The other problem he has to solve is linked to the definition of beatific vision as intuitive knowledge. According to Scotus, intuitive knowledge related to the existing thing as existing involves a direct contact of the faculty with the object. This made it incompatible with mediating species, which came into play only in the context of abstractive knowledge (Tachau 1988: 71). However, arguing with Ockham against Scotus, Brammart maintains that the difference between intuitive and abstractive cognition is not determined by the presence or absence of the object nor by the presence or absence of the mediating species. Moreover, he redefines intuitive knowledge to fit his model of mediated knowledge: following Francis of Marchia, who also defends the theory that beatific knowledge is mediated by species (Duba 2003/2004: 140), Brammart claims that a species can relate to an existing thing as existing, just like intuitive knowledge does, and it can represent the object without mediation, in its particular state and circumstances.

For Brammart, like for Marchia, the species is the result of a direct contact between the faculty and the object of knowledge, just like the intuitive knowledge is for Scotus. The difference is that the species is a representation or a sign, not an act of knowledge, nor the result of an act of knowledge. However, for Brammart, the species is also the content of the cognitive act it generates. He insists that the knowledge generated from the memory species is simple knowledge and cannot be preceded by any other cognition. As such, the content of the actual knowledge generated from the

species is the first cognitive content brought forth by the contact between the faculty and the object, as opposed to a mental representation generated from another mental representation. This means that the memory species from which it is generated should not be understood in any way as a kind of knowledge. Brammart needs to make these adjustments to the model of mediated knowledge in order to reduce the distance between the extramental object and the act of knowledge, while in the same time remaining within a model of mediated knowledge.

Scotus accepts that the memory species can be considered a form of knowledge – not knowledge in the proper sense, but “habitual knowledge,” because it contains virtually all the knowledge about the object it represents. He argues that the actual knowledge, which he also calls “mental word,” is formally the same mental content as the species in the memory from which it is generated (Scotus 1963: 241, ll. 9–17). Scotus is relying on Augustine’s famous psychological model from *On the Trinity*, Book XV, where he talks about the “hidden” knowledge in the memory and the word generated from it as being the same content. Augustine develops this model of the human mind as an analogy for explaining intratrinitarian relations: the Son as the word of God has to be the same essence as the Father, the only difference being that the Son is generated by the Father and from the Father’s knowledge, which is identical with his essence (Friedman 2013: 29–31). The idea of the memory content as knowledge (*scientia*) – as Augustine calls it – even if it is accepted by Scotus, is rejected by Brammart; still, he follows Scotus in arguing that the memory species and the cognitive act are one and the same mental content. This allows him to accept mediating species and in the same time to avoid a view of knowledge as a representation generated from another representation, a model that would deepen the gap between cognition and its object.

Even if he can argue that the intuitive knowledge of the divine essence is not incompatible with mediating species, Brammart, like Marchia, also needs to explain how it is possible for the infinite divine essence to be represented by

a limited created species. His solution to this difficulty comes from Scotus who says that angels have a natural knowledge of God which is mediated by species. However, this natural knowledge is distinct from the beatific knowledge, which is intuitive, and, according to his doctrine, incompatible with species. Brammart takes the arguments that Scotus develops to explain the natural knowledge of God by angels and uses them to justify mediation in beatific vision: he argues that it is possible for the divine essence to be represented by a limited species, because a relation of representation doesn't require an ontological likeness, and the representation needs to be proportionate to the faculty, not to the object.

Although a species is produced by an extramental object, it is a distinct entity both from the extramental thing it represents and from the faculty it informs. Moreover, once it is generated, its existence and ability to function as a sign are no longer dependent on the experience or object that caused it. No ontological conformity is necessary between a species and the things it represents: a species can represent more than it is (i.e., entities whose ontological perfection exceeds that of the species itself) and qualities it doesn't participate in.

The Object of Knowledge and Belief

The object of knowledge and belief was a topic commonly discussed in the Prologue of Sentences commentaries and the subject of one of the most fervent fourteenth-century debates. The candidates for this role, as summarized at the beginning of the discussion by Brammart and many others, were three: the sign, be it complex (a sentence) or simple (a term), the thing signified by a non-complex sign, and the significate of the sentences, also referred to as *complexe significabile*.

Brammart develops his theory on this topic in his first question of his Prologue, and he does it in two steps. First, he argues, against Ockham, that the significate of the sentence is a better choice as the object of knowledge than the sentence or sign. Second, he takes into discussion some of the weaker points of the *complexe*

significabile theories and insists on the importance of the extramental things signified by the terms of the sentence as truth makers and objects of knowledge. He proves to be familiar with the ideas of Walter Chatton, Adam Wodeham, Gregory of Rimini, Hugolino of Orvieto, John Mirecourt, Denis de Montina, Richard Brinkley, Richard Ferrybridge, Nicholas Aston, John Buridan. Out of these, only Rimini and Aston are referred to by name. Rimini and Hugolino are quoted mostly in the second part, where Brammart argues against the *complexe significabile* theory and where their arguments are either being rejected or taken out of context and used support Brammart's own position. Aston is referred to by name only once, in a context where Brammart deviates from his position, but in spite of that he is Brammart's strongest source. In fact, the ones that play the most important part in shaping Brammart's position on this topic are, apart from John Buridan, the English theologians and logicians (Aston, Ferrybridge, Brinkley).

In the first part, Brammart rejects the sentence and the extramental thing as objects of knowledge, but he accepts the sentence as a truth-bearer. He treats any cognitive act, simple or complex, as a sign which can be said to be true or false. The criterion of truth or falsity is the correspondence between what the sign conveys and the way in which it signifies (*modus significandi*) on the one hand and the thing or state of the things (*habitus/habitus rerum*) on the other. This is easy to explain in the case of a categorical affirmative proposition, which can be said to be true if "howsoever it signifies, so it is the case." The more difficult task is showing how this correspondence criterion of truth applies to propositions that refer to the past or the future and, even more difficult, how it applies to negative propositions.

Other fourteenth-century philosophers, like Peter of Ailly and John Buridan, also accept a correspondence theory of truth, but they deal with the difficulties posed by past, future, modal, and negative propositions in different ways (Spade 2002: 182–183). The question they need to answer is the following: What things or states of things in reality correspond to the significate of the aforementioned sentences? Buridan finds

the formulation of the correspondence criterion as “howsoever the sentence signifies, so is the case” (*qualitercumque propositio significat, ita est*) to be an insufficient explanation that does not cover the cases of past or future sentences and prefers to give a more elaborated set of rules of truth and falsity in terms of his supposition theory (Nuchelmans 1973: 246–247). Brinkley also criticizes this “common description” of the truth of sentences, as he finds it to be incorrect for all sentences except for the true, present, non-modal affirmatives. For all the others, he argues that there should be a specific description of what makes each of them true (Cesalli 2007: 239).

Brammart explains that the correspondence criterion also extends to past, future, and modal propositions, but it should not be interpreted in the sense of a presently existing thing or a state of things corresponding to a past or future proposition. What makes these propositions true is their correspondence with past or future things or events.

However, it is the case of negative propositions that stretch the correspondence theory of truth to its limits. The significate of a negative proposition corresponds to what we might call a negative state of things (*qualitercumque significat non esse, ita non est*). However, there is still a question of whether a negative state of things can be accepted as a valid referent for a sign or an act of knowledge, since it is not something that can be thought of as existing, not even to the degree to which a past or future proposition has as a referent past or future reality.

Brammart accepts that the object of knowledge and assent, in the case of a negative proposition, is “nothing,” in a sense similar to that in which Rimini admits that the total significate of a proposition is “not something” when “something” is understood to be an existing thing or entity (Rimini 1981: 9, ll. 20–23). However, his source for these developments is not Rimini, but Nicholas Aston. As we have seen before, Brammart believes, like Rimini, Ockham, and Auriol, that neither abstractive nor intuitive knowledge requires the object to be present or to exist. He argues that it is possible to have a valid act of knowledge, be it simple or complex, in

regard to something that does not exist, since the existence of a mental act or sign does not depend on a relation with an extramental existing entity. Just like before, in the discussion on beatific vision, Brammart relies on the idea that a relation of representation doesn’t require an ontological likeness or connection between the sign and the object.

In the second part of the discussion, Brammart considers the perspective of some of the theologians who criticized the idea of the object of knowledge understood as *complexe significabile* and presents the advantages of accepting the extramental thing as the object of knowledge. He discusses some situations in which the significate of the sentence as a whole can be identified with the individual entities signified by the terms of the sentence: the fact that God exists is signified both by the term “God” and by the sentence “God is,” and the same goes for any other sentence that simply states the existence of something. A statement like “God is God” (A is A) is another case in which the sentence as a whole doesn’t signify more than its categorematic terms. Brammart is arguing, against Rimini, that as long as the existence of an extra-mental thing is sufficient to make a proposition true or false, there is no point in postulating the existence of *complexe significabilia* as something distinct from the proposition or from the things signified by its categorematic terms. For a sentence like “Deus est Deus” to be true, the only thing required is the existence of God.

His arguments against the *complexe significabile* theory rely on an misinterpretation of Rimini’s doctrine, common among the Augustinian’s opponents, according to which *complexe significabilia* are to be understood as a kind of propositionally-structured extra-mental entities that act as referents and truth-makers in relation to sentences. Among the problems that arise from this interpretation are the questionable ontological status of such entities, especially in the case of past, future and negative propositions, and the consequence that they are co-eternal with God: if there is a presently existing state of affairs, a truth, an “it is so” (*ita est*) corresponding to the proposition “The Antichrist will be” (i.e. If

the Antichrist will be, it is true that the Antichrist will be), then such a truth exists from eternity, because this proposition would have been true even before creation, if it had been formed; also, since every entity and every truth that exists is a creation of God, where do these eternal truths fit in, since some of them arguably existed before God created anything? Apart from these, there are also the problems pointed out in the first part in regard to negative, past and future propositions, the significate of which cannot be identified with a presently existing entity or state of affairs.

Brammart's own answer to problem of the object of knowledge and faith is an ontologically realist position the development of which is influenced by Aston, Buridan and Ferrybridge. In the case of a true affirmative categorical proposition, he states, the significate and object of knowledge, which is also the referent and truth-maker, it is the extra-mental entity signified by the subject-term of the proposition. But Brammart also accept as a possible object of knowledge the state of the things (*rerum habitudo*), or, as his example suggest, "a thing in a certain state" (*res taliter se habens*). In a proposition like "Socrates sins", the significate is identical with Socrates, or with "Socrates sinning" (*Socrates peccans*), if the proposition is true. What he refers to as "a thing in a certain state" (*res taliter se habens*) is still centered around an individual existing entity, but it also allows for some degree of complexity. The advantage of this perspective, Brammart points out, is that it preserves the identity of the object of faith, at least in the articles that have God or Christ as a subject, which can be said to always have a presently existing entity corresponding to them in the extra-mental world, regardless of the tense of the sentences: a proposition referring to the past resurrection of Christ still has Christ, an eternally and therefore always presently existing entity, as a subject, and therefore as a referent and object of faith. In the case of all the other past, future and modal propositions, the object of faith can be said to be "nothing," in the sense discussed in the first part (i.e. not a presently existing entity). By the end, Brammart finds a way to combine a realist perspective that satisfies the Christian requirement for the object of faith to be the same

for all men and his preference for a theory of knowledge that allows a higher degree of independence of the intramental world of signs in relation to the extramental reality.

Johannes de Mirecuria

Madalina-Gabriela Pantea

The Institute of History, Romanian Academy,
Cluj-Napoca, Romania

Abstract

John of Mirecourt was born in the first part of the fourteenth century in a small region (Mirecourt) of Lorraine. He accomplished his formation in theology at Saint Bernard's College in Paris, where he was a colleague with the Augustinian Alfonsus Vargas Toletanus and the Carmelite Paul of Perugia. His only extant

work is the commentary on the *Sentences*, on which he lectured in the academic years 1344–1345. In 1347, a number of propositions extracted from his commentary were condemned by the Florentine Robert de Bardis, the then chancellor at University of Paris. After 1347 his trace was lost and the date of his death is not known with certainty.

His name can be found in different forms as follows: Iohannes de Mercuria, Iohannis de Miricuria, Petrus de Hercuria, Monachus Cisterciensis, Monachus Albus, Monachus, Johannes Murchort, Giovanni de Mirecuria, Jean d'Otrecourt, Jean de Méricour, Jean de Mirecourt, and John of Mirecourt.

John of Mirecourt was born between 1310 and 1315 and he probably died in 1348. Since a witness about the year of his birth cannot be found, the researchers had different opinions about it. Franzinelli suggested 1310 as the year of his birth (Franzinelli 1958, p. 319), and Tessier concluded in favor of the year 1315. Perhaps the year 1315 is the year of John's birth, since Tessier based his calculation following the *curricula* from the Faculty of Theology. By the time students lectured on their *Sentences* commentaries, they were around 30 years old (Tessier 1966, p. 7; Pantea 2017).

He originates from the small region Mirecourt of Lorraine (lat. Lotharingia), northeastern France, and he was a member of the Cistercian order. This information is certified by the manuscripts which contain his commentary on the *Sentences* and by the documents attesting his condemnation. For example, the manuscript Firenze, Biblioteca Laurenziana Acquisti e Doni, ms. 347 contains in the *explicit*: "Here ends the meaning of the articles from the monk that is Brother Murchort, bachelor formed in sacred Theology, from the Lorraine nation, of the Order of Saint Bernard. Amen."

John was a student at Saint Bernard's College in Paris, where he pursued his studies in the second quarter of the fourteenth century, and there his elder colleague was John of Mortemer (Tessier 1966, p. 7; Parodi 1977, 1978, p. 300).

His only major work is the commentary on the *Sentences*, on which he lectured in the academic years 1344–1345. Stegmüller identifies two variants in the Cistercian's commentary (*recensio prior et longior, authentica*) (Stegmüller 1947, pp. 227–229). Courtenay questions the authenticity of John's *Sentences* (Courtenay 1972, p. 242). This hypothesis cannot be sustainable, yet, first of all, an integral edition based on a complete collation of all the manuscript does not exist, and if John is reading his *Sentences* in the academic years 1344–1345 and is condemned in the year 1347, he probably had no time to write another version of his *lecture*. So, for now it has to be assumed that both variants were written by John during his time at Saint Bernard's College.

The text comprises four books and is divided as follows: the first book has 44 questions, the second book 23 questions, the third book 12 questions, and the fourth book 2 questions (Tessier 1966, pp. 15–21). Each question is divided into articles, and all articles have conclusions (Courtenay 1972, p. 243; Calma 2012, p. 480).

The copies of his commentary can be found in approximately 20 copies. His texts survived in manuscripts spread around Europe, and this fact showcases the reach of his thought on the continent in the fourteenth and fifteenth centuries. Fortunately, ten of his surviving manuscripts contain his *Principia*. Among his *socii*, with whom John was disputing in his *Principia*, we can identify the Benedictine John Normannus, the only one he quotes during the whole principal debate.

His condemned propositions with the introductory statement of the Florentine Robert de Bardis, who was the then chanceller at University of Paris, can be found in approximately sixth manuscripts. Two manuscripts have been identified until now which do not contain the introductory statement of Robert de Bardis but only the condemned propositions. The introductory statement of Robert de Bardis is edited (Courtenay 1986, p. 191; Pantea 2017).

The year 1347 is for certain the moment when a number of propositions extracted from John's commentary were condemned. There was a misunderstanding about the time of his condemnation, and the year 1346 was suggested for it

(Birkenmajer 1922, p. 110). This confusion was made because in 1346, Nicholas of Autrecourt's commentary on the *Sentences* was condemned, and throughout the centuries, their names were linked (Pantea 2017). As a result of this, we can find their names compressed in the formula "Jean d'Otrecourt." The *Chartularium Universitatis Parisiensis* is the proper source in support of the affirmation that 1347 was actually the year of John's condemnation. Here is the mention in the cartulary: "The articles of John of Mirecourt, bachelor in Theology, from the Cistercian Order, and of others from Paris, condemned by 43 Masters in Theology as being erroneous, and which were collected in this short form by the venerable Master Hugolino, from the Augustinian Order, famous doctor in sacred Theology." The document is signed in 1347 (CUP t. II 1891, n. 1147, 610).

Initially, a number of 63 propositions were put under examination. After this, John wrote two defenses called *Apologia*: the first one was named *excusatio* and is addressed to Pastor de Serrescuderio, archbishop of Embrun, and the second one was named *declaratio* and has no recipient. Both of the *Apologies* were edited at the beginning of the last century by Birkenmajer and Stegmüller (Birkenmajer 1922; Stegmüller 1933). Their studies on John's *Apologies* were a starting point to bring attention to John's thought, to which Michalski already gave a valuable contribution (Michalsky 1921).

Edited text: The edition of the first book of his commentary was initiated by Eugenio Randi, and Masimo Parodi took care of Randi's edition, which can be found online: <http://filosofia.dipafilo.unimi.it/~mparodi/mirecourt/>. This edition also contains a part of his *Principia*. The questions 2 and 3 from Book 1 were edited by Anna Franzinelli in 1958. Massimo Parodi edited the questions 13, 14, 15, and 16 in 1977, 1978; the next three books and his *Principia* are under preparation.

A critical edition of John's condemned propositions as they can be found in their original form is also in progress. Though his condemned propositions circulated among the centuries in printed books in different forms, none of them is kept

in their original form. The editions in which the condemned propositions can be found are *Magna Bibliotheca Veterum Patrum* (La Bigne, Hierat 1664, pp. 933–934), *Historia Universitatis Parisiensis, tomus quartus* (Du Boulay 1668, pp. 298–300), *Collectio judiciorum de novis erroribus* (d'Argentré 1724, pp. 343–345), *Chartularium Universitatis Parisiensis* (Denifle, Chatelain 1891, pp. 610–613), and *I più antichi statuti della Facoltà Teologica dell'Università di Bologna* (Ehrle 1932, pp. 69–73).

Thought

His commentary on the *Sentences* is not extremely revolutionary, but from a historical point of view, it represents an important piece in our understanding of the doctrinal direction of the second half of the fourteenth century. Michalsky was one of the first to examine his thinking and ranked him among the skeptical thinkers of the fourteenth century. The Polish historian was interested to trace the lines between the intellectual formation of the students from Oxford and Paris in the fourteenth century, and he thought that John was part of the nominalist movement from that period (Michalski 1921, p. 21). A reevaluation of his analysis proves the contrary; R. J. Van Neste demonstrated that John was not a skeptic (Van Neste 1976, p. 28).

John was a student at time when the Parisian academic environment began to be strongly influenced by the influx of Oxford theology (Bakker and Schabel 2002, p. 426), and he was not an exception in this respect; on the contrary, his commentary on the *Sentences* is strongly influenced by it. The Faculty of Arts promulgated two statutes to forbid Ockham's circulation in Paris. The first statute dates from 25th of September 1339 and the second one from 29th of December 1340, and both stipulated that anyone who reads William Ockham's works will be excluded from the Faculty forever (Thijssen 1998, pp. 57–72). John was not labeled as an Ockhamist randomly, as in his commentary he is arguing Ockham's concepts which concern the two existing powers in God, the absolute power of God (*de potentia*

Dei absoluta) and the ordained power of God (*de potentia Dei ordinata*). The first power, the absolute one, is referring to the fact that God can “change his mind,” and the second one, the ordained power, is referring to the fact that “God is simple and his will is immutable” (Wood 1997, pp. 23–25). Courtenay's study about the two ordained powers in God remains until now the most relevant analysis on John's conception of the two types of power. Courtenay shows how the two powers are debated by the Cistercian, and he also traces his sources of inspiration which have their origins in the English theology, demonstrating that John is not saying different things from them and perhaps was not the right person to be condemned just because he debated about the two ordained powers in his commentary (Courtenay 1972, 1973).

The concepts of the two existing powers in God were not understood in Ockham's time in the full sense of the word, neither by those who condemned Ockham in the trial that took place in Avignon nor by John. Thus, John discusses about the two ordained powers as Ockham did, the difference between the two of them being the fact that John was not interested to employ them in a political context as Ockham did (Randi 1986).

John was familiar with Ockham's doctrine and concepts, but it is not yet clear whether he had direct access to the inceptor's works, since his name is not mentioned in John's commentary. It is also possible that he got in contact with Ockham by reading him through other authors. For example, the Cistercian had knowledge of Ockham's third distinction of his commentary on the *Sentences*, from Book 1, questions 9 and 10, questions which are concerned to give evidence on how the *vestigium* of the Trinity can exist in each creature, since in John's entire question 23, we can identify fragments imported from Ockham's *Sentences* (Pantea 2017). This is a relevant case study since the topic of the question was of crucial interest for the master's commenting *Sentences*, having almost the same importance as the whole commentary itself (Slotemaker 2013). Moreover in question 23, John debates the concept of the imperfect intuitive cognition and the imperfect abstractive cognition,

by implying the example of Hercules' statues, as Ockham did, in order to explain how the traces (*vestigia*) of Hercules can be recognized by the intellect. The imperfect intuitive cognition refers to the things which were known in the past; therefore they can be found in the memory. Thus, the imperfect intuitive cognition functions in correlation with the imperfect abstractive cognition, the last one producing a *habitus* together with the intellect; hence it can establish that a thing existed for real in the past (Van Neste 1976, pp. 11–12). Therefore whoever saw the statue of Hercules in the past will always recognize it in the future because its *habitus* is in their intellect. John also offers the example of the bull in order to explain the functions of the two acts of cognition. Who did not see Hercules in the past, but saw a bull instead? In a future moment, when they will observe the traces of the bull, due to the fact that they are having the *habitus* of it, they will be able to identify the traces of it, as belonging to the bull and not to another animal.

For the masters and the students of the Faculty of Theology from the fourteenth century, it was a usual practice to copy verbatim from other authors without mentioning the source (Bakker and Schabel 2002, p. 426). This technique, was also characterized as “bricolage textuel,” is constantly used by John during his argumentation (Calma 2011, p. 504; Calma 2012, p. 474). A very useful tool to hide passages from other authors seems to be, in John's case, the structure of his question. The division and subdivision in articles, sets of propositions, and corollaries seem to be a comfortable formula to recycle arguments from other masters. Besides Ockham, the list of English implicit sources used by John is completed by other names:

1. When he argued about the future contingent, he was influenced by Thomas Bradwardine, Adam Wodeham, Robert Halifax, Alexandre Langeley, Richard de Kilvington, and Thomas Buckingham. For example, one of the most well-known questions from his commentary is question 39, Book 1, where John argues about the future contingent, “That God can do in such manner that the world had never been,”

and in his demonstration of the question, he uses the arguments from this group of English authors (Vignaux and Genest 1988, pp. 293–301).

2. When he debated about the traces and the image of God, his other source besides Ockham is Adam Wodeham.
3. When he debates the problem of the sin, besides the authorities like Augustine and Anselm, his English source is Robert Holcot.

The propositions in which John is arguing about the future contingent are condemned, but he was not the only one on the continent who argued about the future contingent under the influence of the English theology. Gregory of Rimini was the first one to have knowledge about the works of Adam Wodeham (Courtenay 2008, p. 351). Also, Wodeham's name is linked to Ockham's name in quotations in Rimini's commentary and also in the commentary of the Cistercian James of Eltville as “Adam, Ockham.” The Franciscan Adam Wodeham was the disciple and friend of Ockham; his commentary on the *Sentences* influenced the Parisian theologians in the fourteenth century, and the history also remembers him as part of the Ockhamist movement, but he never considered himself an Ockhamist (Courtenay 1978, p. 60). Thus, the theses of Rimini were never condemned, even though he was reading his commentary on the *Sentences* a year before the Cistercian in 1343–1344. It was thought that he had a role in John's trial, but there is no proof, and Courtenay is debating the fact that the involvement of Rimini is almost impossible, since he is arguing about the two existing powers in God (Courtenay 1973, p. 157; Pantea 2017). In the second question of Book 1 of his commentary, “If the sensitive cognition is able to remain conserved and caused without object,” John copied passages from Rimini's commentary. Thus, in this question it can also be seen his indirect knowledge of Peter of Auriol's commentary, which was possible through Wodeham's texts (Calma 2012, p. 478).

Even if John chooses not to mention all his English sources, he quotes the authors that are commonly quoted by other colleagues. He quotes

Robert Grosseteste, Richard of Middleton, and Duns Scotus. Showing his erudition, he uses a reach selection of sources from antiquity until his contemporaries. For example, the oldest source can be found in question 10, “If the knowledge exceeds itself in a perfect way and is proportional to the excess of the objects,” where he implies one of the propositions from Euclid’s *Elements*: “because the contingency of the angle is towards the infinity sharper than the contingency of the rectilinear, as the geometer demonstratively proves, because any sharpest of the angles (...), as the 15th proposition of Euclid says.”

The fact that the most quoted source in Book 1 is Augustine is not surprising either, since one of the characteristics of the fourteenth century is the revival of Augustine, both in theology, in literature, and in scholastic philosophy. It has to be mentioned that John did not have access to the original texts of Augustine, as he attributed the treatise *De spiritu et anima* to the bishop of Hippo; this treatise was written in the twelfth century and is a pseudo-Augustinian treatise. Another clue to the fact that he did not have access to the complete corpus of Augustine is the fact that he wrongly misquoted another pseudo-Augustinian treatise, *Hyponosticon*, which is quoted by the White Monk as *Pronosticon*.

The sources implied by the White Monk allowed him to construct his own technical vocabulary. He often combines both a grammatical and a syllogistic argumentation and distinguished between the name of a word implied in a proposition and his grammatical role. When he wants to demonstrate the unicity of God and the relation between the persons of the Trinity, he also includes a grammatical analysis. The adjectives “eternal” and “singular” can be attributed to God himself and to each person of the Trinity, but when it is said that “God is the Father,” it cannot be said that all the three persons are the Father. The distribution of the adjectives can be possible only in the relation to the Trinity and not when the persons are singularly analyzed.

Also, John argues about the ampliative verbs and in what manner the conjugation of the verbs can be used, making the logical construction

easier. For example, the tenth condemned proposition says that God can do in such manner that he can make the humans sin willingly (CUP t. II 1891, n. 1147, 610). This proposition was qualified as heretical, but it has to be understood like a possibility of the name’s predication. The name of “God” is used in this proposition as a noun, and his attributes of being God are lacking, and the noun God can be replaced with another word. Actually, this proposition is not tenable, because, according to faith, God has only one substance, one essence, and his will cannot be changed not even by himself.

In his epistemological debate, John implies the fact that the external world can be known based on sensations. For example, the color white leaves a luminosity in the human eye if it is having a direct contact with it (Calma 2012, p. 474). Thus, this knowledge is produced empirically; considering this example, if an object producing whiteness was destroyed, the eye could no longer be affected by it, as the object cannot produce whiteness after the destruction. In this respect, the intellect cannot produce an a priori cognition of the object, in the sense that the functions he had before the destruction cannot be perceived by the intellect. Thus, the intellect can perceive that the object is destroyed. In John’s thought it is not possible for the intellect to perceive an external object which does not exist; therefore the knowledge based on sensations is the consequence of a cause (Calma 2012, p. 477). Besides, for the White Monk, the intellect is able to have knowledge of the first principle; this knowledge is based on special evidence, and the intellect can produce analytical judgments of the propositions which belong to it. John is offering as example the following propositions from which the first principle can be deduced: “if a man is, an animal is” and “if God is, God is” (Beuchot 2002, p. 378). The first principle also implies the principle of noncontradiction. For example, we have the next phrase from John’s question 6: “it is not evident that ‘God is,’ because now it follows evidently: God is, therefore the being in infinity is, and it is the most perfect.” Furthermore, John brings forth the principle of noncontradiction by saying that a different person, other than myself, can know that the existence of God is not evident,

but at the same time, it can be apparent to him that God is the most perfect being in the world, because he is the first cause, but it is not evident that each cause exists. Besides, my own intellect is capable of understanding the counterargument. Therefore for John the knowledge of the external and of the intelligible is produced in a subjective manner; even though the first principle undoubtedly exists, the knowledge of it is achieved differently by each intellect.

According to John, God cannot interfere in the rules of the analytical judgments; therefore he cannot make the same thing exist and not exist simultaneously. For example, God cannot make a thing which does not exist to be, because this means that he will create a new thing and the thing which does not exist will remain at the level of the nonexistent. God, using his absolute power, can make the nonexistent to be, but, using his ordained power, he cannot make possible a nonexistent; therefore those acts imply a contradiction.

In the same manner, John is arguing about the act of the sin by saying that God is the only one who can make the humans sin, because God is the only one who can make both evil and sin to be as a result of his volition, but as we have seen, this implies a contradiction. John's condemnation is rooted in his affirmations, but the theologians from Paris were not ready to assimilate or tolerate them.

After his condemnation his trace was lost, and it cannot be affirmed with certitude if he continued his career as a theologian at the abbey of Royaumont. Trapp assumes thus that his Cistercian confrere, Ceſſons, named him Abbas Regalis Montis due to the fact that he identified a number of identical paragraphs from John's commentary in Ceſſons (Trapp 1984, pp. 209–216).

John's thought is still under investigation; thus until now it can be said for sure that quotations from John's commentary are found in his later Cistercian fellows, like Peter Ceſſons, Godescalc of Nepomuk, James of Eltville, and Conrad of Ebrach. Moreover, his argumentative method about the principle of noncontradiction and the fact that one can doubt about his existence is anticipating the Cartesian *cogito*.

John Baconthorpe

Simon F. Nolan
Department of Philosophy,
Maynooth University,
Maynooth, Co. Kildare, Ireland

Abstract

John Baconthorpe (c. 1290–c. 1348) was *Doctor resolutus*, theologian and philosopher, English Carmelite friar, master at the University of Paris, author of *Sentences* commentary and three sets of *Quodlibeta*, Prior Provincial of England, taught at Cambridge and probably at Oxford, and an eclectic thinker who opposed key aspects of the philosophical thinking of both Thomas Aquinas and John Duns Scotus.

Biographical Information

The best known of the early Carmelite scholastics, John Baconthorpe, was born in England around 1290. Traditionally, scholars have suggested that he read the *Sentences* at Paris before 1318. However, recent thinking proposes 1320–1321 as a more likely dating. Baconthorpe had incepted as master in the theology faculty at Paris by 1323. He edited his commentary on the *Sentences* around 1325. Baconthorpe's three sets of *Quaestiones quodlibetales* were disputed from 1323 to 1325 and in 1330: *Quodlibet I* (1323–1324), *Quodlibet*

II (1324–1325), and *Quodlibet* III (1330). He produced a second redaction of his commentary on book IV of the *Sentences* around 1340. Baconthorpe was Prior Provincial of the Carmelites in England from 1327 (possibly 1326) to 1333 and taught at Cambridge and probably at Oxford. He died around 1348 (possibly of Plague).

Thought

Baconthorpe's teaching was so highly regarded in his order that both his *Sentences* commentary and his *Quodlibeta* were printed several times in the early modern era. Indeed, by the seventeenth century, he had effectively become the official theologian of the Carmelites with the publication of several manuals of philosophy and theology based on his work, intended to aid in the education of student friars. Key to his status as a preeminent Carmelite theologian was his defense of the doctrine of the Immaculate Conception and his writings concerning the history and spiritual tradition of his order and the importance of its rule. Baconthorpe's positions on the issue of the legitimacy of his Order's origins were vigorously disputed by his contemporary, the Dominican master, Robert Holcott.

In common with other early Carmelite scholastics, Baconthorpe reveals himself to be a consistent, if somewhat eclectic, thinker. His own thinking is most often developed in opposition to the thought of major figures such as Henry of Ghent, John Duns Scotus, and Peter Auriol. Baconthorpe frequently takes issue with Thomas Aquinas and both presents and criticizes key doctrines of Giles of Rome and Godfrey of Fontaines. Baconthorpe was an *opponens* of Thomas Bradwardine. An interesting aspect of his work is Baconthorpe's willingness to engage critically with the thought of other Carmelite scholastics such as Gerard of Bologna, Guido Terreni, and Robert Walsingham. Baconthorpe is always keen to establish his credentials as a true interpreter of Aristotle. Frequently, he is content to settle an argument *secundum philosophum* without much supporting theological discussion. Another characteristic of his thinking is his

tendency to conclude his arguments at key points with the aid of Averroes' commentaries. This led to his being given the rather exaggerated title *Princeps Averroistarum* by masters at the University of Padua in the sixteenth century in recognition of his skill in explaining the doctrine of Averroes concerning the unique intellect. Baconthorpe's undeniable eclecticism may deny to his works the last degree of originality; it does give rise to a strong positive commitment on his part to the meticulous presentation of the opinions of other scholastics in preparation for declaring his own position. For this reason, Baconthorpe's works are highly significant for the insight they afford into the state of philosophical and theological debate in the early fourteenth century. As *Doctor Resolutus*, Baconthorpe is not as reticent as the first Carmelite master at Paris, Gerard of Bologna, but one is constantly aware in reading his work of certain defensiveness with regard to the condemnations at Paris and Oxford in 1277.

The presence of the 1277 condemnations is most keenly felt in Baconthorpe's thinking concerning the status of the will, the substantial form of human beings, and angelology. In keeping with the anti-intellectualist line of the Parisian condemnations, Baconthorpe defends the active power of the will that can move itself without any prior cause and even against any object presented to it by the intellect. With an eye to the Oxford condemnations, the Carmelite master denies the unicity of substantial form. While not ultimately supporting Scotus' solution to the problem, Baconthorpe does insist on there being a corporeal form (*forma corporeitatis*) in addition to the intellectual soul and thereby counters the views of Aquinas concerning the soul as the unique substantial form in human beings. The issue of the substantial form in human beings provides an occasion for Baconthorpe to challenge the views of his Carmelite confrere Gerard of Bologna (d. 1317). Gerard suggests in his *Quodlibeta* that it is very difficult to demonstrate that the soul in human beings is not *accidentally* (per accidens) extended. His reluctance to settle the issue notwithstanding, Baconthorpe explicitly takes issue with his fellow Carmelite (whom

he names) and insists that the human soul is entirely spiritual and is extended neither in itself (*per se*) nor accidentally (*per accidens*). The lively debate concerning the soul and spatial extension is one of the more remarkable features of early fourteenth-century scholasticism. The early Carmelite scholastics were major contributors here along with the Dominican Hervaeus Natalis. Elsewhere in response to the condemnations at Paris, Baconthorpe insists that an angel's presence in the material world cannot be established by its activity; there is a need for a prior non-corporeal connection between the angel and the place where it brings about its effect.

Baconthorpe also seeks to counter Aquinas' insistence that there cannot be many angels in one species. The wider metaphysical problem of the principle of individuation is at issue here. In opposition to thinkers such as Aquinas and Hervaeus Natalis, Baconthorpe argues that the principle of individuation and the principle that accounts for the multiplication of individuals within the same species are not matter along with quantity (*materia signata*) but form. He also notes the opposing opinions of Giles of Rome and Godfrey of Fontaines. While Baconthorpe agrees broadly with the latter's insistence on form as the principle of individuation, he disagrees with the details of Godfrey's account. The Carmelite master's own position ultimately relies heavily on the account in Averroes' *Commentary* on Book II of Aristotle's *De anima*. There the Commentator insists that an individual is an individual only by means of its actualizing principle. Form is what realizes the actuality of an individual. Baconthorpe finds support for his position in Aristotle's own identification of the soul with actuality in *De anima* II. For Baconthorpe, actual distinction and multiplication of individuals within species require actual distinguishing principles, which can only be provided by distinct substantial forms. Neither matter understood as determined quantity nor matter understood as undetermined quantity is up to the task. Having dispensed with a key tenet of the Thomistic tradition, the Carmelite master also rejects Scotus' theory of individual difference (*haecceitas*). Common

essences do not have any being in themselves. Existing essences are individual instances of otherwise nonexistent common essences.

Baconthorpe asserts a real distinction between essence and existence in composite being. Such distinction, however, is to be articulated in terms of degrees of reality. In a version of the doctrine of divine ideas, Baconthorpe articulates his position with regard to the medieval debate concerning divine foreknowledge and future contingents: God's knowledge of future contingents comes from the free choices of his creatures who timelessly cause this knowledge in the divine mind. Creatures are known by God in the divine mind in virtue of their having eternal, ideal being, distinct from the divine essence.

The process of cognition is a major issue in Baconthorpe's *Quodlibeta* I and II. In his denial of any role for intelligible species in the act of intellection, Baconthorpe places himself in the company of earlier thinkers such as Peter John Olivi, James of Metz, Durand of Saint Pourçain, and Gerard of Bologna. For Baconthorpe, the act of intellection (*intelligere*) does not require any mediating species. Actual cognition results from the direct action of the agent intellect on the phantasm. While Thomas Aquinas is the usual target of most scholastics who wish to deny a role to intelligible species, it would seem that Baconthorpe has Scotus and his version of the species hypothesis in mind. Characteristically, he cleverly plays texts of Aristotle and Averroes against Scotus in order to prepare for the presentation of his own view. The act of cognition itself is an *actus rectus* for Baconthorpe. If there were mediating species, the act of cognition would become an *actus reflexus*, turned inward rather than toward the object. In common with most of those who deny the species hypothesis, Baconthorpe does face the charge of denying any real possibility of there being unconscious mechanisms contributing to the acquisition of knowledge in human beings.

Attention to the work of John Baconthorpe is rewarded by real insight into trends in early fourteenth-century thought. Baconthorpe's participation in debates concerning the soul and spatial extension and the process of cognition helps

to establish real lines of continuity and development between late medieval and early modern philosophizing. While some attention has been paid to the Carmelite master's *Sentences* commentary, his strongly philosophical *Quodlibeta* I and II await the further scrutiny of scholars.

John Buridan

Gyula Klima

Department of Philosophy, Fordham University,
New York, NY, USA

Abstract

John Buridan (c. 1300–1362) was “the great systematizer and legitimizer” of Ockhamist nominalism at the University of Paris in the first half of the fourteenth century. His ideas proved to have a lasting influence for centuries in all philosophical disciplines, not only directly, through his own works, but also indirectly, by becoming standard textbook material.

Life, Influence, and Works

Buridan was born around 1300 somewhere in the diocese of Arras, in Picardy. He was probably of humble birth, which is indicated by the fact that we have no reliable record of his family, and by the circumstance that at the College of Cardinal Lemoine, where he completed his early education, he may have been a recipient of a stipend for needy students. If this is in fact the case, then his career is a testimony to the possibility of upward

social mobility in medieval academia through talent and hard work alone. He obtained his license to teach after 1320 at the Arts Faculty of the University of Paris, where he remained teaching for the rest of his life. The fact that he did not follow the usual career path of professors of his time, moving on to one of the “higher” Faculties of Medicine, Law, or Theology, may indicate a prudent choice on his part: staying at the Arts Faculty, he could work relatively undisturbed on his “quiet nominalist revolution,” without getting embroiled in the “ideologically charged” controversies of the Faculty of Theology. In any case, staying at the Faculty of Arts certainly did not hurt his professional stature. He served twice as rector of the university, and lived unusually well off for a university professor of his time, drawing income from at least three benefices till his death, sometime before 1362, when one of his benefices went to another person.

Buridan’s students and professional associates at Paris spread his ideas far and wide in Europe. (All this, however, need not mean that talk about a doctrinally homogenous “School of Buridan” at Paris is justified: see Thijssen 2004.) But besides his enormous indirect influence, we should note that his works themselves, both in manuscripts and later in early printed editions, became required reading at many “new” universities, such as Vienna, Prague, Krakow, Rostock, and Saint Andrews.

Buridan’s works are mostly the by-products of his teaching. As such, they mainly consist of commentaries on Aristotle, covering the entire Aristotelian corpus, ranging from logic to natural philosophy (including physics, biology, and the philosophy of the soul), to metaphysics, and to practical philosophy, including ethics and politics. Among the commentaries, there are running commentaries expounding Aristotle’s texts, but the more significant ones, where his originality shines, are the question commentaries (fitting in the established medieval genre), which, instead of merely expounding the author’s text, provide the opportunity of thorough discussion of the problems raised by the text. In fact, the commentary format suited his style so well that he wrote even his most original, systematic work,

Summulae de dialectica (see Buridan 2001) in the form of a running commentary on an authoritative text, in this case, the enormously influential *Summulae logicales* (or simply *Tractatus*) of Peter of Spain (see Peter of Spain 1972). Besides his major works, he produced a number of short treatises, the most important and original of which is the *Treatise on Consequences*, expounding his original, nominalist conception of logical validity. (For a detailed discussion of his genuinely original conception, see Klima 2009, c. 10; for more on his life and an excellent, historically “contextualized” discussion of his work, see Zupko 2003.)

Logic

In medieval philosophy, logic was commonly regarded as a foundational philosophical discipline, as the universal intellectual tool (*Organon*) to be used in all areas of inquiry (the “art of arts,” *ars artium*; cf. Klima 1988:1–17), but it is particularly important for the nominalist Buridan, in whose hands it serves as the main analytical instrument in the nominalist program of “ontological reduction.” For Ockhamist nominalism, it does not merely consist in the denial of the existence of Platonic universals (which were generally rejected in the later medieval period for both philosophical and theological reasons anyway; see Klima 2008) but rather in the careful articulation of a semantic theory that allows the mapping of the category-rich syntactical structures of our language to a parsimoniously conceived ontology, containing only two or three distinct categories of entities. Thus, what is truly antithetical to Ockham’s or Buridan’s nominalism is not so much Platonic “extreme” realism but rather the “linguistic realism” of thirteenth-century modists (cf. *modistae*; Ebbesen 1998; Marmo 1999; Zupko 2008), and in general anyone before Ockham working in a conceptual framework endorsing the view that linguistic differences have to have some (more or less strictly) corresponding ontological differences, or else they are “vacuous” (cf. Scotus, Ord. II, d. 3, part 1, q. 1, n. 23; Spade 1994:62).

However, in Buridan's hand, the Ockhamist project of "ontological reduction" is no longer some controversial innovation bolstered by an equally controversial reinterpretation of much of contemporary logical theory, as it was initiated by Ockham, but rather a systematic implementation of Ockham's logical principles, showing a consistent alternative way of constructing logical theory *without* the ontological commitments of realist logic. Perhaps the best indication of this attitude is that in his *Summulae*, rather than confronting the doctrines of the realist master he was supposedly commenting on, he simply replaced passages of Peter of Spain he did not like with his own text and in the commentary expounded his own nominalist doctrine without further ado:

I have chosen to deal in particular with that short treatise of logic which the venerable professor master Peter of Spain composed a while ago, by commenting on and supplementing it; indeed, occasionally I am going to have to say and write things that differ from what he has said and written, whenever it appears to me suitable to do so. (Buridan 2001:4)

To see exactly how Buridan carried out the nominalist program of ontological reduction through logical analysis, it will be useful to see what was there in the competing realist theories "to be reduced" in the first place. Ockham often complains that his realist opponents "multiply entities according to the multiplicity of names" and this is an error that stems from an "ignorance of logic" (for detailed discussion, see Klima 1999a). Actually, Ockham's charges were not quite justified. In the first place, realist authors did allow the possibility of identifying the semantic values of different expressions from different linguistic categories. In the second place, even when they did need to recognize such semantic values as distinct, sometimes they reduced the ontological commitment of their theory by attributing these semantic values a sort of "reduced ontological status," by claiming, for instance, that they are mere beings of reason [*entia rationis*], that is, not full-fledged entities on their own but rather just mere objects of the mind with some "foundation in reality" [*fundamentum in re*],

a certain way real things are. (See the entry on Being in this volume.)

It is true, however, that as far as their *semantics* is concerned, the *moderni* criticized by Ockham simply did not seem to care about the apparent "multiplication of entities": their strategy rather seems to have been to assign semantic values to linguistic items as their apparent semantic function demanded and took it to be a different task, a task of metaphysics, to find out about the identity and distinctness and the precise ontological status of each item. Thus, for instance, we find Peter of Spain distinguishing between the sort of entities or quasi-entities demanded by logic [*secundum viam logicae*] and those that there really exist in nature [*secundum viam naturae*] (Peter of Spain 1972:87). And even if he does not seem to have an extraordinary ontology *secundum viam naturae*, he has no qualms about populating his universe of discourse with universals, inherent particulars, or quasi-particulars including privations (such as blindness), or even their modes allegedly signified by syncategorematic terms, and the quasi-entities signified by propositions (which he refers to as *enuntiabilia*, and we would probably identify as "states of affairs") *secundum viam logicae*.

It was this sort of approach that was rejected and swept aside by Ockham, proposing a radically different way of constructing semantic theory, brought to fruition especially by Buridan in his *Summulae*. This alternative way of constructing semantic theory rejects in the first place the "cavalier" metaphysical attitude in logic. On this approach, the assigning of semantic values in logical theory is ontologically cautious from the start, where the logician posits distinct ontological categories only when this is demanded for compelling reasons that settle the issue already in logic. Otherwise, the logician has the task of eliminating apparent ontological commitment to distinct entities through logical analysis, whenever this is possible. The mere possibility of this type of analysis, then, in line with "Ockham's Razor," is sufficient reason for the nominalist logician not to posit a distinct category of entities. To see this in more detail, let us take a closer look at how exactly Buridan manages to provide a semantic theory with an ontology that contains only three

distinct categories of entities, namely, substances, their individualized, inherent quantities (such as length, weight, etc.), and some inherent individual qualities (such as color, heat, etc.).

Buridan's primary analytic tool to this end (partly borrowed from Ockham, partly further developed by himself) is the analysis of semantic distinctions with reference to *mental language*, the natural representational system of the human mind, providing the semantic features of the conventionally meaningful spoken and written human languages.

Although for Buridan mental language is the system of intellectual cognitive acts of individual human minds, it is definitely not to be regarded as a "private language" in the sense criticized by Wittgenstein. For mental language, being the *natural* representational system of *any* individual human mind is common for all humans in the sense that if I have an intellectual cognitive act, a *concept*, whereby I conceive of something in some way, then you, being another human person, have the natural ability to form a *similar concept*, that is, a numerically distinct mental act whereby you conceive of the same things in the same way. For obviously, and this is the key idea of using the idea of a mental language for a nominalist ontological reduction, the same things can be conceived in many different ways, depending on what sorts of concepts we form to conceive of them.

Buridan distinguishes simple and complex concepts. In connection with this distinction, it is important to note that since for him any concept is an ontologically simple entity, a simple individualized quality of an individual mind, not having any ontological components, the complexity of complex concepts is not ontological or syntactical (in the way a written sentence has ontologically and syntactically distinct components) but purely semantic. A concept in this sense is semantically complex if its representative function is dependent on the representative function of other concepts, whereas it is simple otherwise. In this way, subsuming all human concepts under the category of quality, Buridan (and Ockham, in his mature theory) at once eliminated the ontologically obscure category of "merely objective" concepts that

Ockham in his early theory referred to as *ficta*. Concepts on this account are ontologically no more obscure entities than are colors, for instance, for both concepts and colors are simple individualized qualities of individual substances (see Buridan 2001:xxxviii–xxxix).

Simple concepts are either categorematic or syncategorematic. Syncategorematic concepts are "the glue" of mental language; in fact, Buridan often refers to them as "complexive" concepts, that is, concepts whose function is not to represent per se but rather to form complex concepts, thereby modifying the natural, per se representative function of categorematic concepts. Thus, he argues, although by every concept we conceive something, by complexive concepts we do not conceive anything other than what we conceive of by the categorematic concepts with which they are construed, although we do conceive of these things *differently*, in a complex, rather than in a simple manner:

But now there is a difficult question, for it was said earlier that by every concept something is conceived. What then is conceived by the complexive concept corresponding to the copula 'is', when I say 'God is God' or 'A man is a stone'?

I reply that . . . since the intellect cannot form that complexive concept without the categorematic concepts that it combines, nothing is conceived by that concept alone. But we conceive the very same things in a complex manner by means of the categorematic concepts as those that were conceived in an incomplex manner by those categorematic terms without that complexive concept. Therefore, different things are not conceived by the concepts corresponding to the various expressions 'God is God', 'God is not God', 'Every God is God', 'No God is God' and to the term 'God'; rather, that thing is conceived in different ways, namely, in a complex or incomplex manner, and affirmatively or negatively. So, coming back to the solution of the sophism, I say that although the expression 'God is God' signifies more in the mind than the name 'God', nevertheless, it signifies nothing more outside [the mind], but entirely the same [thing], although in a different manner. (Buridan 2001:842–843)

Here, we can clearly see Buridan's nominalist "ontological reduction" at work. The very same simple, absolutely indivisible entity, God, can be conceived in so many different ways, by means of the different sorts of concepts we form of Him.

Likewise, any other entities can be conceived of either in a complex manner, by means of complex concepts, or in a simple manner, by means of simple concepts, either absolutely, in terms of "absolute concepts," or in relation to each other, in terms of "connotative concepts." Thus, according to Buridan, whenever we have a term in our language that belongs to a linguistic category other than to the categories of substance, quantity, or quality, we should not suppose that consequently we must place the semantic values of that term in an ontological category other than substance, quantity, or quality: all we need to do is analyze the meaning of the term by means of a nominal definition that clearly explicates the conceptual structure of the complex concept to which this term is subordinated. This analysis should then reveal that the term in question merely signifies or connotes entities in the three "permitted" categories. (For a thorough discussion of Buridan's conception of mental language and its role in his ontological program, see Klima 2009, c. 4.)

For example, the nominal definition of the term "blind" as "animal not having sight" clearly reveals that the complex concept that renders the term "blind" meaningful merely signifies animals (substances), connoting their sights (qualities), but on account of connoting their sights negatively (because of the added syncategorematic concept of negation), in the context of a proposition it will only refer to (or "supposit for" to use the common English transcription of the medieval technical term *supponit pro*) animals that actually do not have sight. What this analysis reveals, then, is that the term "blind" does not have to be construed as signifying a mysterious "quasi-entity," a privation (as the common prenominalist analysis suggested, see Klima 1993), for its meaning is fully explained only with reference to ordinary entities, namely, animals, their sights, and the qualities of our minds, namely, the concepts whereby we can conceive of animals with a negative connotation of their sights.

In fact, this nominalist strategy of "ontological reduction through logical analysis" is so successful that one may wonder why it is not carried even further. Why allow even the distinct categories of quality and quantity? After all, Ockham could do without a distinct category of quantity (having identified the semantic values of quantity terms with entities in the category of substance or quality), and even his analyses could in principle be carried further by "analyzing away" the distinct semantic values of quality terms, as Buridan himself did with quality terms in the species of "shape" (*figura*) (see Klima 1999b, and the entry Substance, Accident and Modes in this volume). So why would Buridan allow even the distinct ontological categories of quantity and quality? The answer to this question is to be found not in his logic but in his metaphysics.

Metaphysics and Natural Philosophy

Both Ockham and Buridan had specific, non-logical reasons for maintaining the distinct category of quality, namely, their rejection of atomism. For, in terms of the possibility of pure logical analysis, an atomistic metaphysics, qualitative changes (such as changes of color, as opposed to quantitative changes or locomotion) could have been "analyzed away" analogously to the elimination of changes in the species of "shape," with reference to complex connotative concepts referring to and connoting only substances and the locomotion of their quantitative parts. However, Buridan partly convinced by Aristotle's arguments against the ancient atomists, partly seeing the troubles incurred by contemporary atomists, such as John Mirecourt and Nicholas of Autrecourt, flatly rejected atomism as "an obscure and dangerous doctrine," and embraced the category of quality as containing individual entities distinct from substance and quantity (Buridan 1989:122).

Indeed, for similarly extralogical reasons, he departed even further from Ockham's ontology. The most important of his "ontological departures" from Ockham can be summarized in the following points:

1. Acknowledging quantity as a category distinct from substance and quality, for purely physical reasons
2. Positing *impetus* as a distinct quality to explain what *we* would describe as inertial phenomena
3. Positing *modes* as somehow, but not really, distinct from (in the sense of being merely contingently identical with) the absolute categories of substance, quantity, and quality
4. Positing intelligible species but identifying them with phantasms *qua* the immediate objects of the agent intellect
5. Endorsing the unicity of substantial forms, that is, denying the plurality of souls in the same individual while distinguishing the (instrumental) powers, habits, and acts of the simple substance of the soul
6. Positing different degrees of unity, ranging from simple substances through composite substances to merely successively persistent substances, such as rivers

As for the first point, Buridan's main reason for positing quantity as a distinct category, true to his Aristotelian empiricist approach to natural science, is that it seems to be necessary for the explanation of the phenomena of condensation and rarefaction in the framework of a non-atomistic, plenum theory. For in an atomistic theory, the explanation is easy in terms of the smaller or greater distance between the atoms of the body compressed or extended (which is precisely the idea in the modern kinetic theory of gases). But in a plenum theory (i.e., a theory of matter that denies the existence of a vacuum and holds that matter is a continuum), if there is no addition of matter to the substance of the thing (which is what distinguishes decompression or rarefaction from growth), then one has to say that while the substance remains the same, its quantity (i.e., its dimensions) must become greater, which is possible only if the quantity of the thing is distinct from its substance.

But similar (experimental as well as theoretical) considerations motivate Buridan's positing a specific quality, namely, the *impetus* of moving bodies. His *impetus* is introduced, again, as a requisite explanatory principle. Given the

principle of Aristotelian physics that everything that is in motion needs to be moved by a mover, phenomena that we would characterize as cases of inertial motion, such as the motion of projectiles, posed a problem: what moves, for example, an arrow shot from a bow, when it is no longer moved by the bowstring? Aristotle's answer, namely, that it is the air still moved by the bowstring, was heavily criticized already by his sixth-century commentator, Philoponus, who favored the view that it is some impressed force imparted to the projectile by its original mover that sustains its ongoing motion. However, it was Buridan who fully worked out the idea in his theory of *impetus*, viewed by many historians of science as a precursor of the modern notion of inertia, although in its actual description given by Buridan, it is closer to the modern idea of momentum. His *impetus* is an impressed force (imparted to the moving body by its original mover, which brings it up to a certain speed), which is directly proportional to the speed of the moving body and to its heaviness (not quite the same as what in modern physics we would call "mass," but rather a heavy body's natural tendency to be "down," at the center of the Earth) and which is not spontaneously diminished, but is only weakened by the resistance of the medium. The greatest virtue of this theory is its applicability to a whole range of diverse phenomena that were either puzzling or "anomalous" in themselves, such as projectile motion, and/or were treated as falling under radically different explanatory models in the original Aristotelian framework, such as the acceleration of falling bodies, the motion of projectiles, the ongoing rotation of a spinning wheel, and the motion of celestial bodies, thereby providing a coherent, unitary conceptual framework for all these diverse phenomena, serving as a model for the unification of earthly and celestial mechanics in early modern science.

But aside from such explicit theoretical demands of the explanation of phenomena, Buridan, being the "relentless" nominalist, was always reluctant to posit really distinct entities in diverse categories; thus, in the categories other than substance, quantity, and quality, as well as in the species of "shape" in the category quality, he consistently applied Ockham's eliminative

strategy using nominal definitions containing absolute terms only in the “permitted” categories. Nevertheless, occasionally, he does not refrain from referring to what terms in the other categories connote or signify as the modifications or *modes* (*modi*) of things in the “permitted” categories. Thus, he would admit without further ado, for example, that while the quantity of a straight piece of wire is arranged in one way, the same quantity is arranged in a different way, if the wire is bent, that is, the same quantity has some modification at one time and a different one at another. However, although this way of speaking involves what in modern logic we would call “quantification over” different modes, he would not regard this as adding any extra ontological commitment to his theory. For although the *modus* of the quantity of the wire at one time is different from the *modus* it has at another time, each is contingently identical with the same quantity at different times, thereby not adding to the number of things in the universe at any given time. This conception of *modes*, as being somehow different, yet without being numerically distinct, from absolute entities, was to have a bright career in later medieval and early modern philosophy, at first just undermining and eventually completely replacing the Aristotelian distinction between substance and accident. (See also the entry Substance, Accidents and Modes in this volume.)

But Buridan’s nominalist zeal also had its impact in more specific fields, such as his philosophy of the soul. Thus, although he apparently endorsed intelligible and sensible species, already diligently eliminated by earlier philosophers and theologians, such as Durand of St Pourcain or John Peter Olivi, in favor of a direct relationship between cognitive acts and their objects, he would nevertheless identify sensible species with the first receptive acts of the external senses, and intelligible species with *phantasms* (singular, sensory representations of singulars), insofar as they are the indirect objects of the act of the abstractive intellect forming its abstract concept, a mental act whereby it directly conceives all of the corresponding external singulars of the same kind. Indeed, his ontological economy shows up not only in his analysis of the cognitive process

but also in the analysis of the constitution of the soul and its powers or functions, as expressed in point 5 above: contrary to Ockham and the “pluralist” tradition in general, he argued that there is only one substantial form, one soul, in the same living individual, which alone is capable of accounting for the diverse (vegetative, sensitive, and rational) functions of the same individual (plant, animal, or human, respectively), through the diverse instrumental powers it has, as it animates the diverse organs of the same living body (or uses no organ at all, as he held, though not as a provable philosophical conclusion, concerning the intellect). But while he distinguished these “instrumental” powers from the soul itself, he also argued that the “principal” powers of the same soul (the essential abilities to carry out vegetative, sensitive, or rational functions) are nothing but the soul itself, denominated variously from its diverse operations.

Finally, we should mention Buridan’s rather original analysis of different conditions of identity and persistence through time relative to natural kinds, which apparently results in a conception that admits different degrees of unity relative to natural kinds (Buridan 1984, lb. 2, q. 7; Buridan 1509, lb. 1, q. 10). Still, this does not commit him to acknowledging anything like Aquinas’ conception of the analogy of unity and being, since for him, the conceptual order does not have to reflect the real order in such a close way as it was conceived by Aquinas (see Being).

Ethics

Buridan’s ethical theory closely follows upon his naturalistic account of the human soul, insofar as he regards our psychological mechanisms involved in our moral decisions just as natural causal processes as those involved in the workings of any other natural agents, based on a range of natural powers, determined by the nature of the thing. In the case of moral agents, however, there is one power whose operation is not determined to one specific sort of outcome, as the powers of other natural agents are (fire, for instance, cannot but heat by its heat), because its proper operation

consists precisely in determining the action of the moral agent as a whole, namely, the free will of a moral agent, acting by choice. As he puts it:

This is the difference between a voluntary and non-voluntary agent, namely, that a voluntary agent can freely determine itself to either of two opposite alternatives, other things being entirely equal. (Buridan 1513, lb. 3, q. 1, fol. xxvi rb).

To be sure, for Buridan, this is not a demonstratively established conclusion (we do not have a scientific demonstration of the fact that our will is free), as neither is the fact that our intellect is immaterial and immortal; however, in contrast to the intellective soul's immortality, which we can only hold on the basis of faith, we may be sufficiently certain about our freedom, simply on the basis of the evident experience that we might also choose to act otherwise.

However, just because the operation of the will is not determined to one specific type of outcome, it does not mean that its action is indeterminate in the sense of being randomly spontaneous. The determination of the will, given that it is a rational power, has to come from the intellect, in the sense that as long as the intellect presents different alternative courses of action in such a way that one is judged to be definitely better (more securely leading to happiness) than the others, then the will is naturally going to be inclined to choose that one.

Under this characterization, Buridan might seem to be squarely in the Aristotelian "intellectualist" tradition, as opposed to the Augustinian "voluntarist" tradition, despite his explicit claim that he was seeking a middle ground between these two camps concerning the issue of the determination of our voluntary actions (QNE, III, q. 4, fol. Liiii, ra). For, on the one hand, if the judgment of the intellect about the relative values of possible alternative courses of action fully determines the choice of the will, then, apparently, the will is not free, but its act of choice is determined by the intellect; whereas on the other hand, if the will chooses against the judgment of the intellect, then its choice is irrational, which goes against the very idea that intellect and will are our specifically rational powers (the intellect being our specific cognitive, speculative power, and the will our active, practical power), distinguishing us *qua*

humans from brute animals. However, on Buridan's solution of the dilemma, we do not have to opt for either of these bad theoretical alternatives. For although the will's choice may be determined by the intellect with regard to its *content*, namely, insofar as the will is rationally inclined to choose the (ostensibly) better alternative, nevertheless, the will's choice may not be determined by the intellect with regard to its *execution*, for the will always has the power of withholding its choice, especially when the relative values of the alternatives are not quite well defined by the intellect, and may send the issue back to the intellect for further deliberation.

So, on this conception, the freedom of the will consists not so much in "spontaneously" (and hence, perhaps, irrationally) choosing *this* rather than *that* alternative but rather in choosing or not choosing anything at all. To be sure, one may still say that since the will can rationally defer its choice only when there are reasonable doubts about the intellect's actual evaluation of possible alternatives (if for no other reason, then because of the lack of relevant information), and doubting is an act of the intellect; therefore, Buridan's solution is still on the "intellectualist" side. However, his refined analysis still leaves more latitude for the will to act on its own than a simple intellectualist solution, as in practical matters it is almost always reasonable to doubt our evaluation of the situation (after all, we know that we are not omniscient), and so prudence (an intellectual virtue) would in most cases allow the will to defer its choice, unless the urgency of the situation does not allow any further hesitation.

In any case, for Buridan, it is certainly not the intellect's presentation of different alternatives alone that determines the will's choice. For although the will would rationally choose what is presented by the intellect as the best choice (unless the will freely defers its choice), nevertheless, its choice may also be influenced by its acquired habits, namely, its virtues and vices. But this influence is never full determination: the will is always free to choose otherwise (influenced by the judgment of the intellect) or not to choose at all. So, virtues and vices give only a certain tendency to our choices, manifesting our character.

John Calvin, Political Thought

Harro Höpfl

Essex Business School, University of Essex,
Colchester, UK

Abstract

John Calvin, 1509–1564, Reformer of Geneva, Frenchman, naturalized Genevan bourgeois 1559, authority for Reformed Christians throughout Europe, translator of the Bible into French, author of a famed theological

text, the *Institution* (or *Institutes*) of the *Christian Religion* in successive Latin and French versions (first ed. 1536, last eds. 1559 (Latin), 1560 (French)), pastor, ecclesiastical organizer, bilingual preacher, and polemicist whose sermons and catechetical, controversial, and organizational works were very widely diffused.

Calvin, at that time a humanist scholar but neither a priest nor an academic, converted to evangelical Christianity in the 1530s, when many churches repudiating Rome were already established. His theology was and remained largely Lutheran in inspiration. Lutheran doctrines of salvation by faith alone (*fide sola*), the unconditional authority of Scripture (*sola scriptura*) and “Christian liberty,” an extremely problematic and easily distorted doctrine from Calvin’s point of view, are prominent in his theology. However he placed much greater stress on divine sovereignty, on predestination (a highly controversial inference from the doctrine that salvation is the result of God’s inscrutable decree, not of works), and on the Christian’s need for mediators. He had little use for Luther’s “priesthood of all believers” (see also the entry on [► Martin Luther, Political Thought](#) in this volume) and emphasized that Scripture needs authoritative interpretation. Moreover, he represents Christian life as a ceaseless individual and collective striving to “build up” the Kingdom of God in the world. In both respects the role of the church is vital; it was not however Luther’s “invisible,” universal church under the headship of Christ alone that mattered to Calvin, but the concrete, “visible,” institutional churches. Only they can teach, preach, administer the sacraments, and exercise discipline, in the orderly and continuous way that Christian sanctification demands. The first generation of reformers had already devoted much energy and thought to the organization of churches and the ministry, especially Bucer at Strasbourg, where Calvin gained valuable practical experience when briefly exiled from Geneva. Nevertheless, Luther had regarded “external” forms and matters of organization as of secondary importance. For Calvin, by contrast,

ecclesiology was as central to his theology as it was to his activities as pastor and ecclesiastical statesman.

In his time, evangelical churches were increasingly vulnerable. Calvin saw the main threats as: the Roman church and rulers supporting it (the Council of Trent, 1545–1563 marked its resurgence); princes intent on subordinating the reformed churches in their territories to their own purposes; hardening divisions between evangelicals; and the discrediting of reformation by those who interpreted Christian liberty as licensing insubmission to salutary ecclesiastical discipline and rebellion against political authority. To meet these threats, churches in Calvin’s view required above all else a collegial pastorate to lead them, and excommunication, the ultimate weapon of ecclesiastical discipline. Calvin’s *Ecclesiastical Ordinances* for Geneva (1541), setting out the arrangements designed to realize all this, became exemplary for much of “reformed” Christendom (the term “reformed” normally designates the Calvinist tradition). Control of excommunication had already come to symbolize the aspiration to ecclesiastical independence and a measure of clerical reassertion. Calvin however regarded discipline as a necessary means to the building of well-instructed and virtuous congregations, and much of his work was preaching, teaching, and attending to the provision of suitable ministers, teachers, catechisms, and confessions of faith.

However, it was by that time impossible, and in Calvin’s view undesirable, to deny secular authorities a prominent role in evangelical churches. Luther had asserted the distinctness of secular and ecclesiastical authority, but like the reformers of the cities had conspicuously compromised ecclesiastical independence in practice. Unlike Luther, Calvin never even attempted to safeguard the church by demarcating separate jurisdictions for secular and spiritual authorities. On the contrary, the definitive last version of his *Institution* (Book IV) described them both as “mediums” of God’s grace. In his view, they could be brought together without confusion by insisting on their independent authorization by God, their separate organization and personnel, the distinction

between the instruments they are entitled to use, and on their religious duty to cooperate.

Calvin made clear that ideally both secular and spiritual authorities ought to have the same corporate and collegial (i.e., aristocratic) “form.” Like many humanists, he regarded a “mixed” form of government tending to aristocracy as the best way to uphold the rule of law and to prevent tyranny, which he equated with “absolute” monarchy. Ideally, too, magistrates and pastors should animate and constrain each other as well as their subjects, bringing to their cooperation their separate instruments: the church can preach and reprimand, but cannot use force, whereas the magistrates cannot teach or judge conscience, but can coerce. The emblem of such cooperation between ministers and magistrates in Geneva was the Consistory, an ecclesiastical court composed of all the pastors and 12 “elders,” charged with supervising the faith and morals of the laity, “godly discipline.” The eldership was an ecclesiastical office, but elders were also magistrates and were thus able to compel culprits to appear before this court and impose civil penalties as valuable adjuncts to godly discipline. The Genevan Consistory and the “godly discipline” became exemplary for “Reformed” Christianity.

Christians generally acknowledged that God has appointed two agencies to govern the world: the church and the secular authority (not ideal rulers but the “powers that be,” in the words of the most quoted political proof text of the Reformation, *Romans 13*). What was disputed was whether these two agencies of God’s will dealt with two separable bodies of people (as sectarians held, and as Luther sometimes suggested), or whether they both had the same body of subjects, but different manners of acting on them. The orthodox evangelical idea, once the prospect of a reformation of Christendom as a whole had evaporated, was an inclusive church to which all the inhabitants of a given territory were obliged to belong. The Christian and the subject are thus one and the same person, in two different capacities. But Calvin, quite unlike Luther, always emphasized the positive, formative aspect of the Law of God, and of any law or arrangement that in some way embodies it, as well as of secular

magistrates as upholders of law, as a spur to piety and good works. For Calvin, Christian liberty means an active and willing obedience to law and discipline, not as the way to salvation but as its fruit and sign.

A church organized in this way, and supported by a theology that placed the church in the center of the Christian life, was capable of withstanding adverse political circumstances, and could appeal to those looking for an orthodox but more aggressively reforming church than that of the Lutherans. However, there was no guarantee that actual rulers would act in the supportive way that the ideal required. Many who looked to Calvin and Geneva for their inspiration lived under actively hostile rulers, particularly his followers in France who were the constant objects of concern of the Genevan pastors, all of them exiles from France. In part as pragmatic recognition of the need for its protection against a resurgent Rome (especially with the foundation of the Jesuit order in 1540) and against the ever-present sectarian tendencies within Reformation churches themselves, but also as a matter of principle, Calvin insisted that the duty of political obedience was no more conditional on the godliness of princes or magistrates than the duty to obey parents was on theirs. He even condemned the (Lutheran?) view that secular authority is a kind of necessary evil. The question of how to fulfill the duty of building up God’s kingdom when oppressed by hostile rulers therefore became acute.

Blatantly unjust and impious laws and commands must be disobeyed – “we must obey God rather than men” (St Peter in *Acts 5:29*, another much cited text). Calvin however counseled disobeying and then patiently suffering the consequences. He regarded “reformation from above,” and perhaps foreign intervention on behalf of the persecuted, as the best means of advancing reformation. Luther’s followers had however already engaged in armed resistance and justified it in the *Magdeburg Confession* of 1551. Calvin, too, conceded that organized resistance was legitimate where the laws of a particular polity allowed it. However, it is not private individuals but only holders of public offices that may resist force with

force, ideally the magistrates collectively, when assembled in representative bodies (such as Estates General or Parliaments). Calvin took it that all the kingdoms of Europe had a legal order, which made “popular magistrates” (the Lutherans said “lesser magistrates”) individually subject to kings and/or emperors, but collectively superior in authority over them. His successor as chief Genevan pastor Theodore de Bèze and his followers in France (the “Huguenots”), the Netherlands, Scotland, and England developed full-fledged resistance theories and markedly republican (or at least anti-monarchical) doctrines, all of them firmly grounded in Calvin’s own thought.

Calvin’s ideal of church and magistracy cooperating to advance *pietas* and *honestas* and to uphold the glory of God had religious intolerance as one of its consequences. Although many Calvinists subsequently practiced religious toleration, in 1553 Geneva burned at the stake a sectarian evangelical, the anti-Trinitarian and opponent of child baptism Michael Servetus. This was the act of an anti-Calvin ruling council, not the Consistory or Calvin. But Calvin fully approved it (as did Catholics abroad, where Servetus was already under sentence of burning, the normal Catholic penalty for impenitent heretics), and Calvin and de Bèze went on to publish defenses of secular punishment for “heresy,” as a threat to both civil *honestas* and religious *pietas*. Against this implication of the ideal must be set the formation of the upright, industrious, and courageous character that it fostered.

John Capreolus

Thomas Jeschke

Thomas-Institut, Universität zu Köln, Köln,
Germany

Abstract

John Capreolus, or Jean Cabrol, 1380–1444, Dominican friar, known as *princeps thomistarum*, was one of the most important and influential Thomists and commentators of Thomas Aquinas. Born in the French province of Rouergue, he studied at Paris and taught at Toulouse. He spent the last 20 years of his life in the Dominican convent of Rodez. His only surviving work, called *Defensiones theologiae Divi Thomae Aquinatis*, is a vast commentary

on Peter Lombard's *Sentences* which aims solely at defending St. Thomas' theology and philosophy against a group of handpicked critics throughout the fourteenth century. His own position therefore corresponds to Aquinas' thought. Yet in that perspective Capreolus was of great influence for future Thomists throughout the Middle Ages and beyond.

Despite John Capreolus' high profile, we know little about his life. Some facts, however, can be ascertained. John Capreolus was born in 1380 in the French province Rouergue, probably at Rodez. He joined the Dominican order there (an affiliation of the province of Toulouse) and was assigned to lecture on the *Sentences* at Paris in 1407. In 1411–1412, he obtained the license in theology. Somewhere between 1412 and 1426, Capreolus was regent of studies at the convent of Toulouse. From 1426 on, he resided exclusively at Rodez and worked on the completion of his masterpiece. He died there on April 6, 1444. His surname "Capreolus/Cabrol" (which means "little goat") was common in the region of Rouergue. The honorific title "prince of Thomists" is testified in John Mair, though it is not entirely clear since when it was used in order to characterize Capreolus (Grabmann 1956).

His life's work is called *Defensiones theologiae Divi Thomae Aquinatis* (i.e., "vindications of Thomas Aquinas' theology"). In order to grasp Capreolus' intentions in writing a vindication of Aquinas' theology, one should bear in mind the intellectual situation at Paris at the end of the fourteenth and the beginning of the fifteenth centuries (Imbach in Bedouelle et al. 1997). There were sharp critiques against Thomas' way of thought. These critiques might have easily provoked the wish to defend one of the order's greatest scholars and saints in a young Dominican student. In referring back to Aquinas and defending his view in the fifteenth century against thinkers like William of Ockham, Adam Wodeham, and Gregory of Rimini, who Capreolus calls *moderni* or *terministae*, he tries to overcome the fourteenth-century thought. Moreover, by doing so, Capreolus contributes to the establishment or better labeling of two "ways"

of thought, namely the *via antiqua* and the *via moderna*, which became a common distinction later on (Müller 2004b).

Formally, Capreolus' vindication of Aquinas' theology follows Peter Lombard's *Sentences* in their structure and their general content. This means that the first book globally deals with God as such, the second with God's creation and its fall, the third with God as becoming part of His creation, namely with Christology, and the fourth book deals with the means by which creation finds its way back to God, namely with the sacraments and with the last things (*eschata*). All books are subdivided into distinctions and questions according to Lombard's text. A single question of the *Defensiones*, moreover, is generally subdivided into three articles. In the first one, Capreolus exposes several conclusions which are drawn from Aquinas' works. In the second one, he reports several objections against the aforementioned conclusions. Here Capreolus deals with texts from, for example, Peter Auriol, John Duns Scotus, Durand of St. Pourçain, John of Ripa, Guido Terreni, and Wodeham. In the third article, he argues against these objections by using texts from Aquinas or answers them in Thomas' way (*ad mentem Thomae*). Unlike Denys the Carthusian who never lectured on the *Sentences* but solely used the pattern of the *Sentences* as a blueprint for his encyclopedic treatment, Capreolus' *Sentences* commentary is connected with university teaching. Yet, only the first book was finished by the time his lectures at Paris ended (1409). The other three books were finished 1426, 1428, and 1432, respectively. Although it was not uncommon by the time to revise one's lectures for publication, Capreolus' working on his commentary for such a long period points to the later dissociation of the *Sentences* commentary and their function in university education, serving thus primarily as finding aids for philosophical and theological positions, respectively.

For Capreolus' autograph of the *Defensiones* is not extant any more, the modern Tournai edition of the *Defensiones* is based on the *editio princeps*, that is to say the Venice edition of 1483. This edition, however, has been corrected in some places according to later editions. One using this

edition should also know that some quotations, for example, those of Scotus, do not come from their original sources but are transmitted via Auriol's *Scriptum*.

When it comes to Capreolus' doctrinal positions, one has to refer to Aquinas' positions. In fact, John himself states in his prologue that he is inclined just to recite Aquinas' opinions and would add nothing of his own but occasionally (prol., q. 1; but see D'Ettore (2013) on Capreolus' reading of Aquinas' theory of analogy). In that perspective, John's work is located in two different traditions combining two different genres. He picks up the tradition of commenting upon Lombard's *Sentences* and connects it with another tradition, namely the defense of Aquinas against manifold critiques. As one of the first examples for the latter tradition, one finds the *Correctoria* which emerge as a literary genre just after the death of Aquinas. At the beginning of the fourteenth century, Hervaeus Natalis picked up the task to defend Aquinas' view in his *Defensio doctrinae fratris Thomae*. While these works solely discussed selected questions, Capreolus' *Defensiones* bring up almost all the topics which were dealt with by Peter Lombard. Moreover, Capreolus takes into account not only the major works of Aquinas, such as the *Summa theologiae* (as does Thomas of Vio Cajetan) or the *Summa contra gentiles* (as does Francesco de Ferrara or de Sylvestris), but refers also to the minor ones. In that way, Capreolus exposes merely all relevant positions in Aquinas' thought, being also aware of the possible development in Aquinas' ideas. Scholars throughout the centuries therefore used Capreolus' work to grasp Aquinas' position as well as to get an idea of the debates his views had evoked (as does, e.g., Thomas of Vio Cajetan) (Von Gunten in Bedouelle et al. 1997). This success is also witnessed by the four editions of the *Defensiones* (Venice 1483–1484; 1515; 1588, the fourth, scheduled for 1686, though never appeared), and by the many *compendia* of this commentary (Bedouelle in Bedouelle et al. 1997; Montagnes in Bedouelle et al. 1997).

In doctrinal matters, one might give five different examples which illustrate some of Capreolus'

philosophical or theological positions. (1) Although Capreolus starts from a double meaning of being, namely essential and existential being (*esse essentiae* and *esse existentiae*), he does not identify essence with existence and hence follows Aquinas' fundamental distinction in that respect (Hegyi 1959; Dewan in Bedouelle et al. 1997; Osborne 2013). Aquinas' understanding of participation functions as a background (D'Ettore 2014). Whereas in God, being and essence coincide, all other creatures have, in order to exist, to participate in being itself (*esse*). Wells (1960–1961), on the contrary, assumes that Capreolus only claims to follow Aquinas in his interpretation but in fact adopts Henry of Ghent's position (but see also Robertson 2014). (2) Other than often maintained, there is no real difference in position between Capreolus and the *moderni* in terms of God's omnipotence. The relation between language and reality rather plays a key role in distinguishing both approaches. Unlike the *moderni*, Capreolus understands the universals and predicaments not as mere sounds (*voces*), but sees them as in relation to extramental things. Thus, Capreolus adheres to a modest realism (Müller 2004a). (3) In accord with Aquinas and in contrast to other Thomists, Capreolus tries to demonstrate that theology is a science in the strict sense, thereby deviating from the stringent Aristotelian conception of science (Donneaud in Bedouelle et al. 1997). Whereas Aquinas, however, clearly defines science as a single *habitus* of the mind, some Thomists, including Capreolus, misinterpret Aquinas as to say that science is a totality of intelligible species (Maurer 1974). Finally, with respect to the relationship between theology and philosophy, Capreolus goes with Aquinas in accentuating their strong connection. In that matter, he opposes strictly a tendency at the time to depart philosophy from theology in order to strengthen theology (Müller 2004a). (4) In terms of cognition, Capreolus argues, for example, against Auriol's notion of *esse apparens*. This latter concept is introduced by Auriol to explain knowledge as the appearance of the known object to consciousness without further mediation. Hence, Auriol identifies intelligible species and

act of cognition. In contrast, Capreolus adopts a more traditional stance and therefore sticks to the real differentiation between impressed species, act of cognition, and mental word or expressed species. Capreolus affirms that the mental word is the terminus of the intellection and he defines it, unlike Auriol, as a quality of the intellectual power (Bonino in Bedouelle et al. 1997; Mahoney 2004). (5) In moral philosophy, Capreolus argues with Thomas and against fourteenth-century thinkers for the view that human virtues are habitual and that these habitual virtues are necessary to man. Yet it seems as if Capreolus adopts the distinction of Aquinas' opponents between natural and moral being, and hence breaks up with Aquinas' view that moral "habits" are grounded in natural inclinations to the good and the true (Pinckaers 2001).

Capreolus' *Defensiones* finally had a strong impact on future Thomists, such as Cajetan (Von Gunten in Bedouelle et al. 1997), Silvestro da Prierio, who even prepared a compendium of the *Defensiones*, and Petrus Negri (Tavuzzi in Bedouelle et al. 1997). But still in recent times scholars made or make use of Capreolus' *Defensiones* in order to study Thomas Aquinas better.

John Dumbleton

Edith D. Sylla

Department of History, North Carolina State University, Raleigh, NC, USA

Abstract

John Dumbleton's large *Summa of Logic and Natural Philosophy* is a superb exemplar of the state of teaching in the faculty of arts at Oxford in the second quarter of the fourteenth century. It covers several topics of logic and many of Aristotle's natural philosophical works, interspersed with the methods that were typical of the so-called Oxford Calculators. Unfortunately, the *Summa* has never been printed, although it exists in several large and handsome manuscript copies on the basis of which historians have analyzed about half of its contents so far.

Biographical Information

John Dumbleton is mentioned in the records of Merton College, Oxford University, in 1338 and again in 1347–1348. He was named as one of the original fellows of Queen's College in 1341, but likely went to Paris to study theology about that time. Dumbleton was a fellow of the Sorbonne at Paris probably between 1344 and 1347. One manuscript mentions "Master John Dumbleton, one time fellow of the Sorbonne, in his *Summa*..." Another manuscript refers to him as a bachelor of theology, so his theological education extended at least that far. It is thought that he died of the plague because nothing is heard of him after 1348.

Thought

Although there are a couple of very short works or parts of works ascribed to Dumbleton, his reputation is based almost entirely on his *Summa of Logic and Natural Philosophy*, which formed an important part of the basis of the doctoral

dissertations of James Weisheipl at Oxford in 1956 and of Edith Sylla at Harvard in 1970. Excerpts from the *Summa* can be found in the publications of these authors. The *Summa* was planned to have ten parts, but the tenth part, on Platonic forms, seems never to have been written. Most modern attention to the *Summa* has concentrated on Parts II through VI, which cover largely physical topics.

The contents of the *Summa* are described at the start of the work as follows:

- Part I. Logic beginning with the signification of terms, the imposition of terms by convention, and related matters. The next topic is what it means for something to be prior in knowledge to something else and what it means to be better known to us or to nature, with regard to distinct versus confused knowledge, universals versus particulars, and the parts of definitions versus what is defined. Later topics concern the principles of teaching and the intension and remission of credulity and science.
- Part II. First principles, matter and form. Substantial forms and how qualities are intended and remitted.
- Part III. On motion in the categories of place, quality, and quantity. On the causes of motion. How velocity is produced and caused. How alteration and augmentation are measured. The definitions of motion and time.
- Part IV. On the nature of the elements and their qualities. Whether each element has two qualities in the highest degree. The action and reaction of elements on each other. The relations of elemental and qualitative forms. Density and rarity and their variation. How the powers of natural bodies depend on their magnitudes. The relative weights of pure and mixed bodies.
- Part V. On spiritual action and light. Whether light belongs particularly to some element or compound. On the nature of the medium receiving a spiritual action such as light. On the variation of spiritual action in a medium. Whether spiritual agents act instantaneously or in time.
- Part VI. On the limits of active and passive powers. On the difficulty of action. On the

limits of the powers of natural bodies by their natural places. Do the powers of elemental forms seek rest as well as motion? On the motion of the heavens and their movers. On the limits of size of natural bodies. How some bodies are moved by an intrinsic mover and some are not.

- Part VII. In the preface, this part is said to discuss the cause of individuals and species of generable and corruptible things with regard to their numbers and the potencies of matter and agents. Whether the Prime Mover is of infinite power, and whether it has been proved by a physical argument that the world and motion had no beginning. In Part VII, as it actually exists in the manuscripts, Dumbleton discusses whether it can be proved by reason that there is an immobile Prime Mover and whether the possibility of a beginning to the world, to motion and to everything below the Prime Mover can be shown to be plausible (*probabile*) by natural reason. Finally, he raises the doubt whether everything corruptible must necessarily be corrupted at some point.
- Part VIII. On the generation of substances by like substances and of animals by complete animals and by putrefaction. On the numerical unity of the soul with respect to the sensitive and intelligible, and on the operations of the nutritive soul.
- Part IX. On material related to Aristotle's *On the Soul*, Book II, concerning the five senses.
- Part X. (probably never completed) On universals which are called "Ideas" by the Platonists and on the passive intellect. On the simple and complex operations of the human intellect.

Of these ten parts, a fair amount has been published describing Parts II–VI, and nearly nothing on Parts I and VII–IX (with X probably nonexistent). Since it is possible to go to the existing literature for discussions of Parts II–VI, and the description of Parts VII–IX would require preliminary investigation far beyond what is possible here, most of the rest of this article will be devoted to a description of Dumbleton's views as found in Part I, the task being made simpler by the existence of a transcription of Part I made by James

Weisheipl and held in the library of the Pontifical Institute of Medieval Studies in Toronto.

The actual content of Part I as preserved in MS Vatican City, Latin 6750 does not exactly follow the topics announced in the prologue, and moreover, contains some repetitions. With regard to the signification of terms, Dumbleton clearly states a nominalist or Ockhamist position. We learn our first terms, he says, by repeatedly hearing a word spoken while something in our field of vision is moved, drawing our attention to it. For instance, if we repeatedly see a person moving in our field of vision or being pointed out, while someone says the word "Socrates," we understand that "Socrates" is the name of that person. Perhaps the first term we learn is "bread," he says, as the infant repeatedly sees bread while the word "bread" is spoken and remembers this connection. In a similar way we learn the word "white." Things in the external world naturally cause intentions in the mind, but the matching between intentions in the mind and words is a matter of choice (*ad placitum*) and common usage. Two people sensing the same external thing may pick out different qualities, as one person notices that fire is hot and another that it is bright, so that further experience may be needed to match words to what they pick out in the external world. The foundation of knowledge is always the things and their properties in the external world, but it is the human intellect that combines and separates the terms corresponding to things in the external world (incomplex knowledge) into propositions (*complexe*) that can be true or false. If a person only knows words and not the intention in the mind and the thing in the world that the intention corresponds to, that person is ignorant. Of course as knowledge increases, humans eventually conclude that there are also insensible things in the world, for which terms are then imposed. Contrary to Plato, intentions of things and propositions exist only in the mind. (Dumbleton leaves the issue of how universal intentions differ from singular ones to the unfinished Part X). In Dumbleton's view we learn more easily from hearing a teacher's explanation, than we learn from sight.

Here, unannounced in the prologue, Dumbleton veers into an extensive discussion of

insolubles – propositions like the so-called liar paradox – making use of his discussion of the imposition of terms and of the status of propositions in reaching his own conclusions. This mini-treatise on insolubles, consisting of at least thirteen chapters, has so far not been noticed by historians writing the history of the liar paradox. Dumbleton begins by describing the four best-known opinions on insolubles of his time. In the taxonomy of positions set out by Paul Spade, the first two positions are what Thomas Bradwardine calls that of the *restringentes*, that is, of those who say that part of a proposition cannot refer to the whole proposition, and the position of Bradwardine himself, that an insoluble proposition signifies that it is both true and false. The third position, which Spade attributes to Roger Swyneshed, concludes that an insoluble sentence falsifies itself even though it signifies precisely as is the case. The fourth opinion, which Spade links with William Heytesbury, concludes that insoluble propositions do not have their ordinary significations. No more can be done here than to point out the existence of this section of the *Summa*, leaving it to other scholars to unravel Dumbleton's discussion, but even before that is done, two points can be made. Dumbleton's references to the famous positions on insolubles of his time help to cement the dating of the *Summa* after the relevant works of Thomas Bradwardine, Roger Swyneshed, and William Heytesbury. Secondly, the examples that Dumbleton uses make it abundantly clear that he was writing in a context in which extremely complex logical issues were being debated. Many of the insolubles Dumbleton discusses use letters to represent complex propositions embedded within other propositions. For instance A may be said to represent either "God exists" or "man is an ass," and then a respondent is supposed to say whether the proposition B, "I know that A is true," is true, false, or doubtful. Is proposition B insoluble? Or the case may be put that only those telling the truth will walk across the bridge, together with other possibly contradictory conditions. In short, all the techniques of solving sophismata found in William Heytesbury's *Rules for Solving Sophisms* may be called upon to unpack a proposition which may or may not be insoluble. There may be questions of

compounded or divided senses, of knowledge and doubt, of beginning and ceasing, and so forth, all interacting with each other and mixed up by the use of "arguments in terms" or the replacement of propositions by letters. Dumbleton tries to cut through these complications by using the conclusions of the earlier section that the meanings of terms depend on intentions in the mind, which in turn depend on things in the external world; that a person cannot understand the significance of a proposition without understanding the significance of the terms of the proposition; and that no decision can be made between knowing or doubting a proposition unless the proposition is first understood. He concentrates on what is true in a person's mind, not on the external representations of propositions in writing or otherwise, which helps resolve some difficulties. Here and there, what Dumbleton says seems to reflect the conditions of a dispute on obligations (*de obligationibus*), one of the common academic exercises at Oxford in this period. What should the respondent in an exercise of obligation do, if he is obliged to accept a case in which he does not understand one of the terms or one of the extremes of a proposition? How should he respond, for instance, if he has been directed to accept "This is a man," not knowing what or who "this" refers to? Dumbleton recommends that, to succeed in the exercise, the person so obligated should sometimes give a response that is not true in fact, but follows from the obligation he has accepted.

Dumbleton's discussion gradually evolves into one concerning sophismata on knowing and doubting (*sophismata de scire et dubitare*), in which Dumbleton uses prominently tools of analysis involving latitudes and degrees, intension and remission, the application of which to qualities like hot and cold or white and black in Parts II and III of the *Summa* has been studied in detail. Here the issue is, for instance, whether truth is analogous to the maximum degree of hotness in the sense that there are no degrees of truth, but only the whole truth and nothing but the truth. Then any proposition that is not absolutely true, but which might be considered a mixture of truth and falsehood, should be considered false. Could there be a proposition that is neither true nor false? If A is the proposition that God exists and that

God does not exist, then is it neither true nor false, just as a mixture of hot and cold is neither hot nor cold? Dumbleton concludes that A is false, because truth must be pure truth, and any mixture of the true and the false becomes false.

Next Dumbleton turns to the intension and remission of science and credulity, where he treats science and credulity as analogous to velocity, and the evidence for and against a proposition as analogous to forces causing and resisting that velocity. Much of the subject matter of Part I up to this point could be matched to subjects of the various books of Aristotle's *Organon*. This section involves issues dealt with by Aristotle especially in the *Posterior Analytics*. In a passage that is repeated at the end of Part I, Dumbleton distinguishes between first principles that are known in themselves and principles that are known by experience. First, principles that are true in virtue of their terms (or *per se nota*) are not doubted, except by fools, once the individual has learned the meaning of the terms. They are either known or not known and there is no wavering (*hesitatio*). But a person may increase or decrease in degree of knowledge or conviction (*credulitas*) with regard to principles that are known by experience and on the basis of evidence. While Dumbleton's application of the tools of analysis for the intension and remission of light or other qualities including speed to cases of knowledge, conviction, and doubt is not carried through consistently and completely, it is typical of the methodology of the so-called Oxford Calculators.

Finally, Dumbleton turns to what he had announced as his second topic, which comes directly from the *Posterior Analytics* together with Averroes' commentaries on Aristotle, namely, the question of what it means to say that something is better known to us or to nature. Here, the point is to explain Aristotle's intention, as well as to explore what is true. As Dumbleton reiterates several times, human knowledge comes from sense experience, and is derived *a posteriori*. Even geometry is not truly *a priori*, because geometry assumes and does not prove that points, lines, and surfaces exist, whereas these mathematical are known only from sense, as a plane is known as the surface of a body. There could be a universal science, which would include the

demonstration *a posteriori* of the principles of geometry, but geometry as we know it is a particular science, which does not include the demonstration from sense of its foundational principles.

Parts II–VI of the *Summa* are notable for alternating between summaries of the major points of Aristotle's physical works, on the one hand, and, on the other, expositions of the main analytical tools for which the Oxford Calculators are famous, particularly the use of mathematical proportions in describing motions and the analysis of the intension and remission of forms, using concepts of latitudes and degrees. For his discussion of the proportions of forces, resistances, and velocities in motions in the categories of place, quality, and quantity, Dumbleton assumes the theory put forth in Thomas Bradwardine's *On the Proportions of Velocities in Motions*, as well as some of the ideas of earlier Oxford Calculators, including Roger Swineshead and William Heytesbury, with his proof of the so-called Merton mean speed theorem. Infinity and continuity are frequently at issue in discussing the relations of degrees to latitudes, both of which are modeled mathematically by lines rather than points. For more detail on these subjects, see the works listed in the bibliography. Parts VIII and IX, on biology and psychology, which take up almost forty percent of the *Summa*, have yet to be studied in detail.

John Duns Scotus

Thomas Williams
Department of Philosophy, University of South
Florida, Tampa, FL, USA

Abstract

John Duns Scotus (1265/1266–1308) was one of the most important and influential philosopher-theologians of the High Middle Ages. His

brilliantly complex and nuanced thought, which earned him the nickname "the Subtle Doctor," left a mark on discussions of such disparate topics as the semantics of religious language, the problem of universals, divine illumination, and the nature of human freedom. This essay first lays out what is known about Scotus's life and the dating of his works. It then offers an overview of some of his key positions in four main areas of philosophy: natural theology, metaphysics, the theory of knowledge, and ethics and moral psychology.

Life and Works

"Scotus" identifies Scotus as a Scot. His family name was Duns, which was also the name of the Scottish village in which he was born, just a few miles from the English border. We do not know the precise date of his birth, but it is a reasonable conjecture that he was born between December 23, 1265 and March 17, 1266.

In the academic year 1298–1299, Scotus lectured at Oxford on the first two books of the *Sentences* of Peter Lombard. He began revising those lectures for publication almost immediately, probably completing his revisions to Book I in 1300. In 1302 Scotus left Oxford for Paris and lectured again on the *Sentences*, probably in the order Book I, Book IV, Book II, Book III; he completed his lectures in 1303. In June 1303, Scotus was expelled from France along with 80 other friars for taking the Pope's side in a dispute with the king. They were allowed to return in April 1304. On November 18, 1304 Scotus was nominated as Franciscan regent master in theology at Paris, taking up the post in early 1305. In 1307 he was transferred to the Franciscan *studium* at Cologne, probably beginning his duties as lecturer in October. He died there in 1308; the date of his death is traditionally given as November 8.

It is generally agreed that Scotus's earliest works were his logical works: questions on Porphyry's *Isagoge* and Aristotle's *Categories*, *Peri hermeneias* (two sets), and *De sophisticis elenchis*. These probably date to around 1295; the *Quaestiones super De anima* is also very

likely an early work. Scotus's other Aristotelian commentary, the *Quaestiones super libros Metaphysicorum Aristotelis*, seems to have been started early; but Book 9 is probably late, and it is possible that Books 6 through 9 are all late or were at least revised later in Scotus's career. Scotus also wrote an *Expositio* on Aristotle's *Metaphysics*.

We have three distinct versions of Scotus's lectures on the *Sentences*. Of these, the *Ordinatio* (i.e., a version prepared for publication by the author himself) of lectures at Oxford, based in part on earlier lecture notes (the *Lectura*) and on material from his lectures in Paris, is generally taken to be Scotus's premier work; the critical edition of the *Ordinatio* was completed in 2013. Scotus seems to have been revising the *Ordinatio* up to his death. Scotus's lectures in Paris also survive in the form of *Reportationes* (student reports). The most important is the *Reportatio examinata* of Book 1; the designation *examinata* indicates that it was examined and corrected by Scotus himself. The *Reportatio examinata* is in the process of being critically edited.

In addition to these works, we have 46 short disputations called *Collationes* dating from 1300–1305, a late work in natural theology called *De primo principio*, and *Quaestiones quodlibetales* from Scotus's days as regent master (between Lent 1305 and Lent 1307). Finally, there is a work called *Theoremata*. Though doubts have been raised about its authenticity, the recent critical edition accepts it as a genuine work of Scotus.

Natural Theology

Scotus agrees with Thomas Aquinas that all our knowledge of God starts from creatures, and that as a result we can only prove the existence and nature of God by an argument *quia* (reasoning from effect to cause), not by an argument *propter quid* (reasoning from essence to characteristic). Aquinas and Scotus further agree that, for that same reason, we cannot know the essence of God in this life. The main difference between the two authors is that Scotus believes we can apply certain predicates univocally – with exactly the same meaning – to God and creatures, whereas

Aquinas insists that this is impossible, and that we can only use analogical predication, in which a word as applied to God has a meaning different from, although related to, the meaning of that same word as applied to creatures.

Scotus has a number of arguments for univocal predication and against the doctrine of analogy (*Ordinatio* 1, d. 3, pars 1, q. 1–2, nn. 26–55). He draws one of them from Anselm. Consider all nonrelative predicates, Anselm says. (We exclude relative predicates because no relative predicate expresses the nature of a thing as it is in itself.) Let *F* be our predicate variable. For any *F*, either (a) it is in every respect better to be *F* than not to be *F* or (b) it is in some respect better to be not-*F* than *F*. A predicate will fall into the second category if and only if it implies some sort of limitation or deficiency. Anselm's argument is that we can (indeed must) predicate of God every predicate that falls into the first category, and that we cannot predicate of God any predicate that falls into the second (except metaphorically, perhaps). Scotus agrees with Anselm on this point (as did Aquinas: see *SCG* I.30). Scotus has his own terminology for whatever it is in every respect better to be than not to be. He calls such things “pure perfections” (*perfectiones simpliciter*). A pure perfection is any predicate that does not imply limitation.

So Scotus claims that pure perfections can be predicated of God. But he takes this a step further than Anselm. He says that they have to be predicated univocally of God; otherwise the whole business of pure perfections will not make any sense. For if we are going to use Anselm's test, we must first come up with our concept – say, of good. Then we examine the concept to see whether it is in every respect better to be good than not-good. We realize that it is, and so we predicate “good” of God. That test will not work unless it is the same concept that we are applying in both cases.

Not only can we come up with concepts that apply univocally to God and creatures, we can even come up with a proper (distinctive) concept of God. Granted, there is one sense in which we cannot have a proper concept of God in this life: we cannot know his essence as a particular thing. We know God through general concepts that can

apply both to him and to other things. In another sense, though, we can have a proper concept of God, that is, one that applies only to God. If we take any of the pure perfections to the highest degree, they will be predicable of God alone. Better yet, we can describe God more completely by taking all the pure perfections in the highest degree and attributing them all to him.

But these are all composite concepts; they all involve putting two quite different notions together: “highest” with “good,” “first” with “cause,” and so on. Scotus says that we can come up with a relatively simple concept that is proper to God alone, the concept of “infinite being.” Now that concept might seem to be every bit as composite as “highest good” or “first cause,” but it is really not. For “infinite being” is a concept of something essentially one: a being that has infinity (unlimitedness) as its intrinsic way of existing. I will return to the crucial role of the concept of infinite being in Scotus’s natural theology after I examine his proof of the existence of God.

Scotus’s argument for the existence of God is rightly regarded as one of the most outstanding contributions ever made to natural theology. The argument is enormously complex, with several subarguments for almost every important conclusion, and I can offer only a sketch of it here. (Different versions of the proof are given at *Lectura* 1, d. 2, q. 1, nn. 38–135; *Ordinatio* 1, d. 2, q. 1, nn. 39–190; *Reportatio* 1, d. 2, q. 1; and *De primo principio*.)

Scotus begins by arguing that there is a first agent (a being that is first in efficient causality). Consider first the distinction between essentially ordered causes and accidentally ordered causes. In an accidentally ordered series, the fact that a given member of that series is itself caused is accidental to that member’s own causal activity; in an essentially ordered series, by contrast, the causal activity of later members of the series depends essentially on the causal activity of earlier members. Scotus argues that any effect must be produced by something else, and since there can be no infinite regress in an essentially ordered series of causes, there must be a first agent – an agent that is first among efficient causes. Scotus then

goes on to argue that there is an ultimate goal of activity (a being that is first in final causality), and a maximally excellent being (a being that is first in what Scotus calls “preeminence”).

Thus, he has proved what he calls the “triple primacy”: there is a being that is first in efficient causality, in final causality, and in preeminence. Scotus next proves that the three primacies are coextensive: that is, any being that is first in one of these three ways will also be first in the other two ways. Scotus then argues that a being enjoying the triple primacy is endowed with intellect and will, and that any such being is infinite. Finally, he argues that there can be only one such being.

The concept *infinite being* has a privileged role in Scotus’s natural theology. For Scotus, infinity is not only what is ontologically central about God, it is the key component of our best available concept of God and a guarantor of the success of theological language. That is, our best ontology, far from fighting with our theological semantics, both supports and is supported by our theological semantics. The doctrine of univocity rests in part on the claim that “[t]he difference between God and creatures, at least with regard to God’s possession of the pure perfections, is ultimately one of degree” (Cross 1999: 39). Remember Scotus’s argument for univocity: if we are to follow Anselm in ascribing to God every pure perfection, we have to affirm that we are ascribing to God the very same thing that we ascribe to creatures. God has it infinitely, creatures in a limited way.

Scotus criticizes Aquinas’s conception of infinity as purely negative and relational. The infinite, for Aquinas, is that which is not bounded by something else. But Scotus thinks we can have a positive conception of infinity, according to which infinity is not a negative, relational property, but instead, a positive, intrinsic property: an “intrinsic degree of perfection.” It helps, Scotus says, to think of some quality (say, goodness) as existing infinitely: so that there is, as it were, no more goodness that you could add to that goodness to make it any greater. That is infinite goodness. The specific degree of goodness of a thing is an intrinsic, nonquantitative feature of that thing. Infinite being is just like that; it is “a measure of intrinsic

excellence that is not finite.” This is why the concept of “infinite being” is the simplest concept available to us for understanding God. Infinity is not an accidental addition to being, but an intrinsic mode of being. Of course, if this is right, then the concepts of “infinite goodness,” “infinite power,” and so forth are every bit as simple as the concept of “infinite being.” But “infinite being” is of particular interest because it “virtually contains” all the other infinite perfections of God. That is, we can deduce the other infinite perfections from infinite being. So besides being the next best thing to a simple concept, it is the most theoretically fruitful concept we can have of God in this life.

Metaphysics

Metaphysics, according to Scotus, is a “real theoretical science”: it is real in that it treats things rather than concepts, theoretical in that it is pursued for its own sake rather than as a guide for doing or making things, and a science in that it proceeds from self-evident principles to conclusions that follow deductively from them. The various real theoretical sciences are distinguished by their subject matter, and Scotus devotes considerable attention to determining what the distinctive subject matter of metaphysics is. His conclusion is that metaphysics concerns “being qua being” (*ens inquantum ens*). That is, the metaphysician studies being simply as such, rather than studying, say, material being as material.

The study of being qua being includes, first of all, the study of the transcendentals, so called because they transcend the division of being into finite and infinite, and the further division of finite being into the ten Aristotelian categories. Being itself is a transcendental, and so are the “proper attributes” of being – one, true, and good – which are coextensive with being. Scotus also identifies an indefinite number of disjunctions that are coextensive with being and therefore count as transcendentals, such as infinite-or-finite and necessary-or-contingent. Finally, all the pure perfections are transcendentals, since they transcend the division of being into finite and infinite.

Unlike the proper attributes of being and the disjunctive transcendentals, however, they are not coextensive with being. For God is wise and Socrates is wise, but earthworms – though they are certainly beings – are not wise.

The study of the Aristotelian categories also belongs to metaphysics insofar as the categories, or the things falling under them, are studied as beings. (If they are studied as concepts, they belong instead to the logician. For Scotus’s logical treatment of the categories, see Pini 2002.) There are exactly ten categories, Scotus argues. The first and most important is the category of substance. Substances are beings in the most robust sense, since they have an independent existence: that is, they do not exist in something else. Beings in any of the other nine categories, called accidents, exist in substances. The nine categories of accidents are quantity, quality, relation, action, passion, place, time, position, and state (*habitus*).

Scotus follows the Aristotelian orthodoxy of his day, which identified matter as what persists through substantial change and substantial form as what makes a given parcel of matter the definite, unique, individual substance that it is. (There are also accidental forms, which are a substance’s accidental qualities.) But as Scotus elaborates his views on form and matter, he espouses three important theses that mark him off from some other philosophers of his day: he holds that there exists matter that has no form whatsoever, that not all created substances are composites of form and matter, and that one and the same substance can have more than one substantial form. Let us examine each of these theses in turn.

First, Scotus argues that there is matter that is entirely devoid of form, or what is known as “prime matter” (*Quaestiones in libros Metaphysicorum* 7, q. 5; *Lectura* 2, d. 12, q. un.). Scholars debate now (just as they debated in Scotus’s day) whether Aristotle himself really believed that there is prime matter or merely introduced it as a theoretical substratum for substantial change, believing instead that in actual fact matter always has at least some minimal form (the form of the elements being the most minimal of all). Aquinas denied both that Aristotle intended to posit it and that it could exist on its own. For

something totally devoid of form would be utterly featureless; it would be pure potentiality, but not actually anything. Scotus, by contrast, argues that prime matter not only can but does exist as such: “it is one and the same stuff that underlies every substantial change” (King 2003).

Second, Scotus denies “universal hylemorphism,” the view that all created substances are composites of form and matter (*Lectura* 2, d. 12, q. un., n. 55). Universal hylemorphism (from the Greek *hyle*, meaning “matter” and *morphe*, meaning “form”) had been the predominant view among Franciscans before Scotus. Saint Bonaventure, for example, had argued that even angels could not be altogether immaterial; they must be compounds of form and “spiritual matter.” For matter is potentiality and form is actuality, so if the angels were altogether immaterial, they would be pure actuality without any admixture of potentiality, whereas in fact only God is pure actuality. But as we have already seen in his affirmation of the existence of prime matter, Scotus simply denies the unqualified equation of matter with potentiality and form with actuality. Prime matter, though entirely without form, is actual; and a purely immaterial being is not automatically bereft of potentiality.

Third, Scotus holds that some substances have more than one substantial form (*Ordinatio* 4, d. 11, q. 3, n. 54). This doctrine of the plurality of substantial forms was commonly held among the Franciscans but vigorously disputed by others. We can very easily see the motivation for the view by recalling that a substantial form is supposed to be what makes a given parcel of matter the definite, unique, individual substance that it is. Now suppose, as many medieval thinkers (including Aquinas) did, that the soul is the one and only substantial form of the human being. It would then follow that when a human being dies, and the soul ceases to inform that parcel of matter, what is left is not the same body that existed just before death. For what made it that very body was its substantial form, which (*ex hypothesi*) is no longer there. When the soul is separated from the body, then, what is left is not a body, but just a parcel of matter arranged corpse-wise. To Scotus and many of his

fellow Franciscans it seemed obvious that the corpse of a person is the very same body that existed before death. Moreover, they argued, if the only thing responsible for informing the matter of a human being is the soul, it would seem that (what used to be) the body should immediately dissipate when a person dies. (There was a theological reason as well: what lay in Joseph of Arimathea's tomb from Good Friday until Easter morning had to be Jesus' body, and not just something that used to be Jesus' body; and what happened on Easter morning was resurrection, not reincarnation.) Accordingly, Scotus argues that the human being has at least two substantial forms. There is the “form of the body” (*forma corporeitatis*) that makes a given parcel of matter to be a definite, unique, individual human body, and the “animating form” or soul, which makes that human body alive. At death, the animating soul ceases to vivify the body, but numerically the same body remains, and the form of the body keeps the matter organized, at least for a while. Since the form of the body is too weak on its own to keep the body in existence indefinitely, however, it gradually decomposes.

While Scotus's account of form and matter has clear implications for what happens to the body at death, it is less forthcoming about what happens to the soul. Can the animating soul survive the death of the body it informs? Scotus considers a number of arguments for the incorruptibility of the human soul, but he finds none of them persuasive. This is not to say that he denies the immortality of the soul, of course, but that he does not think it can be proved by human reason unaided by revelation.

Another metaphysical topic on which Scotus defends a distinctive position is the problem of universals. The problem of universals may be thought of as the question of what, if anything, is the metaphysical basis of our using the same predicate for more than one distinct individual. Socrates is human and Plato is human. Does this mean that there must be some one universal reality – humanity – that is somehow repeatable, in which Socrates and Plato both share? Or is there nothing metaphysically common to them at all? Those who think there is some actual universal

existing outside the mind are called realists; those who deny extramental universals are called nominalists.

Scotus was a realist about universals, and like all realists he had to give an account of what exactly those universals are: what their status is, what sort of existence they have outside the mind. So, in the case of Socrates and Plato, the question is “What sort of item is this humanity that both Socrates and Plato exemplify?” A related question that realists have to face is the problem of individuation. Given that there is some extramental reality common to Socrates and Plato, we also need to know what it is in each of them that makes them distinct exemplifications of that extramental reality.

Scotus calls the extramental universal the “common nature” (*natura communis*) and the principle of individuation the “haecceity” (*haecceitas*). The common nature is common in that it is “indifferent” to existing in any number of individuals. But it has extramental existence only in the particular things in which it exists, and in them it is always “contracted” by the haecceity. So the common nature humanity exists in both Socrates and Plato, although in Socrates it is made individual by Socrates’ haecceitas and in Plato by Plato’s haecceitas. The humanity-of-Socrates is individual and non-repeatable, as is the humanity-of-Plato; yet humanity itself is common and repeatable, and it is ontologically prior to any particular exemplification of it (*Ordinatio* 2, d. 3, pars 1, qq. 1–6, translated in Spade (1994: 57–113)).

Another important aspect of Scotus’s contributions to metaphysics is his theory of modality. Scotus offers the first systematic exposition of an intensionalist account of possibility and necessity (see the entry on ► [Modal Theories and Modal Logic](#) in this volume). A key element of his theory is the notion of synchronic alternative possibilities, derived from Peter John Olivi: that if a state of affairs *S* obtains contingently at a time *t*, there is a genuine (though of course unrealized) possibility that not-*S* obtain at *t*. Scotus finds application for this theory not only in his account of God’s relation to the created world but also in his theory of human freedom.

Theory of Knowledge

Scotus adopts the standard medieval Aristotelian view that human beings alone, among the animals, have two different sorts of cognitive powers: senses and intellect. The senses differ from the intellect in that they have physical organs; the intellect is immaterial. In order for the intellect to make use of sensory information, therefore, it must somehow take the raw material provided by the senses in the form of material images and make them into suitable objects for understanding. This process is known as abstraction, from the Latin *abstrahere*, which is literally “to drag out.” The intellect pulls out the universal, as it were, from the material singular in which it is embedded. This activity is performed by the active or agent intellect, which takes the “phantasms” derived from sense experience and turns them into “intelligible species.” Those species are actualized in the possible or receptive intellect, whose function is to receive and then store the intelligible species provided by the active intellect. Scotus denies that the active and passive intellect are really distinct. Rather, there is one intellect that has these two distinct functions or powers.

Phantasms do not, however, become irrelevant once the intelligible species has been abstracted. Scotus holds (just as Aquinas had held) that the human intellect never understands anything without turning toward phantasms (*Lectura* 2, d. 3, pars 2, q. 1, n. 255). That is, in order to deploy a concept that has already been acquired, one must make some use of sensory data – although the phantasms employed in using a concept already acquired need not be anything like the phantasms from which that concept was abstracted in the first place. I acquired the intelligible species of dog from phantasms of dogs, but I can make use of that concept now not only by calling up an image of a dog but also by (say) imagining the sound of the Latin word for dog. Scotus’s point is simply that there must be some sensory context for any act of intellectual cognition.

And even that point is not quite as general as my unqualified statement suggests. For one thing, Scotus believes that our intellect’s need for

phantasms is a temporary state. It is only in this present life that the intellect must turn to phantasms; in the next life we will be able to do without them. For another thing, Scotus may have thought that even in this life we enjoy a kind of intellectual cognition that bypasses phantasms. He called it “intuitive cognition.”

Scotus understands intuitive cognition by way of contrast with abstractive cognition. Abstractive cognition involves a universal, and a universal as such need not be exemplified. That is, my intelligible species of dog only tells me what it is to be a dog; it does not tell me whether any particular dog actually exists. Intuitive cognition, by contrast, “yields information about how things are right now” (Pasnau 2003). Sensory cognition, as Scotus explicitly acknowledges, counts as intuitive cognition on this account. It is, after all, quite uncontroversial that my seeing or hearing a dog gives me information about some particular dog as it exists when I see or hear it. Scotus’s much bolder claim concerns intellectual intuitive cognition, by which the intellect cognizes a particular thing as existing at that very moment. Intellectual intuitive cognition does not require phantasms; the cognized object somehow just causes the intellectual act by which its existence is made present to the intellect. Robert Pasnau characterizes intellectual intuitive cognition, so described, as in effect a “form of extrasensory perception” (Pasnau 2003). Richard Cross replies that such a characterization is not apt, arguing instead that intuitive intellectual cognition requires sensation (Cross 2014).

In some places Scotus seems to think of this sort of intuitive cognition as a mere theoretical possibility, but in others he argues vigorously for the reality of intellectual intuitive cognition. Indeed, in the latter sorts of passages it becomes clear that intuitive cognition is quite pervasive in human thought. (For three different takes on what to make of Scotus’s apparently conflicting signals on this matter, see Day 1947, Pasnau 2003, and Wolter 1990a.) He argues, for example, that since the intellect engages in reasoning that makes reference to the actual existence of particular sensible objects, it must know that they exist. Abstractive cognition, of course, cannot provide

such knowledge. Moreover, without intuitive cognition I could never know about my own intellectual states. Abstractive cognition could provide me with an abstract concept of thinking about Scotus, but I need intuitive cognition to know that I am in fact exemplifying that concept right this minute.

If these arguments represent Scotus’s considered views on intuitive cognition, then Scotus is making a bold exception to the general rule that in this life the intellect acquires knowledge only by turning to phantasms. It would seem that he has little choice, given the importance he attaches to our intuitive self-knowledge in his attack on skepticism. For our intellect is immaterial, as are its acts, and it is difficult to see how an immaterial act can be captured in a sensory phantasm. Even so, Scotus is enough of an Aristotelian about the functioning of our intellect on this side of heaven to insist that even though our brute acquaintance with those acts is independent of phantasms, the descriptions under which we know those acts must be capable of being captured in a phantasm. And our intuitive cognition of extramental singulars extends only to material singulars, that is, those that are capable of being captured in a phantasm. Scotus consistently denies that we can have intuitive cognition of nonsensible objects (such as angels) or universals in this life.

Scotus argues that the human intellect is capable of achieving certainty in its knowledge of the truth simply by the exercise of its own natural powers, with no special divine help. He therefore opposes both skepticism, which denies the possibility of certain knowledge, and illuminationism, which insists that we need special divine illumination in order to attain certainty. He works out his attack on both doctrines in the course of a reply to Henry of Ghent in *Ordinatio* 1, d. 3, pars 1, q. 4. (For the text and translation, see Wolter 1987: 96–132.) Henry had argued that the natural cognitive powers of human beings are deficient in various ways that mean that certainty can be attained only by divine illumination. Scotus argues that if Henry is right about the limitations of our natural powers, even divine illumination is not enough to save us from pervasive uncertainty. So Henry’s arguments, far from showing that

certainty is possible through divine illumination, actually lead to a pervasive skepticism. Scotus counters that we can show that skepticism is false. We can in fact attain certainty, and we can do so by the unaided exercise of our natural intellectual powers. There are four types of knowledge in which infallible certainty is possible. First, knowledge of first principles is certain because the intellect has only to form such judgments to see that they are true. (And since the validity of proper syllogistic inference can be known in just this way, it follows that anything that is seen to be properly derived from first principles by syllogistic inference is also known with certainty.) Second, we have certainty with respect to quite a lot of causal judgments derived from experience. Third, Scotus says that many of our own acts are as certain as first principles. It is no objection to point out that our acts are contingent, since some contingent propositions must be known immediately (that is, without needing to be derived from some other proposition). For otherwise, either some contingent proposition would follow from a necessary proposition (which is impossible), or there would be an infinite regress in contingent propositions (in which case no contingent proposition would ever be known). Fourth, certain propositions about present sense experience are also known with certainty if they are properly vetted by the intellect in the light of the causal judgments derived from experience.

Ethics and Moral Psychology

For Scotus the natural law in the strict sense contains only those moral propositions that are *per se notae ex terminis* along with whatever propositions can be derived from them deductively (*Ordinatio* 3, d. 37, q. un.). *Per se notae* means that they are self-evident; *ex terminis* adds that they are self-evident in virtue of being analytically true. Now one important fact about propositions that are self-evident and analytically true is that God himself cannot make them false. They are necessary truths. So the natural law in the strict sense does not depend on God's will. This means that even if (as I believe) Scotus is some sort of

divine-command theorist, he is not whole-hog in his divine command theory. Some moral truths are necessary truths, and even God cannot change those. They would be true no matter what God willed.

Which ones are those? Scotus's basic answer is that they are the commandments of the first tablet of the Decalogue (Ten Commandments). The Decalogue was thought of as involving two tablets, the first covering our obligations to God and the second our obligations toward others. The commandments of the first tablet are part of the natural law in the strict sense because they have to do with God himself. For Scotus says that the following proposition is *per se nota ex terminis*: "If God exists, then he is to be loved as God, and nothing else is to be worshiped as God, and no irreverence is to be done to him." Given the very definition of God, it follows that if there is such a being, he is to be loved and worshiped, and no irreverence should be shown to him. Because these commandments are self-evident and analytic, they are necessary truths. Not even God himself could make them false.

But even the first three commandments, once we start looking at them, are not obviously part of the natural law in the strict sense. In particular, the third commandment, the one about the Sabbath day, is a little tricky. Obviously, the proposition "God is to be worshiped on Saturday" is not self-evident or analytic. In fact, Scotus says it is not even true anymore, since Christians are to worship on Sunday, not Saturday. So, Scotus asks, what about the proposition "God is to be worshiped at some time or other?" Even that is not self-evident or analytic. The best one can do is "God is not to be hated." Now that is self-evident and analytic, since by definition God is the being most worthy of love and there is nothing in him worthy of hate. But obviously that is far weaker than any positive commandment about whether and when we should worship God.

So by the time Scotus completes his analysis, we are left with nothing in the natural law in the strict sense except for negative propositions: God is not to be hated, no other gods are to be worshiped, no irreverence is to be done to him. Everything else in the Decalogue belongs to the natural law in a weaker or looser sense. These are

propositions that are not *per se notae ex terminis* and do not follow from such propositions, but are “highly consonant” with such propositions. Now the important point for Scotus is this: since these propositions are contingent, they are completely up to God’s discretion. Any contingent truth whatsoever depends on God’s will. Moreover, there is nothing that constrains or forces God to will in one way rather than another.

Scotus quite self-consciously puts forward his understanding of freedom as an alternative to Aquinas’s. According to Aquinas, freedom comes in simply because the will is intellectual appetite rather than mere sense appetite. Intellectual appetite is aimed at objects as presented by the intellect and sense appetite at objects as presented by the senses. Sense appetite is not free because the senses provide only particulars as objects of appetite. But intellectual appetite is free because the intellect deals with universals, not particulars. Since universals by definition include many particulars, intellectual appetite will have a variety of objects. Consider goodness as an example. The will is not aimed at this good thing or that good thing, but at goodness in general. Since that universal goodness contains many different particular things, intellectual appetite has many different options.

But Scotus insists that mere intellectual appetite is not enough to guarantee freedom in the sense needed for morality. The basic difference comes down to this. When Aquinas argues that intellectual appetite has different options, he seems to be thinking of this over a span of time. Right now the intellect presents *x* as good, so I will *x*; but later on the intellect presents *y* as good, so then I will *y*. But Scotus thinks of freedom as involving multiple options at the very moment of choice. It is not enough to say that now I will *x*, but later I can will *y*. We have to say that at the very moment at which I will *x*, I also am able to will *y*. (Thus Scotus’s account of freedom depends on the notion of synchronic contingency set forth above in the section on metaphysics.) Aquinas’s arguments do not show that intellectual appetite is free in this stronger sense. So as far as Scotus is concerned, Aquinas has not made room for the right kind of freedom.

This is where Scotus brings in his well-known doctrine of the two affections of the will (see especially *Ordinatio* 2, d. 6, q. 2; 2, d. 39, q. 2; 3, d. 17, q. un.; and 3, d. 26, q. un.). The two affections are fundamental inclinations in the will: the *affectio commodi*, or affection for the advantageous, and the *affectio iustitiae*, or affection for justice. Scotus identifies the *affectio commodi* with intellectual appetite. For Aquinas, intellectual appetite is the same thing as will, whereas for Scotus, intellectual appetite is only part of what the will is, because he does not see how intellectual appetite could be genuinely free. *Affectio iustitiae* is the will as free.

For Aquinas the norms of morality are defined in terms of their relationship to human happiness. We have a natural inclination toward our good, which is happiness, and it is that good that determines the content of morality. So like Aristotle, Aquinas holds a eudaimonistic theory of ethics: the point of the moral life is happiness. That is why Aquinas can understand the will as an intellectual appetite for happiness. All of our choosing is aimed at the human good (or at least, it is aimed at the human good as we conceive it). And choices are good – and, indeed, fully intelligible – only when they are aimed at the ultimate end, which is happiness. So Aquinas just defines the will as the capacity to choose in accordance with a conception of the human good – in other words, as intellectual appetite.

When Scotus rejects the idea that will is merely intellectual appetite, he is saying that there is something fundamentally wrong with eudaimonistic ethics. Morality is not tied to human flourishing at all. For it is Scotus’s fundamental conviction that morality is impossible without libertarian freedom, and since he sees no way for there to be libertarian freedom on Aquinas’s eudaimonistic understanding of ethics, Aquinas’s understanding must be rejected. And just as Aquinas’s conception of the will was tailor-made to suit his eudaimonistic conception of morality, Scotus’s conception of the will is tailor-made to suit his anti-eudaimonistic conception of morality. It is not merely that he thinks there can be no genuine freedom in mere intellectual appetite. It is also that he rejects the idea that moral

norms are intimately bound up with human nature and human happiness. The fact that God creates human beings with a certain kind of nature does not require God to command or forbid the actions that he in fact commanded or forbade. The actions he commands are not necessary for our happiness, and the actions he forbids are not incompatible with our happiness. Now if the will were merely intellectual appetite – that is, if it were aimed solely at happiness – we would not be able to choose in accordance with the moral law, since the moral law itself is not determined by any considerations about human happiness. So in addition to the *affectio commodi*, which is the will as intellectual appetite, Scotus must also posit an *affectio iustitiae*, which is the will as free. In virtue of the *affectio iustitiae*, the will can choose in accordance with the moral law and does not function deterministically as an appetite aimed exclusively at the human good as conceived by the intellect.

John Fortescue

Stephen E. Lahey
Department of Classics and Religious Studies,
University of Nebraska, Lincoln, NE, USA

Abstract

Sir John Fortescue (c. 1397–1479), jurist and political theorist, is significant for a notably English interpretation of Aristotelian political theory in his distinction between royal and political dominion, for his development of the abstract idea of the crown as the corporate personification of the realm, and for his defense of English common law as against the Roman law jurisprudence of the continent.

Life

Fortescue was active in the service of Henry VI. He wrote treatises in support of the House of Lancaster during its years of conflict with the House of York and was a skilled propagandist as well as the Chief Justice of the King's Bench.

Thought

Two of Fortescue's works have been important for the development of English jurisprudence and for political philosophy. *De laudibus legum Angliae* (1468–1471), presented the advantages of the

English common law over the Roman law used on the continent, with particular attention to France. Especially, notable in *De laudibus* is Fortescue's assertion of the presumption of innocence, "I should, indeed, prefer twenty guilty men to escape death through mercy, than one innocent to be condemned unjustly" (*De laudibus* 27, Lockwood 1997: 41).

De dominio regale et politico (1471) articulates the distinction between royal dominion, the sovereignty of a king, and political dominion, in which king and people function together in legislation and governance in a "mystical body" of the realm. Fortescue's conception of these two distinct species of dominion is based in scholastic Aristotelian political thought, particularly as articulated in the *De regimine principum* begun by Thomas Aquinas and completed by his student Ptolemy of Lucca. The Aristotelian concepts of justice and polity were "Englished" when Fortescue introduced the tradition of English common law and the concept of the crown as the corporate entity of the British realm. The idea of the crown as the corporate person expressing the sovereignty of the collective body of the realm, protected and nurtured by the living bodily king and people, had begun to develop in the thought of Henry of Bracton in the thirteenth century. It would continue to develop into the sixteenth century, and Fortescue's use of it in describing the *dominium politicale* that made the English system distinct from continental kingship contributed significantly to the idea.

In Fortescue's distinction between royal and political dominion, royal dominion is based on conquest, with the conqueror subjecting the vanquished to justice as he defines it, eliminating their possible participation in, and contribution to, its development and nourishment. The inevitable result of this is tyranny. According to Fortescue, the best example of purely royal dominion and the strict limits it puts on justice for the people is the French system of rule. While it may have begun as political dominion, the constant threats posed by war with England and the inability of French kings to marshal sufficient support from within to meet these threats caused it to degenerate into its present form, in which the king rules on his

own behalf. The French people live in poverty, despite inhabiting a fertile land, and they have scant hope for justice under the Roman system of law, which depends upon the wisdom and jurisprudence of its royal executive.

The origins of political dominion, on the other hand, are found in a joint agreement of people to the rule of a king that is both royal and political. In this combined model, the king exercises royal rule in the execution of his responsibilities to protect the realm from external threat and internal divisions, but he lacks the power to alter the established system of justice or to change the laws of the realm. This power rests in political dominion, which is held jointly by the king and the people. In describing political dominion, Fortescue harkens back to the rule of the Judges in Israel, to an idealized imperial Roman structure, and to the legend of Brutus as the founder of England popularized in Geoffrey of Monmouth's *History of the Kings of Britain*.

In both, royal and political dominion, the system of government is determined by historical origin. In the case of political dominion, the origin resembles the modern model of social contract, but with two important distinctions. Although the people enter into a design by their own agreement, in which a king rules by laws peculiar to their identity, the design is not that of a trust, as in Lockean political theory, nor are the people wholly incapable of self-direction, as in Hobbes.

The organic model of kingship, with the king as head and the people as the members of the body, was a commonplace in medieval political thought. Fortescue's innovation was to describe political dominion in its terms. He began by describing the heart of the body as the intention of the people. His term, *intencio populi*, has been mistranslated as "will of the people," which too easily suggests an autonomy that the people have in fact surrendered in entering the "mystical body" of government. The king, not the people, provides the body its will. The intention precedes the deliberation, which precedes the willing in Fortescue's model. The desires and ideas of the people serve as the intention, the king's reasoned consideration of these – dependent upon royal council – serves as deliberation, and the royal

action articulates the will of the body politic. Were the former two elements to be absent, the result would be simple royal dominion. The heart distributes the blood, which Fortescue describes as the political provision for the interests of the people, which nourishes all the members of the body and strengthens the sinews, the laws that bind the body together. The body that results is not merely the sum of its parts. Fortescue describes a "mystical body" of the realm, a corporate being, personified in the crown that survives damage done to its members. He gives the analogy of a college, in which laity and clergy are joined together under the guidance of a governing element into a corporate person, a *collegium*. Just as the college endures despite matriculation and graduation and changes in administration remaining a separate entity apart from its members, so, too does the crown.

An important result of Fortescue's version of the mystical body of the realm is that the king is incapable of doing evil. In Augustinian theology, evil is an absence, or privation of good, which means that choosing evil is choosing a nonbeing, a detraction from, rather than use of, the will's power. Willing evil, then, becomes an impotence, a privation of the will's power. This is most particularly the case for angelic wills, unstained by original sin; the angelic rebellion was effectively a surrender of angelic power. Likewise, Fortescue describes tyranny as a privation, a *privatio potestatis* in his analogy of the king as embodying the realm's will, suggesting that the mystical body is more angelic than human. Earlier medieval political theorists might use this as an opportunity to discuss the place of the church in the political structure, but Fortescue speaks little of ecclesiastical matters and never of the relation the quasi-angelic crown has to the corporate nature of the church.

The one role ecclesiastics have to play is in the make-up of the king's council. The contribution of a select group of wise counselors plays an important role in Fortescue's argument that political dominion must be consent-based, affording the people and the king the justice they deserve. Deliberation must precede the exercise of the royal will, and Fortescue describes a private

group of chosen men as ideal for this task. The council he recommends is not made up of the wealthiest in the kingdom but is a body of laity and clergy, twelve of each, with a governing body of six supervised by two of their number. A mistake frequently made in royal councils has been to rely upon the wealthiest members of the nobility, which has led inevitably to oligarchic decision making and, frequently, to the diminution of the royal office. Fortescue's council obviates the need for the king to have an all-encompassing grasp of the law, but the king should be as knowledgeable about the laws of the realm as is necessary for the proper execution of the justice of the crown, just as he ought to be practiced in warfare sufficiently to protect the realm from external threat. These two responsibilities define kingship, and absence of means to either will cripple the realm. Accordingly, Fortescue argued strongly that the king should be, by far, the wealthiest individual in the realm.

John Gerson

Brian Patrick McGuire
Medieval History, Roskilde University, Roskilde,
Denmark

Abstract

John Gerson, theologian, chancellor of the University of Paris, and a leading light at the Council of Constance (1414–1418), came from a family that had to make sacrifices to send him to Paris. Here he showed brilliance in literary achievements and theological wisdom, but he insisted that learning must be made useful for ordinary people. He shared with his sisters his insights and became one of the greatest vernacular preachers of Paris. After losing faith in the

meaning of academic life, Gerson went into voluntary exile but after a year returned to his teaching and administrative duties. The climax of his career was the Council of Constance, where his voice was one of the central ones in an attempt to reform the Christian Church and limit the power of the papacy. If Gerson had succeeded, the reformations of the sixteenth century might never have taken place.

John (Jean le Charlier) Gerson (1363–1429) was one of the central theologians and church reformers of the later Middle Ages. He was born in the hamlet in the Ardennes from which he took his surname and was the first child of a family in modest circumstances. The father was a wheelwright and probably instructed his son in the trade before the parents sent him off at the age of 14 to the University of Paris. Gerson may have been taught Latin by the parish priest or by the Benedictines in a nearby monastery. Whoever his first teachers were, he came to show a remarkable ability to remember language, especially that of the Bible, and to incorporate it into his writings. In Gerson, the affective monastic theology of the twelfth century revived and became integrated with scholastic theology, in a synthesis whose importance only recently has been appreciated. In philosophical terms his approach can be considered to be eclectic, in combining realism and nominalism in untraditional ways.

At Paris, Gerson quickly impressed his teachers, especially Peter of Ailly (c. 1351–1420), who encouraged him to study theology. Peter of Ailly's political connections brought him to reform the university, in a protest against the chancellor, Jean Blanchard, who was doing his best to enrich himself on exorbitant fees for degrees. In 1389, Peter of Ailly replaced Blanchard as chancellor, and at about the same time the young Gerson was invited to begin giving sermons at the royal court. During these years he was completing his doctorate in theology, and it is in this period he may have written a begging letter to a benefactor, perhaps Peter of Ailly himself, in which Gerson described his penury and the shame he would create for his parents if he had to give up

his university career and return to his home village.

Gerson was apparently given the support he needed, for he completed his degree, and in 1395 he succeeded Peter of Ailly as chancellor of the university, a post he kept until his death in 1429. He loved the university so much that he became discouraged by his inability as its chancellor to influence the favoritism and corruption that were rife in it. In the late 1390s, he decided to give up his post and concentrate on the deanship of the church of Saint Donatien at Bruges. Unable to reform the church and university, he would concentrate on one church and its running. As he wrote to his colleagues in explaining his desire to resign the chancellorship: "I am forced because of the consideration of others or because of the custom of the age to promote those who lack knowledge and are morally corrupt" (Gerson 1998: 161).

Gerson soon found out that church institutions were just as immune to reform as the church and university themselves. The canons of Bruges resented his intervention and made his life miserable. In September 1400 he returned to Paris, after having sent more letters to his colleagues in which he explained his reform program. Thus began 15 fruitful years in which Gerson taught at the university, gave sermons in Latin to students and colleagues, preached in French in Paris churches where he eventually got his own benefice at one of them, and wrote on various theological subjects. Already at Bruges Gerson decided to convey some of his thoughts not in the usual scholastic Latin but in a French accessible "for ordinary people who have no Latin" (Gerson 1998: 75).

In the opening lines of *The Mountain of Contemplation*, Gerson made it clear that he was opening theological discussion to women, for he had seen how his sisters understood the ideas that until Gerson's time were only available in Latin: "The lack of learning of my sisters cannot keep me from going ahead, for I intend to speak only about what they can fully grasp according to the understanding I have seen in them" (Gerson 1998: 75).

In *The Mountain* Gerson showed how the way of contemplation involved both knowledge and affectivity. Thanks to predecessors such as Bernard of Clairvaux, Gerson argued that individual

human experience was essential on the path to wisdom. Gerson's faith in the insight and understanding of women shows a remarkable receptivity to the visionary women of his period, even though later in life, in three treatises on the discernment of spirits, he showed doubt and hesitation about trusting such insights. But his *Mountain of Contemplation* remains as a monument to a transference of theological discourse from Latin to French, from university men to village women.

Gerson during these years was teaching theology to his students, and he offered them courses in mystical theology, first of a speculative nature and then in its practical forms. As in the *Mountain of Contemplation* Gerson succeeded in summarizing an earlier tradition and clarifying it. He praised the life of contemplation but warned against abandoning "the care of the people" and seeking "to enjoy the sweetness of contemplative leisure" (Gerson 1998: 295). Gerson never forgot that the task of the clergy was to provide spiritual nourishment for the people, and he considered it wrong for priests caught up in their own interior lives to ignore the parishioners in their care.

Gerson considered his primary responsibility as priest and teacher to open up the way to salvation. At times this task meant warning against dangers, as he did in writing a polemic against *The Romance of the Rose*, the thirteenth-century poem which indirectly urged the necessity of sexual experience. Gerson considered the work pornographic and tried to undermine its attractiveness by composing an allegory with a heavenly court where the poet and author were tried and convicted for crimes against humanity. In involving himself with such a matter, Gerson indicated that the theologian was obliged not only to deal with speculative matters but also to be concerned with practical concerns affecting the moral life of individuals and society.

The primary moral and political issue of the age was the papal schism. From 1378, a few years after Gerson arrived at Paris, the Christian Church in western Europe was divided between two popes, one in Rome and one in Avignon. The French king supported the Avignon pope and tried to forbid any discussion of the matter by

Paris theologians. Gerson did his best to stay clear of the controversy, but after 1400 his thinking matured, and he concluded that the only possible solution to the stalemate was to hold a council, to which each of the papal candidates would be invited. This was finally arranged at Pisa in 1409, but the new pope elected here did not receive universal acceptance. Another council was planned for Constance, and here Gerson journeyed in 1415, never to return to Paris.

The development of Gerson's conciliar thinking in the years after 1400 is a fascinating story of how a medieval intellectual changed with the times and circumstances. Gerson had feared at first that the Holy Spirit would not necessarily guide the decisions of a council in deposing one pope and electing another. But prayer, politics, discussion, and hard thinking led Gerson to the conclusion that the Holy Spirit would be with such a council. Gerson became the champion of a church to be reformed "in head and members" and saw the Council of Constance as a turning point away from a papally controlled church toward a more parliamentary government.

Gerson's efforts were in vain, for the new pope elected on November 11, 1417, Martin V, belonged to a traditional Roman family that had no sympathy for parliamentarism. Also Gerson on leaving Constance could not return to Paris, for the Burgundians in 1418 occupied Paris and murdered some of his colleagues. Gerson was caught in the longstanding conflict between England and France known as the Hundred Years War. From 1419 until his death in 1429 Gerson, after traveling to Vienna, settled down in Lyon, a town safe from the Burgundians, where he continued writing brief theological treatises and letters, especially to the Carthusians. As ever, Gerson considered his task to be the formulation of a pastoral theology with encouragement and enlightenment for his readers, but he no longer wrote in the vernacular and apparently had lost contact with his sisters, who had been so important an inspiration to him.

On the surface Gerson's life was a failure: the reformation of the Church for which he worked came to nothing, and later papal triumphalists in the nineteenth century either ignored him or

considered him to be almost a Gallican heretic. But his writings are being rediscovered today as part of a late-medieval attempt to combine affectivity with intellectuality. In this sense Gerson continued the work of Bernard in his pre-scholastic theology in search of contemplative insight. Gerson might be called a philosophical eclectic who used his own life experience in order to find meaning and hope in the love of learning and desire for God.

John Italos

Katerina Ierodiakonou

Department of Philosophy and History of

Science, University of Athens, Athens, Greece

Department of Philosophy, University of Geneva, Geneva, Switzerland

Abstract

John Italos was one of the most original Byzantine philosophers. A student of Psellos, he taught at the Imperial School of Constantinople and wrote commentaries on Aristotelian logic and treatises on particular topics of logic and metaphysics. He occupies a special place in the history of Byzantine thought for having been put on trial and condemned by the Orthodox Church, on the charge of having advocated the systematic use of philosophical analysis and logical reasoning in clarifying central theological issues.

Biography

John Italos was born in Southern Italy in c. 1025. In 1049, he came to Constantinople with his father, a Norman mercenary, who had been hired to assist the emperor Constantine IX Monomachos (1042–1055) in his campaign against the semi-nomadic Pechenegs. There is no reliable information about his education in Italy, but upon his arrival in Constantinople, he became a pupil of Michael Psellos. In 1055, he succeeded Psellos in the Imperial School of Constantinople as

“Consul of the Philosophers” and taught all branches of philosophy. The emperor Michael VII (1071–1078) and his brother Andronikos Doukas were among his students as well as Eustratios of Nicaea and possibly Theodore of Smyrna. In 1076/1077, Italos was accused of teachings contrary to the Christian dogma, but the emperor Michael VII Doukas (1071–1078) intervened, and he was acquitted. However, in 1082, he was again put on trial and this time he was condemned. The precise date of his death is unknown. It is telling that to this day, during the mass of the first Sunday in Lent, the so-called *Synodikon* of the Greek Orthodox Church is read, in which Italos is anathematized in 11 articles.

Anna Komnene refers to Italos in the *Alexiad* (5.8), the history she wrote of the events during the reign of her father Alexios I (1081–1118). Although in general her report is not at all complimentary about Italos’ physical appearance, character, and rhetorical abilities, she nevertheless admits that his courses attracted crowds of students and that he was better than anyone else in teaching and interpreting Aristotle’s logic. Michael Psellos (*Oratoria minora* 18 and 19), too, acknowledges that Italos’ style was not at all graceful but praises him without reservation for his passionate quest for truth, the clarity of his thinking, and the careful construction of his logical arguments. A negative portrait of Italos is also to be found in the twelfth-century *Timarion* (1075–1130, ed. R. Romano). It is interesting, however, that in this text Psellos is portrayed as happy to be counted among the rhetoricians, whereas Italos is seen as someone who viewed himself as a philosopher; he tries to sit next to Pythagoras, though the latter accuses him of not getting rid of his Christian garment, and when the rhetoricians start throwing stones at him accusing him of not writing elegant speeches, Italos appeals to Aristotle and the syllogisms for assistance.

Thought

What mainly survives from his writings is the commentary on the second, third, and fourth

book of Aristotle’s *Topics*, two small treatises on dialectic and on the Aristotelian syllogisms together with a very brief synopsis of rhetoric, and finally, the *Quaestiones quodlibetales*, a collection of 93 answers to philosophical questions posed to him by his students.

Regardless of the positions Italos advocated in these texts, positions some of which after all were not at all different from those of other philosophers, notably from Psellos’, what seems to have been really unacceptable for the religious and the political establishment at the time was his rationalist approach toward doctrines, which the Orthodox Church considered as beyond comprehension, as something, which Christians should simply accept on faith, and as something, which only the Church had the authority to judge. Furthermore, Italos questioned in his writings the supremacy of theology and defended the ancient conception of philosophy, well known from both the Platonic and the Aristotelian traditions, according to which theology is part of philosophy, since philosophy culminates in the attempt to understand the first principle of everything. It probably was this supposedly arrogant attempt on his part to develop a natural or philosophical theology that the Orthodox Church also refused to accept and that led to Italos’ trial and condemnation.

More specifically, the 11 anathemas that were added to the *Synodikon* of Orthodoxy are concerned with:

1. The application of logical arguments to theological issues such as the incarnation of Christ or the relation of Christ’s two natures
2. The introduction of natural philosophy into the Church
3. The acceptance of the doctrine of the transmigration of the soul and the denial of Christian eschatology
4. The acceptance of the view that matter and forms have no temporal beginning or end
5. The preference for Greek philosophers to Christian saints
6. Suspiciousness against divine miracles
7. The study of Greek philosophy not only for the sake of education but as a repository of

truths to which all other beliefs should ultimately be reduced

8. The denial of God's voluntary creation of the world *ex nihilo* and the acceptance of Platonic Forms
9. The denial that our bodies will be the same at resurrection as now
10. The acceptance of the preexistence of the soul and the denial of its creation *ex nihilo*, of eternal punishment, and of the eternal kingdom of God
11. Any "Hellenic and heterodox" doctrines taught by Italos

Italos' views on universals, which he discusses in many of his *Quaestiones quodlibetales*, are also worth mentioning. Just like many other Byzantine philosophers, Italos defended the Neoplatonic theory that universals exist in three modes; namely, they exist as universals "before the many (particulars)" in God's mind, as universals "in the particulars" within perceptible individuals, and finally as universals "after the particulars" in the form of concepts acquired by our mind by abstraction of the common characteristics of perceptible individuals. Benakis has labeled this position conceptual or moderate realism and stressed that it has nothing in common with the nominalist position on universals that we find in western medieval philosophy; for even the third mode of the universals' existence, namely, the universals after the particulars, should not be confused, on his view, with what western medieval philosophers thought about *universalia post res*, since the *a posteriori* status of such universals does not alter the fact that they do exist.

Indeed, Italos argued that universals are incorporeal in a weak sense, because they are not strictly speaking incorporeal but depend on a body for subsisting; in other words, universals are incorporeal *per accidens* and not *per se*, because they are incorporeal insofar as they are in the human soul, while at the same time, they are corporeal by participation (*kata methexin*) insofar as they subsist in the particulars. Being incorporeal in this weak sense, universals are said to be beings also in a special sense: Italos

often made use of another distinction that is a commonplace in Platonic texts from Plotinus to Simplicius but seems to have its origins even earlier, namely, the distinction between something subsisting and something depending on mere thought. According to Italos, things that do not subsist (*anupostata*) but depend on mere thought are not beings. As for things that subsist, he distinguishes between two different kinds of beings, those that subsist *per se*, which he calls subsistences (*hupostaseis*), and those that subsist in something else (*enupostata*); subsistences are particulars and for the most part bodies, whereas beings that subsist in something else are predicates shared by many things and concepts (*noēmata/dianoēmata*). Italos distinguishes these two kinds of beings from the standard examples of things that do not subsist, that is, goat-stags and centaurs, as well as from his own examples of many-eyed men and four-headed horses; for all these are, on his view, nothing but fabrications of the human mind and products of our imagination (*phantasmata*). Hence, Italos conceives of universals not as beings that subsist *per se* but as beings that subsist in something else and thus in no way can be treated, on his view, as mere products of the human imagination.

John Mair

Henrik Lagerlund

Department of Philosophy, Stockholm University, Stockholm, Sweden

Abstract

John Mair (c. 1470–1550) was a very influential British philosopher and theologian in the beginning of the sixteenth century. He had some very influential students and is claimed to have had a lasting influence on British thought up until the time of John Reid.

John Mair (Maior) is little known, but he was in fact one of the most influential thinkers in the beginning of the sixteenth century. He was originally from Scotland, but studied in Cambridge and Paris. He graduated in Arts in 1495 in Paris and became master at the Montaigu College in 1499. He subsequently continued his career in Paris and took his doctorate in theology in 1501.

Under Mair, Montaigu College became a leading philosophical school in Europe and the thinking of William Ockham and John Buridan flourished among his students. One of the most exciting things about Paris at this time was the intermingling of Scholasticism and Humanism. Both Erasmus and Juan Luis Vives were influenced by the circle of thinkers around Mair, and among his students we find, for example, John Calvin, Ignatius Loyola, Reginald Pole, Robert Wauchope, François Rabelais, and George Buchanan.

In 1518, Mair left Paris and returned to Scotland, where he became the principal of Glasgow University. In 1522, he moved to St. Andrews, where he spent most of his later life, except for a period in Paris again, from 1526 until 1531. He also wrote extensively throughout his career in all areas of philosophy, but foremost in logic. Strangely enough, his most known work is probably the *Historia Majoris Britanniae* (History of Greater Britain) from 1521.

Mair can be said to have continued a long tradition of philosophy initiated by William Ockham and John Buridan in the early fourteenth century. The focus of this tradition is primarily on logic and linguistic analysis. Mair wrote on all areas of philosophy, but his philosophy of mind, metaphysics, political philosophy, and ethics have been very little studied.

John Maxentius and the Scythian Monks

Matthew J. Pereira

Department of Theological Studies, Loyola Marymount University, Los Angeles, CA, USA

Abstract

From their monastic community at the north-eastern borderlands of the Late Roman Empire, the abbot John Maxentius and the Scythian monks coalesced Cyril's teachings on divine suffering (i.e., theopaschism) with Augustine's teachings on divine grace, thereby, transgressing cultural, linguistic, and theological boundaries concomitant with reordering the conciliar (a.k.a. orthodox, catholic and imperial) tradition. During the early winter of 519, the Scythian monks traveled southwards to Constantinople to submit their 12 anathemas and profession of faith before the imperial court of Emperor Justin. After the deacon Victor and papal legate Dioscorus rejected these overtures on account of their inclusion of divine suffering, the Scythian monks departed to Rome to seek support from Pope Hormisdas. Rather than gaining papal approval, the relationship between Hormisdas and the Scythian monks deteriorated during their 14 months in Rome. Simultaneous with the collapse of relations with the papacy, the Scythian monks forged new allies across the constellation of political and ecclesiastical networks, which produced channels for transmitting and rereading the conciliar tradition (i.e., church fathers and ecumenical creeds). The

interventions of the Scythian monks, in tandem with allies, culminated with the vindication of Cyril's theopaschite writings at the Second Council of Constantinople (553) and also shaped canonical decisions regarding Augustine's doctrine of divine grace at the Second Council of Orange (529). Under favorable circumstances including support from two notable compatriots – the vaunted military commander Vitalian and erudite linguist Dionysius Exiguus – the Scythian monks entered the ecclesiastical centers then persisted in collaborations and contestations, which led to the reconfiguring of the conciliar tradition.

Christianity and Monasticism within Scythia Minor

The province of Scythia Minor was nestled along the Black Sea at the northeastern frontier of the Late Roman Empire. The Latinization of Scythia Minor occurred during Roman conquests in the first century, then intensified after the Council of Ephesus (431), so that by the fifth century, the Scythians wrote and read in Latin but followed the Greek liturgy (Holubeanu 2014). In addition to the Greeks who surrounded the Scythian province, the Dacian, Illyrian, Syrian, Gothic, and Hunnic cultures streamed into this eastern territory. Situated as this strategic hub of commercial and cultural exchange, the tradition of the Scythian monks was imprinted with a diversity and an inclusivity akin to proto-ecumenism (Coman 1970). From bishops to missionaries and monks, the Scythian Christians embraced the Latin and Greek church fathers to support the imperial Nicene faith. Prior to the events within Constantinople, the Scythian Church defended the Nicene faith at the frontier-borderlands. From the fourth to the end of the sixth century (with the demise of Nicene Christianity following the northern invasions), the Scythian Church enjoyed amicable relations with the patriarchates of Constantinople, Rome, and then more locally, with the Gothic and Cappadocian churches. The Scythian monks – without the support of the Scythian bishops – reinterpreted the available cultural and linguistic

options, therein, including Latin translations of Cyril's Greek writings provided by their compatriot, Dionysius Exiguus, thereby advancing their integrative rereading of the conciliar tradition (Pereira 2015).

Theopaschite Controversy of 519

Under the patronage of the vaunted Scythian commander Vitalian, the Scythian monks secured safe passage to Constantinople, which presented a rare opportunity to address the imperial court of Justin (r. 518–527). After providing complaints against Paternus, their local bishop of Tomi, they submitted two of their writings: *Chapters of Maxentius* (*Capitula edita contra Nestorianos et Pelagianos ad satisfactionem fratrum*) and *Little Book of Faith* (*Libellus fidei oblatus legatis apostolicae sedis Constantinopolim*). Maxentius wrote these communiqués in collaboration with the Scythian monks who affirmed the catholic teachings with one deviation when inserting their qualified theopaschism. In the *Chapters of Maxentius*, the fourth chapter declared, “If anyone does not consent to confess that Christ who suffered for us in the flesh is ‘one of the Trinity (*unum de trinitate*)’ even with his own flesh, although according to that flesh itself he is not of the substance of the Trinity but is the same as us, let him be anathema.” Chapter six then asserts, “If anyone says that Christ has suffered in the flesh (*Christum passum carne*) but does not consent to say that God has truly suffered in the flesh (*deum vero passum carne*), which is precisely what it means to say Christ suffered in the flesh, let him be anathema.” The deacon Victor and papal legate Dioscorus believed the Chalcedonian Definition – the ecumenical creed produced at the Council of Chalcedon (451) – was entirely sufficient for the church catholic, therefore, they dismissed these upstart monks (Fairbairn and McGregor 2013). The Scythian monks countered by insisting it was necessary to teach the “Word of God suffered in the flesh” in order to protect the Chalcedonian Definition from misinterpretations that separated the human and divine natures of Christ. To interpret the conciliar tradition was accepted as a necessary practice by late antique

theologians with the caveat that the explanations were deemed faithful to the church fathers and ecumenical creeds.

Having exhausted any possibility for agreement in Constantinople, the Scythian monks travelled to Rome seeking the support of Pope Hormisdas (450–523). Justinian (482–565) – the nephew and successor of Emperor Justin – sent a correspondence to Hormisdas that reached Rome prior to the Scythian monks. In this letter (*Exemplum Epistolae Iustiniani*) on 29 June 519, Justinian warned Hormisdas that the Scythian monks threatened the peace by introducing novelty against the “four venerable synods” and Leo’s letter (*Tomus ad Flavianum*). However, in a second letter to Hormisdas (*Exemplum Epistolae Iustiniani. Per Fratrem Proemptoris*), Justinian instructed him to embrace the Scythian monks. From here onwards, Justinian favored the Scythian monks and rehabilitated Cyril’s theopaschite teachings at the Second Council of Constantinople (553). Hormisdas stalled expressing wishes to wait on the papal legates before undergoing deliberations with the Scythian monks. The papal legates to remained outside of Rome until the departure of the Scythian monks. After 14 months of waiting for the papal legates, the Scythian monks distributed writings throughout Rome, then departed to Sardinia, for the North African bishops.

Under the leadership of the Augustinian, Fulgentius of Ruspe (ca. 462–533), the North African bishops enjoyed a mutually formative relationship with the Scythian monks (Gumerlock 2009). Augustine’s predestinarianism became prominent within the writings of the Scythian monks after Hormisdas responded to Possessor’s letter (*Exemplum relationis Possessoris episcopi Afri. Per Iustinum diaconum eius*). Having cited Faustus of Riez (d. 495) against the Scythian monks, Possessor requested Hormisdas’ opinion on the teachings of the southern Gallic bishop (Smith 1990). In *Letter to Possessor (Epistula Papae Hormisdas ad Possessorem)*, Hormisdas advised one may read Faustus and that Augustine’s writings contained the faith of the church catholic. Following his instructions on Faustus, Hormisdas impugned the Scythian monks, consequently, Maxentius wrote his

Response against the Epistle to Possessor (Responsio adversus Epistolam quam ad Possessorem) to free the Scythian monks from all guilt.

Due to the emphasis on the crucified Word of God (who suffered) throughout their writings, the above series of events, from Constantinople to Rome and then Sardinia, is conventionally known as the Theopaschite Controversy of 519. Undoubtedly, the actions and writings of the Scythian monks extended beyond divine suffering, indeed, this story is foremost about convergences and divergences between the Scythian monks and imperial centers, which engendered an alternative conciliar tradition.

Rereading Chalcedon and Cyril on Divine Suffering

The legacy of Cyril was contested from the Council of Ephesus (431) through Chalcedon (451) to the Theopaschite Controversy (519). At Ephesus (431), Cyril defended the *Twelve Chapters* by asserting the Word of God liberated us from “death and corruption by making his own body alive, as God (*Explanation of the Twelve Chapters*).” Following Ephesus, in August of 431, Emperor Theodosius II demanded a profession from the Syrian bishops John of Antioch (d. 441) and Theodoret of Cyrhus (d. 457). Cyril included this profession – known as the *Formula of Reunion of 433* – in a correspondence to John, the patriarch of Constantinople, thereby signaling tacit approval. This ambiguous profession (Price 2009), produced by allies of Nestorius omitted Christ crucified, nonetheless, it was attached to Cyril prior to Chalcedon. Cyril also narrowed the scope of his *Twelve Chapters* to his contest against Nestorius, thus demonstrating his willingness to be flexible for the sake of ecclesiastical rapprochement. Towards the twilight of his lifetime, Cyril returned to theopaschism in a second letter to John of Constantinople therein declaring the “divine Word is impassible, even if in his all-wise economy of the mystery is seen to attribute to himself the sufferings that befall his flesh,” then later, asserted Christ “bears the

suffering of his own flesh in an economic appropriation to himself (*Letter* 39).” Within his mature treatise *On the Unity of Christ* (*Quod Unus Sit Christus*), Cyril returned to theopaschism, declaring the Word of God appropriated all belonging to his flesh while remaining impassible in the Godhead.

On account of his willingness to compromise and then return to his convictions, two iterations of Cyril emerged during oppositional synods convened at Constantinople (448) and Ephesus (449). At the Home Synod of Constantinople (448), the council fathers under Flavian, the patriarch of Constantinople, affirmed Cyril’s synodical letters and Leo’s *Tome*, then they rebuked Eutyches. Countering the Home Synod, Dioscorus of Alexandria convoked another synod at Ephesus (449) to rehabilitate Eutyches and Cyril’s theopaschite teachings, then condemn Flavian and dismiss the *Formula of Reunion*. On the eve of Chalcedon (451), the legacies of Eutyches, Cyril and Leo emerged as theological and cultural fault lines dividing the church catholic (Gwynn 2009).

In the first session at Chalcedon, the council fathers rebuked Dioscorus, who convoked the synod at Ephesus (449). In the second session of Chalcedon, the council fathers received Leo’s *Tome*, then Atticus, the bishop of Nicopolis, called for the inclusion of Cyril’s theopaschite teachings by asserting, “We should also be provided with the letter of the blessed Cyril written to Nestorius in which he urged him to assent to the *Twelve Chapters*, so that at the time of the examination we may be found well prepared.” Atticus’ provocation was ignored and unmentioned in subsequent sessions as the council fathers privileged Cyril’s synodical letters over the theopaschite writings. Under mandate from Emperor Marcian, the council fathers produced, recited and acclaimed their creed – the Chalcedonian Definition – at the conclusion of the fifth session.

