its wickedness. Thus, in his view, the tyrant is not to be resisted or even criticized but must rather be endured as a divine penalty until such time as

God Himself chooses to withdraw His punishment. Second, Isidore of Seville (fl. late sixth–early seventh centuries), in his *Etymologies*, drew a sharp distinction between kingship as the ideal form of government and tyranny as the worst. Though Isidore shows awareness that the term derives from the Greeks and that the early Romans employed it as an equivalent to kingship, he denies any identification of the tyrant with the king. Isidore juxtaposes the tyrant to the true king, who loves justice and seeks what is right or best for his people. The corrupt character of tyranny stems from its incompatibility with the very goals of social order: to realize the harmony and common good of the people in a manner consonant with justice. By privileging his personal passions and desires, the tyrant makes his subjects the servants of his every whim. No rule of law – such as one observes in kingly regimes – is possible under tyranny, because the will of the ruler *is* the law.

The wide diffusion of Gregory's and Isidore's writings in later centuries meant that subsequent political thinkers treated tyranny as the quintessential imperfect regime. In the ninth century, for instance, Hincmar of Rheims (c.805–881) built an entire treatise around the differences between tyranny and kingship. But by far the most extensive discussion of tyrannical government may be found in the *Polycraticus* of John of Salisbury (1115/20–1180), completed in 1159. Time and again over the course of the treatise's eight books, John emphasizes the sources and consequences of tyranny, and he raises the critical issue of whether and how a subject population might extract itself from the clutches of a tyrant. The closing chapters of the final book constitute a tract on the foundations and dimensions of, and appropriate responses to, tyranny. John identifies the following characteristics as constitutive of the tyrannical regime: the tyrant is violently oppressive; he opposes justice; he cancels the laws and enslaves the people; he is an image of the devil and of depravity; and, although he serves God, he may be killed if the fact divinely ordained. While most of these features were shared by medieval authors adopting the Gregorian/Isidorian position, the latter assertion that the tyrant may properly be slain is more unusual and has been hailed as one of

his most important (if controversial) contributions to Latin political thought.

John's work extends the tyrannical temperament to the entire composition of the community. In the fifth and sixth books of the *Policraticus*, John famously described the well-ordered communal whole by analogy to the various parts of the human body. John returns to the organic theme in his discussion of tyranny in Book 8. He labels the unjust, tyrannical community "the republic of the impious." Such a body distinguishes itself by the fact that all its sections partake of the same tyrannical properties, a clear echo of St. Gregory's teaching. While John does not discuss the operation of this tyrannical community in great detail, it is clear that he sees a direct correlation between the goals and values of the leading office and those of the other parts of the sociopolitical totality. Where the common utility animates the rightly arranged civil organism, self-interest pervades the deformed body. In John's vision, the tyrannical ruler could never succeed unless he enjoyed widespread approval and cooperation from the other parts of the community over whom he exercises his violent domination.

The conception of tyranny transmitted by Gregory and Isidore was supplemented during the thirteenth century by the appearance in Latin translation of the major works of Aristotle's social thought, namely, the *Nicomachean Ethics* (during the mid-1240s) and the *Politics* (around 1260). Both works include considerable discussion of tyranny as one, but not the only, form of corrupt rule (alongside oligarchy and democracy). Thomas Aquinas (c.1225–1274) was perhaps the first important medieval thinker to develop an Aristotelian approach to tyrannical government alongside the insights of Gregory and Isidore. In the chapters of a book usually known by the title *De regno* (*On Kingship*) that is commonly (though somewhat controversially) ascribed to him, Aquinas engages in an interesting fusion of Aristotelian and traditional Christian language. Unsurprisingly, he explains that tyrannical government is directed not toward the common good, but instead the private interests of the ruler, and thus is unjust. This follows Aristotle's view quite precisely. Yet Aquinas also recasts Aristotle's important elements of Aristotle's description of

the imperfect constitutions. Specifically, he treats oligarchy and democracy – the corrupt rule of the one and the many respectively – as alternate forms of tyranny, sharing their operative features with the tyrannical regime. Aquinas adapts the discourse of oppression, so that oligarchy and democracy become simply collective tyrannies rather than corrupt systems structured according to their own unique misunderstandings about justice as in Aristotle's analysis.

In a later chapter of *De regno*, Aquinas engages in a tyrannology that touches on the other imperfect regimes only inasmuch as they are instructive for the understanding of the evils of the tyrant and the perfection of the king. Accepting Aristotle's ranking of the best and worst systems within both ideal and corrupt constitutions, Aquinas sets out to excoriate the tyrant. The tyrant appears to constitute such an evil for the community that one might infer that a society would gladly accept democracy or oligarchy over tyranny. But the force of his case is merely rhetorical. Aquinas points out that there are gradations even within forms of tyranny and that there is less evil to be found in tyrannical government than in corrupt government exercised by a group of people. He reasons that the corruption engendered by oligarchy or democracy leads to internal dissention within the community, which is ultimately more harmful than the rule of a single evil man. Likewise, Aquinas observes, the historical study of tyrannical regimes demonstrates that they are more likely to arise from societies in which a multitude rules than in which a monarchy has previously existed. In sum, Aquinas wishes no one to conclude that he has afforded any grounds to prefer democracy and oligarchy to the government of kings, even "moderate" tyrants.

Thinkers who followed Aquinas, many of whom were his students and associates at the University of Paris, often extended the lines of his thought. For instance, Ptolemy of Lucca's (c.1236–1327) appends to *De regno* (which halts abruptly near the beginning of the second book) a treatise named *De regimine principum*. Ptolemy's continuations, which is nearly three times as long as the portion attributed to Aquinas, moves the argument away from an examination of kingship and into a sustained defense of "political rule" or

mixed polity as the best system of government. Ptolemy frames his support of such republican rule through sustained consideration of tyranny's relation to well-ordered constitutions. He steps beyond both Isidore and Aristotle while extending Aquinas's forbearance of tyranny in a striking way. Ptolemy subscribes to a quasi-sociological view of good government that enjoyed some currency among the scholastics, according to which different populations are better suited (by environmental circumstance or temperament) to specific types of rule, even, in some cases, tyrannical rule. In Book 3, Ptolemy asserts the expediency of tyranny in cases where a populace is incapable of benefiting from good government. Indeed, such tyrannies are termed "the instruments of divine justice" by him. Certainly, other Latin Christian authors, at least as far back as Gregory, had held that tyrants might be divine instruments for the infliction of punishments upon wicked peoples. But Ptolemy's view concentrates on utility rather than God's judgment. In a similar passage in Book 4, he appears to posit a distinction between legitimate and unjustified exercise of tyranny. The former occurs in regions where the people are "servile by nature"; he cites the examples of Italian provinces such as Sicily, Sardinia, and Corsica. By contrast, illegitimate tyranny occurs when territories that are suited to freedom are compelled to submit to a single unjust ruler; he refers to the central and northern Italian provinces as illustrations. The intriguing conclusion is that, depending upon context, tyranny is not always evil. As a regime, it may in principle remain corrupt, but as a last-ditch means of imposing peace and order in an otherwise anarchic situation, it may be the best, rather than the worst, of constitutions. Neither Gregory nor Isidore would have been likely to endorse this position; Aristotle, although he may have accepted monarchies that share some characteristics of tyranny in non-European cases, was careful in the *Politics* to explain how and why such resemblances did not lead true kings into tyranny.

Although many later medieval theorists (such as Marsiglio of Padua and William of Ockham) continued to accept the terms of Aristotle's condemnations of tyranny, the fourteenth century also

witnessed a discernable perpetuation of the more flexible attitude evinced by Ptolemy (and, to some extent, Aquinas). Bartolus of Sassoferrato (1313–1357) and Coluccio Salutati (1331–1406) pioneered a specialized genre of political treatise *de tyrannia*, in which the merits of tyrannical government were debated. Not all of those who engaged in this conversation were prepared to condemn tyranny out of hand. Bartolus, for instance, remarks that tyrannical behavior often occurs even in governments that are generally devoted to the common good. Salutati is even more adamant that tyrannical regimes may at times be defended, pointing to Julius Caesar as the archetypical case. Clearly, then, some authors found repetition of conventional ideas about tyranny without critical reflection to be profoundly unsatisfying; others were perhaps propelled by political circumstances to modify accepted teachings concerning the tyrant.

Ulrich of Strasbourg

Irene Zavattero

Dipartimento di Lettere e Filosofia, Università di Trento, Trento, Italy

Abstract

The German Dominican Ulrich of Strasbourg (1220–1277) was a pupil of Albertus Magnus in Cologne, a lecturer in theology at the monastery of Strasbourg, and a prior of the German Dominican province. He wrote the *De summo bono*, a voluminous theological-philosophical *summa* composed between 1262 and 1272. Long considered to have been a fervent disciple of Albertus Magnus and the compiler of a work based largely on his teacher's doctrine, Ulrich has instead been shown, through recent studies and the critical edition of his work, to have been an autonomous thinker who developed on his maestro's ideas in a personal way, often subtly diverging from them. He placed Albertus Magnus's doctrines, including the more strictly philosophical ones such as the theory of the divine intellect, into a theological framework, in keeping with his aim of highlighting possible concordism between philosophy and theology. The *De summo bono* was widely circulated, and its reception followed two distinct lines of thought: a speculative one, particularly with the fourteenth-century brothers of the Cologne *studium*

(Dietrich of Freiberg, Berthold of Moosburg and perhaps Meister Eckhart) and the fifteenth-century “Albertists” of Cologne, and another moral-pastoral one that originated with John of Freiburg, a pupil of Ulrich's, and spread through the German-Polish area until the fifteenth century.

Ulrich Engelbrecht (the family name, according to ancient historiographers) was born around 1220. He entered the Dominican order in 1245, studied under Albertus Magnus probably in Cologne, and later became a lecturer in theology at the monastery of Strasbourg. In 1272, he was elected provincial prior of the German Dominicans. Five years later, he was relieved of this duty in order to continue his theology studies in Paris, where he was to fill the role of *bacalarius sententiarum*, the obligatory step toward becoming a master of theology. However, once in Paris, Ulrich died just before beginning lessons. Thus the German Dominicans lost their opportunity to see one of their representatives in the chair reserved for “foreign” – i.e., non-Parisian s professors.

The earliest testimony of Ulrich's activity and scientific profile is offered by one of his pupils, John of Freiburg (1250–1314) who, in the preface to the *Summa confessorum*, describes his teacher as a man of science and of action. So, although his premature death kept him from earning the title of *magister theologiae*, Ulrich had a reputation as a wise man, as well as an astute administrator of the

German province (*Teutonia*) of the Dominican order. The work that consolidated his fame was the *De summo bono*, a voluminous theological-philosophical *summa* composed between 1262 and 1272. In addition, we have 27 letters, conserved in a codex in Berlin, mainly concerning administrative and disciplinary provisions, and a sermon in vernacular on *John* 20.29. According to historical catalogue sources, Ulrich also wrote comments on Aristotle's *Sentences* and *Meteorology*, both lost.

The *De summo bono*, as the title indicates, deals with the supreme Good and is divided into six books using the following structure: (I) preliminary questions regarding the supreme Good or theology; (II) the essence of the supreme Good; (III) Divine Persons; (IV) the Father and creation; (V) the Son and the Incarnation; and (VI) the Holy Spirit, grace, and virtues. As Ulrich indicated in the preamble to the work, the *summa* was intended to contain seventh and eighth books as well, regarding the sacraments and beatitude, respectively. However, these books appear in no known codex and were probably never written. The sixth book ends abruptly without providing an *explicit*, leaving the treatise on virtues incomplete.

The critical edition of the *De summo bono*, having arrived at its seventh volume and almost fully realized, demonstrates that Ulrich was a significant scientific figure and that his imposing *summa* was something new in the literary panorama of his day. Unlike Albertus Magnus and Thomas Aquinas, Ulrich chose to draw up a systematic treatise rather than adopt the scholastic method of contrasting *pro* and *contra* arguments. His book is configured as a work for consultation, to be kept in the monastery library and used for monastery-based teaching. In the *De summo bono*, the influence of the teaching of Albertus Magnus is evident, as Ulrich makes constant and attentive use of it, especially the *Metaphysica*, the *De causis et processu universitatis*, and the *De intellectu et intelligibili*. Ulrich has thus been defined as "Albertus Magnus' favorite pupil" (Théry 1922) and "co-founder of Rhenish theology" (de Libera 1984),

underlining the relationship that ties him to his teacher. But these labels run the risk of reducing his ideas to a mere re-proposal of Albertus Magnus's doctrines, and of characterizing Ulrich as an unoriginal author. In reality, as the most recent studies on Ulrich demonstrate (Beccarisi 2006; Palazzo 2005, 2006), he was an independent thinker who frequently and subtly diverged from his teacher's ideas. He did not share Albertus Magnus' methodological decision to make theology and philosophy two separate sciences, each with specific methods and objects. In fact, Ulrich championed concordism between theology and philosophy: philosophical speculation thus became the basis and presupposition of theological research. His concordistic approach manifested itself in his attempt to minimize the differences between Platonic and Aristotelian thinkers. According to Ulrich, peripatetic philosophy is subordinate to Platonic philosophy because the field of action of the former is limited to empirical-scientific consideration of the universe, while that of the latter concerns knowledge of divine properties and of God. Thus Ulrich twisted the meaning of the famous page written by Albertus Magnus (*Metaphysica* XI 3 7) that contrasted the "way of Aristotle" with the "way of Plato" and clearly showed his Platonic inclination, although he cites Aristotle liberally and acknowledges the fundamental role of his authority.

One of the principle doctrines Ulrich examines in his *summa* is the theory of the divine intellect. This is one of the most characteristic philosophical doctrines of Albertist teaching, but Ulrich places it in the declaredly theological framework of the *De summo bono*. Ulrich's reflection on man springs from the hermetic assumption drawn from the first chapter of Albertus Magnus' *Metaphysica*: "man is the link between God and the world." Man is such because he has within him something earthly, i.e., the body, and something divine, i.e., the intellect. Man's intellect is divine because "God is intellect" (*De summo bono* II 4 1 4; II 3 5 5; IV 1 2 7); therefore, man, by nature, resembles God. This innate faculty of man, which philosophical tradition calls the *intellectus agens*

(active intellect) and theological tradition calls “the image of God,” allows man to intellectually become one with God. Thus Ulrich underlines the purely natural aspect of the intellect, which is the principle of the nobility of the soul for reasons of a physical nature, independent from grace and from Revelation. The process that leads man to contemplative beatitude is also natural: the human intellect intellectually ascends by successive stages of knowledge until it becomes “divine intellect,” the activity of which is the contemplation of God and of separate substances. Beatitude lies in this cognitive union with God.

The theory of intellectual knowledge of God, which for Albertus Magnus was valid only in a strictly philosophical realm, in the *De summo bono* assume an absolute validity on a par with knowledge by faith. The doctrine of contemplative beatitude played an important role in the historical development of so-called “German mysticism” and demonstrates that Ulrich’s mysticism can be defined as “philosophical” (Sturlese 1996), even though the theologian overlays theological and philosophical arguments in his texts and frames the doctrine of the divine intellect in the mystical theology of Pseudo-Dionysius the Areopagite.

The doctrine of the divine intellect is also found in the ethics section of the *De summo bono*, that is, the sixth, still unpublished book, where Ulrich explains that the divine component present in man, the active intellect, being separate and free from material nature, gives man control over his own actions and is thus the instigator of the entire process of the production of virtue (Zavattero 2008). Just as through the act of cognition man is capable of intellectually knowing God, independent of grace and Revelation, by means of the process of perfecting the intellect, so he is capable in practice of producing his own natural moral excellence, without the intervention of any principle extrinsic to the soul (God or fate). That is, man brings what is inherent in his nature to perfection through the act of reason, which informs all moral acts.

Studies on reactions to the *De summo bono* show that Ulrich’s ideas were utilized not only

by his confreres from the Cologne *studium* (Dietrich of Freiberg, Berthold of Moosburg and perhaps Eckhart), but also played a decisive role in the formation of the fifteenth-century line of thought known as “Albertism,” which referred back to the doctrine of Albertus Magnus. Heymericus of Campo, the most important representative of Albertism in Cologne, explicitly cited Ulrich’s *summa* in his works. Additionally, circulation of the *De summo bono* at the University of Cologne in the fifteenth century is documented by the fact that at least five of the twenty-six surviving manuscripts of the *summa* belonged to scholars who taught and studied there. Even Denys the Carthusian, a student and later professor of arts in Cologne, was a scrupulous and devoted reader of Ulrich, as demonstrated by the frequent citations from the *De summo bono*, especially in his *Commentary on the Sentences* (Palazzo 2004a, 2006).

In addition to this reception, which indicates a speculative interest in Ulrich’s doctrines, there was another one that privileged the doctrines of moral theology, pastoral care, and penitential law contained in the sixth book of the *summa* (Palazzo 2008). These doctrines, collected in manuals for confessors, like the *Summa confessorum* by John of Freiburg, and disseminated in vernacular, were widely circulated in German-Polish areas in the late Middle Ages (thirteenth to fifteenth centuries). Their reputation extended beyond the bounds of the university and academic world, as they concerned above all parish priest directly involved in pastoral activities and the ministry of confession.

Universals

Andrew W. Arlig

Department of Philosophy, Brooklyn College of
The City University of New York,
Brooklyn, NY, USA

Abstract

Medieval discussions of universals are some of the most sophisticated and sustained discussions in the history of this topic. This article focuses on medieval discussions of the ontological status of universals. Speculations about the existence of universal things were prompted by what was said (and what was not said) in ancient Greek treatises on logic and metaphysics. Throughout the medieval period,

philosophers divided roughly into those who believed that there was some mind-independent reality that was common to many particulars (i.e., realism) and those who believed that universality was a mind-dependent property (i.e., anti-realism or nominalism). Anti-realists critiqued contemporary versions of realism. Realists responded to the anti-realists with ever more sophisticated accounts of the real basis for predication and classification.

Preliminaries

Although it is quite common for scholars to refer to “the” problem of universals, this way of speaking is deceptive. There are in fact a cluster of problems in the fields of logic, philosophy of language, epistemology, and metaphysics. Medieval philosophers speculated about universals in all these contexts. This article will focus primarily, but not exclusively, upon the ontological problems associated with universals. (For a survey of medieval discussions of universals with an emphasis on the semantic and epistemological aspects, consult Klima 2008.)

Medieval philosophers developed their theories of universals in light of developments in late ancient philosophy. One important locus for the discussion of the nature and existence of universals was Aristotle’s *Categories*. In this work, Aristotle distinguished between two types of predication: “being said of some subject” or “being in some subject.” The items that are neither said of some subject nor are in some subject were interpreted to be individual substances. Everything else is predicated (Gr. *kategorēisthai*) of these individuals or the properties of these individuals. Aristotle’s analysis of the phrase “x is said of y,” together with his claim in *De Interpretatione* that the universal is that which is predicable of many (7, 17^a39–40), suggested to late ancient commentators that those items that were said of something were universals.

Late ancient commentators wondered what the subject matter of the *Categories* was. Were the predicables things, words, or concepts? In

general, it was felt that since the *Categories* was a logical work, the treatise was primarily about words. But these words were meaningful; they somehow stood for or referred to things and the properties of things. The simplest way for a universal term to signify would be for it to signify a universal thing. Thus, for many interpreters, Aristotle’s logic implied the existence of universal things.

In his “Introduction” (*Isagoge*) to Aristotle’s logic, Porphyry claimed that there were five basic types of universal predications: the genus, the species, the *differentia*, the *proprium*, and the accident. But Porphyry famously refused to determine whether universality applies to anything besides words. He began his *Isagoge* by announcing that he would not address three questions, since they belonged to a deeper inquiry (1.9–14, [trans. Spade 1994, p. 1]). First, he would not consider whether universals “subsist” – that is, exist outside the mind – or whether they only manifest in bare conceptions. Second, he would not consider whether they are corporeal or incorporeal, if they subsist. Third, he would not consider whether they exist separately or subsist only in perceptible things.

Many medieval discussions of universals can be found in commentaries on Porphyry’s opening remarks. The Greek Neoplatonic commentators often used this text as an appropriate place to elaborate a threefold classification of the universal: (1) the universal before the many, (2) the universal in the many, and (3) the universal after the many. Latin-speaking philosophers prior to the end of the twelfth century did not know this classification of the universal. However, it was known in the medieval Arabic world, and the scheme was picked up by many later Latin-speaking philosophers.

In the medieval tradition, the universals before the many were identified with the Divine Ideas in God’s mind. They were the archetypes from which God created everything. No medieval philosopher denied the existence of the Divine Ideas. Hence, medieval philosophers never defended certain forms of anti-realism. Specifically, no medieval philosopher would deny that abstract objects exist, and even thoroughgoing non-

realists such as Abelard and Ockham believed in the existence of at least some forms, although these forms would be particulars or, as present-day philosophers would say, tropes.

The universals after the many were concepts in the human mind, often formed by a process of abstraction. Most medieval philosophers believed that these items were universals properly speaking, since they could be associated with many things.

From the ontological perspective, the main dispute among medieval philosophers was whether there is any mind-independent thing or reality that is common to many individuals – that is, whether there are any universals in re. For something to be a universal in re, it would seem that it must be present simultaneously and as a whole in each of many individuals in such a way that it contributes to the substance of each individual (cf. Boethius, *In Isag.* 2nd ed., I, 10, 161.16–19). Adam and Eve would not share a universal, essential constituent if they merely shared portions of that constituent in the way that they might share a cake, or if they shared all of it in the way that two people can each wholly own a horse (as when the first sells the horse to the other), or if they both participated in all of it as spectators each take in the whole play. But is it possible for any thing to be essentially and entirely present in many individuals at the same time? Many medieval philosophers – even many who are traditionally labeled “realists” – thought that this could not happen.

Boethius

In his second greater commentary on Porphyry’s *Isagoge*, Boethius developed a series of intriguing arguments in favor of the conclusion that universals do not exist outside the mind (*In Isag.* 2nd ed., I, 10–11, 159–167, [trans. Spade 1994, pp. 21–23]; cf. King 2011; Spade 1996). The main thrust of these arguments was that something exists outside the mind only if it is a unity; yet, it is impossible for something to be one and also wholly present in each of its instantiations in such a

manner that it contributes to each individual’s substance. Hence, universals cannot subsist.

Boethius, then, posed a dilemma for the anti-realist, who believes that universals do not exist outside the mind. We surely have concepts that are universal. In particular, we believe that the concept human applies to Adam and Eve and that this is true because Adam and Eve are naturally similar to one another and to all other humans. But if Adam and Eve have no thing in common, then these attributions and classifications do not represent the world as it truly is. In short, if there are no universal things, then our concepts appear to be empty and false.

Boethius offered a solution that he attributed to the third-century Aristotelian philosopher Alexander of Aphrodisias. The mind is capable of considering things in a manner different from that in which they exist. In particular, the mind is able to consider and compare the features of concrete particulars without reference to the particular, even though these features cannot actually be separated from the particulars. By abstracting features in this manner, the mind is able to construct universal concepts. Hence, while universals do not exist in things as something common to many, the concept of a universal – since it is abstracted from things in the right way – can be truthfully attributed to many things. It is not clear that Boethius’ Alexandrian solution resolved his original problem, for it is unclear what the mind abstracts from individuals. Nevertheless, the notion that the mind contributed universality to whatever it is that is abstracted from many individuals would be very popular in succeeding generations.

Realism, Vocalism, and “Nominalism”

In the eleventh and twelfth centuries, the Latin-speaking world possessed a limited set of source material. For most of this period, philosophers possessed Aristotle’s *Categories* and *De Interpretatione*, Porphyry’s *Isagoge*, and Boethius’ commentaries on these works. These texts were supplemented by Boethius’ introductory

handbooks on logic, his five short theological treatises, and a few other minor sources of logic and metaphysics from other later Roman authors. It is little wonder that philosophy in this period focused heavily upon logic. And, indeed, it was in treatments of logic that we find the most sustained early medieval discussions of universals.

There was a lively debate in the later part of the eleventh century (if not earlier) over the subject matter of logic (cf. Marenbon 2004, pp. 28–30). Some thought that logic dealt with things (*res*); others argued that logic is about utterances (*voces*). It is not clear that the early advocates of the *in voce* approach to logic inferred any metaphysical theses from their stance, let alone the specific thesis that universals are merely words. (For that matter, the *in re* approach to logic did not commit one to the existence of universal things.) The thesis that only utterances are universal has been attributed to a few shadowy figures from the last decades of the eleventh century, most notoriously Roscelin; yet, so little of Roscelin's work survives that it is difficult to determine what he really believed (Picavet 1911; Kluge 1976; Jolivet 1992, pp. 114–128). We do know that Roscelin's brilliant pupil, Peter Abelard, developed a series of remarkable arguments against all the main "realist" positions of his day (*Logica ingredientibus* I, 10.8–16.18, [trans. Spade 1994, pp. 29–37]; *Logica "nostrorum"* 515.10–521.17; cf. Tweedale 1976, pp. 95–129; King 2004, pp. 66–72). Abelard concluded from these investigations that universality belonged to words alone.

A word of caution is in order. A "realist" in Abelard's sense of the word is not necessarily committed to the existence of a thing that is entirely present in many individuals simultaneously. Abelard applies the label "realist" to any position that identifies the universal with a real thing (*res*), including theories that identify the universal with an individual or with a collection of individuals. For this reason, Abelard will call some theories "realist," which a contemporary metaphysician might prefer to call "anti-realist" or "nominalist."

According to Abelard, the dominant realist theories of his day were "material essence"

realism and several theories that defined universals in terms of "indifference."

Material essence realism was the view that universal forms constituted the material essence of individual things. The generic form animal and the differentia irrational constituted the material essence of Brownie the donkey. The very same animal and rational constituted the material essence of Socrates. Socrates and Plato shared the very same material essence (animal + rational or human) but were differentiated by accidental forms.

As for the indifference theories, one version claimed that the universal thing is the mereological sum (*collectio*) of all those individuals that are indifferent to one another in some respect (Freddoso 1978; Henry 1984, pp. 235–259). A second version was the identity theory, which asserted that the universal is identical to the individual insofar as that individual is indifferent from other individuals in some respect. A third version, status realism, held that individuals are indifferent in some respect because they share a status, that is, they agree in being φ .

Abelard reported that his old teacher William of Champeaux initially subscribed to material essence realism. Abelard's criticisms of the theory forced William to give up material essence realism and propose, instead, the identity theory. As Abelard tells the tale, he reduced William's second theory to absurdity, and having been humiliated twice in a row, William gave up the teaching of logic altogether. But others were apparently persuaded that some version of the indifference theory was correct. We possess a treatise, possibly by Walter of Mortagne or one of his students, which defends status realism (Dijks 1990, pp. 93–113). And it seems that several philosophers were attracted to revised versions of the *collectio* theory. For example, Gilbert of Poitiers and his followers associated the universal with a group of absolutely similar individual forms (Häring 1966, pp. 269 and 312; cf. Martin 1983, pp. xli–xlii). More strikingly, the anonymous author of *De generibus et speciebus* defended a sophisticated version of the *collectio* theory, in part by responding to some of Abelard's objections (although he does not explicitly mention Abelard) (§§ 85–143).

Abelard also tried to distance himself from Roscelin's position, which he deemed to be too crude, by drawing a distinction between an utterance (*vox*) and a word (*sermo*). The utterance is the physical air insofar as it is merely considered as that which is emitted from the mouth. A *vox* could not possess the property of universality. The word is that same air insofar as it is the bearer of meaning. Many words can have the property of universality, for they are predicable of many words.

Abelard felt compelled to account for the semantic properties of words. In particular, he tried to account for how an utterance acquired a meaning (and hence, became a word), and more specifically, how some utterances acquired the property of being predicable of many. As it turned out, universality was not a matter of convention; it had its foundation in nature. Every substance and every form is particular, but there is a sense in which some things are naturally indifferent to one another. Abelard even claimed that Socrates and Plato share a status, that is, they agree in that they are both human, but in contrast to what he identified as status realism, Abelard insisted that a status is not in any way a *res* (*Log. ingr.* I, 20.7–9).

Ibn Sīnā

Whereas early Latin-speaking philosophers possessed an impoverished collection of resources, philosophers in the Arabic-speaking world had at their disposal the full Aristotelian corpus as well as select Neoplatonic works, all of this being the fruits of an enormous translation project from the Greek originals into Arabic in the eighth and ninth centuries. Not surprisingly, Arabic theories of universals had a broadly Aristotelian character. Nevertheless, many of the Arabic philosophers made some creative refinements to the Aristotelian framework. Perhaps the most significant of these was the theory developed by Ibn Sīnā, known to the Latin-speaking world as Avicenna.

A distinction between essence and existence had been drawn prior to Ibn Sīnā. But in contrast to many of his predecessors, this distinction became a fundamental feature of Ibn Sīnā's

metaphysical system. In everything other than God, there is a distinction between that thing's essence, or nature, and its existence. Ibn Sīnā adamantly denied Platonism, and hence, he did not think of essences as separable and potentially uninstantiated forms. An essence was always instantiated, either as a notion in the mind or as a constituent of a concrete individual thing. Nevertheless, one could consider an essence in itself and separately from its existence. When considered as such, one considered only that essence's definition and not any of the features that come with the essence when it exists. The things that one must bracket include all the necessary concomitants of existence, including being one and being many, and universality and particularity. Hence, for Ibn Sīnā, an essence such as horseness inasmuch as it is horseness is neither particular nor universal, and it is neither one nor many (*al-Shifā': al-Ilāhiyyāt* (the *Metaphysics*), bk. V, ch. 1, § 4).

Ibn Sīnā used an ingenious argument to establish this claim about essences (*al-Shifā': al-Manṭiq* (*Logic*): *al-Madkhal* (*Isagoge*), bk. I, ch. 12; translation in Marmura 1979). If an essence were universal, then universality would be part of the definition of that essence. Let us, for example, suppose that humanity is a universal. But if universality were part of the definition of humanity, then if anything were human, that thing would necessarily be universal. Given that Adam is human, it would follow of necessity that Adam is universal. But that is false. So, essences are not in and of themselves universal. But neither are they particular. For if humanity itself was particular, then humanity could only be this individual, say, Adam, and no other individual could be a human. Therefore, horseness, humanity, and animality in and of themselves are neither universal nor particular. Universality is an accident of horseness when horseness exists in the mind. Particularity is an accident of horseness when horseness exists in an individual that is a horse.

The universal horse is never in many concrete individuals. Nevertheless, the essence horseness can be said to be "in" individual horses given that horseness is a constituent of the particular horse

form that is in an individual horse (*al-Ilāhiyyāt*, V, 1, § 20). Thus, even though there is no thing that is wholly shared by many concrete individuals, there is a common, and objective, feature of reality that determines that each individually existing horse is a horse.

Realism in the Scholastic Period

Ibn Sīnā's notion of the nature considered in itself had a tremendous influence on western medieval philosophers, once his works were translated into Latin in the latter half of the twelfth century. The notion of a neutral nature helped Scholastic philosophers to avoid the commitment to a thing that is itself numerically one but simultaneously present in many individuals; yet, in the same stroke, it allowed them to locate some extramental basis for predication and classification.

The theories that thirteenth-century philosophers developed in response to the newly translated works of Aristotle and Ibn Sīnā are often referred to as versions of "moderate" realism. Moderate realism is routinely contrasted with "extremes" forms of realism. Medieval philosophers mostly knew of Plato's ideas secondhand. As they understood him, Plato believed that universal forms could exist separately from all particulars and from all minds. Scholastic philosophers roundly rejected this form of Platonism.

There was one troubling feature of Ibn Sīnā's notion of a nature in itself. Ibn Sīnā seemed to grant the nature in itself some measure of being (*esse*), yet he denied that the nature had any degree of unity. But it was a commonplace in Scholastic philosophy that something has being only insofar as it has unity. In other words, unity was considered to be a necessary concomitant of *esse*. Scholastic philosophers were, therefore, presented with a choice: either remove all *esse* from the nature as such, or grant that the nature as such has some measure of *esse* and, thus, some degree of unity (Owens 1957, p. 4).

Thomas Aquinas chose the first of these options (*De ente et essentia*, ch. 3; cf. Owens 1957, pp. 5–7). The nature in itself had no being at all. It only had being in the mind, where it was

truly universal, or in individuals, where it was a particular nature. Thus, if we were to take Adam and Eve and really strip away (not abstract with the mind) their matter, their accidents, their substantial forms, and their individual *esse*, we would find neither one nature nor two natures; we would find no nature at all. Nevertheless, in a very real sense, it is the same nature in numerically distinct individuals, and it is the same nature in the individual and in the mind. As one commentator puts it, numerically distinct individuals have the same nature because they are "numerically distinct realizations of the same information-content" (Klima 2008, §7). It is the same nature in the mind and in the individual because the mind is grasping the same information content that is realized in the external world. To see what Aquinas is after, consider Klima's analogy. There is no universal *Moby Dick* in addition to all the individual copies of *Moby Dick*. Nevertheless, it is true that all the copies of *Moby Dick* are the same book, because they share the same information. And if one were to memorize a copy of *Moby Dick* verbatim, it would be true that one's physical copy and one's mental copy are the same book.

John Duns Scotus chose the second option (see *Ord.* II, d. 3, pars 1, q. 1, [Spade 1994, pp. 57–68]; cf. Owens 1957, pp. 7–13). The nature in itself had some measure of being, and hence, it had some degree of real unity. But whereas an individual has numerical unity, the nature has a real but less than numerical unity. The nature must have real unity, for if its unity were merely a product of the mind, then our natural inclination to group Adam and Eve together and call them both human would have no foundation in the order of things. The unity of the nature as such must be less than numerical, for if the nature were itself numerically one, then it would be this particular nature or that one. But if it were, say, Adam's nature and Eve were also human, then Eve would in fact be Adam as well. Scotus knew that his brand of realism depends upon the intelligibility of a mode of unity that is real but less than numerical. Hence, he provided a series of arguments for the claim that there are real but less than numerical unities (*op. cit.*, [Spade 1994, pp. 59–63]).

Moderate Realism and Individuation

Given that the nature was the principle of commonality between individuals, there was a need to locate the principle that made individuals numerically distinct instances of the same kind. The realists of the Scholastic period proposed a number of principles of individuation (see the articles on various thinkers in Gracia 1994). Some Scholastic philosophers thought that matter was the principle of individuation. Aquinas proposed that it was not prime matter, but “designated” matter that individuated material substances (*De ente et essentia*, ch. 2). Others, such as Bonaventure, argued that it was the actual combination of matter and form that individuated substances. Duns Scotus argued that none of these principles would do. What was needed was a positive individual differentia, or haecceity, which was only “formally,” not really, distinct from the common nature (*Ord.* I, d. 3, pars 1, q. 6, [Spade 1994, pp. 101–107]).

Ockham

William of Ockham insisted that no universal exists outside the mind. In his lecture on the *Sentences* of Peter Lombard, Ockham presented his most thorough and sustained treatment of the subject (*Ordinatio* I, d. 2, qq. 4–7). Ockham engaged several realist positions, moving in descending order from what we might consider to be the most realist position – namely, that the universal is truly something outside the soul and really distinct from particulars (q. 4) – to the least realist position – namely, that the same thing under one concept is universal and under another concept is singular (q. 7).

Ockham singled out Scotus’ position for special consideration, painstakingly presenting Scotus’ views prior to attacking them (q. 6; cf. *Summa logicae* I, 16). Ockham pursued two strategies when attacking Scotus’ position. First, he attacked the notion of formal distinction, for if he could show that the formal distinction

was incoherent, then Scotus would be forced back into a version of realism that Ockham thought he had already dismantled. Second, Ockham argued that even if one granted for the sake of argument that created things can be formally distinct, Scotus’ position was internally inconsistent.

Ockham concluded from this sequence of attacks that “no thing outside the soul is universal, either through itself or through anything real or rational added on, no matter how it is considered or understood” (*Ord.* I, d. 2, q. 7, pp. 248–249, [Spade 1994, p. 204]). There were universals, but these universals were found only in the soul. In particular, Ockham thought that some mental terms (i.e., concepts) are signs for several things, and hence, universal. Uttered words (*voces*), which are conventional signs referring back to concepts, are derivatively universal (*Summa logicae* I, 14). Ockham changed his mind about whether any thing corresponded to these concepts (see Adams 1987, vol. 1, pp. 71–107). At first, it seems, he identified the mental word with a thing or quality in the mind. But he abandoned this theory for, first, the *factum* theory, and finally, for the thesis that concepts are identical to mental acts, and not things.

Like all anti-realists in the medieval period, Ockham was eager to avoid the accusation that if there are no universals, then the way that we think about the world has no basis in reality. No matter what ontology of concepts he embraced, Ockham maintained that the universal concept was itself singular but “naturally” capable of being a sign for many. Signification was ultimately based on real relations between things. Ockham did not think that a commitment to real relations forced him back into a realist position, for these real relations were themselves not things (Adams 1987, vol. 1, pp. 111–121).

Realism Resurgent

It was not clear that Ockham had considered all possible realist positions. Moreover, even if he

had done so, some commentators have argued that many of Ockham's arguments failed to show any contradiction or outright falsehood. At best these arguments showed that some forms of realism had unexpected consequences (see, e.g., Adams 1987, vol. 1, pp. 31–38).

Walter Burley agreed with Ockham that the only distinction that can hold between two created things is a real distinction. Hence, universals are really distinct from particulars. Burley also asserted that the whole universal exists in each of its particulars but that this does not imply that the universal is numerically multiplied by its existence in numerically distinct particulars (Adams 1982, pp. 422–423). Ockham thought that the latter thesis implied that the universal that is in particulars is numerically one. But how can one thing exist in many numerically distinct individuals without being divided into many? Furthermore, if all of human were in Adam, then if Adam were annihilated (i.e., every part of Adam utterly ceased to exist), human also would be annihilated. But Burley never claimed that the universal that is in the particulars is itself numerically one, he merely denied that it was numerically many. Moreover, he replied, no particular has anything but particulars for its parts. Accordingly, human is not a “part” of Adam, and the annihilation of Adam would not entail the annihilation of human (*Tractatus de universalibus*, pp. 32–36; cf. Adams 1982, pp. 424–426).

Many realists considered Burley's position to be too “extravagant.” For one thing, Burley seemed to be multiplying entities at an alarming rate. For example, Burley thought that there was both an individual form, which is a part of the individual, and a universal form. But what is the relation between the individual form and the universal (see Boh in Gracia 1994, pp. 351–356)? Moreover, to many, Burley appeared to be flirting with Platonism (Conti 2008, p. 386). If the universal is really distinct from particulars, then it seems possible that God could create a universal that exists separately from all particulars.

A number of later realists reacted to Burley's extravagance by returning either to a broadly Thomist position or to a broadly Scotist position (Conti 2008, pp. 386–403). Dominicans such as Franciscus de Prato and Stephanus de Reate insisted that universal forms have no being outside of the being of their individual instances and that real identity comes in degrees. The limit case of real identity is being “convertibly,” or entirely, the same. A universal and one of its individuals is really identical, but not entirely identical (Conti 2008, pp. 387–388). Wyclif and the so-called Oxford realists defended the view that the universal is formally, and not really distinct from the particular (see, e.g., Wyclif, *Tractatus de universalibus* cap. 4, p. 87).

Universities and Philosophy

Maarten J. F. M. Hoenen
 Departement Künste, Medien, Philosophie,
 Universität Basel, Basel, Switzerland

Abstract

During the period from 1200 to 1500, philosophy was to a large extent located at the Arts faculties of the various universities, of which there were more than 50 by the beginning of the Modern Age. Its main concern was the reading of Aristotle, whose works were commented upon according to analogous procedures at each of the universities. These similarities facilitated the exchange of students and masters, who through the influx of new ideas, stimulated debates about the interpretation of Aristotle's texts as well as the implications of his thought. Time and again, questions about the relationship between philosophy and theology led to serious conflicts, which had important consequences for the teaching of philosophy at the universities, most significantly exemplified by the *Wegestreit* in the late-medieval period.

The Faculty of Arts

Since their emergence around 1200, the universities had formed the most important centers of philosophy, where philosophers met and practiced until the end of the Middle Ages. Philosophy's proper place was the Arts faculty, one of the four faculties that comprised the typical medieval university, along with Theology, Medicine, and Law – although not every university had all four. Philosophical subjects or subjects with a philosophical relevance were also discussed at the other faculties, especially in the faculty of Theology, but it must be emphasized that the medievals themselves opted for a division of their universities into independent faculties, each possessing its own statutes, curriculum, and administration.

Despite their widespread use in the Middle Ages, the titles Arts faculty (*facultas artium*) and Liberal Arts faculty (*facultas artium liberalium*) are misleading, as the syllabus at these faculties had almost nothing to do with the traditional program of the seven liberal arts. Of these liberal arts, only logic and to a lesser extent grammar still played a prominent role in the educational system of the Arts faculty. Other main components of the syllabus, however, such as physics and metaphysics, were not considered liberal arts, as Albert the Great had argued and whose position on the matter was accepted and reiterated over the years. Nevertheless, the designation Liberal Arts faculty was used throughout the medieval period, mainly to stress the propaedeutic role of philosophy in relation to the other academic disciplines. In this sense, for example, the statutes of the Arts faculty of Freiburg im Breisgau maintained that the Arts faculty is the “devout nurse” (*pia nutrix*) of the higher faculties. It was only in the sixteenth century that the term philosophy became itself part of the denomination, in combinations like *facultas artium seu philosophiae*, or even replaced it, as in *facultas philosophica*, which was used in 1560 in Ingolstadt.

The Basic Texts

The practice of philosophy at medieval universities was intimately connected to its teaching program, the keystone of which was a standard set of texts that were read and commented upon in the classroom. These texts also determined the division of subjects treated at the Arts faculty. In their classes, masters did not so much discuss general philosophical topics, like epistemology or philosophy of science, as they read and commented upon standard books such as Aristotle's *Physics* or *Metaphysics*, which were discussed again and again over many years, each time by new masters. They did not always read the complete works, but only significant parts of them, and here again standard practices were followed. As a rule, for example, the first book of Aristotle's *On the Soul* was left out, as well as the thirteenth and fourteenth books of his *Metaphysics*.

It was around the middle of the thirteenth century that the *corpus aristotelicum* became the root of the syllabus. Of course each master had his own focus when reading the texts. For example, in the fourteenth century much more stress was placed on methodological issues than in the thirteenth and fifteenth centuries. However, the starting point for their philosophical reflections was always the same. Apart from the works of Aristotle, a number of others' texts were commented upon, such as those of classical authors like Boethius and Euclid, and those of medievals like Albert the Great and Marsilius of Inghen. However, precisely which and how many of these texts were taught varied in the syllabi of the different universities.

Because teaching focused on standard texts, these were instrumental in determining the issues to be dealt with by the master. Thus, it could happen that one and the same subject would be treated in different classes by different masters, depending on the texts being read and the interests of the master. For example, the nature of universals was not only dealt with in commentaries on the opening of Porphyry's *Isagoge*, which was the *locus classicus*, but also in those on the first book of the *Physics*, where Aristotle said that man first has general knowledge and only afterward particular, as well as in those on second book of *De anima*, in which Aristotle argued that universals are the object of the intellect and particulars that of the senses.

This is not as chaotic as it may seem at first glance, since the structure of the *corpus aristotelicum* was stable, remaining the same over the years at all universities. For modern research this has the advantage that it is relatively easy to locate and identify the topics that were discussed in the different commentaries on Aristotle and to make comparisons between commentaries written at different universities at different times.

The Teaching Program

In general, the teaching program for philosophy was constructed as follows. During the first stage,

primarily the logical works of the *corpus aristotelicum* were studied, then the physical works, followed by the *Metaphysics* and finally the *Ethics*. Additional works in the field of grammar, logic, rhetoric, mathematics, or astronomy were included, but played a less central role.

The program was divided into three consecutive stages. The first stage lasted from the beginning of study until achievement of the first academic grade, that of bachelor. During this time, study consisted primarily of the logical and some parts of the physical works of Aristotle. The student at this stage was called *scolaris*. Once he passed his first exam, which happened generally after 2–3 years of study, he was called *baccalareus* and prepared himself for the next exam, that of the licentiate. During this period he principally followed courses on the remainder of the physical works, the *Metaphysics* and the *Ethics*. This phase lasted longer, sometimes up to 5 years. After he had been awarded his licentiate, the student then applied for the title of master, which was normally awarded within the year. The master's title granted him the *ius ubique docendi*, that is, right to teach at all universities, although in practice this was not always accepted. At the end of the Middle Ages, for instance, when the Arts faculties were divided into a *via moderna* and *via antiqua*, some universities that followed only the *via moderna* refused to accept masters who had been educated in the *via antiqua*.

Commentary, Exercises, and Disputations

The process of studying and discussing the texts of the syllabus was threefold: ordinary lectures on the texts presented by the master, exercises to deepen the students' knowledge of those texts, and disputations on their content. Lectures normally took place in the morning. The text was read aloud by the master, who also explained the division of the text and its content. This was done either in a cursory fashion, with the master sticking close to the text, or more extensively, using the text as a starting point for questions that he then discussed with the students. Most commentaries

that have come down to us in manuscripts or early printed editions only partially reflect what was actually taught in the classroom, having been adapted for publication by the master. Occasionally, lecture notes written by students survived, and these present a different, far less structured picture. Apart from these, statutes, protocols, colophons, and illuminations also help to reconstruct the teaching situation at the Arts faculties.

After lectures, students attended exercises in the afternoon in which the same texts presented earlier that day were dealt with once more. These exercises were given by masters, although not necessarily by the same ones who had given the morning lecture on the subject. Some information about the form of these exercises can be drawn from the statutes of the various Arts faculties; however, their actual content remains unclear. It is possible that the *exercitia*, *puncta*, and *reparationes* which have survived in a number of late-medieval manuscripts are the product of such exercises.

Finally, disputations played an important role in the educational program, and were considered necessary for sharpening the minds of students and masters. To be sure, these disputations cannot be compared to those in the Theology faculties, which had a much more solemn character; nevertheless, they played a similarly central role. In the late-medieval period, an ordinary disputation was held once a week under the presidency of one of the masters, who posed questions to the bachelors and other masters, against whose solutions he then argued. In addition to this, short, daily disputations were held in the colleges. All those living in the college were required to be present, masters as well as students. The subjects of the ordinary disputations varied, yet basically took their starting point from those texts read in the lectures and exercises. The daily disputations primarily treated logical subjects.

Colleges and *Bursae*

Since at least the fourteenth century, it was typical for students to live together with masters in colleges or *bursae*, which were owned and run by the

latter. In these colleges, not only disputations, but also exercises were held. Toward the end of the Middle Ages, a substantial part of the educational program was delivered in the colleges, including, most importantly, some of the ordinary lectures. This shift had enormous impact on the schooling of students. The increased closeness of the master–student relationship facilitated the emergence of different schools of thought, each expressing the preferences of their respective master. An example of great historical import is Cologne, founded in 1388, where attached to the Arts faculty were a number of *bursae*, each with their own reading of the *corpus aristotelicum*. The *thomistae* at the *bursa montana* commented upon Aristotle on the basis of the works of Thomas Aquinas, whereas the *albertistae* at the *bursa laurentiana* preferred the commentaries of Albert the Great. School traditions linked to institutions closely connected to the Arts faculty are a phenomenon typical of the fifteenth century, which does not appear in the thirteenth and fourteenth centuries.

The *Wegestreit*

Also characteristic of the late-medieval period is the so-called *Wegestreit*: the debate between the *via antiqua* and *via moderna* which took shape in the second decade of the fifteenth century and determined the educational program at many universities until the beginning of the sixteenth century. The bone of contention was the correct interpretation of Aristotle – whether it was that exemplified by Thomas Aquinas, Albert the Great, and John Duns Scotus (the *via antiqua*), or that exemplified by William of Ockham, John Buridan, and Marsilius of Inghen (the *via moderna*). That the debate became so intense was due largely to the fact that it bore upon the relationship between philosophy and theology. According to representatives of the *via antiqua*, there is a necessary connection between the two, most significantly demonstrated by Thomas Aquinas, and therefore Aristotle must be interpreted in a way that does not conflict with Christian Faith. Defenders of the *via moderna*

denied this and referred, for example, to Marsilius of Inghen, who had argued that for Aristotle the human soul is mortal and creation from nothing an impossibility, and therefore that Aristotle's thought cannot be completely reconciled with Revelation.

At many universities, masters and students of both "ways" lived in different colleges. Consequently, the same texts of Aristotle were read at the same time by two different masters, each according to their own *via*. Exams were also held separately, so as to avoid students being failed because they did not respond to the question in an appropriate way. This situation interfered with the operation of the Arts faculty in many ways, and the protocols of the various Arts faculties testify to the plethora of difficulties that emerged from this state of affairs. Only toward the beginning of the sixteenth century did circumstances eventually change.

Channels of Exchange

The number of Arts faculties grew continually from the thirteenth century onward, with peaks in the second half of the fourteenth century (Prague, Vienna, Erfurt, Heidelberg, Cologne) and the second half of the fifteenth century (Greifswald, Uppsala, Tübingen, Freiburg, Basel). There was a significant exchange of teachers and students between these institutions. Some students were attracted by the presence of a particular master to take their degree at a foreign university, as was the case when Marsilius of Inghen taught at Paris in the early 1360s. Others followed their master when he moved from one place to another, as when Heymeric of Camp arrived in Cologne in 1422. Naturally, these academic peregrinations were closely tied to political circumstances. The Hundred Years' War, which began in the 1330s, impeded exchange between England and Paris, and this had an immediate impact on academic debates on the continent. The imbroglio of the Schism in 1378, which in Paris subjected those who opposed the University's official support of Clemens VII to boycotts, forced in particular German masters to

leave the city and seek academic positions elsewhere. Some of these played a significant role at the newly established German universities, such as Marsilius of Inghen, who was rector of the University of Paris in 1367 and 1371, but left the city in 1378 to become the first rector of the University of Heidelberg in 1386.

When designing their statutes, the Arts faculties of the newly erected universities often used Paris as a model, as well as Vienna, though to a lesser degree. Consequently, the structures of the different Arts faculties were more or less similar, making the exchange of students and masters easier. Some faculties drew their masters from privileged universities, as in Leuven professors from Cologne were preferred. In the early years of Freiburg University, a significant number of masters came from Heidelberg, which had an immediate effect on the way Aristotle was read there, since these masters were trained in the *via moderna*.

It goes without saying that the movements of masters and students facilitated the exchange of ideas and thus substantially enhanced the level of academic debate with a constant influx of new ideas. For example, the views of the Parisian master Henry of Ghent were already discussed at a very early stage in England, where they had a substantial impact on John Duns Scotus. The exchange of manuscripts also played an important role. Not only did the universities and faculties possess significant collections, but individuals as well. As is apparent from university documents and private letters, manuscripts were often borrowed to be read or copied, sometimes over a period of several years.

Controversies

Within the limits of this article, it is hardly possible to provide an accurate account of those controversies that were central to the philosophical debates held at medieval universities. Generally, they belonged to the fields of logic (universals, signification, supposition); natural philosophy (motion, time, infinity); metaphysics (substance, being, first cause); and ethics (virtues, happiness,

friendship). The bottom line was the correct interpretation of Aristotle, whose writings stood at the center of the educational program; yet, this did not in any way prevent original thought. Even Ockham, whose views were rejected by some contemporaries as new inventions, repeatedly stressed that what he said was precisely that which Aristotle expressed in his writings. And although Aristotle himself was sometimes attacked, especially by theologians (some of whom, such as Francis of Meyronnes in his commentary on the *Sentences*, called him the worst metaphysician), he nonetheless remained the virtually undisputed starting point of philosophical reflection at medieval universities.

Significantly, Aristotle was considered the best example of what human beings are able to achieve through the use of natural reason alone, that is, without the aid of Christian Revelation. This led to repeated conflicts with representatives of the Theology faculty and even the Church, when philosophers underlined in their classes that Aristotle, and thus natural reason, came to conclusions opposed to those of Christian Faith. Landmarks were the Condemnation of 1277, when Bishop Stephen Tempier banned a number of philosophical theses discussed in the Arts faculty at Paris, and the aforementioned late-medieval *Wegestreit*.

Conclusion

In the eyes of many sixteenth-century intellectuals, the debates at late-medieval universities had demonstrated that philosophy practiced in this way could hardly attain its goal, namely, to find the truth, but would always dissolve into endless battles between schools. This belief had a twofold effect on the practice of philosophy. On the one hand, at some universities an effort was made to produce new teaching materials, designed to represent a common view acceptable to all parties, as for example those made by Johannes Eck at the request of the University of Ingolstadt. On the other hand, philosophical movements outside the universities began to gain influence during this time, questioning scholastic philosophy

on the whole and paving the way for future philosophers like Hobbes, Descartes, and Spinoza, who had no university affiliation. To be sure, universities in the sixteenth and seventeenth centuries continued to play a significant role in the production of philosophical texts. But in contrast to the Middle Ages, crucial developments took place increasingly outside the lecture halls.

Virtue and Vice

István P. Bejczy

Stichting Mozaïk, Rotterdam, The Netherlands

Abstract

From the twelfth century, a philosophical notion of virtue as a humanly acquired *habitus* coexisted in medieval moral thought with a religious notion of virtue as a divine gift. The most widespread catalogue of moral virtues was the Platonic quartet of the four cardinal virtues, which medieval authors sought to reconcile with Aristotle's scheme of five intellectals and 11 moral virtues. In theology, the cardinal virtues figured next to virtues of a biblical origin; from the twelfth century, the three theological and the four cardinal virtues were combined as the seven principal virtues of Christendom. Different classifications ("contrary" or "remedial" virtues; the fourfold hierarchy of Macrobius; monastic, economical, political virtues) existed as well.

Vice was mostly defined in theology as the absence of virtue, while philosophers followed Aristotle in locating virtue as a mean between two opposite "vices," one representing an excess, the other a lack of the virtuous quality in question. The most frequently employed catalogue of vices is the scheme of the capital vices or deadly sins,

which originated as an octad in ancient monasticism and was transformed to a septenary by Gregory the Great. Typically, the scheme of the deadly sins appears in monastic, spiritual, and pastoral literature rather than in learned theology, which usually takes its point of departure in the seven principal virtues and contrasts each of them with a variety of vices.

The extent to which a philosophical virtue theory was able to detach itself in the Middle Ages from theology is disputed in scholarship. Many moral philosophers shared religious concerns with theologians. In addition, the moral psychology underlying medieval virtue theory is essentially Christian in character, as it rests on the notion of fallen human nature.

Medieval moral writing, which ranges from academic speculation to all kinds of pastoral and educational literature, centers for a great part around the concepts of virtue and vice (Bloomfield et al. 1979; Newhauser 1993; Newhauser and Bejczy 2008). Virtue and vice were both philosophically as well as religiously defined in medieval thought. From the twelfth century in particular, the relation between the philosophical and religious aspects of both concepts occasioned continuous debate.

Classical antiquity provided the Middle Ages with various philosophical notions of virtue. Peripatetic and Stoic philosophy essentially conceives of virtue as a rational perfection of man's natural capacity for the good. According to Aristotle, virtue is a steadfast *habitus* formed through

continuous application; human beings have an inborn aptitude for the good, which they are able to follow and develop through their own effort. Cicero defines virtue as a *habitus* of the mind in agreement with nature and reason (*animi habitus naturae modo atque rationi consentaneus*; *De inventione* 2.53.159), while Boethius speaks of a *habitus* of the well-ordered mind (*habitus mentis bene constitutae*; *De differentiis topicis* 2). Neoplatonism rather sees human virtue as modeled on the *virtutes exemplares* inherent in the mind of God, a theory chiefly known to the Middle Ages from Macrobius' commentary on the *Somnium Scipionis*.

For patristic authors, however, true virtue is unthinkable outside a Christian context. Goodness has its unique source in God, and any conception of virtue unrelated to God is therefore false. Ambrose, Jerome, and Augustine accordingly reject the notion of virtue as a humanly acquired attitude and redefine it as a divine gift enabling believers to live in union with God – if not perfectly in this life, at least in the next. Virtue thus becomes the exclusive property of Christians, as categories of a religiously conceived goodness culminating in celestial beatitude. Later patristic writers (Julian Pomerius, Gregory the Great) corroborate the Christian character of the virtues while stressing their importance for the active life. Enabling Christians to achieve moral acts and thereby to gain merit, the virtues serve as divine instruments, which secure morality in the here and now and salvation in the hereafter. Until the twelfth century, this line of interpretation dominated moral writing. Meanwhile, Carolingian authors (Alcuin, Hrabanus Maurus) gave the virtues a central role in moral education. They advocated the virtues to their audience as means to live by God's will, stressed the need to propagate them among all Christian believers, and moreover viewed the virtues as necessary tools in the struggle against sin. Quite apart from this tradition, Martin of Braga (d. 579/580) devoted a treatise to the cardinal virtues, which is entirely Stoic in character and probably epitomizes a lost work of Seneca. His *Formula vitae honestae* is the most frequently copied work on the virtues

from the Middle Ages and was usually attributed by its medieval readers to Seneca himself.

In the twelfth century, classical moral philosophy was studied with renewed interest and for the first time since the patristic age, the virtues gave rise to intense debate. Whereas intellectuals such as Peter Abelard and John of Salisbury thought the classical teachings on the virtues highly instructive for Christians, religious authors such as Bernard of Clairvaux refused to recognize the existence of moral goodness outside the faith and took efforts to vindicate the Christian character of virtue. On a doctrinal level, the rediscovery of classical moral thought forced theologians to reflect on the interaction of nature and grace in matters of morality. Most twelfth-century masters stuck to the idea that even if humans possess a natural inclination to goodness, the formation of virtue is dependent on divine grace. Peter Lombard accordingly defines virtue as “a good quality of the mind by which one lives rightly, that nobody uses badly, and that God alone works in man” (*Sententiae* II.27.1 § 1: *bona qualitas mentis, qua recte vivitur et qua nullus male utitur, quam Deus solus in homine operatur*). The generation of Parisian theologians active after the Lombard's death, however (Peter the Chanter, Alan of Lille, Stephen Langton, and others), formally acknowledged the existence of humanly acquired virtues (*virtutes politicae*, *virtutes civiles*) that enable a moral order in the present life, especially in the social and political atmosphere, next to virtues informed by divine grace and procuring salvation (*virtutes catholicae*). Their acknowledgment of naturally acquired virtues facilitated the reception of Aristotle's *Nicomachean Ethics* in the thirteenth century. In effect, most thirteenth-century theologians recognize moral virtue on three levels. First, moral virtues exist as habits acquired through human effort and procuring happiness in the present life, in agreement with Aristotle's teachings (*virtus acquisita*, *virtus consuetudinalis*). Second, charity can transform the acquired virtues into gratuitous virtues (Bonaventure, William of Ockham), or at least provide the acts produced by the acquired virtues with a salvific effect (Thomas Aquinas, John Duns Scotus). Third, Christians possess

moral virtues as qualities directly infused by divine grace (*virtus infusa*); scholastic theologians frequently claim that the Lombard's definition pertains to the latter type of virtue only. From the late thirteenth century, however, the threefold recognition of moral virtue was disputed from two different sides. On the one hand, some theologians (Henry of Ghent, Godfrey of Fontaines, and John Duns Scotus) denied the existence of the infused moral virtues. In their view, the acquired virtues already procure salvation in combination with charity, so that the infused moral virtues are superfluous (Lottin 1948–1960: vol. 3). On the other hand, the existence of acquired moral virtues came under attack from the mid-fourteenth century, when a group of masters associated with the “Augustinian revival” in theology (Gregory of Rimini, Hugolin of Orivieto, Thomas Bradwardine) returned to Augustine's position that morality and virtue entirely depend on grace. Without God's special assistance, humans are incapable according to these theologians to do any good. Their views had a remarkable influence on some early Italian humanists (Francis Petrarch, Coluccio Salutati, Lorenzo Valla; Trinkaus 1970), although Aristotelian, Stoic, Neoplatonic, and even Epicurean views of virtue are strongly represented in fifteenth-century humanism, too (Kraye 1988; Lines 2002).

In contrast to virtue, vice is, as a human inclination to evil caused by the Fall, primarily a theological concept. Yet classical moral philosophy does oppose the virtues to specific moral imperfections. Aristotle famously conceives of virtue as a mean between an excess and a lack of the virtuous quality in question (locating fortitude, for instance, between rashness and cowardice); in medieval philosophy, both sorts of moral defects are usually called vices (*vitia*). Stoicism rather contrasts the virtues – in particular the four cardinal virtues of the mind – with the four passions, or affects, of the body: desire or hope, fear, joy, and sadness. Although some patristic and early medieval authors lent support to this theory, others (Lactantius, Julian Pomerius, and Isidore of Seville) rejected it, claiming instead that the four passions are morally neutral forces, which can be transformed into either virtues or vices by the free

will. In the High and late Middle Ages, this last line of thought prevailed.

In theology, vice and sin were defined from patristic times as the absence of virtue rather than as realities in themselves. Augustine's dictum *non est substantia peccatum* (*De natura et gratia* 20.22) was repeated by many medieval authors and entered into Peter Lombard's *Sententiae* (II.35.4.1). The denial of the real existence of the vices coheres with the idea, fundamental to Christian metaphysics, that evil does not exist in its own right. What humans conceive as evil is merely the corruption or the absence of the good, as the Lombard insists in his discussion of vice and sin (*Sententiae* II.34.4.2). Consequently, vice is not a bad quality, but the absence of a good quality. Still, a number of medieval theologians (Alan of Lille, Thomas Aquinas, and Durand of Saint Pourçain) and philosophers (Radulphus Brito, James of Douai, in their commentaries on the *Nicomachean Ethics*) argue that vice is no mere *privatio virtutis*, but a positive defect or *habitus malus* which moves the moral agent in a way contrary to virtue. The Franciscan friar David of Augsburg (d. 1272) even goes so far as to claim in his highly influential *De exterioris et interioris hominis compositione* (3.28.3) that virtue is the absence of vice, thus turning the orthodox view on the matter upside down.

Due to the diverse conceptualizations of virtue and vice, various classifications of virtues and vices coexist in medieval moral thought. The most widespread catalogue of moral virtues is the Platonic quartet of the cardinal virtues (prudence, justice, fortitude, and temperance); the term “cardinal virtues” was actually coined by Ambrose of Milan. The cardinal virtues were known to the Middle Ages from Stoic and Neoplatonic sources and traditionally served as mother concepts in a genealogy of virtues. Aristotle, however, presents a different catalogue in his *Nicomachean Ethics*, distinguishing five intellectual virtues, which order reason itself (*scientia*, *sapientia*, *ars*, *intelligentia*, *prudencia*), from eleven moral virtues, which have the affective life as their object (*fortitudo*, *temperantia*, *liberalitas*, *magnificentia*, *magnanimitas*, an unnamed virtue pertaining to moderate honor,

mansuetudo, amicitia or *affabilitas, veritas, eutrapelia, iustitia*). Aristotle's medieval readers took efforts to reconcile both classifications: first, by arguing that prudence is also a moral virtue, or occupies a middle position between the moral and intellectual virtues; second, by claiming that prudence, justice, fortitude, and temperance are the four principal virtues even in Aristotle's system, while in their Stoic conception they are conditions of virtue rather than virtues themselves (Bejczy 2008). In theology, the cardinal virtues were accepted from patristic times, but moral and spiritual qualities of biblical origin likewise counted as virtues – the three theological virtues (faith, hope, charity), the seven gifts of the Holy Spirit, the macarisms (the mental preparations for the beatitudes: poorness of spirit, meekness, etc.), the beatitudes themselves, and individual concepts such as humility, wisdom, and patience. Only from the twelfth century were the three theological and the four cardinal virtues combined as the seven principal virtues of Christendom. Finally, in pastoral theology in particular, one frequently encounters schemes of seven or eight virtues conceived as direct counterparts of the seven or eight deadly sins. These are known as “remedial” or “contrary” virtues in scholarship.

Virtues were also classified according to their degree of intensity and their social impact. According to Macrobius, the cardinal virtues exist at four different levels. As political virtues, they regulate earthly concerns; as purgatorial virtues, they help humans to detach themselves from these concerns; as virtues of the purged mind, they define the contemplative life; as exemplary virtues, they reside in the mind of God. This fourfold distinction was commonly accepted from the late twelfth century. Yet from the late thirteenth century, scholastic masters also accepted a threefold distinction into monastic, economical, and political virtues as pertaining to individual, familiar, and political life, respectively. While Macrobius' hierarchy is based on the Platonic view that virtues become more perfect as they better assure individual contemplation, the threefold distinction accepted in the thirteenth century rather rests on Aristotle's assumption that virtues are better as they better secure the common good.

Political virtues hence rank lowest in the first hierarchy, but highest in the second. Nevertheless, Albert the Great and Giles of Rome associated Macrobius' hierarchy with varying degrees of virtue derived by them from book vii of the *Nicomachean Ethics* (Bejczy 2007).