In the fifth session, Aetius recited aloud the Nicene Creed (325) and Constantinopolitan Creed (381), Cyril’s synodical letters and Leo’s *Tome*, which were acclaimed by the council fathers. Having recounted these canonical teachings, Aetius then read aloud the Chalcedonian Definition, which reiterated the christological

teachings of the ecumenical creeds except for Christ crucified, who suffered “for our salvation.” The Nicene Creed declared that – for our salvation – Christ “suffered” whereas the Constantinopolitan Creed omits suffered and inserted Christ “crucified.” The council fathers of Chalcedon deleted Christ crucified, suffered “for our salvation,” thereby reflecting conciliar discourse that increasingly silenced the crucified Word of God who suffered. “For our salvation,” the council fathers of Chalcedon declared the human and the divine natures are recognized “unconfusedly, unchangeably, undividedly and unconfusedly” within the one and same Christ (Pereira 2016). Three of these famed adverbs were first employed within Cyril’s *First Letter to Succensus*, which declared the Word of God is united to the holy flesh “without confusion, without change, and without alteration” in Christ (*Letter* 45). The council fathers of Chalcedon participated in the conciliar revision of Cyril by lifting up his conciliar teachings and ignoring divine suffering.

Prior to arriving in Constantinople, the Scythian monks received Latin translations of Cyril’s Greek writings, including his *Twelve Anathemas*, from the Scythian linguist, Dionysius Exiguus (470–544). After receiving select translations, the Scythian monks reread Cyril’s teachings in a collaborative and inclusive manner that made interpretive claims upon the conciliar tradition. In addition to Cyril’s writings, Dionysius translated Proclus’ *Tome to the Armenians*, which was then referenced in the *Little Book of Faith*, wherein Maxentius cited the following church fathers to demonstrate that divine suffering was intrinsic to the conciliar tradition: Athanasius of Alexandria, Cyril of Alexandria, Gregory of Nazianzus, Flavian of Constantinople, and Augustine of Hippo and then concluded with a lengthy excerpt by Proclus of Constantinople, which included the classic theopaschite profession.

We do not say that he suffered in this same essence (*essentia*), in which he exists and is united to the Father and to the Spirit, but in his flesh (*carne*), by which he was made one of us and for us. In fact, not another one was made flesh, but one of the Trinity: and was crucified in flesh

(*crucifixus est carne*) which he was made of, and he did not suffer in his divinity (*non est passus divinitate*), by which he is united to the Father and to the Spirit, that we may say that these same (Father and Spirit) are crucified with him. If we would say that he was crucified in his divinity, in reality we would introduce suffering in the Trinity; whereas if we say that the Word accepted sufferings in his flesh, we confess there is one of the Trinity who suffered, and that the nature of the Trinity remained passionless (*impassibilis*).

Having cited the Latin and Greek church fathers, Maxentius explained that he turned to Proclus because he professed divine suffering with greater clarity than Augustine and the church fathers (although all professed the crucified Word of God).

In the later work *Response against the Headless Ones* (*Responsio Contra Acephalos*), Maxentius rebuked the Miaphysite *Acephaloi* (i.e., ones without a head), who declared there is one nature in Christ after the union because, “there is no nature without person.” Reflecting on the axiom “God and man, Word and flesh,” Maxentius contended the authentic uniting of the Word of God and flesh means the two natures remained after the Incarnation. If the divine nature subsumed the human nature of the Word of God, then divine suffering “in the flesh” is impossible. Maxentius argued the “divinity of the Word is not uncompounded but complex and capable of suffering” in the flesh. Maxentius also provided a concise profession: “It remains that the union, which causes the coming together (two natures), avoids singleness and this undoubtedly means the assumption of the human nature by the Son of God, and so it is evident that after the union there are in the Son of God two natures – that is, divinity and humanity – from which and in which it subsists the one and single person of Christ.”

In the *Little Book of Faith* and in later writings, Maxentius and the Scythian monks subsumed the Latin inflected Chalcedonian Definition with Greek colored teachings on the crucified Word of God, who suffered in the flesh (for our salvation), thus therein, providing an integrative tradition that transgressed the cultural, linguistic, and theological boundaries.

Augustine of Hippo and Divine Grace

Contemporary historians have puzzled over the Augustinianism in the writings of the Scythian monks because it was difficult to square it with residing in eastern provinces, where Augustine’s teachings rarely circulated. One explanation that enjoyed influence was that their Augustinianism was due to random events that connected the Scythian monks to the exiled North African bishops (Loofs 1887). The Scythian monks sought to appease, so goes this argument, the North African bishops by espousing Augustine. Along similar lines questioning the depth of their commitment, there is a veiled correction of Augustine in the Scythian monks’ *Letter to the Bishops* (McGuckin 1984). Alternatively, Augustine’s teachings on divine grace were located in the earliest writings of the Scythian monks, thus suggesting Augustinianism was native to Scythia Minor (Maxwell 2003). The Scythian monks may have even influenced Fulgentius and his fellow North African bishops (Gumerlock 2009). The Augustinianism of the Scythian monks was questioned by those historians who seemingly ignored the effects of Latinization in the eastern province. Reflective of their Latin education, the Scythian monks preserved a compendium of Augustine’s writings in their monastic library. Predestination was likely preached in Scythia Minor by the fifth century (Holubeanu 2014); however, the Scythian monks focused on divine suffering as it was the more pressing issue related to the Chalcedonian Definition (Pereira 2015).

In the *Chapters of Maxentius*, the Scythian monks reconfirmed Augustine’s teachings on divine grace and human nature, including original sin. Following the defense of divine suffering in the earlier sections of the *Chapters*, Maxentius condemned anyone who believed sin was natural and derived from the Creator, then embraced four popes – Innocent, Boniface, Zosimus, Celestine, Leo – Atticus, archbishop of Constantinople, Augustine, and the African bishops. Reflecting the fifth century conciliar discourse that avoided Augustine’s predestinarianism (most notably the popes muted this

doctrine), Maxentius bypassed this difficult teaching throughout the *Chapters*.

In his second writing, the *Little Book of Faith*, Maxentius expanded upon divine grace, echoing Augustine who taught Adam's punishment was passed down to everyone, thus, newborn children must be baptized for the remission of sins. Human free will is corrupted, therefore, humanity is only capable of desiring "the carnal or mundane," so eternal life must be solely by the "gift of grace of the Holy Spirit." Rebuking anyone teaching the "willing is ours," Maxentius cited the Apostle Paul, who declared, "willing and accomplishing are a divine gift." The doctrine of predestination was also ignored within the *Little Book of Faith*.

Maxentius turned to predestination within the appendix of the *Responsio* against Hormisdas' letter to Possessor. After recounting how Hormisdas asserted to Prosper that Augustine's books to Hilary and Prosper "support the Roman Church" and contained the essential teachings on "divine grace and human free will," Maxentius thought it would be prudent to cull over "certain chapters from Faustus" with the "above-mentioned books" of Augustine to demonstrate that Faustus' writings were heretical. The treatises to Hilary and Prosper contained Augustine's strongest language on predestinarianism, therefore, it was most useful for showing differences against Faustus. To provide an example of his comparative approach, Maxentius cited Faustus who challenged those teaching, "faith is not given to all but is a personal gift and it supplies enough belief for them to whom God has specifically given it," then followed up with Augustine, who declared the "elect from God" must not extol themselves by declaring they do that which God has promised because if divine grace was given "according to our merit" then "grace would not be grace." Here, in the above account from the *Response*, Faustus argued against salvation as a divine gift for the elect alone, whereas Augustine taught divine grace must be a gift given by God to the elect, or else, it was something based on our merit and works, and thus, not divine grace (Pereira 2015).

In the *Letter to the Bishops* (*Epistula Scytharum monarchum ad Episcopos*), the

Scythian monks affirmed Augustine's doctrine of divine grace, then cited the *Prayer to the Altar*, attributed to the Greek bishop, Basil of Caesarea: "Lord, grant strength and protection. We pray make those who are evil to be good. Preserve those who are good in goodness. For you are able to do all things and there is no one may contradict you. When you will, you save, and no one resists your will." The Scythian monks asserted that Basil's *Prayer* anticipated Augustine by declaring God alone makes humanity good, then anticipated his doctrine on the "preservation of the saints" when it professed, "they persevere in the goodness not by their own strength but by the assistance of divine grace." This liturgical prayer, according to the Scythian monks, would have ended the "future controversy" (i.e., controversy beginning with debates between Augustine and Pelagius), thereby insinuating the Eastern Church could have assisted the Western Church (Pereira 2015). Following the recounting of Basil's *Prayer to the Altar*, the Scythian monks returned to citing the Roman Church to illustrate the similarities with the Eastern liturgy.

Literary Works of John Maxentius and the Scythian Monks

The writings of the Scythian monks were written prior to, during or soon after, the Theopaschite Controversy. Maxentius composed seven writings preserved in the critical edition (Glorie 1978). From their initial writing (i.e., *Chapters of Maxentius*) onwards, the Scythian monks blended the Chalcedonian Definition and crucified Word of God (who suffered in the flesh for our salvation) to demonstrate that the Latin and Greek traditions have unanimously professed Christ crucified. Likewise, as illustrated with Basil's *Prayer at the Sacred Altar*, the Scythian monks contended the church catholic – West and East – rightly aligned with Augustine's teachings on divine grace.

In their first extant writing, *Chapters of Maxentius*, completed between 518 and March of 519, the Scythian monks elucidated their central

teachings, which were expanded upon within subsequent writings. The central beliefs that guided the theological tradition of the Scythian monks were the Chalcedonian Definition, the Virgin Mary as Mother of God (*dei genetrix*), the crucified Word of God (who suffered in the flesh for our salvation), and then Augustine's teachings on divine grace.

Three writings by the Scythian monks were theological professions: the aforementioned *Little Book of Faith*; *A Brief Profession of the Catholic Faith* (*Item eiusdem professio brevissima catholicae fidei*); the *Very Brief Reasoning for Uniting the Word of God to a Particular Flesh* (*Brevissima adunationis ratio Verbi Dei ad propriam carne*). The stated objective of the *Little Book* was to clarify teachings on the Incarnation (chapters 1–14) and divine grace (chapters 15–18). Within these three brief professions, Maxentius expanded upon the essential teachings on the Incarnation (consubstantiality of the Son and Father, axiomatic profession “God was made man,” natural uniting of divine and human natures, crucified Word of God), then transitioned to divine grace, which was the consistent ordering of reflection (i.e., from the Incarnation to divine grace) within their literary corpus (Maxwell 2003).

Polemical writings attributed to the Scythian monks include: *Chapters of Maxentius*; *Response against the Headless Ones*; *Dialogue against Nestorius* (*Dialogus contra Nestorianos [libri duo]*); *Response against the Letter to Possessor*; and *Refutation of the Writings of Nestorius* (*Refutatio quorundam Nestorii Dictorum*). The *Dialogue against Nestorius* may have been the “most outspoken” and “interesting” writing of the Scythian monks (Bark 1936, 1943). In book one of the *Dialogue*, Maxentius elucidated Virgin Mary as *Theotokos*, whereas the second book focused on the Word of God, theopaschism and the composite nature (*Christus compositus*) of Christ. Rather than citing the church fathers throughout the *Dialogue*, Maxentius referenced scripture to defend the *Theotokos* and crucified Word of God (who suffered in the flesh).

The Scythian monks collected and preserved select writings from Augustine in the *Chapters of Saint Augustine* (*Capitula sancti Augustini in*

urbem Romam transmissa). Many of the passages preserved within this collection were composed at the height of the contentious debates between Augustine and the southern Gallic bishops; consequently, these selections contain some of the strongest language on divine grace and predestination.

The correspondence to the North African bishops, known as the *Letter to the Bishops*, completed in Rome between June (519) and August (520), has been described as a repackaged (Glorie 1978) and expanded (Fairbairn and McGregor 2013) version of the *Little Book of Faith*. Keeping with their approach throughout their writings, section one focuses on the Incarnation, then section two transitioned to divine grace. Emphasis on the compositeness of Christ (*Christus compositus*) within the *Letter* distinguished their christological position from radical Cyrillines and Monophysites (McGuckin 1984). This *Letter* was heavily Cyrilline inflected, indeed, their theopaschite formula was more aligned with Cyril's *Twelve Anathemas* than the classic formula (McGuckin 1984).

The final writing of the Scythian monks is attributed to an anonymous collator of select texts, known as the *Collectio Palatina*, it includes *Disputation on the Twelve Chapters* (*Disputatio XII Capitulorum*); *Refutation of the Writings of Nestorius* (*Refutatio Nestorii Dictorum*); and an *Epilogue* (*Epilogus Collectionis*). The *Disputation on the Twelve Chapters* provides a defense of Cyril's *Twelve Anathemas* in the format of an unfolding dialogue where each section begins with one of Cyril's anathemas, then is followed by a teaching from Nestorius, and concludes with a response from the rhetorical figure Catholicus. The collator preserved writings from heresiarchs, namely, Nestorius, Eutyches, Paul of Samosata and Sabellius, within *Refutation of the Writings of Nestorius* and the *Epilogue*, therein reflecting the common approach of late antique theologians wherein the conciliar tradition was “defined to a significant degree in negative terms” so that the approved teachings occurred by the “exclusion of those who lied outside” the accepted limits (Gwynn 2009).

Legacy of the Scythian Monks

Contemporary assessments have routinely marginalized the Scythian monks by berating them as rabble rousers marked by an “extreme case of mind” (Smith 1990) who stirred dissension through unsophisticated teachings, at the same time as they are applauded for their contributions to late antique Christology (Grillmeier 1995). As the harbingers of the Neo-Chalcedonian movement (i.e., theologians who affirmed Cyril’s theopaschite teachings and the Chalcedonian Definition), the interventions of the Scythian monks during the Theopaschite Controversy stand as one moment within this “great line of development” from the Palestinian monasteries to the Second Council of Constantinople (Schurr 1935). The writings of the Scythian monks exercised “direct influence” on the Second Council of Orange (529) and Second Council of Constantinople (553) (Maxwell 2003). Their borderland rereading of Cyril and Augustine produced a textured and subversive conciliar tradition, which was proliferated across, within and throughout the ever shifting power relations of the sixth century.

John of Damascus

Andrew Louth

Durham University, Durham, UK

Faculty of Religion and Theology, Vrije Universiteit, Amsterdam, The Netherlands

Abstract

John of Damascus, born in Damascus (c.650/75), died in or near Jerusalem (c.750), after living there for about half a century as a monk: polemist defending conciliar (Orthodox) Christianity, preacher, liturgical poet, and author of *150 Philosophical and Theological Chapters*, which he perhaps intended to develop into a tripartite work, called the *Fount of Knowledge*. The first part of this

work (in either of its forms) is a Christian textbook of logic, to help Christians, living under Islam, to express and defend their faith. This is the most explicitly philosophical of his works, though largely derivative. John's philosophical contribution lies in his clarification of the philosophical, especially ontological, terminology, fashioned to express the Christian faith, in the course of which he develops a metaphysical synthesis revolving round the notion of hypostatic selfhood. Other philosophical topics for which John is important include divine providence and its relationship to human freedom, the notion of the will, and the place of images in human understanding.

Biographical Information

Our knowledge about the biography of John of Damascus is very scanty: the Greek *vita* is late and reveals more about John's later reputation than about the circumstances of his life; his writings are not very revealing, and there is little about him in contemporary records or in the chronicles. It seems that he was born in Damascus probably in the third quarter of the seventh century into a family that had been prominent in the fiscal administration of Syria. His grandfather, called in Arabic Mansour, seems to have served the varying regimes through which he lived: initially appointed by the Emperor Herakleios; soon to serve the Persians; after the reconquest of the Eastern provinces by the Byzantines once again serving the Emperor; and instrumental in the smooth transition of Damascus to the Muslim Arab conquerors, whom he served for the rest of his life. His son, Sarjun ibn Mansour, seems to have followed his father in the fiscal administration, to be followed by his son, John, whose secular name was Mansour ibn Sarjun. Probably at the beginning of the eighth century, John left the service of the caliph to become a monk in (or near) Jerusalem, by tradition the Monastery of Mar Saba in the Judaean Desert. The tradition is, however, late (not mentioned in the entry in the tenth-century *Synaxarion*) and now generally doubted; it seems more likely that he was a monk at the

Church of Anastasis in Jerusalem. At Jerusalem he seems to have been close to Patriarch John V (patriarch 705–35), and it was there that he wrote most, if not all, of his works. The date of his death is not known for certain, but, as he was condemned (under his Arab name of Mansour) at the Iconoclast synod of Hiereia in 754 as already dead, his death is generally given as circa 750.

Works

His works fall into several categories. Many of them are polemical: directed against Manichees, against Christians John regarded as heretical – Monophysites (who he also calls Jacobites and Acephali), Nestorians, and Monotheletes – together with a summary work of 100 chapters on heresies, the last of which is Islam (Ismaelites, Hagarenes, Saracens, he calls them), which he regarded as the “forerunner of Antichrist.” Polemical, too, are his three treatises against the iconoclasts. He was also a noted preacher, called *Chrysorroas* (“flowing with gold”) by Theophanes, the early ninth-century chronicler. His homilies, preserved not as a collection of homilies, but in the service books for feast days (mostly in the *Menaia*), are carefully composed, written to be read (as their presence in the *Menaia* indicates); they mark a transition from the sermons of the great rhetorical preachers of the fourth century (e.g., Gregory Nazianzen, John Chrysostom), delivered extempore, to more liturgical compositions. In this way they complement another genre of the Damascene's work, his liturgical poetry, especially the new form of the canon, composed for monastic matins, and consisting of verses (or troparia) to be inserted in the verses of the biblical canticles, that formed the backbone of the service. Most famous (though not in comparison with the most popular of his canons, e.g., the Easter canon) are three treatises – a textbook of logic (the *Dialectica*), his century of chapters *On Heresies*, and his *Exact Exposition of the Orthodox Faith*, also, as is made clear by Kotter's critical edition, a century of chapters. Seen together in relation to one another, his works as a whole reflect the religious situation in which they were

composed. For John belongs to period when new demands were placed on Christians owing to the rise of Islam. John inherited a pattern of Christianity that had been defined by the councils, convoked by Byzantine emperors in each century from the fourth to the seventh (and called, therefore, “œcumenical”): they represented the form of Christianity sanctioned by the emperors. The rise of Islam and the conquest of the eastern provinces of the Empire changed forever the religious and political situation for those like John. No longer could conciliar Christianity rely on imperial enforcement; the various different groups of Christians, those who supported the Œcumenical Councils and those who rejected some or other of them (Chalcedon, 451, had provoked the deepest schism; but Ephesus, 431, was rejected by many in the East, who took refuge in the Persian Empire), not to mention other religious groups – Jews, Samaritans, Manichees – who had suffered proscription or persecution in the Christian Byzantine Empire: all these had equal rights under politically ascendant Islam. Christians (of all stripes, though we know most about those who supported conciliar orthodoxy) had to know what they believed and how to defend it. The work of John of Damascus, written in the shadow of the recently built mosques on the Dome of the Rock in Jerusalem, is to be seen as part of this project. It is striking, too, that this process of definition and defense was accompanied by celebration in song and verse of the faith thus discerned and affirmed; John was central to both dimensions of this celebration of Orthodoxy. Although doubtless in some way occasioned by the victory of imageless Islam, iconoclasm was seen by John of Damascus and others like him as yet another attack on the inherited traditions of the Church.

Philosophical Thought

The most overtly philosophical of John’s works is his *Dialectica*. It develops what John had set out in his earlier *Institutio Elementaris*, which provided definitions of the kind of terms Christians needed to understand and know how to use in the defense and definition of their faith: terms like essence

(οὐσία), nature (φύσις), person (ὑπόστασις, πρόσωπον), consubstantial (ὁμοούσιον), activity (ἐνέργεια), and will (θέλημα). The *Dialectica* gives a more detailed account and sets out a more elaborate program. It also came to be intended (or maybe was from the beginning) as an introduction to a more extended account of the Orthodox faith of the Œcumenical Councils. At some point, probably late on in his life, John envisaged a three-part treatise, which he called *The Fount of Knowledge* (Πηγὴ γνώσεως). In the introductory letter that precedes the (later version of the) *Dialectica*, John says:

First, I shall set forth what is most excellent among the wise men of the Greeks, knowing that anything that is true has been given to human beings from God, since ‘every good endowment and every perfect gift is from above, coming down from the Father of lights’. If anything is opposed to the truth, then it is a ‘dark invention’ of Satanic error’ and an invention of the mind of a wicked demon’, as Gregory said, who is rich in theology. Imitating therefore the ways of a bee, I shall gather together what belongs to the truth and pick the fruits of salvation from the enemies, and reject everything that is evil and falsely-called knowledge. Then I shall set forth in order the chattering nonsense of the heresies hateful to God, so that by recognizing what is false we may cleave the more to the truth. Then, with the help of God and by his grace, I shall set out the truth, truth that destroys error and drives away falsehood, and is adorned and made beautiful, as with golden tassels, by the words of divinely inspired prophets and divinely taught fishermen, of God-bearing shepherds and teachers, that truth, the glory of which shines from within and illuminates by its rays those who encounter it with due purification and having set aside troubling trains of thought (*Dial. procem.* 43–60).

Here is envisaged a threefold program: first, what can be drawn from the Greek philosophers; secondly, an account of the errors of heresy; thirdly, an exposition of the truth. This threefold program is that we are familiar with modern editions and translations of the Πηγὴ γνώσεως, or “Fount of Knowledge,” consisting of the *Dialectica*, or “philosophical chapters,” the treatise on heresies, and the *Exact Exposition of the Orthodox Faith*. The manuscript tradition, however, tells a different tale: this threefold program is only found in one of the manuscripts, and the extension of the title Πηγὴ γνώσεως to the whole trilogy (rather

than to the *Dialectica* alone, as John's own use is commonly held to imply: *Dial.* 2. 8–9) seems to be no older than the seventeenth-century Greek Catholic scholar, Leo Allatius. In the manuscripts, the *Dialectica* is usually followed immediately by *On the Orthodox Faith*. One of the earliest references to this work, by a certain Elias who made a sharp criticism of John's exposition of Christology, refers to it as "150 chapters," which would seem to be the shorter version of the *Dialectica*, followed by the hundred chapters of *On the Orthodox Faith*, which is indeed one of the commonest arrangements found in the manuscripts (Van Roey 1944, 8). It seems likely then that this was the original version intended by John and that the more elaborate tripartite treatise was a later development, taking place at the same time as the revision of the *Dialectica*, which John never finished.

As Kotter revealed in the first volume of his edition of the works of John of Damascus, there can be discerned in the manuscripts two versions of the *Dialectica*, which are sometimes combined. The earlier version consisted of 50 chapters – a half-century, as it were – whereas it seems that in his revision he intended to extend it to a full century, but never completed it. John was clearly attracted to the form of the century. This genre was introduced to Christian literature by Evagrius (d. 399) and became very popular in the Byzantine ascetic tradition. The first centuries were collections of chapters concerned with asceticism and prayer for a monk to meditate on; later on, notably by Maximos the Confessor, the genre was extended to presentations of dogmatic theology (to emphasize, I would argue, the rooting of dogmatic theology in prayer). It is this tradition that John follows in the three treatises that go to make the *Fount of Knowledge* (in Western editions and translations of *On the Orthodox Faith*, the fact that it is a century is obscured by being divided into four books, a division that goes back to the early Latin translations that assimilate the structure of John's work to Peter Lombard's *Sententiae*).

The *Dialectica* itself also belongs to a genre of what one might call Christian textbooks of logic, which seem to have emerged in the seventh century (see Roueché 1974, 1980). These textbooks

were devised to help Christians argue – among themselves and with others; they are based on classical summaries of logic, for example, Porphyry's *Isagogê* ("Introduction") and Aristotle's *Categories*. The Christian textbooks betray their affiliation by replacing examples concerned with "Socrates," with examples using, for example, "Peter." John, in the *Dialectica*, goes further than this: his introduction to logic is devised to introduce the reader to the terminology of Christian theology that had developed from the controversies of the fourth and following centuries. Furthermore, they lead up to the notion of ὑπόστασις, a term introduced into Christian theology, primarily to designate the members of the Trinity, and then to designate the one Christ, both God and man; the last chapter of the earlier short version of the *Dialectica* is concerned with the hypostatic union, which expressed to conviction that in Christ there are two natures, but only one person, ὑπόστασις.

Although John's work in composing the *Dialectica* seems to be simply that of a compiler, and probably a compiler relying on earlier Christian textbooks of logic, John's purpose in doing this is loftier. In what Richter argues is the first chapter of the revised version of the *Dialectica*, we find John's account of the purpose of his whole theological activity, starting, as it does, with clarification of logical terms and ways of argument (Richter 1964). This chapter is about knowledge (γνῶσις) and he begins by praising it: "Nothing is more honorable than knowledge, for if knowledge is the light of the rational soul, then contrariwise ignorance is darkness." Knowledge is the proper state of rational beings, so for rational beings lack of knowledge renders them worse than irrational beings. John then comments, "knowledge is the true knowledge of beings." Consequently, knowledge of what is not is not knowledge at all, it is simply ignorance. However, in this life the soul is clothed with the veil of the flesh, and though it possesses an intellect (νοῦς) which is "a kind of eye, that sees and knows and is receptive of the knowledge and understanding (ἐπιστήμη) of beings," the intellect does not possess knowledge of understanding from itself; rather it stands in need of a teacher: therefore, John says, "let us

approach the teacher who is free of all deceit, truth itself,” that is Christ, “and let us hear his voice in the divine scriptures and let us learn the true knowledge of everything that is.” To do this, it is necessary to purify the “intellectual eye of the soul” from the passions, for even the purest and clearest eye is scarcely able to attain the truth. It is not enough to reach the gate, we have to knock hard on it, so that:

when the door of the bridal chamber is opened to us, we may see the beauties within. For the gate is the letter, and the bridal chamber within the gate is what is hidden by the letter, the beauty of thoughts, the spirit of truth. Let us knock hard, let us read once, twice, many times, so that by digging we may find the treasure of knowledge and delight in its riches. Let us seek, let us search, let us examine, let us enquire; ‘for everyone that asks receives, and everyone who seeks finds and to everyone who knocks it shall be opened’. (*Dial.* 1. 37–46)

John then goes on to say that in every task, one needs helpers. So, too, in this task of seeking knowledge: let us not be afraid to make use of anything that is good, for they are, as it were, the ‘favorite slaves’ who serve the queen. So rhetoric and argument can be used, in subordination to the truth. With Christ as our guide, we are embarking on a journey, the purpose of which is “to be led upwards by the senses to that which is beyond everything belonging to the senses and beyond any apprehension, to the one who is the source and maker and creator of everything.” John quotes Wisdom 13:5 and Rom. 1:20, which speak of the way we may pass from the creation that we can perceive to the Creator who is beyond perception and then finally reminds his reader of the need for a way of thinking (φρόνημα) that is humble and free from being puffed up by self-regard, if we are to learn from one who himself taught the way of humility (John quotes John 5:44 and Luke 14:11).

This is the voice, not so much of the scholar, as of the monk: knowledge, the pursuit of truth, is to follow Christ, the Truth. The way demands humility and purification: it demands one’s whole life, not just one’s committed intellect. If few claims can be made for John’s place in the development of logic in late antiquity, his role in drawing the resources of classical logic into the pursuit of theology has some importance.

In John’s other works, there are several places where John discusses and develops philosophical themes. First, there is the way in which John’s reflection on the meaning of ὑπόστασις can be seen as placing at the center of his philosophical vision a notion of what Markov has recently called “hypostatical selfhood” (Markov 2015). In reflecting on this, John develops his notion of περιχώρησις, “co-inherence” or “co-penetration” (the older view that John was dependent on Ps-Cyril is disposed of in Conticello 1995). For John, since there can be no “spatial distance, as with us, in the uncircumscribable Godhead,” the ὑποστάσεις are ‘in one another [ἐν ἀλλήλαις], not so as to be confused, but in accordance with the word of the Lord, “I in the Father and the Father in me” (John 14:10)’ (*Expos.* 8. 253–6). It is this being “in one another” of the ὑποστάσεις that John designates by the term, περιχώρησις, “co-inherence”: they have “co-inherence one in another without any coalescence or mixture” (*Expos.* 8. 263–4). The notion of co-inherence of the persons of the Trinity describes something that is uniquely true of the uncreated reality of the Godhead, where the distinction of ὑποστάσεις does not detract from the unity of the Godhead: the ὑποστάσεις can be discerned to be distinct in their several “modes of existence,” but in reality they are wholly at one, and that unity between the ὑποστάσεις is manifest in their interpenetration or co-inherence, περιχώρησις.

John’s understanding of περιχώρησις is relevant to question of the nature of ὑπόστασις and its central role in his metaphysical synthesis. Ὑπόστασις is a central term in John’s Christian ontology: reality is primarily hypostatic. Following earlier theologians such as Leontios of Byzantium and, especially, Maximos the Confessor, John utilizes what might be called a “Chalcedonian logic,” in accordance with which he distinguishes between the level of nature or being, φύσις or οὐσία, at which level beings are defined by their λόγος τῆς οὐσίας, the principle or meaning of their being, and the level of existence, where beings have concrete existence as ὑποστάσεις, persons, individuals, in accordance with their “mode of existence,” τρόπος τῆς ὑπαρξεως. In the Incarnation, the ὑπόστασις of

the Son can assume human nature, for the mode of filial existence can take both a divine and human form. For the most part, however, John defines his logical concepts in terms of creaturely reality. Although the distinction between *ὑπόστασις* and *οὐσία* was first made to elucidate Trinitarian theology, John, in common with his sixth- and seventh-century predecessors, defines this distinction in creaturely terms. The consequence of this for John is not to propose any kind of analogy between divine and personal existence; on the contrary, John rules out any kind of analogical continuity. In fact, it is improper in his view to think of reality as divided into uncreated and created reality, for there is no common reality to be thus divided. Uncreated reality is utterly unlike created reality. We use the same terms, *ὑπόστασις*, *οὐσία*, etc., of both God and created being, but the reality they map on to is quite different: one uncreated and utterly simple, so that the divine persons are co-inherent one in another, the others created, occupying space and time, which entails genuine separation or distance (*διάστημα*) and prevents any genuine co-inherence.

Another philosophical theme, important to the Damascene, is the concept of divine providence, *πρόνοια*, and its consequences for the notion of human freedom. In his development of this notion, John is heavily dependent on Maximus and, through him on the fourth-century bishop, Nemesios of Emesa (whose works it is possible Maximus discovered: there seems no trace of his influence before Maximus' endorsement of his ideas, especially on providence), as well as other Fathers, especially Basil the Great, and his influential homily, *Quod Deus non est auctor malorum* (CPG 2853). In *On the Orthodox Faith*, there are three chapters that discuss providence: the two chapters that come at the end of his discussion of human nature, chapters 43 (on *πρόνοια*) and 44 (on *πρόγνωσις*, foreknowledge, and *προόρισμος*, predetermination), and one of the miscellany of chapters that complete the century, chapter 92 ("That God is not the author of evils"). Chapter 43 develops a notion already discussed in preceding chapters, namely, the distinction between what is up to us (*τὸ ἐφ' ἡμῖν*: identified

in chapter 39 as *τὸ αὐτεξούσιον*, self-determination, often – misleadingly – rendered "freewill") and what is not up to us (chapter 42). Providence, John asserts, "is God's care for everything that is," or "God's will, by which all beings receive guidance toward what is fitting" (*Expos.* 43: definitions taken from Nemesios, *De natura hominis* 42). Providence is an aspect of God's care for all he has created, and John lists the works of providence; all this, however, concerns "what is not up to us, for what is up to us belongs not to providence, but to our self-determination." In chapter 92, drawing largely on Basil's homily, John uses the distinction in providence mentioned in chapter 43 between what happens *κατ' εὐδοκίαν* ("by good pleasure") and what happens *κατὰ συγχώρησιν* or *κατὰ παραχώρησιν* ("by permission"): the former covers acts simply good; the latter events not good in themselves that God uses to guide rational beings to what is fitting. In chapter 92, the distinction is used to make room for what is "up to us" and absolve God from being responsible for evil: an elaboration on Plato's *αἰτία ἐλομένου· θεὸς ἀνάτιος* (*Rep.* X. 617E: "blame belongs to the one who choseth; god is blameless"). John's understanding of will (*θέλημα*) which is by nature *αὐτεξούσιον*, self-determining, is developed in the context of his thought on providence; he draws on Maximus' reflection on the nature of will, occasioned largely by his defense of the presence of a human will in Christ in his refutation of the heresy of monotheletism. John refines Maximus' thought; his concept of will proved to be influential on later Greek thought and also on Latin scholasticism (through the Latin translations on the *Exposition*: see Frede 2002).

Another context in which John's reflections proved of philosophical importance is his understanding and defense of the notion of image, *εἰκών*. John's immediate purpose was the refutation of Byzantine iconoclasm, which, as a subject of the caliph, not the emperor, he was free to oppose. The notion of image played a fundamental role in Platonic thought: images mediated between the world of the senses and the world of the intellect; images derived from what we perceive through the senses gave a glimpse of the

invisible world of the intellect, which expressed itself through images drawn from the senses. Dionysios the Areopagite gave lapidary expression to this central perception in his remark, “truly visible things are manifest images of things invisible” (*Ep.* 10), which John Damascene placed at the head of his most exhaustive florilegia of patristic citations that formed an appendix to the third treatise against the iconoclasts (*imag.* III. 43). In this third treatise, John distinguishes six different meanings of the word “image”: firstly, the natural image, as a son is an image of the father (and more particularly, as the Son of God is the image of God the Father); secondly, the images or paradigms (or predeterminations, as Dionysios calls them) within God of what is to be; thirdly, humankind, as created in the image of God, manifest both in the Trinitarian structure of the human soul as intellect, reason, and spirit and in human self-determination and human rule over the rest of creation; fourthly, there are images that use bodily forms to represent the spiritual world, necessary if human beings, composed of body and soul, are to form some conception of the spiritual; fifthly, there are images in the Old Testament that prefigure the realities of the New – the burning bush as a figure of the virginity of the Mother of God, or water as a figure of baptism; finally, there are images that recall the past, either in written form or in pictures (III. 18–23).

This is not just a list; it is an evocation of the multitude of ways in which reality echoes reality, from the Father imaging forth the Son and the Son the Spirit in the life of God the Trinity, through the patterns of providence, humanity as an image of God, the way in which the visible world finds its reality in the spiritual world and images it forth, the images that shadow the relationship between the Old and the New Testaments, to the images that remind us of the past, of the ‘rock from which we were hewn’ (cf. Isa. 51:1). The notion of image, in its different forms, is always mediating, always holding together in harmony. Images in the form of pictorial icons fit into this pattern, in a quite humble way. But to deny the icon, the pictorial image, is to threaten the whole fabric of harmony and mediation based on the image. At the heart of all this is human kind as the image of

God: it is humanity in the image of God, as John makes clear in his epitome of patristic anthropology in *On the Orthodox Faith*, that is the microcosm, the little universe, the bond of the cosmos (*expos. fid.*, 89). This world of signs was created by God, who first made images, when he created human kind in his image, and manifested himself in the Old Testament in theophanies that took the form of images: Adam hearing the sound of the Lord God walking in the garden in the cool of the day; Jacob fighting with God; Moses seeing God’s back; Isaiah seeing him as a man seated on a throne; Daniel seeing the likeness of man and as Son of man, coming to the Ancient of Days (*imag.* III. 26). John’s seeing the fundamental role of the image in human understanding has a further consequence: his defense of the place of imagination, φαντασία, in human understanding, for it is the imagination that receives and interprets images in the human mind (*imag.* I. 11).

In these ways, what often seems no more than the compilation and summary of the thought of his (mainly, in my view) Christian predecessors discloses hints of genuine philosophical understanding, which he bequeathed to his readers, both in the Greek East and in the Latin West.

John of Jandun

Jean-Baptiste Brenet
Paris, France

Abstract

John of Jandun (c. 1285–1328) was a Parisian Master of Arts known as one of the main supporters of Averroes. "The prince of the averroists" or "Averroes' monkey," he was a commentator's Commentator. Abundantly read, and also criticized, most notably for his theory of the intellect, his influence persisted until the sixteenth century in Padua, Italy.

John's life is not well known. Born around 1285 in the Ardennes, he probably began to study philosophy around 1306 at the University of Paris, where he was admitted for a Master of Arts degree in 1310, which framed his teaching career until 1326. In 1315, he appears as *magister artistarum* among members of the College of Navarre founded by Queen Jeanne. The following year, in 1316, he was appointed by John XXII canon at Senlis, but still continued to teach. His fate, however, made him leave the university. In Paris, he became friends with his colleague Marsilius of Padua, who completed the *Defensor pacis*, a pro-imperial pamphlet in violent opposition to the idea of a theocratic papacy, on June 23, 1324. Its release caused a scandal, and the two men had to flee the city in 1326. At Nuremberg, they found refuge at the court of Emperor Louis of Bavaria, where they continued to argue against the Church. John was excommunicated in 1327, condemned as a "heretic" along with Marsilius. Nevertheless, he followed the emperor to Italy, attended his coronation, and Louis rewarded his loyalty by appointing him Bishop of Ferrara on March 1, 1328 and soon thereafter, member of the court as *secretarius sive conciliarius*. John died before he was able to fulfill his new functions, probably in Montalto, between the 10th and the 15th of September 1328.

His teaching is based on the texts of Aristotle, which the *curriculum* of the Faculty of Arts had just assimilated. An “Aristotle” still impure, produced by the Latin translations from Greek or Arabic and dependent on a vast network of Neoplatonist interpretations. John of Jandun explores almost the entire corpus of Aristotle. We do not have his commentaries on the *Liber ethicorum* and on the *Liber politicorum*, but we have access among other writings to his *Quaestiones* on the *Parva naturalia* (1309), on the *Physics* (written most likely in 1315), on the *De coelo et mundo*, on the *Rhetoric* and the *Economics* (1319), on the *De anima* (written between 1317 and 1319), and on the *Metaphysics* (between 1318 and 1325). He also commented on Averroes’ *De substantia orbis* and wrote, besides various other things, two poems: one in honor of Senlis and the other in honor of Paris, *Tractatus de laudibus Parisius* (1323). His relations with his contemporaries were numerous. He argued with philosophers (Bartholomew of Bruges, Raoul of Breton, and Maino of Maineri) as well as theologians (among others Peter Auriol or Thomas Wylton from whom he borrowed a lot). He also might have been involved with Raymond Lull toward 1310.

The work of John of Jandun is almost entirely structured around the Latin translations of Averroes, to which he refers frequently and in close detail. In the field of natural philosophy, he aims at revealing the *intentio Aristotelis* with the help of Averroes, his foremost interpreter. This earned him the reputation of the principal defender of “Latin Averroism,” which is justified from a formal point of view by the reference system that formed the basis of all his work. However, his readings are not a strict repetition of Averroes’ exegeses and theories. John is involved in the quarrels of his time, and he inevitably departs, sometimes despite himself, from Averroes’ difficult texts that were modified by the Latin translation as well as the manuscript tradition.

This is the most obvious in his doctrine of the soul and of the intellect. John is, for example, a defender of the “agent” sense, which is based on the model of the agent intellect. In noetics, under the influence of Scotus, he confers a different role

to the agent intellect than the usual one of the abstraction of the intelligibles from images. The agent intellect operates on the intelligible species received in the material intellect in order to activate its representative dimension and access the quiddity corresponding to it. Regarding these two intellects, John believes with Averroes that they are ontologically separated from human bodies, unique for the entire species, and eternal. However, it was to Siger of Brabant more than to Averroes himself that he owes his conception of the relationship between the human being and the intellect, and that of the individual intellectual act. The intellect is not the substantial form of the body; it does not give it its being, but it is all the same its form as its “intrinsic operator.” During the intellectual process, it forms a whole with the body, substratum of images. The intellect and the cogitating body unite during an operation (i.e., thought) for which they necessarily cooperate, because we do not think without images. The thinking human being is therefore a being who, as such, contains within him his intellect as a part, just as the sky qua moving includes the intelligence that moves its sphere as one of its parts. The concept of “continuatio” in Averroes is transformed: man thinks qua producing in himself concepts. John uses the idea of a plurality or gradation of forms to explain this relationship between the body and the intellect. A human being has two forms, each of them proper to him or her, one cogitative, the other the intellect. The one is never present without the other. To the contrary of what the anti-averroists claimed, John does not for a moment imagine that my cogitative form – even though it is the ontological form of my body – could exist without the separate intellectual form also being associated with me.

John is equally known as a major figure in the history of the so-called double truth theory, that is to say, the idea that there are two contradictory truths, one in philosophy, (obtained by reason) and the other in theology (given by faith). This is not John’s position. Like other Masters of Arts, he does not intend to question that there is one truth. The Catholic faith, for him, remains the criterion of absolute truth. However, he takes part in the

movement that undermines the unity of knowledge, seeking to liberate philosophical research from religious guardianship, that is to say, proclaiming the intellectual right of the Masters of the Arts faculty to fully explicate the thinking of philosophers and to systematically deduce the logical consequences of the principles guiding their scientific research, these deductions having a truth value only within certain epistemological limits.

John develops his thinking in many individual and original ways (e.g., the collective actualization of knowledge, or his perspective of ultimate happiness, partly influenced by al-Fārābī). We should stop seeing John as a carbon copy of Averroes if we are to better elucidate how philosophy continued to develop within an Aristotelian tradition.

John of La Rochelle

István P. Bejczy

Stichting Mozaïk, Rotterdam, The Netherlands

Abstract

The Franciscan theologian John of La Rochelle (1190/1200–1245) studied and taught in Paris and was active as a preacher. Collaborating with Alexander of Hales from the 1230s to the end of his life, he is best known for his contribution to the *Summa fratris Alexandri*. Scholarship recognizes him as the principal

redactor of the first and third parts. John also planned to compose a *Summa theologiae disciplinae* of his own, which at least partially survives. His other writings consist of theological questions, exegetical works, a treatise *De arte praedicandi*, sermons, (probably) a gloss commentary on Peter Lombard's *Sententiae*, (possibly) a treatise on time, and two interrelated treatises of psychology: *Tractatus de divisione multiplici potentialium animae* and *Summa de anima*. The *Tractatus de divisione* discusses definitions of the soul, the powers of the soul, and the soul's perfection through virtue and grace. It presents an updated survey of the principal authorities of moral psychology available near 1240, but refrains from developing personal views. John's most successful work, the *Summa de anima*, examines the substance of the soul and its powers. It partially depends on the *Tractatus*, but provides a magisterial discussion of the soul and its faculties by systematically confronting received opinions. Particularly remarkable is John's theory on the degrees of abstraction. Further study of the *Summa de anima* may lead to a revision of the still current opinion that John was an able compiler rather than an original thinker.

John of La Rochelle (Jean de La Rochelle, Johannes de Rupella) was born about 1190/1200 in the French town of La Rochelle. Little is known with certainty about his career. He studied in Paris, becoming master of arts and thereupon master of theology under William of Auxerre and, probably, Philip the Chancellor. At some time before 1238, he entered the Franciscan order and started collaborating with his confrere Alexander of Hales. He was a master in the Franciscan school at Paris in 1238; at the University, he appears to have shared Alexander's chair as a public regent master of theology and/or to have succeeded Alexander in 1241. The cooperation between John and Alexander would last until John's premature death (either in Lyon or in La Rochelle) on February 3 or 8, 1245. John counted Bonaventure among his pupils and was succeeded in his regent chair by Odo Rigaldi.

Together with Alexander of Hales and Haymo of Faversham, John headed in 1239 the opposition against Elias of Cortona as Minister General of the Franciscan Order. The three men convinced Pope Gregory IX to summon a chapter general of the Order on May 15, 1239, in which Elias was deposed. In 1241–1242, John, Alexander, and two other masters (probably Odo Rigaldi and Robert de la Bassée) worked together in composing, at the request of the Franciscan chapter of Montpellier, an explanation of the Franciscan Rule known as the *Expositio quatuor magistrorum super regulam fratrum minorum*.

Apart from teaching and writing, John was active as a preacher. Several contemporaries were witness to the effectiveness of his oral rhetoric. The last recorded event of his life is his delivering a sermon before the papal curia in the Dominican church of Lyon on December 4, 1244. Pope Innocent IV had arrived in town two days before in order to make preparations for the First Council of Lyon, in which John appears to have been involved.

Long being reputed as an able compiler rather than an original thinker, John receives increasing recognition in recent scholarship for his achievements in psychology and moral theology. John was primarily a theologian (he defined theology as ultimate *sapientia*), but insisted on the usefulness of philosophy for theological study, even explicitly warning his colleagues for the dangers of neglecting it. Philosophy, in his opinion, provided Christians with the intellectual sharpness and invincible arguments needed, in combination with charity, in order to deepen the understanding of the faith and to live by its standards. St. Anthony of Padua appears to have been his prime model of sacred doctrine (Brady 1974).

As a theologian, John is best known for his contribution to the *Summa fratris Alexandri* or *Summa Halensis*. Scholarship recognizes him as the principal redactor of the first part (*De Deo*) as well as the third (*De verbo incarnato*, *De legibus et praeceptis*, *De gratia et virtutibus*), while the other two parts incorporate many of his surviving writings. The third part remained unfinished at John's death and was completed by, among others, Odo Rigaldi. John also planned to

compose a *Summa theologicae disciplinae* of his own in order to provide basic theological instruction. He may not have fully completed this work either, but its outline is apparent from the extant sections. The work was to consist of two parts, on faith (comprising two sections, *De articulis fidei* and *De divinis nominibus*, which have both been preserved) and on morals (comprising sections on the vices, virtues, beatitudes, commandments, gifts, and sacraments). Several texts survive in manuscript form, in different redactions and combinations, which may correspond to the sections of the second part. Recently, evidence has come to light which suggests that the second part was actually completed, either by John himself or by a collaborator after his death, with sections on the vices and virtues straightly depending on the *Summa de vitiis* (1236) and the *Summa de virtutibus* (before 1248) of William Peraldus, a Dominican of Lyon whom John may have personally met near the end of his life (Bejczy 2004). John's own *Summa de vitiis*, regarded in earlier scholarship as the projected section on the vices of the *Summa theologicae disciplinae*, may hence have been conceived by John as a separate work.

John's other writings consist of some dozens of theological questions on various subjects (portions of these questions were integrated into the *Summa fratris Alexandri*; only the questions on divine grace are partially available in a modern edition), exegetical works (including two introductory lectures on biblical exegesis, *postillae* on several books from the Old Testament as well as on all four gospels (Smalley 1980), and a *summa* on the Pauline Epistles), a treatise *De arte praedicandi*, and over two hundred sermons, a number of which have been edited in recent years (Duval-Arnould 1976–1977; Bougerol 1988; Rasolofoarimanana 2005); however, the cycle of sermons *de communi* attributed to John may actually be the work of Odo Rigaldi (Duval-Arnould 1976). John is also believed to have written a gloss commentary on Peter Lombard's *Sententiae* as well as a short *Tractatus de tempore*. Finally, John composed two interrelated treatises of psychology, which bear a properly philosophical interest: *Tractatus de divisione multiplici potentiarum animae* and *Summa de anima*. Both

treatises have been critically edited and permit an evaluation of John's intellectual achievement.

The *Tractatus de divisione* consists of three parts of highly unequal length: *De anima secundum diffinitionem*, *De anima secundum divisionem*, *De anima secundum perfectionem*. The first part is the briefest. In it, John discusses twelve definitions of the soul; five of these are taken from Pseudo-Augustine's *De spiritu et anima* (a probably Cistercian product of the twelfth century), the others from John Damascene, Alfred of Sareshel, Plato, Aristotle, Nemesius of Emesis, the Book of Genesis, and Seneca. Typically, John discusses each definition in its own right, without confronting them with each other or developing a personal stand. In the second part, which is by far the longest, John explains the various meanings of the terms used for the powers of the soul (*ratio*, *intellectus*, *voluntas*, etc.) and exposits five classifications of these powers: those of "the philosophers, in particular Avicenna" (in fact an amalgam of theological opinions), "the physicians" (Johannitus [Hunayn b. 'Ishāq] and Avicenna), John Damascene, and, again, *De spiritu et anima*. The third part involves a theological perspective and investigates the role of grace in the soul's (supernatural) perfection. After discussing the various manifestations of grace (virtues, gifts, sacraments, beatitudes, etc.), John concentrates on the virtues and exposits their definitions and classifications according to Plotinus (mediated through Macrobius), Cicero, Aristotle, "the theologians" (in fact Philip the Chancellor's theories as expressed in his *Summa de bono*), and the twelfth-century, Stoically inspired *Moralium dogma philosophorum* – thus introducing philosophical theories in his theological disquisition, but again without taking a personal stand. Remarkably, however, John supplies the acquired moral virtues with functions that Philip the Chancellor only attributed to the infused virtues: they make us *uti* the things which are *ad finem* and determine the actions and passions related to our *ingressus in vitam*. The third part ends with a discussion of beatitude *secundum philosophos et sanctos*, taking its departure in the definitions of Boethius, Aristotle, Anselm of Canterbury, Seneca, and

Augustine (one of the three definitions borrowed from Augustine actually derives from Prosper of Aquitaine). It is only here that John confronts the opinions of the authorities and tries to resolve the ensuing conflicts in the form of questions. All in all, however, the *Tractatus de divisione* makes the impression of a compilation rather than a sustained synthesis. It nevertheless has the merit of presenting an updated survey of the principal philosophical, theological, and even medical authorities of moral psychology available to western learning near 1240.

The *Summa de anima* is John's most successful work, being preserved, either or not integrally, in 50 manuscripts. It was written after the *Tractatus de divisione*, while several chapters from the *Summa* were incorporated into the second part of the *Summa fratris Alexandri*. The work consists of two parts, on the substance of the soul and on its powers; the main source of the second part is the *Tractatus de divisione*, which John often copies literally. Yet the *Summa* bears an altogether different character than the *Tractatus*. Using the same set of sources (including Avicenna's *De anima*), John provides a magisterial discussion of the soul and its faculties by systematically confronting received opinions. Particularly remarkable is his theory on the degrees of abstraction, formed under the influence of Avicenna. According to John, the imagination reorganizes sensible features of perceived individual objects; thereupon, the estimative faculty produces corporeal forms by retaining the similarities and eliminating the differences between these features; finally, the intellect strips away all conditions associated with the matter and singularity of the perceived objects and produces pure universals, predicable of all individuals of the same species (Sondag 2003). Also, John holds that the faculties of the soul are substantially identical to the soul itself, even though the operations of the intellect imply a distinction between the two (ibid.).

Macerata, Italy

Abstract

John of Paris (d. in 1306) was a Dominican theologian, deeply and personally involved in the theological and political debates of his time. He is well known as the most outstanding “ideological” supporter of Philip the Fair in his struggle against Boniface VIII. His treatise *De regia potestate et papali* played an important role in medieval political thought, also after the dramatic conclusion of the clash between papacy and the French crown. John counters, in fact, curial claims of plenitude of power in a way that found positive echo also in the Conciliar epoch. His philosophical and theological doctrines have been studied only partially. He was a convinced advocate of the unity of substantial form, against the doctrine of the plurality of forms, held by most Franciscan authors of the time. He also rejected William de la Mare’s criticism of Aquinas; this does not imply, however, that he always reproduces the thought of his great confrere. His most controversial theological opinion was his account of the Eucharistic miracle as “impanation” and not as “transubstantiation.” Although in a moderate way, he also criticized the Catalan physician and theologian Arnau de Villanova for his attempts at determining the exact time of coming of the Antichrist.

John of Paris (also known as Jean Quidort, Johannes Dormiens, Surdus, Monoculus), member of the Order of the Friars Preacher; in an encomiastic sermon most likely held in occasion of the awarding of his doctorate we read that he had been Master of Arts before entering the Dominican Order. Most probably he read the *Sentences* in Paris, in 1293–1294; in 1295 he

drafted a memoir defending himself from accusations leveled against him because of his teaching. Documentary evidence of his presence in Paris, at the Convent of Saint Jacques is dated the June 26, 1303, when he signed in favor of Philip the Fair’s appeal against Boniface VIII. At that date he had already taken part in the dispute between the pope and the French crown, contributing the famous treatise *De regia potestate et papali*. In 1304 he intervened in the dispute between seculars and mendicants: his *De confessionibus audiendis* argues in favor of Benedict XI’s bull *Inter cunctas*, which was highly favorable to the mendicants. His first *quodlibet* is dated 1304/5. In his writings John of Paris shows a self-conscious, critical, and independent attitude. He does not refrain from polemical remarks and biting irony. He died on September 22, 1306, in Bordeaux, while he was waiting for the final results of his appeal to the pope against the sentence that prohibited him from teaching because of his Eucharistic doctrine.

John of Paris is mostly known as a political thinker. While his name seldom appears in handbooks devoted to the history of medieval philosophy and theology, a history of medieval political thought must consider his *De regia potestate et papali* in some detail. This treatise supports Philip the Fair’s position in his controversy against pope Boniface VIII, arguing that Christianity is based on two mutually autonomous principles: nature, which gives rise to temporal institutions such as monarchy, which also exist in pre-Christian and non-Christian societies, and revelation, on which ecclesiastical institutions are based. These two realms do not depend on each other but are complementary, providing mankind with the means to reach its ends, respectively, temporal well-being and eternal beatitude. On the temporal level, John argues in favor of a plurality of kingdoms and criticizes universalistic theories of empire; on the spiritual level, the church is one and universal, ruled by the pope. John argues here along the lines of the ecclesiology of the mendicant orders. Interventions by the authorities of one sphere in the affairs of the other are legitimate only in case of extreme necessity, that is, when the leaders in charge fail to fulfil their duties and risk hindering

the attainment of the specific end for which they are responsible. The reference to Philip the Fair's actions against Boniface is clear. Moreover, scholars such as Janet Coleman have pointed out that John draws a clear-cut distinction between individual right of ownership, which is acquired through one's own labor, skill, and industry, and political power, which can dispose of private goods for the sake of the common good only exceptionally, in case of necessity. The sovereign is therefore in no sense owner of the goods of his subjects. John's idea is close to the principle of inalienability of individual rights to property. The church, on the other hand, can have property, not because of a supposed *a priori* divine right to it, but because it receives donations from legitimate owners (be they temporal rulers or other lay donors); such goods are owned by the church as a community, while prelates are only administrators: the pope is therefore the supreme steward of the properties belonging to the ecclesiastical community.

De potestate regia has traditionally been dated 1302 and considered the most significant Parisian reaction to curial positions and in particular to Giles of Rome's *De ecclesiastica potestate*. More recent studies (first and foremost by Lars Vinx and Karl Ubl) have questioned this reconstruction, pointing out that John of Paris, in fact, criticizes, not Giles, but a *quodlibet* of James of Viterbo held in Paris before the clash between the pope and the king came to its crucial phase. It could well be the case, then, that Giles wrote in answer to John and not the reverse. The discussion among scholars is still open, but its development shows that a new critical edition of the treatise is needed, since the existing ones do not take into account the existence of different versions of John's treatise, which was most probably revised by the author himself. The two last chapters of the treatise deal with the much debated issue of the possibility of papal resignation. Exploiting for his own ends materials from Giles of Rome's treatise on the same subject, originally aimed at defending the legitimacy of Celestine's abdication, and therefore of Boniface VIII's election, John argues, not only that a pope can resign, but that he can also be deposed by a general council. John of Paris'

treatise bears features that ensured it a wide reception long after the dispute between Philip and Boniface, especially, in the first half of the fifteenth century, in the context of the Councils of Constance and Basel. Most recent scholarship tends to exclude John from being the author (or among the authors) of the short political treatise *Rex pacificus* which is most probably among the sources of *De regia potestate et papali*.

John of Paris' metaphysical and theological doctrines have been comparatively less studied than his political thought (Book III and IV of his *Commentary on the Sentences* are still unedited). Specialists have disagreed about the extent of his "Thomism." Their discussion has not led to definitive results yet and most probably never will. Scholars have devoted attention to his doctrine of a real distinction between *esse* and *essentia*, which he defended following Thomas Aquinas. In John's opinion the *esse* of every created being is distinct from its essence. It does not flow from the essence but must be caused by an external cause, by God. Although well acquainted with the debate concerning individuation and with alternative solutions (e.g., Henry of Ghent's and perhaps Thomas Sutton's), John takes the position in his *Quodlibet* (most probably 1304/5) that matter is the most plausible candidate. John is also a supporter of the doctrine of the unity of substantial form. According to him, only this doctrine can guarantee the unity of the human being.

Some doubts notwithstanding, available evidence suggests that John of Paris took part in the so-called *Korrektorienstreit*, authoring the *Correctorium corruptorii circa*. In this work he expounds William de la Mare's criticisms of Aquinas contained in William's *Correctorium fratris Thomae* and rejects them one by one, as far as the discussion of *Summa theologia*, Ia-IIae, q. 50. John took a controversial stance in the debate concerning the beatific vision, arguing for a mediation between the voluntaristic and intellectualistic approach: he claimed that beatitude does not simply consist in seeing God but is a reflective act that comes at the end of a complex process, one which also involves the will, that is triggered by the vision of the divine essence. In his solution, he also allowed for a progress in the

vision of God in the afterlife. As is well known, a much more radical version of such a doctrine was later adopted by Pope John XXII, giving rise to a dramatic controversy.

John's doctrine of change in the Eucharist, which had quite serious consequences for his teaching career, is most probably designed also to overcome the difficulties intrinsic to an account of transubstantiation based on the principle of the unity of the substantial form. In his earlier works he had tried to combine transubstantiation and unity of form; in his *Determinatio*, however, he suggested an alternative to transubstantiation that is a version of the doctrine termed "impanation" in modern theological discourse. This doctrine develops an account of eucharistic changes along the lines of the Incarnation: the substance of bread is not transformed, but in some way assumed by Christ.

John of Paris expressed his opinion also with regard to theology of history and eschatology. In 1300 he wrote a treatise, *De adventu antichristi*; in its second part he criticizes Arnau de Villanova's speculations about the date of the coming of the Antichrist and the end of history. John maintains that investigations concerning eschatology may be a useful exercise but cannot claim to determine with certainty the time of such future events. The scope of human knowledge is in fact limited in this perspective; the resulting uncertainty, however, has a providential goal, because human beings must be aware of being on divine trial in every epoch.

John of Reading

Stephen F. Brown

Institute of Medieval Philosophy and Theology,
Boston College, Chestnut Hill, MA, USA

Abstract

John of Reading was an English Franciscan theologian and philosopher who was a staunch defender of the teachings of his fellow Franciscan, John Duns Scotus. He joined company with Walter Chatton to defend Scotus on most issues, criticizing fellow Franciscans Robert Cowton, William of Nottingham and William of Alnwich who both defended and criticized Scotus' various teachings and Peter Auriol and William of Ockham who later opposed Scotus on many points. Reading and Chatton might even be considered the preparation team for what eventually would be called the Scotistic School. Reading's chief work is his *Commentary on the Sentences*, which has come down to us in a unique copy contained in the Florence manuscript of the Biblioteca Nazionale, Conv.

Soppr. D.IV.95. The main part of it is his Prologue to the *Sentences*, where he attempts in great detail to establish theology's claim that it is a scientific discipline. In his effort to do so, he examines the portraits of theology presented by a dozen other authors and relates them to his own position. Here, and in the rest of his commentary, he provides a detailed history of decades of discussions on the theological themes he examines.

John of Reading (c. 1272–1346) was an English Franciscan who is listed as the 45th Regent Master of his religious order at Oxford, probably in 1319. Earlier records tell us that he was ordained a subdeacon in 1292 and became a deacon 2 years later. Although only one manuscript copy of his main theological work has come down to us, we know from other sources that he lectured twice on the *Sentences of Peter Lombard*, first at Oxford or perhaps prior to coming to Oxford. Wherever he might have first commented the *Sentences*, it was before William of Ockham, who did so in 1317–1319, since Ockham quotes him. He commented again, however, after Ockham, since John criticizes Ockham's commentary on the same work. Ockham's student and frequent defender, Adam Wodeham, according to the student report of his *Lectura secunda* (II, 126), which he delivered at Norwich between 1329 and 1332, confirms that John left two renditions of his *Commentary on the Sentences* when he tells us that Reading was satisfied with a response he had given “to a certain doubt he treated in his *Ordinary Lectures* and also, I believe, in his *Scriptum*.” In any case, it is certain that John of Reading at points was both a source and a critic of Ockham. He was a master at the Franciscan house of studies at Avignon by 1323, the year in which he provided advice to Pope John XXII related to the publication of his bull *Antiquae concertationi* (*To an Ancient Dispute*), until his death in 1346. Since he criticizes the final version of Ockham's commentary, which William brought to Avignon in 1324, we consider his *Scriptum* to be a work completed in Avignon around this time. The only other works that have come down to us as

attributed to Reading are his two *Quodlibeta*, of which the first and second questions of *Quodlibet I* has been published, and an unpublished commentary on Aristotle's *On the Soul*.

Prologue to the *Sentences*

By the early years of the fourteenth century, many *Commentaries on the Sentences of Peter Lombard*, the main instrument for discussing the difficult doctrinal questions of the Christian faith, had changed dramatically from questions with a few simple arguments for and against particular responses to catalogues of authors and collections of their arguments in support of one side or the other. If one examines just the questions of the Prologue to these works, they have expanded from a few pages to a volume of their own. The modern editions of the Prologue of John Duns Scotus' *Ordinatio* fills 237 pages, that of Peter Auriol's *Scriptum* counts 329 pages and William of Ockham's *Scriptum* required 370 pages. The traditional questions about the four causes (material, formal, efficient, and final causes) of the Bible, or the *Sentences*, or the science of theology, exploded into a number of more specific questions and subquestions. John of Reading's *Commentary* provides a text that is the final commentary of Reading. Still, it contains much of the material of his early commentary. This is most evident, as we have mentioned, from the fact that it contains materials criticized by William of Ockham and also has materials criticizing Ockham. Furthermore, it criticizes early fourteenth-century authors like Richard of Conington and Richard Drayton, and also later ones, such as Peter Auriol and William of Ockham. In sum, this final *Commentary* text, which only has the Prologue and six distinctions, is a compilation of his early and late treatments of the questions he debates.

Theology as a Science

The first Prologue question, "Is theology science?," depends in part on what you mean by

"science." In the tradition descending from St. Augustine, "science" could be any form of knowledge by which the Christian faith could be "begotten, nourished, defended and strengthened" (*On the Trinity*. XIV, 1). Or, more technically, "science" could be knowledge of created things in contrast to "wisdom," that is, the knowledge of divine things. However, in the Aristotelian tradition of the *Posterior Analytics*, "science" is of universal, essential, necessary causes of effects that are assented to because of evidence produced through a demonstrative syllogism. Duns Scotus, in his *Ordinatio*, examined the questions "Whether theology is science?" and "Whether theology is a subalternated science?" This combination of questions suggests that he has in mind Aquinas' position that "sacred doctrine is a subalternated science." In the meantime, many objections against Thomas' contention, especially from Henry of Ghent and Godfrey of Fontaines, forced Scotus to examine the conditions for science in the strict Aristotelian sense of the term. This led him especially to discuss "certitude" and "evidence." Scotus' discussions of these terms drew critics, so that John of Reading, sympathetic to the views of Scotus, had to respond. In dealing with "certitude," he was forced to deal with necessity as a ground for certitude. This led him into discussions of God's absolute and ordained power, and while he admitted with Scotus that within the ordained order we could have some certitude because some things followed necessary laws, still, going beyond Scotus' context for discussing the issue, he argued that by his absolute power, God could interfere with the ordained laws. He likewise dealt with "evidence," and in the very same framework, he argued that we could have intuition of non-existing objects if God chose absolutely to give us such knowledge. Reading was later criticized by the Benedictine, Robert Graystones, for his defense of the possible intuition of nonexistents.

One of the subquestions regarding the formal cause or scientific character of the study of theology was the interrelationship of theology with other forms of science. Thomas Aquinas spoke of the study of theology as a subalternated science, subordinated to the knowledge of God and the blessed revealed in the sacred scriptures.

Aquinas, once again, was criticized by his contemporaries Henry of Ghent and Godfrey of Fontaines on this point. It is against these two critics that John of Paris and William Peter of Godino, followers of Aquinas, attempted to respond by arguing that subalternation is a substitute expression for any form of hierarchical relationship. John of Reading centers his attention on Henry of Ghent and his Franciscan follower, Richard of Conington. However, his critique of Thomas' view of subalternation is basically the same as that of Godfrey of Fontaines. Moreover, his demand for greater precision in contrasting "subalternation" with any other form of subordination indicates his discontent with the imprecision of John of Paris and William Peter of Godino. Unlike these defenders of Aquinas, John of Reading insists that "subalternation" is not a synonym for "subordination," but rather a specific form of relationship between superior and inferior sciences. In this discussion, Reading thus seems to be responding to other sources than the ones he actually names, that is, Henry of Ghent and Richard of Conington.

Further Questions

A question raised in the Prologue, but developed in great detail in Question 3 of Distinction III, is a question nominally about memory. "Thirdly, I ask about memory: Is memory found in the intellect having actual or habitual intelligible objects present to it by means of species which formally inhere in the intellect prior to the act of understanding?" Here Reading, defending Scotus against Henry of Ghent, who contended that an intelligible species is not necessary, since, if it were known, it would interfere with knowledge of the object because it takes its place. His second opponent is Richard Drayton, another Franciscan follower of Henry of Ghent, who also fought Scotus and denied the necessity of an intelligible species. The principal opponent of Scotus in Reading's Distinction III text, however, is William of Ockham, who argues in accord with his famous razor that holding to the necessity of intelligible species to account for human and angelic

universal knowledge of created realities should more probably be considered as defending something that is superfluous. Reading's presentation of Ockham's position is a very thorough representation of Ockham's whole portrait of intuitive and abstractive cognition and its various types, both natural and supernatural, before summarizing Ockham's conclusions regarding intelligible species as follows: (1) to have intuitive intellectual knowledge the object and the intellect suffice, without any species; (2) for abstractive cognition the object and intellect are not sufficient; (3) what is needed beyond the intellect and object is not an intelligible species but rather a habit (*habitus*). John of Reading then brings on Scotus to defend the necessity of intelligible species, using the texts of Aristotle and Averroes as interpreted by Scotus, as firm supports. For Scotus, unless the intellect could have its object present to it without it being present to the sense powers, and thus through a species, it would necessarily depend on the sense powers in its own operation and therefore would depend on them for its very existence. Nor is it enough to say, as Ockham argues, that a habit would suffice, since habits depend on acts: how then can an act depend on a habit, when acts themselves build up habits and thus precede them. It is in this debate with Ockham that one can sense that Reading believes that Ockham is the chief threat to Scotus' teachings: he goes into the most detailed presentation of Ockham's disagreement with Scotus and answers every one of his arguments in the most clarifying way possible for a follower of Scotus. It is in discussions such as this one that we can understand why Adam Wodeham considered John of Reading Scotus' most faithful disciple.

One of the most famous positions of Scotus concerns the nature of freedom. He argued that the created will could operate with complete autonomy. Reading summarized his own position with a declaration of allegiance: "As the Subtle Doctor argues, so also do I." The direction of Reading's thinking can be gleaned from the way he poses the question: "Whether when the ultimate end is grasped by the created intellect the will necessarily wills that end?" For both Scotus and Reading, the negative answer is a declaration of the primacy

of angelic and human freedom. This sixth Question of Distinction I fills 76 pages in its modern edition and shows the presence of the authors of his early commentary, Henry of Ghent, Duns Scotus, Robert Cowton, and Richard of Conington, as well as the later discussions of this issue in the works of Peter Auriol and William of Ockham. In this question, Reading not only follows Scotus, he once again attempts to explain Scotus' teaching to those who have over the past 2 decades raised objections or given other interpretations to the Subtle Doctor's teaching and his understanding of St. Augustine, St. Anselm, and Peter Lombard.

John of Reading's metaphysical thought leads him to a twofold approach to the discussion of man's natural knowledge of God. In questions 2 and 3 of Distinction II, Reading poses these problems: "Can a First Being be known with certitude by our natural abilities?" and "Is there but one First Being?" Once again, we can sense that in answering the first question, he is following John Duns Scotus. Scotus, in his discussion of our natural ability to know with certitude that God exists, touches on a number of prefatory definitions regarding causes: univocal versus equivocal, *per se* versus *per accidens*, partial versus total, and essentially ordered versus accidentally ordered. William of Ockham had challenged many of Scotus' explanations and claims regarding each of these couples. John of Reading made it his task to clarify and justify the Scotistic options. For the second question, Reading's chief opponents, as he answers, are William of Ware and Peter Auriol. William of Ware, known as a *Praeceptor Scoti* (a teacher of Scotus), held that the unicity of God is a tenet of faith, and is thus not demonstrable. Reading here takes on the many Franciscans who followed Ware (William of Alnwick, Robert Cowton, Peter Auriol, and William of Ockham) and criticized Scotus. However, most of his effort in dealing with the unicity of God focuses on Peter Auriol who presents him with two theses: an analysis of final causality does not bring us to a single final cause of all things, nor can it show a final cause that is identical with the efficient cause of the world. These are not theses of Auriol himself, but rather his representation of

Averroes' portrait of Aristotle's views. Nonetheless, it provides John of Reading, with some help from the Dominican Robert Holcot, the opportunity to develop his own philosophical arguments for the existence and unicity of God through his reinterpretation of final causality and its link to a unique efficient cause.

Conclusion

The sample of texts of Reading so far edited allows us to appreciate his relationship to Scotus, for the most part as clarifier and defender. This collection of questions also shows one of the early confrontations between Scotus and Ockham and the effort on the side of a follower of Scotus to respond to the head of the Ockhamist camp that challenged Scotus on so many points.

John of Salisbury

Cary J. Nederman

Department of Political Science, Texas A & M University, College Station, TX, USA

Abstract

John of Salisbury (1115/1120–1180) was among the foremost philosophers of the twelfth century, contributing to the development of political and moral philosophy as well as the medieval theory of education and to debates about universals and other metaphysical questions. His general philosophical stance may be labeled “Christian humanism.” While he received extensive formal education in Paris, he spent most of his life in active service to the church. An associate of Archbishop Thomas Becket in his dispute with King Henry II of England, John eventually was raised to the office of Bishop of Chartres.

John of Salisbury enjoys a considerable and well-deserved reputation as an original thinker as well as an observant witness to the vast intellectual and cultural changes that engulfed twelfth-century Europe. Educated in France by some of the best minds of his time, he turned to public affairs in the service of the English church, becoming an intimate of archbishops, popes, and kings. Yet amidst his political entanglements, he still found time to compose two of the most important and influential philosophical works of the mid-twelfth century – the *Policraticus* and the *Metalogicon* – along with a number of other writings in various genres. John survived the conflict between Archbishop of Canterbury Thomas Becket and King Henry II, and devoted his last years to chronicling the turbulent times he had experienced. Late in life, he was raised to high ecclesiastical office as bishop of Chartres.

John was born at Old Sarum (the former site of Salisbury) in England between 1115 and 1120. Specific knowledge of his family background and early life is scant; we know in detail only about a brother, Richard, and a half-brother,

Robert, both of whom held offices within the English church. John probably received an early education at Salisbury and then at Exeter. The first date we can safely associate with him is 1136, when he traveled to Paris to study at Mont-Saint-Geneviève. A famous autobiographical passage of the *Metalogicon*, in which John narrates his 12 years of education, forms an important source for the understanding of French higher instruction in the twelfth century. The list of his teachers during the ensuing years includes many of the great thinkers of the mid-twelfth century. He received instruction at one time or another from Peter Abelard, Robert of Melun, William of Conches, Thierry of Chartres, Adam de Petit Pont, Gilbert of Poitiers, Robert Pullan, and others; his studies encompassed speculative philosophy, rhetoric, linguistic theory, literature, and theology. John also seems to have taught students of his own during his later years in Paris.

Like so many other educated churchmen of his era, John eventually made his way into the corridors of power rather than choosing a life in the cloister or the classroom. Through the intervention of his friend, Peter of Celle, he joined the household of Archbishop Theobald of Canterbury, a vocal and energetic advocate of the rights of the English church, in 1147. In his capacity as secretary to Theobald, John was an omnicompetent bureaucrat: he composed the Archbishop's letters, advised him on legal and political affairs, traveled often to the Continent as an archiepiscopal envoy, and altogether lived in the manner of a trusted intimate.

Theobald's court attracted many clerics with training and experience similar to John's own, so he could continue to indulge his intellectual pursuits in a sympathetic environment at Canterbury during the 1140s and 1150s. John was counted a member of a circle of learned administrators one of whose number was Thomas Becket, the future archbishop and martyr, who was a trusted servant of Theobald before he was appointed as King Henry II's Chancellor in late 1154. This group of like-minded men constituted the immediate audience for much of John's writing. Both the *Policraticus* and the *Metalogicon* were dedicated to Becket and often address him personally about

current events or personalities with which they were both familiar.

John's activities on behalf of the Archbishop brought him into contact with some of the most powerful and prominent men of twelfth-century Europe. He was present at the Roman curia for many crucial occurrences during the pontificate of Eugenius III (1145–1153), 4 years of which he would later chronicle in his *Historia Pontificalis*. He enjoyed a warm friendship with his fellow countryman Nicholas Breakspear, who ascended the papal throne as Adrian IV in 1154. The *Policraticus* relates stories and sayings derived from its author's interviews with Adrian, with whom John was sufficiently intimate to raise criticisms of the conduct of the papal curia.

John was also well-acquainted with important figures in twelfth-century secular life, especially the young King Henry II. He had supported Henry's side in the struggle against the partisans of King Stephen during the period of English history known as the Anarchy. His later writings reveal a consistent horror of civil war of the sort engendered by Stephen's usurpation of the throne. John was, however, sufficiently vocal in his opposition to Henry's policies towards the English church to be banished from court during 1156 and 1157. Although he ultimately recovered favor with his monarch, he acquired a lingering skepticism about Henry's motives which was to be confirmed by later events.

After Becket became Archbishop of Canterbury in 1162, John backed his resistance to the English crown, albeit somewhat reluctantly. John consequently spent much of the 1160s in exile, either in France or at the papal court, lobbying on behalf of Becket and against Henry and the English bishops who backed the King. The large body of his correspondence dating from this period testifies, however, that John felt no more comfortable with Becket's zealotry than with Henry's repressiveness. His letters often adopt an independent line and express a willingness to compromise with Henry which is in marked contrast to Becket's intransigence.

Following the murder of Becket, John served the English church in numerous capacities during the early 1170s. He was consecrated Bishop of

Chartres in 1176 (a post in which he actively promoted the cult of the sainted Becket). His waning years were peaceful and restrained after his intrigues during the era of Theobald and Becket. He died at Chartres in 1180 and is buried in the abbey church of Notre-Dame de Josaphat.

The literary output of John of Salisbury falls broadly into two categories. On the one hand, he composed several treatises of considerable philosophical interest, most notably the *Policraticus*, but also the *Entheticus de Dogmate Philosophorum* (or *Entheticus Major*), a satirical poem about philosophers and courtiers, and the *Metalogicon*, an important discussion of pedagogy and speculative philosophy. These works all date from roughly the period between 1154 and 1159, although they may have had origins in his school days in Paris. By contrast, John's writings of a historical nature – the *Historia Pontificalis* and most of his letters, as well as his lives with St. Anselm and Becket – were composed later in his career, during or after his association with Becket. This should not be taken as evidence that he lost interest in academic or theoretical disputes. On the contrary, his historical writings (and indeed many of the crucial decisions of his administrative career) often represented practical applications of the principles he had already articulated in a philosophical form. Above all, it was a constant concern to unify theory and practice that constituted the hallmark of John's political and intellectual life.

The core of John's thought has often been described as "humanistic" in orientation, since he valorizes human dignity and the concomitant dignity of nature: both are intelligible and may be accessed by human beings through the application of reason. The truth that John seeks is hence nothing less than a comprehensive knowledge of the operation of the universe in which humanity itself constitutes the noblest (if still flawed, because fallen) of God's creations. Yet John admitted that severe impediments exist to the attainment of wisdom. Throughout his writings, he professed to follow the moderate skepticism of the New Academy, and protested that the human mind is poorly equipped to know very much with certainty. The best we can hope for, he says, is probable truth, always subject to reevaluation and

revision. The powers of human reason – its ability to intuit the cosmos and humanity's place therein – are modest.

According to John, a human path to happiness is sought by all human beings. He does not assume that all of humanity is happy or has attained knowledge of the proper route to becoming so; rather, the *possibility* of earthly happiness is held out to those who sincerely struggle and overcome the obstacles to its realization. Happiness is not given to the human race, but is something that must be earned by exertion. And human beings can be fooled or mistaken about the correct sources of happiness, for example, by confusing pleasure with true satisfaction. The happy human existence embraces both active and reflective dimensions: one must do the good (virtue) as well as know the good (wisdom) in order to flourish. In pursuing happiness in the present life, we may learn equally from the deeds and writings of infidels as from those of believers. John's Christian humanism may thus be construed as embracing a "parallelism" in matters of instruction. Christian authorities will certainly guide us toward happiness (eternal as well as temporal), but they may usefully be supplemented by studying the acts and ideas of worthy pagans. The ancients as well as Scripture and the Fathers contribute to instilling in humanity the virtue and wisdom that produce the measure of earthly fulfillment of which we are capable.

The *Policraticus* applies these general principles to the lives of public figures, including rulers and their counselors and courtiers. John presents there a theory of political morality, as well as an influential account of the proper ordering of the political community conceived on the model of the human body. John is concerned with the effects of political disorder, expressed by the idea of tyranny, and he offers advice about how the injustice engendered thereby may be challenged. He even argues that the murder of a tyrannical ruler may be not merely legitimate but just.

In the *Metalogicon*, John investigates the nature of the twelfth-century curriculum, focusing on rhetoric, grammar, and dialectic. He includes brief commentaries on the recently transmitted writings of Aristotle's *Organon*, which had become the basis for higher-level instruction

during his day. John also analyzes the dispute between philosophers and theologians concerning the nature of universals. His own position in the debate may be classified as a form of moderate realism.

John Pecham

Girard Etzkorn

Franciscan Institute, St. Bonaventure University,
Crossville, TN, USA

Abstract

John Pecham (c. 1225–1292), Doctor Ingeniosus, was born c. 1225 in Patcham near Brighton. He pursued his early studies under

the tutelage of the Benedictine monks at the Cluniac abbey at Lewes. He joined the Franciscans sometime between 1250 and 1256 and was sent to Paris to pursue his theological studies. He became regent master at the University of Paris in 1270–1271. From there, he returned to England where he was regent master at the University of Oxford from 1272 to 1275. He was elected minister provincial of the English friars in 1275 and subsequently became lector at the Papal Curia from 1277 to 1279 when he was made Archbishop of Canterbury on January 28, 1279, occupying England's primate's see until his death on 8 December 1292.

In his theory of knowledge, Pecham upheld the need for divine illumination regarding the first principles of veracity and morality, although this influence is not consciously experienced. In opposition to Aquinas, he maintained that the intellect (human, angelic, and divine) had direct and immediate knowledge of singulars. The intellect, he said, abstracts the universal from the singular either knowingly or unknowingly; if unknowingly, how can abstraction be true? The intellect can be variously characterized as *materialis*, in *habitu*, *adeptus*, *accomodatus* (agens), and *practicus*. Cognition requires both sensible and intelligible species or similitudes. There are species of various sorts: abstract, innate, impressed, expressed, latent in memory, and “collated.” The sensible species is first impressed upon the sense and then upon the mind; the abstract species is drawn from the imagination and impressed upon the intellect. Sensible species do not damage their respective organs, although very intense species cause pain. Intellectual cognition originates in sensation. Knowledge is *collativa* and also inquisitive, that is, in search of certitude. *Cognitio simplex* occurs through intuition (I do not find him using the term “intuitive cognition”), composite by collation. Cognition is inquisitive, having a natural desire to know everything. Man has a twofold memory: sensible and intelligible.

In the realm of psychology (in the medieval sense), Pecham's writings are extensive. The first

“act” of the soul is life. The soul is the most noble of forms. There are not two souls in man, but just one composed of two substances as bases for vegetative, sensitive, and intellective functions. Traducianism of souls from parents is excluded, rather each soul is created singly and “daily” by God. The soul is the cause of the body in the threefold genus of causality, namely efficient, formal, and final. The soul is the “act” and mover of a most noble body; it is communicated to each and every part of the body; it is everywhere in its little world as God is everywhere in the bigger world. The soul is united to the body as a form is to matter. The human soul is incorruptible and hence immortal. Although the soul is simple, it has virtual parts, namely powers; memory, intellect, and will are powers of the soul. The sensitive soul is not corrupted with the advent of the rational soul with which it becomes one. As vegetative, the soul has three powers: nutrition, growth, and regenerative. As sensitive, the soul has motive and apprehensive powers, the latter being the five senses. To the sensitive soul are likewise attributed imaginative, estimative, and memorative powers. There is a twofold agent intellect: God and the human intellect as active. The agent and possible intellect are diverse powers of the soul. Averroes is in error for positing but one possible intellect for all humans. The human will is a self-moving power; it is at the apex of creation. The human will is free and cannot be coerced by anything else. Moral virtue is essentially rooted in the will. The appetites of the human will are rationality, concupiscence, and irascibility. The free will is not some third power composed of reason and volition. The will is free to such a point that it can withhold consent to the dictates of practical reason.

In natural philosophy, Pecham emerges as an opponent of Aquinas on a number of issues. Matter is an essence distinct from form and as such is not pure potency; by divine power, it could exist without any form. The root of corruptibility lies in matter. Matter alone is not the principle of individuation but as conjoined with form. He espoused seminal reasons whereby latent forms perdured and could be generated.

Substance is known through its powers and there can be multiple powers in a single substance. Material substances have substantial parts. An accident is more dependent on substance than form is on matter. The world was present to God ideally from all eternity, but it was not “creatable” from all eternity. He is perhaps most noteworthy for his theory of the grades of the form, in opposition to Aquinas and his followers who posited a single form for each individual. His principal treatise *De gradibus formarum* has not survived, although it was in the library of Merton College as late as the fifteenth century (Douie 1952, p. 380 note 2). His grades theory of a single form as distinct from a plurality of forms in individual beings may have been the first such refinement. The most telling argument against the single form theory was based on theological reasons, namely the need to posit a corporeal form (*corporeitatis*) regarding Christ’s body in the tomb. This led Henry of Ghent to posit a twofold form: a corporeal form generated by nature and the rational form/soul created directly by God. As Archbishop of Canterbury, he “renewed” the condemnations of Kilwardby regarding the unicity theory and this intensified the conflict between the Dominicans and Franciscans.

In the realm of moral philosophy, virtue resides essentially in the will. Political and purgative are grades of virtue. Justice is more “delightful” than its opposite. Even the unjust creature knows what justice is in the light of the eternal reasons.

Pecham’s last philosophico-theological treatise was his *Quodlibetum Romanum*, debated while he was lector at the Papal Curia c. 1277–1278. His treatise on the celestial spheres is believed to have been composed during this period.

John Philoponus

Devin Henry

Department of Philosophy, Talbot College The University of Western Ontario, London, ON, Canada

Abstract

John Philoponus was a sixth-century commentator on Aristotle who lived between 490–570 CE. “John” was his Christian name, while “Philoponus” was a nickname given to him by various philosophers (which literally means “lover of work”), though he much preferred “the Grammarian.” Philosophically, Philoponus was perhaps the most brilliant of all the Ancient Commentators, developing some of the most stinging criticisms of Aristotelianism in history. He disagreed with

Aristotle on such important matters as dynamics, optics, the existence of void, and the need for a fifth element. These criticisms in turn gave rise to a series of innovative ideas, placing Philoponus among the important scientific thinkers of Late antiquity. His religious beliefs were no less radical and controversial, which eventually led him to be condemned posthumously in 680 CE by the Third Council of Constantinople. This entry examines Philoponus' most sustained attacks on Aristotelian science, including Aristotle's position on motion, prime matter, space, and void.

Life and Works

John Philoponus was a sixth-century commentator on Aristotle who lived between 490–570 CE. “John” was his Christian name, while “Philoponus” was a nickname given to him by various philosophers, which literally means “lover of work.” According to Sorabji (1987:5), this was the name given to groups of Christian lay workers who were known to have lived together in a guild called a *philoponeion*. Philoponus had referred to himself as “the Grammarian,” for he held no Philosophy Chair though some speculate that he may have held a Chair in grammar and taught grammar to the Coptic community in Alexandria (Sorabji 1987:5–6). (He had also written two books on grammar, neither of which contained any philosophically relevant material.) As far as his philosophical stripes go, Philoponus was a Neoplatonist who flourished in the sixth century. There were two major schools of Neoplatonism, the pagan school in Athens, which was eventually closed by the Emperor Justinian in 529, and the more successful Alexandrian school in Alexandria, which had survived only by capitulating to Christianity. Philoponus was a student in the Alexandrian school, headed by Ammonius. Ammonius had taught all of the influential Neoplatonists, from both the Alexandrian and Athenian schools, including Philoponus, Asclepius, Simplicius (a pagan), and Olympiodorus. (The exception is Damascius, who fled Alexandria after the violent persecution of the Neoplatonists

by the Christians in 488–489.) So both Philoponus and his archrival Simplicius would have been students sitting around Ammonius' lecture throne (*thronos*) listening to his seminars on Aristotle (see Sorabji 2008).

In some ways, Philoponus was a bad commentator. According to Simplicius, the duty of a commentator was to harmonize the thought of Plato and Aristotle, which was something Philoponus did rather poorly. Yet, philosophically, he was perhaps the most brilliant of all the commentators, developing some of the most stinging criticisms of Aristotelianism in history. He disagreed with Aristotle on such important matters as dynamics, optics, the existence of void, and the need for a fifth element (on the latter see Wildberg 1988). These criticisms in turn gave rise to a series of innovative ideas, placing Philoponus among the important scientific thinkers of Late antiquity. In the latter part of his life, Philoponus turned away from philosophy and took up theology. His religious beliefs were no less radical and controversial. For example, he held that Christ had only one nature, not two (one human and one divine), and applied Porphyry's conception of three gods (rather than three persons) to the Holy Trinity, a doctrine that eventually led him to be condemned posthumously in 680 CE by the Third Council of Constantinople (Sorabji 2005a:20).

There are seven extant commentaries on Aristotle from Philoponus, four of which (*in De generatione et corruptione*, *in De anima*, *in Analytica priora*, and *in Analytica posteriora*) claim to be "from the lectures of Ammonius son of Hermeias" (*ek tôn sunousiôn Ammōniou tou Hermeiou*). However, as Sorabji (1987:4–5) notes, comparison with Ammonius' own commentaries shows Philoponus' relative independence and even dissent from Ammonius. The three remaining commentaries (*in Physica*, *in Categorias*, and *in Meteorologica*) were not professed to be lectures from Ammonius but Philoponus' own contributions. And yet none of his commentaries were merely comments on Aristotle. Many (untraditional) "commentaries" express Philoponus' own disagreement with Aristotle and offer fresh ideas. Writing a detailed exegesis on the works of Plato and Aristotle

interspersed with critical analysis was simply the way of doing philosophy at the time. Finally, Philoponus wrote two independent treatises, *Contra Aristotelem*, which contains a systematic attack on the Aristotelian world view (including the fifth element), and *De aeternitate mundi contra Proclum*. The latter presents a series of refutations on behalf of Christianity directed against the pagan belief that the universe – specifically matter – had a beginning. (Philoponus also refers to a commentary on Plato's *Phaedo*, at *in An Post.* 215,5, which is now lost. There are also several medical writings in Arabic translation attributed to Philoponus. For a complete list of Philoponus' writings, see Sorabji 1987:231–235.)

Philoponus Against Aristotle on the Void

Many of Aristotle's predecessors (notably, the Atomists) had argued that motion was impossible without void. In *Physics* IV.8, Aristotle turns the argument on its head and claims that the existence of a void would make motion impossible. His arguments are grounded in two basic assumptions. First, we observe bodies moving at unequal speeds. Second, the speed of a moving body is a function of the density of the medium and the weight of the body. Therefore, a difference in speed must be due either to a difference in the density of the medium or to a difference in the bodies themselves (an "excess of heaviness or lightness"). Aristotle's most famous argument against the void runs as follows. If the same body moves through a void, its journey must take time. And that time must bear some proportionate relation to the times for corporeal media. But since the density of the void is zero, there cannot be any ratio between the void and those other media (e.g., air cannot be "twice as dense" as void). Therefore, motion through a void is impossible. In effect, Aristotle is asserting that motion through a void would take no time, that a body would move through the void with infinite speed (215b20–3), which is absurd.

In *Corollary on Void* (a discussion in his commentary on Aristotle's *Physics* Books V to VIII) Philoponus attacks the claim that the density of

the media varies in direct proportion to the time taken (684,10–20). According to Philoponus, motion through a void must take some time t (684, 23–5), which is determined by the body's inner *rhopê* (its downward impulse). What the medium adds to this is extra time, which is the time needed to part the medium. What should be compared, then, are the additional times taken to part the medium: the density of the medium is proportional to that additional time (684,32–685,10). For the void, this additional time will be zero since it offers no resistance, and so there will be no ratio of extra time through the void to extra time through a bodily medium. In effect, Philoponus thinks Aristotle is wrong to assume that there is some calculable relation that holds between the time taken to move through different media and the densities of those media. The only proportional relation that holds is between density and extra time (Sorabji 2005a:333).

Philoponus' rejection of Aristotle's arguments against the void is connected with three substantial revisions of Aristotelian science: Aristotle's conception of dynamics, his conception of prime matter, and his conception of place (or space).

Dynamics

Throughout his attack on Aristotle's rejection of void, Philoponus is concerned to deny the assumption that the speed of a moving body is a function of the density of the medium and the weight of the body. Philoponus denies that the medium is an efficient cause of motion in a body (cf. Wolff 1990). For Philoponus, the only active cause of motion is the body's own weight, which is the internal source of its downward motion (*Corollary on Void* 678,23; *Contra Proclum* 261,25; cf. *in GC* 229,7–20). The medium is only an incidental cause of motion in the sense of offering resistance (*in Phys.* 195,24–32). This revision forms part of Philoponus' larger project of establishing his theory of impetus, according to which all motion is caused by an internal force of some kind.

Aristotle's account of projectile motion provided the occasion for Philoponus to introduce his impetus theory. Aristotle had explained projectile motion in a way that was consistent with his theory of forced motion. The hand of the thrower moves the portion air immediately adjacent to it, which in turn moves the next pocket of air, and so forth. The projectile rides in front of the different portions of air, which form a series of moved-movers (*Physics* VIII.10). Philoponus rejected this account of projectile motion and instead appealed to the idea of an impetus. He argued that a projectile is carried along, not by the motion of the medium, but by an impressed force (*kinêtikê dunamis*, *energeia kinêtikê*) that is transferred to it by the mover (*in Phys.* 642,3–5; 644,17–22).

The introduction of an impetus likely cleared the way for the end of Aristotelian physics, for it eroded the important distinction between natural and forced motion. A projectile is clearly moved by force, since the "natural" motion of a heavy body is downward. And yet, Philoponus claimed, its motion derives from an internal force imparted to the projectile by the thrower. This notion of an inner force makes no sense in the framework of Aristotelian dynamics. For Aristotle, natural motion is motion that derives from an internal principle of change while forced motion is due to an external cause. Thus, all forced motion requires an external mover that maintains contact with the thing moved. With the introduction of impetus, there was no longer any difference between natural and forced motion. (For an alternative view, see Sorabji 1987:13.)

Prime Matter

When it came to prime matter, Philoponus was no less critical of Aristotle. In his early commentary on the *Categories*, Philoponus had endorsed a traditional Aristotelian view of prime matter as that which is, in itself, devoid of all quality. Bodily substance was thus understood as a composite of this qualityless matter plus the three dimensions (*in Cat.* 83,13–19). The three dimensions were seen as inseparable accidents of prime matter, so that when three dimensionality is stripped away

what is left is prime matter, which is the ultimate subject of all attributes, including the three dimensions (*in Phys.* 578,32–579,8; 561,3–24; cf. Sorabji 2004a:263–264). Eventually Philoponus rejected the view of body as a composite of incorporeal prime matter plus three-dimensional extension (*Contra Proclum* 428,7–10). Instead, prime matter came to be identified with three-dimensional (corporeal) extension itself, which Philoponus took to be qualityless body. Thus three-dimensional extension becomes the ultimate subject of all attributes (405,23–7; 413,24–414,5; 424,4–428,25; 440,6–8). Like Descartes, Philoponus had made this three-dimensional extension the essence of body, since we cannot think of body without extension in three dimensions (424,23–425,14).

Place

Philoponus' reconceptualization of prime matter was connected with his reconceptualization of place (see Sedley 1987), though here he was less innovating. In *Physics* IV, Aristotle made place "the limit of the containing body which is in contact with the contained body" (212a6–7) or "the first immovable limit of that which contains the <body>" (a20). Like most philosophers in antiquity, Philoponus rejected this concept of place. Instead he defended a view of place as three-dimensional spatial extension, which is distinct from the bodies that occupy it (*Corollary on Place* 563,23). More interestingly, Philoponus treated place as coextensive with the concept of void (563,21). In effect, place is seen as empty space (empty with respect to its definition but never actually devoid of bodies):

We may come to see well enough from these considerations that place is not the boundary of the container. That it is a certain extension in three dimensions, different from the bodies that come to be in it, bodiless with respect to its own proper account [*tô pikeiô logô*] – dimensions alone, empty of body (for void and place are in reality the same in subject [*hupokeimenon*]) (567,29–35 Furley transl. with modification).

Of course I do not mean that this extension either ever is or can be empty of all body. Not at

all. But I do claim that it is something different, over and above the bodies that come to be in it, and empty by its own definition, although never without body. In the same way we claim that matter is different from the forms, but can never be without form. In this way, then, we conceive the extension to be different from all body and empty in its own definition (569,7–13 Furley transl.).

Light

Philoponus' theory of light is typically seen as being no less innovative than his theory of impetus in dynamics. According to Sambursky, for example, Philoponus' theory of light represents another major advance over the Aristotelian world view:

Philoponus' conception of light is in many respects of interest from the point of view of the history of scientific thought. As in his criticism of Aristotelian dynamics Philoponus reveals himself once more as an independent thinker, and though, like the other commentators, he gives a loyal description of Aristotle's doctrine, he does not shirk an exposition of his own view, albeit dressed up as an interpretation of Aristotle (125).

In the *De anima*, Aristotle treats light as something immobile and static. *DA* II.7 defines light as the state of the medium when it is actually transparent. According to Sambursky, whenever Aristotle speaks of "movement" in connection with light and color, he simply has in mind the transition from a state of potentiality to a state of actuality (114). Only later, most notably with Philoponus, do we find a significant shift in the meaning of the word *kinêsis* "from that of transition from the potential to the actual to that of locomotion from the luminous object to the eye" (115).

In order to reconcile the Aristotelian theory with the basic facts of geometrical optics, Philoponus reinterprets Aristotle's "*kinêsis*" as an active entity (*energeia*) that is emitted from the luminous object to the perceiver whose behavior could be described by means of geometrical concepts (*in DA* 331,1ff.; cf. Sambursky 118). As Sambursky notes, there are passages in Philoponus' *Physics* commentary that suggests he sincerely took this to be view of Aristotle (*in*

Phys. 642,3ff.), including the view that the *energeia* of color travels through the air (Sambursky 125). However, Sambursky claims that this “interpretation” of Aristotle’s doctrine by Philoponus “amounts to nothing less than a complete rejection of the Peripatetic doctrine” (118). It introduces a “radical shift” in the usage of the terms *kinêsis* and *energeia* in their application to light and color.

Philoponus’ contribution to the history of optics is not quite as radical as this (at least in this area). For the discussion of perception in *Generation of Animals* Book V shows that Aristotle already understood color (and other sensibles) as something that travels in straight lines from the object to the perceiver:

The position of the eyes is the cause of seeing things at a distance and of the fact that the movement coming from distant objects succeeds in reaching the eyes (*tên apo tôn porrôthen horatôn aphikneisthai kinêsin*). For those with protruding eyes do not see well from afar, while those that have their eyes situated in a hollow cavity are able to see things from afar on account of the movement not being scattered into the open space but passes straight into <the eye> (*to tên kinêsin mê skedannusthai eis achanes all’ euthuporein*). It makes no difference whether one says, as some do, that (A) vision is effected by *sending out* the sight (for insofar as there is not something in front of the eyes because it is dispersed fewer of them must strike the visible objects and the less one is able to see the things from afar), or whether one says that (B) vision is effected by the movement *coming from* the visible objects. For it is necessary that the visual ray [on theory (A)] behave similarly to the movement [on theory (B)]. Therefore, things from afar would be seen best of all if there was something continuous, like a tube, extending straight out from the eye to the visible object; for the movement coming from the visible objects would not be diffused (*ou gar an dieluetô hê kinêsis hê apo tôn horatôn*). But if not, then the further this sort of thing extends, the more accurately the things from afar must be seen (780b34–781a12).

(A) of course represents the competing theory of visual rays, whereas Aristotle’s own theory is represented by (B). Vision is produced by “the movement of the colors” (780a24) coming from the visible object and passing into the eye. When Aristotle says it makes no difference which theory

we adopt, his point is a methodological one. Relative to argument at hand it makes no difference which of these two theories turns out to be correct. On either theory accuracy of distance vision will depend on something projecting over the eyes, whether to keep the visual rays together or to funnel the incoming movements into the eye. (For an alternative reading see Sorabji 1987:27.) In many important respects, then, Philoponus’ theory of light is a loyal description of Aristotle’s doctrine. Of course Aristotle did not conceive of light as something traveling; light for Aristotle remains a purely static concept (though see *PA* II.13, 658a1–4). But Philoponus’ theory can be seen as an application of the Aristotelian conception of color as a local motion to the phenomenon of light. (For a discussion of Philoponus’ influence on optics in the Middle Ages see Sorabji 1991.)

John Scottus Eriugena

Dermot Moran

School of Philosophy, University College Dublin,
Dublin, Ireland

Abstract

John (Johannes) (c. 800–c. 877 CE), referred to by his contemporaries as “the Irishman” (*Scottus*), and who signed himself “Eriugena,” was an Irish-born Christian Neoplatonist philosopher and theologian of great originality. The most outstanding philosopher writing in Latin between Boethius and Anselm, Eriugena is best known as the author of *Periphyseon* (*De divisione naturae*, *On the Division of Nature*, c. 867 CE), an immense dialogue unfolding an impressive cosmological system, and as the influential transmitter of Greek Christian theology to the medieval West, notably through his translations of Pseudo-Dionysius the Areopagite, Gregory of Nyssa, and Maximus Confessor.

Eriugena's philosophy centers around God, understood in Neoplatonic terms as an infinite, transcendent “immovable self-identical one” (*unum et idipsum immobile*, *Peri*. I.476b). This God is incomprehensible to created, finite minds (angels, humans) but through His freely willed theophanies (*theofaniai*, divine manifestations) He becomes manifest to and can be apprehended by His creation. The One, as highest principle, engenders all things timelessly, causing them to proceed into their genera, species, and individuals located in space and time, and then retrieves them back into itself. This cosmological process is triadic or Trinitarian, involving a dialectic of oneness, outgoing and return. All created entities, including human nature, are to be understood as eternal “ideas” (*ideae*, *notiones*) in the mind of God. But only human nature is made in the divine image and likeness. Humankind, therefore, plays a special role in the dialectic of outgoing and return. Eriugena quotes

Augustine to the effect that God became man (*inhumanatio*) so that humans can become God (*deificatio*). Humans fail to understand their own true nature as images of God because they are distracted by created, fleeting temporal “appearances” (*phantasiai*), which cloud the intellect and generate the sensible spatiotemporal realm. However, through the practice of intellectual contemplation (*theoria, intellectus*), assisted by the grace of divine illumination (which is the receiving of a divine self-manifestation, *theophania*), humans may return to and achieve unification (*henosis*) with God. Salvation, or return to the One, involves the corporeal body being resolved into its original incorporeal essence. Both heaven and hell are maintained to be states of mind, not actual places (*loci*). Paradise, Eriugena says, is nothing other than perfect human nature. A select few (e.g., St. Paul) will even undergo deification (*deificatio, theosis*). Eriugena’s account of nature as inclusive of God and creation has been interpreted as pantheist. Eriugena, however, stresses both the immanence of God in creation and His transcendence beyond it.

Biographical Information

The place, date, and circumstances of Eriugena’s birth and early life are unknown. Surviving *testimonia* suggest that he was born in Ireland around 800 CE. A letter (c. 850/851 CE) by Bishop Pardulus of Laon refers to a certain Irishman named “Joannes” at the palace of the King of France (*Patrologia Latina* [hereafter “PL”] 121:1052a), who was engaged in a theological controversy. He signed his translation of Dionysius (PL 122:1236a) with “Eriugena,” meaning “Irish born.” Biblical glosses attributed to Eriugena includes several Old Irish terms testifying to his knowledge of Irish. Furthermore, Bishop Prudentius of Troyes refers to Eriugena’s “Irish eloquence” (*Celtica eloquentia*, PL 115:1194a), albeit while disparaging his employment of dialectic in theology.

Eriugena had strong links with the court of King Charles the Bald (Carolus Calvus) and associated ecclesiastical centers (Rheims, Laon, Soissons, and Compiègne). He was esteemed as an erudite Liberal Arts master: Bishop Florus calls him “academic and learned” (*scholasticus et eruditus*, PL 119:103a). Two partial commentaries (c. 840–c. 850) on *The Marriage of Philology and Mercury*, the liberal arts handbook of Martianus Capella, testify to his familiarity with the Liberal Arts tradition of Cicero, Cassiodorus, Isidore, and others. Eriugena wrote poems that confirm his Greek learning and celebrate his royal patron King Charles. Eriugena died around 877 CE.

Eriugena’s Thought

The Treatise on Predestination (c. 851)

Around 850 Eriugena was commissioned by Hincmar, Archbishop of Rheims, and Pardulus, Bishop of Laon, to rebut a treatise on predestination by Gottschalk of Orbais (806–868), a priest in Hincmar’s jurisdiction who interpreted Augustine as teaching a “twin predestination” (*gemina praedestinatio*), namely, of the elect to heaven and of the damned to hell. Eriugena’s opposing treatise, *De divina praedestinatione* (*On Divine Predestination*, c. 851, hereafter *De praed.*), employed dialectical argument rather than scriptural citation to reject the twin predestination thesis. Eriugena invokes the divine unity, transcendence and infinite goodness to show that there can be but one predestination. God’s nature is one, and so is His predestination. God wants all humans to be saved. He does not predestine souls to damnation; humans damn themselves through their own free choices. Furthermore, “sin, death, unhappiness are not from God. Therefore God is not the cause of them” (*De praed.* 3.3). God cannot predestine to evil since evil is nonbeing. Properly speaking, God, who is outside time and acts “all at once” (*semel et simul*), cannot be said to foreknow or to predestine (*De praed.* 9.6), terms that are transferred from created things (*De praed.* 9.7).

Eriugena's tract was itself considered suspect. He was accused of "Origenism" and "Pelagianism" by his former supporter Prudentius (see PL 115:1010c) and the treatise was condemned as "Irish porridge" (*pultes scottorum*) at the councils of Valence (855) and Langres (859), in part for its employment of dialectic instead of scriptural commentary.

The Translation of Dionysius the Areopagite (c. 860–c. 862 CE)

Notwithstanding this setback, around 860, King Charles commissioned Eriugena to translate a manuscript of the writings of Dionysius the Areopagite (then considered to be St. Denis, patron saint of Francia). This manuscript had been presented to Charles' father, Louis the Pious, by the Byzantine Emperor Michael the Second in 827. Eriugena enthusiastically adopted the Areopagite's negative theology, according to which negations concerning God are "more true" (*verior*), "better" (*melior*) and "more apt" than affirmations. Affirmative appellations do not "literally" (*proprie*) apply to God and must be understood analogically or "through metaphor" (*per metaphoram, translativè*). God is not literally "Father," "King," and so on. Negations are more appropriate to express the divine transcendence. God is more properly not being, not truth, not goodness, and so on. Following Dionysius, Eriugena describes God as "beyond being," "more than being," "neither one nor oneness," and "beyond assertion and denial."

Following his Dionysius translation (c. 862), Eriugena translated other Greek Christian works, including Gregory of Nyssa's *De hominis opificio*, Maximus Confessor's *Ambigua ad Ioannem* (*Difficulties in Response to John*) and his *Quaestiones ad Thalassium* (*Questions in Response to Thalassium*), and possibly Epiphanius' *Anchoratus de fide* (*The Anchorite Concerning Faith*). He also wrote a long commentary on Dionysius' *Celestial Hierarchy* (*Expositiones in hierarchiam coelestem*), a fragmentary *Commentary on the Gospel of John* (*Commentarius in Evangelium Iohannis*), and a sermon (*Homilia in Johannem*) on the Prologue to

John's Gospel, all of which show the influence of the Greek theological tradition.

The Dialogue *Periphyseon De divisione naturae* (c. 867)

Eriugena's *Periphyseon* (hereafter *Peri.*), also called *De divisione naturae* (*On the Division of Nature*), written between 860–867 CE, is an extensive treatise on cosmology, anthropology, and theology, written as a dialogue between Master and Pupil, and offering a grand synthesis of Greek and Latin Christian theologies. At the outset, Eriugena defines nature as including both "God and the creature." *Natura* is the "totality of all things" (*universitas rerum*) that are (*ea quae sunt*) and are not (*ea quae non sunt*). Echoing similar divisions in Augustine (*City of God* Bk. V.9, PL 41:151) and Marius Victorinus (*Ad Candidum, To Candidus*), nature is divided into four "divisions" or "species" (*Peri.* I.441b–442a): that which creates and is not created (i.e., God); that which creates and is created (i.e., Primary Causes or Ideas); that which is created and does not create (i.e., Temporal Effects, created things); that which is neither created nor creates (i.e., nonbeing, nothingness). This fourfold division of nature represents God as the Beginning, Middle, and End of all things. The four divisions unfold from and enfold back into the divine Unity. Creation is a process of divine self-articulation; the entire cosmic drama of expression and return takes place within the Godhead. Human nature, as the image of God, plays a very direct role in the cosmic process of the divine self-manifestation and self-gathering.

In *Periphyseon* Book One, Eriugena outlines "five ways of interpreting" (*quinque modi interpretationis*) the manner in which things may be said to be or not to be (I.443c–446a). According to this complex and original account, attribution of being or nonbeing is dependent on the mode of approach and care needs to be taken. Thus, when Eriugena calls God "nothing," he means that God transcends all created being (*nihil per excellentiam*). Matter, on the other hand, is "nothing through privation" (*nihil per privationem*).

Eriugena's fourfold division offers a rich negative theological account of God and His relation to creation. God, as uncreated and creating, transcends everything created and is the "negation of everthing" (*negatio omnium*, III.686d). God is not "literally" (*proprie*) substance or essence, quantity, quality, relation, place, or time. He is *super-essentialis* (I.459d). His "being" is "beyond being," or as Eriugena puts it, in his version of a Dionysian saying, God's being is the superbeing (of) divinity (*Esse enim omnium est super esse divinitas*), or "the being of all things is the Divinity above being" (*Peri.* I.443b). Sometimes, Eriugena speaks simply of the "divine super-essentiality" (*divina superessentialitas*, *Peri.* III.634b), or, quoting Dionysius' *Divine Names* I 1–2 (PG 3:588b–c), of the "superessential and hidden divinity" (*superessentialis et occulta divinitas*, *Peri.* I.510b). God may also be called "nothingness" (*nihilum*), since His essence is unknown to all created beings, including all the ranks of angels (I.447c). Indeed, Eriugena argues, God's nature is unknown even to Himself, since He is the "infinity of infinities" and hence beyond all comprehension and circumscription.

Eriugena understands creation as the self-manifestation of the divine (*Peri.* I.455b), whereby the hidden transcendent God manifests Himself in divine outpourings or theophanies (I.446d). Moreover, there is a strong unity between Creator and created, as there is between cause and effect. God and the creature are not two things distinct from one another, but as one and the same: "For both the creature, by subsisting, is in God; and God, by manifesting himself, in a marvellous and ineffable manner creates himself in the creature. . ." (*Peri.* III.678c).

Although Eriugena asserts the identity of God and creation, he explicitly rejects the view that God is the "genus" or "whole" of which the creatures are "species" or "parts." Only metaphorically (*metaforice*, translative) can it be said that God is a "genus" or a "whole." As is typical in Christian Neoplatonism, the divine immanence in creation is balanced by the divine transcendence and impassibility. God is indeed "form of all things" but He is also formless and above being. The creature can therefore never be simply

identified with God. On the other hand, the creature, considered in itself (following St. Augustine) must be considered to be nothing (*nihilum*).

Periphyseon Book Two discusses the Primary Causes (*causae primordiales*) or "divine willings" (*theia thelemata*), through which God creates all things. Eriugena's conception of these Causes draws on the Platonic Forms, the Stoic–Augustinian notion of eternal reasons (*rationes aeternae*), Dionysius' account of the divine names, and Maximus' notion of "divine willings" (*theia thelemata*, *divinae voluntates*). God is infinite and His Causes too are infinite in number. Moreover, there is no hierarchy or precedence among them; Being is not prior to Goodness, or vice versa. Each is in its own way a divine theophany. This "outflowing" (*proodos*; *processio*, *exitus*) of the Causes creates the whole universe from the highest genus to the lowest species and individuals (*atoma*). In his understanding of this causal procession, Eriugena accepts Neoplatonic principles (drawn from the tradition of Proclus) concerning causation: like produces like; incorporeal causes produce incorporeal effects; causes that are immaterial, intellectual, and eternal produce effects that are equally immaterial, intellectual, and eternal. Cause and effect are mutually dependent, relative terms (V.910d–912b).

The Primary Causes produce their Effects timelessly. The Effects, for Eriugena, are also originally timeless and incorruptible, but, as they proceed from their essences through their genera, species, and individuals (in a kind of ontological descent through the tree of Porphyry), they become located spatially and temporally but not yet in a corporeal sense. Eriugena seems to postulate two kinds of time – an unchanging time (a reason or ratio in the divine mind, *Peri.* V.906a) and a corrupting time. Since place and time are definitions that locate things, and since definitions are in the mind, place and time are therefore said to be "in the mind" (*in mente*, I.485b). The sensible, corporeal, spatiotemporal appearances of things are produced by the qualities or "circumstances" (*circumstantiae*) of place, time, position, and so on, which surround the incorporeal, eternal essence. Indeed, the entire spatiotemporal world (including corporeal

human bodies) is a consequence of the Fall. For Eriugena, God, foreseeing that human beings would fall, created a body and a corporeal world for them. But this corporeal body is not essential to human nature, and in the return of all things to God the corporeal body will be transformed into the spiritual body (*spirituale corpus*). The corporeal world will return to its incorporeal essence, and place understood as extension will return back into its cause or reason as a definition in the mind (*Peri.* V.889d). Since there is nothing outside God (the transcendent nothingness), creation “from nothing” (*ex nihilo*) does not mean creation from anything outside God; rather it means creation out of God Himself (*a se*). All creation comes from God and remains within Him.

Periphyseon Books Four and Five draw heavily on Maximus Confessor’s and Gregory of Nyssa’s accounts of the return (*reditus*) of all things to God. In particular, Eriugena explicates the role of human nature in the cosmic process of return. Eriugena’s theological anthropology is a radical reinterpretation of the biblical theme of humans as made in the image and likeness of God (*in imaginem et similitudinem dei*). Eriugena begins from the ideal nature of humanity had it not sinned. Eriugena argues that paradise and original human nature were entirely spiritual and intellectual. By nature, every effect returns to its cause. Corporeal things return to their incorporeal causes; the temporal to the eternal, the finite to the infinite. As part of this general return, the corporeal, temporal, material world becomes essentially incorporeal, timeless, and intellectual. Human nature will return to its Primary Cause or “Idea” (*notio*) in the mind of God. “Paradise” is actually the scriptural name for this ideal human nature in the mind of God. Humans who refuse to abandon their “circumstances” remain trapped in their own phantasies, and it is to this mental state that the scriptural term “hell” applies. Aside from the general return of all things to God, Eriugena claims there is a special return whereby the elect achieve “deification” (*deificatio, theosis*), merging with God completely, as lights blend into the one light, as voices blend in the choir, as a droplet of water merges with the stream. God shall be “all in all” (*omnia in omnibus, Peri.* V.935c).

In Book Four, Eriugena rejects the classical definition of human nature as “rational animal” since it does not capture the true status of human beings. Just as, according to the dialectic of affirmative and negative theology, God may be said to be or not to be (*Deus est; deus not est*), so too human nature may be said to be animal or not animal. Following Gregory of Nyssa, Eriugena also denies that human nature is a “microcosm.” Rather, human nature is “a certain intellectual concept formed eternally (*aeternaliter facta*) in the divine mind” (IV.768b). For Eriugena, human nature uniquely mirrors transcendent divine nature. Only of human nature can it be said that it is made in the image and likeness of God. Not even the angels are accorded that honor. Perfect human nature would have possessed the fullest knowledge of its Creator, of itself, and of everything else had it not sinned (*Peri.* IV.778c). Just as God knows that He is but not what He is, since He is uncircumscribable, so too human nature knows that it is but not what it is. Human self-ignorance mirrors the divine self-ignorance and is a mark of the infinite and transcendent nature of the human as of the divine. Human nature, without the Fall, would have ruled the universe (IV.782c). Similarly, perfect human nature would have enjoyed omniscience and other attributes enjoyed by God. Just as God is infinite and unbounded, human nature is indefinable and incomprehensible and open to infinite possibility and perfectibility (V.919c). God’s transcendence and immanence are reflected in human transcendence and immanence with regard to its world (IV.759a–b). The Fall is construed by Eriugena as the descent from intellect into sense: *intellectus* is distracted by the voluptuousness of sensibility (*aisthesis*). Eriugena follows Gregory of Nyssa’s view that sexual difference is a consequence of the Fall and not a defining characteristic of human nature. Perfect human being is neither male nor female, just as “in Christ there is neither male nor female” (*Peri.* IV.795a).

Christ as the divine idea of human nature is the centerpiece of the entire cosmic procession and return. Christ as Logos is the manifestation of the divine and also “the perfect human” (*vir autem perfectus est Christus, Peri.* IV.743b). Christ is

actually what all human beings can be and will be, and that is precisely the promise of salvation for Eriugena (*Peri.* II.545a). For Eriugena, a true image is identical to its exemplar in all respects “except number” or “subject” (*Peri.* IV.778a). Neither divine nor human nature is in space or time, both are incorporeal and hence numerical difference, or difference in subject, can only have the Neoplatonic meaning that the first will always differ from what comes after the first. God is creator and humankind is created, but since creation is self-manifestation, that amounts to saying that God manifests himself fully as human nature. Sometimes Eriugena, quoting Maximus Confessor (e.g., V.879c–880a), says that humankind is by grace (*per gratiam*) what God is by nature. On the other hand, all nature is a theophany; nature is the outpouring of grace. Every gift (*donum*) is a given (*datum*), and vice versa. The creation of human nature is both the free outpouring of the divine will and the self-expression of the divine nature. Human nature stands closer to God than any other creature (including the angels, who are not made in the image and likeness of God).

Eriugena places extraordinary emphasis on the infinity and boundlessness of both God and human nature. The divine causes are infinite in number and so are the theophanies under which God may be viewed. Human progress to Godhead proceeds infinitely. Holy Scripture too has infinite richness (*Sacrae scripturae interpretatio infinita est*, *Peri.* II.560a), its interpretations are as innumerable as the colors in a peacock’s tail (IV.749c). Human capacity for perfection and self-transcendence is also endless (a theme that will reappear in Renaissance Humanism).

Eriugena’s Influence

Eriugena’s *Periphyseon* had influence in France at the schools of Laon, Auxerre, and Corbie. It was popular again in the twelfth century (with Hugh of Saint Victor, Alan of Lille, and Suger of Saint-Denis) when circulated in the “edition” of William of Malmsebury and the paraphrase of Honorius Augustodunensis. Eriugena’s translations of Dionysius circulated widely during the eleventh and

twelfth centuries, as did his *Homily on the Prologue to John* (often attributed to Origen). In the thirteenth century, the *Periphyseon* was somewhat unfairly associated with the doctrines of two Paris theologians, David of Dinant and Amaury of Bène, and was condemned in 1210 and 1225. Eriugena was also, again unfairly, linked with certain views on the Eucharist associated with Berengar of Tours. Meister Eckhart of Hochheim (c. 1260–c. 1328) and Nicholas of Cusa (1401–1464) were familiar with the *Periphyseon*. Eriugena’s conception of human nature as *imago dei* influenced Renaissance Humanism. Thomas Gale produced the first printed edition of Eriugena’s works in 1687, which was soon listed on the papal *Index of Prohibited Books*. In the nineteenth century, Hegel and his followers revived Eriugena as the forefather of speculative idealism, and process theologians also acknowledged his dynamic conception of the divine. New critical editions of Eriugena’s works contributed to a revival of interest in Eriugena in the twentieth century.

John Torquemada

Thomas M. Izbicki

Alexander Library, Rutgers State University of
New Jersey, New Brunswick, NJ, USA

Abstract

John Torquemada (1388–1468) was the leading papal apologist of the mid-fifteenth century. Torquemada, a Dominican friar trained as a Thomist, attended the Council of Basel (1431–1449) to represent his order and the King of Castile. There he became concerned that conciliarism would harm the church, the papacy, and his order. He became the pope's defender. Eugenius IV (1431–1447) made him Master of the Sacred Palace and then a cardinal. As a member of the Roman Curia, he promoted orthodoxy, defended the conversos of Castile, and promoted a crusade against the Ottoman Turks. He also promoted reform of religious houses. Most notably, he wrote a massive *Summa de ecclesia* (1453), which defended the institutional church against the Hussite heresy and the Roman see against conciliarism. It became a source for later defenders of Rome, including Cajetan and Robert Bellarmine.

Life and Works

John Torquemada (Juan de Torquemada, Johannes de Turrecremata) (1388–1468), a Dominican friar and cardinal, was the most prominent papal apologist of the fifteenth century. Born of a Castilian noble family, he joined the Dominican Order as a youth. Torquemada accompanied his provincial to the Council of Constance (1414–1418) and then studied theology at the University of Paris. After becoming a master of theology in 1425, he returned to Castile and served as a conventual prior. Torquemada was chosen to represent both his order and King Juan II of Castile at the Council of Basel (1431–1449).

There he participated in debates with the Hussites and interested himself in reform of the church. This did not prevent him from defending the interests of his order and the papacy, on which the friars relied for support in their work of preaching and hearing confessions. Most of his early works were polemics favoring papal plenitude of power. Pope Eugenius IV (1431–1447) chose him to serve as Master of the Sacred Palace, his theological advisor.

Torquemada left Basel in 1437 when Eugenius transferred the council to Ferrara to meet with the Emperor John VIII Palaeologus and representatives of the Greek church. This decision precipitated efforts by the Basel assembly to declare conciliar supremacy a dogma and depose the pope. Torquemada was busy for the following 3 years representing the pope on diplomatic missions and participating in the Council of Ferrara-Florence (1438–1445). He helped negotiate a brief-lived reunion of the Greek and Latin churches and debated Cardinal Giuliano Cesarini on issues of papal versus conciliar power, upholding papal primacy. His influence can be seen in papal letters condemning conciliarism. Pope Eugenius rewarded Torquemada with promotion to the cardinalate in 1439.

John Torquemada was a resident in the Roman Curia for the rest of his life, participating in routine business and advising on important issues. He played a role in the discussions leading to the termination of the Basel schism, arguing for firmness in negotiating with the princes of the Holy Roman Empire. The cardinal participated in four conclaves, casting the deciding vote in the election of Pope Nicholas V (1447–1455). He later supported efforts to organize a crusade against the Ottoman Turks, especially at the Congress of Mantua (1459). Torquemada supported the interests of his order, whose habit he continued to wear, and promoted reform of monastic houses, including the Abbey of Subiaco, of which he was commendatory abbot. He died in Rome in 1468 and is buried at Santa Maria sopra Minerva in the Chapel of the Annunciation. The Guild of the Annunciation, which he founded to dower poor girls of good birth, was favored by the papacy thereafter.

Torquemada continued to write extensively as a cardinal. His most notable works focused on the papacy. A commentary on the *Decretum* of Gratian (finished in 1464) was intended to give the proper, pro-papal interpretation of key texts in canon law that had been used to support conciliarism. His *Summa de ecclesia* (finished in 1453) was the most thorough defense of the institutional church written during the Middle Ages. Other works included defenses of mendicant poverty and the conversos of Toledo, a tract on the legitimacy of the Holy Roman Empire, an exposition of the Psalter, and a brief mystical work. A critique of Islam, as Torquemada perceived it, was intended to promote a crusade. The cardinal also became an early patron of printing. In 1467, he had an illustrated edition of his *Meditationes* printed in Rome. Torquemada's writing style was scholastic, molded by his Thomist education, but the humanist Lorenzo Valla regarded him sympathetically.

Torquemada's influence on papalist apologetics can be seen in the works of the Dominican Cardinal Thomas of Vio (Cajetan) and of the Jesuit polemicist Robert Bellarmine. His defense of papal primacy also has been discerned in the depiction of Saint Peter in the fresco cycles on the walls of the Sistine Chapel. Perhaps his most enduring contribution to the defense of Roman primacy was the contention that conciliarism was derived from the works of Marsilius of Padua and William of Ockham. This polemical genealogy of conciliarism remained influential into the twentieth century, but it is no longer accepted by most scholars. Torquemada, as a Thomist, was a critic of the feast and doctrine of Mary's Immaculate Conception. Edward Bouverie Pusey republished his polemic against celebration of the feast, written at the Council of Basel, to combat the dogmatic definition of the Immaculate Conception by Pope Pius IX in 1854.

***Summa de ecclesia* (1453)**

Torquemada's *Summa de ecclesia* was one of the few tracts on the church (*de ecclesia*) written during the Middle Ages. It was begun with an

eye to defending the institutional church against the Hussites, as well as defeating the conciliarist challenge to papal primacy. The methodology is scholastic, thorough, phrased with arguments *pro et contra* leading to solutions of disputed questions, and rich in citations to authorities. The *Summa* has four books, concerned with the nature of the church, the papal office, the general council, and schism and heresy. The work was distributed, but not widely, in manuscript form. It was first printed in Rome in 1489. Two of the printed versions conclude with an additional text, Torquemada's anthology of excerpts from the works of Thomas Aquinas that deal with papal power (Lyon, 1496) or his commentary on the decree *Laetentur coeli* of the Council of Florence, the document that briefly united the Greek and Latin churches (Venice, 1561).

The first book of the *Summa* focuses on the church as an institution. It includes a defense of the visible institution as legitimately representative of the true church (*vera ecclesia*) against the Hussites. The principal definition of *ecclesia* employed by Torquemada is "the congregation of the faithful" (*congregatio fidelium*). The emphasis is on membership in the visible church through faith expressed in baptism. The good Christian has faith formed by charity (*fides formata*). Torquemada did not deny that some believers are predestined to damnation, but he treated this as known only to God. The church could not function on the basis of such hidden knowledge as the clergy preached the gospel and administered the sacraments.

The second book concentrates on the powers of the pope. The pope had no greater power of orders than any other bishop, but he was supreme in jurisdiction. His jurisdictional supremacy, the plenitude of power (*plenitudo potestatis*), was exercised in the external forum of censures and other practical measures. This included the pope's ability to settle doctrinal disputes and grant indulgences. The cardinal's proofs of this supremacy included interpretation of all biblical texts about Peter and the other apostles as recording the conferral of jurisdiction by Christ through Peter on the other apostles. Diffusion of power from the pope downward through the hierarchy was

described in terms derived from Pseudo-Dionysius the Areopagite. Torquemada discussed the possibility of papal infallibility, but he accepted older ideas about a few popes having fallen into error. In such cases, the cardinal believed that an errant Roman pontiff could lose his see by embracing heresy. This canonistic concept saved the pope from judgment by a council, but it left him open to being declared self-deposed by his enemies. Torquemada also argued that the pope might intervene in secular affairs but only where religious concerns motivated him. Lay regimes had their own legitimacy grounded by reason in natural law, conferring the means of temporal felicity on both Christians and non-Christians.

The third book treats general councils as authorized by the pope. They had no additional jurisdictional power, but they might offer the prestige of wide participants backing conciliar decrees and their wisdom advising the pope about issues of doctrine and practice. A legitimate pope could convoke, transfer, or dissolve a council. This was the cardinal's response to the refusal of the Council of Basel to move to Italy or disperse. Nor could anyone appeal a decision of a pope to the next general council, as opponents of papal policies occasionally did. Torquemada dismissed the decree *Haec sancta* of the Council of Constance, one of the foundation documents of conciliarism, as the act of only one obedience in the Great Schism. This argument against the decree remained a cornerstone of pro-papal polemic on conciliar power into the twentieth century.

The fourth book was divided into two sections. One section was concerned with schism, division of church unity. This was a crime if someone intruded himself into the papacy, but no legitimate pope could be forced to step aside under those circumstances. Another type of schism, a choice between claimants to the see of Peter, could be addressed through an inquiry to determine the truth. Torquemada enumerated several schisms in the past, but he was careful not to take the side of any claimant in the Great Schism. The other part of book four was concerned with heresy, the teaching of false doctrine. Remedies for

heresy were discussed, and an enumeration of past heresies was offered. The most recent heresies described are those of John Wycliffe and John Hus, whose teachings had been condemned by the Council of Constance.

John Wyclif

Stephen E. Lahey

Institute of Medieval Philosophy and Theology,
Boston College, Chestnut Hill, MA, USA
Department of Classics and Religious Studies,
University of Nebraska, Lincoln, NE, USA

Abstract

John Wyclif (c. 1331–1384) was an English philosopher and theologian whose thought led later historians to incorrectly associate him with the Protestant Reformation. Wyclif was Master of Balliol College at Oxford in 1360 and became famed for his philosophical abilities thereafter. He entered royal service with John of Gaunt in 1376, arguing vigorously for the royal right to control the church, was condemned by Gregory XI in 1377, and was compelled to leave Oxford in 1381. He retired to Lutterworth, Leicestershire, where he died on December 31, 1384. His main works are two large *Summae*: the *Summa de ente*, containing philosophical and theological treatises, and the *Summa theologie*, containing his political, ecclesiological, and other later controversial thought. He also composed a *Postilla* of the *Bible*, second only to Nicholas Lyra's work, a set of sermons, Scripture commentary, and the *Trialogus*, an introductory-level summary of the whole of his theological project. While many of his works were published by

the Wyclif Society a century ago, many need to be reedited. His *Postilla* has never been fully edited. His reputation as a philosopher continues to suffer in light of his condemnation for heresy.

Logic and Philosophy of Language

Until recently, Wyclif's philosophy has generally been described in terms of the vigorous arguments for philosophical realism that characterize his metaphysics, which has led to the use of the term "ultrarealism" to describe his thought. The result of this approach has been the assumption that Wyclif's interests lie primarily in revivifying an ontological program harking back to the twelfth century in a reactionary rejection of the Ockhamist *Moderni* conceptualism. This is a mischaracterization of Wyclif's philosophical approach caused in large part by nineteenth- and twentieth-century scholars' unfamiliarity with the sensitivity to the logic and semantics of terms and propositions pervading philosophical discourse in Oxford in the fourteenth century. Before engaging in the metaphysics and philosophical theology that make up the *Summa de ente*, Wyclif had explored questions of the reference of terms and propositions in a number of earlier treatises, including the three grouped together in *De logica*, and a treatise on *Insolubilia*. Wyclif's logic is less notable for innovation in inferential reasoning than it is for the clarity with which it introduces students to the general elements of Aristotelian syllogistic. The popularity of Wyclif's logic that continued into the fifteenth century, after his more controversial works had been condemned, arose from the utility of its introductory treatise, the first of the three logical treatises. The second two treatises are less approachable, in large part because Wyclif begins his chapters with an ostensibly traditional question about how terms refer with particular propositions and then invariably launches into complex analysis of the relation of species of reference to the semantics of propositions and the corresponding relation of such propositions to questions in ontology. His chief

interest is in establishing a theory of propositional realism, the understanding of which makes his ontological realism, his Scripture hermeneutics, and other significant elements of his philosophical theology much more intelligible.

Wyclif's conception of the relation of propositions to things is that whatever is, is a proposition. "A proposition, broadly speaking, is 'a being signifying in a complex way'; and so, because everything that is signifies in a complex way that it exists, everything that is can well enough be said to be a proposition." The problems that arise from this are manifold: how to account for propositions expressing absence or nonexistence, or for false propositions, or for propositions of indeterminate or future contingent truth-value? In what sense is the fact that a stone is lying in the road propositionally structured? Why should there be a necessary isomorphism between the propositions we construct to describe our perceptions of reality and the nature of the world outside our minds?

His theory of the reference of terms is derived from Ockham, who understood that terms naturally signify concepts, which naturally represent things in the world. Wodeham followed Ockham, and introduced the complex significant, akin to a state of affairs to which our statements about the world refer, but did not posit an isomorphism between things in the world, the complex significant that relates the things in the world, and the propositions we construct describing the complex significant. Wyclif made the leap to suppose that reality is structured in exactly the way that the sentences we form in our minds, and with our words, suggest. He explains that there are five kinds of propositions: mental, vocal, and written ones, real ones, and true ones. The latter two are especially relevant to Wyclif's realist ontology.

A "real proposition" is the individuated reality of a creature, made up of a subject and a predicate. Take Socrates: in him there is this person, an individuated particular of the human species, which functions as the subject. In him there is also a human nature, which is essentially present in the subject as a predicate. Uniting the subject, Socrates, and the predicate, a human nature, is his essence, the actualization of the union of the two,

making the real proposition "Socrates (subject) is (essential actualization) a human being (predicate)." A "true proposition" is a truth significant apart from the thing. For example, "To be a man" is a complex truth, indicating the truth of a number of real propositions considered in themselves. That is, the existence of all the subjects having human being as a predicate essentially actualized in them comprises a reality "to be a man." This is functionally similar to Adam Wodeham's complex significant. So there are real propositions existing as individuals in creation, and true propositions existing as describing, and organizing, the individuals.

As a linguistic proposition has subject and predicate, so every created being has a predicative structure. Predication, then, becomes more than just a topic for philosophy of language; it is the primary element to be described in metaphysics. Wyclif lists three kinds of predication in *De universalibus* that account for every aspect of a particular thing's being. Real formal predication expresses the existence of a form in a subject. The proposition "Peter is a man" describes the state of affairs of the form Humanity existing in Peter, while "Peter is musical" describes the state of affairs of a formal quality in Peter whereby he is musical. Real essential predication indicates an indissoluble, real identity between subject and predicate, although we can rationally distinguish between the definition of the subject and the definition of the predicate. Hence, while "Peter is a man" and "Humanity is in Peter" appear to say the same thing, the first expresses a truth about a particular being, Peter, while the second seems to have for its subject Humanity. Humanity is formally distinct from Peter, for we conceive of an idea of Humanity from our experience of Peter, but we cannot actually separate Humanity from Peter. When we say something like "Humanity entails being a rational animal," the referent is this Humanity that is formally distinct from each of its subjects. This is the basis for what Wyclif will describe as Universals of Communality in his description of the kinds of universals; it is not something really distinct from particular human beings, but it is a real something about which true propositions are formulable. The questions that

naturally arise from this asserted isomorphism between propositions and reality, such as the referent of propositions about nonexistent entities like “All chimeras growl,” are the focus of *De logica*, making it absolutely necessary for understanding his realist ontology.

Metaphysics and Epistemology

Wyclif’s epistemology is an important part of his philosophical approach, grounded in his conviction that reality is propositionally structured. His account of cognition is structured on the model of optics, as was common in fourteenth-century Oxford: how the mind perceives truths about the world is analogous to the way in which the eye perceives objects in the world. While Ockham had argued that we directly perceive objects, many of his immediate successors, including Adam Wodeham, Robert Holcot, Richard Fitzralph, and William Crathorn, argued for the species model of perception. In this model, objects of perception emit appearances, or species, which are refracted in the eye and converted by mental act into the material of intuitive cognition. Crathorn is exceptional among species theorists in dismissing the need for mental acts in the process, arguing instead that the species enters directly into the mind to become the idea of the object perceived. Wyclif directed his epistemic account against Crathorn, arguing that mental acts are qualities of the mind while enthusiastically advocating the species model. Indeed, his fondness for the heuristic of optics appears frequently throughout the body of his works; for example, he uses the terminology and mechanics of optics to account for the real presence of Christ in the elements of the Eucharist and also in his discussion of kingship. Wyclif follows Fitzralph, Henry of Ghent, and ultimately Robert Grosseteste in his belief that understanding is reliant on divine illumination, although he does not argue directly for the position in his discussions of epistemology. Instead, his frequent assertions that human understanding is impossible without its assent to the divinely given teaching lead the reader to recognize that his epistemology depends on God’s illumination

of truth for its model of certainty. The mental assent we give to what we come to know is common to both truths known about the perceptible world, truths we learn through deductive reasoning, truths we are shown through direct divine illumination, and truths that are accepted as matters of faith. Faith has a natural place in all our acts of understanding, great and small, and if we can claim to have an accurate explanation for even the least act of understanding the simplest thing, we should also admit to the possibility that great truths of faith, like the Trinity, may be explored and understood by human reason. So to view faith and reason as incompatible is premature. Faith is at once an act of believing and assent to a truth; since what is known is believed as well, faith and knowing are not really incompatible. This incorporation of faith into every act of knowing forms the basis for his refutation of the *Moderni* contention that theology and philosophy are different in kind, which Wyclif articulates in the first part of his philosophical analysis of the Trinity.

Wyclif’s metaphysics, like that of many of his Oxford predecessors, grows out of his understanding of how terms fit together in propositions, and he is not the first to have concluded that universals have a reality apart from the particulars of which they are predicated. Walter Burley had argued that fundamental truths that we form about the world, like “Socrates is Human,” are structured like their objects, such that Humanity is something real that is a part of Socrates that is also a part of every other particular of which Humanity is predicable. The universal Humanity cannot exist apart from the particulars of which it is a part, but it has a “specific identity” that is different in kind from the “numerical identity” of individual substances. There is a certain reciprocity relation holding between the two kinds of identities: the identity of the particular depends on the identity of the universal, but the being of the universal depends upon the being of the particulars. Wyclif believed that Burley’s position was dangerously close to Platonism, in which universals have being apart from particulars and apart from God’s ideas of created beings. On the other hand, he was unable to accept the Ockhamist rejection of their reality, and he felt that the

Thomist and Scotist position, in which universals have reality arising from our cognition of individual objects, was likewise inaccurate. Their answer was to emphasize the commonality of the form of the human beings, which commonality is realized as a universal Man in our understanding of the things. Wyclif argued that it was better to distinguish between Man's existence in God's mind, and its existence in creation, a distinction between first- and second-intention universals. A first-intention term is a concept we derive from a real thing: when I hold a red apple, I can consider the redness of that apple. That concept is a first-intention concept of the apple's redness. I can then reflect back on all the other red apples I have encountered and compare this apple's redness with them. This reflection back is itself a concept, derived from earlier concepts, and is a second-intention concept. Similarly, universals have existence as objects of God's mind, or divine Ideas, and they also have existence in the being of things. When we encounter an individual apple, we recognize the universal "fruit" as it exists in the essential nature of the apple as a universal of the first intention. This gives us a foundation for understanding the universal's primary being, which is to have being as a second-intention Idea in God's mind. Since the divine Ideas are eternal, while universals are created, this means that second-intention universals have ontological primacy over first-intention universals.

Wyclif's realism is very carefully developed, beginning with a distinction between universals of causality, universals by community, and universals by signification, exhaustive analysis of relation holding between the real predication of universals by created beings and the species of predication by which we formulate truths about the identities of these beings and their universals, and patient treatment of the manifold objections to ontological realism that were common in fourteenth-century arguments. It is necessary to understand the relation of Wyclif's treatise on universals to his treatise on the divine Ideas, which together articulate his understanding of the relation of first- and second-intention universality. The realism described in *De universalibus* can easily lead one to wonder how he understands

the divine understanding of the universals to be distinct, yet not a detraction from the divine unity. This is the substance of his argument in *De ideis*, making it an important part of his ontological program.

The Necessity of God's Knowledge

Wyclif's philosophical theology is based on his propositional realism, and encompasses many of the traditional problems generally associated with the medieval *Sentence* commentary. This suggests that the treatises that describe it may contain the traces of the commentary on Lombard he would have been required to complete for the doctorate in theology. Wyclif develops metaphysically complex accounts of the relation of the persons of the Trinity, of the natures united in the Incarnation, and of the contents of God's knowledge to divine willing and understanding. The theological approach he attempted to articulate was condemned for its inability to accept the philosophical possibility of annihilation in creation, which was an important aspect of traditional accounts of the transubstantiation of the Eucharistic elements into the body and blood of Christ. Admitting the possibility that substance might be annihilated, Wyclif argued, was as good as recognizing that God could both eternally know and not know that substance. A large part of Wyclif's energies was directed toward defining the nature of God's knowledge. He is best known for espousing a strongly determinist theology which, along with his repeated definition of the church as being the body of the elect, has led critics both medieval and modern to condemn him for eliminating human free will from his soteriology. This is a misinterpretation of Wyclif's complex account of the necessity of God's foreknowledge and the reciprocity that holds between human free willing and God's eternal volition. He departs from the traditional position by positing a two-way relation between eternal knowledge and created action, in contingent created acts that cause divine knowledge, which is necessary, even though it is caused by created action. Wyclif's method of addressing this was to distinguish between absolute and

hypothetical, or suppositional, necessity. Wyclif's modal theory is complex, and the species of necessity he posits as he describes the eternal nature of divine knowledge and the contingent nature of created action are manifold. The heart of his resolution is his use of "antecedent suppositional or hypothetical" necessity.

Consider the following argument:

1. If God eternally knows that Peter sins today, then Peter sins today.
2. God eternally knows that Peter sins today.

Therefore, Peter sins today.

Statement 1 is eternally true, and would be logically unavoidable, no matter what. This is an instance of absolute necessity – necessary because connected to the necessity of divine omniscience. Likewise, the argument formed by combining 1 and 2 leads directly to the conclusion according to Modus Ponens. This argument is both valid and true by absolute necessity from eternity, as is every logical, mathematical, and geometric truth. Suppositional necessity arises from the relation of truth-values in propositions that are used syllogistically to explain our understanding of how God knows created events. With antecedent suppositional necessity, once the truth of the situation described as antecedent is met, the consequent will necessarily come about, as with "God wills Socrates to exist," the truth of "Socrates exists" will necessarily follow. The antecedent in 1, "if God eternally knows that Peter sins today" is not absolutely necessary in itself, although the whole of 1 is. The antecedent is dependent upon God eternally knowing that Peter sins, which is where Wyclif perceives room for nuance. He argues that truths like "God eternally knows that Peter sins today," true by antecedent suppositional necessity, do not thereby lose contingency. Peter's sinning is dependent upon Peter, and God's knowledge follows from Peter's choice. That God eternally knows how Peter will choose does not cause Peter's choice. This allows room for contingency in Peter's action without plunging the eternality of God's knowledge into temporal constraints. While God knows what Peter will choose, it is possible from all eternity that Peter

have chosen differently, thereby admitting contingency into the mix without limit to the necessity of God's knowing. This means that while God eternally knows who will be among the elect, and who among the damned, this does not entail the freedom-destroying effect of double predestination.

Wyclif's ecclesiology rests upon this balance between God's eternal knowledge and human free willing, as does his hermeneutic of Scripture. He understands Scripture to be ontologically structured as universal and particulars, in which the eternal contents of the divine mind function as universal, giving reality to a hierarchy of particular instantiates. The first instantiate is the *Book of Life*, which contains the names of the elect, and the instantiate most immediate to us is the *Bible*. This makes Scripture the repository of all that is knowable, every part of which is eternally true; at the same time, the events described in it were dependent upon the wills of the people who acted, as in the example with Peter above. Wyclif's posthumous fame for instigating the first English translation of the *Bible* was not based in an assumption that its truths are readily comprehensible; his Scripture hermeneutic repeatedly emphasizes the need for the reader to be adept at the "logic of Christ," which entails both a moral and a philosophical awareness few were likely to master.

Wyclif's Political Philosophy

Wyclif developed a monarchist political theory out of the realist metaphysical program he had articulated in *Summa de ente*, prior to 1376. Unlike many medieval political theorists, Wyclif perceived a strong tie between an ontological position, in his case realist, and the just articulation of church and state. His understanding of the fundamental term of mastery, *dominium*, provides the basis for this unified understanding. *Dominium* had become a word with two commonly united referents, namely, the master-slave relation and property ownership. Wyclif combined the two senses in his use of the concept and conceived of *dominium* as a relation holding

between two *relata*. God's *dominium* relation to creation originates in the act of creation, implying that true lordship/ownership is only possible for a creator. Divine *dominium* serves as a universal by causality for all cases of just human *dominium*, of which there are three possible kinds. Prelapsarian *dominium* entailed communitarian enjoyment of creation without the burden of property ownership or artificial mastery, but was lost with the Fall. Postlapsarian human *dominium* relations are founded in ownership and mastery and are artificial approximations of the ideal for which human beings were created. The Incarnation has made possible two interrelated species of just human *dominium*: the first, an apostolic poverty imitative of the life of Christ and fully realized in the early church, and the second, a just human lordship designed specifically to protect the former in a world still rife with sin. Wyclif argued that the church should retain this rejection of private ownership, and vigorously attacked its political and proprietary interests as indicative of Antichrist's control over the institution intended to save mankind. Grace has provided an antidote to the fall of the earthly church, though; a civil lord or king may, and should, divest the church in his realm of all political and proprietary concerns. In so doing, the civil lord would be serving God and his subjects by providing the basis for the just evangelical lordship first realized by the apostolic church. Wyclif described this politically reformative vision in *De civili dominio* and *De officio regis* and articulated his ecclesiology in *De potestate pape* and *De ecclesia*. While Gregory XI compared his vision to that of Marsilius of Padua, Wyclif's political thought is intimately connected with his understanding of the true nature of the church, and with his soteriology, and should not be considered apart from his theology.

Juan Luís Vives

Lorenzo Casini

Department of Philosophy, Uppsala University,
Uppsala, Sweden

Abstract

Juan Luis Vives (1492/3–1540) was a Spanish-born humanist who spent the greater part of his life in the Low Countries. He strongly opposed scholasticism and made his mark as one of the most influential advocates of humanistic learning in the early sixteenth century. His bent was philosophical rather than philological. His works deal with a wide range of subjects including education, psychology, politics, social reform, and religion. Vives was not a systematic writer, which makes it difficult to classify him as a philosopher. His thought is eclectic and pragmatic, as well as historical, in its orientation. He took what he considered most valid from a variety of sources and combined these elements into a Christianized Aristotelianism.

Biographical Information

Juan Luis Vives was born in Valencia, Spain in 1492, or more likely in 1493, to Jewish parents who had converted to Catholicism. He attended the Estudio General of his hometown until 1509,

when he moved to Paris and enrolled as a freshman in the Faculty of Arts. He began his studies at the Collège de Lisieux, where Juan Dolz del Castellar had just started a triennial course, but soon moved to the Collège de Beauvais, where he attended the lectures of the Fleming Jan Dullaert (1470–1513). From the fall of 1512, Vives started to attend the course of the Aragonese Gaspar Lax (1487–1560) at the Collège de Montaigu. Through Nicolas Bérault (c.1470–c.1545), who was an associate of Guillaume Budé (1467–1540) and taught at various colleges in Paris, Vives also came into contact with the Parisian humanist circle.

In 1514, Vives left Paris without having taken any formal academic degree and moved to the Low Countries. He settled in Bruges, where he would spend most of his life. About this time, he was introduced to the court of Brussels, where he met Erasmus and, around 1517, was appointed as tutor to the Flemish nobleman William II of Croy. Until Croy's sudden death in 1521, Vives lived in Louvain and taught at the Collegium Trilingue, a humanist foundation based on Erasmian educational principles. During this period, he wrote "Fabula de homine" (1518), an early version of his views on the nature and purpose of mankind; *De initiis, sectis et laudibus philosophiae* (1518), a short essay on the history of philosophy; *In pseudodialecticis* (1520), a lively and trenchant attack on scholastic logic; and a critical edition of, with an extensive commentary on, Augustine's *De civitate Dei* (1522), which was commissioned by Erasmus.

From 1523 to 1528, Vives divided his time between England, which he visited on six occasions, and Bruges, where he married Margarita Valldaura (1505–52) in 1524. In England he attended the court of Henry VIII and Catherine of Aragon and was tutor to their daughter, Mary. He also held a lectureship at Corpus Christi College, Oxford, and associated with English humanists such as Thomas More and Thomas Linacre. During these years he published *De institutione feminae Christianae* (1524), in which he set out pedagogical principles for the instruction of women; the extremely popular *Introductio ad sapientiam* (1524), a short handbook of ethics, blending Stoicism and Christianity; and *De*

subventionem pauperum (1526), a program for the organization of public relief, which he dedicated to the magistrates of Bruges. In 1528 he lost the favor of Henry VIII by siding with his fellow countrywoman Catherine of Aragon in the matter of the divorce. He was placed under house arrest for a time, before being allowed to return to Bruges.

The last 12 years of Vives' life were his most productive, and it was in this period that he published several of the works for which he is best known today. These include *De concordia et discordia in humano genere* (1529), a piece of social criticism emphasizing the value of peace and the absurdity of war; *De disciplinis* (1531), an encyclopedic treatise providing an extensive critique of the foundations of contemporary education, as well as a program for its renewal; and *De anima et vita* (1538), a study of the soul and its interaction with the body, which also contains a penetrating analysis of the emotions. *De veritate fidei Christianae*, the most thorough discussion of his religious views, was published posthumously in 1543. He died in Bruges on May 6, 1540.

Thought

Vives' career as a leading Northern European humanist starts with the publication of *In pseudodialecticis* (1520), a satirical diatribe in which he voices his opposition to scholastic logic on several counts. In his criticism, he follows in the footsteps of earlier humanists such as Lorenzo Valla (1406–57) and Rudolph Agricola (1443–85), who set about to replace the scholastic curriculum, based on syllogistic and disputation, with a treatment of logic oriented toward the use of the topics, a technique of verbal association aiming at the invention and organization of material for arguments, and persuasion. Vives' severe censure of scholastic logic derived from his own unhappy experience with the scholastic curriculum at Paris. Therefore, as he himself emphasized, no one could accuse him of condemning it because he did not understand it. Erasmus wrote to More that no one was better suited than Vives for the

battle against the dialecticians, in whose ranks he had served for many years.

The main targets of Vives' criticism are Peter of Spain's *Summule logicales*, a work dating from the thirteenth century but which still held an important place in the university curriculum, and the theory of the property of terms. He repudiates the use of technical jargon, accessible only to a narrow group of professionals, and maintains that if scholastic logicians made an effort to speak plainly and according to common usage, many of their conundrums would disappear. Instead, they choose to fritter away their ingenuity on logically ambiguous propositions known as *sophismata*. Vives provides many examples of such propositions, which in his view make no sense whatever and are certainly of no use. Many of these, such as "Some animal is not man, therefore some man is not animal," were standard scholastic examples. Others, such as "Only any non-donkey *c* of any man except Socrates and another *c* belonging to this same man begins contingently to be black," are intended as a mockery of the futile quibbling he associated with scholastic method. Since dialectic, like rhetoric and grammar, deals with language, its rules should be adapted to the rules of ordinary language; but with what language, he asks, have these propositions to do? Moreover, dialectic should not be learned for its own sake but as a support for the other arts; therefore, no more effort should be spent on it than is absolutely necessary. Vives' criticism is also informed by ethical concerns and the demand for a method that would be of use in everyday life rather than in academic disputations.

A more detailed criticism can be found in *De disciplinis* (1531). This encyclopedic treatise is divided into three parts: *De causis corruptarum artium*, seven books devoted to a thoroughgoing critique of the foundations of contemporary education; *De tradendis disciplinis*, five books in which Vives outlines his program for linguistic and educational reform; and five shorter treatises *De artibus*, dealing mainly with logic and metaphysics. These five treatises include *De prima philosophia*, a compendium of Aristotelian physics and metaphysics from a Christian point of view; *De censura veri*, a discussion of the proposition and the forms of argumentation; *De*

explanatione cuiusque essentiae, which offers an account of the predicables and definition; *De instrumento probabilitatis*, which contains a theory of knowledge, as well as a detailed account of dialectical invention; and *De disputatione*, in which he discusses nonformal proofs. In these treatises, Vives not only continues the trends in humanist dialectic initiated by Valla and Agricola but also displays a familiarity with philosophical technicalities that was unusual among humanists and that reveals the more traditionally Aristotelian aspects of his thought. His appraisal of the Aristotelian corpus is summarized in *Censura de Aristotelis operibus* (1538). A posthumously published treatise entitled *Dialectices libri quatuor* (1550) appears to be a youthful work that Vives evidently did not consider suitable for publication.

Vives' criticism of scholastic logic hinges on a profound analysis of the arts of discourse. For him, the supremacy of ordinary discourse (*sermo communis*) over the abstract language of metaphysics is indisputable. Philosophy ought not to invent the language and subject of its own specific investigation. Instead of the formal language of the dialecticians, which he found completely unsuited to interpreting reality, he proposes the less rigorous but more concrete universe of everyday communication, which answers all our practical needs and aims to provide a knowledge that is useful.

Vives was pessimistic about the possibility of attaining knowledge as understood in Aristotelian terms. His thought anticipates the moderate skepticism of early modern philosophers such as Francisco Sanches (1551–1623) and Pierre Gassendi (1592–1655). Vives belongs, like Francis Bacon (1561–1626), to the so-called "maker's knowledge" tradition, which regards knowledge as a kind of making or as a capacity to make. He often insists on the practical nature of knowledge, maintaining that peasants and artisans know nature far better than many philosophers. A central tenet of the maker's knowledge tradition is that man cannot gain access to nature's intimate works, since these, as divine works, are only known to God, their maker. In *De prima philosophia*, he describes nature as an automatic

machine, like a clock, prepared and adapted by God. Moreover, God is always present to nature, holding together his construction with his continual assistance in the same way as the human soul maintains the harmony of the human body.

Vives subscribes to the Aristotelian principle that all of our knowledge has its origin in perception. We cannot learn anything, he asserts, except through the senses. But since that which is incorporeal or hidden cannot be grasped by the senses, sense perception does not yield any knowledge of the essence of things but only of their accidents. Vives' view, however, is that sensory knowledge must nonetheless be transcended by means of reasoning. Yet, according to him, the best that human reason can accomplish in this process is to provide a judgment grounded in all the available evidence, thereby increasing the probability of the conclusion. In his view, our knowledge of the essence of a thing is only an approximate guess based on the sensible operations of the thing in question.

The most reliable guide for human inquiry, he argues, is mankind's natural propensity toward what is good and true. This light of our mind, as he also calls it, is always, directly or indirectly, inclined toward what is good and true and can be regarded as the beginning and origin of prudence and of all sciences and arts. This natural propensity can be perfected if it is subjected to teaching and exercise, just as the seeds of plants grow better if they are cultivated by the industrious hands of a farmer. The topics, which Vives conceives as a reflection of the ontological order, represent another valuable instrument for human inquiry. In his view, the topics are a set of universal aspects of things that help to bring order to the great variety of nature. As such, they play an important role as organizing principles of knowledge. They are like a grid through which knowledge can be acquired and arguments formulated. Nevertheless, human knowledge can be nothing other than a finite participation in creation. Because of the limitations that characterize man's fallen state, investigations into the realm of nature can only lead to conjectures, and not to firm and indubitable knowledge, which we neither

deserve nor need. In his opinion, certainty is not a prerequisite for advances in science and philosophy; and as a criterion for scientific progress and for the rational conduct of life, he advocates a method consisting in sound judgment based on experience.

History, seen as the sum of all human experience, is therefore of great importance for every branch of learning. In principle, each new generation is better equipped than the preceding one, since it can derive advantage from all earlier experience. Hence, the idea of progress plays an essential role in Vives' conception of intellectual history, and several of the cultural problems he deals with, such as the causes of the corruption of the arts, are approached from an historical perspective.

Vives' moral philosophy stems mainly from his Christian humanism and is aimed at the reform of both individuals and society. He often proclaims the superiority of Christian ethics over pagan wisdom. In *De causis corruptarum artium*, he argues at length that Aristotle's ethics, on account of its worldly conception of happiness and virtue, is completely incompatible with the Christianity. He has more sympathy for Platonism and Stoicism, which he believes are broadly in line with Christian morality. In *Introductio ad sapientiam*, he recommends self-knowledge as the first step toward virtue, which he regards as the culmination of human perfection. In his view, vice follows from a wrong judgment about the value of things. To be wise, however, is not only to have true opinions about things but also to translate this knowledge into action by desiring honorable things and avoiding evil. Wisdom therefore requires the subordination of the passions to the control of the intellect.

Vives holds that the best means to secure the reform of society is through the moral and practical training of the individual. Man, by his own nature, is a social being. In the first book of *De subventionem pauperum*, which consists of a theoretical discussion of the human condition, he stresses not only our need for and dependency on others but also our natural inclination to love and help one another. He regards the development

of society as a distinctly human achievement, based on the ability to profit from experience and turn knowledge to useful ends. Social problems, such as poverty and war, are the result of emotional disorders. During Vives' lifetime, Europe experienced dissention and war between princes and within the church, as well as the increased threat posed by Muslim expansion into Western Europe. He addressed the problems of political and religious disturbances in several works, which also deal with the psychological origins of discord, the proper conduct of all the offices of the commonwealth, and the theme of Christian harmony. His major political treatise on European war and peace is *De concordia et discordia in humano genere* (1529), where he sets out the case for the origins of discord in society and then aims to show how peace and concord can be fostered through knowledge of human nature, especially the emotions. According to him, the virtue of the people can only be maintained and promoted in peace.