The most frequently employed catalogue of vices is the scheme of the capital vices or deadly sins, which has its origin in fourth-century hermetic monasticism. Evagrius Ponticus formulated a series of eight “evil thoughts” by which the devil attempted to distract monks from a life devoted to God. The arrangement of Evagrius passed to the West by John Cassian and exerted considerable influence on early medieval Irish and Anglo-Saxon penitentials. Gregory the Great transformed the scheme into a septenary of *principalia vitia*: vainglory, envy, wrath, sadness, avarice, gluttony, and lust, all originating from the root vice of pride. Later medieval authors usually took vainglory and pride together as a single vice and replaced sadness with sloth; the ensuing list of seven deadly sins has remained intact until present times (Bloomfield 1952; Newhauser 1993; Casagrande and Vecchio 2000). Typically, the scheme of the deadly sins (a designation which became common in the thirteenth century) appears in monastic, spiritual, and pastoral literature rather than in learned theology, which usually takes its point of departure in the virtues. The scheme is absent, for instance, in the work of Bernard of Clairvaux, while the *Secunda secundae* of Thomas Aquinas (the part of the *Summa theologiae* concerned with moral theology) basically consists of an exposition on the seven principal virtues and the many vices opposed to each of them. In the prologue of the *Secunda secundae*, Aquinas points out that moral theology amounts to a discussion of virtue, and that a theological discussion of virtue amounts to a discussion of the three theological and four cardinal virtues. Following a similar logic, John Duns Scotus even explicitly rejects the scheme of the deadly sins. In his view, a catalogue of principal vices may well be construed, but such a catalogue should consist of vices opposed to either the theological and cardinal virtues or the Ten Commandments. In the latter case, one should postulate the

existence of ten principal vices; in the former case, there are seven, but not the seven accepted ones, as the septenary of Gregory the Great does not contain disbelief (the opposite of faith) and despair (the opposite of hope). In either case, the current scheme of the deadly sins is deficient. Theological attempts to construe alternative schemes of principal vices are few, however; yet from the twelfth century in particular, one occasionally finds lists of four main vices devised as counterparts of the cardinal virtues and sometimes actually called *vitia cardinalia* (Bejczy [forthcoming](#)).

The common view that confronting the seven capital vices with the seven principal virtues became the typical stratagem of moral literature from the late twelfth century thus needs revision. Such a confrontation is staged for the first time in two works ascribed to a twelfth-century Benedictine monk of Hirsau called Conrad by posterity: *De fructu carnis et spiritus* and *Speculum virginum*. Both works oppose the seven principal virtues, which have humility as their root, to the seven principal vices rooted in pride, and depict this opposition in the form of trees of virtues and vices. Conrad's definitions were occasionally copied in moral literature, while his trees stand at the base of an iconographical tradition of its own. Theologians, however, more frequently contrasted the principal virtues with a variety of vices, while most pastoral authors opposed the principal virtues to the remedial or contrary virtues. Meanwhile, philosophers who based their theories on the *Nicomachean Ethics* followed Aristotle in locating the virtues between pairs of opposed defects.

Much recent scholarship discusses the extent to which a philosophical virtue theory was able to detach itself in the Middle Ages from theology. On the one hand, humanly acquired virtues were recognized from the twelfth century, while commentators on the *Nicomachean Ethics* claimed from the thirteenth century to discuss Aristotle's ethical system on its own merits (Wieland [1981](#); Müller [2001](#); Bejczy [2005](#)). On the other hand, the recognition of acquired virtue, as well as the rejection of infused moral virtues from about the 1300s, were primarily theological affairs, while

many commentators of Aristotle betray theological and religious concerns. Theologians and philosophers usually agree that even acquired virtue has its first origin in God, as the ultimate source of all goodness. Moreover, many of them believe that acquired virtue is conducive to supernatural ends, assuming that it has a civilizing effect which prepares the human mind for accepting the gifts of God. According to a famous thirteenth-century distinction, the acquired virtues bring humans *ad finem*, while the gratuitous virtues bring them *in finem* (Philip the Chancellor, who introduced this distinction, rather applied it to the cardinal and theological virtues, respectively, which in his view were probably both infused). In addition, the moral psychology underlying medieval virtue theory is unmistakably Christian in character. Virtue is, in the medieval conception, not just a realization of a natural aptitude for the good, but a victory over the defects, which are attached to human nature since the Fall. The Fall entailed a corruption of the will, and it is only by redirecting his will to the good that postlapsarian man can hope to live in virtue. Virtue and morality hence essentially reside in the will rather than in reason, as ancient moral philosophy assumes; a will which is autonomous from reason and even, paradoxically, from virtue itself. From about the 1300s, theologians and philosophers admit that the will does not really need virtuous habits in order to act morally, while some masters even suggest that virtue, as a steadfast habit, undermines the will's autonomy and thus hinders rather than furthers moral choice (Kent [1995](#)). Another consequence of the account of the Fall is the idea that virtue and morality concern every human individual in the same way, regardless of sex and rank, and pertain to his or her individual good. The egalitarian aspect of medieval virtue theory, as well as its focus on the individual good, contrast with Aristotle's premise that virtue primarily relates to free, male citizens with sufficient fortune and talent to operate successfully in the public atmosphere. Medieval masters, including commentators on the *Nicomachean Ethics*, usually argue that virtue is equally accessible to men and women, rich and poor, and aim at achieving individual perfection rather than promoting the

common good. Magnificence and magnanimity, for instance, which Aristotle reserves for the elite, can be possessed as interior *habitus* even by the poor, as Thomas Aquinas insists, despite the absence of corresponding exterior acts. Gerard Odonis and John Buridan reject this theory, but then they both view magnificence and magnanimity as secondary virtues, in contrast to the cardinal virtues which are necessary for moral perfection and accessible to everyone. Also, late medieval masters generally claim, in contrast to Aristotle, that the virtues of rulers and those of the ruled are essentially one (Lambertini 2008).

Vital du Four

Roberto L. Plevano

Scotus Project, The Catholic University of America, Washington, DC, USA

Abstract

Vital du Four (lat. *Vitalis de Furno*) was a prominent French Franciscan friar active from the last decade of the thirteenth century to the first quarter of the fourteenth century. He studied theology at the University of Paris and later on taught in Montpellier and Toulouse. Philosophically, he opposed Peter John Olivi's views about the active nature of the human cognitive faculties, and stressed the necessity of the senses in forming intellectual knowledge. He posited sensible and intelligible species as a medium in the cognitive process, but he nevertheless allowed for the intellectual cognition of singulars.

He was provincial minister of Aquitaine in 1309 and was created cardinal bishop in the see of Albano in 1321. He took part in the Conventual side of the Franciscan Order against the spiritual factions. In the last part of his life, he fought strongly against Pope John XXII's ruling on Christ's poverty.

His large output of works includes university treatises (on physics, metaphysics, and psychology, readings on the *Sentences*, disputed and quodlibetal questions), a treatise on medicine, sermons, biblical commentaries, polemical and doctrinal writings.

Life

Vital du Four (lat. *Vitalis de Furno*) was born in Bazas in Aquitaine around 1260. The town, now of the Gironde department, lies 60 km southeast of Bordeaux and was at that time a bishopric. Vital entered the Franciscan order when he was still young, if we are to trust his own testimony in a letter addressed in 1313 to the general chapter in Barcelona. By the second half of the thirteenth century, however, a novice was allowed to enter a Franciscan convent when he was as young as 12 years old. He must have been a brilliant student, as he entered the lectorate program at the *studium* of Paris. A note, at the beginning of Vital's commentary on the fourth book of Peter Lombard's *Sentences*, mentions that the work is a *reportatio* of Vital's lectures delivered in Montpellier, and that Vital himself had documented in it the lectures of master Jacques de Quesnoy (Jacobus de Carceto), a friar who had the regency in Paris in the last decade of the thirteenth century. Another Franciscan master, Raymond Rigaut (Raymundus Rigaldi), taught in Paris in 1287–1289 and may have been another of Vital's teachers, since Vital's *Quodlibet I* shares with Rigaut's *Quodlibet VIII* the same rare stylistic feature of a prologue. However, it is unlikely that Vital remained in Paris long enough to meet the requirements for the doctoral degree.

From another note in the same commentary on the *Sentences* we also learn that by 1295 he was *lector* in the Montpellier *studium generale* of the Order, where Olivi also had taught from 1279 to 1282. Vital's appointment as lector in this city should probably be placed around 1292. At that time Montpellier was part of the crown of Aragon, and was a great center of learning and had a long tradition of medical studies. Here Vital engaged in a disputation with Louis of Anjou, who had just

been released from captivity in Catalonia (November 1295) and still had to enter the Order of the Friars Minor.

In 1297, Vital moved to the Franciscan *studium* of Toulouse, again in the capacity of *lector*. He appears to have spent 10 years in Toulouse, obtaining eventually the title of Master of Theology. Vital opposed vigorously Olivi's views of psychology in several questions disputed in Montpellier and Toulouse. Olivi himself responded to the *impugnaciones* of his brother. Vital did not limit his activity only to scholarly matters in the *studium*, since he is mentioned in a 1328 papal bull issued by John XXII as a very effective preacher, capable of publicly converting a group of women in Toulouse known to lead a loose life.

His life of teaching duties lasted 15–20 years. In 1307, Vital left the schools to be appointed provincial minister of Aquitaine. Possibly due to an acquaintance with Pope Clement V, he was created cardinal priest of S. Silvestro e Martino ai Monti in the consistory of December 23, 1312, and finally cardinal bishop in the see of Albano on June 14, 1321.

Under the papacy of Clement V, Vital contributed to the struggle of the Conventual party of the Order against the French and Italian spiritual factions. In August 1311, he took part in the response against the thesis regarding *usus pauper* advanced in Ubertino da Casale's *Rotulus*, and in 1312 he refuted Bonagrazia da Bergamo. However, he was probably regarded by both sides as a moderate, since the general Michael of Cesena invited him to give the opening sermon at the Order's general chapter of Marseille in 1319. Michael also remembers in the *Appellatio in forma maiori* the verbal abuse meted out by John XXII against Vital's views on Christ's poverty, an encounter that took place at the Avignon curia around 1321. Later on, Vital produced three answers to John XXII's bull *Cum inter nonnullos* (issued in November 1323), where the Franciscan doctrine of the poverty of Christ was condemned as erroneous and heretical. On this occasion, Vital attacked the position of the Dominican John of

Naples, who had been a regent master in Paris in 1315 and afterward *lector* in Naples.

Vital died in Avignon on August 16, 1327. He was buried in the church of the convent of S. Francis in Avignon.

Works

Vital's output was large. As a *lector* in the Franciscan schools he commented on the *Sentences*, although only a *reportatio* of his lectures on the fourth book has been found. He held disputations on psychology, epistemology, and metaphysics, and his three *Quodlibeta* attest to his standing in the Franciscan educational system. He also wrote sermons, biblical commentaries, polemical and doctrinal works. An encyclopedic treatise on medicine is attributed to him. Besides his scholarly production, as provincial minister and cardinal he contributed to the ecclesiastical literature of the Order.

His scholarly works survive mainly in four manuscripts: Rome Vat. Lat. 1095, Todi Bibl. com. 95, Rome Vat. Borghese 192, Rome S. Isidore 1/15. The list of Vital's work is given in Delorme, 1947.

1. *Memorialia quaestionum*, Todi 95, ff. 8a–13d, 22a–24b (abbreviated questions of the English friar Joannes de Persora, of Vital himself and of Peter John Olivi).
2. *Quodlibet I* (18 questions): Todi 95, ff. 12d, 14a–18a. All three *Quodlibeta* in Delorme, 1947.
3. *Quaestiones disputatae de rerum principio*, S. Isidore 1/15, ff. 1r–35r. A late hand attributed these questions to John Duns Scotus. They have been edited in the Wadding edition of Scotus' works: Lyon, 1639, t. III; Paris, 1891, t. VI, 267–346.
4. *Quaestiones breves de rerum principio*, Todi 95, ff. 18a–22a. Ed. Delorme F, Sophia 10 (1942), 290–327.
5. *Quaestio de productione creaturarum*, Todi 95, ff. 24b–27c.

6. *De anima et eius potentiis*, S. Isidore 1/15, ff. 35r–95r; Todi 95, 27r–51b. In the Wadding edition of Scotus' works: Lyon, 1639, t. III; Paris, 1891, t. VI, 346–493.
7. *Quaestiones super IV libro sententiarum reportatae in Montepessulano*, Rome, Vat. Lat. 1095, ff. 1–66.
8. *Quodlibet II* (14 questions): Todi 95, ff. 51b–58b.
9. *Quaestiones de cognitione* (8 questions), Todi 95, ff. 58b–89a; S. Isidore 1/15, ff. 95r–125r (incomplete). Ed. Delorme (1927).
10. *Quodlibet III* (14 questions): Todi 95, ff. 89b–104d.
11. *Quaestiones de numeris, tempore et instanti* (9 questions), S. Isidore 1/15, ff. 126r–201r; Borghese 192, ff. 93r–129r. In the Wadding edition of Scotus' works: Lyon, 1639, t. III; Paris, 1891, t. VI, 555–710.
12. *Abbreviatura qq. 28 G. de Fontibus*, S. Isidore 1/15, ff. 203r–205r (incomplete); Borghese 192, ff. 130r–145v.
13. *Comm. super librum de sex principiis*, ed. Gondras AJ. AHLMA 50 (1975), 196–317.
14. *Treatise Pro conservanda sanitate tuendaque prospera valetudine, ad totius humani corporis morbos et aegritudines salutarium remedium curationumque liber utilis*, [Apud Ivonem Schoeffer] Mainz 1531 (an encyclopedia of medical knowledge with 343 separate entries).
15. *Speculum morale totius sacrae scripturae*, ed. Lyon 1513; Venice 1594 (a moralizing exposition of the Old and New Testament, written in Toulouse around 1305).
16. *Super Apocalypsim*, Venice 1600, Paris 1647, Trento 1773 (in *Supplementum operum omnium S. Bonaventurae*. II, 5).

Doctrine

In general, Vital's teaching is an attempt to make a synthesis of many positions in late thirteenth-

century theology, epistemology, and psychology. His teaching, however, was often derived from the doctrines of different authors and did not show originality and strict consistency. His opposition to Olivi, and more generally his tendency to defend the most common views of his time, puts him outside the movement of renewal of Franciscan thought at the turn of the century. In his discussions of human cognition, he often summarizes to a great length John Pecham, Matthew of Aquasparta, and Roger Marston. Vital shares Henry of Ghent's view on the intentional distinction of essence and existence, but his discussion lacks the depth of Henry's metaphysics. Giles of Rome influenced Vital and also the less known Jacques de Quesnoy and Raymond Rigaut.

In considering intellective cognition, Vital holds that it is possible for humans to intellectually grasp singular things. In the cognitive process leading to the acquisition by the knower of the nature of an object, the knowledge of an object in its singularity depends in first place on the perceptive sense-data attesting the *hic et nunc* of the object and its accidents. Most medieval thinkers, however, agreed with Augustine's principle that the senses cannot provide knowledge in a proper and true sense. Henry of Ghent, for instance, claimed that a true and "sincere" knowledge only stems from the intellect's judgment of the sense-data, and concerns the essence of things, insofar as the intellect, by a divine illumination, discovers these essences by comparing a thing to its divine *exemplar*, that is, the eternal idea of the thing in the mind of God. Thus, the senses allow only knowledge in an imprecise and generic way.

Vital responds to Henry that the intellect "terminates" its cognitive action regarding singulars in sense organs, even though this action is incorporeal and independent from senses, and corporeal only in a certain regard. Furthermore, he draws a distinction between, on the one hand, the singular object as something actually existing *hic et nunc*, which is the primary object of the senses, and, on the other, the singular conceived

as a different “grade” of the specific nature of an individual with respect to another individual of the same species. This singular cannot be grasped by the senses but only by the intellect. Two apples taken from the same orchard may look and taste the same to the senses, and only intellectual cognition can tell them apart (*Quaestiones de cognitione*, q. 1, ed. Delorme, 163–164).

The inclusion of sensitive cognition in the cognitive process does allow for a role of the *species* as a medium of knowledge. The *Species* inform the intellect in the understanding of both singulars and universals. The species are not *impressae* upon the intellect by the sensitive powers, but rather “collected” by the intellect: (a) from sensing a singular, in order to understand an object in its actual existence, and to maintain the species after the act of sensation (*species sensibilis*); (b) from the very *species sensibilis*, thus producing absolute knowledge of the singular, with no regard to its actual existence (*species intelligibilis rei singularis*); (c) from memory and the imaginative power, whenever there is no sensitive act toward a singular; (d) from these three kinds of *species* the intellect can finally collect a species of a universal, that is, the consideration of an object in its universality (*Quaestiones de cognitione*, q. 2, ed. Delorme, 210–211).

Walter Burley

Marek Gensler
Department of Philosophy, University of Łódź,
Łódź, Poland

Abstract

Walter Burley (ca. 1275 – after 1344), known as *doctor planus et perspicuus*, was one of the most eminent logicians and natural philosophers of the first half of the fourteenth century and the chief polemist of William Ockham. Of his almost 80 works composed over a period of some 40 years from his studies in Oxford to the final days of his intellectual activity (about 60 of them have survived), most are devoted to logic and natural philosophy, the remaining ones, to theology and practical philosophy. In logic, he was the champion of *via antiqua*, defending realist views against the criticism of Ockham. In philosophy of nature, his favorite problem was change. Apart from local motion, he was interested in the issues related to substantial, qualitative, and quantitative change, called generation, alteration, and growth, respectively. Some of his ideas underwent changes and refinements in discussions with his colleagues in Oxford, Paris, and elsewhere, others formed a solid core relatively early and were repeated in consecutive works or were simply taken for granted.

Biographical Information

Walter Burley was born in a village of Burley (today part of greater Leeds) in Yorkshire between 1274 and 1276. Nothing is known about his life before 1301, when he had already been a graduate in Philosophy at Oxford University. As a Master of Arts, Burley became a fellow of Merton College and was a Regent Master in the Faculty of Liberal Arts until 1306 or 1307. His earliest works (questions to book III of *De anima*, probably the only surviving work from his student times, early versions of commentaries on *Ars Vetus*, *Posterior Analytics*, *De Sophisticis Elenchis*, logical treatises, commentaries on *De generatione et corruptione*, *Parva naturalia*, and the early version of commentary on *Physics*) come from that period. In 1308, Burley went to Paris to study theology. While studying theology he continued his interest in logic and philosophy of nature: the first version of *De puritate artis logicae*, his comprehensive treatise on the subject, as well some commentaries on logical works of Aristotle testify to his intellectual maturity as much as three treatises on accidental change, known as *Tractatus primus*, *Tractatus secundus*, and *De formis*, and the questions to *Physics*. Ironically, his main theological work, the commentary on the *Sentences*, is now lost. Still as a student of theology, before 1319, he disputed *de quolibet* in Toulouse: the topic was the first and last instant of change (*De primo et ultimo instanti*).

In 1324, Burley received the title of Master of Theology (he had already been a priest since 1321) and remained in Paris as a professor and fellow of College de Sorbonne for three more years. In late 1326, he started a diplomatic career: over a period of almost 20 years he served as an envoy for the king of England Edward III. He visited the papal curia in Avignon several times; he also traveled to Germany and Italy. His diplomatic and ecclesiastical career was supported by Richard de Bury, later bishop of Durham and Chancellor of England. At bishop's court Burley met a group of learned men, some of whom (John Maudit, Thomas Bradwardine) he had known from Oxford. The intellectual atmosphere inspired him to return to philosophy: he completed the final versions of his commentaries on *Physics* (started in Paris) and *Ars Vetus*, revised *De puritate artis logicae* to respond to Ockham's arguments from *Summa logicae*, and composed commentaries on Aristotle's *Ethics* and *Politics* as well as a new treatise *De universalibus*. His last work was probably a quodlibetal question in philosophy of nature he discussed in Bologna in 1341. The date of his death is unknown: last information about him comes from 1344 but he may have lived until the Black Death reached England in 1348.

Thought

Burley's contribution to philosophy is most visible in two disciplines: logic and philosophy of nature. He is not a deliberate innovator. He tries to give a precise and penetrating (*planus et perspicuus*, hence his nickname) explanation of the teaching of Aristotle and other authorities, which would be in agreement with the common opinion of scholars (*communis opinio doctorum*). It is seldom that he opposes the prevalent views or proposes a new solution. Still, in both fields he is able to leave a visible mark of his talent. In logic, his *De suppositionibus*, giving an overview of the theory of supposition, helped to revive interest in it not only in William Ockham; his *De obligationibus*, *De exclusivis*, *De exceptivis*, and other treatises similarly set standards for

respective parts of logical theory. His main logical work *De puritate artis logicae* was intended to be a comprehensive study of the whole discipline: Burley did not complete his project in the original version, now known as *Tractatus brevior* but returned to it later and revised it in *Tractatus longior*. The two versions of *De puritate* contain a thorough though not uniform presentation of types of logical argumentation: in *Tractatus brevior* he divides them into enthymematic consequences, conditional syllogistic consequences, and hypothetical unconditional consequences; in *Tractatus longior*, written with a clear polemical intention against Ockham, he refined his original division of consequences into absolute and as-of-now ones, further dividing the former category into natural and accidental ones (the criterion being whether the antecedent includes the consequent), and introducing three other divisions.

As a realist, he believes that logic is nothing but an analysis of general structures of reality. Aristotle's categories show an order that things bear in themselves (first intentions) and that is only secondarily reflected by our ways of speaking about things (second intentions); therefore, logic and ontology are inseparable. The opposition to Ockham's nominalism is best visible in his views on supposition: for Burley, the word "man" in the proposition "Man is the noblest creature" is in the simple supposition because it signifies some thing, i.e., a species, for Ockham, it is not because it signifies a mental intention rather than a true thing. Burley's realism does not go as far as Scotus'; however, he agrees with the Subtle Doctor that both common nature and individual difference really exist, but he denies that they differ only formally. Burley tries to avoid the subtleties of *formalitates* and claims that the differences between universals are real. Moreover, common nature is not contracted by the individual difference, as was the opinion of Scotus, but remains in an individual in its totality. This assumption allows Burley to analyze the divisions of a universal, looking for something general in various items of minor generality. Though he upholds the real difference between universals, he denies it – contrary to Giles of Rome – between essence and existence.

In philosophy of nature, Burley's interests were truly focused on the problems of duration and change. He analyzed it on various levels of abstraction, starting from particular classes of things and actions observed in the world. Some of his opinions were modified in successive works, of which the most important are the three versions of his *Physics* commentary, the commentary on *De generatione et corruptione* and three Parisian treatises on change. The constant part of Burley's views on elementary and organic change can be summarized as follows. Prime matter, devoid of definite dimensions, is first informed by primary qualities, which – working in pairs – constitute the forms of first bodies, i.e., the elements. Heat is the first among equals in primary qualities. Its activity causes both generation and corruption; it is necessary for life but brings about death too. These various forms of action are related to various types of heat: celestial, elementary, and animal. The three types do not differ from one another in their natures; on the contrary, they share the same nature and the observable differences between them are attributed to intensity in action, which in turn is dependent on the source of heat. Elements, constituted by heat and the remaining three primary qualities serve as material for all bodies of sublunary world in such a way that every body is a mixture of all elements, which are virtually present in it (an idea borrowed from Thomas Aquinas), and their qualities concur to produce a mixed quality, characteristic for a particular body.

The bodies of inanimate beings, such as minerals, are constituted from elements under the influence of celestial heat. In animate beings, the process is more complex, for it requires concurrence of three parties: the form of a generated being, say an animal, comes in semen from the male parent, matter is provided by the female parent, and solar heat is a necessary condition for creation of a new life. Semen is a form that exists only during the process of generation passing the nature to the newly formed being; in the same vein, an embryo remains a *quasi* part of a mother until a vegetative soul is formed in it.

Animate beings need food both for preservation of life and growth. In the process of nutrition,

the form of food is destroyed in such a way that animal heat digests the humidity of the food, which brings about the destruction of its substantial form. The matter is then immediately informed by the substantial form of the animal. The nutrient substance thus produced, *spiritus*, is then transported by blood to all parts of the body. Subsequent physiological processes are dependent on the quantity of digested food. If it is sufficient, an animal preserves its life in its perfection or, if it has not reached its perfection yet, it grows. If it is insufficient, animal's heat starts digesting its own humidity, which causes shrinking of the body and may bring about death. If it is superfluous, an animal not only preserves its form (regardless of the stage of its development) but puts on weight: this is a process in which the excess food is converted into new parts of the body. It is different from growth, in which no new parts are produced. Both putting up weight and growth produce a secondary change in the extension of a body, which occupies larger space as a result of each. Unlike the former two processes, the change in extension is continuous, for space is infinitely divisible but bodies are composed of *minima naturalia*, since flesh or bones cannot be divided infinitely without losing their properties. Apart from extension (covering a larger space), qualities of a body may also possess their intension (greater or smaller degree in which the quality exists).

It is to the problem of intension and remission of forms that Burley devoted most time and attention in his physical works, presenting several complementary solutions. He is best known for a "succession of forms" theory, first applied by Godfrey of Fontaines to explain augmentation and diminution. In his early commentaries on the *De generatione et corruptione* and *Physics*, Burley saw a qualitative change as a process occurring between specifically contrary forms within the same genus. He noticed that the process can be broken down into infinite individual instantaneous stages, in each of which a quality has a new form of greater or smaller intensity. In *De primo et ultimo instanti*, he presented an explanation of differences between two modes of understanding qualities undergoing change of intensity: one,

seen as a process, and another, seen as an instant. The fullest and most original exposition of Burley's views on the problem of change can be found in the *Tractatus primus*. He claims there that also the termini of qualitative change belong to the same species (so, effectively, a qualitative change is between a form and a lack thereof). This allows him to use effectively the concept of latitude of forms to explain the process. The criticism drawn by his original theory made Burley revisit the issue of qualitative change several more times. In his *Tractatus secundus* and, later, in *De formis*, he gradually gave up some parts of his solution, and finally, in his Bolognese quodlibet, accepted a Scotist view on the issue, which saw intension or remission as addition or subtraction of individual degrees of a form, merged into it.

In his theory of local motion, Burley accepts the prevalent Aristotelian division into "permanent beings" and "successive beings," the former being objects, the latter, motions. Permanent beings have their first instants, but not last ones, successive beings have neither. This distinction allows Burley and other realists to analyze motion in separation from objects in motion. For Ockham, who recognized only substances and qualities as things, motion was not separable from its object and thus was understood only as *forma fluens*, disregarding the other aspect of motion distinguished by Avicenna, *fluxus formae*, i.e., flux of form, belonging to the category of relation. For Burley both aspects of motion had to be taken into account in order to give an adequate description of it.

Practical philosophy attracted Burley's interest relatively late and his contributions to that field are the smallest despite the size of his works devoted to it. Although it was not uncommon for him to follow some authority in his works in logic and – more often – in natural philosophy (for instance, Averroes), the commentaries on *Nicomachean Ethics* and *Politics* exhibit extraordinary dependence on the commentaries by Thomas Aquinas and Peter of Auvergne, respectively. Burley does not add to their opinions much beside references to English cultural context.

Burley's intellectual activity brought him renown of his contemporary and later philosophers. A good measure of this respect is the number of works mistakenly attributed to him, of which two, *Auctoritates Aristotelis* and *De vitis et moribus philosophorum*, were very popular until the end of the Middle Ages. Problems with attribution of some known works and possibility of discovering or identifying some new ones make the list of his works still open for change.

Abstract

Walter Chatton (c. 1290–1343) was an important fourteenth-century English philosopher and theologian. He was a follower of Duns

Scotus and a relentless critic of William of Ockham and Peter Auriol. Because complete critical editions of Chatton's writings have only recently become available, the recovery of his thought is still in the beginning stages. Nevertheless, it is already clear that Chatton made significant contributions to number of areas in medieval philosophy and theology. These include his development and defense of an "anti-razor" principle in ontology, his contributions to fourteenth-century debates about intuitive cognition, his one-level account of consciousness, and his influential criticisms of Ockham's theory of concepts and judgment.

Walter Chatton was born (c. 1290) in the village of Chatton in the northern part of (modern) England. He entered the Franciscan Order at a young age, most likely received his philosophical education in the north, and was then sent to Oxford to study theology. At Oxford, Chatton encountered the teaching of William of Ockham (d. 1347) who at the time (c. 1317–1319) was delivering his lectures on the *Sentences* of Peter Lombard. This encounter was to shape much of Chatton's subsequent philosophical thinking. Chatton, while highly critical of his older colleague, was also enormously influenced by him. Indeed, Chatton often takes up precisely the issues Ockham treats, and, likewise, the terminology and conceptual apparatus in which he frames them, only to reject Ockham's conclusions – typically in favor of Scotus'. Ockham's influence is particularly pronounced in Chatton's *Sentences* commentaries, both the *Reportatio* and the later *Lectura* (including the separately edited *Collatio et Prologus*), but it is also present to a lesser degree in his (as yet unedited) *Quodlibeta*. Chatton's training at Oxford was completed in 1330, when he attained the status of Franciscan regent master. The rest of his career (c. 1333–1343) was spent in Avignon, where, among other things, he served as advisor to Pope Benedict XII. Chatton died at Avignon in late 1343 or perhaps early 1344.

Scholarship on Chatton's philosophy is nascent, but growing. To date, the aspects of

his thought that have received the most scholarly attention include his treatment of issues in ontology, philosophy of mind and cognitive psychology, will, and moral philosophy.

Ontology

When it comes to questions of ontology, Chatton's leanings are Scotistic. Indeed, his treatment of issues in ontology often consists in his defending hallmark Scotistic doctrines against criticism – usually, against objections raised by Ockham and Peter Auriol (d. 1322). For example, Chatton adopts Scotus' views about universals as well as his theory of individuation; accordingly, Chatton labors to defend the Scotistic doctrines of common nature and haecceitas. (Chatton does not actually use the term haecceitas, however; instead, following Scotus' own usage in the *Ordinatio*, he uses *individualis differentias*.) Again, Chatton follows Scotus – and opposes Ockham – in arguing for the reality of ten (irreducibly) distinct classes of entity corresponding to each of Aristotle's ten categories. In this connection, he gives special attention to defending the reality of both quantity (as something distinct from substance and quality) and relation (as something distinct from absolute entities).

Although the sorts of ontological views Chatton adopts are not particularly original, his defense of such views is often subtle and innovative. One particularly notable example is his development and application of a certain meta-ontological principle to derive a number of realist metaphysical commitments. The principle, which Chatton himself refers to simply as “my rule” (*mea regula*) or “my principle” (*mea propositio*), has come to be known in the literature as “Chatton's anti-razor” – a label indicative of his use of it as a foil for Ockham's famous razor principle. Chatton deploys the anti-razor in a variety of contexts, and its precise formulation varies and develops across these contexts, but the following can be taken as representative: “where an affirmative proposition is made true by things (*res*), if fewer things (uniformly present, without anything else) cannot suffice [for that proposition's being

true], one must posit more” (*Collatio et Prologus*, 33). Chatton's anti-razor amounts to a kind of truth-maker principle. The idea behind the principle is just this: truth depends on being – that is, on what entities or things exist. So stated, the principle may appear uncontroversial, but the particular way in which Chatton elaborated and applied the principle was both innovative and contentious.

A case in point is Chatton's development of the anti-razor in the context of defending realism about relations. In *Rep.* I, d.30, q.1, for example, Chatton argues in favor of the existence of irreducibly real relations – that is, for the existence of a distinct class of entities answering not only to the Aristotelian category of Relation but also to other relational categories such as Action and Passion. In this context, Chatton is especially concerned to defend the reality and irreducibility of causal relations (i.e., relations of action and passion). His strategy is straightforward: he considers cases of true relational statements (e.g., “Socrates generates Plato,” “Heat produces heat,” “This hand moves a stick,” etc.) and argues that in each case the existence of merely absolute (or non-relational) entities – regardless of the number or type invoked – “will not suffice” for the truth of such statements. And, as his discussion makes explicit, he thinks an entity suffices for the truth of a given statement just in case its existence *necessitates* the statement's truth. Citing his “rule,” Chatton then concludes that “it is, therefore, necessary to posit relational accidents.”

What is most significant about Chatton's reliance on this principle is the way in which it renders explicit a certain methodological approach to questions of ontological commitment. According to this approach, one's ontological commitments extend to all and only those entities whose existence is sufficient for the truth of a given set of truths. To be sure, there is nothing particularly novel in Chatton's adopting this sort of “truth-maker” approach to matters of ontology. Indeed, it is plausible to suppose many medieval philosophers tacitly assumed such an approach. But Chatton's explicit formulation and defense of the principle proved controversial and, as a result, his treatment of it brought new

attention to questions about the methodological assumptions guiding metaphysical speculation.