Vives' philosophical reflections on the human soul are mainly concentrated in *De anima et vita* (1538), which provides the psychological underpinning for many of his educational ideas and can be characterized as a prolegomenon to moral philosophy. He attempts to reconcile the Aristotelian view of the soul as an organizing and animating principle with the Platonic conception of the soul as an immaterial and immortal substance. He also pays close attention to physiology and, following the Galenic tradition, maintains that our mental capacities depend on the temperament of our body.

The structure of the treatise is indebted to the traditional approach of faculty psychology, in which the soul is said to be composed of a number of different faculties or powers, each directed toward a different object and responsible for a distinct operation. The first book covers the functions of the vegetative soul (nutrition, growth, and reproduction), of the sensitive soul (the five external senses), and of the cogitative soul (the internal senses, i.e., a variety of cognitive faculties, including imagination, fantasy, and the estimative power, which are located in the three ventricles

of the brain and whose actions follow from those of the external senses). The second book deals with the functions of the rational soul and its three faculties (mind, will, and memory), as well as with topics stemming from Aristotle's *Parva naturalia*, such as sleep, dreams, and longevity. The third and final book explores the emotions, which Vives, rejecting the Stoic view, regards as natural responses to the way things appear to us and as essential constituents of human life.

In *De disciplinis*, Vives did not include a section on theology, which he proposed to deal with at a later time. His work *De veritate fidei Christianae* was still in progress when he died. The treatise, which consists of five books, was published posthumously in 1543. In the first two books, he expounds his views on God, human nature, and Christ. The next two books are dialogues, in which a Christian engages a Jewish and a Muslim interlocutor. The fifth book concludes by recapitulating the superiority of Christianity over any other religious persuasion.

Vives' works, which went through hundreds of editions and were translated into several vernacular languages, continued to be widely read and extremely influential during the century after their publication. His critical attitude toward the Aristotelian orthodoxy of his day left a mark on several authors. Psychology was another area within which he enjoyed considerable success. His views were recommended, quoted, or discussed by Philipp Melancthon, Francisco Suárez, Robert Burton, René Descartes, and William Hamilton, among many others. During the second half of the nineteenth century and the first decades of the twentieth, Vives was read and studied by philosophers such as Ernest Renan, Friedrich Albert Lange, Wilhelm Dilthey, Pierre Duhem, Ernst Cassirer, and José Ortega y Gasset. Lange regards him as one of the most important reformers of philosophy of his time and as a precursor of Bacon and Descartes. In Vives' method based on experience, as well as in his emphasis on a culture that ought to be founded, not on barren speculation, but on the usefulness of knowledge, one could, according to Ortega y Gasset, discern some anticipations of the modern *Zeitgeist*.

Judah Halevi

Raphael Jospe

Bar Ilan University Department of Jewish Philosophy, Hebrew University of Jerusalem-Rothberg International School, Jerusalem, Israel

Abstract

Judah Halevi (Spain, c. 1075–1141), Hebrew poet and Jewish philosopher. His *Book of the Kuzari*, a fictional dialogue between a king and a Jew (based on the historical conversion to Judaism of the king of the Khazars), presents a critique of the dominant Aristotelian philosophy of the day, especially the theory of emanation. The critique is philosophical: Aristotle is wrong because he failed to demonstrate what he claimed, not because he contradicts Scripture. Metaphysical speculation is uncertain, whereas historical fact is undeniable. If, as rationalist philosophers suggest, prophecy is an intellectual process, one would expect to find prophets among all nations, in all places, and at all times. For Halevi, the fact is that only the prophets of Israel are universally acknowledged to be true prophets (i.e., also by

Christianity and Islam). Halevi therefore proposes that the Jewish people, in addition to universal human reason, are endowed with a particular biological “divine faculty” (*amr ilahi*) enabling them, under certain conditions (in the ideal median clime of the Land of Israel, and when activated by the “divine actions” of the sacrificial cult), to prophesy.

Judah Halevi (c. 1075–1141), Hebrew poet and Jewish philosopher, was born in Spain, possibly in Toledo or Tudela, to a wealthy family, and received a thorough education in both Hebrew and Arabic sources. He supported himself by commerce and medicine, but achieved renown for his poems, of which we have approximately one thousand, including love poems, eulogies, liturgical poetry (some of which were adopted in various communal rites), and most famously, poems expressing love and longing for Zion. His social circle included leading poets and intellectuals, including the Bible exegete, grammarian and philosopher Abraham ibn Ezra (1089–1164), who cites Halevi in his Bible commentaries, and whose son Isaac seems to have been married to Halevi’s daughter. In 1140, as he alludes in the closing sections of his *Kuzari*, Halevi left Spain, intending to fulfill the religious obligation of *aliyah* (immigration to the Land of Israel), in his eyes an act not merely of personal fulfillment but of national redemption. Debarking in Alexandria, Halevi was warmly welcomed and hosted by the Egyptian Jews, with whom he spent some months. In May, 1141 his departure by boat from Alexandria for Israel was delayed by stormy weather, and while awaiting a favorable west wind he wrote his last two poems. There is no concrete evidence that Halevi reached Israel, although according to a popular legend (recorded in the sixteenth century), when Halevi reached Jerusalem and composed his “Ode to Jerusalem,” he was killed by an Arab horseman. References to Halevi in the summer of 1141 indicate that he was no longer alive.

Although Halevi was not a rigorous philosopher of the rank of Maimonides, in many respects he remains an existentially compelling thinker. Perhaps because of his skills as a poet, he was

able to reduce complex questions to stark, basic formulas. For example, Halevi succinctly summarized the differences between impersonal philosophic conceptions of God (generically called *Elohim*, known through intellectual deduction, *qiyas*) and the personal God of biblical religion (loved and experienced existentially in “taste,” *dhaug*, and called by the Tetragrammaton) respectively as “the God of Aristotle” and “the God of Abraham” (*Kuzari* 4:16). There is no sharper (and more humorous) critique of the intellectual bankruptcy of the dominant theory of emanation than Halevi’s assertion that if it were true that intellectual self-contemplation results in the emanation of a sphere, and that contemplation of the first cause results in the emanation of an angelic (separate) intellect, when Aristotle was conscious of himself he should have emanated a sphere, and when he contemplated the first cause he should have emanated an angel (*Kuzari* 4:25). What other medieval thinkers asked his readers – and by extension our generation of Jews, the first in two millennia to have a state and military power – whether Jewish morality is not merely a function of powerlessness, not principle, “and if you had the power, you would also kill” (*Kuzari* 1:114)?

Halevi’s Judeo-Arabic philosophical work, *Kitāb al-Radd wa’l Dalīl fī ‘l-Dīn al-Dhalīl* (*The Book of Refutation and Proof in Defense of the Despised Faith*), usually called *Kitāb al-Khazari* (*The Book of the Kuzari*), translated into Hebrew by Judah ibn Tibbon, takes the form of a dialogue between the king of the Khazars (“the Kuzari”) and a Jewish spokesman, the *ḥabr* (Hebrew: *haber*). According to internal evidence, the book was written in 1140. However, in an earlier letter, which S. D. Goitein dated as having been written in 1125, Halevi already refers to having sent the book to a Karaite Jew in Christian Spain, who had asked him some questions to which the book responds. This led Goitein and some other scholars to conclude that the book was written in stages over some 20 years, initially as an anti-Karaite polemic; according to them, those sections of the book (notably *Kuzari* 3:33–65) dealing with Karaism are its oldest strata.

In a literary analysis of the work, Eliezer Schweid suggested that Halevi personally

identified with the *haver*, and that the king represents the reader. Yochanan Silman's meticulous study of Halevi's thought, agrees that the book was written in stages, and differentiates between Halevi's "early thought" (when Halevi still believed in Aristotelian philosophy) and his "later thought" (when Halevi freed himself from Aristotelianism and emphasized the superiority of the historical-religious Jewish experience). The two titles of the book, according to Silman, reflect this evolution: *The Kuzari* (the name mentioned in the letter) is the earlier name, and the final version is *The Refutation and Proof in Defense of the Despised Faith*. The early thought may be found in *Kuzari* 1:68–79, 2:1–7, and 3, whereas the later thought is contained in *Kuzari* 1:1–67, 2:7–81, 4, and 5. This evolution is not merely autobiographical, according to Silman's theory, but also reflects the stages necessary for anyone's (i.e., the reader's) intellectual and spiritual development. Silman's theory, however closely argued, fails to explain how the allegedly early anti-Karaite sections of the book reflect Aristotelian philosophy, nor how the book was ultimately put together. If, as alleged, the book represents a guide or spiritual pilgrim's progress, it would have made more sense for Halevi, a talented poet with exquisite literary sense, to have written, or at least later edited, the book with a linear structure, taking the reader from earlier positions to a more mature understanding of the truth. A free and atomistic admixture of earlier and later elements is not only literarily clumsy, but logically and pedagogically self-defeating. Moreover, such scholars as D. Z. Baneth have questioned the early dating of Halevi's letter (the original basis for the speculation of the evolution of the book in stages), and Halevi's letter never states that the book was written as an anti-Karaite polemic, nor even that the questions related to Karaism, but only that a Karaite Jew had asked for his views "on several subjects."

Other scholars see the book as an instance of esoteric writing. Leo Strauss regarded the *Kuzari* as exoterically opposing philosophy, while esoterically regarding philosophy as at least partially useful for religion, whereas Dov Schwartz has concluded the opposite: exoterically the book

retains a positive function for philosophy, whereas esoterically it totally repudiates philosophy, a "secret" position Halevi, who moved in intellectual circles, had to conceal. However, Halevi's critique of Aristotle, and especially contemporary Aristotelianism, is explicit, both in the book and in one of his poems: "Do not let Greek wisdom entice you/Which has no fruit but only flowers." His critique, however, is not of philosophy *per se*, but of Aristotelianism as a philosophical failure; he never states that Aristotle and his followers were wrong because they contradict Scripture, but that they fail to prove their claims (especially in metaphysics), and their fallacious theories fail to take into account undeniable historical fact.

Borrowing from a historical account of the conversion to Judaism of the King of the Khazars (known from several sources, including the exchange of letters, c. 960, between Khazar King Joseph and Hisdai ibn Shaprut, a leader of Spanish Jewry), Halevi portrays a fictional Khazar king ("the Kuzari") who in a dream "as it were" sees an angel who tells him that his intentions are pleasing to God, but not his actions. Seeking an explanation of his dream, the king first consults a philosopher (typical of the Aristotelianism of the day), then a Christian, and a Muslim. The Jews, universally degraded and despised, apparently lack divine favor and therefore need not be consulted. However, the claims of the philosopher, Christian, and Muslim fail to persuade the king, and the most reasonable claims of the other religions are based on their common Jewish source. The king, accordingly, engages the Jewish *haver* in a dialogue for the rest of the book.

The *haver* surprises the Kuzari by affirming his belief in the God of Abraham who miraculously led the Israelites out of Egypt, sustained them in the wilderness, revealed the Torah at Sinai, and brought them to the Promised Land, rather than by affirming a belief in God as the creator of the universe. A universalistic conception based on natural reality is dubious, because it is the product of theoretical speculation which cannot be scientifically and conclusively demonstrated. The disagreements among the philosophers are evidence of the inadequacy of metaphysical speculation.

Historical fact, however, originally experienced by thousands and then reliably transmitted publicly (as Saadia Gaon had already argued), is indisputable, and our theories must conform to the facts, not vice versa; moreover, these historical facts are confirmed, not denied, by the Christians and Muslims.

Rationalist philosophers (like Saadia Gaon and especially Maimonides), who identified the process and content of prophetic revelation with reason, have no way to explain the historical anomaly that the only prophets universally acknowledged as such, by other religions namely Christianity and Islam, are the prophets of Israel. Reason and morality are universal (even a gang of bandits must operate, at least internally, on some moral basis; *Kuzari* 2:47–48), and if the phenomenon of prophecy were a function of reason, it would also have to be universal, among all peoples, at all times, and in all places. In fact, however, no philosopher was ever a prophet, and no prophet a philosopher. For Halevi, the fact is also that prophecy occurred only among the Jews, in or near the Land of Israel, and while the sacrificial cult existed. Halevi therefore proposes that in addition to faculty of reason, Adam was endowed with a higher biological “divine faculty,” the *amr ilahi* (Hebrew: *‘inyan elohi*), enabling him to communicate with God. This inborn “divine faculty” was passed down to unique individuals, reaching Abraham, Isaac, and Jacob, from whom it passed to all the children of Israel. Like a vineyard, whose grapes can only flourish in certain soil and with proper cultivation, the “divine faculty” could only be activated in the ideal median climate of the Land of Israel, through the “divine actions” of the sacrificial cult.

The Jewish People thus possess a unique innate faculty for divine communication, and are the essential “core” (*lubb*) of humanity (the husk or shell, *qishr*), but their latent “divine faculty” can no longer be activated in the absence of the temple cult. Reversing Paul’s parable of the olive tree (Romans 11), Halevi explains the degraded status of the Jews in exile in terms of the parable of the seed which seems to be degraded into its environment, but actually assimilates the surrounding soil into itself to produce a tree. Christianity and Islam

are “a preparation and introduction for the messiah,” because they are the ground permitting the Jewish seed to grow into the tree, the fruit of which is the hoped-for messiah. “They will then revere the root they had previously despised” (*Kuzari* 4:23).

al-Juwaynī

Jan Thiele

Centro de Ciencias Humanas y Sociales, Consejo Superior de Investigaciones Científicas, Madrid, Spain

Abstract

Abū l-Ma'ālī al-Juwaynī is considered as the last important representative of so-called “early” (or “classical”) Ash'arism, a school of Sunni “rational theology” (*kalām*). He was the

teacher of the famous Abū Ḥāmid al-Ghazālī, with whom Ash'arism entered a new phase and increasingly came under the influence of Avicennian philosophy. Yet the introduction of “philosophical” ideas into the doctrinal system of Ash'arism was to some extent anticipated by al-Juwaynī: not only did he engage with the ideas of his opponents in *kalām* theology, but also with those of the *falāsifa*.

Life and Works

Abū l-Ma'ālī al-Juwaynī was born in 1028 in the region of Nīshāpūr. He studied “rational theology” (*kalām*) and Shāfi'ite law with his father, who had already played a role in Khurāsānian Ash'arism. After his father's death, al-Juwaynī followed him as teacher in Nīshāpūr. Yet with the Seljuq conquest of the city in 1037, Ash'arites like al-Juwaynī faced growing hostility: the vizier Tughril Beg (d. 1063) implemented an anti-Shāfi'ite and anti-Ash'arite policy and denounced the practice of *kalām* theology as an illegitimate innovation. In order to escape from persecution, al-Juwaynī fled with other scholars inclined towards Ash'arism – like the mystic Abū l-Qāsim al-Qushayrī (d. 1074), one of Nīshāpūr's leading scholars – to Baghdad. Later, he spent 4 years in the Ḥijāz and taught at Mecca and Medina – wherefore he earned his honorific title of “the Imam of the two sacred cities” (*imām al-ḥaramayn*). When the vizier Niẓām al-Mulk (d. 1092) eventually came to power the Seldjuqs' attitude towards Ash'arism radically changed: the vizier became a patron of Ash'arism and founded a series of colleges in Iraq, the Arabian Peninsula, and Persia – specifically Khurāsān – to promote their teachings. He invited al-Juwaynī to return to Nīshāpūr and to teach at a *madrassa* that was built specifically for him.

Some of al-Juwaynī's writings in *kalām* have survived – either partially or in their entirety – and provide substantial information about his thought. The longest is a supercommentary on a work by the eponym of Ash'arism, Abū l-Ḥasan al-Ash'arī's (d. 935–6) *al-Luma'*. Al-Juwaynī's work is entitled *al-Shāmil fī uṣūl al-dīn*, and it is based on a commentary by Abū Bakr al-Bāqillānī (d. 1013), another

major figure of Ash'arism. The *Shāmil* has not survived in its entirety and its largest parts have not been rediscovered. A second text, entitled *al-Irshād ilā qawā'ī' al-adilla fī uṣūl al-ī'iqād*, is much shorter than the *Shāmil* but complete. Allard (1965) argued that the length of al-Juwaynī's works most likely decreased over the course of their relative chronology. The *Shāmil* and the *Irshād* would then have been followed by *Luma' al-adilla fī qawā'id ahl al-sunna* and finally *al-Aqida al-Nizāmiyya*, a short work dedicated to the vizier Nizām al-Mulk.

Al-Juwaynī died in 1085 near Nīshāpūr. He is often considered as the last important representative of so-called "early" or "classical" Ash'arism. The school then entered a new phase that was marked by an increasing engagement with Avicennian philosophy. It was al-Juwaynī's student, the famous Abū Ḥāmid al-Ghazālī (d. 1111), who played a significant role in stimulating this transition. Yet the introduction of "philosophical" ideas into the doctrinal system of Ash'arism had already started earlier – this is in fact visible in al-Juwaynī's own thought. Two other students of al-Juwaynī, al-Kiyā' al-Harrāsī (d. 1010–11) and Abū l-Qāsim al-Anṣārī (d. 1118) followed the doctrines of their teacher much closer than al-Ghazālī. Abū l-Qāsim al-Anṣārī has two major works that draw on his teacher's *al-Irshād*: one is explicitly called a "commentary" (*Sharh al-Irshād*), the other is entitled *al-Ghunya fī l-kalām*. Al-Juwaynī's *al-Irshād* was furthermore very popular in the Islamic west with numerous commentaries that were devoted to it.

Teaching

Al-Juwaynī's works and the accounts of later Ash'arite theologians bear witness to a number of revisions and changes in his doctrinal positions and argumentations. Consequently, he did not follow a consistent teaching throughout his life. This reflects perhaps a character trait portrayed by biographers, who describe al-Juwaynī as someone in constant quest for the truth behind the theological and metaphysical problems of his time.

The Theory of ḥāl

One of such problems was the question of the ontological status of the properties of beings. It shall serve here as a first example for providing some insight into al-Juwaynī's views, specifically because this issue had implications on various levels of his teaching, including metaphysics, epistemology, and theology in a narrower sense. The question of the ontological status of the properties of beings concerned on the one hand the qualifications of objects in this world and on the other hand God's attributes. Al-Juwaynī addressed the issue by adopting the so-called theory of *ḥāl* (literally "state," pl. *aḥwāl*). After Abū Bakr al-Bāqillānī, he was the second major representative of Ash'arism (there were others, less well-known, though) to endorse this theory. Originally the *kalām* notion of *ḥāl* was developed by opponents of Ash'arism, namely, the Mu'tazilite Abū Hāshim al-Jubbā'ī (d. 933) and his followers.

The theory of *ḥāl* built upon the assumption that the properties of things have a metaphysical reality. Previously, *kalām* theologians considered that only entities (i.e. only that which is qualified by properties) possess a reality. The proponents of the *ḥāl* believed, however, that unlike entities a *ḥāl* is metaphysically real without being described by either existence or non-existence. Proponents and opponents of *aḥwāl* divided over the question whether or not we really need to affirm their reality alongside entities which constitute the basic elements of their ontology. According to *kalām* ontology, entities comprise God, atoms, and accidents.

Al-Juwaynī's definition of *aḥwāl* departs from dividing them into two groups: the "grounded" or "caused" (*mu'allal*) and the "ungrounded/uncaused" (*ghayr mu'allal*). In the context of *kalām* theology, the Arabic term *mu'allal* always means "caused" by something distinct from the affected object (that is, saying that something is *mu'allal* by itself would be self-contradictory). The "caused/grounded" *ḥāl* is therefore understood by al-Juwaynī as the effect of an entity that resides in another entity and causes it to have a property. This can be realized in two possible ways: the first case applies to an accident that inheres in an atom

and causes its locus of inherence to have a property; the second case applies to God in whom reside entitative attributes (*ṣifāt*) which cause him to possess such properties as “knowing,” “powerful,” or “living.” “Ungrounded/uncaused” *aḥwāl* are in turn those qualities that things possess by virtue of themselves, that is, that which is predicated whenever we describe their very nature. In the case of atoms, for example, such qualifications include descriptions like “being an atom,” “being existent,” and “occupying space.”

There were essentially three major concerns for al-Juwaynī that lead him to posit in some of his works the reality of the *ḥāl*. The first argument is that the *aḥwāl* are necessary to account for why distinct things may share some common features despite their distinctiveness. In his view, such accidents as the colors black and white are distinguished by their “blackness” and “whiteness,” but they both share a common feature: namely, their “being color.” If “blackness,” “whiteness” and “being color” were not ontologically real, al-Juwaynī argued, we were not able to establish what they have in common and what distinguishes them. This claim is related to al-Juwaynī’s second argument, namely, that without affirming the notion of *ḥāl* we would fail to draw definitions of things. The reasoning behind this is that definitions consist in identifying what all defined items have in common and what distinguishes them from other objects. Al-Juwaynī’s third argument finally highlights the theological dimension of positing the *ḥāl*. He claims that a central Ash‘arite doctrine actually presupposes the reality of the *ḥāl*. Ash‘arites posited that God’s co-eternal attributes are entities that subsist in Him. This doctrine was criticized by other schools of *kalām* as a fundamental violation of monotheism: they argued that there cannot be more than one eternal being. The Ash‘arites countered this objection by positing that if man is knowing by virtue of an entity of knowledge, the same must be true for God. Yet for al-Juwaynī, this analogy can only be valid if the common feature “knowing” has a reality distinct from entitative knowledge. Otherwise, he argues, the reasoning would result into an attempt to prove the existence of God’s entitative knowledge by itself.

Al-Juwaynī’s adoption of the notion of *ḥāl* is found in his two longer works, the *Irshād* and the *Shāmil*. In contrast, al-Juwaynī’s *Luma‘* and his *al-‘Aqīda al-Nizāmiyya* no longer appeal to the theory (Allard 1965; Gimaret 1970; Frank 2004; Benevich 2016).

The Proof of God

Al-Juwaynī did not only engage with the theories of his detractors within the field of *kalām* theology. As previously mentioned, he also felt the challenge posed by the views and arguments advanced by the *falāsifa*, that is, the “philosophers” who draw on the Hellenic tradition. This challenge had become even more acute with the rise of the Avicennian system in the eleventh century. There were profound divergences between the *falāsifa* and *kalām* theologians, including the controversy over the “philosophers” doctrine of the eternity of the world – a topos that was rejected by their opponents as heretical. Despite these differences, al-Juwaynī acknowledged that some arguments of the *falāsifa* made a good point and could be adopted by *kalām* theology. This was, for example, the case with their demonstration of God’s existence. Whether or not al-Juwaynī’s proof was directly influenced by Avicenna (as claimed, for example, by Davidson 1987; Rudolph 1997) is not entirely clear. Madelung has proposed an alternative scenario, whose starting point is the observation that al-Juwaynī’s argument has significant parallels with that of Abū l-Ḥusayn al-Baṣrī (d. 1044). Abū l-Ḥusayn was a Mu‘tazilite theologian from Baghdad, who had lived too early for there to be a possible influence of Avicenna’s theories on his thought. He was, however, trained by Christian philosophers in Baghdad and therefore familiar with *falsafa* teachings (Madelung 2006).

Al-Juwaynī’s starting point in revising the proof for God’s existence concerned its central premiss: the traditional argument in *kalām* built on the assumption that the world is created. In order to prove this assumption, it was claimed that bodies, which make up the world, necessarily carry accidents that have a temporal existence. It

was then reasoned that bodies must also have temporal existence. However, this argumentation falls short of the possibility of an infinite series of created accidents. Yet the upshot of this assumption would have been that an eternal body could possess an infinite number of accidents, an idea that completely undermined the argument for creation. This deficiency of the traditional proof was already identified by Abū l-Ḥusayn al-Baṣrī. Al-Juwaynī took these reflections into consideration and therefore demonstrated that whatever is created has “a first.” He thereby neutralized the argument of an infinite series of accidents inhering in an eternal body (Davidson 1987; Madelung 2006).

A second version of al-Juwaynī’s revised proof for God’s existence eventually got along without the necessity of positing accidents at all. As mentioned, the existence of accidents was traditionally affirmed to prove that a particular body must be created. It was then concluded that the temporal existence of bodies requires a creator, who must be God. This conclusion was drawn by way of analogy with our worldly experience that any such works as manufacture, writing need a manufacturer, writer, etc. In this second version of the proof, al-Juwaynī no longer appeals to the case of a particular body and rather considers the creation of the world as a whole: he claims that the world, instead of being existent, could also be non-existent or come into existence at different times. This, he went on to argue, implies its being possibly existent, which, as he says, self-evidently implies that there must be an agent by virtue of whose arbitrary choice the world comes into existence at a given time instead of continuing in a state of non-existence or of coming into existence at some other time. This agent and creator of the world, he concludes, cannot be other than God. Al-Juwaynī denotes God’s choosing by the verb “to particularize” (*ikhtaṣṣa*), and, therefore, the proof is also known as “particularization argument.” The central assumption that underlies the argument is an idea formulated by Avicenna, namely, that the existence of the world is contingent (*mumkin al-wujūd*) and that God is necessarily existent (*wājib al-wujūd*). Referring to the world, al-Juwaynī in turn uses the formulations

jā’iz al-wujūd or *wujūd mumkin*. Yet the core of al-Juwaynī’s line of reasoning is already found in Abū l-Ḥusayn al-Baṣrī’s teaching, who uses, however, another (less Avicennian) terminology (Davidson 1987; Rudolph 1997; Madelung 2006).

Human Acts

With regard to the free will problem, the Ash‘arites were determinists. The doctrine of divine determinism was for them a logical corollary of God’s omnipotence, which cannot be restricted in any way. They therefore believed that whatever happens in this world depends on Him, including human actions. Nonetheless, the Ash‘arites had to provide an explanation how man can be held morally responsible in the absence of freedom of action. The school’s founder al-Ash‘arī therefore developed a theory that distinguishes between two types of acts: appealing to our intuition, he claimed that such motions of the body as walking on the one hand, and trembling on the other hand do not occur in the same way. Trembling implies our “weakness” and occur “necessarily,” whereas this is not the case with our walking from A to B. While both acts are determined by God, they are still distinct because our walking occurs voluntarily and our trembling not. Therefore, we would never be held responsible for our trembling, but we are accountable for our voluntary acts. Now if “necessary” acts involve our weakness, the opposite must be true for voluntary acts: they involve our “power” (which means an accident of “power” (*qudra* or *quwwa*) in the agent).

Al-Ash‘arī’s theory proposed an alternative to the doctrine of freedom of action in order to account for our moral responsibility, but he fell short of providing solutions to some problems, and so it was up to his later followers to resolve them. One of these questions was the precise function of “power.” Al-Ash‘arī posited that this “power” is conjoined to man’s voluntary acts but has no effect whatsoever. In the *Irshād*, al-Juwaynī follows this idea, and he consequently failed to explain why one should posit the existence of “power” if it is not correlated in any way to man’s

acts. Later, however, in *al-ʿAqīda al-Nizāmiyya*, al-Juwaynī develops an original theory of human acts that departs from the assumption that man's power *must* be effective. His central argument is that otherwise God's imposing duties and obligations was no longer a tenable idea. In order to resolve this theological dilemma, he affirmed that man's acting is caused by his power. He could consequently argue that whatever we do is controlled by our very own selves. By this line of reasoning, he provided an explanation why we are rightly rewarded or punished for our acts. Nonetheless, al-Juwaynī did not give up the central Ashʿarite idea that all happenings in the world originate in God: he maintained the claim of God being the all-encompassing Creator by reasoning that man's power is only an intermediate cause, which in turn is created by God. This theory was not uncontroversial. Al-Juwaynī was later blamed because his reasoning recalls to some extent the notion of emanation supported by the *falāsifa* – that is the idea of God being the first cause from which all other causal relations proceed. Irrespective of whether or not al-Juwaynī was really inspired by the idea of emanation, this is at least not entirely excluded: as we have seen, he was actually acquainted with, and even adopted, ideas developed by the *falāsifa* (Gimaret 1980).

Kalām

Frank Griffel
Department of Religious Studies, Yale University,
New Haven, CT, USA

Abstract

Kalām is a genre of theological and philosophical literature in Arabic that was actively pursued between the eighth and nineteenth centuries. In its early period, the genre employed a particular type of argumentative technique and developed a distinct method that is also referred to as *kalām*. First produced by Muslim authors in Iraq, the genre and its method was also employed by Jewish and to a lesser degree Christian Arab theologians. A practitioner of *kalām* is known as a *mutakallim* and, in plural, as *mutakallimūn*. Often translated as “rationalist theology,” *kalām* is in Islam among the most important genres of theological literature. Muslim *kalām* can be divided into three periods: an early period of development as Muʿtazilite *kalām*, a middle period after the ninth century when the discourse and its method were adopted by Sunni Muslim theologians of the Ashʿarite and Māturīdite schools, and a late period after the eleventh century when *kalām* appropriated many techniques and teachings from the movement of Neoplatonized Aristotelian philosophy in Arabic (*falsafa*). In medieval European

philosophy and theology, we find references to and refutations of teachings developed during the second period by Ashʿarite authors, who were known in Latin as *loquentes in lege Maurorum*. In its third period, *kalām* engaged in an active reception of Aristotelian philosophy in Arabic, most importantly the philosophy of Avicenna (Ibn Sīnā, d. 1038).

Development of the Genre and Its Methods

Kalām describes a particular genre of theological and philosophical literature in Arabic. In its later period after the fourteenth century, it also appears in other Islamic languages such as Persian or Ottoman Turkish, though even then Arabic remains the main language of *kalām*. As a genre of literature, *kalām* focuses on establishing and defending certain theological positions through the use of rational arguments. In doing so, *mutakallimūn*, that is, the practitioners of *kalām*, have developed elaborate and systematic views in such fields as epistemology, the natural sciences, metaphysics, ethics, and psychology, and it is a matter of debate whether and to what degree *kalām* should be considered part of philosophy in Islam (Frank 1979; Sabra 2006). The claim of *kalām* to be considered an integral part of the history of philosophy in Islam is clearest during its late period after the twelfth century, when it appropriates and continues much of the earlier

discourse of *falsafa*. *Kalām* is often translated as “rational theology,” although this neglects the philosophical element particularly in its late period. Developed in Islam, *kalām* also establishes itself as a genre of Jewish and Christian Arabic literature (Wolfson 1979). It went through significant changes throughout its history, which can be classified into three main periods: early Muʿtazilite *kalām*, classical Sunni *kalām* particularly of the Ashʿarite tradition, and the late *kalām* of the period after the eleventh century that incorporates techniques and teachings of *falsafa*.

As a genre of literature and a particular method of argumentation, *kalām* established during the mid-eighth century in Iraq. Although much about the early history of *kalām* is unknown, it appears that it originated in public religious debates (singular *munāẓara*) between members of different religions and different Muslim denominations that aimed at the conversion of one’s adversaries to one’s own theological views (van Ess 1991–1997, 1, pp. 48–56). Leading participants in these public disputes became known as *mutakallimūn*, “those who appear as speakers (of a certain group).” *Kalām* (“to appear as speaker”) is the verbal noun of that activity. During the earliest period, it need not be connected to theology or even rationalist theology, as grammar and law were also subjects of debate. By the mid-ninth century, however, a *mutakallim* was a theologian who aimed to convince his adversaries through rationalist arguments. Public debates between *mutakallimūn* remained a staple of *kalām* for many centuries (van Ess 1976). The focus on rational evidence (singular *ḥujja*) may have resulted from the fact that scriptural arguments are of little value in public disputes between members of different religions. Another etymology of *kalām* focuses on its original meaning as “speech” and on the verb *takallama fī* (“to speak about”), from which the name of its practitioners derived. *Mutakallimūn* spoke about and publicly debated subjects such as God and His attributes, where other, more traditionalist scholars in Islam practiced self-imposed restraint (Abdel Haleem 1996). *Kalām* is therefore also translated as “speculative theology,” in the sense of formal, conceptual, and theoretical reasoning into such subjects

as God and questions of ontology and ethics (Frank 1992, pp. 9–12). Such reasoning was not unanimously accepted among the scholars of Islam, and there have always been groups who opposed its practice and/or deemed it illegitimate.

During its early period up to the beginning of the tenth century, *kalām* is largely synonymous to Muʿtazilite *kalām* (see below) and even the Jewish and Christian theologians who adopted *kalām* during this period should be regarded as Muʿtazilite *mutakallimūn* (Adang et al. 2007). The relationship of early *kalām* to the contemporaneous movement of translating Greek texts into Arabic is still unclear. There is a significant amount of common technical language that was used in these two movements, although the words do not always bear the same meaning. Both movements, that of early *kalām* and the translation movement from Greek into Arabic, were influenced by Aristotelian as well as Neoplatonic undercurrents in the scientific and religious scholarship that existed in pre-Islamic Iraq. Unlike in *falsafa*, however, there was no direct influence of Greek philosophical literature on early *kalām* and the type of connections we see appear to be mediated by such channels as the Christian Aramaic discourse on theology or Persian natural sciences. Also unlike *falsafa*, there are no textual connections of early *kalām* to any preceding theological or philosophical literature of the wider region, and the lines of influences seem to go along oral transmissions, possibly by imitating the argumentative strategies and the technical language of non-Muslim theologians in public debates.

Early *kalām* theologians refer to their method as “disputation” (*al-munāẓara*) and “dialectic” (*al-jadal*) and thus describe the dialogical character of their works (Frank 1992). Most early *kalām* works cite the position of an opponent or an interlocutor and then present the model response to that position or challenge: “if someone says . . . then I respond” (*in qīla . . . fa-qultu*) (van Ess 1970). Often an adversary’s position is refuted by showing that one of its implications is either undesirable or leads to an impossibility. Thus, early *kalām* texts frequently employ the *modus ponens* where a position P is shown to be wrong through the impossibility of one of its

implications $Q (P \Rightarrow Q; \neg Q, \text{ therefore } \neg P)$. *Kalām* texts tend to focus on a discussion of the implications of and the opposition to a given position, a practice that would lead philosophers of the Aristotelian tradition in Arabic (*falāsifa*) to criticize *mutakallimūn* for pursuing a non-apodictic method of inquiry (Gutas 2005). One of its methods is “exhaustive investigation and successive elimination” (*sabr wa-taqṣīm*), in which the presentation of one’s own solution to a problem is accompanied by a discussion and refutation of all known alternatives and all possible objections. Many *mutakallimūn* were also active in the field of Islamic law, and the dialectical methods developed in that field, particularly that of legal analogy (*qiyās*), had a strong influence on *kalām*.

One of the most important literary vehicles of the genre was the “*kalām* compendium,” a textbook or comprehensive *summa* where subjects discussed in *kalām* are dealt with according to the same basic scheme. *Kalām* compendia were produced up to the thirteenth century, when Fakhr al-Dīn al-Rāzī’s (d. 1210) activity changed this basic scheme and adapted it to the literary genres of *falsafa*. A classical *kalām* compendium would begin with the discussion of questions of epistemology (*al-ʿilm wa-l-naẓar*), then proceed to proofs for the existence of God, then discuss the attributes of God and turn to the way God relates to His creation. At the end of such a compendium stood the discussion of prophecy (and thus revelation) as well as the afterlife, sometimes followed by an inquiry into the status of the individual and the order of society, including its leadership (*imāma*) (Frank 1992, p. 12f.).

The First Period: Muʿtazilite *kalām*

The development of *kalām* as a genre of Arabic literature coincides with the formation of the first group of systematic theologians in Islam, the Muʿtazilites. The Muʿtazilites emerged from the earlier group of Qadarites, who engaged in the Islamic theological dispute about human free will versus divine predestination. Qadarites, who were active in the Iraqi city of Basra, argued that

humans are morally responsible for their actions and therefore must have power (*qadar*) over them. They argued against a traditionalist group of scholars (the *ahl al-ḥadīth*) who held that the power to act lies with God, whose omnipotence determines human actions. Later Muʿtazilites claimed that around the year 740, the Basrian scholar Wāṣil ibn ʿAṭā (d. 748) disputed with his colleague ʿAmr ibn ʿUbayd (d. 761) and convinced him that the teaching of the prominent Qadarite al-Ḥasan al-Baṣrī (d. 728), namely, that a grave sinner is a “hypocrite” is wrong. Wāṣil ibn ʿAṭā together with ʿAmr ibn ʿUbayd are credited to have formed a new school of thought that called itself “those who set themselves apart” (*al-muʿtazila*). Various positions of this group developed into a system of thought that expressed itself in five principles: (1) God’s unity (*tawḥīd*), (2) God’s justice (*ʿaḍl*), (3) God’s absolute sincerity regarding the promised rewards and punishments for human actions (*al-waʿd wa-l-waʿd*), (4) the claim that a grave sinner is neither an unbeliever nor a believer, which implies that he should not be subject to legal sanctions while he should still be morally shunned and will certainly be punished by God in the afterlife (*al-manẓila bayna al-manẓilatayn* “the station between the two stations”), and (5) the obligation to command right and forbid wrong (*al-amr bi-l-maʿrūf wa-l-nahy ʿan al-munkar*).

After the ʿAbbāsid dynasty took control of the Caliphate in 750, the Muʿtazilites became the leading theological school in Basra and the new capital Baghdad. The early ʿAbbāsid Caliphs, particularly al-Maʾmūn (reg. 813–833) and his successors, favored them over their traditionalist and more scripturalist adversaries. Although he himself was not committed to Muʿtazilite theology, al-Maʾmūn invited prominent Muʿtazilites to his court. During the so-called Inquisition (*miḥna*), al-Maʾmūn unsuccessfully tried to compel acquiescence in the Muʿtazilite doctrine that the Qurʾān was created in time as opposed to being eternal. The Inquisition excited great opposition among prominent traditionalists and would become one reason for the diminishing influence of Muʿtazilite theology during subsequent centuries.

During the first half of the ninth century, leading proponents of the Muʿtazilites in Baghdad, most prominently Abū l-Hudhayl (d. 842) and al-Nazzām (d. around 840), developed the school theology into a system that included explanations of physical processes, God's nature, His relationship to creation, and ethics (van Ess 1991–1997). A second intellectual peak was reached during the early tenth century in Basra, where Abū ʿAlī al-Jubbāʾī (d. 915–916) and his son Abū Hāshim al-Jubbāʾī (d. 933) dominated the school tradition. The teaching tradition of Abū Hāshim (known as Bahshāmiyya) became the most influential expression of Muʿtazilite *kalām*. To it belonged the Qāḍī ʿAbd al-Jabbār (d. 1025), who in his *Replete Book* (*al-Muḡnī*) formulated the most comprehensive treatment of the school's theology and remains our most important source for Muʿtazilite *kalām*. He created a circle of Muʿtazilite theologians in Rayy (modern Tehran, Iran) and had a significant influence on Zaydī Shīʿite theology and early 12th-century Shīʿite theology.

Although Muʿtazilites continued to be influential in regions on the edge of the Islamic world (in Khwarezm, that is, modern Uzbekistan, and among the Zaydī Shīʿites in Yemen), their influence on theological debates in the center diminished during the eleventh century. One of their last major proponents was Ibn al-Malāḥimī (d. 1141) in Khwarezm and al-Zamakhsharī (d. 1144), author of an influential Qurʾān commentary. Both were influenced by the teaching tradition of Abū l-Ḥusayn al-Baṣrī (d. 1044), a renegade student of ʿAbd al-Jabbār who was educated in medicine and thus familiar with an Aristotelian approach to the natural sciences.

Under the heading of God's unity (*tawḥīd*), the principal Muʿtazilite concern was to uphold divine simplicity and to defend God against anthropomorphism (*tashbīḥ*). They taught that the relationship between God and His attributes (*ṣifāt*) is totally unlike that of humans and the attributes they have. Theirs was an austere view of God in which the essential divine attributes were grounded directly in His essence and were not affirmed as distinct entities. Thus, when one affirms God to be living (*ḥayy*), knowing (*ʿālim*), or powerful (*qādir*), one does not affirm

a separate life (*ḥayā*), knowledge (*ʿilm*), or power (*qudra*), the way one does when talking about a human, in whom such attributes are grounded in so-called entitative accidents or *maʿānī* (sing. *maʿnā*) (van Ess 1991–1997, 3, pp. 270–276, 399f.; 4, pp. 425–445). God is believed “to be” the perfect mode of essential divine attributes like “living,” “knowing,” or “powerful.” Al-Nazzām taught that “God is by Himself continuously knowing, living, powerful, hearing, seeing, and eternal, not through a (separate) knowledge, power etc. (that he has).” Although a similar range of attributes can be predicated both of human beings and God, the mode of their predication or entitlement (*istiḥqāq*) differs (Frank 1978).

The insistence on divine unlikeness under the principle of God's unity (*tawḥīd*) was nevertheless accompanied by a different emphasis on divine likeness with regard to the attributes themselves, particularly that of God's justice. In defending divine justice, the Muʿtazilites claimed that the same standards of right and wrong apply to divine actions as to human actions, arguing that these standards are innately known to all human beings through reason and constitute objective characteristics (*wajh*, pl. *wujūh*: grounds or act descriptions) of actions (Hourani 1985, pp. 57–117). Any human action has one of four objective characteristics: obligatory (*wājib*), recommended (*nadb*), permissible/morally neutral (*mubāḥ*), or bad (*qabīḥ*). Performing a morally relevant action creates a certain “desert” (*istiḥqāq*) on the side of the human, either as blame and punishment or as praise and reward. In his dealings with humankind, God necessarily abides by the moral code that results from these objective characteristics and by the economy of deserts that it generates. He honors claims of reward when they arise, punishes only the deserving, and compensates for undeserved suffering. This claim was complemented by the view that human beings are free to act and responsible for their moral failures or successes, and thus also with the view that God gives every human being an opportunity to attain salvation (Vasalou 2008). The view that God in His justice administers no unjust punishment led to the admission that destruction through

natural disasters, for instance, must either be compensated in the hereafter or is just punishment for bad actions that could have been avoided. Acting according to the morals of the one justice that is both divine and human would, in turn, force God to grant salvation.

The Second Period: Sunni *kalām*

It was the heavily moralistic outlook of Muʿtazilite *kalām* evident in this short account that made it vulnerable to the attacks of Sunni theologians, mostly of the Ashʿarite school, who argued that human conceptions of justice were inapplicable to God and, more generally, that human beings can have no full understanding of the divine attributes. At the beginning of the tenth century, al-Ashʿarī (d. 935–936), a renegade Muʿtazilite theologian from Basra, pointed to what he saw as a fundamental incoherence at the heart of the Muʿtazilite attempt to give a systematic rationalization of God’s justice and the futility of efforts to reconcile God’s justice with His foreknowledge: Assuming that God knows whether a given human will go on to make the right or wrong moral choices within his or her lifetime and assuming also that God determines a person’s time of death, how can the Muʿtazilites explain why an infant who dies without having performed any actions, whether good or evil, has been deprived of the chance to earn rewards in the afterlife, while numerous wretched people are allowed to live long lives in which they thoughtlessly waste their chances to obey God – chances that the infant craved in vain? Prompted by this objection, al-Ashʿarī developed an alternative to Muʿtazilite *kalām* that would preserve the Muʿtazilites’ technique of rational argumentation yet criticize their extension of human rational principles into the divine realm. He insisted, for instance, that when God describes Himself in the Qurʾān as “knowing” (*ʿālim*) this would imply – according to the rules of the Arabic language – the existence of an entity (*maʿnā*) of “knowledge” that God has. Such knowledge is different from human knowledge and humans cannot gain a full understanding of divine attributes. With regard to the entitative quality of the divine attributes (*ṣifāt*)

and the way they are grounded in God’s unity – as well as other subjects of theology that would apparently defy human reason – the Ashʿarites applied the principle of acknowledging what they understood to be the teachings of revelation “without asking how” (*bi-lā kayf*). Al-Ashʿarī’s aim was to practice *kalām* in a way that would preserve the outward wording of the text of revelation as much as possible (Gimaret 1990). Unlike the Muʿtazilites, he saw himself as part of the broader movement of traditionalist Sunni Islam that grew out of the opposition to al-Maʾmūn’s Inquisition.

The Ashʿarites’ refusal of extending human rational principles into the divine led in their ethics to the rejection of the Muʿtazilite view that God’s justice follows a moral code that is innately known to humans. Ashʿarites acknowledge that humans have an innate understanding of “good” and “bad,” but this does not reflect objective ethical characteristics but is determined to be a mere consideration of their innerworldly benefits. These innate judgments, however, are ultimately fallacious and cannot be the basis of ethics or jurisprudence (*fiqh*). Ashʿarites have a voluntarist understanding of ethical values, where “good” and “bad” are determined by God’s will. Good actions are those that are rewarded by God (in this world as well as in the afterlife) and bad actions are those that are punished. The kind of connection between human actions and divine reward or punishment can only be learned from revelation (Hourani 1985, pp. 124–166).

While the Ashʿarites were the first group of Sunni *mutakallimūn*, they were soon joined by a second group that established itself in the border region between Iran and Central Asia and took its inspiration from the work of al-Māturīdī (d. c. 944), a contemporary of al-Ashʿarī from Samarkand. Whereas Ashʿarite *kalām* adopted certain positions in a conscious effort to oppose Muʿtazilism, Māturīdite *kalām* was less driven by such an opposition and is thus in general more rationalist than Ashʿarite *kalām* in its approach and in this respect closer to Muʿtazilism (Rudolph 2015).

Ashʿarite *kalām* developed in Basra and Baghdad, where al-Ashʿarī taught, but moved to

Khorasan in northwest Iran at the beginning of the eleventh century. Its main proponents al-Bāqillānī (d. 1013), Ibn Fūrak (d. 1015), al-Isfarāʾīnī (d. 1027), and al-Juwaynī (d. 1085), whose *Guide to Conclusive Proofs* (*Kitāb al-Irshād*) remains a point of reference for this period, developed systematic positions in many fields of the sciences. Initially only a small movement, Ashʿarite *kalām* benefited from the patronage of rulers beginning with the second half of the eleventh century and became the most influential branch of *kalām* in Islam. During this period, Ashʿarite *kalām* also became institutionalized in the newly formed *madrassa*, a seminary-type school or college – often financially independent – where *kalām* was part of the curriculum (pace Makdisi 1981, p. 302f).

Central to early (or also: classical) Ashʿarite *kalām* was a concern with the preservation of God’s omnipotence, which provided the context for their systematic denial of the Aristotelian concept of “natures” (Arab. *ṭabāʾiʿ*). Classical Ashʿarites denied that beings contained inherent potentialities capable of determining their future states and development and emphatically rejected the existence of any true potentiality outside of God. Out of that position grew an independent attempt to explain physical change in this world and the performance of human actions. Ashʿarites adopted their understanding of physical processes from earlier theories developed in Muʿtazilite *kalām*. The Muʿtazilite movement was particularly rich in attempts to explain physical processes (Dhanani 1994). Some Muʿtazilites speculated that movements are not continuous processes but consist of smaller leaps (singl. *ṭafra*) that our senses cannot detect and whose sum we perceive as a continuously flowing movement. This theory, in turn, led other Muʿtazilite thinkers to suggest that time itself is not a continuous flow but is rather a fast procession of “moments” (singl. *waqt*), which again is concealed from our senses. Al-Ashʿarī adopted these notions and created an explanation of physical change known as occasionalism. Occasionalism assumes that no element in the created world has any causal efficacy over any other. God is the only cause in this world and He does not employ secondary agents

or intermediaries to mediate His creative activity. God creates each event immediately, or rather, He creates this world anew at every moment and arranges the relationship between the elements therein anew without causal connection to a prior moment. What we consider causal natural laws is merely God’s custom (*ʿādat Allāh*) in creating certain sequences of events. God, however, can break His custom and He does so when He creates a miracle in order to confirm the claim of one of His prophets (Perler and Rudolph 2000, pp. 23–62).

Moses Maimonides (d. 1204) gives a faithful yet critical report of the occasionalist teachings in classical Ashʿarite *kalām* at the end of the first part, in chapters 71–76, of his *Guide of the Perplexed* (*Dalālat al-hāʾirīn*, pp. 121–162; English trans. 1, pp. 175–231). He presents 12 premises (*muqaddimāt*) of Ashʿarite occasionalism and explains their implications. While written in Arabic, Maimonides’ *Guide* became known in Europe first through its Hebrew translation (*Mōreh nevūkhīm*, translated c. 1200 by Samuel ibn Tibbon) and through a Latin translation (*Dux neutrorum* or *Dux perplexorum*, translated c. 1240) of the Hebrew version, which renders the Hebrew word *medabberīm* (for Arab. *mutakallimūn*) as *loquentes* (Niewöhner 1974). Maimonides thus introduced medieval European thinkers such as Thomas Aquinas (d. 1274) to the occasionalist ontology of Ashʿarite *kalām*. Aquinas discusses and refutes a number of their assumptions in his *Summa contra gentiles* and in other works (Perler and Rudolph 2000, pp. 131–153).

The Third Period: The Appropriation of *falsafa* in *kalām*

Already Ibn Khaldūn (d. 1406) in his history of *kalām* divides it into two main periods and distinguishes the “method of the later authors” (*tarīqat al-mutaʾakkhkirīn*) from those who preceded them in the classical period. He characterizes the new method as “meddling with philosophical works” and locates the turning point al-Ġazālī (d. 1111) (Ibn Khaldūn 2005, 3, pp. 23–36,

English trans. 3, pp. 34–55). The Arabic philosophers of the Aristotelian tradition (*falāsifa*) had criticized the *mutakallimūn* for their use of dialectical methods of argumentation and their rejection of Aristotelian logic and the method of demonstration (*burhān*). At the turn of the twelfth century, their criticism is taken up by al-Ġazālī, who began his career as an Ash‘arite *mutakallim* and who also wrote a fairly traditional *kalām* compendium (al-Ġazālī 2006). In his *Incoherence of the Philosophers* (*Tahāfut al-falāsifa*), he employs the method of *kalām* as well as arguments developed by earlier *mutakallimūn* to show that many teachings held by the *falāsifa* are not apodictically proven. Al-Ġazālī’s *Incoherence* aims to counter the philosophical accusation against *kalām* that it constitutes a nonapodictic science by showing that much of *falsafa* is equally nonapodictic. The book also points the way to a new kind of *kalām* by acknowledging that the teachings of the *falāsifa*, even if they are unproven by demonstrative arguments, are not necessarily wrong. Al-Ġazālī accepts that Aristotelian logic is superior to the logic of the *mutakallimūn* and should be adopted by them (Rudolph 2005). Given the nature of Aristotelian logic, any incorporation of its system of definitions and syllogisms also implies a significant incorporation of Aristotelian ontology, and al-Ġazālī was not opposed to that. In the natural sciences, al-Ġazālī appropriated the methods of the Aristotelian *falāsifa* and adopted their results. Overall, while rejecting the Aristotelian claim of metaphysics as a demonstrative science, al-Ġazālī employed and adopted many philosophical teachings in metaphysics as well as other branches of the sciences, including, for instance, the psychology of Avicenna (Ibn Sīnā, d. 1038). These teachings are, for al-Ġazālī, not the indubitable results of demonstrative arguments, as the *falāsifa* claim, but merely sound explanations of phenomena that we witness or that are mentioned in the Qur’ān. For al-Ġazālī, many teachings of the *falāsifa* are true because they have taken them from the earlier revelations of such prophets as Abraham and Moses. The *falāsifa* later concealed this and falsely ascribed their origin to Aristotle and other Greek philosophers (Griffel 2009, p. 100).

Al-Ġazālī’s critique of both *falsafa* and *kalām* leads to a gradual rapprochement between these two genres of Arabic literature. During the twelfth century, the Aristotelian tradition in Arabic performed a “dialectical turn,” most importantly in the work of Abū l-Barakāt al-Baġdādī (d. c. 1165). He dismissed earlier claims of *apodeixis* on the side of the *falāsifa* and tried to conduct metaphysics as a dialectical science, using techniques similar to those already established in *kalām* (Griffel 2011). The next step was Fakhr al-Dīn al-Rāzī, who like al-Ġazālī began his career as an Ash‘arite *mutakallim* of classical outlook but who wrote books in *kalām* that make full use of arguments developed in *falsafa* as well as in earlier *kalām* literature. In his two influential textbooks of philosophy, *Eastern Investigations* (*al-Mabāḥith al-mashriqiyya*) and *The Summary in Philosophy and in Logic* (*al-Mulakhkhaṣ fī l-ḥikma wa-l-mantiq*), Fakhr al-Dīn developed a novel division of the sciences that was adopted by many later textbooks of *kalām*. He rejected the types of divisions found earlier in philosophical literature according to the books in the *corpus Aristotelicum* as well as the established divisions in *kalām*. Instead, Fakhr al-Dīn created a new division – and thus a new curriculum of studies – along the lines of the most basic ontological distinctions in philosophy (Eichner 2009). Fakhr al-Dīn al-Rāzī’s works led to an adaptation of philosophical divisions in later textbooks of *kalām*. Authors of postclassical Ash‘arite *kalām* who were active at the *madrasas* of the Muslim east were often equally familiar with the works of earlier *mutakallimūn* as with those of the *falāsifa*, most importantly that of Avicenna (Endress 2006). Although driven by the overarching theological concerns of Ash‘arite *kalām*, they made extensive use of concepts and arguments developed by philosophers such as Avicenna (Endress 2005; van Ess 1966). Often they made small but significant changes to these concepts and arguments that reflect the different theological positions of Ash‘arite *kalām* and Avicennan *falsafa*. Fakhr al-Dīn al-Rāzī’s *Summary in Philosophy and in Logic* provided the template for a group of theological and philosophical *summae* that were produced during the Il-Khānīd period

(1256–1353) in Iran and Iraq. These works, such as al-Bayḍāwī's (d. c. 1286) *Risings Lights* (*Ṭawālī' al-anwār*) and 'Aḍud al-Dīn al-Ījī's (d. 1355) *Book of Stations in kalām* (*Kitāb al-Mawāqif fī 'ilm al-kalām*), became centerpieces of *kalām* instruction and were used for centuries. Together with the commentaries and the supercommentaries on these works, they were part of *kalām* education in Muslim *madrasas* up to the mid-twentieth century (Robinson 1997). Among the 12er Shī'ites, Naṣīr al-Dīn al-Ṭūsī (d. 1274) adopted the synthesis of Fakhr al-Dīn al-Rāzī and established an intellectual tradition that includes teachings and techniques of earlier *kalām* as well as earlier *falsafa*. His *Undressing of Religious Convictions* (*Tajrīd al-aqā'id*) would become a popular textbook of *kalām* even in Sunni *madrasa* education. His student al-ʿAllāma al-Ḥillī (d. 1325) revived the study of Muʿtazilite *kalām*, particularly the tradition of Abū l-Ḥusayn al-Baṣrī (Schmidtke 1991). Subsequently, 12er Shī'ite *kalām* was – and still is – open to influences from Ashʿarite and Muʿtazilite *kalām* as well as *falsafa* (Schmidtke 2000).

Among the three periods of *kalām*, this last one has attracted the least attention among researchers and many questions remain open. *Kalām*, however, was practiced throughout the centuries at intellectual centers such as the al-Azhar seminary in Cairo, and some of these works were used in the instruction. The literary activity of this late period focuses mainly on commentaries and supercommentaries to earlier works (Wisnovsky 2004). One of the last productive *mutakallim* of al-Azhar in Cairo was al-Bājūrī (d. 1860) who composed numerous commentaries to earlier works of *kalām*. Muḥammad ʿAbduh's (d. 1905) influential *Epistle on Divine Unity* (*Risālat al-Tawḥīd*) of 1897 is still written in the tradition of *kalām* although it no longer situates itself in the context of earlier works in that genre and implicitly argues from the background of the European Enlightenment. The rediscovery of many texts of Muʿtazilite *kalām* during the twentieth century led to renewed interest in *kalām* among Muslim scholars and to partial efforts of reappropriating Muʿtazilite doctrines (Hildebrandt 2007).

Khafri, Shams al-Din al-

Mathieu Terrier

LEM (UMR 8584), CNRS, PSL, Paris, France

Abstract

Shams al-Din al-Khafri (dated between 942/1535 and 946/1539) was one of the most prominent philosophers, mathematicians, and astronomers of his times. He completed his education in Shiraz in various religious and rational sciences under the philosopher and theologian Ṣadr al-Din al-Dashtakī (dated 903/1498), then spent the last part of his life in Kashan. As a jurisconsult (*mujtahid*), he seems to have played an important role in the instauration of Imāmi Shī‘ism as the religion state of Iran under the first Safavid Shāhs. The importance of his works in astronomy has been emphasized by George Saliba, however. In the field of philosophy, he took on from al-Dashtakī the heritage of both peripatetic and mystical – Ishraqī and Akbarian – traditions, but in contrast with his master, aimed to bring them together. In logics, he wrote two treatises dealing with the famous “Liar paradox.” In physics, he defended the Aristotelian conception of prime matter against the criticism of Suhrawardī. In metaphysics and theology, he composed five works attempting to prove the philosophical concept of “the necessary being” against the attacks of theologians and supported Ibn ‘Arabī’s doctrine of “unity of being.” He was particularly concerned by the problem of the nature of God’s knowledge, which he focused on in his philosophical commentary of the Qur’anic verse known as “the Verse of the Pedestal” (II, 255). By combining

all these influences in a personal endeavor, al-Khafri must be considered as a forerunner of the “Renaissance of Islamic philosophy” in the eleventh/seventeenth century.

Shams al-Din Muḥammad b. Aḥmad al-Khafri

(d. between 942/1535 and 946/1539), also known as al-Fāḍil, al-Muḥaqqiq, or al-‘Allāma al-Khafri, was a philosopher, mathematician, astronomer, and Shī‘i jurisconsult (*mujtahid*) of the second half of the eighth century and the first half of the ninth century of the Hegira. He was active in Iran under the reign of the two first Safavid Shāhs, Ismā‘īl (r. 906–930/1501–1524) and Tahmāsb (r. 930–984/1524–1576) (Shūshtarī 2014-15, vol. 2, p. 233; Idem, vol. 4, p. 568; Afandī 1981, vol. 7, p. 88). He witnessed thus major changes in the political, religious, and intellectual fields of the Eastern Islamic world, subsequent to the establishment of Shī‘ism as a religion state in Iran in 906/1501. In the field of mathematical astronomy, Khafri shall be considered one of the most competent scientists of medieval Islam (Saliba 2011, p. 341). In philosophy, he is rightly counted among the representatives of the philosophical School of Shiraz with Ṣadr al-Din Muḥammad al-Dashtakī (d. 903/1498), Jalāl al-Din al-Dawānī (d. 908/1502-03), and the son of the former Ghiyāth al-Din Maṣṣūr al-Dashtakī (d. 948/1541-42) (Nasr and Aminrazavi 2015, pp. 27–116). Moreover, his influence is sensible in the works of the two most prominent philosophers of the subsequent century and maybe of all the early modern philosophy in Islam, Mīr Dāmād (d. 1041/1631) and Mullā Ṣadrā Shīrāzī (d. 1050/1640-01).

His Life

As indicated by his *nisba*, Shams al-Din al-Khafri was probably born in Khafr, a little village in the outskirts of Shiraz, circa 885/1480 (Saliba 2011, p. 341). He completed his education in Shiraz in various religious and rational sciences such as logic, *fiqh*, *kalām*, and philosophy, under the philosopher and theologian Ṣadr al-Din Muḥammad

Dashtakī (Shūshtarī 2014-15, vol. 2, pp. 233–234; Idem, vol. 4, p. 568; Saatchian 2011, p. 20). We don't know any other of Khafri's masters, especially in the field of astronomy. The claim of 'Alī al-Dawānī that he had been the student of his father Jalāl al-Dīn al-Dawānī, a Sunni Ash'arī theologian and a philosopher rival to Dashtakī, does not gain any evidence (Naṣr and Aminrazavi 2015, pp. 114–116; Bdaiwi 2014, p. 74).

We don't know exactly at which date Khafri emigrated from Shiraz to Kashan, in central Iran, where he spent the last part of his life composing his works, teaching his thought, and delivering juridical advices (*fatwa*, pl. *fatāwā*). According to Ni'matullāh Jazā'irī (d. 1112/1700-01), he settled in Shiraz in 909/1503–04, at the venue of Shāh Ismā'īl in this city, and was already famous enough to be invited by him to profess publicly his allegiance to Shi'ism (Ja'fariyān 2009-10, vol. 2, p. 1140). He had already composed his *Muntahā al-idrāk fī madrak al-aflāk*, in the field of astronomy, completed in 901/1496, and perhaps his *Ibrat al-fuḍalā*, in the field of logic, in which he criticized Jalāl al-Dīn al-Dawānī when the latter was still alive. It should be *circa* 926/1519–20 that 'Alī al-Karakī (d. 940/1533–34), an eminent Shī'i scholar who migrated from Jabal 'Āmil (present South Lebanon) to Iran at the invitation of the Shāh, visited him in Kashan. Khafri had many students, among whom the most famous are his son Mullā Qawām al-Dīn Ḥusayn Khafri (n.d.), who led a career as an astronomer and philosopher, and Shāh Ṭāhir Raḍī al-Dīn Dakkanī (d. 952/1546), who played an important role in propagating Twelver Shī'i thought in India (Shūshtarī 2014-15, vol. 2, p. 235; Idem, vol. 4, pp. 571–572; Kākā'i 2008, pp. 61–65).

As regards Khafri's confessional affiliation, the reports are somewhat confusing. Some biographers say that he was initially a Sunni and converted to Shī'ism during the reign of Shāh Tahmāsb (Afandī 1981, vol. 7, p. 88), while according to other sources, he was already a Shī'i at the advent of Shāh Ismā'īl (Qazwīnī 1986, p. 64). According to a story reported by Nūrullāh Shūshtarī (d. 1019/1610) and Ni'matullāh Jazā'irī, two overtly Shī'i-oriented historians, when Shāh Ismā'īl ordered religious

scholars to curse the three first caliphs Abū Bakr, 'Umar, and 'Uthmān, whose legitimacy is denied by Shī'is, Khafri approved it and insulted the three caliphs in private too (Shūshtarī 2014-15, vol. 2, pp. 233– Idem, vol. 4, pp. 568–570; Qazwīnī 1986, p. 64; Al-Khwānsārī 1971, vol. 7, p. 196; Ja'fariyān 2009-10, vol. 2, pp. 1203, 1240). Qāsim Kākā'i suggests that Khafri dissimulated his Shī'i faith before the Safavid advent because of the high anti-Shī'i attitude of the population of Shiraz (Kākā'i 2008, p. 50). Shūshtarī also reports that in the beginning of the Safavid era – or during the interim period between Qara Qoyunlu and Safavid rule – when all Sunni jurists had fled from Kashan, the people of this city asked Khafri for juridical advice; because of his lack of juridical science and of the poor amount of Shī'i sources available to him, he did it according to the “sane reason” (*'aql-i salīm*); then, when 'Alī al-Karakī, in charge of the religious policy of the state, came in Kashan and examined Khafri's *fatāwā*, he found them tally with Imāmi religion and confirmed Khafri's position in Kashan (Shūshtarī 2014-15, vol. 2, pp. 233–234; Idem, vol. 4, pp. 568–70; Mudarris Tabrizī 1995, vol. 2, p. 154; Khwānsārī 1971, vol. 7, p. 196; Kākā'i 2008, pp. 50–51). It is also said that once Karakī became a real minister of religious affairs, he appointed Khafri as his chargé d'affaires when he went on pilgrimage (Mudarris Tabrizī 1995, vol. 2, p. 154).

However that may have been, the Shī'i affiliation of Khafri is obvious in some of his works. In *Ithbāt al-wājib*, he claimed that from God emanates the eternal light of Muḥammad al-Muṣṭafā, the Prophet, and 'Alī al-Murtaḍā, the first Imām (*al-nūr al-muṣṭafawī al-murtaḍawī*), identical to the “First Intellect” (*al-'aql al-awwal*) of the philosophers (Saatchian 2011, p. 23), and that the elite of the knowers are the Shī'i Imāms (Saatchian 2011, Arabic text, p. 29). He devoted his *Arba'īnīyāt* to the commentary of fourteen *ḥadīths* on the virtues of the “people of the Holy Prophetic Family” (*ahl al-bayt*) (Saatchian 2011, pp. 48–49).

As for the date of Khafri's death, the records are divergent. Some say he passed away in 935/1528 (Qazwīnī 1986, pp. 64–65; Hidāyat

1994, p. 209; Mudarris Tabrizi 1995, vol. 2, p. 154); others say in 942/1535 (Al-Ṭihrānī 1983, vol. 4, p. 331; Idem, vol. 7, p. 73) and others, or even the same authors, in 957/1550 (Al-Ṭihrānī 1983, vol. 4, p. 331; Idem, vol. 7, p. 73; Mudarris Tabrizi 1995, vol. 2, p. 154). Reporting the testimony of another scholar, Sayyid Jalāl Ṭihrānī attests that at the end of a copy of his *Muntahā al-idrāk fī madrak al-aflāk*, his death is given as the 28th Šafār 942/27th of August 1535. On the other hand, an expression found on a manuscript of Khafri's *Ithbāt al-wājib* indicates that he was not alive when the book was copied in 946/1539 (Kākā'i 2008, p. 51). Consequently, it can be assumed that he passed away between 942/1535 and 946/1539.

If Khafri seems to have played an important role in the instauration of Imāmi Shī'ism as the religion state of Iran, a process that was not achieved before the end of the Safavid period (end of the eleventh/seventeenth century, beginning of the twelfth/eighteenth century), his role was not of less importance in the emergence of the "philosophical Renaissance" in Safavid, Iran, especially in the eleventh/seventeenth century, with major thinkers such as Mīr Dāmād and Mullā Šadrā.

His Thought

Shams al-Dīn Khafri was an original and influent thinker in both fields of philosophy and theoretical astronomy. The importance of his works in the "science of the stars" (*'ilm al-nujūm*), as Khafri and his contemporaries were calling astronomy, has been rightly emphasized by George Saliba in his studies devoted to these works (Saliba 1997, 2000, 2004); however, his place in the history of Islamic philosophy remains poorly considered and recognized. He was one of the first thinkers of Safavid Iran to combine the sources of Avicennian philosophy, Suhrawardī's (d. 587/1191) "Illuminationist philosophy" (*ḥikmat al-ishrāq*), Ibn al-'Arabī's (d. 638/1240) theosophy, and the tradition of Shī'i esotericism. In both fields of astronomy and philosophy, he was concerned about studying and discussing the

systems of his forerunners, whether Greek masters or Islamic philosophers, to elaborate his own thought.

Shams al-Dīn Khafri was primarily a scientist, considered by Saliba "a genius in mathematical astronomy and a pioneering innovator with a profound insight into the nature of the science of astronomy itself" (Saliba 2011, p. 343). After such scholars as Naṣīr al-Dīn al-Ṭūsī (d. 672/1274) and Quṭb al-Dīn Shīrāzī (d. 710/1311), Khafri embarked "on the most important project of medieval times project, namely to try to bring some inner consistency to the Greek tradition [especially the Ptolemaic legacy], or, in case of failure, to overhaul that tradition all together, by creating an entirely new astronomy to replace it" (Saliba 2011, p. 342). In his own works, Khafri aimed to synthesize and to achieve the efforts of his forerunners. He began with a critical and innovative commentary upon Ṭūsī's *al-Tadhkira fī 'ilm al-hay'a* ("The Memento of Astronomy") and its traditional commentary by Sharīf Jurjānī (d. 815/1413), which he called *al-Takmila fī sharḥ al-tadhkira* ("The Completion of the Commentary on the Memento"), in which he states that the problems of the Ptolemaic model for the Moon and Mercury can be resolved in different ways (*wujūh*) – most of them invented by him – without introducing any of them as *the* correct one (Saliba 1997). Then he wrote a supercommentary upon two extensive commentaries on Ṭūsī's *Tadhkira* by Shīrāzī, *Nihāyat al-idrāk fī dirāyat al-aflāk* and *al-Tuḥfa al-Shāhiya*, which he called *Muntahā al-idrāk fī madrak al-aflāk* ("The Ultimate Comprehension in the Grasping of the Spheres") (Saliba 2000). Finally, Khafri composed an independent book in his own words, a short treatise entitled *Hall mā lā yanḥall* ("The Resolution of That Which Cannot Be Resolved"), especially devoted to theoretical astronomy. Having showed in his previous works that several mathematical models can represent the same observational data, he supports that mathematics is just like a language separable from the phenomena it attempts to describe (Saliba 2000; Idem 1997, p. 119).

Like other Islamic philosophers of the pre-modern and modern period, whether Peripatetics

or Ishrāqīs, Khafri was extremely competent in the field of logic. He wrote two treatises dealing with the famous “Liar paradox,” whose earliest form can be traced back to Epimenides of Crete (circa 600 BC) who is reputed to have said, “the Cretans are always liars.” The paradox of the liar became very popular in the Islamic world and was discussed by logicians, theologians, and philosophers, especially in later times by thinkers such as Athīr al-Dīn Abharī (d. c. 663/1265), Naṣīr al-Dīn al-Ṭūsī, Najm al-Dīn Kātibī (d. c. 657/1276), and the aforementioned philosophers of Shiraz (see Alwīshah and Sanson; Qaramaleki). Khafri’s first work on the subject is *Risāla ‘Ibrat al-fuḍalā’ fī ḥall shubha jidhr al-aṣamm* (or *fī ḥall shubha kull kalāmī kādhib*) (“Treatise on the Bewilderment of the Learned: The Liar’s Paradox”), in which he exposes and criticizes the solution proposed by Jalāl al-Dīn Dawānī (Al-Ṭihirānī 1983, vol. 15, p. 113). Then, in the more extensive *Ḥayrat al-fuḍalā’* (“The Perplexity of the Learned”), he proposed five solutions to the paradox, among them that of Ṣadr al-Dīn Dashtakī seems to be preferred by him (Pourjavady 2011, p. 84).

As a philosopher, Khafri could hardly be classified in a specific school of thought. To be sure, he made more than receive passively the teaching of his master Ṣadr al-Dīn Dashtakī. The latter was assuming the heritage of Peripatetic philosophy, in contrast with most of the contemporary Shī‘i theologians (*mutakallimūn*), by teaching the *Ishārāt wa tanbīhāt* of Avicenna and the *Tajrīd al-mantiq* of Naṣīr al-Dīn Ṭūsī; he also presented some mystical tendencies under the influence of Suhrawardī and Ibn ‘Arabī. However, he recommended a separation (*tafkīk*) between rational philosophy and spiritual gnosis (*‘irfān*), considered as two different modes of knowledge. As a result, he considered the doctrine of “unity of Being” (*waḥdat al-wujūd*), as elaborated by Ibn ‘Arabī and his disciples, to be indemonstrable, and the famous analogy of the sea and waves – the numerous waves being the manifestations of the same and unique sea – to have just a rhetorical value (Kākā’ī 2008, pp. 52–53). Khafri took on this double heritage of Peripatetic and mystic traditions but, in contrast with his master, aimed to

go beyond the separation by bringing together rationalist philosophy and spiritual gnosis. To give an example, he wrote a short treatise aiming to prove “the Necessary Being” (*wājib al-wujūd*) by both Peripatetic and Illuminationist methods (Saatchian 2011, pp. 35–36). In his *Marātib al-wujūd* (“The Hierarchy of Being”), he also took up the analogy of the sea and waves to ascertain the unity of Being through the multiplicity of its manifestations (*MW*).

Khafri composed five works attempting to prove the “Necessary Being” and to defend this concept against the attacks of theologians (edited in Saatchian 2003). Although he was committed to the Avicennian philosophical tradition, he aimed to elaborate an independent thought on this issue. He claimed that the “Necessary” or “Real Being” (*al-wujūd al-ḥaqīqī*), whose existence is necessary by essence, bestows existence, by the way of procession (*ṣudūr*) or emanation (*ḥayḍ*), onto all other beings which are possible by essence. Consequently, Being or Existence is unique for all the existents, which are separated from each other only in the external and apparent reality (*RI*, pp. 111–114). According to Kākā’ī, Khafri was also supporting the primacy of existence (*iṣālat al-wujūd*) over quiddity (*māhiyya*), the former being “real” or “true” (*ḥaqīqī*) when the latter is only “derived” (*muntazī*) from existence, a “point of view” (*i’tibār*) taken on it. It is on this “principality of existence” that Mullā Ṣadrā would eventually build his metaphysical system, one of the most creative and achieved of all the history of Islamic philosophy (Kākā’ī 2008, pp. 53–54). As a result, Kākā’ī argues, Khafri should be considered a major source of the thought of Mullā Ṣadrā (Kākā’ī 1996). Even the title of the latter’s masterpiece, *al-Ḥikma al-muta‘alliyā fī l-asfār al-‘aqliyya al-arba‘a* (“The Transcendental Philosophy. On the Four Intellectual Journeys”), could be borrowed from that of an epistle of Khafri beginning by these words, “the Gnostics have four journeys...” (*li-l-‘arīfīn arba‘a asfār*). The manuscript of this epistle, whose copy is conserved in the Central Library of the University of Tehran, is incidentally attributed to Mullā Ṣadrā (Kākā’ī 2008, pp. 55–56).

Khafri was not affiliated to any Sufi order and seems to have been an autodidact in the field of mysticism. About the “philosophy of illumination” of Suhrawardī, he adopted a selective attitude. Resuming the hierarchical structure of knowledge and knowers as defined by Suhrawardī in his introduction of *Ḥikmat al-ishrāq* (Suhrawardī 1999, p. 3; Bdaiwi 2014, 76), he distinguished between the “veiled philosophers” (*al-ḥukamā’ al-mahjūbūn*), who pretend to prove everything by logical demonstrations (*barāhīn*), the “people of the spiritual unveiling” (*ahl al-kashf*), and “the self-divinized philosophers” (*al-ḥukamā’ al-muta’allihīn*), who combine demonstration and mystical experience (*IWW*, pp. 86, 93–94). He also borrowed from Suhrawardī the concept of “dominating lights” (*anwār qāhira*) that he identified to the “angels of proximity” (*al-malā’ika al-muqarrībūn*) (*TAK*, p. 274). However, he adopted a much more skeptical attitude toward the “*mundus imaginalis*” (*‘ālam al-mithāl*), the intermediary world between the corporal and the spiritual ones. After distinguishing between the obscure “images and apparitions” (*muthul wa ashbāh*) produced by the inferior faculty of imagination and the “luminous icons” (*al-muthul al-nūrāniyya*) of the immaterial world, i.e., the “Platonic forms” (*al-muthul al-aflāṭūniyya*) (Khafri, *IWW*, pp. 55–56), he denied to the “*mundus imaginalis*” (*‘ālam al-mithāl*) any kind of substantiality (*TAK*, p. 276).

Undoubtedly, the school of Ibn ‘Arabī had a more decisive influence on Khafri’s thought than any other, especially with the doctrine of “unity of Being,” one of the most discussed doctrine of all medieval Islam. According to Mullā Ṣadrā, Khafri was one of the philosophers having adopted this doctrine, like Naṣīr al-Dīn al-Ṭūsī and Ibn Abī Jumhūr (d. after 904/1499). He would have supported that things, in the intelligible world, exist by the unique real existence (*al-wujūd al-ḥaqīqī*) which is the essence of the Creator itself and that existence is subject to division and change only when in relation with sensible perception (Mullā Ṣadrā 1996–97, p. 457). He would also have argued that existence has an individual essential reality (*ḥaqīqa shakṣiyya*), free of any

multiplication, subsisting by its own essence, and that everything depends on it, whether by unification, like the Necessary Being, or by relation, like the possible being (*ibid.*, p. 461). This idea leads to the concept of “hierarchical structure of existence” (*marātib al-wujūd*), in the terms of Khafri, or what Mullā Ṣadrā would eventually call the “gradation of being” (*tashkīk al-wujūd*).

Khafri was particularly concerned by the problem of the nature of God’s knowledge. This issue, which undoubtedly proceeded from Plato’s *Timaeus* in the Arabic tradition (Arzen 2012), can be expressed as follows. Did God create things following preexistent forms or without any preconception in His knowledge? The thesis makes run the risk of introducing plurality within the essence of God, since knowledge is an essential attribute of God (*ṣifa dhātiyya*), while the alternate view seems to result in admitting that God created what He had no knowledge of. Muslim philosophers such as al-Fārābī (d. 339/950) and Avicenna were supporting the former position, speaking about “inscribed forms” (*ṣuwar murtasima*) in the Divine Knowledge, or “divine Forms” (*ṣuwar ilāhiyya*) (Al-Fārābī 1999, pp. 146–147). Khafri, in his *Risāla ithbāt wājib al-wujūd* (“On the Demonstration of the Necessary Being”), scrutinized critically the positions claimed on this issue by ancient Greeks such as Thales, Anaximenes, Empedocles, and Plato, following the accounts of Shahrastānī’s *Kitāb al-milal wa l-niḥal* (“The Book of Religions and Sects”), like those of al-Fārābī, Avicenna, and Suhrawardī, in order to develop his own argumentation (Khafri, *IWW*, pp. 36–100). He particularly aimed to refute the doctrine of the “divine Forms,” whose origin he found in the teaching of Anaximenes of Milo (*Anaximēnēs*), as reported by Shahrastānī: “The form of every innovated being (*mubda’*), before its manifestation in the limit of its innovation, is already present in the Knowledge of its Innovator, the First One; and the forms that are within Him are in infinite number. If we say that God created what was in His Knowledge, it results that the form is eternal by His eternity, but neither His Essence becomes plural because of their plurality, nor it changes due to their change” (Khafri, *IWW*, pp. 38–39;

Shahraṣṭānī 1955, vol. 2, p. 71; French transl., vol. 2, p. 189; the primary source of this saying is the Neoplatonic Pseudo-Ammonios: Rudolph 1989, p. 36). Khafri objects that if it were the case, God would not have a perfect and essential knowledge (*‘ilm kamālī dhātī*) because His knowledge would follow the effusion (*fayḍān*) of these forms. This argumentation is reported, and most of its conclusions are shared, by Mullā Ṣadrā in several of his works (Mullā Ṣadrā 1981, vol. 6, pp. 221–227, 232; Idem 2014, vol. 2, pp. 205–206).

Contrary to the view of the Peripatetics, Khafri asserted that God, the Necessary Being, has a synthetic (*ijmālī*) knowledge which is the very knowledge of His Essence, identical to it, and an essential perfection (*kamāl dhātī*). In this sense, God’s knowledge of the proceeding being pre-dates the existence of the latter, and God’s knowledge of all proceeding being is verified within the Divine Essence itself. “His Essence, be He exalted, is a synthetic knowledge of all things emanating from His Essence” (Khafri, *RI*, pp. 128–129; Idem, *TAK*, pp. 283–284). God has also an analytic knowledge (*tafṣīlī*) which is the very procession (*ṣudūr*) of all beings, His detailed disclosure of all things by giving existence to them (Khafri, *RI*, p. 130; Idem, *TAK*, p. 284). Khafri also argued that God’s knowledge of all existents, whether sensible or intelligible, is a knowledge by presence (*ḥuḍūrī*), identical to the act of giving existence to them (*ījād*) (Khafri, *IWW*, p. 57). All these positions would eventually have a strong echo in the thought of Mīr Dāmād, the first master of Mullā Ṣadrā, in his *Taqwīm al-īmān* (“The Strengthening of the Faith”) (Mīr Dāmād 2003, pp. 368–369). Therefore, it appears that Khafri played a decisive role, rarely noticed until now, in the formation of the thought of the two most prominent philosophers of the eleventh-/seventeenth-century Iran.

As regards the principles of physics, Khafri defended the Aristotelian conception of prime matter (*hayūlā*, Arabic transcription of Greek ὕλη) against the criticism of Suhrawardī, explaining the view of Ibn Sīnā upon the form of corporality as stipulated in the *Shifā’* and offering a number of proofs of his own. He considered

prime matter to be an individual entity on which forms and figures may appear continually: “The prime matter of all the elements is a single entity to which no plurality attaches. It acquires unity by virtue of its continuous existence on the two states of conjunction and separation (. . .) It is multiplied accidentally by virtue of the plurality of forms. Prime matter is then an individual entity in itself, and an ambiguous entity by virtue of the forms” (*TH*, Engl. transl. in Nasr and Aminrazavi 2015, p. 113). This position would be eventually rejected by Mullā Ṣadrā, who asserts in his *Asfār* that contrarily to Khafri’s claim, the existence of matter does not precede the existence of forms but, quite the reverse, is subsequent to it; as a result, matter cannot possess more unity than form does (Mullā Ṣadrā 1981, vol. 2, p. 223). Khafri also wrote a short note refuting the indivisible particle, i.e., atomism (*Naḥī al-juz’ [alladhī lā yatajazza’]*), also known and mentioned by Ṣadrā (Mullā Ṣadrā 1981, vol. 5, p. 34; Ḥā’irī 1968, vol. 22, p. 187; Saatchian 2011, pp. 39–40). These positions on matter and corporality are tally with Khafri’s position upon unity of existence, as seen before. As a scientist and a philosopher, he seems having tried to build a holistic system in which the whole reality, whether physical or metaphysical, would be explained (Pourjavady 2011, p. 40).

Khafri shall also be counted among the Shī‘ī philosophers who, following the example of Sayyid Ḥaydar Āmulī (d. after 787/1385–86), appropriated the practice of Qur’anic esoteric interpretation (*ta’wīl*). It is worth reminding that in early Shī‘ism, the authority to interpret the Qur’an is a privilege exclusive to the impeccable Imāms. The works of Khafri in this field are much more modest than those of Āmulī, as well as those, equally monumental, of Mullā Ṣadrā; however, his *Tafṣīr āyat al-kursī* (“Commentary of the ‘Verse of the Pedestal’ [II, 255]”) offers an outstanding example of Qur’anic philosophical exegesis. This verse says, “God there is no god but He, the Living, the Everlasting. Slumber seizes Him not, neither sleep; to Him belongs all that is in the heavens and the earth. Who is there that shall intercede with Him save by His leave? He knows what lies before them and what is after

them, and they comprehend not anything of His knowledge save such as He wills. His Throne comprises the heavens and earth; the preserving of them oppresses Him not; He is the All-high, the All-glorious" (transl. Arberry). According to a saying of Prophet Muḥammad, this verse comprehends "the mothers of the metaphysical questions" (*ummahāt al-masā'il al-ilāhiyya*) (TAK, p. 290). As prolegomena to his commentary, Khafri summarized his cosmological, metaphysical, and theological views, revealing mixed Avicennian, Ishrāqī, and Akbarian influences (TAK, pp. 270–284).

Khafri divided the system of being in four words: the world of Kingdom (*al-mulk*), i.e., the sensible world; the upper Angelic World (*al-malakūt al-a'lā*), that of the Intellects; the lower Angelic World (*al-malakūt al-adnā*), that of the Souls; and the *mundus imaginalis* (*'ālam al-mithāl*), whose substantiality is uncertain. Except for the latter, this division corresponds to Plotinus' hierarchy of realities: at the top is the One, identified to God the Creator, then comes the Intellect (*νοῦς*, *'aql*), then the Soul (*ψυχή*, *nafs*), and then finally Nature, the world of matter (TAK, pp. 270–272). Khafri accepted Avicenna's system of ten celestial spheres attached to ten souls and ten intellects, the tenth of them, i.e., the instrument of bringing into existence the world of generation and corruption, being identified to the Holy Spirit and Angel Gabriel. He also borrowed from Avicenna the conception of the immaterial souls dominating bodies, whether celestial or human. All souls have perceptions and will. The souls of the spheres are in love with the perfections of the Intellects which effused them and try to be at their semblance. The human rational soul has got two perfections, moral and theoretic. Its moral perfection is justice, i.e. the convenient balance between the appetitive, spirited and directive (rational) faculties of soul, according to Plato's tripartite division. Its theoretical perfection consists in becoming an intelligible world where the forms of all the existents, whether spiritual or material, are reflected, as mentioned by Avicenna in the last part of *The Metaphysics of the Shifā'* (TAK, p. 276; Ibn Sīnā 1960, p. 425).

In his commentary of the verse II, 255, Khafri identified certain Qur'anic images, namely the Throne (*'irsh*), the Pen (*qalam*), and the Tablet (*lawh*), to the respective philosophical concepts of God's synthetic and analytic knowledge, First Intellect, and prime matter. Within the verse, he distinguished four kinds of divine attributes: the attributes of Essential Reality (*ḥaqīqiyya*), some of them being subjects to relation and others not; and the attributes which are not of Essential Reality, whether negative (*salbiyya*) or relative (*idāfiyya*) (TAK, pp. 286–297).

As witnessed in this commentary, Khafri was sharing with many Shī'i thinkers of the previous and following centuries, such as Sayyid Ḥaydar Āmulī, Ḥāfiẓ Rajab Bursī (d. after 813/1410–11) (see the relevant entries), and Mīr Dāmād (d. 1040/1631), a predilection for *gematria*, or what they called "the science of numbers and [Arabic] letters" (*'ilm al-a'dād wa-l-ḥurūf*). This trend, originated in Shī'i early esotericism, gained its philosophical respectability with a short epistle ascribed to Avicenna, *al-Risālat al-nayrūziyya*, which joints summarily the classical Neoplatonic hierarchy to the alphanumeric system (Ibn Sīnā 1999; Massignon 1952). Khafri made him this "philosophical alphabet", mapping each letter and number to a level of reality or an ontological relation: first, the Necessary Being (*ālīf* = 1); then intellects (*bā'* = 2); then souls (*jīm* = 3); then natures (*dāl* = 4), each of them being considered in itself (from 1 to 4); then in relation to the lower stage (from 5 to 8 = *hā'*, *wāw*, *zā'*, *ḥā'*); and then finally the material things (*ṭā'* = 9), which is the lowest stage of the hierarchy of realities. In the favor of these speculations, Khafri also proposes an original etymology of the Supreme Name *Allāh*, as it opens the "Verse of the Pedestal," in a way that reminds Ibn 'Arabī's theosophy (TAK, p. 277). Mīr Dāmād would eventually take on this development in two works devoted to Shī'i esoteric topics (Mīr Dāmād 1995, p. 84; 2001, pp. 124–125). Khafri's interest toward "occult sciences" (*'ulūm gharība*) was not limited to *gematria*, as indicated by his quotation of many Imāmi traditions upon the magic efficacy of the "Verse of the Pedestal" (TAK, pp. 289–290).

Additionally, he composed two works on geomancy (*raml*) (Saatchian 2011, p. 53).

Khafri also disclosed his mystical background while interpreting the pericope, “His Pedestal (*kursī*) comprises the heavens and earth.” He asserted that “the Pedestal is the substrate of the Knowledge, which is the heart (*qalb*),” an idea that would be resumed by both Mīr Dāmād and Mullā Ṣadrā. He wrote that “the Pedestal is similar to the heart as the substrate of the self-disclosure (*tajallī*) of God, the Truth, as long as nothing can be distinguished from Him, but everything vanishes (*yatalāshā*) in His manifestation. Since nothing exists except by His Existence, and nothing is distinguished from Him.” Furthermore, while proceeding to the esoteric commentary (*ta’wīl*) of the verse, Khafri quoted two famous mystical figures, referring to them familiarly: “Al-Ḥasan [al-Baṣrī] said, ‘the Pedestal is God’s Throne’, according to the saying of the Prophet, ‘The heart of the believer is the Throne of God’ (*qalb al-mu’min ‘irsh Allāh*). And Ṭayfūr [Abū Yazīd al-Baṣāmī] said: ‘Shall the whole world occupy one of the corners of the heart of the Gnostic (*al-‘ārīf*) for thousand times, he would even not feel it’, in virtue of his knowledge of God, the Truth, and of the vanishing of all things in Him” (*TAK*, p. 288). According to his claim that God, the Necessary Being, is the principle of emanation of human knowledge (*IWW*, p. 28), this pericope means that the substrate of this emanation is the heart, i.e., the organ of spiritual unveiling. This statement clearly suggests a Gnostic, rather than intellectualist, meaning of philosophy.

In conclusion, Shams al-Dīn al-Khafri was not only a brilliant scientist and a philosopher of science but also a metaphysician and a theologian combining rationalistic and mystical approaches of different issues. By combining Avicennian tradition, its Ishraqī criticism, and the Akbarian doctrine of “Unity of Being,” he had a major influence on the thought of Mīr Dāmād and Mullā Ṣadrā, the two prominent figures of the “Renaissance of Islamic philosophy” in the eleventh/seventeenth century. Further studies could show to what extent Khafri’s speculations on metaphysics are fit with his epistemological conceptions as expressed in

the field of astronomy. In this respect, his thought remains a subject of investigation for a broadest approach of the early modern philosophy in Islam.

Bibliography

Edited Works of Shams al-Dīn al-Khafri

For a complete list of his writings, published and unpublished, see Saatchian 2011, pp. 25–59.

I. On Logic

Risāla ‘Ibrat al-fuḍalā’ fī ḥall shubha jidhr al-aṣamm (or *fī ḥall shubha kullu kalāmī kādhīb*), ed. A. F. Qarāmalikī, *Khīrad-Nāmah-yi Ṣadrā* 1/4 (Tehran, 1375 Sh./1996), pp. 86–89; reprinted in *Dawāzda risāla dar pārāduks-i durūghū*, ed. F. Qarāmalikī and T. ‘Ārif Niyā, Tehran, 1386 Sh./2007, pp. 265–269; Engl. transl. M. Fakhri, *Treatise on the Bewilderment of the Learned: The Liar’s Paradox*, in Nasr and Aminrazavi 2015, pp. 114–116.

Hayrat al-fuḍalā’, ed. A. F. Qarāmalikī, *Dawāzda risāla dar pārāduks-i durūghū*, pp. 271–309.

II. On Philosophy and Kalām

Risāla fī ithbāt wājib al-wujūd bi-l-dhāt wa ṣifātihi (abr: *IWW*), ed. F. Saatchian in Saatchian 2011, Arabic text, pp. 12–108; also in Khafri, Shams al-Dīn Muḥammad, *Sitt Rasā’il fī ithbāt wājib al-wujūd bi ‘l-dhāt wa fī l-ilāhiyyāt*, ed. F. Saatchian, Tehran, 2012.

Risāla fī marātib al-wujūd, ed. R. Pourjavady, in *Dard-i falsafa, dars-i falsafa (Jashn-nāma-yi ustād-Dr. Karīm-i Mujaḥidī)*, hrsg. M. Ra’īszāda, B. ‘Abbāsi, M. Manṣūr-i Hāshimī, Tehran, 1384 Sh./2005.

Ta’līq ‘alā ilāhiyyāt Sharḥ Tajrīd Mullā ‘Alī Qūshchī, ed. F. Sa’atshiyān, Tehran, 1382 Sh./2003.

Risāla fī l-ilāhiyyāt, ed. F. Saatchian in Saatchian 2011, Arabic text, pp. 109–142.

Khojazāda

Veysel Kaya

Department of Islamic Philosophy, İstanbul
Üniversitesi, İstanbul, Turkey

Abstract

Khojazāda is a prominent Ottoman theologian who lived in the fifteenth century in Anatolia. He is best known for his work titled “Incoherence of the Philosophers,” which was written in the footsteps of Ghazālī to refute the theological stances of the philosophers. Not only he is the exemplar of the traditional Islamic sciences in his age, due to his accepted prominence among the official statesmen including the sultan, he arguably represents the attitude of the Ottoman State towards the nonreligious sciences in general.

Life and Theological Teachings

Khojazāda, Musliḥuddīn Mustafā b. Yūsuf in his full name, was born in Bursa *circa* 1434. His famous name Khojazāda (literally means “the son of a *khoja*”) came from his father's occupation who was a wealthy merchant, because such merchants

were given the epithet “*khoja*” (master) in the Ottoman community at that time. Khojazāda's education in his early years was not easy, because his father did not want him to be a member of the Ottoman scholars (*ulamā*) and thus did not support his scientific endeavor. However, Khojazāda sought to complete his education in the basic Islamic sciences (language and jurisprudence) throughout Anatolia. He first became a student of Molla Mehmed Efendi (famously known by the nickname “Ayaslug Celebisi”) in Isparta. When he turned back to Bursa, he entered under the service of Molla Hizir Bey (d. 1459) in Sultaniye Madrasah in Bursa. After he completed his education, Khojazāda was introduced by Hizir Bey to Sultan Murat II, in order to serve as a *mudarris* (lecturer) in Esiye Madrasah in Bursa. As his scholarly erudition on Islamic sciences developed along with this official occupation, he was then introduced to Mehmed II (the conqueror of Constantinople), this time by the vizier Mahmut Pasha. This led Khojazāda to participate in scholarly discussions that took place in the Ottoman palace, and contribute to his fame among the Ottoman elite and statesmen. Finally, he was granted the title “*Mu'allim-i Sultānī*” (the lecturer of the sultan), one of the most important bureaucratic positions in the Ottoman State. Although Khojazāda's relationship with the sultan attracted uneasiness among other scholars who sought certain political agenda and caused him to be suspended from some positions afterwards, he successfully regained Mehmed II's respect in the following years. Khojazāda died in Bursa in 1488, while he was busy with working on his commentary on al-Jurjānī's *Sharḥ al-Mawāḳif*, a work which was a cornerstone of the Ottoman madrasah curriculum.

Khojazāda's scientific production covers many areas in Islamic disciplines, mainly in philosophy, theology, and Arabic linguistics; however, he is best known for his work *Tahāfut al-Falāsifa*, i.e., *Incoherence of the Philosophers*. This work is written as an evaluation of Ghazālī's famous *Tahāfut al-Falāsifa*. Khojazāda wrote this treatise because he and his contemporary colleague Alāuddīn al-Tūsī were commissioned by Mehmed the Conqueror to comment on Ghazālī's refutations of the philosophers and judge whether

Ghazālī was right in accusing the Muslim philosophers al-Fārābī and Avicenna of unbelief (*kufṛ*). In fact, we learn from the bibliographies of Ottoman scholars that Khojazāda studied canonical philosophical works such as Avicenna's *al-Shifā'*, in order to lay out his own theological argumentations (*iḥtijāj*) (Tashkoprižādā, p. 89).

In the *Tahāfut*, Khojazāda mostly follows Ghazālī's general approach to the views of philosophers: philosophers are among those who opposed the religious doctrines of the divinely guided prophets. Their success in establishing the sound proofs in certain sciences, such as geometry and logic, does not give them the right to claim so in the field of physics and especially metaphysics. In fact, most of their claims in metaphysics and theology are liable to be rebutted on rational grounds. Thus, they must be rejected in their views by which they oppose the established religious doctrines. Although Khojazāda, with these statements, concurs with Ghazālī in his basic attack to philosophers, he differs in some significant details. First and foremost, he did not end his book with a concluding section, like his predecessor did, in which he juristically labeled the philosophers as unbelievers (*kuffār*). This attitude of Khojazāda shows that he saw the refutation of philosophers as a theoretical issue, not a judicial one. Khojazāda's stance was later supported by subsequent Ottoman scholars such as Kamalshazāda, who contended that there is no need to expel philosophers from the borders of Islam, just because their ideas contradict the theological argumentations supported by early theologians. This tolerant attitude towards philosophy was arguably coming from the great authority Fakhr al-Dīn al-Rāzī, who himself sought to accommodate the philosophical argumentations in classical Islamic theology.

Khojazāda's attitude on Ghazālī's criticisms towards philosophers is best to be seen in his discussions of the eternity of the world, the most important subject in the *Tahāfut* genre, an issue which had caused heated debates and even accusations of disbelief between Muslim theologians and philosophers. Khojazāda holds that Ghazālī

was right when he contended that the logical terms "necessity," "contingency," and "impossibility" are solely mental concepts; thus, philosophers were wrong since they treated these terms as ontological entities. Khojazāda also supports Ghazālī on his views on the concept of "time" (*zamān*): time is an imaginary (*mawhūm*) thing and cannot be defined as the number of motions of the celestial spheres, as Aristoteles and his followers explained. On the other hand, Khojazāda criticized Ghazālī in some important aspects of the eternity issue. Ghazālī, according to Khojazāda, was in error when he stated that the idea of the eternal world must certainly be accepted in order to establish God as a creator. Khojazāda holds that were the world as eternal in time as God, this would not mean that it is free from the creating agency of God, because God is still the unique creator of something eternal. To put it more simply, God and the world can coexist eternally, without compromising God's creating power. This idea of Khojazāda was a huge step in the Ottoman philosophy, since it gave the way for later theologians to seek common grounds with the philosophical tradition, along with their established orthodoxy.

al-Kindī, Abū Yūsuf Ya‘qūb ibn Ishāq

Peter Adamson

Philosophy Department, LMU Munich, Munich, Germany

Abstract

Al-Kindī (c. 800–870) was the first figure in the Arabic philosophical tradition to make explicit and extensive use of Greek ideas. He is thus often described as the first philosopher of this tradition. He also oversaw the work of translators who rendered works by Aristotle, Plotinus, Proclus, and others into Arabic. His own writings, usually in the form of epistles to patrons, range widely over the topics of Greek philosophy and science. His fusion of Aristotelianism with Neoplatonism was intended to be congenial to Islam, and this approach influenced several other authors of the early Arabic philosophical tradition.

Abū Yūsuf Ya‘qūb ibn Ishāq al-Kindī was probably born around 800 into an important family: his father was the governor of Kūfa in Iraq, and al-Kindī could trace his lineage back to a companion of the Prophet. To highlight his origins in the tribe of Kinda, and perhaps the failure of the Arabs to produce other prominent philosophers, he was later given the sobriquet “philosopher of the Arabs.” He himself was a highly placed intellectual, serving as tutor to the son of the Caliph al-Mu‘taṣim (who reigned from 833–842). We know that he died after 866, the date of an event mentioned in one of his astrological works; his death date is usually put at around 870–873.

Al-Kindī’s association with the caliphal family is connected to his important role in the translation movement (for which see Gutas 1998; Endress 1987/1992). He was apparently not himself a translator but coordinated and revised the work of a translation circle whose members seem to

have been mostly Christians of Syrian extraction. This so-called Kindī circle (see Endress 1997) produced Arabic versions of Aristotle (for instance, the first translation of the *Metaphysics*) and, famously, Plotinus and Proclus. A redaction of their version of Plotinus came to be known as the *Theology of Aristotle*, the most important source for Neoplatonic ideas in the Arabic-speaking world (see Adamson 2002b). Their version of Proclus (on which see Endress 1973) would be influential in the Latin world, in a version later called the *Book of Causes* (*Liber de causis*: see D’Ancona 1995).

This circle of translators seems to have produced two kinds of translations: painfully literal ones and remarkably free paraphrase versions. Of the literal type, the most significant is their version of Aristotle’s *Metaphysics*, ascribed to one Uṣṭāth and preserved in the lemmata of Averroes’ *Long Commentary* for some books of the *Metaphysics*. The paraphrase translations, which include their Arabic renderings of Plotinus and Proclus, revise and rework the philosophical content of the texts and also reorder the texts, though the extent to which the reordering was done already in Kindī’s circle is a matter of controversy. Part of the point of the reworking was to make these works seem useful for a contemporary audience. Most obviously, the Neoplatonic First Principle is assimilated to a Creator God.

The same motivation guides many of al-Kindī’s own philosophical works, which are edited in Abū Rīda (1950, 1953) (see also Rashed and Jolivet 1998) and translated in Adamson and Pormann (2012). These philosophical treatises, usually written as epistles to the caliphal family and other patrons or colleagues, constitute a sizeable corpus, especially if they are taken together with extant works on a range of scientific topics. (Particularly well represented are astrology, optics, mathematics, meteorology, medicine, and music.) But much of his prodigious output is lost. We have a list of his works in the *Fihrist* of the tenth-century bookseller Ibn al-Nadīm. Like the extant corpus, this list indicates that al-Kindī worked in an astonishing variety of fields, ranging

from metaphysics to the production of perfume and swords. This eclecticism is in itself a sign of al-Kindī's desire to satisfy the needs of his cultivated audience (see Rosenthal 1942).

The most famous of al-Kindī's more narrowly "philosophical" works is *On First Philosophy* (translated in Ivry 1974 and Rashed and Jolivet 1998), which draws extensively on Aristotle, especially the *Metaphysics*, but also weaves in themes from Neoplatonic texts and borrows arguments from John Philoponus. *On First Philosophy* is only partially preserved: we possess the "first part," which is divided into four sections. Al-Kindī's best-known philosophical ideas are contained in this work.

In Section 1, al-Kindī mounts a spirited defense of the utility and acceptability of using ideas drawn from the Greek tradition and criticizes detractors of "foreign" philosophy. It is unclear who these detractors might be, though Ivry (1974) speculates that they were contemporary theologians, such as those collectively described as "Mu'tazilite." Adamson (2007a, p. 25) suggests that the opponents are more likely to be traditionalists who took a literalist attitude toward scriptural descriptions of God. One reason to think this is that al-Kindī's patrons in the caliphal court supported the Mu'tazilites in their argument against the traditionalists over the question of the eternity of the Qur'ān (see further Adamson 2003).

That debate may be somehow related to the topic of Section 2, where al-Kindī argues at length that the created world is not eternal. Here al-Kindī uses and reworks arguments drawn from John Philoponus' attack on Aristotle (see Davidson 1969). The thrust of these arguments is that if the cosmos were eternal *a parte ante* (i.e., if it has existed for an infinite time), then this would make the cosmos an "actual infinity," analogous to an infinitely large body. Al-Kindī thus argues, for instance, that if the cosmos is finite in magnitude, it cannot have an infinite quantity predicated of it. But time is a quantity, so only a finite amount of time can be predicated of the cosmos. Now Aristotle too regarded the actual infinite as impossible. He held, however, that an eternity of time would constitute only a potential infinity (the sort

of infinity involved in counting up through the integers: the process is indefinite but never actually reaches an infinite number). Thus, al-Kindī, following Philoponus, disagrees with Aristotle primarily in that he believes an *ex parte ante* eternal cosmos would constitute an actual, rather than potential, infinity.

In Sections 3 and 4, al-Kindī gives a complex argument for a "true One" who is the cause of unity in all other things. As is made explicit at the close of the extant text, this true One is the God of Islam. Al-Kindī also argues that this true One transcends characterization by the *maqūlāt*, that is, things that can be said. These terms include the predicables from Porphyry's *Isagoge* and also part, whole, relation, motion, and soul. Finally, the true One is higher than the intellect: this is a departure from Aristotle but agrees with Plotinus. The reason given for denying all these terms to God is that they imply both multiplicity and unity. Indeed, the argument for God's existence given in Section 3 is based on the claim that all created things are characterized by both unity and multiplicity. Al-Kindī then argues that some cause is required to explain this association of unity and multiplicity. The cause must be entirely one and not many at all, so that it is outside the set of things that are both one and many.

Al-Kindī also expresses this idea by saying that while God is "essentially" one, that is, one but not at all many, other things are "metaphorically" one, that is, both one and many. A similar idea is found in a very short, perhaps fragmentary text called *On the True Agent*. Here the point is that only God is truly an Agent, because other things are acted upon, even if they also act. Al-Kindī thus describes God's first effect as an intermediary for God's creative action. This too may be an inheritance from the Neoplatonic translations produced in his circle.

On the other hand, in works on cosmology, al-Kindī presents not a Plotinian intellect but the heavenly bodies, as the chief instrument by which God indirectly brings about a providentially ordered cosmos. Al-Kindī follows the Aristotelian tradition in seeing the world below the sphere of the moon as consisting of the four elements, air, earth, fire, and water. The heavenly bodies, by

contrast, are made of an indestructible fifth element. Al-Kindī devotes an epistle to arguing for this claim, apparently unconcerned or unaware that it was a key part of Aristotle's arguments for the eternity of the world, and was attacked by Philoponus in his *Against Aristotle*. He does, however, add the caveat that the heavens exist without being generated or destroyed, but only for as long as their Creator ordains.

Because heavenly motion brings about the mixture of the four sublunary elements, it is the heavens that are directly responsible for the well-ordered world we live in. As al-Kindī puts it, they are the "proximate cause of generation and corruption," while God is the remote cause, exercising His providence by commanding the heavens to move in the appropriate way. Though al-Kindī draws these ideas from Aristotle and his commentator Alexander of Aphrodisias, he extends the theory in several ways. For example, he uses the theory to interpret a verse from the Qurʾān which states that even the stars "prostrate" themselves before God. Al-Kindī also discusses in detail how the cosmological theory can work in practice, arguing for the effects of heavenly motions on weather and the tides. His extensive work in astrology presupposes the cosmology described in his more Aristotelian epistles. The same theory is used by his associate, the great astrologer Abū Maʿshar (see further Adamson 2002a, 2007a, chap. 8).

By contrast, al-Kindī is not clear on how God's creative activity relates to immaterial things, notably the human soul. He does describe the soul as a "light from the light of the Creator" in a doxographical work, the *Discourse on the Soul*. But the emphasis in this and other works of psychology is usually on the immateriality of the soul and its essentially intellective nature. In one short epistle, for example, he uses ideas from Aristotle's *Categories* to prove that the soul is immaterial. The argument turns on an identification between soul as the form of the body and the form that is the species of mankind. Since, in general, species are immaterial substances (this follows Aristotle in the *Categories*, though al-Kindī omits the point that species are only "secondary" substances), the soul too will be an immaterial substance.

In the more famous *Letter on the Intellect*, a forerunner of works on the intellect by al-Fārābī, Avicenna, and others, al-Kindī classifies intellect ('*aql*) into four types: "first," potential, actual, and acquired. The "first" intellect is separated from human soul and is apparently to be identified with the maker intellect of Aristotle, *De Anima* III.5 (we know from *On First Philosophy* that this is not to be identified with God). The other three are aspects or states of the human intellect. Humans think by taking on an intellectual form which is seated in the first intellect. Before they do this, they have a merely potential intellect. Actual intellect refers to the human intellect when it is actually grasping such an intellectual form. For al-Kindī the term "acquired intellect" means simply the intellectual forms which one has already learned and can then think about at will – like a storehouse of intelligibles within the soul. This is in contrast with al-Fārābī's use of the term to mean the full attainment of all the intelligibles.

A puzzle about al-Kindī's epistemology is how this theory of intellect relates to his acceptance of the Platonic theory of recollection, which he discusses in a short epistle (see Endress 1994). More generally there is an unclarity about the role of sense experience in al-Kindī's epistemology. It usually seems that for him there is a strong divide between the intelligible and sensible realms and that the human soul properly belongs on the intelligible side. This picture is basically confirmed, though with greater nuance, in texts dealing with faculties between intellection and sensation. The most important of these is a work on prophetic dreams, based closely on the *Parva Naturalia*. Al-Kindī here makes dreams a product of the imaginative faculty and discusses the interaction of this faculty with the body. But significantly, and unlike Avicenna, for instance, he argues that the imagination does not use the brain or indeed any organ directly. Instead, it belongs to the immaterial soul. It is able to receive signs about the future precisely because it is ontologically closer to intellect than to the body. Despite these differences from Avicenna, he does anticipate the latter's theory of the internal senses, but only in a classification found in a work on music (Adamson 2007a, p. 142).

Music is one area where al-Kindī deploys his expertise in mathematics. This is unsurprising since music was considered part of the mathematical curriculum already in antiquity. More distinctive is his use of mathematical methods of argument in purely philosophical contexts; on this see Gutas 2004. Aside from methodology, one might think of the Pythagorean flavor of his portrayal of God as a pure One (though he is careful to contrast God to the one that generates number). Al-Kindī also uses mathematics in discussing cosmology, for instance, to demonstrate that the cosmos consists of concentric spheres (the heavens and elements), and in explaining why the ancients associated the heavens and elements with the Platonic solids. This latter point is clearly indebted to the *Timaeus*, though the means of influence is unclear. We do know that one Pythagorean work on mathematics was known to and used by al-Kindī, namely, Nicomachus of Gerasa's *Introduction to Arithmetic*.

He also brings his mathematical sensibilities to bear on medicine, in an influential work on calculating the effects of compound drugs (translated into Latin as *De Gradibus*). He applies geometry to problems of optics, in this following the tradition of mathematical optics already explored by Euclid and Ptolemy. His theory of light is an important precursor of the visual theory of Ibn al-Haytham (d. 1040). The success of geometry in optics may have encouraged him to extend a theory of "rays" to deal with a broad array of physical phenomena. We find such a theory on *De radiis*, a work preserved only in Latin and influential on medieval theories of magic. Though this work is ascribed to al-Kindī, its authenticity is disputed. (For further discussion of al-Kindī's mathematically inspired works, see Travaglia 1999 and Adamson 2007a, chap. 7. For his works on optics, see Rashed 1997.)

We know from the *Fihrist* that al-Kindī wrote extensively on practical philosophy, but unfortunately most of this output is lost. We are left with only a few relevant works, the longest and most influential of which is *On Dispelling Sorrow* (see Druart 1993; Mestiri and Dye 2004; Adamson 2007a, chap. 6). In general, al-Kindī's ethical

outlook is simple and uncompromising: turn away from the things of the body and concentrate on the "world of the intellect." This is already clear from the aforementioned *Discourse on the Soul*. But in *On Dispelling Sorrow*, al-Kindī adds to the intellectualist picture familiar from his psychological works, giving the reader encouragement with an abundance of anecdotes and maxims. A couple of these are drawn from his anthology of sayings and witticisms ascribed to Socrates, which is an early example of the so-called wisdom literature, an often-overlooked means of cultural contact between literary Arabic and the Greek philosophical tradition.

Finally, mention should be made of two propaedeutic works by al-Kindī or his circle, which are intended as guides to the Greek philosophical tradition for his Arabic-speaking audience. First, *On the Quantity of Aristotle's Books*, which provides a picture of al-Kindī's knowledge of the Aristotelian corpus. The structure into which he puts his overviews of each Aristotelian work tells us something about how he saw the Greek philosophical curriculum: he follows the tradition of seeing theoretical science as divided into three parts, dealing with bodies, immaterial things that are related to bodies (i.e., souls or mathematical entities), and wholly immaterial things (notably God). His summaries show an uneven knowledge of Aristotle's corpus, to the point where he can at times add nothing beyond the title. But there are longer discussions of the *Categories* and *Metaphysics*, for instance, works which we know he used in his own writings.

Second, there is, *On the Definitions and Descriptions of Things*, a work preserved in several very different versions. Each version comprises a list of philosophical terms with definitions. The terms defined seem to be drawn from Greek sources, but the terms themselves are Arabic. This shows that al-Kindī and his circle realized the need to produce a new Arabic technical vocabulary based on the Greek vocabulary of their source texts. They realized also that this new Arabic terminology would not be easily understood by their audience. *On Definitions* can thus be seen as a guide to the new language of philosophy in Arabic, or *falsafa* (which, as it happens, is

one of the two terms with the longest definitions, the other being “virtue”). The terminological innovations of the Kindī circle had mixed success. Some of their technical words were taken up in the later tradition, while others were dropped. But as mentioned above, the translations they produced were influential.

The influence of al-Kindī’s own thought was confined largely to a group of authors who might be called the “Kindian tradition” (see Adamson 2007b). These include, in the first instance, attested students and associates of al-Kindī himself: al-Sarakhsī (d. 899), Abū Zayd al-Balkhī (d. 934), and the aforementioned astrologer Abū Maʿshar al-Balkhī (d. 886). Abū Zayd was an important conduit for the Kindian tradition, since he taught the well-known philosopher Abū l-Ḥasan al-ʿĀmirī (d. 922) and the more obscure Ibn Farīghūn (tenth century). Apart from first- and second-generation students, figures influenced by al-Kindī include the Jewish thinker Isaac Israeli (d. c. 907) and the historian and Neoplatonist Miskawayh (d. 1030), both of whom quote from al-Kindī and texts produced in his circle.

The Kindian tradition is distinctive, first of all, geographically: most of the thinkers just mentioned were from Central Asia (e.g., Balkh and Sarakhs). Intellectually, they are distinguished by their openness to a wide range of disciplines, including Muslim speculative theology (*kalām*) and the finer literary arts. In both respects they can be contrasted to the tenth-century circle of Aristotelian thinkers in Baghdad, who included the famous al-Fārābī. But perhaps because of Avicenna’s disdain for the Kindian thinkers, al-Kindī’s influence seems to peter out around the end of the tenth century.

al-Kindi, Latin Translations of

Charles Burnett

The Warburg Institute, London, UK

Abstract

Al-Kindi was known in the Latin West as an expert on astrology, weather forecasting, medicine, philosophy, and the theory of magic. In university contexts he ranked alongside al-Fārābī, Avicenna, al-Ġazālī, and Averroes as an Arabic philosophical authority, as a result of the translation of three of his philosophical “letters.” Two Latin works, not extant in Arabic, became classical texts in two practical subjects: weather forecasting and magic.

Conspicuous in his Latin works is the application of mathematics to natural science.

Because of the selection of texts written by al-Kindi and translated into Latin, and, in particular, because two texts popular in Latin (*De radiis* and *De mutatione temporum*) have no identified equivalent in Arabic, the figure of al-Kindi in the Latin West is rather different from that in the Islamic world. It is fairer to say that we find different figures in the Latin tradition. There is al-Kindi the astrologer, al-Kindi the principal authority on weather forecasting, al-Kindi the doctor, al-Kindi an interpreter of, and commentator on, philosophy, and al-Kindi an expert on the theory of magic. There is some overlap between these different personae, but distinctions remain, partly due to the different routes of transmission of al-Kindi's texts.

It is debatable whether “Alchandreus,” the Arabic authority whose name is associated with the earliest Arabic astrological texts translated into Latin (late tenth century), is a corruption of “al-Kindi.” Nevertheless it is in the field of astrology that al-Kindi first became known in the Latin West. In the mid-twelfth century, the translator Robert of Ketton quotes Hermann of Carinthia as saying that he is the “preeminent authority in astrology” (preface to Robert's translation of al-Kindi's *Forty Chapters*). His substantial work on astrological judgments known as *The Forty Chapters*, extant in Arabic, was translated into Latin both by Robert of Ketton (fl. 1141–1143) and, in all probability, by Hugo of Santalla (fl. 1145). The latter translator also promised a translation of al-Kindi's commentaries on Ptolemy's *Almagest* and *Tetrabiblos*, but there is no evidence that this promise was fulfilled. We do, however, have a Latin work on weather forecasting (*De mutatione temporum*), which is probably the translation of a lost Arabic summary of two letters on the theory and practice of forecasting the weather from the movements of the heavenly bodies which have survived in a double translation in Hebrew (*On the Causes Attributed to the Higher Bodies Which Indicate the Origin of Rains* and *On Moistures and Rain*). The *De mutatione temporum* brings together astrological doctrine on

the lunar mansions, of purported Indian origin, with speculation on how the heavenly bodies influence sublunar events, which matches the theories in al-Kindī's *Letter on the Proximate Efficient Cause of Generation and Corruption*. In conformity with the Aristotelian account of the fifth essence, al-Kindī denies that the heavenly bodies are themselves hot, cold, dry, and moist, but claims that they are rather states that cause variations in temperature by their movement. The Latin translator of *De mutatione temporum* (called "Azogont" in two of the 30 odd extant manuscripts) has not been identified; of the Hebrew versions one was made by Kalonymus ben Kalonymus in 1314, the other is anonymous. The comprehensive and scientific nature of the text ensured that it remained the most important authority on weather forecasting until the early modern period. Girolamo Cardano praised weather forecasting as "the most noble part of philosophy," and al-Kindī as one of the 12 "outstanding men in the scientific disciplines" (*De subtilitate*, bk XVI, Nuremburg 1550, pp 310–311 and 317), while Bernardino Baldi (1588) singled out for mention the *De mutatione temporum* in his account of al-Kindī as a mathematician (*Le vite de' matematici*, pp 120–121).

A small selection from al-Kindī's numerous "letters" (*rasā'il*) on philosophical topics was translated in Toledo by Gerard of Cremona (d. 1187) in conjunction with Aristotle's *libri naturales* and their Arabic commentaries. These are *De ratione* (*On the Intellect*), *De quinque essentiis* (*On the Five Essences*), and *De somno et visione* (*On Sleep and Dreams*). A second Latin version of *De Ratione*, called *De intellectu*, also exists. The Arabic original of *De quinque essentiis* has not been identified. These three letters take up questions raised in Aristotle's *De anima*, bk. 3, *Physics* bk. 4, and *De somno et vigilia*, respectively. Other Latin sources refer to a commentary by al-Kindī on *De generatione et corruptione* (a reference in a rubrication in Baltimore, Walters Art Museum, Ms. W. 66, fol. 82r: *Aristoteles Latinus, Codices*, no. 3) and "proofs and objections" concerning *De anima*, bk 3 (Cracow, Bibl. Jag., 742, fol. 193v: *probationes et improbationes Jacobi Alkindi*), but the existence of such texts in Arabic or in Latin cannot be

verified. These works gave al-Kindī a place, alongside al-Fārābī, Avicenna, Algazel, and Averroes, among Arabic authorities on Peripatetic philosophy.

Gerard of Cremona also translated a systematic treatise on optics by al-Kindī (*De aspectibus*). This is a mathematical text, dealing with the geometry of the projection of rays of light, rather than the physiognomy of vision. It is complementary to another treatise called the *De radiis*, which deals with rays at a cosmic and metaphysical level, and is also known as the *Theorica artium magicarum* (which we might translate as "the theory behind the arts of magic"). The origins of the Latin text are obscure: no Arabic original has been found, and the Latin shows no sign of the influences of the Arabic language, which are characteristic of the literal translations of the time, though a parallel in terminology and style has been noted in an anonymous translation from Arabic of the first few paragraphs of Aristotle's *Metaphysics* (Martini 2001). The *De radiis* follows the traditional Peripatetic line of ascribing all sublunar movement and change to the movement of the celestial bodies. However, al-Kindī takes up an astrological concept – the projection of rays – and tries to apply this universally. In astrology, the projection of rays refers to the influence exerted by one planet on another when the two planets are in a certain geometrical relation to each other (i.e., in one of the astrological "aspects"). Although hinting at these relations by using the usual technical term for aspect (*respectus*) and referring to the celestial "harmony," which is traditionally achieved by these geometrical relations, al-Kindī conceives of the rays as being cast on whatever object – celestial or elemental – falls within the range of the star's light. But he goes further: the objects in the world of the elements, containing the "species" of the sidereal world, also transmit rays. Sounds and colors, too, emit rays. Recalling the traditional definition of sound, the author writes that "the collision of bodies" makes a sound that flows out in all directions by the rays belonging to its kind. Above all, man produces rays; for he is a microcosm since the species of all mundane things are imprinted in his imagination, and therefore his "imagining spirit" (*spiritus ymaginarius*) has rays that conform to the rays

of the world, and hence he achieves the power to move things outside him by his rays just as the world (both upper and lower) moves things into different motions by its rays. Hence, when man conceives something corporeal in his imagination, that thing receives actual existence according to species in his imagining spirit. This accounts for the ability of the spirit to move objects outside it by its rays. Similarly, the voice can effect change in the outside world, through incantations. The *De radiis* provided the most philosophical and scientific justification for the effectiveness of magic in the Middle Ages, and as such was the object of attack of Giles of Rome in his chapter on al-Kindī in his *Errores philosophorum*.

Another area of influence of al-Kindī in Latin was due to his text on how to calculate the “degrees” in compound medicines (*De gradibus*), also translated by Gerard of Cremona. According to Galenic medicine, every simple medicine (be it a plant, animal part, mineral or “water”) was classified according to a range of one to four degrees of heat, coldness, dryness, and moisture. In his *De gradibus* al-Kindī explains how one should work out the effects of the combinations of simple medicines. His system was accepted by the influential Catalan medical authority, Arnald of Villanova.

If there is a leitmotif in the Latin works of al-Kindī it is the application of mathematics to natural sciences. The calculation of degrees of quantities appears in both *De gradibus* and *De mutatione temporum*. Weather forecasting itself cannot be approached unless one has a thorough grounding in the mathematical sciences. The effects of the projection of rays (*De radiis*) cannot be understood unless one first has a grounding in optics (*De aspectibus*).

Lambert of Lagny

Laurent Cesalli

Department of Philosophy, University of Geneva,
Geneva, Switzerland

Abstract

Lambert of Lagny (Lambertus de Latiniaco) (fl. 1250) (not to be confused with the Dominican Lambert of Auxerre) is the author of one of the main logic textbooks of the terminist logic (*Logica* or *Summa Lamberti*). He belongs to the Parisian tradition as opposed to the Oxonian one. The *Summa* is posterior to and independent from the corresponding works of Peter of Spain, William of Sherwood, and Roger Bacon. Lambert's semantic of terms is characterized by the acceptation of natural supposition (also in propositional context) and an original doctrine of appellation as a syntactic limitation of personal supposition.

Life and Work

Lambert of Lagny's exact date of birth and death are not known. On the basis of indications found in some of the 15 manuscripts preserving his only known work – the *Logica* or *Summa Lamberti* – one can locate his period of main activity around the middle of the thirteenth century. Lambert of Lagny was a scholar (*clericus*) in the Diocese of

Meaux. Between c. 1250 and 1255, he was the preceptor of the young count Theobald V of Champagne (1238–1270, King of Navarre under the name of Theobald II the younger since 1253). Later on (1263–1265), Lambert became administrator of the Parisian possessions of the counts of Champagne. Lambert of Lagny is not identical with Lambert of Auxerre (*Lambertus de Autissiodoro*), the Dominican friar under whose name the *Summa* was transmitted. The confusion can be explained by the fact that the *Summa* played an important role as a logic textbook in the *studia* of the Dominican Order (de Libera 1982: 229–232, correcting the previous view held by Alessio 1971: XVI–XXXII as well as De Rijk 1969: 160–162).

The *Logica* or *Summa Lamberti* (noncritical edition by Alessio 1971; edition of part VIII of the *Summa*, *De appellatione*, based on five manuscripts by de Libera 1982) is likely to have been written between 1253 and 1257 probably in Troyes, possibly in Pamplona (De Rijk 1969: 161) or between 1250 and 1265 (de Libera 1990: 214). The work seems to have been produced in several phases: a first redaction was completed in Navarre and the final edition, augmented by different treatises on the properties of terms, was made later on in France. This hypothesis, originally indicated by Alessio (1971: XLVI), was confirmed and specified by the study of the relation between the last part of the *Summa* (*De appellatione*) and the *Appellationes* of the Parisian master Johannes Pagus. As de Libera (1982:

233) has argued, Lambert must have known the *Appellationes* of Pagus before editing the final version of the *Summa*. Besides its utilization as logical textbook within the *studia* of the Dominican Order, the *Summa* might have exerted an influence on subsequent terminism (traces of Lambert's logico-grammatical doctrine of *determinatio* as a means to solve paralogisms involving the *fallacia compositionis et divisionis* are present in tract VII of John Buridan's *Summulae* – de Libera 1990: 222).

The *Logica* or *Summa Lamberti*

The *Summa* is one of the four main textbooks of the so-called terminist logic of the thirteenth century. It is both posterior to and independent from Peter of Spain's *Tractatus*, William of Sherwoods' *Introductiones in logicam*, and Roger Bacon's *Summulae dialectices*. The logical work of Lambert belongs to the Parisian tradition (as opposed to the Oxonian one). Two main characteristics of his semantics allow one to consider Lambert as a continental logician: his acceptance of natural supposition (*suppositio naturalis*) and, as a consequence, his conception of appellation (*appellatio*) as a restricted supposition. Accordingly, the main sources of Lambert's work are treatises pertaining to the Parisian tradition such as Johannes Pagus' *Appellationes* but also the *Summe Metenses* and the *Synkategoremata* of Nicolas of Paris.

The work is divided into eight parts. Alessio (1971) provides the following division:

1. De propositionibus
2. De predicabilibus
3. De predicamentis
4. De postpredicamentis
5. De sillogismo
6. De locis
7. De fallaciis
8. De suppositionibus et de significationibus

The tract *De appellatione* edited by A. de Libera in 1982 is the third section of part eight of the *Summa*, which is divided as follows:

- 8.0. Prologus
- 8.1. De significatione
- 8.2. De suppositionibus
- 8.3. De appellatione
- 8.4. De restrictionibus
- 8.5. De ampliacionibus
- 8.6. De distributionibus
- 8.7. De relationibus

This structure shows that the tracts 1–7 reflect the content of the Aristotelian *Organon*, whereas tract 8 consists of the so-called *parva logicalia* or treatises on the properties of terms (the last section on relations is not devoted to the category of relation, but to relative pronouns).

Some Theoretical Issues of the *Summa*

Universals

On the background of the prologue of Porphyry's *Isagoge*, Lambert defines a universal as that which is naturally able to be said of many (*aptum natum dici de pluribus* – Alessio 1971: 51). He insists on the fact that not every universal is effectively predicated of many, for some universal, like *phenix*, is said of many but only successively (there is always and only one phoenix at a time) and some other, like *sol*, is just said of one individual (there is only one sun, but *sol* is not a proper name). Lambert seems to have a realistic conception of the universal: it is a universal form (*forma universalis*) multiplied in different substrates (*multiplicatur in plura supposita*).

Parts and Wholes

In the tract on categories (*De predicamentis*), commenting on Aristotle's distinction between *esse in* and *dici de*, Lambert identifies nine modes for something to be in something else (Alessio 1971: 66–67), which comes down to distinguish as many types of parts. Thus, we can have:

- (a) Integral parts (a finger as part of a hand)
- (b) A whole as part of its constituents (a house as part of its walls)
- (c) Specific parts (the species man is part of the genus animal)

(d) Generic parts (the genus as part of its species, the *definiens* of its *diffinitum*)

(e) Formal parts, subdivided in formal substantial parts (the soul as part of the body)

(f) Formal accidental parts (the accident white as part of its substratum)

(g) Effective parts, that is, an effect as part of its efficient cause (the kingdom as part of the king)

(h) Contained parts (something located as a part of space)

Thus, Lambert seems to have a physical and metaphysical mereology, including several possibilities for wholes to be parts of their constituents.

Signification

According to Lambert, *significatio* is a semantic relation resulting from the free imposition of a sound (*vox*) on a concept (*intellectus rei* – Alessio 1971: 205–206). It corresponds to our contemporary notion of meaning. As many of his colleague logicians in the thirteenth century, he understands Aristotle in the first lines of the *De interpretatione* (16a6–7) as saying that spoken words are signs of concepts, which, in turn, are signs of things. Thus, for Lambert, signification is transitive: a spoken word is a sign of a sign (i.e., of a concept); and a concept is a sign of a significate (i.e., of a thing). The signification is analyzed in four constituents: a thing, a concept of a thing, a sound, and the union of the sound with the concept of a thing (*res, intellectus rei, vox et unio vocis cum intellectu rei*). The conjunction of the four results in a term (*terminus* or *vox significativa*). The conventional component of signification is only the union of the sound with the concept; the three other components are natural. Therefore, Lambert conceives of concepts as natural signs of things.

Supposition

Supposition is a property of a term. It bears some affinities with our contemporary notion of reference, and it differs from signification insofar as signification is prior to supposition and only extends to the thing on which the sound was imposed (i.e., the universal nature “man”), while supposition can also concern the *supposita* contained under that universal nature (i.e., Socrates and Plato). Lambert’s definition of supposition

reads as follows: supposition is the understanding of a term for itself or for its thing or for some *suppositum* (or *suposita*) contained under its thing (*suppositio dicitur acceptio termini per se sive pro re sua vel pro aliquo supposito contempto sub re sua vel pro aliquibus suppositis contemptis sub re sua* – Alessio 1971: 206). This definition pertains to supposition generally speaking (*communiter dicta*) which is itself divided in supposition properly speaking (*proprie dicta*) and copulation, the difference being that the former amounts to the representation of an autonomous thing (*res fixa et per se stans*), whereas the latter amounts to the representation of a dependent thing (*res dependens*), a difference linguistically expressed by the opposition between substantive and adjective terms (Alessio 1971: 207). Lambert divides supposition as follows (the next division divides the second terms of the previous one): *naturalis/accidentalis; simplex/personalis; discreta/communis; determinata/confusa; mobilis/immobilis*. The acceptance of natural supposition is a clear mark of Lambert’s belonging to the Parisian tradition (Peter of Spain, Johannes Pagus) as opposed to the Oxonian one (William of Sherwood, Roger Bacon). Natural supposition is the semantic property that a term possesses per se and intrinsically to stand for all the things present, past, and future participating in the form (or universal nature) it signifies. Natural supposition is not necessarily a non-contextual property. Indeed, Lambert also allows for a term to stand in natural supposition within a proposition: it is the case, when it supposes for the totality of its present, past, and future *supposita*. In that sense, and since accidental supposition always amounts to a limitation of the range of considered referents, the propositional use of natural supposition is a case of *ampliatio* (de Libera 1981: 64–66).

Appellation

Appellation is a supposition restricted to presently existing things: *appellatio est acceptio termini pro supposito vel pro suppositis actu existentibus* (de Libera 1982: 252). It corresponds to what we could call actual denotation. It is not an intrinsic property of a term, but a syntactical limitation of a certain type of accidental supposition, namely, of

personal supposition: contrary to Peter of Spain, Lambert does allow appellation only for common (and not for discrete) terms. Appellation is itself divided according to the divisions of personal supposition: we have determinate appellation when a common term stands only for one among its presently existing *supposita* (as in *homo currit*) and distributive appellation when it stands for all of them (as in *omnis homo currit* – de Libera 1982: 255–256). Furthermore, Lambert does not accept the rule of the *sufficiencia appellatorum* stipulating that at least three *appellata* are always required: according to him, a single *appellatum* is sufficient. And in case there are no *appellatum* at all, Lambert allows for a term to stand actually for a nonexistent entity (de Libera 1982: 257, as well as Goubier 2000: 50 and 57).

Landolfo Caracciolo

Christopher Schabel
Department of History and Archaeology,
University of Cyprus, Nicosia, Cyprus

Abstract

Landolfo Caracciolo, the *Doctor Collectivus* (c. 1280/1285–1351), a member of an aristocratic family from Naples, entered the Franciscan Order and eventually lectured on the *Sentences* at Paris in 1318–1319, from which lectures stems his main philosophical writing, his questions on the four books of Peter Lombard's *Sentences*. After his academic career, Landolfo served in the administration of the Angevin dynasty in Naples and rose in the ecclesiastical ranks, ending his life as archbishop of Amalfi. Landolfo was a Scotist and spent most of his energy refuting the attacks that his immediate Franciscan predecessor at Paris, Peter Auriol, had directed at the Subtle Doctor. Yet Landolfo was no slavish follower, departing from “the Doctor” in various significant contexts, such as freedom. Landolfo placed particular emphasis on the distinction

between instants of time and instants of nature, maintaining that contradictories can be true in the same instant of time. For years, Landolfo debated this point with his Franciscan successors at Paris, Francis of Marchia and Francis of Meyronnes, and with scholars outside the Franciscan Order, such as Thomas Wylton and John of Jandun. Aside from an incunabulum edition of book II, few of Landolfo's questions on the *Sentences* have been published.

The Franciscan Landolfo Caracciolo, the *Doctor Collectivus*, belonged to the Rossi branch of the famous Neapolitan Caracciolo family, whose aristocratic roots go back to the first millennium. There are several prominent figures with the name "Landolfo Caracciolo," and the assertion that our Landolfo is identical to the one who held an office at the University of Naples from 1269 to 1284 and again in 1300–1301 is surely erroneous. Presumably, after joining the Franciscan Order at San Lorenzo in Naples, where he would have received his basic education, Landolfo was sent to study theology at Paris. According to an undocumented tradition, Landolfo was in the Capetian capital around 1305–1307, hearing John Duns Scotus' lectures, then returned to the Minorite *studium generale* at Naples, which with the patronage of King Charles II Anjou of Naples had been functioning de facto as part of the Faculty of Theology of the University of Naples since 1302. From 1310 to 1316, the story goes, Landolfo served as lector at San Lorenzo, after which he was sent to Paris to lecture on the *Sentences* of Peter Lombard. Contemporary sources in fact demonstrate that Landolfo did perform this task at Paris in 1318–1319, quoting and paraphrasing from the *Reportatio* version of Peter Auriol's questions on book I of the *Sentences*, which suggests that Landolfo had been in Paris attending Auriol's lectures in 1317–1318, while preparing for his own. If the above scenario is true, we can date Landolfo's birth to around 1280–1285.

Although many of Landolfo's sermons and biblical commentaries have come down to us, and he composed *Quaestiones in Metaphysicam* and probably at least one *quodlibet* that have not

been identified, his Parisian questions on the *Sentences* are virtually his only surviving philosophical work. Some 35 manuscripts preserve one or more of the four books of his questions, the most popular being book IV, extant in roughly 20 witnesses. There is an imperfect incunabulum edition of book II, but otherwise only sections have been published. Landolfo lectured in the traditional sequence, books I, IV, II, and III, and probably ran short on time, because his set of questions on book III is very brief. Landolfo therefore began an ambitious second redaction of his questions on book III, leaving it incomplete at the end of the fifth of the 40 distinctions, although even in its truncated form it is almost three times as long as the first redaction. Doubts have been expressed about the authenticity of the second redaction, but Landolfo's idiosyncratic use of "conclusions" as the equivalent of "articles" and his habit of asking several questions at once are evident here, and self-citations prove that the work is Landolfo's. Presumably, he abandoned the project because of other duties, since by 1325, as master of theology, he was Franciscan provincial minister of Terra di Lavoro in southern Italy; in 1327, he became bishop of Castellammare di Stabia, 30 km SE of Naples; in 1331, he was transferred to Amalfi, where he remained archbishop until his death, probably in 1351. All the while he maintained close ties to the Angevin dynasty, for example, serving King Robert the Wise on a mission in 1326, and acting as logothete and protonotary for Queen Joanna I as late as 1349.

Landolfo is attributed with bringing Scotism to the University of Naples and southern Italy in general, so it is not surprising that, on his own admission, Landolfo followed Scotus *plurimum*, for example, on the Immaculate Conception. Peter Auriol, Landolfo's immediate predecessor as Franciscan bachelor of the *Sentences* at Paris, was an independent thinker who quite often disagreed with the Subtle Doctor and frequently criticized him on basic points. Landolfo was left the task of refuting Auriol's attacks against the man whom Landolfo and many other Franciscans were already calling "the Doctor." Time and again we find Landolfo replying to an opinion that

runs contrary to Scotistic doctrine, an opinion identified in the margins of the manuscripts as that of Auriol. This Landolfo did on a wide range of issues, from epistemology to soteriology to physics. He did confront other challenges to Scotism, for example, Henry of Hareclay's atomism, but since Landolfo was the first to oppose Auriol, the Italian's questions on the *Sentences* often read like one long attack on his French predecessor.

Sometimes Landolfo's rebuttals were compelling, but on occasion, he could not dissolve Auriol's criticism of Scotus. In these instances, Landolfo might remark that Auriol's own position was no better, but there are times when Landolfo disagreed with Scotus. On the fundamental problem of the freedom of the will, for example, theological considerations forced Scotus and his followers to admit that what is free, like the procession of the Holy Spirit via divine willing, can also be necessary. Auriol found an awkward way around the problem, maintaining that what is done "complacently" is done freely. Although Landolfo rejects Auriol's position, he cannot follow Scotus and instead seeks a univocal definition of freedom: "I hold the opposite conclusion, that a power is free because it can do one act and the opposite, and when this *indifference* has been removed, there will be no freedom." Turning to face the objection about the procession of the Holy Spirit, Landolfo tries to find another way out: "I respond that the will's not being able to do the opposite can be understood to stem from two things: either from the formal *ratio* of the operating will, or from the condition of nature in which it operates. Then I maintain that, inasmuch as it is of the formal *ratio* of the will in divine things, just as God loves Himself, He could not love Himself, and just as He produces the Holy Spirit, He could not produce [the Holy Spirit]. But this determination comes from the condition of nature in which He operates. This condition of nature is that all things in Him must necessarily be." Peter of Candia would attack Landolfo's position at length, in part because he found it "astonishing how this doctor – whose avowed teaching as a whole is the teaching of the Subtle

Doctor with clearer words – deviated from his master."

Landolfo was cited at least into the sixteenth century and clearly his impact on the Neapolitan ecclesiastical milieu has never faded from memory: when the Franciscan theological school of San Lorenzo, suppressed in the eighteenth century, was reestablished in central Naples in 1937, the library was named the Biblioteca Fra Landolfo Caracciolo. Among historians of philosophy, Landolfo is best known for his view that instantaneous change involves a contradiction: "In an instantaneous change each terminus exists in the same instant; but in such a change the termini are contradictory; therefore contradictories are true in the same instant." One could object that "these termini are neither in the same instant nor in different instants, but rather the entire preceding time measures and corresponds to one contradictory, namely the thing-to-be-generated's non-being, while the last instant of this time corresponds to the other contradictory, namely the being of the thing-to-be-generated." Landolfo replies that, "when everything that is accidental is removed, nothing is removed from what exists per se; but the entire time preceding generation is accidental to it; therefore, with this time removed, generation will still be in the last instant; but generation will not be without its termini; therefore in that last instant the thing will be and not be, and these are the termini of generation." Landolfo's explanation for how these contradictions can exist in the same instant of time relies on "signs" or "instants of nature," a device that Landolfo employs quite frequently. Each instant of time can be divided into conceptual instants of nature, which are "indivisible measures to which simultaneity and succession do not apply." These instants explain causation: at one and the same instant of time, the agent causes and the effect comes to be; the causing of the agent is logically prior to the coming-to-be of the effect, so it can be said that, in the same instant of time, the cause is in a prior instant of nature and the effect in a posterior one. Many thinkers before Landolfo, including Scotus himself, appealed to instants of nature, but it was Landolfo's predecessor, Hugh of

Novocastro, OFM, who, in the years before Peter Auriol's lectures at Paris, took the further step of claiming that ontological states corresponded to those instants of nature. In the prior instant, where the cause causes, the effect, Hugh argues, does not exist, and thus the effect does not exist and exists in the same instant. Landolfo adopts Hugh's innovation and publicizes it.

Landolfo's notoriety in this context is not a modern anachronism, because a number of scholastics attacked his position in the decade following his teaching. Landolfo himself placed great emphasis on his doctrine, since he returned to it repeatedly. The academic context in which he first treated the problem at length is quite interesting. Landolfo's questions on the *Sentences* seem to be the first to preserve both the sermons or *collationes* on each of the four books of the *Sentences* and the questions that constituted part of the running debate held with the other bachelors, together called *principia*. In the *principium* for book II, after a *collatio* beginning with his standard *Fundamentum primum jaspis*, Landolfo asks "Utrum contradictoria quae sunt termini creationis possint competere eidem in eodem instanti temporis secundum idem," and he specifically targets the doctrine of the Sorbonne master Thomas Wylton. A bachelor of the Sorbonne likely defended this doctrine, for in the *principium* to book III Landolfo asks: "*Utrum, si proprietates Verbi sit idem quod essentia, ponere quod incarnatio terminetur ad proprietatem et non ad essentiam ponit contradictionem.*" Landolfo continued his attack against Wylton's circle, in his final lecture on the *Sentences* calling out by name Wylton and his student, Annibaldo di Ceccano, for failing to appreciate his doctrine of simultaneous contradictories. The notoriety of Landolfo's position spread, for the arts master (a client of the same patron as Wylton and Annibaldo) John of Jandun took up Landolfo's *principia* and provided his own refutation in a reply dated September 3, 1320, or a full year after Landolfo's *Sentences* lectures. Finally, in the second redaction of book III, Landolfo informs us that his famous Franciscan confreres Francis of Marchia and Francis of Meyronnes, who

succeeded Landolfo as Parisian bachelors of the *Sentences*, attacked his opinion, which Landolfo goes on to defend once again.

Laws of Nature

Yael Kedar

Multidisciplinary Studies, Tel-Hai College and
the University of Haifa, Kiryat Shmona, Israel

Abstract

Many historians of science consider laws of nature a modern category. Some, however, claim for the consolidation of a nomic conception of nature in the thirteenth and fourteenth centuries. The first time that specific laws were formulated in medieval texts was in the scientific works of Robert Grosseteste (c.1175–1253), who stated the law of refraction and the law of reflection of light rays, and of Roger Bacon (c. 1220–1292/1293), who added the law of the gravity of water and the law of universal nature. It is probable that Bacon's concept of optical law had reached the modern times before Descartes. The nominalists-voluntarists of the fourteenth century, and most prominently William of Ockham (1288–c.1348), may have had an important part in the emergence of the concept of laws too. They rejected the realism of forms and immanent factors and stressed the sovereignty of God in creating and the contingency of his imposed decrees. This philosophy of nature provided a context within which the idea of a law of nature was comprehensible and natural. It had reached seventeenth-century scientists through Martin Luther (1483–1546).

Laws of Nature

Laws of nature are defined as general statements about the properties of natural entities, relating various variables and constants. A law of nature is thought to have counterfactual implications, to presuppose certain idealized conditions, and to have quantitative aspects and explanatory power. Many historians of science hold to the view that laws of nature became an essential concept in

scientific practice and theory from the seventeenth and even eighteenth century onward (Needham 1969; Henry 2004). They contend that before that time, the use of “law” in connection with natural regularities had been in use – if at all – merely as a loose metaphor or a restricted statement of principles of mathematics, never as explanatory proposition in natural philosophy (Henry 2004). Order in pre-seventeenth century science was based on logical relations, hierarchy, forms, or similarities, so the story goes. Following Plato, Aristotle, and the Stoics, the distinction between ideal order and rough actuality was conceived as the distinction between celestial and terrestrial realms. Orderliness descends from higher to lower and is lost as one moves from higher causes to lower effects (Wilson 2008).

The contention that laws of nature are to be considered exclusively a modern category did not remain unchallenged. Leaving aside arguments in favor of an ancient Roman conception of laws of nature in Lucretius and Cicero, this entry reviews the claim for the consolidation of a nomic conception of nature in the thirteenth and fourteenth centuries, well ahead of the scientific revolution.

One finds several allusions to the term in the twelfth century. Writers on nature such as William of Conches (c. 1080–c. 1154) and the Platonist Bernard Silvester (fl. c. 1143–1148) had used “law” freely. In a metaphysical work by Hermann of Carinthia (fl. 1138–1143), *habitus* is defined as our means of knowing “qua lege [literally, by what law] things occur,” and in the poems of Alan of Lille (c. 1128–1202/3) a personified Nature lays down laws (Ruby 1986). In the thirteenth century, the phrase “laws of nature” (and also “of multiplication” and “of material forms”) is found in the writings of Roger Bacon (c. 1220–1292/3) and, in the fourteenth century, in the writings of William of Ockham (1288–c.1348), Nicole Oresme (1320–1382), and Henry of Langenstein (c. 1325–1397), who used the phrase “secundum legem agencium naturaliter” in his work on comets (*Questio de cometa*). At the end of the fourteenth century and the beginning of the fifteenth, one finds the phrase in Pierre d'Ailly (1350–1420) and Jean Gerson (1363–1429). The

use of the phrase, however, did not necessarily mean that the modern sense was present and that a fully grown conception of laws of nature was at stake. Moreover, in some cases, a nomic conception can be present but not accompanied by the expected terminology. Nevertheless, appropriate terminology could serve as an indication that some medievals were thinking of nature as governed by laws long before they were in a position to state any of the laws themselves.

An instance of a specific formulation of such laws is found in the thirteenth century. This is the first time that one finds not only the general statement that such laws exist but also the first formulation of specific laws. Their locus is the scientific works of Robert Grosseteste (c.1175–1253) and Roger Bacon.

Grosseteste developed an original light metaphysics, in which the universe is created out of a dimensionless point of light, which he called “the form of corporeity” (*De luce*). The form of corporeity multiplies itself infinitely, thus creating the material universe by inserting dimensions onto matter. It therefore exists wherever there is matter. The ability to provide explanations based upon a form present throughout nature enables a reduction to a minimal number of principles and renders those explanations universal: the same few principles can be used in different ways, in accounts of different phenomena. In this way Grosseteste was able to describe natural processes in general statements about the behavior of light, rather than by definitions of specific natures (Kedar 2016). Light, or the form of corporeity, multiplying equally in all directions in straight lines, introduces dimensions into matter in a way which can be described and measured by the laws of geometry. Light, the source of all causal action, became thus the key to the study of the material universe. Grosseteste believed that geometry provides *propter quid* knowledge of the physical aspects of natural phenomena, even though he could not always supply convincing geometrical explanations. This is why he is thought by some to have started the project of mathematization of nature and the move away from explanation by form to explanation by law (Crombie 1959). Grosseteste indeed set up some quantitative lawlike rules,

such as that natural force is more active when propagated in straight lines and that the force is strong in inverse proportion to the length of the line. In *De iride* Grosseteste formulated a law of refraction, according to which rays passing from one medium to another, which is denser, will be refracted at an angle equal to half the angle of incidence, and the law of reflection, stating that the incident and reflected angles are equal. Grosseteste was completely original in this formulation. No such law existed in any earlier known treatise on optics or natural science in general (Eastwood 1967). These laws were based on the principle of uniformity in nature, which states that a natural action will always occur in the same way, assuming identical conditions; in fact, the agent considered by itself will always act in the same way, but the effects may vary with change in external conditions (Eastwood 1967).

Roger Bacon took Grosseteste’s methodological convictions and developed them further. He was the first in the medieval period to invoke the concept “law of nature” as a comprehensive, unconditionally binding, and constitutive ordering of nature. His laws displayed a necessary, causal connection between geometrical properties and physical effects. He stressed the universal and uniform aspects of these laws. Bacon formulated laws of nature of several types, including the law of the gravity of water and the laws of the multiplication of species (Kedar 2016). “Wonderful,” Bacon declared, “is the power of this multiplication, since all things hidden and revealed happen in accordance with its laws” (Bacon *Opus majus* 4.4.3). His laws of multiplication (which included the laws of refraction and reflection) qualify for most of the properties of the modern conception of laws, such as an if/then formulation, counterfactual implications, independence of space-time, explanatory power, and systematicity (Kedar and Hon 2018). Most telling was Bacon’s treatment of the problem of the water remaining in the clepsydra in opposition to their natural inclination to flow downward. Bacon did not employ the Aristotelian terminology of substance, species, genus, and the four causes. Instead, he appealed to a “universal nature” of the continuity of matter,

without which the general order of the world machine would not hold on. The law of “universal nature” overpowers the “particular nature” of the water and provides nature with unity and order (Schramm 1981). It may be the case that Bacon’s concept of optical law had reached modern times before Descartes (1596–1650), through the *Perspectiva* of John Peckham (c. 1230–1292), which Johannes Kepler (1571–1630) read (Ruby 1986). John Peckham was to draw on Bacon in saying that in certain circumstances vision proceeds according to the “law of spirits” (*spirituum*) rather than the “law of diaphanousness.” In the fifteenth century, Regiomontanus (1436–1476) pointed to Bacon as an authority in optics and Lorenzo Ghiberti (1378–1455) paraphrased the *Perspectiva* in his *Third Commentary* without acknowledgment. In the sixteenth century, Francesco Maurolico (1494–1575), the astronomer from Messina, drew directly on Bacon’s *Perspectiva* in his *Photismi de lumine et umbra* and so did Giambattista Della Porta (1535–1615) in his *De Refractione*, even though he did not provide references or mentioned Bacon by name (Ruby 1986). All four used *lex* of optical phenomena, and Regiomontanus (1436–76) used *lex* also in astronomy and mathematics (Ruby 1986). The significant similarities between the concept of laws held by Roger Bacon and by Francis Bacon (1561–1626) and Robert Boyle (1627–1691), such as the distinction between the laws of universal nature from laws of a particular nature, strengthen the claim for historical continuity (Steinle 1995).

Even though they did not bequeath any formulation of specific laws, it is argued that medieval nominalists-voluntarists, of which the most prominent was William of Ockham, had an important function in the historical emergence of the concept of laws in the seventeenth century. Some goes further to claim that a complete conception of laws was in fact already there. The nominalist-voluntarist thesis holds that the major influence of Ockham and his successors was less on the content of the scientific ideas themselves than on the new metaphysics and philosophy of nature which they began and which was further developed by the advocates of the new mechanical philosophy.

It was this philosophy of nature that provided a context within which the idea of a law of nature was both comprehensible and natural (Milton 1981). The metaphysics which Ockham and his successors proposed was made of the following tenets: there exists an infinite gap between the omnipotent God and the created world; everything which exists is an individual – metaphysical realism is to be rejected altogether; God governs the world, not by means of intermediaries, but directly, by regulating the motions of every single body; creation, therefore, is radically contingent (Milton 1981). From all this, it follows that God’s rule of the universe is executed in a manner of decrees which take the form of laws of nature. Given God’s absolute freedom and omnipotence, these laws are imposed upon matter and do not arise out of nature’s internal structure. The laws are therefore contingent and can be discovered by empirical methods only.

The voluntarists devised explanations in terms which were opposed to the realist and organic Aristotelian outlook, which used essences and substantial forms as explanatory concepts, and placed laws of nature instead (Milton 1981). The dominant conception of laws of nature among seventeenth-century scientists working under the mechanistic hypothesis was that these laws are not immanent but imposed upon the universe by an omnipotent God. The voluntarists of the fourteenth century developed the conception of imposed laws, a conception which was carried further in time by thinkers of the voluntarist tradition such as Pierre d’Ailly, Jean Gerson, and Gabriel Biel (d. 1495) who influenced, among others, Martin Luther (1483–1546). The thesis is exemplified by figures such as Pierre Gassendi (1592–1655), Robert Boyle, and Isaac Newton (1642–1727) who were committed both to voluntarism and the empirical investigation of nature (Oakley 1961). This is especially the case in England, where Hobbes (1588–1679), Boyle, Locke (1623–1704), and Newton all show clear signs of the influence of nominalist or voluntarist ideas; it is also the case in France, where similar influences strongly affected the thought of Descartes, Gassendi, and Mersenne (1588–1648) (Milton 1981).

It would appear that in fact before Newton, there was no one concept of laws agreed by all scientific figures. Some (Galileo Galilei (1564–1642) and Descartes) held to laws of idealized conditions expressed in mathematical terms, while others (Francis Bacon (1561–1626) and Boyle) demanded no mathematical formulation and distinguished general from specific laws lacking absolute necessity (Steinle 1995). Some held to contingent laws discovered by experiments (Francis Bacon, Newton, and Boyle), while others believed in immutable and necessary laws (Descartes). It therefore could be the case that both strands of medieval philosophy – geometrical optics and nominalism – have contributed equally to the formation of the concept. Indeed, the variety of concepts of law in seventeenth-century science suggests different traditions of distinct origins (Wilson 2008).

Leo Magentenos

Börje Bydén

Department of Philosophy, Linguistics and Theory of Science, University of Gothenburg, Gothenburg, Sweden

Abstract

Leo Magentenos (Leōn Magentēnos) was a Byzantine commentator on Porphyry's *Isagoge* and Aristotle's *Organon*.

Biography

According to superscriptions in manuscripts containing his works, Leo Magentenos was Metropolitan of Mytilene. One of these manuscripts (Vat. gr. 244) is probably to be dated to c. 1200. On the other hand, one of his commentaries has been shown to be dependent on a collection of scholia that was compiled after c. 1150. This allows us to place Leo with some certainty in the latter half of the twelfth century. We have no further information about his life.

Works

Leo wrote commentaries on Porphyry's *Isagoge* and all of Aristotle's logical works, not only those normally included in the curriculum for higher education in Middle and Late Byzantium (i.e., the *Categories*, the *De interpretatione*, the first seven chapters of *Prior Analytics* 1, and the first seven chapters of the *Sophistici elenchi*). Only parts and fragments of his commentaries have appeared in printed editions (in addition to the primary sources listed below, note that the commentary on *Posterior Analytics* B edited by Wallies under John Philoponus' name seems in fact to be by Leo, as suggested by Ebbesen 2012, 363–364), and consequently they have been little studied in modern times. In at least one case, his commentary on the *Sophistici elenchi*, it is clear that Leo did little more than rework older collections of scholia and compose a brief general introduction to the work. In other cases, such as his commentary on the *Topics*, he added much explanatory material that is not known from other sources. His mode of exposition is twofold: each new commentary starts with a general introduction, which purports to discuss all or some of eight preliminary issues inherited from the Alexandrian tradition of commentary, namely, the subject of the treatise, its usefulness, its authenticity, the reason for its title, its division into chapters, its method of teaching, its place in the curriculum, and the part of philosophy to which it belongs. After that follows a collection of notes on individual passages and words in Porphyry's or

Aristotle's text. The oldest manuscript containing Leo's works (Vat. gr. 244) also contains the texts on which they comment; Leo's notes are then keyed to the texts by reference numbers, much like modern footnotes. They are more philologically than philosophically orientated, offering little in the way of in-depth discussion. Their value has been harshly judged, and it is true that while Leo often fails to make Aristotle's meaning clearer, he sometimes happens to make it significantly more obscure as a result of elementary misunderstandings.

In the case of the *De interpretatione*, two commentaries attributed to Leo survive. One (Commentary 1) is a collection of notes preceded by a general introduction in the manner just described; this has never appeared in print. The other (Commentary 2) is a continuous text that was edited by Aldus Manutius in 1503. The authenticity of Commentary 2 has been contested (by Busse 1897), but on weak grounds. On the other hand, there might be positive reasons for thinking that it is after all authentic. In the first note of Commentary 1, Leo refers to another work in which he has enumerated the senses of *thesthai* (Int. 16a1). It does not seem unlikely that the reference is to another commentary on the same Aristotelian text; looking in Commentary 2, one will find that six senses of *thesthai* are indeed enumerated, approximately the ones given by Ammonius (In Int. 9.4–27). The styles of the two commentaries exhibit many similarities; and even if it is true that Commentary 2 is superior to Commentary 1, as Busse thought, this may be due to the use of different sources: Commentary 2 draws heavily on Ammonius on the *De interpretatione*, whereas Commentary 1 does not seem to make direct use of Ammonius. However, if Commentary 2 is authentic, it seems that Leo must have composed two series of commentaries on the *Organon*, since the author of this commentary refers back to earlier commentaries on the *Isagoge* and the *Categories* dealing with the prolegomena to philosophy and logic respectively, and the prolegomena to philosophy and logic are not dealt with in the commentaries on these works ascribed to Leo in the manuscripts.