For example, as we have just seen, Chatton's way of formulating the principle places particular emphasis on the criterion of sufficiency as the basis for truth-making. This approach suggests that, for him, the truth-maker for a given statement can simply be identified with that entity (or those entities) whose existence necessitates that statement's truth. So formulated, however, Chatton's principle gave rise to a number of objections and counter-examples. Thus, at *Quodlibet* I.5, Ockham explicitly argues against Chatton's principle, offering a counter-example (one involving God's creation of an angel) designed to show that an entity's being sufficient for the truth of some statement is not necessary for making it true. By contrast, Ockham argues that the truth-maker for a given statement is "sometimes sufficient to make the sentence true, but sometimes not." And, some years later, Adam Wodeham (d. 1358), Chatton's slightly junior confrere, uses roughly the same example to argue that necessitation is not a sufficient condition on truth-making either. Yet, even if Chatton's principle was not immediately adopted as a means for identifying a statement's truth-makers (and, hence, as a guide to ontological commitment), his articulation and defense of it seems to have had the effect of focusing attention on what exactly truth-making involves.

Philosophy of Mind and Cognitive Psychology

Chatton treats a wide range of issues in philosophy of mind and philosophical psychology. As elsewhere, his views here are almost always Scotistic in inspiration and developed in direct response to Ockham (and, often, Auriol as well). For example, Chatton upholds the Scotistic line on the unicity of the soul in human beings against Ockham, who argues for a real distinction between sensory and intellective souls. Again, he follows Scotus in arguing that, pace Ockham, there is a formal distinction (i.e., formal non-identity) between both the soul and its powers as

well as among the powers themselves. Finally, like Scotus and unlike Ockham, Chatton holds that cognition involves the multiplication of species from the object, through the sense faculties, to the intellect. Indeed, in response to Ockham's radical and wholesale elimination of species (both sensible and intelligible, as well as in medio), Chatton develops a fairly systematic defense of species as necessary for both sensory and intellective cognition.

Chatton's account of cognition includes an extended discussion of the nature of intuitive cognition, which we can think of as approximating our contemporary notion of perception. One of Chatton's contributions here is to focus the debate on questions about the certainty of intuitive cognition. Thus, Chatton considers and rejects Auriol's theory, which leaves open the possibility that intuitive cognition could occur naturally in the absence of its object, on the grounds that such a view utterly vitiates the "certitude" of knowledge grounded in the senses. Given this, it is all the more interesting that Chatton sides with Ockham (and against Scotus) in allowing the possibility God could cause an intuitive cognition of a nonexistent object, but then resists Ockham's further contention that such a case would not result in deception or error. Chatton insists that it surely would. His stance on these various issues is interesting insofar as it indicates, on the one hand, a special concern to safeguard the epistemic security of sensory intuition, and yet, on the other, resistance to any notion of its being infallible.

Like many of his contemporaries, Chatton restricts intuitive cognition to the senses and, thus, resists the introduction of intuitive cognition at the level of intellect. In rejecting intellective intuitive cognition, he is essentially rejecting the idea (and plausibly so) that we possess (at least in this life) a nonsensory mode of perception-like awareness. In taking this position, however, Chatton departs from Ockham (and also, perhaps, Scotus), who argues for intellective intuitive cognition largely on the grounds that it provides the best explanation for consciousness and self-knowledge. Indeed, on Ockham's view, consciousness turns out to be a kind of higher-order (intellective) perception of one's lower-order

states. Against this sort of view, Chatton argues that it both (a) entails commitment to an infinite regress in higher-order intuitive states, and (b) that appeal to higher-order states does not, in fact, explain the phenomena in question – namely, subjective awareness of one’s own states. On Chatton’s view, by contrast, any conscious experience – my perception of a rock, say – involves two components: first, an awareness of some object (the rock, in this case); and, second, a subjective or first-personal awareness of the experience (namely, a perceptual experience) as something I am undergoing. According to Chatton, therefore, consciousness is an internal feature of first-order mental states themselves. On his view, self-knowledge can be explained without the introduction of any higher-order states, not to say higher-order states of intellectual intuitive cognition.

As the foregoing suggests, Chatton made a number of important contributions to medieval debates about the nature and mechanisms of cognition. Although scholars are not yet in a position to assess the precise extent of Chatton’s influence on subsequent thinkers in this regard, it is clear that he exercised a great deal of influence on Ockham. Indeed, on a number of issues, Chatton’s objections were felt by Ockham to be sufficiently forceful as to require substantial modifications to his views. The best-documented case of such influence concerns Ockham’s developing views of concepts.

In his early writings, Ockham presupposes a kind of act-object analysis of thought (i.e., of intellectual cognition). On this analysis, concepts turn out to be thought-objects distinct from but dependent on the mental acts directed at them. Because concepts, on this view, are mind-dependent objects. Ockham often refers to them as “ficta” (i.e., “mentally-fashioned entities”). Chatton vigorously attacked Ockham’s early view on the grounds that such ficta are (a) ontologically superfluous, since mental acts themselves can function as mental representations, and (b) epistemologically problematic, since they stand in the way of the mind’s direct cognitive access to reality. On Chatton’s alternative, “mental-act”, analysis of thought, concepts are

not construed as intentional objects of acts of thinking, but rather as the act of thinking itself. Ockham eventually accepts these criticisms and, likewise, Chatton’s own analysis of concepts. He does not, however, arrive at Chatton’s view all at once. On the contrary, he initially remains neutral between the fictum-theory and the mental-act theory. It turns out, however, that Chatton also plays a crucial role in pushing Ockham from this intermediate position to a wholesale rejection of the fictum-theory. He does so by calling attention to a number of related difficulties in Ockham’s theory of judgment – in particular, in his account of the objects of knowledge (*scientia*). The details are complicated, but the end result is that these criticisms lead Ockham to recognize systematic advantages of Chatton’s analysis of intellectual cognition generally. In his most mature writings, therefore, Ockham not only wholeheartedly endorses the mental-act theory of concepts but even rejects his own earlier account of objects of judgment in favor of a view that comes quite close to Chatton’s own.

Will and Moral Philosophy

In his later writings, Chatton turns increasingly to topics in moral philosophy. By contrast with his views in ontology and cognitive psychology, however, very little is known about his ethics or his views about freedom and moral responsibility. It seems clear that Chatton takes the divine will as the ultimate source of morality and holds that God’s will is most clearly revealed in the commands found in Scripture. Accordingly, his discussions of questions of sin, merit, and moral responsibility often focus on the *de facto* order of creation, and on laws, precepts, and regulations derived from Scripture. Again, it would seem that he accepts a broadly Scotistic picture of the will and human freedom and so accepts a libertarian and voluntarist conception of the will’s freedom. Beyond such generalizations, however, our understanding of his views on these topics is limited.

Chatton takes particular interest in questions about how to reconcile human freedom with divine foreknowledge. He devotes considerable

attention to puzzles about future contingents – in particular, to questions about whether God’s knowledge and willing of future events is consistent with their contingency (and, hence, with human freedom). His own response to these puzzles is as complex as it is controversial: he offers a novel analysis of sentences attributing knowledge of future events to God (thus, he takes claims like “God knows that *a* will occur” to be equivalent to the conjunction of the following claims: “God knows *a*” and “‘*a* is occurring’ will be true”), he invokes a distinction between the determinately and indeterminately true and false (claiming, for example, that no future tense proposition is determinately true), and, finally, he defends a controversial analysis of the objects of God’s knowledge and will (on his view, the objects of knowledge and divine will are not propositions, but rather are the individual entities (*res*) represented by propositions).

Chatton’s commitment to a voluntarist conception of the will leads him, much as it led Scotus, to reject the traditional Aristotelian account of unity of the virtues. In particular, Chatton rejects the view that the possession of prudence is a sufficient condition for possessing moral virtue. Because moral virtues are habits of willing, and because the will does not necessarily will in accordance with the judgments of practical reason, it follows that even where prudence is generated through the dictates of right reason, moral virtue may, nevertheless, be lacking. Chatton also rejects any strong connection between the virtues of temperance, fortitude, and justice. While, he at times, emphasizes the cooperation of such virtues in the production of a single virtuous act, he nevertheless holds that one can possess (or acquire) one virtue in the absence of the others.

Finally, Chatton maintains that the object of moral appraisal is not only an agent’s interior character and intentions in acting but also the actions themselves. In taking this position, Chatton opposes Ockham who is an internalist regarding moral evaluation. On Ockham’s view, it is only factors internal to agency – namely, acts of willing – that are morally significant. Hence, anything external to agency, such as exterior acts

and their consequences, are indifferent – neither good nor bad. Chatton offers a number of arguments against Ockham’s view, some of which are grounded in theological considerations (e.g., he argues that Ockham cannot account for the moral significance of Christ’s exterior act of dying on the cross), whereas others are grounded in difficulties internal to the theory itself (e.g., he finds Ockham’s way of individuating acts of will implausible).

Conclusion

Chatton is best known today for his criticisms of and influence on Ockham’s philosophy. In fact, the relationship between these thinkers is such that scholars have often had to turn to Chatton’s work to fully understand the development and shape of Ockham’s views. (The relative dating of Ockham’s writings, for example, is established by reference to the three-stage development in his theory of concepts, a development, which as explained above, is due to Chatton’s influence.) For this same reason, the areas of Chatton’s philosophical thought that have received the most attention correspond to those aspects of Ockham’s thought that have most attracted scholarly interest – namely, issues in metaphysics, cognitive psychology, and, to a lesser extent, questions about the will and moral responsibility.

There are, however, a number of other areas to which Chatton makes significant contributions. In natural philosophy, for example, he is among the few medieval proponents of indivisibilism (i.e., the view that continua are literally composed of indivisible elements). Again, he treats at some length the distinction between permanent and successive entities and offers an important defense, against Ockham, of the coherence of the notion of a successive entity (*entia successiva*). Chatton also seems to have played a significant role in a number of fourteenth-century debates in philosophical theology, including how to reconcile the Christine doctrine of the Trinity with Aristotelian syllogistic logic and

the nature of sacramental efficacy (the latter of which was recalled and cited some 200 years later at the Council of Trent). Finally, like Ockham, Chatton wrote extensively on questions surrounding the debate over Franciscan poverty. In this connection, his work includes treatment of issues central to medieval discussions in political philosophy.

It will be some time yet before any systematic presentation or evaluation of Chatton's philosophical oeuvre can be undertaken. There is, nevertheless, good reason to expect that the recent publication of critical editions of Chatton's *Sentences* commentaries (the *Reportatio* appeared in 2002–2005, the *Lectura* in 2007–2009) together with increased scholarly interest in the fourteenth century will significantly advance both the recovery of his thought and our understanding of his place in the broader development of late medieval philosophy.

War (Just War, Holy War)

John Kelsay

Florida State University, Tallahassee, FL, USA

Abstract

This article surveys medieval discussion of “just war” and “holy war.” While a strong division between these is a modern development, the terminology does reflect distinctive trajectories of interpretation present in the earliest of medieval commentators on war. This article begins with Christian texts and then analyzes analogous writings by Jews and Muslims. In these texts we see both just war and holy war trajectories, and begin to understand how it came to be that late medieval and early modern authors like Alberico Gentili or Francisco de Vitoria could make strong distinctions between the two conceptions, to the end that difference in religion, considered in and of itself, ought never constitute a just cause of war.

Early Developments

When Augustine wrote *The City of God*, he built on several centuries of discussion regarding the status of war and of military service among Christians. For example, Tertullian (d. 220) wrote that Christ had “unbelted” every soldier, and that Christians participating in the Roman army would in all likelihood find it impossible to retain their faith. In a slightly different vein, Origen of Alexandria (d. 254) responded to charges of Christian irresponsibility, arguing that believers who refused induction into the military nevertheless provided valuable service by praying that God send the heavenly hosts to fight against those invisible, yet powerful forces assisting the emperor's enemies. More generally, authors like Lactantius (d. 320) decried the wastefulness and tragedy of war.

At the same time, the Roman army included Christians, at least from the late second century

forward. And once the status of Christianity began to change in the early part of the fourth century, even an author like Lactantius changed his tune, saying that some wars, at least, might be legitimate from a Christian point of view. By the time of Ambrose, bishop of Milan (d. 397), a Christian leader could see his authority as complementary to that of the state. Even the partly legendary refusal of communion to the Emperor Theodosius following the massacre of 7000 in Thessalonica –punishment decreed by the emperor for the murder of a Roman commander in that city – should be seen in this regard. Ambrose understood his role as bishop to include the giving of moral advice, and even the imposition of moral discipline, just as he saw the duty of the emperor and other officials as a matter of carrying out the guidance provided by the church.

As Ambrose's *De officiis* indicates, Christian discourse on war in this period could be cast as a transformation of the Roman *bellum iustum*. Indeed, the very title of Ambrose's work suggests this, as it reflects his use of Cicero's similarly named treatise. In Cicero's account, the Roman way of war suggests that military force is governed by norms of justice. For example, war must be declared by publicly authorized officials; it cannot be a matter of private or personal revenge. Then, too, resort to war should take place only when disputes cannot be resolved through discussion. The justification for going to war involves securing the peace of Roman society. When fighting, soldiers should conduct themselves with honor. When war is over, the victors should be magnanimous to the vanquished, since the point is to persuade the enemy not to repeat its offense, and to deter others from similarly threatening the peace of the Roman state. Ambrose took these notions of public, honorable, and thus just war, and connected them with Christian notions of neighbor-love and obedience to God. With respect to the former, the bishop's argument was that the command to love one's neighbor as oneself might in certain contexts be fulfilled by protecting the weak from aggressors. Indeed, Ambrose took the example of Moses in Exodus 2:11–15 as an indication that anyone who is able to prevent an injury, but fails to do so, might be judged as

complicit in injustice. Defense of a neighbor is distinguished from defense of oneself, however. The latter might be judged as an expression of inordinate self-love and a denial of faith in the providence of God. But the former is required, as a matter of obedience to God's command. In that connection, too, Ambrose found a way of tying Christian notions of war to the fighting described in Joshua and other books of the Old Testament. For Ambrose, war commanded by God is a distinct species of just war. In some particulars (e.g., the total destruction of the enemy described in Joshua), such war differs from the more ordinary fighting by which military action relates to purposes of state. Nevertheless, in its moral species, war commanded by God should be seen as a type of *bellum iustum*; in fact, it is the prototype of such fighting, since God, the author of justice, can never command believers to do an unjust act.

Augustine built on these insights of Ambrose, which explains his response to Faustus, or more generally to the challenge presented by those who saw in the Old Testament a contradiction to the New Testament. As Augustine had it, the fighting of the people of Israel was an expression of obedience rather than of brutality. In commanding such wars, God assigned punishments that were just. The real evil of war, after all, is not that some people are killed, since all mortals must die. Rather, the desire to inflict harm or to dominate others exemplifies aspects of war, as more generally of human behavior, that should be condemned.

For Augustine, war is related to the condition of fallen and therefore sinful humanity. In one sense, war results from sin. Hence, aggressive fighting is an expression of evils like those already mentioned. In another sense, however, war provides a remedy for sin. In fighting just wars, a wise person does what is necessary, even if in some sense the conditions that impose and legitimate his or her actions are regrettable. It is important, of course, that in waging war the wise person resist sinful dispositions. Thus, just wars are characterized by limits. Authorized by public authorities, such wars are not an occasion for private vengeance. Fought for legitimate public purposes, they are not to be waged for purposes of

aggrandizement. Soldiers must punish aggressors, and in turn must take care to distinguish the innocent from the guilty. And, while a number of tactics involving (ostensible) deception (ambush, for example) are legitimate, one must never violate a promise to one's enemy, or engage in massacre.

As with Ambrose, Augustine's writing suggests that *bellum iustum* is a category that includes wars of several types. Most significantly, the category includes wars undertaken by God's command, as well as at the command of legitimate (i.e., public) authority. With respect to the latter, the limits and norms connected with honor and neighbor-love apply. With respect to the former, the command of God may direct fighting in ways that seem to violate such limits. The qualification is important, however. Fighting commanded by God may, as in the book of Joshua, appear to violate the limits of justice. Nevertheless, it does not or cannot do so, since by definition God is just, and God's commands are correspondingly expressive or even constitutive of justice. Faced with this proviso, some interpreters have wondered whether Augustine considered such a command an actual possibility, or whether his comments on this matter are rather dictated by theological interests. That is certainly an interesting, if eminently controversial question. As further developments would show, however, the notion that *bellum iustum* might include wars authorized by God, or derivatively, by religious authorities, came to be an important feature of Christian reasoning about military force.

The "Classic" Formulation

Many scholars describe Augustine as the "father" of Christian just war thinking. Given his great legacy in this, as in other areas of political thought, there is some reason for such a characterization. Nevertheless, as noted above, Augustine's notions of war build on several centuries of development. In particular, Ambrose's combination of biblical and Roman ideas of *bellum iustum* provides a context in which Augustine's ideas make sense.

Also, Augustine never provides a succinct, systematic statement of just war criteria. Instead, his judgments are sprinkled throughout his works, especially *The City of God*. A far more systematic statement is found in the *Summa theologiae* of Thomas Aquinas (d. 1274). At IIaIIae, q. 40, Thomas asks whether it is always a sin to wage war. In response, he writes that there are three things required for a war to be just. First, the war must be commanded by a prince who possesses the authority to make war. Second, the war must be fought for a just cause; showing his debt to Augustine, Thomas indicates that this usually implies a war fought to avenge injuries, for example, when a state deserves to be punished for failing to restore things unjustly taken or to right wrongs done by its people. The third requirement is right intention, and again Thomas quotes Augustine with respect to those evil dispositions, which may be described as the "real" evils associated with war.

As noted, Thomas built on Augustine. He references a number of other sources, however, and thus points to the continuing development of Christian just war thinking.

By Thomas' time, the efforts of ecclesiastical and political leaders to limit war by such conventions as the Peace of God and the Truce of God (tenth and eleventh centuries) were well-entrenched. In particular, the former forbade direct and intentional attacks on specific targets. These included churches, as well as certain classes of people whose age, gender, or vocation would normally identify them as nonparticipants in fighting. The latter tried to prohibit fighting on specific days, at least among Christians. The influence of both efforts are evident in Thomas, as he addresses questions regarding the participation of clergy in fighting (he says it is not normally allowed, because it does not fit with their vocation) and of the possibility that fighting may be prohibited in certain times and places.

Most notably, though, Thomas' statement of just war criteria presupposes developments in canon law. The influence of Gratian's *Decretum* (mid-twelfth century), as well as of the various commentators on that work and on the *Decretals*, is particularly evident in the first of Thomas'

concerns. From the late ninth century, the collapse of the Carolingian Empire provided a context in which various authorities competed for power, and in which the incidence of fighting among Christians became a cause of concern. As the canon lawyers (and Thomas) had it, only a prince possessed *competence de guerre*; and a prince, in their vocabulary, meant a ruler whose control of a particular territory indicated that he had no superior. Such a ruler could be recognized by the Pope, who as the vicar of Christ was responsible for the moral and spiritual welfare of Christians. When Urban II appealed to Christians in 1095 to join in a Crusade against the Seljuk Turks, he did so particularly with reference to those princes whose sphere of power qualified them as authorities, in Thomas' sense.

Right authority thus constituted the most important area in which Thomas' statement indicates the influence of canon law. As with the canonists, however, the summary of Thomas leaves a certain ambiguity. If those who possess authority with respect to war do so in part because of ecclesiastical recognition, where does authority actually rest? Is it with those secular authorities described as princes? Or with the Pope, who recognizes and, in the instance of the Crusades, summons the princes to organize their armies for a particular fight? In dealing with the topic of war, Thomas seems to say that the princes possess authority for war and that ecclesiastical authorities only direct and exhort them in the exercise of that authority. And yet, the authority of the church does involve an evaluation of the legitimacy of secular rulers. Particularly with respect to fighting against the Turks, or to Christendom's internal fight against heretics, the Pope's authority seems paramount. As succeeding generations would have it, the "just war" allowed for a distinction between two sorts of causes, and the role of secular and ecclesiastical authorities differed as one considered this distinction. Thus, secular authorities might authorize fighting for the common good, construed in terms of recovery of territory or goods taken through aggression. By contrast, fighting for a religious cause – here, Thomas' reference to Augustine's notion that the "injury" justifying war might involve punishment for

wrongs done could be extended to include idolatry and other matters of religion – should be authorized by the Pope, and Christian rulers did their duty by responding to his call.

Interestingly, Thomas' own position on the war against the Turks shows considerable nuance. He is not convinced that fighting Muslims in order to punish their religious errors is justified, and seems to prefer to refer such fighting to notions of a right of passage. All people, including Christians making pilgrimage to Jerusalem, have a right to travel peacefully. If Muslim authorities restrict that right, there may be a just cause of war against them. Such a cause might even justify taking back the lands conquered by Muslims, a rationale further supported by the notion that territory taken by aggression may be recovered through military force. Even here, though, Thomas' argument shows nuance, since he wonders whether retaking territory after a long occupation may not upset established patterns of living, and thus do more harm than good.

Where Thomas does suggest that religion presents a just cause of war is in matters of heresy and blasphemy. It is not right to fight against unbelievers, for example Jews, in order to compel their faith. But it is right to fight against those who claim to be Christians, but dissent from the teaching of the church. The latter case involves the breaking of a contract with God; it is the church's right and duty to punish such wrongdoing, and to provide an example to others who might be tempted to part ways with the church.

In all these matters, Thomas and others involved in the just war discussion addressed issues which vexed morally sensitive souls throughout the Middle Ages. Augustine's writings on the Donatist controversy provided an early example of the tensions built into the connection of just war with wars fought on behalf of religion. Given instances in which the latter could be connected with disproportionate force, or even with massacre, the notion of fighting for religious causes was gradually separated from the more clearly political causes for which secular rulers possessed authority. At the close of our period, Francisco de Vitoria could evaluate the claim of the Spanish emperor with respect to fighting

against the indigenous peoples of the New World in such a way as to suggest that difference of religion, in and of itself, could never provide a just cause of war. Nor could the emperor authorize fighting based on a claim that dominion over the natives' lands had been granted him by the Pope. The Pope's authority with respect to the New World extended only to the matter of sending missionaries who would preach the Gospel. Should the natives refuse passage to these envoys, and particularly if they should kill or otherwise harm them, then a limited use of military force might be justified. But just wars have to do with limited, political causes, and secular authorities show their good intention by understanding that limited causes require limits on means – in other words, the conduct of war provides an important measure of the justice of the various sides.

Judaism and Islam

Development of a Christian idea of *bellum iustum*, including distinctions between just war and holy war, was a matter of utmost import for the history of Europe and of the Americas. In the process, Christian writers made use of many non-Christian sources. The legacy of Rome, Greek philosophical and historical writing, and the knightly or chivalric code all provided material, which Christians connected with a reading of the Bible.

As well, the existence of Judaism and Islam played a part in Christian just war discourse, though not so much in the way of providing source material or precedents. The persistence and, in the case of Islam, the power of non-Christian religious communities pressed just war thinkers to answer significant questions. Should war be used to spread the Christian faith? Under what conditions could an alternative religious community become an enemy? For what purposes could a war between Christians and Jews or Muslims be fought?

From the standpoint of Christian just war thinking, Jews were identified as a persistent, though for the most part nonthreatening religious

minority. The task of Christians was to govern those Jewish communities living under Christian rule. Thomas Aquinas illustrates well the ambiguity of this position. Christians should think, he wrote, of the persistence of Jews and their erroneous practices as the result of God's providence. Their position should be regulated in ways designed to reinforce the costs of error, and correlatively of the impending triumph of Christ. Jews might be invited to receive the Gospel. But they ought not to be coerced, at least if that involves the use of military force. The payment of special taxes, the imposition of restrictions on freedom of movement and association, and the like were acceptable to Thomas. War within Christendom should be reserved for heretics and apostates, however.

That said, it is of interest to historians that Jewish tradition developed its own "just war tradition" in the period of our interest. Following the failure of wars of liberation against Rome in 70 and again in 130–135 CE, rabbinic authorities interpreted the Hebrew Bible in a way that radically delimited the right of Jews to resort to military force for political and/or religious purposes. For reasons connected to purposes of communal discipline, God had decreed that the people of Israel be governed by others, and anyone who raised the sword by organizing a revolt should be judged as controverting the purposes of God. The Talmudic tract called *Sotah* articulated this judgment, even as it noted that biblical tradition indicated God's authorization for two types of wars. The one, *milhemet mitzvah* or "obligatory" war involved fighting commanded by God, as in the book of Joshua or more generally, against the mythic enemy identified as Amalek. In terms of means, the obligatory war is total war, according to the rules recorded in Deuteronomy 20. The other, *milhemet rashut* or "permitted" war, identified with the wars of King David and other exemplary rulers, suggests a war for political purposes, for example the expansion of Israel's territory and/or the enhancement of its security. In its means, this type of war is more limited, again as indicated by the provisions for war against cities

“far away” in Deuteronomy 20. The Talmud, in the portions called Mishna and Gemara (usually dated c. 200 and 500 CE, respectively) recorded rabbinic commentary suggesting that the ruler of a Jewish state should gain the approval of the Sanhedrin or council of 70 prior to initiating a “permitted” war.

In *Mishneh Torah*, the great medieval scholar Moses Maimonides (d. 1204) systematized these and other rabbinic judgments. In discussing the laws pertaining to kings and wars, Maimonides restates the distinction between obligatory and permitted wars, and notes that these are valid for any King of Israel. Maimonides, born in Spain at a time when Christians were making progress toward retaking the peninsula from Muslims, migrated to Egypt and thus produced most of his work in a context dominated by Islam. It is not clear whether and how Maimonides thought these judgments might be implemented, though it is of interest that his comments, along with the views presented by Nachmanides (d. 1270), provide material for Jewish debate over the military and political policies of present-day Israel.

By contrast with authorities like Maimonides, Muslim scholars dealt with questions of war in connection with rule over vast expanses of territory. Following the rapid conquest of much of the Middle East and North Africa, members of the religious class (*al-‘ulamā’*) articulated a set of judgments indicating that diplomatic and military activity designed to spread the blessings of Islamic government should be viewed as consistent with the program of the Prophet Muhammad (d. 632). According to this view, Muhammad’s early career in Mecca, the city of his birth, involved a divine restriction, in that he had only received the order to preach. Around the time of the migration to Medina (622 CE), the Prophet and his followers received first the permission to fight (cf. Qur’ān 22: 39–41), and then in successive revelations the command obligating them to do so. Before his death, Muhammad declared that Arabia was now under the control of Islam, and according to tradition, sent letters to the ruler of the Byzantine, Sasanian, and ‘Abbāsīd Empires

inviting them to accept Islam, to pay tribute to the Islamic state, or to make themselves ready to fight. As many Muslims understood it, such actions of the Prophet constituted a standing order for the faithful to struggle by means of the sword, as well as by teaching and preaching, so as to bring the world into a pattern consistent with God’s will or to “make God’s cause succeed” (Qur’ān 8: 39).

Muslim thinking about war thus tied fighting to the example of the Prophet, and similarly restricted its means according to reports of orders Muhammad gave to his army. These include restrictions on targeting (women, children, the very old, members of religious classes, and others are classified as noncombatants and thus are not to be the direct target of attacks), as well as exhortations to keep pledges and in general to fight in ways worthy of the title *mujāhid* (one who struggles, particularly by fighting in approved wars).

By the mid-ninth and tenth centuries, texts presenting the judgments of well-known scholars like Malik ibn ‘Atta (d. 795), al-Shaybani (d. 804), and al-Shafi’i (d. 820) provided material studied by members of the learned class. These included a set of “judgments pertaining to armed struggle” or *ahkām al-jihād*, which were regarded as establishing precedents that could be extended so as to provide guidance for contemporary questions. The general character of such judgments provides a remarkable parallel with Christian just war thinking. Thus, Muslim authorities indicate that legitimate war requires authorization by a competent authority, must be fought for an approved cause, and must be conducted with right intention. The first requirement is usually taken to mean the head of state or his designee, albeit in consultation with recognized religious scholars. The second has to do with the establishment or extension of Islamic authority, or in some circumstances with its maintenance or defense. The third requires that Muslim military policy and the conduct of Muslim armies follow the orders of the Prophet. As Muslim just war thinking developed, these came to be associated not only with avoidance of direct or intentional harm to noncombatants, but also with a discussion

about certain weapons and tactics. The use of hurling machines in siege warfare might be approved, for example; but the use of fire was more problematic.

One of the more interesting developments in Muslim discussion related to the problem of rebellion. In general, the idea of Muslims fighting Muslims was seen as problematic; as well, there are many sayings attributed to Muhammad designed to discourage Muslims from revolt, even in the context of unjust rule. Nevertheless, the subset of just war judgments indicated by the term *ahkām al-buġāt* or “judgments pertaining to rebels” indicates that political authorities faced with a revolt orchestrated by a group with a clearly Islamic intention must tread lightly. Their goal should be reconciliation, in the manner suggested by Qurʾān 49:10.

Three further items deserve mention: first, the texts in which authorities speak about the justification and conduct of war make a rigorous distinction between fighting intended to extend or defend Islamic territory, and the use of force with respect to faith. Here, as in the Christian case, forced conversions violate the rule of faith, though heretics, apostates, and religious minorities (*ahl al-dhimma* or “protected” people) who are recalcitrant may be fought. Second, a minority view, represented by the various Shīʿite groups, argued that most of the fighting by which Islam expanded had been illegitimate, since these wars did not take place under the leadership of a divinely appointed imam or religious-political authority. Third, during the period of the Crusades, the notion of fighting as an “individual duty” came to the fore. This notion, which received further development in the writings of Ibn Taymiyya (d. 1328) in connection with the advance of the Mongols, suggested that when the Muslims of a particular region (e.g., Syro-Palestine during the eleventh and twelfth centuries) proved unable to defend themselves, the rulers of neighboring Muslim territories should send armies to help. It is this judgment which, by an interesting twist, would come to be developed in the nineteenth and subsequent centuries in

connection with a variety of Muslim resistance movements.

Concluding Remarks

The medieval development of religious thinking about war thus presents important background for contemporary discussions of justice and war. By the end of the period, Christian authors made a strong distinction between just war, construed as war fought for approved political and moral purposes, and holy war, understood to be war fought because of difference in religion. Just war came to be approved, while holy war stood within the class of prohibited acts. Jews and Muslims, by contrast, did not make this distinction. While Muslims thought of war for the sake of conversion as wrong, the idea that the phrases “legitimate state” and “Islamic state” are two ways of saying the same thing persisted. Thus, wars fought for the establishment or defense of Islamic territory remained within the category “just war,” and one might speak of an enemy in terms of religious identity, particularly in the case of Christian encroachment upon lands controlled by Islam. And Jews, who would not organize armies until the mid-late twentieth century, maintained a way of speaking about wars commanded by God and wars authorized by state authority that suggested a religious base for distinctions between just and unjust wars.

More generally, advocates of all traditions spoke about war as a rule-governed activity. Even in cases where authors noted the approval of fighting involving something approaching total destruction, their argument focused on the command of God. And, in more ordinary settings, restrictions on the conduct of war are consistent: one must avoid direct targeting of noncombatants, and one must avoid the use of means that cause disproportionate damage to enemy property and life.

Finally, one should note a series of developments in the fifteenth and sixteenth centuries that would presage a more modern and alternative way

of speaking about war, in terms of reasons of state. By the time of Grotius (d. 1645), Hobbes (d. 1679), and Locke (d. 1704), new forms of politics, and with these, new understandings of political authority, were shaping just war discourse. The old tradition needed to be recast. And so, it seems, is ever the case.

Abstract

The notion of the will or *voluntas* was central both to medieval psychology and ethics. As the will was commonly conceived, it was through the choices of their will that an individual exercised freedom in the performance of action, and in well or ill-directed love determined their ethical relation to God and neighbor; and it was through the persistence of their will along with their intellect that an individual survived bodily death to live out in eternity the consequences of choices of the will made by them in this life.

Medieval theories of the will developed out of both the Christian and pagan thought of late antiquity. The foremost influence on medieval Latin philosophy was St. Augustine, but his own thought was already marked by the influence of pagan philosophy, especially that of Stoicism. Stoic thought had developed far more clearly than Aristotelianism (which in the Hellenistic period Stoicism came in turn to influence) a general theory of the actions of rational beings as involving the exercise of a capacity for internal action of choice or decision – conceived by Stoics

as *sunkatathesis* or practical assent – which preceded and explained the external actions decided upon. And this conception of the exercise of an inner agency of the will as a general constituent of human action was a constant feature of the action theory of medieval and early modern scholasticism. Indeed, it was fundamental to its moral thought.