Logic in the Arabic and Islamic World

Khaled El-Rouayheb

Department of Near Eastern Languages and Civilizations, Harvard University, Cambridge, MA, USA

Abstract

The Arabic logical tradition emerged from the Graeco-Arabic translation movement from the eighth to the tenth centuries. In its initial stages, it was closely linked to the activity of translating and commenting upon Aristotle's *Organon*. By the early tenth century, a circle of Aristotelian scholars had emerged in Baghdad who saw themselves as a continuation of the Alexandrian tradition. Its most prominent representative was undoubtedly Al-Fārābī (d. 950), who wrote esteemed commentaries on Aristotle's logical works, as well as a number of treatises introducing logic (*mantīq*) to an environment that often viewed the Greek sciences with suspicion. The influence of the Baghdad circle eventually reached Islamic Spain, where Aristotelian philosophy and logic flourished in the eleventh and twelfth centuries, culminating in the monumental commentaries on Aristotle by Averroes (d. 1198). In other parts of the Islamic world, however, the influence emanating from Avicenna (d. 1037) eventually superseded that of Aristotle. Avicenna was less concerned with getting the interpretation of Aristotle right and more willing to make radical departures from the Aristotelian tradition. By the thirteenth century, his works had replaced those of Aristotle as the point of reference for

most logicians writing in Arabic. The prominent theologian Fakhr al-Dīn al-Rāzī (d. 1210) approached the Avicennian tradition with the same irreverence with which Avicenna had himself approached the Aristotelian tradition. He also decisively reoriented the scope of logic toward a focused study of terms, propositions, and syllogisms, rather than the entirety of topics covered in the *Organon*. A number of thirteenth-century logicians working in the wake of Avicenna and Fakhr al-Dīn al-Rāzī produced sophisticated and original summaries of formal logic. They also produced a number of condensed handbooks that formed the basis of logical studies at colleges throughout the Islamic world until modern times.

Logic in the Arabic and Islamic World

The origins of the logical tradition in Arabic can be traced back to the Graeco-Arabic translation movement from the late eighth to the early tenth centuries. Recent studies have argued that this movement was more than just a matter-of-course translation of the Greek intellectual heritage into the new ruling language of the Middle East and that it was as much a process of active rediscovery of the Greek scientific and philosophical tradition (Gutas 1998). To be sure, the *Organon* had already been translated into Syriac and been the subject of commentaries by a number of Syriac scholars before the eighth century. This meant that basic Greek logical terminology was already available in a Semitic language prior to the Arabic translation movement. Arabic translations of philosophical works were sometimes based on Syriac intermediary translations rather than translated directly from Greek. The translators were usually eastern Christians versed in the Greek and Syriac intellectual tradition. Yet, the Arabic logical tradition, as it emerged in the late ninth and early tenth centuries, was arguably more than a continuation in Arabic of a preexisting Syriac or Greek tradition. Works were translated into Arabic that may not have been regularly studied for centuries. Of Aristotle's *Organon*, the *Categories*, *De Interpretatione*, and the first seven chapters of

Book I of the *Prior Analytics* (dealing with the assertoric syllogism) seem to have dominated the Syriac tradition of logic. By contrast, all the books of the *Organon*, along with many of the Greek commentators, as well as some of the logical works of Galen, were translated into Arabic – often more than once – between the late eighth century and the early tenth. Al-Fārābī (d. 950) claimed that the scope of logical studies had been considerably expanded in his time from what it had been in preceding centuries, to incorporate the latter parts of the *Prior Analytics* (dealing with modal syllogistic), the *Posterior Analytics*, the *Topics*, and the other books of the *Organon* (Gutas 1999). The accuracy of Al-Fārābī's claim is certainly not beyond question. There is evidence that at least some Syriac scholars from the sixth and seventh centuries were familiar with the later books of the *Organon* and considered them the pinnacle of the course of logical studies (Watt 2009). Nevertheless, Al-Fārābī's account is generally considered to have an element of truth, for there is also evidence, both in Syriac and in Latin, for an “abridged” *Organon* consisting of the *Categories*, *De Interpretatione*, and the first seven chapters of Book I of *Prior Analytics*, and it is this tradition that tends to loom large in independent Syriac presentations of logic. This focus on the early books of the *Organon* is also in evidence in the earliest extant Arabic overviews of Aristotelian logic, by Ibn al-Muqaffaʿ (d. ca. 757) and al-Kindī (d. 873). The tradition of the “abridged” *Organon* was consciously rejected by Al-Fārābī and played a marginal role in the later Arabic logical tradition.

In its earliest period, reflections on logic in Arabic were closely linked to the process of translating and commenting upon the works of Aristotle. The first important center for this activity was the Abbāsīd capital, Baghdad, in the late ninth and early tenth centuries, during which a circle of scholars emerged who saw themselves as a continuation of the Alexandrian Aristotelian tradition (Hasnawi 1985). The most important figure of this circle was undoubtedly the aforementioned Al-Fārābī, who wrote esteemed long and short commentaries on the works of the *Organon*, many of which are now lost (Zimmermann

1981; Rescher 1963a). He also wrote a number of popularizing works designed in part to introduce and fix logical terminology in Arabic and in part to advocate the advantages of the study of logic (*manṭiq*) in an environment that often viewed the “ancient sciences” with incomprehension or religiously motivated hostility (Lameer 1994; Dunlop 1958).

Other prominent figures in the Baghdad Aristotelian circle were Al-Fārābī’s student Yaḥyā b. ‘Adī (d. 974); the latter’s student Ibn al-Suwār (d. 1017), whose annotated copy of the *Organon* underlies the earliest extant manuscripts in Arabic; and Ibn al-Ṭayyib (d. 1043), whose commentaries on Aristotle’s *Categories* and on Porphyry’s *Isagoge* are extant (Ferrari 2006; Gyekye 1979). In the late tenth century, the influence of the Baghdad “school” was extended to Islamic Spain, where it flourished in the following two centuries, with such prominent scholars as Ibn Bājja (Avempace, d. 1138) and – most famously – Ibn Rushd (Averroes, d. 1198), whose monumental commentaries on Aristotle’s works were to have a good deal of influence in the Latin West.

In the Islamic world, however, the approach of the Baghdad circle was gradually superseded by the influence emanating from Ibn Sīnā (Avicenna – d. 1037), who was active in Central Asia and Persia. With Avicenna, the Arabic logical tradition started a process whereby it became entirely divorced from the exegesis of Aristotle’s logical works. Avicenna was less concerned with getting the interpretation of Aristotle right and more willing to make radical departures from received views (Gutas 1988). For example, the Arabic Aristotelian commentators had inherited from the Greek commentators an acceptance of the Stoic schemata of propositional logic (*modus ponens*, *modus tollens*, and disjunctive syllogism) alongside the term-logical categorical syllogisms of Aristotle. Avicenna – while retaining this Stoic element – devoted a considerable part of the book on syllogism (*qiyās*) in his magnum opus *al-Shifā’* (*The Cure*) to developing wholly hypothetical syllogisms, that is, syllogisms in which both premises are either conditionals or disjunctions. Avicenna also took the apparently unprecedented step of “quantifying” conditionals, thus distinguishing

between the universal-affirmative “Always: if P then Q” and the particular-affirmative “Once: if P then Q” and their negations (Shehaby 1973). Avicenna’s distinctive approach to the Aristotelian corpus is also in evidence in his discussion of modal logic. The Arabic Aristotelian commentators had continued the efforts of their Greek predecessors to arrive at a satisfying interpretation of Aristotle’s modal logic (Elamrani-Jamal 1995). By contrast, Avicenna baldly stated that Aristotle’s remarks on the topic were tests for students, rather than considered opinions, and that what Aristotle really meant to state as a considered opinion was what he (Avicenna) would go on to expound at some length. Central to Avicenna’s modal logic was the distinction between a *waṣfī* (descriptive) and a *dhātī* (substantial) reading of a modal proposition. On the first reading, the modality inheres in the description of the subject: in this sense, for example, it is true that “Every sleeper is necessarily asleep.” On the second reading, the modality inheres in the essence or substance of the subject: in this sense, for example, it is true that “Every sleeper is possibly not asleep” (Street 2002).

Besides the monumental *al-Shifā’*, Avicenna wrote a number of shorter works, including the highly condensed *Pointers and Reminders* (*al-Ishārāt wa-l-tanbīhāt*) that were much commented upon in subsequent centuries. The influence of these works was momentous. Within two centuries of Avicenna’s death, they had replaced Aristotle’s works as the point of departure for logicians writing in Arabic. After the middle of the thirteenth century, it is difficult to find a logician writing in Arabic who engaged directly with the writings of any logician before Avicenna.

In the course of the eleventh and twelfth centuries, the Arabic tradition of Neoplatonized Aristotelian philosophy (*falsafa*) came head to head with Islamic rational theology (*kalām*). A number of theologians attempted to refute – by rational argument – those aspects of Neoplatonic and Aristotelian physics and metaphysics that they perceived to be incompatible with the Islamic faith. Most prominent among these theologians were al-Ġazālī (d. 1111) and Fakhr al-Dīn al-

Rāzī (d. 1210). Both scholars had no trouble with the discipline of logic and in fact explicitly defended its usefulness (Marmura 1975). Their endorsement was important for getting logic accepted into mainstream Islamic intellectual culture, though pious opposition never died out entirely (see Hallaq 1993) and has been strengthened in modern times by the rise of the Sunni fundamentalist Salafī–Wahhābī movement (El-Rouayheb 2004).

Both al-Ġazālī and Fakhr al-Dīn al-Rāzī wrote works on logic. al-Ġazālī confined himself to elementary and noncontroversial expositions intended for budding jurists and theologians, whereas al-Rāzī wrote lengthy, sophisticated, and influential logical works. He too took his point of departure in the writings of Avicenna, but approached them with a critical spirit similar to the way in which Avicenna had himself approached the preceding Aristotelian tradition. For example, al-Rāzī had no qualms about accepting the fourth figure of the syllogism, and that remained the mainstream view among Arabic logicians down to modern times. He also distinguished – more systematically than Avicenna did – between alethic and temporal modalities and between one-sided and two-sided modalities (e.g., between possibility and contingency). These distinctions, along with Avicenna’s distinction between *waṣfī* and *dhātī* readings, formed the core of a developed system of more than a dozen modal propositions that bore little resemblance to anything in Aristotle (Strobino and Thom 2016). al-Rāzī was also a pivotal figure in what the famous historian Ibn Khaldūn (d. 1406) noted was a thoroughgoing revision of the scope of logic. From al-Rāzī onward, Ibn Khaldūn observed logicians writing in Arabic ceased to be interested in covering all the topics of the *Organon* and started focusing almost exclusively on the five predicables, definition, propositions and their immediate implications, and the formal syllogistic, including modal and hypothetical syllogisms (Rosenthal 1958: vol 3, pp. 142–143). In the thirteenth century, logicians working in the wake of Avicenna and al-Rāzī subjected these topics to lengthy, critical, and sophisticated treatment, producing comprehensive summās of formal logic

that have only recently started to receive the attention they deserve from historians of logic. Another logician mentioned as a pivotal figure by Ibn Khaldūn was Afḍal al-Dīn al-Khūnajī (d. 1248), a Persian-born scholar and judge in Ayyūbid Egypt. His lengthy *Kashf al-Asrār* clearly exhibits the turn toward an extensive and critical discussion of formal topics with little patience for exegetical questions. Among the many innovations of that rich work, which in many ways set the agenda for most other thirteenth-century Arabic works on logic, the following can be mentioned (see Khūnajī 2010):

- (a) Avicenna’s discussion of hypothetical syllogisms was expanded and modified. For example, hypothetical syllogisms were discussed in which the premises only share a term, rather than an entire antecedent or consequent, for example:

Always: If Every A is B, then J is D.

Always: If Every B is H, then W is Z.

Once: If (Always: If A is H, then J is D), then (Always: If A is H, then W is Z).

- (b) The logical relations between terms and propositions were explored systematically. Two terms can be related in one of the four ways: they can have identical extensions (*musāwāt*), they can have partially overlapping extensions (*‘umūm wa-khuṣūṣ min wajh*), they can have extensions that do not overlap (*mubāyana*), and one can be more “general” (*a‘amm*) and the other more “specific” (*akhaṣṣ*). Khūnajī went on to establish the relations between the contradictories of terms related in one of the four ways: for example, if A is more general in extension than B, then not-A is more specific in extension than not-B. Two propositions can be related in the same four ways: they can be such that the truth of either implies the truth of the other (*musāwāt*); or the truth of one implies the truth of the other but not vice versa (*‘umūm wa-khuṣūṣ muṭlaq*); or they are compatible, but either can be true without the other (*‘umūm wa-khuṣūṣ min wajh*); or they are incompatible (*mubāyana*). Khūnajī

discussed at length the relations that obtained between the more than dozen modal propositions presented by al-Rāzī. He brought these relations to bear on the discussion of conversion, contraposition, and the syllogistic, explicitly recognizing, for example, that if a proposition p implies another proposition, then any proposition more “specific” than p also implies that proposition. Similarly, if it could be shown that a proposition q does not imply another proposition, then any proposition that is more “general” than q also does not imply that proposition.

- (c) The immediate implications (*lawāzim*) of conditionals and disjunctions were discussed extensively. For example, De Morgan’s laws were recognized: an “exhaustive disjunction” (*munfaṣila māni’at khuluww*) of the form “Either P or Q ” implies an “exclusive disjunction” (*munfaṣila māni’at jam*) consisting of the negation of both disjuncts: “Not both $\sim P$ and $\sim Q$,” and vice versa. Also, the implications of conditionals and disjunctions with complex antecedents, consequents, or disjuncts were investigated. For example, the universal-affirmative conditional “Always: if P then (Q and R)” implies the two universal-affirmative conditionals “Always: if P then Q ” and “Always: if P then R .” By contrast, the universal-affirmative “Always: if (P and Q) then R ” only implies two particular-affirmative conditionals “Once: if P then R ” and “Once: if Q then R .”

- (d) Avicenna had advanced the principle that the truth of a conditional implies the falsity of a conditional with the same antecedent and negated consequence (i.e., “Always: if P then Q ” implies “Never: if P then not- Q ”). This was questioned by Khūnajī, who pointed out that any valid argument consisting of two premises and their conclusion could be turned into a complex *reductio* syllogism in which the two original premises and the negation of the conclusion imply both a proposition (the original conclusion) and its contradictory (the negation of the original conclusion). This in turn meant that one could construct a true

conditional having the three inconsistent premises as antecedent and both contradictories as consequences. Related to this point, what has come to be known as “Aristotle’s principle” that no proposition is implied by its own negation was challenged. Khūnajī pointed out that the apparently true universal-affirmative conditionals “Always: if (P and not- P) then P ” and “Always: if (P and not- P) then not- P ” produce (by the first mood of the third figure of the hypothetical syllogism) “Once: if P then not- P ” (see El-Rouayheb 2009). Incidentally, the idea that Aristotle’s principle is false and that two contradictory propositions may follow from the same impossible antecedent is the closest that Arabic logicians came to formulating the principle that any proposition follows from a contradiction (*ex falso quodlibet*) that was widely accepted in medieval Latin logic (and is widely accepted in modern logic).

- (e) Avicenna had given a proof for the productivity of first-figure syllogisms with possibility minors, that is, the following syllogisms of the form:
- Every J is possibly B .
Every B is necessarily A .
Therefore, Every J is necessarily A .

He did so by supposing the possibility in the first premise actualized (i.e., that “Every J is actually B ”) and then arguing that the mentioned conclusion evidently follows in such a case. This in turn meant that the conclusion also follows from the original first premise (“Every J is possibly B ”), for it is not possible that supposing a possibility actualized should lead to an impossibility such as the conclusion becoming necessary when it is not already so. It has recently been shown that Avicenna’s proof assumes the principle (accepted in modern modal system S5) that modal propositions have the same modality in every possible world (Thom 2008): he in effect considers the possible world in which every J is actually B shows that in that world, the necessity conclusion follows and hence that in this world too, the necessity conclusion is true. His proof was

rejected by Khūnajī, who drew a distinction – following al-Rāzī – between understanding the subject term of a proposition such as “Every J is B” as applying to everything that is J in extra-mental existence (the so-called *khārījī* reading of a proposition) and understanding the subject term as applying to anything that would be J if it existed (the *ḥaqīqī* reading). The first reading, akin to the *de re* understanding of modality in the Latin tradition, interprets the proposition as saying that it is true of everything that is J that it is B with some kind of modality (possibly, necessarily, always, etc.). On this reading, the mentioned syllogism with a possibility minor is sterile: donkeys are possibly ridden by Zayd, and everything ridden by Zayd is necessarily a horse (if he in fact only rides horses), and yet it is not true that donkeys are possibly horses. The second reading interprets the proposition as saying that everything that is J if it exists is B (with some modality) if it exists. This seems to add an element of *de dicto* necessity to the previous *de re* reading: it is necessary that if something is J, then it is B with some modality. On this reading, the mentioned counterexample is not relevant, for the major “Everything ridden by Zayd is necessarily a horse” is false as a *ḥaqīqī* proposition. Khūnajī, while conceding that no counterexamples were readily available when the premises are taken as *ḥaqīqī* propositions, nevertheless objected to Avicenna’s proof, and he considered as illegitimate precisely the moves in the proof that presuppose S5 and would be impermissible from the perspective of other modern modal systems such as T: in the possible world in which every J is actually B, one cannot assume that the original major remains true.

Other prominent logicians of the thirteenth century include Athīr al-Dīn al-Abharī (d. 1265), Naṣīr al-Dīn al-Ṭūsī (d. 1274), Najm al-Dīn al-Kātibī (d. 1276), Sirāj al-Dīn al-Urmawī (d. 1283), and Shams al-Dīn al-Samarqandī (d. 1322). Besides writing lengthy summas, these scholars also produced condensed and widely studied handbooks, such as Abharī’s *Īsāgūjī*, Kātibī’s *al-Risāla al-Shamsiyya*, and Urmawī’s *Maṭālī‘ al-anwār*. Abharī’s *Īsāgūjī* is an elementary introduction to logic (and hence of wider scope than Porphyry’s *Isagōgē*). The latter

two handbooks are more advanced and clearly indebted to Khūnajī’s *Kashf al-Asrār*. Such condensed handbooks formed the point of departure for writings on logic in Arabic after the thirteenth century.

The notion of “the Middle Ages” has little application in the case of Islamic history. There was no cultural or intellectual upheaval in the fifteenth and sixteenth centuries comparable to the Renaissance and the Reformation in Europe. This also meant that logical studies in the Islamic world could be pursued until the modern period without the shadow of the misgivings of humanists and reformers. After the twelfth century, logic (*manṭiq*) became an integral part of the education of Muslim scholars and continued to be studied at colleges like Al-Azhar in Cairo until the twentieth century. Neoplatonic/Aristotelian *falsafa* had fallen into disrepute in many parts of the Islamic world, but logic was still considered useful as an “instrumental” science (like grammar, semantics-rhetoric, and dialectic) without which one could not master jurisprudence (*uṣūl al-fiqh*) or theology (*kalām*). The latter disciplines became increasingly suffused with logical terminology and argument forms after al-Ġazālī (Hallaq 1990), and several influential handbooks on jurisprudence and theology started with an exposition of logic.

A vast amount of commentaries, glosses, and super-glosses on logical handbooks and treatises survive from what Europeans would call the late medieval and early modern period (Wisnovsky 2004). Important centers for logical studies included Persia and Central Asia, Ottoman Turkey, Northwest Africa (modern Morocco, Algeria, and Tunisia), and – from the seventeenth century – India. Influential later logicians include the following:

- (a) Quṭb al-Dīn al-Razī al-Taḥṭānī (d. 1365), a Persian scholar who settled and died in Damascus. He wrote widely used commentaries on Kātibī’s *Shamsiyya* and Urmawī’s *Maṭālī‘* and a number of shorter treatises on logical topics, including a treatise on the division of knowledge into conception and assent (which was the typical starting point of handbooks on logic).

- (b) Saʿd al-Dīn al-Taftāzānī (d. 1390), active in Timurid Central Asia. He wrote a commentary on Kātibī's *Shamsiyya* and his own epitome of logic entitled *Tahdhīb al-manṭiq*.
- (c) al-Sayyid al-Sharīf al-Jurjānī (d. 1413), Taftāzānī's rival in Timurid Central Asia. He wrote widely studied glosses on Quṭb al-Dīn al-Rāzī al-Taḥṭānī's commentaries on the *Shamsiyya* and the *Maṭālī*ʿ.
- (d) Meḥmed Fenārī (d. 1431), one of the first prominent Ottoman scholars. He wrote a demanding and widely glossed commentary on Abharī's *Īsāgūjī* and prefaced his voluminous work on jurisprudence *Fuṣūl al-badāʾī*ʿ with a lengthy and sophisticated exposition of logic.
- (e) Muḥammad b. Yūsuf al-Sanūsī (d. 1490), active in the town of Tlemcen in what is today Algeria. He wrote a commentary on an expanded version of Abharī's *Īsāgūjī*; a commentary on an epitome on logic by the Tunisian scholar Ibn ʿArafā (d. 1401), and his own epitome of logic (known as *Mukhtaṣar al-Sanūsī*); and a commentary on it that became a standard handbook in North Africa.
- (f) Jalal al-Dīn al-Dawānī (d. 1502), active in western Persia. He wrote an esteemed but incomplete commentary on Taftāzānī's *Tahdhīb al-manṭiq*, glosses on Jurjānī's glosses on Quṭb al-Dīn al-Taḥṭānī's commentaries on *al-Shamsiyya* and *Maṭālī*ʿ *al-anwār*, and a treatise on the liar's paradox.
- (g) ʿIsām al-Dīn al-Isfarāyīnī (d. 1536), active in eastern Persia and Central Asia. He wrote extensive glosses on Quṭb al-Dīn al-Taḥṭānī's commentary on the *Shamsiyya*.
- (h) Mīr Abū l-Faṭḥ al-Ḥusaynī (d. 1568), active in Safavid Iran. He wrote esteemed glosses on Dawānī's commentary on *Tahdhīb al-manṭiq*.
- (i) Mullā ʿAbdullāh al-Yazdī (d. 1581), active in Safavid Iran. He wrote a commentary on Taftāzānī's *Tahdhīb* that was widely studied in Persia and India.
- (j) Mullā Ṣadrā al-Shīrāzī (d. 1635), active in Safavid Iran. He wrote extensive glosses on the logic section of *Ḥikmat al-ishrāq* by the philosopher Suhrawardī (d. 1191), a handbook on logic entitled *al-Tanqīḥ* and a treatise on the division of knowledge into conception and assent (Lameer 2006).
- (k) ʿAbd al-Ḥakīm al-Siyālkūtī (d. 1657), active in Mughal India. He wrote extensive glosses on Quṭb al-Dīn al-Taḥṭānī's commentary on the *Shamsiyya*.
- (l) Mīr Zāhid al-Harawī (d. 1690), active in Mughal India. He wrote esteemed glosses on Dawānī's commentary on *Tahdhīb al-manṭiq* and on the treatise on conception and assent by Quṭb al-Dīn al-Taḥṭānī.
- (m) al-Ḥasan al-Yūsī (d. 1691), active in Morocco. He wrote extensive glosses on Sanūsī's *Mukhtaṣar* and a treatise on the difference between the differentia (*faṣl*) and the unique property (*khāṣṣa*).
- (n) Muḥibbullāh al-Bihārī (d. 1707), active in Mughal India. He wrote a handbook on logic entitled *Sullam al-ʿulūm* that was much commented upon by later Indian scholars.
- (o) Ismāʿīl Gelenbevī (d. 1791), a Turkish Ottoman scholar who wrote a commentary on Abharī's *Īsāgūjī*, extensive glosses on Dawānī's commentary (and Mīr Abū-l-Faṭḥ's glosses) on *Tahdhīb al-manṭiq*, a treatise on modality, and a handbook on logic entitled *al-Burhān* that was much commented upon by later Ottoman scholars.

For much of the twentieth century, it was assumed that the mere fact that school handbooks, commentaries, and glosses became the main form of logical writings after the middle

of the fourteenth century is an indication of “stagnation,” “decadence,” and “commentary mongering” (Madkour 1969; Rescher 1964; Inati 1996). This view has been challenged by scholars who argue, sensibly, that one should at least look at this material before making such sweeping judgments (Street 2004; Wisnovsky 2004). After all, the very same scholars who have made such damning judgments would presumably not want to say that Al-Fārābī and Averroes do not deserve the attention of historians of logic merely because they wrote commentaries. Preliminary samplings of later literature indicate that the basics of modal and conditional logic as outlined by the thirteenth-century handbooks were taken as settled. However, extensive and often sophisticated discussions continued on other topics: the division of knowledge into conception and assent (Lameer 2006); whether a proposition has three parts (subject, predicate, and propositional connector) or four (plus assertion or negation of the connector) (El-Rouayheb 2016); the liar’s paradox (*al-jadhr al-aṣamm*) (Qaramaleki 2007); the apparently self-refuting nature of the principle that it is not possible to make any judgment about “what is not conceived in any way” (*al-majhūl al-muṭlaq*), the problem being that the principle seems precisely to be a judgment about what is not conceived in any way (Lameer 2014); and inferences involving relational propositions (El-Rouayheb 2010).

Nevertheless, the change of literary form that Arabic writings on logic underwent in the course of the fourteenth century is striking. After around 1350, extensive summaries of logic, such as had been written by a number of thirteenth- and early fourteenth-century scholars, become exceedingly rare. Henceforth, almost all lengthy Arabic writings on logic assumed the form of commentaries and glosses (on condensed handbooks, didactic poems) or short treatises on particular topics. In this respect, the development of Arabic logic had come full circle. After the mid-fourteenth century, writing on logic in Arabic again became intimately linked to the exegesis of texts.

theories of the properties of terms, entered into the Latin world from translations of Byzantine and Arabic logical works. This was, as M.L. de Rijk showed in the 1960s, completely wrong. He argued convincingly that this part of medieval logic was partly due to Aristotle's *Sophistici elenchi* but foremost it was due to the creative minds of late twelfth-century logicians. His judgment of earlier views was so harsh, however, that Arabic logic in the Latin tradition has hardly been studied at all. Most scholars are of the opinion that Arabic logic had very little, if any, influence on western logic, but although Arabic logic did not revolutionize western logic as was once thought, it certainly is part of the western logical tradition and as such it had quite a significant influence, though not in the way previously thought.

The Latin logicians of the thirteenth century had quite a good grasp of Arabic logic. The major source for this knowledge was the *Maqāṣid al-falāsifa* (*Intentions of the Philosophers*) by Abū Ḥāmid Muḥammad al-Ġazālī (1058–1111). It was supposed to be a preparatory work for his later much more well known *Tahāfut al-falāsifa* (*The Incoherence of the Philosophers*). The whole of the *Maqāṣid* contains a presentation of logic, physics, metaphysics, and theology and has been claimed to be an intelligent reworking of Avicenna's *Dānesh-name* (*Book of Science*), which is a compendium of his doctrines written in Persian. Al-Ġazālī's work was translated in full into Latin early in the second half of the twelfth century, which is not more than 50 or 75 years after it was written. In one of the manuscripts the title is *Liber Algazelis de summa theoricæ philosophiæ*, but it was also printed in Venice in 1506 under the title *Logica et philosophia Algazelis arabis*. The twelfth-century translation was by Dominicus Gundissalinus and was commissioned by John, the Archbishop of Toledo (1151–1166).

The Latin translation of the *Maqāṣid* was very much read and became, at least in the thirteenth century, the basic text from which the Latin authors gained their knowledge of Arabic

Logic, Arabic, in the Latin Middle Ages

Henrik Lagerlund

Department of Philosophy, Stockholm University,
Stockholm, Sweden

Abstract

C. Prantl argued in the mid-nineteenth century that the part of western logic nowadays called *logica modernorum*, that is, the so called

philosophy. The reason it became so much read was because it mentions some of the “hot” topics of the period, for example, the divisions of the sciences, the distinction between essence and existence, the eternity of the world, the number of souls, etc. It was also a very controversial work. In his *Tractatus de erroribus philosophorum*, Giles of Rome lists 18 errors of al-Ġazālī taken from the *Maqāṣid*. They later found their way into the *Directorium inquisitorum* from 1376 by Nicholas Eymerich. The logic became very well known as well. Albert the Great used it quite extensively and it was used or copied by Ramón Llull.

Al-Ġazālī begins the *Maqāṣid* with a distinction between imagination (*imaginatio*) and belief (*credulitas*). An imagination is an apprehension of a thing, he writes, which is signified by a single mental utterance (*dictio*) in the intellect. Names like “stone” or “tree,” etc. signify these apprehensions or imaginations. A belief is on the other hand a sentence or a complex utterance, that is, that which says or expresses something, like “the world begins.” A belief is always a composition of at least two imaginations. The kind of knowledge that is mediated by imagination is arrived at through definitions and descriptions and the kind of knowledge that is mediated by belief is arrived at through arguments. It is logic that gives the rules by which we are able to give good and true definitions and arguments. Hence, logic is the very foundation of knowledge and all science, argues al-Ġazālī.

The division of logic is done to show the aim or intention of logic. The aim is to define and prove. He gives the following fourfold division:

1. On terms and how they signify understandings (*intellectiones*).
2. On concepts (terms) and their divisions.
3. On propositions and their composition.
4. On proofs, which are subdivided into material and formal syllogisms.

The main thing to note about this division is the close connection between mind and logic. The view of logic as being about intentions is derived from Avicenna and it was very influential. It gave

rise to a major controversy in the thirteenth century between those who argued that logic was a science of discourse (*scientia sermocinalis*) and those who argued that it was a science of reason (*scientia rationalis*). Albert the Great argues, for example, that logic is a science of mental intentions.

The Arabic discussion of the matter of the syllogism found in al-Ġazālī’s logic is of particular interest. His division of the matter had an influence on several Latin logicians and among them on Thomas Aquinas. The matter of a syllogism consists in its premises. If they are credible and true, then the conclusion will be credible and true, but if the premises are false, then the conclusion will not be credible. Al-Ġazālī tries to explain what he means by the distinction between the matter and form of a syllogism by an analogy with a coin. The matter of the coin is the gold it is made of and its form is its roundness. If the form is destroyed or falsified in some way, we will not call it a coin anymore. Sometimes the matter of the coin is also changed, that is, a coin, he notes, might be made from iron or silver. It is then not worth as much, but it is still a coin. In the same way, the form and matter of a syllogism can change. If the form changes so that it is not in accordance with any of the figures, then it is no longer a syllogism and presumably not an argument anymore, but sometimes the form is the correct one, but the matter is different and the premises are only opinions or even sometimes false.

He gives the following division of the matter:

1. Demonstrative premises
2. Topical premises
3. Rhetorical and legal premises
4. Sophistical premises, and
5. Poetical premises.

Logic is hence subdivided into these five kinds.

Although the *Maqāṣid* was a summary of al-Fārābī’s and Avicenna’s doctrine, the Latin medieval logicians also had some knowledge of al-Fārābī’s and Avicenna’s logic directly. A twelfth-century translation of the beginning of Avicenna’s encyclopedic work *Kitāb al-Shifā’*

(*The Book of Healing*), namely the part on Porphyry's *Isagoge*, was circulating, and also a fragment of the part on the *Posterior Analytics* from the same book existed in Latin. Small fragments of some of al-Fārābī's logical works have also been discovered in Latin. Salman (1939), argues that there was knowledge of a commentary of the *Posterior Analytics* by al-Fārābī in the thirteenth century.

In the early thirteenth century, some of Averroes' commentaries on the *Organon* were translated into Latin. William of Luna translated the middle commentary on Porphyry's *Isagoge* and the middle commentaries on Aristotle's *Categories*, *De interpretatione*, *Prior Analytics*, and *Posterior Analytics* between the 1220s and 1230s, but Latin writers seem to have had knowledge of other logical works by Averroes than these.

Averroes' commentaries were important for a general understanding of Aristotle's very difficult texts. They are generally helpful in expounding the text and clearing up mistakes otherwise easily made, but the middle commentaries, unlike the major commentaries, do not really go beyond Aristotle's own text. In reading them carefully, however, an interpretation is usually indicated, but what influence, if any, they had in the subsequent thirteenth-century commentary tradition has not been carefully studied.

In many commentaries on Aristotle's logical works in the thirteenth century, a heavily metaphysical interpretation of logic is defended. There has been some discussion in the secondary literature about the source of this interpretation and one suggestion is that it has its source in Averroes' commentaries. His view of *differentia* can be found in Robert Kilwardby's commentaries on the *Isagoge* and the *Categories*. It can also be read into Aquinas' *De ente et essentia*. Averroes' treatment of modal syllogistics is also very interesting and strengthens his general metaphysical interpretation of Aristotle's logic. It seems also to have had some influence in the thirteenth century, particularly on Kilwardby's commentary on Aristotle's *Prior Analytics*. A detailed study of the logical theories in Arabic logic works accessible to Latin logicians has not been written yet. It is clear, however, that these doctrines never were as

influential as Prantl assumed, but neither did they exert no influence whatsoever.

Logic, Byzantine

Katerina Ierodiakonou

Department of Philosophy and History of Science, University of Athens, Athens, Greece
Department of Philosophy, University of Geneva, Geneva, Switzerland

Abstract

The Byzantine attitude toward the study and use of logic was ambivalent. Although some Byzantine thinkers argued that logic is of no value in the search for true knowledge, and so logical studies should be dismissed, some others treated logic as the preliminary stage of the philosophical curriculum as well as an instrument in defending Christian doctrines or

in rejecting heretic and pagan views. Thus, there were Byzantine philosophers who wrote commentaries and paraphrases of the Aristotelian *Organon*, small essays on specific logical issues, and brief introductions to logic. Their interpretations of Aristotle's texts are not always original, but they are worth studying as important sources of ancient logic and as stepping-stones in the history of logic.

The Byzantines' engagement in logic focused mainly on the explanation and interpretation of the different treatises of the Aristotelian *Organon*. The Byzantine philosophers wrote commentaries and paraphrases of Aristotle's logical writings, small essays on specific issues raised in Aristotle's logic, as well as brief introductions to logic covering sketchily the whole of the *Organon*.

For instance, on the *Categories*, we have Photios' and Arethas' comments from the second half of the ninth century and George Scholarios' extensive commentary from the fifteenth century; on the *De interpretatione*, two paraphrases by Michael Psellos and Leo Magentenios, from the eleventh and thirteenth century respectively (only in their Renaissance editions), and again an extensive commentary by George Scholarios; on the *Prior Analytics*, Michael Psellos' and Leo Magentenios' paraphrases; on the *Posterior Analytics*, and in particular on the second book, the twelfth-century commentaries by Eustratios of Nicaea and by Theodore Prodromos; on parts of the *Topics*, the comments by John Italos from the eleventh century and by Leo Magentenios; and on the *Sophistici elenchi*, the twelfth-century commentary by Michael of Ephesus, wrongly attributed to Alexander of Aphrodisias, and by Sophonias from the thirteenth century. Moreover, on the margins of manuscripts in libraries all over the world, there are many Byzantine logical comments by anonymous authors, which are unfortunately still unedited and need to be carefully studied.

Among the numerous Byzantine essays on logical issues, we have, for instance, a small essay by Theodore Prodromos which systematically argues against Aristotle's doctrine in the

Categories that “great” and “small” are not quantities but relatives; Michael Psellos’ *opusculum* no.6 on whether the two Basils or the two Gregories are homonyms or synonyms; and John Italos’ paragraph 38 of his *De arte dialectica* which is devoted to an account of *reductio ad impossibile* as a kind of hypothetical proof.

Finally, there are many Byzantine introductions to logic, for instance, the short synopsis by the so-called ‘Anonymus Heiberg from the beginning of the eleventh century, Nikephoros Blemmydes’ thirteenth century *Epitome logica*, and George Pachymeres’ still unedited compendium of the *Organon* from the late thirteenth century. It is worth noticing that in their logical introductions, the Byzantines often added short accounts of the hypothetical syllogisms, in which Stoic elements can sometimes be detected, although their Stoic origin is hardly ever acknowledged.

The Byzantine philosophers were interested in the study and interpretation of Aristotle’s logic as the preliminary stage of the philosophical curriculum. During the eleventh century, the standard syllabus of a course at the advanced level of the Byzantine educational system started with Porphyry’s *Isagoge*, Aristotle’s *Categories*, the *De interpretatione*, and *Prior Analytics* 1.1–7. Thus, we also have Byzantine comments on Porphyry’s *Isagoge*, like those by Arethas and by George Scholarios, but also a short Plato-style elenctic dialogue by Theodore Prodromos on topics from the *Isagoge* under the title *Xenedemus*.

The explanations and interpretations of Aristotle’s logical texts suggested by the Byzantine scholars are not always original. There is no doubt that the Byzantines made ample use of the ancient logical commentaries, especially of those by the Neoplatonic commentators (e.g., Porphyry, Ammonius, Simplicius, Olympiodorus, Philoponus). They also tried to incorporate into their logical writings views expressed by the Christian Fathers (e.g., John of Damascus, Gregory of Nazianzus), in order to show that logical theories are in perfect agreement with the Christian dogma. Finally, right at the end of the Byzantine era, George Scholarios’ logical commentaries

show a strong dependence on Western scholasticism both in terms of their content and in terms of their structure.

It is not the case, however, that the Byzantine authors slavishly follow their sources, for there are occasions on which they explicitly criticize Aristotle’s logical theories or proudly stress their own contribution to logic. Indeed, sometimes they give a slightly different argument to support an established position, sometimes they make a small but interesting addition to an ancient doctrine (for instance, by supplying a logical diagram), and sometimes they considerably diverge from the generally accepted view and introduce their own ideas which often aim at reconciling the Christian tradition with ancient philosophy. The Byzantine works on logic, therefore, are quarries for information about ancient logical theories and offer explanations or modifications of Aristotle’s doctrines, many of which are interesting and some of which are surprisingly subtle.

But it was not only for teaching purposes that the Byzantines read Aristotle’s logic and commented on it. In their attempt to defend Christian doctrines and reject the views both of the heretics and of the pagans, logic seemed, at least to some of them, to be a helpful instrument. For the Byzantine attitude toward the study and use of logic was rather ambivalent. Although some Byzantine thinkers praised and themselves made use of, to a lesser or greater extent, Aristotle’s logic, there were others who fiercely rejected the logical doctrines of pagan philosophers and their use, especially in theology.

In particular, there are two periods in the history of Byzantine thought that clearly attest to the centrality of the debate concerning the value of logic. At the end of the eleventh century, John Italos was put to trial and condemned by the Orthodox Church for defending the view that logical reasoning should be applied to theological questions. His student Eustratios of Nicaea also tried in his theological treatises to prove the truth of Christian doctrines by using logical arguments and even stated that Christ himself had argued with the help of Aristotelian syllogisms. On the other hand, during the first half of the fourteenth century, Nikephoros Gregoras argued that logical

studies should be altogether dismissed and logical theory should be regarded as completely useless. His contemporaries, however, Barlaam of Calabria and Gregory Palamas, claimed that logic is indeed useful in defending Christian belief, but they disagreed between them as to its precise use; for although they both stressed that neither demonstrative nor dialectical syllogisms yield any knowledge of God's essence, they debated over the question whether God's attributes can be the subject of demonstrative syllogisms.

Logic, Jewish

Charles H. Manekin
Department of Philosophy, University of
Maryland, College Park, MD, USA

Abstract

The study of Aristotelian logic was widespread among medieval Jews who studied even a rudimentary amount of profane science. Jews in Islamic lands appear to have learned logic mostly from the Arabic translations of Aristotle and the works of the Muslim Peripatetics. In Southern Europe, especially Spain, Southern France, and Italy, the earliest logical texts translated from Arabic into Hebrew were by al-Fārābī, followed by Averroes, whose paraphrases (Middle Commentaries) on the Aristotelian *Organon* were the authoritative texts that spawned commentaries. Beginning in the fourteenth century, Jews became familiar with the works of Scholastic logic, especially the *Tractatus* of Peter of Spain, and in the fifteenth century, Scholastic writings were translated into Hebrew, and one can speak of Hebrew Scholastic logic. Aside from the elementary primers that covered most of the *Organon*, the focus of the study was the *logica antiqua* (*Isagoge*, *Categories*, *De Interpretatione*); some authors were also interested in the *Posterior Analytics*. With the exception of Levi Gersonides (1288–1344), none embarked on an independent analysis of syllogistic, including modal syllogistic. Physicians, as well as rabbis engaged in religious disputations, had practical motives for the study of Scholastic logic, but some Jews simply were attracted to logic for its own sake. Because of its ideological neutrality, logic was studied not only by Aristotelian philosophers but by kabbalists as well.

The study of Aristotelian logic was widespread among medieval Jews who were educated even a rudimentary amount of profane science. Jews in Islamic lands appear to have learned logic mostly from the Arabic translations of Aristotle and the works of the Muslim Peripatetics. Aside from a short logical treatise attributed to Maimonides, little is extant in Judaeo-Arabic, the language of Jews living in Islamic lands. In Christian Europe, the earliest philosophical texts translated from Arabic into Hebrew were al-Fārābī's short treatises on the books of the *Organon*. These texts can be divided into three categories: (a) introductory works with sections on logic, (b) introductory essays to the study of logic, and (c) short treatises on individual books of the *Organon*. There is evidence for Hebrew translations of al-Fārābī's long commentaries on the *De Interpretatione* and the *Topics*; fragments of his long commentary on the *Prior Analytics* are preserved in Averroes' *Logical Questions*, some of which were translated into Hebrew, and in the last chapter of Maimonides' *Medical Aphorisms*. Some passages from the long commentary on the *Categories* are preserved in a commentary by the fifteenth-century Judah b. Isaac b. Moses Cohen on Averroes' *Middle Commentaries* on the *Categories*. These may have belonged to a commentary on the *Categories* by the fourteenth-century translator-savant, Samuel b. Judah of Marseilles, whom Judah considered his "teacher." The Hebrew translations of al-Fārābī's logical writings are extant in a significant number of copies, especially the *Enumeration of the Sciences*, the incomplete Hebrew translation of the short treatise on the *Topics*, and the *Sophistics*.

Two highly popular thirteenth-century Hebrew works that show clear influence of Farabian doctrine are Samuel Ibn Tibbon's glossary of foreign and original terms his Hebrew translation of Maimonides' *Guide for the Perplexed* and the Hebrew translation of the aforementioned logical treatise attributed to Maimonides under the name *Logical Terms*. The glossary includes several extended definitions of terms in logic, including the five predicables, ten categories, kinds of statements, and terms. Entire paragraphs from al-Fārābī's *Short Treatises* on the *Isagoge* and *Categories*

are “appropriated” without attribution, a practice that occurs frequently in Hebrew logical texts. Samuel also shows familiarity with Averroes’ *Epitome* of the *Organon* and his *Middle Commentaries* on Aristotle’s books. The *Logical Terms* appears to have been one of the most widely read works of Jewish logic: it is extant in over 80 manuscripts and 30 printed editions and was translated into Hebrew from Arabic three times. The work was used mostly as a primer for students before beginning the study of logic and is sometimes found in manuscripts with more advanced works. There is no evidence that the *Logical Terms* had any impact on Jewish intellectuals until late in the thirteenth or early in the fourteenth centuries, but since this work owes so much to al-Fārābī, ascertaining such impact would be difficult. Fourteenth-century savants Joseph Ibn Kaspi and Moses of Narbonne commented on it; the work is also mentioned by their contemporary Gersonides. Other medieval commentaries are attributed to Joseph Albo and Mordecai Comtino in the fifteenth, Abraham Farissol and Moses b. Shem Tov Ibn Habib in the sixteenth, and Samuel b. Saadia Ibn Danan in the seventeenth centuries, in addition to anonymous commentaries.

Between Samuel Ibn Tibbon’s glossary and the *Logical Terms*, one finds a somewhat more ambitious exposition of logic in Judah ha-Cohen Ibn Matqah’s encyclopedic work, the *Investigation of Wisdom*. It is the first Jewish compendium of the books of the *Organon*, or more precisely the first five books of the *Organon*. Judah was only interested in that part of Aristotle’s logic that led up to and included the theory of demonstration, since his work dealt with the sciences. Although the section on logic is mostly an abridgment of the Averroes’ *Middle Commentaries* on the relevant books, it also contains many elements from al-Fārābī’s introductory works and commentaries, as well as from Averroes’ *Epitome* of the *Organon*. Averroes’ *Middle Commentaries* on the first five books of the *Organon* were translated into Hebrew by Jacob Anatoli in 1232. The remaining four books of the *Organon* were translated in the next century by Qalonymos b. Qalonymos (*Topics*

and *Sophistics*) and Todros Todrosi (*Rhetoric* and *Poetics*).

By the mid-thirteenth century, Jewish intellectuals in Provence and Italy had at their disposal an array of Hebrew logical texts of varying difficulty. The doctrines to which they were exposed stemmed mainly from the introductory works and short treatises by al-Fārābī, although increasingly students were studying the texts of Aristotle themselves in Hebrew translation “as understood by the sage Averroes,” i.e., Averroes’ *Middle Commentaries*. The second half of the thirteenth and early fourteenth centuries saw translations of two other works that were destined to become popular vehicles for the transmission of Arabic Aristotelian logic into Hebrew: Averroes’ *Epitome* of the *Organon* in 1288–1289 by Jacob b. Makhir in Provence and Al-Ġazālī’s *Intentions of the Philosophers* by Isaac Albalag (late thirteenth century). Both works differ in order, structure, and occasionally content from Aristotle’s logical writings as presented in Averroes’ paraphrases. The *Epitome*, like other works of Arabic logic, is organized around the two types of knowledge, conception and assent. Under the former are subsumed the components of conception (signification of terms) and what leads to conception (the doctrine of the predicables), as well as what is useful, though not necessary, for conception (the doctrine of the *Categories*). Under the latter are subsumed the structure of assent (the doctrine of the proposition) and what leads to assent (the doctrine of the syllogism), as well as the rules according to which syllogisms are constructed (the doctrine of topical inferences). Having covered the broad outlines of conception and assent, Averroes applies them in the second half of the work to the five logical arts – demonstrative, sophistic, dialectic, rhetorical, and poetic. Jacob b. Makhir’s translation of the *Epitome* was criticized by Samuel b. Judah of Marseilles, who retranslated it in 1329, but the sole extant manuscript of the latter’s translation shows few significant divergences. Under the shortened and misleading title *The Entire Art of Logic* (at title appearing in manuscripts for various texts), the work was printed in 1559, one of the

few works of Hebrew logic to be printed in the premodern period.

In addition to Isaac Albalag's translation of the *Intentions of the Philosophers*, which he supplemented with his Averroistic "emendations," there were at least two other translations: one by an anonymous writer around the same time as Albalag and the other by the Provençal physician Judah Nathan in the mid-fourteenth century. The first section of this tripartite "encyclopedia" deals with logic, and, because of the popularity of the work as a whole, it became one of the most popular presentations of logic among the Jews through the Middle Ages and Renaissance. The section on logic is also constructed around conception and assent and is divided into five parts: terms, concepts, propositions, and syllogisms in their formal and material aspects. These parts correspond roughly to the five subsections, except that the material aspect of the syllogism, i.e., the epistemic value of syllogistic premises, is treated in the fourth subsection and the theory of demonstration in the fifth. The *Intentions* was appreciated by Jews both as an introduction to philosophy, albeit a popular one that needed emending (Albalag), and as a convenient manual that would obviate the need for further study (Nathan).

In the fourteenth century, especially in Southern France, the translation of Arabic manuals, encyclopedias, and commentaries gave way to the production of Hebrew compendia and commentaries. The Provençal Jewish savant, Joseph Kaspi, wrote his own abridgment of logic, *The Bundle of Silver*, while living in Spain (c. 1332–1333), for his son and his contemporaries. Kaspi writes that he only includes logical doctrines necessary for understanding the Scripture, drawn from the first five books of the *Organon* and the *Sophistics*, and not the *Topics*, *Rhetoric*, or *Poetics*, which, he claims, are for idle thinkers. While he was familiar with the short works by al-Fārābī and Averroes, these were too difficult for the beginning student. Kaspi follows and drastically abbreviates Averroes' *Middle Commentaries* in the early books, but he borrows from Averroes' *Epitome* and al-Fārābī's short treatises throughout the work, adding examples of his own

and from the Scripture to illustrate logical doctrine. The part corresponding to the *Sophistics* is an abbreviation of al-Fārābī's short treatise and not Averroes' *Middle Commentaries*, which had been translated into Hebrew in 1313 by Qalonymos ben Qalonymos (who later attacked Kaspi for misunderstanding Maimonides). In general, Kaspi relies on Averroes' *Epitome* and al-Fārābī's short treatises when the text in Averroes' *Middle Commentaries* becomes too challenging for beginners.

Al-Ġazālī's *Intentions of the Philosophers* was commented upon twice in the late thirteenth and fourteenth centuries, first by the translator Isaac Albalag and then by Moses of Narbonne, both Averroists. Albalag only devotes a handful of his emendations to the section on logic; some of the manuscripts, however, have two interpolated comments attributed to "Abner" that defend the need to posit a fourth syllogistic figure and criticize the Christian practice of adding five "indirect moods" to the first figure. G. Vajda identified the author of the glosses with the fourteenth-century Jewish philosopher and later convert Abner of Burgos; whoever the author is, he seems to be unaware that Galen had posited a fourth figure or that Averroes had criticized it; both points are contained in Averroes' *Middle Commentaries* and *Epitome*. Moses of Narbonne comments sporadically on the text, occasionally using examples from the Bible and Talmud. In addition to Moses' commentary, there are commentaries by the fifteenth-century Italian poet Moses da Rieti, the sixteenth-century Karaite scholar Abraham Bali (c. 1510 – the commentary is only on the first section), his younger contemporary the Salonican philosopher Moses Almosnino entitled *The Tower of Strength*, and two anonymous commentaries, one of Provençal origin.

The *Intentions of the Philosophers* presented to its readers the doctrines of Avicenna, little of whose own work was translated into Hebrew during the Middle Ages, as far as we know. Excerpts from Avicenna are preserved in a philosophical anthology of texts translated by Todros Todrosi in a single manuscript. In the section dedicated to logic, Todrosi presents excerpts from Fakhr

al-Dīn al-Rāzī's *Eastern Investigations*, al-Fārābī's short treatises on logic, and Chapter 8 of the long commentary on the *Topics* (extant only in this Hebrew excerpt). Avicenna's *Cure*, Themistius' paraphrase of the *Prior Analytics* and the *Posterior Analytics* (extant only in this Hebrew excerpt), Al-Ġazālī's *Criterion of Knowledge*, and Averroes' *Middle* and *Long Commentaries* on the *Posterior Analytics* and the *Middle Commentaries* on the *Topics*.

Critical gloss-commentaries on the first seven books of Averroes' *Middle Commentaries* on the *Organon* were completed between c. 1321 and c. 1323 by Levi Gersonides, the first part of his project of writing gloss-commentaries on the writings of Averroes available to him. These may have originated as oral comments in his lectures, but he wrote them down and in some cases revised them significantly. Gersonides assumed that his readers would have access to Anatoli's translation of the first five books, but not necessarily to Qalonymos' translations of the *Topics* and *Sophistics*. For the former he presented just his own gloss-commentary; for the latter, he weaved his commentary together with the translation.

Gersonides' commentary on the first three books of Averroes' *Middle Commentaries* takes the form of notes, explanatory and critical; only in the commentary on the *De Interpretatione* does one encounter longer quotations from Aristotle, with brief explanations inserted within the text. In his introduction he informs his reader that he is not writing a commentary for its own sake, since, in his opinion, the contents of Aristotle's logical works need no explanation. His intention is threefold: to explain Averroes' abridgments in the books of logic summarily, to mention the places where his views differ from those of Aristotle "according to what Averroes understood from his words," and to investigate matters not investigated. Since the original works really need no explanation, he writes, composition and not commentary is his primary aim. At first glance, that statement seems odd since there is much commentary in the work. But what Gersonides appears to be saying is that the aim of his commentary is not so much to explain Averroes' commentary on Aristotle, although there is some of that as well.

Rather, he wishes to provide his readers with the correct teachings of logic by means of commenting on the canonical texts of the ancients and correcting and completing them when necessary.

In the commentary on the *Prior Analytics* and the *Posterior Analytics*, the commentary is expanded because of the purported "difficulties" of the former and the "great usefulness" of the latter. His commentary on the *Posterior Analytics* was initially planned to be even more extensive. Gersonides' sources are mostly Averroes' commentaries, both *Middle Commentaries* and the *Epitome*, although he mentions al-Fārābī's commentaries and refers to the *Logical Terms* obliquely. There is no indication that he was familiar with Scholastic logic, but, like other philosophers in Provence, he makes occasional remarks about the "language of the Christians."

Gersonides' commentaries on the *Organon* "as understood by Averroes" were much studied by subsequent Jewish students, beginning already with his contemporaries, if we may judge from the large number of extant manuscripts and references to it in other works. Textual evidence from an anonymous commentary on the *Isagoge* and the *Categories* and from the aforementioned excerpts of a lost commentary by Samuel b. Judah of Marseilles preserved by Judah b. Isaac b. Moses Kohen in his commentary indicate that Gersonides was read and much criticized by contemporaries such as Jedaiah ha-Penini and Samuel, who appear to have corresponded with him after his commentary was disseminated. This is especially true of the commentaries on the first three books of the *Organon*, which formed the core of logical studies for Jewish intellectuals. If Averroes' *Middle Commentaries* became canonical works for the Jews, then Gersonides' commentaries became the canonical commentaries to Averroes. The Italian Jewish poet Moses da Rieti actually versified in Hebrew (and in *terza rima*!) some of the *Middle Commentaries* on the *Isagoge* "with the objections of Gersonides." It is small wonder that when Jewish savants in the Renaissance translated the commentaries of Averroes into Latin for the Venice Juntine edition of Averroes (1562–74), they included Gersonides'

commentaries on *Isagoge*, the *Categories*, and the *De Interpretatione*.

In fact, a critical note from Gersonides' *De Interpretatione* commentary in Jacob Mantino's Latin translation was discussed several centuries later by Sir William Hamilton and J. S. Mill. Hamilton had included the note in a list of authorities who purported to defend the doctrine of the quantification of the predicate. J. S. Mill pointed out in *An Examination of Sir William Hamilton's Philosophy* that according to the note, while one could theoretically quantify the predicate, the resulting sentence would express two propositions, e.g., "All As are Bs" and "All Bs are As," which violated the linguistic custom of one sentence expressing one proposition, a position that Mill endorsed. In subsequent editions, Mill referred to Levi's note as "an excellent passage from a Jewish philosopher of the fourteenth century, which exactly confutes Sir W. Hamilton's doctrine."

Gersonides' independent positions in his logic commentaries earned him more censure than praise. Fifteenth-century critics in Europe included Judah Kohen, probably in Northern Italy (according to Zonta); Judah b. Jehiel Messer Leon, one of the central figures of Italian Jewry during the Renaissance and, as we shall see below, the chief representative of what may be termed, "Hebrew scholastic logic"; and "the sage Eli," whom Steinschneider identified with the fifteenth-century Spanish Jewish translator and philosopher, Eli Habillo, although this identification has recently been questioned. Other anonymous commentaries cite Gersonides' commentary, one occasionally defending him against the criticisms of "Eli, known as Geronimo." Abraham Bibago, an older contemporary of Eli Habillo, wrote a commentary on Averroes' *Middle Commentaries* on the *Posterior Analytics* in which he criticizes Gersonides. More than any other commentator, he remarks, Gersonides had been led by confusions and mistakes to disagree with Averroes on several points and "to spout nonsense upon nonsense" in his commentary. In the second half of the fifteenth century, the Byzantine scholar Elijah Mizrahi wrote a highly penetrating series of animadversions on Gersonides' *Isagoge* commentary.

Gersonides' most interesting work from the standpoint of the history of logic is *The Book of the Correct Syllogism* (or *The Correct Book of the Syllogism*), which contains his treatment of syllogistic and non-syllogistic inference. Gersonides took it upon himself to "correct the errors" of Aristotle's modal logic, notably in the validity of the conversion of modal premises and modal syllogisms and the assessed modality of their conclusions. But to do this, he broadened the scope of the book to deal with all inferences: immediate and mediate (i.e., syllogistic). The treatment of inference is by far the most formalized among the Jews and arguably the most formalized in premodern logic. First positing and defending a set of rules that yield "consequences by virtue of the whole and the part," he deduces through them the laws of conversion and subalternation, justifies the various conditions of the syllogism, investigates the concludent premise pairs, and constructs the rules of inference for arguments with modal premises. Along the way he provides a spirited defense of the fourth syllogistic figure against the criticisms of Averroes and considers inferences with quantified predicates, as well as relational terms and prepositions, and two different interpretations of modal operators in the two editions of the book. Unlike Gersonides' commentaries on the *Organon*, the *Correct Syllogism* made little impact upon subsequent Jewish intellectuals, although the work was translated into Latin during the Renaissance.

The study of Arabic-Hebrew logic continued in Provence well into the fifteenth century, even after the general decline of philosophy among the Jews there. Two works testify to the enduring interest of this material: *The Royal Treasure*, a compendium of logic, metaphysics, and physics, in verse form, by Abraham Abigdor, and a lengthy commentary on Averroes' *Epitome* on the *Organon* by Mordecai Nathan. In the latter work, the influence of Scholastic logic is felt, especially in the section on the syllogism, where Mordecai cites the *Tractatus* of Peter of Spain. By the fifteenth century in Provence, a classic like Averroes' *Epitome* had been supplemented with a commentary that takes the Scholastic tradition of logic for granted.

Beginning in the fourteenth century in Provence and Italy and the fifteenth century in Spain, one finds a growing acquaintance with Scholastic logic among the Jews and then Hebrew Scholastic logic, itself. Much of this logic was familiar, since both Arabic and Latin logic derived in large part from the Aristotelian canon. Yet there were whole areas of Latin logic that had no counterpart in the Arabic tradition, such as supposition and syncategorematic theory, or the theory of consequences and insolubles.

The earliest dated work that draws on Scholastic logic is a translation and adaptation of a Latin gloss-commentary on the *Tractatus* of Peter of Spain, by Hezeqiah bar Halaftha in 1320. In the introduction Hezeqiah writes that he had come across a Latin gloss-commentary on that popular work. Hezeqiah translated the commentary because of its usefulness in disputations with Christians, its value for sharpening the mind, and its brevity and comprehensiveness. As is the practice of other Hebrew translators of this period, Hezeqiah does not translate word for word; rather he introduces glosses that cite freely from the Jewish and Arab philosophical traditions and "Judaizes" the material when possible.

A more telling example of literary appropriation through adaptation is found in Abraham Abigdor's translation of the *Tractatus* in the late fourteenth century. Abraham replaces Peter's definitions with others taken from the Arab Aristotelian tradition and waves into the text long passages of Averroes' *Middle Commentaries*, substituting them for the Latin text where possible. In the work's only gloss, Abraham informs his audience of the Christian practice of listing the major premise first; he needs to mention the divergence from the Arab tradition in order to explain the Scholastic "Barbara, Celarent" mnemonic, which assumes the priority of the major premise. The fourteenth-century scriptural exegete Shemariah the Cretan translated the *Tractatus* and passed it off as his own work, saying that he would write a book containing "all that is necessary for the readers of my books and commentaries to know." The "author" tries as best as he can to disguise the book's foreign origin by writing in the first person and substituting Hebrew linguistic

phenomena for Latin. Shemariah may have translated this book in his youth at the court of Robert d'Anjou.

Jewish treatments of logic written in Byzantium in the late fourteenth and early fifteenth centuries, such as Elijah b. Eliezer's *Book of Logic*, the relevant chapters of the Karaite Aaron b. Elijah of Nicomedia's *Tree of Life*, and Joseph b. Moses Kilti's "the Greek's" *Offering of Judah*, show no evidence of Scholastic logic. Only later, in the commentary on the *Logical Terms* by Mordecai Comtino (Khomatiano) do we find some familiarity with Latin logic manuals of the Renaissance, perhaps because of the ties between Venice and Constantinople. Comtino is one of the first Jewish logicians who mentions the so-called "false" fourth figure of the Renaissance logicians, which is really nothing other than a first-figure syllogism with transposed premises. He allows for their being four possible figures, but he holds that only the first three are significant. Comtino wrote a philosophical commentary on the Torah "containing Logic and Grammar, whereby the Torah is elucidated." Like Shemariah, if less enthusiastically, Comtino believed in the importance of logic for the study of Scripture.

The study of medicine provided one impetus for Jews to study manuals of Scholastic logic; another was to engage in religious disputations with Christians, especially in Spain and in Italy. Moses da Rieti lists the Latin names of the 14 direct syllogistic moods, with examples, in order to aid Jewish religious disputants, "so that their syllogisms not be rejected [by the Christians] as ill-formed, although their opinions are correct." He makes the important remark that the order of the premises in the syllogism does not matter, provided that the syllogistic rules are observed, a logical point that was disputed as late as the nineteenth century. But rather than provide a more detailed explanation of the information contained in the mnemonic, da Rieti refers his reader to the *Tractatus*, presumably in one of its Hebrew versions.

While these practical motivations for the study of logic from Latin sources were of importance, some Jews were simply attracted to the new kind of logic, though not to all aspects of Scholastic

logic. Jewish readers were interested mainly in the *logica antiqua*, the standard material of the Aristotelian *Organon* (less the *Posterior Analytics*) because it corresponded by and large to the subject matter of logic as reflected in the popular works of the Arabic-Hebrew logical tradition and it was not bound to the peculiarities of Latin. In contrast, the *logica modernorum* developed by the Scholastic logicians in the twelfth and thirteenth centuries was of considerably less interest. The exception was the “Barbara, Celarent” mnemonic, which seems to have been quite important, considering the number of attempts to render it in Hebrew.

More advanced works of Scholastic logic were translated into and composed in Hebrew in the fifteenth century. In Spain, Abraham Shalom translated a series of disputed *quaestiones* on the *Isagoge*, the *Categories*, and the *De Interpretatione*, which he attributed to “the sage Marsilio.” Abraham Shalom’s acquaintance and philosophical correspondent, Eli Habillo, translated several Scholastic tracts of logic concerning the problem of universals. One of these has been shown Zonta to be identical with the version of the *De unitate universalis* of Vincent Ferrer used by Petrus Niger. Two others are the four chapters on universals from Ockham’s *Summa Logicae* (I:14–17) and the *De Universalibus* mistakenly attributed to Aquinas. The four chapters from the *Summa Logicae* are the only known Hebrew translation of Ockham’s popular textbook.

The full impact of Scholastic influence on Hebrew logic was felt in Italy, first in the writings of isolated individuals and then in the education of Italian Jewish youth. We noted above Shemariah the Cretan’s ties to the court of Robert d’Anjou; another translator who had been associated with the court was Judah Romano, whose anthology of philosophical questions includes excerpts from the commentaries on the *Posterior Analytics* and the *Rhetoric* by Giles of Rome and commentaries and writings on the *De Interpretatione* and the *Categories* by Angelus de Camerino. Another of Romano’s anthologies includes a translation of an excerpt from the *De fallaciis ad quosdam nobiles* mistakenly attributed to Aquinas.

With Judah Messer Leon (Italy, d.1498), we encounter something new: a Jewish Scholastic logician writing in Hebrew. Messer Leon’s works include an introductory textbook on logic, *The Perfection of Beauty* (based to some extent on Paul of Venice’s *Logica Parva*); commentaries on the *Isagoge*, *Categories*, and *De Interpretatione* according to Averroes (dependent, according to Husik, on Burley’s *Super Artem Veterem Expositio*); and commentaries on the *Prior Analytics* and the *Posterior Analytics*, according to Averroes. His student, David the Sefaradi, calls the latter a translation of Paul of Venice. In the introduction to the *Perfection of Beauty*, Messer Leon adds to the conventional motives for writing a new logical textbook the need to combat the “sophistries and deceits” of the “pseudo-philosophers among our co-religionists,” namely, Gersonides. It should be emphasized that Messer Leon’s use of Scholastic logic was not directed against the older logical tradition of the Arab Peripatetics. On the contrary, he saw himself as a defender of Averroes and Aristotle against the bold and audacious attacks of the heterodox Gersonides. The *Perfection of Beauty* encompasses almost the entire range of elementary Scholastic logic, including obligations and insolubles. It is extant in around 13 manuscripts, and an abridgment was made of it by the translator-philosopher Abraham Farissol, who had studied at Messer Leon’s academy. Messer Leon, or one of his students, may have written a compendium and questions on Porphyry’s *Isagoge*, followed by a compendium on the *Categories*. Some of the questions and discussions show a marked similarity to the *Quaestiones in Veterem artem* of Radulphus Brito.

By the mid-sixteenth century, logical works by Jews had become increasingly rare, especially in Europe. One important work is by the physician-philosopher, Moses b. Judah Galiano, a translator from both Arabic and Latin, which covers the material from the *Isagoge* and the *Categories*, and in which the author wishes to defend Aristotle and Averroes against the objections of some of the “recent” authors; he cites Boethius, Albertus Magnus, Thomas, Scotus, and Burleigh “the sophist” among others.

Lorenzo Valla

Lodi Nauta

Department of Philosophy, University of Groningen, Groningen, The Netherlands

Abstract

Valla was one of the most important and interesting humanists of fifteenth-century Italy. Not only did he give the humanist program some of its most trenchant and combative formulations, but also made numerous positive contributions to scholarship. He translated Herodotus and Homer, commented on Livy and Quintilian, and exposed the famous Donation of Constantine as being a forgery. He approached critically for the first time the Greek text of the New Testament, an approach that had an immense

influence on Erasmus. He also wrote a highly influential textbook on the *Fine Points of the Latin Language* (*Elegantiae linguae Latinae*), in which he discussed a host of semantical, syntactical, and morphological features of classical Latin. Philosophically the most interesting work is his *Repastinatio dialectice et philosophie*, a heavy critique of some basic tenets of scholastic-Aristotelian philosophy and dialectic. What connects all these contributions is his central idea that language lies at the basis of our intellectual endeavors. Rejecting the scholastic, scientific approach toward language, he argued that the study of language – from the meaning of singular words to the analysis of extended forms of argumentation – should be thoroughly based on a close empirical study of language. For Valla it was important that words and arguments should not be taken out of context, for this invariably brings with it a change in meaning, and consequently gives rise to philosophical problems where none existed. He insisted that we should follow the linguistic custom of the ancients rather than construct abstract theories about language and argumentation in general. But he was no slavish follower of one particular brand of classical Latin, for example, Ciceronian Latin, and often treated classical Latin as a common language in opposition to the technical vocabulary of the scholastics.

Life

Lorenzo Valla (1406–1457) did not have an easy life. Equipped with a sharp and polemical mind, an even sharper pen, and a sense of self-importance verging on the pathological, he made many enemies not only among his scholastic contemporaries but also among his humanist colleagues. Born in Rome in a family with ties to the papal curia, Valla hoped to succeed his uncle as papal secretary, but he had already aroused the anger of some major humanists at the court. In 1431, he moved to Pavia where he taught rhetoric and wrote the first version of his controversial dialogue on pleasure. He also started to work on

his attack on scholastic philosophy and on his handbook of the Latin language. After having attacked the jurists for their mediocre learning and lack of the linguistic skills necessary to study law, he had to flee Pavia. He then worked in the court of King Alfonso of Aragon who was campaigning against Pope Eugenius IV. As court humanist, Valla wrote a series of anticlerical treatises, the most famous of which was *On the Donation of Constantine*, in which he exposed that document to be a forgery, thereby exploding one of the pillars of the papal claims to worldly power. In 1447, Valla returned to Rome to work at the Papal curia, first as apostolic scriptor and later as a papal secretary. He taught rhetoric and translated Thucydides and Herodotus. His last years were marred by further unedifying polemics with other humanists. He died in 1457 and was buried in the Lateran, somewhat surprisingly for a man who had spent so much time fighting the clerical establishment.

Valla's Thought: Some Basic Convictions

Valla's thought is shaped by the following basic convictions; most of them are typical for a humanist but Valla was much more conscious about them. They shaped his critical review of scholastic-Aristotelian philosophy.

1. Valla's world is the world of things we see and experience. It is pretty much a world of things with their qualities that do or undergo things. In order to explain or analyze this common sense picture of the world we do not need theoretical constructs, metaphysical notions, elaborate theories, or technical vocabulary.
2. This world – including human beings with their mental and spiritual inner life – naturally finds expression in language. But language is not just a piece of garment or a neutral medium that leaves the contents of what is being said unaffected. Language shapes the way we think about the world and how we categorize it. Whoever does not understand the workings of language falls prey to muddled thinking.
3. For a humanist such as Valla, this language could only be the Latin as used in Antiquity, especially that of the great authors. Valla was not wedded to one particular brand of classical Latin – for example, Ciceronian Latin – but considered postclassical developments to be detrimental to a common sense expression and explanation of the world. He was not against the introduction of new words as new things were being discovered unknown to Antiquity (e.g., “bombarda”), but the language of the scholastics was something wholly different.
4. Valla's aversion against scholastic Latin was thus not solely aesthetic. The study of language as pursued by the scholastics and speculative grammarians was misguided in a fundamental way. Of course, the scholastics had a wholly different program of study: they wanted to lay bare the logical forms inherent in language, being interested, for example, in the properties of terms and how terms were related to things in the world. They tried to formalize patterns of reasoning in order to establish truth conditions and rules of inference. But they had to do this in Latin, even though in a particular brand that was only vaguely related to its classical form. Their Latin was not only a metalanguage, a technical device, but was also used as an object-language, as an object of study. According to the humanists, the scholastics imposed artificial rules on Latin rather than examined the linguistic practice of the great Latin writers in order to determine the meaning of terms and rules of grammar and syntax. In this, they often erred in their judgments and opinions. They analyzed, for example, the behavior of words such as “all,” “some,” “not,” “possible,” and “necessary” without first making a proper study of how these words were actually used by Latin authors. Indeed, it was not simply a matter of making a mistake here or there. The scholastic language fundamentally distorted our view of reality, and confounded people.
5. Moreover, it had confounded people in a very essential way. According to Valla, the scholastics tried to explain Christian dogma's by

superimposing their theories and technical vocabulary on religious faith. Scholastic terminology had functioned as a kind of Trojan horse, bringing within the citadel of Christian faith pagan elements that had spoiled, defiled, and needlessly complicated its purity. As part of Valla's program to return to the sources of Christianity he inaugurated a program of study of the New Testament and patristic sources that had a great impact on biblical studies by later humanists. The explication of Christian faith had to appeal to the hearts of men. It had to turn to rhetoric and grammar rather than to logic and metaphysics.

6. Closely related to the previous point was Valla's critique of what he saw as the stifling atmosphere of the scholastic establishment. The scholastics recognized only one master whom they followed not only in philosophy but also in theology. Valla attacked this ipse dixit attitude: if Aristotle has said so, it is true. This is a gross distortion of scholastic practices, but it is of course true that Aristotle was often regarded as "the master who knows." Safeguarding his authority was a major task of scholastic exegesis. Valla however held that the true philosopher does not follow any one master. The true philosopher does not belong to a sect or a school but sees it as his task to critically examine even the greatest authorities. That is why in Antiquity, Pythagoras modestly claimed not to be a wise man but a lover of wisdom. What the scholastics had forgotten was that there were many alternatives in Antiquity to "The Philosopher," many sects and many other types of philosophers.

These basic convictions found expression in many of Valla's works. In what follows, his *Repastinatio dialectice et philosophie* will be singled out because it is widely considered to be the most philosophical of his works. But his other works too, such as his advanced handbook of Latin, his dialogue on the highest good, and his critical work on the New Testament, proceed from the same convictions. Obviously, the notion of "philosophy" in a humanist thinker such as Valla should be taken in a wide, flexible sense.

The Critique of Aristotelian-Scholastic Thought

In his *Repastinatio*, Valla tries to shaken the foundations of the Aristotelian edifice. The term "*repastinatio*" not only means "re-ploughing" or "re-tilling" but also "cutting back" and "weeding out." Valla wants to weed out all that he thinks is barren and infertile and to recultivate the ground by sprinkling it with the fertile waters of rhetoric and grammar. The term *repastinatio* is therefore an indication that Valla considers his program one of reform rather than one of destruction in spite of his often aggressive and polemical tone. The ten categories of Aristotle, for instance, are reduced to three (substance, quality, and action) rather than abolished entirely. At the back of his mind was the grammatical triad: noun, adjective, and verb, even though Valla realized that there was no simple one-to-one correspondence between nouns and substances or between verbs and actions. (A verb, for example, can also signify a quality.) From a grammatical point of view, words like "father," "tall," "at home," and "grey-haired" all describe a quality of someone: hence, there is no need to keep separate categories for place, time, relation, etc. Valla went on to apply his analysis of things in terms of substances qualified by qualities and actions to the soul and God. The result of his reduction of the ten Aristotelian categories to his triad is a very lean ontology that has reminded scholars of William of Ockham's nominalism. But while Ockham wants to keep the categories as long as we realize that they categorize terms rather than things, Valla wants to reduce them to substance, quality, and action because only this triad points to really existing aspects of things. Valla's grammatical analysis has hardly anything in common with Ockham's terminist-logical approach. On a similar note, Valla reduces the six transcendental terms – "being," "thing," "something," "one," "true," and "good" – to "thing" (Latin *res*).

Another well-known example of his grammatical approach is his rejection of scholastic terms such as "entity" (*entitas*), "this-hood" (*hecceitas*), and "quidity" (*quidditas*) because they do not conform to the rules of word formation, rules that can be gleaned from a detailed study of

classical texts. Related to this analysis is Valla's repudiation of what he presents as the scholastic view of the distinction between abstract and concrete terms, that is, the view that abstract terms ("whiteness," "fatherhood") always refer to quality only, while concrete terms ("white," "father") refer to substance and quality. In a careful discussion of this distinction, taking into account the grammatical categories of case, number, and gender, Valla rejects the ontological commitments, which such a view seems to imply, and shows, on the basis of a host of examples drawn from classical Latin usage, that the abstract term often has the same meaning as its concrete counterpart (useful/utility, true/truth, honest/honesty). In other words, there is no need to posit abstract entities as referents of these terms; they refer to the concrete thing itself, that is, to the substance, its quality, or action (or a combination of these three components into which a thing can be analyzed). Hence, one of his main concerns throughout the first book is to determine to which category a word refers.

Valla further criticizes the Tree of Porphyry for putting nothing on top but substance, a notion that is barely intelligible: bare substance does not exist as a thing is always already a qualified substance. Moreover, it is difficult to place a human being, which consists of soul and body, in a Tree that divides substance into something corporeal and spiritual. In the rest of Book I of the *Repastinatio*, Valla criticizes distinctions such as matter and form and potency and act, using as weapons grammatical analysis and common sense.

In a long chapter in the same book, Valla takes up themes he had developed in an earlier work, *On Pleasure* (c. 1431). This was a dialogue between three interlocutors, a "Stoic," an "Epicurean," and a "Christian." The result of this confrontation between pagan and Christian moral thought is a combination of Pauline fideism and Epicurean hedonism, in which the Christian concepts of charity and beatitude are identified with hedonist pleasure, and the philosopher's concept of virtue is rejected. In taking "Epicureanism" (used in a rhetorical rather than a historical sense) as a stepping stone for the development of a Christian morality based on the concept of pleasure, Valla repudiated the traditional synthesis

between Stoicism and Christianity, popular among scholastics and humanists alike. He found the Stoic notion of virtue as something to be aimed for its own sake abstract and unrealistic. He also criticized in a lengthy passage the Aristotelian notion of virtue as a mean between two vices as unduly dogmatic and inflexible. A similar attitude informs his critique of Aristotelian natural philosophy. While his interests are clearly not those of a natural philosopher, he insists on common observation and experience as criteria for testing ideas and hypotheses. Hence, many of Aristotle's contentions, so Valla argues, are not true to the facts. In arguing, for instance, for the existence of a fiery sphere below the moon, Aristotle had claimed that leaden missiles shot out by force melt in the air. Valla rejects this claim by appealing to common experience: we never see balls – whether leaden, iron, or stone shot out of a sling or cannon – heat up in the air. A similar argument was used later by Galileo.

The attack on Aristotelian-scholastic metaphysics, natural and moral philosophy is often couched in a highly polemical tone, but it carries a serious message. Valla is in effect sounding a serious warning against abstraction and theory: philosophers purport to analyze the world, but as soon as they start philosophizing they often leave that world far behind and play a game of their own making, with their own rules. This conviction recurs in books II and III of the *Repastinatio* when Valla turns to dialectics. This is the more constructive part of Valla's attempt to reform what he considers to be the scholastic-Aristotelian paradigm. In these books he discusses propositions and their indicators of quality and quantity ("every," "any," "not," "no one," etc.), the square of contraries, proof and argument, and various forms of argumentation. His approach is oratorical rather than logical. What counts is whether an argumentation works, which means whether it convinces one's adversary or public. Formal validity is only one way of looking at argumentation, and a rather narrow way of looking at that. Rejecting the formal approach of the scholastics, Valla wants to base dialectic on real language by studying arguments in context, and what counts as

context is much broader than the single sentence structure of the scholastic example. He thus rhetoricizes dialectic by stating that it is no more than a species of confirmation and refutation, and as such merely a part of one of the five parts of rhetoric: invention. Compared to rhetoric, dialectic is said to be an easy subject, which requires not much time to master, since it considers and uses the syllogism only in abstracto; its sole aim is to teach. The rhetorician, on the other hand, uses not only syllogisms, but also enthymeme (incomplete syllogism), epicheireme (a kind of extended reasoning), and example. The orator has to clothe everything in persuasive arguments, since his task is not only to teach but also to please and to move. This leads Valla to downplay the importance of the Aristotelian syllogism and to consider forms of argumentation that are not easily pressed into its straightjacket. Among these are captious forms of reasoning such as dilemma, paradox, and sorites ("heap argument"). Valla offers a highly interesting analysis of these types of arguments, which betrays his common sense approach and close attention to the common meaning of words and their context.

He regards the syllogism as an artificial type of reasoning, unfit to be employed by orators as it does not reflect the natural way of speaking and arguing. What is for example the use of concluding that Socrates is an animal if one has already stated that every man is an animal and that Socrates is a man, thus that he is one of them? Valla rejects the additional moods of the first figure of the syllogism as wholly artificial. For the same reason the third figure should be utterly rejected. The first and second figure, however, can be accepted within limits, but Valla refuses to grant the first figure priority as Aristotle had done. Valla's oratorical point of view leads him to reject the logical rules for transposing premises and converting terms as useless. Logicians used these rules in order to prove the validity of moods. When a syllogism can be reduced to one of the four of the first figure the syllogism is valid. But Valla thinks this technique absurd as it legitimizes syllogistic forms that lack any practical utility. Moreover, the traditional account unjustly ignores other syllogistic forms

that might be accepted as valid, for example: God is in every place; Tartarus is a place; therefore God is in Tartarus. Here the "all" or "every" sign is added to the predicate in the major proposition. An all singular syllogism can also be valid: Homer is the greatest of poets; this is the greatest of poets; therefore this man is Homer. Valla gives many other examples of such deviant schemes, thus deliberately ignoring the criteria employed by Aristotle and his commentators. In his view, they unnecessarily restrict the number of possible valid figures.

Valla's insistence on studying and assessing arguments in terms of persuasion and usefulness leads him to criticize not only the syllogism but also other less formal modes of argumentation. These arguments usually involve interrogation, leading to an unexpected or unwanted conclusion, or to an aporetic situation. Valla was one of the first to study and analyze types of arguments such as the heap argument (*sorites*) and dilemma. The heap argument is supposed to induce doubts about the possibility of determining precise limits especially to quantities. If I subtract one grain from a heap, is it still a heap? Of course. What if I subtract two grains? And so forth, until the heap consists of just one grain, which of course is an unacceptable conclusion. It seems impossible to determine the moment when the heap ceases to be a heap, and any determination of such a moment seems to be an ad hoc decision, for the difference between heap and no-longer-a-heap cannot be caused by the subtraction of just one single grain. Valla discusses a number of similar cases. He recognizes the fallacious nature of this sort of arguments, even though he does not clearly state what the solution would be or what a respondent should answer during such an interrogation.

Another type of argument is dilemma. Dilemmatic arguments had been widely studied in Antiquity. The basic structure is a disjunction of propositions, usually in the form of a double question in an interrogation, which sets a trap for the respondent, since whichever horn of the dilemma he chooses he seems to be caught up in a contradiction and will lose the debate ("If he is modest, why should you accuse him who is a

good man? If he is bad, why should you accuse him who is unconcerned by such a charge?”). It was also recognized that the respondent could often counter the dilemma by duplicating the original argument and “turn it back” (*convertere*) to the interrogator, using it as a kind of boomerang (“if he is modest, you should accuse him because he will be concerned of such a charge; if he is bad, you should also accuse him because he is not a good man”). Alternatively, he could escape the dilemma by questioning the disjunction and showing that there is a third possibility. There were many variations of this simple scheme. Based on Cicero, Quintilian, the Greek text of Aristotle’s *Rhetoric*, Aulus Gellius and George of Trebizond’s *Rhetoric* (c. 1433), Valla analyzes a series of such dilemma’s and the maneuver to counter a dilemma by converting it, called *antistrephon* in Greek and *conversio* in Latin. In all these cases he thinks, for various reasons, that the conversion is not a rebuttal at all but at best a correction of the initial argument (but a correction is not a refutation), at worst a simple repetition or illegitimate shift of that initial position. Valla’s reasonable suggestion then is that it was a product of the schools of rhetoricians, when the study of arguments could easily lead to an examination of their structure and strength without taking into account their wider context and the normal meaning of words. It had no real place in the oratorical practice.

Philosophical Relevance

Valla’s attempt to transform or reform the scholastic study of language and argumentation, and indeed an entire mode of doing philosophy, will likely be met with hostility by the historian of medieval philosophy who is dedicated to the scholastic enterprise and argumentative rigor and conceptual analysis. It is not difficult to point to howlers in Valla’s argumentation, to superficial and unfair criticisms, to straw men types of arguments. For the logician, for example, who defines the rules of the game first and then – so to speak – starts to play, it is unfair or illegitimate to ignore

the rules while playing (one is then no longer playing the same game as one’s opponent) or change the rules while playing and then accuses the others of cheating. This is what Valla often seems to do. He takes an Aristotelian doctrine in a way it was not designed for, for example, the syllogism, hypothetical syllogism, modal propositions, and the square of contraries. In all these cases we can see Valla starting, as it were, from the inside of the Aristotelian paradigm, from some basic assumptions and ideas of his opponents, in order to refute them by using a kind of *reductio ad absurdum* or submitting them to his own criteria that are external to the opponents’ paradigm. It makes his critique often seem unfair and inconsistent but such an interpretation only tells half of the story. It would miss a fundamental point, namely that in order to criticize a piece of established Aristotelian doctrine, Valla has to move in and out of the Aristotelian paradigm, so to speak. This moving inside and outside the Aristotelian paradigm can also explain (and perhaps excuse) Valla’s inconsistency, for it is an inconsistency that is closely tied to his tactics and agenda. Valla did not want to be consistent if this notion means only to comply with the rules of the scholastics, which in his view amounted to rigorously defining one’s terms and pressing these into the straightjacket of a syllogistic argument no matter what common sense and linguistic custom teach us. Behind this inconsistency thus lies a consistent program of replacing philosophical speculation and theorizing by an approach based on common linguistic practice and common sense. Its historical importance in the development of humanism is beyond doubt. But arguably it has also philosophical relevance. For throughout the history of philosophy a cautionary warning can be heard against abstraction, speculation, and formalization. One need not endorse this cautionary note in order to see that philosophy thrives on the creative tension between these two basic views on philosophical analysis – a tension between, on the one hand, abstraction and speculation and, on the other hand, a salubrious warning that the object of philosophical analysis should not be lost from sight.

Manuel Chrysoloras

George Arabatzis

Research Centre on Greek Philosophy, Academy
of Athens, Athens, Greece

Abstract

Manuel Chrysoloras (c. 1350–1415) was a Byzantine writer and scholar better known as professor of Greek language in Florence after 1397, the first one to hold public teaching office of Greek in Italy. His audience included famous Italian humanists like Guarino da Verona (his most loyal pupil), Jacopo Angeli da Scarperia, Coluccio Salutati, Roberto Rossi, Niccolò Niccoli, Leonardo Bruni, Carlo Marsuppini, Pier Paolo Vergerio, Uberto Decembrio, Poggio Bracciolini, and others. After 1400, Chrysoloras left his teaching position and carried out mainly diplomatic missions in the service of the Byzantine emperor Manuel II Palaiologos. He converted to Catholicism and died in 1415 in Constance, Switzerland, while attending the Synod in an effort to convince the Westerners to save Byzantium from the Ottoman threat. He used a personal method of teaching that consisted in part in the discussion between the students of the translation of Greek works. He translated Plato's *Republic* with the help of his student Uberto Decembrio and his son Pier Candido and he authored a Greek Grammar that had a

wide circulation as textbook. His teaching influenced the art criticism of Renaissance by relating art works to literary works and by insisting on the importance of the artist as the efficient cause of Art and the public as the intelligent agent. As to his ideology, this scholar who is said that his teaching had a strong political motive, in his work on the *Comparison of the Old and the New Rome*, he insisted on Constantinople's lineage to Ancient Rome. His posthumous fame was somehow limited because the Italian humanists' scholarly activity to which he had greatly contributed had grown strong autonomously.

Biography

The Byzantine author, professor, and scholar Manuel Chrysoloras was born in Constantinople around 1350 in a noble family. Very little is known about the first half of his life until he came to Venice in 1390–1391 with a diplomatic mission. Later he was invited to teach Greek in Florence where he started professing in 1397 with a contract of 5 years. But he was not to spend all this time in Florence because in 1400 he left his position probably in order to join the emperor Manuel II Palaiologos who came to the West seeking help to save the Byzantine Empire from the Ottoman threat. For the rest of his life, Chrysoloras will carry out mainly diplomatic missions, traveling in the service of his country, and

only secondarily will assume scholarly and teaching work. In late 1405 or in 1406 he will ask the papal permission to be converted to the Latin dogma and perform the Latin rite; the permission was granted but Chrysoloras never undertook any priestly duties. He died in 1415 while attending the Council of Constance in Switzerland in a last effort to convince the Westerners to help Byzantium.

His fame rests principally on his teaching activity in Florence as the first Greek to hold public teaching office in Italy. Neither Barlaam the Calabrian nor Leonzio Pilato, who preceded him and taught Petrarch and Boccaccio, could equal him in importance and fame. As it has been noted, “from at least the eighteenth century, when scholars first began to discuss the ‘Italian Renaissance’ as a cultural phenomenon, the importance of Manuel Chrysoloras, the first notable professor of Greek in western Europe, has been widely recognized. Writers such as Carlo Rosmini, Jacob Burckhardt, John Addington Symonds, and Remigio Sabbadini have given him, deservedly, honorable mention as the teacher of a number of influential humanists” (Thomson 1966:63). But it was a monograph by Cammelli published in 1941 that permitted the modern evaluation and scholarly appreciation of his life and activity. Chrysoloras’ coming to Italy marks the real beginning of Greek studies in Italy. Thanks to him, the Italian humanists of various scholarly interests were able to focus on the rich classical tradition of Byzantium. Among his famous pupils and those attending his lessons we can name Guarino da Verona, Jacopo Angeli da Scarperia, Coluccio Salutati, Roberto Rossi, Niccolò Niccoli, Leonardo Bruni, Carlo Marsuppini, Pier Paolo Vergerio, Uberto Decembrio, Poggio Bracciolini et al. Jacopo Angeli da Scarperia described Chrysoloras as “*eruditissimus (et) suavissimus literarum Graecarum... praeceptor*.”

It has been said that the teaching activity of Chrysoloras was auxiliary to his principal mission and that it had a political motive. His very first voyage to Italy was of diplomatic nature and his invitation to a teaching position may have been a response to a need for a more profound

rapprochement than the establishment of good diplomatic relations between the East and the West. As professor of Greek he was always related to influential people and his subsequent career was clearly that of a diplomat. His conversion to Catholicism must also be seen as part of the Byzantine politics of reconciliation with the West. In Andrea Giuliano’s funeral oration on Chrysoloras we read that his true task was rather “to save his country from danger than give delight to Italy” (Thomson 1966:81).

Thought and Works

It seems that Chrysoloras had a natural charisma for communicating and a friendly and warm character. His reputation was not based solely on his teaching ability but also on his methodology, and furthermore on his ideas on education. His approach marked a rupture with the tradition of medieval education; as Paolo Vergerio’s *De ingenuis moribus* (1404) shows, Chrysoloras has given the learned men in the West a vigorous inspiration as to the ideals of Greek education while Leonardo Bruni’s *De studiis et litteris* (c. 1425) gives a detailed exposition of the pedagogic technique that Chrysoloras had brought from Constantinople. The technique stressed accurate pronunciation, the use of mnemonics, constant and regular revision of each lesson’s topics and the preparation of copious notes under the headings of *methodice* (grammar, syntax, and vocabulary) and *historice* (what we should call “background material”) (Thomson 1966:66–67). Chrysoloras insisted that for the students to discuss the subject of every lesson was part of a learning technique; he also insisted on the pedagogical value of translating from Greek into Latin. He criticized the literary, word by word, translation as well as the free translation that betrayed the original; he promoted a midway between these two practices, a mean that would accomplish the comprehension of an author’s spirit and its rendering to another language (*transfere ad sententiam*).

His work as an author has been less valued, but this view is beginning to change. His writings are

not many but they give insight to the profile of a scholar that was more than the right man at the right place for the right job. His most known work is a Greek Grammar, the first in the western world, which under the title *Erôtēmata* had a very wide circulation as a manuscript and later was repeatedly published in numerous editions. He translated Plato's *Republic* with the help of one of his pupils, Uberto Decembrio (and this one's son Pier Candido), since Chrysoloras' use of Latin was rather moderate. The rest of his work consisted mainly of letters, some extensive, that give an image of his philosophical, literary, and educational ideas. Chrysoloras appears to have influenced the art criticism of the Renaissance mainly through his pupil Guarino da Verona. We see in him the idea of the visual arts' inferiority as to the written word through a transposition of the Byzantine *ekphrasis* (rhetorical description of works of art). Although the rhetoricism of *ekphrasis* does not help the establishment of critical categories about the fine arts, it nevertheless facilitates the connection between visual representations and the literary universe. Furthermore, Chrysoloras wrote that "the representations are praised in proportion to the degree in which they seem to resemble their originals...[but they] rather do indicate a certain nobility in the intellect that admires them;" what he is actually saying is not proper to Byzantine icons' aesthetics and although the frame is traditional, Chrysoloras' conclusions are related neither to commonplaces of Byzantine Aristotelianism nor to the views of the Iconophiles (the supporters of the icons) of Byzantium. It is the artistic sensibility, the efficient cause of art, that takes, thus, priority over the subject matter, a turn that conforms perfectly to the highly valued role of the artist in the Renaissance Art (Baxandall 1965:198–199).

Regarding the content of Chrysoloras' "philosophy," it has been said that he belonged to the Palaiologian revival of letters in Byzantium, which nonetheless covered more than one ideological tendency and thus Chrysoloras' position has to be further elucidated. He was close to Demetrios Kydones, a key figure in the Latinophile Party of Constantinople, who translated Thomas Aquinas in Greek; Kydones had

escorted Chrysoloras to his first trip in the West. Chrysoloras' work *Synkrisis tēs palaia kai neas Romēs* (a letter known by the title *De comparatione veteris et novae Romae = On the Comparison Between Rome and Constantinople*) that was designed to foster good relations between the East and the West shows Chrysoloras' position. He wrote on the Graeco-Roman origins of Byzantium: "two were the most powerful and wise nations... Romans and Greeks who by joining up they made Constantinople"; he was translating in these terms Manuel Palaiologos' politics of reconciliation with the West. His recently published *Discourse Addressed to the Emperor Manuel II Palaiologos* is more revealing as to Chrysoloras' philosophy of education: he states there his faith in the value of Greek *Paideia*, its great importance if the Byzantines were to ensure the safety and the well-being of their country and his confidence in his homeland's autarky as to the quality of its scholars. In the same discourse, he develops the idea of natural virtue to which the education is complementary.

Although Chrysoloras' impact on the Italian intellectual scene is certain and most of his pupils were ready to acknowledge his influence, only Guarino da Verona showed a life-long devotion to him. The later praise of Chrysoloras by the Humanists never reached the enthusiasm and this is due to the fact that in the meantime the Italian scholars discovered the value of Latinity and were progressively feeling more assured as to their knowledge of Greek Letters.

Marsilius of Inghen

Maarten J. F. M. Hoenen
Departement Künste, Medien, Philosophie,
Universität Basel, Basel, Switzerland

Abstract

Marsilius of Inghen belonged with William of Ockham and John Buridan to those thinkers who substantially shaped late-medieval Nominalism. He taught in Paris and Heidelberg and left behind a significant number of writings that were used as set texts at many universities in the fifteenth and sixteenth centuries, especially in the German Empire. Characteristic was his rejection of real universals outside the human mind (Realism) and his distinction between the approaches of natural reason and faith. He was also known for his dismissal of the notion of *suppositio simplex*, his defense of an eleventh category, and his criticism of the Aristotelian theory of motion. His thought was appreciated by humanists and Spanish scholastics.

Biography

Marsilius of Inghen, born in or around Nijmegen (Netherlands) in the 1340s, was one the most

influential thinkers of the late-medieval period. His lectures drew large audiences and his writings were read at many universities. He received his philosophical education at the University of Paris, where he became active as a Master of Arts in 1362, purportedly remarkably young of age. Nicolas Prowin, in his funeral speech, highlighted that Marsilius was not yet 20 when he earned his Master's degree. As a Master, he had many students, especially from the region around Nijmegen, who went on to become teachers at local schools. It was perhaps for this reason that the City of Nijmegen honored him with a copious banquet in 1382. Marsilius was rector of the University of Paris in 1367 and in 1371, and procurator of the so-called *natio anglicana* from 1373 to 1375. He also represented the University at the Papal Court in Avignon in 1377–1378. Most likely due to troubles related to the Great Schism, he left Paris for an unknown destination following his visit to Avignon. In 1386, he became the first rector of the University of Heidelberg, which he shaped substantially, serving as rector nine times in 1386–1392 and 1396. In Heidelberg, he was a Master of Arts and student of theology, the study of which he had begun in Paris around 1366. He obtained his theological degree in 1395–1396, being the first theologian to earn a doctorate in Heidelberg. Soon afterwards, on August 20, 1396, the day of Saint Bernhard, he died and was buried in the Church of Saint Peter in the choir before the main altar. Regrettably, his grave no longer exists; however, both a small square next to the University and a Centre for Advanced Study carry his name.

Soon after his death in 1396 he was labeled a “Nominalist” and bracketed together with William of Ockham and John Buridan. To be sure, however, he himself never used this nor any other label to characterize his thought. At points he was even critical of Ockham and Buridan, although he shared their conviction that universals were only names or concepts and that the object of knowledge was not the thing but the proposition that referred to the thing, hallmarks of late-medieval Nominalism.

Since the early sixteenth century, historiography has considered Marsilius to be a pupil of Buridan, induced from the fact that Marsilius

often referred to Buridan as his master, and even once remarked that he may have been guided by a passionate predisposition towards the latter. Modern research, however, seriously questions whether Marsilius was a pupil of Buridan, since the two belonged to different nations at the University of Paris. It appears that Marsilius was not educated by Buridan, even though he admired his teachings or writings. His teacher was in fact William Buser of Heusden, who, like Marsilius, belonged to the *natio anglicana*. That he referred to Buridan as his master, therefore, must be considered a mark of honor, as was not unusual at the time.

Writings

Marsilius' writings were the product of a medieval academic. Most important are (1) a collection of small logical treatises that deal with the properties of terms such as supposition and ampliation, and which later were referred to under the general title of *Parva logicalia Marsilii*; (2) several commentaries in various forms on the *Logica vetus* and the *Logica nova*; (3) commentaries on Aristotle's physical treatises, such as the *Physica*, *De caelo*, *De generatione et corruptione*, *De anima*, and the *Parva naturalia*; (4) a commentary on Aristotle's *Ethica Nicomachea*; (5) a commentary on Aristotle's *Metaphysica*; (6) commentaries on two books from the Scriptures, namely, Daniel and Matthew; and finally (7) a commentary on Peter Lombard's *Sentences*.

All of these works arose out of his teaching, which is to say, his reading of the works of Aristotle, Peter Lombard, and the Scriptures in the classroom. Notably, his commentaries on Aristotle were structured in a manner very similar to those of John Buridan and Nicholas Oresme. Even the titles of the many questions addressed were similar, although the solutions differed. As a rule, these questions followed the text of Aristotle sequentially, though not all parts were discussed. Marsilius followed the same structure in his commentary on Lombard's *Sentences*, although the arguments in it were much more elaborate and referred to a wide array of sources.

Only a small number of his writings are available in a modern critical edition. Several of his treatises were printed in the fifteenth and sixteenth centuries. Approximately 35 modern libraries contain manuscript copies of his works, particularly libraries in Erfurt, Krakow, Munich, and Vienna. The strict format of his writings may create the impression that their content is uniform and formalistic; however, this is not the case. Marsilius imbued his writings with a personal outlook through the sharpness of his mind and his individual approach to a number of problems.

Main Thoughts

Universals and Supposition Theory

A clear theme throughout Marsilius' works is the conviction that there are no real universals. Reality consists only of individuals, which can be signified by written or spoken words or by concepts in the human mind. Things that are similar can be signified and made known by the same name or concept. This is, for example, the case with the concept of "tree," which refers both to an oak and to a beach. Universality, therefore, is a property of names and concepts that refer to like individuals. These names and concepts are themselves individual: each human being has his own concept of "tree" even if this concept signifies the same tree as that of another human being.

This theory, which he shared with William of Ockham, John Buridan, and many other contemporaries, had a direct impact on his theory of logic. In his treatise, *On supposition*, for example, he maintains that older logicians (like Peter of Spain) used a special kind of supposition, namely, *suppositio simplex*, to refer to the use of a term or concept that stands for a universal thing. Since, to Marsilius, there are no universal things, this type of supposition was senseless and should be abolished, since it confused students. To refer to the universal use of a term or concept in phrases such as "Tree is a genus," another traditional type of supposition, namely, *suppositio materialis*, would suffice, as this kind of supposition takes the term or concept as referring to itself. In the above phrase, it is the term or concept "tree" itself which signifies universally and therefore is a

genus, and not something in the trees outside in the yard.

In this connection, Marsilius explicitly criticized some of his contemporaries (he may have been thinking of Albert of Saxony), who, even if they did not accept the existence of real universals, still wished to retain the notion of *suppositio simplex*. They would say, like the old logicians, that the word or concept of “tree” in the given example has *suppositio simplex*, rather than *suppositio materialis*. Marsilius, however, saw no need to retain the vocabulary of the old logicians. The use of the term *suppositio simplex* was entirely arbitrary, he argued. Therefore, there was no reason not to replace it with *suppositio materialis*, which was moreover preferable, in that it avoided confusion.

This celebrated passage has important historical significance, as here Marsilius linked the acceptance of real universals with the old logicians (*antiqui*) and their denial with the modern logicians (*moderni*). However, though tempting, his remarks cannot be regarded as an early example of the fifteenth-century “*Wegestreit*” between *Antiqui* and *Moderni*. The *antiqui* of whom Marsilius spoke were no contemporary Realists, but rather logicians from earlier generations, as evinced by the fact that he referred to them also by the term *antiquitus*, that is, from ancient times. Nevertheless, this passage reveals why the Realists of the fifteenth century who based themselves on these older logicians were labeled as *Antiqui*, even if they themselves were not from the old days.

Aristotle, Natural Reason, Faith

A second feature the reader will encounter at several points in Marsilius’ works, and which also foreshadows the “*Wegestreit*,” is the sharp distinction between faith and natural reason. This occurs not only in his theological works but also and especially in his commentaries on Aristotle. At several places in these commentaries, Marsilius juxtaposes two different answers to one and the same problem, the one according to Aristotle and natural reason, and the other according to truth and faith. He leaves no doubt that for him truth and faith gives the right answer

and should judge Aristotle and natural reason, not only in theology but also in philosophy. Yet this does not prevent him from carefully setting out what should, according to natural reason, be regarded as possible or impossible in each particular case, even if this is in opposition to faith. Nor is his approach to these two views in his commentaries on Aristotle always the same. In some cases both views are dealt with extensively, in others he merely comments that according to faith things are different, but that he would not enter into the view of faith, as that was not the task of the philosopher, but of the theologian.

For Marsilius, natural reason is human thought based solely on sense-perception (*experientia*) and on self-evident principles (*principia per se nota*). To him this is essentially identical to what Aristotle said in his writings, for example, that nothing can come from nothing. Only very rarely are there instances in which he criticizes Aristotle for saying something not in agreement with sense-perception or self-evident principles — most prominently, in the case of the theory of movement, as we will see below.

The juxtaposition of the views of natural reason (Aristotle) and of faith occurs so frequently, both in his philosophical and theological writings, that it indeed seems programmatic. This is most clearly observed in his *Abbreviationes librorum physicorum*, which were written in Paris (as can be deduced from examples in which he repeatedly referred to the towers of Notre Dame and of St. Geneviève). In this treatise, both views are often presented in different sets of statements intended to make clear what their presuppositions are and under which conditions they could be accepted. A good case in point is the discussion of the eternity of the world. Here, Marsilius begins with a number of statements accepted both by Aristotle and by the believer. He then continues with statements held by Aristotle and rejected by the believer, such as that the movement of the heavens is eternal. At the end of this list, he remarks that although these statements must be accepted by all who use only the senses, nonetheless, the opposite is in fact true, as faith maintains.

Marsilius also follows this procedure in his discussion of other topics in the *Abbreviationes*

librorum physicorum. For example, he argues that for Aristotle and natural reason (1) creation from nothing is impossible, (2) the first principle cannot act on earth without the assistance of the heavens, (3) an imaginary space outside of the heavens must be infinite, (4) the existence of a vacuum cannot be accepted, (5) the heavens cannot move faster than they actually do, (6) the first principle has no infinite power, and (7) the first principle is not everywhere. On all of these points, he explains that faith, since it accepts divine omnipotence, asserts a differing or opposite position. Remarkably, for Marsilius, natural reason alone is not able to accept the position of faith. It must indeed reject all of those views that would presuppose the existence of something beyond sense perception and self-evident principles.

To be sure, Marsilius did not defend the theory of double truth. For him there is only one truth, namely, that of faith, which partially, but not completely, covers the claims of natural reason. However, and this is crucial, natural reason cannot judge on its own whether that which it necessarily has to accept according to its own principles is also true. To do this, natural reason requires faith. Marsilius therefore maintained a position which was very different from that, for example, of Thomas Aquinas. According to Thomas, regarding any tenet of faith whatsoever, natural reason can at least show that it is not impossible. For Marsilius, natural reason cannot do this. On the contrary, at crucial points it leads human reason in the opposite direction.

In his commentaries on Aristotle, Marsilius does not discuss the background of this radical view. His commentary on the *Sentences*, however, provides a clue. As a consequence of the Fall, human reason is bound to the senses and can no longer by itself give a sound judgment of what is true. Its evidence is evidence of the bodily, fallen man, not that of the spiritual man assisted by divine grace.

Marsilius defended his reading of Aristotle not only in Paris but also in Heidelberg, as can be judged from his commentaries on the *Metaphysics* and the *Sentences*, both of which were composed in Heidelberg. Testifying to his influence as rector there, this interpretation of Aristotle found its way

into the vows the masters were required to take at their inception. At most other universities, the master was obligated to refute, to the best of his ability, those of Aristotle's opinions that were contrary to faith. However, in Heidelberg the situation was different. There, the master was required to tell students that in such cases, the position of Aristotle was based solely on natural reason and therefore was deficient, although his position could not be refuted, since using sense-perception and self-evident principles one must necessarily reach the same conclusion as Aristotle.

This way of dealing with Aristotle was to become typical of late-medieval Nominalism, for which Marsilius was one of the main sources of inspiration. It provoked harsh criticism especially from the Thomists, who were of the opinion that, principally, there were no points on which Aristotle was against faith, provided that he was understood correctly — which is to say, in the manner of Thomas Aquinas. Herein is rooted the historiographical myth that Nominalism destroyed medieval scholasticism by questioning the harmony of faith and natural reason (Aristotle).

Categories, Motion, Univocity of Substantial and Accidental Being

There are also other striking views put forth by Marsilius in his commentaries on Aristotle. For example, commenting on the *Logica vetus*, he argues that alongside the ten traditional categories, an additional eleventh must be accepted, namely, the category of signs. This view was much discussed in the late Middle Ages. Some thinkers saw it as rooted in the works of John Duns Scotus, although there was general agreement that Marsilius was the inventor of the eleventh category. Among its main defenders, next to Marsilius, was the Nominalist Johannes Parreut, who discussed the problems attached to this view elaborately in his *Exercitata veteris artis*, with reference to Marsilius. Realist authors, however, saw in it a deviation from Aristotle, and accordingly rejected the view as completely absurd.

In his commentary on the *Physics*, Marsilius follows Buridan in asserting that the motion of a projectile is not caused by air being pressed away

from the top of the projectile and then pushing the projectile from behind or by air set into more rapid motion by the original impact, as Aristotle had thought. According to Marsilius, this runs counter to the observation that a projectile hitting the ground bounces upwards, even though, on the ground, there is no air to move the projectile. Its motion therefore needs to be explained otherwise, namely, by assuming that the mover transfers to the projectile a certain quality, which in turn causes the motion — a quality which some, he adds, call “*impetus*.” At the same time, Marsilius was fully aware that this theory too had its difficulties, although it was the better alternative.

Also noteworthy is a passage from his commentary on the *Metaphysics*, in which he argues that there is no univocal concept of substance and accident. In itself, this theory was unexceptional and quite in accordance with the traditional interpretation of Aristotle. However, in this case, things are more complicated. Marsilius writes that on this point he disagrees with Buridan, who had followed the common view held by many theologians. According to this common view, it is possible to have a univocal concept of substance and accident if transubstantiation is taken into consideration, as is the case with faith. During transubstantiation, the accidents of the substances of bread and wine (their shape, taste, and color) remain for a short moment without a bearer, as the substances are replaced by the substance of Christ. These accidents do, therefore, rightly exist by themselves, just as do substances by nature. Therefore, it is possible to have a univocal concept of both, notwithstanding the fact that accidents cannot exist naturally without a bearer. However, Marsilius does not agree with this view. When commenting on the *Metaphysics*, he claims, one must argue according to natural reason and not according to faith. Applying the principles of natural reason to the concept of being, therefore, one must conclude that it cannot be univocally said of substance and accidents, since both have a different kind of being. Marsilius thus contrasts the common view with what he calls the “metaphysical” view. However, he makes clear that neither of these can be proven demonstratively, but are only probable. Nevertheless, the

fact that he argues for the second view shows that in his mind the philosopher should not be distracted by the miracles of faith when there is no immediate necessity to do so. Indeed, whereas the eternity of the world and the limited power of God stand in direct opposition to the wording of the Creed, with the statement that there is no univocal concept of substances and accidents, this was not the case. For, as Marsilius states in his commentary on *De generatione et corruptione*, even if God miraculously changes substances, by virtue of his divine power he could do this in a such a way that the accidents would not remain without a bearer.

Commentary on the *Sentences*, Multiple Sources, Eternity of the World

When reading Marsilius of Inghen’s commentaries on Aristotle, his personal views are not always clear. This is especially the case when Marsilius applies both the solution of faith, which he calls the truth, and that according to natural reason, adding that the solution of faith should not bother the natural philosopher or metaphysician. Does this mean that, as a natural philosopher and metaphysician, Marsilius asserted solutions which he knew were not true? However it may be, in his theological works, and in particular in his commentary on the *Sentences*, things were different. Here we find the most elaborate exposition of his ideas, both philosophical and theological. Even if his commentary on the *Sentences* was a theological work, he discusses in it a whole range of philosophical issues also dealt with in his other works, including the eternity of the world and God’s infinite power. In this work, Marsilius attributes a crucial role to natural reason in explaining matters of faith, but thinks that its role is only partial, since it uses principles different from those of faith. Only if natural reason accepts the principles of faith — for example, that things can be created from nothing — can it clarify issues of faith.

The commentary on the *Sentences* is an enormous work that discusses all four books of Lombard’s original work and covers more than a thousand narrowly printed pages in the edition of 1501. Marsilius most likely began preparation for

this work in Paris in the late 1360s and early 1370s, leaving the work unfinished when he died in Heidelberg. Striking is the wide range of sources he used to construct his arguments. He not only quoted William of Ockham, Adam Wodeham, Robert Holcot, and Gregory of Rimini – authors considered to be forerunners of late-medieval Nominalism – but also Bonaventure, Thomas Aquinas, Giles of Rome, and Thomas of Strasbourg, the principal authorities of the Realists. The modern reader may be confused by the fact that an alleged Nominalist author quoted so many Realist authorities. However, Nominalist authors prided themselves on using all important authors who had contributed to the solution of the problem, even those used by their adversaries – something which they claimed Realists were unwilling to do.

Due to the immense number of problems addressed, the work may be considered an encyclopedia of late-medieval knowledge. The themes addressed range from the divine nature and problems related to the creation of angels and human beings, to Christological issues, the sacraments, and the final judgment. Marsilius shows a strong awareness of scientific methodology and applies logical tools throughout the book, despite remarking that one should not overvalue the use of logic in theology. It is difficult to distinguish one particular line of theological reasoning, since he builds upon very different traditions, even Neoplatonic ones, as in his discussion of the theory of divine ideas. However, here too, as in the commentaries on Aristotle, the reader is struck by the careful distinction made at certain points between faith and natural reason. According to Marsilius, it is possible to prove that the heavens are not coeternal with God, provided one accepts that God is omnipotent, as does faith. The concepts of “heaven” or “creature” and “coeternal with God” exclude each other as much as those of “horse” and “bullock,” Marsilius writes. This is noteworthy, since in his commentaries on Aristotle he gave one to understand that, for the unaided natural reason, the concepts of “heaven” and “coeternal with God” are necessarily linked. From this, it once more becomes clear how different his approach was from that of Thomas

Aquinas, even though he regularly quoted the Angelic Doctor on other occasions. According to Thomas Aquinas, whether illuminated by faith or not, human reason has to admit that both statements are possible, namely, that *P* “The heavens are coeternal with God” and $\neg P$ “The heavens are not coeternal with God.” But for Marsilius, this is not the case. If natural reason is illuminated by faith, it must admit that *P* is impossible and, hence $\neg P$ is necessary. If, on the other hand, it does not accept faith, it must hold the opposite, namely, that *P* is necessary, and hence $\neg P$ impossible. If Luther, in his famous *Disputatio theologica* of 1539, rebuked Parisian theologians for claiming that the same thing was true in theology which was also true in philosophy, he may have been thinking of authors like Thomas Aquinas, but surely not Marsilius of Inghen.

Influence

Marsilius had a substantial impact on the late-medieval and early-modern period. His works were read at many universities with a Nominalist signature, or where Nominalism was taught next to Realism. In Vienna and Freiburg, his *Parva logicalia* were compulsory. On the title page of the *Modernorum summulae* of Florentius Diel, printed in Mainz about 1490, he was mentioned in one breath with Aristotle, Augustine, and Boethius. Not even Ockham, Albert of Saxony, or Buridan were mentioned in this prominent place. Marsilius’ commentaries on Aristotle were used in classrooms of Heidelberg, Vienna, Freiburg, and Prague, as can be concluded from the colophons in the manuscripts and the protocols of the Arts faculties. His commentary on the *Sentences*, edited by Jacob Wympfeling and printed by Martinus Flach in 1501, was quoted by Spanish theologians like Domino de Soto, Luis de Molina, and Francisco Suárez. Exemplary of Marsilius’ strong influence is a booklet published in 1499 by Peter Friedberg in Mainz, commemorating his birthday. This booklet is notable for containing a fictitious speech of Marsilius defending Nominalism and answering the attacks of Realism. One of the main points was a

quotation from John Gerson, saying that the Council of Constance had condemned the thesis that there are real universals in the extramental world. Noteworthy was the humanist form of the treatise. It contained more than 50 epigrams by students and masters singing the praises of their divine Master Marsilius. Obviously, the humanists in Heidelberg and Mainz advocated the Nominalism coined by Marsilius even a century after his death.

Marsilius of Padua

Vasileios Syros

The Martin Marty Center for the Advanced Study of Religion, The University of Chicago, Chicago, IL, USA

Abstract

Marsilius of Padua (1270/1290–1342) was a seminal late medieval political thinker. In 1313 Marsilius went to Paris to study medicine. During his stay in the French capital, he befriended John of Jandun, a leading commentator of Aristotle and adherent of many of Averroes' positions. In 1324 Marsilius published his magnum opus, the *Defensor pacis* (*Defender of the Peace*), a work containing a fierce attack on papal interference

in temporal affairs. In 1326, Marsilius and John, who was considered the coauthor of the *Defensor pacis*, fled to Louis of Bavaria's court. In 1327 John XXII issued the bull *Licet iuxta doctrinam*, in which he condemned Marsilius and John for heresy. In the same year, Marsilius and John joined Louis' expedition to Italy. After the failure of the expedition, Marsilius returned to Germany, where he spent the remainder of his life at Louis' court. Marsilius' professed goal in the *Defensor pacis* is to reveal a singular cause of civil strife, that is, the papacy's involvement in temporal affairs. The first part is to a large extent a patchwork of quotations from Aristotle's works, in particular the *Politics*. Marsilius articulates there a scheme of political organization with ultimate power for making laws and appointing the government residing with the "*legislator humanus*," that is, the entire body of the citizens or its "weightier" part ("*pars valentior*"). In the second part of the treatise Marsilius argues for the community of the faithful being the highest authority within the Church and possessing the power to appoint and monitor the clerics and to interpret Scripture. In the thorny issue of papal-imperial relations, Marsilius is an advocate of the pope's and the general council's, being subject to the emperor. Marsilius takes up a number of these issues in the *Defensor minor* (c. 1342), a large portion of which deals with questions of excommunication and the *plenitudo potestatis*.

Biography

Marsilius de' Mainardini (1270/1290–1342) was born in a family with a tradition in the legal profession in the Northern Italian city of Padua (Miethke 2000; Pincin 1967). Information about Marsilius' youth is scarce and derives from a poem that Albertino Mussato (1261–1329), the famous Paduan poet and historian, dedicated to him. Mussato relates there in a jocular tone Marsilius' dilemma whether to study medicine or law and how the latter sought Mussato's advice concerning his future studies. Marsilius went to

Paris to study arts and medicine probably after a period of studying in his home town with Peter of Abano (1257–c. 1316), one of the major figures in the history of medieval natural philosophy and medicine and professor at Paris and since 1307 in Padua. In December 1312, Marsilius was elected rector of the University of Paris for a period of 3 months. As a holder of that office, he had access to the French royal council as well as to the papal curia in Avignon. The most significant event in Marsilius' stay in Paris was his association with John of Jandun (between 1285 and 1289–1328), a foremost commentator on Aristotle and Master of Arts at the Collège de Navarre, who has been considered one of the leading figures of Latin Averroism (Brenet 2003; MacClintock 1956). Between 1316 and 1318 Marsilius was promised by John XXII a benefice in Padua, but this was not realized. In 1319, he was sent as the emissary of Matteo Visconti and Cangrande della Scalla I, the signori of Milan and Verona, respectively, to Charles de la Marche (the future Charles IV of France), soliciting for the latter's support against Robert of Naples and offering him the captaincy of the Ghibelline league. The negotiations bore no fruit and Marsilius returned to Paris.

In 1324 Marsilius completed his *chef-d'œuvre*, the *Defensor pacis* (*Defender of Peace*), which he dedicated to Louis IV of Bavaria. The *Defensor pacis* contains a fierce attack on papal power and was regarded as a joint work of Marsilius and John of Jandun. Despite its polemical intent, it did not provoke immediate reactions on the side of the papacy and Marsilius and John lived undisturbed in the French capital for a certain period after its publication: Marsilius borrowed money and announced courses in 1326, and John signed a lifetime lease on a house. In the summer of 1326, Marsilius and John fled to the court of Louis of Bavaria, in Nuremberg, which would host a galaxy of eminent excommunicated Franciscans, such as Michael of Cesena, Bonagratia of Bergamo, William of Ockham, and Francis of Marchia. In 1327 John XXII issued the bull *Licet iuxta doctrinam*, in which he condemned Marsilius and John, as the authors of the *Defensor pacis*, for heresy. As noted before, John was

considered both in the Middle Ages as well as in earlier modern scholarship coauthor of the *Defensor pacis* (Valois 1906). However, between the political teaching of the *Defensor pacis* and John's political ideas, as pieced together from his commentaries on Aristotle, there exist crucial differences with regard to, for example, the purpose and the unity of the political community and the notions of the lawgiver, natural law, world monarchy, and natural slavery (Syros 2007; Gewirth 1948, 1951).

In 1327, Marsilius and John joined Ludwig's expedition in Italy. Marsilius was appointed *iudex clericorum et amministrator archiepiscopatus Mediolani in temporalibus pro regia maiestate* in Milan. It is possible that he had a hand in organizing Louis coronation in Rome in 1328, the deposing of John XXII, and his replacement by the Friar Minor, Peter of Corbara, who was elected pope as Nicholas V. In 1328, Louis and his army returned to Germany. Marsilius spent the remainder of his life at Ludwig's court in Munich. Around 1342 he wrote the *Defensor minor* as well as a memorandum dealing with the legitimacy of the marriage between Margaret Maultasch, countess of Tyrol and Carinthia, and Louis son, Louis of Brandenburg. In 1342 Pope Clement VI mentioned that Marsilius was dead. The *Defensor pacis* was also intensively used during the Great Schism. Its *editio princeps* appeared in 1522 in Basel (Piaia 1977). In 1535 Thomas Cromwell sponsored its translation into English, although the English version exhibits a number of excisions (Simonetta 2000).

Political Ideas

The *Defensor pacis* is divided into three parts: in the first part Marsilius expounds the chief principles of his political thought by drawing on various treatises of Aristotle, most notably the *Politics*, and inquires into the origins and the nature of a well-ordered political community. In the second part, which is about four times longer than the first, he discusses and refutes a number of claims in favor of the church's possessing temporal authority. The third part contains a summary of

the main arguments of the entire work in the form of forty-two conclusions. As short as the first part of the *Defensor pacis* may be, its interpretation poses several difficulties. Marsilius' intensive use of the *Politics* has led to the conclusion that he chose the *Politics* as an authoritative basis for articulating his own ideas (Sternberger 1985). Yet, a closer comparison between the political ideas of Marsilius and of his Greek predecessor reveals marked differences (Syros 2007; Nederman 1995a; Miethke 1989; Gewirth 1951).

Marsilius' declared purpose in the *Defensor pacis* is to lay bare the singular cause of strife and dissension that afflicted the cities of Italy in his own time, that is, the papacy's attempt to involve itself in and controls temporal affairs. The quest for the efficient cause of political phenomena assumes a normative importance in Marsilius' thought. For instance, he identifies the efficient cause of the political community, its laws and its government. Following Cicero, rather than Aristotle, Marsilius ascribes the creation of human communities to the human need for self-preservation and mutual assistance. Departing from Aristotle, Marsilius does not depict the establishment of the community as the work of a single individual; under the influence of Cicero's views on the civic function of rhetoric, he presents it as the fruit of the collective will of the first "*patresfamilias*," who were summoned and persuaded by prudent individuals to band together into human associations (Nederman 1992). Families were administered according to the will of the father and villages were governed according to the judgment of their eldest members. The creation of a perfect community, on the other hand, presupposes the diversity of its constituent parts, which generates inner discord and strife. Its maintenance depends, thus, on the existence of laws and of a government with the task of regulating the relations among its members. Along these lines, peace is defined by Marsilius as the orderly function of the parts of the political community, as is the case with a well-formed living organism: whereas Aristotle looks upon strife as originating from the conflict between rich and poor, for Marsilius strife is the result of the attempts of the church to gain control over temporal affairs.

Human acts are classified by Marsilius into two categories: transient, that is, those that can benefit or harm someone other than the agent, and immanent, that is, those whose impact concerns solely the agent himself. This classification serves Marsilius as a starting point for the demarcation of the spheres of human and divine law: human law is concerned with transient acts, divine law with the immanent acts, although these two spheres may overlap. On the basis of the aforementioned distinction of human acts, Marsilius illustrates the *raison d'être* and the function of the various parts of the political community, that is, to moderate the acts and passions of its members. The principal six parts of the political community are the agricultural, artisan, financial, military, judicial or deliberative, and the sacerdotal. In allowing for the possibility that farmers, artisans, and mechanics are an integral component of the political community, Marsilius deviates from Aristotle, according to whom farmers and craftsmen are to be excluded from any healthy form of constitution. In his classification of constitutions, Marsilius adopts the Aristotelian criteria of the number of those governing and of the extent to which a constitution takes into account and advances the common good. To these he adds a third one, that is, the degree to which a constitution comes into being and exists in accordance with the consent of the citizens and the laws. Marsilius takes this criterion as a key condition for the legitimacy and longevity of any sort of government, and gives it primacy over the other two. In keeping with this, Marsilius, in his account of the different types of kingship, looks on elective kingship as the best one, and makes a strong case for the limitation of royal authority. In this regard, he departs from Aristotle's notion of the absolute ruler who exceeds the other members of the political community in virtue and political capacity and governs according to his will without laws.

Marsilius' notion of justice approximates Aristotle's concept of corrective justice, whose task is to correct potential excesses in the acts of the citizens and to bring them into equality. Consequently, Marsilius depicts the ruler as judge, whose function consists in repressing excesses

and guaranteeing the due proportion of the acts of the citizens in conformity with the laws. Laws are not the product of a single lawgiver à l'Aristotle, such as Lycurgus or Solon, but of the collective prudence and experience of a number of people or even generations. The *legislator humanus* is the entire body of the citizens or the *weightier* part (*pars valentior*) that has to represent them. Marsilius draws on Aristotle's doctrine of the collective wisdom of the multitude, according to which many people coming together can make better judgments than a small group of experts or wise men. Yet, although Aristotle's theory applies to the appointment and correction of office holders, Marsilius extends its validity to legislation and regards the entire body of the citizens as the sole legitimate source of legislative and governmental authority within the political community. This model exhibits certain affinities to the organization of the city-states of medieval Italy, in which ultimate authority resided with the council of the citizens and the appointment of the *podestà* and the other office holders and the preparation of drafts of laws was entrusted to committees that acted on its behalf.

The Marsilian view of the exemplary prince is premised on the medieval notion of the ruler as judge and guarantor of justice. In enumerating the ruler's virtues and attributes, Marsilius relies on Aristotle's account of the qualifications requisite in the possessors of the highest offices of the government. The prince should epitomize prudence and justice, virtues that are indispensable for the administration of justice, and equity, which enables the him to make decisions in case the laws exhibit gaps (contrary to Aristotle, Marsilius does not define equity as the modification of deficient laws). Moreover, the would-be prince should be motivated by love for the existing constitution. Further, he needs coercive force (Aristotle speaks of the great capacity for running the affairs of the political community, but due to a mistake in William of Moerbeke's translation of the *Politics*, Marsilius interprets this as military force), in order to be able to enforce his decisions and to punish transgressors of the laws.

In illustrating the relationship between the *legislator humanus* and the government or the ruler,

Marsilius employs Neoplatonic motifs: the *legislator humanus* is the primary cause and the government the secondary. Moreover, in terms of Aristotle's biology, Marsilius sees the function of the *legislator humanus* as analogous to that of the soul during the creation of a living organism; the *legislator humanus* appoints the government as the counterpart of the heart, which is in charge of setting up, differentiating and sustaining the other parts of the political community just as the heart is in charge of creating of the other parts and organs of a living organism. Marsilius differs from the majority of medieval thinkers in being rather indifferent to the question of the best form of government, although he does mention in passing that kingship might be the best one. His aim is rather to provide the outlines of a universal model that would be applicable to various political realities. In this sense, Marsilius makes the unity of the political community contingent not on the existence of a single ruler but on the proper and harmonious functioning of its parts under a single government.

The first part of the *Defensor pacis* provides much of the basis for Marsilius' teachings about the organization of the church in the second part, although there are a number of discrepancies between them. The community of the faithful constitutes the highest authority within the church and possesses the power to nominate and appoint the clerics and to monitor them in the performance of their duties. It also has the right to decide and determine the interpretation of Scripture. The latter is the task of a general council, in which the faithful or their delegates voice and discuss their opinions and vote. Marsilius views the priesthood as an integral part of the political community that performs, like the rest, a civic function. Marsilius denies the pope the right to issue decrees of coercive character and reserves for him solely the power to call an ecumenical council and to reinforce the decisions and interpretations of the latter. With regard to the relations between the emperor and the pope, Marsilius argues that the pope and the general council are subject to the power of the emperor that the sovereign pontiff receives power over other men only with the permission of the emperor. Marsilius expatiates on these issues in

the *Defensor minor*, which is a sort of epitome of the chief principles of Marsilius' political theory, as set forth in *Defensor pacis*. At the outset of that work, Marsilius explicates the term *iurisdictio* and, afterwards, denies the coercive power of the clergy. Large portions of this work deal with questions of excommunication and the *plenitudo potestatis*.

Marsilius' ideas on the precedence of temporal over spiritual power animated scholarly debates on the republican or imperialist interpretation of Marsilius' political thought. Marsilius' views on the superiority of emperor to the pope served to underpin an "imperialist" reading of the *Defensor pacis*, which found its strongest advocate in Quillet 1970. A number of scholars, on the other hand, saw Marsilius as an ardent apologist of republican ideas and have related his political theory to the political realities that prevailed in late medieval Italy (Gewirth 1951/56, 1979; Skinner 1978; Syros 2007; cf. also the discussion in Nederman 1995b).

Martin Luther, Political Thought

Harro Höpfl

Essex Business School, University of Essex,
Colchester, UK

Abstract

Martin Luther (1483–1546) was a German Reformer, theologian, translator of the Bible into German, priest, theology professor (from 1512) at the university of Wittenberg in Electoral Saxony, preacher and pastor, prolific author in both German and Latin, former Augustinian monk, and excommunicated by the papacy in 1521. His best known political doctrines are the *Zwei Reiche/Regimente Lehre* (*Two Kingdoms and/or Two Governments*); political obedience and hostility to rebellion and millennialism; endorsement of princely “absolutism”; the territorial “prince’s church” (*landesherrliches Kirchenregiment*). Slightly less well known are his opposition to usury, his anti-Jewish attitudes, his very “secular” interpretation of marriage and divorce, his doctrine of the three estates (the military, economic, and ecclesiastical), his “congregational” tendencies in church government, and his belief that his was the “end-time” when Satan and Anti-Christ ruled the world. His principal political doctrines were not unfamiliar; they resemble Augustine’s conception of the two *civitates*, the medieval “two swords” controversy, and conventional doctrines of obedience and good order of his time. Luther, moreover, set out his political ideas in pamphlets prompted by specific emergencies, and never consolidated them in a definitive text. Some interpreters see them as an expression of “social conservatism” rather than as inferences from his theology.

Luther’s personal and pastoral concerns from the first centered on the right understanding of how the Christian is saved (or “justified,” accounted or

rendered just). They gained a Europe-wide reception from 1517 in the controversy over indulgences, a practice that for Luther symbolized the pernicious misrepresentations of true doctrine afflicting Christianity. The main themes of his theology were salvation by God’s grace alone, experienced in faith (*sola fide*), and rejection of what he regarded as the received doctrine of the “sophists” (the scholastic theologians) that salvation was a reward “merited” (earned) by “good works.” For Luther, good works, which to be truly good must be done freely and not out of self-interest or fear, are the product and not the cause of justification (*On Good Works*, 1520). A right understanding of Scripture thus frees Christians from trying to achieve salvation by their own efforts, an impossible burden imposed by the “tyranny” of Rome. Even God’s law is no longer a coercive, external imposition for Christians but is obeyed freely and willingly. All this Luther summarized as “Christian liberty.” He regarded Scripture alone (*sola scriptura*) as the source for these teachings, especially its “core,” the Pauline Epistles, St John’s Gospel and the First Letter of St Peter. Its authority is unconditional, irrespective of traditions and popes, although Luther acknowledged the value of the church fathers, especially Augustine, and works such as Tauler’s *Theologia Deutsch*. The Christian must continually “search” Scripture for him/herself. Luther rejected any distinction in spiritual dignity between a “higher” spiritual estate, bound by duties of “perfection,” and a lower lay estate of which less was demanded (his “priesthood of all believers,” that is, their *equality*). He acknowledged that every community (*Gemeinde*, with *Reich* or *Land* his nearest approximation to “state”) must have an ecclesiastical “estate,” along with a ruling (protecting) and an “economic” (nourishing) estate. But ecclesiastics merely occupy a distinct office (*Beruf, Amt*), not a higher spiritual status. Duties previously incumbent only on those in “holy orders” vowed to spiritual perfection, therefore, now bound every Christian, or ceased to enjoy esteem, such as celibacy.

These doctrines undermined the authority of the established ecclesiastico-political order and its personnel. Given the hostility of the papacy

and its supporters to the fundamental reform of the whole of Christendom that Luther came to demand, only *territorial* “Protestant” or “evangelical” churches could be established (“evangelical” meaning gospel or good news, “Protestant” alluding to the princes and estates that protested against the second Diet of Speyer’s (1529) decision to ban any further reformation). Luther became increasingly convinced that the opposition of the pope and his theologians to reformation demonstrated that the pope was the Antichrist. Provisional remedies such as territorial churches were therefore appropriate in this “end-time.” Evangelical churches depended on rulers for political support, and for protection against the papacy and Catholic princes bent on eradicating “heresy,” but also against those who wanted to advance reformation by violence and iconoclasm. The most serious occurrences of this sort were the religio-political “Peasant Wars” of 1524–1525 and millennialist Münster between 1534 and 1535. The “Romanists” blamed them on the “heresiarch” Luther. Princely protection was, however, often neither unconditional nor disinterested. Luther had no intention of replacing “Romanist tyranny” with that of territorial overlords. His attitude to secular rulers was distinctly ambiguous. In his *Appeal to the German Nobility* (1520) he called on the rulers of the Holy Roman Empire to use their authority to advance reformation, since as rulers they had the right and as Christians the duty to do so. But in *On Secular Authority* (1523), prompted by rulers banning his German translation of the New Testament (published 1522), he condemned secular rulers generally (“a good prince is a rare bird in heaven”), and attempted to safeguard true faith and doctrine by contending that the Christian inhabits two realms (*Reiche*), each with its own government (*Regiment*), the spiritual and the secular or “worldly” (*weltlich*). The two have entirely distinct competences and instruments of rule. The spiritual *Reich* is the invisible community of all true Christians, governed by God through Christ and the Word alone. Its members neither need nor use the protection of law or the sword (Luther’s symbol for coercive, secular government) for themselves, since they do not resist evil and expect no advantage or protection from rulers.

The worldly or temporal *Reich* is composed of those not justified in the sight of God. They would tear each other apart, but for the fact that secular government coerces them into behaving in a purely “externally just” manner by means of laws and punishments. Insofar as no Christian is a perfect Christian in this life, they too require the law and secular government. Secular government is thus a divine institution, which also protects true Christians, since they voluntarily do what is right – Luther assumed that legal and moral obligations were much the same – and are therefore obedient subjects. Christians may also exercise temporal authority themselves, out of love for their neighbor, even if that love means extreme harshness. This was the case when Luther subsequently exhorted rulers to show no mercy to the rebellious peasants in his *Against the Murderous, Thieving Hordes of Peasants* of 1525. However, when rulers command what is incompatible with the will of God, Christians may not obey but may not rebel either: they must disobey and suffer. However, the Lutheran justification of political resistance in the *Magdeburg Confession* of 1550 has a basis in some highly circumstantial concessions in terms of the right of self-defense by Luther himself (*Warning to His Dear German People*, 1531). He had little regard for secular laws, less for lawyers, none at all for canon law. Even though the Reformation was mainly urban, he had no interest in republican institutions or questions of the best political form; his instincts were monarchical and he normally simply equated secular authority and “princes” (*Fürsten*). His theology of spirit versus letter tended to minimize the significance of “externals” and “forms” in general.

The “true church” cannot be a this-worldly institution, since the true Christians that alone compose it cannot be known. All the same, Luther treated it as a template for the “physical” or “external” church (i.e., the institutional church) as a voluntary association of believers governed only by Christ, Scripture, and the moral authority of pastors which it chose itself, complete with schools and provision for the poor (see *Right and Power of a Christian Assembly*, 1523). Secular rulers have (according to this version) no role

whatever in bringing men to true justice or true faith, contrary to what he taught in his *Appeal* and subsequently. In practice he endorsed an ecclesiastical order in which political subjection and religious allegiance are coterminous. He never resiled from his position that true faith could not be coerced, and indeed that coercion was counter-productive in dealing with “weak” Christians. Large sections of his *On Secular Authority* were later reprinted verbatim in justifications for religious toleration. Equally, however, he discerned dangers to souls from bad laws, institutions and practices, and urged their forcible abolition or prevention, either out of “charity” to neighbors, or as matters of “natural law” which he regarded as, for example, prohibiting “blasphemy,” which covered many “Romanist” practices.

Luther tended to posit apparently mutually exclusive antitheses (spiritual/worldly, spirit/letter, external/internal, freedom/law, gospel/traditions of men). His mode of expression was often confrontational, vituperative, and in his vernacular writings scatological. Disagreements with humanists like Erasmus over free will, and with other nonsectarian reformers, for example, Zwingli, over the sacrament of the Lord’s Supper, proved irresolvable, since the mere fact of disagreement despite the supposedly plain meaning of Scripture itself compromised the reformers’ authority. Luther’s intention had, however, never been to found a new church, still less a denomination, but to reform the old one.

Martin of Dacia

Lidia Lanza

Instituto de Filosofia, Universidade do Porto,
Porto, Portugal

University of Lisbon (CFUL), Lisbon, Portugal

Abstract

Martin of Dacia, Danish Master of Arts and theologian of the last quarter of the thirteenth century, attempted to establish a new grammar that could be considered as an autonomous science. This grammar would be universal and grounded on ontological reality, its aim being the study of the properties of language.

Martin of Dacia was a Danish Master of Arts and theology at the University of Paris. What is known about his life and intellectual activity can be summarized as follows: he was active as a university teacher and wrote his works before 1287–1288, when he became Chancellor to the Danish King Erik VI Menved, whom he served for the rest of

his life. A canon first in Paris, he obtained the same office at Roskilde, Lund, and Slevig, as a reward for services rendered to the King. He died in 1304.

Martin is the author of a grammatical work and logical commentaries. The former, the *De modis significandi*, includes two parts, of which the first, on the parts of discourse (*Etymologia*), leads on to the second part, on syntactic analysis (*Dyasynthetica*). In this work Martin leaves aside two other sections, the *Orthographia* and the *Prosodya*, which deal with accents and syllables. These two sections, which were part of the traditional writings on grammar, were usually placed before the sections of *Etymologia* and *Dyasynthetica*. Martin's *De modis significandi* was very well known and influential, judging by the number of manuscripts in which it survives and the many references to it by later grammarians. It became so important that several authors wrote commentaries on it in the following decades. As for Martin's logical work, it consists of a set of questions on the *old logic* (*logica vetus*), that is, Aristotle's *Categories* and *De interpretatione*, the *Isagoge* of Porphyry, Gilbert of Poitiers' *Liber sex principiorum*, and Boethius' commentary on Aristotle's *Topics*. His logical work is extant in only one manuscript, which suggests that it was much less widely distributed than the *De modis significandi*.

His prominence as a medieval philosopher relies almost entirely on his *De modis significandi*. If we assume as certain Martin's chronological priority over Boethius of Dacia, as scholarship tends to do (see Marmo 1994), this work is the first systematic treatment of the logical aspects of language. Along with Boethius of Dacia, Martin was one of the outstanding exponents of the first generation of the "speculative grammarians" or *modistae*.

Martin's project was to establish a new grammar departing from the existing descriptive approach and the reading of classical authors that had constituted the discipline's traditional curriculum. For Martin, as for Boethius of Dacia, grammar should no longer be considered as a mere introduction to the other domains of the *Trivium* (such as rhetoric and logic) and the *Quadrivium*, but as an autonomous field of research. To this end, he developed a

theory of the formal aspects of language concerned solely with the correctness of propositions and concepts and, unlike logic, not with their truth or applicability to reality. In this way he attributed a scientific status to grammar, considering it an autonomous science with its own subject matter. This autonomy had been endorsed as early as the eleventh century, but it gained further consistency under the influence of Aristotle's *Posterior Analytics*, as this work defined the criteria for any possible science: the subject matter has to be necessary and universal.

As far as the criterion of necessity is concerned, Martin shares with Boethius of Dacia the view that grammar is a science even though its principles are not absolute at the same level of the principles of other sciences, such as metaphysics. As for the criterion of universality, it is assured by establishing as its object "modes of signifying" (*modi significandi*), that is, ways in which a lexical notion, in addition to its essential reference, can express different values, just as the verb *dolere* and the noun *dolor* or the noun *domum* and the participle *datum* refer to different aspects of the same notion. In other words, the same idea can be signified through various parts of speech as long as its "modes of signifying" are not in contrast with that idea, or, again, the lexeme (*dictio*) is suitable to receive the form of a noun, pronoun, verb, participle, or adverb. By means of this form or "mode of signifying," it is possible to express categories belonging to extralinguistic domains, as in the case of verbs or participles and nouns or pronouns, which express the metaphysical categories of change and permanence, respectively.

Establishing the "the modes of signifying" as the object of grammar guarantees the universality of grammar, as these modes are considered to be linguistic universals. Thus this science focuses on a universal grammar, valid for all languages, on which the grammars of each particular language are grounded. The difference between the diverse languages consists in the different way through which each language forms its vocal expression (*vox*). This fits into the domain of the accident and thus involves a devaluation of the level of vocal expression; yet, because the *vox* is a sign of the thing which must be signified, and given that is

more proper (*habilius signum*) than other signs such as a nod or a glance, grammar includes it, though only as an accident, as it falls more properly under the realm of natural philosophy. This view was followed by John of Dacia, but not by other *modistae*, such as Boethius of Dacia.

A further reason to assert grammar's universality, which allows an understanding of the underlying connection between the grammatical–logical level and the epistemological–ontological one, is that “modes of signifying” reflect corresponding “modes of being” (*modi essendi*) of some existing entity through the mediation of an intellectual act, which understands and conceptualizes it, giving rise to the corresponding “modes of understanding” (*modi intelligendi*). This, along with the Aristotelian characterization of the intellect in the act of knowing as a passive faculty, justifies the claim of grammar to be a science by rooting its object in reality: each thing has its properties or “modes of being” that determine the corresponding modes in which it can be understood (*modi intelligendi*), while the ways in which the intellect conceptualizes it determine the modes of signifying (*modi significandi*). The correspondence between the three “modes” rests on the assumption that any of the parts of speech is a hylomorphic compound, in which the matter (the *vox*) receives its signification through the form (the “modes of signifying”). Martin is clear on how the correspondence between modes is achieved, though he left some unresolved problems for the succeeding *modistae*: the “modes of signifying” derive from the “modes of understanding” as from their immediate cause and from the properties of things, the “modes of being,” as from an indirect cause, as this is made through the mediation of the intellect. This narrow derivative chain provides a grammar well anchored in reality, which avoids the risk of attributing arbitrariness to the object; yet it raises further problems, as in the case of empty or privative names such as “nothing” or “blindness,” or in the case of names of fictitious beings, such as “chimera.” If the relationship between the three kinds of modes is conceived as a narrow chain, there is no answer to the question as to the derivation from “modes of being” in the case of an object that does

not exist in reality or without the properties denoted by its “modes of signifying.” This is one of the main points that Boethius of Dacia and the succeeding *modistae* attempted to solve (see the entry on ► “[Radulphus Brito](#)” in this volume). Their solutions are varied, but they all departed from Martin by rendering more complex the process of derivation of the “modes of signifying” from the “modes of being.” In fact, later authors broadened the ways in which the “modes of signifying” can be attributed, as in the case of their attribution to other objects – whether existing or fictitious – by reason of supposed similarities of the “modes of signifying” with existing objects.

Modistae of later generations inherited a further divergence between Martin and Boethius on the relationship between the three modes. While Boethius argued for a relationship of similarity between the modes – they cannot be one and the same thing, otherwise each property or “mode of being” of a thing would have a corresponding “mode of signifying” – Martin rejected the notion that one mode can signify another: the three modes are, in his view, completely one and the same thing, being only accidentally different, just as Socrates remains one and the same person regardless of the places where he might be. Each mode cannot be a sign for the other two modes, because it would be a sign of something equal to itself, and nothing can be a sign of itself.

For Martin, the “modes of signifying” reside in the *vox* as in a sign, though they inhere in the signified thing like accidents in a substance. In this case too, Martin's solution, in contrast to that of Boethius, is probably carried out – as Marmo (1994) suggests – to prevent a hypostatization of the “modes of signifying”: in the act of giving a name, the intellect does not create anything really existent to be added to the substance of the *vox*; the “modes of signifying,” as well as the “modes of understanding,” reside in external things, and only in a weaker sense do they reside in the intellect and in the *vox*. In the ontological frame, each kind of mode has its peculiarity and autonomy, making possible an autonomous inquiry of each kind, and this tripartite structure does not involve the production of something new when an act of intellection or signification occurs.

The differences between Martin and Boethius of Dacia extend further to logical matters. This can be noted regarding their response to the question of signification and the truth value of general assertions (see Mora-Márquez 2014, 2015). Unlike Boethius of Dacia, Martin sticks to the Boethian traditional interpretation of the key passage of Aristotle's *Perihermeneias* (I.16a3–8) championed by most of the commentators on the *Perihermeneias* in the first half of the thirteenth century. According to this view, an utterance (*vox*) signifies first a concept and only subsequently a thing. In his commentary on the *Perihermeneias*, Martin maintains that in the case of things that exist both inside and outside of the soul, a *vox* signifies both a concept or passion in the soul and a thing outside it. However, as just mentioned, it primarily signifies the concept and only secondarily the thing by means of the signification of concepts, for words are imposed on things insofar as they are represented in the intellect. The signification of concepts precedes that of things because there is no proportion between a material being and a *vox*: as a product of the rational faculty, thoughts are the only thing that can be proportionate to the *voces* (see Mora Márquez 2014, p. 32), and therefore, names first and foremost have to necessarily signify concepts. For Martin, truth belongs to the intellectual domain: an assertion can have a correspondent in reality, but its truth value rests primarily upon the human intellect. In this sense, an assertion with empty terms can be true, even though it refers to nothing existent: in the domain of logics, what matters is the truth of the utterance, not its semantic congruity (*congruitas*) – which is instead relevant in the domain of grammar. For this reason, even an utterance such as “chimaera est chimaera” is true, for it expresses an intellectual composition of elements that fit together.

Mathematics and Philosophy in the Arab World

Antonella Straface

Facoltà di Lingue e Letterature Straniere,
Università degli Studi di Napoli L'Orientale,
Napoli, Italy

Abstract

In the Arab world, the real cultivation of science and philosophy in the form of academic disciplines began in the second/eight century, after the period of the great conquests, as a result of the translation movement that was fostered by the 'Abbāsids of Baghdad. The "translation" into Arabic of the scientific and philosophical knowledge of the Ancients (Greeks, Persians, and Indians) was not uncritical, as the necessity (for religious reasons) of synthesizing this cultural heritage and the Islamic religious thought led to the foundation of a gnoseological itinerary, the final aim of which was God. It was on the basis of this purpose that the recovery of the ancient knowledge and the study of all disciplines, both philosophical and scientific, were justified.

Arab scholars generally used to present science as a branch of philosophy, since the process of inquiry into the nature of science was the same as that used to inquire into the nature of philosophical knowledge. In turn, science was generally distinguished into two main groups: mathematical sciences and natural sciences.

Mathematical sciences included arithmetic, geometry, astronomy, and music. Regarding mathematics, it seems that there were two different systems of thought in the school of Baghdad. One system was influenced by the classical heritage and tried to recover the Greek and Mesopotamian knowledge. The other system, more practical, was influenced by Indian sources, which had its champion in the beginner of algebra, Muḥammad b. Mūsā al-Khwarizmī.

As for philosophy, it played a fundamental role not only in the process of absorption and synthesis of "foreign" sciences and the formation of the Islamic ones, but also in the cultivation and the development of sciences in general, to the extent that this process would have been impossible without the contribution of the *falsafa* or *ḥikma* (wisdom).

As for the role of science and its relationship with theology, the Arabs maintained that science, in its general meaning, was useful in order to understand and implement the divine law.

The Arab contribution to the development of science and philosophy has been remarkable. After the period of the great conquests, the Arabs showed a particular interest in other cultures and civilizations they came in contact with and whose intellectual outcome they wanted to assimilate through the translation movement. Started under the Umayyads (661–750) of Damascus, the translation movement reached its apex during the first centuries of the long history of the 'Abbāsids (750–1258) of Baghdad who fostered this process, which was not only a cultural one.

The main reasons for supporting this kind of "diachronic encounter" between the Arabs and the Ancients were due to both political and social changes and the development of a new ideology that took place in the 'Abbāsids period. In a social and political climate such as that of the 'Abbāsids Baghdad, the need for theoretical sciences became more and more pressing. On the other hand, the necessity (for religious reasons) of synthesizing the heritage of the Ancients and the Islamic religious thought led to the foundation of a gnoseological itinerary, the final aim of which was God.

It was on the basis of this purpose that the recovery of the ancient knowledge and the study of all disciplines, both philosophical and scientific, were justified. In this regard, it is worth noting that the "curriculum" of the school of Baghdad was inspired by Greek sources, although it also included Islamic sciences such as law (*fiqh*) and theology (*kalām*).

With regard to scientific disciplines, the Arab scholars generally used to present science as a branch of philosophy, so that al-Kindī (801–873), in defining the epistemic position of science within the philosophical knowledge, maintained that the process of inquiry into the nature of science was the same as that which is used to inquire into the nature of philosophical knowledge.

In turn, science was generally distinguished into two main groups: mathematical sciences (*al-'ulūm al-riyādiyya*) and natural sciences (*al-'ulūm al-ṭabī'iyya*). Mathematical sciences included arithmetic, geometry, astronomy, and music.

Like the other disciplines studied by the Arabs, also the mathematical sciences, which developed in Baghdad around the third/ninth century, experienced remarkable progress, thanks to the translations of Greek texts into Arabic; the translation of Euclid's *Elements* by al-Ḥajjāj seems to go back to the fifth 'Abbāsids Caliph Hārūn al-Rashīd (786–809), who encouraged this kind of translations. His son, al-Ma'mūn (809–833), who succeeded to him in the caliphate, encouraged learning even more strongly than his father. To this aim, he founded in Baghdad a centre for translation and research: the House of Wisdom (*Bayt al-ḥikma*).

The most important Greek mathematical texts that were translated are Euclid's works, including, besides *Elements*, the *Data*, the *Optics*, the *Phaenomena*, and *On Divisions*. As far as Archimedes, although among his works only two texts seem to have been translated, that is, *Sphere and Cylinder* and *Measurement of the Circle*, their influence was remarkable, since they stimulated original researches. Instead, almost all of Apollonius' works were translated, as well as Diophantus' *Arithmetica* and Menelaus' *Sphaerica*. The development of mathematics was also encouraged by the necessity of respecting religious prescriptions: the duty of observing the holy days, and the related ritual practices, represented a stimulus for the study of astronomy. On the other hand, the need of applying the Islamic law to some situations concerning

problems of inheritance, dowry, or tithe (*zakāt*), for example, required the development of algebra, an Arabic invention.

Regarding mathematics, it seems that there were two different systems of thought in the school of Baghdad. One system was influenced by the classical heritage, and tried to recover the Greek and Mesopotamic knowledge. The other system, more practical, was influenced by Indian sources which had its champion in the beginner of algebra, Muḥammad ibn Mūsā al-Khwarizmī (d. 850), as he wrote a treatise on the Indian numbers, preserved only in its Latin version, *De numero Indorum*.

The name of al-Khwarizmī, however, is linked to his famous treatise *Ḥisāb al-jabr wa-l-muqābala*, later translated into Latin by Robert of Chester and Gerard of Cremona (*Liber algebrae et almucabala*). Here he turned the Greek concept of mathematics, which was essentially geometric, in a revolutionary way. In fact, the Greeks, as they felt the impossibility of conceiving in an analytical way the idea of the irrational numbers, gave geometry the function of studying "immeasurable" greatness. From this standpoint, the Arabs went over the Greeks and, in applying the same procedures of the rational numbers to the irrational ones, contributed to the progress of mathematics in a remarkable way.

The Arab mathematicians Thābit ibn Qurra and 'Umar Khayyām were influenced by the Greek mathematical heritage. Thābit ibn Qurra (826–901), one of the most important translators from Syriac and Greek, did not only translate the major Greek mathematicians (Euclides, Archimedes, Apollonius, and Ptolemy) but also wrote a mathematical treatise on the solution of problems of algebra through geometric demonstration. He was also influenced by the Neoplatonic doctrines and recovered their ideas, as showed by his translations of Proclus and Nicomachus of Gerasa (*Introduction to Arithmetica*). As for 'Umar Khayyām (1050–1122), although he is considered one of the major Persian poets, he was also a scientist. He also wrote a *Kitāb al-jabr* in which, unlike al-Khwarizmī, he dealt with cubic equations.

Although the Arab mathematicians are famous for their works on algebra, number theory, number systems, geometry, and trigonometry, they also gave their contributions to astronomy. In this respect, the translation of Ptolemy's *Almagest* provided important astronomical material.

As a result of the study and the practice of astronomy, during this period two observatories were founded in Baghdad and in Damascus: here the astronomers, entrusted by the Caliph himself, carried out a program of astronomic observations. The aim of this program was to verify the theories explained by Ptolemy in his *Almagest* and to improve the astronomical tools. Historical sources also report of private observatories. Particular attention deserves the private observatory of the Banū Mūsā who, besides being important translators in the *Bayt al-Ḥikma*, completed, from 840 to 869, some studies about the sun and the fixed stars. The Shī'ite Persian dynasty of the Buyids, too, encouraged several astronomical projects in Persia where they founded permanent observatories equipped with sophisticated instruments. From one of these observatories, the astronomer 'Abd al-Raḥmān al-Sūfī (903–986), the author of *The Book of the Fixed Stars*, began the measurement of the ecliptic in the presence of several astronomers, as referred by the versatile scholar al-Bīrūnī (973–1048). The Buyid 'Aḍūd al-Dawla (936–983), when he became the governor of Baghdad, founded in the garden of his house a building, which Ibn al-Qifṭī (1172–1248) called *Bayt al-raṣad* (the house of the astronomical observation), to promote a program of observation of the planets.

As for philosophy, it played a fundamental role not only in the process of absorption and synthesis of "foreign" sciences and the formation of the Islamic ones, but also in the cultivation and the development of sciences in general, to the extent that this process would have been impossible without the contribution of the *falsafa* or *ḥikma*. As a matter of fact, the term *ḥakīm* was used to denote a physician, a scientist, as well as a philosopher.

With regard to its definition, the Arabs used two terms to translate the Greek word "philosophy": *falsafa* and *ḥikma*. *Falsafa*, a calque from

Greek, was understood according to its original meaning, which the Arabs perfectly knew, of *ḥubb al-ma'rifa* (love for knowledge). As for its function, al-Kindī, one of the first philosophers of the Arab world (and of Arab origin), interpreted philosophy as the knowledge of the reality of things according to human possibility. Since this kind of knowledge is both theoretical and practical, *falsafa* has a double aim: to reach the truth and to behave in accordance with this truth. Starting from this definition, some philosophers like al-Fārābī (870–950) drew a distinction between *falsafa yaqīniyya* and *falsafa maẓnūna*; the first was based on demonstration (*burhān*) while the second, deriving from opinion, was based on dialectics.

On the other hand, *ḥikma*, a Qur'ānic term that occurs 20 times in the Sacred Book and appears in the *Ḥadīth* literature too, had several meanings. The majority of Muslim authorities, who debated its exact meaning in the Qur'ān as well as in the Tradition, identified it with theology (*kalām*), as well as with the "intellectual sciences" (*al-'ulūm al-'aqliyya*) or with "traditional philosophy" or, even with the so-called *ḥikma ilāhiyya*, literally "theosophia." *Ḥikma* may imply a connection between knowledge and practice of knowledge, through which man can realize his happiness and bring his being to perfection, as was stated not only by al-Fārābī but also by another eminent *ḥakīm*, Ibn Sīnā (known as Avicenna, 980–1037) and the Ikhwān al-Ṣafā' (The Brethren of Purity, fourth/tenth century). With the *Ishrāqī* school represented by Suhrawardī (1155–1191), *ḥikma* combined the formal religious sciences and the essence of pure gnosis: in this way, it acquired the connotation of both theoretical knowledge and spiritual vision.

In the Shī'ite circles, *ḥikma*, being connected with the "cycle of initiation" that follows the "cycle of prophecy," would be identified with the esoteric dimension of religion, as stated by the *Ismā'īliyya*. In this way, *ḥikma* had a soteriological aim insofar as it involved not only theoretical knowledge but also the direct vision of the Truth that implied the salvation of man's soul.

Regarding the development of philosophy and its diffusion in the Arab world, it should be noted

that although it goes back to the translation movement, philosophical schools existed in the East long before the appearance of the Arabs in the history of the world. After the advent of the Islam and thanks to the translations from Greek, the Arabs, after having assimilated the classical heritage, developed their personal and independent system of thought in which, because of religious conditioning, Aristotelian theories were interpreted in a Neoplatonic way. One of the main reasons of this “misinterpretation” is linked to the works that introduced Neoplatonism in the Arab world; in this regard, it is worth noting that the diffusion of Neoplatonism was due not to Plotinus’ *Enneades* but to some of its later and adulterated versions, among which was the so-called *Theology of Aristotle*. This was an epitome of Plotinus’ *Enneades* akin to another pseudo-Aristotelian treatise based on Proclus’ *Element of Theology*, which, in turn, was known in the Arab world with the title of *Kitāb al-īdāh fī khayr al-mahḍ* (*The Book of the Absolute Goodness*). A further reason for Neoplatonic tendencies in Aristotelian theories was religious influence. From this standpoint, the recovery of Greek philosophy, especially of Neoplatonism, was functional to a cosmological and gnostic system hierarchically structured, at the top of which there was God.

With the historical development of Islam, the real nature of *falsafa* changed from a system of rational thought to a kind of wisdom that played a pivotal role in theology; nevertheless, philosophy, although it was interpreted as theosophy sometimes connected to illumination or gnosis, did not disdain the use of rational thought. So, philosophy in the Arab world, even when interpreted as “Greek philosophy,” did not concern Greek doctrines only, insofar as it developed a system of rational thought which made use of analysis, logic, and rational inquiry. If these philosophical tools were adopted and developed by different Islamic sciences (grammar, rhetoric, classification of tradition, geometry, arithmetic, etc.), on the other hand, philosophy would also give the Arabs the appropriate intellectual background, which enabled them to encounter other civilizations and cultures and to integrate the Arabic

(Islamic) heritage into the new ideas they came in contact with.

A paradigm of this is the emanatistic solution proposed by al-Fārābī and Ibn Sīnā who, establishing also the ontological foundations of science, influenced the subsequent history of Islamic sciences and philosophy.

Regarding the role of science and its relationship with philosophy–theology, it is worth noting that jurists as well as theologians generally maintained that science, in its general acceptance, was useful in order to understand and implement the divine law. As for mathematical sciences, the theologian al-Ġazālī (1005–1111), to mention the most representative thinker, did not attribute to them any function in spiritual and metaphysical matters. On the other hand, the Ikhwān al-Ṣafā’ praised Pythagoras not only because he was considered “a wise man” but also because the Pythagorean doctrine, unlike other doctrines on number, considered existing things as ruled by the nature of numbers, the knowledge of which here implies the knowledge of their origin. On this assumption, the authors of the most ancient encyclopedia of the Arab world known so far, the *Rasā’il Ikhwān al-Ṣafā’ wa-Khullān al-Wafā’* (*The Epistles of the Brethren of Purity and the Loyal Friends*), made the arithmetic a part of the propaedeutic disciplines; for this reason they started their *Rasā’il* with the epistle on number. In particular, in two of the 52 epistles of the *Rasā’il* (namely the 32nd and the 33rd, which belong to the third section of the encyclopedia), they argued that the knowledge of numbers equals the knowledge of God, since the origin of numbers from the “one” represented a way to prove the origin of the universe from God. Moreover, echoing the Pythagorean doctrine, the Ikhwān al-Ṣafā’ compared the number one to God; just as the number one is not similar to the other numbers, although it is the origin of numbers, God is not similar to His creatures although He is the Creator of the universe. In this respect, Pythagoras could be considered a “monotheist.” Finally, the way in which numbers come from the one may be compared with the way in which created beings come from God. This assumption involves a kind of symmetry between the numerical progression from the number one and the

emanation (*ḥayḍ*) of the universe from God, according to the following correspondences: 1 = God; 2 = Intellect; 3 = Soul; 4 = matter; 5 = nature; 6 = body; 7 = stars; 8 = elements; 9 = generated beings.

The use of mathematical sciences, in particular of arithmetic, as a metaphorical reading of Neoplatonism is also found in the Ismāʿīlīs, who adopted numbers in their metaphorical interpretation (*taʿwīl*) of the Scripture. In particular, they recovered the so-called *sīmīyāʾ* (or “esoteric science of the letters”) which drew upon the Pythagorean tradition for its symbolic numerology, just as they used the Neoplatonic tradition as a framework of their cosmology. The result of the application of this particular science is a kind of exegesis of the Soul, achieved through a process of transmutation of the words and letters into numbers thanks to a variety of techniques such as, and first of all, the *ḥisāb al-jummal* (i.e., the calculation made by giving to each letter of the Arabic alphabet a numerical value). Thus, the application of the *sīmīyāʾ* and the recovery of numerological techniques become a “sign” (one of the literally meanings for *sīmīyāʾ*) not only of the Ismāʿīlī *daʿwa* (propaganda) but also of the intrinsic unity of all levels of reality (cosmological, epistemological, and imamic), recognized within the Ismāʿīliyya.

By the end of the fifth/eleventh century, philosophy was attacked and criticized by the most important champion of the orthodoxy, al-Ġazālī. If his polemical treatise *Tahāfut al-Falāsifa* (*The Incoherence of the Philosophers*) has been considered as a mortal blow for philosophy, on the other hand, it provoked a very interesting reaction, like the one that took place in the western lands through the main philosophers of the Andalusian school: Ibn Bājja (known as Avempace, d. 1138) and, especially, Ibn Rushd (known as Averroes, 1126–1198), the great commentator of Aristotle, who undertook the defense of philosophy with his *Tahāfut al-tahāfut* (*The Incoherence of the Incoherence*), a polemical answer to al-Ġazālī’s attack. With the death of Ibn Rushd and the subsequent power shift from Muslim to Christian, the philosophical activity in western Islamic countries came down.

In eastern Islamic countries, after the fall of the ʿAbbāsīd caliphate (1258) and the subsequent end of the symbolic political unity of the Islamic world, philosophy was dominated, in general, by the heritage of Ibn Sīnā and Suhrawardī. Their ideas and influences stimulated the rise of several philosophical schools such as that of Sadr al-Dīn al-Shīrāzī (d. 1640) known as Mullā Sadrā, the founder of the so-called “transcendent theosophy” (*ḥikma mutaʿāliyya*). His idea of an “existence preceding essence,” which goes back to Ibn Sīnā and Suhrawardī, made the transition from essentialism to the existentialism possible. Moreover, in dividing the way to knowledge into four parts (metaphysics, physics, theology, and psychology), he gave a further demonstration of the intrinsic unity between philosophy and science in general.

Matthew of Aquasparta

Mikko Yrjönsuuri

Department of Social Sciences and Philosophy,
University of Jyväskylä, Jyväskylä, Finland

Abstract

Matthew of Aquasparta (c. 1237–1302) was a theologian who made a considerable career in the Franciscan order. In his theory of the human soul, he accepted the plurality of forms and opposed the conception of the unity to the soul and its powers. Among epistemological issues, he developed the elements of the theory of intuitive knowledge which became important in the thought of John Duns Scotus and William Ockham. Matthew pointed out that Augustine refuted the ancient skeptics by the soul's certain knowledge of its own existence. He also defended the Augustinian theory of illumination in his epistemology and the freedom of the will over the intellect.

Matthew of Aquasparta was born of the noble Bentivenghi family and made a strong ecclesiastical career in the Franciscan order. He entered the order as a child in Umbria but moved to Paris for university studies at about 1268, becoming a student of Bonaventure and John Peckham. He taught at Bologna, Paris and the Papal Curia. In the year 1287, he became the minister general of the order.

Matthew's university studies were no doubt influenced by the doctrinal quarrels between Thomas Aquinas and other Aristotelian thinkers on the one hand, and the Bonaventure and other Augustinians on the other. While Matthew of Aquasparta was not really a highly original mind, he was a clear and acute Franciscan thinker continuing on the lines set by Bonaventure. In his theory of the human soul, he accepted the plurality of forms and thereby opposed attributing strong unity to the soul and its powers. Among epistemological issues, Matthew defended the capability of human intellect to directly perceive individuals. He divided intellectual knowledge into three classes: acquaintance by sign (*per ratiocinationem*), by direct apprehension (*per inspectivam contuitivam; per intuitionem*), and by understanding the essence (*per quidditatis speculationem*), and thus developed the theory of intuitive knowledge that became very important in the accounts of intellectual knowledge of singulars by later Franciscans John Duns Scotus and William Ockham. Matthew also pointed out that Augustine refuted the ancient skeptics by the soul's certain knowledge of its own existence. He defended the Augustinian theory of illumination in his epistemology, and defended the freedom of the will over the intellect.

Maximos Planoudes

George Zografidis

Department of Philosophy, Aristotle University of Thessaloniki, Thessaloniki, Greece

Abstract

Maximos Planoudes (1255–1305) was a Byzantine scholar and writer, an influential teacher, learned in many fields, a copyist and “editor” of numerous Greek texts, and a translator of Latin works. His efforts have enriched the manuscript tradition of a considerable part of Greek literary and scientific production. He was the most eminent scholar of his time and probably the most productive Byzantine classical scholar. Planoudes was the first Byzantine with sufficient knowledge of Latin and of Latin culture. He translated systematically theological and secular Latin works (among them Augustine’s *On the Trinity* and Boethius’ *The Consolation of Philosophy*) and made possible, after a long time, the communication of

Greek- and Latin-speaking worlds. Planoudes is one of the leading figures of the Early Palaiologan Renaissance.

Biographical Information

Nikomedeia 1255 – Constantinople 1305. Byzantine scholar with impressive range of interests, grammarian, productive “editor” of Greek texts and translator of Latin works, monk, representative of the intellectual movement in the Early Palaiologan Renaissance (mid-thirteenth- mid-fourteenth-century), and the most outstanding Latin scholar in the East. Manuel Planoudes was born in Asia Minor and settled in Constantinople where he completed his higher education and learned Latin.

Quite young (c. 1280) Manuel entered the Imperial Court as a state official and began to teach, perhaps in the imperial Chora Monastery. He abandoned a promising career in the civil service, became a monk (1283/1292) and changed his name to Maximos. He devoted himself to the monastic life of a scholar. Through his teaching activity, within the monasteries of the capital, he became famous and attracted many scions of noble families. Among his pupils were scholars like Manuel Moschopoulos, Georgios Lekapenos, Demetrios Triklinios, the Zarides brothers, and Ioannes Zacharias. Except philosophy, he taught grammar, poetry, and rhetoric (*trivium*) but from late 1280s he started to teach astronomy, mathematics, and geography (*quadrivium*). His teaching was based on the best ancient sources available to each field: Plato and Aristotle, Strabo, Pausanias, Diophantus, Cleomedes, Euclid, Nicomachus, Ptolemy, and many others. Planoudes was an outstanding member of a wide circle of well-educated Byzantines like George of Cyprus, Nikephoros Choumnos, Manuel Bryennios, and many other future Patriarchs and state officials. As many Byzantine thinkers and scholars, Planoudes had close relations to the imperial court and even to the emperor himself, Andronikos II.

At first Planoudes supported the pro-union policy of the emperor Michael VIII and within the West-friendly atmosphere that followed the

unionist Council of Lyon (1274) he showed his enthusiasm for the Latin culture and started to translate works of Latin theology and literature. Later on he supported the anti-union policy of Andronikos II and, finally, he decided not to participate into state and ecclesiastical missions and to avoid his involvement into theological questions. So he preferred to confine himself to activities such as the teaching and the editing of ancient Greek texts. He entered the Monastery of Akataleptos where he taught from 1299 until his early death in 1305.

Planoudes was really a man of books, a devoted reader of the entire corpus of Greek literary and scientific texts, an owner of many codices, and a systematic copyist of numerous works with a constant concern to provide appropriate texts for himself and for his students. His scholarly achievements cannot be underestimated though he was not an editor exactly in the modern sense. The main bulk of his writings were done for didactic purposes. He wrote grammar and syntax manuals and translated a Latin grammar. He edited and/or commented on Greek poetry, tragedy and comedy, and historiography. He reintroduced nine plays of Euripides, started an edition of *Moralia* of his favorite writer Plutarch (that was completed after his death), accomplished the voluminous *Anthologia Planudea* (1299, a version of the *Greek Anthology*), and compiled collections of various Greek texts. Planoudes' extensive work contains also a corpus on rhetoric, encomia, canons, hymns, scientific writings, and translations of Latin texts. His extensive letter-writing (1292–1300) is a valuable source for the political and intellectual events of this period as well as for Planoudes' life and personality.

Thought

During the Early Palaiologan period, a decisive (re)turn to the ancient Greek tradition took place, not for the first time in Byzantium. In spite of the economic and military decay of the empire, the Byzantines developed a vivid intellectual life. Many scholars seemed to find relief from the

calamities of the present and from the uncertainty for the future by turning to what they considered as their glorious past and their natural heritage, that is, ancient Greek civilization. Without repudiating their Christian identity they were lovers of (pagan) antiquity that they had to rediscover for themselves. It was also the military and trade presence of the Catholic Westerns in the Orthodox East, and the possibility of the Church union, that made the Byzantines to realize the necessity to learn more about Latin/western civilization. In this context we can understand Planoudes' project (a) to preserve as many ancient texts as he could, to write commentaries on them and treatises on all the sectors of higher education, and (b) to translate Latin works and offer, for the first time, a reliable access to the otherwise unknown intellectual Latin world.

Planoudes probably taught philosophy but he did not write anything on Aristotle; he could use the textbooks on the *Organon* written by his contemporaries, George Pachymeres, Maximos Holobolos and John Peditasimos. As for Plato, he included excerpts of Platonic works in one of his collections and collaborated in the copying of a manuscript of Plato. Planoudes' preferences are perhaps to be found in his choice to translate Cicero's *The Dream of Scipio* and Macrobius' commentary. In the *Dream* there are views acceptable for Christians, as the omnipotence of God and the immortality of human souls, together with political thoughts about the love of justice and the ideal of devoting one's life to the service of one's state that were suitable for a Byzantine emperor like Andronikos II. The reminiscences of Plato are evident throughout both Latin texts. The same can be said for another choice of Planoudes, namely, his translation (before 1296) of Boethius' *Consolation of Philosophy*, where the Christian confrontation to impending death resorted to non-Christian sources.

Byzantine scholars' interest in Greek scientific writings went together with their interest in Greek philosophy and literature. Planoudes' interests and teaching activity covered also the sciences of the *quadrivium*. Around 1292/93 Planoudes was interested in mathematics and specifically in Diophantus, whose work Pachymeres had already

used in his *Quadriuvium*. He made a manuscript of Diophantus' *Arithmetic* (with comments) and it is thanks to Planoudes that the work of Diophantus survived in the history of mathematics. He also wrote the *Calculation according to the Indians* (1292/3), preserved in forty-one manuscripts. It is an important work that shows the diffusion of Hindu arithmetic in the Byzantine world and contains the first use of zero as a place holder at the right of the other symbols. For his teaching Planoudes prepared scholia on Euclides' *Elements* and he edited Aratus' *Phenomena* (c. 1290) and the circular theory of the Stars of Cleomedes. He was interested also in the geography of Ptolemy (1295) and music or harmonics; he wrote a book on harmonics and collected nearly all the relevant works (1294).

Planoudes proved to be a pioneer in the eastern Christendom and with his systematic translations of both profane and Christian Latin authors he contributed to the restoration of the contact between the two parts of Christendom that their ways had parted long ago. Except the philosophical works, he translated the anonymous' *On the Misdeeds of the Age*, Ovid, Caesar and grammatical works, as well as many others. The quality of his translations is generally more than satisfactory. In this activity Planoudes is probably unique in Byzantium and, though appreciated, he found no imitators until Demetrios Kydones (1324–1397/98).

Planoudes was the first Byzantine to study Augustine and his major achievement was the rendering into Greek of *On the Trinity* (completed before 1282). That was a thoughtful choice, because the western conception of Trinity, a much debated issue between East and West, derived mainly from Augustine. Thus, Augustine after centuries of ignorance was put on the map of Byzantine theology with Planoudes' widespread translation. And the Augustinian text had significant influence on Byzantine theologians; for instance, the hesychast Gregory Palamas made use of Planoudes' translation. Few years after this translation Planoudes wrote two anti-Latin treatises about the procession of the Holy Spirit and then he decided to withdraw from such debates considering himself as a classical scholar and not as a theologian.

Planoudes' ethical-political views are conventional and they are expressed in his epistolography and in the *On King* that was addressed both to the young emperor Michael IX Palaiologan, few days after his coronation in 1294, and to his father Andronikos II. It is an idealized portrait of the emperor who should have all the classical virtues. Planoudes declared that their race (*genos*) is a "Roman" (*Rhomaïos*) and exhibits a kind of patriotism common to the Byzantines after their liberation from the Latins and under the threat of the Ottomans. It is interesting that the monk Maximos is against pacifism when he considers the circumstances of his country. He justifies the war insofar as it is a liberating war of the pious against the impious who threatened the homeland and the faith of *Rhomaïoi*.

Planoudes gained his reputation as a teacher and a scholar. His work influenced Byzantine philosophers and thinkers like Metochites, Demetrius Kydones, Joseph Bryennios, and cardinal Bessarion. His teaching and his writings covered nearly every aspect of Byzantine learning and played a significant role during the Early Palaiologan Renaissance. Planoudes' manuals were used for a long time and, translated into Latin, were used even by Italian humanists. His meticulous efforts in finding, copying, and editing ancient texts facilitated their use and helped the re-appreciation and the recovery of the Greek heritage by the Byzantines. Finally, his translations broadened the horizon of Byzantine thought through the approach of the Latin culture – a path that only few followed in the Orthodox East.

Maximus the Confessor

Matthew J. Pereira

Department of Theological Studies, Loyola Marymount University, Los Angeles, CA, USA

Abstract

Maximus the Confessor (c. 580–662) was a Byzantine ascetic theologian who advanced an integrative theology borne out of the monastic circles he inhabited – the Chalcedonian Definition of 451 (i.e., two natures of Jesus Christ) and the church fathers – whereby, he advanced a spiritual theology that placed humanity and creation in a salvific relationship with the Word of God. Maximus, in alliance with the Roman Church, challenged the imperially backed Monothelite teachings that stated the one divine will subsumed the human will in Jesus Christ. In response to monothelitism, Maximus taught Jesus Christ possessed two faculties of the will within the one modality of willing. In the midst of the contestations against ecclesiastical and political authorities, Maximus coalesced teachings from the church fathers, often preserved and circulated in anthologies (i.e., *florilegia*), thereby reframing their teachings to address interrelated questions related to theology, cosmology, ontology, and anthropology. Steeped in the monastic networks of the seventh century, Maximus developed an ascetical theology centered on Jesus Christ and the Triune God as the divine reality that provided the ontological ground for dynamic movements of human divinization (i.e., *theosis*). The uniting of the human and divine natures in Jesus Christ (i.e., *hypostatic union*), according to Maximus, placed human

beings as the mediators between the world and God. Humanity and creation becomes deified through participation in the divine as the cosmos receives by grace what belongs to God by nature. Maximus recapitulated traditional concepts, hypostasis, *idiomatum communicatio*, and *perichoresis* to explicate a doctrine of Christ that was fully connected to his anthropology and teachings on creation. Having stood strong in his convictions even after being exiled and maimed, Maximus, the Byzantine monk and ascetical theologian, is known in sacred memory as the Confessor.

The Life of Maximus the Confessor

Many of the biographical details for Maximus the Confessor (c. 580–662) are derived from the Syriac and Greek *Lives*. In the Syriac *Life* (written during the lifetime of Maximus; published in the 1970s by Sebastian Brock), George of Reshaina, who served in the court of Emperor Heraclius, provided an unflattering portrayal whereby he asserted Maximus was conceived within an adulterous relationship between a Samaritan man and a Persian slave girl. Contrary to this inflammatory Syriac account, the laudatory Greek *Life of Saint Maximus*, composed in the tenth century by the Studite monk, Michael Exaboulites, recounts that Maximus was of noble birth and received an excellent education befitting of a high social status. The Greek *Life* asserts that Maximus rose to head of the Imperial Chancery under Emperor Heraclius until becoming dissatisfied with civic life in 614, when he chose to enter the monastery at Chrysopolis. Around a decade later, between the years 624 and 625, Maximus relocated to the monastery of Saint George at Cyzicus. During the Persian invasion of 626, Maximus fled from Saint George to settle at a Greek monastery in Carthage sometime around 630.

In 654, at the monastery in Carthage, Maximus and Pyrrhus, the former was the exiled patriarch of Constantinople (r. 638–641), entered into the debates on the nature of the will in Jesus Christ. In the seventh century, to reach agreement

between ecclesiastical factions, Sergius (patriarch of Constantinople) advanced the Monothelite teaching that asserted there are two natures (see the Chalcedonian Definition of 451) along with a new position, that is, there is only one divine will or energy (known as monenergism) in Jesus Christ. Having affirmed the two nature Christology of the Council of Chalcedon (451), which professed Jesus Christ is fully human and fully divine, Maxentius asserted that to teach there was only one divine will (as the Monothelites had done) was incompatible with the orthodox faith of the Chalcedonian Definition. Prior to Maximus entering into the debates on the nature of the will in Jesus Christ, the ecclesiastical and political authorities sought to reunite two factions that emerged after the Council of Chalcedon (451), that is, the Chalcedonian (e.g., Rome) theologians, who affirmed two natures in Jesus Christ, and Monophysite (e.g., Antioch) theologians, who professed one nature in Jesus Christ. In 624, to encourage rapprochement, Emperor Heraclius and the Monophysites, produced a doctrinal formula that declared there was two natures and one will in Jesus Christ. Notably, the patriarch of Constantinople, Sergius, argued that Cyril of Alexandria had taught there was two natures and one will in Jesus Christ, which initially, persuaded many of the Monophysites to reconcile with the imperial Church that held to the two-nature Christology of Chalcedon. Yet, at the same time, opposition emerged, initially, from Sophrinus of Jerusalem who sent correspondence to Pope Honorius to condemn Monothelitism. Responding to Sophrinus, Honorius approved of Monothelitism and included the term “one will” in Jesus Christ, which thereafter, replaced the language of “one energy (monoenergism) within the preferred doctrinal formula of the Monothelites, known as the Ecthesis, which was promulgated by Emperor Heraclius in 638. Whereas the Eastern churches largely accepted the Ecthesis, the Roman papacy (after Pope Honorius) condemned this Monothelite profession, therefore, Emperor Constans replaced the Ecthesis with a new profession, known as the Typos. The Typos, which was probably composed by Paul II, the

patriarch of Constantinople, condemned Monothelitism and the alternative teachings that affirmed the two wills in Jesus Christ. The Typus did not resolve the issue, indeed, in 649, at the Lateran Council, the council fathers condemned this opaque doctrinal document.

In response to Pyrrhus and other opponents, Maximus affirmed the Chalcedonian Definition of 451 (<http://anglicansonline.org/basics/chalcedon.html>), which taught the two natures (divine and human) in the one person of Jesus Christ. Emperor Constans II demanded a recantation from Maximus, who was first exiled and after two additional refusals during imperial summons in 658 and 661 was increasingly persecuted. Maximus has been memorialized with the title Confessor after enduring intense persecution for the orthodox faith, including the cutting off of his right hand and tongue according to the tradition. Maximus died in Georgia on 16 August 662.

The Literary Works of Maximus

In his literary corpus, Maximus wrote on a wide range of theological topics related to the spiritual life, anthropology, creation, Jesus Christ, and the Trinity. His writings may be divided into theological commentaries (*The Ambigua*, *Quaestiones to Thalassium*, *Quaestiones to Theopemptum*, *Quaestiones et dubia*, and *Exposition of Psalm 59*), ascetical writings (*The Ascetic Life*, *Two Centuries on Knowledge*, and *Four Centuries on Love*), and liturgical writings (*Mystagogia* and *Exposition of the Lord's Prayer*). There are several extant epistles of Maximus (*Epistle to Abbot Thalassium*, *Epistle to Anastasius*, and *Second Epistle to Thomas*). One of Maximus' favorite literary forms was "centuries" (*hekatontas*), which consisted of one hundred "chapters," typically the length of a paragraph. Maximus has four *Centuries on Love* and two *Centuries on Theology and the Incarnation*. Maximus preferred the traditional intellectual method of progressing in understanding through questions and responses, known as *erôtapokriseis*. Maximus' *Ascetic Life* is an example of this intellectual technique.

Maximus' Synthesis

Reflecting the approach of many learned theologians, who appropriated the church fathers, Maximus synthesized a diverse range of intellectual sources to connect his teachings into a singular vision of the spiritual life, salvation, the Triune God, and the cosmos. Maximus recast various traditions into an ascetic spiritual theology that spoke to his own community. Maximus advanced a mystical vision that synthesized dogmatics and the spiritual life to explain how humanity moves to close communion with God. Maximus' intellectual sources reach back from Plato, to the Cappadocian fathers, and to Leontius of Byzantium. Maximus borrowed from Neoplatonic thought in developing his theological worldview. His relationship to Origen of Alexandria remains more of an open-ended question (Sherwood 1955; Balthasar 2003). Maximus had to navigate his relationship to the teachings of Origen when Emperor Justinian's condemnation of Origen, which marked the high watermark of the Origenist controversy. Thus, Maximus was intentionally opaque albeit his theology may be read as a synthesis of Origen's theology, the degree of interrelatedness is often difficult to assess. Maximus' doctrines often moved beyond Origen and Neoplatonism. For example, Maximus' concept of the eternal state of humanity involves an ongoing restful movement, whereas Origen stresses an absolute rest. Beyond Origen, Maximus drew from the "scholastic" Aristotelianism of the seventh century. Leontius of Byzantium and Sophronius (patriarch of Jerusalem) shaped Maximus' intellectual life. Furthermore, Maximus' work is preoccupied with affirming the Councils (Nicea, Chalcedon, and Chalcedon II). Maximus' Christology is articulated within the imperial philosophical circles of the late sixth and the seventh century. Maximus' employment of philosophical terms, discourse, and the complexity of his thought were borne out of Neo-Chalcedonianism of the seventh century that affirmed the Chalcedonian Definition of 451 (i.e., two nature Christology) and Cyril of Alexandria's teachings (i.e., single nature Christology and doctrine of divine suffering).

Maximus' Christology

While Origen influenced Maximus' early thought on the Logos, Neo-Chalcedonian Christology was the starting point for his more mature thought. In agreement with the Ecumenical Councils (Ephesus 431; Chalcedon 451), Maximus affirmed the Incarnation as a hypostatic union, where the human and divine natures coexist in the God-Man. The term hypostasis was one of the most controversial terms during the Christological debates that had dominated Maximus' life. For Maximus, the Christological question was not merely an academic concern; rather as an ascetic monk, he understood that Christ impacted the spiritual life and the entire cosmos. Christ's hypostatic union provided the primordial synthesis that makes the deification of humanity possible. The person of Christ is the foundation and goal for all creation moving toward perfection through participation.

One of Maximus' greatest achievements was his appropriation of philosophical terminology (such as hypostasis, *communicatio idiomatum*, and *perichoresis*), in order to advance a dynamic Christology, which reflected the Neo-Chalcedonian position. Maximus' explication of Christ's hypostasis begins by drawing a parallelism within the human composite of body and soul. For Maximus, the nature of the union between the soul and body is a pivotal concept. Maximus insists that the whole is nothing else but its parts and that there is no other existence without these unified parts (*Opuscula*, PG 91, col. 117D). Furthermore, it is the totality of the parts in their mutual indwelling that has prominence over all divergence (*Opuscula*, PG 91, col. 521 BC). The whole of the human being in the sense of their person and existence is the hypostatic unity (*Ambigua*, PG 91, col. 1044D). Following this course of reasoning, the human nature of Christ, on account of having being in the Logos, consequently derives personality and existence from the Logos (*Epistles* 11, PG 91, col. 468AB). In additional writings, Maximus further explicated Christ's hypostasis through the concepts of *communicatio idiomatum* and *perichoresis*.

Maximus was probably the first theologian to employ the term *perichoresis* in order to

express the *communicatio idiomatum* of Christ's divine and human nature (Thunberg 1995). According to the Scholies to Ps.-Denis, Gregory Nazianzen's *Letter to Cledonius* (*Letter* 101) influenced Maximus' concept of *perichoresis*. For Maximus, *perichoresis* conveyed a double penetration where the divine penetrates humanity (*Quaestiones ad Thalassium* 59, CCSG 22, p. 51 ff. and humanity penetrates into the life of God (*Ambigua* 5m PG 91, col. 1053 B). Maximus' doctrine of *perichoresis* provides the foundation for all activity whereby the unity of the human and divine in Christ provides a redemptive framework for humanity. The Incarnation makes dynamic "modes of existence" possible, where true human nature becomes open to relationship with God. This mode of participation leads to deification through Christ, who is the perfection of humanity and the world.

In the fifth session of the Council of Chalcedon in 451, after reaffirming the Nicene Creed (325), the Niceno-Constantinopolitan Creed (381), Pope Leo's *Letter to Flavian*, and Cyril's synodical letters, the council fathers received the Chalcedonian Definition, declaring that the two natures of Jesus Christ are without confusion, change, division, and separation even as they (divine and human natures) remain in mutual communication. The Chalcedonian Definition significantly contoured Maximus' cosmology and anthropology. Furthermore, Irenaeus' doctrine of recapitulation, in collaboration with monastic writings and the Cappadocian fathers, informed Maximus' understanding of the relation between the *logoi* of humanity and the Logos (i.e., Word) of God that both participate in the story of salvation or deification (Blowers 2016). In the opening section of *The Centuries on Charity* (Book 4), Maximus provides his fullest discussion on a theology of creation, wherein, Thunberg delineated eight elements in Maximus' cosmology: (1) *creatio ex nihilo*, (2) creation because of God's will, (3) creation because of God's benevolence, (4) creation by the Word, (5) creation because of God's prudence, (6) creation as divine condescension introducing an element of motion, (7) every creature composite of substance and

accident, and (8) creation, not of qualities but of qualified substances that need divine providence (Thunberg 1995). The primary principle in all of creation, for Maxentius, is the synthesis of binaries expressed in the hypostasis of Christ. The Incarnate One is reconciling all of the polarities between God and the world. All nature finds fulfillment in God, where the Logos brings unity out of diversity through movements of contraction and expansion.

Maximus' approach may be characterized as proto-scholastic without being rationalistic or systematic. Ultimately, Maximus' spiritual theology belonged to the monastic circles he inhabited, working from the starting point of apophatic love (Blowers 2016), continually pushed the boundaries of articulation outward into the darkness of mystery (Balthasar 2003) as he pointed to the mystery of the incarnation of the Word of God.

Medicine and Philosophy

Joel Chandelier

Université de Paris 8, Paris, France

Abstract

The question of the connection between philosophy and medicine raised in Antiquity remains a serious bone of contention in the Middle Ages. The problem, which stems from the acceptance of the Galenic synthesis as the foundation of medicine in late Antiquity, is the discrepancy between the concrete, empirical foundations of medieval medical practice and the cosmological model that is supposed to integrate it. While the first authors are circumspect, the eminent Arabic doctors and philosophers Avicenna and Averroes propose solutions, one through a strictly instrumental view of medicine, the other through a drastic limitation of its field of experience. Translated into Latin in the twelfth and thirteenth centuries, these developments lead scholastic doctors to construct a more autonomous medical discipline that distinguishes itself more neatly from natural philosophy and delineates its own goals and methods. Thus, at the birth of the Renaissance, medicine loses its ambition of being a “second philosophy” but secures greater independence.

From the time of Hippocrates, the proper relation between medicine and philosophy has been the

subject of great debate. In simple terms, the central problem is whether medicine must appeal to philosophical principles to determine the model of human nature that grounds the conditions of its practice, or whether it must be wholly autonomous and draw its knowledge solely from its experimental resources. In the first case, philosophy provides information on the elements that constitute human beings and thus situates them in a cosmology; in the second, doctors settle for perceptible information gathered empirically. In the Hippocratic corpus, we find two opposite answers: *Ancient Medicine* or *Nature of Man* states that the doctor does not need to rely on the principles of natural philosophy to establish its art, while for the treatise *Regimen* (I.10), human beings are said to be “a copy of the whole.” Galen’s answer, in the second century CE, sets the context for subsequent medieval discussions. Indeed, he asserts in his *That the Best Physician is Also a Philosopher* that “if, then, philosophy is necessary to doctors with regard both to preliminary learning and to subsequent training, clearly all true doctors must be philosophers.” Galen insists, moreover, on the necessity, for the practitioner, of mastering the three parts of philosophy defined by the Stoics, namely, logic, physics, and ethics: the first to understand the science of demonstration, the second to have an understanding of nature in general, and finally the third to instill a contempt for wealth and the love of work. However, the links that Galen highlights between medicine and philosophy do not lead him to adopt a precise cosmology: on the contrary, he borrows as much from Plato as from Aristotle, for instance for the division of matter in four elements, and does not hesitate to contradict these authors on many important points. The result is a balanced synthesis, however fragile, between the most important ancient philosophers.

Alexandrine Teaching and the Ancient Heritage

This heritage is adopted and systematized by the authors of late Antiquity, and in particular by those active around the school of Alexandria,

chief center for the teaching of traditional ancient Greek philosophy. One of the characteristics of this school is that medicine and philosophy are frequently, if not systematically, associated during the sixth and the seventh century. In this school is born a figure destined to remain in the Arab and Byzantine world, the iatrosophist, a doctor-philosopher capable of providing care as well as mastering grammar and dialectic. The thought of Galen is linked by the Alexandrians more strictly, and often more inaccurately, to the great philosophical systems of Antiquity. To justify their reasoning, the iatrosophists rely on the statements of Aristotle, who insists in his *On Sense and Sensible Objects* on the necessary link existing between the philosophy of nature and medicine: "Most natural philosophers, and those physicians who take a scientific interest in their art, have this in common: the former end by studying medicine, and the latter base their medical theories on the principles of natural science" (*On Sense and Sensible Objects*, I, 436a19–436b2). The Alexandrians go even further, attributing to Aristotle many definitions that depict medicine as a "philosophy of the body" or the "sister of philosophy." The echo of these Alexandrine's conceptions is found in the encyclopedist Isidore of Seville (d. in 636). In his *Etymologiae* (IV, XIII 5), he asserts that medicine deals with the whole human body, and therefore is rightly called a "second philosophy," in the image of the first, which pertains to the soul. Though the Latin medicine of the time is in full intellectual decline, this mention reveals the influence of conceptions developed by the last heirs of ancient philosophical teachings. However, integrating the two domains of knowledge in a single system is not without important difficulties. On many points, Galen and Aristotle are in clear opposition. The most famous example of these conflicts involves the organic origin of the functions of the soul. For Aristotle, the heart is their unique seat; but Galen, thanks to vivisections, notices that brain or nerve lesions can cause paralysis, and logically places the seat of sensation in the brain. Thus, Galen favors a return to the platonic conception of the tripartite soul, whose functions are placed in the heart, the brain, and the liver. Another famous case is the role

attributed to the woman in generation: for Aristotle, she has the passive role of providing matter, while Galen credits her also, as he does the man, with the active role of giving the embryo's form. Embarrassed by these contradictions, Alexandrian thinkers prefer to sidestep these problems or to approach them indirectly. Thus, on the question of the existence of a neutral state between health and sickness, stated by Galen at the beginning of *Medical Art* and contradicted by Aristotle who affirms in the *Categories* that these two terms are an example of contraries that admit no intermediate, Agnellus of Ravenna (sixth century) avoids citing explicitly Aristotle but answers objections from anonymous critics – plainly Aristotelian – by relying on other passages from the Stagirite. Stephanus of Athens, iatrosophist from the sixth century, is equally cautious in his commentary on Hippocrates' *Prognostics* when he addresses the question of the origin of sensation: enumerating the reasons that lead some to place it in the brain, and those that lead others to place it in the heart, he concludes his presentation of opposing arguments by a simple sentence: "The question remains unresolved up until now, whether the governing principle is situated in the brain or heart." In this way, the authors of late Antiquity had provided a framework to the relation between philosophy and medicine, but without answering the essential problems the relation raises.

By conquering the principal intellectual centers of Late Antiquity, like Alexandria, the Arabs integrated a large part of Greek science, in particular through translations carried out in the eighth and ninth centuries. Hence, it is not surprising that we find, in the first medical texts written in the language of the Qur'ān, the same categories and the same problems, than those that had preoccupied the iatrosophists. Thus, Yuhanna ibn Masawayh (l. 777–857), in the eighth aphorism of his *Medical Axioms*, declares that "when Galen and Aristotle agree upon something, it is true; when they are in disagreement, it is exceedingly difficult for the mind to determine the truth of the matter." Al-Majūsī (d. at the end of the tenth century) represents the synthesis of these Alexandrine teachings revisited by the Arabic authors. In his *al-Kitāb al-Malakī* (*Royal Book*), he takes up

again the distinction between theory and practice, by specifying that the first is a science, that is, a true knowledge necessary for action. This science divides, in turn, into things that are natural, those that are nonnatural and those that are against nature. Though al-Majūsī does not point it out, he is certain that this scientific part of medicine must tackle the problems posed by the correspondence between the two disciplines. For the rest, when he treats certain questions concerning the connection between medicine and philosophy, he prefers to suspend judgment: thus, when he wonders if the soul that we find in the brain is the soul itself or if it is merely its instrument, since the soul is not a body, he prefers not to argue the point stating that it “belongs to philosophy more than to medical art.”

The Systems of Arabic Authors

The Instrumentalism of Avicenna

However, from the tenth century, conflicts between Arabic philosophers and doctors intensify, and this attitude of avoidance seems no longer tenable. Certain scholars, often philosophers, devote themselves to finding a general solution to the problem, in order to provide a general principle to mediate conflicts between the two disciplines. The first to propose a solution of this kind is the philosopher al-Fārābī (872–950). His comments come down to an attack against the philosophical pretensions of the doctors, especially Galen’s. For al-Fārābī, Aristotle, who draws on logical reasoning, prevails against Galen and his empirical observations. This clear choice for Aristotelianism leads al-Fārābī to place medicine among the practical arts, with agriculture or cooking, and to divide it in seven parts, of which the first three (knowledge of the organs, health, and diseases) are totally or partially common to natural philosophy and medicine, while the next four (symptomatology, nutrition and medication, hygiene and dietetics, and therapeutics) are part only of the second.

Still, this solution does not resolve the problem completely, since it has no answer to an essential question: how must the doctor act in a

controversial case? Must he, despite their incorrect theoretical origin, apply against his better judgment all the treatment methods that Galen heartily recommends? Faced with this difficulty, Avicenna (980–1037) goes further than al-Fārābī and proposes an original solution, developed in particular in the *Canon of Medicine*. Avicenna gives first a definition of medicine that reduces neatly his ambition, since for him medicine is concerned with the human body solely qua healthy or sick, and not, as does natural philosophy, in itself. From this model follows logically another way of looking at the relation between the two subjects. Avicenna explains often that “the physician does not need to proceed following a demonstrative argument that will lead him from this disagreement to the truth, nor qua physician will he see the path to this, nor does this impede him in his investigations and actions.” Avicenna’s position is simple: the doctor must not take an interest in the causes of phenomena and search for the principles of natural mechanisms, since this search is within the purview of the philosopher alone; he must be content to take an interest in the remedies that he uses against illness without wondering about their first causes: only the immediate causes are for him relevant, and if they seem to contradict the claims of natural philosophy, he is not authorized to search for a reconciliation that only the philosopher is able to achieve. However, Avicenna takes care to specify that the doctor’s actions, that is, his concrete activities as a therapist, must not be changed according to debates that arise in another discipline.

This attitude is called “instrumentalism” (McVaugh), because it regards medical theories as adequate instruments for predicting and evaluating phenomena, but ill-suited for attaining truth. Instrumentalism, in the work of Avicenna, goes hand in hand with a model of the doctor that confine him to the restoration of health without exploring the true nature of things, and merely studying sensible and manifest entities on which he can act. It is interesting to note that this position does not forbid doctors from being philosophers as well, like Avicenna was himself, because the important element is the expression “as a doctor”: in reality, a doctor can, as philosopher, ask himself

questions concerning the true nature of things; but he must then refrain from basing himself on medical empirical observation and, thus, to conduct himself as a doctor. We see that Avicenna establishes a neat distinction between philosophy and medicine, each having its proper objectives and methods. Such a conclusion might seem to subordinate medicine to natural philosophy; in reality, we must instead insist on the great autonomy conferred on a medical discipline that, while on a more restricted domain, can henceforth develop with fewer restrictions.

Averroes and the Subordination of Medicine to Philosophy

Averroes (1126–1198) pushes even further the distinction between medicine and natural philosophy. In his *Colliget*, one of his rare medical works, he defines the discipline thus: “Medicine is an effective art, based on true principles and concerned with preserving man’s health and abating disease, as far as possible” (*Colliget*, I, 1). Comparing medicine with navigation or military affairs, he states explicitly that the “true principles” on which it must be established are those of natural philosophy. The two domains of knowledge are thus completely separate and placed in a clear and restrictive hierarchical relationship, since the doctor must, according to Averroes, deduce from the principles expounded by the philosopher the practical applications that he carries out. Where Avicenna affirms clearly the autonomy of medicine as a science, Averroes, who returns partially to al-Fārābī’s solution by radicalizing it, makes medicine into a simple practical application of philosophical theories.

So, as a faithful Aristotelian, Averroes attacks Galen repeatedly, not hesitating to renounce established treatments for their theoretical incompatibility with natural philosophy, all the while trying to justify certain biological claims of the Stagirite. If we consider Avicenna’s an *instrumentalist* position, we can rightly call Averroes’ own a *realist* position insofar as it insists on the coherence between philosophical theories and their concrete medical applications; the definition of the *Colliget* emphasizes the fact that medicine cannot even aim for complete recovery but only

try to do what is possible to help nature take its course. In this way, Averroes reinforces the importance of the prognostic art and of the pure practical art of the doctor, and limits drastically its theoretical pretensions. It is tempting to compare Averroes’ position on medicine to the one he adopts in his commentary on *De caelo* concerning Ptolemy’s theories; in fact, he does not hesitate to reject them despite their usefulness, as they seem to him not to comply with the Aristotelian philosophy that predicts uniquely circular movements for stars, when the Ptolemaic system, to save appearances, introduces a complex system of epicycles and eccentrics. In astronomy as in medicine, Averroes’ object is to make all knowledge coherent with Aristotelian philosophy, which is the only one to be authorized to research and expound truth.

The Salernitan Masters and the *Physica*

The texts of Avicenna and Averroes are not known in the West before the thirteenth century. However, the Latin scholars have access, before this date, to some of the thoughts of Greek and Arabic authors, notably due to the translations of Constantine the African in the eleventh century. These translations, mostly of medical texts, push Latin doctors of the following century to take a closer look at philosophy, especially since the texts then available make medicine a part of natural philosophy. For the rest, it is the thought of the twelfth century on the whole that aims to replace the study of the human body, and so its diseases, in a global analysis of Creation. This tendency, which develops at a moment where most of the Aristotelian corpus is still unknown, is most prevalent among the doctors of Salerno. The texts studied in this great center of teaching are of Greek or Arabic origin: for example, *The Isagoge* by Johannis, the *Aphorisms*, *Prognostics et Regimen of Acute Diseases* by Hippocrates, the *Medical Art* by Galen, or the *Pantegni* by Constantin, adapted from the *al-Kitāb al-Malakī* by al-Majūsī.

In their commentaries on *The Isagoge*, the Salernitan masters strive to situate medicine in the general organization of knowledge, while it

belongs neither to the *trivium* nor to the *quadrivium*. Contra Hughes of Saint-Victor, who around 1120 makes medicine a purely mechanical art, the Salernitan authors divide all knowledge into three branches, logic, ethics, and physics, and place medicine in the latter, with physics and meteorology. Medicine is then considered a full-fledged science, divided itself into theory and practice on the Arabic model.

In this way appears in the West the idea that medicine includes a theoretical part, which is grounded in natural philosophy. The definition of medicine given by Bartholomew of Salerno (twelfth century) is in this regard emblematic:

The science of medicine deals with the actions and passions of the elements in mixed bodies. Although it has been invented for the human body, it considers every thing that can change it, as the nature of animals, herbs, trees, spices, metals, stones, because all of them can change the human body.

Medicine has, thus, for most Salernitans, a universal reach, which expresses itself in particular by the use of the term *physicus*, which designates the doctor-philosopher at Salerno.

But the relation between medicine and philosophy goes even further than this connection established between medicine and natural philosophy. Indeed, the Salernitan and the authors of the twelfth century, such as William of Conches, could not know the zoological works of Aristotle, which had not yet been translated; so they strive, from available texts such as the *Physics*, *On Generation and Corruption* but also from the commentary of Plato's *Timeus* by Calcidius, to reconstitute a natural philosophy coherent with medical data, in a process that reverses the trend that had until then dominated. This trend ends with doctor Urso of Salerno, who dies around 1200. The latter strives to connect, in one systematic theory, the contributions of medicine and natural philosophy. His thought develops around the question of the elements: Urso tries to show how elements shaped by the Creator from prime matter combine to form the "*elementata*" in bodies. These "*elementata*," which can transform under the effect of the interactions between the essential and accidental qualities of the elements that compose them, are at the base of all natural

phenomena, in the human body (through the intermediaries of complexions) as in the sublunary world in general. Through his detailed study of the theory of elements, Urso aims to provide a single explanation for natural phenomena that come under medicine or philosophy; his goal is to be an *inventor*, that is, a founder like Hippocrates was for medicine, to whom the qualifier was traditionally attributed, and to found a new discipline synthesizing contributions of doctors and philosophers. This discipline constitutes, for Urso, the *Physica*, whose ambition largely exceeds medicine in the strict sense, since its investigations spread to all things in nature.

However, this ambitious project has no immediate sequels in the West for two main reasons: first, the arrival of new translations, notably of Aristotle, Avicenna, and Galen, modify clearly from the beginning of the thirteenth century the idea of the relation between medicine and philosophy; second, the decline of the Salerno school does not permit the pursuit of the intellectual tradition established in the city. Of course, the Salernitan's works are not completely forgotten and continue to be studied, but the reception of the great philosophical systems provokes important reconsiderations in the West. Many debates on the relation between medicine and philosophy then repeat the terms of the question that Arabic authors had already tried to resolve; but the new conditions of the practice of medicine, and especially its teaching in universities, are eventually going to modify radically this perspective.

Scholastic Teaching and the Synthesis of Greek and Arabic Contributions

The Search for an Agreement

For Latin authors, the problem was always the same: harmonize Aristotle's physiological and biological information with Galen's, all the while according, as much as possible, the philosophical systems of the two scholars. However, the question presents itself in a new light, since at the same time were translated the Arabic interpretations, notably those of Avicenna (*Canon*, translated in the twelfth century by Gerard of

Cremona), of ‘Alī ibn Ridwān (commentary of *Tegni* translated by Gerard of Cremona) and of Averroes (*Colliget* translated in 1285 by Bonacosa in Padua). The assimilation of all these works in the first half of the thirteenth century leads to a period of important debates between 1270 and 1320, a period that has been called the “times of controversies” (Jacquart and Micheau 1990). The two most debated questions are the primacy of the heart as a first principle of the body, and the existence of a feminine seed. Contrary to what is often claimed, these debates are not limited to a simple controversy with the “doctors” on one side and the “philosophers” on the other. The double quality of many authors, notably in Italy, prevents us from a too cut-and-dried opposition between the followers of the two disciplines. Thus, Pietro Torrigiano, medical doctor active in Paris in the first decades of the fourteenth century, defends the Aristotelian position that makes the movements of the heart a simple physical process, while the majority of doctors of the thirteenth and fourteenth centuries go along with Aristotle’s denial of the existence of a female seed. However, beyond the diversity of views, it is possible to find a certain number of constants, particularly in some centers of teaching. In Italy, the problem is more acute because medicine and philosophy are often taught in the same faculty, and by the same person, as in the case of Iacopo da Forlì (d. 1404) who teaches natural philosophy from 1384 to 1386, moral philosophy and medicine in 1392–1393 and 1395–1396, and finally logical and natural philosophy in 1398–1399. The *Conciliator* of Pietro d’Abano, written between 1303 and 1310, must be considered an attempt to bring solutions to these debates that then stimulate the medical community. The acuity of these questions, as institutional as intellectual, doubtlessly explain in part the success obtained in Italy by the *Canon*, which becomes over the course of the fourteenth century the almost unique source of all medical teaching: it was the only one to give a solution allowing to conserve the benefits of Galenism and the great principles of philosophy. It is therefore not surprising that the Averroist doctor and philosopher Antonio da Parma proposes, in the first years of the fourteenth

century, a solution to the problem based on Avicennian instrumentalism, by distinguishing, in accordance with Aristotle, two types of arguments: the first one, the dialectic argumentation, is the philosophers’, and is true and necessary; the second one is the rhetorical argumentation, which is “much less probably” (comm. *Canon*, I.1.6.2.): it is the doctors’.

In the following generation, Gentile da Foligno (d. 1348) deepens this distinction by trying to show, for each of the controversial questions, that the contradiction between the discourse of philosophers and doctors does not prevent the latter from acting to maintain health. He concludes that the physicians can content themselves with the assumptions of their discipline, even if they appear false. We must note, however, that Avicennian instrumentalism does not lead these authors to abandon the debates between Galen and Aristotle. On the contrary, the distinction between the doctor acting “as a doctor” and the doctor reflecting “as a philosopher” allows them to engage these questions without confusing the two disciplines, and without substantially modifying the modes of treatments left by the Galenic tradition: the theoretical questions still remain, in the first half of the fourteenth century, an essential part of medical education.

The Influence of Averroes and the Decline of Philosophy in Medicine

The introduction of Averroes’ *Colliget* in the West has a determining role in the subsequent evolution. While the position of the Andalusian doctor and philosopher can seem totally opposed to Avicennian instrumentalism, the Latin authors succeed in integrating it to a coherent global vision. Averroes considers, as we have seen, that all medicine is practical, and that theoretical aspects come under another discipline, superior to it, that is, natural philosophy. Such a presentation goes against the stated willingness of Latin authors of bestowing on their discipline the status of a science, and, in Italy, against the separation, in the medical curriculum, of theoretical and practical medicine. However, the integration of medicine as a university discipline at the end of the thirteenth century, as well as the progressively

more important place granted to the doctor in society, permits authors to cast a critical eye on accepted definitions, and in particular on the distinction between theory and practice. Wondering about the legitimacy of this distinction, Gentile da Foligno maintains that medicine can be divided in this way, but the theoretical part then coincides with a part of natural philosophy, since medicine is “a science made up of numerous other sciences” (comm. *Canon*, I.1.1.1). For him, medicine is composed of a theoretical part, which corresponds to natural philosophy, and a practical part of its own; contra Avicenna, he abandons the existence of a distinct and specific medical theory. The consequence of such a presentation is evident: the medical theory no longer constitutes a proper part of medicine, and while the doctor must know it, he must not learn it as a science that forms an integral part of his discipline.

The influence of Averroes on the relation between philosophy and medicine appears to be even more evident in Paris and Montpellier, probably because the two disciplines are more distinct in these particular universities. During the trial of the empiricist Jean de Domprié (1423–1427), the masters of the faculty of Medicine in Paris declare “*ubi desinit phisicus incipit medicus*” (“where the philosopher ends, the doctor begins”), while in the preceding century Évrard de Conty uses a similar formula in his *Livre des eschez amoureux moralisés*: “*ou philosophie fine, medicine commence*.” Jacques Despars, in the first half of the fifteenth century, comes to a synthesis between the Avicennian instrumentalism and the Averroist definition slightly different from those of contemporary Italian authors: he tends to insist on the practical character of medicine, to distinguish it from theoretical questions that must come under natural philosophy, and thus must not influence recommended modes of treatments. For Despars, as claims Arnaud de Villeneuve in Montpellier at the beginning of the fourteenth century, the doctor is foremost a *sensibilis artifex*, whose explanations are hypothetical constructions founded on sensible experience, necessary for practice but only approximating truth without ever corresponding to it perfectly.

So, in most of the Latin world, Avicennian instrumentalism is adopted to resolve difficulties

connected to the relation between medicine and philosophy, since it permits the conservation of the advanced therapeutic ideas of the first while it respects the truth expounded by the second; however, we must note that the precise interpretations vary from one place to another, in that they integrate more or less the restrictive definition of medicine given by Averroes in his *Colliget*. It seems reasonable to relate, in this case, these differences to institutional conditions then prevalent in universities: strong connections between the disciplines in Italy, more distant links in the rest of Europe. Anyway, it must be said that the originality of western thinkers is that they propose a synthesis of the different solutions that have been advanced before them.

The end of the Middle Ages is traditionally considered a period during which the philosophical side of medicine is gradually neglected, to the benefit of a renewed interest in practical observations, *experimenta* and other *mirabilia*. In reality, theoretical discussions lose their keenness, and are no longer treated, even in Italian universities, as routine questions. Significantly, the most famous Paduan doctors of the second half of the fifteenth century abandon their theoretical chairs to occupy those *in pratica*. Medical theory then becomes a simple foundation course for first-year students, one that coincides largely with natural philosophy, while the renewed interest for observation and experimentation paves the way for the important developments of the sixteenth and seventeenth centuries. If the social and cultural conditions had an important role to play in these changes, it is certain that the synthesis realized by the Latin masters from the *Colliget* and the *Canon* contributed to, if not presided over, this tendency. In this way, we can say that the construction of the philosophical and medical models of the Middle Ages played an essential role in the progress of experimentation and observation that characterize the beginnings of Renaissance science.

Medicine in the Arab World

Hans Hinrich Biesterfeldt
Seminar für Orientalistik, Bochum University,
Bochum, Germany

Abstract

Medicine in the classical Islamic world was basically shaped by three different traditions, sometimes interacting with each other: pre-Islamic Bedouin folklore; the so-called Prophetic medicine, the diagnosis and therapy of which was informed by the alleged practice of the Prophet Muḥammad; and Hellenistic medicine. Prophetic medicine must have enjoyed a considerable share in everyday life, since a large number of compilations, all of them by traditionists, jurists, historians, rather than physicians, is extant in numerous manuscripts (and continues to be reprinted until today). However, far more productive and representative of medicine in Islam is the Hellenistic tradition,

as it was standardized mainly by Galen (d. c. 216 CE), translated from Greek into Arabic and developed from the ninth century onwards. Arabic medical compendia which reflect this tradition in structure and contents are Abū Bakr al-Rāzī's *Comprehensive Book on Medicine*, al-Majūsī's *Complete Book on the Medical Art*, and Avicenna's *Canon of Medicine* that by its comprehensiveness and sophisticated organization dominated the field for centuries and gave rise to a long series of commentaries and adaptations. Apart from general handbooks such as these, there is a rich and, to a degree, innovative literature on special disciplines, notably ophthalmology, *materia medica*, and general surgery – although highly invasive operations would seem to have been performed comparably rarely. Actual medical attendance may be witnessed in larger towns, preferably political centers, which offered doctors to have an office of their own, to visit the patient in his own house, to perform their services in public places – this activity was ideally controlled by the municipal authorities – or, most honorably, to be part of a team in a hospital which constituted the center of public medical welfare, medical instruction, and research. The ideals of professional ethics are represented in a considerable number of works on the history, state, and demands of the medical art, on examinations, and on the business of quacks and charlatans; they reflect discussions of late Antiquity on the relation between medicine and philosophy.

Treatises on “Prophetic medicine” emerged in the ninth century, flourished in the period of Sunni anti-Hellenistic traditionalism, the thirteenth and fourteenth centuries, and are quite popular today, as can be seen from numerous modern printings. Their authors were religious scholars rather than physicians. One of the earliest specimens of Prophetic medicine is the ninth-century *Medicine of the Imams* by al-Ḥusayn b. Bisṭām b. Sābūr and his brother, writing in Iran, which collects medical advice of the Prophet and of Shīʿite religious

authorities, magical expedients, and prescriptions of compound drugs. Another example is the contemporaneous *Summary on Medicine* by the Andalusian Ibn Ḥabīb (d. around 853). From the heyday of this type of compilations, we have the works of the scholars of Ḥanbalī jurisprudence, Ibn al-Jawzī (d. 1200), Ibn Qayyim al-Jawziyya (d. 1351), and of al-Suyūfī (d. 1505). *The Medicine of the Prophet* by the Damascene historian and Shāfiʿite traditionist al-Dhahabī (d. 1348) again compiles medical sayings from religious authorities, but also from Greek medical authors such as Hippocrates, Galen, and Dioscurides along with Arabic authors in this tradition, for example, al-Rāzī and Avicenna. The peculiar fusion of this tradition and that of *al-ṭibb al-nabawī* (Prophetic medicine) is evident in a passage in the beginning of this work, which presupposes the Galenic definition of health as the right balance (Greek *eukrasia*, Arabic *iʿtidāl*) of the four humors and then goes on to attribute the progressively perfect balance to, first, man among the animals, then to the believers among the humans, the prophets, and so on, and finally the most perfect balance to the Prophet Muḥammad. It is difficult to determine the exact share of Prophetic medicine in the medical care of the medieval Islamic world and to know the names of its practitioners, but, apart from the Hellenistic admixtures that one notes not only in al-Dhahabī's book, the sheer bulk of works of this type, multiplied by a great number of manuscripts (and in modern times, printings), attests to the fact that Prophetic medicine coexisted with the Hellenistic tradition – as did popular magical medicine whose evidence consists not only of texts but also of amulets, talismans, magic squares, and magic-medicinal bowls. The pious fringe of Prophetic medicine, however, maintained that all human medical measures are to be considered as an impairment of God's omnipotence and that care and cure should be limited to a healthy diet, simple medicines, prominently honey, and recitations and prayer.

Far more productive and prestigious than Prophetic medicine, and clearly better to evaluate in modern scholarship, were Hellenistic medicine and pharmacology, translated and appropriated

from the early days of the ʿAbbāsīd empire by the middle of the ninth century. It can safely be said that the whole of Greek medicine was translated into Arabic and was to dominate Islamic medicine – as well as long centuries of the Latin medical tradition. (For the translation movement, the role of the Alexandrian tradition in shaping the medical curriculum and the principal genres of medical literature, and the impact of “Galenism,” see the entry on ► [“Alexandrian Tradition into Arabic: Medicine”](#) in this volume.) One of the most obvious features of medical literature both in Late Antiquity and in classical Islam is the compendium, or encyclopedia, endeavoring to present all medical knowledge in systematic order. Two early specimens of such compendia are ʿAlī b. Sahl Rabban al-Ṭabarī's (fl. c. 850) *The Paradise of Wisdom*, which predominantly uses Greek authors such as Hippocrates, Galen, Aristotle, Dioscurides, but appends an exposition of the system of Indian medicine (available through Persian and Arabic translations) and displays a characteristic mix of information also on natural philosophy, climate, astronomy/astrology, magic, the human soul, and popular customs, and Abū Bakr Muḥammad b. Zakariyyā' al-Rāzī's (d. 925, or 935?) *Comprehensive Book on Medicine* (in medieval Latin translations *Continens* or *Comprehensor*), a large collection (compiled and roughly ordered *a capite ad calcem* posthumously by his students) of quotations from Galen and other authors and observations of his own. Another compendium by al-Rāzī, more systematized than the former, is his *Book for al-Manṣūr*, dedicated to the Sāmānīd ruler Abū Ṣāliḥ al-Manṣūr b. Ishāq in Rayy (south of today's Tehran), where al-Rāzī directed a hospital. The two most famous medical encyclopedias in medieval Islam are ʿAlī b. al-ʿAbbās al-Majūsī's (around 980) *Complete Book on the Medical Art* (Latin: *Liber regius*, after another version of the Arabic title, *Royal Book*) and Avicenna's (Ibn Sīnā, d. 1037) *Canon of Medicine* (Latin: *Liber canonis*). In accordance with the ancient classification, al-Majūsī divides medicine into theory (part 1) and practice (part 2); the first part dealing with the fundamental concepts of elements, humors, natures, faculties, anatomy, the natural

and non-natural causes influencing the human body and soul, the doctrines of symptoms and diagnosis, pathology, the second part with hygienics and therapy. In his introduction, the author interestingly evaluates at length the works of his predecessors, duly praising Hippocrates and Galen, but critically noting the former's terseness and the latter's prolixity, and pointing out omission of entire medical disciplines and lack of systematic order in other Greek and Arabic works. The most famous medical encyclopedia in Arabic is certainly Avicenna's *Canon of Medicine*, whose rigorous and sophisticated arrangement of material shows the author's mastery of logic and philosophy in general and helped to dominate the medical theories in the Islamic world and later in Latin Europe. The *Canon* consists of five "books"; the first covers much of what al-Majūsī's *Complete Book* treats in its first part, the second book treats the simple medicinal substances (in alphabetical order), the third and fourth books basically deal with illnesses concerning only one part of the body and more than a single organ (like fevers), respectively, and the fifth book contains a formulary of compound substances. The systematic rigor of the *Canon* has necessitated various forms of vulgarization. Already the author himself published an epitome of its core material in didactic rhyme, and the list of subsequent commentaries, supra-commentaries, and summaries is indeed long. Perhaps the most influential commentator and epitomator of the *Canon* is Ibn al-Nafīs (d. 1288) who, in the section on the anatomy of the heart, famously asserted, against Galen's prevalent doctrine of a passage connecting the ventricles of the heart, that there is no such connection, visible or invisible, and that the blood in the right ventricle must arrive at the left one by way of the lungs – thus intimating, though not precisely formulating and proving, the model of the so-called "lesser" circulation. In the Islamic West, a noteworthy medical encyclopedia was compiled by Abū l-Qāsim al-Zahrāwī (d. soon after 1009), putting medical knowledge at the disposal of those unable to compile it for themselves. Besides Chaps. 1 and 2 on physiology and pathology, this compilation's most extensive, and most famous and influential, part is the last

Chap. 30 on surgery, an art which, the author says, was largely obliterated on its way from Antiquity to Arabic medicine and is in need of a new anatomical foundation and accurate descriptions of operations such as cauterization, section, extraction, amputation, and the therapy of fractures and luxations. This chapter in particular had a considerable influence, through its translation by Gerard of Cremona, on anatomical and surgical literature of the Latin West down to the eighteenth century, as well as on early Ottoman medicine. Another interesting feature of this chapter is its abundant illustration with drawings of surgical instruments.

Notwithstanding the extensiveness and long afterlife of al-Zahrāwī's exposition (and some of his colleagues' books, prominently the *Foundation of the Art of Medicine* by a student of Ibn al-Nafīs, the Damascene Christian physician Ibn al-Quff, who died in 1286), it is a matter of debate whether the numerous and detailed surgical procedures described in the literature reflect real practice. From the lack of actual descriptions or realistic illustrations one may surmise that highly invasive operations, like surgically treating abdominal wounds or amputation, were performed very rarely, and the Caesarian section, during parturition or post-mortem, never. Surgical measures that are attested included – apart from minor measures such as bloodletting and cauterization, the latter used to seal bleeding wounds, but also to treat a great variety of complaints, including mental ones – removal of tumors and growths, treatment of wounds, such as extraction of arrows, excision of cysts, ligation, or sclerotization of hemorrhoids, and of course circumcision.

A surgical discipline of remarkable variety and innovation was developed in ophthalmology; in fact, the works on the anatomy of the eye and the therapy of eye diseases can be seen as a distinct branch of Arabic medical literature. Already in the ninth century the famous translator from Greek into Arabic and medical author in his own right, Hunayn b. Ishāq, and his teacher Ibn Māsawayh wrote influential ophthalmological works, advancing beyond their Greek forerunners (Galen, Oribasius, Paul of Aegina, et al.). 'Alī b. 'Īsā (d. after 1010) is the author of a highly regarded *Memorandum for Oculists*, which

systematically treats 130 eye diseases with their symptoms, causes, and therapies. A close contemporary of his was ‘Ammār al-Mawṣilī whose *Book of Selection on the Treatment of Eye Diseases* was dedicated to the Fatimid sultan al-Ḥākim and presents less than half of ‘Alī’s inventory of disorders, but contains a number of original observations and measures, for example, actual reports on six operations on a cataract, including his invention of a metallic hollow needle used to suck the cataract from the eye, and on the examination of the pupil’s reaction to light incidence before operating a cataract. Other authors describe an operation to treat corneal vascularization, a complication of trachoma, which is called peritomy today and which involved the use of hooks to keep the eye open during surgery and of a thin scalpel for excision.

Another flourishing field of Arabic medical literature and practice was pharmacology. As for Arabic authors Galen was the chief authority in general medicine, so was Dioscurides (d. around 90) the leading author on *materia medica*, whose work was translated into Syriac and Arabic at a very early stage and was repeatedly commented upon by authors such as Ibn Juljul (d. after 994) and Ibn al-Bayṭār (d. 1248). The latter composed also a work on “simple” drugs and their use against illnesses *a capite ad calcem*, and thirdly, the most famous compilation of pharmacognosy and dietetics, based on his own observations and excerpts from over 250 works and describing, in alphabetical order, more than 1400 medicaments, the *Comprehensive Book on Simple Drugs and Foodstuffs*. In pharmacology, one may say that Arabic writers excelled over their Greek forerunners, because their wider geographical horizons introduced them to a vast variety of new plants and drugs, and because of their descriptive sophistication and not least their keen interest in linguistic and terminological matters.

Medical attendance in the medieval Arab and Iranian world depended, like any other public service, on the economic and political situation in a given place and period. Urban settlements were privileged over rural areas, and political centers offered more opportunity to claim and dispense medical treatment than provincial

towns. Principally, doctors could operate in their own office, or visiting the patient in his own house, or in the streets and on the markets, or in a hospital. Administering treatment in a public place was the business of popular practitioners – bone-setters, cuppers, quacks pretending to heal eye and tooth complaints, and often was the object of control by the official inspector of the market (*muḥtasib*). Hospitals, on the other hand, are a manifestation of a continuous respectable concern of Muslim society with public welfare. Generally, the foundation of hospitals was due to the initiative of the ruler and the high officials surrounding him and was part of their aim – often in the initial phases of new dynasties which wanted to manifest their profile and splendor – to further the public weal by establishing religious and secular institutions – in addition to hospitals, schools, libraries, fountains, rest houses for travelers, etc. The origin of hospitals in the Islamic realm is not quite clear; the hospital in seventh-century Sasanian Gondēshāpūr was already famous in the seventh century, and the Christian Bokhtīshū’ family of physicians, summoned from there by the ‘Abbāsīd Caliph al-Manṣūr (d. 775) to the court in Baghdad, may have been instrumental in importing this institution (the term *bīmāristān* is of Persian origin) and, generally, a Christian concern for public charity. At any rate, in the classical period of Islam every major city had one or more hospitals: Baghdad (since the first half of the tenth century, prominently the ‘Aḡudī hospital, founded in 982), Damascus (the Nūrī hospital around 1150), Cairo (the Manṣūrī hospital, founded in 1284), as well as in Iran and al-Andalus. A full-fledged hospital consisted of an outpatient clinic and an infirmary and housed departments for the specialists – surgeons, oculists, pharmacists –, an asylum for the insane, a home for elderly patients without a family, and a lecture yard and library for medical education.

Despite the fact that medicine and its practitioners enjoyed such a high status in Muslim societies – to be judged by the social eminence and high salary of the top-rank physicians and the impressive endowment of the large hospitals – we have numerous examples of invectives against the professional failings of the physician as an

individual and against the pretensions of medicine as a discipline. The rich deontological branch of Arabic medical literature, basing itself on the professional ethics and example of Hippocrates and on the programmatic treatise by Galen, "*That the Best Physician is Also a Philosopher*," is full of lamentations over the present state of the art. Physicians are blamed as arrogant, incompetent, and, more often than not, greedy for money. A small essay by one 'Abdalwadūd (late eleventh/early twelfth century) on "*The Blameworthiness of Making Money by the Craft of Medicine*" presents a number of examples of the decline of medicine: prescription of, and trade with, expensive drugs regardless of the specific climate and humoral disposition of the patient, conflict between worldly power and the physician's professional ethics, lack of cooperation between colleagues, where a complex diagnosis would call for more than one specialist, and plain practical and theoretical ignorance. 'Abdalwadūd's main argument is that incompetence and love of money are two sides of the same coin and that practicing medicine merely with regard to making money perverts the idea of this noble art. Other noteworthy works on the physician's professional ethics are Ishāq b. 'Alī al-Ruhāwī's (probably working in the second half of the ninth century) *The Ethics (Arabic adab) of the Physician*, 'Alī b. Riḍwān's (d. 1068) treatises *The Useful Book on How to Teach the Art of Medicine*, *On the Path to Happiness by Medicine*, and *The High Rank/Dignity (Arabic sharaf) of Medicine*, and Ṣā'id b. al-Ḥasan's (writing in 1072) *Arousing the Desire for Medicine*. These programmatic monographs are complemented by handbooks for the examination of the student of medicine (al-Rāzī's *On Examining and Appointing the Physician* contains several quotations from Galen's corresponding work) and for the control of the physician practicing in public by the *muḥtasib*, and by polemical treatises exposing the tricks of medical charlatans, as contained in al-Jawbarī's (around 1240) *Book of Selection on Disclosing Secrets and Lifting Veils*.

Both the claims of medicine to constitute a "noble art," founded on philosophical authority, and the lamentations over its shortcomings and

present decline have their roots in Late Antiquity. In its Athenian phase, philosophy had enjoyed the eminent status of a religion for intellectuals and in Alexandrian scholarship a central position as art (Greek *technē*) and as science (*epistēmē*), which furnishes the other sciences with their principles (medicine, according to Ammonius son of Hermias, receiving from philosophy its system of elements). In later Alexandrian scholarship, beginning with the fifth century, philosophy as an academic career lost its basis; whereas rhetors, grammarians, particularly physicians after their examination found a flourishing job market, philosophy graduates had to look for openings in rhetoric, teaching grammar, and not least in medicine: many of the sixth and seventh-century Alexandrian commentators on Aristotle's works worked as doctors – a lucrative profession, which drew the jealousy of the few advocates of "pure" philosophy and which, in turn, explains the remarkable self-image of medicine as a philosophical discipline. In Arabic medicine, this characteristic persisted: all medical encyclopedias and many monographs on special subjects display their theoretical basis at length and organize their subject matter in strict hierarchy; even the "practical part" of these works obeys the – highly speculative – theory of humoral pathology, and references to Aristotelian logic and natural science and Galenic ethics are ubiquitous. As in Alexandria (and in Byzantium) the philosopher-physician was a prominent figure in Islam: al-Rāzī, Ibn al-Ṭayyib (a commentator on works by Aristotle, Hippocrates, and Galen, who was a physician at the 'Aḍudiyya hospital in Baghdad and d. in 1043), Avicenna, and Ibn Rushd (Averroes, d. 1198) are well-known examples. On the other hand, representatives of "pure" philosophy have disputed the philosophical aspirations of medicine. Al-Fārābī (d. 950), a scholar working in Baghdad and disdaining any financial gain from a non-philosophical practice and refusing any public position, did not include medicine in his *Enumeration of the Sciences*, doubted Galen's competence in logic, and granted only a limited validity to the *generalia* of medicine, the doctrine of the human organism, and the theory of health and illness as subjects of the natural

sciences. In his preface to a short *Epistle on Medicine*, al-Fārābī defined medicine as a “productive craft, which is not concerned with treating its objects as *intelligibilia* for the soul, as in (philosophical) reflection, but to produce effects on the objects and to provide them with qualities and other *accidentia*.” Medicine is, al-Fārābī implies, not concerned with the human soul and is not a science (Arabic *‘ilm*, Greek *epistēmē*). Comparable to the fields of agriculture or rhetoric, medicine is concerned with the particular and the contingent, not the general and logically demonstrable, and it leads to “opinions,” not to “certainty.”

Medicine: Byzantine

Barbara Zipser

Department of History, Royal Holloway,
University of London, Egham, UK

Abstract

The Byzantine period saw a massive rise in the production of medical encyclopedias. These were mostly based on earlier models, mainly Galen. Only in few cases these models were criticized. The language of these texts was mainly learned Byzantine Greek; the vernacular was rarely used. Overall, there was a certain tendency toward the practical application of medicine rather than a development of new models. Medical practice centered around hospitals. Some of these institutions also had the facilities to offer a specialized treatment, for instance, for gynecological problems.

Medicine in Byzantium

The medical history of the Byzantine age (roughly speaking fourth to mid-fifteenth century CE) is not easily described. If one understands “Byzantine” as being part of the eponymous empire, one has to bear in mind that this same empire changed its geographical boundaries over the centuries. If, on the other hand, one assumes that Greek language was the main characteristic of Byzantine culture, this raises the problem that the geographical extension of the Byzantine empire never coincided with the area in which Greek was spoken, as the vernacular in everyday life or as the lingua franca of learned academic discourse. In the case of medical writings, it is often impossible to decide from where the text originated or where it was revised, and beyond doubt there was an exchange between the different parts of the Greek-speaking world.

A variety of sources give us insight into the medical practice of the Byzantine period. Archaeological sites allow us to understand the structure and capacity of hospitals; numerous written accounts tell us about the date of their foundation and their history. Other literary sources describe the role of medicine in the society, perceptions of illness, death, and medical treatment. Some hospitals issued their own manuals; these texts were custom made to suit their specific needs. Apart from texts like these, other popular genres of medical literature were *florilegia* of ancient sources, medical encyclopedias, and collections of recipes. Byzantium also saw a flourishing book production, which led to a number of revisions or editions of texts. The sheer amount of text involved in this process is tremendous, and very little of it has, as yet, been made accessible in printed editions. The fall of Constantinople was not the end of Byzantine medicine – genres as the *iatrosophion* lived on, and later medical authors used medieval sources for their works.

Health care was widely available in the Byzantine empire and usually centered around hospitals, of which a large number are accounted for, founded between as early as the fifth century and the fourteenth century. They had their roots in charitable institutions, which offered shelter to the poor and homeless, or pilgrims. The most

detailed information we have is on the Pantocrator hospital in Constantinople. Its statutes (*typikon* in Greek) have survived, along with copies of the medical books which were either held or produced there. The hospital had several wards, offering among other services specialist treatment for eye diseases. A woman physician attended to gynecological problems. The surgical instruments from the period bear strong resemblance to the classical instrumentarium. The same applies to pharmaceutical ingredients. However, in both cases, a certain simplification can be noted, with a tendency toward the practical and ordinary rather than the sophisticated.

Throughout the Byzantine period, medicine kept a strong interest in earlier writings, either by preserving them in a copy or by transforming and adapting them to the needs of their audience. Oreibasius (fourth century CE) epitomized Galen's works. Aetius of Amida (sixth century CE) compiled an extensive medical encyclopedia on pharmacology, diseases, and dietetics. Although his work is, strictly speaking, an amalgamation of diverse excerpts, it forms a readable and well-balanced corpus. Paul of Aegina (seventh century CE) wrote a shorter yet comprehensive medical handbook that is partly based on excerpts but does also contain original material. It covers all common diseases along with an extensive chapter on surgery. Similar in length and style is the *Therapeutics* by Alexander of Tralles (sixth century CE). The main characteristic of this author is an especially humane and careful way in dealing with the patients. Other works attributed to Alexander are texts on ophthalmology, fevers, and intestinal worms. Paul of Nicaea (date not entirely clear) wrote a handbook in form of an *erotapokrisis* (or “question and answer” style). All of these texts were suitable as reference books for an educated medic.

Another group of texts has a similar aim but differs from the aforementioned in a crucial point: their authors remain obscure, and we only have a vague idea about the date and the history of these texts. The shortest and most learned is Leo's *Synopsis*, definitely written before the tenth century, which shares a large amount of content with an encyclopedia by Theophanes Chrysobalantes.

From this text, or a cluster of material with a similar content, the *Therapeutics* of John the Physician was derived. John's work was then translated into the vernacular, and a commentary was added. Later on, probably in Constantinople, an unknown reviser attempted to translate the text back into the learned idiom.

Some parts of these works coincide with the so-called *xenonika*, medical texts associated with hospitals; also their scope is similar. Theory is disappearing or taken for granted, and these texts are largely focusing on therapy. This means that an author might mention phlegm or bile and offer a treatment but does not explicitly refer to the theoretical background of the humoral pathology or in any other way explain why he chose this very remedy.

One of the typical genres of the Byzantine period is that of the so-called *iatrosophion*; these are compilations which can be based on earlier or contemporary authors or both and can either fill an entire volume or just a few pages. The *iatrosophia* usually have a thematic structure (although this might not be apparent at first sight) and are personalized to the extreme: from what was available to him, the compiler selected anything he believed to be useful and organized it in a way that made sense to him.

At the other end of the spectrum, we might rank some highly sophisticated writings produced in the mid to late Byzantine period. Theophilus Protospatharios (probably ninth or tenth century CE) wrote a Christian interpretation of human anatomy mainly based on Galen's *de usu partium*. Meletius, probably a contemporary, also wrote on anatomy, but with a more strongly teleological approach. His work contains numerous quotes from literary sources. Nicolaos Myrepsos (thirteenth century AD) and Symeon Seth (eleventh century) wrote on antidotes. Stephanus of Athens (sixth century CE) is the most prominent commentator of the time. He wrote on Hippocrates and Galen. Ioannes Zacharias Actuarius (fourteenth century CE) is commonly regarded as the most intellectually refined medical author of the period. His works deal with urine diagnosis and therapeutics. Ioannes Actuarius and Alexander of Tralles sometimes question earlier models.

On the whole, medical history of Byzantium bears strong characteristics of the continuation of earlier models, with emphasis on practice. Medical education and publishing were highly developed and had an impact on medicine in the entire western world. Throughout the time of the Byzantine empire, medicine was influenced by foreign, mainly eastern writings, which even led to Arabic works being translated into Greek; a prominent example is the treatise on smallpox and measles by Rhazes, which was incorporated into a canon of medical texts together with Alexander of Tralles and Artemidorus.

Meister Eckhart

Alessandro Palazzo

Dipartimento di Lettere e Filosofia, Università degli Studi di Trento, Trento, Italy

Abstract

Eckhart of Hochheim (c. 1260–1328), a leading figure within the Dominican order, was a professional theologian and as such he performed all the three duties related to his profession: lecturing on the Bible and on the *Sentences*, disputing questions, and preaching sermons. He was twice appointed as theology professor at the University of Paris. Eckhart's reputation is confirmed by the several senior posts he held in the administration of his order.

One original characteristic of Eckhart's work lies in the fact that he carried out a large part of his literary activity in Middle High German by reframing for wider audiences the issues discussed during disputations in class and the themes explored in his specialist lectures on the Bible. In so doing, he contributed to the creation of a German technical philosophical vocabulary. Eckhart's effort to present the arduous contents of scholastic speculation to common people seems to have been a crucial factor in the proceedings for heresy to which he was subjected toward the end of his life and which led to a posthumous condemnation of some propositions drawn from his works.

Eckhart of Hochheim (c. 1260–1328) was born into a family of the lower aristocracy in Tambach, a town south of Gotha in Thuringia. It is not known when he entered the Dominicans; the earliest evidence indicates that in 1293–1294 he acted as Bachelor of the *Sentences* (*lector sententiarum*) in Paris. From 1294 through 1298, he served simultaneously as prior of the Dominican convent at Erfurt and as vicar of Thuringia. In 1302–1303, he was called to Paris to teach theology as *magister actu regens*. In 1303, he was elected first provincial of the newly created province of Saxonia, to which he added the office of

vicar-general for Bohemia in 1307. The 1310 provincial chapter held in Speyer elected him provincial of Teutonia, but Master General Eymerich of Piacenza did not confirm the election. In 1311, Eckhart was sent to Paris as theology professor for a second time, an honor which only Aquinas among Dominicans had received before him and which shows how distinguished his reputation was during his lifetime. Eckhart remained in Paris until 1313, thereafter returning to Germany.

The widespread assumption that between 1314 and 1322 Eckhart resided in Strasbourg with the special office of spiritual counselor and preacher to convents of Dominican nuns and houses of Beguines lacks evidence. In fact, this idea is due to the misinterpretation of three documents which attest Eckhart's presence in or near Strasbourg at three different times (1314, 1316, 1322), but from which nothing can be inferred regarding Eckhart's alleged official appointment as responsible for the so-called *cura monialium* (see Sturlese, in Quero-Sánchez and Steer 2008).

In 1324, Eckhart was certainly in Cologne, where he has long been conjectured to have carried out the office of lecturer at the *Studium generale*. In 1326, following the accusations of two of his brethren, inquisitorial proceedings for heresy against him were started by the Archbishop of Cologne, Henry II of Virneburg. The trial, which continued at the Papal Court in Avignon after Eckhart's appeal to the Holy See in 1327, would eventually lead to the bull "In agro dominico" by Pope John XXII (1329), condemning 28 excerpts from Eckhart's works. In the meantime, Eckhart had already died (1328). Despite the condemnation, his thought did not cease to be influential and themes characteristic of his teaching found their way into the writings of John Tauler, Henry Suso, and Berthold of Moosburg.

The idea that man, in the deepest ground of his soul, is intimately conversant with God lies at the heart of Eckhart's thought. The human intellect is an image of God and therefore stands in a relationship of coessential univocity with Him, from Whom it goes forth and to Whom it comes back in a timeless movement and in a dialectic of identity

and difference. In his writings Eckhart explores the metaphysical, anthropological, ethical, and religious aspects and implications of this privileged connection God-ground of the soul, a connection which constitutes an exception to the general rule of analogy predominant in the God-creatures relation. Moreover, since people usually live plunged in the dimension of creatureliness and estranged from their authentic self, Eckhart's preaching aims at making them become conscious of their inner union with God.

Recent scholarship has shed light on the dependence of Eckhart's speculation about the nobility of the soul on the noetics and the anthropology of Albert the Great, whose name appeared in Eckhart's first work, the *Sermo Pasqualis*, and whose teachings set the intellectual background in Germany from the mid-thirteenth to the mid-fourteenth century. It has also been rightly emphasized how relevant some teachings of Dietrich of Freiberg (e.g., the doctrine of image), with whom Eckhart was personally acquainted (between 1294 and 1298 Eckhart was the vicar of Dietrich, provincial of the Dominican province of *Teutonia*), were for his thought.

Works

An Easter sermon in Latin (*Sermo Pasqualis*: LW V, 136–148) and the *Collatio in Libros Sententiarum* (LW V, 17–26), which depends in some ways on the *Collatio* of the Franciscan Richard Rufus of Cornwall, are all that remain of Eckhart's early teaching activity as Bachelor of the Sentences in Paris (1293–1294). Both texts are noteworthy for the large number of references to philosophical and scientific literature: Avicenna's *De animalibus* and *De anima*, the pseudo-Hermetic *Liber XXIV philosophorum*, Ptolemy's *Almagestus*, al-Fargānī's *Rudimenta astronomica*, Maimonides' *Dux neutrorum*, Aristotle's *Physica*, Boethius' *Philosophiae consolatio*, etc., are quoted, either implicitly or explicitly. The use of al-Fargānī and Maimonides is very unusual in the context of a *Collatio*, a lecture serving as a prologue to Eckhart's commentary upon Lombard's *Sentences*.

Even this early in his career, Eckhart showed himself fully aware of the exegetical value of philosophical authorities and also persuaded that there is substantial harmony between the Holy Scriptures and the Fathers, on the one hand, and philosophical learning, on the other.

The Talks (*Die Rede*, DW V, 185–309; the more common title *Die rede der underscheidunge* is not original), are the result of table-talks given by Eckhart to the novices of the convent at Erfurt. They are the earliest evidence of Eckhart's literary activity in German, dating from when he served as prior in Erfurt (1294–1298).

Formerly these were often disregarded as examples of devotional literature without speculative ambitions, but recently *The Talks* have been given increasing scholarly attention. Eckhart offered a new and philosophically based interpretation of the traditional monastic virtues. Obedience, the foremost virtue, does not mean only subordination to the superior but implies an existential breakthrough which consists of forsaking oneself, annihilating oneself's will, giving up what is one's own; in a word, detachment (*abegescheidenheit*). The denial of self is strictly related to the possibility of establishing a more intimate relationship with God because a man able to reach detachment will necessarily enjoy the presence of God in himself and will be transformed by it. So portrayed, obedience looks like an attitude of openness toward God rather than to other men, an attitude whose adoption requires considerable and continued hard effort.

The Talks also present a few other points on which Eckhart was later to expand further: the ethics of intention (the idea that sanctity does not lie in works but in the perfect and righteous will of human agents); the related conviction that what counts for Christian life is inner self-denial rather than external practices of asceticism; the view that to the human intellect God is by nature very close and present.

Very little is still extant from the period of Eckhart's theological mastership in Paris: three disputations plus a sermon on St. Augustine date probably from his first period as theology professor (1302–1303), and another two disputations probably from the second period (1311–1313).

The first two disputations focus on the relationship between intellect and being, in God as well as in angels, and provide valuable insights into Eckhart's teaching on intellect.

In the first disputation (*Utrum in deo sit idem esse et intelligere*, LW V, 37–48) – actually, it postdates the second one – Eckhart departs radically from Aquinas' doctrine. After having reported Aquinas' arguments in favor of the identity of intellect and being in God, Eckhart claims that God exists because He understands, and not the converse – that He understands because He exists. Such a claim is tantamount to saying that God is intellect and understanding and that understanding is superior to being. Being qualifies the mode of existence of creatures, which are all formally (*formaliter*) beings, and therefore does not apply to God the creator. Yet, though not formally, being is in God as in its cause (*sicut in causa*), for God causes with his science everything. In other words, God is *puritas essendi* since He, as intellect, pre-contains everything in purity, plenitude, and perfection.

The otherness of intellect from being is clearly established in the second disputation (*Utrum intelligere angeli, ut dicit actionem, sit suum esse*, LW V, 49–54), where Eckhart expands further on the concept of intellect as intellect (*intellectus, in quantum intellectus*), on which Albert the Great and Dietrich of Freiberg had already worked. Being pertains to those substances which exist in space and time and are determined according to genus and species. Intellect can also be taken as a being, namely as a natural power of the soul which is a principle eliciting single acts of intellection. However, if considered in its proper nature, intellect is something which escapes any kind of determination, whether by time or by space or by genus and species, and is therefore radically different from all other substances which are given a being localized in space and time and restricted to one genus and species.

Probably around 1304, or even earlier, Eckhart started working on an original theological summa, the *Opus tripartitum* (the *Three-Part Work*), which, however, he left unfinished. According to the original project, the work would have had three parts: the *Work of General Propositions*

(*Opus generalium propositionum*), the *Work of Questions* (*Opus quaestionum*), and the *Work of Expositions* (*Opus expositionum*). The first part would have contained a thousand or more propositions concerning the transcendental terms (Being, Unity, Truth, and Goodness) and other metaphysical concepts. The *Work of Questions* was to solve some of the questions discussed in the *Summa theologiae* of Aquinas. The *Work of Expositions* was subdivided into two parts: one consisting of an exegetical commentary on the authorities (*auctoritates*) contained in the books of the two Testaments and the other of a series of sermons (*Opus sermonum*).

To Eckhart's mind, the general propositions were clearly to provide the fundamental philosophical principles according to which a theologian should both solve disputed questions and interpret Sacred Scriptures. In the *General Prologue* (LW I, 148–165), Eckhart offers a concrete example of his way of proceeding in the *Opus tripartitum*: he first formulates the general proposition “Being is God” (*Esse est Deus*); then, on this basis, he goes on to answer the question “Whether God is” (*Utrum Deus sit*) and elucidate the meaning of Genesis 1,1 (*In principio creavit deus caelum et terram*).

Of the original project Eckhart accomplished, besides the prologues (a *General Prologue*, a prologue to the *Opus propositionum*, and two different prologues to the *Opus expositionum*), only some of the third part (*Work of Expositions*): commentaries on a few books of the Bible (two on Genesis, one on Exodus, on Wisdom, on Canticle – of which only a fragment is preserved – and on the Gospel of St. John), two lectures, two sermons on Chapter 24 of the Book of Sirach, and some 50 model Latin sermons.

Eckhart worked on the *Three-Part Work* for several years and at least three different redactional stages are documented in the manuscript tradition. This means that the surviving parts were composed at different times.

The two lectures and two sermons on Chapter 24 of the Book of Sirach (LW II, 231–300), for example, date more or less from the same time of the first three Parisian questions. These texts seem to have had a programmatic value

because Eckhart gave the lectures and the sermons in front of the German intellectual elite of the order on the occasions of two provincial chapters.

The second lecture is one of the places where Eckhart sets forth his original teaching on analogy. Analogates, Eckhart maintains, have nothing positively rooted in themselves of the form according to which they are in a relation of analogy. Being and all other general perfections (One, True, Good, Light, Justice, etc.) are predicated in an analogical way of God and creatures. Therefore, each creature has its being, its being true, its being good, etc. not in itself, but in and from God alone. Eckhart goes so far as to say that all creatures, insofar as they are outside God, are nothing in themselves, for God only is Being. Eckhart's doctrine of analogy serves thus to show that creatures stand in a relationship of total dependence on God.

Apparently the doctrine of analogy, to which Eckhart was to keep throughout the course of his life, runs counter to the views he had put forward shortly before in the first two Parisian questions, where he had maintained that creatures are beings, while God is not being but intellect. As a matter of fact, the contradiction can be explained away as a shift from a “physical” to a “metaphysical” perspective: in both the disputations and the lecture on the Book of Sirach Eckhart is concerned with stressing the radical difference between God and creatures, but whereas in the disputations by “being” Eckhart means the imperfect mode of existence of creatures (which are localized in space and time and determined according to genus and species), in the lectures on Sirach he takes Being as one of the general perfections which properly belong only to God but are participated in also by creatures.

In the *Commentary on the Gospel of St. John* (LW III), one of the latest sections of the *Opus*, Eckhart expresses in a programmatic fashion how he conceives of his exegetical work by pointing out that in his scriptural commentaries his purpose is to explain on the basis of the natural reasons of the philosophers what Christian Faith and the Bible teach. Such a view of exegesis was the obvious result of the conviction about the unity of Truth: Moses, Christ, and Aristotle, Eckhart

maintains, teach the very same things, the only difference being in the way they do it.

The second commentary on Genesis (one of the last parts, if not the very last, of the *Opus tripartitum* to have been written) marks a substantial change in the original project of the *Opus* because, unlike the first commentary, it focuses only on the explanation of the parables – hence the title *Liber parabolarum Genesis* (LW I,1, 447–702). One scholar has claimed that the commentary could be the first book of an entirely new project: the *Liber de parabolis rerum naturalium* (*The Book of the Parables of Natural Things*) (see Sturlese 2007).

The *Liber Benedictus*, consisting of the *Book of Divine Consolation* (*Daz buoch der götlichen troestunge*, DW V, 8–61) and a sermon *On the Nobleman* (*Von dem edeln Menschen*, DW V, 109–119), is generally dated after 1318.

It is more difficult to date the German sermons, because Eckhart had always with him a “book” of his sermons, composed at different times, on which he continually kept working by adding, revising, etc. Some of them seem to have been composed quite early (e.g., those forming the so-called *Gottesgeburt* cycle [sermons 101–104] seem to date back to the time of the *Rede* (1294–1298)). Those belonging to the *Paradisus animae intelligentis* collection may date from the time of his provincialate (1303–1311).

It is generally assumed that Eckhart’s vernacular preaching should be seen in light of the movement of female piety and Beguine spirituality flourishing at that time in Germany; Eckhart’s sermons, in other words, would have been an attempt to face the challenge represented by various forms of Beguine mysticism and to reconcile them with the orthodoxy. Whatever may be the nature of his relationship with the Beguine movement, it is certain that in his German treatises and sermons Eckhart discusses and analyzes the same contents and motifs as in his Latin scholastic writings. From what Pope John XXII states in the bull “*In agro dominico*” it can be argued that one of the chief reasons for Eckhart’s legal misfortunes was that he had preached highly speculative concepts in front of an audience of simple people, thereby confounding the true faith in their

hearts. Even before the proceedings took place, Eckhart seems to have been reproached for writing or preaching such ideas to the untaught. At the end of the *Book of Divine Consolation*, he replied that the untaught were exactly the people needing instruction with a view to making them become learned, and that he could not worry about being misunderstood because he was aware that what he had said or written was true. Given these reactions, it is no surprise that the two lists on which the accusation against Eckhart was based contained many excerpts from the *Liber Benedictus* and from the German sermons.

Among other doctrines censored is that of the spiritual perfections (Goodness, Justice, Wisdom, etc.), a doctrine which is dealt with in great detail in the *Liber Benedictus*. Between Goodness and the good man exists a relationship of univocal causality, or reciprocal relationality: Goodness, which is neither created nor made nor begotten, begets the good man, who is neither created nor made but is the son born and begotten of Goodness. Goodness and the good man, in other words, are identical and the action of begetting of the former is one with the latter’s being begotten, the only difference between them being that the former begets and the latter is begotten. Whatever pertains to the good man, he has in and from Goodness. This doctrine is a radical transformation of Aristotelian metaphysics: it is not a quality (goodness) that lies in and is supported by an underlying subject (i.e., the good man), but the subject that is in the spiritual perfection. Insofar as he is good, namely, insofar as he abandons the dimension of creatureliness, the good man is nothing but pure and simple Goodness.

The two most characteristic and interrelated issues of the vernacular sermons are detachment and the birth of the Word or Son in the soul. Detachment, as has been said, is the way man has to go in order to recover consciousness of his inner union with God. The origin of this crucial concept of Eckhart’s thought has been traced back to the philosophical tradition, notably to the Anaxagorean-Aristotelian view of the intellect as something separable, pure from all admixture, simple, having nothing in common with anything else.

The birth of the Word in the soul is an idea which Eckhart could find in the Christian tradition, but which he modified in an original fashion. Indeed, he conceived of the generation of the Word in the soul as a timeless process: the Father is always bearing the Son in the soul, provided the soul realizes that its ground is identical with God's ground.

Recent Publications

In the last decade scholars have focused their attention on new or so far neglected aspects of Eckhart's thought, adopting new perspectives of research and opening up new fields of analysis.

Eckhart's sources have been one of the domains most intensively studied by scholarship. Unlike the studies conducted in the past, the present investigations are mainly characterized by a doxographic approach and often endowed with statistic analysis of quotations. Usually, this kind of research is aimed at identifying Eckhart's direct sources and at describing the way in which he actually used them, rather than at reconstructing his supposed adherence to a general philosophical tendency (Platonism, Aristotelianism, Stoicism, etc.) (Löser 2009; Schiewer 2017; Sturlese 2011, 2013; Vinzent 2013).

Language cannot but play a crucial role in a thinker that, like Eckhart, is a bilingual preacher and exegete. Accordingly, many topics related to language were already dealt with in the past: Eckhart's bilingualism; the process of translation; his views on logic and semantics; the linguistic features of his sermons; the issues concerning the hidden meaning of Scriptures; etc. Recent conferences and publications have showed a shift in the scholarship's interest in linguistic matters, for two new specific subjects have been addressed: the relationship between Eckhart's views on logic and the grammatical treatments of the so-called Modistae, and the content, use, meaning, and context of the images and metaphors present in Eckhart's sermons (Dietl and Mieth 2015).

Interestingly, Eckhart's views on nature ("naturalia"), which, with very few exceptions, had been a neglected side of his thought, have

recently begun to be explored. Independently of each other, a few scholars have cast light on different aspects of Eckhart's reflections on concepts and topics related to the natural and physical world: the mechanism of sight; celestial causality and astrology; space and time (Beccarisi 2017; Gottschall 2015; Palazzo 2016; Vincent and Wojtulewicz 2016).

It is also noteworthy that modern categories, such as interreligious dialogue and individualism, have started to be used in order to interpret Eckhart's thought and its context. Rather than being a mere anachronistic modernization, this hermeneutic move is intended to combine solid historiographic research with the appraisal of how Eckhart's legacy, rightly understood from a historical and philological perspective, may have an impact on today's world (Büchner et al. 2016; Löser and Mieth 2014).

Mental Language

Pekka Kärkkäinen

Faculty of Theology, University of Helsinki,
Helsinki, Finland

Abstract

William of Ockham has been considered the first thinker to develop a theory of mental language with grammatical structures. Ockham's early views built upon Augustine's and

Boethius' twofold concept of a mental word: a concept common to all people and a resemblance of words to actual spoken and written languages. Ockham understood mental language to be identical with thinking. The spoken and written words are subordinated to their mental counterparts and therefore share their signification. According to Ockham, mental language does not contain figurative speech, grammatical genders, synonyms, or equivocations but does contain most other features of external languages, including suppositions of terms and certain fallacies related to the suppositions. John Buridan diverged from Ockham's view at this point and used the notion of modes of thinking to discuss related problems. Gregory of Rimini modified the view of mental language in several respects. He considered the major part of mental language to consist of a mentalized conventional language, with only the act of assenting to a mental proposition, which he considered to be the mental proposition itself, being independent of conventional languages. Peter of Ailly further developed Gregory's and Ockham's ideas. In Italy, Peter of Mantua and Paul of Venice discussed the problems of word order and mental language that William of Heytesbury had raised earlier. The former was mainly critical of Heytesbury, while the latter for the most part shared Heytesbury's views. Several later fifteenth- and sixteenth-century logicians continued the discussions.

William of Ockham's starting point in developing a theory of mental language was the traditional notion of mental word. In particular, he adopted the idea, developed in diverse ways by Aristotle, Augustine, and Boethius, that some phenomena of the human mind are closely related to the words in conventional languages, yet are common to all people despite their diverse spoken and written languages. Ockham's claims about the nature and function of mental speech having an idiosyncratic grammatical structure, however, justify the oft-repeated statement that he was the first to present a comprehensive theory of mental language. In addition to human mental language, Ockham

also discussed the problems his theory poses for the language of angels (*Rep.* II.20; *Quodl.* I.6). On the development of different views of mental words and concepts before Ockham, see the entry Mental Word/Concepts.

Ockham began to develop his view of mental language in his early writings by adopting Augustine's distinction between two types of mental words: those that are the same for all human beings and those that are mental renderings of actual spoken words (*Ord.* I.27.2). He considered the first type to be mental words in a proper sense, whereas he considered latter to be mental words only in an improper sense. The first type of mental word had several characteristics of Ockham's later, mature concept of a syncategorematic mental word: such word was unambiguous and could be the subject or the predicate of a mental proposition. Ockham conceived of these words as being produced by intuitive cognition, and, according to him, as concepts they were proper objects of the acts of knowledge. The formation of a mental sentence with the help of this type of mental word seems to imply a nonlinear rather than a discursive act of understanding, where the conceptual *ficta* of subject and predicate are combined by a syncategorematic act. During this stage, Ockham seems to have excluded syncategorematic and connotative concepts from the group of proper mental words, considering such terms as belonging to the second type of mental words, those derived directly from spoken and written languages (*Ord.* I.2.8). Walter Chatton criticized this view, since according to him syncategorematic concepts are not conventional, as mental words of the second type were supposed to be. Rather they are produced naturally, as are the categorematic concepts.

At the heart of Ockham's mature concept of mental language, outlined in his *Summa logicae*, was the priority of mental terms vis-à-vis written and spoken terms in regards to signification. The terms of conventional languages derive their signification from the terms of mental language. Ockham conceived of signification in a specifically propositional context. A term signifies when it directs the mind's attention to the external objects and at the same time stands for those objects in a proposition. Accordingly, Ockham

conceived mental terms as signs in addition to written and vocal terms. With such a primary logical notion, Ockham began to construct a view of mental language by eliminating certain features of the conventional spoken and written languages that were not essential for signification. These included metaphorical expressions and genders but not such features as numbers, cases, declensions, and so on. Ockham also raised the question of whether participles and pronouns are needed in *Mentalese*.

Generally it seems to hold that, according to Ockham, there are no synonymous or equivocal terms in mental language. However, according to Ockham, there are fallacies, which also occur in mental language. These include some fallacies that he classified as equivocations, such as those arising from a confusion between simple and personal supposition. However, most mental language fallacies are fallacies of accident, some sort of logical mistakes.

The explanation of synonyms elucidates how Ockham understood the relationship between mental language and conventional languages in general. Synonymous terms in conventional languages correspond generally only to one term in the mental language. The synonymous terms share the signification of the corresponding mental term, and their signification is asymmetrically dependent on the signification of the latter. This is what Ockham meant when he stated that conventional terms are subordinated to mental terms. Ockham did not believe, as did Walter Burley and John Buridan, that terms of conventional languages signify their corresponding mental terms, but rather the spoken and written terms share the extension of the mental terms and signify the objects immediately.

Against the representatives of modist or speculative grammar, Ockham argued that signification is a linguistic phenomenon restricted to mental and conventional languages, and therefore the modes of signification do not reflect the constitution of the extramental world. In Ockham's view, the structures of spoken and mental languages are clearly distinguished from the structures of external reality. This line of argument is consonant with and closely connected to Ockham's program of ontological parsimony, and it marked a line that was

still visible in fifteenth-century disagreements between modists and nominalists.

There has been long-standing debate among scholars on whether there are or should be connotative terms in the mental language according to Ockham's theory. One of the main problems in admitting connotative terms into a mental language has been that it seems to contradict the rule that there is no synonymy in a mental language. The possible coexistence of connotative terms and their complex nominal definitions seem to violate this basic rule, which many scholars have considered an essential feature of Ockham's idea of mental language. Claude Panaccio has argued that Ockham considered connotative terms a natural part of the mental language. According to Panaccio, Ockham did not consider connotative terms and their nominal definitions to be synonymous (for arguments for and against this view, see Panaccio 2004).

Ockham believed that the categorematic terms of a mental language are passively acquired through the psychological processes of sense perception, abstraction, and intellectual cognition rather than being either innate or learned. According to Ockham's mature theory, the syncategorematic terms are not passively acquired as are the categorematic ones. Rather they are caused by the innate capabilities of the rational soul.

A particular problem that led to wide discussion concerns the structure of mental propositions. Ockham noted that there are propositions that do not have the same truth-values, although they consist of the same terms, but in different order. Since the terms of a mental sentence are simultaneous acts that take place in an unextended mind, they cannot be ordered either temporally or spatially. As a solution, Ockham proposed that a mental proposition is either one cognitive act, which is equivalent to an ordered combination of terms, or that it is composed of parts, which are not identical to individual spoken and written words. A similar problem was also raised by William of Heytesbury. He concluded that whereas spoken and written propositions are distinguished by their constituent words and their order, mental propositions may be distinguished by cognitive acts that do not correspond exactly to individual words in the written sentences.

A categorical proposition must have at least two mental concepts of things and one that composes or divides the concepts, but there can be more acts that link the concepts together in different ways.

In fourteenth-century Oxford, Ockham's theory was immediately criticized by Dominican thinkers. Hugh Lawton objected to the very idea that there are propositions in the mind and consequently held that, properly speaking, propositions exist only in written and spoken languages. Lawton argued that it can be shown that at least some propositions of external languages do not have mental counterparts, that external speech and the operations of the mind are generally incommensurable, that there is no way to account for the formation of mental propositions, and that mental similitudes cannot serve the linguistic functions necessary for a proper language.

Lawton's fellow Dominican, William Crathorn, launched similar criticism against the idea of a mental language based on natural similitudes of things. However, unlike Lawton, Crathorn developed the notion of a mental language that is composed of the mental similitudes of the words in the spoken and written languages. Another Oxford Dominican, Robert Holcot, responded to Crathorn's criticism and defended Ockham's position.

In Paris, Ockham's theory was received in various ways. Buridan never developed a fully elaborated theory of mental language as did Ockham, but the idea of mental language was nevertheless an integral part of his thinking. Buridan's view of mental language largely resembles Ockham's mature theory, but there are also significant differences. According to Buridan, mental terms have personal rather than material suppositions, even when they refer to other mental concepts. Only vocal and written terms have a material supposition, which is the case when they refer merely to mental concepts rather than objects of the external world. Buridan distinguished diverse modes of thinking (*modi intelligendi*), which correspond to different suppositions of the conventional languages on the mental level.

Unlike Ockham, Buridan did not believe that there are fallacies of equivocation in the mental language, and consequently, he opposed to Ockham's broad definition of equivocation, which included the confusion between simple

and personal supposition. Buridan discussed the problem of differing word order discussed by Ockham and Heytesbury by referring to differing modes of thinking about mental concepts, which result in diverse word orders and consequently diverse suppositions of the terms in written and spoken propositions. Like Heytesbury, Buridan considered compositive and divisive acts of the mind to correspond to positive and negative copulas in the spoken and written categorical propositions. Buridan called them "complexive concepts," distinguishing them from "simple" concepts such as subject and predicate. According to Buridan, the principal parts of a categorical proposition included a copula.

Gregory of Rimini recognized the problem of considering the mental proposition as one compositional act in a proper sense. For him such a view did not sufficiently address the problems of word order that Ockham and Heytesbury had discussed. Therefore, he concluded that the mental proposition must be one undivided mental act, which he identified with the act of assenting to the mental proposition. Based on Ockham's view of lying, Gregory also argued that there are no insoluble paradoxes in the mental language, since no proper mental sentence is self-referential.

Gregory revived Augustine's view of the dual nature of mental words. According to Gregory, a major part of thinking consists of mental language, which is based on spoken and written languages. Only the act of assenting to or dissenting from a proposition belongs to the mental language common to all people. Similarly, Peter of Ailly followed Ockham's early views in distinguishing mental language in the proper and improper senses. Peter also developed Gregory's view of insolubles and adopted his view of the mental proposition as one undivided act. Like Buridan, Peter considered the personal supposition the only option for mental terms (Peter of Ailly, *Concepts and Insolubles*: 67–68).

In Italy, the discussion proceeded in a slightly different manner. Peter of Mantua construed a view where each written term of a proposition, be it categorematic, syncategorematic, absolute, or connotative, was subordinated to a single, non-complex term in the mental language. Thus, "is" in the proposition "man is not an animal"

corresponds to an act that links the subject with the predicate, but does not affirm the latter of the former, whereas “not” corresponds to an act that denies that the predicate inheres in the subject. As Gaetano of Thiene did later, Peter directed many of his critical comments against the views of William of Heytesbury.

In contrast, Paul of Venice espoused the view that was close to Heytesbury’s in several points. Aware of the problems of transferring the word order of external sentences to their mental counterparts, Paul stated that there must be an order of mental acts in a mental proposition that are metaphysically understood as possessing a discrete quantity and that do not contradict the mind’s nonextensionality, which is only incompatible with continuous quantity. The order can be a temporal succession, but the intellect is also capable of thinking of one or more propositions simultaneously. Unlike Gregory of Rimini, Paul considered a mental proposition to be a compositional whole. Similar views are also found in Blasius Parmensis. In discussing the word order of mental propositions, Paul noted on modal terms that in propositions taken in a compound sense, the modal term comes first in the mental proposition, even though it stands at the end of the corresponding written or spoken sentence.

Many fifteenth- and sixteenth-century logicians carried on lively discussions of several themes concerning mental language and commented on positions represented by authors such as Ockham, Paul of Venice, and Gregory of Rimini. At the beginning of the sixteenth century, Gregory of Rimini’s view of the mental proposition as one undivided act was adopted by very few authors, but later during the same century it gained many supporters, including Domingo de Soto and many Spanish Jesuit philosophers, to the point that the view eventually became the dominant one.

concept by the mid-thirteenth century. It was developed in several ways and all the features we now attribute to this concept were more or less already present in the Middle Ages.

The Ancient Background and the Formation of the Concept

The English words “representation” and “to represent” derive via Old French from the Latin words “repraesentatio” and “repraesentare,” but these are by no means commonly used words in classical Latin. In late Ancient thought it is foremost Quintillian and Tertullian that uses the terms in a philosophically interesting way. It is not until the twelfth century Latin translation of Avicenna's *De anima* that these terms become frequently used in connection with cognition and the mind (see Lagerlund 2007).

Early logic works like Garlandus Compotista's *Dialectica* (17) and Abelard's *Dialectica* (II, 188) discussed a distinction between a word's signification by imposition and representation. A denominative term such as “white” signifies by imposition a substance that is white, but it signifies by representation the whiteness inhering in the substance. The white thing stands in for or is an instantiation of whiteness – white is re-presented in the object. Garlandus mentions the example of a traveler (*viator*) who can be said to represent a road (*via*). The term “traveler” signifies by imposition the human being who is a traveler, but also represents the road the traveler travels on. It is exactly this usage of representation applied to mental signs that becomes important with Ockham and Buridan.

M

Mental Representation

Henrik Lagerlund

Department of Philosophy, Stockholm University,
Stockholm, Sweden

Abstract

The concept of mental representation played an important role in late medieval cognitive theories. It was primarily introduced in the Latin translation of Avicenna and became a central

Thomas Aquinas and the Conformality View

The most influential theory of thought in the thirteenth century goes back to Aristotle and has its foremost medieval defender in Thomas Aquinas. It rests on viewing mental representations or intelligible species, as Aquinas calls them, as sameness in form. The explanation for why thoughts

are about something, exhibit intentionality, or represent is that the form of the object thought about is in the mind of the thinker.

On Aquinas' view, the mind is nothing before it thinks of something. The active intellect abstracts the intelligible form from the particular sensitive form in the internal senses and places it in the potential intellect. The form placed there by the active intellect hence actualizes the potential intellect. The thought is also always universal on this view since it is immaterial and matter is the individuating principle, according to Aquinas. The immaterial intelligible species in the potential intellect constitutes the thought.

There are many problems associated with this view of mental representation. A famous problem is: why do the daffodils outside my soul not represent my thought about the daffodils? The forms inside and outside my mind are the same, suggesting that mental representation is symmetrical. Aquinas has a famous answer to this problem, which is that the daffodils in the garden do not represent my thought because of the mode of the form's presence in them. The forms in the daffodils are really present whereas in my mind the universal form is spiritually or intentionally present.

The distinction between forms being really or spiritually present is central to Aquinas' physics and natural philosophy. A form may be present somewhere without literally making whatever substance it informs into something else. Colors in the air, for example, do not make the air really colored: we see colors in the objects around us but not in the intervening air, although they must be there spiritually if sensation is to be a causal process. This means, of course, that the air must also represent the color, which entails that intentionality is not a mark of the mental for Aquinas. The air is not in itself a mind (for discussion, see Pasnau 1997, Chap. 2).

Peter John Olivi and the Rejection of the Conformality View

One of the first to criticize the conformality or species theory of cognition, in the late thirteenth

century, was Peter John Olivi. He argued, contrary to Aristotle and Aquinas, that the mind is active in its cognition of the world; it attends to the object, and it is this move on his part that puts the species theory of cognition in a completely different light. In fact, there seems little point in postulating a species through which the object is cognized. He argues:

Third, because the attention will tend toward the species either in such a way that it would not pass beyond so as to attend to the object, or in such a way that it would pass beyond. If in the first way, then the thing will not be seen in itself but only its image will be seen as if it were the thing itself. That is the role of a memory species, not a visual one. If in the second way, then after the inspection of the species it will inspect the object in itself. In this way it will cognize the object in two ways, first through the species and second in itself. It will indeed be like when someone sees an intervening space and then beyond that sees the fixed object. (Peter John Olivi, *Quaestiones in secundum librum Sententiarum*, III, q. 74, 123)

In this passage, it seems clear that for Olivi the species is a thing in itself and that there really are three things involved in the cognition of an object: the object, the species, and the cognizer. The species is on his view a re-presentation, namely a thing that stands in for the object in the mind. The main problem he sees with the theory is hence epistemological. How can we be sure we are cognizing the object and not the species. Ockham will later repeat this objection (see Toivanen 2009, Chap. 4). Olivi hence argues that this third representing thing is not needed and that the mind can attend to the object directly.

Henry of Ghent and John Duns Scotus and the Introduction of Mental Content

For various reasons, the late thirteenth century saw an increased interest in epistemology. One of the reasons for this were certain developments of new theories of mental representations and intentionality. Some of these developments were due to problematic features of, on the one hand, Aquinas' view of mental representation and on the other, of Henry of Ghent's interpretation of Augustine's view of divine cognition. Aquinas

seems to have held that the intelligible species is supposed to play a dual role both as a universal common to all of us thinking it and as my individual thought. One and the same entity seems not to be able to fulfill both these roles. Henry on the other hand reinterprets Augustine's doctrine of divine ideas and introduces a distinction between the ideas and the divine nature. The ideas are *possibilia* or the natures of possible things to be created (de Rijk 2005, pp. 81–84). Both of these views contribute to the introduction of a distinction between the vehicle and the content of a representation.

The distinction developed by Henry in relation to the divine nature was almost immediately taken up into the debates about human cognition. It was applied to Aquinas' theory of mental representation, taking the conformality view a step further by introducing a distinction between the thing representing and the thing represented. John Duns Scotus was instrumental in adapting this view to human cognition. Scotus' implemented Henry's distinction and treated the thing that does the representing as a mental act or concept, which ontologically speaking is an accident of the mind, and the thing represented as the form of the object thought about (which is why this is still a conformality account of mental representation).

Scotus claimed that the accident or mental act is subjectively in the soul, whereas the object being represented is present objectively, or has objective being in the mind. He also said that the object exists *sub ratione cognoscibilis seu repraesentanti* or "in keeping with the nature of something cognizable or represented" (Ord. I, d. 3, pars 3, q. 1, n. 382) to express the content side of the mental representation. Scotus thus had a clear way of expressing what Brentano later called intentionality, that is, the way the object of thought exists in the mind. It has objective existence in the mind on his view, which later came to be regarded as the mark of the mental (see Normore 1986; Pasnau 2003; King 2007).

Although the advantages of this approach over Aquinas' are clear, problems remained concerning the ontological status of these mental contents. The medieval debate here is famous and features a wide variety of opinions (for a survey,

see Tachau 1988). Scotus himself says that thought objects have a diminished kind of being, which is supposed to be a state between real being and no being at all. Ockham would later subject this view to much criticism.

William of Ockham and Mental Language

Foremost William of Ockham developed the theory of mental language in the fourteenth century. It rests on a theory of mental representation that combined the notions of cause and signification. A concept or a mental term on this view represents because it was caused efficiently by a thing in the world. It signifies that thing also because of the causal relation between them. The object and the concept are said to covary. On Ockham's view, a mental representation or concept is caused by an intuitive cognition:

Intuitive cognition is the proper cognition of a singular not because of its greater likeness to one thing more than another but because it is naturally caused by one thing and not by another; nor can it be caused by another. If you object that it can be caused by God alone, I reply that this is true: such a visual apprehension is always apt to be caused by one created object and not by another; and if it is caused naturally, it is caused by one thing and not by another, and it is not able to be caused by another. (*Quodlibeta septem* 1.13)

According to Ockham's metaphysics there are only individuals in the world so that when an individual causes a concept to exist in the mind, it causes an individual concept and hence a singular conception of itself. Nothing else can cause that concept (except perhaps God). The singular concept functions as the word of the object that caused it in our language of thought. It is an atomic constituent that can then be combined to form more complex concepts or sentences in the language. In this way, one can say that Ockham develops a kind of medieval functionalism, since the determinate content of a concept is fully specified by the input (covariance) and the output (linguistic role) (see King 2007).

Ockham's notion of concept acquisition and mental representation is developed as part of a

very sophisticated theory of thought involving not only a theory of signification, but also a whole range of logico-semantic properties such as connotation and supposition. It explains how concepts, which in turn are the direct objects of belief and knowledge, are assembled into mental sentences describing the world (for the details, see Panaccio 2004).

John Buridan and Vague Concept

Ockham and John Buridan's accounts of thought are on the one hand very similar, but on the other hand there are fundamental differences between them. This is particularly true when it comes to their view of mental representation. A case in point is their views of singular thought. It starts out from the same idea, that is, that thinking something singularly is having a singular concept in mind, but they disagree fundamentally on what a singular concept looks like and foremost on how it manages to latch onto the world. On Ockham's account, as mentioned, a concept is singular because its cause was proper, as he calls it, and proper causes are necessarily tied to one object. But on Buridan's account, a singular concept is singular because of its complexity. It has a descriptive content that enables it to narrow down its signification to only one thing.

Buridan thinks that we always cognize or conceive of something first as singular, but this also means that we first conceive of it as this or that, that is, we conceive of it as something. For him, this also means that our concepts are from the very beginning loaded with some content and a proper singular concept picks out whatever it is of or represent in all circumstances. Such a concept is not vague, since it applies to only one thing, but it is also not what we first acquire. The first singular concepts we acquire are the so-called vague singulars. A vague concept is singular because it is about only one thing, but it is not determined what thing that is; examples of such concepts are "this human," "this cup," hence the name "vague singulars." It is from these we arrive at determinate singular concepts by adding content and to universal concepts by abstracting away from singularizing circumstances.

To explain how the process he is advocating works, he uses an example that, after him, became a standard example used to explain singular cognition. In the example, Socrates approaches from afar. At first, I cannot tell exactly what I see approaching; something (a substance) is coming closer and closer to me. After a while, I see that it is an animal of some sort, but I cannot tell exactly what kind of animal it is. As it comes closer, I realize that it is a human being, and, finally, when he is close enough, I recognize Socrates. Although this example seems to have had a long tradition, nowhere else did it play as important a role as it does for Buridan and some of his followers. Cognition, it shows, is always in the first instance about "that thing," "that animal," "that human being," and finally about "Socrates." Hence, it is always about a singular thing in the first instance. The example can be found in John Buridan, Nicholas Oresme, Marsilius of Inghen, Peter of Ailly, Gabriel Biel, and later authors, and all these authors used it in virtually the same way. The example can thus be said to reform the theory of thought developed by Ockham (see Lagerlund 2006, forthcoming).

Mental Word/Concepts

Toivo J. Holopainen
Faculty of Theology, University of Helsinki,
Helsinki, Finland

Abstract

The medieval thinkers did not have any one agreed-upon term for concept as a mental entity, but it was generally assumed that there are some such units and they were often viewed as mental words of some kind. In contrast to the words of spoken languages, which vary from nation to nation, the concepts were taken to be the same for all people. Issues related to concepts or mental words were discussed in several fields of inquiry, including logic, theology, and philosophical psychology. In logic, concepts were traditionally called “understandings” (*intellectus*), and they were supposed to have a mediating role between words and things in signification. This view goes back to Aristotle’s *De interpretatione* and Boethius’ commentaries on it. In theology, the mental word (*verbum*) was a prominent theme because Augustine had elaborated an analogy between the human interior word and the Word, that is, the second person of the Trinitarian God. In the tradition of philosophical psychology starting from Aristotle’s *De anima*, the acquisition of concepts was a central theme. These and other influences led to intricate discussions in the medieval

universities about what kind of entities in the mind relating to concepts one should postulate and how they should be described. Thomas Aquinas developed a model that includes a distinction between the intelligible species, the act of understanding, and the concept proper. There was extensive dispute about issues related to concepts in the late thirteenth and early fourteenth century, and much of it revolved around ideas presented by Aquinas. William of Ockham developed an alternative to the *De anima*-based approach on the basis of his nominalist philosophy. The concept or mental word, identified as an act of understanding, became the basic unit in the theory of mental language that Ockham advocated.

An important source for the medieval understanding of concepts was the opening passage of Aristotle's *De interpretatione* (16a3–9). The text was available in the Latin translation that Boethius had prepared at the beginning of the fifth century, and in medieval logic courses, it was usually read together with Boethius' two commentaries on the treatise. Following Boethius' translation, the pertinent lines can be rendered as follows:

What are spoken are signs of the passions in the soul, and what are written are signs of those that are spoken. And in the same way as written letters are not the same for everyone, so the spoken sounds are not the same. But the primary things of which these are signs, the passions of the soul, are the same for all; and those of which these are likenesses, namely, the things, are also the same (English translation from Knuuttila and Sihvola 2014, p. 266).

Aristotle here speaks of concepts as "passions in the soul," but Boethius' preferred terms for concept are "understanding" (*intellectus*) and, less frequently, "conception of the soul" (*conceptio animae*). Boethius' discussion of the passage contains a number of ideas about concepts that would be influential in the Middle Ages. (1) There are concepts in the human mind that correspond to the words (in particular, nouns) of spoken language. (2) The concepts are natural in the sense that they are the same for all people. In contrast, the spoken words are conventional and vary from nation to nation. Speakers of different

languages use different words to express the same concepts. (3) Semantically, the concepts mediate between words and things. Boethius explains that spoken words primarily signify concepts and only secondarily the things in the world. (4) Concepts are likenesses (*similitudines*, sing. *similitudo*) of things. To explain this idea, Boethius discusses the example of a geometrical figure and its image in the mind. (5) Referring to earlier commentators, Boethius maintains that there is a kind of inner speech which makes use of concepts, but he does not develop the idea.

Boethius did not use the word *verbum* to refer to concepts. He reserved that expression for another use: *verbum* in the meaning "verb" is one of the basic terms discussed in *De interpretatione*. There were other sources where *verbum* was used of words in general and of mental words in particular. The most influential of these was Augustine's theological treatise *De trinitate*, where the author develops an analogy between the human interior word (*verbum interior*) and the Divine Word (*Verbum*), that is, the second person of the Trinitarian God (see *De trinitate* XV:10–16).

The analogy about the word is part of a more extensive analogy between the three powers in the rational mind and the three persons in God. The three powers in question are memory (*memoria*), intelligence (*intelligentia*), and will (*voluntas*). The memory is a treasure-house of latent knowledge, whether it is innate or based on reasoning, sense perception, or testimonies of others. The intelligence is the power that brings pieces of knowledge into the focus of actual attention. The distinction between memory and intelligence is the context for the analogy between the interior word and the Word. The human interior word is an act of intelligence born from a piece of knowledge in the memory, and in the same way, the Word (the Son) is born from the Memory (the Father). According to this analogy, then, there is a *verbum* only when something known is actually uttered in the mind. Augustine declares that the interior words do not belong to any particular language and are the same for all people. He also characterizes the act of intelligence as a kind of intellectual seeing.

Aristotle's *De interpretatione* and Boethius' commentaries on it were widely used at least since the eleventh century. They were the main source for discussions about concepts within the early medieval "old logic." Peter Abelard's *Tractatus de intellectibus* (*A Treatise on Understandings*) offers an innovative treatment of concepts within this framework, but it did not have any notable influence on the later scholastic discussions.

Already before Abelard, Anselm of Canterbury had commented on mental words in the treatise *Monologion*. This is a theological treatise that draws much of its inspiration from Augustine's *De trinitate*, but Anselm was also familiar with the sources of logic and his treatment of mental word brings together Augustinian and Boethian ideas. In *Monologion* 10, Anselm distinguishes three kinds of words (*verba*) and three kinds of speaking of a thing. First, we can speak of a thing by uttering a word of a spoken language, for example, "man." Second, we can speak of a thing by uttering the word of a spoken language (e.g., "man") silently within our mind. Third, we can inwardly utter the thing itself either by imagining the image of its body (*imago corporis*) or by understanding the thing's "reason" (*ratio*), for example, by imagining the perceptible shape of man or by thinking of the universal essence of man as "rational, mortal animal," respectively. Anselm says of the words of the third type that they are natural and the same for all nations, and he characterizes them as likenesses of things. Anselm's synthesis affected the way in which Augustine's remarks about the interior word were construed in later discussion. The connection between one kind of mental word and the definition of the thing is noteworthy.

The tradition of philosophical psychology starting from Aristotle's *De anima* entered the Latin discussions gradually during the latter half of the twelfth century and the first half of the thirteenth century. It became the dominant framework for the discussions about concepts until Ockham. In addition to *De anima* itself, the basic sources included a work by Avicenna, also known as *De anima*, as well as Averroes' Long Commentary on Aristotle's *De anima*.

In the *De anima* model, the intellectual cognition of an external object, for example, a horse, is based on the presence of the object's form in the intellect. The intellect can think of a horse because it becomes actualized by the same form that makes the horse into a horse. There was a complex story to be told about how the form of the object gets into the intellect.

A standard account of concept acquisition in the latter half of the thirteenth century would begin with a description of how the forms are transmitted through the medium (e.g., air) to the organs of external senses (e.g., sight or hearing) and are received in these organs as sensible species (*species sensibilis*). The species received will be further processed by the internal senses – a group of cognitive faculties that Avicenna had described, including common sense, imagination, and (sensory) memory. One of the tasks of the internal senses is to store the sensory information as phantasms, which are sensory likenesses or representations of things.

For Augustine or Anselm, a mental image of a man would count as a *verbum*. The Aristotelian model in *De anima* puts more stringent conditions on what qualifies as a concept. An image in the mind is a phantasm, and the phantasms are not concepts but the raw material for concepts. The phantasms are in the internal senses, which belong to the sensitive part of the soul, whereas the concepts are in its intellective part. The phantasms also differ from concepts in that they are about particular things, real or imagined, whereas concepts are universal.

The internal senses make use of a material organ, whereas the intellect is immaterial. It was assumed that the material cannot affect the immaterial, and hence the emergence of concepts in the intellectual soul could not be explained in terms of plain reception. To circumvent this, the Aristotelian model assumed a mechanism involving two intellectual powers, the active intellect and the possible intellect. The same mechanism explained how the concepts are universal even though the phantasms are particular.

The distinction between the active intellect and the possible intellect goes back to a not particularly clear passage in Aristotle's *De anima* III, 5

(430a10–25). There had been considerable discussion about the nature and function of these two powers in the Greek and Arabic commenting tradition. For example, Avicenna held that the active intellect (or agent intellect) is a separate substance from which the forms of the things emanate into the human soul when it has intellectual cognition. The usual thirteenth-century Latin position was to take both the possible intellect and the active intellect as powers within the individual human mind. What happens in concept formation is that the active intellect illuminates the phantasms in the internal senses and abstracts the intelligible content in them by stripping them of their accidental features. The universal forms thus abstracted will be imprinted in the possible intellect as intelligible species (*species intelligibilis*), and the intellect can then use them in intellectual operations.

The preceding paragraphs describe the late thirteenth-century standard view about how the forms of the things are acquired in the possible intellect, which is the power of intellectual thinking in humans. When we move on to consider what takes place within the (possible) intellect, the picture will get complicated. There were competing views about what kinds of entities in the mind relating to concepts one should postulate and how they should be described. The psychological *De anima* tradition provided the main framework for the discussions, but other influences were also involved. Importantly, attempts were made to relate the *De anima*-based model to the theologically oriented doctrine of the interior word (*verbum*).

The intelligible species are universal representations of objects in the intellect, and some scholastic thinkers identified them as concepts. However, the standard view in the late thirteenth and early fourteenth century was to consider the intelligible species and the concept as two distinct entities. The writings of Thomas Aquinas were instrumental in the development of this view, even though the details of his account vary from one work to another. In some important passages, he distinguishes (1) the intelligible species, (2) the act of understanding, and (3) the concept (see, e.g., *De potentia*, q. 8, a. 1, co.). Here, the

intelligible species precedes the act of understanding and makes it possible, whereas the concept (*conceptio intellectus*) is seen as the end product of the act. Aquinas identifies the concept as the *verbum*, and it is the likeness and representation that mediates in signification between the spoken word and the extramental thing.

There was extensive dispute about issues related to concepts in the late thirteenth and early fourteenth century. Much of the argument revolved around Aquinas' ideas, but there were also some highly original contributions. Peter John Olivi was among the early critics of Aquinas' views. He identified the act of understanding as the concept and denied that there are either intelligible species preceding such acts or some end products terminating them. Other critics of the intelligible species included Henry of Ghent and Godfrey of Fontaines. Against these criticisms, John Duns Scotus defended the necessity of postulating intelligible species that are distinct from concepts and precede the acts of understanding. Scotus and some others discussed the mode of existence that concepts, as end products or objects of acts of understanding, have. It was assumed that concepts have a special mode of being: they exist "objectively" or "intentionally" by being objects of understanding, whereas the intelligible species are forms inhering in the intellect.

The thought of William of Ockham opens a new phase in the medieval discussion about concepts. He developed an alternative to the *De anima*-based approach on the basis of his nominalist ontology. Ockham rejected the idea that intellectual cognition requires the presence of the object's form in the intellect, and he rejected the doctrine of species in its all forms, including intelligible species. In his mature thought, he also rejected the idea that concepts are objects of thought having merely objective or intentional existence. (Ockham referred to such objects as *ficta*. In earlier phases of his career, he considered the *fictum*-theory of concepts a genuine option.)

For Ockham, concepts are acts of understanding. More precisely, concepts are abstractive acts of understanding, as opposed to intuitive acts. An intuitive act of understanding is about a present particular object as existing, whereas the

abstractive act of understanding does not require the presence of the object and is universal in the sense that it is applicable to many objects (say, to all the members of a species). In Ockham's view, the human mind is so constructed that it is capable of forming concepts of the things it encounters under suitable conditions. When a person sees a horse for the first time, he or she will have an intuitive act of understanding about the particular horse as existing, and this intuitive act will automatically be followed by an abstractive act of understanding, which is applicable to all horses. Ontologically, concepts are qualities: they are states in which the intellect can be. In addition to concepts or abstractive acts of understanding, there are also habits related to them. These habits are also qualities in the intellect.

In Ockham's approach, there is a strong emphasis on the viewpoint of logic and semantics. He developed a theory of mental language, and concepts or mental words are among the basic units of that language: they are terms of the mental language. As terms of a language, the concepts are signs, and they have the kind of semantic properties that terms have. In fact, the concepts are the primary signs, and the words of spoken language signify because they are subordinated to concepts. Ockham maintains that this is what Aristotle had meant in the opening passage of *De interpretatione*. He also follows Aristotle in saying that concepts are likenesses of things, but he is not explicit about what kind of likenesses they are.

changes in parts. Second, the fact that a whole depends upon its parts entails that God must be absolutely simple. The final section examines the question whether an integral whole is identical to its parts.

Introduction

The concepts of part and whole are two of our most basic and prevalent concepts. We reason with these concepts all the time and in many different contexts. When we step back and reflect on the logical and metaphysical nature of parts and wholes, we are engaged in mereology. Critical reflection on parts and wholes has a long history. (For a way into this history, see the survey by Burkhardt and Dufour (1991), the collection of essays edited by Mann and Varzi (2006), and Harte's (2002) study of Plato.) Medieval philosophers used the concepts of part and whole liberally. But there is also a medieval tradition of mereology.

Mereology

Brooklyn, NY, USA

Abstract

This article is a survey of medieval treatments of parts and wholes. The first section covers the medieval taxonomy of parts and wholes. The second section examines some of the ways that medieval philosophers distinguish one class of parts and wholes from another class. The rest of the article focuses upon metaphysical issues concerning parts and wholes. The third section examines the common medieval supposition that the whole depends upon its parts and considers two ramifications of this supposition. First, it seems that if the whole depends upon its parts, the whole cannot persist through

Types of Parts and Wholes

A theory of parts and wholes should tell us what items can be parts. Since something is a part only if it is a part of a whole, a mereology will tell us what items can be wholes. Essentially, the medieval answer is that a part is either anything that is the product of a division or anything that composes something else. Accordingly, a whole is either anything that is divisible or anything that is composite.

Medieval Aristotelian treatments of parts and wholes tend to start by distinguishing between different types of whole. The source of these distinctions ultimately comes from Aristotle's *Metaphysics* (V, 26). The proximate source for the medieval version of the division of "whole" is Boethius' *De divisione* where he proclaims that a whole can be a continuous thing (such as a body or a line), a discrete thing (such as a crowd or pile), a universal, or a thing that consists of "powers of some kind" (such as a soul) (887d–888a). Boethius' treatment of the division of "whole" is

refined by subsequent medieval philosophers into a standard threefold division (*Compendium logicae Porretanum* III.12, 72–79):

Among wholes, some are universal, some are integral, and some are potential. An example of a universal whole is Animal. An example of an integral whole is a house. An example of a potential whole is a soul. And among integral wholes, some are aggregated out of their parts – for example, a tree – while some are disaggregated – for example, a flock. And among the aggregated wholes, (a) some are continuous – for example, a stone – (b) some are contiguous – for example, a fence – and (c) some are successive – for example, a time.

Almost without exception, medieval philosophers divide “whole” into these three classes: the universal whole, the potential whole, and the integral whole. Some, like the author of the *Compendium*, provide a further elaboration of the integral whole. The better medieval philosophers tend to endorse something like the *Compendium*’s thoroughly articulated division of wholes.

Different parts correspond to these different wholes. Again, the sources are ultimately Aristotle’s *Metaphysics* (V, 25) and Boethius’ *De divisione* (888a–c). Anyone who examines medieval treatments of parts will quickly find that there are some differences in terminology. But at root, the framework is essentially the same. According to this framework, there are three basic types of whole and at least three basic types of part:

1. Subjective parts of universal wholes
2. Potential parts of potential wholes
3. Integral parts of integral wholes

A wide variety of objects can be integral wholes. Piles, flocks, artifacts, and substances are all integral wholes. Aquinas even argues that the virtue of prudence and the act of penance have integral parts (*Summa theologiae* II–II, q. 48, and III, q. 90, articles 1–3, respectively), and Ockham thinks that complex mental acts (such as “Every man is animal”) are composed of parts (namely, “every,” “man,” “is,” and “animal”) (*Quaestiones in physicam* q. 6 [*Opera philosophica* VI, 407–410]; *In De int.* I, prooemium, 6 [*Opera philosophica* II, 354–358]). This prompts later authors to distinguish between a number of types

of integral part, including most often what we will call substantial parts (substantial form and matter), functional parts (such as fingers, skin, and hearts), and material parts (such as the stones that compose a pile or the geese that constitute a flock).

There is some disagreement among medieval philosophers whether substantial parts are really integral parts. Aquinas, in some passages, suggests that substantial parts are a type of integral part (*Summa theologiae* I, q. 8, a. 2, ad 3; III, q. 90, a. 2). But Aquinas seems ambivalent about the status of form and matter, for in other passages he calls matter and form “parts of an essence” and he distinguishes these “parts of an essence” both from parts of a quantity and from parts of a potential whole (*Summa theologiae* I, q. 76, art. 8). If parts of a quantity are integral parts, then it seems that Aquinas is saying that form and matter are not integral parts. Other philosophers take a less ambiguous position. They insist that only parts that constitute some quantity or other can be integral parts (Lambert of Auxerre *Logica* 126, Peter of Spain *Tractatus* V, 14:64; Walter Burley *De toto et parte*, 302; Albert of Saxony *Sophismata* 45, 25rb–26vb). These latter philosophers believe that substantial parts are a different species of part, not a type of integral part.

Functional parts and material parts are generally accepted to be integral parts. They differ, however, with respect to their ontological status. Functional parts are defined by the role that they perform for the whole. This role, in turn, is defined by the form of the whole. For this reason, medieval philosophers sometimes call functional parts “parts *secundum formam*,” or parts with respect to the form (Walter Burley *De toto et parte*, 301). For example, this thing is a hand because it belongs to a thing that is imbued by the form of a human. It follows from this fact that if the form of the whole is removed, the part ceases to exist. This part of a corpse, even though it looks like a hand, is not a hand, for it no longer performs the functions of a hand.

Some functional parts and some material parts are heterogeneous parts – that is, they are not divisible into parts belonging to the same type. For example, a hand is not divided into hands. But

other functional parts and other material parts are homogeneous parts. Divide up a quantity of blood and you still have bits of blood; divide up the bronze of the statue and you still have bits of bronze.

No matter how medieval philosophers divide up the types of parts, there is all but universal agreement that each different kind of part is specific to a type of whole. Subjective parts are only parts of a universal whole. Integral parts are only parts of an integral whole. Socrates can be an integral part of a crowd in the Agora, and he is a subjective part of the species Human Being. But Socrates cannot be an integral part of Human Being. Moreover, it is generally agreed that these three basic parts are irreducible. Integral parts cannot be reduced to subjective parts. Potential parts are irreducible to either subjective parts or integral parts.

The only philosophers who take exception to the thesis that types of parts are irreducible are the *collectio* theorists, who explicitly argue that a universal is a kind of integral whole and that subjective parts are reducible to integral parts (Pseudo-Joscelin *De generibus et speciebus* §§ 85–143). But very few medieval philosophers are *collectio* theorists, especially after Abelard famously critiques the theory (Freddoso 1978; Henry 1984, §4.5).

We find the threefold distinction between integral wholes, universal wholes, and potential wholes throughout the medieval period and in both logical and metaphysical treatments of parts and wholes. In addition to these three basic types of parts and wholes, later medieval logicians offered a different taxonomy of parts and wholes (Peter of Spain *Tractatus* V.11–18: 63–67; Radulphus Brito *Commentary on De differentiis topicis* II, q. 9; Lambert of Auxerre *Logica*:126–127; Buridan *Summulae* 6.4.2):

- (a) The universal whole
- (b) The integral whole
- (c) The whole in quantity
- (d) The whole in a respect (*in modo*)
- (e) The whole in place (*in loco*)
- (f) The whole in time

One of the notable features of the logician's taxonomy is the absence of the potential whole. This may be because a potential whole is of little interest to the logician. Or it may be that the logical behavior of a potential whole is reducible to one of the other types of whole (cf. Lambert of Auxerre *Logica*:130).

The wholes that correspond to items (c) through (f) reflect the medieval realization that the adjective “whole” (*totus/-a/-um*) can have a distributive function. Hence, the whole in quantity is the sense of “whole” that acts as a quantifier ranging over individuals, as for example when I say that “humans as a whole are rational.” Likewise, the whole in a respect is the sense of “whole” found in such propositions as “the whole surface of the ball is white,” which means that every part of the ball's surface is white. The whole with respect to place is the sense of “whole” that is found in such propositions as “Lucy is occupying the whole seat,” which means that every part of the seat is occupied by Lucy. And the whole with respect to time is the sense of “whole” that is found in such propositions as “God is present for the whole of time,” which means that God is present at every moment of time.

It was recognized that the adjective “whole” has a distributive sense at least as early as the middle of the twelfth century (Henry 1985:66–68; Zupko 2003:152). In the thirteenth and fourteenth centuries, medieval logicians refined this understanding by distinguishing between two senses in which the adjective “whole” can be distributive. Consider two examples: “the whole human is rational” (*totus homo est rationalis*) should be interpreted as “the whole of human is rational.” That is, each human is rational. But when I say “Socrates as a whole” (*Socrates totus*), I am referring to Socrates in so far as he is composed of parts. These two senses of “whole” are labeled, respectively, the syncategorematic sense of “whole” and the categorematic sense of “whole” (Kretzmann 1982). It is crucial to distinguish between these senses when considering a claim such as “the whole Socrates is less than Socrates” (Walter

Burley *De puritate artis logicae tractatus brevior* 256.9–13; Albert of Saxony *Sophismata* 45, 24vb–25va).

Differences Between the Different Types of Parts and Wholes

According to medieval philosophers, at least some classes of parts and wholes are not reducible to other classes of parts and wholes. Medieval philosophers offer several ways of distinguishing between the various types of part.

One method that medieval philosophers use is the predicative criterion (Boethius *In Cic. top.* 289.11–16; Abelard *Dialectica* 546.24–547.5; Buridan *Summulae* 8.1.4). According to this criterion, the mark of a subjective part is that its whole is entirely attributable to it. An integral whole, on the other hand, is not predicable in its entirety of its part. The integral whole can only be predicated of the parts when they are taken together all at once. For example, Socrates is a subjective part of the species Human Being. Hence, Socrates is a human being. Socrates' hand is an integral part of Socrates. A hand is not Socrates. Socrates is only predicable of the hand, when the hand is taken together with all the other parts, so that this collection of parts (including the hand) is Socrates.

Some medieval philosophers seem to suggest that the predicative relationship that obtains between a part and its whole is itself merely a sign that some deeper relation obtains between the two items. Aquinas, for example, suggests some deeper relations that explain what it is to be an integral part of something, what it is to be a potential part of something, and what it is to be a subjective part of something (*Summa theologiae* I, q. 77, art. 1; and III, q. 90, art. 3, *responsio*):

1. x is a subjective part of y because the total essence and power of y is present to x .
2. x is a potential part of y because the total essence of y applies to x , but the total power of y does not.

3. x is an integral part of y because neither the total essence, nor the total power of y is present in x taken singularly.

Aquinas implies that the relations spelled out in (1)–(3) ground the various predicative relations that obtain between parts and wholes. Aquinas' characterization of the differences between the types of wholes and parts also attempts to account for the peculiar behavior of potential wholes. Potential wholes are predicable of their potential parts – that is, the rational soul and the vegetative soul are both soul – but the potential parts do not belong to the same species. The rational power of the soul has a different definition than the vegetative power. Other philosophers who appeal to the predicative criterion omit mention of the potential whole.

A second criterion that medieval philosophers sometimes offer is this: an integral whole always “draws together,” or “embraces” (*comprehendere*), some quantity, whereas a universal whole does not embrace a quantity (Abelard *Dialectica* 546.21–27). Notice that this criterion does not require that the parts themselves possess any quantity. For example, an angel is immaterial and hence, does not possess a quantity. Nonetheless, one can make an integral whole out of two angels, since that whole has a quantity, namely, a number.

A third way to distinguish between the universal whole and the integral whole is by determining whether the parts actually compose the whole (see William of Ockham *Expositio in librum Porphyrii* 2.16 [*Opera philosophica* II, 54]; John Buridan *Summulae* 6.4.4). On this view, the parts of a universal do not strictly speaking compose the whole, whereas the parts of an integral whole do literally compose the whole. That is, in order to construct an integral whole, one needs to first find some parts. A universal is not a construction out of particulars. One does not need to first gather together some particular humans in order to make the universal Human Being.

Given that the parts compose the integral whole, it may seem that an integral whole depends upon its parts, whereas a universal whole does not

require the existence of its subjective parts in order to exist. In his *De divisione*, Boethius uses differences of priority to distinguish between the genus and the whole (879b–c). The genus is prior to its species, whereas a whole is posterior to – that is, depends upon – its parts. In later treatments of parts and wholes, the universal whole – which Boethius lumps together with integral and potential wholes – is distinguished from the integral wholes by appealing to relations of priority. Often these relations of priority are encapsulated in the maxims associated with the various topics (*loci*). (On the medieval understanding of the topics see Green-Pedersen 1984 and Stump 1982.) For example, the maximal proposition that corresponds to the topic from the integral part is the following

If the integral part is removed, the integral whole is also removed.

In the next section, the reader will see that there is significant disagreement over how to interpret this maximal proposition.

When discussing these criteria for distinguishing between types of wholes and parts, many philosophers make no mention of potential wholes. Again, this may be because potential wholes are thought to be reducible to either integral wholes or universal wholes. Or it may be that the philosophers who propose these criteria for distinguishing between integral wholes and universal wholes do not think that potential wholes are true wholes. For example, such a philosopher might think that the soul is mereologically simple (i.e., has no parts), and that mereological language, when applied to the soul, is figurative. The nature of the potential whole is not well understood. Much more research is needed in this area (although, see Perler 2010, 2015).

Dependence and Persistence

One of the proposed hallmarks of an integral whole is that it is actually composed out of its parts. This thought naturally implies that the whole depends upon its parts for its existence. In *On the Trinity* II Boethius tells us that the

composite “gets its being from those things which compose it.” In one sense, this claim is not controversial, for in the case of a composite being, some parts are required to bring the composite into existence. Many medieval philosophers would also concede that in order for a composite to exist at some time, the right sort of parts must exist at that time. For example, in order for a human to exist at time *t*, there must be a substantial human form and the right sort of matter at *t*. But some medieval philosophers consider an even stronger reading, namely, that in order for this whole to exist at *t*, these parts (and no others) must exist at *t*. Boethius suggests this stronger thesis in his treatments of parts and wholes (*De divisione* 879c):

If a part of the whole perishes the whole, whose one part is destroyed, will not exist. But if the whole perishes the parts, although scattered, remain.

Boethius reiterates his claim that the removal of a part removes the whole in his treatments of the topics (*In Ciceronis topica* III, 331.23–29 and I, 289.35–39). Taken at his word, the thesis is remarkable, for it suggests that if Socrates’ fingernail is a part of Socrates, then the removal of the fingernail removes Socrates.

There is an innocent way to interpret Boethius’ maxim that the removal of the part entails the removal of the whole. In his *Metaphysics*, Aristotle notes that one sense of “*x* is whole” is that *x* is complete (V, 26, 1023^b26–27). Accordingly, if one were to remove *y* from the whole of which it is a part, the whole consisting of *y* and some other parts is removed. For example, if I cut off Socrates’ finger, the whole that consists of Socrates’ finger as well as all of his other parts is compromised. But this just means that Socrates has been “mutilated” (cf. Aristotle *Metaphysics* V, 27). The removal of Socrates’ finger does not entail the destruction of Socrates. Radulphus Brito might have this interpretation of Boethius’ maxim in mind. He claims that in the case of heterogeneous wholes, the maxim holds because “each part is required for the *esse totius*” and thus, when even one part is destroyed “the *forma totius* does not obtain” (*Commentary on De differentiis topicis* II q. 9:45). It is not quite clear what

Radulphus means by “*esse totius*” and “*forma totius*,” but one possible interpretation is that each part is required in order that the composite be “all there” and have the form characteristic of something that is whole, or complete. If that is right, then for Radulphus the loss of a part merely implies that the thing that lost the part ceases to be complete, not that the thing ceases to be altogether.

Other philosophers insist that Boethius’ rule must be restricted in some manner. Most commonly, the rule is restricted in this way: the whole is removed only if one removes a “principal” part. If one were to amputate Socrates’ right hand, Socrates would not cease to exist. He would merely lack a hand. Hence, a hand is a “secondary part.” Yet, if someone were to remove Socrates’ heart or brain, Socrates will be destroyed. Thus, hearts and brains are “principal parts.” The distinction between principal and secondary parts is in place by the middle of the twelfth century (Pseudo-Joscelin *De generibus* §§ 6–10; anonymous *Introductiones maiores Montane* 71va–72rb; cf. Arlig 2013). The restriction of the Boethian maxim to principal parts is common throughout later Scholastic treatments of mereology (cf. Buridan *Summulae* 6.4.4; Joachim Jungius *Logica Hambergensis* XI, §§ 16–18).

What often underwrites this distinction between principal and secondary parts is a metaphysical commitment to forms that are not dependent upon their matter. If a form is independent of its matter, it can be the metaphysical glue that holds an object together as it changes material components. For example, Walter Burley draws a distinction between the whole *secundum formam* and the material whole. The formal whole persists so long as the form persists (*De toto et parte*, 301). Most commonsense objects are identified with a whole *secundum formam*, not a material whole. Hence, Socrates is not substantially compromised by material changes.

However, there are a few medieval philosophers who argue that the removal of any part entails the removal of the whole. Peter Abelard insists that every integral whole is composed by a unique set of integral parts. This house must be

composed out of these nails, these boards, and this cement (*Dialectica* 551.4–9). If I use other nails or other boards, I could make a house, but not this very house. Given that each whole is composed by a unique set of parts, if any part is removed, that whole is destroyed. Another whole similar to the original might exist after the mereological change takes place, but strictly speaking the two wholes are not identical (cf. Henry 1972:118–129, 1991:92–151; Arlig 2007).

Ockham and a number of other fourteenth-century nominalists also flirt with the notion that any mereological change brings about the destruction of the whole. (See, especially, Buridan *Quaestiones in physicam* I, q. 10 (with English paraphrase in Pluta 2001), and *Quaestiones super De generatione et corruptione* I, q. 13; Albert of Saxony *Quaestiones in Aristotelis physicam* I, q. 8. On Ockham, see Normore 2006; Pasnau 2011:692 f.) Ockham is somewhat circumspect, but Buridan and Albert say some unambiguous and remarkable things about the persistence of objects through mereological changes. According to them, there are three senses of numerical sameness: there is a proper sense, a less proper sense, and an improper sense. Something is properly the same in number if all its parts remain the same and it neither acquires nor loses any parts. In this strictest of senses, no corruptible thing persists through mereological change. Something is less properly the same in number if its “most principal part” remains numerically the same. This is the sense that allows us to claim that Socrates is numerically the same man now as that man 10 years ago, since Socrates’ intellectual soul persists through the change. Finally, something is improperly the same in number if there is a continuous succession of beings that maintain a similar shape, disposition, and form. This improper mode of numerical sameness allows us to claim that the Nile River here today is numerically the same river as the Nile back in Caesar’s time. The reason why these philosophers flirt with an extreme notion of persistence is that both Buridan (at least in his physical works, for compare *Summulae* 6.4.4) and Albert claim that plants and animals can only be numerically the same in the third, improper sense, for these creatures do

not have the sort of soul that can act as a guarantor of less proper identity (Buridan *Quaes. super De gen.* I, q. 13:114–15; Albert *Quaes. in phys.* I, q. 8:131).

The extreme view of persistence held by Abelard, Buridan, and Albert of Saxony threatens the Aristotelian distinction between substantial and accidental change. Strictly speaking, we do not have one substance, but rather a succession of substances loosely unified by three facts: these successive beings have some of the same parts, this line of succession is continuous, and each member in the line of succession belongs to the same species of substance. It is perhaps for this reason that these philosophers resort to some interesting antirealist strategies to maintain at the least the appearance of Aristotelian orthodoxy. First, all three philosophers make an exception for human beings. Personal identity is guaranteed by the persistence of the intellectual soul. When it comes to other substances, such as houses and horses, Abelard regrettably is silent (Arlig 2013:91–96). However, one option that is open to him, if he in fact wished to take a hard line, is to treat not only persisting inanimate substances and artifacts but also plants and animals as convenient fictions, that is, conceptual items constructed from ephemeral things. On this proposal, they would be analogous to days and utterances, which strictly speaking do not exist since their putative parts do not exist all at once (see Arlig 2007:217–223). Buridan and Albert, by contrast, explicitly acknowledge the challenge and they meet it head on by denying that their analysis entails that every mereological change entails substantial change. But they do so by reinterpreting substantial change. Substantial change occurs only in those cases where the specific substantial name is changed. So long as one can apply the name and definition of “horse” to the whole in question, no substantial change has occurred.

Given that most medieval philosophers do not endorse an unrestricted reading of the claim that the whole is posterior to its parts, it is interesting to note that many appeal to this very principle in order to demonstrate the absolute simplicity of God (Anselm *Monologion* 17; Anselm

Proslogion 18; Aquinas *Summa theologiae* I, q. 3, a. 7; Maimonides *Guide of the Perplexed* II, prop. 21 and II, 1). These philosophers argue that if something is complex, then that thing has parts. But if something has parts, then that thing is posterior to and depends upon its parts. Hence, if God is complex, then God has parts and God depends upon these parts. If God depends upon any x , then x is a higher form of being than God is. So, if God is complex, then God is not the highest form of being. But God is the supreme being. Therefore, God cannot possess any parts whatsoever. God is absolutely simple. Medieval philosophers typically take this to mean that God is not divisible in any respect. God is not a composite of hylomorphic parts, He is not a composite of subject and accident, He is not a composite of genus and differentia, and He is not a composite of being and essence. He is utterly noncomposite (*Summa theologiae* I q. 3, art. 7).

The thesis that God is absolutely simple has interesting metaphysical and theological implications. For example, if God is absolutely simple then God cannot occupy space or time, since occupying space and time divides the occupant into parts (Anselm *Monologion* 21).

God’s simplicity also entails that anything that is identical to God’s essence is identical to the whole of God’s essence (Anselm *Monologion* 17; cf. Boethius *De trin.* IV). In particular, God is traditionally identified with the Good itself, Justice itself, and Being itself. But since God has no parts, the Good, Justice, and Being cannot be parts of God’s essence. Since identity is transitive, the Good is identical to Justice, Justice is identical to Being, and Being is identical to the Good. Many medieval philosophers are willing to accept and defend this odd result rather than deny that God is absolutely simple. Those who deny that God’s Goodness and Justice are identical do not in turn think that God has parts. Rather, they insist that names such as “Good” and “Just” do not name the essence of God. The best way to describe God’s essence is to say what God is not (Maimonides *Guide* I 58). In other words, the so-called negative way is motivated by an unwavering commitment to the absolute

simplicity of God, which is in turn founded on the principle that a whole depends upon its parts.

Identity and the Problem of the Many

It is sometimes assumed that the extreme view of persistence espoused by philosophers such as Abelard and Albert of Saxony is founded on the principle that a whole is identical to the sum of its parts. If that were so, an easy way to avoid the conclusion that a change in parts entails a change in the whole would be to deny that the whole is ever identical to the sum of its parts (Brown 2005: esp. 150–155).

An orthodox Aristotelian will readily assert that an integral whole is not always identical to its parts. Some integral wholes are weakly bound together. For example, a crowd is a very loose and weak unity: it is a combination of substances and an accidental form (Aquinas *In Metaphys. expositio* V, lectio 21, sections 1102–1104; *Summa theologiae* III, q. 90, art. 3, ad 3; Buridan *Summulae* 8.1.4–5). For this reason, its parts might be identical to the whole, and a removal of one part might compromise the existence of that whole. But a combination of a substantial form and matter yields the truest sort of unity one finds in the sublunar world (Aquinas *Summa theologiae* I, q. 76, art. 8). In the case of substances, the whole is clearly not the sum of its integral parts. First, a substance is not identical to the elements that make it up, since when the substance exists, its parts exist only in potentiality. As for the functional parts, which exist in act only when the whole exists, the sum of these is not identical to the whole, since the whole consists of all the parts plus something that is not a part, but rather a principle, namely, the soul (Aquinas *In Metaphys. expositio* VII, lectio 17, sections 1674–1680).

Yet, it would also be wrong to suppose that Abelard or Albert of Saxony think that an integral whole is *identical* to its parts. Abelard presents the clearest illustration of this point. Abelard admits that it is not always sufficient to gather together the parts in order to create a whole. Some wholes

require the imposition of structure in order to bring about the existence of the whole (*Logica ingredientibus* II, 171.14–17; *Dialectica* 550.36–551.4). A house, for example, is a collection of boards, nails, and bricks that have the right arrangement. While this arrangement is not a part, it is a difference maker. Abelard claims that a house and the parts that compose it are the “same in being (*essentia*) and in number,” but they are “distinct in property” (*Theologia Christiana* III, § § 139–154: 247–253; cf. Brower 2004; King 2004:85–92; Arlig 2012). Certain characteristics are true of or can be predicated of the thing, which are not true or predicable of its matter, and vice versa. But this fact does not entail that the matter and the thing are numerically distinct entities, for x is the same in being as y if and only if every part of x is a part of y and every part of y is a part of x . If x is the same in being as y , then x is numerically the same as y . Therefore, the house is numerically the same as its parts, even though the house is not identical to its parts. The claim that the whole is something over and above its parts is, in Abelard’s view, too unrefined to capture the relations that obtain between a thing and its parts.