Theories of the will of the high and latter middle ages were strongly marked by the rediscovery of Aristotle, and in particular by the discussion of mind and action to be found in the *Nicomachean Ethics*. But Aristotle's texts were assimilated into the existing Stoic–Augustinian conception of the will. *Prohairesis* or rational choice or decision was for Aristotle himself a motivating element in only some intentional human action, being absent from the motivation of akratic action; and the status of *prohairesis* as an action itself was not emphasized. By contrast, the term generally used to translate *prohairesis* in Latin thought, *electio*, denoted a decision or choice that was viewed on most theories, including those of Aquinas or Scotus in the high middle ages down to Suárez in the sixteenth century, as the primary form taken by all intentional human action.

Medieval theories of the will are often divided between intellectualists and voluntarists: intellectualists such as Aquinas emphasizing a dependence of the operation of the will on that of the intellect, and voluntarists such as Henry of Ghent, Scotus, or Ockham emphasizing the will's independence of the intellect. These debates were real, but were generally carried out within a more fundamental consensus about the nature of will and its fundamental role in action.

For all these thinkers, the will was our capacity for choice and decision, providing motivation for actions chosen or decided upon. It was responsive to the deliberation and judgment of our intellect or understanding about how we should act, and in the extent of this responsiveness it was distinguished from the nonrational corporeally based motivations or passions of the sensitive appetite (*appetitus sensitivus*) that were common to us and the animals. Deliberate human actions were generally seen as occurring first and foremost as

decisions or choices of the will, all else that we did intentionally being willed effects of these decisions and choices of the will. It was through the will that all such actions were performed and freedom or control over those actions was exercised.

Hence, the will was generally conceived as a rational appetite (*appetitus rationalis*) or rational motivating power, closely linked with the intellect. Both faculties were supposed to exist together in beings capable of reason, and so were to be found in humans and angels and, in a quite different way befitting his infinite nature, in God; but were not to be found in nonrational animals. Unlike other corporeally based psychological capacities, such as the senses and imagination, the will, like the intellect, was generally held to be an immaterial faculty, operating independently of any bodily organ and surviving bodily death. This immateriality was connected with its status, shared with the intellect, as a rational or intellectual faculty, involving a grasp of concepts in their generality. For such a grasp was widely thought to exceed the capacities of any bodily organ.

Why was the will generally seen by medieval thinkers as a primary locus of human action? Such a conception of action became much more controversial in the seventeenth century, where the opposition to medieval psychology mounted by Thomas Hobbes included an attack on the existence of a freedom or agency of the will. For Hobbes, the will was neither a distinctively rational faculty, being simply a general corporeally based capacity for motivation that is common to us and the animals; nor was it a locus of action, being entirely passive, our actions occurring only as the subsequent willed effects of its exercise. It is no coincidence that such an attack on the agency of the will should have been accompanied by an attack on its status as a distinctively rational or reason-involving faculty. For central to medieval theories of the will was a generally accepted theory of deliberate or fully intentional human action as a mode of exercising rationality at the point of the will.

This conception of action was practical reason-based: to perform a deliberate or intentional action

was to exercise a capacity to respond to and apply an intellectually presented practical reason. The intellect was directed at truth and seen as our capacity to reason and thereby arrive at belief or knowledge; in exercising the intellect to deliberate practically, about how to act, we arrived at conclusions about how we should act. Actions in their primary form were seen as occurring as the exercise of a capacity to respond to such deliberations not simply at the level of belief or knowledge, but at the level of motivation, through a faculty directed at goodness or some other practical value (such as, for Scotists, justice) as presented by the intellect. So in concluding by the intellect that, say, it is good that we should give alms, we could also respond to the goodness of that option by exercising the will to decide and become motivated to give alms. And that response was, by its very nature, a deliberate or intentional action.

This conception of action was common ground between intellectualists and voluntarists about the will. Thus, Aquinas understood the will in intellectualist terms, as dependent on the intellect in its function: acts of will stood as matter to the form provided by judgments of the practical intellect, the act of *electio* being informed by a judgment that the act chosen should be performed. Thus, actions of the will were described by Aquinas as cognitively informed inclinations. But we find the same conception of action in a more voluntarist thinker such as Scotus. Though for Scotus actions of the will were undetermined by practical judgments of the intellect, their status as actions was still understood by him in the same practical reason-based terms. He gave a widely discussed definition of intentional action or *praxis* as the act of a faculty that has at least the function, which in cases of irrationality may not be fulfilled, of responding to and being guided by judgments of the intellect – a faculty that he identified as the will.

Actions were generally viewed as taking two forms: *actus elicit* or *interni*, elicited or internal actions of the will itself, in which we perform actions of *electio* or decision and choice; and then through the effect of these *actus elicit*, further *actus imperati* or *externi*, commanded external actions involving faculties or capacities

outside the will, in which we acted as decided on or chosen. The conception of action as a mode of responding to reason in the intellect applied directly only to the will itself. For as we have noted, the dignity and nature of reason was generally seen as precluding the material embodiment of faculties directly responsive to reason. Hence, the status of commanded actions chosen or decided upon through the will, actions that occurred outside the will itself and which, in the case of actions such as hand raisings and the like, were located in corporeal motive capacities, was explained indirectly, in terms of their being willed effects of actions of the will. The status of the will as the primary locus of action was then a direct consequence of its being the only capacity to which the dominant practical reason-based conception of action could directly apply.

This conception of action as a mode of exercising rationality through the will could not apply to nonrational animals, who were supposed to lack wills and merely possessed passions of the sensitive appetite. But notice that the influence of the practical reason-based conception shaped even the theory of animal action. For although nothing exactly like human action might take place in animals, still something quite like it did take place in what Aquinas termed “imperfectly voluntary” form. And the principal case of imperfectly voluntary animal action, as thinkers such as Aquinas and Suárez agreed, was to be found, not in bodily motions, but in the prior passions that motivated these motions. The closest analogue of human actions in animals were not cases of animal bodily motion, but rather animal passions. For in responding appetitively to particular goods presented through the imagination, animals were approximating as closely as they could to the responses to an intellectually presented good made by human wills.

The debate between intellectualists and voluntarists did not involve any fundamental difference about the nature of agency. It did however reflect important differences about the nature of freedom and about how freedom is based in the will. In Thomism, the freedom of the will was explained in terms of the nature of its object as presented by the intellect. Freedom as a power to do or not to do

was explained in terms of the will, a faculty oriented toward the agent's good as happiness, being presented by the intellect with a range of imperfect, finite goods as options. So while freedom was a characteristic of the will, Aquinas taught that its root was to be found in reason. And the will's status as an intellectual or rational faculty at all was derivative, owing to its acts being informed by those of the intellect. The state of *beatitudo* or happiness, which was the destiny of the saved in heaven, was primarily a state of the intellect as involved in the beatific vision or contemplation of God.

Whereas for Scotus, the will's freedom depended on a duality in its proper object – as consisting both in the good of the agent and in justice. But the nature of freedom was not exhausted by the nature of will's intellectually presented object. Freedom was understood by Scotus to consist in a power of the will to determine itself; and the presence of this power was only revealed to us in our experience of our own choices. Moreover, the will determined its actions as an efficient cause of them, judgments of the intellect serving only as secondary, partial, or nondetermining efficient causes. Indeed, appealing to the characterization of rational power by Aristotle in *Metaphysics Book IX* as involving a potential to opposites, in Scotus' view, thanks to the possibility of freedom, it was the will rather than the intellect that was the truly rational power. And it was the will rather than the intellect that was the primary source of the happiness of heaven, as the faculty by which we direct ourselves to God in love of him.

Besides its central role in action, the will was also fundamental to the medieval Christian understanding of love. The central demand of the New Law presented by Christ was that people love God and love their neighbor as bearing the image of God. And, following Augustine, it was generally held that the love required by the law actually existed in the will. Not only was the will taken to be a locus of action, it was also taken to be a seat of affect and emotion.

In exercising the will, we favor or incline ourselves toward something. But we might favor or incline ourselves toward a person rather than an

action. For the object of the will might be, not an action, but a substance. In which case, the will's exercise toward its object could amount to love of a person. And so it was taken to be by Augustine, who took the orientation of our will to determine the direction of our love, and by later authors. In fact, corresponding to nonrational emotions felt in the sensitive appetite, passions properly so called, there were generally supposed to be corresponding rational emotions of the rational appetite or will.

In so far too as the will was a locus of agency, the identification of the will as the seat of love allowed the accommodation of a generally held view of law. What law required of us and made obligatory, it was generally thought, is action or refraining from action. That is, law served to govern agency as something over which we possess *dominium* or control provided by our freedom. But if what the law required of us is first and foremost properly directed love, then it was important that love take the form of a kind of free action. And if love of something was an orientation of the will toward it, and to direct one's will toward something was to perform a free action, then this demand could be met. The law could both govern action and directly require of us that we love. The emotion of love was therefore widely broken down into an action, what the law could and did directly require of us that we perform, and a *habitus* or disposition – a character of the soul that was not itself an action, and not directly obligatory under law, but by which we came to perform the obligatory action more readily and easily.

Included among *habitus* were the virtues and vices. And there was much dispute about the location of the moral virtues. Justice was generally agreed to be a virtue or disposition of the will; but what of courage and temperance? Aquinas held these to be virtues of the sensitive appetite, defective passions being the main obstacle to the performance of courageous and temperate actions. But Scotus and his followers put all the moral virtues in the will. For a moral virtue, properly speaking, must be a disposition of that faculty by which, morally, we act well or badly; and the will, precisely because possessing a freedom of

alternatives or opposites, was the more in need of virtues to dispose it toward morally good action and away from evil.

In fact, it was generally held that by virtue of its imposing obligations on external actions, the natural law directly addressed the will and imposed obligations too on our decisions: that, as Aquinas made clear (in Aquinas 1948:1.2, q100 a9), under natural law we were bound to will obligatory external actions, and bound not to will prohibited ones, so that the existence of an obligation to give alms implied a corresponding obligation to decide and intend to give alms. Behind this lay a conception of obligation, not simply as a kind of command – though obligations might be imposed through commands – but as a mode of justificatory support or, to use a term from Suárez, a *vis directiva* or justificatory force.

The force of a justification is the kind of justificatory support provided for what it justifies – the support we refer to when we say that an argument has “great force.” And in the practical sphere, the force of any justification must apply not only to the external actions justified or supported, but also to the will itself. If a justification for an action such as giving alms is to move someone to act, it must equally justify and support not only giving alms but their first deciding to give alms. Otherwise, the agent would remain quite unmoved by the justification for alms giving since they would lack any justification for deciding to act as it directed them. But practical justifications must be able to move us to act. They must justify the decisions and motivations that are involved in our responding to them. The assumption that obligations applying to external actions also apply to decisions of the will themselves is, then, a direct consequence of a conception of obligation as a mode of justificatory support or force. And again, in so far as obligation was also conceived as directive of action, so this conception of obligation required that the will be a locus of agency. Hence, scholastic moral theory was committed to the will’s being a locus of action in two ways: by its conception of what the moral law required as being, first and foremost, a will-based emotion of love; and then by its conception of obligation as a *vis directiva* or mode of justificatory support.

Will, Weakness of

Tobias Hoffmann

School of Philosophy, The Catholic University of America, Washington, DC, USA

Abstract

Weakness of will, taken broadly, characterizes actions performed against one's better judgment or against one's resolve. The Aristotelian concept of *akrasia* (incontinence) denotes the special case of weakness of will due to passions. Prior to the reception of Aristotle's teaching on *akrasia*, the medievals saw weakness of will predominantly as a volitional rather than a cognitive deficiency. The early

phase of the reception of Aristotle's teaching on *akrasia* (from Albert the Great to Henry of Ghent) focused on the voluntary character of incontinence by investigating the will's control of the passions and of the momentary corruption of the incontinent's moral convictions. With notable exceptions, in the later period, interest in Aristotle's account of *akrasia* waned, and the focus shifted more exclusively toward the interaction of intellect and will. Aristotle considered incontinent action to be contrary to the individual's choice, whereas Christian thinkers agreed that incontinent action is freely chosen. Christian thinkers disagreed, however, on whether it is possible to act contrary to one's better judgment while one is still fully aware of this judgment (synchronic or clear-eyed weakness of will) or only when this conviction is momentarily obscured or not properly applied to the specific situation (diachronic weakness of will).

Historical and Systematic Development of the Concept

Medieval thinkers rarely employed the term "weakness of will" (*infirmitas voluntatis* or its cognates). Yet the phenomenon of intentionally acting against one's better judgment or against one's resolve, which in contemporary philosophy is called "weakness of will," was the object of lively discussion. Historically, the mid-thirteenth century is a watershed for treatments of weakness of will in the Latin West, for only in 1246/1247 was Aristotle's discussion of *akrasia* translated into Latin. The term *akrasia* was translated as *incontinentia* (incontinence). Prior to the reception of Aristotle, weakness of will was mainly discussed under two headings: acting against one's conscience and sinning from weakness.

Earlier medieval thinkers tended to explain weakness of will as a volitional rather than a cognitive deficiency. For Anselm of Canterbury, the weak-willed abandon their initial desire for the moral action: in other words, they do not persistently will (*pervelle*) what they initially intended. Yet such weakness of will is not due to intellectual failure or impulsive passions, but rather due to a

deficient and voluntary act of the will. Peter Abelard distinguishes two kinds of weakness of will: on the one hand, the free consent to follow sensory desires rather than the rational will, so that one does not will what one judges best; on the other hand, the abandonment of one's initial will, so that one does not do what one had intended to do. Bernard of Clairvaux envisages a cognitive dimension in what he explicitly calls "weakness of will" (*infirmetas voluntatis*). The weak-willed are self-deceived about their order of preferences. While they think they want to avoid sinning, they actually prefer sinning to enduring that which a moral decision would entail. Yet even Bernard explains the failure of the weak-willed in terms of a volitional rather than a cognitive defect (for Anselm, Abelard, and Bernard, see the chapters by Goebel, Müller, and Trottmann in Hoffmann et al. (2006); see also Müller (2009: 381–495)).

Albert the Great is the first Latin author to comment on Aristotle's treatment of *akrasia*. Aristotle, sharing the Socratic presupposition that one cannot do evil in full awareness that the action is evil, was more concerned with explaining how *akrasia* is possible than with its voluntary character. He argues that because of vehement passions, the incontinent fail to apply their general, habitual moral knowledge to the particular situation they are in (*Nicomachean Ethics* 7.3). Albert and later Christian authors, by contrast, are more concerned with showing that the incontinent freely choose to act incontinently and are fully responsible for their action. According to Aristotle, choice is the result of practical deliberation. Thus, failure to act according to one's better knowledge means acting against one's choice. Hence the incontinent do not act from choice. In the Augustinian tradition, of which Albert is an heir, choice may or may not conform with practical reason. Albert explains *akrasia* in Aristotelian terms: the incontinent act contrary to their choice, because due to the onslaught of passions, they are momentarily unaware that their particular action conflicts with their general moral beliefs. Yet Albert explains the incontinent's cognitive failure in Augustinian terms: by their own free will, they allowed themselves to be unaware that their action is not choiceworthy (Saarinen 1994: 100–118).

Thomas Aquinas and Henry of Ghent, who wrote in the two decades after Aquinas' death, provide the most elaborate contributions to the medieval debate on weakness of will. They represent two opposite tendencies in discussing weakness of will, as a result of their fundamentally different views on the will's relation to the intellect. For Aquinas, the will's desires and choices are strictly proportional to the practical judgments of what is worth desiring or choosing. Accordingly, he does not admit "clear-eyed" or "synchronic weakness of will": that is, like Aristotle, he denies that at the moment of weak-willed action, the person actually acknowledged the better judgment that he or she generally holds. According to Aquinas, even deliberate evil-doing (*peccatum ex certa malitia*) involves at least "ignorance of choice" (*ignorantia electionis*), which is the ignorance that in truth it is not worth sinning for the sake of whatever gain (*Summa theologiae* 1a2ae q. 78 a. 1 ad 1 and a. 4 ad 1). Deliberate evil-doing characterizes the intemperate, who wrongly consider self-indulgence to be choiceworthy. In contrast, the incontinent correctly believe that self-indulgence should not be pursued. They act incontinently, however, because their vehement passions distract them from dwelling on their moral convictions, drawing their attention toward considerations that speak in favor of the desired act. When tempted, someone who normally admits that adultery is to be avoided is temporarily dominated by the thought that immediate pleasure is worth pursuing. Thus, incontinence is like momentary intemperance. When the passions calm down, the incontinent tend to regret the act, whereas the intemperate, whose disposition is stable, see nothing bad in their action. Aquinas maintains the parallelism of intellect and will in incontinence; in his view, incontinence involves not the refusal of the will to follow a correct practical judgment, but rather a momentarily mistaken practical judgment that presents the action as choiceworthy. Nevertheless, the will is also at fault, because it failed to counteract the effect of the passions by directing the attention of reason away from tempting pleasures. Like Albert, Thomas blames the incontinent for their momentary lack of acknowledgment that their action is sinful. It is only

because of this voluntary cognitive failure that they can act contrary to their better judgment (for concise accounts of Thomas's theory of incontinence, see Kent (1989), Denis (2008), and Müller (2005, 2009: 512–547); for the contrast with deliberate evil-doing, see Kent and Dressel (2016) and McCluskey (2017)).

Henry of Ghent reverses Aquinas' explanation. Rather than holding that incontinent action presupposes ignorance or unawareness of what is best to do here and now, Henry argues that ignorance follows upon incontinent action. For Henry, the possibility of synchronic weakness of will is inherent to the will, whether or not passions are involved. But normally, passionate desires have a part in weakness of will, that is, typically, weakness of will takes the form of incontinence. Yet for Henry, the passions or the cognitive deficiency they might cause do not by themselves entail the corruption of the will. The passions that assail the incontinent cause the will to delight in them, and if the will freely consents to the object of delight, it pursues the incontinent action and causes reason erroneously to judge it as good. Over time, repeated evil choices destroy practical knowledge entirely: someone who initially thought that theft is bad comes to think that it is good. Thus, an evil will corrupts reason, rather than vice versa (Eardley 2006; Hoffmann 2008; Müller 2009: 569–617).

While Duns Scotus repeatedly defends the possibility of acting contrary to one's practical judgment, he shows little interest in the Aristotelian notion of incontinence as passionate weakness of will, as in fact he is generally not very interested in the role of the passions in human agency. He agrees with Henry that the will can depart from reason. But he rejects Henry's view that an evil will can corrupt the judgment of practical reason, for the activity of practical reason is ultimately rooted in self-evident practical principles. Rather than corrupting reason, the will can either turn it away from a correct practical consideration or it can command it to find the means to an evil end (see the chapter by Noone in Hoffmann et al. (2006) and Müller (2009: 636–672)). William of Ockham follows Duns Scotus on this point.

These theories leave us in a dilemma. On the one hand, if one considers the will to be capable of

willing contrary to practical reason, as the voluntarists do, it is hard to see why someone would will to act contrary to what he or she has subjectively judged to be best (e.g., pursuing pleasure if abstinence is judged best, or avoiding pleasure if self-indulgence is judged best). On the other hand, if one asserts that the will must act in conformity with practical reason, as the intellectualists do, it seems that moral failure is caused by a cognitive mistake, and it appears implausible to fault a person for such a mistake. In order to avoid both alternatives, John Buridan denies that the will's desire or choice can be contrary to an unambiguous judgment of reason, but he grants that when the judgment is uncertain, the will can abstain from willing, postponing its decision until the ambiguity is resolved. For Buridan, weakness of will presupposes weak practical judgments, allowing the will to be divided between following what is pleasurable and avoiding what is immoral (Saarinen 1994: 166–187).

William Arnaud

Julie Brumberg-Chaumont
Laboratoire d'Études sur les Monothéismes,
CNRS, Paris, France

Abstract

William Arnaud was a Master in the Arts Faculty of the University of Toulouse in the South of France at the end of the thirteenth century.

He wrote a course on logic that was published under the name of Giles of Rome and a very interesting commentary of Peter of Spain's *Tractatus*. His views are deeply influenced by Thomas Aquinas' semantic and ontological positions and very often opposed to those of Peter of Spain.

Life and Work

William Arnaud is principally known in medieval philosophy for two reasons: he wrote a very interesting commentary on Peter of Spain's *Tractatus* and a course on *logica vetus* ascribed to Giles of Rome under whose name they have been published. According to L. M. De Rijk, William Arnaud was a Master in Toulouse who taught in the 1240s or in the 1250s. This view has been challenged by Gauthier (1989a:52*, 69*sq) because William quotes Thomas Aquinas' commentary on the *Peri hermeneias* (as “expositor”), as well as other works from Thomas and Giles of Rome when commenting on Aristotle's logic. His activity is therefore to be situated in the late thirteenth century. This date has now been generally adopted by scholars (except Lahey 2005). William's commentary on the *Liber de six principiis* has been attributed to “Master Vital” (i.e., Vital du Four) and so edited separately (Gondras 1975). He also wrote a commentary on the *Analytics* (*Prior* and *Posterior*). Not much of his life is known except for these pieces of information on his logical production as a Master in the Arts Faculty of the University of Toulouse, since he is no longer identified with the Archdeacon of Lanta, who died in 1255, with William of Saint Amour or with the inquisitor beaten to death in 1242. A list of his works, manuscripts, and editions are to be found in Weijers (1998).

The Course on Aristotle's Logic

William's course on the *Logica vetus* (*Isagoge*, *Categories*, *Peri hermenieas*, *Liber VI Principiis*) has been edited under the name of Giles of Rome. It is known in two manuscripts from Avignon

(BM 1078 and BM 1089); there is a third manuscript (Vatican, Bibl Apost. Barberini, lat. 433) that is perhaps a copy of the ancient edition, and a fourth manuscript concerning the commentary on the *Liber De six principiis* (Berlin Staatsbibl. Preussischer Kulturbesitz, Fol.624, ff 51ra–62ra). The set of commentaries on *Logica vetus* is headed by a prologue called “*principium*” (Tabarroni 1988:374) or “*divisio logice*” (Gauthier 1989a:70*). This division is influenced by John of Dacia’s division of sciences (Tabarroni 1988:372). The attribution of the whole course to William can be based upon an ascription in one manuscript (Avignon 1089), but the most serious arguments are derived from the doctrinal content of the work, which is very close to the *Lectura Tractatum* on Peter of Spain’s *Tractatus*, which is unquestionably by Arnaud. Quotations from Thomas Aquinas can be read in all parts of his work (Gauthier 1989a:71* for the *Peri hermeneias*’ commentary, as an example).

A. J. Gondras has given an edition of William Arnaud’s commentary of the *Librum de six principiis* though he does not attribute this work to him, but discuss in detail the attribution to Vital du Four. He sees the commentary as the work of a young Master because he does not quote the Fathers nor the theologians and also because he is far from being an expert in the Arts (Gondras 1975:187). The last point seems rather inaccurate considering the vast amount of quotations from Aristotle’s works on natural philosophy contained in the commentary, and the first one can probably be explained by the nature of the text commented upon and by the fact that the course belongs to the Arts Faculty, and not to theology. Gondras’ edition is based on two manuscripts from Avignon (BM 1078 and BM 1089), that is, from those manuscripts containing the whole course of William Arnaud on *Logica vetus*. Another version of the commentary on the *Liber* is mentioned in an other manuscript (Toulouse Arch. Dep. 4, F2, see Gauthier 1989a:71*, note 2).

One can gain an idea of William’s unpublished commentary on the *Categories* thanks to the study of R. Andrews (Andrews 2001:299–300) who listed his questions and published one on quantity, together with some similar questions written by

other thirteenth-century masters (Andrews 2001:305–307). William follows Albert the Great’s solution with regard to the definition of quantity (Andrews 2001:284).

William’s commentary on the *Peri hermeneias* has been thoroughly examined by A. Tabarroni, elaborating on the discoveries of R. A. Gauthier (who mentions two other fragmentary manuscripts, Gauthier 1989a:71*). William is very faithful to Thomas Aquinas, whom he calls the “Expositor” not only in the sections where Aquinas’ *Expositio* is extant, but also in the final part of the treatise on which Thomas did not comment. This shows that William had access to an anonymous *Continuatio* otherwise partially transmitted in two manuscripts. His own exegesis is so dependent on his source that A. Tabarroni considers it a very good testimony for the reconstitution of that work (Tabarroni 1988:373–374). This anonymous *Continuatio*, strongly influenced by Herveus Natalis’ commentary on the *Peri hermenias* was thought to be authentic by William. A partial edition of the *Continuatio* is given by A. Tabarroni, followed by the parallel text of William (Tabarroni 1988:420–427).

William’s commentary on the *Analytics* is found in one manuscript (Barcelona, Arch de la Corona de Aragon Ripoll 109). It has been studied by R. A. Gauthier in his introduction to Thomas Aquinas’ *Expositio*; it is based upon Thomas but also upon Giles of Rome’s commentary on the same treatise, so that it should be dated after 1290 (Gauthier 1989b:65*–66*). A partial edition of his commentary on the *Prior Analytics* has been made by Grabmann (1928).

The Commentary on Peter of Spain’s *Tractatus*

The text is known in five manuscripts and has been partially edited by de Rijk (1969). The author is quite critical towards the text on which he is commenting and develops original positions in his theory of supposition (see Brumberg-Chaumont 2010). It has been thought that William’s teaching in logic should be understood within the new general framework introduced by

the modists in logic. Envisaged in this way, his commentary could be seen as a very interesting testimony of the encounter between the new paradigm and the revival of the interest in the theory of the properties of terms observed elsewhere at the end of the thirteenth century (see Pinbord and Ebbesen 1984). Nonetheless, the immediate inspiration of the text is to be found in Thomas Aquinas' logical and ontological works on a philosophical point of view. William introduces into the analysis of the theory of signification and supposition Avicenna's theory of essence as interpreted by the Dominican on a semantic point of view (especially in the *De ente et essentia* and in his commentary on the *Peri hermeneias*). Conversely, R. A. Gauthier has shown how Thomas Aquinas was dealing with the same referential problems as the terminist treatises did when analyzing the signification and the scope of universal nouns as subject and as predicate, but that Thomas used different tools, though he knew the terminist tradition (Gauthier 1989a:55*–56*). Similar examples are used, studied in detail by R. A. Gauthier who mentions the defense William gives of the Thomistic interpretation against Peter of Spain (Gauthier 1989a:54*–56*). One can say that William translates Thomas Aquinas' approach into the language of terminism, as can be seen in the analysis of the supposition of the predicate, a very interesting case from the philosophical point of view. According to Peter of Spain, the predicate “man” is in simple supposition, the supposition the term can also have in a subject position in propositions such as “man is a species.” But this is impossible in a Thomistic approach inspired by the Avicennian paradigm, because the property of being a universal predicable as a species cannot be possessed by the essence itself, but by the essence as it is thought, the intention, whereas it is the essence itself that is predicated of the thing in which it has its being, so that “man” in the two propositions (“Socrates is a man,” “man is a species”) cannot have the same supposition. For William, simple supposition is the supposition for the intention in the soul and cannot be the supposition of the predicate because propositions such as “all men are animals” would always be false (*Lectura tractatum*, p. 147). The

predicate is in personal supposition and the proposition is about things, not concepts. The proposition can all the same remain true even if there is no man left, because William favors the signification of the thing as thought, so that nouns do not lose their signification if the things named are destroyed, and because he sees natural supposition as the supposition for the form as preserved in particulars whether they exist or not (*Lectura tractatum*, p. 146).

Abstract

William Crathorn (fl.1330s), Oxford Dominican whose unique epistemology fueled controversies during Oxford's "Golden Age" of theology. Crathorn's thought emerged from the epistemically oriented Ockhamist approach, but it incorporated an older account, in which the perceived object projects "species" which are received in the act of perception and interpreted by the understanding as the basis for formulating ideas about the perceived object. Crathorn argued that the ideas we formulate about the species projected by the object take on the physical characteristics of the object, so that perception of a black cat results in the formulation of an idea that is black, possessing felinity, and so forth. Crathorn's position was the object of great scorn from his contemporaries, notably Robert Holcot. This led to increased attention of the

relation of perceived appearances to the substance behind the perception, and Crathorn recognized that his position entailed a difficulty in a certain distinction between the Aristotelian categories of substance and quality.

Biography

Very little is known of the Dominican William Crathorn, save that he entered the O.P. around 1315, and active in Oxford in the early 1330s. Crathorn was a contemporary of Robert Holcot, O.P., and appears to have been engaged in heated debate with Holcot for a time. There is no record of his presence at Oxford after this period, although his unique positions continued to attract comment in the 1360s. Crathorn's commentary on the first book of Lombard's *Sentences* is the sole source of our knowledge of his thought, although a manuscript in Vienna contains quodlibetal questions that may also be his.

Oxford theology in the early fourteenth century was very heavily influenced by Ockham's philosophical emphasis on the relation of logic and philosophy of language on epistemological questions, demoting ontology from the pride of place it had enjoyed in thirteenth-century thought. It by no means follows that all Oxford thinkers were thereby Ockhamists; the so-called "Modern" approach lent itself to great variation within philosophical speculation, of which William Crathorn proves a very good example. (It should be understood that the term *moderni* was understood to mean thinkers roughly contemporary to whoever was using it. Before the condemnation of Wycliffism in the late fourteenth century, when the term was used to mean positions opposed to Wyclif's realism, the term was not used to refer to one specific philosophical position. Everyone from Thomas and Scotus onward could count as "modern.") Crathorn's *Sentence* commentary is characterized by the epistemologically oriented approach of the *Moderni*, but his philosophical conclusions were sufficiently divergent from the mainstream as to lead Robert Holcot to comment that one should only read Crathorn for amusement. In an age when it was common to make

few personal references to proponents of opposing philosophical viewpoints, this kind of comment is remarkable. It is very likely that Crathorn's thought was very widely discussed in Oxford from the 1330s through the 1370s, as is evidenced by Wyclif's hostile references to positions associated with him.

The hallmark of Crathorn's philosophy was a development of the then common notion that human knowledge is reliant on the species of objects perceived, a position developed initially by Roger Bacon, whose model of perception was inspired by medieval optics. When we perceive a given object, what we perceive is a result of the emitted appearances, or species, of the object. This is analogous to the refraction of an object through a lens; given the medium of light, when a lens is held up to an object, an image of that object is produced on the other side of the lens. This image, the species of the object, is what we perceive with our senses. It has a lesser form of being than the substance that produces it, but it has sufficient being as to convey likeness of that substance. Crathorn adopted this optically oriented epistemological model, but added a significant limitation: he eliminated the mental act normally associated with receiving the perceived species in the mind from his account. That is, he believed there to be no grounds for distinguishing between the cognitive power and the acts it might produce. Aquinas' model of cognition, in which there are four elements at play (soul, powers, acts, and species) typified thirteenth-century epistemology. Ockham had eliminated the distinction between soul and powers, identifying the two, and had done away with species, emphasizing the cognitive power's direct perception of the object. Crathorn agreed with Ockham in identifying the soul and its powers, retained species in the formula, and arguing against the distinction between a power and the acts that arise from it. This left the Soul, or mind, and the species. The mind receives the species, which reflect the qualities of the object perceived, which results in the mind acquiring the qualities of the object perceived. Hence, when I perceive a black cat, the species of the cat contain the qualities of felinity, blackness, quadrupedality, and so forth; when the species

enters my mind, my mind becomes a substantial foundation for felinity, blackness, quadrupedality, and so forth. In effect, my idea of the black cat is, to a very real extent, black cat-like in all the qualities associated with the being of the cat. It is this aspect of Crathorn's thought that led Holcot to his derisory comment; considered charitably, it is unique to scholastic epistemology.

The first question to arise from such a remarkable position is whether the species we perceive is veridical. That is, how can we be certain that the species of the black cat that is identical to our idea of the black cat we perceive is the same as the qualities as they exist in the black cat itself? Obviously, the species is not identical to the qualities that produce the appearance, so the question stands: what is the grounds for certainty that the species fully embody the qualities of the substance in question? Ockham's position adroitly avoids this question by eliminating the intermediary species in favor of our direct perception of the object itself, but Crathorn's departure from Ockham leads him to a position familiar to anyone familiar with Descartes. The species of skepticism Crathorn faces is different, then, from that arising from Ockham's conviction that God can cause us to perceive objects that do not exist. Ockham's arises from a consideration of God's absolute power, while Crathorn's arises naturally from his epistemology. Crathorn's response is similar to Ockham's, depending on the unlikelihood of God's leading people into error, but it plays a much greater role in Crathorn's thought than it does in Ockham's. Elsewhere, Crathorn argues against skepticism by relying on Augustinus's *si fallor, sum*, a then widely known counter to traditional skepticism.