Several medieval authors consider a specific puzzle that is generated by the identification of a whole with its parts, namely, the Problem of the Many (Abelard *Theologia Christiana* III, § 153: 252; Pseudo-Joscelin *De generibus* § § 22–25; Albert of Saxony *Quaes. in Arist. physicam* I qq. 7–8, and *Sophismata* 46, 25va–vb; cf. Fitzgerald 2009; Normore 2006). Contemporary philosophers perhaps best know this puzzle as Peter Geach’s puzzle concerning Tibs and Tibbles (Geach 1980:215). Assume that Socrates’ body is perfectly intact: he has all his limbs, and their parts. Now consider every part of Socrates’ body except one finger. Call this whole W . W is not numerically the same as Socrates, so it appears that W and Socrates must be numerically distinct. Socrates’ whole body is imbued with the soul of a man. But it also happens that W is imbued with the soul of a man. So, there are now two numerically distinct men where it initially appeared there was one. But it gets worse. Considering the body apart

from one finger was only one of an indefinite number of such considerations. And by the same reasoning, these other bracketed wholes composed from Socrates' body are also men. Hence, it is easy to generate an indefinite number of numerically distinct men where commonsense tells us that there is only one.

Most medieval philosophers who consider the Problem of the Many reject the premise that while W is a part, W is a human. If W is a part of a per se being (i.e., an Aristotelian primary substance), then W itself cannot be a per se being. There cannot be many per se beings occupying the same location at the same time. Therefore, there are not innumerably many men. There is only one man consisting of innumerably many parts (see, e.g., Albert of Saxony *Sophismata* 46, 25vb).

While Abelard's theory of sameness and difference is subtler than most, it appears that ultimately even he would resolve the Problem of the Many in more or less the same manner. If x and y are the same in being, then x and y are numerically the same. But, according to Abelard, it does not follow that if x and y are different in being, x and y are numerically distinct. This is because if even one part is not shared by x and y , x and y are different in being, but in order to be numerically distinct, x and y cannot share any parts. This characterization of numerical sameness and difference leaves logical space for overlapping objects, which are neither numerically the same nor numerically distinct. Thus, according to Abelard it is true that W is not numerically the same as Socrates. But it does not follow from this fact that W is numerically distinct from Socrates. Hence, there is not an indefinite number of numerically different men. So far, so good. But if one asks Abelard to pinpoint *which*, if any, of these overlapping men is Socrates, Abelard's theory of identity cannot provide the answer. It might be that Abelard would be content with this lacuna. But it is not unreasonable to think that Abelard instead might have offered this answer: Socrates is the maximal sum of parts that is vivified by Socrates' soul (*Theologia Christiana* III, § 153; cf. Arlig 2012:132 n. 38).

Conclusion

Medieval philosophers have a sophisticated understanding of parts and wholes, and they make use of these mereological principles when reflecting on metaphysical questions concerning persistence, dependence, and identity. Some of these reflections, as the reader has seen, are of the first rank. Students of logic and metaphysics should be richly rewarded if they continue to explore this important body of work.

Abstract

This entry surveys some of the major issues in medieval metaphysics. It examines at length medieval positions on the nature and scope of metaphysics, especially in relation to theology. This entry then briefly surveys some of the major topics that exercised the minds of medieval thinkers, including the transcendentals, the categories, existence, universals, ontological reduction, individuation, material constitution, identity, persistence, and modality.

In the collection of books known as the *Metaphysics*, Aristotle provided several characterizations of this science. In book I (A), Aristotle claimed that the fruit of the highest philosophical investigation is a “wisdom” concerning the first causes and principles of things. In book IV (Γ), Aristotle claimed that metaphysics is the study of being in so far as it is being (chapter 1), but given that all beings ultimately depend upon substance for their existence, metaphysics is primarily a study of substance (chapter 2). Finally, in book VI (E), Aristotle itemized the subject matters of the three theoretical sciences, which are marked off from the practical and productive sciences in virtue of the fact that the former are pursued for their own sake. The theoretical sciences are divided into natural science (“physics”), mathematics, and the “divine” science, or theology. Physics considered things insofar as they are changeable and inseparable from matter. Mathematics considered things, which are actually inseparable from matter, in abstraction from their matter and from change. Theology, however, considered things that exist separately from matter and are not subject to change. Aristotle noted that if there were only natural things, physics would be the first

philosophical science. But given that there are eternal, immaterial substances, there must be a higher science that studies these. Hence, metaphysics comes after the study of physics. For the Aristotelian, one does not have complete knowledge of a science until one knows the causes and principles of the subjects of that science. In this sense, metaphysics is prior to physics. For these reasons, metaphysics is the first philosophical science.

While medieval philosophers were more than happy to parrot these Aristotelian formulae, there was considerable debate over the proper “subject” of metaphysics. For it is one thing to consider the *x*’s in a science, it is another matter for the science to have the *x*’s as its primary object of study. For example, one may have to consider substance in physics, but substance as such is not the subject matter of physics.

The Subject Matter of Metaphysics

The tradition that medieval thinkers received presented them with three plausible candidates for the subject matter of metaphysics: being as such (which included the study of the first principles and causes of beings), substance, and God. In practice, it seems that the main struggle was between the conception of metaphysics as the study of being qua being, which was associated with Avicenna, and the conception of metaphysics as the study of eternal substances, which was often attributed to Averroes.

Duns Scotus, like many of his contemporaries, sided with Avicenna. Avicenna’s understanding of the subject matter of metaphysics was not without precedent (compare al-Fārābī, *The Aims of Aristotle’s Metaphysics*, in McGinnis and Reisman 2007: 78–81, but see Fakhry 1984). But it was Avicenna’s particular formulation of the claim that metaphysics is the study of being inasmuch as it is being which was to be extremely influential in the thirteenth and fourteenth centuries.

Avicenna observed that metaphysics could not be solely about God or about substance. The

subject of metaphysics cannot be God, because the subject of any science is something whose existence has been postulated at the outset of the investigation; a science only studies the states and properties of its subject. But the existence of God cannot be postulated at the outset of metaphysical study (for no other science has established His existence); rather, the existence of God is something that is sought in metaphysics (Avicenna, *The Metaphysics of al-Shifā’ (The Healing)*, I, 1). Likewise, the subject of metaphysics cannot be the first principles and causes of substances. They too are the things that the science seeks after, not what it has already postulated. Finally, if metaphysics were solely about substance, then metaphysics would fail to be fully general. It would only study being under one of its aspects, namely, substance, and not being in general. Metaphysics would not be the highest science; it would be a science that is subordinate to some yet unspecified science that studies being in general.

Avicenna concluded that the subject of metaphysics is being inasmuch as it is being: some of the science will study the causes of being, some of it will study the accidents, some of it the First Cause, and some of it the starting points of the other sciences, all of which also study being but under one aspect or another (*Metaphysics*, I, 2).

Avicenna’s conception of metaphysics was very influential, but it did not go unchallenged. Averroes, for example, attacked Avicenna’s reason for rejecting the notion that God is the subject matter of metaphysics (*In I Phys.*, com. 83 [*Aristotelis Opera cum Averrois commentariis*, IV, 47v]). Avicenna is mistaken, for the demonstration of the existence of the separate substance, which Averroes identified with the first form and the final cause of everything else, has already occurred by the end of the study of physics (cf. Aristotle, *Physics* VIII). Accordingly, Averroes seems to have endorsed the opposing claim that the proper and primary subject of metaphysics is the separate substance, or God.

Even those who leaned toward Avicenna’s view, as opposed to Averroes’, often added refinements and qualifications. For example, Aquinas agreed with Avicenna that the subject matter of

metaphysics was being qua being, or “being in general” (*ens commune*) (*In Metaphys.*, Proem.). But Aquinas refused to admit that God is included in the subject matter of metaphysics. God and angels are examined in metaphysics, but only indirectly as the principles and causes of being qua being (*In De trinitate*, q. 5, a. 4; cf. Wippel 2000: 15–22). Divine things may be studied in and of themselves, and not merely as principles of other things, but this can only happen insofar as their existence has been revealed to humans in a nonphilosophical way. Hence, Aquinas draws a distinction between philosophical theology (metaphysics) and revealed theology (“sacred doctrine”) (*In De trinitate* q. 5, a. 4; cf. Wippel 2000: 17–18). Aquinas thought that philosophical theology was a part of, and indeed, the culmination of philosophy. Revealed theology studied God and divine things as its proper subject, but its basis must be handed down in Holy Scripture. Since sacred doctrine is known by something that is superior to the natural light of reason, it is superior to metaphysics (cf. *Summa theologiae* I, q. 1, a. 1).

Being and Its Necessary Concomitants

Start with the notion that metaphysics is the study of being qua being. There are at least two components to the study of beings, namely, determining the manner in which a being exists and determining what that being is. We will return to the former after a few sections touching upon the latter.

In the broadest terms, we determine what something is by locating it among the types of beings. This avenue leads to the discussion of the categories (see next section). But it was also felt that there were some properties of a being, which are predicable of that being merely because it is a being. The most common among these “transcendentals” – so named because these predicates applied across the categories and, in some sense, were prior to the differentiation of being into one of the general kinds of being – were “good” (*bonum*), “one” (*unum*), and “true” (*verum*). But there were several other candidates for transcendentals mentioned in the literature. Saint Bonaventure, for example, added “beauty” (*pulchrum*),

and Aquinas added “thing” (*res*) and “something” (*aliquid*).

The medieval discussion of the transcendentals is by and large confined to the Latin Scholastic period, but there were some notable predecessors among the Arabs and in the writings of Boethius (see, especially, his *Quomodo substantiae*). (For an overview of the study of transcendentals, see Gracia 1992, and the other articles in *Topoi*, vol 11, pt. 2.) No Scholastic philosopher assumed *prima facie* that the discussion of the transcendentals was merely a discussion about the status of words or concepts, and many assumed that the transcendentals had some sort of ontological status.

The transcendentals were widely believed to be “convertible” – that is, x is one only insofar as x is true, and only insofar as x is good, and only insofar as x is a being. It was a matter of debate whether the transcendentals were merely co-extensional, or whether they were in reality one and the same thing (*idem secundum rem*). (Rationality and being capable of laughter are co-extensional, but different *secundum rem*.) But while there was disagreement over whether the transcendentals were the same *secundum rem*, there was near unanimous assent that the intensions of the transcendentals were not equivalent.

The transcendentals had a special appeal to Scholastics. It did not escape their notice, for example, that the transcendentals corresponded to some of the fundamental names of God. The transcendentals and their status also had clear implications for other theological and philosophical topics. For example, there was the problem of the metaphysical status of evil. For if x is a being only to the extent that x is good, then it seems that evil (or at least pure evil) is unreal.

It was often felt that there was an ordering among the transcendentals and that “being” (*ens*) was first in the hierarchy. In general, however, medieval thinkers were careful not to treat *ens* as the highest kind, for they were mindful of the Aristotelian doctrine that being is not a genus. According to the orthodox Aristotelian line, the range of ways that something could be a being was too diverse for all beings to share some real element in common. Moreover, there was one being who, for both philosophical and theological

reasons, could not have anything in common with all other beings. This transcendent being was God. This consensus and the weight of the authorities behind it should be noted in order to fully appreciate John Duns Scotus' idiosyncratic and controversial doctrine of the univocity of *ens*.

Scotus took the unusual step of asserting that metaphysics was the study of a univocal conception of being (*Ordinatio* I, d. 3, q. 3; translation in Duns Scotus 1987: 5–8). In particular, Scotus asserted that there is one notion of being underlying both the notion of infinite being (i.e., God) and finite being (i.e., creation). Most of Scotus' contemporaries asserted the absolute transcendence of God. There was not one notion of being, but rather two: one proper to God and one proper to creatures. But Scotus thought that this doctrine entailed intractable epistemological difficulties. God could not be naturally known by us unless being were univocal with respect to both the uncreated and the created. Scotus' predecessors tried to avoid the conclusion that being is an equivocal concept and, hence, the epistemological difficulties that Scotus identified, by asserting some form of the doctrine of analogy. The notion of being proper to creatures is secondary to and derived from the notion of being proper to God. Scotus thought that the analogical account of being was incoherent; it either resolved into a commitment to equivocity or into a commitment to a univocal, common conception of being.

To many of his contemporaries, Scotus seemed to be asserting that being was a genus and, even worse, denying the transcendence of God. It seems that Scotus did not fully convince even his own followers, for they tended to divide into those who accepted that there was some sort of real community between God and creatures and those who thought that the unity of the concept of being that was applicable to both God and creatures was merely logical and not real (Dumont 1992: 140–146).

The Categories

A being insofar as it is a being has a number of necessary concomitant properties. But this being will also belong to one of the kinds of being. First

of all, it will either be a substance or an accident – that is, a dependent property of a substance. If it is an accident, it will fall under one of the nine classes of accidents that Aristotle laid out in his *Categories*.

The *Categories* traditionally stands at the beginning of Aristotle's *Organon*, or logical corpus. Considered as a logical work, the *Categories* appears to be about the nature and classification of simple terms. Yet almost from the beginning, interpreters wondered whether the *Categories* was about more than the study of simple terms. Scattered remarks in the *Categories* as well as other parts of Aristotle's corpus implied that beings were divided into the ten basic categories. It is natural, then, that medieval philosophers would be tempted to read the *Categories* as a treatise about the classification of beings.

As soon as one takes the *Categories* to be about the classification of beings, a number of issues quickly arise. First, it appears that Aristotle is committed to the existence of universal things, and not merely universal terms (see below). Second, one might wonder whether each category term picks out a discrete, nonoverlapping collection of entities. (e.g., do “Substance” and “Quantity” pick out distinct sets of things?) Third, there is the question whether the ten categories exhaust the basic kinds of beings.

Medieval philosophers answered the second and third of these questions in a variety of ways. Many medieval philosophers thought that there were exactly ten categories and that these categories uniquely picked out nonoverlapping classes of beings. Some even thought that they could “prove” that there were exactly ten categories (e.g., Albert the Great, Thomas Aquinas, and Walter Burley). John Duns Scotus expressed skepticism about the possibility of proving the sufficiency of the categories, although he believed that there were ten and only ten categories and that each of these categories corresponded to a class of things.

Other philosophers attempted to reduce the categories in one fashion or another. Henry of Ghent observed that there are some accidents where it is not contradictory to conceive of them as existing without their subjects (namely, qualities and quantities), but that for most accidents it would be a contradiction to conceive of them as

separate from their subjects (namely, those accidents belonging to the remaining seven categories). The first three categories (Substance, Quantity, and Quality) had not only their own proper mode of being, but also their own proper reality. The remaining categories had their own proper mode of being, but they were not distinct things from the first three kinds of beings (Pini 2005: 71–73). Peter John Olivi took this reductivist program one step further and determined that the categories do not pick out distinct kinds of things (*res*), but only distinct ways of describing the same things. The categories, hence, were mind-dependent classifications (idem, 74–75).

William of Ockham's reduction of the categories was also quite radical. He reduced the real categories to two: substance and quality. In a series of arguments, Ockham attempted to demonstrate that entities belonging to one of the other eight categories were either not needed in order to explain semantic phenomena, or the positing of the existence of entities in some category led to a contradiction (for his arguments against quantity and relations, see Adams 1987, vol I, chapters 6 and 7 respectively). Terms corresponding to the latter eight categories were merely indirect ways of speaking of the two kinds of items that are real, individual substances and individual qualities. It is a curious fact that Ockham did not apply the same reductivist strategy to qualities as well. Adams has suggested some philosophical reasons why quality might be irreducible (1987: 277–285). Spade has argued that Ockham never explicitly employs the strategies suggested by Adams. The real motivation behind Ockham's refusal to reduce away qualities seems to be theological (Spade 1999: 105–106).

Medieval thinkers not only worried about whether there were no fewer than ten categories, they also were aware that the categories do not appear to exhaust all of reality, as they noticed that the ten categories did not have an obvious place for a number of important entities. For example, where do matter and the substantial differentiae fall in the categorial scheme? And what about God? In his commentary on the *Categories*, Boethius espoused a view, which traces back to

at least Porphyry, that the *Categories* is restricted to composites of matter and form. It is not a scheme that can classify matter alone, or form alone, let alone simple, immaterial substances (*in Cat.* 183D–184B). In his treatise on the Trinity, Boethius endorsed Saint Augustine's assertion that God is “beyond substance” (*ultra substantiam*) (*De trin.* IV). The fact that the categories only appear to apply to a select portion of reality had a number of ramifications. For instance, it shaped later interpretations of Aristotle's discussion of “primary substance” in his *Metaphysics*, since it was unclear whether Aristotle thought that substantial forms or hylomorphic composites are the primary substances – and thus, the primary beings – in his overarching ontology (see Galluzzo 2013).

Grades and Modes of Existence

A being not only has properties and (with some exceptions) belongs to one of the ten greatest kinds, it also has existence (*esse*). Medieval philosophers have a rich understanding of the nature of existence and its interplay with the characteristics that make a being what it is (i.e., the being's essence). We can only mention some of the general features of this rich tradition.

Many medieval thinkers felt the need to distinguish between the mode of existence that a concrete individual has and the modes of existence that this individual's constituents and ingredients have. One motivation seems to be this. If the constituents of an individual possessed the same mode of existence as the individual itself, then these constituents would exist in their own right – that is, they would be *per se* beings. But Aristotle had claimed that no substance is composed of substances, which many medieval philosophers interpreted as the claim that no *per se* being is a composite of actual *per se* beings. A *per se* being is something that is truly one and capable of independent existence. But how could something be independent and truly one if its parts themselves are also independent and truly one? It appeared, then, that if *x* is composed of *per se* beings, then *x* is merely one in a weaker or

accidental sense – it is an aggregate of substances, not itself a substance.

One strategy was to distinguish between actual existence and potential existence. A human body is made out of the four elements, but when the human body actually exists, these ingredients only potentially exist in the body. They exist in potentiality, since upon death the body is resolved back into the four elements. Hence, in one sense, the elements are not parts of the body.

But some of the items that play a role in the creation of an individual must continue to be present in the individual, when the individual exists. In particular, the nature or essence of the individual must exist in the individual when it exists. Otherwise, the individual would not be what it essentially is. One strategy, which is very old, is to distinguish between the mode of existence that the nature has in itself and the mode that it has in the material world. Boethius, for example, claimed that natures in themselves merely “subsist,” whereas concrete instances of the nature “substand.” It is only when something substands that it can be the subject for accidental properties – that is, to be an individual, material substance. The details of Boethius’ theory are a bit obscure, but it appears that he was espousing a Neoplatonic theory of individuals. The nature itself is a separately existing Form. This Form is then copied in matter. The chunks of matter imprinted with the copy of the Form are the things that substand. The matter and the copy of the Form are parts of the concrete individual, and indeed they are essential parts of the individual, but they are not themselves *per se* beings. The matter needs the copy of the Form to be something, and this copy of the Form needs to be enmattered in order to be a copy of the Form.

The dominance of Aristotelian philosophy in the Scholastic period meant that most philosophers rejected the Platonic conception of separately existing essences. Essences were only found in the mind or in individual beings. Given that the essence contributed to the existence of the individual, there was still the need to distinguish between the mode of existence of the essence as such and the individual. The Avicennian answer was to distinguish between the essence in itself

and the essence in an existent. The essence considered in itself did not exist. It only had existence in so far as it was an essence in the mind or an essence in this individual.

Avicenna, nonetheless, allowed for the essence to have some measure of mind-independent reality, for in itself it was indifferent with respect to this individual or that one. Avicenna’s position did not sit well with Scholastic thinkers, for in their view, if the essence itself had some sort of mind-independent reality, then in effect it has a minor form of existence. And if it has a minor form of existence, then the essence should have a minor form of unity. Generally speaking, there were two solutions to this dilemma: either deny that that essence in itself had any existence at all or accept that the essence had a minor form of being, and hence a minor form of real unity. Aquinas chose the former strategy; Duns Scotus chose the latter strategy.

Universals

The generality of the discussions of being, the transcendentals, and the categories, strongly suggested to medieval thinkers that there are things that are both independent of the mind and really common to many individuals. The majority of medieval philosophers were “realists,” where this means that they thought that there are mind-independent features (but not necessarily things) that are common to many. A small but influential group of philosophers rejected the thesis that there were any things or aspects that existed universally and mind independently. These philosophers are typically labeled as “nominalists,” since they generally argued that universality is a property of names (*nomina*) or concepts only. However, it should be stressed that no medieval believed that there were no properties or abstract objects (a position that is nowadays occasionally associated with the term “nominalism”).

Some realists argued that universals were things that literally were a part of an individual composite thing. The version prevalent in the later eleventh and early part of the twelfth centuries has been called “material essence” realism (Tweedale

1976: 95–111; Erismann 2011). Peter Abelard attributes such a view to his master William of Champaeux and he boasts in his *Historia Calamitatum* that he publicly demolished the view (King 2004; for the arguments he might have used in this disputation, see *Log. Ingr.* I, 10–13 [Spade 1994: 29–33]). Whether Abelard personally brought an end to material essence realism is not absolutely certain. What is clear is that no thirteenth-century philosopher of note embraced material essence realism. However, a more sophisticated version of material essence realism seems to be the considered later position of Walter Burley (ca. 1275–1344) and his followers.

The most popular versions of realism in the Scholastic Period were forms of what scholars describe as “moderate realism.” Moderate realists argued that a nature or essence is only really universal when it is in the mind. In the mind-independent world, the nature is somehow individualized, so that the nature that is in Socrates is not numerically the same as the nature in Plato.

Like Abelard before him, William of Ockham embarked on a systematic attack of all the forms of realism current in his day. He concluded from this exercise that universals had no reality outside of the mind.

Peter Abelard, William of Ockham, and other nominalists tended to point out the metaphysical difficulties that plagued the various forms of realism. They proposed instead that all things are fundamentally particular. Universality is restricted to the realm of concepts or language. But while realists were plagued by metaphysical difficulties – especially difficulties that centered around identity and difference – the nominalists were plagued by epistemological difficulties. Predicating a universal of an individual can only be legitimate if there is some real basis for the predication. Otherwise, as Boethius famously pointed out, predications are “empty” – that is, they convey nothing truthful about reality as such. But by banishing universals to the realm of the mind and language, the nominalists appeared to undermine the foundations of science.

Nominalism and Ontological Reduction

The nominalists’ denial that universals are things and Ockham’s reduction of the categories to substance and quality were both attempts to reduce the number of types of things. (However, it should be noted that the reduction of the categories and antirealism about universals are, and in the Middle Ages were sometimes taken to be, logically independent.)

Ockham’s reductivist program is often associated with his principle of parsimony (“Ockham’s Razor”). But Ockham did not invent this principle (indeed, one can find versions of the principle in Aristotle), nor was he the only philosopher in the thirteenth and fourteenth centuries who made use of the principle. Moreover, the importance of the principle of parsimony is often overestimated. As one commentator observes, no one advocated the postulation of unnecessary entities (Spade 1999: 102). The real dispute was over precisely what entities were necessary.

Much like contemporary forms of antirealism, medieval antirealists tried to determine what words actually pick out things and what words only appear to pick out things (cf. Normore 1985). Sentences that only appeared to commit someone to a certain kind thing were paraphrased into statements that did not commit one to things of this type. So, for example, sentences that seemed to commit one to quantities were transformed into sentences about substances and qualities existing in this or that way.

But some commentators have wondered whether medieval antirealists actually achieved ontological economy. Ockham, for example, seems to have substituted an ontology of modes for one of things. Even if that accusation does not stick (see Adams 1987: 306–310), it still appears that Ockham’s program cannot reduce away objective temporal, spatial, and causal ordering. Yet Ockham insists that these features of reality are not things (Spade 1999: 106–111). Abelard had a similar problem. He insisted that no thing is a universal, and yet universality is grounded in objective “agreements” between individual things (cf. Tweedale

1976: 204–209). Hence, in practice, those with antirealist tendencies often tacitly employed a “two-tiered” ontology (Spade, *op cit.*).

Individuals and Individuation

The corollary of any theory of universals is an account of particulars, or individuals. A full account of individuals would answer a number of questions about the extension and intension of “individual.” It would also include an account of what makes something an individual. Medieval philosophers were not always aware of the need to account for the extension and intension of “individual,” but many of them embarked upon sophisticated investigations of the cause, or principle, of individuation.

The source of the search for a principle of individuation was often a theological controversy. Boethius, for example, considered the question of individuation as an aside to his discussions of the Trinity and the Incarnation. Other philosophers considered individuation in the context of the problem of individuating angels (e.g., Duns Scotus, *Ord.* II, d. 3, part 1).

In his *On the Trinity*, Boethius attempted to demonstrate that the Persons of the Trinity are not numerically distinct from one another (*De trin.* I). Boethius proposed that numerical distinctness is brought about by the inherence of accidents in a substance. Given that God has no accidents, and given that each of the Persons is God, it cannot be the case that the Persons are numerically distinct from one another.

The idea that accidental forms, either the whole set of them or some subset of them (such as spatiotemporal properties), make some thing an individual became part of what one scholar has called “the Standard Theory of Individuality” (Gracia 1984, 1994: 26–28). According to the Standard Theory, (1) individuality is conceived in terms of difference or distinction, (2) the extension of the term “individual” is restricted to Aristotelian primary substances, and (3) the principle of individuation is either due to one or more

accidents or to the collection of all properties (including nonaccidental ones) belonging to the substance. The Standard Theory dominated much of the thinking of the early Middle Ages, although there were some notable exceptions, such as Peter Abelard and Gilbert of Poitiers.

Other medieval thinkers looked for the principle of individuation in either a substantial or a noncategorical component of individuals. A common candidate for a principle of individuation was the individual’s matter. This theory is commonly associated with Aquinas (although see Father Owen’s addendum in Gracia 1994: 188). In the same vein, some medieval thinkers proposed that the matter together with the substantial form of the individual was the principle of individuation. A notable proponent of this view was Bonaventure (Gracia 1994: 141–172).

Sometimes the substantial form alone was considered to be the principle of individuation. For this solution to work, the form itself would have to already be individual. One intriguing version of the notion that an individualized substantial form is the principle of individuation was hinted at by a remark in Boethius’ greater commentary on *De interpretatione* (in *De int.* 2nd edn., II, 137.3–137.16). There Boethius suggested that Socrates is individuated by a personal form, his “Socrateity.” It is not clear what the status of these personal forms is or whether Boethius really thought that these forms were the metaphysical cause of individuality, but it was interpreted this way by some later medieval thinkers.

Duns Scotus held that an individual differentia, or haecceity, is the cause of a thing being the very thing it is (Gracia 1994: 284–291). Given that this haecceity does not affect or alter the formal content of the things nature, it is a noncategorical principle (King 2000: 177–179).

Finally, philosophers such as Peter Abelard, William of Ockham, and John Buridan argued that there is no principle or cause of individuation (Gracia 1994: 373–376 and 397–430; King 2000: 180–183, and King 2004). Everything that exists is already individual. Hence, there is no need to find a cause for their individuality.

Composition, Identity, and Emergence

Another cluster of metaphysical problems focused on the relation at a time between a thing and those items that compose the thing. One such problem was whether the whole is identical to the sum of its parts. Medieval answers to this question were often informed by the Aristotelian principle that there are degrees of unity. Material composites were typically divided into three classes: aggregates, accidental unities, and substances. Aggregates were the weakest sort of unity, since they exist when some things are present in one location. A thing with a greater degree of unity exists when there are some things in one location and these things are arranged in the right way. These arrangements are due either to accidental forms or to substantial forms. Composites of some things and an accidental form are accidental unities; composites of some things and a substantial form are substances. Among material composites, substances were thought to have the greatest degree of unity.

Medieval philosophers generally agreed that an aggregate is identical to the sum of its parts, but there was considerable disagreement when they turned to accidental unities and substances.

Most medieval philosophers thought that artifacts – even complicated ones such as houses – were accidental unities. They disagreed about whether an artifact was identical to the sum of its parts, due in some measure to a disagreement over the ontological status of relations. Those who thought that relations were things could answer that the artifact is not identical to the material out of which it is composed, for the composite has an additional part, the relation, which the sum of the material parts lacks. Those who thought that relations were not things could not make this claim, though there was still a feeling among some that it was improper to reduce the artifact to being merely the sum of its parts. Abelard, for example, thought that arrangements were not things, and hence they could not be parts of things. However, this does not imply that an artifact is identical in every respect to the sum of its parts. An artifact and the parts that compose it are the “same in *essentia* and in number,” but they are “distinct in

property,” because there is something true of the latter, which is not true of the former, and vice versa (cf. *Theologia Christiana* III, § 140: 247–248; King 2004: 89–92).

There were also differences of opinion about the relation of a substance to its substantial parts. Some thought that a material substance is not a sum of two actual, ontologically independent objects (Aquinas *In Metaphys.* VII, lec. 13, n. 1588; cf. Normore 2006: 740–741). Yet others believed that the substantial form and the matter were in some sense independent things, and hence, they had to determine whether the composite is identical to the sum of these two things. Those who answered in the affirmative were in effect offering a reductionistic account of material substance; those who answered in the negative were antireductionists. Antireductionists, such as Duns Scotus, asserted that a numerically distinct object comes to be when the substantial form combines with matter (Cross 1995). Otherwise, he argued, material substances would be nothing more than aggregates or accidental unities. Ockham and Buridan thought that the material substance is nothing more than the sum of its substantial parts, but that this reductionistic account of material substance did not imply that substances are aggregates or accidental unities (Normore 2006: 744–747).

In more general terms, medieval philosophers felt that there were some items that were numerically or really the same thing, yet not entirely identical. This led to an explosion of senses of the terms “same” (*idem*) and “different” (*differens*, or *diversum*) (the preferred terms for medieval discussions of identity). Many of these senses of sameness and difference corresponded to distinctions in the order of things. Hence, Duns Scotus’ famous “formal” and “modal” distinctions were both in the broad sense, real distinctions, even though he reserved the term “real” for a case where *x* and *y* could, at least in principle, exist separately in reality.

The formal and modal distinctions had a number of applications in philosophy and theology. The formal distinction was employed to explain how the essence in itself and the essence in Socrates were related to one another. The modal

distinction had applications in Trinitarian theology. Indeed, the utility of these nonconceptual modes of distinction in theological applications was the primary reason that even ardent critics of the formal and modal distinction, such as Ockham, often conceded that the distinction was useful when trying to come up with a rational account of the Trinity.

Dependence and Persistence

Most medieval philosophers paid lip service to the maxim that the whole is ontologically posterior to its parts (cf. Boethius, *De div.* 879C). Although most, then, duly, restricted this claim to cover only some parts – the essential or principal parts. Very few medieval philosophers flirted with forms of mereological essentialism.

But the occasional philosopher did seem to endorse the thesis that a whole depends upon each one of its parts. Abelard, for example, insisted that every integral whole is composed of a unique set of integral parts (Henry 1991: 92–151). This house must be composed out of these nails, these boards, and this cement. Given that each whole is composed of a unique set of parts, if any part is removed, that whole is destroyed. Another whole similar to the original might exist after the mereological change takes place, but strictly speaking the two wholes would not be identical. Some later medieval nominalists, such as Ockham and Buridan, also argued that even minute mereological changes bring about the destruction of most integral wholes, including nonrational animals (Normore 2006: 751–753; Pasnau 2011: 692–702). According to these nominalists, there are three senses of numerical sameness: there is a proper sense, a less proper sense, and an improper sense. Something is properly the same in number if all its parts remain the same and it neither acquires nor loses any parts. In this strictest of senses, no corruptible thing persists through a change of a material part. Something is less properly the same in number if its “most principal part” remains numerically the same. This is the sense that allows us to claim that Socrates is numerically the same man now as

that man 10 years ago, since Socrates’ intellectual soul persists through the change. Finally, something is improperly the same in number if there is a continuous succession of beings that maintain a similar shape, disposition, and form. This improper mode of numerical sameness allows us to claim that the Nile River here today is numerically the same river as the Nile back in Caesar’s time. The nominalists claimed that plants and animals can only be numerically the same in the third, improper sense, for these creatures do not have the sort of soul that can act as a guarantor of less proper identity.

Time and Necessity

Many of the topics that seemed to most excite medieval thinkers, such as the relation of Providence and Divine Omniscience to human freedom or demonstrations of the existence of God, involved modal notions. Often in the preliminaries of such discussions, one can find rich discussions of the nature of possibility and necessity.

One prevalent conception of modality was closely aligned to a qualified commitment to the so-called Principle of Plenitude – that is, that no real possibility remains unactualized. Medieval thinkers qualified their assumption of the Principle because it was felt that an unrestricted version of the Principle would constrain God’s power and will. Nonetheless, in the natural order of things, it was often assumed that the Principle held. If *A* is a real possibility, then there was, is, or will be some time at which *A* is true. On this conception of modality, modal notions were effectively reduced to extensional terms that were merely means of classifying what happens in this world, the one and only one there is, at different moments of time (Knuuttila 1981: 169). *A* is possible if and only if there is some time at which *A* obtains. *A* is impossible if and only if *A* never obtains. *A* is necessary if and only if *A* always obtains.

While prevalent, especially in the thirteenth century, this “statistical” model of possibility and necessity was not the only model countenanced by medieval thinkers. Anselm, for example, developed a conception of possibility based

upon inherent capacity; necessity properly signified external constraint (Serene 1981). There are some passages in Abelard, which suggest that he did not wholeheartedly embrace the statistical model (cf. *Log. ingr.* II, 272–274). Abelard's followers, the so-called *nominales*, seem to have consciously rejected the statistical model.

Duns Scotus was deeply critical of the statistical model of modality, and in its place, he developed a “synchronic” model of modality. On the statistical model, it was hard to avoid the consequence that every present thing or state-of-affairs was necessary. This followed from the fact that actualizing a potentiality takes time. If *a* is actually *F* at *t*, then in order to make it so that *a* is not *F*, *a*'s potentiality to become not *F* must be actualized. But if a potentiality takes time to actualize, it follows that given that *a* is *F* at *t*, *a* cannot be not *F* at *t*. Scotus, on the other hand, argued that even though *a* is actually *F* at *t*, *a* could be not *F* at *t*.

Scotus' position was not without precedent. The twelfth-century philosopher Gilbert of Poitiers, for example, also thought that there were synchronic alternative possibilities (Knuuttila 1993: 75–82). Yet Scotus presented a distinctively sophisticated articulation and forceful defense of the doctrine that the present could have been different than it in fact is. His synchronic picture of modality had a tremendous influence on the development of theories of modality in the fourteenth century and onward.

Scotus is sometimes credited with anticipating the notion of a possible world, either in the sense that Leibniz had or in the late-twentieth-century sense of the notion. While Scotus does not use the term “possible world” or any equivalent, he does defend the idea that God considers all compossible combinations of things and contingently wills that one of these maximally consistent composites of things be made true. However, Scotus did not believe, as Leibniz did, that objects mirror their whole universe, nor did he have the contemporary notion of “truth in a world” (Normore 2003: 155).

Scotus' synchronic conception of modality should perhaps be described as the doctrine of “the contingency of what has not passed into the

past” (Normore 2003: 135), for like many medieval thinkers, Scotus accepted the claim that the past is necessary. This latter proposition, however, was not universally held in the middle ages. In the twelfth century, for instance, Peter Damian famously defended the claim that God's will is absolutely unconstrained. This meant that God could even change the past. But given that Damian started with a statistical understanding of modality, his position implied that God could violate the laws of logic. A popular solution to this dilemma was that God could not do impossible things; to be able to do the impossible would be a sign of impotency, not power. Peter Abelard, notoriously, argued that God could not do anything more or other than what He in fact does (*Theologia “Scholarium”* III, §§ 27–60: 511–526; Marenbon 2013: chapters 2 and 4).

More generally, medieval thinkers tried to strike the right balance between God's power, God's will, and human freedom. God must be the necessary, first cause of all creations, but the manner in which God's creative activity is necessary cannot be such that it either compromises God's very own freedom or human freedom.

Conclusion

Medieval metaphysicians were preoccupied with a variety of issues, many of which are still of interest to contemporary philosophers. This survey can only hint at the richness and sophistication of this tradition.

There are some current focal points of debate that have no direct medieval correlate. In general, medieval thinkers were realists about relations between causes and their effects – although, there were some who were skeptical of the necessary connection between cause and effect (most notably, al-Ġazālī and the Ash'arite *mutakallimūn* in the Arabic speaking world, and Nicholas of Autrecourt in fourteenth-century Europe). And no medieval philosopher was a thoroughgoing materialist or opponent of abstract objects.

This article did not dwell upon medieval discussions of time, space, and to some degree

change, because these topics lied outside the scope of metaphysics as it was traditionally conceived. Nevertheless, this should not suggest that medieval philosophers had nothing to contribute to the study of these topics. It should also be emphasized that many medieval treatments of what we now consider to be metaphysical subjects can be found in not only the physical treatises but also in logic and doctrinal discussions (such as treatments of the Eucharist and the Trinity).

Metaphysics, Byzantine

John A. Demetracopoulos

Department of Education, University of Patras,
Patras, Greece

Abstract

There is no agreement on whether metaphysics proper did exist in Byzantium or, if so, in what it consists. Religion and theology covered officially the realm previously occupied by

philosophy. Still, some room was available for discussing some special questions, the principal among them being the ontological status of “universals,” the structure of the divine being, and the way the sensible beings derive their existence and qualities from the first principle. Many Byzantines from the eleventh to fifteenth centuries, posing themselves in the Platonic tradition, seem to elaborate Ammonius’ doctrine of “universals,” whereas few subscribed to a less “realist” theory. An extra-realist theory was propounded in the first half of the fourteenth century by Gregory Palamas, who projected the multiplicity of the types of the created beings to an inferior divine level, that is, to God’s “energies” construed as naturally emanating from God’s transcendental “essence.” Palamites in the latter half of the fourteenth century polished the harshness of this distinction by qualifying that it is “conceptual,” that is, points just to different aspects of a single being, whereas anti-Palamites argued against any sort of real distinction between God’s essence and acts. In the first half of the fifteenth century, a metaphysical quarrel between Scholarios’ Thomism and Plethon’s anti-Christian Platonism focused on whether things derive hierarchically from each other (Plethon) or each is created directly from God and used by Him as a “*causa proxima*” of this or that fact. To get a better picture of metaphysics in Byzantium, a lot of work has still to be done.

Byzantine Metaphysics: *Ens Reale* or *Fictum*?

If by “metaphysics” we mean the systematic “investigation into the nature of reality” or the rational attempt to “uncover what is ultimately real,” it may be argued that metaphysics did not exist in Byzantium. Indeed, since almost all Byzantine thinkers were officially Christians and produced more theological than philosophical writings, their quest for the ultimate source of reality came full circle from its very beginning. For, in their minds, the ancient Greek (and

Roman) “reasoned knowledge” (*epistêmê*) and “wisdom” (*sophia*), accessible through “reason” (*logos*) or, at least, not without it, were substituted by “religious faith” (*pistis*) in Revelation (*apokalypsis*), and, as a result, metaphysics and philosophy in general were substituted by theology, that is, the theoretical elaboration of Christian religion. (This reservation is often kept for the philosophical character of Christian thought in its entirety.)

Further, it has been argued that Byzantine thought failed to do even what its western counterpart is, by some (e.g., É. Gilson) optimistically, supposed to have achieved, that is, to produce some philosophical ideas (such as those by Thomas Aquinas, Bonaventure, and Duns Scotus) stimulated by the philosophically unqualified yet potentially fruitful content of Christian Revelation. This seems to a large extent true. Indeed, in the context of these two roughly contemporary Christian civilizations, speculative thought has emerged and developed in different ways. In Europe, Medieval intellectual life succeeded a state of decline bordering on collapse (fifth to seventh centuries) and went on by constantly being stirred up by waves (ninth to thirteenth centuries) of acquaintance with several previously unknown individual pieces or bulks of philosophical, scientific, and theological literature through Latin translations (Greek Patristic authors, parts of the *corpus Aristotelicum* accompanied by some ancient Greek and Latin as well as Byzantine commentaries on them, Arabic treatises and commentaries on Aristotle, works by Jewish authors, Neoplatonic texts), which provoked Christians to deal with them as well as with the way other Christians were dealing with them. Byzantium, on the contrary, exhibits strong marks of continuity with the intellectual life of Late Antiquity (even though, admittedly, not with its highest figures), and the development of its own intellectual life enjoyed a relative stability, which was nominally and positively called “tradition” and usually resulted in repetition.

Further, most of the Greek Fathers of the Church, whose thought was normative for most of the Byzantine intellectuals, though well acquainted with most aspects of Middle Platonism

and some strands of Neoplatonism, had a predilection for the “apophatic” aspect of these trends. And, in contrast with them, where this aspect acquired metaphysical sense in terms of its being the result of a philosophical investigation where “reason” normally played a central role (though tending to show a way of superseding itself), Greek Patristic thought integrated apophaticism into the context of the Christian belief in the Biblical God whose personal way of act cut off any possibility of constructing a metaphysical concept of Him.

Notwithstanding this discouraging context, however, some texts of Byzantine philosophy do testify to the raise of some specific metaphysical questions, whose fundamental character (philosophy or theology?) still remains to be patiently detected and soberly assessed.

Special Topics of Byzantine Metaphysics

The Ontological Status of “Universals”

Byzantines inherited from the opening paragraph of a famous text of Late Antiquity, Porphyry’s *Isagoge* (late third century), and from the ancient Greek Neoplatonic commentaries on it (by Ammonius, Elias, and David; fifth to sixth centuries) as well as on Aristotle’s *Categories* (by John Philoponus; sixth century) and from the *Prolegomena* (by Olympiodorus; sixth century) a question that later on proved of paramount importance for many philosophers in the twelfth, thirteenth, and fourteenth centuries in Europe, that is, the question of the ontological status of the “universals.” Do “universals” exist in extramental reality or are they just concepts (*epinoiai*) in our minds? And, if the former, are they corporeal or incorporeal? And, if the latter, do they exist independently from the sensible beings or just inhere in them? In the ninth century, when Byzantine philosophy proper begins, Photios, Patriarch of Constantinople, subscribes to a conceptualist stand, which is very close to (if not identical with) the Stoic doctrine, by explicitly stating that the universals are “bodies” or “corporeal” (*Amphilochia*, 77). Photios argues against the Platonic “ideas” by using Aristotle’s famous “third man” argument

as well as the argument that an intelligible reality, such as a Platonic “Idea,” is by nature unable to account for the identity of two or more sensible realities. True, Photios describes the Platonic “Ideas” as a threat to God’s omnipotence, conceived as His freedom to create the world according to His own will only, without any constraint by this or that “exemplary form” potentially existent independently from His will. Further, his arguments are not original. Still, it is Photios himself who distinguishes the philosophical arguments against the Platonic “Ideas” from the theological ones; and he seems to have investigated the question at stake in depth, insofar as he not only understood Aristotle’s disagreement with Plato but also detected from some indirect sources what the Stoics held on the question and voted for it.

In the second half of the eleventh century, John Italos and Eustratios of Nicaea, in the context of the revival of the Platonic tradition by Michael Psellos, seem to have been interested in the problem of the ontological status of universals and elaborated some version of Ammonius’ and Proclus’ relevant doctrines. It is not, however, quite clear whether they did adhere to some metaphysical tenets or, following Psellos’ policy, they just discussed the problem in the context of their teaching activity for learning purposes. Further, it is not quite clear if their application of some ancient doctrines of the “universals” on some strictly theological (Christological and Trinitarian) matters allows for extracting from this context some lines of argument, taking them at their face value, and drawing the conclusion that Italos and Eustratios held this or that metaphysical doctrine.

In the late thirteenth century, a fierce attack on the “universals” was launched by Nikephoros Choumnos, who rejected not only Plato’s “Ideas” but also Aristotle’s immanent “forms” (*On Matter and Forms*, 242–316). True, Choumnos’ purpose was to exalt God’s power as the absolutely sufficient cause of the world’s existence and form; still, his description of the way God’s power acts is very close to that offered by Plotinus in *Ennead* II, 2, 1–2. Likewise, in the second half of the fourteenth century, Nicholas

Kabasilas, being a strict Aristotelian with no Neoplatonic affinities, claimed that no being whatsoever can be regarded as a model of any other than itself; in so stating, he cut off any metaphysical tie between God and the created beings.

Yet, cases like that of Photios, Choumnos, and Kabasilas were exceptions; during the second Byzantine revival of Platonism (second half of thirteenth century to middle fifteenth century), Ammonius' doctrine of "universals" as existing "before the many," "in the many," and "after the many" was typical, even though thinkers like Nikephoros Blemmydes, George Pachymeres (fourteenth century), Theodore Metochites (thirteenth to fourteenth centuries), Nikephoros Gregoras, Barlaam of Calabria, and Gregory Palamas (fourteenth century) added each of their own epistemological nuances.

The Structure of the Divine Being

A question closely connected with that of the "universals" was how to explain the production of a multiplicity by the highest level of unity, which is God. Most of the abovementioned thinkers placed the "universals before the many" in God's mind (an idea traced back to Middle Platonism, if not, *mutatis mutandis*, to ancient Stoicism). This solution, however, explains the multiplicity of the created beings away just by transposing multiplicity to the realm of God. In the first half of the fourteenth century (either in connection with the history of the Byzantine treatments of the question of the "universals" or not), Gregory Palamas, a monastic figure well trained in ancient Greek philosophy, formulated (probably inspired by Proclus) a peculiar doctrine of God as consisting of two levels, that is, essence (*ousia*), which is absolutely simple and totally unknown, and His eternal "energy" (*energeia*), which is participated by the created beings, the difference between these levels being not only more real than the merely conceptual rank of a logical relation but also no less than "infinite" (*Triads* III, 2, 8). Arguing that these levels are discernible not only in God but in every being, as well as that for all the real difference between these levels, God's being is nevertheless "one," Palamas believed that his doctrine did not clash

with God's simplicity. He also distinguished between the various "acts" themselves and identified God's "eternal and without beginning acts" with the "reasons of beings," which preexist eternally in God's mind and according to which the world was created (*Triads* III, 2, 24). Palamas' opponents, such as Gregoras, who was inspired by Christian and pagan Neoplatonism, as well as John Kyparissiotes, Demetrios Kydones, Prochoros Kydones, and Manuel Kalekas, who were inspired by Thomas Aquinas and Boethius, too, rejected any sort of *distinctio realis* in God. Palamas' adherents, such as Neilos Kabasilas, Philotheos Kokkinos, Theophanes of Nicaea (second half of fourteenth century), and Markos Eugenikos (first half of fifteenth century), restated Palamas' doctrine by describing his distinctions as drawn by the human mind (*kat' epinoian*), that is, as not implying any sort of separation between God's "essence" and "energy." And John VI Kantakouzenos (middle fourteenth century), influenced by Thomas Aquinas, regarded them as true only *ex parte subjecti*, that is, in the sense that our mind, since it is composite in this life, cannot help grasping the absolutely simple God in terms of multiplicity. Yet, all Palamites insisted, like Palamas himself (e.g., *Triads* III, 1, 24), that all beings, whether created or uncreated, consist not only of essence but also of act.

In the first half of the fifteenth century, George Scholarios – Gennadios II subscribed to John Duns Scotus' *distinctio formalis* (archetypal distinction between God's various properties, notwithstanding their absolute unity), which he found to be very close to that of Palamas.

Palamas' thought is also characterized by a peculiar doctrine of "light," which may be deemed metaphysical. According to him, the stuff of the "rational beings," that is, of God, angels, and the human mind, is "light" or, at least, beings of this sort manifest themselves and are perceived as light (*Triads* I, 3, 8).

In Late Byzantium, Augustine's doctrine (*De trinitate* V-VII) of the inapplicability of Aristotle's ten Categories on God found a place in the thought of authors such as Barlaam of Calabria and Gregory Palamas. It is not clear, however, if this testifies to an interest in

metaphysical matters proper or forms part of a principally theological discussion.

Mediated Versus Direct Derivation of Beings from the First Principle (Plethon Versus Scholarios)

In the middle of fifteenth century, a strong quarrel between George Gemistos (or, as he called himself, “Plethon”), the only pagan Byzantine thinker, who adhered to Platonism and rejected the idea that Aristotle can be reconciled with Plato, and George Scholarios – Gennadios II – who defended Christianity in terms of his professed Thomism, took place. Plethon accused Aristotle of having an “atheistic” conception of nature. He rejected Aristotle’s doctrine of “entelechy” as the metaphysical principle immanently present in everything, causing the transition from “potentiality” to “actuality” and bringing about the perfect “form” of any particular being. In his own metaphysics, he postulates a hierarchy of beings, each of them responsible for the existence and the qualities of its inferior. Instead, therefore, of Aristotle’s supposed self-actualization (*energeia* in the sense of “entelechy,” that is, being *energês*) of a being, Plethon spoke of *energia* as the productive action of every being, that is, as its being “efficacious” (*energon*) and bringing about its proximate being. Scholarios, for his own part, replied by setting forth Aquinas’ doctrine of *causa remota* and *causae proximae*, each of the latter ones being directly dependent on the former and producing not beings, as in Plethon’s system, but just effects in virtue of their nature as created and “predestinated” by God. To Scholarios, Aristotle’s metaphysics of “forms” fitted better with Christianity, because of Aristotle’s idea that each “form” is an autonomous cause (even though they all depend on the “first mover” or “first cause,” God). A peculiar feature of Plethon’s metaphysics, which contrasts both with Christianity and ancient Platonism, is that it is absolutely “cataphatic.”

A Metaphysics of Icons?

Byzantine metaphysics has sometimes been sought for in a field principally theological, that is, the quarrel between adorers and enemies of the

holy icons (eighth to ninth centuries). It has been argued that the idea of the defenders of the icons, such as John of Damascus and Theodore the Studite, that a material being such as an icon can reflect the high qualities of a divine being, that is, Jesus Christ, implies a close and positive relation between God as the archetypal being and the sensible world as the realm of derivative beings, in contrast with what is the case in the Platonic bipolar ontology, where the sensible world is just a dull reflection of the real one, that is, the intelligible, whence it derives. This interpretation, apart from the fact that it does not take into account the monistic aspect of Neoplatonism, which, in virtue of its ramification of things, brings images close to realities, argues for the similarity of the sensible with the intelligible realm not from the qualities of the former itself but from a specific sort of sensible beings, that is, the artificial objects, and, more specifically, the religious ones. Thus, it fails to show that a metaphysical doctrine really lies there, since the similarity spoken of by the adorers of the icons does not regard the material aspect of icons but their content, which is incarnation and its effects, and hence has no natural relation or necessary links with the intelligible realm.

Another topic of Byzantine metaphysics, which remains unexplored, has to do with the question of the priority of “one” over “being” or vice versa in the divine realm. This question was posed, for example, by Michael Psellos (*Philosophica minora*, 7), in the context of his predilection for Platonism and by Demetrios Kydones in the context of his subscription to Thomas Aquinas’ doctrine of the four “transcendentals.”

Further discussion on Byzantine metaphysics would probably endanger going far away from what research has as yet established.

Michael of Ephesus

Katerina Ierodiakonou

Department of Philosophy and History of

Science, University of Athens, Athens, Greece

Department of Philosophy, University of Geneva, Geneva, Switzerland

Abstract

Michael of Ephesus most probably belonged to the twelfth-century intellectual circle around Anna Komnene and took part in her project to produce commentaries on Aristotle's writings. His work on Aristotle's ethics, logic, metaphysics, and biology was instrumental in the revival of Aristotelian studies in Byzantium but also in the transmission and rediscovery of Aristotelian thought in the Latin West.

Biography

We know next to nothing about Michael of Ephesus' life. His dates have been disputed, but at least we can now say with confidence, thanks to Browning's and Ebbesen's research, that he lived not in the eleventh century, as Praechter had argued, but in the twelfth century, and moreover that he most probably, together with Eustratios of Nicaea, belonged to Anna Komnene's circle of intellectuals, which had the task to produce commentaries on Aristotle's works. According to a twelfth-century source, he is said to have complained that his eyesight was spoiled because he had to work through the night to comply with Anna Komnene's wishes. It still remains unsettled, however, whether he wrote his commentaries only while he was working under Anna or whether he commented on Aristotle's treatises also before and after this period.

Thought

Michael's breadth as an Aristotelian commentator is remarkable. He could justifiably be compared to

Alexander of Aphrodisias both in respect of his mode of exposition and in respect of his method of interpretation; besides, some of his comments were initially edited under Alexander's name. He wrote commentaries on the fifth, ninth, and tenth book of the *Nicomachean Ethics*; in fact, it has been plausibly suggested that it was he who compiled this commentary, bringing together the comments of Aspasius, Eustratios, and two anonymous commentators. He also commented on *Metaphysics* 7–14 and on the *Sophistical Refutations* (both wrongly attributed to Alexander), on the *Parva naturalia*, on the *Generation of Animals* (wrongly attributed to Philoponus), on the *Parts of Animals*, on the *Movement of Animals*, and on the *Progression of Animals*. Finally, he wrote comments on the pseudo-Aristotelian treatise *De coloribus*, which are still unedited, and on the *Politics*, which have only partly survived. His commentaries seem to have been widely read, since his very words often appear in Byzantine commentaries and paraphrases from the thirteenth to the fifteenth century. Moreover, his comments on the *Nicomachean Ethics* were translated in 1246/1247 by Robert Grosseteste and became very influential in the West through the agency of Albert the Great.

Michael's commentaries are of historical interest, because they contain remarks about the contemporary political situation; for instance, there are sometimes critical remarks about the emperor as well as discussions of the contemporary educational system. Most importantly, though, his comments, especially those on Aristotelian treatises for which no other commentary has survived, are treasures of information for the history of philosophy, even if the interpretations suggested were not his own. Zervos has pointed out the Platonic influences on Michael; Praechter has contrasted Michael of Ephesus, the Aristotelian, with Michael Psellos, the Platonist; Preus has claimed that Michael tries to stay as close as possible to the spirit of Aristotle; Mercken has suggested that Michael's Aristotelianism is never a militant one. It seems, therefore, that modern scholars have moved from regarding Michael as a Platonist to

regarding him as an Aristotelian, even if not a militant one. But perhaps it is rather difficult to put a specific label to Michael. He is a commentator of Aristotle and thinks that Aristotle's work is significant, so when he ventures to explain it, he stays close to Aristotle's spirit. This does not mean, however, that he agrees with Aristotle in everything; he often follows Plato, Plotinus, and the Neoplatonists or other ancient thinkers, like Galen.

Besides, as a Christian commentator, it seems important to him at places not to adhere uncritically to an Aristotelian, Platonic, or other ancient viewpoint. For example, the way he discusses the notion of *eudaimonia* indicates that his reading of Aristotle's text is not close to Aristotle's spirit but is rather an interpretation influenced by different traditions; Neoplatonism is certainly one, but Christianity is also present. According to Michael, there are two kinds of *eudaimonia*, namely, the theoretical *eudaimonia* and the political or practical *eudaimonia*; the person who has the ethical or practical or political virtues achieves political *eudaimonia*, whereas the person who has both the political and the theoretical virtues achieves theoretical *eudaimonia*. In other words, political *eudaimonia* is an imperfect kind of *eudaimonia*, whereas theoretical *eudaimonia* is the only perfect *eudaimonia* the virtuous person can have. But to this Platonist account of *eudaimonia*, and in particular to the notion of theoretical *eudaimonia*, Michael adds a further feature; he claims that, apart from being perfect, the most pleasant, continuous, chosen for itself, and self-sufficient feature of theoretical *eudaimonia* is that there is no need for regret and repentance (*metameleia/metanoia*) in this state. Aristotle does not characterize the life of contemplation in these terms nor do the Platonists stress such a characteristic of *eudaimonia*; on the other hand, both the notion of regret and that of repentance are very much part of the Christian outlook.

Michael of Massa

Russell L. Friedman

Institute of Philosophy, De Wulf-Mansion Centre for Ancient, Medieval and Renaissance Philosophy, Katholieke Universiteit Leuven, Leuven, Belgium

Abstract

Michael of Massa (d. 1337) was an Augustinian Hermit active in Paris (and elsewhere) in the 1320s and 1330s. His voluminous philosophical writings are nearly totally unpublished, but the studies of his thought to date show a keen mind and a characteristic approach to philosophical and theological challenges. In the domain of divine foreknowledge and future contingents, Michael passed on to Gregory of Rimini the criticism leveled by Francis of Marchia at Peter Auriol. If this example is representative, then Michael had an important role in the development of Parisian thought in the second quarter of the fourteenth century.

Michael of Massa is something of an enigma and in several ways. He is certainly an enigma when it comes to his biography. We know that he was born in the region near Siena in Italy. He joined the Augustinian Hermits and was *definitior* at the Augustinian General Chapter held in Venice in 1332; he died, probably in Paris, in 1337. He never obtained the master's degree in theology, but recent research supports the position that he held lectures on the *Sentences* at Paris in the early 1330s (although they could have taken place anywhere from 1326 to 1337) while arguing that Michael's extant commentary on book I of the *Sentences* may date from c. 1324 (Courtenay 1995, p. 204; Schabel 1998, pp. 168–171; Schabel and Courtenay 2007, p. 567) and at least the parts of the extant commentary on book II of the *Sentences* that contain explicit criticism of William Ockham's ontological and physical ideas date from the mid- to late 1330s, on the cusp of a heated discussion at Paris of aspects of Ockham's thought (Courtenay 1995). This is basically all we know or can surmise about Michael's curriculum vitae.

Michael is an enigma in a second way: although he has received high marks for his intelligence and importance from the few scholars who have studied his work – Albert Lang (1930, p. 130) called Michael “an extremely gifted and prolific theologian” (ein äußerst begabter und fruchtreicher Theologe), and William J. Courtenay (1995, p. 191) has written that Michael's “*Quaestiones in Sententias* remains one of the richest unedited and, for the most part, unstudied texts of the fourteenth century” – nevertheless we continue to know very little about his ideas. This is in part because his most important philosophical and theological work, his commentaries on the first and the second books of Peter Lombard's *Sentences*, is enormous (some 900 folio pages) and nearly totally unedited. Parts of Michael's commentary on book I of the *Sentences* survive in three manuscripts (Bologna, Biblioteca Universitaria 2214 = Prol.-d.38,q.2; Bologna, Collegio di Spagna 40 = Prol.-d.1,q.9 and d.27, q.3-d. 38,q.2; Napoli, Biblioteca Nazionale VII. C.1 = Prol.-d.8); the work was abbreviated twice in the fifteenth century, these two abbreviations

each existing in two manuscripts (Andrea de Mediolano's in Firenze, Biblioteca Nazionale C. 8. 794 and Oxford, Bodleian, Canonici Misc. 276; Johannes de Marliano's in Bergamo, Γ 3. 21 and Pavia, Università 226). Michael's book II of the *Sentences* is found in a single manuscript (Vatican, Vat. lat. 1087), where it is anonymous; the text is clearly a composite made up of several large treatments of predominately philosophical issues (e.g., creation, the instant, duration, time, eternity, the continuum, cognitive species) added to a truncated but more traditional commentary on dd. 1–2 of book II of the *Sentences*, which Damasus Trapp dubbed the *Opus ordinarium* (for a list of the questions found in Michael's book I and II of the *Sentences*, see Trapp 1965). In a section of his book II of the *Sentences* dealing with motion, Michael makes what is probably the earliest reference at Paris to “Ockhamists” (*Occamistae*) who were teaching that motion is merely a description of the thing that is said to move, having no reality of its own; Michael, approaching the question from the point of view of physics and not of semantics, rejects the Ockhamists' position (Courtenay 2003). In addition, in his book II of the *Sentences* Michael appears to attack William Ockham by name in the process of rejecting several aspects of Ockham's program of ontological parsimony, like the elimination of an independent category of quantity (Hödl 1975, pp. 245–252).

Michael is an enigma in yet a third way, and this stems almost directly from the fact that we know so little about his thought: we have as yet no clear view of where he fits into later medieval intellectual history. The modern pioneer in the study of the thought of the Augustinian Hermits, Damasus Trapp, believed (Trapp 1956, pp. 163–175) that Michael was a representative of a dying intellectual movement in the Augustinian order, that of the “ultra-Aegidianists,” theologians who took the ideas of the order's teaching doctor, Giles of Rome, to extraordinary lengths. Ultra-Aegidians like Michael, according to Trapp, were opposed by more traditional Aegidians among the Augustinian Hermits, men like Gerard of Siena and Thomas of Strasbourg. For Trapp, the victorious traditional Aegidians denied Michael the doctorate and effectively buried his

thought and even his name. More recent research has begun to modify this view in significant ways. First, Schabel's and Courtenay's suggestion that Michael read the *Sentences* in the early 1330s has the effect of removing anything suspicious about the fact that Michael never received the doctorate: it was quite common for Augustinian Hermits to wait many years between finishing their *Sentences* lectures at Paris and being awarded the doctorate, and Michael simply died before that long waiting period was up. Second, in the few recent studies of Michael's thought (Friedman 2012; Schabel 1998, p. 168; 2002, pp. 251–252), no trace is found of ultra-Aegidianism (however that might be defined), and indeed faithfulness to Giles' doctrine does not seem to be a major issue. Michael rejects, for example, Giles' famous position concerning the real distinction between essence and existence, opting instead for a purely psychological distinction based on conceiving the same thing in two different ways, statically (*per modum stantis* = as essence) or "flowingly" (*per modum fluentis* = as existence) (Hödl 1975, pp. 240–245).

A new picture of Michael's place in later medieval thought is emerging from the area upon which he has been studied most intensely: future contingents and divine foreknowledge. Schabel (1998; 2000, pp. esp. 214–220) has shown that Michael expands upon and clarifies not only the criticism that the Franciscan Francis of Marchia had made of the ideas of Peter Auriol but also Francis' own view, even though Michael does not mention that Francis is the source of much of his position. Michael follows Francis in his rejection of Auriol's views that propositions about the future are neither true nor false and that, strictly speaking, God does not know the future as future. Auriol postulated both of these views in order to preserve human free will from any sort of determinism. As part of his response to Auriol's views, Michael accepts Francis' position that the natural world is, strictly speaking, fully determined: the only sources of contingency in the world are God, angels, and human beings. Moreover, Michael accepts from Francis the distinction between two types of "indetermination": an indetermination about the possible (*de possibili*) and an

indetermination about what inheres in reality (*de inesse*). The former is the innate indetermination of the human will by which the will is fully free and contingent; the latter is a lack of determination with respect to bringing some particular thing or action about. For both Francis and Michael, a *determination* toward bringing some particular action about (i.e., a *determinatio de inesse*) is fully compatible with the absolute freedom of the will (i.e., the will's *indeterminatio de possibili*), and in fact that type of determination is required in order for the will to bring about any particular action at all. Thus, in order for our will to bring about a particular action, it must be both fully contingent and qualifiedly determined toward that action. In adopting this position, Michael of Massa was Francis of Marchia's "truest follower on the subject of divine foreknowledge" (Schabel 2000, p. 214). With that said, Michael's treatment is both longer and at times more clear than Francis'. Moreover, parts of Michael's treatment of these issues are significantly different from Francis' treatment, and based on these differences a compelling argument can be made that Michael's treatment influenced Gregory of Rimini's rejection of Auriol as well as Gregory's own positive theory. The picture of Michael of Massa's historical significance that emerges from this example is that he served as a link between Francis of Marchia's innovative response to Peter Auriol's ideas, on the one hand, and Gregory of Rimini's, on the other, and in so doing Michael "may be a key figure in the Augustinian movement away from Dominican-oriented theology and toward the Franciscans" (Schabel 2000, p. 220). It should be noted that also in the area of trinitarian theology, Michael clearly adopted some of Francis of Marchia's ideas, although definitely not slavishly so. Here, as elsewhere, Michael exhibits his own theological and philosophical "style" (Friedman 2013, Chap. 12, Sect. 3).

Another area of Michael's philosophical thought that has received some attention is his views on human intellectual cognition. Michael accepts the important later medieval distinction between intuitive and abstractive cognition, adding to that basic division a further type that

he calls “deductive” cognition (Tachau 1988, pp. 321–322, 332–333; Friedman [forthcoming](#)). Further, Michael holds that the intellect’s first object in terms of generation, i.e., what first moves the intellect to its act, is the extramental singular. In arguing for this view, Michael employs a basic parallelism between the senses and the intellect, claiming that what first moves the senses must also first move the intellect and specifically arguing that singular accidents – e.g., this white patch – are what first move our intellect. The intellectual knowledge we get on this basis is as imperfect as it can be, it is completely unprocessed, and it requires the power of the agent intellect through a process of “abstraction” to refine this initial intellectual knowledge, categorizing it and making it useful in further intellectual activity (Friedman 2012). This view of Michael’s appears to be a part of a conceptualistic tendency to emphasize the singular in both ontology and epistemology, since the singular as singular is the foundation of all our knowledge, although, as mentioned, Michael rejects the parsimonious ontology often associated with “nominalism” that denies motion some reality of its own and eliminates quantity as a separate category. Also of note is that in arriving at his own view on the object of the human intellect, Michael uses without direct attribution the words and ideas of the Dominican theologian Hervaeus Natalis while modifying the Dominican’s conclusions (Friedman 2012, pp. 444–447).

As the above indicates, Michael critically discussed the views of a good number of later medieval university thinkers, principal among them being Gerard of Siena, Peter Auriol, John Duns Scotus, Henry of Ghent, Thomas Aquinas, and Durand of St. Pourçain (on one of Michael’s critiques of Durand, see Friedman and Jeschke 2017). Michael’s use of Francis of Marchia’s ideas without acknowledging his source shows that further research may uncover other influences on Michael. That Michael’s thought had an impact on his contemporaries is shown by the example of Gregory of Rimini (who also cited Michael in other contexts) as well as by that of the Augustinian Hermit Alphonsus Vargas of Toledo who in his own *Sentences* commentary mentioned Michael no fewer than 15 times (Trapp 1956, p. 221). Further, the existence of two separate

fifteenth-century abbreviations of Michael’s book I of the *Sentences* shows that he was being read into the next century. But, again as the example of Gregory of Rimini shows, we will only have a full reckoning of Michael of Massa’s influence when we have made available in print and have studied much more of his work, in the process determining his role in the intellectual development of his religious order and of the fourteenth century as a whole. It seems likely that his role will have been an important one.

Michael Psellos

Katerina Ierodiakonou

Department of Philosophy and History of

Science, University of Athens, Athens, Greece

Department of Philosophy, University of Geneva,
Geneva, Switzerland

Abstract

Michael Psellos was one of the most erudite and prolific thinkers of the Byzantine Middle Ages. His works include historical writings; philosophical treatises and commentaries; theological writings; poems; speeches; legal, geographical, military, and medical works; as well as works on music. Psellos taught all branches of philosophy, by closely reading and commenting on the works of ancient philosophers and especially on Aristotle's logical treatises. At the same time, he had a strong preference for Plato and the Neoplatonists, and especially for Proclus, whom he considered as an authority among ancient authors. Psellos may not have been an innovator, but he systematically tried to reconcile the Christian dogma with the ancient philosophical traditions. In his attempts to advance philosophical learning, he was often attacked concerning his theological orthodoxy, so that he often had to be careful to distance himself from heretical doctrines.

Biography

Psellos' baptismal name was Constantine, but he is better known by his monastic name Michael. He was born in Constantinople in 1018 and died sometime around 1076. He studied under John Mauropous, and among his fellow students were the future patriarchs John Xiphilinos and

Constantine III Leichoudes as well as the later emperor Constantine X Doukas. Psellos worked in civil administration under Constantine IX Monomachos (1042–1055) and was given the honorary title “Consul of the Philosophers” as the head of the school of philosophy in Constantinople. In 1054 he had to resign for political reasons and took the monastic habit at the Olympus monastery at Bithynia. He soon returned to Constantinople, but he never again played an important role in politics, though he remained most of his life as a court intellectual. There is no reliable information about his later years.

Psellos was a polymath and extremely prolific. His works include historical writings, of which the most important is the *Chronographia*, a history of the years 976–1078, which places more emphasis on portraits of characters than on political events. He also wrote another shorter historical text in the form of a world chronicle, *Historia syntomos*, philosophical treatises and commentaries, theological writings, poems, legal, geographical, military, and medical works as well as works on music. His speeches are famous as examples of rhetorical style (his best known panegyrics are on John Xiphilinos and on his own mother). Finally, a collection of about 500 letters is also extant.

Thought

Psellos taught all branches of philosophy (i.e., logic, natural philosophy, and metaphysics). He was undoubtedly among the most prominent scholars of the eleventh and twelfth centuries and greatly contributed to the revival of philosophical studies in Byzantium. In particular, he provided philosophical instructions by closely reading and commenting on the works of ancient philosophers, and especially on Aristotle’s logical treatises, which he thought should be given a propaedeutic role as a necessary preparation for dealing with more philosophical issues but also as an intellectual exercise which enables one to dispose off heretical views. Thus, Psellos commented on and paraphrased treatises from

the Aristotelian *Organon* (*Categories*, *De interpretatione*, *Prior Analytics*). The commentary on Aristotle’s *Physics* attributed to him in some manuscripts has recently been argued to be the work of George Pachymeres. Moreover, Psellos wrote a large number of short treatises discussing particular philosophical issues raised, in part at least, by his pupils, for instance, the distinction between homonyms and synonyms, the characteristic of substance as self-existent, the Platonic Forms, the unity of the soul and the body, the problem of evil, and dreams. He also compiled a short encyclopedia with the title *De omnifaria doctrina*, a set of brief outlines of various notions in philosophy, science, and theology. Many of the works attributed to him are spurious, for example, the so-called *De daemonibus*.

Although the amount of attention he paid on Aristotle’s treatises was significant, there is no doubt that Psellos had a strong preference for Plato and the Neoplatonists. His works show that he carefully read Plotinus, Porphyry, Iamblichus, and especially Proclus, whom he considered as an authority among ancient authors. He also had a close familiarity with most of the Greek commentators, whom he treated as helpful guides to the works of Plato and Aristotle, and drew extensively from them, for instance, Alexander of Aphrodisias, Ammonius, Philoponus, and Olympiodorus. In general, Psellos was well acquainted with the whole corpus of Greek philosophy, which at the time was somewhat larger than it is now, since he read and used some works which have since disappeared, for example, Proclus’ *Commentary on Plotinus*, his *Commentary on the Chaldaean Oracles*, Iamblichus’ *On Pythagoreanism* V–VII, and most probably other works which have not yet been identified.

In his philosophical views, Psellos may not have been an innovator, but he systematically tried to reconcile the Christian dogma with the ancient philosophical traditions. This at times required some independent thinking on his part, in the form of a slightly different argument from those found in the ancient texts or some interesting additions to already established views. But

there is certainly little evidence to support the view that he was a revolutionary or a cultural extremist in renouncing Christianity in favor of Hellenism. It is true, though, that in his attempts to advance philosophical learning, he was often attacked concerning his theological orthodoxy, so that he often had to be careful to distance himself from heretical doctrines, for example, in his writings on the *Chaldaean Oracles*. Thus, Psellos was instrumental in the revival of the serious study of ancient philosophy, but at the same time, he was able to clear himself of the charge of heresy, in contrast to his student John Italos.

Psellos strongly believed that the philosopher should be a man of comprehensive learning, and he often stressed on the importance of *polymatheia*, that is to say of a boundless curiosity and wide knowledge, which he invoked in order to defend the study of the pagan texts of antiquity. There are many passages in Psellos' writings in which he underlines the importance of rational philosophical thinking, logical syllogisms, and especially demonstrations, as something which essentially characterizes human beings and helps them in their attempt to understand reality, and in particular nature. Moreover, Psellos explicitly argued that logical reasoning does not bring one into conflict with Christian doctrine; on the contrary, the use of logical syllogisms is said to be an indispensable instrument in our pursuit of truth. At the same time, however, Psellos juxtaposed the kind of knowledge we derive from logical reasoning to another kind, namely, wisdom or dialectic, which can be acquired neither through demonstration nor through inductive reasoning. For there are things, according to Psellos, which cannot be understood by rational thought, ineffable things which are beyond demonstration.

Indeed, Psellos, invoking Plato's authority, claimed that wondering about the ineffable and the supernatural constitutes the ultimate task of philosophy. He, therefore, adhered to the view that the human mind is capable of grasping the truth both through reason and through illumination; that is to say, there are things which can be

known by reason, while others, namely, the ultimate principles of reality, can be known only by illumination. Difficult though it may be to draw the line between the things known by reason and those known by illumination, at least Psellos in many of his writings gives us some idea of how he understands the notion of illumination; he describes it as the state which presupposes the end of all rational thinking and the prevalence of silence after a great deal of turmoil. In this, Psellos clearly followed the Neoplatonists, and in particular Proclus, with the difference that in Proclus the soul's illumination comes from the intellect, whereas in Psellos the Neoplatonic intellect is replaced by the Christian God.

Mirrors for Princes

Roberto Lambertini

Dipartimento di Scienze Storiche, Documentarie,
Artistiche e del Territorio, Università di Macerata,
Macerata, Italy

Abstract

“Mirrors for Princes” designates a literary genre in which political ideas are expressed in the form of advice to a ruler. This genre has its roots in Antiquity and especially in Late Antiquity. The first medieval flourishing of works of this kind dates back to the so-called Carolingian Renaissance, when the image of the ideal ruler is strongly influenced by the monastic background of most authors writing on this topic. After a long decline, John of Salisbury gave a renewed impulse to the genre, exerting a long-lasting influence with his *Policraticus*. In the cultural context of the twelfth century, Mirrors for Princes opened not only to the patristic heritage, but also to classical authors. Many mirrors date back to the second half of the twelfth and to the first half of the thirteenth century, when they mostly took the form of compilations. In the following period, great thinkers such as Aquinas and Giles of Rome tried to insert the newly rediscovered Aristotelian ethical and political language into the mirrors tradition. Giles’ *De regimine principum* was the most successful and influential result of such effort. The rise of *De potestate papae* treatises in the first half of the fourteenth century reduced the role of Mirrors for Princes as carriers of political ideas but could not completely supersede them. On the contrary, when the heyday of *De potestate papae* was over, mirrors regained at least in part their function. The present article does not cover the Quattrocento: it is well known, however, that the tradition of the Mirrors continued in the Renaissance and in the following centuries.

The use of the expression “Mirrors for Princes” to designate a literary genre goes back to German scholarship that refers with the term *Fürstenspiegel* to writings dealing with the virtues of the ideal ruler, with his duties and his behavior in general. The counterparts of *Fürstenspiegel* in other European languages, such as *Miroir de princes*, *Specchio dei principi* (and the Latin *specula principum*, although it is attested much later than the first examples of the genre) have also established themselves in present day scholarship. These terms can be used in a rather loose sense, referring to a very wide range of sources, even narrative or iconographic ones, or parts thereof, carrying notions concerning rulership, or in a stricter sense, limited to independent works explicitly aiming at instructing kings and lesser rulers about the virtues they should cultivate, their lifestyle, their duties, the philosophical and theological meaning of their office. Mirrors for Princes can therefore be used as a source for many purposes, from the reception of classical literary texts to the history of mentality. They usually follow standard conventions so that their teachings about royal justice, princely virtues, and the like tend to give the impression of a continuous repetition of commonplaces. This notwithstanding the genre undergoes interesting changes during the Middle Ages. This article will focus on the aspects that can be brought to bear on the history of ethics and political philosophy.

Roots in Late Antiquity and in the Earliest Medieval Centuries

It is well beyond doubt that the genre is indebted to classical works and to patristic literature as well, although there is still lively discussion among specialists about the extent and relevance of such influence. Seneca and Cicero played a very important role, but also Ambrose (*De divinis officiis*) and Augustine, whose Chap. 24 in Book V of his *City of God* have been regarded as examples of Christian Mirror for Princes, obviously in a very loose sense of the expression. Martin of Braga’s *Formula vitae honestae*, (570–579), mediated a virtue ethics strongly influenced by

Cicero and Seneca, and in the Middle Ages was often referred to as a work of the latter. The discussion about *De duodecim abusivis* (or *abusionibus*) *saeculi*, falsely attributed to Cyprian, but now dated to the seventh century, is still open among scholars. It seems ascertained beyond doubt, however, that this work of Irish origin influenced, especially with its treatment of the sixth *abusio* (*dominus sine virtute*) and of the ninth (*rex iniquus*), later Carolingian Mirrors for Princes.

Carolingian Mirrors for Princes

Although some writings by Alcuin during the reign of Charles the Great already bear some essential features of the Mirrors for Princes, the first flourishing of the genre is usually dated to the ninth century, in the context of Carolingian courts. Scholars have rightly pointed out that some authors of this century draw on previous works, such as the already mentioned *De duodecim abusivis seculi*. Nevertheless, Smaragd of Saint Mihiel's *Via regia* (813), Jonas of Orléans' *De institutione regia* (831), Sedulius Scottus' *De rectoribus christianis* (855–859), together with some works by Hincmar of Reims' (806–882) build up the first noteworthy body of texts explicitly devoted to the moral instruction of the ruler. A common feature of such treatises is the focus on the personal Christian virtues of the sovereign. They represent therefore an important source for the history of virtue ethics in the early Middle Ages, since authors such as Smaragd are persuaded that the ruler should possess the same virtues as other Christians, obviously at the highest level. A striking feature of Smaragd's mirror, is that it overlaps in part the *Diadema monachorum* (a sort of manual for monks) of the same author. From this point of view, Carolingian Mirrors for Princes can be regarded as a source for the ethical doctrines of the period, which are in turn heavily influenced by the monastic background of their authors.

From the point of view of the history of political thought, such "mirrors" share the implicit assumption that the well-being of the kingdom

depends almost exclusively on the moral righteousness of the ruler. As far as the relationship between the secular rulers and religious authority is concerned, the authors of such "mirrors" consider the king or the emperor as the highest authority of a community that is temporal and spiritual at the same time. *Sacerdotium* and *regnum* are conceived of as integral parts of a whole. Sedulius Scottus (*De rectoribus christianis*) defines the temporal ruler as God's vicar in his church. Notwithstanding this, as Jürgen Miethke has pointed out, authors such as Jonas of Orléans, writing in the troubled period of Louis the Pious' empire, try to draw at least some boundaries dividing the sphere belonging to the spiritual power (mainly understood as the power of bishops) from temporal jurisdiction, without excluding however, the possibility of interference. In case of necessity, for example, the temporal ruler is allowed to have recourse to church goods, but on the other hand, he should submit to the judgment of the bishop when he fails to fulfill his duties.

Twelfth Century

Between 1148 and 1153, Bernard of Clairvaux wrote a treatise addressed to Pope Eugenius III, the *De consideratione*, enlightening him not only about the duties and perils of the most important office in Christianity, but also about his view of the role of the pope in the church. Many scholars emphasize the similarities of this work to the Mirrors for Princes, describing it as a *speculum paparum* (mirror for popes). Bernard in fact devotes large sections of his treatise to the virtues of a good pope (the four cardinal virtues that are according to him necessarily connected), to the vices he should avoid in himself and correct in the faithful, and to the advisers he should choose, on the governance of the papal household. In addressing his advice to the pope, Bernard also expresses his ecclesiological views: on one hand, he stresses the fullness of power of the supreme pontiff, on the other, he claims that the exercise of this power should result in a service (*ministerium*) to the church and not in a dominion over it. In

particular, the pope is morally bound to respect the rights of the local churches.

Written by a cleric who had attended the French schools at the eve of the age of universities and had personal experience of life at lay and ecclesiastical courts alike, John of Salisbury's *Policraticus*, even though it is not only a *speculum principis* in the strict sense, gave a renewed impulse to the genre, as Wilhelm Berges noted in his ground breaking survey, which accordingly begins its detailed analysis with this work. Deeply indebted to the interest in the classical heritage that is peculiar to the so-called twelfth century Renaissance, John draws not only on biblical texts, such as Deut. 17 (which was to become an almost topical reference for this literary genre) but also on authors from Antiquity. The *Institutio Traiani* that John attributes to Plutarch and inserts in his *Policraticus* is a fake, but it adds a distinct classical flavor to John's political organicism, which conceived of the realm as a body. The hierarchical functionalism that is implicit in the detailed parallelism between limbs of the body and the parts of the regnum was also to exert a long lasting influence on later specula. Historians of political thought have also taken great interest in John's attitude toward unjust rulers, because he does not limit himself to contrasting the ideal ruler with the tyrant but supports the right to resist the tyrant, and even to kill him. According to some interpreters this right is, in John's mind, also a duty. John of Salisbury's impact is particularly noticeable in Helinand of Froidmont's work, completed before 1210. This former troubadour converted to the Cistercian Order devoted a chapter of his huge *Cronica* in 49 books to the issue *De bono regimine principis*, drawing on the *Institutio Traiani* and its organicism, but also on John's conviction that the just king should rule according to the law. In turn, Helinand contributed to the diffusion of John of Salisbury's views, thanks to the fact that his *De bono regimine principis* was excerpted in the following century by Vincent of Beauvais and inserted in his well-known and widely read *Speculum historiale*.

Writing on the ridge between the twelfth and thirteenth centuries, Gerald of Wales combined in his *De principis instructione* a detailed virtue

ethics enriched with exempla from classical writers (first *distinctio*) with reports about the life of contemporary rulers (second and third *distinctiones*) that is an important source for historical events as well.

Thirteenth Century: From Compilation to the Reception of Aristotle

To Vincent of Beauvais and the team working under his guidance we owe a large number of works based on a compilational method, that is, on the collection of authoritative short texts (called in medieval Latin *auctoritates*) interspersed with remarks by the authors who also shape the overall structure of the work. Wilhelm Berges pointed to the parts of Vincent's works that could be seen as Mirrors of Princes. Berges' hypothetical reconstruction of the original, although not completed, plan of Vincent's work devoted to the prince was not confirmed by subsequent research. The rest of his remarks remain valid even after the recent critical edition of *De morali principis institutione*. In this treatise, together with the usual description of the just ruler contrasted with the tyrant and the stock-in-trade advice concerning life at court, one finds an interesting account of the origins of power among human beings. According to a long-lasting theological tradition, the establishment of one human being's power over others is first and foremost an act of violence, triggered by the perversity of mankind corrupted by sin. Only afterward can power, so to speak, redeem itself by fulfilling the function of compelling and punishing evildoers. The method adopted by Guillaume Perald's *De eruditione principum* (later falsely attributed to Aquinas) is very similar to Vincent's: together with the substantial identity of many of their views, this had led Berges to think that they belonged to the same, unfinished encyclopedic work about Christian kingship.

To the same period belongs Guibert of Tournai's *Eruditio regum et principum* (1259): the Franciscan friar explains the function of secular power with the necessity of compelling those who cannot be persuaded by spiritual means.

Strongly influenced by the corpus of treatises attributed to Dionysius the Areopagite, Guibert conceives of the duties of princes according to the pattern of angelic hierarchies, thereby attributing to secular powers a mediating role between God and mankind. According to Jenny Swanson, John of Wales' *Breviloquium de Virtutibus*, written most probably in the mid 1260s, can be numbered among the Mirrors for Princes. In fact, the treatise penned by this prolific Franciscan author shows the features of a mirror centered around a virtue ethics (more indebted to texts such as *Morale dogma philosophorum* than to Aristotle's *Nicomachean Ethics*) designed especially for the ruler. Inserting in his text many exempla, John of Wales was deemed to exert a durable influence on the literary genre, if for no other reason than as an easily accessible collection of edifying anecdotes, mainly from classical Antiquity.

Comparison of Vincent of Beauvais' views concerning the origins of power with those maintained only a few years later by his confrère Thomas Aquinas offers a telling example of the changes brought about by the reception of Aristotelian practical philosophy. In the only extant part of his *De regno* (shortly after 1270), Aquinas offers an account of the origin of the political community that is strongly influenced by the Aristotelian pattern of the natural, teleological development of the city from the smallest social community, the family. In Aquinas' account of the establishment of power relations among human beings, the Fall does not play the role it played in Vincent. Moreover, Aquinas describes different types of constitution. Monarchy is not the only possibility anymore, so that Aquinas, unlike Vincent, feels a need to argue in favor of the monarchical constitution as reflecting in the best way the order of nature and the universe. It is still controversial whether Aquinas, in defining the duties of the ruler also toward God, suggests that regnum should be subordinated to *sacerdotium*.

Innovative as it might have been, Aquinas' *De regno* remained but a fragment. With his *De regimine principum* (most probably around 1279) Giles of Rome fulfilled the task of writing a Mirror for Princes that exploited the

opportunities offered by the reception of Aristotle's *Nicomachean Ethics* and *Politics*. The first book of the *De regimine* consists, in fact, in a description of the virtues of the ruler that is much indebted to Aquinas' reception of the *Nicomachean Ethics*. At least for its first part, the third book relies heavily on Aristotle's *Politics*. According to the traditional subdivision of practical philosophy into individual ethics, doctrine of the household (*oeconomica*), and politics, Giles, still lacking a Latin translation of the pseudo-Aristotelian *Oeconomica*, draws on the *Nicomachean Ethics*, the *Rhetoric*, and the last two books of the *Politics*, especially as regards the upbringing of children. The *De regimine principum* presented itself as a mirror that meets the expectations of an audience interested in the newly discovered Aristotelian practical philosophy. At first glance, it could seem that Giles limited himself to summarizing Aristotle's relevant works. On the contrary, he did not only draw on the reception of Aristotle through Aquinas (there are many tacit references to the *Sententia libri ethicorum*, to the fragmentary *Sententia libri politicorum*, to *De regno*, and even to the *Summa theologiae* of the great Dominican master), but also very often succeeded in bending the Aristotelian texts he quoted in his treatise to an apology for hereditary monarchy (presented as the best form of government according to Aristotle), where the king is above positive law and subordinate only to natural law. Giles of Rome also succeeded, however, in setting a standard, so that his Mirror for Princes enjoyed an enormous success, partly because it was used as a handbook of Aristotelian practical philosophy. The *De regimine principum* was also translated into many vernaculars. Some of these versions, however, were not literal, but rather free arrangements that inserted remarks by the translator and also used other sources, such as the Bible, that Giles had neglected in favor of Aristotle, in order to offer an almost purely philosophical Mirror for Princes. Among such modified versions one can count, for different reasons, the so-called *Glossa castellana* to the *Re regimine principum* (first half of the fourteenth century) and John Trevisa's rendering in Middle English. Writing a

philosophical, that is, in his opinion, an Aristotelian Mirror for Princes, was also the intention inspiring, Engelbert of Admont, whose *De regimine principum* (shortly after 1300) had, however, almost no diffusion in the Middle Ages. This work is nevertheless of great interest, since Engelbert develops a virtue ethics that distinguishes between the four cardinal virtues, that are necessary to anybody, and the virtuous habits that are required in kings and emperors. Only the latter, in fact, need what Engelbert calls *virtutes regales*, using an expression that most probably derives from the *Secretum secretorum*, a spurious Aristotelian work whose first part was sometimes referred to as the *De regimine principum* written by the Stagirite. Engelbert also provides the reader with a quite original discussion of the forms of government, in which he takes into consideration not only simple constitutions, but also mixed ones. Surprisingly enough for a supporter of the imperium, Engelbert admits that monarchy in its simple form is extremely rare, because of the rarity of virtues among rulers. Therefore, according to the most recent interpretation by Karl Ubl, he gives his preference to a blend of monarchy, aristocracy, and democracy.

Examples from the Fourteenth Century

Already at the beginning of the fourteenth century, the literary genre of the Mirrors for Princes begins losing ground as a carrier of political theories, in favor of other genres, such as the *de potestate papae* treatises, especially in the first half of the century, or the *somnia* literature, toward the end of the same century. This does not imply, however, that the production of *specula principum* ceases abruptly. On the contrary, political authors continued to recur to this genre to express their views during the Renaissance and well into modern times, even after Machiavelli and often against him. An overview of such development would exceed the scope of an article devoted to medieval Mirrors. It seems reasonable to conclude with some examples from the fourteenth century, before the influence of Humanism introduces a new shift in the Quattrocento.

For example, at the beginning of the 1330s, William of Pagula uses the literary form of the *speculum*, to protest against the institution of royal purveyance in the English kingdom. He does not limit himself to a moral complaint but argues in defense of a sort of “basic economic rights” that the king himself is not allowed to infringe. Interestingly, William supports his claim by arguing that the English realm is a fief of the pope, so that the sovereign does not possess the same fullness of power that an emperor or a pope can legitimately claim.

Some years later, Guido Vernani of Rimini dedicates to the Malatesta, most probably Malatesta and Galeotto, a *Liber de virtutibus*, that is an abridged version of Aristotelian virtue ethics mediated through Aquinas’ doctrine of happiness attainable in the present life. Guido had criticized Dante’s *Monarchia* and supported a hierocratic theory of power. Here he develops his own ethics for an Italian signore whose territory is inscribed in the boundaries of the “state” claimed by the Roman church.

In 1340–1344, the Portuguese Franciscan friar Alvaro Pais dedicated to Alfonso XI of Castiglia a *Speculum Regum* that not only puts a strong emphasis on princely virtues but also defends the superiority of monarchy over other constitutions and supports the supremacy of the spiritual over the temporal. His account of the origins of power is, as usual in many Franciscan authors, especially after John Duns Scotus, clearly not Aristotelian. He prefers tracing back the origins of subordination among men to pride and other vices. However corrupted the intention of the first rulers could have been, they still played a role in preserving social order. For this reason, God tolerates such a state of affairs, although it does not correspond to his original plan for mankind.

Wilhelm Berges numbered Francesc Eiximenis’ *Regiment de la cosa publica* (1383) among Mirrors for Princes. More recent studies have emphasized that the scope of this work exceeds the traditional limits of a mirror, developing an overall theory of monarchy. His views about monarchy are not only inspired by the principle that Christian faith must be the unifying element of every political community but

are also guided by the peculiar experience of the kingdom of Aragon, where this Catalan Franciscan friar spent most of his life. As a result, Eiximenis supports the idea of a monarchy that is bound by covenants to its subjects and shares its power with parliamentary institutions.

Miskawayh, Abū 'Alī

Elvira Wakelnig

Department of Near Eastern Studies, University of Vienna, Vienna, Austria

Abstract

Abū 'Alī Aḥmad ibn Muḥammad ibn Ya'qūb Miskawayh was a prominent figure in the intellectual milieu and at different courts of the Arab-Islamic world throughout the tenth and at the beginning of the eleventh century. Besides having held various positions in the service of a number of rulers, he occupied himself with many sciences, such as philosophy, history, *adab*, alchemy, medicine, and even cooking. Although Miskawayh is said to have composed works in most of these fields, the writings extant today mainly cover the first two mentioned. His universal history *The Experiences of the Nations* (*Tajārib al-umam*) outlines the time from Noah to his own lifetime, the Buyid reign. His genuine philosophical writings, among which *The Refinement of*

Character (*Tahdhīb al-akhlāq wa-tathīr al-a'rāq*) and the *Minor Book of Triumph* (*al-Fawz al-aṣḡar*) are the best known today, display a main interest in ethics and on how to reach ultimate happiness. Miskawayh's philosophical doctrines are deeply influenced by Aristotle as well as by Neoplatonism and firmly rooted in the tradition of al-Kindī.

Biographical Information

Miskawayh is said to have been born around 325/936 in Rayy and died in 412/1030 in Isfahan aged 100 years. Nowadays the allegation that he himself converted from Zoroastrianism to Islam is no longer upheld but transferred to his forefathers.

According to the *Muntakhab Šiwān al-ḥikma* which contains information about the lives and doctrines of philosophers of the Greek and the Arabic-Islamic world, Miskawayh was consecutively in the service of the viziers Abū Muḥammad al-Muḥallabī, Abū l-Faḍl ibn al-'Amīd, and the latter's son Abū l-Faḍl Dhū l-Kifāyatayn and the monarchs 'Aḍud al-Dawla and Šamsām al-Dawla and then served at the court in Rayy under several patrons mainly as librarian, secretary, boon companion, and emissary. Furthermore he had contact with a number of well-known philosophers of his time, namely, Abū Sulaymān al-Sijistānī al-Mantiqī, al-Ḥasan ibn Suwār ibn al-Khammār, Abū l-Ḥasan al-'Āmirī, Ibn Sīnā, and Abū Ḥayyān al-Tawḥīdī, with whom he engaged in a philosophical exchange which is preserved in the *Book of Rambling (Questions) and Comprehensive (Answers)* (*Kitāb al-Hawāmil wa-l-Shawāmil*) and a *Treatise on Justice* (*Risāla fī l-māhiyyat al-'adl*).

Thought/Philosophy

Miskawayh's extant philosophical writings comprise two lengthy books, namely, *The Refinement of Character* (*Tahdhīb al-akhlāq wa-tathīr al-a'rāq*) and the *Minor Book of Triumph* (*al-Fawz al-aṣḡar*), and a number of smaller treatises and fragments. A quite striking feature of

Miskawayh's style of writing is that he is frequently quoting himself, i.e., there often occur literal parallels between two or more of his works. The *Minor Book of Triumph* presents the most remarkable example of this practice as it seems to have existed in at least two versions or recensions, which may both well go back to Miskawayh himself. The standard version is claimed to have been written at the request of an emir who wanted to have three issues dealt with which comprise all knowledge, namely, the existence of God, the soul and its conditions, and prophethood. The alternative version is only preserved in fragments which present about half of the material of the standard version in a completely different arrangement and order apparently focusing on other questions, namely, the hierarchy of being, the man as microcosm, the human soul, the attainment of happiness, and the classification of knowledge. The last two issues do not occur in the standard version of the *Minor Book of Triumph* but are also dealt with in Miskawayh's *Kitāb al-Sa'āda* (*Book on Happiness*).

The question of the classification of knowledge is, in fact, quite a prominent topic in Miskawayh's extant writings. The most basic division is the one between theoretical and practical knowledge or philosophy. In the *Minor Book of Triumph*, Miskawayh recommends to start one's search for truth with mathematics and logic and then to turn to natural philosophy and metaphysics before dealing with practical philosophy. In the alternative version of the *Minor Book of Triumph*, mathematics is said to comprise geometry, arithmetic, astrology/astronomy, and music, and the natural sciences are divided according to an eightfold Aristotelian division, which is also applied by al-Fārābī in his *Iḥṣā' al-'ulūm*. In the *Book on Happiness*, Miskawayh classifies philosophy entirely according to Aristotle's writings.

Miskawayh's worldview is set within the framework of a Neoplatonic hierarchy of being, which is characterized by the sequence of the following levels of existence: God, Intellect, Soul, Sphere which corresponds to Universal Nature, and the bodily beings. Establishing the existence of God, the Creator, is the main intent of the first of the three parts of the *Minor Book of*

Triumph, where Miskawayh thus demonstrates Him to be one, single, eternal, incorporeal, the first unmoved mover, and the cause of all other existents, which He has created ex nihilo. Knowledge of God may only be reached and expressed by negation.

The first created existent is the Universal Intellect. Whether Miskawayh indeed pictured the level of intellect as encompassing ten intelligences which cause one another and the celestial spheres must remain doubtful. This Farabian doctrine is expounded in the *Treatise on the Intellect and the Intelligible* (*Risāla fī l-'aql wa-l-ma'qūl*) which has been ascribed to Miskawayh. However, his authorship is questionable, and no tenet expressed in this treatise seems to be genuinely characteristic of his philosophy.

In any case, Miskawayh's main concern is not with universal hypostases but with intellect and soul as present in human beings and, in fact, with granting immortality to them. Three Platonic proofs are cited in the second part of the *Minor Book of Triumph*, the part on the soul and its conditions, in order to establish the soul as life-giving, as containing no badness or evil, and as self-moving and therefore being an immortal, spiritual substance. Consequently, man must not fear death, as Miskawayh explicitly sets out to show in a chapter of *The Refinement of Character* which also circulated as a short self-contained text, namely, as the *Treatise on the Fear of Death* (*Risāla fī l-khawf min al-mawt*) and in a passage on the same topic preserved in the entry on Miskawayh in the *Muntakhab Ṣiwān al-ḥikma*. On the contrary, one should die willingly, i.e., abandon the sensible world and the bodily pleasures and desires and turn toward the intellect and the intelligibles, before one dies naturally. The rational human soul is potentially intellectual, and by intelligizing the intelligibles, it becomes actualized and is an intellect. Intellect, in turn, is one and the same as its intelligibles and its intellection and furthermore possesses self-knowledge. It does not derive all its knowledge from sense perception; rather, as the senses may err, intellect is able to judge sense data through the first principles which it finds in its own substance.

Miskawayh distinguished three kinds of happiness: happiness of the soul, which is true knowledge and acting accordingly; happiness of the body, which is health, proportionality, and beauty of the body's limbs; and happiness resulting from things outside the body, e.g., wealth, honor, family, and friends. The two latter ones are not ends in themselves but only means by which to reach the happiness of the soul, which is the ultimate happiness, end, and perfection of the human being. As Miskawayh points out explicitly, man cannot attain perfection on his own, but being a social animal, he needs the company of his fellow men. Therefore hermitism has to be renounced. Furthermore, it is important that the four cardinal virtues, i.e., wisdom, temperance, courage, and justice, which are depicted each as a mean between two vices, are extended beyond the virtuous person toward others who should thus benefit from these virtues and become virtuous themselves.

In order to spread wisdom, i.e., theoretical and practical wisdom, among the people, God has sent the prophets who are physicians of the soul.

As to Miskawayh's historical works, *The Experiences of the Nations* (*Tajārib al-umam*), which starts with the occurrence of the flood in the days of Noah and ends in 980 when the Buyids are still in power, presents past events to serve as examples to the rulers of the present. Miskawayh describes events happening during the Buyid reign based on personal experience and often takes a subjective point of view. He stresses the value of eyewitnessing over the retelling of hearsay accounts. A different kind of historical interest, namely, an interest in the history of learning, wisdom, and philosophy, becomes apparent in Miskawayh's *Eternal Wisdom* (*al-Ḥikma al-khālida*) in which he gathers wise sayings of the Persians, Indians, Arabs, and Greeks to show the unity which prevails in human thought throughout time and place.

Modal Theories and Modal Logic

Simo Knuuttila

Helsinki Collegium for Advanced Studies,
University of Helsinki, Helsinki, Finland

Abstract

Early medieval thinkers were acquainted with ancient modal theories through Boethius' commentaries on *De interpretatione*, which dealt with Aristotelian and other ancient modal paradigms extensively. Modal syllogistic was brought into the discussion by the recovery of Aristotle's *Prior Analytics* in the twelfth century. Medieval considerations were also influenced by Augustine's ideas, which deviated from philosophical paradigms, particularly his conception of God as acting by choice between simultaneous alternative possibilities. There were analogous discussions of philosophical and theological modalities in Arabic philosophy. Arabic modal theories influenced Latin discussions mainly through the translations of Averroes' works.

Apart from ancient philosophical conceptions, the new idea of associating modal terms with simultaneous alternatives was discussed by Abelard and some other early medieval thinkers. While these innovations were used to some extent in thirteenth-century theology, they were not often discussed in philosophical contexts. The increasing reception of Aristotle's philosophy in the thirteenth century gave support to traditional modal paradigms, as is seen in Robert Kilwardby's influential commentary on Aristotle's *Prior Analytics*, where modal syllogistics is treated as an essentialist theory of the structures of being.

Things became different when John Duns Scotus combined the various elements of the conception of modality as alternativeness into a detailed theory. A logically possible state of affairs is something to which to be is not repugnant, though it may not be compossible with other possibilities. Scotus' modal semantics influenced early fourteenth-century philosophy and theology in many ways. The new modal logic which was developed by William Ockham, John Buridan, and others was based on the new modal semantics. Thirteenth-century essentialist assumptions were largely dropped from modal syllogistics, the Aristotelian version of which was regarded as a fragmentary theory without a sufficient explication of the various fine structures of modal propositions.

There are four originally Aristotelian ways of understanding the meaning of modal terms in ancient philosophy: the "statistical" or "temporal frequency" interpretation of modality, which is found in the discussions of eternal beings, the natures of things, and the types of events and which implies that what is possible is sometimes actual (the so-called principle of plenitude), the conception of possibility as a potency, which was associated with the assumption that no natural potency type remains eternally frustrated, the conception of antecedent necessities and possibilities with respect to a certain moment of time (diachronic modalities), and the idea of possibility as non-contradictoriness. None of these conceptions

includes the view that the meaning of modal terms should be spelled out by considering simultaneous alternative states of affairs. On the contrary, ancient modal thinking is characterized by the assumption of the necessity of the present and the necessity of unchanging states of affairs in general.

An example of the statistical approach in the Boethian tradition is found in Thomas Aquinas' commentary on chapter 9 of Aristotle's *De interpretatione*, where various types of propositions are classified on the basis of their "matter."

In necessary matter, all affirmative propositions are determinately true; this holds for propositions in the future tense as well as in the past and present tenses; and negative ones are false. In impossible matter, the contrary is the case. In contingent matter, however, universal propositions are false and particular propositions are true. This is the case in future tense propositions as well as those in the past and present tenses. In indefinite ones, both are at once true in the future tense propositions as well as those in the past and present tenses (*In Peri herm*, I.13).

The matter of a proposition is associated with the habitude of a predicate to a subject and is explained as follows:

If the predicate is per se in the subject, it will be said to be a proposition in necessary or natural matter, for example 'Man is an animal' and 'Man is risible'. If the predicate is per se repugnant to the subject, as in a way excluding the notion of it, it is said to be a proposition in impossible or remote matter, for example 'Man is an ass'. If the predicate is related to the subject in a way midway between these two, being neither per se repugnant to the subject nor per se in it, the proposition is said to be in possible or contingent matter. (Ibid)

The ancient theory of the matter of propositions was often associated with the rules of contraries, subcontraries, and contradictories in the traditional square of opposition. While these rules defined how the members of various opposed pairs were related to truth and falsity, it was thought that they could be further specified by classifying propositions on the basis of their matter. A typical feature of Aquinas' account of the contingent matter is that universal affirmative and negative propositions are false and particular affirmative and negative propositions are true. Comparing this with what is said about propositions in

other matters, modal differences can be characterized as corresponding to a descending order in the frequency of true cases: the predicate is not truly said of any subject in impossible matter; it is truly said of some subjects in contingent matter and of all subjects in necessary matter.

Boethius' discussion of the necessity of the present shows how this principle was understood in ancient modal thought. In dealing with chapter 9 of Aristotle's *De interpretatione*, Boethius argues that:

1. It is not possible that p obtains at t and not- p obtains at t .

This implies that

2. It is not the case that p obtains at t , and it is possible at t that not- p obtains at t .

This move is natural only when possibilities refer to one and the same history without simultaneous alternatives. (2) was generally accepted in ancient philosophy, and it is equivalent to the principle of the necessity of the present.

3. If p obtains at t , then it is necessary at t that p obtains at t .

Boethius thought that the temporal necessity of p is qualified by the possibility of being otherwise at another time. One might wonder how the alleged necessity of Socrates' sitting at a certain moment of time is qualified by what he does at other times. According to Boethius, this shows that sitting as such does not inhere in Socrates by necessity. Qualifying the necessity of the present by a "statistical" conception of possibility remained a popular idea in the Boethian tradition.

Boethius was eager to argue that the necessity of an event at a certain time does not imply that it was antecedently necessary. The idea of diachronic modalities was considered important in the later Aristotelian tradition, which stressed against Stoic determinism, that there are genuine future alternatives which remain open until the moment of time to which they refer. Even the Stoics spoke about alternative prospective

possibilities which were not yet fixed at the level of known causes, but they also regarded fate as an active potency which ultimately necessitates everything. Boethius follows the Aristotelian tradition of diachronic possibilities: there are transient individual alternative possibilities, but those which will not be realized disappear. There are no unrealized possibilities which might remain intact even when their diachronic counterparts have vanished.

In dealing with possibilities based on potencies, Boethius writes that some potencies are never unrealized, their nature being such that they are always actual and as such necessarily so. There are no contrary potencies in these cases, Boethius says, because they would remain unrealized forever, and the constitution of nature cannot include elements which are in vain. The potencies of non-necessary features of beings do not exclude contrary potencies. They are not always and universally actualized, but as potency types, even these must be sometimes actualized. This is in agreement with the “statistical” model of modality.

Aristotle’s theory of active and passive potencies was originally meant to explain how and why a singular change takes place. This background made it a cumbersome model for singular possibilities. While it allowed Aristotle and his medieval followers to speak about unrealized possibilities in the sense of partial possibilities, that is, as the correlates of active or passive potencies, full singular possibilities were actualized when they could be actualized. Natural passive potencies could not be actualized without an active power and were necessarily actualized when an active power activated them, and there was no external hindrance (Aristotle, *Met.* IX.5). While the conceptions of power and potentiality were widely regarded as important elements in understanding modality, Anselm of Canterbury attempted to base the whole of modal semantics on these notions. The problems in his theory show that the notion of potency is too narrow a basis for this purpose.

In *De caelo* I.12, Aristotle supposes, per impossibile, that a thing has contrary potencies, one of which is always actualized. He argues that

the unactualized potency cannot be real, because one cannot assume it to be realized at any time without contradiction. Aristotle applies the model of possibility as non-contradictoriness which is defined in *Prior Analytics* I.13 as follows: when a possibility is assumed to be realized, it results in nothing impossible. In speaking about the assumed non-contradictory actualization of a possibility, Aristotle thinks that it is realized in our one and only history. In some places he suggests that for the purposes of argument, one can assume counterfactual states of affairs in thought even though they are not realizable in the world. Assumptions of this kind were not uncommon in late ancient philosophy; they were called impossible hypotheses. Averroes and Aquinas tried to explain these by using the idea of abstract possibilities. The possibilities of a thing can be dealt with at various levels which correspond to Porphyrian predicables. Something which is possible for a thing as a member of a genus may be impossible for it as a member of a species. The same holds of it as a member of a species and an individuated thing. While counterfactual abstract possibilities are counterpossible in the sense that they cannot be actualized, they are understandable metaphysical fictions which can be used in indirect proofs.

Augustine’s doctrine of God’s eternal free choice of the content of creation, which influenced early medieval theological discussions of divine omnipotence and omniscience, involved an intuitive idea of modality as alternativeness. Some authors regarded this as a special theological matter which did not affect the use of traditional ideas in other disciplines, an attitude supported by the general reception of Aristotle’s philosophy in the thirteenth century, but there were some twelfth-century thinkers who realized the philosophical significance of this new modal conception.

Abelard made use of traditional modal conceptions, but he also developed new ideas. Assuming that what is actual is temporally necessary at a certain point of time as no longer avoidable, he adds that unrealized counterfactual alternatives are possible at the same time in the sense that they could have happened at that time. There are

also merely imaginable alternatives, such as Socrates’ being a bishop, which never had a real basis in things.

Gilbert of Poitiers stressed the idea that natural regularities which are called natural necessities are not absolute, since they are freely chosen by God and can be overridden by divine power. This basically Augustinian conception had become a widespread theological view in the twelfth century. In explaining Plato’s “Platonitas,” Gilbert says that this includes all that Plato was, is, and will be, as well as what he could be but never is. The modal element of the individual concept was probably needed in order to speak about Plato in alternative possible histories or, as Abelard did, about Socrates as a bishop. Gilbert seems to have been the first to formulate an individual concept in this way. A significant early thirteenth-century analysis of the modal aspects of the Augustinian theological modalities was put forward by Robert Grosseteste.

A third context of the systematic interest in simultaneous alternatives was the new twelfth-century theory that declarative singular propositions should be primarily treated as temporally definite and as having an unchanging truth-value. This approach was developed by twelfth-century authors, later called *nominales*, one of

whose theses was that “What is once true is always true.” It was argued that while tensed statements about temporally definite singular events have a changing truth-value, the corresponding non-tensed propositions are unchangingly true or false, without being necessarily true or false for this reason. This was in agreement with Abelard’s view that future contingent propositions are true or false. The actuality of a contingent state of affairs at a specified future time does not exclude the nontemporal possibility of simultaneous alternatives, nor does the truth of a proposition about this state of affairs make it necessary. While medieval commentators usually followed Boethius in assuming that in Aristotle’s view future contingent propositions are not true or false, their own position was closer to that of Abelard who in fact ascribed it to Aristotle as well.

Modifying Boethius’ systematization of Aristotle’s remarks in *De interpretatione* 12 and 13, twelfth- and thirteenth-century logicians often presented the equipollences between modal terms and opposed relations between modal propositions with the help of the following diagram (Fig. 1).

The square could be taken to refer to modals *de dicto* or singular modals *de re* (see below). Abelard tried to define the opposed relations between

Modal Theories and Modal Logic, Fig. 1 The square of opposition for modal propositions

quantified *de re* modals as well. He thought that these were the same as those between singular modal propositions, which is completely wrong. This question was not much discussed before its satisfactory solution in the new fourteenth-century modal semantics presented in Buridan's famous modal octagon (see below).

The anonymous *Dialectica Monacensis* (c. 1200) involves the analysis of modal propositions which is influenced by Abelard and is found in many medieval logical treatises. In discussing the quantity (universal, particular, and singular) and quality (affirmative and negative) of the modals, the author states that modal terms may be adverbial or nominal. The modal adverb qualifies the copula, and the structure of adverbial modal propositions without negation is:

4. Quantity/subject/modalized copula/predicate (e.g., every A is necessarily B).

In this form, the negation may be located in different places, either

5. Quantity/subject/copula modalized by a negated mode/predicate (e.g., every A is not necessarily B).

or

6. Quantity/subject/modalized negative copula/predicate (e.g., every A is necessarily not B).

If modal propositions with a negation are read in accordance with (5), then the mode is denied; if they are read in accordance with (6), the modal adverb qualifies a negated predication. Modal propositions with the structure of (4)–(6) are also called *de re* or divided modalities. Modal propositions with nominal modes can be taken to mean the same as corresponding adverbial modal propositions or can be taken to mean that what is expressed by a non-modalized proposition is necessary, possible, or impossible. Propositions with non-adverbial nominal modes are singular, their form being:

7. Subject/copula/mode (e.g., that every A is B is necessary).

Modal propositions of this structure are called *de dicto* or compound modalities. Modalities *de dicto* are said to be dealt with in Aristotle's *De interpretatione* and modalities *de re* in the *Prior Analytics*.

These distinctions were often mentioned in discussions of the composition-division ambiguity in fallacies – this was their historical background. The compound interpretation of “A standing man can sit” was usually taken to be “It is possible that a man sits and stands at the same time.” Many authors formulated the corresponding divided interpretation as involving a reference to a later or earlier time. The reference to another time was based on the Boethian assumption that the necessity of the present prevents the acceptance of:

8. p (now) and it is possible that not- p (now).

The authors who regarded (8) as false did not operate with counterfactual alternatives, thinking that if an unactualized present possibility is assumed to be actualized, something impossible follows.

As for the logic of unanalyzed modal propositions, Aristotle mentioned its basic inference rules without a further development in *Prior Analytics* I.15. These were dealt with in later ancient discussions and generally accepted in medieval logic as follows: if the antecedent of a good consequence is necessary/possible, the consequent is necessary/possible. However, the main interest was in the modal syllogistics and modalized syllogistic premises, the logic of which was more complicated.

Avicenna wrote a brief summary of Aristotle's modal syllogistics, but his own theory was different, being based on the assumptions that the subject terms and the predicate terms of assertoric and modal propositions stand for all possible applications and the truth-conditions of assertoric propositions and corresponding possibility propositions are the same. It follows that syllogisms with assertoric and necessity premises coincide with syllogisms with possibility and necessity premises and syllogisms with assertoric and possibility premises or with assertoric premises with uniform possibility syllogisms.

While Averroes' commentaries on the *Prior Analytics* followed the main lines of Aristotle's text, his separate treatise on modality involved new systematic ideas, mainly the theory of accidental and per se necessary terms and the interpretation of syllogistic necessity premises as per se necessary predications with per se necessary terms. Both ideas were inspired by Aristotle's remarks in the *Posterior Analytics* I.4; the syllogistic applications were Averroes' own inventions. Since Averroes takes modal premises to be of the divided type, assertoric premises in Aristotelian mixed necessity-assertoric syllogisms must have a predicate term which in fact is necessary. The same applies to the subject term of the first premise in mixed assertoric-necessity syllogisms. This is a speculative explanation of Aristotle's asymmetric treatment of mixed necessity-assertoric syllogisms and mixed assertoric-necessity syllogisms. Analogous essentialist ideas were developed in thirteenth-century Latin discussions.

The first known Latin commentary on *Prior Analytics* is an anonymous late twelfth-century treatise which involves detailed discussions of modal conversion and modal syllogisms as well as many problems dealt with in ancient commentaries. A concise summary of Aristotle's modal syllogistics is also provided in the *Dialectica Monacensis*, and the elements of modal syllogistics were discussed in logic courses in Paris in the first part of the thirteenth century. Robert Kilwardby's commentary (c. 1240) became an authoritative thirteenth-century work on the *Prior Analytics*, from which the discussions of modal syllogistics in Albert the Great's commentary (c. 1250) were also largely derived. The conversion inference rules played an important role in Aristotle's deduction proofs of syllogisms. While the conversion of assertoric propositions ("Every A is B" implies "Some B is A," "Some A is B" is equivalent to "Some B is A" as well as "No A is B" to "No B is A") was frequently discussed in early medieval logic, the modal conversions were not often dealt with before the *Prior Analytics* began to be used in logic teaching in the thirteenth century. According to Aristotle (*An. pr.* I.3), necessity propositions are converted in the same way as the corresponding assertoric propositions;

negative contingency propositions are converted to affirmative contingency propositions of the same quantity and these by the conversion of terms to particular contingency propositions. While these rules are not problematic with respect to modals in the compound (*de dicto*) sense, Aristotle employed them in proving modal syllogisms, some of which seem to be acceptable only when the premises are necessity propositions in the divided (*de re*) sense. However, reading these conversion rules in the divided sense raises questions, since the actuality of a subject changes into necessity when the subject becomes the predicate and similarly with possibility and actuality.

Many historians think that Aristotle's modal syllogistic included various modal insights which did not form a coherent theory. This was not the view of mid-thirteenth-century logicians, who believed that Aristotle's theory was perfect. In discussing the conversion rules and syllogistic moods, they hardly paid attention to the distinction between compound and divided modalities, although some kind of divided reading was the underlying assumption. Many logicians discussed the same alleged counterexamples to the universal conversability of necessity propositions, such as:

9. Everything healthy (or awake) is necessarily an animal.

Robert Kilwardby's explanation is based on the view that convertible necessity premises in modal syllogistics are necessity propositions per se and not per accidens, like (9), which are not convertible. In affirmative necessity propositions per se, the subject is per se connected to the predicate. In negative necessity propositions per se, the subject is per se incompatible with the predicate. The terms in per se inferences or incompatibilities are essential and necessarily stand for the things they signify. The historical background to Kilwardby's interpretation is not clear, but it does show close similarities to Averroes' discussions and may have been influenced by them.

As for the conversion of contingency propositions (neither necessary nor impossible), Kilwardby notes that while the converted

propositions of indefinite (*utrumlibet*) contingency propositions are of the same type of contingency, the conversion of natural contingency propositions (possible in most cases) results in contingency propositions when contingency means possibility proper (not impossible). There were extensive discussions of the kinds of contingency based on various philosophical ideas of contingency in the commentaries by Kilwardby and Albert the Great and in other treatises by their contemporaries.

Following Aristotle's remark according to which "A contingently belongs to B" may mean either "to that to which B belongs" or "to that to which B contingently belongs," Kilwardby argues that the subject terms in contingency syllogisms are read in the second way, having the amplified form "Everything/something that is contingently B is contingently A," if syllogistic relations do not demand restriction. In explaining the difference in this respect between necessity propositions and contingency propositions, Kilwardby argues that since the terms in per se necessity propositions are necessary, "Every A is necessarily B" and "Whatever is necessarily A is necessarily B" mean the same. Contingency propositions which are amplified do not mean the same as those which are not so amplified, although both are convertible.

According to Kilwardby, the modal character of the predication in the conclusion of perfect first-figure syllogisms follows that of the first premise, which involves the whole syllogism in accordance with the *dici de omni et nullo*. The premises and the conclusion in uniform necessity syllogisms are necessary per se. In mixed first-figure syllogisms with a major necessity premise and a minor assertoric premise, the non-modalized premise should be *simpliciter* assertoric, that is, a necessarily true per se predication. Similarly, in mixed first-figure syllogisms with contingent major and assertoric minor premises, the assertoric premise must be *simpliciter* assertoric, but this time the criteria are that the predicate belongs to the subject per se, invariably or by natural contingency.

Kilwardby explains the various readings of assertoric premises of mixed syllogisms by stating

that a first-figure major necessity premise "appropriates" to itself a minor which is necessary per se. No such appropriation occurs in first-figure mixed assertoric-necessity syllogisms. In the second figure, while the universal negative necessity premise appropriates a necessary premise to itself, a particular necessity premise cannot appropriate a universal necessary premise to itself, nor an affirmative a negative. There are similar appropriation rules for third-figure moods. In a mixed first-figure necessity-contingency mood, the first premise appropriates a natural contingency minor to itself. While the major premise of a mixed first-figure assertoric contingency syllogism does not appropriate a minor premise of any special contingency, the major premise of a mixed first-figure contingency-assertoric syllogism demands a simply assertoric minor premise which is true in most cases, if not necessary.

Kilwardby and his followers considered Aristotle's modal syllogistics as the correct theory of modalities, the explication of which demanded metaphysical considerations. Restricting the modal conversion of necessity propositions into those involving necessary terms and the discussions of the kinds of contingency are examples of this approach as well as the various appropriation rules. Kilwardby assumed that propositions of the same form had different interpretations, depending on how they were related to other propositions in a syllogism. From the logical point of view, the rules pertaining to this variation have an ad hoc character.

Late medieval discussions of necessity and possibility were strongly influenced by the modal theory of John Duns Scotus, who took as an obvious fact that there are contingent states of affairs which could be otherwise at that very moment of time at which they are actual. This idea of simultaneous alternatives played an important role in Scotus' proofs for the existence of a necessary first being which acts as the free first cause of the contingent world. Augustine had already argued that the eternal and immutable creative act of divine will is free only if it is a choice between alternatives and could be other than it is. This conception was developed in much more detail in Scotus' metaphysics. God's

omniscience involves all possibilities, which as objects of God's knowledge receive an intelligible or objective being. Some of these are included in God's providential plan of creation and will receive actual being. The description of a possible state of affairs at a certain moment consists of compossible possibilities. Although possibilities necessarily are what they are, the actualizations of non-necessary possibilities are not necessary but contingent. Since all finite things are contingently actual when they are actual, they are associated with alternative possibilities with respect to the same time, though these are not compossible with what is actual. Impossibilities are impossibilities between possible components, such as Socrates' sitting at a certain time and Socrates' not sitting at that same time.

One of Scotus' new ideas was the domain of possibility as a nonexistent objective precondition of all being and thinking. This was well known in the seventeenth century as well through Suárez's works. In his discussion of eternal truths, Descartes criticized the classical view of the ontological foundation of modality as well as the Scotist theory of modality and conceivability. He thought that necessities and possibilities as such are freely established by God and that they could therefore be different from what they are. This was criticized by Leibniz, whose modal views were influenced by the Scotist conception of alternativeness, although he developed it in a different way. Another influential idea was the systematic distinction between logical and natural necessities and possibilities; this called for new explanations of what was meant by the necessities of natural philosophy, the denials of which were not logically inconsistent.

One important branch of medieval logic developed in treatises called *De obligationibus* dealt, roughly speaking, with how an increasing set of true and false propositions accepted in a disputation might remain coherent. According to thirteenth-century rules, false present-tense statements could be accepted as expressing possible positions only if they were taken to refer to a moment of time different from the actual one. Scotus deleted this rule, which was based on the thesis of the necessity of the present, and later

theories accepted the Scotist revision. Obligations logic could now be regarded as a theory of how to deal with logically possible states of affairs and their mutual relationships. These discussions were related to the interest in counterfactual reasoning. As mentioned above, Averroes and Aquinas developed a theory of abstract possibilities for dealing with counterfactual assumptions without the theoretical idea of simultaneous alternatives. John Buridan heavily criticized this approach from the point of view of the new modal theory. Investigating possibilities is to think about them as actualized in a coherent context of compossibilities. If the abstract possibilities in Averroes and Aquinas cannot be treated in this way, calling them possibilities is based on a conceptual confusion.

William Ockham, John Buridan, and some other fourteenth-century logicians took the new notion of logical possibility as the starting point of their modal logic, which largely dropped the thirteenth-century essentialist assumptions and consequently became much more complete and satisfactory. Questions of modal logic were discussed separately with respect to modal propositions *de dicto* and *de re*; modal propositions *de re* were further divided into two groups depending on whether the subject terms referred to actual or possible beings. It was thought that logicians should also analyze the relationships between these readings and, furthermore, the consequences with various types of modal propositions as their parts. Richard of Campsall played an interesting role in the development of medieval modal syllogistics. He introduced the habit of treating the *de dicto* and *de re* moods separately, but he was also dependent on Kilwardby's interpretation. The new modal logic of William Ockham, John Buridan, and Pseudo-Scotus was among the most remarkable achievements of medieval logic. Aristotle's modal syllogistics was now regarded as a fragmentary theory in which the distinctions between different types of fine structures were not explicated. These authors did not try to reconstruct it as such into a uniform system, believing, like some modern commentators, that such a reconstruction is not possible. Buridan's modal logic, dominant in late medieval

times, was embraced by such influential authors as Marsilius of Inghen, Albert of Saxony, and Jodocus Trutfetter. The rise of the new modal logic was accompanied by theories of epistemic logic and deontic logic which also belong among the remarkable achievements of late medieval philosophy.

Modistae

Ria van der Lecq

Utrecht University, Utrecht, The Netherlands

Abstract

Modistae is the name of a group of Parisian grammarians and philosophers who lived in the period between 1270 and 1300, the most important being Martin of Dacia, Radulphus Brito, and Thomas of Erfurt. Their work on grammar and logic is characterized by the intention to situate these former liberal arts within the medieval system of sciences. In order to achieve this goal, they had to find universal objects for these new sciences. The result was the introduction of the concept of modes of signifying (*modi significandi*) in grammar, denoting the general meanings of words which constitute grammatical categories. In logic, they shared the opinion of other intentionalists of their time that the

proper subject of logic is the second intention. In grammar as well as in logic they assumed a complete interdependence between the structure of reality and the operations of the mind. To warrant the foundation of our mental and linguistic operations in reality, they argued that every extra-mental object has various modes of being (*modi essendi*), which serve as the ontological counterpart of the modes of signifying and the second intentions.

The term *Modistae* is used to denote the, mostly Parisian, masters of the late thirteenth and early fourteenth century who wrote on grammar, logic, and metaphysics. They worked within a tradition that had its origin in ancient Latin grammar but had undergone considerable change under the influence of the work of scholars such as Robert Grosseteste, Peter Helias, Robert Kilwardby, and many anonymous commentators on Priscian (± 500), the author of the *Institutiones grammaticae*, the standard textbook for the study of Latin during the Middle Ages. The first representatives of the modist school were the Danish grammarians Boethius and Martin of Dacia (± 1270), but the most important author was Radulphus Brito (± 1290). The last significant member of the group was Thomas of Erfurt (± 1300), whose work *Grammatica speculativa* is considered the most complete modistic treatment of grammatical theory available (Bursill-Hall 1971; Thomas of Erfurt 1972; Pinborg 1982; Rosier 1983).

In the early Middle Ages, grammar was one of the seven liberal arts, the most important of which were the arts belonging to the so-called *trivium*: grammar, logic, and rhetoric. Grammar was the art of speaking well, vocal expressions being its object. After the recovery of Aristotle's *Posterior Analytics*, however, the ideas about grammar changed: grammarians now wanted to make grammar a science. This scientific approach to grammar was called "speculative grammar" (Bursill-Hall 1971). Taking seriously Aristotle's requirements for the construction of a scientific theory, the *Modistae* were looking for universal and immutable objects that could function as the foundation of their science. Since speech

differs from one language to another, vocal expressions could no longer constitute the immutable objects of a universal grammar. Thus, grammarians became philosophers, speculating about the universal features of language, in particular, the construction of linguistic expressions. The *Modistae* were interested in the meanings of words in so far as these meanings constitute grammatical categories, such as nouns, verbs, cases, or tenses, the so-called modes of signifying (*modi significandi*). The modes of signifying were the principles of grammar.

According to modistic analysis, words acquire their meaning by a deliberate act of imposition (*impositio*; Knudsen 1982). In a first imposition, a sound (*vox*) is connected with a referent. The relation between sound and referent is called the *ratio significandi*. The result of this coupling of expression and meaning is a so-called *dictio*, which is not yet a word or term in the logical sense, but rather a lexeme (Pinborg 1972). This lexeme can become a term and part of speech when it has received, as a result of a secondary imposition, a number of modes of signifying. The following example may help to make this clearer. The English word “drink” would be a manifestation of the lexeme “drink,” which includes all occurrences of the word “drink,” “drinker,” “drinking,” etc. For this lexeme to become a particular term or part of speech (*pars orationis*), as in “drinks are served at the bar,” several modes of signifying are necessary, in this case the modes of noun, plural, and nominative case. It is clear, then, that the object referred to by the lexeme is not a particular thing, but a more or less abstract content not yet determined in a category. Now the modes of signifying prepare the lexeme for various syntactical functions. Each lexeme has one essential mode of signifying and various other modes. The essential mode determines to which fundamental grammatical category it will belong, for example, noun or verb, whereas other modes provide it with less basic grammatical features, such as tense, case, or number.

As a result of their philosophical background, the *Modistae* believed that there is a structural parallel between language, thought, and reality,

but unlike philosophers they were not interested in truth conditions of sentences, but in the construction of linguistic expressions (Rosier 1994). Such a construction is a union of two parts of speech (*partes orationis*), for example, a noun and a verb, or a noun and an adjective. Each part has its own modes of signifying. A construction is well formed if the modes of one part of speech are compatible with the modes of the other part, for example, a part of speech with the modes of signifying of noun, plural and accusative case, would in many cases be compatible with another part of speech with the modes of participle, and present tense, as in the expression “selling books.”

Although the aim of speculative grammar was to describe relationships between linguistic elements, the *Modistae* had to take the structure of reality into account. To ensure the scientific status of their doctrine, they needed an ontological foundation (*fundamentum in re*) of the modes of signifying. Being moderate realists, the *Modistae* assumed that the structure of reality is mirrored in language and thought. As the necessary ontological counterparts of the modes of signifying, they introduced the modes of being (*modi essendi*), which they considered to be accidental properties of the extra-mental objects, as distinct from their substantial form. Furthermore, since modes of being cannot be signified without being understood, a mental counterpart was needed: the modes of understanding (*modi intelligendi*), i.e., our concepts. The modes of signifying correspond with the modes of understanding, and through these they find their ontological foundation in the modes of being. This modistic “triangle of modes” is in accordance with the traditional interpretation of Aristotle’s *De interpretatione* chapter 1, according to which words signify concepts and concepts are natural likenesses of extra-mental objects. Later philosophers criticized the modists for confusing linguistic distinctions with real ones (Pinborg 1982), but this confusion was a consequence of their Aristotelian conception of science.

The grammatical theory of the modes of signifying also determined the modistic outlook on logic (Pinborg 1975a). The *Modistae* were

interested in metalogical questions about the status of logical concepts. In their view, logic should be considered not as an art, as in the tradition of the liberal arts, but as a science, and what holds for grammar also holds for logic: if it is to be a science, its object must be immutable and eternal. In the case of logic, this object appeared to be the second intention. Second intentions are concepts of a certain kind, which are supposed to be universal and objective and to have a foundation in reality (*fundamentum in re*), for example, “genus,” “species,” “proposition,” and “syllogism.”

Thomas Aquinas and other intentionalists in the Middle Ages considered second intentions as second order concepts (concepts of concepts) and first intentions as concepts of extra-mental things. The *Modistae*, however, were of the opinion that second intentions are only secondary in the sense that they presuppose first intentions. Both first and second intentions are first order concepts, in their view. Moreover, an intention is a concept as well as the foundation of its content; it can be every extra-mental object as far as it is known, for example, a man as conceived (De Rijk 2005). This reflects the epistemological view that the human intellect grasps extra-mental objects through concepts that designate these things, including the ways in which they are conceived.

First and second intentions result from the operations of the intellect in the following way. The act of apprehension produces first intentions like “man” and “animal” and second intentions like “genus” and “species”; the act of judgment generates first intentions like “man is an animal” and second intentions like “conclusion” and “proposition”; and the act of reasoning brings about first intentions like “every man runs, Socrates is a man, therefore Socrates runs,” and second intentions like “syllogism” (Pinborg 1975b). The second intentions are the proper objects of logic, according to the *Modistae*, but the most interesting question is: how do they see the extra-mental foundation of these concepts? Here, the modes of being appear to be useful again.

Both first and second intentions are drawn from the modes of being (*modi essendi*) of extra-mental objects: first intentions from the proper

modes of being and second intentions from the common modes of being. Second intentions conceive and signify extra-mental objects under a common mode of being. In this process, the intellect and the object cooperate, for example, the extra-mental object man has a proper mode of being from which the first intention “man” can be drawn and a common mode of being which is the foundation of the second intention “universal.” The accidental properties (of being) of the extramental object man are the foundation of the concepts “man” and “universal.” Logicians consider things according to their common modes of being. Therefore, second intentions are their primary object of study (De Rijk 2005).

The theory of second intentions sketched above is the version of this theory that can be found in the work of Radulphus Brito. In his view, all second intentions have a relation to the real world, although it is less clear how this works in the case of conclusions and syllogisms, which seem to be examples of mental constructions. Anyhow, the Modists’ views on grammar and logic are formed by the same intention: to make sciences out of these liberal arts. In both cases, their inspiration was Aristotle’s conception of science and its focus on the immutability of scientific objects. Their opinions were severely criticized by later philosophers (De Rijk 2005), but their foundation of logic and grammar in reality was an expression of the intellectual climate of the end of the thirteenth century.

conceptualized a moral dilemma to consist of a pair of contradictories, where an agent must select between an act and its omission, both of which are morally prohibited or sinful. The high level of theorizing about moral dilemmas in the medieval period occasioned the gradual development and clarification of a variety of moral principles that are still discussed in present-day philosophical literature. These principles include “ought implies can,” “always choose the lesser evil,” and the principle of double effect. Discussing moral dilemmas became standardized with the practice of producing commentaries on Peter Lombard's *Sententiae*. Distinction 39 of Book II of that magisterial theological textbook became the *locus classicus* for discussions of *perplexitas*, and the issue also surfaced as a popular topic in quodlibetal disputations. The medieval debate over the existence of moral dilemmas was largely interdisciplinary, as earlier canon law theorizing greatly influenced later discussions among theologians and philosophers. The legal tradition provided thinkers not only with a distinctive terminology but also supplied many stock examples for discussion that at times featured agents in unusual situations.

M

Moral Dilemma Theory

M. V. Dougherty
Philosophy Department, Ohio Dominican
University, Columbus, OH, USA

Abstract

Many philosophers, theologians, and canonists in the Latin West during the twelfth through fifteenth centuries regularly considered whether an agent could ever face a necessary choice between sinful options. This medieval theorizing about the possibility of inescapable moral wrongdoing was usually framed in terms of whether an agent ever experiences genuine perplexity (*perplexitas*) or is genuinely perplexed (*perplexus*). Medieval theorists often

Development of the Concept of *Perplexitas*

The beginning of serious theorizing about the problem of moral dilemmas in the medieval period arose in the canon law tradition with the appearance of Gratian's masterwork, the *Decretum*, in the mid-twelfth century. In distinction XIII of that famous legal textbook, Gratian advised that no exemption from the natural law is allowable except perhaps for agents who find themselves obliged to select from a pair of evils. Appealing to authorities (including Gregory the Great), Gratian argued that agents in such situations should always choose the lesser evil. Opposition to Gratian's position appears to have been swift, as the influential multi-authored commentary on the *Decretum*, the *Glossa ordinaria*,

severely criticized the master of canon law for this position, on the grounds that all wrongdoing must be voluntary and all ordinances must in principle be capable of being fulfilled by agents. The opposed positions of Gratian and the Glossators were reflected in the two accepted senses of the Latin term *perplexitas*. Gratian emphasized the metaphysical sense of the term as “entanglement” or “ensnarement,” and the Glossators emphasized the epistemic sense of the term as “confusion” or “doubt.” Against Gratian, the Glossators contended that agents who believe themselves to be in moral dilemmas are really only confused, and such agents should overcome their ignorance or foolishness to see that there is always a morally blameless or morally permissible course of action for every situation.

Gratian and his Glossators became the two most significant authorities for all subsequent medieval theorizing about moral dilemmas. Their opposed positions were frequently invoked by later discussants of moral dilemmas in the centuries that followed. In the 1200s, canon law theorizing and its general supply of stock cases of *perplexitas* slowly and gradually migrated to theology. By the early thirteenth century, the wholesale appropriation of this portion of the canon law tradition by Latin theologians was complete. The first major systematic and substantive exposition is found in the *Summa aurea* of William of Auxerre, which was followed then by a similar treatment in the Franciscan compendium attributed to Alexander of Hales, the *Summa Halesiana*. Both works analyze alleged cases of moral dilemmas involving agents who are seemingly entangled between sinful options. Later medieval discussions appearing in works of various genres, such as Antoninus of Florence’s *Summa*, Johannes Capreolus’s *Defensiones*, or John of Freiburg’s *Summa confessorum*, still framed the issue in light of the opposed authoritative positions of Gratian and the Glossators.

Thomas Aquinas is strangely silent about Gratian and the Glossators in his account of moral dilemmas. He argues that an innocent agent will never be unqualifiedly perplexed (*perplexus simpliciter*). Nevertheless, a prior fault (e.g., an infelicitous vow, or a badly formed

conscience, or an unrepented sin) can make the fulfillment of future obligations impossible, and such an agent can be said to be qualifiedly perplexed (*perplexus secundum quid*). In his discussion of a stock example heavily discussed in the canon law tradition, Aquinas notes that an unrepentant priest who persists in fornicating cannot fulfill his obligation to say mass worthily while remaining in a state of sin. Such situations constitute self-imposed, prior-fault dilemmas, and agents in them should rectify the bad effects of their previous wrongs to fulfill their future impending obligations. In this particular case, Aquinas notes, the priest should simply repent to solve the situation of *perplexitas*.

Moral Dilemma Strategies

Gratian’s famous advice for agents who find themselves in situations of unavoidable wrongdoing was to choose the lesser evil. Gratian had indicated that determining which of two evils is greater, and which is lesser, is an exercise of reason, and later commentators understood Gratian to be distinguishing between the traditional categories of moral failure known as mortal sin and venial sin. Even within the more serious category of mortal sin, the longstanding tradition of the seven capital vices – the so-called deadly sins – implied a hierarchical ordering where even greater and lesser mortal sins could be determined. Following the Glossators, the great majority of medieval theorists considered moral dilemmas to be simply epistemic, that is, to be simply the result of the ignorance and confusion on the part of agents. Their recommendation to perplexed agents was that they should increase their knowledge by asking for advice from the wise, consulting the scriptures, and the like. In contrast, Ramon Llull provides a striking autobiographical defense of the existence of genuine moral dilemmas and offers a distinctively theological resolution. In his *Vita coetanea*, Llull discusses his own situations of *perplexitas*, and he depicts them as being resolved through divine interventions that follow from petitionary prayer.

Moral Principles

Medieval theorizing about the possibility of moral dilemmas prompted detailed consideration of various moral principles, such as the above-mentioned principle of the lesser evil. Another principle, expressed today as “ought implies can” can be found in a variety of notable medieval formulations, such as “no one is obliged to do the impossible” or “it is always possible to avoid sin.” Theorizing about moral dilemmas also occasioned discussions of related philosophical topics such as free will, culpability, the conditions of voluntariness, the possibility of virtue, as well as fundamental theological issues including judgment, salvation, and damnation.

One frequently-discussed stock example of *perplexitas* occasioned the development of the principle of double effect. The example involves an agent who is questioned by an unjust aggressor regarding the whereabouts of an innocent party. In various formulations, the agent is described by many medieval theorists as *perplexus* between the sinful prongs of (1) committing the venial sin of lying to the unjust aggressor in order to shield the innocent party, or (2) committing the mortal sin of revealing the whereabouts of the innocent party by answering truthfully. A common response by some theorists, likely inspired by St. Augustine’s influential writings on the topic of lying, holds that an agent can maintain silence in such a scenario without sin, on the justification that any foreseen but unintended evils that may befall the innocent party because of the silence will fall entirely outside the agent’s ambit of moral culpability and will be credited to the unjust aggressor alone. Solutions of this type provided an early formulation of the principle of double effect, as they explicitly required a determination what is outside the intention (*praeter intentionem*) of the agent.

Later Theorizing

Much of the medieval theorizing on moral dilemmas, including the collection of standard cases of *perplexitas* treated by medieval

philosophers and theologians, resurfaced among ethicists of the early modern period, when great attention was placed on the problem of moral uncertainty. Defenders of the moral theory of probabilism incorporated many of the examples and distinctions of the earlier period, and in this later reincarnation of the medieval debate the canon law origins of the medieval discussion largely fell from view.

Moses Maimonides

Howard Kreisel

The Goldstein-Goren Department of Jewish Thought, Ben-Gurion University of the Negev, Beer Sheva, Israel

Abstract

The article deals with the leading Jewish philosopher of the Middle Ages, Moses Maimonides. It provides an overview of the topics he deals with in his treatise, *The Guide of the Perplexed*. These topics include the nature of God, the creation of the world, miracles and prophecy, the problem of evil, providence, and human perfection.

Biographical Information

Moses Maimonides (b. 1138, Cordoba; d. 1204, Cairo) was not only the most important Jewish philosopher of the Middle Ages, but one of the greatest scholars of Jewish Law of all ages, and a leading physician in his period. He also served as head of the Jewish community in Egypt. Maimonides' philosophy finds expression not only in his treatise, *The Guide of the Perplexed*, but also in his legal writings, most notably the opening chapters of the *Mishneh Torah* and in some sections of his *Commentary on the Mishnah*, in some of his medical writings, such as *Medical Aphorisms*, and in some of his epistles, such as *Treatise on Resurrection*. In this article I will confine myself to Maimonides' thought as it emerges from the *Guide*.

Philosophy

The Guide of the Perplexed: An Overview

Maimonides' *The Guide of the Perplexed* is not a philosophical work in the strict sense of the term. His primary intent in writing this treatise is not in order to expand the borders of philosophical knowledge or to explore topics on the basis of reason alone. It is closer in spirit to theology, defining and rationally defending basic religious tenets. Yet it is far different from the classic works belonging to this genre, such as Thomas Aquinas' *Summa theologiae* which is far more systematic in its presentation. The *Guide* devotes as much attention to the interpretation of Scriptural verses and passages from rabbinic texts as to rational argumentation and the rationale behind the order in which it presents its topics and the manner in which they are presented is not always evident.

In the introduction to his treatise Maimonides indicates that he wrote it for the individual who was steeped in Jewish tradition and went on to study philosophy, becoming in the process perplexed by the seeming contradictions between these two areas. Such an individual often feels that he is faced with an either/or choice – either to remain loyal to religious tradition at the expense of human reason or to abandon tradition in deference to reason. Maimonides sets out to show that there is another alternative – the reinterpretation of traditional texts in light of reason. Tradition hides certain profound truths from the masses by presenting them in a figurative manner in accordance with their limited capacities. Maimonides is very much influenced in this matter by the Platonic political tradition, particularly as developed by the Islamic philosopher al-Fārābī. Most people are not prepared to appreciate the bright light of the truth and are blinded by it instead. Only with the attainment of wisdom does one begin to appreciate the truths underlying the Bible and rabbinic writings and understands that not all their words should be interpreted literally. Certain terms have figurative meanings and the prophets often speak in allegories. The corporeal descriptions of God, for example, are meant to uphold the masses' belief in God, since they can only accept the existence of corporeal entities.

In truth, however, all these descriptions should be interpreted in a figurative manner. Maimonides feels that the time was ripe to reveal the truth of God's incorporeality to all the adherents of Judaism and insist that they uphold this belief. Many other topics, however, must continue to be presented in a veiled manner – for example, the Account of Creation at the beginning of the book of Genesis and the Account of the Chariot at the beginning of the book of Ezekiel – in order not to disturb the faith of the masses.

Maimonides explicitly indicates that while he will attempt to further enlighten his readers on the true meaning of traditional texts dealing with the most profound topics pertaining to Jewish thought, he will at the same time uphold the spirit of the prohibition not to present these truths explicitly but only hint at them. One of the techniques he employs is that of purposeful contradictions in his treatise in order to hide what he regards as the true view. Another is the diffusion of remarks hinting to his true view on a given topic in the context of his discussion of a different topic. Thus, to reconstruct Maimonides' position on a given topic, it is important not only to pay close attention to the manner he presents his positions and the premises underlying them, but also to study the treatise in its entirety and not only the chapters pertaining to the topic in question. Maimonides assumes that the average reader is an inattentive reader who will not pick up on his hints. His writing technique, however, has resulted through the centuries in far different interpretations of the views he presents in his treatise.

From Maimonides' introduction it is tempting to conclude that he sees the esoteric level of the traditional texts of Jewish tradition as being in essential agreement with the Aristotelian philosophical conception of the world, while on their exoteric level they appear to contradict the worldview of the philosophers. Otherwise why would he go to such extremes to hide his true views? This indeed has been the thrust of one important school of interpretation of the treatise throughout the ages, whose most famous modern exponent has been Leo Strauss. Yet in the *Guide* itself much of the most significant *philosophical* argumentation goes to proving that the philosophers accepted

doctrines not demonstrably proven by reason and the traditional doctrines are in fact more in harmony with the dictates of reason. This is particularly true of Maimonides' discussion of the creation of the world, which will be discussed in more detail below.

Maimonides divides his treatise in three sections. Many of the chapters of the first section form a philosophical lexicon, for the most part devoted to showing how terms connoting God's corporeality or the corporeality of the angels should be interpreted figuratively. He also deals with the problems involved in attaining philosophical knowledge and the limits of human reason. Beginning with Chap. 50 of the first part he enters into a detailed discussion of divine attributes and the names of God. He also presents his view of God's relation to the world. All the positions he presents are in harmony with the Neoplatonized version of Aristotelian philosophy prevalent in his period. Maimonides concludes the first part by expounding in detail the proofs for the existence, unity, and incorporeality of God as presented in Moslem theology, the *kalām*, after depicting its fundamental premises. While he displays an exceptionally critical approach to this theology, particularly the premises upon which it is based, for the most part regarding them as false, he nevertheless ascribes to it an important role in proving God's existence. The theologians prove God by first proving that the world is created. Maimonides argues that their proofs for creation are not demonstrative, resulting in their proofs for the existence of God being non-demonstrative. The Aristotelian philosophic proofs for the existence of God, on the other hand, are based on the premise that the world is without beginning. This too in Maimonides' view has not been adequately demonstrated. We have then two sets of proofs for God based on contradictory propositions – that is, the world is created and the world is without beginning. Neither set provides us with a demonstrative proof for God's existence. Yet if we combine both sets we have a demonstrative proof, since the world must be either created or without beginning, there is no third alternative. If we assume that the proofs for the creation of the world are correct, then the *kalām* has provided

us with a demonstrative proof for the existence of God. If we assume that the proofs for eternity *a parte ante* of the world are correct, then the Aristotelian philosophers have provided us with a demonstrative proof.

Interestingly, Maimonides analyzes the philosophic proofs and the 26 premises upon which they are based at the beginning of the second part of the treatise, rather than at the end of the first. As opposed to his approach to the *kalām* he expresses full agreement with all the philosophic premises with the crucial exception of one – that time and movement are eternal and always existed in *actu*. In the following chapters of this part (Chaps. 2–12) Maimonides proceeds to express his agreement also with the Aristotelian view how God governs the world through the order of nature and shows how Scripture should be interpreted accordingly. All physical changes in the world result from the fixed motion of the living spheres, each standing in relation to a Separate Intellect, with God serving as the First Cause and the Unmoved Mover on the pinnacle of the hierarchy of existence. The one point on which Maimonides breaks with the view of the philosophers is on the question of creation. The philosophers claim that the world with its fixed order always existed, God serving as the eternal First Cause of an eternal world eternally emanating from Him. Maimonides claims that God created the world and its order *ex nihilo*. Chapters 13–31 are devoted to negating the philosophic arguments for the eternity of the world and providing philosophic and religious arguments for its creation. Maimonides also discusses the question whether the world is eternal *a parte post* and presents his philosophic exegesis of the Account of Creation. In the context of this discussion he deals with the problem of miracles (Chap. 29). He concludes the second part of the *Guide* with an analysis of the phenomenon of prophecy (Chaps. 32–48), drawing a sharp distinction between this phenomenon, for the most part treated by him as a natural one, and two other phenomena which he treats as supernatural – the prophecy of Moses and the Revelation at Sinai. One can see that the acceptance of the doctrine of creation allows Maimonides to break with the

Aristotelian philosophers, at least according to his explicit views, on the issue of purposeful exceptions to the natural order. Only the God of creation can also be the God of history, though Maimonides attempts to limit the occurrence of miracles and God's immediate involvement in human affairs.

The third part of the *Guide* opens with a philosophical exegesis of the Account of the Chariot (Chaps. 1–7), treating Ezekiel's vision of the heavenly world as essentially presenting the order of the spheres and their Movers and their influence on the four sublunar elements – that is to say the scientific picture of the world – in an allegorical manner. The next topics that Maimonides discusses are the problems of evil, personal providence, and God's knowledge of particulars. He also presents a philosophical analysis of the Book of Job (Chaps. 8–24). He continues with a lengthy excursus of the reasons for the divine commandments presented in the Pentateuch (Chaps. 25–50), and concludes the *Guide* with a discussion of human perfection (Chaps. 51–54).

God

In his discussion of God's essence Maimonides combines Neoplatonic and Aristotelian ideas. Maimonides' God is the absolute One from whom all positive attributes must be negated. These not only include attributes belonging to the Aristotelian categories pertaining to material beings, such as quantity, quality, place, time, relation etc., but even such attributes as living and powerful. Anything that entails change or multiplicity in God cannot be ascribed to Him. For Maimonides all corporeal descriptions of God in Scripture should be interpreted figuratively and all positive attributes attributed to God should be understood as either negative attributes or attributes of action. When Scripture says, for example, that God is alive and powerful, the intent is not to attribute the attributes of life and power to God but to indicate that God is not dead or powerless. Descriptions of God as merciful or vengeful are not meant to ascribe to Him these human emotions but to describe the divine actions which when translated into the human sphere are most often

seen as stemming from such emotion. Hence, war and famine are ascribed to divine wrath, while plentiful crops are traced to divine mercy. Numerous and even contradictory actions, Maimonides argues, can stem from a single essence without entailing multiplicity, just as fire by virtue of a single quality blackens, bleaches, cooks, burns, melts, and hardens.

Together with the doctrine of negative attributes Maimonides appears to maintain the view that God lives, knows, and is powerful in some positive sense. His solution to the problems raised by this position is to argue that God lives, but not through life; knows, but not through knowledge, etc. That is to say, in reference to God these are not attributes superadded to the divine essence but all are one with the essence. God's knowledge, thus, is totally different from our knowledge, having nothing in common with it, and hence completely incomprehensible to us.

Maimonides' God is also Avicenna's Necessary Existent. Like Avicenna, Maimonides treats existence as an attribute superadded to essence. God is the one existent whose essence necessitates existence. All other existents attain their existence from an external cause; hence, their existence is only possible by nature. If their cause did not bring them into existence they would not exist.

In addition to viewing God as the absolute One who possesses no positive attributes and whose essence is unfathomable, as well as the Necessary Existent, Maimonides continues to uphold the Aristotelian view of God as Self-intellecting intellect, thereby treating God's essence as intellect. According to Maimonides, God's self-intellection encompasses all existence in a single thought, since God is the cause of all existence. The transcendent deity is at the same time the ultimate efficient, final, and formal cause of the world, the world being regarded by him as a single organism. Maimonides insists that while the world's existence is completely dependent upon God – the world could not exist even for a fleeting second without God existing – God's existence is in no manner dependent upon the world. All apparent contradictions entailed by these diverse

views of God are reconciled by God's absolute, unfathomable "otherness."

Creation

At the outset of the discussion Maimonides presents three fundamentally different views on this issue: the traditional view treating the world in its entirety as created *ex nihilo*; the Platonic view that the world is created from eternal matter since creation *ex nihilo* is regarded as absolutely impossible; the Aristotelian view that the world existed without beginning with God as its source. Since the Platonists, like the Aristotelians, posit some form of eternal state to the world, Maimonides feels that it is sufficient to tackle the more rigorous arguments of the Aristotelians on this question and ignore the Platonic approach. Maimonides maintains that while the Aristotelians have presented many arguments in support of their view, none of them is demonstrative. He summarizes and critiques the known philosophic arguments for eternity showing that each suffers from a major flaw. The philosophic proofs are either predicated on the laws of physics, such as every motion must be preceded by a motion, hence motion is without beginning, or on theological premises, such as creation entails a change in God, while it has been demonstrated that God is not subject to any form of change. Against the former set of proofs Maimonides argues that physical laws came into being with the creation of the world and do not reflect the state of affairs prior to creation. In other words, they are natural laws, and not logical ones, which God introduced when creating the world. The theological proofs for eternity are regarded by Maimonides as more compelling since they are based on the nature of the Deity. He argues that the act of creation does not entail the movement from potentiality to actuality, nor does the act of willing after not willing entail a change of essence since this is the essence of will – that is to say, to will or not will. Only if we posit external factors influencing the divine will would this entail a change in God. The argument that just as God's wisdom, which mandated the creation of the world is eternal so must the world be eternal is dismissed by Maimonides on

the grounds that we do not fathom the divine wisdom which may have mandated the creation of a non-eternal world.

Maimonides concedes that his critique of the philosophic arguments does not in itself constitute a proof for creation, it only shows that creation is possible from a philosophic perspective. Maimonides presents one dialectical argument for creation which he finds rationally compelling, one based on the notion of “particularization” – that is to say, the peculiarities exhibited by the heavenly order which indicate that they are a product of design. While the Aristotelians, according to Maimonides, can provide a true explanation for the lack of uniformity in the entities of the earth, they have no convincing explanation for the lack of uniformity in the size of the planets or the differences in their motion. Since these particulars cannot result from natural necessity – the matter of which the heavenly bodies are composed is completely uniform – they must be the product of one who particularized them in this manner. This in turn entails their creation. Maimonides is aware that one can still argue that God may have particularized them in this manner from eternity. His rejoinder is that the eternity of the world entails necessity, eternal creation being an oxymoron, and only by positing the world’s creation from a state of absolute nonexistence, can one explain those particularities of the heavenly order that reflect divine purpose and will.

A version of this argument was already brought by al-Ġazālī in his *Incoherence of the Philosophers* with a critical difference. Al-Ġazālī tries to show that there are aspects of the heavens that reflect the workings of absolute will that can choose between alternatives that are completely alike from the perspective of reason. This proves the existence of a divine will which has in its power the creation of a world when it wills, though there is no rational reason why it chose to create it when it did as opposed to any other possible moment. Maimonides treats the creation of the world with all its peculiarities not only the result of will but also purpose and wisdom. There is for him a rational reason for all the particularities of the heavenly order and they are not the product of will alone. According to

Maimonides, the eternity, hence the necessity, of the world does not leave room for the designing of a heavenly world in which all its non-standardized particulars are the product of wisdom.

To the philosophic arguments in favor of creation Maimonides also brings a list of theological arguments. Creation is in harmony with the literal meaning of the Torah, which should be maintained when there is no demonstrative argument against the literal reading. Moreover, only by positing creation can we explain why God granted certain individuals prophecy and why He gave a certain nation the divine law and why He legislated certain prohibitions. A world governed by natural necessity provides no answers to these questions – in short, it leaves no room for revelatory religion.

The God of Nature Versus the God of History: Miracles and Prophecy

While the doctrine of creation leaves open the possibility of miracles, Maimonides takes pains to argue their limited occurrence. God created a perfect natural order; hence, there can be no permanent changes in nature. Nature, and not miracles, is regarded by Maimonides as the true expression of divine wisdom. Miracles are rare, temporary disruptions in nature. Moreover, Maimonides suggests that miracles are in some manner implanted in nature at creation, God experiencing no change of will after the creation of the world. This view entails that nature is created also to meet certain historical exigencies.

Prophecy is treated by Maimonides as a completely natural phenomenon. Only the person who possesses a perfect intellect and imagination can receive prophecy. Maimonides does introduce an element of divine will in dealing with this phenomenon by maintaining that God can intervene and withhold prophecy from one who is worthy, just as the case with miracles in general, which disrupt the natural functioning of the order. Yet God, Maimonides, argues, never bestows prophecy to one who does not possess all the necessary qualifications. Whether Maimonides, in fact, believed that God ever intervened in the process, or whether he added this point to mask

his complete agreement with the Aristotelian position, is a subject of debate among his interpreters.

Prophecy itself is not defined as a message from God but rather an emanation from God to the Active Intellect and from there to the rational faculty of the individual and to the imagination, resulting in seeing theoretical truths in figurative form, or learning principles of governance, or viewing the future. Maimonides' account appears to allude to the view that God does not bestow a particular vision on the individual but the emanation strengthens the individual's own rational and imaginative faculties, thereby providing the person with a vision regarding matters that he was thinking about. This interpretation is strengthened by the fact that Maimonides in his discussion of prophecy speaks also of an emanation from the Active Intellect to the rational faculty alone due to the weakness of the imagination which results in the person becoming a philosopher, and the emanation to the imagination alone, characterizing politicians and diviners. Prophecy thus appears to be a completely natural phenomenon, just as the other phenomena are. Even the prophetic mission is explained by Maimonides in terms of an emanation that is so strong that the prophet feels compelled to extend his perfection to others. Maimonides notes that a similar phenomenon occurs by philosophers, leading them to write books and teach others. The prophetic mission for Maimonides essentially is the result of internal compulsion as a result of the prophetic experience rather than an explicit command from the Deity.

The two phenomena most closely associated with the revelation of the Divine Law, however, are removed from the category of normative prophecy. Maimonides treats both the Revelation at Sinai and the prophecy to Moses as *sui generis*. His discussion suggests that Moses received his prophecy directly from God. Whether Maimonides' God is a deity who, in fact, acts directly in history, even if only on exceptionally rare occasions, has been a subject of debate among his interpreters through the ages. It is clear at any rate that Maimonides felt it crucial to preserve this conception of God in order to preserve the nation's faith in the notion of God as the immediate author of the Divine Law.

The Problem of Evil, Providence, and Human Perfection

In its classic formulation the problem raised regarding the existence of evil is: Why does a good, all-powerful and all-knowing deity create evil or even allow evil to occur – whether the evil consists of natural disasters, disease, or the evils humans perpetrate against each other. In other words, why are the innocent allowed by God to suffer while we often see the evil flourish. Maimonides addresses this problem but he is much more interested in reformulating it. Rather than a problem that questions God's goodness or power, it is a problem Maimonides transforms into a call for action on the part of human beings to recognize the true nature of the evils that affect them and adopt a course of action to limit these evils as much as possible.

The problem of why God creates evil is solved by Maimonides by considering all evils as privations of the good, that is to say, privations in that which exists rather than something existent in its own right. They indicate a lack of a quality, such as blindness is a lack of sight or death is a lack of life, and are not something positive. What does not exist cannot be said to be created; hence, God does not create evil but creates entities lacking certain qualities. This argument appears to be begging the question, for then the problem arises why God does not create a world without privation, a world without floods and earthquakes, diseases and deformities, etc. Maimonides indicates that the essence of earthly matter is characterized by privations and change which allows for the world's continuity. His answer suggests that anyone who asks why God does not create a world without natural evils or even human evils is asking why God created the world at all, for such evils inevitably characterize earthly matter. Underlying this answer appears to be a view of divine plenitude. A world which is characterized by all possible levels of existence – form without matter (Separate Intellects), form with changeless matter except for motion (the spheres), and form with matter in a state of constant generation and corruption (the existents on the earth) – is more complete or perfect than a world lacking one of these levels. A perfect world then

inevitably contains evils consequent upon earthly matter.

The real problem thus becomes what humans can do given this state of affairs. The answer is that they can recognize the nature of the hierarchy of existence and their place in it. More important they can recognize the nature of true human perfection and strive to attain it, in the process avoiding many of the evils that normally affect them. Maimonides points out that there are three types of evils affecting human beings. The first and least prevalent from Maimonides' standpoint are natural evils, such as natural disasters or the death of infants. Maimonides' earlier discussion of the phenomenon of prophecy suggests that even many of these evils may be avoided by advanced knowledge of the future. For example, knowing in advance when a flood will occur allows for saving oneself from the flood. Far more prevalent than this type of evil are the evils humans perpetrate against each other. Given the fact that these evils result from human choice, it is clear that it is in our hands to avoid practicing them.

The most prevalent type of evil, however, is neither of these two, but the evils the individual perpetrates against himself. For Maimonides, any action that brings the individual a step away from perfection is an evil; every action bringing one closer to perfection is good. Human perfection lies in putting an end to our greatest privation, the privation of knowledge, specifically knowledge of God and the manner of divine governance of the world. It lies in adopting a life of moral virtue in order to free oneself from the slavery of one's passions and live a life of intellect. In short, we practice evils against ourselves and others because of a lack of knowledge, which in turn leads to our maintaining a false value system by which we allow ourselves to be ruled by a craving for physical pleasures, jealousy, feelings of honor, etc. without realizing that all these goals are essentially meaningless and distance us from true perfection. A world united in the desire to attain knowledge of the one God, according to Maimonides, is one in which people will no longer practice so much evil against others and against

themselves. The problem of evil, thus, is one that demands of us to stop asking why God does not do more to create a better world for human beings, but what we should be doing in order to create such a world and achieve true human perfection.

On the issue of divine providence Maimonides at first glance adopts a radical interventionist view of God's activity in the world. Nothing, either good or bad, happens to human beings that does not constitute their just deserts in consequence of their freely willed actions. He rejects the view of the Epicurians who maintain that everything in the world happens by chance as well as the view of the Moslem theologians belonging to the Ash'ariyya who maintain that everything that happens in the world, including all human actions, result from divine decree. The view of the Mu'tazilite theologians that God exercises providence over all beings, not only humans, but human beings enjoy some limited form of free will is also rejected. The same is the case with the Aristotelian view that God exercises providence only over the species – by the instruments he gives to each to preserve one's life and to propagate the species – and not over individuals of the species, whose circumstances are governed by chance. Maimonides' own position is closest to the Aristotelian view with the critical proviso that in the case of human beings, as opposed to all other species, God exercises providence over all individuals and nothing happening to them should be attributed to chance. His view that the "otherness" of God's knowledge allows the Deity to know all particulars through all time without this knowledge necessitating change or plurality in God on one hand, nor human determinism on the other, serves to bolster this view of providence.

Maimonides' approach to divine providence, however, undergoes a subtle and radical change as his discussion unfolds, essentially moving him even closer to the Aristotelian position. He maintains that the degree of providence that humans enjoy is in direct proportion to the perfection of the intellect. One who does not develop one's intellect is in fact subject to the vicissitudes of

chance, just as the case of the individuals of all other species, and enjoys no special protection. His view suggests that the intellect itself is the basic instrument of divine providence. A person who perfects the intellect adopts a lifestyle which minimizes the evils that befall human beings since this person does not indulge the appetites leading to physical and psychological maladies, is satisfied with little and maintains a moral equilibrium. The individual attaining perfection may also acquire prophecy allowing him or her to foresee impending evils that others wish to perpetrate, or impending natural disasters, allowing the individual to take the proper precautions for avoiding them. Most important, one of perfect intellect realizes that all evils connected to corporeal being – whether they affect his possessions, family, or body – have no real significance, hence the individual should not feel psychologically affected by them. Thus, the evils that befall the imperfect individual by chance may be said to be this person's "just deserts" for not striving to attain perfection. This interpretation of Maimonides' position is reinforced by his discussion of the book of Job which he treats as a philosophical parable. Satan represents the evils associated with matter that cannot affect the immortal soul of the individual. Job finally attains enlightenment on the nature of the world order, realizing that all the evils affecting him are inevitable aspects of God's wondrous created order. It is left to the individual to view these evils in the proper perspective and pursue what truly has lasting value – the true understanding of God and the world.

Maimonides concludes his treatise reiterating his philosophic approach to human perfection. He also alludes to the philosophic view that only those who attain the perfection of the intellect attain immortality, their intellect existing in its state of contemplation of the eternal truths through eternity. The ending of the *Guide* introduces an additional aspect of human perfection. Those attaining intellectual human perfection should also engage in extending their perfection to improving the surrounding society, just as God's perfection emanates to all existents by ordering their circumstances in an ideal manner,

thereby extending the divine goodness to all that exists. *Imitatio Dei* lies in living simultaneously a life of active contemplation and one of governing others in accordance with the perfection one has attained.

Mu'ammār ibn 'Abbād

David Bennett

Representation and Reality, Department of
Philosophy, Linguistics and Theory of Science,
University of Gothenburg, Gothenburg, Sweden

Abstract

Mu'ammār ibn 'Abbād (d. 830) was a prominent figure in the classical period of Mu'tazilism, a rationalist movement in Islamic theology. None of his works have survived, but he was frequently cited in later works of systematic theology; his philosophical positions may be assessed from extensive fragmentary testimony. His notoriety derives mainly from his original positions on causality and the inherent nature of things, positions which, even in the heterodox environment of the early Mu'tazilites, were considered frightfully deviant.

Biographical Information

Mu'ammār was a client, that is, a non-Arab associated with a tribal group – in this case, the Sulaym tribe in Basra. With other early Mu'tazilites, he flourished in Baghdad at the Abbasid court, celebrated in particular for his skills in the practical sciences; he had been an apothecary by trade. Indeed, few writings are ascribed to him on theological or philosophical topics (see van Ess 1993 [vol. 5]: 254). Although no subsequent thinkers adhered to his system in full, two of his students became well-known Mu'tazilites: Hishām al-Fuwaṭī and Bishr ibn al-Mu'tamir.

Philosophy

Mu'ammār's physical system was unique among the Mu'tazilites. Although he upheld the standard cosmological model of atoms (*jawāhir*; sing., *jawhar*) and accidents, their ontological status was not quite equal with respect to God. Once

atomic particles are combined into bodies (a minimum of eight particles), each otherwise indiscernible particle, according to and necessitated by its specific nature, produces (literally: enacts) the accidents particular to it (*Maqālāt* 303). Elsewhere, he is reported to claim that all accidents are acts of the (composed) body, proper to it. Unlike all of his contemporaries, Mu'ammār insisted that God does not enact accidents nor is He attributed with power over them (*Maqālāt* 405). The language of “action” challenged conventional views insofar as it suggested some sort of agency beyond the direct action of God (or humans). On the other hand, accidents are merely products of the nature of that in which they inhere; Mu'ammār's defenders (such as al-Khayyāt: see *Intiṣār* 46–47) could extricate him from accusations of impiety by reminding his detractors that God had, after all, created the atoms which had engendered the accidents.

As an interesting corollary to this way of thinking, Mu'ammār inadvertently anticipated the dispute about the “createdness” of the Qur'ān which wracked the intellectual community of the ninth century: for by his reckoning, the Qur'ān, insofar as it is a perceptible content, is the accidental product of a *jawhar* in which it inheres, be that “an angel, a stone, or a tree” (*Maqālāt* 405; see also 584). This position didn't sit well with anybody. Another result of this theory was that dream images could be analyzed as the production of nature particular to dreaming subjects, i.e., not implanted directly by God (*Maqālāt* 433).

Besides nature, Mu'ammār is most famous for a theory of *ma'ānī* (sing. *ma'nā*), a term that has proven difficult to translate from Arabic. Generally it is used to denote meaning in some way: either definitional meaning (the *ma'nā* of X is...) or the cognisable content inherent in things or in agents perceiving those things (as in Avicenna, later). For Mu'ammār, however, the term was used to indicate a differentiating factor provoking motion or rest in an underlying *jawhar* (*Maqālāt* 372–3). As such, *ma'ānī* were “causal determinants” (Frank 1967, although Frank's reading evolved thereafter) or reasons for a thing being one way or another. Moreover, each *ma'nā* is in turn determined by another *ma'nā* and so on

infinitely. These *ma'ānī* determine primarily motion and rest, but were evidently applied to all accidents by Mu'ammār.

Besides these views on the physical world, the sources indicate that Mu'ammār attempted to apply some of this reasoning to the operation of divine knowledge, instances of which were also determined by *ma'ānī* (*Maqālāt* 488). Acts of creation, too, involved infinite chains simultaneously manifested (*Maqālāt* 511). He was not, however, involved in most of the contemporary debates about God's attributes.

Mu'ammār presented a philosophical anthropology that requires further study. The human person itself seems to be a special case in his system: he describes it using the standard Mu'tazilite expression for an atom, that is, as an indivisible particle (*Maqālāt* 331) but also as a "substance" (*'ayn*), as a "soul" or "self" (*nafs*), and, confusingly, as a *ma'nā* unto itself (*Maqālāt* 405; for the previous terms, see van Ess 1993 [vol. 5] 272–4). The human person can act upon itself, but perception and extra-personal effects are determined by nature.

Mu'ammār's philosophical positions are encapsulated in many modern surveys of Islamic thought, but the most significant study remains Daiber's 1975 monograph; a more recent survey may be found in van Ess 1992 (English translation forthcoming), with a selection of fragmentary evidence translated into German and helpfully collected in van Ess 1993.

al-Mubashshir ibn Fātik

Emily J. Cottrell

Department for Religious Studies, Leiden University, Leiden, The Netherlands

Département des Sciences de la Foi et des Religions, Philosophie, Université de Fribourg, Fribourg, Switzerland

Abstract

Al-Mubashshir ibn Fātik was a scholar and patron of the Fatimid court in Cairo in the middle of the eleventh century. He studied medicine, astronomy, and history, and composed a lost *History* of the Fatimid Caliph al-Mustanshir (r. 1036–1094). His only book to have survived, *The Choicest Maxims and Best Sayings* (*Kitāb mukhtār al-ḥikam wa-maḥasin al-kalim* or *al-kilam*), gives 20 biographies of some of the main Semitic, Greek, and Egyptian figures of wisdom and prophecy (including the monotheized Alexander the Great). An important part of the biographical and gnomological materials may be compared with similar fragments attested in Greek literature. *The Choicest Maxims* was a medieval success, translated in

at least four European languages from the thirteenth to the fifteenth centuries.

‘Abū l-Wafā’ Mubashshir ibn Fātik (d. 480/1087?) is said to have been originally from Damascus and of Syrian descent. He was close to the Fatimid court during the reigns of the Fatimid Caliphs al-Zāhir (r. 411–427/1021–1036) and al-Mustanşir (r. 427–487/1036–1094) and would have married there a woman issued of the nobility (he himself belonged to the *arbāb* of the court, according to Ibn Abī Uṣaybi‘). According to Ibn al-Qifṭī and to Gerard of Cremona (who used the chapter on Ptolemy to compose an introduction to his translation of the *Almagest*), he had the title of prince (Arabic: *al-amīr*) and received further the honorific title of Praised by the State (*Maḥmūd al-Dawla*). He was probably an Ismā‘īlī, as the Fatimid court was then at the peak of its proselyte activity. Mubashshir may have been related to ‘Azīz al-Dawla Fātik al-Qā’id, the first Syrian governor on behalf of the Fatimids appointed by al-Ḥākim on Aleppo in 1017. Ibn Taymiyya, writing in the second part of the thirteenth century, mentions that Mubashshir ibn Fātik was close to Ibn al-Haytham and was a member of the court of the Caliph al-Ḥākim (r. 386–411/996–1021). Although we have no knowledge of the date of Mubashshir’s birth, it seems unlikely that he ever encountered al-Ḥākim except as a child. His association with the Fatimid court was probably a sufficient reason in the eyes of Ibn Taymiyya for condemning him as a *baṭīnī* (Ismā‘īlī Shī‘ite) (see Ibn Taymiyya, *al-Fatāwā al-kubrā*, Vol. 3, p. 496).

In Cairo, Mubashshir ibn Fātik studied mathematics and astronomy with Ibn al-Haytham (d. c. 430/1039) whose *Kitāb al-Manāẓir* (*Book of Optics*) was a major revolution in optics after Ptolemy’s *Almagest*. Mubashshir also studied with the astronomer, physician, and philosopher Ibn Riḍwān (d. 461/1068), one of the main scientists of the Fatimid court. Ibn Riḍwān authored commentaries on Hippocrates, Aristotle, and Galen, and had access to some of al-Fārābī’s books (see the lengthy bibliography given by Ibn Abī Uṣaybi‘ in his *Ṭabaqāt al-aṭibbā’*).

The edition of *The Choicest Maxims* was completed by ‘bd al-Raḥmān Badawī in Madrid in 1958. He gave the book the Spanish title “*Bocados de Oro*,” which he took from the medieval translation realized in 1257 for Alfonso the Wise (Alfonso X of Castile, r. 1252–1284). Rosenthal felt offended that Badawī had double-crossed him in achieving the edition and wrote a bitter review (see Rosenthal 1960–1961). In the Arab world, the book was rarely available in libraries, as it had been published in Franco’s Spain and not diffused properly. These are among the reasons that have left *The Choicest Maxims* little-studied to this day.

To the references given by Rosenthal (1960–1961) in what remains a fundamental article for the study of Mubashshir’s works, Ibn al-Qifṭī, *Akhbār al-ḥukamā’* [269 f. Müller-Lippert]; Yāqūt, *Irshād* 6.241 Margoliouth [= Vol. 5, p. 227, n° 934, ‘bbās]; Ibn Abī Uṣaybi‘ *Ṭabaqāt al-aṭibbā* [2.98–99 Müller, Wiedemann 1906, p. 176], one should add Ismā‘īl Bashā al-Bābānī (or Ismā‘īl al-Baghdādī), the seventeenth-century author of the *Hadiyat al-‘ārifīn*, a *Continuation (Dhayl)* to Ḥajjī Khalīfa’s *Kashf al-zunūn*, who lists twice as many titles as Ibn Abī Uṣaybi‘ and gives 480/1087 as the date of Mubashshir’s death. Ibn Abī Uṣaybi‘ quotes the following titles: *Kitāb al-waṣāyā wa-l-amthāl wa-l-mu’jaz min muḥkamal-aqwāl*; *Kitāb mukhtār al-ḥikam wa-maḥasin al-kilam*; *Kitāb al-bidāya fī l-mantiq*, and *Kitāb fī l-ṭibb*. Al-Bābānī, in the *Hadiyat al-‘ārifīn*, mentions the same titles (with a variant for the last one, which he quotes as the *Asrār al-ṭibb*) and adds the following works: *al-Iṣṭilāḥāt al-ṭibbiyya*; *al-Tanbīh wa-l-tabyīn li-maṣāliḥ al-dunyā wa-l-dīn*; *Sharḥ al-‘Unwān*; *Sharḥ kitāb al-adwiyya al-murakabba li-Jālīnūs*; *Sharḥ mufradāt Diyusqūrīdis*; *Kitāb al-nihāya fī l-ḥikma*; *Mufradāt al-adwiyya*; and other epistles. To these, Yāqūt adds the *Sīrat al-Mustanşir*, in three volumes.

The looting of the Fatimids’ library by the Turks during a revolt in 1068–1069, and later on its dismantlement and destruction at the express will of the (Sunni) Ayyubid ruler Saladin (r. 1171–1193), may have led to the nearly

complete disappearance of Mubashshir's works. Nevertheless, Yāqūt notes that Mubashshir collected an innumerable number of books, which, Ibn Abī Uṣaybi' adds, he was later able to peruse while working at the Ayyubid court in Cairo. He complains that many of these had been damaged after Mubashshir's widow and some neighbors had thrown them into a basin to take revenge for her husband's passion for books and scholarship. Ibn Abī Uṣaybi' says he saw many of Mubashshir's books "on the Ancients" (i.e., philosophy, medicine, the sciences of the quadrivium, and probably some history) in autograph copies.

Only one of Ibn Fātik's works has survived, and it is therefore impossible to give a comprehensive evaluation of his thinking. The composition of *The Choicest Maxims*, in 440/1048–1049, may have been part of a proselytizing attempt, following a general tendency in Fatimid policy. In the aftermath of the Druze schism, *The Choicest Maxims* explores some of the ways to conciliate the theory of the *theios aner* with a monotheistic religion: asceticism, encratism, and Hermetism. In conciliating apophatic theology with the necessity of a spiritual master or guide, Ibn Fātik does not depart from the doctrine officially taught in his time at the Fatimid court.

The Sages advocate as examples by Ibn Fātik, whose lives and sayings ought to be reflected upon, Seth, the three Hermeses, Tat, Asclepius, Solon, Zeno, Pythagoras, Hippocrates, Socrates, Plato, Diogenes, Aristotle, Alexander the Great, Galen, Ptolemy, Saint Basil, Saint Gregory (of Nyssa and Nazianzus seem to have been confused into one figure), and finally the Coranic Luqmān and the little-known Mahadarjis (seemingly an Indo-Persian figure who has recently been identified with a Zoroastrian sixth-century priest). The biographies are integrated within a general frame imitated from the classical genres of the "literature of inventions" and "successions." Melting Neoplatonic and Ismā'īlī traditions, Mubashshir uses these models of wisdom as exempla of conduct, which the believer should follow to ascend the ladder leading to prophetic perfection.

The chapters of *The Choicest Maxims* are organized by Mubashshir according to a unique pattern, unless he could not find such information in his sources: biography, doxography, sayings, and more rarely some elements of bibliography. If the sapiential genre had been in use for millennia in the ancient literacy of Near East, and the apophthegms in particular were still favored in Egyptian Christian literature, the scheme, here, is reminiscent of Diogenes Laertius' *Lives of the Philosophers*, which 'bd al-Raḥmān Badawī considered was one of the sources used by Ibn Fātik. Recent research on the Diogenes chapter led Oliver Overwien (2005) to suggest that Mubashshir rather draws on sources that were also used by Diogenes Laertius. A trace of the use of late-antique Greek literature is the frequent use of epistolary novels (as in the Solon, Hippocrates, Aristotle, Alexander, and Galen chapters) (see Cottrell 2004–2005).

Moritz Steinschneider (1893, pp. 28–29), noted that Ibn Fātik has used directly or indirectly a lost work by Ḥunayn ibn Ishāq, the *Ādāb al-falāsifa*, also known as *Nawādir al-falāsifa* (*Wise Sayings of the Philosophers*), of which a Hebrew and a Spanish translation were known in his time, as well as two Arabic manuscripts then unpublished. Steinschneider also remarked that the thirteenth-century physician Ibn Abī Uṣaybi' used Mubashshir (whom he explicitly quotes from) for his chapters on Hippocrates, Pythagoras, Socrates, Plato, and Aristotle. Rosenthal (1960–1961, pp. 145–147) gave a complete concordance table of these parallels in his article on *The Choicest Maxims*. Rosenthal also minimized the use of Ḥunayn ibn Ishāq by Ibn Fātik, rather unconvincingly (see Rosenthal 1960–1961, p. 135). Badawī did follow Steinschneider on that point in his introduction to his edition of *The Choicest Maxims*, where he also emphasized the importance of the *Alexander Novel* for the success of the medieval translations.

The *Alexander Novel* is among the most extensive pieces of the books, spread out in the chapters related to Alexander the Great, Aristotle and Diogenes chapters. It offers quite striking parallels with the Pseudo-Callisthenes' hellenistic novel, but does not preserve the Egyptian features of

Pseudo-Callisthenes' work. On the contrary, it gives to the Persian king Darius the role of a romantic hero betrayed by his own people, a man who put all his trust in Alexander, to whom he gives his daughter Roxane as a bride. Mubashshir's *Alexander Novel* does not share the features of the known Syriac versions, but a Syriac intermediary is not to be excluded. The translation method is that of the calque, including for some of the names (Ruqīyya – the Semitic root *RQY designates the idea of ascension and elevation – is given as the name of Alexander's mother, instead of Olympias). The precise relation of *The Choicest Maxims*' extracts of both the *Alexander Novel* and the *Alexander Letters* with Ḥunayn's *Ādāb al-falāsifa*'s use of similar extracts remains to be investigated.

A manuscript of Mubashshir ibn Fātik's *The Choicest Maxims* reached the court of Alfonso the Wise (r. 1252–1284), where it was translated into Spanish in 1257. Through his mother, the king belonged to the Hohenstaufen family and shared with his famous cousin Frederick II a wide intellectual curiosity. On the Spanish version, a Latin translation was realized, of which two recensions have been discovered by Franceschini (see further Anawati 1959–1961 and Rosenthal 1960–1961). Franceschini accepted Knust's thesis according to which the Spanish *Bocados de Oro* had been translated from Arabic and not from Latin, as had been supposed earlier. Only one of the manuscripts of the Latin *Liber philosophorum* attributes the translation to John de Procida (ital. Giovanni da Procida, d. 1298, another member of the Hohenstaufen court), and as a consequence this attribution has been questioned since the end of the nineteenth century (see Rosenthal 1960–1961, p. 133).

If *The Choicest Maxims* had lost the name of its author in the medieval translations, the prince Abū l-Wafā' (Mubashshir ibn Fātik) is known to Gerard of Cremona (d. 1187) who transcribes it as Albuguefe (for *Abu al-Guefe=al-Wafā'?) and correctly translates the Arabic title into Latin as *Scienciarum electionem et verborum pulcritudinem*, nearly a century before the Spanish translation. Gerard was able to use the chapter on Ptolemy's life and sayings for the introduction

to his translation of the *Almagest* (see Kunitzsch 1974, p. 98s). Rosenthal first demonstrated that Gerard had at his disposal the Arabic text, and did not depend on a translation (see Rosenthal 1960–1961, p. 150).

Before 1402, the Latin version was translated into French by Guillaume of Tignonville (d. 1414). It quickly became a success, and numerous manuscripts are known (see Anawati 1959–1961 and Rosenthal 1960–1961, who both mention a number of early modern printed editions as well). The first critical edition of the text was given by Roder Eder in 1915. A Provençal translation is also known and has been partly published, but its date has not been established (see Brunel 1939).

Because of this success, the French translation was rapidly translated into English. The first translation, made in 1450 by Stephen Scrope, was later on corrected by William of Worcester, who added some extra materials to the Socrates and Ptolemy chapters (see Schofield 1936, p. 31). A second and better translation was realized by the Earl Ryvers, between 1474 and 1477. The book was printed in England on November 18, 1477, by William Caxton, among the first books ever printed on English soil with a print which he had brought back with him from Brugges.

Mubashshir ibn Fātik was honored with an early and thorough diffusion, comparable in his time only to the *Bible* and the *Alexander Novel*. The very fact that an *Alexander Novel* constitutes the core of *The Choicest Maxims* gives one of the reasons of its success. In the East too, important authors such as Ibn Abī Uṣaybi' and al-Shahrazūrī made a thorough use of the text, assuring Ibn Fātik a popularity which led the book to be known as far as Iran and India (through al-Shahrazūrī's anonymous lengthy quotations in his *Kitāb nuzhat al-arwāḥ*, which was further on translated into Persian). In the eastern Christian realm as well the book enjoyed some fame, as can be witnessed from the incomplete Berlin Manuscript (MS Or. quart. 785) showing two bilingual seals (Syriac/Arabic), possibly originating from the Mar Mattai monastery in Mossul. This universal diffusion was the very object of the book, showing the ultimate journeys of wisdom through time and ages.

Mullā Shams al-Dīn al-Fanārī

Veysel Kaya

Department of Islamic Philosophy, İstanbul
Üniversitesi, İstanbul, Turkey

Abstract

Mullā Shams al-Dīn al-Fanārī (d. 1431) was an Ottoman theologian, jurist, and Sufi, who became a prominent figure after the “Fetret Devri” (Ottoman Interregnum), a historic period in which the Ottoman Empire faced severe civil wars among the sons of Yıldırım Beyazıt (r. 1389–1403). He is widely accepted by historians as the first “sheikh al-Islam” (head of the juristic affairs) in the Ottoman Empire. Al-Fanārī is the author of several works in various Islamic disciplines, each of

which became very influential in their fields. These influential works include *Misbāh al-Uns*, a work in theoretical Sufism which was written as a commentary on *Miftāh al-Ġayb* by Ṣadr al-Dīn al-Qūnawī (d. 1274) and *Fuṣūl al-Badāyi’*, a work in the field of jurisprudence (*usūl al-fiqh*). Al-Fanārī’s engagement with the mystical school of Ibn Arabī, along with the traditional methodological disciplines, gave him the epithet of “the combiner of the two main domains” in Islamic sciences, i.e., the domains of classical religious sciences and mysticism. This authority of him continued in the scientific atmosphere of the Ottoman State with his successors who were his family descendants and were known as “Fanārīzāde”s, i.e., the sons of al-Fanārī.

Life

Al-Fanārī was born in 1350 in Ottoman Anatolia and received his early education in Ottoman cities, such as Bursa, Iznik (ancient Nicea), and Amasya. His father is known to be a follower of Ṣadr al-Dīn al-Qūnawī, the main theoretician of the Akbariyya school in Anatolia. Al-Fanārī received his early education from his father; then he was sent to several madrasas (the official learning institutions in Ottoman State) to continue his scholarly training in canonical Islamic sciences, Islamic theology (kalām), and Islamic jurisprudence (*fiqh* and *usūl al-fiqh*). Al-Fanārī’s teacher in Orhaniye Madrasa, which was situated in Iznik, was Alāuddīn al-Aswad (d. 1393). Afterward, due to some disagreements between him and his teacher, al-Fanārī decided to leave Iznik for Amasya, where he took the chance to become a disciple of Jamāluddīn al-Aqsarāyī (d. 1388). Al-Aqsarāyī was an important figure due to his active role in disseminating the philosophical tradition in Anatolia, which was mainly based on the Avicennan corpus. After receiving his *ijāza* (educational license) from his teacher, al-Fanārī’s academic career entered in a new dimension when he embarked on a scientific voyage to Egypt. At that time, Egypt was a center of attraction for Ottoman students and scholars, who aimed to

specialize in classical religious sciences. In Egypt, al-Fanārī became a disciple of the Hanafite scholar Akmal al-Dīn al-Bābartī (d. 1384) and met his contemporary colleagues al-Sayyid al-Sharīf al-Jurjānī (d. 1413), (for al-Jurjānī's contact with al-Fanārī, see Van Ess, *Die Träume*, 20f.), Ḥājī Pāshā (d. 1424?), Aḥmadī (d. 1412), and Sheikh Badruddīn al-Simāwī (d. 1420), all of whom exerted crucial influence over the scientific atmosphere in the fourteenth- and early fifteenth-century Anatolia. It is reported by Abdurrahmān Bistāmī (d. 1454), a prominent occult scientist of the century, that al-Fanārī studied Bistāmī's work *Qabs al-Anwār* along with the author, a statement that evinces his early interest in occult sciences such as alchemy and the science of letters, i.e., the occult science which seeks secret relations among ontological and numerical entities (Kaya, "Abdurrahman Bistami," 195). After completing his education in Egypt, al-Fanārī began to ascend the ladder of his official career, a process which would lead him to the top position of the religious affairs in the Ottoman State, i.e., the "sheikh al-Islām." Before the civil war (Ottoman Interregnum), he was appointed by the sultan in madrasas and courts as teacher and judge. When political rivalries intensified at the expense of the security of the scholarly elite in Anatolia, al-Fanārī felt obliged to visit Hejaz (today's Saudi Arabia) and once again Egypt and waited for the political situation to stabilize. These visits gave him the opportunity to meet eminent Sufi figures of the age, such as Muhammad Pārsā (d. 1420) of the Naqshbandiyya order and Zayn al-Dīn al-Ḥāfi (d. 1435) of the Suhrawardiyya order. After al-Fanārī returned to Anatolia, he maintained and strengthened his prestigious position among the Ottoman sultans, Mehmed I (r. 1413–1421) and Murad II (r. 1421–1444), respectively, a situation which continued till his death in 1431.

Works and Philosophical Teachings

The chief historian of the sciences in Ottoman times, Tashkoprižāda, in his *Miftāḥ al-Sa'āda* regards al-Fanārī "the achiever of the leadership in two methods in theology (*al-ilm al-ilāhī*),"

that is, the method of rational argumentation (*naẓar*) and the method of spiritual purification (*taṣfiya* and *dhawq*) (Tashkoprižāda, *Miftāḥ*, p. 251). This statement of Tashkoprižāda posits that al-Fanārī was an authority not only in classical Islamic sciences but in mysticism and theosophy too. Tashkoprižāda specifically states that al-Fanārī's predecessor in this achievement was Ṣadr al-Dīn al-Qūnawī, the highly acclaimed commentator of the works of Ibn Arabī. In fact, al-Fanārī wrote his magnum opus, *Misbāḥ al-Uns*, as a commentary on al-Qūnawī's *Miftāḥ al-Ġayb*, which was a fundamental text that shaped the subsequent literature of theoretical mysticism in Anatolia, Iran, and North Africa. In *Misbāḥ al-Uns*, al-Fanārī closely follows the overall stances of al-Qūnawī in the Sufi discourse. First and foremost, the work preliminary posits a distinction between the exoteric (*ẓāhir*) and esoteric (*bāḥin*) aspects of the religious truth. The scholars who belong to the exoteric side are to be regarded as the scholars of customary rules (*ulamā al-rusūm*), that is, the experts of the Muslim law regulations; thus, they are busy with appearances and far from understanding the true realities of God's governance in the universe. On the other hand, the scholars who possess the esoteric and essential meaning of the religious doctrines are to be regarded as the pioneers for those who search for spiritual salvation. The followers of the righteous path, "the people of verification" (*ahl al-taḥqīq*) as is called by al-Fanārī, are required to interpret the literal meanings in the Quran and the Hadith (sayings of the Prophet) according to the inner reality, keeping themselves away from the figurative meanings. Al-Fanārī's ontology is based on the principle that there is a mutual relationship between God and his creation: the universe is related to God, and God is related to the universe, in spite of the fact that God's ultimate essence transcends the universe (al-Fanārī, *Misbāḥ*, 9–11). To understand the nature of this relationship, the true realities (*ḥaqāʾiq*) of things are to be known. However, it is not enough for the achievement of the true science to grasp only the knowledge of the true realities of things, one must know these realities as they are found and individualized (*taʾayyun*) in the divine knowledge of God: God's

knowledge of things as an attribute of God is the real place where one must seek to grasp the essences of all realities, and this requires a special unification with the divine realm. This is what is done by the possessors of the highest level of knowledge, and this knowledge is certainly not achieved by the people of rational argumentation and disputation, because this way limits itself to search for pure rational inquiries. Al-Fanārī contends that both the *mutakallimūn* (Muslim dialecticians) and philosophers have fallen short of the achievement of the true divine realities, which are definitely to be sought beyond logical argumentations. Dedicating a special chapter in his *Miṣbāḥ* to the subject, he relates the failure of the abovementioned schools to their unawareness of the deficiencies of the sensual and rational perceptions, the relativist nature of the pure rational subjects (changing from one authority to another), and last but not least human beings' incapability of comprehending the divine realm in the first place. Al-Fanārī asks, "how would someone allege to know anything at all, given that they even do not know the closest thing to them, that is, their own souls?" (for this sentence and other criticisms, see al-Fanārī, *Miṣbāḥ*, 32f). All in all, along with his master al-Qūnawī, al-Fanārī apparently tries to establish an ultimate and independent science of metaphysics in fully mystical tones, a paradigm which entails a combination of the philosophies of Avicenna, al-Suhrawardī, and Ibn Arabī. Al-Fanārī's acceptance of the theory of emanation shows his allegiance to Avicenna's philosophy, inasmuch as the theory is compatible with the former's understanding of the absolute/all-pervasive being (*al-wujūd al-muṭlaq*) (Janssens, "Elements of Avicennian Influence", 326).

Al-Fanārī's holistic perspective continues in his *Fuṣūl al-Badā'iy*, a work which was written in the field of the methodology of Islamic law and is said to be compiled in a period of 30 years (Kātip Chelebī, *Kashf al-Zunūn*, II, 1267). Accordingly, it addresses the classical subject matters of Islamic law, beginning with the chapters on legal argumentation, literal and figurative meanings of the religious texts, legal judgments (*ḥukm*), the problem of the morality of human

actions (*ḥusn* and *qubh*), the four basic proofs (the Quran, the Hadith, scholarly consensus, and deductive analogy), and ending with the chapters on legal opinion (*fatwā*). Although al-Fanārī mainly follows the Hanafite tradition in such legal matters and sees himself as a member of the Hanafite school, he is much more a philosopher when he goes into the explanations of the fundamental terms. The introductory chapter comes with in-depth philosophical explanations of the epistemological and ontological terms, such as existence, essence, logical argumentation, theory of intuition (*ḥads*), the science of metaphysics, the five logical arts, the middle term in logic, mental existence, and so on. This spectacular array of the philosophical issues is addressed in reference to many figures of Islamic theology and philosophy, such as al-Fārābī, Avicenna, Ḡazālī, Fakhr al-Dīn al-Rāzī, Sayf al-Dīn al-Āmidī, and Abu l-Ḥasan al-Ash'arī, along with many others. Hence, the methodological sections in al-Fanārī's *Fuṣūl* appear to come out from the pen of a scholar who is well versed in the classification of sciences, both in religious and nonreligious, so much so that it even brings to the front such specific matters as Ibn Haytham's theory of lunar eclipse (al-Fanārī, *Fuṣūl*, 51; al-Fanārī here rejects the theory), the difference between the science of chemistry, and the occultist science of alchemy (*Fuṣūl*, 14). All in all, al-Fanārī, as is also seen in his other works, aims to establish a system which exhibits an encyclopedic approach to all divine and human sciences and disciplines, a system which is not dedicated to the religious data solely derived from the religious scriptures.

One of the most influential works of al-Fanārī, especially in Ottoman education curriculum, is his middle-sized commentary on al-Abharī's (d. 1264) *Īsāgūjī* (Introduction to Logic). Al-Abharī's work, titled *al-Risāla al-Athīriyya*, was written in the footsteps of the *Īsāgūjī* literature in Islamic philosophy with Muslim philosophers such as al-Fārābī, Ikhwān al-Safā, and Ibn Sīnā, all stemming from Porphyry's *Eisagoge*. Al-Fanārī contends that *Īsāgūjī* is basically about the five universals in logic, that is, species, genus, differentia, proprium, and accidents. What al-Fanārī does in this commentary is to

provide linguistic and logical explanations, which would enhance and update al-Abharī's work in accordance with contemporary scholarly literature in al-Fanārī's time. Thus, along the pages of work, al-Fanārī gives subtle references to the masters of logic in Islamic sciences, such as Ibn Sīnā, Fakhr al-Dīn al-Rāzī, and al-Taftāzānī, in spite of the fact that the main figure on whose works he depends is distinctly Ibn Sīnā. While doing that, he does not miss the opportunity to bring about his holistic approach and integrate some mystic elements to the text. In one intriguing example, when he defines the art of rhetoric (*khatāba*), he states that rhetorical syllogisms are derived from the premises which are accepted and received from an authority, and this authority could either be a prophet or a friend of God (*walī*) (al-Fanārī, *Sharḥ Ṭisāğūjī*, 62). Such deliberate integrations, as are seen in all works of al-Fanārī, provided a dynamic ground for the development of Islamic disciplines in Ottoman scientific and philosophical spheres.

Music, Medieval

T. J. H. McCarthy

New College of Florida, Sarasota, FL, USA

Abstract

The philosophical background to music in the Middle Ages was ultimately derived from Classical ideas about music, its rudiments, and its place in society. The fact that early medieval thinkers in the West looked in the first place to ancient learning to codify their newly emerging ecclesiastical song (which would ultimately become known as by them as “Gregorian chant”) led to a conflict between the theory of ancient music and the reality of music in the Middle Ages. The uneasy cohabitation of ancient philosophical and cosmological thought with the new and different practical music of the medieval West is an ever-present feature of medieval theoretical literature on music. The extent and importance of this conflict varies from century to century and according to the aims of the theoretical literature in question.

Classical Sources

The complex epistemology of music in the Middle Ages is due initially to the diverse Classical sources that influenced its history. Perhaps the most influential of the Classical authors was

Boethius (c. 480–c. 525), whose *De institutione arithmetica* and *De institutione musica* (ed. Friedlein 1867) offered to medieval thinkers the most detailed account of ancient thought on the closely related disciplines of arithmetic and music. Both of these treatises circulated widely from the ninth century onward, while an extensive corpus of Carolingian glosses and commentaries points to active engagement with these texts (ed. Bernhard and Bower 1993/1994/1996). Music, for Boethius, was a liberal discipline pertaining to ethics as well as to reason: it was a body of immutable knowledge requiring study for mastery. Consequently, *De institutione musica* aimed to quantify music through the study of ratios, proportions, intervals, and sound. Boethius' definition of the true musician – the scholar who can criticize poetic compositions or instrumental performance – is a function of the centrality of intellect to his approach: the practice of music, with pejorative connotations of manual activity characteristic of the ignoble, was perceived negatively because it lacked any sort of rationality.

Boethius' *De institutione musica* enjoyed a far wider dissemination than did the six books of St Augustine's *De musica* (completed between 387 and 391; ed. Jacobsson 2002), which were concerned mainly with rhythm and metrics. Far more influential were St Augustine's many remarks on music scattered throughout his other works: they show both his endorsement of music for its ability to uplift the spirit and his condemnation of it for its ability to distract. Although medieval thinkers generally took St Augustine's positive comments to heart and ignored his criticisms, many, such as St Thomas Aquinas, vacillated in true Augustinian fashion.

More immediately important for the formation of opinions on music were the encyclopedists Cassiodorus (c. 487–c. 580) and Isidore of Seville (c. 560–c. 636). Their works became standard reference works, transmitting much information, as well as speculation, on ancient music and its rudiments. A subtle shift from the Boethian definition of music and its dismissal of practice is apparent in Cassiodorus and Isidore. From Cassiodorus' *Institutiones* 2.3.21 (ed. Mynors 1937)

came the influential definition that whereas “mathematical science is that science which considers abstract quantity,” music is the division of it “that treats of numbers in relation to those things that are found in sounds.” Although the introduction to Isidore's *Etymologies* (ed. Lindsay 1911) classifies music as a liberal discipline, other sections describe it in terms of the varieties of chant, with the result that five of the nine sections concerned with music are practical in their approach. This surely hints that, by the time Isidore was writing, scholars were already struggling to apply the Classical view of music to the new liturgical music of the post-Roman West.

The Greek philosophers Plato and Aristotle influenced music in different very ways. Prior to the rediscovery of Plato's works in the twelfth century, only part of *Timaeus* (17a–53b) was known. It was available in the translation by Calcidius (c. 256–c. 357), whose accompanying commentary incorporated various middle- and Neoplatonic influences from the earlier commentaries of Iamblichus and Porphyry (ed. Waszink 1975). Calcidius' translation and commentary was extremely popular in the Middle Ages, but since Calcidius had omitted those sections dealing with man, it was understood primarily as a cosmological exposition of the origins and order of the universe. Calcidius was not, however, the only intermediary through which Platonic thought reached the Middle Ages. Boethius had sought to harmonize the philosophy of Plato and Aristotle, and while he was practically the sole means of transmission for a selection of Aristotle's works until the late twelfth century, he simultaneously perpetuated much of Plato's teaching. The influence of Plato is to be seen most vividly in Boethius' *Consolation of Philosophy* (ed. Moreschini 2005), which became one of the medieval period's best-known works of literature. Plato was also behind much of *De institutione arithmetica* and *De institutione musica*. To Calcidius and Boethius should be added the late-Roman authors Macrobius and Martianus Capella, who also contributed much to the medieval reception of Plato. Macrobius' *Commentarius in Somnium Scipionis* (ed. Willis 1970) was very popular in the early and central Middle Ages, while of the nine books

of Martianus Capella's *De nuptiis Philologiae et Mercurii* (ed. Willis 1983), books 7 and 9 were most relevant for music. As with Boethius, the survival of numerous ninth- and tenth-century gloss collections on Macrobius and Martianus Capella points to Carolingian scholars' engagement with these authors (White 1981; Teeuwen 2002).

Although a number of Aristotle's logical works were available to the early medieval West through the translations and commentaries of Boethius, it was not until the end of the twelfth century that his remaining logical works – as well as those on ethics, metaphysics, and the natural sciences – became available in Latin translations. The study of Aristotle thrived in the medieval universities, with Aristotelian methodology and terminology appearing in music treatises from the thirteenth century onward. Nevertheless, Aristotle did not offer to medieval thinkers a useful philosophy of music and thus his influence is visible primarily in the introduction of new procedures of argumentation or his citation as a new authority in support of one or other position.

The Early and Central Middle Ages

The music theory sources of the early and central Middle Ages show that the main preoccupation of western thinkers was with practical music, specifically music as the vehicle for the liturgy of the Church. They were thus at odds with Boethius' approach to music. The shift in emphasis evident in Isidore's *Etymologies* has already been mentioned; it is even more apparent in his *De ecclesiasticis officiis* (ed. Lawson 1989), which deals with music from a liturgical point of view. Nevertheless, even though there was a fundamental dichotomy between Boethian theory and the requirements of the post-Roman West, Boethius was to some extent assimilated by western Europe's earliest post-Classical theorists in the Carolingian period, who applied him to western plainchant: he provided the vocabulary for music theory, while they provided the model for its use. The music that Boethius described, however, had nothing to do with church music. Until about the

ninth century there was no real modal organization in western chant. It was the Carolingian thinker Aurelian of Réôme who, in his *Musica disciplina* of c. 840–c. 850, first described a modal organization of western plainchant in writing (ed. Gushee 1975). Aurelian assumed that Boethius was relevant to plainchant and adopted the names of the ancient Greek *tonoi* for the new western modes. Others followed his example, including the tenth-century author of *Alia musica* (ed. Chailley 1968), who appropriated Boethius' table of octave-species for each *tonos* to furnish names for his own modal octaves, in the process inverting Boethius' layout.

Carolingian music treatises focus above all on the rudiments and classification of ecclesiastical music ("Gregorian chant") and thus have limited scope for philosophical material. Where this does occur, it is largely peripheral and draws mainly on sources such as Cassiodorus and Isidore. At the same time as scholars were writing such treatises, others were commenting upon Boethius, Macrobius, and Martianus Capella. Many of these commentaries and glosses – which are now beginning to be studied – deal with the cosmological aspects of the source texts.

Perhaps the most sophisticated integration of philosophical thought with practical music during the central Middle Ages is to be found in the music treatises written by a group of monks and clerks working in Salian Germany (1024–1125): the "south-German circle" of music theorists (McCarthy 2008). These scholars were among the foremost intellectuals of their age, making valuable contributions in disciplines such as theology, liturgy, history, chronology, astronomy, and geometry, as well as frequently playing leading roles in contemporary ecclesiastical politics. Abbot Bern of Reichenau (d. 1048) was the founding father of this circle: his teaching was modified by his pupil Herman of Reichenau (1013–1054) and absorbed by figures such as William of Hirsau (d. 1091), Aribon (fl. 1070–1078), Frutolf of Michelsberg (d. 1103), and Theoger of Metz (c. 1050–c. 1120).

For the south-German circle music was a reflexion of natural order. Its theory was practical, growing out of the emphasis placed upon proper

regulation of the liturgy by the Gorze monastic reform movement. Frutolf of Michelsberg summed it up thus in his treatise entitled *Breviarium de musica*: “music is the science of singing well through long reflexion and constant practice” (ed. Vivell 1919). It is the science of commanding correctly all the elements affecting the performance, analysis, and composition of Gregorian chant, the primary vehicle of the *opus Dei* and the liturgy of the Latin West. This definition of music represents a subtle and important reworking of Boethius, for whom only the criticism of music was a worthwhile pursuit: the ideal musician was now he who practised flawlessly because he understood completely. Thus Theoger of Metz was described as “excellently skilled in all disciplines of the liberal arts, consummate in music and outstanding in its performance” (Trithemius, *Annales Hirsauenses*, 1511–1514). The central importance of music to intellectual life required that it be a true reflexion of God’s divinely ordained universe. Thus, for the south-German circle, music’s cosmological and philosophical aspects merged with its more practical aspects.

Bern of Reichenau incorporated Neoplatonic thought into music theory in his treatise *Prologus in tonarium* (written between 1021 and 1036; ed. Rausch 1999). Bern emphasized the significance of the number four, which was vital to the cosmological exposition of *Timaeus*, and which validated the theory of the four modes having their final notes (D E F G) in the tetrachord of the *finales* (D E F G). He wrote that “from its [the tetrachord of the *finales*] four notes, the origin of all modes or tones can be seen to proceed,” just as the fabric of the Platonic universe proceeds from the four elements. This statement also hints at the important Platonic concept of unity. Bern used Macrobius (who had glossed Plato with the influential comment that unity was the fount and origin of all numbers) to argue that the tetrachord of the *finales* was also the fount and origin of the modes. His arguments, retaining their Neoplatonic terminology, were developed by later members of the south-German circle, notably William of Hirsau and Theoger of Metz. They took care to situate the Neoplatonic imagery in a Christian

context, as they were doubtless aware of the potential dangers of “pagan literature” (a contemporary topos of some influence).

The response of the south-German circle to the Platonic inheritance also involved the conscious use of Platonic metaphors. The idea of “generation” was particularly important, with the theorists using verbs like *generare* and *procreare* to describe the natural origins of musical phenomena: for example, Herman of Reichenau declared that the two octaves of the monochord “are not said to be born twice, but that those already born, in the manner of the seven days of the week, are repeated or renewed” (*Musica* 1; ed. Ellinwood 1936). Elsewhere, Aribo criticized a faulty technical description of the monochord as “perverse” because it confused the natural order of the monochord “which never departs from her own nature” (drawn from *Timaeus* 50bc), while praising his own alternative description in avowedly Platonic terms (ed. Smits van Waesberghe 1951). The use of such natural imagery by these thinkers mirrors a wider contemporary trend toward metaphors of generation and growth. It also points to a growing expression of Platonic thought in a Christian context and the personification of *natura*. A number of contemporary authors employ the idea of an artificer behind creation: Bern of Reichenau describes an *artifex natura* (*Prologus in tonarium* 4) and Theoger of Metz a *creatrix natura* (*Musica* 8, ed. Lochner 1995), while the widely read German author Honorius Augustodunensis (c. 1080/1090–c. 1156) speaks of a similar artisan who made the universe “like a great zither upon which he placed strings to yield a variety of sounds” (*Liber XII questionibus* 2). The south-German theorists, therefore, sought to combine the practical and philosophical aspects of music because they believed practice to be a reflexion of nature. This characteristic distinguished them from other European thinkers. The important Italian music theorist Guido of Arezzo, for example, chose to ignore the philosophical aspects of music in his treatises (*Micrologus*, *Regule rithmice*, *Prologus in antiphonarium*, and *Epistola ad Michaelem*; ed. Smits van Waesberghe 1955; Pesce 1999), commenting that Boethius was useful to philosophers but not musicians. Conversely,

eleventh- and early twelfth-century French scholars such as Bernard and Thierry of Chartres, William of Conches, and Bernard Silvestris were more exclusively cosmological in their discussions of the Neoplatonic aspects of music: this is true of William of Conches, for example, in his glosses on *Timaeus* (ed. Jeaneau 2006). The distinguished teacher Hugh of St Victor (c. 1096–c. 1141), in his *Didascalion* of c. 1130 (ed. Buttner 1939) described music as a liberal art encompassing both practical and intellectual aspects. In doing this he was following the example of the German theorists who articulated most coherently an understanding of music that must have been widespread among the educated in the central Middle Ages. Yet Hugh's pupil, Richard of St Victor, reverted to the exclusively impractical Boethian classification of music as a liberal art a few years later in his *Liber exceptionum* (ed. Châtillon 1958).

The High and Late Middle Ages

The tension between the practical and cosmological aspects of music revealed itself in different ways with the development and expansion of the European universities. Some historians have looked to university statutes to assess the place of music in the curriculum (Carpenter 1958). In Paris, the statutes offer little information on the subjects taught, but other universities modeled on Paris – notably German universities – specified musical studies in their curricula. Anecdotal evidence from former university students sometimes suggests that music was taught: Johann von Jenzenstein, who studied at Paris from 1375 to 1376, attests to hearing lectures on music as a cosmological science. In Oxford, Boethius was a prescribed element of the arts curriculum from at least 1431 until the sixteenth century. Yet despite the persistence of music as a formal curricular requirement, one cannot but form the impression that it was not generally considered an important discipline. Later evidence from Oxford and Cambridge, both of which instituted degrees in music during the fifteenth century for which there were no residence requirements, suggests that these

degrees were seen as the poor relation of degrees in “proper” academic subjects.

Nevertheless, the introduction and assimilation of Aristotelian texts directed renewed attention to the nature of music as a discipline. The second book of Aristotle's *Physics*, which deals with the classification of astrology, music, and optics was formative in inspiring opinions as to the nature of music. Avicenna (Abū ‘Alī al-Husain ibn ‘Abdallāh ibn Sīnā; 973/980–1037) and Averroes (Abū l-Walīd Muhammad ibn Rushd; 1126–1192) were among the first scholars to comment on this matter; they later were joined by Robert Grosseteste (*Commentarios in VIII libros physicorum Aristotelis*), Albert the Great (*Physicorum libri VIII*), Thomas Aquinas (*In II physicorum*), and Duns Scotus (*Quaestiones in octo libros physicorum Aristotelis*). Aquinas referred to the problem of disciplines such as music, which seemed to confound traditional categories, as the problem of the *scientiae mediae*. A number of surviving university texts address the specific problem of music – including Radulphus Brito's *Questiones communes mathematicae*, the *Questiones mathematicales* by Ralph the Breton, and questions 16 and 17 of Peter of Auvergne's sixth *Quodlibet* (which relies on Aristotle's theories of the soul and judgment as outlined in *De anima* and the *Nicomachean Ethics*).

Scholasticism undoubtedly influenced the literature of music theory. An early example is the early twelfth-century German treatise *Quaestiones in musica* (ed. Steglich 1911), which anticipates the *quaestiones* genre that would become so familiar in the later French schools and universities (on the *quaestiones* genre in the university context see Duhamel 2007). The *summa* genre, which was such a feature of thirteenth- and fourteenth-century scholasticism, was also applied to music. The *Speculum doctrinale* by the Dominican scholar Vincent of Beauvais (c. 1190–c. 1264) brings together authors with very different views of music such as Boethius, Isidore, Richard of St Victor, and the Arab theorist al-Fārābī (whose works were by then available in Latin translations). In one sense, *summae* responded to the concerns underlying such early twelfth-century manuals as

Honorius Augustodunensis' *De animae exsilio et patria* or Hugh of St Victor's *Didascalicon*, which grappled with the fracture of the accepted curriculum of the seven liberal arts on account of new studies, such as theology or canon law.

Late medieval discussions about the philosophical and cosmological natures of music occurred in tandem with the production of more practical music treatises. New technical preoccupations, such as the expansion of polyphony and rhythm, required codification and explanation through theoretical literature. Although many of these treatises were written outside the scholastic milieu, a number of university-based scholars contributed valuable practical treatises. The challenge to determine the time values of notes arising out of the development of polyphony can be seen behind the treatise of Johannes de Grocheo (fl. c. 1300), who dismissed the arithmetical speculations of Boethius in favour of an Aristotelian empiricism. Yet de Grocheo was still concerned with the nature of music, substituting a different division for Boethius' division and following Aristotle in discussing the social uses of secular music. Jehan de Muris (c. 1290–c. 1351), who taught at Paris, reaffirmed on the authority of Aristotle and Boethius the primacy of theoretical knowledge over practical experience and gave mathematical theorems for the measurement of rhythm in contemporary mensural notation in his influential *Notitia artis musicae* of c. 1321. De Muris was primarily a philosopher and mathematician for whom music was a secondary interest. This is reflected in his use of the language of scholasticism, more familiar to university-trained scholars than to practical musicians. Nevertheless, the overtly scholastic technique of his writing did not diminish its importance for contemporaries. Along with Philippe de Vitry (1291–1361), de Muris sought to justify the novelties behind the new musical art of the fourteenth century – in this case from a scholastic point of view. In a sense, de Muris was engaged in the same project as the south-German circle two centuries earlier: the use of ancient philosophical wisdom to demonstrate the validity of a particular musical practice.

By contrast, the conservative commentator James of Liège was appalled by the musical practices of the *ars nova*: his vast *Speculum musicae* (c. 1330) cites the relevant Greek and Roman authorities to refute de Muris and de Vitry.

The disagreements over musical practice in the fourteenth century highlight how, as the Middle Ages progressed, music theory became more practical. Technical issues dominate to the exclusion of philosophical and cosmological issues. All-round scholars comment upon music more rarely. Where they do – such as Thomas Aquinas, for example – their contribution offers little beyond the rudimentary. Thus, although the members of the south-German circle were able to make important contributions to music theory because music was an important part of their lives, later thinkers and philosophers were not because music had become a specialization in which certain practitioners were the experts. Scholars such as Jehan de Muris, who could bridge this gap, must be seen, therefore, as isolated examples. Although some philosophers would continue to speculate on music as a cosmological science, the greatest utility of “philosophy” would be in support of this or that technical practice.

Natural Law

Rupert John Kilcullen
Department of Politics and International
Relations, Macquarie University, North Ryde,
NSW, Australia

Abstract

Natural law was a key concept in medieval moral and political theories. Originating in ancient Greece, it came to medieval thought mainly through the canon and civil law texts. Commentators on these texts tried to solve various difficulties, especially regarding the justification of property. Thomas Aquinas, Duns Scotus, William of Ockham, and many other theologians discussed natural law, especially in relation to God's commandments.

In medieval texts the term *ius naturale* can mean either natural law or natural right; for the latter sense see the entry ► “Natural Rights”. *Ius naturale* in the former sense, and also *lex naturalis*, mean the universal and immutable law to which the laws of human legislators, the customs of particular communities and the actions of individuals ought to conform. It is equivalent to morality thought of as a system of law. It is called “natural” either (a) because it is taught by natural instinct, that is, some capacity innate in human beings, or (b) because it is accessible to “natural

reason,” that is, to personal reflection independent of any special revelation from God (such as the Christian faith claims to be) and independent of the moral authority of other human beings; or for both reasons.

Medieval writers referred to human law as “positive law,” “custom,” or “convention.” The positive law of a particular community was called “civil law” (there is no contrast here with criminal law); often the term referred especially to the civil law of the Romans. The term “law of nations” (*ius gentium*) seems equivalent in some Roman law texts to natural law, or perhaps to part of natural law; in medieval texts it usually means the laws common to the positive law of all, or most, human communities. (The boundary between natural law and the law of nations was never very clear.) Natural law was also distinguished from “divine positive law,” which is not knowable by natural reason but is notified to some human beings, and not to others, through special messengers (Moses, the Prophets, the Apostles, etc.).

Justinian and Gratian

In Justinian's corpus there is a disagreement about natural law, or at least some confusion of terminology. Sometimes “natural law” and “law of nations” are distinguished and contrasted: thus slavery was introduced by the law of nations, whereas “according to natural law all persons were born free” (Dig. 1.1.4). But in other texts

the terms seem interchangeable. “By *natural law* we obtain the ownership of some things which, as we have already stated, is called *the law of nations*. . . Therefore. . . all creatures that exist on the earth, in the sea, or in the air, as soon as they are taken by anyone, immediately become his property by *the law of nations*, since whatever formerly belonged to no one is conceded by *natural reason* [which establishes natural law] to the first person obtaining possession of the same” (Inst., 2.1.11–12). If the law of nations is distinguished from natural law, what is the distinction? Ulpian says that natural law is what nature teaches all animals, whereas the law of nations is used by human beings (Dig. 1.1.1.3 and 4). This seemed unsatisfactory, since it suggested that animals follow law, which most medieval readers thought only rational beings could do, and it might seem to suggest that human beings are bound by the same laws (e.g., in matters of sex) as animals follow.

Whether the law of nations and the natural law are identical or different affects the status of two important institutions, slavery and property. According to Dig. 1.1.4 (quoted above), the two laws are not identical, and slavery belongs to the law of nations and not to natural law. Might this be true also of property? The civil law texts say that property belongs to the law of nations, but in these contexts the law of nations and the natural law are not contrasted. According to one text, property, *dominia distincta*, that is, appropriation of a thing to some individual or group to the exclusion of others, was established by the law of nations (Dig., 1.1.5, 41.1.1 and 3). According to another text, property was established by the natural law “which is called the law of nations” (Inst., 2.1.11–12). Generally civil lawyers held that property exists by natural law, but Gratian quotes a text in which Augustine says that property exists by human law (dist. 8 c.1, cols. 12–13): since medieval civil lawyers could not ignore the opinion of Augustine, and canon lawyers and theologians could not ignore the civil law, the status of property became a problem.

Gratian’s *Decretum* makes no mention of a natural law common to mankind and other animals, and the law of nations is treated as distinct

from, and subordinate to, the law of nature. According to Gratian, the law of nature is a divine law found in the Law (i.e., the law of Moses) and the Gospels (I, dist. 1, d.a.c.1; Friedberg, Vol. 1, col. 1). Gratian’s account of law is given mainly through quotations from the sixth century ecclesiastical writer, Isidore of Seville. According to Isidore, human “civil” law consists in customs or human enactments (c.8, col. 2), which differ from one community to another (c.1). Natural law, on the other hand, is common to all peoples and is everywhere held by the instinct of nature, not by any enactment (c.7, col. 2). The law of nations is the law that is used by nearly all peoples (c.9, col. 3); it seems to belong within the category of human law, as a nearly universal body of customs or enactments. According to Gratian, natural law is supreme: “In dignity the natural law prevails absolutely over custom and statute. For anything accepted by custom or contained in writing should be held null and void if it is opposed to natural law” (dist.8, d.a.c.2, col. 13). Custom must give way to truth and reason (c.4 and 5, col. 14).

Problems Arising from the Law Texts

The relationship between the law of nations and natural law clearly needed to be sorted out, and there were also problems about property and slavery. Isidore’s text as quoted by Gratian says that natural law establishes “the common possession of all things,” but also that it allows “the acquisition of what is taken from air, land and sea” and requires “the restitution of an article given in trust or money loaned.” The common possession of all things seems inconsistent with the acquisition and restitution of property. There was also conflict between natural law and human law. Gratian and Isidore say that by natural law all things are common, and according to Augustine property exists by human law: if natural law invalidates any contrary human law, as Gratian says it does, how can human law establish property?

One solution was offered by Rufinus, one of the early commentators on Gratian. According to Rufinus (pp. 6–7), natural law includes commands, prohibitions, and *demonstrationes*. By *demonstratio* (which can perhaps be translated “indication”) natural law points out what is fitting

or shows what is good (*demonstrat quod convenit, bona esse ostendit*). According to Alexander of Hales (Vol. 4, p. 348), by “demonstration” Rufinus means “advice” (*consilium*). Demonstrations include the “one liberty of all” and “common possession of all things.” Unlike commands and prohibitions, demonstrations can be set aside for a good reason – to do so in some circumstances may serve purposes recommended by natural law (e.g., the enslavement of criminals may serve peace and justice). Demonstrations are not merely “licit” or “permitted.” Natural law not only permits but recommends certain things, such as freedom and community, without commanding them.

Others offered a solution based on the idea of permission or concession. They suggested that property and slavery exist by the permission of the natural law. (Tierney has discussed permissive law in many places: see Tierney 1997, index “Natural Law, permissive”; Tierney 2001, 2002, p. 399ff). But the idea of “permissive” natural law needs clarification. In civil law, a positive or explicit permission may be needed to correct other laws. Corrective provisions will not be needed in natural law, which is not the imperfect work of human legislators. Implicit permission may be given, however, by the silence of the law – that is, when the law includes no command or prohibition on some matter – under the general understanding that what is not prohibited is permitted. Thomas Aquinas (ST 1–2 q.94 a.5 ad 3) and many who followed him held that the question whether goods should be common or private is left open by natural law to be decided by human beings – natural law does not command or prohibit either. Property would have been legitimate also in the state of innocence. Community belongs to the natural law “negatively” as some later writers put it, meaning that it belongs to natural law in that natural law permits it. However, as Suárez realized, it is not enough to say that natural law merely permits either community or property, freedom or slavery; rather, community and freedom are the preferred state for mankind, to be set aside only for good reasons, pertaining to natural law “positively” (see Suárez, II.xiv.16–19, Vol. 4, p. 33ff). Suárez in effect returns to Rufinus’ notion of “demonstrations,” things that are recommended though not commanded.

The *Summa fratris Alexandri* put forward another possible solution. This *Summa* reported Rufinus’ distinction between precept and “demonstration” (Alexander of Hales, Vol. 4, p. 348), and the distinction between precept and permission as stated by Hugh of St Victor (pp. 351–352), but also suggested that natural law may give different precepts for different circumstances. (This is based on Augustine’s explanation of how the same God can be the author of the Old Law and of the New.) Adam’s sin introduced a great change of circumstances, and in view of this difference natural law prescribes the one liberty and community of goods for the state of innocence but for the fallen state prescribes slavery (for some) and property (p. 348). The leading Franciscan theologian of the next generation, Bonaventure, adopted a similar position (Bonaventure, 2 *Sent.*, dist. 44, a. 2, q. 2, ad 4, Vol. 2, p. 1051). Similarly, Scotus held that community of goods is highly consonant with natural law for the state of innocence, property for the fallen state (see below). Ockham followed Alexander and Bonaventure (see below).

Some civil lawyers in the later middle ages (e.g., Bartolus, Paulus de Castro) tried to answer the questions whether, and how, property exists by the law of nature by suggesting that property in moveables (e.g., consumables) is basic and natural, whereas property in immovables (e.g., land) developed in the secondary law of nations in imitation of property in movables: thus one kind of property is natural, the other conventional. All of this was later taken over by Grotius in *De iure praedae* (see Kilcullen 2001b, p. 905ff; on Bartolus see editor’s note in Suárez, Vol. 4, p. 130, n. 274). Whether property exists by natural law, the law of nations, civil law or divine positive law continued to be debated into the eighteenth century.

Thomas Aquinas

Albert the Great, Alexander of Hales, Bonaventure, and others wrote about natural law (see Cunningham, Quinn). However, the most influential theological treatment was given by Thomas Aquinas in the *Summa theologiae*.

According to Thomas, reason directs human acts in view of some end. Action is commanded by the will, which wills the end, but for a command to count as law it must be in accord with some rule of reason (ST 1–2 q.90 a.1); thus law is from both the reason and the will of the lawgiver. Natural law is from the reasonable will of God (q.97 a.3); God’s reason, will, and law are identical with God himself (q.93 a.4 ad 1). The ultimate end to which reason directs action is the well-being of the whole community, the common good; every law, therefore, is ordered to the common good (q.90 a.2), and every law is ordered to friendship among those who share this common good (q.99 a.1 ad 2; a.2); the natural law fosters the friendship of all mankind with God. Laws are made and promulgated by someone who has charge of the community. The natural law is promulgated by God’s inserting into the minds of human beings a natural capacity to come to know the natural law (q.90 a.4 ad 1). Laws include commands and prohibitions, and perhaps counsels and permissions. Whether Thomas thinks that law includes counsels is not certain: in one place (q.92 a.2; ad 2) he seems to say it does not, in another (q.100 a.2) that it may. Law can give permission by leaving some matters undetermined; according to Thomas, the Gospel law is a law of freedom because it leaves many things to the decision of the individual (q. 108 a.1). Natural law leaves some matters to be determined by human positive law (q.94 a.5 ad 3; 2–2 q.66 a.2 ad 1).

Thomas postulates an eternal law. In God there are “ideas” or “types” of created things (1 q.15), in creatures there are “participations” of these ideas. The eternal law is the type of God’s government of the universe (1–2 q.93 a.1), the participation in human beings of the eternal law is the natural law. Whereas irrational nature is governed without knowing it by the eternal law, human beings can govern themselves consciously in accordance with this participation of the eternal law written into human reason (q.91 a.2). Natural law binds human beings in conscience (q.96 a.4). Natural law is morality (q.100 a.1, q.104 a.1).

The primary principles of natural law are the most basic general principles of practical reason.

There is a plurality of indemonstrable principles of practical reasoning, but one is fundamental and the others are founded on it (*fundantur, referuntur, reducuntur*), though not by being demonstrated from it. Thomas draws an analogy between practical and scientific reasoning (q.90 a.1 ad 2, q.91 a.3, q.94 a.2): the fundamental principles of natural law are the counterpart in practical reasoning of the fundamental indemonstrable principles of scientific reasoning (cf. Aristotle, *Anal. post.* I.3, 72b 18–25, *Metaph.* IV.4 1006a 5–12). A fundamental principle is known per se, that is, its predicate is part of the ratio (intelligibility) of its subject. (Ratio here means not just a stipulative or verbal definition but an understanding of what something is.) Just as the first notion that speculative reason forms of something is that it is something, a being, so practical reason first apprehends what is to be done or brought about as a good. The first principle in practical reasoning, based on the ratio of good (“that which all things seek”), is that good is to be sought and done and evil avoided. Other indemonstrable principles are based on this first principle, in that various kinds of ends are naturally apprehended as good, namely those to which man has a natural inclination. (Inclinations belong to the appetitive faculty, the will; q.58 a.1.) Going from general to specific, natural inclinations can be classified as belonging to man as a substance, as an animal, and as a rational animal. Regarding man as a substance, there are precepts of natural law relating to the preservation of human life, regarding man as animal there are precepts relating to sex and the education of children, regarding man as rational there are precepts relating to the seeking of knowledge of God and participation in social life – forming a list reminiscent of, though not identical with, the content of natural law according to Cicero and the writers quoted by Justinian and Gratian. (For all this see q.94 a.2 and Grisez 1965.) Though the ordering of principles is from general to specific, it seems unlikely that preservation of human life is supposed always to override the others; Thomas does not discuss the possibility that in particular cases natural laws may conflict.

Secondary principles of natural law are derived as “quasi-conclusions” from the primary

principles (q.91 a.3), again in an order from general to particular (q.94 a.4, a.6). The term “quasi-conclusions” (q.94 a.6, q.97 a.4 ad 3, q.99 a.2 ad 2), suggests that the derivation may not be strict logical inference. Thomas says that the most basic principles are exceptionless and are known to all, but practical reason is concerned with contingents, and the closer we come to contingent particulars the more often we encounter defects – one of the principles of Aristotle’s natural philosophy is that corruptible natures are defective in some cases. Derivative rules may therefore not apply in some circumstances. For example, in typical cases natural law requires “restitution of an article given in trust,” but that does not hold if the thing will be used to attack one’s country (q.94 a.4), or if it is a sword belonging to a madman (2–2 q.120 a.1). Adding conditions to the rule will not preclude exceptions, since the more conditions are added the greater the possibility that the rule will fail (1–2 q.94 a.4). Although the fundamental principles (including, as we will see, the Ten Commandments) are exceptionless and do not admit of dispensation, dispensation is possible from the more particular rules in unusual cases (q.94 a.5; q.97 a.4 ad 3; q.100 a.8).

The process of derivation continues into positive law. The two branches of human positive law, the law of nations and the civil law, are derived from natural law in different ways. The law of nations is derived, like the secondary principles of natural law, by inference (*per modum conclusionis*), the civil law is derived “by determination” (q.95 a.2). (It is natural law that we must not kill other people; if traffic is dense and fast moving, the duty not to kill may suggest that motorists should all drive on the same side of the road, but whether this should be the right side or the left is determined by the civil law.) Human law may bind in conscience (q.96 a.4), but human laws inconsistent with natural law are a corruption of law and do not bind morally (q.93 a.3 ad 2; q.95 a.2). Among the matters natural law leaves to be determined by human law is possession of external goods. The natural law permits human beings to use natural things (2–2 q.66 a.1), but (for reasons given by Aristotle, q. 66 a.2) in some circumstances it is best if some individuals

control access to some things, and human law may provide for this by instituting property (q.66 a.2 ad 1).

The Decalogue (the Ten Commandments, Exodus 20:2–17) is a republication of some precepts of natural law. The natural law is a participation of the eternal law, which is divine, but there is also a “revealed” divine law, not promulgated by inscription in the minds of all mankind but promulgated to some human beings through messengers – Moses, the Prophets, the Apostles, etc. (q. 91 a.4); some of its precepts are positive laws (q. 99 a.4), but the Decalogue, promulgated through Moses, re-promulgates some precepts of natural law. The Decalogue does not include the most basic principles of natural law, which are immediately obvious to all mankind and do not need republication, and on the other hand it does not include the more recondite implications of natural law (q.100 a.3, a.5 ad 1). The Ten Commandments are more particular than the most general principles, but they are (at a lower level, so to speak) general principles and can easily be seen by anyone; yet, because in a few cases human judgment regarding them can be perverted, they needed to be republished by divine revelation (q.100 a.11). The “first table” (the first three commandments) consists of precepts ordering mankind to the ultimate end, God; the second table consists of precepts regarding the order of justice among mankind (q.100 a. 8). (Commandments of the first table are self-evident to human reason informed by faith; q.100 a. 3 ad 1, q. 104 a.1 ad 3.) Just as the general principles of natural law are immutable, exceptionless, and indispensable, so are the Ten Commandments, which contain the very intention of the lawgiver (q.100 a.8). There have been cases when God directed or permitted action apparently contrary to one or other of the commandments, but these were not really contrary and were not really changes of natural law or dispensations from it (q.94 a.5 ad 2; q.100 a.8 ad 3). Some apparent dispensations were interpretations (q.100 a.8 ad 4). The explanation of other apparent dispensations is that because God is supreme lord and supreme judge, He can deprive some people of their life as punishment, or transfer their goods to others, or allot some woman to

be some person's wife, without violating the relevant precepts of the Decalogue.

Thomas' account of natural law gives rise to many questions. How "good is to be sought and evil avoided" known per se – is it because "to be sought" is included in the ratio of good? If so, then "that which all things seek" cannot be an accurate statement of the ratio of good, since it implies no such prescription. What are the other self-evident basic principles? Thomas does not state them, but merely indicates their subject matter – for example, "whatever is a means of preserving human life and of warding off its obstacles *belongs to* the natural law." How are the other basic principles "founded on" or "reduced to" the first principle, if not by being demonstrated from it? What are the derivative natural laws, and how are they derived? How do natural inclinations generate laws (q.94 a.2)? How is the list of natural inclinations drawn up – is man's having these inclinations supposed to be known per se in the specified sense (i.e., that the predicate is included in the ratio of the subject), or in some other sense? Is the list "self-evident" merely in the loose sense that it will strike most people as obviously correct, "intuitively"? Some common inclinations (e.g., selfishness, revenge) are not good: if they are ascribed to "sin" and not to nature, we must be able to distinguish between what is common and what is natural. Are all truly natural inclinations good, or do we regard as truly natural only those we recognize (on what grounds?) as good?

Duns Scotus

According to Scotus, the term "law of nature" has a strict sense and a broad sense. In the strict sense, the laws of nature include practical principles known from their terms (*nota ex terminis*) and conclusions that can be inferred evidently from those principles. In a broad sense, the laws of nature include practical truths that are consonant (*consonans*) with the law of nature in the strict sense (Wolter 1986, pp. 262–263; on what Scotus may mean by "consonant" see Ragland). Laws of nature in the strict sense hold always, for whatever state or condition human beings may live in

(pp. 264–265). They are prior to any act of will, even God's – the divine intellect must recognize their truth and the divine will must will in accordance with the intellect's recognition of their truth. They admit of no exceptions; not even God can dispense from them. What they command is good in itself apart from the command, what they prohibit is wrong in itself apart from the prohibition.

Scotus distinguishes between commandments of the first table of the Decalogue, which formulate duties we have toward God Himself, and commandments of the second table, which regulate our conduct toward other human beings. The command to keep holy the Sabbath day is not part of natural law in the strict sense, and the other two commandments of the first table belong to strict natural law only if given a negative formulation, as precepts not to hate God and not to love as supreme any but the true God. (Scotus holds that only negative commands belong to natural law in the strict sense.) The commandments of the second table are natural law only in the broad sense, and God has power to set them aside. God's power is limited only by the impossibility of his doing anything self-contradictory (p. 256). To set aside a practical truth *nota ex terminis*, or one evidently inferred from such a truth, that is, a natural law in the strict sense, would involve self-contradiction. But God can without any contradiction revoke any of the commandments relating to the good of our neighbors.

Against this it might be argued that love of God implies love of our neighbors, since if we love God we must wish others to love him, and wishing for that is to love them; the commandments of the second table therefore follow evidently from natural law in the strict sense and are therefore natural laws in the strict sense. Scotus rejects this argument for several reasons (pp. 282–284): first, because the duty to love God is affirmative and therefore not part of strict natural law – the strict duty is not to hate God, and we can fulfill this duty without wishing anyone else to love God. Second, because God may not wish to be loved by everyone, for example, not by those whom he has not predestined to salvation. Third, because even if we do want our neighbor to love God, that does

not imply any of the commandments of the second table for example, we can want our neighbor to love God without having any duty not to kill our neighbor. God has revealed that he wills us to love our neighbor in ways that go beyond anything that can be strictly inferred from the natural law obliging us to love God; the second table expresses that will, it does not spell out strict implications of natural law.

These are arguments for rejecting Thomas' doctrine that not even God can dispense with the commandments of the Decalogue. Whether God has in fact done so is another question. Thomas referred to a number of occasions on which God apparently dispensed with one or another of the commandments (ST 1–2 q.94 a.5 obj. 2). Scotus repeats these examples, and argues that they show that God has in fact dispensed. To the objection that the command “thou shalt not kill” does not fully express the intention of the legislator, that is, that it is only an approximate statement of the obligation, Scotus answers that precision is not the issue. Granted that the commandment does not intend to forbid every killing, the question remains: Can God's permission in a particular case makes licit an act that, apart from this permission, would be really forbidden, by the commandment precisely formulated? If so, then God can dispense from the Decalogue, just as he replaced the Old Law with the New, just as a legislator can replace one positive law with another; if not, then He cannot dispense. If Abraham had killed his son that would really have been a violation of a commandment in its true intention, which proves that God has dispensed from the commandment “thou shalt not kill.”

God also revoked the law that prohibited appropriation in the state of innocence (pp. 280–281, 312–315). (The law against appropriation does not belong to the Decalogue, but according to Isidore (above) natural law includes “the common possession of all things.”) After the fall God revoked the prohibition against appropriation; some time after that, human law established the institution of property, and God's law then prohibited theft. Scotus explains (pp. 312–313) that the original prohibition and later permission of appropriation served the same

ends, namely peace and sustenance, under different circumstances. In the state of innocence community of goods served those ends best, in the fallen state appropriation does; if goods had remained common in the fallen state, the physically weak would have suffered from the greed of the powerful. That the physically weak should be protected, that people should live together peacefully, and that there are many morally weak persons who care mostly about themselves and not much about others, all seem obvious. The institution of property in the fallen state is very consonant with those suppositions, though not implied with strict necessity. Scotus comments that perhaps it is thus with all positive laws: they do not follow with strict necessity from the underlying principles, but only as very consonant with them (p. 281).

Unlike Thomas, Scotus in his account of natural law makes no reference to natural human inclinations. An appeal to natural inclinations would have been inconsistent with Scotus' view of freedom of the will and the contingency of creation. According to Scotus, the will is free in the sense that it has an instantaneous “power of opposites,” that is, when the will chooses something, it simultaneously has full power to choose the opposite (*Ordinatio* 1, dist. 38–39; Scotus, *Opera omnia*, Vol. 6, pp. 417–419). According to Scotus, human decisions, and God's, are not determined by thoughts, dispositions, or other causes. This implies that God is not bound by any rules or laws in His decisions about creation. God is free to create human beings with certain natural inclinations, without being bound to issue them with any commandments, and without being bound to command them in ways that further their natural inclinations. Human will, according to Scotus, has two “affections”, an *affectio commodi*, which is a tendency to seek objects of natural inclination, and an *affectio iustitiae*, a tendency to choose to do what is right and good because it is so (Wolter 1986, pp. 178–179). It is the *affectio iustitiae* that constitutes human freedom. It sets us free to disregard our natural inclinations and to choose to follow God's commandments instead, whatever they may be, even if they do not suit our inclinations.

William of Ockham

According to Ockham (Quodl. II q. 14, OTh, Vol. 9, p. 177), positive morality consists of laws that oblige a person to seek or avoid things only because they have been ordered or prohibited by a superior, but there is a “non-positive” morality consisting of laws that direct human acts apart from any command of a superior. Non-positive morality consists of directives that are either fundamental principles *per se nota* or laws deduced from such fundamental principles together with experience. (The reference to factual experience differentiates Ockham’s position from that of his predecessors.) Non-positive morality is the natural law (3.2 Dial., 1.5, 1.10).

There are three kinds of natural law (3.2 Dial., 3.6). The first (elsewhere called “absolute” natural law, 3.2 Dial., 1.11) consists of natural laws that hold always, everywhere, in all conditions of mankind; no necessity excuses disobedience (3.1 Dial., 2.20), they are immutable and no dispensation from them can be given (except by God, as we will find): for example, “Do not commit adultery,” “Do not lie.” The second kind are the laws to be observed by those who make no use of custom and human legislation, laws that would have been observed in the state of innocence and would still be observed if everyone lived according to natural reason or divine law: for example, common possession. The third kind are laws gathered by evident reasoning from the law of nations or another law or from some act, divine or human, unless the contrary is decided on with the consent of those concerned. The third kind are natural laws “on supposition.” On the supposition of the fall from innocence, and on the supposition that human law has established the institution of property as a way of reducing conflict and other evils of the fallen state, natural reason will infer that one must not use something belonging to another without the owner’s consent. The law of nations consists in, or includes, natural law of the third kind (3.2 Dial., 3.7 near the end). Ockham’s doctrine of three modes seems to be a development of ideas of Alexander of Hales, Bonaventure, and Scotus (see above), and likewise resolves the conflicts found in Gratian’s extracts from Isidore.

Ockham does not follow Scotus in giving a lower status to the second table of the Decalogue, but unlike both Thomas and Scotus, he says that God may make dispensations from any of the Ten Commandments (even commandments of the first table). Ockham seems to hold that one of the principles of non-positive morality is that God is to be obeyed, and that this principle overrides the others when there is conflict. From this it seems that God can make exceptions or give dispensations from any natural law, either by allowing an occasional exception or by replacing the current moral law: “I say that. . . hate, theft, adultery and the like. . . could be done by the wayfarer even meritoriously if they were to fall under a divine precept, just as now in fact their opposites fall under divine precept. . . But if they were thus done meritoriously by the wayfarer, then they would not be called or named theft, adultery, hate, etc., because those names signify such acts not absolutely but by connoting or giving to understand that one doing such acts is obliged to their opposites by divine precept” (OTh, Vol. 5, p. 352). To love God, or at least the negative, not to hate God, is a principle of natural law; love of God is necessarily a good act and the most basic of good acts. Nevertheless, the natural law that God is to be obeyed overrides even the law that God is to be loved – if God commanded an act of hatred of God, the commandment would bind. “Everything that can be a right act on the way [i.e., on earth], also [can be right] in the fatherland [i.e., in heaven]. But to hate God can be a right act on the way, for example if it is commanded by God, therefore in the fatherland” (Vol. 7, p. 352).

The overriding force Ockham gives to divine commandments has led some historians to classify him as a “voluntarist,” implying that he holds that morality is whatever God wills it to be (cf. Copleston, Vol. 3.1, p. 115ff). In Ockham’s view, the obligation to obey God’s commands is an obligation of natural law that overrides other precepts of natural law, but that it overrides them does not imply that they hold, when they do, only because they are commanded by God. Perhaps his view is that an act contrary to natural law, such as adultery, is wrong in itself but the wrong of disobedience to God would be greater, so that a

person might be obliged by divine command to commit adultery, which would then, under the circumstances, be right (see Kilcullen 2001a). Ockham states explicitly (see above) that there is a non-positive morality independent of the will of a superior, and there are places where he distinguishes between things wrong in themselves and things wrong because prohibited (3.1 Dial., 2.20). However, it must be said that Ockham did not make his position clear. (For an account of the role of reason in Ockham's moral theory see McGrade 2006, pp. 66–70; on divine command and rational ethics in Ockham's moral theory, see McGrade 1999.)

Gregory of Rimini

Though modern historians classify them as voluntarists, Scotus and Ockham say that natural law in the strict sense, or “non-positive morality,” is independent of God's will. According to Scotus, propositions which “are true by reason of their terms... would be true even if, to assume the impossible, no act of willing existed” (Wolter 1986, p. 275). Gregory of Rimini went further and said that the necessary truths of morality are independent also of God's intellect – if human beings existed but God did not, adultery would still be wrong. To the question why he says that sin is against right reason, rather than against divine reason, Gregory answers that he says this

lest it be thought that sin is precisely against divine reason and not against *any* right reason... and lest it be thought that something is sin not because it is against divine reason as being right, but because it is against it as being divine. For if, to assume the impossible, the divine reason or God himself did not exist, or his reason was in error, still, if someone acted against angelic or human right reason or any other (if there be any), he would sin. And if there existed no right reason at all, still, if someone acted against what some right reason, if it existed, *would* say should be done, he would sin. (Gregory 1980, p. 235)

Many things are sins of themselves and not just because they have been prohibited; even if no divine command were ever given, a person could know and judge that such things are not to be

done. “If anyone acts solely against the natural law or against the right judgment of reason, certainly he would sin, though, *if he were to have with this a superadded precept, he would sin further*” (Gregory 1980, p. 238, emphasis added). Since God forbids what is already wrong, there is a double sin.

In the seventeenth century, Gabriel Vasquez held a similar position (see St. Leger 1962, pp. 131–134). According to Suárez, the term natural law implies the command of a superior, namely God, but it commands or forbids what is right or wrong intrinsically, apart from any divine command: God's command imposes a moral obligation additional to the “(so to speak) natural” evil the act has in itself (Suárez, vi.12, Vol. 3, p. 94ff). There are echoes of Gregory, Vasquez and/or Suárez in Grotius (*De iure*, Prol. 11, and lib. I.1.10), and Samuel Clarke (Raphael, Vol. 1, pp. 212–214). According to all these authors, rightness and wrongness are intrinsic to actions of certain kinds, and God commands right action and forbids wrongdoing.

Medieval natural law theories belong to the genus of theories that suppose that morality is “objective,” that is, that moral standards are independent of the opinions of any human individual or social group. Specifically, natural law theories (1) undertake to derive the standards from basic principles *per se nota*, and (2) claim that the standards are laws sanctioned by God. However, medieval writers failed to present the self-evident basic principles clearly enough to make it possible to judge whether they really are *per se nota*, and they failed to show in detail how other precepts of the natural law can be demonstrated from the basic principles. The rational derivation of morality remained merely a project lightly sketched out.

Natural Philosophy

Johannes M. M. H. Thijssen
Faculty of Philosophy, Radboud University
Nijmegen, Nijmegen, The Netherlands

Abstract

Before the publication of Newton's *Principia mathematica philosophiae naturalis* (1689), Aristotle's *Physics* was the most widely read and influential book of natural philosophy. After 1250, it constituted the core text of the discipline of natural philosophy and was, together with Aristotle's other "natural books," routinely studied at all European universities. Change and motion were the central topics in Aristotle's "natural books," and, as a

consequence, came to be pivotal in medieval natural philosophy. For Aristotle, and the medievals in his wake, motion was not merely a starting point from everyday experience, but a phenomenon whose nature needed closer investigation. This article will pay attention to medieval studies of the nature of motion, but also to medieval dynamics and kinematics (gravity, accelerated free fall, projectile motion, and qualitative changes, such as heating). The medieval discussions raised interesting ontological, semantic, and mathematical issues. The focus will be on developments at the universities of Oxford and Paris.

Introduction

Nowadays, philosophy and science are two distinct domains, separated by dividing lines that were nonexistent in the past. We often associate philosophy with the examination of unanswerable questions, whereas the core activity of science seems to be the collecting of empirical data and the creation of explanatory mathematical models. In antiquity and in the Middle Ages, however, philosophy and science were one discipline with one shared history.

Medieval natural philosophy did not originate out of nothing; it did not stand on its own shoulders but on those of ancient philosophy. The famous British philosopher Bernard Williams once remarked that "the legacy of Greece to western philosophy is western philosophy." Before the publication of Newton's *Principia mathematica philosophiae naturalis* (1689), Aristotle's *Physics* was the most widely read and influential book of natural philosophy. How could Aristotle become such an important authority? The answer to this question is linked to the site of philosophy during the Middle Ages. After 1200, philosophical and scientific culture primarily flourished at the universities, instead of, for instance, in laboratories or learned societies, cathedral schools, monasteries, or courts. At all universities in medieval Europe, Aristotle's works came to be compulsory reading for all students. The works of Plato or of other Greek thinkers were hardly known. This historical

circumstance shaped medieval (natural) philosophy in a unique way (see the entries on ► [“Aristotelianism in the Greek, Latin, Syriac, Arabic, and Hebrew Traditions”](#) and ► [“Universities and Philosophy”](#) in this volume).

In medieval universities, the curriculum of the Faculty of Arts included the seven liberal arts (grammar, rhetoric, logic, arithmetic, geometry, music, and astronomy) and what were called the three philosophies: natural philosophy, moral philosophy (or ethics), and first philosophy (or metaphysics). Aside from astronomy, then, most of the disciplines that were later called “science” fell under the heading of “natural philosophy” (*philosophia naturalis*). Other terms that designate the domain of natural philosophy are natural science (*scientia naturalis*), physics (*physica*), and, in the post-medieval period, physiology (*physiologia*).

In addition, medieval scholars were familiar with the term “science” (*scientia*). It was applied, however, in different ways than we are used to today. In the Middle Ages, the term “science” referred to the mental condition of possessing certain knowledge of something. It was a type of knowledge that was produced by a logical demonstration. In this respect, “science” distinguishes itself from “opinion” or “view” in that the latter are not based on any particular method and are not universally valid and certain. In a derivative sense, “science” can also refer to a discipline in the Middle Ages, a discipline with its own domain of inquiry, principles, and methodology. In this sense, “science” is a collection of propositions about a particular topic, organized in a coherent set of arguments and proofs. Thus, “physics” is a science, but so are metaphysics, medicine, and theology. Overall, *scientia*, the medieval term for science, was not exclusively reserved for physics, but was applied to any field that contained certain and valid statements (see the entry on ► [“Posterior Analytics, Commentaries on Aristotle’s”](#) in this volume).

The basic content of philosophy was constituted in medieval universities by the works of Aristotle, known as “the Philosopher,” often accompanied by the commentaries of Averroes, known as “the Commentator.” To fulfill their

requirements in natural philosophy, selections were made of Aristotle’s works in natural philosophy. Natural philosophers of the Middle Ages and the Renaissance believed that Aristotle had raised and discussed crucial questions about the natural world and had explained important definitions, general principles, and concepts of physical science. In addition to the *Physics*, Aristotle had provided this explanation in other “natural books” (*libri naturales*), such as *On the Heavens* (*De caelo*), *On the Soul* (*De anima*), *On Generation and Corruption* (*De generatione et corruptione*), “Meteorology” (*Meteorologica*), and *The Short Natural Treatises* (*Parva naturalia*). These books were arranged around the *Physics* as treatises that discussed particular aspects of natural objects. In sum, the medieval and Renaissance scholars found their natural philosophy in the books of Aristotle rather than in the Book of Nature, written in the language of mathematics, as Galileo expressed two centuries later in a very powerful metaphor (see the entries on ► [“De caelo, Commentaries on Aristotle’s,”](#) ► [“De generatione et corruptione, Commentaries on Aristotle’s,”](#) and ► [“Parva Naturalia, Commentaries on Aristotle’s”](#) in this volume).

Aristotle as well as the medieval and Renaissance scholars who followed in his footsteps, were utterly convinced of the intelligibility of nature. Nature possesses an order that is accessible to the human mind, an order that initially discloses itself in the way we speak of nature. Investigation of the natural world begins with phenomena (*phainomena*) and it moves from “that what is better known to us” to “that what is more knowable by nature,” that is, the “objective” principles and causes that are concealed and intrinsic to the phenomena (Aristotle, *Physica*, 184a17–22 and *Metaphysica*, 1029b3–12). Aristotle speaks about “phenomena” in a much broader sense than we are used to. For Aristotle, “empirical data” not only refer to the observable facts themselves, but also apply to common opinion or to scholarly opinion about these facts. It is Aristotle’s traditional method to investigate how, for instance, one speaks of a specific topic. He reflects on commonly held views, signals all kinds of problems, and subsequently offers us a more profound analysis of a “phenomenon.”

One of the essential research themes in Aristotle's "natural books" is the phenomenon of change. What is most remarkable about the natural world is that it is susceptible to all kinds of change. Natural objects originate and perish; they are altered; they move (they change location); and they grow. From this perspective, natural philosophy includes the study of celestial bodies, of meteorological phenomena, and of important concepts that are fundamentally intertwined with change, such as "place," "space," and "time" and related notions such as "continuity" and "infinity" (see the entry on ► ["Atomism"](#) in this volume). But it also includes the study of material objects, which have the characteristics of living beings, such as human beings and animals (see the entry on ► ["Philosophical Psychology, Jewish Tradition"](#) in this volume). For the first time in the history of western thought, a systematic attempt was made to give a conceptual analysis of change and motion, including their temporal and spatial aspects.

From Athens to Western Europe

How did medieval natural philosophers become aware of the theories of a Greek thinker from the fourth century BCE? Did they read the papyrus scrolls, which Aristotle had scribbled down in Greek 600 years earlier? The ideas and views of Greek philosophers, strolling and chatting in the local marketplace or at a gymnasium, traveled a long way before they had their impact at the universities of Oxford, Paris, or elsewhere in Europe.

Roger Bacon (1214/1220–1292) once claimed that proficiency in languages "offers the first door to wisdom, which certainly applies to the Latins, who only possess philosophical and theological texts written in a foreign language" (Roger Bacon, *Opus tertium*, Cap. XXVIII). Bacon had a point: Latin wisdom had mainly been imported from Greece. If one wonders how western philosophy had become the legacy of Greece to western philosophy, then the answer is clear: through translation. From the end of the twelfth century onward, a basically alien philosophical and scientific

culture was reintroduced into the Latin West that meanwhile had become Christian. In the time span before the twelfth century, Latin natural philosophy was based on a very small number of sources (see the entries on ► ["Adelard of Bath"](#) and ► ["Roger Bacon"](#) in this volume). Due to political developments within the Roman Empire, the intellectual ties between the Latin West and the Greek East were gradually severed. The days when members of the intellectual elite in Rome were able to speak and write in Greek had definitely passed.

Western scholars read Aristotle in Latin, even long after 1470, when the first Greek editions of Aristotle's works had appeared in the West. The Latin translations continued to be published for reasons of user convenience. From the Middle Ages until far into the seventeenth century, Latin simply was the language in which scholars conversed and wrote, no matter their geographical origin. Galileo, Descartes, Spinoza, and Newton, for instance, consulted Latin translations of Aristotle. The position of Latin as the universal language for scholars explains why Aristotle and other Greek thinkers were translated into Latin, rather than into Europe's different vernacular languages.

In certain respects, the transmission of Greek science and philosophy into Latin is comparable to an infectious disease. Both pass from one community to another through contact. Whenever an "outbreak" is diagnosed, we ask ourselves "Where did it first originate?" Can all outbreaks be traced back to one primary source, or have there been several independent starting points? How did the first Latin translations of Aristotle's works originate? The question might seem obvious, but the answer is rather complex, at least when one wants to delve deeper than the mere enumeration of data, names, places, and titles of works. The translators came from all parts of Europe. Some worked individually, while others were part of a systematic translation movement. The activities of the Latin translators were part of a process that can best be characterized as the appropriation and assimilation of Greek knowledge in the Latin West. The choice of phrasing implies that much more was at stake than the mere

continuation and reception of Aristotle's works. The Greek thinkers had not come to the West as uninvited guests; they were not thrust upon western culture. On the contrary, translators went to seek out Greek erudition. Extraordinary historical circumstances offered western scholars the unique opportunity to revert to the Greek originals, as well as to their Arabic translations.

Texts written in Arabic played an important role in western philosophy and science. They were an Islamic legacy to the West. The authors came from an area stretching from North-East Africa and the South of Spain to eastern Asia, and wrote in Arabic. The Arabic translations of Aristotle's works were only a small segment of this Islamic legacy. It further consisted of Arabic translations of other Greek authors, such as Hippocrates, Galen, Euclid, and Ptolemy and, obviously, of independent works of Islamic scientists and philosophers (see the entries on ► [“Arabic Texts: Natural Philosophy, Latin Translations of”](#); ► [“Aristotle, Arabic”](#) in this volume).

Which role did Islamic science play as an intermediary in the transmission of Aristotle's natural philosophy to the West? The picture often given is that the West came to know Aristotle's works through translations from Arabic. These translations supposedly had given the impulse toward the western revival of philosophy and science: the light came from the East. However, around the same time when the Latin translations from Arabic were made, Aristotle was also translated from Greek into Latin. The manuscript evidence demonstrates that, in the West, Aristotle's works were mainly read in Latin translations that were made from the Greek original, certainly since the first half of the thirteenth century. An exception is *De animalibus*, one of Aristotle's treatises on biology, which was read throughout the Middle Ages in a Latin translation made from Arabic.

More important Arabic sources, however, from a western point of view, are the Latin translations of paraphrases and commentaries by al-Fārābī (d. 950–951), Ibn Sīnā/Avicenna (980–1037), and Ibn Rushd/Averroes (1126–1198). They belonged to the philosophical movement known by the Arabic loanword *falsafa* (*philosophia* in

Greek). Their works would come to play an important role in the Latin reflection on the writings of Aristotle (see the entries on ► [“Ibn Rushd \(Averroes\), Latin Translations of”](#); ► [“Ibn Sīnā \(Avicenna\), Latin Translations of”](#); ► [al-Fārābī, Latin Translations of](#) in this volume).

The origins of the translations and the details about scholars who traveled wide distances in search for texts and who spent most of their lives translating them, are told elsewhere in this Encyclopedia. Important translators of Aristotle's “natural books” from Greek are James of Venice, Burgund of Pisa, and William of Moerbeke. They helped Aristotle to become the companion of any late-medieval (natural) philosopher in the West.

The Universities of Paris and Oxford

After 1250, every teacher in the arts-faculty at any university in Europe was required to teach using Aristotle's natural books. The teaching resulted in commentaries on Aristotle's works, which contained contemporary discussions about natural philosophy provoked by Aristotle's text. For this reason, the commentary literature on Aristotle is a rich source of information about medieval theories. In addition, issues in natural philosophy were discussed in the context of theological works, notably commentaries on the *Sentences*, and in separate treatises. The favorite format, however, was the commentary on Aristotle's natural books.

Literally hundreds of commentaries were written on Aristotle's natural books during the Middle Ages and the Renaissance. For reasons of convenience and historiographical tradition, this survey will devote special attention to the universities of Oxford and Paris. They were the sites of the two most prominent schools in natural philosophy, that is, the network of scholars linked to John Buridan (d. 1361) at Paris and the group linked to Thomas Bradwardine (d. 1349) at Oxford. In recent research, it has been argued that there was no such thing as a Buridan school. More accurately, John Buridan and his alleged pupils Albert of Saxony (d. 1390) and Nicholas Oresme (fl. 1345–1360) were contemporary scholars at

Paris, engaged in the discussions of their time. Even so, they remain the key figures in Parisian natural philosophy and its aftermath. Oxford's main protagonists were Richard Kilvington (d. 1361), Richard Swineshead (fl. 1340–1355), William Heytesbury (d. 1372/1373), and John Dumbleton (fl. 1338–1348). Richard Swineshead (not to be confounded with his contemporaneous namesakes John and Roger) came to be designated by later authors as “the Calculator” (*Calculator*), whereas the Oxford group in its entirety has been called “Calculators” (*calculatores*) (see the entries on ► “Albert of Saxony”; ► “John Buridan”; ► “John Dumbleton”; ► “Nicholas Oresme”; ► “Oxford Calculators”; ► “Richard Swineshead”; ► “Thomas Bradwardine,” and ► “William Heytesbury” in this volume).

Change and Motion

As has been mentioned above, change and motion were the central topics in Aristotle's “natural books,” and, as a consequence, came to be central in medieval natural philosophy. The *Physics* was only one of Aristotle's works on natural philosophy, but from the medieval perspective, it was the most important one. It was understood to provide a characterization of the most general principles and properties of the “things that are by nature” (Aristotle, *Physics*, 192b9–193a30). It covered the most general truths of natural philosophy, true for all bodies. Examples of natural things are animals and their parts, plants, and the four basic elements: earth, air, fire, and water. They are natural in a way that other objects are not, such as artifacts and things that are due to chance. But why are plants natural objects, and beds not? According to Aristotle, “things that are by nature” are distinguished from nonnatural things in virtue of having an inner source of moving and being at rest. In the case of natural objects, as in contrast to those artificially made by man, their specific nature disposes them to certain kinds of behavior, notably to all kinds of natural change. Fire, for instance, naturally heats other bodies. Acorns naturally develop into oak trees. Artifacts lack such

an inner source of motion (although they too contain such an inner principle insofar as they are made out of natural things). A coat, for instance, considered as a coat, does not have an inner impulse to change. As a consequence, “we must therefore see what motion is; for if it were unknown, nature too would be unknown” (Aristotle, *Physics*, 200 b 10–15). Precisely this endeavor was undertaken in the *Physics*.

Aristotle's account of nature and natural objects is couched in the terminology that was primarily reserved for local motion (*kinēsis*, *motus*). But how does it relate to change in general? In an influential passage in Book 3 of the *Physics*, Aristotle had maintained that motion does not constitute a separate category of its own over and above the things that are moving, but is placed in several categories of entities that are capable of change: substance, quantity, quality, and place (*Physics*, 200b32–201a10). Thus, “motion,” in this broad Aristotelian sense, includes (1) change of quantity (growth and decline); (2) change of quality (alteration, such as white into nonwhite); (3) locomotion; and (4) substantial change or generation and corruption. In the first three types of change, the substance remains the same and its properties change, whereas in the latter, the substance itself changes. For this reason, medieval thinkers sometimes classified generation and corruption not as a type of motion (*motus*), but as a *mutatio*, that is, an instantaneous change. Motion, by contrast, was gradual and successive.

What Is Motion?

For Aristotle, and the medievals in his wake, motion was not merely a starting point from everyday experience, but a phenomenon whose nature needed closer investigation. The question about the nature of motion not only concerned the adequacy of Aristotle's definition of motion, the *quid nominis* so to speak, but also, more interestingly, the question of what motion really is, that is, the *quid rei* or ontological status of motion. In response to certain conceptual puzzles that the Eleatic philosophers Parmenides (fl. 480 BCE)

and Zeno (fl. 450 BCE) had raised, Aristotle had introduced his form–matter theory of motion. If we may believe Aristotle’s account, Parmenides and Zeno had claimed that none of the things that exist come into being or pass away, or, in other words, that change is only apparent. They had argued that what comes to be must either do so from what already is, in which case it is no veritable coming-to-be, or from nothing at all (ex nihilo). The latter option, however, was considered absurd. On these logical grounds, they denied that change was possible.

Aristotle starts from the common sense assumption that perceived change is real. By his doctrine of form and matter, Aristotle tries to solve the logical impasse created by Parmenides and Zeno. He considers the objects in the world as composites of underlying matter and imposed form. From the perspective of matter, change involves continuation. The underlying substrate does not change. From the perspective of form, however, change involves real change, because it consists of the successive replacement of one form by another. For example, if a black object turns white, the matter or substrate remains, whereas the form of blackness is replaced by that of whiteness. In similar fashion, if an acorn becomes an oak tree, the change can be described in terms of the continuation of a substrate on which a new form is imposed.

In Aristotle’s view, the replacement of one form by another is not a transition from nonbeing to being. He supposed that any change was a transition from potentiality to actuality. The black, or rather, the not-white, is potentially white. By becoming white, it becomes actually what it was already potentially. Similarly, an acorn is potentially an oak. In sum, Aristotle’s invocation of matter and form, and of potentiality and actuality solved the logical puzzles raised by the Eleatic philosophers. Change does not involve a passage from nonbeing to being, which both Aristotle and Parmenides considered impossible, but rather a passage from potential being to actual being. As a consequence, matter and form, and potentiality and actuality became the most fundamental explanatory principles of medieval physics. Form is the principle that bears the essential

properties of a substance, that is, of any object in reality. It determines what the thing is, that is, what its specific nature is. Matter is the passive recipient of the form (see the entry on ► [“Form and Matter”](#) in this volume). Medieval attempts to define motion and discuss its ontological status were later ridiculed by Descartes. In the *Rules for the Direction of the Mind* (*Regulae ad directionem ingenii*, Rule 12 AT X, 427–27), Descartes pokes fun at the Aristotelian definition of motion. “Who doesn’t know what motion is?,” he asks rhetorically. In *The World* (*Le Monde*, AT XI 39), started around the same time, Descartes even claims that he finds the scholastic definition of motion so obscure that he is forced to leave it in “their language,” that is, “motion is the actuality of a thing in potentiality insofar as it is in potentiality” (*motus est actus entis in potentia prout in potentia est*).

In his works, Aristotle had made contradictory statements concerning the ontological status of motion. In *Physics*, book 3 (200b32–201a10) he maintained that motion is not something over and above the things in motion. In other words, motion does not constitute a separate category, but belongs to the same category that is gained by motion, that is, the category of Place in the case of local motion. In the *Categories* (11b1–8), however, Aristotle had claimed that motion fell into the category of Affection (*passio*).

Averroes tried to reconcile these incompatible statements by pointing out that in the *Physics*, Aristotle had set forth the more correct view, whereas in the *Categories*, he had maintained the more common view. Averroes’ explanation of Aristotle’s view hinges on an analysis of motion from two different perspectives. Motion, if considered from the terminus toward which it tends, only differs from it in its degree of “more or less,” that is, in its degree of perfection. If, however, motion is considered as a process (*via*) toward perfection or actuality, and, as a consequence, is different from the perfection it attains, it belongs to a category of its own. When seen as a road toward actuality, motion cannot coincide with that actuality. The same twofold analysis of motion recurs in Averroes’ commentary on *Physics* V. There it is couched in the terminology of

change “according to matter” and “according to form.” According to matter, change and its terminus belong to the same category; according to its form, one must view change as a transmutation that takes place in time and constitutes a category of its own, namely that of Affection (*passio*).

In the thirteenth and fourteenth centuries, these alternative analyses of motion came to be captured under the formulas *forma fluens* and *fluxus formae*, a distinction that medieval authors usually attributed to Albert the Great. According to the *forma fluens* theory, change is nothing but the forms successively gained by the changeable body. In the case of local motion, the *forma fluens* is the place successively attained by the mobile body. In other words, motion is the same as the perfection or form it acquires, but it represents that form in a state of flux. It is important to note that the flowing character of the form is not posited in the form itself, but results from the degree of actualization of the form in the subject. Thus, the view of motion as *forma fluens* did not contradict the common medieval view that forms are unchangeable. The *fluxus formae* theory, on the other hand, maintained that change is not the form acquired but is “the flux” of that form – the flow, the process, or the road toward an actuality or perfection. These distinctions were, at least implicitly, in the background of fourteenth-century discussions of Aristotle’s statement that there is no change over and above real things.

In the fourteenth century, the two main positions in the debate over the nature of motion were clear: some claimed that motion is a flux, which is distinct from the mobile object and the place, whereas others advocated that motion requires nothing more than mobile body and place. However, the debate was complicated by other elements that were woven into the discussion, such as the correct interpretation of Aristotle’s and Averroes’ views and a discussion of whether local motion should be treated in the same way as alteration, that is, change of quality. On the basis of arguments that invoke God’s omnipotence in rotating the whole cosmos, John Buridan had argued that local motion cannot be treated in the same way as alteration. Albert of Saxony found Buridan’s arguments concerning God’s

omnipotence compelling and gave up the *forma fluens* theory for local motion, which in his view represented the theory genuinely advocated by Aristotle and Averroes.

John Buridan, Nicholas Oresme, and Albert of Saxony describe local motion as fluxus and as “being continuously in another way than before” (*aliter et aliter se habere quam prius*). But what is fluxus? Buridan and Albert of Saxony agree that the fluxus character of motion should be interpreted as an inherent quality or disposition (*dispositio*) of the mobile object, as a property of a mobile being, but of such a nature that it is purely successive.

Oresme, on the other hand, rejects the idea that the fluxus is an inherent quality, such as a form. He disqualifies this interpretation of fluxus as “the worst possible view.” How then should the fluxus be understood? Oresme introduces a new ontological entity, the *modus rei* or way of being, to explain the phenomenon of motion. Motion is nothing but the mode or condition of the mobile object, its condition of traversing spaces in succession. The successiveness of the mobile body, however, should not be taken in the sense of a successive thing (*res successiva*) that is distinct from it. Thus, Oresme’s interpretation of fluxus almost turns it into a *forma fluens* theory.

The Causes of Motion

Other significant problem areas to which medieval thinkers addressed themselves are the dynamic and kinematic aspects of motion, that is, motion’s relations to its causes and to distance and time, respectively. In medieval terminology, these aspects concerned the study of motion “with respect to cause” (*penes causam*) and “with respect to effect” (*penes effectum*). In the former case, some consideration was given also to the forces acting on bodies to produce motions. Phenomena which fourteenth-century thinkers at Paris and Oxford discussed under these headings, and to which they often took a semantic and quantitative approach, were gravity, accelerated free fall, projectile motion, and also qualitative changes in a given subject, such as heating.

This section discusses the approach of motion with respect to its causes, which roughly corresponds to the dynamic study of motion (as in contrast to kinematics). Aristotle distinguished two kinds of local motion: natural and nonnatural or violent. Natural motion is the motion toward the natural place of the mobile body, which is determined by the proportion of the four elements – water, earth, air, and fire – in it. Bodies in which the elements earth or water predominate are heavy and consequently move downward, whereas bodies in which the elements air and fire predominate are light and move upward. Violent motions are motions in any direction deviating from the moving body's natural place, for instance upward for bodies mainly consisting of the element earth. Aristotle explained the local motion of inanimate bodies, that is of bodies that do not move themselves, by invoking the principle that motion is never spontaneous but that everything that is in motion "is moved by something" (*Physics*, 241 b 34; 259 a 29–31). In medieval terminology, this proposition was rendered as "everything that is moved is moved by another" (*omne quod movetur ab alio movetur*). Moreover, Aristotle had argued that there is no action at a spatial distance: the cause of motion and the thing moved need to be in contact (*Physics*, 243 a 3–4). Both propositions seemed to require that mover and moved were separate entities. When medieval commentators turned to these two basic Aristotelian principles of the explanation of motion, they concentrated their discussions on two problem areas that seemed to present counterexamples to Aristotle's axioms: one in the field of natural motion, and one in the field of violent motion.

Natural Motion: The Explanation of Gravity and Accelerated Free Fall

In violent motion, it was not difficult to see that an external motive force was involved; but how were mover and moved body to be distinguished in natural motion? Some medieval scholars followed Thomas Aquinas' lead and concluded that the generator (*generans*) gave the mobile body its form and everything that followed from that

form, including its motive powers and its disposition to move, that is, its heaviness (*gravitas*) or lightness (*levitas*). In this way, the generator acted as a kind of remote motive cause in natural motion. A body's natural motion was conceived of as the consequent of its original generation. In case a body was impeded to move after it was generated, the cause of its natural motion was identified with whatever removed the impediment to its motion (*removens impediendum*). The natural motion, for example, of a stone hanging on a rope was caused by the agent that cuts the rope. However, the generator and the remover of the impediment could not explain the continuation of a body's natural motion, since they were not in continuous simultaneous contact with the moving body. How did fourteenth-century authors solve this problem?

A decisive viewpoint was taken by John Duns Scotus (c. 1265–1308). He concluded that heavy and light bodies are moved by their heaviness and lightness, and in this sense, they move themselves. This was an important deviation from Aristotle, Averroes, and earlier commentators. They had emphasized that the generator was the real cause of the fall of a body, and that the substantial form, heaviness, and lightness were, at best, lower-order instrumental causes. After Duns Scotus, however, authors such as John of Jandun, William Ockham, Walter Burley, John Buridan, Marsilius of Inghen, and Albert of Saxony embraced the position that heaviness and lightness were the proximate causes of a body's unobstructed natural motion. In this way, they gave up Aristotle's principle that mover and moved are separate entities. The mover was therefore no longer an extrinsic cause (such as the generator had been), but was now conceived of as an intrinsic principle, inhering in the moving body. As a consequence, the important Aristotelian distinction between the motion of animate and inanimate bodies became blurred. None of these fourteenth-century authors, however, stressed the new turn they had taken, but, on the contrary, tried to justify Aristotle's views by "glossing" them.

Another question raised in the context of falling bodies was acceleration: a body in natural fall

moves with accelerated velocity, not with uniform speed. Discussions about “heaviness” and “lightness” ignored the phenomenon of acceleration. The causal explanation of acceleration took its point of departure from the rules concerning motion, which Aristotle had provided in Book 7 of the *Physics* (249 b 27–250 a 9) and book 1 of *De caelo* (273 b 30–275 a 20). In these books, he had discussed the notions of “quicker,” “slower,” and “of equal speed” and formulated the relations that obtain between velocities and the forces and resistances that determine them. Aristotle’s passages are often presented as his “mechanics” and certainly helped to develop late-medieval mechanics.

With respect to natural motion, in which weight acts as the motion’s internal force, and the density of the medium as the resistance, Aristotle states a number of rules. In sum, they provide two options to account for the acceleration of a falling body: it was caused by either an increase in force or a decrease in resistance. Most late-medieval thinkers, however, eliminated the second option. The most influential theory was proposed by John Buridan. He maintained that the body’s weight not only caused its downward fall, but also generated an impressed force in the falling body, which he called *impetus*. Since the body’s weight does not expire, but continues to act as a cause, it continues to produce new increments of *impetus*, which successively increase the falling body’s velocity. This explanation was basically followed by other thinkers in Paris, such as Nicholas Oresme, Albert of Saxony, and Marsilius of Inghen.

Violent Motion: The Explanation of Projectile Motion

Buridan also uses his *impetus* theory to solve another problem in Aristotelian physics, namely that of the explanation of projectile motion. Projectile motion seemed to contradict Aristotle’s principles about movers and mobile bodies: how could the mobile body continue its motion after it had lost contact with the moving force, say, the hand throwing a stone? Aristotle had claimed that

it was the surrounding medium, which accounted for the continuation of the projectile’s motion. Simultaneously with the projectile, the medium too received a motive force from the projector, which it continued to transmit by means of the activation of the medium, thus pushing the projectile along. In this way, Aristotle could uphold his principle that the external force is in continuous contact with the mobile body: the projector’s role had been taken over by the medium.

This account came to be rejected in the fourteenth century. The medium’s role in continuing the projectile’s motion was considered problematic. Francis of Marchia (fl. 1320) pointed out that if the original projector could produce some motive force in the medium, there was no reason why it could not do so also in the projectile itself. Indeed, this “left-behind force” (*virtus derelicta*) or impressed force (*vis impressa*) given to the projectile was the real proximate cause of the projectile’s continued motion. This solution had been anticipated by the Greek commentator John Philoponus (d. after 575), who had also found it implausible that the medium should serve as a motive force rather than as resistance to the projectile’s motion. His work, however, was not available in translation, and neither were the several writings of Islamic thinkers who had developed theories of impressed force (*mail*) in projectile motion.

John Buridan introduced the technical term “*impetus*” for this impressed force and developed an advanced theory about it. In Buridan’s view, *impetus* was a motive force transmitted from the initial mover that could act in any direction to which it had been. Buridan took a first step toward the quantification of *impetus* by declaring that its strength was determined by the velocity with which the initial mover had moved the projectile. Furthermore, he considered its strength proportionate to the projectile’s weight, which in turn depended on its quantity of matter (*quantitas materiae*). Buridan substantiated this rule by reference to the phenomenon that a leaden projectile can be thrown further than a wooden one of the same volume and shape, because it has a greater capacity to receive *impetus*.

Buridan applied his *impetus* theory not only to the explanation of the acceleration of falling

bodies, but also to that of celestial motions. He declared that at the moment of creation, God might have imprinted an impetus on the heavens. Since in the case of the heavenly motions, the impetus is not producing a violent motion away from their natural place, and therefore encounters no resistance, it will continue forever. In the sub-lunar region, however, the impetus is corrupted by the mobile body's tendency to move to its natural place, and by resistances (from the medium, for instance) acting on the body. In sum, Buridan conceived of impetus as a quasi-permanent quality inherent in the mobile body, which, under terrestrial conditions, interacted with the body's natural tendencies, and dissipated as a consequence. Albert of Saxony adhered to the same position, even though he avoided the terminology of impetus and spoke instead of "moving force" (*virtus motiva*) or "moving quality" (*qualitas motiva*). Still other slight variations were introduced by Nicholas Oresme and Marsilius of Inghen. New medieval concepts such as impetus and weight (*gravitas*) helped abolish Aristotle's principle that mover and moved are separate entities that must be in contact. Instead, they represent an internalization of Aristotle's external motive force. The medieval impetus theory was to remain the dominant explanation of projectile motion until the seventeenth century, although it had little impact in Oxford.

The Quantification of the Causes of Motion

At Oxford, scholars took a more quantitative approach toward the causal explanation of motion. The quantitative rules for force and resistance by which Aristotle had tried to capture the interaction between mover and moved (*Physics*, book 7), came to be criticized at the beginning of the fourteenth century. In his *Treatise on Proportions* (*Tractatus de proportionibus*), written in 1328, Thomas Bradwardine gave a general treatment of how one can relate a change of speed of a mobile to a variation in its causes, or as he put it, "of the proportion between the speeds with which

motions take place with respect to both moving and resisting powers."

Bradwardine's mathematical approach had a tremendous influence. At Oxford, Richard Swineshead further developed Bradwardine's insights by applying them to two new problems. In his *Book of Calculations* (*Liber calculationum*), written about 1350, Swineshead specifies, among other things, Bradwardine's theorem for different kinds of changes in velocity, such as uniform, difform, uniformly difform, and so on. Moreover, he applies Bradwardine's function to the fall of a heavy body near the center of the universe.

Bradwardine's theorem of motion was incorporated into the Parisian commentaries on the *Physics*. Starting with John Buridan, other fourteenth-century scholars at the University of Paris began to show familiarity with Bradwardine's views. Moreover, Albert of Saxony and Nicholas Oresme elaborated Bradwardine's function in their *Treatise on Proportions* (*Tractatus proportionum*) and *Treatise on Ratio of Ratios* (*Tractatus de proportionibus proportionum*), respectively. They abstracted from the physical problems that Bradwardine had discussed and, instead, concentrated on a calculus of proportions as such (see the entries on ► ["Oxford Calculators"](#) and ► ["Richard Swineshead"](#) in this volume).

Logic and Geometry in Natural Philosophy

The quantification of motion not only occurred in medieval dynamics, but also in kinematics, which relates motion to time and space traversed. This type of approach should be seen in the light of the introduction of logic and geometry in natural philosophy.

Scholars at Paris had a predilection for providing semantic analyses of the terms in which their physical problems were formulated. Terms such as "motion," "nature," "change," "alteration," "point," "space," "time," and "instant," for example, were submitted to an analysis that employed all the logical techniques available. Especially the

theory of supposition was fundamental. It was a tool that analyzed a term's reference within the context of a proposition and in this way determined the meaning and truth of that proposition. The supposition theory provided, for instance, different semantic analyses of the propositions "man is a species" and "man is a three-letter word." Another much-used semantic tool was the analysis of a term's position within a proposition, the "word-order," so to speak. This aspect was expressed in the technical vocabulary of distinguishing between the categorematic and the syncategorematic use of a term. Since these semantic aspects significantly affected the truth-value of the propositions in which the physical problems were stated, they had a bearing on the solution of these problems (see the entries on ► ["Supposition Theory"](#); ► ["Terms, Properties of"](#) in this volume).

At Oxford, the application of logic in kinematics was blended with mathematical techniques. As a matter of fact, one of the distinctive features of most of the Calculators' treatises is that they originated out of a logical, disputational context. This is especially true for the *Sophismata*, collections of counterintuitive statements called "sophisms" that served as examples to illustrate semantic theories. Often, *sophismata* have a purely logical character, but especially at Oxford a new genre originated, that of the mathematical-physical sophisms. This emphasis on logico-mathematical techniques, rather than directly on physical theory, is present in the treatises of Heytesbury and Swineshead and also in the *Sophismata* of Richard Kilvington. A typical example of the type of problems discussed there is the truth of sophism 34, "Plato can move uniformly during some time and as fast as Socrates now moves" (see the entries on ► ["Sophisms"](#) and ► ["Richard Kilvington"](#) in this volume).

The quantification of kinematic aspects of motion was introduced in the context of the so-called doctrine of the latitude of forms (*latitudo formarum*), a theory that was developed to deal with the different degrees that may be assigned to one and the same quality. For instance, one banana can be more yellow than another one, or one object hotter than another one. The idea that qualities in a subject can exist in varying

degrees was first expressed in Aristotle's *Categories* (10 b 26 and following). It gave rise to two problem areas that were only very loosely connected. The first one, called the problem of the intension and remission of forms in medieval terminology, developed further the idea that qualities can become more or less, that is, that they can undergo intensification and remission (*intensio et remissio*). It focused on ontological issues such as the search for the subject of the strengthening or weakening: was it the quality itself, or the subject's participation in the quality? And how was a quality intensified or weakened? The two most prominent alternatives that had emerged by the fourteenth century were the succession theory and the addition theory.

Discussions of the intension and remission of forms tacitly assumed that a quality was uniformly distributed in a subject and uniformly changed over time. However, precisely this assumption was further investigated in the second problem area, namely that of the latitude of forms (*latitudo formarum*). This problem area studied the phenomenon of qualitative changes in a subject from the perspective of space and time. The point of departure was the idea that qualities can be non-uniformly, or difformly (*difformiter*) according to medieval terminology, distributed over a given subject and that they can change difformly. The scholars at Oxford focused on the problem of measuring these qualities, especially the uniformly difform qualities, that is, that class of qualities that strengthened or weakened at a constant rate from one end of the subject to the other. By analogy, they addressed questions of measures of other types of change, especially of local motion. It was in this context of measuring qualities and motions that the concept of latitude came to play a pivotal role. It is important to note that these discussions often were hypothetical (see the entry on ► ["Intension and Remission of Forms"](#) in this volume).

The philosophical analysis of the degrees of qualities helped to develop the idea of velocity as a magnitude to which can be attributed a numerical value and by which motions can be measured. The idea had been quite alien to Aristotle, who had conceived of velocity as an unquantifiable

concept. One theorem that developed out of the latitude of forms context has been characterized by at least one historian of science as “probably the most outstanding single medieval contribution to the history of mathematical physics”: the mean speed theorem (Grant 1996, p. 101). This theorem measures uniformly accelerated motions with respect to the spaces traversed by comparing them with uniform motions. The mean speed theorem states that a mobile moving with a uniformly accelerated motion covers the same space in a given time as it would if it moved for the same time with a uniform speed equal to the speed at the middle instant of the duration of its acceleration. The mean speed theorem has attracted much scholarly attention, because it was mentioned by Galilei in his *Discourses on Two New Sciences* (Day 3, theorem 1) and applied to the free fall of bodies, which is an example in nature of a uniformly accelerated (i.e., uniformly difform) motion.

The Calculators provided many proofs of the theorem, but none was as easy to visualize as Oresme’s geometrical proof, which was also employed by Galilei. Oresme noted that a right triangle is equal in area to a rectangle whose height is the mean height of the triangle. In this way he graphically compared the quantity of a uniformly difform quality to that of a uniform quality of mean intensity. Other Parisians besides Oresme were also well acquainted with the Oxford’s Calculators’ discussions of the measure of the effects of motion, as is clear from their discussions in commentaries on the *Physics*. As Edith Sylla has convincingly argued, the aim of the logical and geometrical discussion of kinematics was to instruct students to think and argue clearly and exactly. Newton’s *Principia mathematica philosophiae naturalis* still carries the echos of medieval natural philosophy in its title, although the emphasis had now definitely shifted toward the mathematical approach.

Natural Philosophy, Arabic

Josep Puig Montada

Facultad de Filología, Universidad Complutense de Madrid, Madrid, Spain

Abstract

Natural philosophy written in Arabic from the time of the Koranic message through the VII AH/XIII CE century is the subject matter of the entry. It consists of an introduction and two chapters: the first examines the thinkers of the *kalām* tradition, i.e., rational defenders of Islamic dogmas, and the second, the *falāsifa*, whose ideas are grounded on the Greek philosophy and science. Within each entry, the order is chronological.

Introduction

Islamic philosophy does not have a unique doctrine about nature and physical issues but has common features. Two main streams flow in a related direction: the *kalām* tradition mostly assumes that substances are bodies made of atoms; the *falsafa* distinguishes between sensible and immaterial substances and assumes substances are bodies that can be infinitely divided. Under the influence of Greek philosophy, *falsafa* develops a deeper and more comprehensive explanation of nature. It conflicts with *kalām* on the issue of the pre-eternity of the universe, because the *mutakallimūn* understand that eternity in the past excludes the causal action of a free agent. Although this is an important issue, it is not the only one. The condemnation of Averroes in Almohad times and occasional burnings of philosophy books, including Avicenna's, should not

make us believe that *falsafa* was ousted from Islamic learning. Many Islamic thinkers, such as al-Baydawī (d. 1316?), did not see any conflict in studying *kalām* and *falsafa* at the same time (Calverley and Pollock 2001). They were abiding by the Qur'ānic teaching to contemplate and reflect on nature.

The Merciful taught the Qur'ān
Created man,
Taught him the explanation:
The sun and the moon are in a reckoning
The star and the tree do obeisance (Qur'ān
55:1–5).

The Qur'ān's cosmological model consists of the seven heavens and seven earths that we also find recorded in the Bible and in ancient Mesopotamian texts; the heavens are built up on a flat earth [Qur'ān 65:12]. However the Qur'ān is obviously not a treatise on nature, and its doctrine aims at man and at his behavior. God instructs man how to do good and avoid evil, and He shall punish or reward him in the afterlife for his bad or good actions. This is possible not only because of His omnipotence but also because of His goodness toward man. Man has to show Him gratitude for the goodness; one way to show Him gratitude is by contemplating creation, which reveals to us His omnipotence as well as His intelligence.

Therefore, Muslims who were interested in knowing the secrets of nature have to abide by some principles. There is one God who is almighty. He not only created the world but He also intervenes in its daily activity. Moreover, He may be the real agent of events, which appear to be the work of human agents.

Islam expanded as Muslims conquered many lands in a short time period; Muslims thus entered into contacts with other religions and civilizations. Present Iraq was under Sasanian rule, but its population consisted of Arameans, Persians, and Arabs (Morony 1984). The official religion of the Sasanian Empire was Zoroastrianism, which was practiced by many Persians, although some were Christians. Jews and Christians were strong in Mesopotamia, and most of them spoke Aramaic dialects. Arabs immigrated to Iraq since the Parthian period when Arabs organized border

states. They were sedentary as well as nomads; the former converted mainly to Nestorianism.

The Muslim conquest brought new Arab populations into Iraq, and new cities were founded where they settled. Kufa (founded in 638) and Basra (founded in 635) are the most representative cities, and together with an enlarged Baghdad, they became centers where arts and sciences flourished over the years. In the first-century Hijra/seventh CE, Basra was a center of Qur'ānic studies. There were early Basrians who knew the various readings of the Book and the traditions of the Prophet (Pellat 1953). In the first century, discussion on religious issues began, including whether or not a capital sinner is any longer a Muslim. In addition, the Basrian population was acquainted with foreign cultures and their scientific creations.

Philosophy of Nature in the *Kalām* Tradition

The science of *kalām*, that is, rational explanation of the Islamic dogmas, developed later in the second-century Hijra. However, the *kalām* was not the only discipline aiming at rational explanations. The theologian and heresiograph al-Ash'arī (d. 935) occasionally mentions those “who sustain the natures,” *aṣḥāb al-ṭabā'i* (Ash'arī 1929–1933, 382, 517). “Natures” were the four principles (hot–cold–humid–dry) of the four elements following the Aristotelian tradition (fire–air–water–earth). These people should be considered as the first philosophers of nature who were active in Iraq, mainly in Basra, already in the second-century Hijra/eighth century CE. Van Ess identified several of them, the most important being Mu'ammār Abū l-Ash'ath (Van Ess, Band II 1992a, 2, pp. 37–39).

The third/ninth century is the time when the Mu'tazila shaped *kalām* developing it into a philosophical system and comprehending the study of the Divine essence, His creation of the world and natural reality, and man and his moral responsibility. Mu'tazila is the plural of Mu'tazilite and means the “Separatists,” those who separated themselves from something. Nallino produced evidence that the word meant separation from

those religious parties that fought each other with the sword (Nallino 1916–1918). However, the meaning remains a matter of discussion (Van Ess, Band II 1992a, 2, pp. 335–342).

Two men are named as the founders, Wāṣil ibn ‘Aṭā’ (d. 131/749–9) and ‘Amr ibn ‘Ubayd (d. 143/760 or 144/761) who lived in Basra. The textual evidence shows that both were interested in theological and political matters, not in philosophical ones. We find the first references to ontological issues in Abū Bakr ‘Abd al-Raḥmān al-Aṣamm (d. 200/816 or 201/817) (Van Ess, Band II 1992a, 2, pp. 396–418). Al-Ash‘arite quotes al-Aṣamm: “I only affirm the three-dimensional body” so that he denied movement, rest, and other accidents of the bodies (Ash‘arī 1929–1933, 343).

We have more information about Abū ‘Amr Ḍirār ibn ‘Amr (d. 180/796) (Van Ess, Band III 1992b, 3, pp. 32–67) and his doctrines on physical reality. He affirmed that accidents, *a‘rāḍ*, first build a body, and then the body becomes the bearer of accidents. Accidents mean physical properties:

Body is accidents which are put together and joined so that they stand and are permanent. Then they become a body which bears the accidents; once it settles down, it bears the accidents and changes from one state into another. Bodies cannot exist without accidents or their contraries. For instance, in life and death, not a single body can exist without one of them, and none of its kind can be separated from colors and tastes nor from weight, as heaviness and lightness, nor from coarseness and softness, nor from warmth and coldness, nor from humidity and dryness, nor from resistance. (Ash‘arī 1929–1933, 305) (Ash‘arī, ed. ‘Abd al-Ḥamīd 1985, 2, p. 6)

Ḍirār seems to have supported two theses: bodies are made out of accidents, and bodies bear accidents of which bodies cannot be deprived of (unless they are destroyed). The doctrine looks rather contradictory, but we should not forget that the information is supplied by al-Ash‘arī, who lived almost two centuries later and who reports only fragments or phrases ascribed to the authors he mentions. The main point is that bodies are defined by the accidents they bear.

Abū ‘Amr Mu‘ammar ibn ‘Abbād al-Sulamī (d. 215/830) built a system which we can better reconstruct (Daiber 1975). He lived in Basra and was in touch with Ma‘mar Abū l-Ash‘ath. Mu‘ammar was a pharmacist, which may explain

his interest in the physical constitution of bodies. He appears to have been the first person to expound atomism. Atomism became the most original contribution of the Basrian rationalists (Dhanani 1994). Mu‘ammar admits that the body is something three-dimensional, but he adds the reason: its atomic composition. The best known definition reads

[The body] is that which is long, wide, and deep. Bodies consist of at least eight parts. When the parts are reunited, accidents are generated, and they are caused by the force of nature. Each part produces accidents that inhere to it. He affirmed that length is produced when one part is joined to another one; width is produced when both are joined to other two parts; and depth is produced when the four are applied to other four parts. Therefore, eight parts comprise a three-dimensional body. (Ash‘arī 1929–1933, 303; cf. Pines 1997, 6)

We may, therefore, see the atom as some kind of substance, but the real, effective substance is the body, which is composed of eight atoms. From the body, accidents will result. The substance “body” cannot be perceived; only accidents are perceived. Colors and tastes, odors and sounds, warmth and coldness, and humidity and dryness are accidents; Mu‘ammar adds movement and rest. God does not intervene directly in the events and activities of creatures; instead, He uses an instrument – bodies (Ash‘arī 1929–1933, 405). Giving life and bringing death are caused by God but also natural color.

Mu‘ammar looked for a scientific explanation of nature. This search led him to recognize capacities in the bodies, which moved thanks to them; also, these capacities caused effects in a regular way. He introduced the concept of *ma‘nā*, to explain movement in particular. *Ma‘nā* is commonly translated as “meaning”; but, when Mu‘ammar says that movement and rest in a body differ because of a *ma‘nā*, a notion of cause is implied. Mu‘ammar establishes an endless chain of *ma‘ānī* residing in bodies (Khayyāt 1925, 55). Wolfson saw in the doctrine of endless *ma‘ānī* a way to integrate Aristotle’s doctrine of nature with its eternal motion (Wolfson 1976, 164).

Abū l-Hudhayl Muḥammad ibn al-Hudhayl al-‘Allāf (d. 227/841) was originally from Basra, but he succeeded in entering the court of the Caliph al-Ma’mūn (Van Ess, Band III 1992b, 209–291). He

is the major representative of Muʿtazilite atomism (Frank 1966). Atoms do not have dimensions; if six of them touch each other, a body results. The body has three dimensions and six directions: right and left, back and front, and top and bottom. We should not imagine any geometrical figure because the smallest “touchable” body needs 36 atoms, that is, six sets of minimal bodies (Juwaynī 1969, 407). Atoms can move or rest, join others, or separate from others, but they cannot have colors and tastes, or life, or knowledge. As for the possibilities of movement, there was a discussion whether an atom can have two movements, and Abū l-Hudhayl al-ʿAllāf did not accept this notion. Although one stone is moved by two different movers, the movement is one for it:

Abū l-Hudhayl taught: like there is one movement divided into two agents, there is also one movement of many atoms, and two different actions. He claimed that accidents divide in time and place, according to the two agents. He also claimed that the movement of the body divides according to the number of its atoms, as does its color. The part of movement which affects this atom is different from the part of movement which affects that atom. (Ashʿarī 1929–1933, 319)

Time is an accident, but it does not reside in a body; Abū l-Hudhayl does not explain what place is. When an atom moves on a surface, it reduces the distance covering or touching each atom of the surface. No doubt, movement and rest are major issues of the atomistic doctrine. Bodies move at different speeds, and Abū l-Hudhayl explained that not all atoms get movement at the same time. Some get rest, so that speed is the ratio between atoms endowed with movement and those with stops. A body is at complete rest when all of its atoms have the accident of rest.

The difficulties of the atomic idea of reality were obvious to his relative and disciple Abū Ishāq Ibrāhīm al-Nazzām (d. c. 230/845). Al-Nazzām objected that if atoms have sides, then they must be divisible. Bodies are not made of atoms:

Body is length, width and depth. Its parts do not have a number by which you can stop; not a half, from which a half can be given, not a part from which another part can be given. The philosophers define the body as width and depth. (Ashʿarī 1929–1933, 304)

Natural Philosophy, Arabic, Fig. 1 The square and the two ants

Accidents are the elements of substance, except for movement. Al-Nazzām raised many objections to the atomistic theory of motion. He believed that movement happens in a discontinuous space, through leaps. If movement were continuous over infinite atoms, even if it were possible, one object could not run faster than another. His best-known argument is that of the square and two ants (Juwaynī 1969, 439; Fig. 1).

The ant going on the diagonal shall arrive at its goal before the ant going on the legs of the triangle. Al-Nazzām argues as if he accepts the atomic structure: the ant going on the diagonal or hypotenuse “jumps” over a smaller number of atoms than the ant “jumping” over the atoms of the legs. The atomists, represented by Abū l-Hudhayl, reacted against his criticism, and the discussion was continued by Ibn Ḥazm, Shahrastānī, and Fakhr al-Dīn al-Rāzī, theologians who opposed atomism (Baffioni 1982).

Another important notion of Nazzām’s physical doctrine is latency, *kumūn*, which he shares with other Muʿtazilites: “Abū l-Hudhayl, Ibrāhīm [al-Nazzām], Muʿammar, Hishām ibn al-Ḥakam, and Bishr ibn al-Muʿtamir taught: oil was in the olive, ointment was in the seed of sesame, and fire was in the stone” (Ashʿarī 1929–1933, 329). Al-Nazzām stressed the importance of fire for life. If we take into consideration what his contemporary al-Jāhīz (d. 255/869) wrote about him, fire was for him more important than other elements, like water and earth.

Latency points to the nature of bodies and physical entities. They contain a mixture of elements; while one shows up, the rest is hiding in the substance. The doctrine is opposite to the continuous creation of events by God, but we do not know the necessary details. We expect that al-Nazzām establishes the order about how effects appear. In a general sense, his doctrine reminds the Aristotelian doctrine of potency and actuality.

About a century later, Abū Hāshim ibn al-Jubbā'ī (d. 321/933), the son of a Mu'tazilite master, Abū 'Alī al-Jubbā'ī (d. 305/915–916), introduced the doctrine of states or modes, *aḥwāl*, in the course of the discussion on divine attributes. Abū Hāshim distinguished between caused and uncaused states. Caused states include “living” in a creature, which has the *ma'nā* of life in itself, and uncaused states include the property of occupying a place or genera and species of the substance (Shahraṣṭānī 1931, 132).

Abū Hāshim ibn al-Jubbā'ī was a contemporary of Abū l-Ḥasan 'Alī al-Ash'arī (d. 324/935). Al-Ash'arī was born in Basra but he spent most of his life in Baghdad. He remodeled *kalām* into a form acceptable to the orthodoxy in theological aspects. Concerning cosmology, al-Ash'arite followed his master al-Jubbā'ī who was a follower of Abū l-Hudhayl al-'Allāf (Gimaret 1990, 43): the universe consists of substances and accidents. Natural substances are atoms, and their aggregates build bodies. Accidents explain the variety of substances because the latter are homogeneous.

Al-Ash'arī classified accidents into various categories and formulated rules applying to them. The accident *kawn*, “being,” belongs to the local category; by virtue of the accident “being,” any substance is situated in a place, and no substance can be devoid of the accident “being” in this sense. Place means a body or atom on which something relies, against which something leans, and one place suffices to be at rest; movement requires at least two places (Ibn Fūrak 1987).

Two disciples of al-Ash'arī, Abū Bakr al-Baḳillānī (d. 403/1013) and Abū l-Ma'ālī al-Juwaynī Imām al-Ḥaramayn (d. 478/1085), shaped the physical doctrine of Ash'arite *kalām*. Al-Juwaynī argued that since an infinite number of accidents are impossible, there must be a beginning of all bodies (Juwaynī 1969, 215). They both helped atomism triumph over al-Nazzām's theory of the infinite divisibility of the body. Prevailing did not mean the end of the adversary school: we have instances of the latter doctrine in *kalām* authors such as Ibn Ḥazm (d. 456/1064). Ibn Ḥazm was influential during a short period of the Almohad dynasty (1121–1269) and to a limited extent.

Atoms, the void, and the possibility of other worlds are doctrines of Abū l-Faḍl Muḥammad Fakhr al-Dīn al-Rāzī (d. 606/1209). He was one of the most important theologians of the Islamic postclassical period and embodied the Ash'arite thought for this late period. The Sufi Ibn Ibn 'Arabī regarded him as the leading philosopher of the time although he wrote him that mystical gnosis was superior to rational discourse (Ibn al-'Arabī 1948). Fakhr al-Dīn al-Rāzī was a prolific author, his works encompassing the great Qur'ān commentary, his theology treatise *The Acquired Thoughts* (*Muḥaṣṣal* 1991), or his criticism of Avicenna's *Remarks and Admonitions* and *The Sources of Wisdom*.

Al-Maṭālib al-'Āliya, *The Higher Issues* (Rāzī, Maṭālib 1987), deals with theological as well as physical issues, and as 'A. Setia observed, the work represents his final thought and for this reason we are relying on it (Setia 2006, 116). There he defines being (*mawjūd*) either as that which occupies a place (*ḥayyiz*) or as that which is a condition or state (*ḥāl*) of what occupies a place or that which is neither of both and that is God. If that which occupies a place is divisible, is a body, and if not, it is an atom (Rāzī, Maṭālib 1987, 4, p. 9). That which is a condition or state is an accident; besides the qualities related to the five corporeal senses, al-Rāzī counts *kawn* “coming-to-be” as accident. “*Kawn* is the expression of the fact that substance occurs in a place” (Rāzī, Maṭālib 1987, 4, p. 10) and comprehends four categories: movement, rest, gathering, and disassembling. Among living beings we find exclusively the accidents of life and the attributes of knowledge and action.

Section V of *The Higher Issues* contains treatises on time and place: Our knowledge of time is a primary intuitive knowledge (*'ilm badīhī awwālī*). Time is composed of successive instants that are indivisible (Rāzī, Maṭālib 1987, 5, pp. 10–11); it is not a property of motion (Rāzī, Maṭālib 1987, 5, p. 17), but motion cannot be understood before one understands the essence of duration and time because motion implies occupying a place after being in another (Rāzī, Maṭālib 1987, 5, p. 30), and this is the definition of motion: leaving an occupied place and striving for another (Rāzī, Maṭālib 1987, 5, p. 168).

Time is not a continuous quantity, as Aristotle and his followers assert, but a succession of instants and “the actual instant does not admit division” (Rāzī, Maṭālib 1987, 5, p. 72). He distinguishes between incidental time (*zamān*), endless time (*sarmad*), and unlimited time (*dahr*), and he explains as follows:

Plato’s opinion concerning time and duration is closest to ours. Time is a being subsisting by itself, autonomous by itself. If we consider its relation to the permanent beings free from change we call it endless time (*sarmad*), if we consider its relation to that which precedes motions or changes we call it unlimited time (*dahr*), and this is the very unlimited time, and if we consider its relation to the changing beings insofar as they are connected to it and occurring together with it, we call it time (*zaman*). (Rāzī, Maṭālib 1987, 5, p. 91)

Al-Rāzī reports that the philosophers agree on the pre-eternity (*qidam*) of the *sarmad*, the endless time, and duration, while the theologians defend its innovated creation (*ḥudūth*), and he is among them (Rāzī, Maṭālib 1987, 5, p. 99).

On place, al-Rāzī considers two views: one as expression of the matter or form and the other as the void; the second view comprehends the view of the theologians and some philosophers (Rāzī, Maṭālib 1987, 5, pp. 111–113). He aligns with the theologians and maintains that place is “the distance called void” (*faḍā’*), an empty distance. Void is defined also as that which exists between two bodies that are not in touch (Horten 1910, 129). Rāzī refutes at length and with detail the arguments based on the impossibility of motion in the void and explains how the void plays its role in motion, for instance, when the fish moves in the water:

Our view is that plenty of void is produced in the water, and it is the cause why water is rare and waving although water is heavy and flowing by nature. Whenever some parts of water strive to some empty places, the other places become empty, and the parts of water strive again from their places to them, and so on indefinitely. For this reason, the body of the water is always waving and moving. (Rāzī, Maṭālib 1987, 5, p. 159)

Section VI of *The Higher Issues* deals with first matter, and al-Rāzī knows two definitions, one says that it is the atoms and the other “a self-subsisting entity in which corporeity dwells”

(Rāzī, Maṭālib 1987, 6, p. 6); he needs to analyze the conditions of the body in order to decide about the definition of the first matter.

Al-Rāzī opposes the definition of body of the Mu‘tazilites to that of the philosophers. The former define a body as “the long, the wide and the deep” and the latter as “the substance in which the three dimensions can be determined, standing on right angles” (Rāzī, Maṭālib 1987, 6, p. 8). He relates the definitions to the issue whether the body is composed of atoms, and he examines the doctrines of the philosophers and the Kalam people in the following pages. This examination leads him to consider motion, and he summarizes:

We prove that motion is an expression of successive occurrences (*ḥuṣūlāt*) in contiguous places so that each one of these occurrences does not admit division at all. We also prove that time is composed of consecutive contiguous instants so that each one does not admit division at all. Then once this discourse on motion or on time is clear, we can prove with certainty that the body is composed of atoms. (Rāzī, Maṭālib 1987, 6, p. 29)

Motion, therefore, is not something continuous admitting infinite divisibility, and he argues against it although he says that its falsity is known by obvious intuition (*badīḥiya*). Al-Rāzī mentions Avicenna regarding (Rāzī, Maṭālib 1987, 6, p. 44) the discussion about a stone thrown high into the air and then falling to the earth. Avicenna claimed that it is at rest for some time between the two motions, and al-Rāzī denies the possibility and defends the theory of successive instants. Other examples are considered, and al-Rāzī wants to interrelate motion, time, and atoms. The sphere can only be in touch with a plain surface if there is an atom, an indivisible contact point, and on this basis he starts arguing for the existence of the substance that is one. Al-Rāzī says that he resorts to Euclid’s geometry and explains:

If we roll the sphere on the surface so that it completed its circle, there is no doubt that the contact never ceased, and the contact has occurred in another point, and there is nothing different between the two points because we speak only of the point in which the contact has occurred in the first instant of contact as the first point. According to this appraisal, the line is drawn by the assembling of points and if the line results from the assembling of points, likewise the surface results from the assembling of lines, and the

body from the assembling of surfaces. The contact point in the sphere is not divisible, and the body results from the integration (*inḍimām*) of points, and that is intended by “single substance.” (Rāzī, Maṭālib 1987, 6, pp. 48–49)

Therefore, the point is something that exists, to which the senses can point to, and indivisible: it is the “single substance” (*al-jawhar al-fard*). From the single substance, al-Rāzī proceeds to the body which is composed of them and of a finite number. He refers, for instance, to the polemic between the atomist Abū l-Hudhayl al-ʿAllāf and his opponent al-Nazzām and the question of the leap (Rāzī, Maṭālib 1987, 6, p. 69) and is definite in his affirmation of atomism. Arguments of geometrical kind abound in many chapters with references to Euclid or to Ibn al-Haytham.

“Aristotle’s followers” argued that the universe has a spherical shape and that is one alone because if there were two spheres, the void would exist between them and the existence of void is not possible, but al-Rāzī already asserted the opposite, namely, the existence of void. Furthermore he asks them: why the shape of the world must be spherical? The first body has the shape of a cube. He puts more questions on the philosophers showing that there can be more than one world (Rāzī, Maṭālib 1987, 6, pp. 193–195). He rejects the existence of first matter, although he accepts that “the body in itself is something one and continuous but continuity for us is simple unity” (Rāzī, Maṭālib 1987, 6, p. 205). Divisibility of a substance implies two substances; there is no option for an eternal first matter.

The new creation of the world (*ḥudūth*) should be mentioned as one of the fundamentals of al-Rāzī’s philosophy. The Divine Writings inform of the creation of the world, but they do not contain a clear affirmation that the world is newly created after its nonexistence (Rāzī, Maṭālib 1987, 4, pp. 29–32). However if we look at Sect. I of *The Higher Issues*, we already meet “Those who affirm the anew creation of the world, are more than those who affirm its eternity and besides the majority maintains that He be Exalted became agent of the world after He was not agent of it” (Rāzī, Maṭālib 1987, 1, p. 76). He was careful to give all arguments, against and in favor of the

anew creation, but he sided with the Muʿtazilite doctrine.

An entire chapter of Sect. I of *The Higher Issues* (Rāzī, Maṭālib 1987, 1, pp. 192–199) summarizes his view of the universe. Every celestial sphere has a given quantity and density (*kathāfa*). Every sphere is composed of parts as any other substance. Motion and rest are equally possible in all these bodies, as different velocities also are. The spheres are different from the stars embedded in them, and the stars take a determined point in them. F. al-Rāzī uses the term *jāʾizāt*, “thinkable objects,” to refer to this possible character and to oppose absolute necessity concerning the number or details of the spheres. He reminds that the existence of the void was proved and adds that it is endless, existing outside the sphere, and that this occupies just one part of the void. Therefore al-Rāzī’s view of nature is well defined and opposed to the view of Avicenna and the Aristotelian philosophers, as we will see.

Despite their differences, the authors of *kalām* were united in articulating philosophy in accordance with the Qurʾānic teachings. They all agree on the temporal creation of the world and on the best-known proofs in favor of it relying on the connection of substances (atoms) and accidents. They both cannot exist independently.

Philosophy of Nature in the *Falsafa*

Basra lost its importance in the *kalām* tradition in favor of Baghdad, the capital of the Abbasid empire. The Abbasid Caliphs not only encouraged the science of *kalām*, but they were also eager to acquire the wisdom that had once flourished in the countries that Islam had conquered. There were already translations of Greek sources into Syriac, the main Aramaic dialect spoken across Mesopotamia and Syria, which was the basis for translations into Arabic. However, much more numerous were the translations made from Greek into Arabic under the auspices of the Abbasid Caliphs or of high-ranking personalities of their courts. Although medicine and astronomy initiated the movement, philosophy had its share in the translation movement too (D’Ancona

2005), and translation was the first step toward creating an Arabic philosophy.

Abū Yūsuf Ya'qūb ibn Ishāq al-Kindī (d. c. 870) is paradigmatic for this synthesis of translation and creation of philosophy (Endress 1997). He arranged the translation of Aristotle's *Metaphysics*, and the *Theology* falsely ascribed to Aristotle (*Enneads* IV–VI), and on the basis of the translations as well on the contributions of the Mu'tazilite *kalām*, he worked out his own philosophy. His ideas on nature and the universe were conditioned by his Islamic belief that God created the world, which cannot be eternal. God is the only eternal, and the Eternal is mainly defined in negative terms. For instance, He is not a body; He has neither genus nor species.

On the contrary, the universe is finite: it has a temporal beginning and its body is limited. In his treatise *On First Philosophy* (Kindī, Rasā'il al-Kindī al-Falsafiyya 1950, 97–193) al-Kindī produces four proofs for creation. The first proof establishes the finiteness of the body of the universe, and as a result, it establishes the finiteness of time, because time is a predicate of this body (Kindī, Falsafa al-Ūlā 1950, 114–110). The second proof insists that any quantitative entity cannot be infinite in actuality and that time must have a beginning; body, motion, and time are never prior to one another; therefore, are all limited. The third proof argues that composition and combination build bodies, which is a Mu'tazilite doctrine. Composition and combination are motions, and through motion there is time; now, “if time is finite in actuality, then necessarily, the being of a body is finite in actuality” (Kindī, Falsafa al-Ūlā 1950, 120) (Ivry 1974, 120). But no doubt, the fourth argument is the most important to al-Kindī. It proves that an infinite cannot be traversed, and if time were infinite, the actual time could never exist. He argues:

Before every temporal segment there is (another) segment, until we reach a temporal segment before which there is no segment, i.e., a segmented duration before which there is no segmented duration. It cannot be otherwise – if it were possible, and after every segment of time there was a segment, infinitely, then we would never reach a given time – for the duration from past infinity to this present time would be equal to

the duration from this given time regressing in times to infinity. (Kindī, Falsafa al-Ūlā 1950b, 121, Ivry 1974, 74).

As H.A. Davidson has shown, al-Kindī employed some of Philoponus' proofs for the temporal beginning of the universe (Davidson 1987, 106–116; see the entry on Philoponus, Arabic in this volume). The temporal beginning implies that time is concomitant with body and motion; all the three come to be with the creation of the heavens.

In sum, the universe is finite in extension and duration. No void or plenum lies outside the universe. Its shape is spherical, and al-Kindī composed an essay entitled *That the Elements and the Outermost Body Are Spherical in Form* (Kindī, Kurriyat al-shakl 1953b) to sustain it. Al-Kindī has another treatise *On the explanation that the Nature of the Celestial Sphere is different from the Natures of the Four Elements*, which begins saying that physics, that is, the science of the natural beings, deals with the movable things because “nature is something that God made a direct cause ('illa) and a cause (sabab) for a direct cause of all that is capable of motion and of rest after motion” (Kindī, Ṭabī'at al-falak 1953a, 2, p. 40) (Adamson and Portmann 2012, 188).

In these writings we read that there are four elements: earth, water, air, and fire; they are concentrically ordered according to their lightness or heaviness; the fire is the lightest, and the earth the heaviest. The outermost sphere extends from the perigee of the moon to the limits of the universe, and it is made of a fifth element, following Aristotle's teachings, which is neither heavy nor light.

In spite of their spherical form, the elements and the outermost body are very different. The elements consist of opposite qualities, something that is proved by their movements. Al-Kindī distinguishes two kinds of motion, circular and rectilinear motion. The movements of the elements are rectilinear, and they are not continuous. In contrast, the celestial sphere moves always around the center “for the duration of its existence.” Al-Kindī concludes that this body cannot be made of any of the elements: its substance is simple.

As for the shape of the elements, al-Kindī shows familiarity with Plato's doctrine of the

polyhedra in the *Timaeus*. Plato assigned the tetrahedron to fire, the hexahedron or cube to the earth, the octahedron to the air, and the icosahedron to the water (54d – 55a); the dodecahedron, whose faces are not triangular, would represent the universe (55c). Al-Kindī follows him, but he combines his reading with neo-Pythagorean numerology (N. Rescher 1968, 15–37). His interest in a geometrical explanation of the simple bodies is shared by the *kalām* in its explanation of the atoms.

Al-Kindī believes in the influence of the heavenly bodies upon the sublunary world and talks about the role of the Sun and the Moon as the efficient causes of generation and corruption (Kindī, *Kitāb al-Kindī fī l-ibāna ‘an al-‘illa al-fā‘ila al-qarība li-l-kawn wa-l-fasād* 1950a); they carry out God’s providence acting upon the realm of generation and corruption. Moreover, the heavenly bodies are intelligent beings who serve God through their regular motions. Al-Kindī praises God for His providential design of the universe:

How perfectly has the Creator, great be His praise, arranged things by putting the sun close to the zenith above our heads, coming is high in the air and draws far away from the surface of the earth, so that it has reached the beginning of the declination (*mayl*); then it draws nearer to us until it arrives at the end of the declination. Then it turns celestial equator descending and breaking the distance in the degrees whose declination in one direction is one. There are two different seasons in each inclination, and the seasons are four, corresponding in quality to the four elements. (Kindī, *al-‘illa al-fā‘ila* 1950a, 230–231) (Adamson and Portmann 2012, 167)

Thus al-Kindī knew the Ptolemaic astronomy but also its astrology that associated spring with the element air, summer with the fire, autumn with the earth, and winter with the water. However the Islamic faith guides him to view God as the remote mind governing the universe.

Al-Kindī offers us a general description of the physical world in which he agrees with the Mu‘tazilite *kalām* on essential issues. Abū Naṣr Muḥammad al-Fārābī (d. 339/950) offers us a more precise description, and he distances himself from *kalām*. In Baghdad, he met scholars, many of them Christians, who were engaged in the transmission of the Aristotelian corpus; and he

mastered logic. Al-Fārābī constructed a system in which he tried to comprehend all the fields of philosophical speculation. Among his works, *On the Perfect State* (Fārābī, *Perfect State* 1985) and *The Political Regime* (Fārābī, *Political Regime* 1964) represent the most developed stage of his thought.