While his epistemology represents a remarkable departure from the *Moderni* norm, Crathorn's ontology is slightly more commensurate with Ockhamist conceptualism. Ockhamists generally had reduced the ten Aristotelian categories to just two, substance and quality; the latter serving as ontological basis for the remaining eight. Crathorn's position, arising from his epistemology, prevents him from distinguishing with certainty between species of substance and species of quality, leading him to suggest that the categories

are primarily conventional. There are objects, and the species we perceive suggest Ockham's division between substance and qualities, but we lack the certain evidence we would need to construct a complex ontological account of things in the world. Crathorn was among the Oxford indivisibilists, or atomists, who argued for the existence of fundamentally indivisible constituents of a continuum. Opinions varied regarding the nature and number of these atomic units; some argued for a potentially infinite number of indivisibles in a finite continuum, while others stipulated that a finite continuum must be composed of a finite number of atomic units. Crathorn was among the latter, and he seems to have advocated a somewhat richer atomism than others, holding these indivisible elements to be discrete, kind-defined beings.

Given Crathorn's skepticism regarding the categories, and the uncertainty about the similarity relation holding between the species we perceive and the objects behind the species, one might well ask what Crathorn believed there to be that we perceive. Crathorn argued that when we perceive a black cat, there is more involved than simply the perceiving subject and the perceived object; when we make a judgment like "the cat is black" we are referring to a complex that serves as the basis for our proposition. Crathorn's position is different from Wodeham's complex significable in that he does not seem to have worked out the philosophical arguments need to account for what might correspond to statements about nonexistent object, or assertions like "man is not an ass." Crathorn's account of propositions is further complicated by his rejection of the mental language that many of his contemporaries believed to be the primary mode of formulating mental propositions prior to their semantic articulation in a conventional language. Because there is no distinction between the mental power and the mental act, there is no space in Crathorn's philosophy of mind for the distinction between the cognition of the species and the translation of the cognition into a conventional language. Further, the linguistic apparatus by which complex propositions are formulated, including verbs, substance-terms, syncategoremata, and so forth are not contained

within the cognition. Hence, when we translate the cognition into the semantic expression of the proposition, we use the conventional language that has been developed by the linguistic community in which we have been raised.

William Heytesbury

John L. Longeway
Department of Philosophy, University of
Wisconsin, Kenosha, WI, USA

Abstract

William Heytesbury (before 1313–1372/1373) was a fellow of Oxford's Merton College from 1330. Developing the work of Richard Kilvington and Thomas Bradwardine, he applied supposition theory to the logical exposition of "sophisms," attending in particular to scope problems and compounded and divided sense. His chief work is the *Rules for Solving Sophismata* (*Regulae solvendi sophismata*). He is particularly noted for applying his methods to puzzles about motion and the continuum, and is best known for the mean speed theorem concerning the distance covered over a period of time under uniform acceleration.

His work had some influence on the development of early modern science, though he cannot be said to have been doing empirical science, his work being much closer to mathematical analysis.

William was born before 1313, probably in Wiltshire, Salisbury Diocese. He served as the first bursar in his college in 1338–1339. He had become a Doctor of Theology by 1348, and was chancellor of the university in 1371–1372. He died in the winter of 1372/1373. Heytesbury was one of the second generation of the Mertonian school, building on Richard Kilvington's *Sophisms* (*Sophismata*) (before 1325), and Thomas Bradwardine's *Insoluble Sentences* (*Insolubilia*) and *Treatise on Proportions* (*Tractatus de proportionibus*) (1328). Heytesbury's work deals chiefly with "sophisms," statements occurring within formal disputations, the truth of which was at issue given specified assumptions. The respondent must agree to or deny the sophism, and then answer his opponent's questions, granting whatever follows deductively from his admissions, without falling into contradiction. All of William's works would have been written during his regency in the Arts at Merton, approximately 1331–1339. Most influential is the *Rules for Solving Sophismata* (*Regulae solvendi sophismata*). A work supplementing the *Rules*, *On the Proofs of Conclusions from the Treatise of Rules for Resolving Syllogisms* (*De probationibus conclusionum tractatus regularum solvendi sophismata*), which may not be by William himself, appears with it in early printed editions and manuscripts. William also wrote a number of more elementary pieces, focusing chiefly on logical and semantical issues rather than paradoxes involving the continuum. These include a collection of 32 *Sophismata*, and a second collection of 39 sophisms purportedly proving that the respondent is a donkey (*tu est asinus*), entitled *Sophismata Asinina*. He produced a number of short works at the more elementary level as well, including *On the Compound and Divided Senses* (*De sensus composito et diviso*), and *Concerning the Truth and Falsehood of Premises*.

(*De veritate et falsitate propositionis*). All of these appear in the 1494 edition of Locatellus. Works found only in manuscript include a treatise on consequences, another on obligations, one on future contingents, and a beginner's book of definitions and divisions in natural philosophy. For these, see Weisheipl (1969).

The Rules contains six chapters. The first deals with insoluble sentences, self-referential paradoxes such as "what I am now uttering is false." The second deals with intensional contexts. For instance, it presents the sophisma "you know the king is seated," given that the king is seated, and you know that sentence A, in fact asserting this, is true, but do not know what A says. The third chapter deals with problems connected with relative pronouns, and the fourth with paradoxes involving the terms "begins" and "ceases." Here Heytesbury notes that if something begins to have a property at a given moment, then it might either have the property for the first time at that moment or lack the property for the last time at that moment, and tries to set forth rules as to which "exposition" to adopt in any particular case. In the fifth chapter of the *Regulae*, on maxima and minima, Heytesbury considers the limits of capacities. He assumes that every active capacity is measured by the resistance (the passive capacity) it can overcome. Thus an active capacity to lift weights will be measured by the weight (a resistance) that it enables one to lift. It is natural to assign as one's weight-lifting capacity the greatest weight one can lift, the limit of one's capacity. But in some cases, there will be no greatest passive capacity by which the active capacity can be measured. Still, as long as the active capacity has some limit there will then be a least passive capacity that the active capacity cannot overcome. Thus, any given active capacity will divide the range of passive capacities on which it is measured into two sets, every element of one of which is greater than every element of the other, and the limit of the capacity will be that unique capacity which is at the boundary between the two sets, either the greatest in the first set, or the least in the second. The situation is parallel to that with beginning and ceasing, where it turned out that two different expositions

were needed for "A begins to be F," one assuming a first instant at which A is F, the other a last instant at which A is not. Heytesbury lays down some rules as to which of these options to choose in any particular case. He also tries to determine when the limit of a capacity in fact exists, and his work here is strongly reminiscent of Dedekind's definition of real numbers in terms of rationals. The sixth chapter deals with change and motion.

Heytesbury's central interest is the logic of continua and infinite divisibility, a pursuit nowadays identified as part of mathematics. His puzzles are logical, and Heytesbury works, like other logicians who treated sophisms, "according to imagination," allowing any consistent set of propositions whatever to be assumed for the presentation of a sophism, regardless of metaphysical or physical possibility. He treated qualities such as heat and whiteness as measurable on a continuous range and accustomed thinkers to the notion that any quality varying in "intension" could be conceived quantitatively. Ancient physics envisioned quantitative treatments only of spatial dimensions, time, and motion, and so Heytesbury's work helped lay the logical groundwork for sixteenth- and seventeenth-century breakthroughs in such areas as the physics of heat and temperature. In the sixth chapter of his *Rules*, Heytesbury developed the mathematics of uniform acceleration, proving that uniformly accelerated bodies will, in a given period of time, cover the same distance they would have covered traveling at a uniform velocity one half the sum of initial and final velocities. Domingo de Soto noted the theorem's application to free fall in 1555, and Galileo benefitted from the medieval discussion of uniform acceleration to which William contributed, though he probably was not directly acquainted with his work.

William of Alnwick

Jeffrey C. Witt

Department of Philosophy, Boston College,
Chestnut Hill, MA, USA

Abstract

William of Alnwick was a Franciscan theologian who became Bishop of Giovinazzo at the end of his life. He is known primarily for his close association with John Duns Scotus as a secretary and a collaborator. Alnwick's own work shows a reliance on Scotus as a starting point, but shows independence in the conclusions he draws. He is notable for his positions on the univocity of being, the epistemic status of theology, as well as being conversant with many of the main voices of the early fourteenth century. His work as a whole provides helpful clarifications into the mind of Scotus, and raises influential objections that helped shape the ongoing conversation of the fourteenth century.

William of Alnwick (1275–1333) was a Franciscan theologian who at the end of his life was consecrated as the Bishop of Giovinazzo. His name is derived from his birthplace of Alnwick in Northumberland, England, and it is believed that he was born sometime around 1275. As a Franciscan friar, he must have spent time studying theology at a Franciscan *Studium* – most likely at the nearby *Studium* in Newcastle. What he did next is less clear, but we know that at least by 1303, he was licensed as a Doctor of Theology at the University of Paris (he is listed as one of the masters who sided with Phillip IV against Pope Boniface VIII). There is little doubt that by this time, Alnwick was in close dialogue with the famous thinker with whom he would always be associated in posterity – John Duns Scotus. When exactly Alnwick later left Paris is unknown, but we do know for sure that he eventually found his way back to England to teach at Oxford. He is listed as the forty-second regent master at Oxford,

which situates him chronologically around 1316 during the Oxford chancellery of Henry Harclay.

Alnwick's relationship and interaction with Scotus consisted initially in the form of assistance that he could provide to the latter. Alnwick was a collaborator in the completion of Scotus' *Ordinatio* and functioned as secretary for one of Scotus' *Collationes*. He likewise went on to compile what are called the *Additiones Magnae* or long additions, which were compiled by Alnwick from Scotus' lectures in both Oxford and Paris. These additions soon became attached to Scotus' *Ordinatio* as an appendix and then eventually became inserted directly into the *Ordinatio* to fill in what were perceived of as holes in books one and two. Alnwick was, no doubt, incredibly indebted to the influence of Scotus in his life, and he is certainly remembered primarily for his relationship to Scotus. But Scotist studies are equally indebted to Alnwick because, through his close association with Scotus, he has been able to offer key points of clarification at otherwise frustratingly ambiguous places in Scotus' corpus.

Moreover, it is not entirely fair to reduce Alnwick to a mere personal assistant of the great John Duns Scotus. To focus on this relationship exclusively is to overlook the fact that Alnwick was a significant thinker in his own right, often distancing himself from Scotus' views at critical points. As various scholars have often echoed, while Alnwick's work in philosophy and theology most often began from the foundation laid by his early work under the tutelage of Scotus, this foundation was only the starting place for his own independent thinking. He cannot, therefore, be reduced to a blind student imitating a former teacher.

Besides his cooperative work with Scotus, Alnwick has left us with his own commentary on the *Sentences*, of which select questions have been edited in journals. We also have a selection of questions from his commentary on Aristotle's *De anima*, a lengthy list of questions in his *Determinationes*, an independent sermon on the beatific vision, and finally his *Quodlibet* questions and his *Quaestiones de esse intelligibili*, which were edited and published in full in 1937.

Perhaps one of the most visible examples of Alnwick's reliance on the thought of Scotus as a starting place and his simultaneous independence with regard to the conclusions reached is found in Alnwick's discussion of the univocity of being.

There are two halves to Scotus' doctrine of the univocity of being. The first is that a common concept of being is shared between God and creatures and therefore being is a univocal predicate, having a *ratio* or meaning that means the same thing in all of its applications. The second is that this univocal concept of being cannot be predicated essentially (*in quid*) of everything to which it is univocally said. That is, for Scotus it appeared to follow logically from the premise that being is said univocally, that other irreducible concepts like ultimate differences and the transcendentals cannot include the concept of being essentially. If they contained being and yet were not merely the same thing as being, but distinct from being, then they would not be irreducibly simple, for they would contain being and something that differentiates them.

Alnwick argues vigorously on behalf of the first half of Scotus' position. He, like Scotus, agrees that there is one single univocal *ratio* for being, and he defends this position against the criticisms of Robert Cowton and Richard of Conington. But Alnwick, equally as vigorously, argues against the second half of Scotus' position. Alnwick does not think it follows that being can be excluded from certain intelligible concepts. He insists that being must be predicable of all intelligible things with no exceptions. So he argues for the essential predication of being to extend to the transcendental attributes of being and ultimate differences. At one point, Alnwick poses the question: if the transcendental attributes of being and its ultimate differences do not essentially contain being, then how can they be anything at all? (Alnwick in Noone 1993 ll. 359–363, 398–404). While the Scotist position is able to offer its own answers to such a question (and did so), Alnwick at least presented an objection that later thinkers found interesting and at the very least were obliged to refute. Peter Aureoli and Walter Chatton are two subsequent thinkers who took

up and addressed directly this question posed by Alnwick.

Alnwick's status as "independent Scotist" is also seen in his questions on intelligible being. Faced with the question of the ontological status of an object *as known*, William is perplexed by what he perceives as Scotus' answer. While Scotus was willing to say that such an object attains a relative status of being (*esse cognitum*), William finds this merely confusing. His own answer is to say that the being of the object known is nothing other than the being or existence of the knowing intellect. An accompanying consequence of this position pertains to the status of divine ideas. Since no separate existence is granted to what is in the mind, William denies any existence, created or produced, of the divine ideas distinct from the existence of God.

Besides his views on univocity and the status of intelligible being, Alnwick opposes Scotus' belief that the immortality of the soul is truly demonstrable. He asserts instead that it is something that can only be held by faith. Also, contra Scotus, he maintains that God is the subject of metaphysics and not being. Since, according to Aristotle, no science proves the existence of its subject, Alnwick concurs with Averroes that God's existence cannot be proven by metaphysics, but only through the science of physics and motion. Scotus sides with the position of Avicenna, holding that being is the subject of metaphysics, and therefore God's existence can be proven through the science of metaphysics. Finally, Alnwick is noted for bringing his own clarification and specification to the well-known and often ambiguous Scotistic doctrine of the formal distinction. In his *Determinatio* 14, he argues for a gradation within the context of real distinctions. In conversation with Henry of Ghent and the later work of Scotus, he posits three kinds of real distinctions: *simpliciter*, *secundum quid*, and *formaliter*. Thus, the formal distinction is freed from any confusion with a mere distinction of reason existing only in the mind. Likewise, it is ensured the status of having a reality in the nature of things themselves, though it remains the weakest of all three real distinctions.

Within the realm of natural philosophy, Alnwick has been associated with a debate over an early and peculiar form of atomism known as “indivisibilism.” This position, as it was first advanced by Henry Harclay, took aim specifically at Aristotle’s assertion that a line could not be composed of indivisibles, and more broadly the position opposed Aristotle’s suggestion that time, space, and even motion could not be constructed out of indivisible units. Alnwick is documented as developing a response – in terms of terminist logic or *logica moderna* (Murdoch 1982) – in opposition to Harclay and later proponents such as Walter Chatton and Gerard of Odo.

Finally, Alnwick’s role in the developing conversation about the compatibility of faith and science is worth mentioning. Setting the stage for the discussion is Thomas Aquinas’ position that faith and scientific knowledge regarding the same thing are incompatible. No one can scientifically know something to be true and still have faith in it. The objection had been raised against Aquinas that if faith and scientific knowledge are incompatible, then theology itself could not be a science. Wanting to preserve the scientific status of theology – once again in distinction from his teacher Scotus who argued that theology strictly speaking is not a science – Alnwick took issue with the problematic premise. Alnwick claimed, contra Aquinas, that faith and scientific knowledge were not incompatible. Rather, he insisted that someone could continue to have faith regarding a particular truth even while having scientific evidence of its validity. The major hurdle in his reasoning was to show, through fine distinctions, how evidence and nonevidence can be had simultaneously without contradiction. With a certain innovation and originality of his own, Alnwick departs from the position of his teacher and attempts to find a unique way to preserve the scientific status of theology.

Toward the end of Alnwick’s life, he found himself caught up in an ecclesiological controversy that prompted his departure from England. In 1322, Alnwick joined a contingent of Franciscan theologians who drew up the decree, *De paupertate Christi*, written in opposition to Pope John’s XXII’s position on apostolic poverty. The

Pope insisted that Christ and the Apostles had indeed owned property and this contingent of Franciscans insisted that Christ and the Apostles had not, thus legitimizing their call for poverty within the Franciscan order against the dissenting voices of rival Franciscans. Alnwick, while he may not have been involved in the drafting of the decree itself, nevertheless gave a public defense of it found in the last question of his *Determinationes*. Alnwick must have left Oxford by this time, for his *Determinationes* are said to have been held at Bologna in 1322–1323. In this final question, William argued that Christ and the Apostles had owned nothing privately or even in common, and this direct opposition to the Papal decree caught the Pope’s attention. John XXII ordered that action be taken against Alnwick, who subsequently fled to Naples. In Naples, he fell favorably under the hospitality of King Robert of Sicily, who, in 1330, made Alnwick the legitimate Bishop of Giovinazzo. He died three years later in Avignon.

William of Auvergne

Roland J. Teske, S. J.
Department of Philosophy, Marquette University,
Milwaukee, WI, USA

Abstract

William of Auvergne was one of the first thinkers in the Latin West to offer a positive reception to the Greek and Aristotelian thought pouring into Europe through the new translations. He was deeply influenced, especially by Avicenna with regard to his understanding of God, the proofs for his existence, the structure of the created world, and the nature of the human soul. He said that Aristotle, by whom he most often meant Avicenna, should be upheld wherever he was correct, but rejected wherever he was in conflict with the faith (*De anima* 2, 12). Accordingly, he rejected and refuted Avicenna on many points opposed to the Christian faith.

Biographical Information

William of Auvergne, also known as William of Paris, was born c. 1180–1190 in Aurillac in the

former Province of Auvergne, southwest of the present Clermond-Ferrand. Little is known of his early life, but after studying at Paris, he became a canon of the cathedral and was a master in theology at the University of Paris by 1223 (Marrone 1983). When Bartholomaeus, bishop of Paris, died in 1227, William was displeased over the man chosen by the canons to replace him. Accordingly, William went to Rome where he persuaded Gregory IX to ordain him bishop and place him over the see of Paris in 1228; here he remained bishop until his death in 1249 (Valois 1880). Although he was strongly reprimanded by Gregory for failing to settle the strike at the University during the years 1229 to 1231, William soon returned to the good graces of the pope for whom he carried out several diplomatic missions. During the strike of the masters and students at the university, he appointed the first members of the mendicant religious orders to chairs in theology at the university, the Franciscan Alexander of Hales and the Dominican, Roland of Cremona, thus giving entree to members of these orders from which would come some of the greats of medieval philosophy and theology (Switalski 1976). William strongly opposed a plurality of benefices and condemned various theological errors in 1241 or 1244, thus setting a pattern for more significant condemnations in the future by bishops of Paris (Bianchi 2005). He also issued strong condemnations of the Talmud in 1248. William was on good terms with the royal family, first with the regent, Blanche of Castille, and then with Louis IX, the future saint. William strongly discouraged Louis against undertaking a crusade, which he vowed to do upon recovering from a fever, but to no avail. By the time Louis returned to Paris, William was dead and was buried at Saint Victor's.

Philosophy

William was one of the first in the Latin West to give a favorable reception to the Greek and Arabic philosophy that was rapidly becoming available through the recent translations and presenting to Christian Europe a new and scientific view of the world that was often at odds with the Christian

faith. Though the teaching of Aristotle was repeatedly condemned by ecclesiastical authorities during the early thirteenth century, William, the bishop of Paris, clearly read and appreciated the thought of the Greek and Islamic philosophers, especially of Avicenna. He, of course, could not and did not completely accept such philosophy, but upheld it where he could and rejected it where the Christian faith required.

His *Teaching on God in the Mode of Wisdom* (*Magisterium divinale et sapientiale*), which has generally been viewed as one huge summa-like work in the author's intention, but also more recently simply as a way of philosophizing (Corti 1968), was begun in the years before his episcopacy and was continued until his death. The *magisterium* is usually said to consist of seven works: *On the Trinity, or First Principle* (*De trinitate, sive primo principio*), *On the Universe of Creatures* (*De universo creaturarum*), *On the Soul* (*De anima*), *Why God Became Man* (*Cur Deus homo*), *On the Faith and the Laws* (*De fide et legibus*), *On the Sacraments* (*De sacramentis*), *On the Virtues and Morals* (*De virtutibus et moribus*). Thus the whole *magisterium* has the full sweep of the emergence from God of the world, the creation of human beings, as well as their return to God through the redemption, sacraments, virtues, and final reward in heaven. In that respect the *magisterium* has the same plan of emergence from and return to God as works of the later thirteenth century, such as the *Summa theologiae* of Thomas Aquinas. Viewing the *magisterium* as a way of doing philosophy rather than as one huge work has the advantage of allowing one to include other works of William, such as *Divine Rhetoric* (*Rhetorica divina*) and *On Grace* (*De gratia*) under that rubric, for which there seem to be good reasons.

William's works were treated simply as individual works in the *Opera omnia* and were recognized as forming the huge *magisterium* only early in the twentieth century (Kramp 1920, 1921). His extant works, manuscripts, and translations have been recently listed (Ottmann 2005), and advances have been made in their relative and absolute dating (Corti 1968). The *magisterium* contains a more philosophical *primum*

magisterium, which aims at demonstrative proofs, within the more theological whole *magisterium*, which aims at the glory of God through the perfection of human souls and their attainment of eternal life, although the two parts of the *magisterium* are not sharply distinguished either in terms of the time of their composition or of their intended order within the *magisterium*.

The present article is limited to four of William's works that contain his main philosophical teachings on God, the created world, the human soul, and ethics. *On the Trinity, or First Principle*, the first work in the *magisterium* in terms of temporal composition and intended order, contains a philosophical approach to God as the first principle of creatures as he is known through reason and as the triune God of the Christian faith. The influence of Avicenna on William's thought is clearly seen in his distinction between essence and existence in creatures and in his argument from beings possible in themselves, although actually existing, to God as a being necessary through himself. William, however, rejects and argues against both the Aristotelian and Avicennian arguments for the eternity of the world and argues for the freedom of God in creating the world. William's metaphysics combines an Avicennian account of the structure of the world with Avencebrol's emphasis on the divine will as the explanation of why there is a created world at all (Caster 1996). The Trinitarian part of the work may have been intended more as a demonstrative proof of the Trinity than as a faith-based understanding of the Christian mystery. It, for example, appeals to an Avicennian principle to show that God could generate only one Son (Teske 2006).

The second work in the *magisterium* in terms of the intended order, but not of its time of composition, *The Universe of Creatures* is divided into a first principal part on the universe in general and more specifically on the world of bodily creatures and a second principal part on the spiritual universe, that is, of the separate substances or intelligences, including the good and bad angels. In the first principal part, William takes up some questions on the universe in general. For instance, he argues that there is only one world, rejects the

dualism of good and evil found in the Carthar or Manichaean view of the world, where he adapts arguments from Avicenna rather than borrows from Augustine (Teske 2006).

William argues against Avicenna's doctrine that from the first intelligence or God only one second intelligence can proceed, and so on with the third, fourth, and others. Although he agrees with the truth of the Avicennian principle that from one as one only something one can proceed, he insists that from God or the first intelligence other things proceed not from the unity of God, but from his will. Against Avicenna William appeals to Avencebrol, a Jewish philosopher, but one whom he takes to be Christian, who held that God created through his word.

William argues against the eternity of the world and develops a concept of divine eternity as all at once, distinguishing it from the sort of eternity that the Aristotelians claimed for the world (Teske 2006). He also employed the sort of arguments ultimately derived from the Greek philosopher, John Philoponus, but perhaps more proximately from kalam arguments of various Islamic thinkers, for the finiteness of past time (Teske 2006). In this respect he anticipated the position of Bonaventure as opposed to that which Aquinas was going to defend.

The three sections of the second part discuss the intelligences, which William understood in terms of Avicennian metaphysics as pure spirits or incorporeal substances, thus clearly departing from the Augustinian view that the angels were composed of matter and form, albeit spiritual matter. William, however, insisted that, unlike the nine Avicennian intelligences that cascaded forth successively after the first, there are many more than nine intelligences or angels in the heavenly court since, as William argues, nine courtiers are far too few even for a respectable royal court on earth. He also holds that they do not necessarily proceed from the first and that they are certainly endowed with wills and are not merely intellects. For otherwise they could have no goodness or virtues. With such important qualifications the separate intelligences are according to William pure spirits ontologically on a par with the angels and demons, to which the remainder of the second

part is devoted, although further discussion of them will be omitted here.

In psychology William is greatly indebted to Avicenna's *De anima*. He endorses the latter's conception of a human being as a spiritual soul, but he expresses his amazement that philosophers have classified the study of the soul as a natural science as opposed to a divine science (*De anima, Prologue*). He critically examines Aristotle's definition of soul as the first act of a body potentially having life, which he fails to understand, and borrows Avicenna's "floating man" argument, quoting it twice, to prove that a human being or soul is not a body (Teske 2005). William divides the powers of the soul into cognitive and moving powers. The cognitive powers include the five external senses, various internal senses, such as the memory, imaginative and estimative powers, and the intellect, while the moving or appetitive powers are divided into a higher moving power, namely, the will, and the lower moving powers, namely, the concupiscible and irascible appetites. William's arguments for the soul's immortality in *On the Soul* closely parallel those found in *On the Immortality of the Soul* (*De immortalitate animae*), which had once been attributed to Gundissalinus, but is now accepted as William's work. Hence, the bishop has been cleared of the charge of plagiarism.

William strongly argues against the role of Avicenna's agent intelligence in the acquisition of knowledge. For he saw the agent intelligence, the tenth intelligence, as simply pouring knowledge into souls and, hence, making the acquisition of knowledge an entirely passive reception that does away with all study and effort at learning. He also rejected the Platonic archetypal world of Forms or Ideas, which he knew only through Cicero's translation of part of the *Timaes*, because he was convinced that such a really real world led to a reduction of the sensible world to something less than real, though like the real world. He also greatly reduced the role of divine illumination, which Augustine had given as a source for our knowledge, to only a few ideas found in both God and creatures, such as being, one, true, and good (Marrone 1983). Despite a common view to the contrary, William did not

have God play the role of the agent intellect (Teske 2006).

Up until the fifth of the seven parts, William treats the essential properties of the soul, such as its incorporeality, indivisibility, and immortality. But then William takes up the fallen nature of the soul, which he argues is a penal condition, of which he claims that Aristotle had no knowledge, although he says that he should have been able to infer it from our present state. Our present state of misery is clearly, William claims, one of punishment that must stem from the first parents' sin. As one of the first Christian thinkers to come into contact with the Aristotelian concept of nature, William was faced with the challenge of trying to reconcile the Augustinian and the Aristotelian concepts of nature. He attempted to combine a philosophical conception of the nature of the soul derived from Avicenna, which remains unchanged in its essentials, with an Augustinian concept of nature, which changed over time. He speaks of the original state of our nature, its present fallen state, which may be somewhat healed by grace, and its future state in glory. According to William our present state of misery is due to our bodies rather than our souls since he claims that God could not and does not create damaged souls; rather, souls suffered damage through their union with bodies. The original condition of our first parents, however, contained many elements that later theologians labeled as preternatural or supernatural (Teske 2006). Clearly William is struggling to integrate an unchanging Aristotelian concept of nature with an Augustinian nature that has changed and will change.

In ethics, William's knowledge of the *Nicomachean Ethics* was limited to the books two and three contained in the *versio vetissima* (Jüssen 1995). In his *On the Virtues*, William criticizes Aristotle's definition of virtue from the *Nicomachean Ethics* and finds fault with other ideas of his, such as that a virtue stands in the mean between two extremes and that a person can have one virtue without the others. He clearly prefers Augustine's account of the cardinal virtues from *De moribus* as four forms of love. He distinguishes three sorts of virtue: natural virtues such as Adam's soul and, it seems, our soul had when

created; consuetudinal or moral virtues, such as those of which Aristotle spoke; and gratuitous virtues, such as Christian faith, hope, and charity, which are infused by God. William compares the consuetudinal virtues to crutches or wooden legs insofar as they repair to some extent the damage done to our natural powers or virtues, but do not completely restore them to their original condition.

William expresses amazement at the fact that Aristotle, by whom he usually means Avicenna, said so much about intellect and little or nothing about will. He argues that the will is most free in its act of willing and refers to it as the king and emperor over the other powers of the soul (Teske 1994). The intellect acts merely as a counselor to the will, and the senses serve as messengers that seek out and bring back information to their king.

William of Auxerre

Boyd Taylor Coolman

Theology Department, Boston College, Chestnut Hill, MA, USA

Abstract

William of Auxerre, (d. 1231), was a secular master, scholastic theologian from the University of Paris, author of the *Summa aurea*, an early, influential "summa" of Christian theology/doctrine, and a *Summa de officiis ecclesiasticis* (*Summa of Ecclesiastical Offices*), a commentary on the mass, was appointed by Pope Gregory IX in 1231 to head a committee charged with examining for errors the "books of Aristotle," later became archdeacon of Beauvais.

William of Auxerre

Author of the first scholastic *summa* of theology and early *magister* at the University of Paris, William of Auxerre (d. 1231) is a seminal figure in thirteenth-century scholasticism. From the uncertain theological and philosophical climate of the preceding century, William's thought and writing emerge with impressive originality. Both traditional and innovative, his *Summa aurea* incorporates into many traditional theological

topics the methods and teachings of the full scope of Aristotelian philosophy rapidly gaining currency in the early University of Paris. In particular, William breaks new ground in medieval intellectual culture by attempting to give a genuine and considerable role to reason and philosophical argument within the discipline of theology, thus establishing theology as a legitimate science (*scientia*), while also retaining its revealed and supernatural character. On various other fronts, William is a pioneering figure in the development of medieval scholasticism.

Though often overshadowed by such later scholastic luminaries as Aquinas and Scotus, William of Auxerre was a highly regarded university theologian throughout the later Middle Ages, as the nearly 120 surviving manuscripts of his entire *Summa aurea* ("Golden Summa") – not to mention abridgements – manifestly attest. (William also wrote *Summa de officiis ecclesiasticis* (*Summa of Ecclesiastical Offices*), a commentary on the mass.) Later Parisian scholars remembered William for his facility in disputation and his profundity in preaching. Surprisingly little, however, is known with certainty of his life, except that he occupied a prominent place among the theological masters of the nascent University of Paris in the first three decades of the thirteenth century, and was involved in various high-level negotiations between the university and church authorities. Most notable of these was his appointment by Pope Gregory IX in 1231 to head a committee charged with examining for errors the "books of Aristotle" (*Natural Philosophy* and *Metaphysics*) that had already been prohibited at Paris in 1210. William's death in the same year brought this task to naught. A letter of Pope Gregory IX indicates that William was also an arch-deacon of Beauvais.

Though it roughly follows the structure of Peter Lombard's *Sentences*, William's *Summa aurea* (so-called by, and reflecting the esteem of, later generations) is arguably the first high-scholastic "*summa*," whose independent structure and dialectical style reflect, respectively, his distinctive theological vision (developed over

decades of university teaching and disputation) and the increasing influence of Aristotelian philosophy on university theology. The work is divided into four books (I – God's existence and nature; II – creation, free will, and sin; III – Christ, salvation, and the virtues; IV – sacraments and eschatology). One of the most intriguing features of the *Summa aurea* is its subtle and implicit engagement with contemporary authors and discussions in the course of explicit treatment of traditional questions and topics. The result for modern readers is the tantalizing sense of being able to hear only one voice in a lively, multilateral debate over the most important issues of the day.

William is one of the first medieval thinkers to grapple with the fuller presentation of Aristotle's philosophy, rapidly emerging at that time. Though he is acquainted with Aristotle's *Physics* and *Metaphysics* and with a partial translation of the *Ethics*, William is especially influenced by the so-called *logica nova* (especially the *Posterior Analytics*), whose conception of genuine *scientia* inspires and informs his attempt to establish theology as a genuine scientific discipline (see below). At the same time, William is also in the vanguard of medieval thinkers, whose appropriation of Aristotelian philosophy is mediated and accompanied by the Stagarite's later Arabic commentators, such as Avicenna and Averroes, whom William clearly knows, though only infrequently quotes by name. Subsequent scholastic generations will assimilate these Arabic interpretations more fully and systematically, but William inaugurates this monumental trend.

William made important contributions, both innovative and influential, on several theological fronts, regarding both scholastic method and content. Perhaps his most far-reaching achievement is in methodology, where he provides a point of departure for subsequent thinkers (e.g., Alexander of Hales, Albert the Great, Bonaventure) in his attempt to provide a crucial and clearly conceived role for reason in the theological enterprise, and thereby to establish its genuinely scientific character. For William, theology begins with the supernatural gift of formed faith, which cannot

be arrived at by prior reasoning. But once established in faith, reason can play a vital role, not merely in refuting heresies and providing a reasonable defense against objections from non-believers, but in extending and deepening the knowledge (*scientia*), and understanding (*intellectus*) of what is believed. William's analogy here is the above-mentioned Aristotelian conception of genuine *scientia*, which begins with first principles that are themselves not proven, but axiomatically self-evident (*principia per se nota*), which are the basis for further knowledge derived logically therefrom. So, for William, the creedal articles of faith (*articula fidei*), given through revelation and embraced with supernatural certitude, are not rationally provable, but once accepted by faith become the basis for further theological knowledge derived logically from them. Rational argument is never the basis of faith, but nonetheless plays a crucial, necessary role in the pursuit of theological truth. Later scholastics will appropriate and develop William's pioneering approach in this regard. William also made important contributions to the theological method in relation to the form of theological discourse, especially its written form. William's *Summa* reflects his pioneering skills at systematic organization, and clear and concise formulation of the abundant and diffuse theological material accumulated by the end of the twelfth century. This is particularly evident in his treatise on the Incarnation, whose topical ordering, clarity of presentation, and precision of analysis marked a new point of departure for later scholastic Christology.

Regarding content, William is something of a Janus-figure in relation to the development of medieval thought. On most topics, he is rather traditional, much indebted to the Augustinian tradition, mediated by intervening figures, such as Boethius, Anselm, and the Victorines. So, for example, William's arguments for God's existence include Anselm's so-called ontological argument, though William identifies that being "than which nothing greater can be conceived" not simply as "God," but as the highest good (*summum bonum*), thus reflecting his proclivity

for a metaphysics of goodness, which seems to have inspired contemporary thinkers, such as Philip the Chancellor's *Summo de Bono*. In general, William's treatment of such divine attributes as the good, being, and unity influenced later thirteenth-century discussions of the so-called transcendentals. On issues of epistemology, moreover, William is an illuminationist in the Augustinian tradition, yet even here he reformulates this teaching in the Aristotelian terms of assimilation of the knower to the known.

Yet, in other respects, William initiates new trends. He was one of the first medieval thinkers, for example, to deploy the distinction between God's absolute and ordained powers, which would be so central to later scholastic debates regarding the divine nature. William also writes the first treatise devoted in its own right to the topic of free will (*liberum arbitrium*). Similarly, William's treatment of the virtues in Book III of the *Summa aurea* sets important developments in train. This massive, systematic analysis of the virtues, constituting nearly the whole of Book III, brings medieval moral theory to a new level of philosophical and theological sophistication and also previews similar attention to virtue among later scholastics. William originated the theological distinction between the perfect happiness proper to God and the imperfect happiness appropriate to created beings, a distinction which Aquinas will later employ in his *Summa theologiae*. Again, reflecting his employment of Aristotelian thought within theology, William appears to be one of the first to use the distinction between form and matter in his analysis of the sacraments. Finally, William's teaching on the spiritual senses of the soul draws on the philosophical tradition of the internal senses of the soul.

William of Champeaux

Margaret Cameron

Department of Philosophy, University of Victoria,
Victoria, BC, Canada

Abstract

William of Champeaux (d. 1122) is best known as the leading master of dialectic (which included logic, grammar, and rhetoric) at Notre Dame when his more famous student, Peter Abelard, came there to study. William allegedly stopped teaching at that centre around 1108, shortly after his realist defenses on the controversial topic of the status of universals were attacked by Abelard, and he took up as a canon regular at the monastery at Saint Victor (Abelard, *Historia calamitatum*, ed. Monfrin J. Vrin, Paris, 1967); there is no historical evidence to support the oft-repeated claim that William founded that famous monastery and school, his name is not found among the writings of the Victorines, and upon his death he was buried elsewhere, at Clairvaux (Mews, Abelard and his legacy. Ashgate, Variorum, Aldershot, 2001). William's educational background in dialectic is unknown, but he studied under and taught with Anselm of Laon, and their theological work is preserved in the *Liber pancrisis* (William of Champeaux, *Sententiae. Psychologie et Morale au XII^e et XIII^e siècles*, ed. Lottin O. Duculot, Gembloux, pp 190–227, 1959), the first known work to publish together the writings of both modern, practicing theologians and patristic sources. After his retirement from teaching, William eventually became Bishop of Châlons-sur-Marne, and belonged to circles of ecclesiastical influence (Mews, *Logica in the service of philosophy: William of Champeaux and his influence on the study of language and theology in the twelfth century*. In: Rosier-Catach I (ed) *Les Glosulae super Priscianum*, Guillaume de Champeaux, Abélard: arts du langage et théologie aux confins des XI^e-XII^e, les conditions enjeux d'une mutation, forthcoming).

Although none of his writings has been thought to survive, recently a number of anonymous commentaries and tracts on dialectic datable to the early years of the twelfth century have been either attributed to William or said to contain his teachings (Iwakuma 1993, 1999, 2003, 2008). None of these claims has been definitely proven, and scholars recognize that more work is yet to be done to sort out the authorship of these materials and their relationships to one another and to known masters. Complicating this project is that explicit references to a master's view are normally given by abbreviating a name to a sole initial, and given fluid spelling and orthography it is difficult to judge whether every "W," "G," or "V" should apply to the same person (i.e., William), especially when the variety of initials can be found in one and the same text (e.g., Abelard's *Dialectica*, which also contains references to "My teacher (magister noster)").

William's realist theories of universals are the best known part of his philosophy. The defeat of these two positions led, according to Abelard, to William's lectures on dialectic "falling to pieces" (Abelard 1967); John of Salisbury, writing years later, reports that William "is convicted of error by his own writings" (John of Salisbury 1991). William's first theory is known as "Material Essence Realism": each existing thing possesses a material essence, which William identifies as the species of the individual, or genus of the species. What makes one individual different from another individual that shares the same material essence (i.e., is of the same species) is the addition of particular, accidental forms. Abelard launched a series of arguments against William's theory, after which William took up anew with what is called "Indifference Realism": individuals (x, y) of the same species (A) are indifferently the same insofar as they do not differ in being (A) (Abelard 1919; Spade 1994; King 2004). This second position, too, was crushed by Abelard, and no further theories on this question by William are known. Abelard's attacks on William took place during William's lectures on rhetoric. It is possible that William's rhetorical teachings have been identified (Fredborg 1976).

The details of William's theory of signification are unknown, although it is certain that he distinguished between literal and figurative locutions, appealing to the latter to resolve problems such as the signification of expressions containing apparently contradictory terms (e.g., "dead man," where "man" means "rational, mortal animal"). In his theological writings, William advocated the view that terms used to refer to God are to be taken in a sense that is transferred from their usual meaning, namely what they were imposed (on things in the created world) to signify. Abelard, followed by other twelfth century figures, developed William's improper or figurative signification into a doctrine of *translatio* in order to determine the signification of expressions that are affected by their context (Rosier-Catach 1999).

William likely borrowed the notion of improper signification from the discipline of grammar. References to a Master G and W in a set of notes on a widely copied commentary on Priscian's *Institutiones grammaticae* have suggested William's important role in the development of grammatical theorizing at this time (Rosier-Catach, forthcoming). William believed that grammar and dialectic present two different theories about the sense of propositions and predicative questions, based on the answers that each discipline's authorities give to the question of the proper relation between the subject, predicate, and copula. "Snow is white," according to the grammarian, means that snow is a white thing, and the terms "snow" and "white" thereby co-refer; according to the dialectician, it means that whiteness inheres in snow. Mocked by one scholar for thinking that meaning is determined according to disciplinary boundaries (where the author wonders whether there is not also an ethical and a physical sense), the view is criticized at length by Abelard who urged that propositions and predicational questions have a single sense.

Several of William's opinions are given in anonymous discussions of Boethius treatment of topical reasoning, and a number of these are criticized by Abelard elsewhere (Green-Pedersen 1974; Martin 2004). William seems to have held that the force of a topical argument is the thing referred to or understood itself, such that in the

consequence “if Socrates is man, Socrates is animal,” *man* provides the force. The *locus differentia* is the relation (*habitus*), for example, speciality, generality, equality, and so on, that holds between the things referred to. Each maximal proposition generates a multitude of meanings, for example, “Whatever is predicated of the species is predicated of the genus” contains as its meanings “if it is man it is animal,” and “if it is pearl, it is stone” (Green-Pedersen 1974). This view is variously criticized by the anonymous commentator reporting it and by Abelard. William also added additional *loci* to Boethius’ list, including the *loci* from the predicate and the subject, and from the antecedent, consequent, or either of these through contraposition. An anonymous logic primer, the *Introductiones secundum Wilgelmum* (Iwakuma 1993) includes some but not all of these additional *loci*. Possibly associated with William’s teachings or his followers, this primer exemplifies several features of topical theory of which Abelard was deeply critical, such as the failure to distinguish between the rules for syllogistic and topical reasoning (Abelard 1969; Martin 2004).

William of Champeaux is an important figure whose dialectical views provoked much response during the volatile period of the early twelfth century. Snippets of William’s other views can be found throughout the anonymous commentaries from this period (Iwakuma 1999). We will be in a better position to understand his theories once more of the anonymous commentaries and tracts from this period are critically edited and studied.

William of Ockham

Stephen F. Brown

Institute of Medieval Philosophy and Theology,
Boston College, Chestnut Hill, MA, USA

Abstract

William of Ockham, most famous for “Ockham’s Razor,” was an English Franciscan theological and philosophical author whose academic work was mostly done in England. He never became a Master of Theology, but he did teach at Oxford from 1317 to 1319, commenting there on the “Sentences of Peter Lombard.” He earned in the Middle Ages the title “Venerable Inceptor,” so it is presumed that he began the early ceremony (the *inceptio*) that formally initiated entry into the rank of Master. However, he was stopped en route. “Ockham’s Razor” is essentially the principle of parsimony. This principle, established long before Ockham, gained its name from him because of his more frequent appeal to this device in all the areas of his theology and philosophy.

William of Ockham, an English Franciscan theologian and philosopher, was born around 1287 in Ockham, a hamlet in Surrey that is southwest of London. He joined the Franciscans as a teenager and began his studies at their convent in London. Although this house of studies was a provincial *studium*, not a general or international *studium*, it had a faculty that traditionally had trained in theology at the University of Paris. There William received his preparatory studies in the seven

liberal arts and philosophy and did his first studies in Bible and the *Sentences* of Peter Lombard. He pursued his advanced studies in theology at Oxford and commented as a *baccalarius sententiarum* (Bachelor of the *Sentences*) on Peter Lombard’s work from 1317 to 1319. His honorific title “Venerable Inceptor” suggests that he had taken the first step toward becoming a Master of Theology at Oxford. However, he never went beyond the *inceptio* ceremony or formal university initiation rite. Quite likely he was prevented from becoming a Master of Theology by some of the masters who challenged his teachings or by John Lutterell, the chancellor of the university who later accused Ockham of heresy. At this point he returned to teach in London at the Franciscan *studium*.

Although the details of Ockham’s coming to Avignon are not all clear, we know that Pope John XXII summoned Ockham to Avignon and appointed a commission to examine the erroneous and heretical charges that masters of theology had brought against him. No formal condemnation was ever issued by the pope; Ockham simply was forbidden to leave Avignon. At this point, however, the direction of Ockham’s life was about to change. The chief superior of the Franciscans, Michael of Cesena, who had been feuding with Pope John XXII over the nature of Franciscan poverty, was summoned to Avignon. He ordered Ockham to study previous papal documents regarding the Franciscan rule to see if John XXII’s stance violated them. Ockham concluded that the pope in fact had contradicted earlier papal constitutions, held false views concerning the nature of Apostolic poverty, had thus fallen into heresy, and thereby surrendered his right to the throne of Peter. When Pope John XXII called a chapter of the Franciscans to elect a new superior to lead the Order, Michael of Cesena, Ockham, and two other Franciscans fled Avignon on May 26, 1328. They were automatically excommunicated.

Ockham and the other three Franciscans arrived in Pisa in September, 1328 and there joined up with a strong enemy of Pope John XXII, Ludwig of Bavaria. Ludwig, whose election as the Holy Roman Emperor was not

recognized by the pope, invited them into his service. When the emperor returned to Munich in 1330, they went with him and Ockham stayed there until his death. Ockham's first writings in this period were produced with an eye to Pope John XXII (d. 1334), and then to his successors, Benedict XII and Clement VI. Gradually, however, they took on a broader scope. He always claimed to be a faithful Christian and stood willing to submit to the legitimate authorities of the Franciscan Order and the church. He died on April 10, 1347 in Munich and was buried in the Franciscan church there, without ever finding the legitimate authorities that could rescind his excommunication.

Works

The writings of Ockham are many and were produced in different places. Most of his philosophical and theological works date from his teaching in London and Oxford. His *Quodlibets* were begun in England but completed in Avignon. His political writings all were produced during his late years in Munich. The philosophical writings were works mainly focused on logic and natural philosophy or physics. Some of his logical works were traditional commentaries connected with Aristotle's treatises: (1) *Exposition on Porphyry's "Isagoge"*; (2) *Exposition on the Book of Categories*; (3) *Exposition on the Two Books of the Perihermeneias*; (4) *Exposition on the Two Books of the Sophistical Refutations*. The other logical works are independent of the texts of Aristotle's *Organon*. The most impressive is (1) the *Summa logicae*, a very lengthy unified treatise on the whole of logic. The previous general logic works of Peter of Spain, William of Sherwood, Roger Bacon, and Lambert of Auxerre are in reality collections of logical treatises on different subjects. In contrast, the *Summa logicae* is an integrated whole. Two other works on logic attributed to William are (2) *The Compendium of Logic* and (3) *An Elementary Logic*. The *Compendium* is not a summary text of the *Summa logicae* but a short rendition of the basic positions of Ockham's logic. The *Elementarium* is a beginner's logic

text that is in agreement with Ockham's authentic work. It is a work that leaves out any theological applications, so in this way it differs noticeably from the *Summa logicae*. The last two works have had their authenticity challenged, but they contain nothing that contradicts Ockham's teachings. The author of the *Elementarium* refers to his own *Logica* and it is hard to find someone other than Ockham who holds the positions that the *Elementarium* and the *Summa logicae* hold in common.

The attention that Ockham gave to philosophical matters centered on natural philosophy. All such works were based on the doctrine of Aristotle's *Physics*. He has four works in this area of study: (1) *Exposition on the Books of the Physics*; (2) *Questions on the Books of the Physics*; (3) *A Summula of the Books of the Physics*; and (4) *Brief Summa of the Physics*. Ockham's *Exposition* is a long, detailed study of the text of Aristotle's *Physics*, the largest of his philosophical works. The *Questions* follows the alternative form of a commentary: it just poses the questions that arise from the text and presents them in a form that suggests they are William's questions rather than Aristotle's. The *Summula* is an incomplete work covering only the materials of the first few books of Aristotle's *Physics*. It provides the essence of Ockham's positions in the form of an exposition. Remarks made in the prologue have led a recent specialist in Ockham's Avignon period (*Franciscan Studies* 46 [1986]: 70–71) to suggest that it was written there. The *Brief Summa* is a sketch of each of the books of Aristotle's *Physics* that one might consider a digest of the *Expositio*; however, it provides a summary of the whole of Book VIII which stops after chapter 2 in Ockham's own *Expositio*.

William's theological writings are likewise numerous: (1) *Scriptum in primum librum sententiarum* (*Written Commentary on Book One of the Sentences*); (2) *Reportationes in libros II–IV sententiarum* (*Student Accounts of His Lectures on Books II–IV of the Sentences*); (3) *Seven Quodlibets*; (4) *Treatise on the Sacrament of the Altar*; (5) *Treatise on the Body of Christ* (also called *The Treatise on Quantity*); (6) *Treatise on*

Predestination and on God's Foreknowledge and Future Contingents; (7) *Quaestiones variae* (*A Collection of Various Questions*). The *Scriptum* or *Written Commentary* is the text of Ockham himself. Though it is a single work, William made changes to his text which are indicated as additions or clarifications in the recent Latin edition of his works. The *Reportationes* for Books II, III, and IV of the *Sentences* are the reports or accounts of very able students. Some of the *Seven Quodlibets* certainly are based on disputes carried on in England but other elements and the final redaction of this work indicate that it was formally completed in Avignon. The next two works, on the Eucharist, are *A Treatise on Quantity*, since a great deal of the discussion in these works centers on issues of quantity related to the Eucharist, and *On the Body of Christ*. It is possible that these works also might have ties to Avignon. At one time both treatises together were called *On the Sacrament of the Altar*. The *Treatise on Predestination and Foreknowledge* covers much the same material as is found in discussions of God's knowledge and power in the late distinctions of Ockham's *Scriptum on Book I of the Sentences*. The *Various Questions* were disputed questions that were edited as parts of the *Reportationes in II–IV Sententiarum* back in 1495. For the most part they are found in manuscripts of the *Reportationes*, but they really do not belong there. In the recent edition of Ockham's *Opera theologica* they are published separately along with an independent question *On the Connection of the Virtues* which is not found among the manuscripts that have the *Reportationes*.

Ockham's political and polemical writings, dating from his years in Munich, are also many: (1) *The Work of Ninety Days*; (2) *A Letter to the Friars Minor*; (3) *A Dialogue*; (4) *On the Teachings of Pope John XXII*; (5) *Compendium of the Errors of Pope John XXII*; (6) *Letter Against John XXII*; (7) *Letter Against Benedict XII*; (8) *Allegations Concerning Imperial Power*; (9) *Eight Questions on the Power of the Pope*; (10) *Treatise on the Power of Emperors and Pontiffs*; (11) *Consultation on a Marriage Case*; (12) *A Brief Declaration on Tyrannical Power*.

Philosophy and Theology

By the time of William of Ockham, the university view of the nature of theology had long been debated. Key figures, such as Thomas Aquinas, Henry of Ghent, Godfrey of Fontaines, John Duns Scotus, and Peter Auriol, had pushed the discussion concerning the nature of theology to the point that the term "theology" came to mean either the study of the Scriptures, or deductive theology or declarative theology. The last two technical expressions pointed to different ways of studying the contents of the Christian scriptures. Each approach used philosophy in different ways. Deductive theology received its name from its primary role: a deductive theologian assumed as true certain basic teachings of the Scriptures, such as the truths summarized in the creed of the church. Reason or philosophy could not prove such truths; they were accepted by faith. However, once the theologians accepted them as true, they could assume them as premises and search to see if they could find other premises that might allow them to draw further conclusions. When they found a suitable necessary premise, then they could draw a conclusion that would also be necessary. When they found a strong contingent premise, their drawn conclusion would be contingent, but a strong theological conclusion. In short, the first option would produce theological certainty; the second option would develop theological opinions. Deductive theologians aimed to have their theological opinions to be as strong as possible, so they tended in lieu of certainty to pursue premises that were most probable. The deductive approach thus demanded the strongest arguments and modeled its procedures on the *Posterior Analytics*, Aristotle's book on demonstration. Pursuing this method, theologians realized that if they started with premises that were accepted on faith, they differed from Aristotle who started with self-evident or evident premises. Still, their method itself was similar and they could claim that they were at least doing "a science of the faith." They could go further and see what kind of arguments would bring them even closer to science as Aristotle saw it. They could

try to find arguments that would demonstrate things about God and his attributes, so that even in an Aristotelian sense they would have demonstrated or necessary naturally known conclusions about God or the works of God. This made the logic of demonstration and the study of metaphysics and physics very important to the deductive theologian.

The declarative theologian approached things differently. He too started with the main truths of Christian faith. However, he did not deduce further conclusions. He tried to bring understanding to the articles of the Creed. Following St. Augustine and St. Anselm, the declarative theologian concentrated mostly on truths the church accepted on faith and then asked if he could find supporting or confirming arguments for the believed truths. He knew that many of the things Christians believed could not be demonstrated; still he knew that if God were not contradictory, then what he revealed in the Scriptures could not contradict his gift of reason when it was used properly. The declarative theologian still proceeded according to logic, but he did not take the model of demonstration in the *Posterior Analytics* as his primary guide. Like Augustine and Anselm, he aimed at bringing understanding to the truths accepted on faith. He asked: what causes misunderstanding? He realized that there were many things that could confuse believers. Sloppy definitions cause misunderstanding. Weak analogies cause misunderstanding. Lack of supporting reasons leads to hesitation regarding things that are believed. Opponents, attackers, and heretics also cause confusion. The declarative theologian knew then that his task was to find clearer definitions that help understanding. He needed to discover better analogies and supporting arguments gained mainly from a knowledge of the natural world that might bring some recovery from doubt and confusion. Finally, he needed to show the weaknesses in positions that opposed or distorted what he knows by faith must be true. These are the main tasks of the declarative theologian as a theologian. Like the deductive theologian, he might also examine what about God and creation might be demonstrated, but he would call it metaphysics

rather than theology. He might want to discover what new necessary truths of faith he might deduce; but realizing how limited is the knowledge of necessary evident truth that might help in this endeavor, he tended to concentrate on whatever probable or confirming arguments would help him best to refute heretics and critics. William of Ockham, like many of his predecessors mentioned above, was both a deductive and a declarative theologian. To achieve the goals of both approaches to theology, he had to pursue logic in all its areas and dimensions, metaphysics as a science that searches for what is necessary and certain, and physics as a scientific portrait of creation.

Logic

The *Summa logicae* (*Opera philosophica* I) is Ockham's text dealing with the whole of logic. Its principal positive aim is to produce scientific thinking. It sets the necessary directions for doing so, but at the same time, most explicitly in its treatment of fallacies (*Summa logicae*, 749ss.), it indicates that the Scriptures, the writings of the fathers and even the writings of the philosophers often speak rhetorically rather than logically. St. Augustine at the very beginning of his *De trinitate* cautions his readers about speech that says that God remembers or forgets, even though the Scriptures (*Psalms* 13, 1) say: "How long, O Lord? Will you forget me forever?" St. Anselm, in chapter 16 of his *Monologion*, following the lead of St. Augustine in the opening chapter of VII *De trinitate*, corrects the language coming from the church fathers that says "God has wisdom" or "God has justice" instead of "God is wisdom" and "God is justice." Ockham tells us that Aristotle himself in his natural philosophy stressed that it is necessary to clarify the meanings of statements such as "motion and time differ" and "a statue is composed of iron and its shape" before agreeing or disagreeing. Ockham's message is that even philosophers and theologians at times speak according to a common parlance. It has to be noted, however, that there is a common

parlance which is that of the broad community and there is also a common parlance (*usus loquendi*) among philosophers and patristic and medieval theologians when they speak or write. According to Ockham, his readers at times realized that this was the case; often, however, they did not. Logic, when dealing with philosophers and theologians of the past, had to teach readers how to decode or reconstruct statements to render them accurate. First, they had to put the statements into their proper form, and then they had to judge the proper form in terms of their truth.

Ockham's Theory of Supposition

Ockham inherited significant contributions from Walter Burley's *Treatise on Suppositions*. However, the criticism of Ockham's *Summa logicae* by Burley in his *De puritate artis logicae* shows their dramatic differences. For both, supposition is the characteristic of a term as it functions in a proposition, whereby it refers to a thing (Personal Supposition), to a concept in the mind (Simple Supposition), or to itself as a spoken or written term (Material Supposition). The supposition of a term tells us for what it stands or supposits. In the proposition "A man is running," "man" stands for any man who is presently running. In the proposition "Man is monosyllabic," "man" supposits for the word "man." In the proposition "Man is an animal," "man," according to Walter Burley, supposits or stands for the universal essence of man. For Ockham, in the same proposition "man" stands for concrete individual men. For William, there is no universal essence or reality in men, as Burley contends. Men are, for Ockham, essentially alike, and they are essentially alike prior to any action of our minds; yet, there is no essential "likeness" in them. Ockham's theory of supposition in this case presupposes his theory of universals. He denies the exaggerated realism he found in Burley's early writings. It is the same exaggerated realism that Walter also defends in his later *De puritate* where he admits that universal essences are in individuals. Ockham's theory of supposition extends to all areas of scientific study.

Ockham's Portrait of the Categories

There are for Ockham, as was just said, no universal substances. There are only individual substances. Such individual substances, then, are realities, whereas universal substances are concepts. For Ockham, some qualities are also realities. However, some are not. If the grass you see is green, it is because green is an inhering quality of the grass. If two white men are white, each has whiteness as a quality in them. They are thereby also alike or similar to one another insofar as each is really white. Yet, even though they are really alike according to the accident of whiteness that each has, this does not mean that there is a quality of "likeness" in them. Twins also are alike, really and essentially alike, because both are human beings; but they do not have "twinness" in them as an inhering real quality expressing that they were born of the same mother within a short period of one another. Men also are really tall and really short, but when we speak of the tall one being taller than the short one, the relation between them does not demand that we admit a quality of tallness in a man whom we might describe in common parlance as "really tall." When, then, we deal with the Aristotelian categories and want to speak scientifically or precisely, we have to ask for what realities do our terms expressing substances, qualities, quantities, relations, and the other categories supposit. They do not all supposit for directly corresponding realities.

The Realities of Natural Philosophy

As a general point, Ockham notes that when we use nouns we are tempted to think that there are realities that directly correspond to them. Due to common parlance, we might believe that there is a reality called "weather," "a cold spell," or "a day." Ockham noted that according to the common parlance of natural philosophers, "motion" and "sudden change" are spoken of as if they were actual realities in themselves. We might be led to think that when we have nouns for them we must reify

all things spoken of in natural philosophy. This is not how Aristotle proceeds. If we follow him, we have to search for what exactly nouns or noun-expressions like “motion” or “sudden change” supposit when we, in our common way of speaking in natural philosophy, say that motion and sudden change exist. According to Ockham, Aristotle’s portraits of motion or of sudden change are such that one could best represent the realities corresponding to them by substituting the following descriptions for them. “Motion” is a mobile thing that now coexists at a part of a place where it did not coexist before. “Sudden change” is that which signifies that some form is acquired all at once. Many expressions of natural philosophy thus must be decoded, if we are to understand them precisely and not create fictional realities representing them.

Ockham’s Razor

Ockham is most famous for using the principle of parsimony in his writings: denying universal realities, reducing the realities often associated with the categories, employing his razor wherever relevant. In its original presentation the razor or principle of parsimony was a principle enunciated by Aristotle in Books I and VII of his *Physics* (188a 17–18 and 259a 8–15): “Plurality must not be admitted without necessity.” William appealed to it in the very first question of his Prologue to *Book I of the Sentences* in his discussion of the distinction between intuitive and abstractive cognition (*Opera theologica* I, 74–75). We can see from the discussions above concerning supposition, the categories and natural philosophy that he was ridding the world of extra realities he considered unnecessary. One of his chief targets was John Duns Scotus and the metaphysical principle of *haecceitas* (thisness) that Scotus employed to explain the distinctness of individuals within a species. In the *Summa logicae* (*Opera philosophica* I, 772) William tells us that the proposition “The ‘thisness’ of Socrates is something” can be understood in two ways: it can mean

that the “thisness”, which is a thing distinct from other “thisnesses”, is something or it can mean that Socrates who is this man or this creature or this being is something. Ockham thinks it is so evident which is correct, that he does not explicitly tell you which choice is his. If it was evident to him which was the correct choice, it was not evident to Walter Chatton. Walter, a great defender of Duns Scotus, was teaching at London with Ockham, in the years before Ockham was called to Avignon. Chatton’s challenge to Ockham was his “rule” or “anti-razor” which he formulated in this way: “If three things are not enough to verify an affirmative proposition about things, a fourth must be added, and so on.” In brief, he was arguing that one must not posit less than are necessary. In response, in *Quodlibet VII*, q. 1 (*Opera theologica* IX, 704, 17–19) Ockham casts his razor in corresponding new terms: “When a proposition is verified of things, if three or two things suffice for its truth, it is not necessary to posit a fourth,” etc.

Metaphysics and Theology as a Science

The deductive theologian, as explained above, had reason to pursue philosophy in the strongest possible way: he aimed at gaining certainty. Even if his subject matter could deliver only probable conclusions, he aimed at the highest type of probability. His greatest helper, then, was metaphysics. If he wanted to deduce further certain truths from a faith premise that was certain, such as an article of the Creed, then he needed either another certain faith premise or a metaphysical premise. If he wanted to demonstrate by reason some truth about God and his attributes, then he was actually doing metaphysics. Ockham, in his role as a deductive theologian, also was a metaphysician. This is evident in his defense of the univocal concept of being as providing the necessary common ground for arguments concerning the existence of God and the divine attributes. Ockham denies any univocal reality between God and creatures, but he admits a univocal concept that

is a common concept, not a proper one which would include the differences of “infinite” and “finite” that distinguish God from creatures. Often he is accused of nominalism, but certainly he is not a nominalist in the sense of Hobbes’ non-spiritual nominalism. Ockham denies that there are universal essences or realities, but he does admit that there are universal concepts in the mind, so he might justly be labeled a conceptualist. He is, nonetheless, not an idealistic conceptualist like Kant, where universality comes from the mind and the way it organizes. Ockham’s concepts have their source in the objects. Men are essentially alike, even though they do not have, according to Ockham, a further common human likeness in them beyond their actually being men. He might more accurately be called a realistic conceptualist.

The Absolute and Ordained Power of God

Among the attributes of God that Ockham discusses is divine omnipotence or the power of God. There is a traditional distinction regarding God’s power that Ockham inherits: God’s absolute power and God’s ordained power. He discusses this distinction at length in *Book I of the Sentences*, and particularly in the context of talking about grace. In the *Summa logicae* (*Opera philosophica* I, 777), he gives a brief helpful way of understanding God’s so-called “two powers.” “This proposition ‘God by his absolute power can accept [for eternal life] someone who does not have grace but not by his ordained power’ is ambiguous. One meaning is that God by one power, which is absolute and not ordained, can accept someone without grace, and through one other power, which is ordained and not absolute, cannot accept him, as if there were two powers in God and that through one of them he could do this and not through another. This way of understanding it is false. In another way, the original proposition is taken improperly as though it were substituted for this statement: ‘God can

accept someone who does not have [created] grace informing his soul, because doing so does not entail a contradiction, and yet God ordained that this would never take place’.” Here we see Ockham using his razor, we watch him decoding the original statement, and we thereby come to understand that there are not two competing powers in God.

Ockham’s Moral Theory

Within the context of natural morality, Ockham joins the many medievals who, following Aristotle, thought of ethics as being a practical science where man pursues the fulfillment of his nature that brings happiness. Motivation, however, also plays a major part in his moral philosophy. In his question *On the Connection of the Virtues*, William stresses that no one acts virtuously if he does not act with knowledge and freedom. The basic virtuous act is one where “the intellect dictates that a particular just work should be done at such a place and time for the sake of the intrinsic worth of the deed or for the sake of peace or some such thing, and the will elicits an act of willing such deeds in conformity with the dictates of the intellect” (*Opera theologica* VIII, 335). William judges that one would deserve more respect if beyond this basic expectation one were to do this act when it costs a price, e.g., death in honor for one’s country, which right reason would tell us we should be willing to pay. An even higher level of respect is due when one acts for no other motive than that right reason demands it. Taking into account theological motives, there can be even higher motives, e.g., doing something for the love of God. Motives are important for Ockham’s doctrine of morality, but they are not the only determinants of morality. Ockham’s theological considerations will also deal with further dimensions of the moral life – going beyond what human nature demands. This leads him into discussions of obedience in regard to the divine laws revealed in the Bible and theological

discussions of merit, which consider the conditions necessary for moral actions to be also meritorious actions, i.e., worthy of eternal beatitude.

Political Writings

William's political interests were primarily stimulated by Michael of Cesena, who, as head of the Franciscan order, was feuding in Avignon with Pope John XXII over the Franciscan view of poverty. Michael and his Franciscan followers believed that their vocation was to imitate their vision of the poverty of Christ and the apostles. They appealed to the bull *Exiit qui seminat* promulgated by Nicholas III in 1279. This bull set up the arrangement that the papacy held ownership of the goods that were not owned but simply used by the friars. In various bulls in the 1320s, John XXII rejected this arrangement and also declared it heretical to deny that Christ and the apostles had rights of ownership in regard to the things they used. Asked by Michael to examine the documents and to judge the legitimacy of John XXII's claims, William wrote the *Letter to the Friars Minor* in 1334, where he concluded that many of John's pronouncements were "heretical, erroneous, silly, ridiculous, fantastic, insane and defamatory" (*Letter*..., 3). In *The Work of Ninety Days*, written at the same time, William criticized in detail John's errors which he listed in the previous letter, and also challenged John's claim that Christ, both as divine and human, was universal king and lord of all things. In this work, Ockham provided the basic definitions and distinctions that he would unfurl later, in the *Dialogus*, as a full-blown treatise that would discuss the government of the church and lay political authority. His treatment of both types of government is extensive and shows that William in his theory concerning governments goes far beyond the immediacy of the political struggles between Pope John XXII and Ludwig of Bavaria. He basically defends the position that ecclesiastical and political societies should, except in prudently defined instances, operate independently of one another.

William of Sherwood

John L. Longeway

Department of Philosophy, University of Wisconsin, Kenosha, WI, USA

Abstract

William of Sherwood was an English logician of the thirteenth century, whose *Introduction to Logic*, covering the standard logical syllabus of the day, presented a version of supposition theory that, unlike that of Peter of Spain, made no ontological commitments unfriendly to nominalism. He also wrote discussions of syncategorematic words, insolubles, and obligations, which develop their teaching from the consideration of sophisms. His work quickly sank into obscurity after his death, but it marks the point at which the new elements of medieval logical thought coalesced into a coherent and stable whole made independent of metaphysical considerations.

William of Sherwood, born between 1200 and 1205 in Nottinghamshire, taught as a Master of Theology at Oxford from 1252, and died between 1266 and 1271. Only his logical works have survived. Though praised by Roger Bacon as a finer logician than Albert the Great, no doubt in part because he agreed with Bacon's own theory of supposition, William quickly sank into obscurity after his death. His work marks the point at which the new elements of medieval logical thought coalesced into a coherent and stable whole, a whole made independent of metaphysical considerations.

William's *Introduction to Logic* contains six chapters covering the standard logic syllabus of the day. The first corresponds to Aristotle's *On Interpretation*, concerning the structure of statements, logical opposition, immediate inferences, and modal terms. The second deals with the five predicables, genus, species, differentia, property, and accident, the topic of Porphyry's *Isagoge*. The third, on syllogism, answers to Aristotle's *Prior*

Analytics. The fourth, on “dialectical” reasoning, draws on Boethius’ *On Different Topics* (*De differentiis topicis*). It deals with the application of principles specific to no particular science, involving such terms as “part” and “cause.” The sixth, on fallacy, is developed from Aristotle’s *Sophistical Refutations*.

The fifth chapter discusses the “properties of terms,” signification, supposition, copulation, and appellation. This represents an entirely medieval development. In William’s version, the signification of a term, the presentation of its signified form to the understanding, is independent of its occurrence in any particular sentence. The meaning of the subject or predicate within the context of a categorical statement is its supposition there. A term “supposits a form” in a given context if its supposition depends on that form. But to know a term’s supposition we must also know what it supposits *for*, roughly, what it refers to. It is what is true of what its terms supposit for that makes a sentence true. For instance, if we were to say “an animal is walking,” the form of animal would be signified by the term “animal,” and the term would supposit the form, but the term would supposit *for* individual animals, since it would only be in virtue of an individual animal’s walking that “an animal is walking” is true.

The term “animal” may signify the the form of animal, but not supposit it. In “Animal is trisyllabic” it supposits itself, the term making the sentence true. If we say it does supposit the form it signifies, it may supposit for what it signifies as well, in three ways, in “animal is a genus,” “humanity is the noblest of creatures,” and “pepper is sold here and at Rome.” If it supposits what it signifies for what falls under what it signifies, this is formal, personal supposition, as in “an animal is walking.” Personal supposition may be confused, when a term supposits for more than one thing, as in “every animal perceives,” or for one (undetermined) thing, as in “an animal is running.” Confused personal supposition is mobile if one can apply the predicate truly to each item supposit for, as in “every animal perceives,” from which it follows that “*this* animal perceives,” or immobile (or merely confused) if one cannot, as in “every donkey is an animal,”

from which we cannot conclude that “every donkey is *this* animal.”

Copulation corresponds to supposition, but belongs to terms such as “white,” which signify accidents. William argues such terms mean only “of this sort,” “of every sort,” or “of some sort,” and signify only in conjunction with a substantive term. One cannot say that “of every sort perceives,” but only “animals of every sort perceive.” If one wants to say something about perceiving, say “perceiving is an accident,” then “perceiving” has supposition, not copulation.

This allows reference to real universals, but William himself assumes that a particular must enter into every actual state of affairs, so a sentence can only be made true by what is true of particulars. His discussion of genus suggests we read “animal is a genus” as “animal is predicable of several particulars differing in species in respect of their essence.” His theory of supposition differs from Peter of Spain’s realist theory in that it can be used within either a nominalist or realist context.

Appellation occurs when a term is taken to supposit only for things that actually exist at the present time.

The theory of supposition did much of the work done in modern logic by quantification theory. It is built around Aristotle’s account of the syllogism, but no artificial logical language was envisioned within which the syntax precisely mirrored the semantics. Logic was done in ordinary Latin, and in the quest to make Latin itself an ideal logical language logicians introduced artificial semantic rules to cover the necessary distinctions and allow exceptionless rules of validity within a Latin syntax. William, at the beginning of this development, is often satisfied simply to note an ambiguity and give an account of it in terms of the properties of terms.

In his *Treatise on Syncategorematic Words*, William considers words other than the subject and predicate terms that alter the supposition of “categorematic” terms. Such “syncategorematic” terms may have no signification of their own, and include “whole,” “all,” “but,” “only,” and others of this sort, as well as such terms as “begins” and “ceases.”

In his discussion, William often introduces “sophisms,” problem statements occurring in the course of a disputation. A set of background conditions is proposed, which must be granted as long as it is consistent, and then the sophism is proposed. The student must respond to it, and all further statements proposed by his opponent, by affirming it if it follows from what he has granted, denying it if it is inconsistent with what he has granted, and assigning it its truth value, or declaring it uncertain if that is unknown, if it is logically independent. The questioner aims to drive the respondent into contradiction, the respondent to avoid this. Sherwood’s smaller treatises, *Obligations*, *On the Assumption of Contraries*, and *Insolubles*, concern such sophisms.

“Insolubles” are self-referential paradoxes, such as “I am now uttering a falsehood.” This sentence cannot be true, for if it is, it is false, but it cannot be false either, since then it must be true. William rejects the suggestion that the one who utters such a sentence “says nothing,” for the statement is grammatical, and its meaning is clear enough so that we can argue from it. One might hold that the statement has to refer to some statement other than itself, because a term cannot supposit for a whole of which it is a part, so that the term “falsehood” in the statement must refer to some other sentence than the sentence it is in. But this rule rejects perfectly harmless sentences, such as “every name signifies some substance,” in which the term “name” surely must be taken to supposit for itself. William himself agrees that the term “falsehood” in the problem sentence cannot refer to the sentence it is in, but for another reason. He invokes the principle of charity, holding that the sentence should be read so that at least it *could* be true. The sentence is false because one is not uttering some other falsehood while uttering it.

The treatise on obligations (i.e., the obligations of the respondent in a logical disputation) deals with a variety of sophisms, among them paradoxes that depend on the influence of the pragmatic context on the meanings of or logical relations between the statements granted. For instance, it is assumed that you have never granted that God exists, but instead hold this to be uncertain. The questioner now asks you if God exists.

The proposition is logically unrelated to what has been granted already, so one must assign it its known truth value. Ordinarily no contradiction is created from following this rule, but here, if you grant that God exists, you are then asked if it is the case that you have never granted that God exists.

William of Ware

Jeffrey C. Witt

Department of Philosophy, Boston College,
Chestnut Hill, MA, USA

Abstract

William of Ware was a Franciscan theologian who flourished in the 1290s and into the first years of the fourteenth century. He is remembered primarily as a teacher of John Duns Scotus, and many of his positions on the nature of theology, the subject of metaphysics, ontology, and the will share striking resemblances to the more precise and more complete views ultimately found in Scotus. Moreover, William is also often engaged with the work of Henry of Ghent making him a figure of great importance as a mediating bridge in the well-known intellectual rivalry between Henry and Scotus.

From the town Ware in Hertfordshire near London, William of Ware (fl. 1290–1305) is thought to have flourished primarily in the 1290s. At a young age, he joined the Franciscan order and it is believed, but remains difficult to confirm, that he first read the *Sentences* in the Franciscan *Studium* in Oxford. He may also have lectured on the *Sentences* there, but he is, however, not listed as a *magister* at Oxford and therefore probably never began to teach there as a master of theology. Shortly thereafter, he is thought – but again it is hard to confirm – to have gone to Paris to teach. Throughout the

fourteenth century, William is remembered as the teacher of Scotus, and the inscription on his tomb reads “Magister Gulielmus Varro Praeceptor Scoti.” Despite the inscription, it is not yet clear where and when Scotus, as student, would have encountered William. William is referred to under several titles in scholastic literature, but he is most commonly called the *Doctor Fundatus*.

William's commentary on the *Sentences* is not a commentary in the strictest sense, treating every distinction thoroughly, but is instead a series of major questions occasioned by the text of Lombard. No complete edition currently exists, but several small selections of the text have been edited in various journals.

The work of William is of interest not only because of its inherent value and intense rigor, but also because he is situated within a pivotal moment of late-scholastic thought. He is frequently engaged with the work of his contemporary Henry of Ghent, and when he departs from the views of Henry he shows his value as an innovator, often putting forth positions new to the scholastic tradition. Moreover, William clearly exerts an influence over the thinking of John Duns Scotus, the extent of which is not yet fully known. In light of the amount of attention Scotus gives to the work of Henry of Ghent, the importance of William's mediating role cannot be underestimated. His work is also of preeminent value because of the time and attention he gives to surveying the thought of his immediate predecessors and contemporaries. He dialogues regularly with thinkers as important as Thomas Aquinas, Godfrey of Fontaines, Giles of Rome, and Richard of Mediavilla. He therefore is integral in the preservation, interpretation, and transmission of the scholastic thinking into the fourteenth century and beyond.

William's status as an innovator at a critical juncture is particularly evident in his position taken on the status of theology as a science. After surveying several opinions, William makes a distinction regarding theology that later wins the acceptance of Scotus. There can be theology proper (*theologia in se*) and theology from a human vantage point (*theologia quoad nos*). William maintains that *theologia in se*, from the perspective of God, angels, and the blessed, is indeed

a science. However, contrary to the opinion of Aquinas and Henry of Ghent, *theologia quoad nos* is not a science. William asserts that a science must proceed from principles that are known perfectly in themselves. And while *theologia quoad nos* does proceed from first principles, they are not known evidently, but are only believed. Thus, for the pilgrim, theology is not a science. William, however, is quick to point out that this is in no way due to some fault in the object of such a science. Rather, he explains that God is like the sun; in itself the sun is the most visible thing, but it cannot be looked at with human eyes. God in himself is the most knowable and most evident thing, but to the human eye he remains obscure and unclear on account of his own brilliant clarity.

Such a position further necessitates a strong distinction between the science of metaphysics and theology. William takes the position that while God is not excluded from the science of metaphysics, he is not the exclusive concern of metaphysics. Rather God is only considered in metaphysics inasmuch as he can be known from the natural light of reason. And under this light, God can only be considered as a being among other beings. Theology, on the other hand, considers God as its proper subject, but can do so only through the supernatural light of faith. William's exclusion of a strict definition of theology from the realm of natural reason presents real doubts about what can be known about God without the supernatural light of faith and anticipates restrictions about what metaphysics can ultimately tell us about God.

Despite his cautiousness, William continues to uphold many of the standard metaphysical positions, but at the same time he continues to add nuance and raise questions. For example, William asserts, with tradition, that though the proposition that God exists is not self-evident, it can still be demonstrated by natural reason. However, he claims that the argument from motion is the weakest argument because reason has not shown that God is the only thing that can be self-moved. He notes that nothing prevents the angels from being self-movers, and, owing to his position on the primacy of the will, William suggests that the will could also be self-moved. Consequently, the argument from motion does not show that there

can only be one unmoved mover, but opens up the possibility of several unmoved movers.

Concerning the attributes of God, William presents a position that is at once open to the possibilities of reason, but cautious about its reach. He affirms that we can indeed know something of the "what" of God from his effects. However, he makes a threefold distinction between knowing God through his essence, through his proper concept, and through the concept of another. It is only in this third and removed sense that we can know about God. Every simple perfection found in creatures is able to tell us something about God, not about his perfection simply, but of the modes of his perfection. Here William anticipates Scotus' insistence on our ability to know something about God from the univocal perfections common to both creatures and God.

William demonstrates at once both his willingness to put forward new opinions and his cautiousness with regard to natural reason perhaps nowhere more clearly than in the question regarding the oneness of God. In contrast to the established scholastic tradition of affirming that reason can indeed prove that God is one, William is one of the first scholastics to claim that natural reason is not in fact able to demonstrate such a claim. This position is subsequently adopted by many later scholastics, including William of Ockham, Adam Wodeham, Robert Holcot and Peter of Ailly. Even Scotus, who on this point does not accept his conclusion, alludes to and refutes William's position in his own treatment of the question (*Opus Oxoniense* I, dist. II, q. iii).

His contribution to ontology is also evident in the manner in which he distinguishes the divine attributes. Here, his importance for Scotus is unmistakable. William denies any real distinction between the attributes of God, but he also denies that any distinction between attributes is merely generated by an intellectual act, whether of humans, angels, or God. This is a different kind of distinction, one that has its foundation in the object itself, but is not, strictly speaking, "real." This peculiar type of distinction, while not explicitly named by William, is an evident precursor of the formal distinction made famous by Scotus.

William likewise holds, contra Aquinas, that there is no real distinction between being and essence, but nor is it merely a distinction of reason. The distinction of being and essence is similar to that of the distinction between being, truth, and goodness in creatures. It is found rather than produced, despite the fact that there are no “really” distinct composite parts.

The notion of an objective, but non-real distinction, is also important for William as he rejects the idea that matter is the principle of individuation. In contrast, he asserts that just as an essence has its own existence – that is not “really” distinguishable – so an individual essence has its own individuality through itself. Such ideas on individuality clearly foreshadow Scotus’ full theory of the ultimate formal distinction (the so-called *haecceity*) as the principle of individuation.

Finally, it would be remiss to ignore altogether William’s position on the will. He asserts the primacy of the will over the intellect, since, as he claims, the object of the will is nobler than the object of the intellect. William holds a position of high respect for the will, stating that the greatest nobility of the human being is in the freedom of the will. Consequently, he claims that nothing determines the will, neither the intellect, nor its object, nor even God. Here again we can see William’s formative influence upon the ultimate position of Scotus, who holds a strikingly similar view.

Abstract

The reception of the thought of John Wyclif in Prague in the late fourteenth- and early fifteenth-centuries is important both for understanding late medieval realism, and for appreciating the role Wyclif played in the genesis of the Hussite movement. Stanislaus of Znojmo and Stepan Paleč, along with Jerome of Prague and Jakoubek of Stribro, were profoundly influenced by Wyclif's realism, as was Jan Hus. In addition to the Oxford Realist school, these thinkers are the most important late medieval thinkers to have engaged with Wyclif's philosophy as a viable alternative to Ockhamism and the Aristotelian syntheses of Aquinas and Scotus.

Prague experienced a relatively brief but historically important period in which John Wyclif's thought captured the attention of a large number of Bohemian intellectuals. Charles University had been founded by Charles IV in 1348 in Prague, the first university in Central Europe. The School of Theology was divided into four groups of masters and students: Bavarians, Saxons, Poles, and Bohemians. The former three groups, "the Germans," dominated the curriculum, so the Bohemian group, including scholars from Bohemia, Moravia, and Hungary, sent advanced students to the University of Paris for doctoral study, to expand the Bohemian theological faculty. While at Paris, several Bohemian students developed a strong interest in the Latin Neoplatonism of the twelfth century,

particularly the thought of **William of Conches**. The philosophical realism he described appealed to the Bohemians' interest to present a response to the Ockhamism, Thomism, and Scotism of "the Germans," so copies of William's works, along with the Latin *Timaeus* and Calcidius's commentary, came to Prague in the 1360s.

Among these Bohemian students were Adalbert of Ranconis and Matthias of Janov, who became leaders of this realist school among the Bohemian students in Prague. Matthias composed a landmark critique of the ecclesiastical *status quo* in his *Regulae Veteri et Novi Testamenti* (ca. 1390), grounded thoroughly in a conception of the relation of God to creation evocative of Latin Neoplatonism. Matthias ran afoul of the church in Prague and in 1389 was forced to retract some of his ideas. Adalbert had also studied in Oxford in the 1360s and appears to have met **Richard Fitzralph**. He brought Fitzralph's *De Pauperie Salvatoris* back to Prague in the 1370s. Among the characteristic positions the Bohemians adopted at this point included a hostility toward scholastic thought after the period of **Thomas Aquinas** and **Bonaventure**, a conviction that Scripture was the primary source and authority for all human reasoning, and a preference for the thought of **Augustine**, **Chrysostom**, **Bernard**, and **Anselm**.

By the mid-1380s, Bohemian scholars like Nicholas Faulfisch and Jerome of Prague began to bring John Wyclif's writings to Prague. The appeal was immediate: Wyclif's philosophical realism evoked the Latin Neoplatonism of the School of Chartres but was presented in a semantic-logical language that could engage in dialogue with *Moderni* thinkers. Further, many of his theological criticisms of the church were consonant with the thought of Matthias of Janov, including apocalypticism, frustration with the papacy, and the abuse of ecclesiastical office. Wyclif's thought quickly became identified with the nascent Bohemian theological movement.

It is important to recognize that only a portion of Wyclif's thought took hold in Prague. Wyclif's

atomist physics, his monarchist *dominium* theory, his antifraternal polemics, and the greater part of his logical and hermeneutical thought were copied there but appear to have attracted little attention. His revised *Sentences* commentary, compiled into 13 interrelated treatises entitled *Summa Theologie*, initially attracted the most attention. Of these, two treatises enjoyed great popularity, *De Ideis* and *De Universalibus*. They feature arguments connecting the divine ideas to real universals in a “great chain of being” evocative of the twelfth-century conception and were the subject of many *disputationes*, *quodlibeta*, and *quaestiones* in the 1390s and 1400s. In 197N Frantisek šmahel compiled a catalogue of extant literature from this period, from extended commentaries on Wyclif’s treatises to brief *quaestiones*, containing over 200 separate entries.

The three significant figures for Wyclif’s reception in Prague are Stanislaus of Znojmo (d. 1414), Stephan Paleč (1367–1423), and Jerome of Prague (1378–1416). Later, Stanislaus and Paleč would renounce Wyclif in 1409, while Jerome renounced Wyclif under duress at Constance in 1415 and then recanted his renunciation and was executed in 1416. Of the three, Stanislaus has left the most extensive and philosophically interesting analysis of Wyclif’s metaphysics, with a long commentary on *De Universalibus* (1400), a later, shorter commentary on the same topic (1408), and a treatise on the relation of propositional truth values to ontological reality, *De Vero et Falso* (1404). In the first, Stanislaus pursues Wyclif’s reasoning about part-whole relations, the relation of generic and special characteristics within substantial essence, and reframes Wyclif’s discussion of identity and difference by replacing identity with composition. The complexity of this treatise led the nineteenth-century editors of the Wyclif Society to assume that the commentary was actually Wyclif’s *De Universalibus*. *De Vero et Falso* tests the “propositional realism” Wyclif had developed in his logical works, in which individual states of affairs are ontologically isomorphic with the subject-predicate structure of our descriptions of them. Stanislaus teases out tangled questions regarding

the relation of the divine ideas to true statements, ascribing modal operators to true and false statements, and problems about privative or negative propositions’ relations to reality. Stanislaus explores philosophical problems arising from Wyclif’s discussion of mental acts and states, mental and spiritual change over time, and their relation to the nature of morality in his *De Felicitate*, dating from the same decade. Stanislaus’s works are perhaps the fullest philosophical exploration of Wyclif’s thought until contemporary scholars began to analyze it in the late twentieth century.

Stephan Paleč later gained fame for his zealous efforts to oppose Wycliffism, and the bulk of his extant writings fall into this grouping. His earlier works include several *Quaestiones* on the nature of universals, and on the causal power of the divine ideas, and logical treatises in the English logical tradition of **William Heytesbury**, **Richard Billingham**, and other notable figures from Oxford. These include *De Suppositionibus*, *Notabilia confusionum terminorum*, *Notabilia consequentiarum*, and *Notabilia in Richardi Billinghami Tractatum de propositionibus*. Paleč has also been credited with a running summary of the first nine chapters of Wyclif’s *De Universalibus*, but his authorship has recently come into serious question. Jerome of Prague was an active proponent of Wyclif’s philosophy during this period but wrote considerably less than Stanislaus or Paleč. His extant *quaestiones* address many of the same issues that characterize the disputations from the period at Prague. Among these are questions on the relation of general truth to specific true propositions, on the convertibility of terms, on the form of universals, and on the relation of universals to the harmony of the perceptible world.

By 1408, Gregory XII had become alarmed at the discussion of Wyclif’s remanentist Eucharistic theology in Prague. Wyclif had argued that transubstantiation was physically and logically impossible and that the bread and wine remained after consecration. Stanislaus and his students did not fully embrace Wyclif’s position but advocated for a refined remanentism that the Archbishop of

Prague was willing to tolerate. Stanislaus and Palec were called to Rome to explain themselves, and 45 articles condemning Wycliffism were published in Prague in May 1408. When Stanislaus and Palec returned, having abjured their Wycliffism, the university had dramatically changed. The emperor had declared that the Czech students' voice was equal to the combined voices of the Saxons, Poles, and Bavarians, and a large number of the "German nation" left the university for Leipzig and Vienna. Of the 45 articles, 3 were directly related to Wyclif's philosophy, while the other 42 were against his theological ideas. A group of six young theologians staged a public defense of Wyclif's thought in 1410, with Hus defending his *De Trinitate*, Jakoubek of Stribro for *De Mandatis Divinis*, Zdislav of Zvřetice for *De Universalibus*, Jan of Jičín for *De Materia et Forma*, and in what was certainly the most comical defense, Simon of Tišnow for *De Probacione Propositionis*, in which Simon engaged in a dialogue with the logic text regarding the dangers a work on propositional semantics posed to Catholic orthodoxy.

Academic drollery came to an end shortly thereafter, when Jan Hus expanded his preaching to include a ringing condemnation of the church based on Wyclif's *De Ecclesia*. The atmosphere for philosophical analysis of Wyclif's thought had vanished, and his ideas were subsumed into the Bohemian reform movement Hus was leading. Wyclif's name and some of his ideas continued to be associated with Hussitism after 1412, but after Hus's death, Wyclif's influence dwindled; with the onset of hostilities between the Hussites and the Church and the Emperor, Wyclif's name was used as a blanket reference for the reform movement, but only in the most general sense.

Yaḥyā ibn ‘Adī

Cecilia Martini Bonadeo

Dipartimento di Scienze Storiche, Geografiche e dell’Antichità, Università degli Studi di Padova, Padova, Italy

Dipartimento di Filosofia, Università di Padova, Padova, Italy

In the tenth century Baghdad, during the decay of the ‘Abbāsid Caliphate and in the following Buyid age, the translators were still at work translating into Arabic the last Syriac versions of Greek philosophical works, and revising some of the already available Arabic versions. In addition, an increasingly autonomous and original philosophical discussion was moving its first steps. In this context, we meet Yaḥyā ibn ‘Adī.

Abū Zakariyyā Yaḥyā ibn ‘Adī ibn Ḥamīd ibn Zakariyyā al-Takrītī al-Manṭiqī (893–974) is well known through the works of the ancient Arab biographers. Those who mention Yaḥyā b. ‘Adī are al-Mas‘ūdī (d. c. 956) in his *Kitāb al-Tanbīh wa-l-Ishrāf*, Ibn al-Nadīm (990) in the *Kitāb al-Fihrist*, Abū Ḥayyān al-Tawḥīdī (d. 1023?) in the *Muqābasāt* and in the *Kitāb al-Imtā’ wa-l-mu‘ānasa*, al-Bayhaqī (d. c. 1169) in his *Tatimmat ṣiḥwān al-ḥikma*, Ibn al-Qifṭī (d. 1248) in the *Ta’rīkh al-ḥukamā’*, Ibn Abī Uṣaybi’a (d. 1270) in the *‘Uyūn al-anbā’ fī ṭabaqāt al-a‘ibbā’*, Ibn al-‘Ibrī, or Barhebraeus (d. 1286), in the *Ta’rīkh*

mukhtaṣar al-duwal, the Christian Abū l-Barakāt b. Kabar (d. 1324) in the *Miṣbāḥ al-ḥidma wa-īḍāḥ al-ḥidma*, Ibn Faḍlallāh al-‘Umārī (d. 1349) in his *Masālik al-abṣār*, and Ḥājji Ḥalīfa (d. 1657) in the *Kashf al-ẓunūn ‘an asāmī l-kutub wa-l-funūn*.

Yaḥyā ibn ‘Adī belonged to a Jacobite Christian family of Takrīt, an old metropolis of the East, situated on the right bank of the Tigris to the north of Samarra, between Mosul and Baghdad. Later on he moved to Baghdad aiming at studying logic, philosophy, and theology: from Ibn al-Nadīm – who was in close contact with him – and from Ibn al-Qifṭī, we know that in Baghdad Yaḥyā b. ‘Adī had as his teacher the Nestorian Abū Bishr Mattā ibn Yūnus and then Abū Naṣr al-Fārābī. Al-Bayhaqī ascribed to Yaḥyā b. ‘Adī a compendium of the whole corpus of al-Fārābī’s works. Probably he also got in touch, for a short time, with Muḥammad ibn Zakariyyā al-Rāzī: al-Mas‘ūdī reports that Yaḥyā b. ‘Adī’s thought was rooted in al-Rāzī’s metaphysical theory based on the doctrine of the “Pythagoreans” about first philosophy.

He seems to have worked as a professional copyist and bookseller, a job he inherited from his father; in addition, he was a collector of manuscripts. Ibn al-Nadīm himself tells us that he read many books in the handwriting of Yaḥyā b. ‘Adī, and that he got acquainted with many texts in the catalogue of his books, written by his own hand.

He became after Abū Bishr Mattā ibn Yūnus and Abū Naṣr al-Fārābī the *ra'is* (the chief) and the *ustādh* (the teacher) of the *majlis* in Baghdad. This *majlis* was a sort of informal circle in which the participants were motivated by a shared interest in the sciences of the Ancients. The school consisted of a teacher, his home, books, colleagues, pupils, and occasional visitors. On special occasions, large assemblies were convened for discussions. The teacher often dictated texts, usually adding his own comments. In discussion sessions, a question was initially proposed and then theses and antitheses stated in turn (Kraemer 1986).

According to al-Tawḥīdī, in this *majlis* the members were of different religious affiliation: the predominant Christians – Abū 'Alī 'Īsā ibn Ishāq ibn Zur'a (d. 1008), Ibn Suwār ibn al-Khammār (d. 1017), Ibn al-Samḥ (d. 1027), and the Muslims – Abū Sulaymān al-Sijistānī (d. 985), and Abū Ḥayyān al-Tawḥīdī himself (d. 1023).

Following the teaching of Abū Bishr Mattā ibn Yūnus and Abū Naṣr al-Fārābī, the members of the *majlis* were involved in copying and translating ancient philosophical and scientific texts as well as in editing them, as we see testified by the MSS Paris, Bibliothèque Nationale, ar. 2346 and Leiden, Universiteitsbibliotheek, or. 583, containing respectively Ibn Suwār's edition of the *Organon* and Ibn al-Samḥ's edition of the *Physics*. They were also involved in philosophical speculation about the problem of the relationship between philosophy and religious doctrine. This relationship in the thought of Yaḥyā b. 'Adī and more in general in his school was the object of a debate between G. Graf and A. Périer. In the opinion of Graf, Yaḥyā b. 'Adī conceived of philosophy as the *ancilla theologiae*; on the contrary, Périer maintains that also in his theological works Yaḥyā b. 'Adī was first and foremost a philosopher, and only secondarily a *defensor fidei* in favor of the Jacobite Church. Following the teaching of al-Fārābī, Yaḥyā b. 'Adī considered the theological notions as symbols of philosophical concepts (Périer 1920). In any case, Yaḥyā b. 'Adī

was a prime order apologist of the Christian dogma: he wrote in favor of the monophysite doctrine of the incarnation of Christ, presented a strong critique of Nestorianism, and was a fine exegete of the Scripture.

Ibn Abī Uṣaybi'a tells us that Yaḥyā b. 'Adī had an excellent knowledge of the technique of translation, and translated from Syriac into Arabic. He is credited with the following translations of Aristotelian and related works: the Arabic version of Ishāq b. Ḥunayn's Syriac translation of the *Topics*, together with the commentary of Alexander of Aphrodisias on books I and V–VIII and Ammonius' commentary on books I–IV; the Arabic version of the *Sophistici elenchi* from the Syriac translation of Theophylus of Edessa; the version of a Syriac translation of the *Physics*, book II, together with the commentary of Alexander of Aphrodisias; the version of Alexander's commentary on the *Meteorology*, and finally the versions of books *Lambda* and *My* of Aristotle's *Metaphysics*. According to Ibn al-Nadīm, Yaḥyā b. 'Adī translated book *Mi* of Aristotle's treatise on first philosophy, and Averroes quotes in his *Tafsīr* the translation of book *Lambda* by Yaḥyā b. 'Adī (1070a2–7).

If we give a look at the knowledge of the Aristotelian philosophy in Yaḥyā b. 'Adī's school and at the specific role played by Yaḥyā b. 'Adī in promoting it, the overall picture is impressive. Aristotle's *Organon*, which incorporated Porphyry's *Eisagoge*, was well known. From the *Fihrist* we learn that Abū Sulaymān al-Sijistānī al-Manṭiqī, Yaḥyā b. 'Adī's eminent pupil, had asked him to translate the *Categories* and the commentary of Alexander on them. From the Paris MS of the *Organon* mentioned above, we know that Ibn Suwār made use of Yaḥyā b. 'Adī's copy of Ishāq b. Ḥunayn's translation, and Yaḥyā b. 'Adī himself composed a commentary on the *Categories*, based in part on Simplicius' one (quoted by Ibn Suwār in his critical notes). Yaḥyā b. 'Adī also made use of the commentary of his teacher Abū Bishr Mattā ibn Yūnus on the *Prior Analytics*, as appears from the notes included in the Paris MS. According to a colophon

of the Arabic translation of the *Posterior Analytics*, Ibn Suwār used for his edition the copies of the Arabic versions made by Yahyā b. ‘Adī and Abū ‘Alī ibn Zur‘a. Yahyā b. ‘Adī wrote also a commentary of his own on the *Topics*. He probably wrote a commentary on the *Sophistici elenchi*, and finally he revised the version of the *Poetics* by Abū Bishr Mattā ibn Yūnus.

Yahyā b. ‘Adī revised an earlier translation of the *Physics*, book I. Ibn al-Nadīm in the *Fihrist* says that he translated or revised the Arabic translation of Themistius’ commentary on *De caelo et mundo*. He also corrected the Arabic translation of Olympiodorus’ commentary on *De generatione et corruptione* made by Abū Bishr Mattā ibn Yūnus. Al-Qifṭī notes that Yahyā b. ‘Adī wrote a commentary on *Alpha elatton* of Aristotle’s *Metaphysics* in Ishāq b. Ḥunayn’s translation: this commentary is extant and is known as the *Tafsīr li-l-maqāla l-ūla min kitāb Aristūṭālīs al-mawsūm bi-Māṭāfūsīqā ay fī Mā ba’d al-ṭabī‘a wa-hiya l-mawsūma bi-Alif al-ṣuġrā*.

Yahyā b. ‘Adī did not limit his interests only to the Aristotelian philosophy: he is credited with the Arabic translations of Plato’s *Laws* and *Timaeus* and wrote many other works on mathematics and physics – especially on the critique of atomism, on the infinite magnitudes, and on the theory of motion – on ethics and on *kalām*. But we get from the accounts of Yahyā b. ‘Adī’s activity given by the biographers the impression that he was first of all a commentator and a translator of Aristotle, sharing in his editing and commenting the texts of the ancient Greek philosophers the same critical attitude of the circle of Ḥunayn b. Ishāq, although he did not have any direct access to the Greek sources (Platti 1983).