Al-Fārābī decided there in favor of a generative model. His system starts with the absolute One: “The First is that from which everything which exists comes into existence” (Fārābī, *Perfect State* 1985, 88–89). Everything comes into existence in a way like an overflow, *fayḍ*, which is commonly translated as emanation; it follows an exact order. The first emanated, that is, “the Second,” is an incorporeal substance, which is intelligence, a separate intellect. It is thinking itself and also is thinking the First. We may add, just as an aside, that knowledge of the cause and of the self is a crucial concept for Proclus and many Neoplatonists, as Damien Janos rightly reminds (Janos 2012, 170). From the Second thinking the First emanates the Third; from thinking itself, it becomes substance; and substance is here the First Heaven, the Outermost Sphere. The process of “thinking itself and thinking the First” goes on through the spheres of the Fixed Stars, Saturn, Jupiter, Mars, the Sun, Venus, Mercury, and the Moon; they are nine altogether. In each step we have a reciprocal process of being intelligent and being intelligible, i.e., they are Active Intellects, *‘uqūl*, and passive intelligibles, *ma‘qūlāt*.

The matching spheres are not composed of matter, although they are bodies; the spheres and their contents are composed of two principles of soul (*naḥs*) and substrate (*mawḍū‘*). Their motion is essentially harmonious and natural; they all move in circles but at different speeds so that they are affected by contraries of accidental import. The celestial bodies emit light, which is in turn responsible for generating heat in the sublunary world.

Al-Fārābī combined the metaphysics of Plotinus (d. 270 CE) and his school with the astronomy of Ptolemy (d. 161 CE), although he simplified it. Walzer thought that al-Fārābī was inspired by a later Greek tradition in his synthesis, but he could not identify any source (Fārābī, *Perfect State*

1985, 362–367). M. Maróth traces al-Fārābī's equation between the intellects and the celestial sphere bodies to Alexander of Aphrodisias (Maróth 1995). The blending was very successful in spite of its intrinsic weakness, as it remains purely speculative. Al-Fārābī assumes, for instance, an eternal creation of the universe, but he does not buttress the statement with arguments.

According to al-Fārābī, after the Moon thinks the First, an Eleventh intellect comes into existence, but the process stops herewith. The last separate intellect is the Active Intellect, whose intellection is threefold, as it understands the First, the nine emanated intellects, and itself. The Active Intellect is necessary for the existence of the material beings as well as for intellectual knowledge by man. Al-Fārābī emphasizes that the individuals existing under the sphere of the Moon have their most imperfect way of existence in the beginning, in contrast to the celestial bodies, which are always perfect. Matter has the most defective existence, and in ascending order of perfection, he aligns:

The elements such as fire, air, water, earth and things belonging to their genus such as vapor and flame and other things; the minerals such as stones and what belongs to their genus; the plants; the animals which lack speech [and thought], and the animals which have speech [and thought]. (Fārābī, Perfect State 1985, 106–109).

Al-Fārābī does not seem to distinguish between the elements as principles and as real individuals; he even understands prime matter as their effective matter: “the matters of the elements have no matter” (ibid.).

Through mixture, *ikhtilāṭ*, all material beings arise. The first mixture is that which combines some of the elements, and mixtures go on, but there is a last level of mixture: “Man alone arises as a result of the last mixture” (ibid.). Mixture brings out various potencies or powers, some active and some passive. Al-Fārābī adds the celestial bodies to the causes acting in the processes. He obviously believes in astrology and maintains that stars sometimes help and sometimes oppose the sublunary agents with their works.

Al-Fārābī's exposition is suggestive and rather imprecise. He depicts a dynamic nature in which

opposite entities, *muḍaddāt*, which are either inherent or external to the body and their powers, *qūwāt*, overcome each other destroying substances and creating new ones. Al-Fārābī sketches some rules such as the contrary that destroys an element must come from the outside or, when the mixture is not very complex, like in stone or sand, the contraries that destroy a body of a complex mixture “come simultaneously from outside and inside its body” (Fārābī, Perfect State 1985, 148–151). Living beings are of a very complex mixture, and al-Fārābī adds that they can be destroyed by “things contrary to them from their inside.”

Powers go from more defective to more perfect. In the case of man, the first power to arise is the nutritive faculty, followed by the faculties of the various senses, by the faculty of imagination, with the rational faculty as the highest. Sensation, imagination, and reason are complemented by parallel appetitive faculties. The exposition is neither original nor precise, although al-Fārābī makes further distinctions. He distinguishes between one ruling faculty and auxiliary faculties within the nutritive faculty as well as the faculty of sense. He views the heart as the ruling faculty of nutrition and sensation.

The faculties of imagination and reason have no auxiliaries. Al-Fārābī places the faculty of imagination in the heart: the heart is the ruling organ and is followed by the brain, which “is ruled by the heart and rules over all the organs and limbs” (Fārābī, Perfect State 1985, 174–175). Although he does not know precisely where the rational faculty resides – Aristotle did not either – he states that the rational faculty consists of a material part, which is “a shape, *hay'a*, in matter prepared to receive the imprints of the intelligibles” (Fārābī, Perfect State 1985, 198–199). In order to become intellect in actuality, the material intellect, that is, man, needs something else, which is always in actuality, namely, the Active Intellect. Thus, al-Fārābī links together the world of nature with the celestial architecture, and man is the linking band.

Such an intervention of the Active Intellect that gives sublunary beings their forms is not mentioned by al-Fārābī's in his writings. He gives all celestial bodies the decisive role of creating prime

matter and the contrary forms of the sublunary beings. Nevertheless matter, the elements, and nature have an inherent force to develop into higher forms of existence.

How well organized are al-Fārābī's doctrines? M. Mahdi claimed that his cosmology was political and devoid of scientific value since its purpose was to be a guide for the inhabitants of the virtuous city (Mahdi 2001). On the contrary, D. Janos argues that the doctrines are consistent, "grounded in the most up-to-date physical, metaphysical, and astronomical theories of his time" (Janos 2012, 7). However, he recognizes in other places that al-Fārābī's doctrines are not always homogeneous or that, for instance, he does not devote much space in his extant works to celestial motion, which is a crucial issue in physics. Al-Fārābī's carelessness may hint at the fact that he was much more concerned by a metaphysical foundation of ethics and politics.

In the tenth century CE and matching the lifespan of Al-Fārābī (ca. 870–950), a society of learned men flourished in Basra. They remained anonymous on purpose, and their interest in philosophy and science was stirred by a way of life, where knowledge was "nourishment of the soul." The Brethren of Purity, as they called themselves, have bequeathed us with 54 epistles comprising all the learning available at their time (Ikhwān al-ṣafā' 1957). The epistles often combine Platonic and Aristotelian doctrines, but sometimes they drink from other sources, for instance, Pythagorean. Whether the epistles can be considered as a disseminating work aiming at a general audience or one intending to reach scientific level remains a matter of discussion.

Epistles 16 through 21 deal with the natural sciences; they have been translated into English by Carmela Baffioni (2013). The doctrine of the human being as a microcosmos enjoyed broad dissemination in medieval Islam, and the Brethren of Purity reproduce the doctrine of both man as a microcosmos and the universe as a macro-anthropos. In Epistle 16, c. 2, we read:

Know, o my brother, that by saying 'world' the wise men mean the heavens, the earths, and all the creatures of them, and they called it a 'big man' because they think that it is a simple body with all its spheres,

the layers of its heavens and the elements of its basic compounds, and the things generated from them. They believe that it has a soul whose faculties pervade all parts of its body as the soul of an individual man pervades all his parts. (Baffioni 2013, 135)

In the classical issue of the character of the creation of the world, the Brethren of Purity join ranks with those who sustain the world. In several places, for instance, in the Epistle 42, they insist in the doctrine that the world is temporally created: *muḥdath* (Ikhwān al-ṣafā' 1957, 3, pp. 452–453). Generally speaking, the Epistles are close to the *falāsifa* tradition, but they are not concerned by scholarly rigor and even contain matters of magic, astrology, and superstition.

While Al-Fārābī's school was based in Baghdad and the Brethren of Purity were active mainly in Basrah, Avicenna will move through different places of present Iran and Uzbekistan. Abū 'Alī al-Ḥusayn ibn 'Abd Allāh ibn Sīnā (d. 1037 CE/428 AH; for his biography, see al-Juzjānī, (Juzjānī 1974) was indebted to al-Fārābī; however, his philosophy is not only most original but also embraces all aspects of knowledge. The major work that we know is *The Book of Healing*, an encyclopedia which begins with logic, more precisely with the *Introduction*, which is a reformulation of the Porphyrian *Isagoge*. Avicenna describes the purpose of philosophy as "the knowledge of the realities of all the things insofar as man can know them" (Avicenna, *Mantiq* 1952, 12). These things can be dependent on human will or not, and the latter are the subject of theoretical philosophy. They divide into things that mix with movement and things that do not. God and the intellect are the only beings that do not mix with movement.

Movement means something like engagement with matter. Avicenna tells us that the different sciences arise according to the relationship of beings toward movement. Some beings exist in movement in their intellectual apprehension, *taṣawwur*, as well as in their subsistence, *qiwām*; they cannot be separated from matter. Some beings exist in movement only in their intellectual apprehension; they can be separated from matter. Some beings exist in movement and can be separated from matter in their intellectual apprehension and in their subsistence. Natural science deals

with the first kind of beings, mathematics with the second, and metaphysics, the “divine science,” with the third (Avicenna, Manṭiq 1952, 14).

The Book of Healing contains a first section on logic considered as a preparatory part of philosophy, followed by a section on mathematics, and then a section on natural beings. The order may vary; in the *Dānesh Nāmeḥ*, the rank is Logic, Metaphysics, Physics, and Mathematics. Following the rules of scientific knowledge exposed in logic, Avicenna enquires for the subject matter of physics. The subject matter of natural science is “the sensible body insofar as it undergoes change” (Avicenna, Samāʿ al-ṭabīʿī 1983, 7) (Avicenna, Sh. Physics 2009, 3), and he proceeds to describe the natural body:

The natural body is that substance in which you can presuppose an extension, then another extension cutting it vertically, and then a third extension cutting them both vertically. Its being, *kawnu-hu*, is the form by which it became a body. (Avicenna, Samāʿ al-ṭabīʿī 1983, 13) (Avicenna, Physics McGinnis 2009, 13)

The three-dimensionality is reminiscent of the *kalām* tradition, but it is not exclusive of it. Avicenna and the Muʿtazilite scholar ʿAbd al-Jabbār al-Asādabādī (d. 415/1025) might have met in Rayy, in 1013–1015, and textual evidence of a discussion on physical theory exists (Dhanani 2003). For Avicenna, the three dimensions however are properties and not principles of the natural body because they are changing, not stable. He explicitly denies the existence of atoms and the void (Avicenna, Ishārāt 1957, 152–157).

There are two principles that produce corporeity, matter and form, and a third one, privation, that intervenes in change and motion. Avicenna introduces a corporeal form, *ṣūra jismīya*, from which matter is never separable (Avicenna, Ishārāt 1957, 207–213). When wax is squeezed and creased, it takes on many shapes while remaining a body. And matter and motion are the subject of physics.

As for the attribute “natural,” *ṭabīʿī* of the body, Avicenna affirms that “natural” comes from the relationship to “the potency, *qūwa*, called nature, *ṭabīʿa*” (Avicenna, Samāʿ al-ṭabīʿī 1983, 7) (Avicenna, Physics McGinnis 2009, 4), but on the

other side, he defines nature as “the efficient principle common to natural things” (Avicenna, Samāʿ al-ṭabīʿī 1983, 25) (Avicenna, Physics McGinnis 2009, 32).

Nature in its restricted sense is the source of motion and change under two conditions “the action has only one outcome and is without volition” (Avicenna, Samāʿ al-ṭabīʿī 1983, 30) (Avicenna, Physics McGinnis 2009, 39), and the example he gives is that of the stone falling and coming to rest at the center. However Avicenna admits there are three other meanings of nature insofar as it is the source of motion with only one outcome but with volition, that of motion with variable outcome and no volition, and that of motion with variable outcome and volition. The rotation of the Sun belongs to the second category, and its proper source is the celestial soul; the generation, growing, and halting of the plants belong to the third category, and the proper source is the vegetative soul; the motion in place of the animals belongs to the fourth category, and its source is the animal soul. After this explanation, Avicenna considers that he has given enough reasons to call nature an efficient principle, and not an efficient cause, producing motion and to call it an efficient power too (Avicenna, Samāʿ al-ṭabīʿī 1983, 32) (Avicenna, Physics McGinnis 2009, 43).

In *The Book of Science*, Avicenna observes that motion in a proper sense applies only to change in place but that it has acquired a broader sense, “any state and any actuality of something insofar as this something is in potency” (Avicenna, Dānesh Nāmē 1958, 14). Motion means change in general, which is found also in the categories of substance, quantity, and quality. Avicenna defines movement in the *Book of Healing* in similar terms, but he additionally distinguishes two meanings, internal and external, of movement. Its internal meaning is our perception of it as continuous; its external meaning is its existence as an intermediate state in the instant (Hasnawi 2001, 228–234).

There is another division depending on that change, which takes place gradually, as colors sometimes do or, at once, as substances do. Substantial change occurs at once, motion in quantity as well as in place is always gradual, while qualitative change has both forms (Avicenna, Dānesh

Nāmē 1958, 14–16). In the case of sperm, which becomes an animal, the gradual progression is only apparent. The distinction is not Aristotelian; Avicenna remarks that the Ancients, that is, Aristotle and the Greeks, referred to movement as only that which occurs gradually (Avicenna, Samā' al-ṭabī'ī 1983, 84). McGinnis hints at the possible influence of John Philoponus concerning the affirmation that substantial change occurs at once (McGinnis 2004, 47–48), but here again we should not lose sight of the *kalām* tradition, including their doctrine of states.

“Every body has a nature, form, matter and accidents” (Avicenna, Samā' al-ṭabī'ī 1983, 34) (Avicenna, Physics McGinnis 2009, 45); with this statement, Avicenna summarizes his views that differ from Aristotle; he integrates nature as a dynamical dimension into the composition of matter and form and adds the accidents as a necessary expression of any substance.

Since the realm of physics comprises simple and composite bodies, the simple ones are primarily natural. Simple bodies divide into those having only one potency or power and those having two potencies, for instance, one proceeding from the form and the other from an accident. Composite bodies receive the potencies corresponding to the bodies from which they are mixed, and if they blend, a common potency arises, which is mixed (Avicenna, Samā' wa-l-'ālam 1969, 1–2).

In his book *On the Heavens and the World*, Avicenna looks at the simple bodies and sees that they have simple movements, either circular or rectilinear. Bodies with circular movement are completely different from those moving in a straight line, that is, the elements. They are neither hot nor cold, neither heavy nor light. The simple spherical form has no contrary; it is not generated from anything simple, and it is created, *mubda'*. As for the spherical matter, it does not have any contrary form; it is unalienable, *mawqūf* (Avicenna, Samā' wa-l-'ālam 1969, 28–30). He concludes that such a substance must be a soul endowed with the choice of movement.

The celestial body contains a number of stars, following a hierarchy since “we see that some eclipse others and that some cause a change of appearance, *manẓar*, and others do not.” Further,

we observe that some stars move according to their approved movement, while others disobey and move in the opposite direction (Avicenna, Samā' wa-l-'ālam 1969, 37). Avicenna comes closer to the results of observation; the Moon is dark and receives the light from the Sun, for instance.

Some people claim that the earth is moving in a circle and the sphere is resting and that sunrise and sunset are not true. Avicenna refutes this because he proved that there is a resting body on which all others turn and which cannot be anything but the earth. He adds “if it were as they claim, a clod of earth would not fall vertical, but slanted, and the arrow thrown toward the east would reach a shorter distance than the one thrown toward the west” (Avicenna, Samā' wa-l-'ālam 1969, 55).

Avicenna's universe is finite in extension and infinite in duration. He follows al-Fārābī's design of the universe based on emanation; from the First Principle emanates an intellect one in number, it is the first of the separate intellects. Each sphere possesses a separate intellect “whose relation to it is as the relation of the Active Intellect to us” (Avicenna, Metaphysics Marmura 2005, 325). The intellect cannot move directly but by means of the soul that is “the proximate principle of motion.” Each sphere is moved by the corresponding soul and each sphere has a body. Chapter four of Book IX of the “Divine Matters,” *Ilāhīyāt*, reviews the hierarchical structure (*tartīb*) emanating from the First Principle:

You know that we have here numerous separated intellects and souls. It is thus impossible that their existence should be acquired through the mediation of that which has no separate existence [from matter]. But you [also] know that the aggregate of existents proceeding from the First includes bodies [...] these bodies come into being from Him through an intermediary. (Avicenna, *Ilāhīyāt* 1960, 405, l. 9-12) (Avicenna, Metaphysics Marmura 2005, 329–330)

The intermediary must have duality or plurality in itself so that it can produce the duality inherent to any body because a body is a possible existent by itself and necessary existent because of another. To sum up, the intellects and the souls can proceed directly from the First, but the bodies, and their possible matter, can only proceed

through an intermediary that is contingent. Moreover, it should be reminded that for Avicenna the number of unmoved movers or separate intellects is explained through the art of astronomy and therefore through observation.

Because of the souls and the spheres, there is motion and herewith time comes to being; it depends on motion. More precisely, it is dependent on a single motion, and Avicenna even affirms that the body endowed with this single motion is the efficient cause of time (Avicenna, *Samā' al-ṭabī'ī* 1983, 169) (Avicenna, *Physics* McGinnis 2009, 252). Avicenna clearly means the infinite movement of the universe and adheres to Aristotle: "The head of the Peripatetic school has proved that the mover of the universal sphere moves it with an infinite motion, that his power is infinite and that this mover is not in any corporeal power" (Avicenna, *Ishārāt* 1957, 179–180).

Composite bodies are investigated in the rest of the natural books including the treatises on animals. Living beings have the four kinds of motion; qualitative and quantitative motion is found in growth, for instance. The movers in the living body are its faculties or powers. The human faculties divide into natural, animal, and mental, and the heart is the principal organ that spreads the potentialities over all other parts; thus, the brain runs the mental faculty. Avicenna designed a system, which extended from matter and from the simplest elements to biology and medicine (Scrimieri 1973).

Avicenna started a new approach in the philosophy of nature when he used movement as the criterion to classify beings and then proceeded to study them. In addition, he tried to integrate observation within the system, but he eventually yielded to the seductive, all embracing emanation system designed by al-Fārābī. His approach was successful throughout centuries of Islamic thought in the East, that is, Iran, regardless of the different developments of this thought. So we see the Qur'ānic commentator 'Abd Allāh al-Baydawī (d. 1316?) and his disciple Maḥmūd Isfahānī (d. 749/1348) making a comprehensive effort to combine Avicenna's philosophy and *kalām* (Baydawī 2002). Al-Baydawī expounds on both doctrines

about bodies. For instance, the *mutakallimūn* say that a body is composed of atoms, and the philosophers say that a body is continuous in itself.

Abū Bakr Muḥammad Ibn al-Ṣā'ig Ibn Bājja (d. 533/1139), known in the West as Avempace, contributed to the development of the philosophy of nature. Ibn Bājja sketched a theory of dynamics based on a notion of "power" (*qūwa*) different from the Aristotelian notion of *dynamis*: his "powers" are mechanical forces, which can join with another force or counteract it by offering resistance. Shlomo Pines introduced the term "dynamics" to define his views, which were influenced by the tradition linked to John Philoponus (Pines 1986). There is a minimum amount of moving power for each movable. For instance, to move a boat, a minimum of manpower is needed. When two opposing powers are equal, there is no motion, and when one power "overcomes" the other, the body moves until it suffers "exhaustion," *kalāl* (Avempace 1973, 112).

Avempace made a remarkable contribution related to motion in the void; we are dealing here with "natural" movements such as a stone falling through air and water. Aristotle rejected the possibility of motion in the void because the medium was essential to natural movement at a finite speed. John Philoponus had already expressed the view that the medium is not a necessary condition but only provides resistance (Lettinck 1994). The different velocity with which the stone passes through the air or the water is only caused by the different density of the medium; it is not connatural to the medium. As a proof that motion without any medium, namely, through a void, is possible, Avempace adduces the movement of the spheres:

[In the heavens] there are no elements of violent motion because nothing bends their movement; the place of the sphere remains the same and no new place is taken by it. Therefore circular movement should be instantaneous, but we observe that some spheres move slowly – such as the sphere of fixed stars – and others fast – the daily movement – and that there is neither violence nor resistance among them. The cause for the different velocities is the difference in nobility (*sharḥ*) between mover and movable. (Avempace, *Samā' al-ṭabī'ī* 1973, 116)

D. Wirmer has written a monograph on the role of potency/power in Avempace's philosophy (Wirmer 2014) in which he extends the outreach of this concept from psychology to metaphysics through natural science and considers "active and passive potencies as universal explanatory principles" in Avempace's thought. No doubt, potency/power is not limited to the mechanical field, and it has a wider function in his natural philosophy. In the processes of a substance as well as in qualitative and quantitative changes, potency is an active and passive factor. Hot and cold are active potencies in the case of the elements, and as far as the passive potencies are concerned, Avempace explains them in the case of the element water:

Since the element insofar as element possesses a receptive potency of one of the composing forms, the water is neither [element] of the air nor of the earth nor of the fire, but it is element of the wine, of the vinegar, of the blood or of the phlegm, or of what belongs to the kind. (Avempace, Kawn 1994, 65)

Avempace adds that the passive, or receptive, potency of each element divides into two. One underlies its transformation into other simple elements; the other allows it to receive the form of composite substances. He puts the oxymel as an example where the active and passive potencies intervene: the form arises by means of the active potency and the subsisting matter by means of the passive one.

Avempace makes a wide use of the concept of potency in natural philosophy, and the comparison with Avicenna and his use of "nature" comes to mind. Avempace shares with Avicenna his cosmological doctrines although he makes some interpretations of his own, when he calls "spiritual forms" the forms of the celestial bodies (Avempace, Régime 2010, 132).

The correction in the sense of separating the account of timeless emanation from philosophical explanation came from Abū l-Walid ibn Rushd, Averroes (d. 595/1198). He reacted to the criticism of Abū Ḥāmid al-Ġazālī, Algazel (d. 505/1111) against Avicenna and resorted to Aristotle who did not know emanation as his source and guidance:

The habit of our contemporaries to say that such-and-such a mover proceeds from such-and-such a

mover or emanates from it, or follows necessarily, or similar expressions, is something which is not correct in the case of these separate principles [the heavenly bodies]. (Averroes, LC Met. 1984, 174)

Like Aristotle, Averroes admits the existence of these separate principles and adds that their number has to be established by the astronomer. He was not satisfied with Ptolemaic astronomy, but he could not propose another more Aristotelian version in this case.

Since Aristotle's works are not systematic, his disciple had to solve some inconsistencies, at least apparent. When Averroes comments on *Met.* 1069a 30–32, his passage establishing three kinds of substances (i.e., a sensible one "of which there is one eternal and one corruptible" and another immobile) states that the sensible substance without generation and corruption is "the fifth body," that is, the heavenly spheres, and insists that natural philosophy studies the principles of both substances. Physics and metaphysics complement each other. The metaphysician acquires from the philosopher of nature the assessment that the corruptible sensible bodies are composed of matter and form and that the eternal sensible body has an immaterial mover (Averroes, LC Met. 1984, 72–73). In the beginning of his *Epitome of the Metaphysics*, he stresses the continuity of physics and metaphysics:

In sum, the first purpose of Aristotle in this science [metaphysics] is to expound on the part needed for knowledge of the remote causes of the sensible beings, because what he expounded in the natural science was only two remote causes, i.e., the material and the moving cause. (Averroes, SC Met. 1998, 7–8) (Amzen 2010, 23)

For Averroes, the books of Aristotle's *Physics* consistently expound matter, motion, and related subjects as time and place; the treatises on *Coming-to-Be and Passing Away* and on *Meteora* deal with kinds of motion that are not in space, that is, substantial change and quantitative and qualitative change. Aristotle's well-known definition of motion in *Phys.* 201a 10–11 reads: "motion is the perfection of that which is in potentiality under the aspect that it is in potentiality," and Averroes comments on it that the movable has two kinds of perfection, a perfection in actuality and a

perfection in potentiality, under the aspect of which it is called motion (Averroes, LC Phys. Latin 1962, LC 88AB TC6). Averroes could have learned the distinction either from Philoponus (Lettinck 1994, 213) or Themistius (Themistius, On Aristotle's *Physics* 2012, 85). He observes that the definition is valid for both eternal and non-eternal classes of motion, and he considers that the continuity inherent to motion shows in the definition itself (Averroes, LC Phys. Latin 1962, 88C TC6).

Averroes raises the question whether motion is a category in itself or it belongs to the category, i.e., the genus of the perfection toward which it intends, so that motion in substance belongs to the genus of substance and motions in quantity, place, and quality to the respective genera. Averroes accepts both answers: insofar as transition toward a perfection is different from the perfection itself, motion is something different from its goal and considered in this way, "Motion must be a genus per se, for the way toward something is different from it [the end]" (Averroes, LC Phys. Latin 1962, 87D TC4). For this reason, he believes Aristotle classified motion in own category in his book *Categories*.

Averroes sustains that motion does not differ from its final perfection essentially but only in a matter of degree, *nisi secundum magis et minus* (Averroes, LC Phys. Latin 1962, 87C TC4). Therefore, the definition of motion as belonging to the genus of its perfection is more adequate, *verior*, although the definition of motion as a genus in itself is better known, *famosior*; Averroes points out that Aristotle in the *Physics* deals accordingly with the first definition. Medieval Latin philosophy would call this view of motion as genus in itself "a flow of form," *fluxus formae*, and the contrary view, "a flowing form" *forma fluens* (Maier 1958, 62–64) (Glasner 2009, 112–117).

The issue of motion in the void was discussed by Avempace as we saw above; Averroes opposed to his solution, and herewith he made Avempace's position known to the Latin philosophers (Averroes, LC Phys. Latin 1962, 160D TC71). Averroes blames Avempace for misunderstanding the essence of velocity. Velocity is not a motion added to or subtracted from another motion, in

this case, natural motion, "like a line added or subtracted from a line" (Averroes, LC Phys. Latin 1962, 161A). For Averroes, there is a *ratio* between the power of mover and the resistance of the movable, and a ratio between the hindering and the hindered, and velocity depends on both factors. Velocity in the celestial spheres results from the first kind of *ratio*, since there is no medium, and Averroes agrees with Avempace in considering the degree of nobleness (*sharf*) of the various spheres as the factor explaining their different velocities. *Sharf* is the surplus of "energy" between the power of motor and the resistance opposed by the movable.

Matter is another subject of inquiry in the *Physics*, as one of the four causes and as a principle. According to Aristotle (Phys. I.7–9), and Averroes, there are three principles: matter, form, and privation. In his commentary on the Aristotelian passage, Averroes points to the privation of form as the nature of matter. Prime matter is "almost composed of being and not-being" (Averroes, LC Phys. Latin 1962, 45C TC80). Because of the presence of not-being in material beings, coming-to-be and passing-away is possible in them but not in heavenly bodies which do not have matter. Sensible substances are made of matter and form, but both are of different kinds in celestial and corruptible bodies; the difference clearly appears – Averroes thinks – in the case of the corporeal form. Avicenna spoke of the corporeal form as that primary form, which gives a body its three dimensions and which is essentially prior to them. Averroes accepts the principle of corporeal form: matter never separates itself from the three dimensions, but he distinguishes between determinate and indeterminate dimensions. He blames Avicenna for missing this distinction (Averroes, Sub. Orbis 1986, 63–65). Prime matter first receives the indeterminate three dimensions, which are identical with the corporeal form; the composite receives the determinate dimensions. This is not the case with the celestial bodies, whose forms do not exist by means of the three indeterminate dimensions. "They are not powers in bodies" (Averroes, Sub. Orbis 1986, 66).

They cannot be powers in bodies, because celestial bodies have an infinite activity in spite

of being of finite extension. However, they have dimensions, and Averroes resolves the issue stating that celestial bodies receive the dimensions in a different way: “their matter receives the dimensions by means of its forms” (Averroes, *Sub. Orbis* 1986, 68), and the dimensions are obviously determinate.

Following Aristotle, Averroes describes the universe as a unique self-containing body in a spherical shape. It is neither heavy nor light; it is eternal and not corruptible; its only change is moving from place to place. While Aristotle introduces a fifth nature for the heavenly bodies, he cautiously explains that Aristotle meant that such a nature does not accept any changes (Averroes, *LC Caelo* 2003, 36–37).

In his commentaries on the *Physics*, Averroes deals with a discussion about the place of the celestial sphere, an issue raised by Aristotle in the *Phys.* IV.5 and one which concerned his Greek, Arab, and Latin commentators. Averroes first accepted Avempace’s explanation that the sphere is in a place by means of its concavity, so that its place is the convexity of the resting body that the sphere surrounds (Averroes, *SC Phys.* 1983, 55). Later he rejected the distinction “from inside – from outside” and decided in favor of the distinction “essential – accidental” after discussing the views of Alexander of Aphrodisias, Themistius, al-Fārābī, and Avempace. The earth is at rest and has to be in a place per se; the heavenly body is rotating on it and can be in a place per accidens (Averroes, *LC Phys.* Latin 1962, 141C–143D).

He is aware that some commentators regard Book VII of the *Physics* as superfluous because it proves what is better described in Book VIII – *perfectius* “as some commentators thought.” He does not agree that Book VII sets up a key premise for the enquiry: “everything that moves has a mover” (Averroes, *LC Phys.* Schmiejia 2007, 2). The issue is neither that the hand moves the stick and the stick moves the stone nor that something moves because of a part of its whole; rather, it only moves accidentally. He gives as an instance of the latter the heart, which is the first movable in animals and is moved by some part that moves itself and the whole. The mover is not external but is

found in the movable itself. According to Averroes, the inquiry excludes the corruptible bodies and leads to the one and simple movable, that is, the celestial body, and he concludes:

The following has now been proved: there is a first movable and a first movement. For this reason [Aristotle] presupposes at the beginning of Book VIII that there is a first movement and a first movable and investigates whether that movement is temporally produced or eternal. (Averroes, *LC Phys.* Schmiejia 2007, 20)

Book VIII proves the eternity of the movement of the celestial body and also the immaterial nature of its mover. This is not the correct reading of Aristotle, who employed the definition of movement in general to prove its eternal duration, and, indeed, Averroes had followed the correct reading before changing his view. In his revision of the epitome of the *Physics* (Averroes, *SC Phys.* 1983) in his *Quaestiones* (Averroes, *Qst. Phys.* 1990, 17–20) or even in the same text of the long commentary – although in form of a reconsideration of his previous opinion (Averroes, *LC Phys.* Latin 1962, 339C) – he tells us that Aristotle’s aim at the beginning of Book VIII is to prove that the heavenly movement is eternal. Aristotle’s purpose here is not to demonstrate that motion does not pass away as genus (*bi-l-jins*) because he investigates a specific movement, that of the universe. Since he studies it as a whole, he does not consider its parts, where movements are following one after the other in an accidental succession.

The cause of this eternal movement lies outside the universe and is not material. Physical inquiry leads to the existence of God as the Prime Mover. The argument based on motion is seen as the best way for Averroes, Maimonides, and Aquinas (Davidson 1987, 237–280) to prove the existence of God, and Averroes deserves the credit for setting up this important proof in an explicit way.

While Avicenna wanted to build his own “Oriental” philosophy independently from the Aristotelian tradition to which the Arab philosophers of Baghdad adhered, and he was proud of his achievements, Averroes just wanted to be a faithful interpreter of Aristotle. However the history of ideas has its own dynamics, and *volens nolens*, Averroes essentially contributed to it.

Natural Philosophy, Byzantine

Börje Bydén

Department of Philosophy, Linguistics and Theory of Science, University of Gothenburg, Gothenburg, Sweden

Abstract

Byzantine natural philosophy is heavily dependent on that of late antique Neoplatonic Aristotelianism, especially in the idiosyncratic form it took in the works of John Philoponus. In this tradition, nature is considered to be an inner principle of change (kinanti) and stability (stasis), and natural philosophy is the branch of theoretical philosophy that studies such entities as are subject to change in accordance with nature, in contradistinction to mathematics and theology, the objects of which are exempt from change. The views of the late antique philosophers were mostly followed by the Byzantines as long as they were not perceived as contrary to the Christian faith. One view that was shared by most of the former but none of the latter is the view that the world is eternal. The Byzantines followed Philoponus in rejecting this view, rather than trying to harmonize it with creationism, as Proclus and others did. They also generally rejected views which seemed to entail it: thus the Aristotelian doctrine that the heavens are composed of an imperishable kind of body met with little support in Byzantium. Other features of Aristotelian-Ptolemaic cosmology were, however, readily accepted: the world according to most Byzantine writers is a system of nine nested spheres rotating at various speeds and in different directions (the ninth sphere being responsible for the diurnal motion from east to west) around the sublunary realm, where fire,

air, and water form concentric layers with the small spherical earth at rest at the center. These elements are involved in a continuous cycle of transformation into one another, by virtue of each possessing one of the active qualities of hot and cold and one of the passive qualities of dry and moist. Some Byzantine writers, who found fault with Aristotle's theory of place, also lent a willing ear to the Stoic cosmologist Cleomedes' arguments in favor of the existence of extracosmic void. Philoponus' influence is also obvious in the field of psychology, where most writers subscribe to an interpretation of Aristotle which leans strongly toward dualism: according to it, the lower soul faculties are inseparable from the body, but the rational soul, although dependent on the human body for some of its activities, is wholly separable from it in substance, and thus immortal.

Natural Philosophy in Byzantium

Natural philosophy was always taught and studied in Byzantium, but for the most part only to a limited extent. Its importance in general education is evidenced by a number of elementary works, including, in the eleventh century, Symeon Seth's *Conspectus rerum naturalium* and Michael Psellos' *De omnifaria doctrina*; in the twelfth century, Theodore of Smyrna's *Epitome of Nature and Natural Principles according to the Ancients*; in the mid-thirteenth century, Nikephoros Blemmydes' widely influential *Epitome physica*; and around the year 1300, the relevant parts of George Pachymeres' compendium-paraphrase of Aristotle's philosophical works. The commentary on the *Physics* attributed in some manuscripts to Michael Psellos is now also considered to be the work of Pachymeres (Golitsis 2007). In addition, detailed commentaries on Aristotle's *Parva naturalia* and on his zoological treatises, as well as on the pseudo-Aristotelian *De coloribus*, were composed by Michael of Ephesus in the early twelfth century; and in the early fourteenth century Theodore Metochites published his commentaries on all of Aristotle's writings on natural philosophy.

Essays on various topics in the field were written by Theodore Doukas Laskaris, Nikephoros Choumnos, Theophanes of Nicaea, Nikephoros Gregoras, Gregory Palamas, and others.

The Byzantine conception of natural philosophy is most clearly and directly influenced by that of late antique Neoplatonic Aristotelianism. In this tradition, nature is considered to be an inner principle of change (kin Byz) and stability (stasis), and natural philosophy is the branch of theoretical philosophy that studies such entities as are subject to change in accordance with nature, in contradistinction to mathematics and theology, the objects of which are exempt from change. On the other hand, natural philosophy is also distinguished from natural history, which studies the same entities, although not in a general way. The natural world is the world of sense-experience, extended in space and time; the higher reality constituting the domain of theology is accessible only to the intellect. On this division the Byzantine writers superimposed the Christian dichotomy of Creator and created world. As a consequence, the Aristotelian bipartition of the natural world into one realm (the celestial) in which no other change than locomotion takes place, and another realm (the sublunary) where things are also subject to coming-to-be and passing-away (substantive change) as well as quantitative and qualitative change, was generally rejected: it was assumed, on the authority of Scripture, that heaven and earth had come into being and would pass away (Matt. 24: 35). Nevertheless, the division of natural philosophy embodied in the *corpus aristotelicum*, where a part dealing with the most general principles of the natural world precedes specific parts dealing with cosmology, elemental theory, meteorology, psychology, and biology, is adhered to by most if not all Byzantine writers, and in this article the several parts will be treated separately.

General Physics

By and large, the doctrines of the late antique Neoplatonic writers on natural philosophy were accepted by their Byzantine successors as long as

they were not felt to be in conflict with the Christian faith. The general theoretical framework was Aristotelian. Thus Michael Psellos began the original redaction of the *De omnifaria doctrina* by defining "nature" as the proximate cause of change and rest (ēby de) in bodies, implanted in them by the ultimate cause, which is God (Chap. 57). Assuming that no bodies are eternal, coming to be and passing away are the most fundamental kinds of change that all bodies undergo. The four "primary bodies" or elements come to be and pass away by losing one of their qualities and taking on the contrary quality: thus, for instance, water becomes air by exchanging its coldness for heat. This they can do, Symeon Seth explained, in virtue of being composed of the two first principles of the natural world: (prime) matter, which seems to have a very peculiar ontological status as a "mere attempt at existence," and forms, which exist in separation from the matter, not independently but in the mind of God (CRN 56–58).

The cosmogony of the *Timaeus*, according to which the world was created from preexisting forms and matter, sits ill with the Christian doctrine of creation *ex nihilo*, and was repudiated by Psellos and others. It came under a concerted attack in the early fourteenth century, when Nikephoros Choumnos, in an essay purporting to show that matter and form are inseparable and simultaneously created (*Against Plato*), argued by elimination against the separate existence of matter, and objected to the eternal existence of forms that if forms do not allow self-predication, they are not participated in by individuals; but if they do, they are not universal and eternal, but individual and perishable.

Aristotle insisted in *Physics* 4 that the natural philosopher should also study place and time: the first because it seems to be a prerequisite of change (especially of locomotion), the second because it seems to be a constant attribute of change. The Byzantine writers took him at his word. A peculiarity in Byzantine – as compared to late antique and Latin medieval – cosmology is the continuous influence of Stoicism through the agency of Cleomedes' *Caelestia*. This is manifest, for instance, in the refusal on the part of some

authors to endorse Aristotle's theory of place as "the limit of the containing body," with its consequent denial of the existence of extracosmic void. Aristotle's theory is accepted without reservation by Symeon Seth (CRN 62–64), who also regards it as a demonstrated fact that there is no void outside the cosmos (CRN 34); but Michael Psellos (OD 120, 153) and Nikephoros Blemmydes (EP 31) reproduce Cleomedes' arguments in favor of extracosmic void with no attempt to refute them. Blemmydes also criticizes Aristotle's definition of place for being applicable only to place conceived of as immobile and separate, and praises the greater accuracy of the definition provided by Damascius apud Simplicium, who says that place is the measure of the position of things in a position. Two possible reasons why he preferred Damascius' theory are (1) that it regards the internal well positioning of the parts of the universe as not only the point of reference for all local movements in the universe but also as the final cause of all natural movements, and Blemmydes explained natural movement by the two related concepts of affinity of an element with a place, and the tendency of the part toward its whole; and (2) that it does away with a notorious problem in Aristotle's theory, namely, how the outermost heavenly sphere is capable of being moved, in spite of not being in a place. A further advantage of Damascius' theory actually noted by Blemmydes is (3) that it takes the places of incorporeal entities into account.

Nikephoros Gregoras, in his anti-Aristotelian dialogue *Phlorentius* (c. 1333), goes further. He argues that place would be better defined as the boundary of the contained body itself, since this definition, which Gregoras fathers on Anaxagoras, Democritus, and Anaximander, entails that the heaven, too, is in a place. In addition, against the consensus of Plato, Aristotle, and the Stoics (as well as Blemmydes), he subscribes to the view, which he attributes to "Pythagoras and Democritus and the other wise men," that there is void not only outside but also inside the cosmos, distributed in small portions in the elements, since otherwise bodies would not be able to expand except by extending through other bodies, which is impossible (cf. Aristotle, *Physics* 4.6).

As regards time, Michael Psellos seems content to define it, with Aristotle, as the measure of movement with respect to before and after, and to assign to it the ontological status of a mere concept (*OD* 102). Elsewhere (*Theol.* 88.12–19) he defends a view based on a literal interpretation of Plato's *Timaeus* against Aristotle's contention that time cannot have been generated. It must have been generated with the heavens, Psellos says, for it requires movement, and the Forms do not change. As against Plotinus' account of eternity as having no extension, he champions that of Gregory of Nazianzus, according to which eternity and time are different, because the former is immeasurable, but analogous, because eternity is also "coextensive with the eternal beings, like a kind of temporal movement and extension" (*Or.* 38.8). The notion of an extended eternity, most famously promoted in late antiquity by John Philoponus, was also favored by Blemmydes, although it looks like a concession to Plotinus' account that he qualifies the relevant kind of extension as "concentrated" (*EP* 24.21).

Nikephoros Choumnos (*De natura mundi*, probably 1310s) departs from all his predecessors in that he declares both measured, sensible, time and intelligible eternity to be, in a sense, time. Both have been created: measured time, in order to change and dissolve into eternity; eternity, in order to remain unchanged. The Creator, unique and unlimited in being, nature, and power, transcends even the everlastingness of eternity, and everything, whether changing or unchanging, depends on Him.

Cosmology

The doctrine that the world was eternal was undoubtedly the single doctrine of Aristotelian natural philosophy that Byzantine writers found hardest to accept. In contrast to some of the late antique and medieval commentators (including Thomas Aquinas), they tended to resolve the tension between this doctrine and (Platonic or Christian) creationism not by recourse to a theory of creation which allowed for the world's being eternal, but by rejection of the Aristotelian doctrine.

The example was set by Philoponus, who attempted to prove through philosophical argument, in his *Contra Proclum* (529), *Contra Aristotelem*, and *De contingentia mundi*, that it is both possible and necessary for the world to have had a beginning, before he proceeded to show by scriptural exegesis that the biblical account of creation does not contradict the findings of natural philosophy (*De opificio mundi*, probably 550s). Thus he maintained, against the literal interpretation of Genesis advanced by Kosmas Indikopleustes and other followers of the Antiochene school of exegesis, that the cosmos is a system of nested spheres, the outermost of which, being responsible for the diurnal movement from east to west, encompasses the fixed-star sphere, seven lower spheres each carrying the epicycle of a planet, and, at the center, the small immovable spherical earth. Against the Aristotelian–Ptolemaic world-view, however, he argued that the celestial realm is not composed of a fifth ungenerable and imperishable kind of body, but of different mixtures of the four elements (mostly water and air in crystalline form); and that the movement of the heavenly spheres is not due to their eternal nature, but to the motive force impressed in them by God. He also repudiated a view which he seems to have still held in his works against Proclus and Aristotle on the eternity of the world, namely, that the heavenly spheres and bodies have souls.

Much the same basic cosmology is defended with similar arguments by numerous later authors. Symeon Seth (*CRN* 30) and Nikephoros Blemmydes (*EP* 24) both assume that the doctrine that the world has had a beginning can be scientifically proved, and they both draw their arguments from Philoponus; Michael Psellos (*OD* 157) more cautiously refers only to Scripture. Aristotelian–Ptolemaic celestial mechanics is more or less universally accepted, but the five-elements-theory is discarded as groundless. Choumnos, for instance, points out that Aristotle's attempt to deduce his theory from the fact that the heavens have a circular movement fails, inasmuch as he has only secured the premise that all simple bodies have simple movements, not that all simple movements belong to simple bodies, which is

what his argument requires. Most authors either agreed with Philoponus in *De opificio mundi* or followed the Platonic view that the heavens consist of an elemental mixture dominated by fire, but Choumnos accepted Plotinus' view that they consist of fire alone.

Elemental Theory

Turning from the eternal entities in the celestial realm to the world of coming-to-be and passing-away, Aristotelian doctrine assigns to each of the four sublunary elements a natural place in accordance with its absolute or relative lightness or heaviness. These elements, forming concentric layers of fire, air, water, and earth in descending order, are involved in a continuous cycle of transformation into one another, by virtue of possessing one of the active qualities of hot and cold and one of the passive qualities of dry and moist. The distribution of these primary qualities is such that earth is dry and cold, water cold and moist, air moist and hot, and fire hot and dry.

An interesting development in some Late Byzantine texts is the idea that the sharing in each primary quality by neighboring elements is responsible for preserving the unity of the world. This idea appears full-fledged in Blemmydes, *Epitome physica* 11.22, and later reappears in Choumnos, *De natura mundi*. Its proximate source is probably Basil the Great, *Homiliae in Hexaemeron* 4.5, another important source text for Byzantine natural philosophy. In Basil, however, it is only sensible compounds that are assigned two primary qualities; the elements have only one, and their connection is left unexplained. Blemmydes enhances the idea by insisting on the Aristotelian theory assigning two primary qualities to each of the elements, so that earth essentially connects with water, and so on. Possibly the idea of shared primary qualities was linked in Blemmydes' mind with that of natural places, each element having its natural place between those two elements with which it shares each of its primary qualities (cf. Aristotle, *Physics* 4.5 and *De caelo* 4.3 with Simplicius, *In Phys.* 597.16–20).

It is against this background that one must view Gregoras' denial, in the *Phlorentius*, that the absence of shared qualities would pose a threat to the unity of the world, since all bodies share in weight. Some of Gregoras' statements in the dialogue seem to suggest that he understood the problem as that of securing spatial cohesion, which is indeed a classic problem for those who believe, as Gregoras did, in extracosmic void (see "[General Physics](#)" above).

Psychology

Another potential conflict between Aristotelian natural philosophy and Christianity is created by Aristotle's definition of the soul as "the first actuality of a natural body," which seems to rule out the possibility of its being immortal. To a large extent this conflict was suppressed by the Neoplatonic exegesis of Aristotle. Especially Philoponus' commentary on the *De anima* was studied throughout the Greek Middle Ages, although virtually unknown in the Latin West. Philoponus thought that what Aristotle meant to say was that the vegetative soul is wholly inseparable from the body, whereas the irrational soul is separable from the gross body, though inseparable from the *pneuma*, and thus mortal, and the rational soul or intellect, the substance of which transcends all body, but some of whose activities are bound up with the human body, is wholly separable and thus immortal. This interpretation was adopted by numerous writers, including Theodore Metochites in his commentary on the *De anima* (c. 1320), where he explained that Aristotle's famous query of whether the soul is analogous to a sailor on a ship was meant to suggest that some part of the soul may per se be wholly separable from the body, even though it is inseparable *qua* the actuality of that body, in the same way that the sailor is inseparable *qua* sailor. Metochites also claimed in his *Semeioseis gnomikai* that Aristotle's cosmological argument in *Physics* 7 and 8 for the existence of an unmoved mover entails the existence of a self-moved soul à la Plato, and that the latter must necessarily exist forever. The inferences are astonishing and

apparently fallacious, but can at least be partly defended on the assumption that Aristotle's ban on self-movement is only applicable to physical change.

Metochites was aware that Aristotle had been taken by some interpreters to deny the immortality of the soul, but so entrenched was the Neoplatonic reading that even George Gemistos Plethon, who tried his best in his *De differentiis* (1439) to document the inferiority of Aristotelian to Platonic doctrine, conceded that Aristotle made the human intellect immortal. He did, however, think that the Stagirite was inconsistent in affirming, on the one hand (in *De gen. an.* 2.3), that the intellect exists prior to the body, and denying, on the other hand, that learning can be called "recollection". In his reply, George (Gennadios) Scholarios explained that Aristotle's view should be understood in terms of a transition from potentiality to actuality: the soul is the fulfilment of the body, and the intellect is its only immortal part. It is prior to the body in substance, not in time. Plethon retorted that on Scholarios' and Aristotle's own showing (*De caelo* 1.12) an immortal intellect must be ungenerated. Anyone, he contended, who regards the human soul as immortal must admit that it is uncreated in time as well as subject to reincarnation. Otherwise, something which according to Aristotle's arguments in *Physics* 3.5 is impossible will follow: there will be an infinite number of simultaneously existing souls. This point had been previously raised by Philoponus (*In De anima* 3, 38.90–96).

Natural Philosophy, Jewish

Tzvi Langermann

Department of Arabic Faculty of Humanities, Bar Ilan University, Ramat Gan, Israel

Abstract

After a period of ingestion, when Jewish thinkers came to grips with a large and variegated body of scientific literature, mainly written in the Arabic, comprehensive philosophies of nature were developed. The most systematic and influential thinker in this field as in so many others was Moses Maimonides. A fixed and permanent natural order was an important feature of his philosophy. Though in conception and in most details it was an Aristotelian philosophy of nature, in fact Maimonides

asserts that an unchanging natural order is a key and requisite feature of his religious philosophy that recognizes a Creator God above nature. However, Maimonides' seemingly wholesale acceptance of "Greek" science irked many later thinkers, most especially Moses Nahmanides' who proffered a particularist philosophy. If nature has a role here, it is only as a lower order system; if they behave properly, Jews can insert themselves in a higher order, in which they come under the direct control of God.

In this entry, we will investigate some Jewish conceptions of how the world as a whole operates. The earliest attempt to articulate what can be called a comprehensive, if highly schematic, natural philosophy is found in an extremely concise and highly enigmatic treatise, *Sefer Yesira* (*The Book of Creation*). There is considerable controversy about the book's date, provenance, and purpose (Langermann, *Aleph Hist Stud Sci Jud* 2:169–189, 2002; Wasserstrom). The Hebrew word *teva*, which later came to mean, "nature," does not appear there, nor is there any other word with a similar meaning. Instead, *Sefer Yesira* lists correspondences, mostly based upon numbers (3, 7, 12) and the 22 letters of the Hebrew alphabet, on the one hand, and three dimensions of reality on the other: *'olam*, which refers here to the physical universe, both heavens and earth; *shanah*, literally "year," here meaning time; and *nefesh*, signifying here the human body. These correspondences explain the overall pattern of events in the universe. In the tenth, eleventh, and twelfth centuries, Jewish savants throughout the diaspora expounded and expanded upon this text. Most tried in one way or another to read into it the medicine, astronomy, and physics that they had absorbed from other sources; many attempts to articulate a philosophy of nature can be found in these commentaries (Jospe).

Moses Maimonides (d. 1204) deepened the Jewish engagement with the sciences. He advocated the view, according to which a fixed, permanent,

"nature of reality" (*ṭabī'at al-wujūd*) is the touchstone of all philosophy, including, of course, theology. Just as Maimonides urged a single truth, he argued for a single, fixed nature governing reality. We may learn how nature operates by observation and the application of logic to our findings; in short, scientifically. Maimonideans, then and now, as a rule, deny any special status for the Jewish people within the natural scheme of things.

In contrast, many Jewish thinkers advanced the concept of two modes of governance (*hanhagah*). This was a highly particularist view, emphasizing the special place accorded to the Jews within the cosmic scheme. This view, which won increasing acceptance during the late medieval period (and has strengthened ever since in "orthodox" circles), recognizes two governances: the one called "natural," identified with the rules and laws of natural science (particularly astrology, which provides a mechanism for the causality of terrestrial events), and the other called by a variety of names, especially "miraculous" or "higher" governance. It is an alternative, higher system, almost a sort of parallel universe, in which cause and effect play themselves out in accordance with obeisance to divine command, in place of the natural law (usually identified with astral causality), which manages the affairs of non-Jews, as well as those Jews (individuals or communities) who do not adhere to the Law. The remainder of this entry will address these two alternative philosophies of nature, (even though the second often involves the formal denial that "nature" exists).

Maimonides: One Single, Permanent Nature of Reality

Ṭabī'a, "nature," was a widely used technical term in Arabic. Maimonides knew of several different meanings that were assigned to it, and he recognized the need to be clear in which sense one employs the term in any given discussion. In his *Medical Aphorisms* VI, 94, he employs the formulaic declaration that *ṭabī'a* is an equivocal term (*ism mushtarak*) possessing several meanings. One of these, the one most relevant to medicine, is "the faculty which governs the body of living

beings. . . This faculty always spares the most eminent activities of the body and always strives to maintain the integrity of all [its] activities” (trans. Bos, 20).

There is no concentrated discussion on the various usages of *ṭabī‘a* in Maimonides’ *Guide of the Perplexed*, but the term is often employed and defined in different ways. The most important of these, indeed one of the bedrocks of Maimonides’ religious philosophy, is this: nature is the fixed mode of operation by which the cosmos functions, a set and unchanging protocol that forces things to move in a certain fashion. We shall shortly elaborate upon and illustrate this concept. Nonetheless, Maimonides takes care on occasion to alert the reader that he is using the term in a different sense. Indeed, in some cases, confusion is almost inevitable. For example, in *Guide* II, 4, Maimonides takes up the knotty and delicate issue of the principle or source of the celestial motions. This cannot be a “nature”; in a kinematic context, that term applies specifically to the upward motion of the light elements and the downward motion of the heavy ones. Both classes of body move only insofar as it is necessary to regain their “place,” where they come to rest. The celestial bodies possess a circular motion, and, therefore, the principle of this motion cannot be “nature.” Is the principle then a soul? Ensouled bodies move only “because of a certain nature or because of a mental representation.” Here “nature” must have a different meaning than the one assigned to it previously. Maimonides duly elaborates, “I mean here by the expression ‘nature,’ the seeking to attain what agrees with one and the flight from what disagrees.”

A fixed and permanent nature, or natural order, is basic to Maimonides’ worldview. This is the half of Aristotle’s worldview that conforms to his own: “We agree with Aristotle with regard to one half of his opinion and we believe that what exists is eternal *a parte post* and will last forever with that nature which He, may He be exalted, has willed” (II, 29; trans. 346). The natural order as such is blind and unthinking; the intentionality or purposefulness that is evident in the natural order must come from some other principle. The purposes of the natural bodies are interconnected; for example, plants exist for the sake of animals.

Aristotle recognized an intellectual or divine principle. For Maimonides, this “principle” standing above nature is surely the God of Jewish tradition. (This, by the way, is a clear indication that Maimonides does not subscribe to the notion of *deus sive natura*.) More precisely, according to Aristotle, the “craftsmanlike governance proceeds from an intellectual principle” but, “according to us,” it is the act of an intelligent being (III, 19; trans. 479).

But there is more: Maimonides insists that the combination of the two ideas – the *teloi*, or “final purposes” for which natural things exist, and the inflexible and permanent nature of the components of the universe that possess these *teloi* – leads inevitably to the belief in creation. Otherwise, how can one explain the existence of a set of bodies, all uncreated, yet well-ordered in a system in which the one exists for the sake of the other? In Maimonides’ words: “Know that the existence of this final end in natural things has of necessity led to a belief in a principle other than nature. . . Know too that to the mind of an equitable man, one of the strongest proofs for the production of the world in time is the fact, demonstrated with reference to natural beings, that every one of these has a certain final end, some of them existing for the sake of others; for this is a proof of purpose on the part of a being possessing purpose. And purpose can only be conceived with reference to the production in time of something so produced.” (III, 13; trans. 449; see also the beginning of II, 19).

By extension, “nature” refers to any fixed and unalterable rule, and it can be applied to entities that, strictly speaking do not belong to the world of nature. In the passage to be cited presently, the “flow” of intellect from one individual to another is compared to the overflow of water from one vessel to another. Maimonides is there developing his theory of prophecy, and he is eager to emphasize that the phenomenon is essentially “natural”; in line with this, he speaks of the “nature of the intellect.” Maimonides writes, “But the nature of that intellect is such that it always overflows and is transmitted from one who receives it after him until reaches an individual beyond whom this overflow cannot go and whom it merely renders perfect. . .” (II, 37; trans., 375). Even the nonexistent (because it is impossible for it to exist) has a

“nature,” meaning here that its status cannot be changed. “The impossible has a stable nature, one whose stability is constant and is not made by a maker; it is impossible to change it in any way” (Guide III, 15; trans. 459). This statement is an important principle for Maimonides.

Human nature, or what we may call the natural inclination of most people to look at things in a certain way, figures as well in Maimonides’ thought. Biological “nature” is fixed too, but in a weaker sense. In line with the general thinking of the period, biological characteristics are true statistically (to use an anachronism) rather than absolutely; in the scientific idiom of the period, they are *akthariyy*, “mostly usually so.” We must distinguish here between societies and individuals. With regard to the former (because they are statistical), Maimonides is more open to stating rules. For example, certain opinions can be revealed only in the form of parables because “it is not within the nature of the common multitude that its capacity should suffice for apprehending that subject matter as it is” (III, 27; trans. 510). Understandings of this sort are part of the *raison d’être* for writing the *Guide*.

Concerning the individual, on the other hand, Maimonides is much more circumspect. Committed as he is to the freedom of the will, he must carefully define just what human functions are determined by “nature.” The lengthy final chapter of his *Eight Chapters* focuses upon the problem of the *fitra*, the inborn human nature. Human nature (*tab’*) cannot predetermine any ethical or intellectual quality or even profession. However, it does mold significantly character traits concerning which the Jewish tradition pronounces a moral judgment. A person endowed with coarse natures (here in the sense of the four humors) will have great difficulty in her studies. These and other traits, however, can be overcome, to some degree, but only with great difficulty.

Alternatives to the Natural Order

Certainly, the most significant voice in the formation of an alternative natural philosophy was that of Moses Nahmanides (d. 1270). To be sure, Nahmanides insists that he rejects “nature”

altogether. His system (if it may be called that) was in large measure a reaction to Maimonides, who, in Nahmanides’ words, “diminishes miracles and augments nature” (Twersky, 232). Nahmanides will, then, “augment” miracles and diminish nature. Moreover, he draws upon ideas of earlier Jewish thinkers whose views were at variance with those of Maimonides.

In several clear statements, Nahmanides rejects out of hand any notion of “nature,” asserting that Jewish belief maintains that there are only miracles – miracles here meaning, direct products of the divine will. Will is not whim; it is an intervention elicited by Jewish moral and ritual behavior. Nahmanides does not propose an alternative physics (such as atomism, adopted by Muslim *mutakallimūn* and some Karaites). As we shall see, he in effect accepts the explanations of Aristotelian physics and Galenic medicine for mundane affairs; they cannot be allowed only when the observance of the Torah is somehow involved. “The blessings and curses are all miracles, for it is not natural that the rains should fall in season when we worship God. . .” (Commentary to Exodus 6:2). When the Jews as a whole behave as they should, “their affairs will not be realized by nature at all: not with regard to their bodies, their land, their collective, or any of their individuals” (Commentary to Leviticus 26:11).

Indeed, Nahmanides recognizes a permanence in the cosmic setup, which, he insists, includes the spiritual as well as sensible realms, which is hardly distinguishable from Maimonides’ proclamation of a fixed and permanent natural order. He may even discern some sanctity in the scheme of things that God created. These ideas are divulged in his discussion of the biblical prohibition to cross species (*kil’ayim*):

The rationale underlying *kil’ayim* is that God created the worldly species of things possessing a vegetative soul and those with a motive soul [an Aristotelian phraseology for plants and animals!], and he gave them the capacity to reproduce so that the species would maintain themselves forever, so long as He (Blessed is He!) wills the world to exist. As part of this capacity, He commanded that they reproduce within their own species, and that they do not change forever. . . Whosoever crosses two species denies the act of creation, thinking as if God did not perfect the world as required, and so he wishes to aid in the creation. . . [Therefore]

animals will not reproduce [when mated] with another species, and even those that are close in nature and do reproduce, such as mules, will have no issue, since they are infertile (commentary to Leviticus 19:19).

Though formulated largely as a response to Maimonides, Nahmanides' approach has roots in other, earlier Jewish approaches. He was well acquainted with the astrological worldview of Abraham ibn Ezra, for whom he professed "open antagonism and concealed love." According to Ibn Ezra, man is bound within a universe governed by the stars, but he can escape their decrees by linking up to a higher order of reality, one which is above the stars. Nahmanides is much clearer than Ibn Ezra in specifying that this is achieved by observance of the Torah. We are not speaking about a subjective liberation from this-worldly drudgery, that can be achieved by developing the proper spiritual outlook – that would seem to be the view of Ibn Ezra. Instead, at issue here are the rewards and punishments clarified in the Torah: "For man receives no benefit in reward of a commandment nor evil in punishment of a violation unless it be by miraculous action. If he were left to his nature or his [astral] sign, his actions would be of no consequence..." (Commentary to Genesis 17:1). The idea that the natural course of events is astrally governed, or, to put it differently, that someone left to the governance of nature would be subject to the decrees of the stars, was widely held by Nahmanides' followers, and largely identified by them with the lower order governance of the universe.

Nahmanides firmly believes that natural science is severely myopic. Aristotle and his school limited their interest to the sensible phenomena alone. They totally ignored the spiritual dimension of the cosmos and, therefore, had not a clue about the most telling set of operative causal connections: the linkage between human behavior, more precisely, Jewish ritual observance, and sensible phenomena such as rainfall. Revelation and the prophetic tradition teach Jews about this linkage, which is a key element of belief.

This idea fits into an earlier tradition that asserted that Jews have access to a richer body of knowledge than Gentiles. The poet and

philosopher, Judah Halevi, argued it would be wrong to assert that reason (*qiyās*) is the criterion distinguishing Jewish from Greek science. The Greeks came up with "rational" explanations for whatever phenomena they could detect with their senses. Had they been able to visually attest to the miracles performed by the prophets, they would have "explained" them as well; but they cannot be faulted for denying events that they could not possibly witness. This line of thought was pressed by later thinkers. Joshua ibn Shueib, an influential preacher, criticized those who proffer illegitimate, allegorical interpretations of Jewish lore; they err "because they believe only what their eyes see and their senses apprehend. Whatever is beyond intellect or nature, they reject, in the manner of the philosophers. But whoever has belief in his heart... will believe that God creates new things on earth, as the situation or the moment [require]" (Derashot, Beshalah, I, 132). The "Greeks" are not accused of maliciously spreading disbelief; quite to the contrary, they are excused for not including in their theories dimensions or modes of operation of the world that lie beyond their grasp.

Miracles or nature are not the only options for Nahmanides. There exists a third alternative: God may occasionally intervene in a non-miraculous fashion, but rather by manipulating the usual, haphazard course of events (*derekh ha-miqrim*). Such was the case when quail were dispatched in response to the Children of Israel's craving for meat. They arrived in greater than usual quantities, and their descent proved to be a punishment: both of these features are characteristic of miracles. Nonetheless, avers Nahmanides, there was no innovation here in "the nature of the world" (commentary to Numbers 11:19, end). Nahmanides also knows of one nature supervening upon another. At creation, animals were impressed with a vegetarian nature, "and that is the nature that was placed in them permanently." They became carnivorous (and murderous) only with Adam's sin, and this "custom" endures. In the messianic age, animals will revert to their "first nature" (comm. to Leviticus 26:6).

The idea of a higher order gained acceptance among Jewish thinkers who are classified as

philosophers and overall adhere to the Maimonidean path. Here follow applications of the concept in the writings of two such thinkers. According to Jedaiah Penini, the higher mode becomes operational when the Jewish people behave as they ought to. Repentance is one way to activate the higher governance, and, as a rule, the Jews repent only when motivated by a hostile environment. Hence the Jewish people are paradoxically closest to salvation when they are most downtrodden. Repentance places them under divine providence, rather than natural law (*Lashon ha-Zahav*, Venice, p. 15a). Isaac Arama notes that the implementation at times of a higher order, which in effect “robs” the natural order of its governance, does not necessarily mean that there is no fixed natural order. He agrees that there is one indeed, the philosophers are correct in recognizing it and seeing in it a proof for God’s existence; but the Jews are no less well-grounded in finding proof in the miraculous violation of nature. “Just as the customary natural order of reality testifies to the truth of God’s existence, so also the occasional robbing and destruction of its nature proclaims the majesty of His kingship. . .” (Aqedat Yitzhaq, Bo, beginning of ch. 38).

Natural Rights

Rupert John Kilcullen
Department of Politics and International
Relations, Macquarie University, North Ryde,
NSW, Australia

Abstract

From the twelfth century onwards, medieval canon lawyers and, from the early fourteenth century, theologians and philosophers began to use *ius* to mean a right, and developed a theory of natural rights, the predecessor of modern theories of human rights. The main applications of this theory were in respect of property and government.

In medieval texts the term *ius naturale* can mean either natural law or natural right; for the former sense see the entry on ► “[Natural Law](#)” in this volume. Medieval texts sometimes use the term *ius* in a way that seems equivalent to English “a right.” In other modern European languages this sense is indicated by the adjective “subjective” (e.g., *subjectives Recht, droit subjectif*). “Subjective” means that there is a “subject” to whom the right belongs; it does not imply subjectivity in the sense of arbitrariness. Some medieval writers, beginning with the canon lawyers of the twelfth century, refer to certain *iura naturalia*, “natural rights” that belong to human beings apart from any human positive law. They held that some of these natural rights are alienable or able to be overridden by human law, but others (or these same rights) are in certain circumstances operative irrespective of positive law – that is, at least some natural rights are, at least for some circumstances, inalienable. This is the ancestor of the modern idea of human rights, that is, rights belonging permanently to any human being as such, independently of the law or customs of any community.

Meanings of *Ius*, *Dominium*

The canonistic rights vocabulary, like our own, is a rich one. *Libertas, potestas, facultas, immunitas, dominium, iustitia, interesse*, and *actio* can all in the appropriate circumstances be translated as ‘right’. (Charles Reid, quoted Tierney 1997, p. 262)

The key words are *ius* and *dominium*. In medieval Latin *ius* had a number of meanings – according to Tierney (Tierney 1997, p. 115; cf. Tierney 1997, p. 40), the canonist Johannes Monachus listed two dozen. Some were not relevant to ethics and politics (e.g., *ius* in the sense of broth), but those that were include the following: (1) what is just (*id quod iustum est*); (2) a law (also signified by *lex*); (3) a natural innate force or power that leads human beings to act rightly; (4) the innate capacity in *any* creature that leads it to do what the creator appoints; (5) a right.

Sense (3) is seen by the chief authority on this subject, Brian Tierney, as fundamental. He suggests that both natural law and natural right can be

seen as deriving from the innate force of reason (Tierney 1997, p. 65). Huguccio and others who use *ius* in this sense (Tierney 1997, pp. 62–65) seem to echo Cicero (*De inventione* II. liii.160–161, II.xxii.65). According to Cicero, natural law is brought to us by some innate force (*De inventione* II.xxii.65): these canonists referred to this innate force as *ius*. Some identified it as reason, some as free will, and some as *synderesis*; in any case, it is the ability to distinguish between good and evil. Clearly *ius* in this sense is not a law or a right but a rational agent’s power of moral discernment.

Sense (4) seems to be related either to sense (2) or to sense (3). It is either a law or a power that directs nonrational agents to act as God intends. Roland of Cremona says that in a spider is a *ius* that leads it to spin a web (Crowe 1977, p. 117). Gerson says that the sun has a *ius* to shine (Gerson 1960–1973, Vol. 3, p. 142). Summenhart and Vitoria sometimes follow Gerson’s usage (Tierney 1997, p. 248; Brett 1997, p. 126). Gerson did not mean to attribute *rights* to irrational creatures. He goes on to say of *ius* that “it is taken more narrowly by those concerned with politics, so that *ius* is said only of things that belong to rational creatures” (Gerson 1960–1973, p. 142). The idea that God has given *all* creatures an inclination toward their appointed ends is equivalent to Thomas Aquinas’ doctrine that creatures participate in the eternal law, but, as Thomas explains (ST q.91 a.2 ad 3), there is no natural law in irrational creatures except by a similitude. To translate this sense of *ius* as “a right” seems inappropriate, since it has no implication of duty, rights, or other moral qualities, which all agreed belong to rational beings alone.

Sense (5) is uncommon in Thomas Aquinas (though it is not entirely absent; see Hering). This has led some historians to look for a “watershed” after Aquinas in the use of *ius*, a time at which it first began to mean “a right.” According to Michel Villey, Ockham was the first to use *ius* to mean a right, according to Richard Tuck it was Gerson. However, Brian Tierney has shown that *ius* was used in this sense by canonists from as early as the twelfth century, and that the theologian Hervaeus Natalis and the philosopher Marsilius adopted the lawyers’ usage before Ockham

did. Thus Ockham was not the originator of the concept of subjective right, though, as will be seen below, he seems to have been the first to have constructed a political philosophy based on natural rights.

The term *dominium* also had many senses. On the meaning of *dominium*, *dominare*, etc., in the fourteenth century (including in natural science) see Ockham, OND 2.262ff. Four senses are worth noting: *dominium* may mean (1) the mastery a rational being with free will has over his or her own actions, (2) rulership (e.g., a king's rulership), (3) ownership over things (*proprietas*), and (4) the mastery Adam and Eve had in the state of innocence over other creatures. Sense (4) was sometimes called "original" *dominium*, and by analogy with this some wrote of evangelical *dominium*, beatific *dominium* and other kinds enjoyed by particular categories of people.

Only beings with *dominium* in sense (1) can rule themselves by law or possess rights, but this *dominium* is not itself a right. Rulership and ownership are rights or objects of rights: a king has a right to his *dominium*, an owner has a right to his property (*ius domini*). In sense (3) *dominium* meant, originally, possession of and complete control over a thing. Such *dominium* implies the exclusion of others. *Dominium* was distinguished from more limited rights such as usufruct, just as we would distinguish ownership of a house from tenancy. In Justinian a *dominus* who granted usufruct to another retained only "bare" *proprietas* (*Inst.* 2.4.1) and enjoyed *dominium proprietatis*, but in medieval usage, at least among theologians, *proprietas* was synonymous with *dominium* in sense (3).

On the question whether every *ius* is a *dominium*, see Tierney 1997, pp. 243–245, 260), and Brett (1997, pp. 34–40, 128–129, 149–150).

Natural rights were usually referred to as *iura naturalia*, but there were occasional references to *naturale dominium*.

The Chief Natural Rights

A full-fledged medieval natural rights theory (for example, as presented by Ockham – see below) consisted of two elements: a treatment of property

rights, and a treatment of political rights. Whether property itself was a natural right was disputed; theologians generally said that property was not natural but a creation of human positive law; lawyers generally said that property, or at least some kind of property, existed by natural law. But it was generally agreed that every person has a natural right to self-preservation and hence a natural right to use things – in a situation of necessity even things belonging to another. Medieval writers postulated other natural rights with important implications for politics. They held that everyone has a natural right to self-defence. Like the right to use things to sustain life, the right of self-defence was seen as implied by the natural law duty to preserve human life, one's own first of all. Another natural right with political implications was the right to freedom. The right to use things, the right to freedom and the right of self-defence were included in Isidore's statement of natural law: "the common possession of all things and the one liberty of all. . . and the repelling of force with force" (quoted Gratian, I dist.1 c.7, Friedberg, Vol. 1, col. 2).

Property and the Right to Use Things

Although Isidore says that natural law includes "the common possession of all things," he also says that it includes "the acquisition of things taken from air, sea, and sky, the restitution of an article given in trust or money loaned"; and one of the Ten Commandments is "Thou shalt not steal," which shows that property is approved by God. Some held that common possession existed only in the state of innocence and had been superseded when property was instituted after the Fall. However, according to the canonist Huguccio and many others the original common possession still holds, in the sense that in time of need the better-off are obliged to share their means of sustenance with the poor, who commit no theft if they help themselves (Tierney 1997, pp. 72, 73, 139).

According to Thomas Aquinas, human beings have a natural lordship (*naturale dominium*) over useful external things, because by reason and will we are able to use them (ST 2-2 q.66 a.1). This *dominium* is not ownership, which is the topic of

the next article, but an extension of *dominium* in sense (1), that is, it is an exercise of free choice, as in 1-2 q.1 a.2; man has natural lordship in the sense that he can use things at his choice (Compare 2-2 q.66 a.1 ad 1). In the next article (2-2 q.66 a.2) Thomas asks whether it is licit to possess something *quasi propriam*, that is, as being one's own, to the exclusion of others – that is, whether property is licit. He answers that it is (for the reasons given by Aristotle), but one must be ready to share one's property with others, especially in time of need. A poor person who takes another's property in time of need is not guilty of theft (2-2 q.66 a.7).

Discussion of property and the right to sustain one's life by using things intensified with Pope John XXII's attack on the Franciscan claim that they had renounced all legal rights and used food and other things only by "simple use of fact," without ownership. According to Bonaventure (*Apologia pauperum* 1269: 312, followed by Pope Nicholas III, *Exiit qui seminat* (1279), Friedberg, Vol. 2, col. 1113), the Franciscans renounce property and other rights, but since life is impossible without use of external goods, and self-preservation is a duty, "no profession may ever be made that renounces entirely the simple use of temporal goods." This answers the objection that complete renunciation of property is suicide (Bonaventure: 323, Nicholas, col. 1113). In his attack on the Franciscan position, Pope John XXII argued that no one can justly consume something without owning it. He was answered by various writers, including Bonagratia of Bergamo and Marsilius, who argued that one can justly use another's property, without acquiring it as one's own property, if the owner gives permission. To this the Franciscans' opponents replied that permission confers a right, indeed (in the case of consumables) a right of ownership: to give permission to use a consumable is to hand over property in it. To consume with the owner's permission is therefore incompatible with the Franciscan's claim to have renounced all rights.

Ockham in the *Opus nonaginta dierum* distinguishes between natural rights and positive legal rights (OND 65.35), and he claims that an owner's permission does not confer a legal right, or any

new right, but merely "unties" the original natural right to use things. Like Alexander of Hales, Bonaventure, and Scotus, Ockham says that in the state of innocence property would have been contrary to natural law but after the Fall became permissible and in most circumstances obligatory. After the Fall, human communities have the right to enact positive law establishing the institution of property. The right to establish property is said in OND to be from natural law, supposing the circumstances of the fallen state (OND 92.16–45: 439), in *Breviloquium* it is said to be from divine positive grant (Brev. iii.7.35–36: 179); but in both works Ockham holds that the original right to use things to sustain life is a natural right. After the Fall, once human positive law has established property, the original natural right is "tied" but not abolished. Anyone can use any unappropriated thing, anyone can use anything necessary to sustain life in a situation of extreme necessity, and, even outside a situation of necessity, anyone can use another's property with the owner's permission. An owner's permission does not necessarily confer any legal right – it does not necessarily confer the "right to use" that is a legal right. (It is important here not to confuse the *usus* and *ius utendi* (OND 2.127ff, 2.155ff) that are legal rights with the "simple use of fact" to which a legal right is not necessarily attached (OND, 6.268–270).) In some cases permission is intended to grant a legal right, and may be accepted in that sense; but an owner may give – using a term Ockham does not himself use – "bare" permission, without conferring any legal right whatever, so that if the permission is withdrawn, for any reason or for none, the beneficiary may not complain and cannot take the owner to court. Bare permission is the only kind Franciscans accept. The Franciscans' use of things, outside the situation of necessity, rests upon the bare permission of owners. This is true even of the use of consumables: though by use a consumable ceases to exist, the friars can with permission consume things, just as slaves, children, guests, and others may consume food and other things that continue to be the householder's property as long as they exist (OND 4.255ff). The permission that does not confer a legally enforceable right

merely unties the original natural right to use things, and this right is enough to make the use just. (On all this see OND Chaps. 64 and 65.)

Later theologians were not much interested in “simple use of fact,” but otherwise their view of property was like Ockham’s: in the state of innocence every person had the natural right to use anything; this right is now restricted by property, which is an institution of positive human law; but one can use another’s property with the owner’s permission, and in a situation of necessity the original natural right revives so that helping oneself without permission is not theft.

Political Rights

When Ockham’s conflict with Pope John led him to questions about the constitution of the church and the relationship between church and secular government, the notion of natural rights was again central to his thinking. In a number of places (OND 88.308–310, Brev. iv.10.54–58, 3.1 Dial. 2.28, 3.2 Dial. 3.6) Ockham invokes the canon *Ius civile*, a text in which Isidore explains the meaning of the term “civil law”: “Civil law is the law proper to itself that each people or city establishes, in accord with divine and human reason.” Ockham interprets this not merely as the explanation of a term but as an assertion of the right of each people to establish for itself a law and a government and to elect its own ruler. (“People” here does not mean what it meant for nineteenth century nationalists. It means human beings living in some locality or region who have common interests, for example, in peace; see OQ iii.1.66–70.) These natural political rights are said to be given “by God and nature”; they are not given by God through positive divine law, but through the law of nature (which is divine law in a broad sense). “Law of nature” is here understood in the third sense, that is, natural law on supposition (see the entry on ► “Natural Law” in this volume). The natural political rights have application even to the government of the church. For example, the Christians of Rome have a natural right to elect the pope (3.2 Dial. 3.6–7). Although by Christ’s institution monarchy is the normal constitution of the

church, there may be situations in which Christians have the right to vary the ecclesiastical polity at least for a time – for example, there may be situations in which different parts of the church have the right to appoint heads not subordinate to a pope (3.1 Dial. 2.20–28).

Independent rulers hold power “from God alone” in the sense that regularly they are answerable to God alone, but rulers receive their power from the people and on occasion can be corrected or deposed by their subjects, or even by an individual subject (Brev. iv.6). Rulers have a (positive) right to their rulership, so that they cannot be replaced except for misconduct (Brev. iv.13). Hence the right to establish law and government can be exercised only by a people with no superior, i.e. a people not already under government (3.2 Dial. 3.6). Ockham accepted the view of the Roman lawyers that when the Roman people transferred their power to the first emperor, they also gave the emperor and his successors power to provide for the succession (OQ, viii.4.218–236: 193–194; Brev. vi.2.31–8:251). Similarly, the Christians of Rome, who have a natural right to elect the pope, may have transferred the right of election to others, for example, to the cardinals, or in some cases to the emperor (3.2 Dial. 3.6–7). Which rights are given to the ruler and which are retained by the people, and what is the constitution of the government, varies from one community to another (3.2 Dial. 2.29; OQ v.6.56–61:159–160). However, just as in situations of necessity an owner’s positive rights may be overridden by the right to use, so if government breaks down, or if the ruler becomes a tyrant, the people’s natural right to provide themselves with government and law revives and they may depose one ruler or regime and establish another. In view of the possibility of breakdown or tyranny, a ruler should not have so much control that he can evade correction – it is unnecessary, indeed dangerous, for everyone in the state to be subject in every case to one supreme ruler (OQ, iii.3.34–39).

Even in normal situations, the rights or powers of a ruler, even of pope and emperor, are limited by the rights of subjects, not only by the right to replace a tyrannical ruler but also by other “rights and liberties.” Ockham does not specify these in

detail. The ruler's power is obviously limited by the natural rights of subjects. Ockham takes this pretty much for granted, since no one claimed that rulers have power superior to natural law. His main contention, in regard to both popes and secular rulers, is that their power is limited not only by divine and natural law and natural rights, but also by positive rights and by natural and positive liberties. The pope's power is limited by the freedom Christians have under the gospel, which is a "law of liberty" (Brev. ii.3, 16–18); the secular ruler's power is limited by the freedom which (not all but most) subjects have because they are not slaves but free – the freedom of subjects is necessary to the best form of government (OQ iii.4, 6; 3.2 Dial., 2.26–28). The indefiniteness of the array of rights and liberties may well be deliberate; perhaps Ockham did not need, or wish, to set out a purportedly complete list. The conception of the subjects' rights and liberties is given content by two things: first, by tradition – the rights and liberties people have had since Roman times should be respected unless there is some good reason why not (Brev. ii.16.12–13:142–143); and second, by the notion of the common good – rulers must aim not only at their own good, but at the good of all the members of the community (OQ iii.4.7–14:103).

Ockham's accounts of the right to use, the right to property, the rights of rulers and the rights and liberties of subjects make no reference to the difference between Christian believers and unbelievers. Political rights belong to all human beings. The empire of the pagan Romans may have been established at first unjustly, but later the subjected peoples came to consent to government by the Romans and this made it legitimate – Christ himself acknowledged its legitimacy (Brev. iv.9–11, 3.2 Dial. 1.27). The Christian Roman emperors and other Christian rulers succeeded to the political rights of their non-Christian predecessors (Brev. iii.5). Against those who assert that all *dominium* belongs to the church, Ockham argues explicitly that unbelievers have rights under both natural and positive law (Brev. iii.2–6, 8, 12, 13). Some medieval writers, notably Giles of Rome and John Wyclif, denied that unbelievers (or sinners, or the reprobate) had rights,

but, like Ockham, most theologians rejected this view. When the Spaniards invaded South America the property rights, and other rights, of the Indians were asserted by Vitoria and Las Casas and others (see Tierney 1997, p. 255ff).

Theories like Ockham's were put forward by many later medieval writers. The leaders of the Conciliar movement studied Ockham (d'Ailly, for example, produced an *abbreviatio* of Ockham's *Dialogus*) and were also influenced directly by the canonist tradition that had influenced Ockham (Tierney 1955). Gerson's conception of a body whose members had individual rights prior to any enactment by that body, rights that include a right to self-defense and also certain "political" powers (Tierney 1997, pp. 220–225), echoes both Ockham and the canonist tradition. The political theory of Locke's *Second Treatise* has obvious similarities with Ockham's; the Conciliarists are the most likely medium of transmission of fourteenth century ideas into the seventeenth century (see Oakley).

Though the general architecture of natural rights political theory did not change much, if at all, after Ockham, later writers made interesting contributions. Vitoria, de Soto and Suárez extended and strengthened the natural right to freedom. In defending the rights of the Indians, Vitoria followed Scotus (Flüeler, Vol. 1, pp. 75–81) in rejecting, or greatly modifying, Aristotle's doctrine of natural slavery: the less intelligent may need leadership, but it is unjust to subordinate their interests to the interests of the intelligent. Aristotle did not mean "that it is lawful to seize the goods and lands, and enslave and sell the persons, of those who are by nature less intelligent" (Vitoria 1991, p. 251). Even if it were true, as Spaniards allege, that the Indians are less intelligent, they have a right to their property and to their freedom. Vitoria reflected on the duty or right of self-preservation and argued that the duty of self-preservation leaves an individual free in some cases to accept his own death for the sake of others (Tierney 1997, p. 299). De Soto says that an individual is not bound to preserve his own life at the cost of great pain, for example, by undergoing amputation (Brett 1997, p. 161). In attributing to individuals

some choice in respect of their own survival (though not to the extent of approving suicide) these authors are acknowledging a natural right to freedom that is not merely an implication of natural duties. Similarly Suárez (II.xiv.15–16, Vol. 4, pp. 32–34; cf. Tierney 1997, p. 306) tried to strengthen the foundations of freedom and the right to use things to sustain life by postulating that these rights pertain to natural law “positively,” that is, not merely in the sense that natural law leaves these open as possible choices, but in the sense that there is a presumption in their favor, so that they cannot be abolished without good reasons.

The Definition of Rights

Hervaeus Natalis, Marsilius, Ockham, Gerson, and many others give substantially the same definition of a right, namely, that it is a licit power to do something (or a power licitly to do something). Some writers substituted for “power” some other term – for example, *facultas* (Gerson), *auctoritas* (Summenhart) – but the meaning is the same. (For illustrations see Ockham, OND 2.127–129, 6.170, 6.269–270, 61.46–50, 65.273–275; Tierney 1997, pp. 106–107, 210, 246, 293.) The power to “do” something covers also inaction and claiming (claiming is an action). There is no trace in medieval texts of the idea found in some modern writers that the beneficiary of another’s duty *eo ipso* has a right to that benefit – for medieval writers a right is a licit power of action, implying a choice to exercise the right. Ockham sometimes gives a more elaborate definition of a legal right: “a right of using is [a] a licit power of using an external thing [b] of which one ought not be deprived [c] against one’s will, without one’s own fault and without reasonable cause, and [d] if one has been deprived, one can call the depriver into court” (OND 61.46–50). Point (a) applies the generic definition of a right as a licit power to do something, (b) indicates the duty other people have in relation to rights, (c) indicates circumstances in which the right may be alienated or cancelled, and (d) is the specific difference of a legal right.

What sort of reality can a right be? A right clearly cannot be a passive power (like the potentiality of brass to become a statue). Neither can it be an active power (like intellect or will, or the power of fire to boil water), since one can have a right to do something without having any causative or “agent” power to bring the act about – we may not be physically able to do what we have a right to do. Several theologians, including Peter John Olivi, John Mair (Maior), and Konrad Summenhart, reflected on the metaphysical status of rights (see Tierney 1997, pp. 39–40, 240–241, 245; for Olivi see also Doyle, Boreau). According to Olivi, a right cannot be an accidental essence added to the person whose right it is. This is proved by many arguments, including the following: the person who confers the right may be at a distance, or the concession may be for the future or may be conditional on some future event; no created agent can produce real effects in such ways (Olivi in Boreau: 318–319, 326). The only reality in a right consists in God’s will together with the created things he wills to be related by the right and the intermediaries through which he wills the right to be assigned (Olivi: 323–324). In denying that a right adds anything real to the right-holder, Olivi seems to be right: possessing a right does not help anyone actually to effect what they have a right to do. It would seem better to say that “power” here means what it means in such expressions as “legal power” or “constitutional power” – that is to say, when someone has such a power and he or she “can” exercise it, his or her action will not be (morally, legally, or constitutionally, as the case may be) wrong. In the definition of a “right” *potentia* contributes nothing; the word that conveys the meaning of “a right” is *licite*. To say that someone has a right is to say that a certain kind of action, if they choose to do it, will (ordinarily) be licit, that is, right, not wrong, permissible.

In any case, there is no conflict between the (at least purported) “objectivity” of morality or natural law and the ascription of “subjective” rights. On any view of morality, it will be true that in some cases some persons can licitly do or claim certain things. Morality prohibits some things and commands others, but it also implies

that for some persons in some circumstances some acts (at least acts commanded and the opposites of acts prohibited) are permissible: that is, it implies that some persons have a right (a “subjective right”) to do or omit certain actions. Some have believed that Thomas was right not to use *ius* in the sense of subjective right because the ascription of rights to individuals is a betrayal of the objectivity of morals. This is a mistake: there is no incompatibility between moral objectivism and the ascription of subjective rights.

The Origin of Rights

Since Michel Villey, historians have focussed on the question: Did medieval thinkers develop a theory of rights comparable with modern theories, and if so when? Historical research has therefore been guided by conceptions of what counts as a right in the modern sense, and therefore by various philosophical suppositions, some of which have been misleading. Some have argued that medieval theories of rights were not equivalent to modern theories because the latter put more emphasis on choice, freedom, and individual sovereignty.

Since a right relates to a “kind” of action or claim, and since acting or claiming involves choice, to say that a right marks out an “area of choice” is a truism. Exercise of a right may be a duty (e.g., the rights that go with a role), but even then exercise is a matter of free choice, since one can always choose not to perform one’s duty. Every list of rights and duties, indeed every moral code of whatever kind, is addressed to persons who have freedom of choice. Freedom in another sense (not freedom of choice, but freedom from obligation) is what is left after duty, and the shorter the list of socially enforced duties the greater the individual’s freedom in this sense. The medieval list was not all-embracing, and therefore there was freedom in this sense during the Middle Ages – though certain kinds of freedom, for example, freedom of religion, were not as well recognized as they have been since. It is not true that medieval rights were for the sake of duty while

modern rights are for the sake of freedom; both kinds of rights have been recognized both in the Middle Ages and in modern times. Both kinds are rights in the same sense of the word – in every case, to say that one has a right to do or claim something is to say that the action or claim is permissible. If it is also a duty, the point of describing it as a right is to remind potential opponents that one must be permitted to do one’s duty. Both kinds of rights impose duties (different duties) on other people, but only if the right-holder or his or her representative chooses to exercise the right. Finally, it is not true that the modern, in contrast with the medieval, conception of a right attributes “sovereignty” to the right-holder. On either the modern or the medieval view, a person’s choice to exercise a right imposes on others certain duties, but these duties are determined by the moral or legal code and merely triggered by the right-holder’s choice to exercise the right; they are not legislated by the right-holder.

Nicholas Chamaëtos Kabasilas

Georgi Kapriev

Faculty of Philosophy, Sofia University
St. Kliment Ochridski, Sofia, Bulgaria

Abstract

Nicholas Chamaëtos Kabasilas (1319/1323–1397/1398) is considered as one of the greatest theologians of the Middle Ages. His work is based on the tradition of the Eastern Church and on the teaching of Gregory Palamas and, along with that, he tried to achieve a synthesis of the two traditions: the eastern and the western one. Kabasilas owes his place in the Christian theology mainly to his sacramental teaching. The life of men is nothing else but life in Christ, which is mainly achieved by free sacramental participation.

Biography

Nicholas Chamaëtos, who took his mother's name Kabasilas, was born in Thessaloniki between 1319 and 1323. He started studying by his uncle Neilos Kabasilas – one of the most active Palamites – and received in Thessaloniki and in Constantinople a brilliant education. During the 1340s he came to Constantinople, where about 1345 he drew closer to the emperor Kantakouzenos' court and occupied various offices. Thanks to his classmate and friend Demetrios Kydones, he got acquainted with Thomism. In 1347 he accompanied the newly elected metropolitan Palamas to Thessaloniki and Athos. Presumably in 1353 he was among the candidates for patriarch, in spite of his being a layman. In 1354 he withdrew from public life. At that time appeared his main works: *Explanation of the Divine Liturgy* and *The Life in Christ*. Once more in the 1350s he wrote a polemic text against Gregoras, an anti-Latin text consistent with the tradition (an introduction to his uncle's works), as well as the treatise on the value of reason and against skepticism. There is no further evidence about his life except for the presumable fact that in 1387 and in 1391 he wrote two letters to the emperor Manuel II. Perhaps Kabasilas died in 1397 or 1398. He was acclaimed a saint in 1982.

The Teaching

In his treatise on the value of reason, one can ascertain the influence of Thomas Aquinas. Here Kabasilas introduces an anti-skeptical debate and undertakes to defend the power of the human ability for knowledge and of the human morality. His optimistic theory of knowledge, which represents a revised Christian version of the Aristotelian one, enters into polemics against Gregoras' epistemology and also – although not explicitly – against the more radical formulations of the Palamite position concerning secular wisdom. Human perfection is defined on the basis of knowledge (in virtue of the *nous*) and of love (in virtue of the disposition of the will – *gnomē*). But

in this state man can be perfect only in love and not in respect of knowledge. Nevertheless, he stresses the high value of secular knowledge. The rational knowledge which grasps being qua being, guides and controls the sphere of the irrational. The same position Kabasilas represents also in his writing *Against Pyrrhon*.

These views are also to be found in his main works. It is noticeable that he opposes the view according to which the life of the monks is the only true life in Christ. For him the mystical attainment is not a sufficient condition for getting near to God. He brings to the foreground the constant presence of Christ in his Grace. Both writings are meditative texts and not theological or philosophical treatises. The argumentation is directed not only against intellectual mysticism, but also against dogmatic formalism. Kabasilas stresses the value of existence in Christ, that is, in the one power and energy of the Trinity, without thus undermining Christ's transcendence. Spiritual life and the life of man in general can be nothing else but the life in Christ. On this basis he constructs his entire doctrine: the Christology, the anthropology (together with his expressive mariology), the ecclesiology, and the sacramentology. Kabasilas maintains an uncompromising Christocentrism, whereby he speaks of no other kind of life, apart from the liturgical and sacramental one. From this perspective it is still very important to him to demonstrate in detail the joint action of the free divine and human activity. While the first five books of the work *The Life in Christ* are devoted to the divine activity, the other two deal predominantly with human action, whereby the emphasis on the spiritual Jesus-prayer is noticeable. Kabasilas is considered as "the great theologian of Christian freedom" who binds the perfection of the latter with the divine "sonship," that is, the participation of the "adopted sons" in the divine nature.

In Kabasilas' work one can notice a reception of *Cur deus homo* of Anselm of Canterbury. In fact, he speaks about a "satisfaction" (*hikanopoiesis*) in the sense of "recreation" (*apokatastasis*). The justice of God generates the divine justification (*dikaiosis*), the justice coinciding with the love,

the wisdom, the peace – through those three God is in relation with mankind. Man was wounded by nature and the suffering of Christ is the healing of this wound. Christ reintegrates the divine image in the human nature. This is his justice and through the paschal mystery he himself restores its original beauty. The new life is the life in Christ, the ecstatic love of God toward men and of man toward God. This justification does not simply happen in the order of morality but on the ontological and personal level. Christ is the center and the goal of the universe, he is the cosmic synthesis of the created and the uncreated. The entire economy, based on the Incarnation, is no historical coincidence called forth by the Fall, it is a realization of the divine plan. History is a function of the Incarnation. Christ is Head not only of the Church but also of the whole mankind. Man is part of Christ and can exist only by virtue of and through this fact.

Kabasilas owes his place in Byzantine theology mainly to his teaching on sacraments. For Kabasilas the sacramental theology summarizes the entire religious experience. The enlightenment through the mysteries of Christ is the central point and the beginning of the life in Christ. The sacraments are bearers of the uncreated divine energies, that is, of the uncreated life of God, which fills up the believer and calls him anew to life. Kabasilas discusses more closely three sacraments: baptism, anointment, and the Eucharist. Baptism relieves man of his serving to Satan and endows him with the ability to be active in the field of the spiritual energies. In baptism is received the being, while during the anointment – the *energeia*. The anointment allows the new “spiritual senses” to grow. The Eucharist stays in the center of the human life. This is the perfection and the synthesis of all sacraments. In the Eucharist Christ grants His energy and renders men gods, although not according to the essence. In the Eucharist Christ bestows himself and men live the same life with Christ. The divine energy is denoted as acting love, which is identical with divine life.

A debatable point today is the attitude of Kabasilas toward Palamism. The views vary between elucidating his spiritual identity with Palamas and defining him as anti-Palamite, by

which his stated engagement in Palamism is claimed to be of merely political nature. Indeed, Kabasilas does not tackle in particular the distinction between divine essence and energy and, in general does not confine himself to the conventional Palamite issues. This fact however gives no reason for the attempts to rank Kabasilas among the cryptoanti-Palamites. Palamas himself in his last period hardly mentions the famous distinction and deals predominantly with the issues of the Incarnation, the Salvation, and the sacramental participation in the grace. Nevertheless, the teaching about God’s energies stays in the background of all his statements. In the main works of Kabasilas the fundamental Palamite theses are available. Kabasilas’ christocentric sacramentalism is close to the teaching of Palamas, but he manages not to enter into the already commonplace problems. He demonstrates a way, which starts from Palamas without completely confining to him.

In these writings Kabasilas is neither scholastic nor yet polemic. His conduct as an author is perfectly autonomous. Kabasilas seeks for a synthesis of the two traditions: the eastern and the western one, and presents the common spiritual heritage of both great traditions. Aside from the new historical and intellectual situation was his position “old-fashioned”; it was simply non-schismatical. His failing to achieve a new systematic synthesis because of accidental circumstances does not change the fact that he remains among the most meaningful theologians of the East, nor does it cancel his remarkable acceptance in the West. It is hardly a coincidence that the Council of Trent adopted his teaching on sacraments as his one original *theologumenon*.

Nicholas of Autrecourt

Christophe Grellard

Philosophy, University of Paris 1 Panthéon-Sorbonne, Paris, France

Abstract

Nicholas of Autrecourt (c. 1300–1369) was one of the most important Parisian Masters of Arts of the fourteenth century. He is best known for his alleged skepticism, which has led many medieval scholars to call him the “Medieval Hume,” and for his radical atomism. Unfortunately, the condemnation of his work in 1347 stopped his thought from having any real influence in the late Middle Ages.

Nicholas was born in the village of Autrecourt, Lorraine, c. 1300, and he was a student at the Faculty of Arts in Paris during the first quarter of the fourteenth century. He graduated around 1317 from the University of Paris, after which he was a bachelor of civil law, probably at Orleans. He came back to Paris around 1326, where he was both a student at the Faculty of Theology and a professor at the Faculty of Arts. In 1331, he became member of the College of Sorbonne, where he was prior in 1333. He lectured on the *Sentences* between 1335 and 1336, and probably obtained his license in theology before 1339. He was then summoned to Avignon in 1340, after some envious colleague had submitted a list of suspect theses that he had held. He was retained there until 1346, which is the date of his conviction. As a consequence his writings were burned, and Nicholas was banned from teaching. After this, he moved to Metz, where he received the benefit of Canon. He died in 1369 as Dean of the Chapter. Because of this conviction, he leaves us

with very few writings. The main source of information is an unfinished treatise called *Tractatus utilis ad videndum an sermones peripateticorum fuerint demonstrativi*, of about 100 pages, named after his incipit: *Exigit ordo*. A few fragments of correspondence with Bernard of Arezzo OFM and a colleague of the College of Sorbonne, Gilles van Faeno, supplement this work. Finally, we have also a disputed question on the beatific vision, which gives us a glimpse of a new epistemological conception of theology that developed in the later Middle Ages and in which Nicholas was involved. The condemned articles also contain extracts from his teaching, but they remain difficult to interpret out of context.

The philosophy of Nicholas of Autrecourt is essentially critical. As he notes in the prologue of the *Exigit ordo*, he condemns his Art Faculty colleagues who merely comment on and repeat Aristotle and Averroes without going to things themselves. Nicholas' philosophy, such as it has reached us, seeks to establish the conditions for an alternative to the Aristotelian school philosophy. From this perspective, Nicholas proposes first a fallibilist epistemology that seeks to accurately assess the degree of certainty that could be claimed by a theory, and second an atomistic and mechanistic natural philosophy that is contrary to Aristotelianhylomorphism.

Nicholas' epistemology aims to assess the strength of the arguments advanced by his opponents, whether Aristotelian or Scotist. Its approach is normative insofar as it aims to determine which theories can claim to be demonstrative, which ones are to be regarded as sufficiently evident to be qualified as knowledge, and which ones are mere fictions and can be shown to be fallacious (see on this topic the two prologues of the *Exigit ordo*). The highest level of epistemic justification is that of evidentness, which is twofold, namely incomplex and complex. Complex evidentness first of all applies to the first principle, that is, the principle of noncontradiction. For Nicholas of Autrecourt, any evident proposition must in the last analysis be clearly reduced to this principle. Thus, more generally, an analytic proposition (*per se nota*) can be said to be evident only if its justification rests on the principle of

noncontradiction, and there are hence no degrees of evidentness, since all evidentness is based on this first principle. Nicholas' perspective is explicitly foundationalist. From the first principle and any analytical propositions, a transfer of evidentness is possible if some rules are respected. If a consequence is evident (which is a superior requirement of simple validity), it is a necessary and sufficient condition that the signification of the consequent is partly or wholly included in the signification of the antecedent, that is to say, that there is a connection of signification or meaning between the antecedent and consequent. Thus, the consequence "a house exists, therefore a wall exists" is evident, while the consequence "an accident exists, therefore a substance exists" is not, unless we assume that the notion of substance is contained in the definition of the accident, but then we make the fallacy of begging the question in assuming what we want to demonstrate. Besides these propositions, a certain number of our perceptions can be claimed to be evident. Nicholas argues for the idea that all complete appearances, also called appearances in full light (*apparentia plena, apparentia in pleno lumine*) are evident. He develops, therefore, a theory of veridical perception that implies a relationship of conformity between a mental act and an external thing. A relationship that requires both that the thing actually exists, *per se*, and that it is perceived by the external senses. Conversely, in the case of incomplete appearances, which include among others sensory illusions, the appearance does not end in the thing itself, but only in an image of the thing. In the first case, such appearances give rise to correct judgments, which will allow for the eventual correction of any incomplete appearances.

Below the level of evidence is the level of clear knowledge, which is characterized as the knowledge that leads to assent, without being evident, that is to say, to absolutely exclude any risk of error. The last degree of justification, finally, is that of the probable. One must not misunderstand the status of probability, it is indeed knowledge. Unlike most medieval thinkers, Nicholas of Autrecourt does not make evidentness a necessary condition for knowledge. Sufficiently argued

propositions, justified by reasonable proofs such as an argument for convergence, or by partial experiences such as induction (based on a number of complete and evident singular experiences, and generalized by our disposition to conjecture, *habitus conjecturativus*) are only probable, but are nevertheless knowledge if they are more probable than the opposite propositions. This is an essential criterion, and hence probable knowledge is always relative to a context (temporally determined), and in this context, it must be non-contradictory and more argued than its opposite.

Armed with these epistemological principles, Nicholas tries to show that the Aristotelian and Scotist philosophies are not evident (fully justified), but only probable. Given this, it is legitimate to seek an alternative to these systems by proposing an alternative theory at least as likely. All of Nicholas of Autrecourt's natural philosophy and metaphysics are motivated by an intuition about the eternity of the world. In this perspective, Nicholas develops a universal and coherent atomistic vision of the world. There is no generation and corruption in the sensible sublunary world. All that we can perceive are the appearance and non-appearance of things, the tangible facts that something presently exists, whereas before it did not exist, and afterward it will cease to exist. However, to realize this fact, the mere local motion of atoms is enough. Generation is nothing else than the aggregation of atoms, while corruption is their separation, and alteration is the removal of some atoms. Nicholas takes this fundamental axiom from Democritus, as Aristotle presents him in several of his treatises on natural philosophy, and the *mutakallimūn* criticized by Maimonides in the *Guide for the Perplexed* (Ch. 72). He, however, strongly modifies these sources in interpreting the atom from a qualitative perspective. This is the price of mixing Democritus' view of the atom with Anaxagoras' *homeomeron*. Hence there are white atoms, atoms of flesh, etc. that determine the discernible structure of the atomic compound. However, alongside these accidental atoms whose removal does not cause the alteration of the compound, there are atoms that are essential parts and whose removal will destroy the

compound. Finally, the soul is an atom that plays a similar role as a magnet attracting and holding the atoms, and Nicholas qualifies this as a formal principle. These atoms are indestructible and eternal. They are sometimes called *vera entia*. From this qualitative understanding of the atom and a mechanistic theory of local motion, he tries to account for all natural phenomena. Thus, the local motion of a body is merely the movement of atoms from one indivisible space to another, and the rest of these atoms explain the difference in speed. Similarly, the increase and decrease, and the phenomena of densification and of rarefaction of gases and liquids can be explained by the presence of an interatomic void, inside the compound, which may increase or decrease, allowing the arrival of new atoms, or excluding certain atoms from the compound. But it is mostly at the level of psychology and anthropology where the atomism of Nicholas of Autrecourt proves to be innovative, highlighting his vision of a totally atomistic nature.

Nicholas of Cusa

Thomas M. Izbicki

Alexander Library, Rutgers State University of New Jersey, New Brunswick, NJ, USA

Abstract

Nicholas of Cusa produced, in *De concordantia catholica*, a synthesis of medieval ideas on hierarchy, representation, consent, and reform. He later gave up support for the Council of Basel (1431–1449) for loyalty to the pope but without abandoning his interest in reform. His unique metaphysical ideas, especially “learned ignorance” and “coincidence of opposites,” were developed after Cusanus left Basel, and they continued being refined until he died in 1464.

Life and Works

Nicholas of Cusa or Cusanus was born to a family of comfortable but middling means at Kues (*Cusa* in Latin) on the Moselle River in 1401. A common German version of his name is Nikolaus Krebs. He already was a cleric of the archdiocese of Trier when he studied at the University of Heidelberg in 1416. In 1417, he moved to Italy and studied canon law at the University of Padua, receiving his doctorate in 1423. Cusanus pursued further studies at the University of Cologne, becoming acquainted with Heymeric of Camp and, through him, with the works of Ramon Llull. He also practiced law and searched for previously lost classical and patristic manuscripts. Cusanus attended the Council of Basel (1431–1449) beginning in 1432 as the representative of his patron, Ulrich von Manderscheid, one of the claimants to the vacant archbishopric of Trier. His case for Ulrich's promotion was not successful, but Cusanus attracted attention for his writings on issues of theology and reform. He also became dean of St. Florin in Koblenz, where he preached his first recorded sermons.

While present at the Council of Basel, Cusanus took part in negotiations with the Hussites of Bohemia, arguing in published letters (1433) that they should follow established practice in administering communion, instead of demanding that wine, not just bread, be given to lay communicants. He also wrote a *Libellus de maiori auctoritatis concilii* (*A Little Book on the Preeminence of the Authority of a Council*), which, with its treatment of the authority of church councils, reads like a draft of his larger and more famous work on church and empire: *De concordantia catholica* (*On Catholic Concord*), completed by 1434, a synthesis of ideas on institutional issues balancing hierarchy with representation and consent, papacy, and councils. This treatise remained useful to critics of the papacy long after Cusanus left Basel and became an agent of Pope Eugenius IV (1431–1447). Cusanus became close to Cardinal Giuliano Cesarini, the papal legate to the council, who tried to reconcile pope and council, especially in a dispute over the seating of presidents of the Basel assembly appointed by Eugenius. In 1434, Cusanus wrote a tract *De auctoritate praesidendi* (*On the Authority of Presiding*), trying to reconcile competing interests.

He also involved himself in a dispute over the site of a council to meet with the Greeks, who, needing aid against the Ottoman Turks, were willing to discuss reunion with the Latins. He and the other members of the conciliar minority supported Pope Eugenius IV in his effort to bring the Greeks to Italy, a region more acceptable to them than Basel's choice of Avignon. The council split over this issue, and the minority issued its own decree favoring a site in Italy. In 1437, Cusanus undertook a mission to Constantinople to persuade the Greeks to attend the council Eugenius decreed would be held at Ferrara. On his voyage back in the winter of 1437–1438, he had a shipboard experience that changed his point of view. Thereafter his writings tended to be on more philosophical topics, especially on the limits of human knowledge in the quest for God. The treatise *De docta ignorantia* (*On Learned Ignorance*), completed c. 1440, set forth his typical themes of "learned ignorance," enfolding and unfolding, and "conjecture." This last, possibly better

understood as a learned surmise, was expounded at length in *De coniecturis* (*On Conjectures*), completed in 1443 or 1444, which discusses the mind's ascent from sense to reason to the inspired intellect. Cusanus even tried to apply these concepts to the Basel schism by writing about the "conjectural church" (*ecclesia coniecturalis*).

After returning to Italy, he represented the pope in Germany, becoming known as "the Hercules of the Eugenian cause" on account of his heroic work for Eugenius against the Council of Basel. He presented the case for papal primacy at several imperial diets, arguing that the church was monarchical. His polemics from the period also argued that the Council of Basel lacked the consent of the princes and of the church throughout the world. This bold presentation of Eugenius' case helped persuade the princes to reach agreement with Rome, which in turn conceded control of local patronage. Eventually, they abandoned the Council of Basel, which recognized Pope Nicholas V (1447–1455), who had succeeded Eugenius.

After playing this key role at imperial diets, Cusanus was rewarded by Pope Nicholas V, who made him a cardinal in 1448 or 1449 and bishop of Brixen in the Tyrol in 1450. He also was named papal legate to the Empire. In 1451, he embarked on extensive travels, proclaiming the Jubilee indulgence and holding local councils to enact reforms. Many of these decrees were not enforced, since Pope Nicholas canceled them when pressed by lay authorities. Cusanus' unsuccessful effort to discourage pilgrimage to the supposed bleeding hosts of Wilsnack was typical of the failures of his legation. The greatest successes were achieved where he found allies in local groups of reformed religious.

Cusanus then retired to his diocese. There he tried to impose reforms on the diocesan clergy and the local monasteries. He also tried to reclaim diocesan revenues lost to other powers in the Tyrol. His efforts were backed with ecclesiastical censures, but they aroused fierce local opposition. Most important of the opponents was Duke Sigismund of the Tyrol. In 1460, the duke briefly imprisoned Cusanus, who left for Rome after being released. Pope Pius II (1458–1464) excommunicated Duke Sigismund and imposed

an interdict suspending church services throughout his domains. Cusanus never returned to his bishopric, and Sigismund only capitulated in 1464, a few days after Cusanus' death.

Cusanus became a resident member of the Roman curia. In 1453, after the Fall of Constantinople, he wrote a dialogue, *De pace fidei* (*On the Peace of Faith*), envisioning a celestial conference that reconciled the differences of all religions. Nevertheless, he became a partner in Pope Pius' more worldly efforts to launch a crusade against the Ottomans. He governed Rome while the pope was absent at the Congress of Mantua, trying in vain to persuade Europe's princes to take the cross. Cusanus also wrote a critical but not entirely hostile account of the Qur'ān, the *Cribratio Alchorani* (*Sifting of the Qur'ān*). In addition, he represented the pope in local negotiations at Orvieto and continued writing works on metaphysical themes. His later works tried out new metaphors for God, particularly the idea that the divine was "not-other" (*non aliud*) than human beings and other creatures.

Cusanus became involved in Pius II's efforts to lead a crusade and died at Todi in Umbria on August 11, 1464, on his way to join the pope in Ancona. (Pius, although mortally ill, had gone to that seaport, hoping to lead the crusade himself.) The cardinal's body was interred in his titular church, San Pietro in Vincoli, in Rome. There is a sculpted image of the cardinal on his monument. In accordance with his last wishes, his heart was taken for burial to the Cusanusstift in Kues, a charitable foundation for the housing of the aged that he established. He bequeathed his books, scientific instruments, and money to it.

De Concordantia Catholica

Cusanus' *De concordantia catholica* is divided into three books. The first discusses the nature of the church and the role of the clergy, including the Roman pontiff. The second discusses church councils, from local synods to ecumenical councils. The third book opens into the larger context of Christendom, the political community of the peoples within the Latin Church. It discusses the

nature of political communities and especially the role of the emperor. Cusanus included in this book his proposals for reform of the Empire, including possible revisions of the system of imperial elections. The entire work drew upon a rich heritage of pagan and Christian texts, especially the canon law collections he had studied in Padua. At the time of his education, these texts, in particular those in Gratian's *Decretum*, and previous discussions by learned doctors of the church as a corporation, were read by many as supporting the ability of the church, represented by a council, to limit papal power. This was tied directly to a desire for reform of the church "in head and members," especially reform of the Roman curia.

De concordantia catholica opens with a preface calling for union in church and empire and saying that councils have been neglected but have the weight of authority behind them. Book I then discusses the nature of the church, the priesthood, and the hierarchic order in ecclesiastical affairs. His emphasis on faith and charity as uniting Christians with Christ was traditional, and he defended the institution against accusations that the church had lost validity through sin. Both good and bad persons belonged to it, although in different ways. Nor did bad priests lose sacramental power because of sin. This was one of the key lines of anti-Hussite argument, a posture shared with writers like John Torquemada. Cusanus linked sacramental validity not just to the church militant but to the church triumphant in heaven.

Book II turns to the question of the location of authority in the church. The focus of the book is on councils, from diocesan synods to a universal council. A presiding person – bishop, metropolitan, or pope – ordinarily had the right to call a council. The universal council represented the church's power to bind and loose. Its decisions were to be considered inspired by the Holy Spirit. All of these councils, local up through universal, represented the church in a virtual manner. Its decisions were made not just by a binding decree of the presiding officer but with the consent of all present. Even after a decree had been issued, it was binding only when it had been accepted at the local level. Cusanus was able to demonstrate the correctness of his arguments by appealing to

the examples of the great councils of the fourth and fifth centuries, which had defined the key dogmas of the church.

He applied the same principle of consent and reception to the papacy. Papal decrees gained force from "usage and reception" (Bk. II c. 11). This was, in Cusanus' system, a form of consent. Papal power was administrative, requiring submission of subjects. Plenitude of power was not automatic. Its exercise required the consent of the College of Cardinals to be valid. Cusanus also recommended that the cardinals should be chosen from all nations to make their consent more representative. Looking wider, he argued that all coercive power similarly depended on consent under natural law. This, in turn, opened the way for a defense of free elections to office.

The wide representation of the church also guaranteed that a universal council was superior to the pope and more likely to be divinely guided. This being the case, the council was above the pope and able to bind him to accept its decisions. The pope, using the power granted by Christ, could dispense from canons in case of need but not capriciously. Even the papal role in convoking councils did not grant a right to dictate their decisions or disobey them. Abuse of any ecclesiastical power was not tolerable and was subject to reform.

Book III is focused on the Empire. The emperor was head of the temporal hierarchy, and his power derived from consent under natural law. The papacy had not conferred this supreme authority on him. The translation of imperial power from the Greeks to the Latins occurred by the consent of the clergy and people of Rome in the reign of Otto the Great. The electors who chose the next emperor acted by the common consent of their subjects. By their consent, he was Christ's vicar in temporal affairs, although not the direct ruler of all lands. By consent of the orthodox faithful, the emperor was guardian of the church and the faith, as well as the protector of a sitting general council. A limited role for lay persons in church councils is included in Cusanus' discussion of the Empire. The Empire was expected to be governed, like the church, with the consent of representatives of its provinces.

Like the pope, the emperor was expected to judge justly and not to abuse his power. The book concludes with a detailed proposal for the reform of the Empire.

The entirety of *De concordantia catholica* emphasizes unity and harmony. The hierarchy of councils, the expanded College of Cardinals, the superiority of a general council to a pope, and the role of the emperor in secular and ecclesiastical affairs were all intended to promote harmony and concord. The Council of Basel, however, could not achieve concord throughout Christendom. Its squabbles over reforms and the site of a council with the Greeks may explain why Cusanus was willing to abandon the Council of Basel for the pope and his council of union in Italy.

Pro-Papal Writings and Reform Proposals

After Cusanus left Basel, his major writings were concerned with metaphysical issues. Nonetheless, he continued addressing questions of authority and reform. The speeches and memoranda prepared for the meetings of the German princes emphasized papal primacy. A more interesting effort, especially in the *Dialogus concludens errores Amedeistarum* (*Dialogue Refuting the Errors of the Amedeists*) accuses the followers of Felix V, Amadeus VIII of Savoy, and the antipope chosen by the Council of Basel, of erring in their opinions on church government. In the *Dialogue*, Cusanus rewrote the doctrine of consent, arguing that Basel's deposition of Pope Eugenius was invalid because it lacked the consent of the church throughout the world. Cusanus stressed, for diplomatic purposes, the role of the princes in giving or withholding consent. He also offered a more traditional view of papal power, with the pope holding plenitude of power over the general council and its decrees. Nonetheless, Cusanus expected hierarchical order to be preserved except where dispensations from rulers were required on grounds of equity.

Cusanus tried a different approach in a letter to a Castilian diplomat. The church was only known by surmise (*ecclesia coniecturalis*). It was

unfolded from Peter (*explicatio Petri*). All powers were “contracted” in Peter but unfolded from him in the bishops and curates. All represented Christ, but Peter’s successors did so most perfectly. Nicholas, however, insisted that the pope be like Peter, having the faith of his exemplar, in order to be most fully pope. This sentiment can be found in Cusanus’ sermons. It also appears forcefully in his proposed reform of the Roman curia. Reform was to begin with the pope. He was to accept reform to set an example of what Christ expected of prelates. Then reform was to spread out to the curia and from the curia to the church worldwide. This proposal remained in circulation in the curia for another half century, but it never was adopted.

These pro-papal and reform writings had little circulation outside Rome. Cusanus’ earlier work, *De concordantia*, however, remained in circulation. It was quoted against Eugenius even after its author had changed allegiance. When Cusanus’ works were printed in the sixteenth century, *De concordantia* gained renewed circulation. Its attack on the Donation of Constantine, in particular, was widely read. It was quoted, in Latin or in translation, throughout the sixteenth century. Even Protestant writers quoted Cusanus in their defenses of lay authority, especially lay independence of papal power.

Nicholas of Methone

Jozef Matula

Department of Philosophy, Center for Medieval and Renaissance Philosophy, Palacky University, Olomouc, Czech Republic

Abstract

Nicholas of Methone was a leading thinker of the twelfth century in Byzantium. He published a detailed refutation of Proclus’ *Elements of Theology*. He became concerned by the popularity of Proclus and acted as a defender of Christian Orthodoxy. Nicholas was interested in Proclus’ Neoplatonic categories and their influence on Christian doctrines. He objected to heretical Christian teachings confused by pagan learning and his criticism

of Neoplatonism was a reaction to the Christian Hellenism of the eleventh century. Nicholas commented on Proclus' use of specific philosophical terms (e.g., participation) and systematically criticized Proclus' inconsistencies.

Biographical Information

Nicholas of Methone (early twelfth century – c. 1160/66) was one of the most important thinkers of the twelfth century in Byzantium. He became bishop of Methone c. 1150, but otherwise his life remains obscure. As a theological adviser and panegyrist of the Emperor Manuel I Komnenos (1143–1180), he dreamt that the Emperor would unite the western and Byzantine Churches. Nicholas developed a concept of unity between the State and the Church, and criticized the Bogomils. He actively took part in the discussion with the Latin theologians about the *filioque* and in the resistance against the Christological doctrine, which was condemned at the Councils of 1157 and 1166 (Angelou 1981). In most of his writings, he dedicated considerable space to different topics besides these theological debates and his works maintained their authority and popularity up to the end of Byzantium. Nicholas is the author of 16 works on a variety of subjects, and his last dated work was written in 1160. His most important philosophical work is *The Refutation of Proclus' Elements of Theology* which survived in 13 manuscripts and in a Latin translation from the sixteenth century.

Thought

By the middle of the twelfth century, Proclus' philosophy was considered to be a source of heresies. Nicholas' treatise illuminates the nature of the conflict between pagan and Christian Hellenism (Michael Psellos, John Italos). A "refutation" was quite new in the Byzantine intellectual world since John Philoponus' *De aeternitate mundi contra Proclum*. Contrary to other critics of Proclus (Theodore Prodromos,

George Tornikes) who rejected Proclus' theory in general, Nicholas analyzes Proclus' propositions in detail, in the light of Orthodox Christian dogmas. He argues that the contemporary interest in Proclus and Platonic arguments threatens the concept of Trinity.

The refutation represents a philosophical genre that was used against pagan philosophy, and especially against admiration for Proclus' work as the epitome of human wisdom. The aim of the work is to protect the doctrines of the Church from the infiltration of Neoplatonic philosophy (Benakis 1987). The treatise contains important theological issues which were relevant in connection with the influence of Neoplatonism on the thinking of Bogomils. He is probably the author of the anti-Bogomil work *The Dialogue Concerning Demons*, which used to be attributed to Michael Psellos. Similar criticism also appears in Nicholas' other treatises in which he rejects the heresy of Soterichos Panteugenos (*Bibliotheca ecclesiastica*, pp. 321–359). Nicholas objected to heretical doctrines in accordance with the anathemata contained in the *Synodikon Orthodoxiae*, claiming that heretics draw their ideas from Proclus. His treatise is similar to older criticisms of Proclus, especially those dealing with the issue of the eternity of the world (Philoponus); as to his method of argumentation, he often appealed to the authority of the Church Fathers, for instance Pseudo-Dionysios Areopagita and Gregory of Nazianzus (Dräseke 1892). Nicholas' *Refutation* is written as a confrontation between Areopagita and Proclus, in which Proclus is portrayed as an unorthodox pupil of Areopagita.

Nicholas does not refute Proclus' doctrine in general but he deals with the propositions of *The Elements of Theology* chapter by chapter. The treatise can be seen from two angles: in comparison with conceptual consistency and in relation to Christian dogmas (Tatakis 1949). His criticism of Proclus is pointed not only against cosmology and polytheism but also against specific philosophical terms which prove Proclus' discrepancy with Christian teachings. Nicholas discusses the most basic of Proclus' triads: remaining, procession, and reversion (*mone*, *proodos*, *epistrophe*) and unparticipated, participated, and participating

(*amethektos*, *methektos*, *metechon*). He adopts the first one (*mone*, *proodos*, *epistrophe*): all things are pre-contained in God, are unfolded from him into creation, and return to him as their end (Terezis 1995). Nicholas accepts the triple existence but not the multitude of creators, since it is only one creator from which everything derives. He refuses to attribute the creative power to anything apart from God. Nicholas also criticizes Proclus' concept of participation. He understands that God is both participated (*methektos*) and unparticipated (*amethektos*), in the sense that a term that is directly unparticipated (*amethektos*) can be indirectly participating (*metechon*) by means of the participated things (*metechomena*), which it creates. Nicholas adopts the phrase unparticipated participated things (*amethektos metechomena*) from Pseudo-Dionysios Areopagita. The division of the participated intelligence into terrestrial and celestial sphere is according to Nicholas a fallacy, and it is unacceptable because it leads to polytheism (Niarchos 1983–1984).

The only source and cause of the existence of every being is God, the supra-intelligence (*hypernoun*). All beings derive their existence from God, who is the only unparticipated, for everything unparticipated subsists prior to the participated. The perfection of God does not depend on the participation of others in him. Nicholas states that the divine substance (*ousia*) remains ineffable and incognoscible. God by his own act gives substantiality to all other intelligences. Nicholas understands the intelligences as mediators between God and all other beings (*Refutation*, pp. 115–116). He argues that not every intelligence knows everything nor creates everything. This is the attribute of the Intellect (*nous*), which, being itself unparticipated, knows and creates everything. All its acts are directed toward all beings and things in general. The Primal Intellect is identified with God, while all other intelligences are subordinate, close to One, and divine and perfect due to the participation in the Primal Intellect (*Refutation*, pp. 143–144).

According to Nicholas, the first six propositions of the first group of *The Elements of Theology* are against the Christian doctrine of the

Trinity. According to him, Proclus deals unsuccessfully with theological matters, mainly with intelligible concepts, which he drags down to the corporeal sphere. Nicholas attempts to demonstrate the contradictions in Proclus' conclusions and he makes extensive comments on the ambiguities of *The Elements of Theology*. He is persuaded that Proclus blended together metaphysical and logical conclusions, a mistake that led him to a series of contradictions. The first proposition of *The Elements of Theology* (Every manifold in some way participates unity) is set against other propositions (for instance, proposition 5 or proposition 24) to prove that Proclus refuted himself when he stated that the One is simultaneously participated and unparticipated; in doing so, he made the One to be at the same time many. Also, Proclus states that the unparticipated Intelligence is superior and has primal existence (propositions 23 and 24), while at another place he accepts both; namely, that it is an unparticipated and participated intelligence and the latter is participated either by celestial or by terrestrial souls (proposition 166).

Moreover, Nicholas refutes Proclus' statement that the cause of all things (the intelligence) must be motionless, since, if it moved, it would be imperfect (for all motion is an imperfect activity); and it would be subject to time, although it is the cause of time. He also criticized Proclus' statement that emanative creation is timeless, which is in contrast to the Christian doctrine of deliberate creation in time (*Refutation*, pp. 152–153). Nicholas argues that if intellection is creation, then, since each intelligence has intellection of itself and its priors, each intelligence must create itself and its priors, which is absolutely absurd.

Nicholas also finds Proclus' proposition that "all that participates in time, but which has perpetuity of movement, is measured by periods," unacceptable, because according to him, the soul cannot have an eternal and a temporal movement simultaneously. Whatever participates in time can never be eternal, nor can that which is eternal be at the same time temporal, for beings are divided into those that participate in time and those that are eternal (*Refutation*, pp. 174, 3–6).

Nicholas rejects Proclus' proposition that "all things are in all things but in each thing according to its proper nature" by putting the argument that the prior and the great cannot be in the posterior and the small (*Refutation*, pp. 99–101). For Nicholas it is only the Intellect that remains indivisible, being itself incorporeal, without magnitude and possessing all kinds of plurality. Even its activity is single in itself but dispersed to many things (*Refutation*, p. 110).

Nicholas' treatise is an important testimony of the Byzantine interest in Proclus' thought, for it seems that he was inspired by numerous refutations of Proclus. However, the influence of his thought is still not well examined.

Nicholas Oresme

Olli Hallamaa

Department of Systematic Theology, University of Helsinki, Helsinki, Finland

Abstract

Nicholas (Nicole) Oresme (c. 1320–1382), was a mathematician and philosopher, a translator of Aristotle, and a prelate. Oresme was one of the most distinguished scholars at the University of Paris in the fourteenth century. As a natural philosopher, Oresme was a younger associate of John Buridan. Oresme was deeply influenced by the Oxford Calculators, a group of natural philosophers who had developed mathematical means to analyze natural phenomena. Their work was Oresme's starting point when he invented the configurations,

geometrical presentations, which describe with two-dimensional figures various hypothetical distributions of the intensity of qualities in a subject or velocities in time. As for the latter, he presented a geometrical proof of the so-called Merton mean speed theorem. Inspired by Thomas Bradwardine's exponential function which describes the relationship between forces, resistances, and velocities in motions, Oresme set out to study the relations of proportions as such. He applied the results to create a sophisticated argument against astrology which he ardently opposed. Around 1359 he became acquainted with the dauphin of France who would later be enthroned as King Charles V. In 1369, Charles commissioned Oresme, who had acted as his secretary, to translate Aristotle's treatises in practical philosophy from Latin to French. These translations were Oresme's last scholarly achievement; in particular the translation of Aristotle's cosmological treatise *De caelo et mundo* was to be a major accomplishment. This translation, *Le Livre du ciel et monde*, contained a lengthy commentary in which Oresme appears to be as innovative and original a thinker as in his youth. The translations made Oresme one of the founders of scholarly French.

Biography

Nicholas Oresme was born around 1320 in the diocese of Bayeux in Normandy. The village he came from was probably Allemagne (today Fleury-sur-Orne) on the southern edge of the town of Caen. Early stages of Oresme's life remain obscure; the very first time his name appears in an official record was in 1342 when the pope provided him, along with several other Parisian scholars, with ecclesiastical benefices. The papal letter granting the benefices refers to Oresme as clerk of the diocese of Bayeux and a master of arts. Thus, Oresme had completed his first degree at Paris in his early twenties and most probably began his theological studies soon after 1342. His was licensed for the doctorate in theology in 1356 after which he became regent master

in theology. In 1356, he was elected as *grand maître* of the College of Navarre. From the late 1350s onward, Oresme established a close connection to the court of France; royal support probably promoted his ecclesiastical career. In 1361, Oresme was appointed archdeacon of Bayeux, a position he eventually discarded. In 1362, he was appointed canon at Rouen and a few months later he was nominated to a similar post at Sainte-Chapelle in Paris. He became dean of the cathedral of Rouen in 1364, and in 1377 he was elected as bishop of Lisieux. Oresme died on July 11, 1382.

Oresme and Buridan

When Oresme arrived in Paris in the middle of 1330, the most renowned teacher at the arts faculty was John Buridan, who is often mentioned as Oresme's teacher and mentor. This, however, is most unlikely. According to the university statutes, Oresme could not have officially studied under Buridan's supervision, since students were allowed to enroll only with a master from their own nation. Buridan, who originated from Béthune, had to affiliate to Picardian nation whereas Oresme had to enroll with a master from Norman nation. Though Buridan could scarcely have been Oresme's supervising master, it is possible that Oresme attended his lectures since students in the faculty of arts had the right to attend the lectures held by the masters of other nations. Oresme could have also consulted Buridan's works in the libraries kept by the institutions affiliated to the university. Buridan offers us a small piece of evidence, which shows that the two scholars were in contact, even though it does not reveal the extent of their collaboration. In his treatise *Quaestiones super meteorum*, he noted that "The Reverend Master Nichole Oresme said to me himself to have seen two <parhelions>, one on either side of the sun."

In many respects these two scholars have a unique profile. Buridan remained at the faculty of arts all of his life never taking a theological degree whereas Oresme, after completing his studies in the arts, continued in the theological

faculty and eventually pursued an ecclesiastical career. A major share of Buridan's works is commentaries on Aristotle, whereas, apart from three commentaries, most of Oresme's production consists of treatises on separate scientific topics. When Buridan focuses on logic and leaves mathematics aside, Oresme does the opposite. Although both scholars shared the conviction that ultimate truth is based on faith and that even the most certain human knowledge is merely contingent and probable, their mentality differ considerably from each other. Buridan was a natural philosopher who mostly considered Aristotelian natural philosophy to be a valid and sufficient foundation for scientific knowledge. Oresme, for his part, was ultimately a theologian who had severe doubts about results achieved through reason and experience. These were not capable of identifying the true explanation for physical problems from all the given tentative alternative explanations. Eventually, Oresme's aim was to cast doubt on the theories and power of natural philosophy, to attain certain knowledge in order to protect the truths of faith. Human knowledge was always second to God's, who alone could know the true causes of natural phenomena.

Mathematics and Its Application in Natural Philosophy

One of Oresme's major achievements in mathematics is his development of the theory of the relations of proportions. Here Oresme based his work on the ideas of the Oxford-scholar Thomas Bradwardine, who had developed the mathematics of the exponential-type function to treat the relation of forces, resistances, and velocities. Bradwardine's function was an attempt to correct the obvious deficiencies in the prevailing interpretation of the fragmented remarks found in Aristotle's *Physics*, book 7. According to the common understanding, the general rule that Aristotle intended but never explicitly formulated was that motion occurs only when force is greater than resistance, that is when $F > R$, where F is force or motive power and R is resistance of a medium or mobile. In the next, V is used for velocity or

speed. In modern notation, the common medieval understanding of Aristotle's remarks on dynamics are represented as:

$$\frac{F}{R} \propto V$$

Bradwardine argued against this view by showing that it led to absurd consequences when either F or R is varied while the other is held constant, which was a common technique in Aristotelian physics. Thus, when the resistance is continually doubled,

$$\frac{F}{nR} \propto \frac{V}{n}, \text{ Where } n = 2, 4, 8, 16, 32 \dots$$

Even after $R > F$ there will be a value for V , which goes against the assumption that whenever motion is produced, F must be greater than R . Furthermore, the result implies that any given force can move any resistance whatever, and therefore the force would be of infinite capacity.

Thus, Bradwardine had shown that the prevailing interpretation of Aristotle's *Physics* led to incorrect results. To overcome such absurd outcomes, Bradwardine suggested that the proportion of force to resistance must vary geometrically, where as the velocity changes arithmetically. Thus, when the proportion is squared, the velocity caused by the proportion will be doubled. Using modern conventions Bradwardine's solution can be written as follows:

$$\frac{F_2}{R_2} = \left(\frac{F_1}{R_1} \right)^{\frac{V_2}{V_1}}$$

The advantage of Bradwardine's solution, where two ratios of force and resistance are related geometrically or exponentially, is that when given initially that $F > R$, R can never become equal or greater than F .

Oresme, who was well acquainted with Bradwardine's work, took the Bradwardine's function as a starting point for his inquiries to the mathematics of "ratios of ratios," which is the expression he applies to the exponent. The aim of his treatise *De proportionibus*

proportionum is to explore the various ways where any two ratios can be related exponentially. In this inquiry, the central concepts Oresme deploys are “part,” “commensurable,” and “irrational.” Oresme uses the term “part” here strictly in its proper sense meaning an aliquot or multiplicative part. Thus, for example, in the set of proportions $2/1$, $4/1$, $8/1$, $16/1$, $32/1$, we may conclude that $2/1$ is a third part of $8/1$, since it is tantamount to $(2/1)^3 = 8/1$. Likewise, $2/1$ is the fourth part of $16/1$ and fifth part of $32/1$. Oresme then continues to explore the “parts relation”; he asks what is the relation of $32/1$ to $8/1$. The two ratios share the common base $2/1$ and there are five $2/1$ -parts in $32/1$ and three $2/1$ parts in $8/1$, therefore $32/1$ is five third parts of $8/1$; in modern notation this is written as $(8/1)^{5/3} = 32/1$. As both ratios have a common base, they are proper parts and commensurable with each other. However, not all proportions are commensurable, that is one proportion is an aliquot part, or parts of another proportion. Thus, for example $5/1$ is not a part or parts of $64/1$. In fact, most of the ratios are incommensurable with each other and thus irrational. Oresme proves this by taking 100 ratios from $2/1$ to $101/1$ and comparing them two at a time. The result is that out of altogether 4,950 ratios of ratios only 25 are rational whereas the rest are irrational, which implies that two arbitrarily chosen rational ratios will most probably produce an irrational ratio of ratios. Oresme applied this result to treat local and celestial motion. In his treatise *Algorismus proportionum*, Oresme developed particular rules for handling ratios.

Another of Oresme’s major achievements pertains to the geometrical description of the theory of the latitude of forms, which medieval natural philosophers used to describe and analyze the distribution of qualities in a subject and to describe qualitative changes and changes of velocity. Latitude was used as a technical term meaning the range within which the intensity of a certain quality like whiteness or, in the case of local motion, velocity could vary. In the *Tractatus de configurationibus qualitatum et motuum*, Oresme introduces two-dimensional figures to describe hypothetical distributions of the intensity of qualities in a subject or hypothetical velocities in time.

Nicholas Oresme, Fig. 1 Two-dimensional presentation of qualities or motions

The term *configuratio* describes geometrical figures or graphs in which the baseline represents the subject in the case of qualities or time in the case of velocities, and the perpendiculars raised on the base line describe the intensities of the quality distributed in the subject or, in the case of motion, the velocity at each instant of time (Fig. 1).

The totality of perpendiculars represents the whole distribution intensities of a quality in a subject or in the case of locomotion, the total velocity. The two-dimensional figures, the configurations of qualities or locomotion, have different forms respective to the type of distribution: in a quality of uniform intensity and a motion of uniform velocity, all the perpendiculars raised on the base are of equal length and thus the figure produced is a rectangle. A quality of uniformly difform intensity starting from zero and a uniform acceleration of velocity are represented by a right triangle, and respectively a quality of uniformly difform intensity ending at zero and uniform deceleration of velocity are represented by a left triangle. Difformly difform qualities or velocities would correspondingly produce figures where the line describing maximum intensity at a point or velocity at an instant is curved or, in the case of sudden changes, contains step-like shapes.

Using the configurations of motions, Oresme gave a geometrical proof to the mean speed theorem stemming from the Oxford Calculators. According to the theorem, a uniformly difform motion is equal to its mean degree in so far as the same space is traversed in the same time. Oresme’s proof shows (Fig. 2) that the configuration of the uniform motion (rectangular ABED)

Nicholas Oresme, Fig. 2 Geometrical proof of the mean speed theorem

and the configuration of the uniformly difform velocity (triangle ABC) have equal areas since the exceeding triangles AFD and FEC are equal; thus the total velocities depicted by these configurations are equal. But where the Oxford Calculators were unable to fully take advantage of the quantification of qualities in measuring the phenomena of nature, Oresme equated e.g., the “quantity of velocity,” that is, the intensity of velocity times extension of velocity in time, with the total distance traversed. The geometrical proof of the mean speed theorem was to be among the most enduring aspects of Oresme’s work; its influence can be traced up to Galileo.

Just as his predecessors at Oxford, Oresme was interested in infinite series, which typically occur when a given magnitude is divided unendingly into proportional parts. In *De configurationibus*, Oresme introduced the result for the following convergent series:

$$1 + \frac{1}{2} \cdot 2 + \frac{1}{4} \cdot 3 \cdots + \frac{1}{2^{n-1}} \cdot n \cdots = 4.$$

In his *Questiones super geometricam Euclidis* (q. 2), Oresme did differentiate some convergent series from divergent series. This result was based on the observation of an infinite summation of proportional parts which follow the pattern:

$$1 + \frac{1}{m} + \frac{1}{m^2} + \frac{1}{m^3} + \cdots + \frac{1}{m^n} + \frac{1}{m^{n+1}} + \cdots$$

When Oresme explored the ratio a/b determining the proportional parts, he noticed that when $a > b$, “the total would be infinite” as it is in the following summation:

$$1 + \frac{1}{3} + \frac{1}{9} + \frac{1}{27} + \cdots + \frac{1}{3^n} + \frac{1}{3^{n+1}} + \cdots = \frac{3}{2}.$$

This series is divergent. When the ratio a/b is less than one, the series has a finite sum. Oresme’s views on infinity are deeply rooted in the medieval discussion, yet he substantially promotes mathematical understanding of the infinite.

Opposition to Astrology

Oresme applied the results of his mathematical inquiries to various other fields. He was convinced that the inquiries into the “ratios of ratios” had implications for astronomy which he ardently opposed. Astrologers, whose predictions were based on the precise determination of celestial phenomena, were not able to find the exact astronomical data they needed. Astronomical predictions are inexact since they are based on the ratios that are derived from celestial phenomena. But as Oresme had proved, the more ratios of ratios there are, the greater the number of incommensurable ratios of ratios is, and therefore it is probable that the ratio of any two ratios is irrational. For astrologers there was no escaping this mathematical indeterminacy. The explanation for Oresme’s attack may relate to King Charles’ strong interest in astrology and magic. As a friend and advisor to the King, Oresme the scientist tried to direct the king’s interest away from superstition. In his treatise *De causis mirabilium*, Oresme tried to show that every physical phenomenon has a natural explanation. However, Oresme’s efforts had scarcely any effect.

Concept of Time

Regarding the particular issues of natural philosophy, Oresme appears to be at the same time a

product of the Aristotelian tradition and a scholar looking for novel and accurate descriptions of natural phenomena. An example of this twofoldness is his theory of time in which his setting is clearly contemporary and yet his conclusions go beyond Aristotle's views. Oresme argues that there are two meanings for the term "time." Its proper sense is a successive duration of things; it is neither a substance nor an accident inherent in a subject. Thus time is, in contrast to permanent things, an ever flowing entity, *res successiva*. The broader meaning of the term "time" is the unit of measure which, in the first place, is used to measure motion in the heavens and the motion of the sun in particular, and which is secondarily applied to local motion. Oresme's definition of the proper as well as the improper sense of time deviated from Aristotle's conception which by definition connected time with motion as it is "the number of movement in respect of the before and after."

Where Oresme's notion of time shows his deviation from traditional views, a great many other examples are prove of his unwillingness to depart from prevailing scientific explanations. An example of this tendency is the question of the diurnal rotation of the earth, which Oresme discussed in *Le Livredu ciel et du monde*. Here Oresme presented several arguments to prove that astronomical phenomena could be explained by the earth's rotation contrary to the commonly accepted theory which postulated that the earth was the center of the universe around which the heavens moved. Rational arguments indicated that the rotation of the earth was a plausible, even a better explanation than the alternative theory. Still, Oresme considered experience as insufficient for demonstrating either of the theories and, as usual, chose the traditional explanation: "However, everyone maintains, and I think myself, that the heavens do move and not the earth: For God hath established the world which shall not be moved, in spite of contrary reasons because they are clearly not conclusive persuasions." The quote expresses the uncertainty of natural knowledge, an attitude which characterizes his last work, *Le Livre du ciel et du monde*. Oresme, being a theologian, gave

preference to articles of faith over natural reason. As a natural philosopher he is also a traditionalist: despite presenting ingenious emendations and radical alternative resolutions, Oresme remained within the broad limits of the Aristotelian framework.

Translations

During the years 1370–1377, while still a canon at Rouen, Oresme published translations of four treatises by Aristotle. The translation of *Ethics*, *Politics*, and *Economics* was initiated by King Charles V who, "for the common good," desired to cultivate the French political elite with Aristotle's works on practical philosophy. The King, who is known as a bibliophile and a promoter of vernacular literature, had several other translations made. These included the pseudo-Aristotelian *Problemata* translated by court physician Evrart de Conti, Ptolemy's *Quadripartitum* translated by Guillaume Oresme (possibly a brother of Nicholas), and a number of treatises on astrology. Oresme, for one, tried to convince his royal patron of the problems pertaining to astronomy by writing a treatise called *Contra judicarios astronos*, which he also translated into French as *Le Livre de divinacions*. Oresme's final scholarly work was his translation of Aristotle's *De caelo et mundo*. It is uncertain whether this was included in the King's commission; the translation may well have been undertaken on his own initiative and the choice of the work to be translated may have had something to do with Oresme's attempts to convert the King away from astrology. Whatever the backgrounds for the translation might have been, *Le Livre du ciel et du monde*, Oresme considered Aristotle's treatise to be the finest work in natural philosophy. Oresme supplemented the translation with an extensive commentary which is a synthesis of his mature thinking.

Perhaps the most influential part of Oresme's production is his translations. Oresme, who was one of the first translators of philosophical text into French, laid the foundation for the vernacular scientific language.

Nicomachean Ethics, Commentaries on Aristotle's

István P. Bejczy
Stichting Mozaïk, Rotterdam, The Netherlands

Abstract

The first Latin translations of Aristotle's *Nicomachean Ethics*, the *Ethica vetus* and the *Ethica nova*, are the object of six commentaries

from the first half of the thirteenth century, presumably written by Parisian arts masters. Typical for these early commentaries is the interpretation of Aristotle's doctrine in the light of Christian religion. In 1246/1248, Robert Grosseteste achieved a complete translation of the *Nicomachean Ethics*. The first to write commentaries on it were Albert the Great (twice) and Thomas Aquinas. Both attempted to interpret Aristotle philosophically; the extent to which Aquinas nevertheless admitted theological views is disputed in scholarship. The commentary of Aquinas was a major source for many other commentaries of the late thirteenth and early fourteenth centuries, while his *Summa theologiae* influenced the commentaries written by Parisian arts masters around 1300. The most influential commentaries of the fourteenth century were those of Gerald of Odo and John Buridan, where both claimed that only the four cardinal virtues were essential for moral goodness. Buridan's work became the object of intensive study, notably at the newly founded universities of Central Europe where it even replaced the *Nicomachean Ethics* itself. Meanwhile, Aristotle's work attracted the interest of Italian humanists. Leonardo Bruni and John Argyropoulos composed new translations on which Italians and others wrote commentaries, which often betray scholastic influence.

The first Latin translations of Aristotle's *Nicomachean Ethics*, known as the *Ethica vetus* (the oldest translated part, covering books ii–iii) and the *Ethica nova* (book i), were probably made by Burgundius of Pisa before 1150. Six commentaries on Burgundius's translations, presumably written by Parisian arts masters, have come down to us from the first half of the thirteenth century: two on the *Ethica vetus*, one on the *Ethica nova*, and three on both. One of these last commentaries can be attributed to Robert Kilwardby; the others are anonymous (Wieland 1981). Typical for the early commentators is their interpretation of Aristotle's doctrine in the light of Christian religion. Most notably, they conceive

happiness as the union with God (a conception influenced by Neoplatonic teaching); the moral virtues make human beings fit for this union, while the intellectual virtues produce it. Many commentators even affirm the human need for divine grace.

In 1246/1248, Robert Grosseteste achieved a complete translation of the *Nicomachean Ethics* together with a series of ancient Greek and Byzantine commentaries (by Aspasius, Eustratius of Nicea, Michael of Ephesus, and several anonymi) on all ten books of Aristotle's work. Grosseteste's original translation is known as the *recensio pura*; *recensio recognita* is the name given to a revision dating from about 1260 and previously attributed to William of Moerbeke.

Albert the Great was the first to write a commentary on Grosseteste's complete translation. Actually, Albert produced two commentaries. The first one, *Super ethica*, is a literal (phrase by phrase) commentary with adjunct questions, which much influenced Thomas Aquinas' literal commentary, the *Sententia libri ethicorum*. Albert's second commentary, the *Ethica*, is written in the style of a paraphrase. In contrast to the early commentators, Albert and Aquinas try to avoid confounding theological and philosophical categories. Albert explicitly attempts to expound Aristotle's doctrine philosophically (Müller 2001). As for Aquinas, the point is disputed in scholarship. His wish to interpret Aristotle charitably is generally recognized: his aim seems to illuminate what he takes to be Aristotle's philosophical ideas together with the doctrines that he believes at least implied by Aristotle's text – doctrines which are of special interest to Aquinas himself and occasionally lead him to make digressions beyond Aristotle's apparent intentions (thus, both Albert and Aquinas impose the Platonic and Stoic scheme of the cardinal virtues on Aristotle's work). But while some modern commentators believe that Aquinas in fact "baptizes" Aristotle, others claim that he examines Aristotle's teachings without measuring these by the standards of Christian religion. Arguments on either side can be put forward. Aquinas certainly refrains from Christianizing Aristotle as much as he does in the

Summa theologiae. Thus, in the *Sententia*, Aquinas does not mention martyrdom as an example of fortitude, although he does so in his *Summa*. Yet, his Christian convictions sometimes shimmer through even in the *Sententia*. For instance, he defends virginity against the charge of being a vice contrary to temperance, as Aristotle's notion of *insensibilitas* would seem to suggest (but then he avoids religious motivations of virginity; Blažek 2008); he rejects Aristotle's idea that the poor cannot develop the virtue of magnificence; and while Aristotle holds that moral dispositions determine one's actions, Aquinas claims that vicious persons cannot stop being vicious "right away," while virtuous persons "can" (but do not "have to") always act virtuously.

Aquinas' *Sententia* exercised a considerable influence on other commentators active in the late thirteenth and early fourteenth centuries. The work is a major source for the commentaries of John of Tytynsale, Henry of Friemar, and Walter Burley, while Conrad of Ascoli, Peter of Corveheda, Guido Vernani, Paul of Venice, and (as late as 1472) Giovanni Battista Cambio extracted or paraphrased the work. Burley's commentary – which also absorbs many of the notes added by Grosseteste to his translation – served in turn as a base for the commentaries of John Dedecus (c.1350) and Albert of Saxony. By contrast, the six or seven interrelated commentaries composed by Parisian arts masters around 1300, once erroneously labeled "Averroist," betray little influence from Aquinas' *Sententia*, but borrow in varying degrees from his *Summa theologiae*; their possible connection with the commentary of Guido Terreni still has to be established. At the same time, these commentaries enjoy a reputation for being radically Aristotelian, notably because of their tendency to connect the philosophical life with perfect happiness (Wieland 1982). Yet the commentators occasionally propose interpretations which distort Aristotle's views. They present, for instance, heroic virtue as an effort of the will (a concept unknown to Aristotle) which pushes the intellectual virtues to knowledge of the most sublime realities (Costa 2008), and they reduce the Aristotelian ambit of friendship by seeing it as a

private relation among individuals rather than a tie binding the political community (Toste 2008).

The most influential commentaries of the fourteenth century were those of Gerald of Odo (1285–1349) and John Buridan (d. 1358/1360). Although both claim to discuss virtue and happiness from a philosophical perspective, Gerald declares that humans are incapable of acquiring moral virtues without divine assistance, while Buridan – who made ample use of Gerald's work (Walsh 1975) – recognizes that true happiness resides in the contemplation of God in the hereafter, something for which the moral virtues are no absolute requirement. In Buridan's view humans do not even strictly need virtuous habits in order to act virtuously, although virtuous habits do make virtuous choices easier and more pleasant. Buridan's view, which upsets a basic premise of the Aristotelian system, is tributary to the ethical voluntarism of Henry of Ghent and John Duns Scotus. Accordingly, Buridan also claims that Aristotle locates all moral virtues in the will rather than the sensitive appetites, and that virtuous habits are not so much generated through repeated virtuous actions as through repeated instances of willing the good.

Perhaps the most striking novelty of Gerald's and Buridan's commentaries is the claim that only the four cardinal virtues are essential for moral goodness (viewed from a philosophical, not a theological perspective). Aristotle's remaining moral virtues merely add a kind of adornment to a person's moral character. As a consequence, Gerald claims that Aristotle's theory of the necessary connection of prudence with the moral virtues applies to the cardinal virtues only. Prudence, justice, fortitude, and temperance imply each other's presence, but they can exist without any of the remaining moral virtues. Buridan likewise challenges the doctrine of the connection of the virtues. Conceding that all moral virtues are connected through prudence at their highest level of perfection, he nevertheless argues that virtues such as virginity, magnificence, magnanimity, and military courage (conceived as a superlative form of the cardinal virtue of fortitude) are not necessary for everyone. Hence, Gerald and

Buridan simply admit Aristotle's view, unacceptable to most earlier commentators, that the poor cannot acquire the virtue of magnificence: as magnificence is not a cardinal virtue, the lack of it does not detract in any essential way from the moral goodness of the poor. By contrast, the cardinal virtues are accessible to every upright human being, as Buridan in particular insists, whether poor or rich, man or woman. Buridan even maintains that mortal sin consists in violating the cardinal virtues, whereas disrespect of other moral virtues results only in minor vices. The cardinal virtues are therefore essential not only to the philosophical idea of moral goodness, but also to the theological idea of sin and the salvation of Christian believers (Bejczy 2008).

Buridan's commentary, which survives (like the *Sententia* of Aquinas) in just over 100 known manuscripts, enjoyed great authority in the late medieval period and itself became the object of several commentaries, notably at the newly founded Central European universities (Prague, Cracow, Vienna, Leipzig). In fifteenth-century Vienna, university courses on the *Nicomachean Ethics* were in fact devoted to the study of Buridan's commentary rather than Aristotle's work (Flüeler 2008). In Paris, Buridan's influence was more moderate. The most widespread Parisian commentaries of the fifteenth century were those of John Versor (Jean Le Tourneur, d. 1482/1490) and Pierre Tartaret (d. 1522), who are known as a Thomist and a Scotist, respectively. Meanwhile, the *Nicomachean Ethics* attracted the interest of Italian humanists. In 1416/1417, Leonardo Bruni composed a controversial new translation, followed in the late 1450s by John Argyropoulos. Commentaries on Bruni's translation were written by, among others, Marsilio Ficino, Niccolò Tignosi, Pedro Martínez of Osma, and Peter of Castrovol, while the translation of Argyropoulos was used by Donato Acciaiuoli, Jacques Lefèvre d'Étaples, and Giles of Delft. The "humanist" commentators are traditionally reputed to have made relatively sparse use of scholastic distinctions and *dubia* and to have given more attention to matters of literary and historical interest than

their medieval predecessors, but the point is revised in recent scholarship. From a doctrinal point of view, they did not break with scholasticism; notably, Aquinas and Buridan remained important authorities (Lines 2002).

Apart from comprehensive commentaries, compendia of the *Nicomachean Ethics* and questions devoted to specific problems occasioned by the work appeared as well. The questions of Richard Kilvington (d. 1361) gained some renown in their day. *Florilegia* of Aristotelian ethics were relatively rare and usually had a modest diffusion. A prominent specimen is the *Tabula moralium, Milleloquium philosophiae*, or *Manipulus philosophiae* (1346) of Jean Bernier du Fayt.

Nikephoros Blemmydes

George Zografidis

Department of Philosophy, Aristotle University of Thessaloniki, Thessaloniki, Greece

Abstract

Nikephoros Blemmydes (1197–1269) was a Byzantine theologian and philosopher, of vast learning (polyhistor) and considerable influence. His major philosophical work is a two-fold manual on logic and physics that reflects the interests and the status of the philosophical discussions in early thirteenth century Byzantium. In these *Epitomes* he exposes systematically, and in a manner suitable for teaching, the Aristotelian logic and physics, clarifying many issues and emphasizing the points (in physics) that are irreconcilable with the Christian views. Apart from his theological and scientific writings, Blemmydes wrote also shorter treatises on anthropology (on the soul, on the body, on the term of man's life), ethics (on virtue) and politics (on the king's offices), advocating traditional Byzantine views under the influence of Greek classical literature and philosophy.

Biographical Information

Constantinople 1197 – Emathia, near Ephesos 1269. Byzantine theologian and philosopher, teacher and ecclesiastical man, representative of the intellectual movement in the Empire of Nicaea and the best-known figure of the Byzantine letters of the thirteenth century. Blemmydes was born in a family of high social status, which after the Latin conquest of Constantinople (1204 CE) migrated to Asia Minor. In Nicaea and in other smaller cities he received his encyclical education and he studied poetry, rhetoric, philosophy (Porphyry's *Isagoge*, *Categories*, *On Interpretation*, *Prior Analytics*, and *Physics*), mathematics, geometry, astronomy, medicine, and the Scripture.

Back to Nicaea (1224) Blemmydes began his clerical career and his teaching on philosophy and medicine. Nicaea was then the capital of the Byzantine government in exile and was trying also to be the new theological, philosophical, and educational center. Blemmydes contributed to this effort as a teacher and helped for the foundation of new schools and the creation of libraries. He became a monk (1234) and “hegoumenos” at a monastery in Ephesos (1237). He refused further teaching (1245/1246) and also to accept his appointment as a Bishop and as a Patriarch. He participated in Greek–Latin theological controversies (see his treatises on the *Procession of the Holy Spirit*). He was devoted to his monastic life and to the composition or revision of his writings. Later (1248) he founded a monastery near Ephesos, where he retired for his last years.

Through his teaching activity and his writings, Blemmydes had a reputation as one of the most erudite men of his time, both in philosophy and science. Among his students were Theodore Laskaris (the future Emperor, theologian) and George Akropolites (diplomat, historian).

Blemmydes was the author of many works, including theological, ascetic, exegetical, liturgical, hymnography, hagiographical, historical, poetical, medical, and geographical. His *Autobiography* is an important testimony for his own education and career and for the intellectual life in thirteenth century Byzantium.

Thought

Blemmydes' philosophical work came out mostly from his teaching activity and it must be seen within the frame of Byzantine higher education. Blemmydes taught not only Orthodox theology but a wider range of subjects; in fact all the “sciences” of his time. He situates them in a monastical context where education and knowledge were conceived as a kind of exercise that contributes to soul formation: knowledge should go hand in hand with a moderate ethos (*Statue of a King*, 169). Hence, humans are “logical beings”

and “educable” and they most esteem “reason” and “education” (*Autobiography*, I.2).

The place of philosophy is dominant within this curriculum. Blemmydes (*Epitome logica*, 7) adopted the six classical definitions of philosophy that had Platonic and Aristotelian origins and prevailed through the Byzantine period. He also follows the ancient division of philosophy into theoretical and practical, including thus all sciences, that is, theology, physics, geometry, astronomy, arithmetic, music/harmony, ethics, poetics, rhetoric, law, economics, and politics.

His major philosophical work is an *Epitome* (first draft 1237–1239, composition of the final version c. 1260) in two books, the first on Logic and the second on Physics.

The *Epitome logica* was first written at the request of the Byzantine Emperor, when Blemmydes was “young and inexperienced in philosophy.” Logic, taken either as a part or as a mere tool of philosophy, was accepted throughout Byzantium as an introductory and compulsory course. But Blemmydes gives another reason for its justification: “The science of logic is quite useful for the study of Holy Scripture, as well as for all reasoning related to truth” (Proemium). If Logic is the best mean to approach the truth and since God is truth itself, then approach to the truth means approach to God; hence the necessity of a careful study of Logic.

Epitome is a systematic and concise exposition of the essence and the method of Logic, that is, the Aristotelian logic. It contains a summary of Porphyry’s *Isagoge* with Blemmydes’ comments (Chaps. 1–13), a fuller paraphrase of *Categories* (Chaps. 14–25), a summary of *On Interpretation* (Chaps. 26–30), *Prior Analytics* (Chaps. 31–36), and references to *Sophistical Refutations* (Chaps. 37–39) and to syllogisms and sophistic proofs (Chap. 40). Blemmydes clarifies all the technical terms and concepts and gives the necessary examples – as he usually does throughout his writings.

In his *Epitome physica* Blemmydes follows the structure and the content of the Aristotelian physics. He analyzes the basic concepts of physics, such as principium, cause, nature, matter, form, generation and corruption, time and place, and

infinite (Chaps. 1–10, based on Simplicius’ *Commentary on Physics*) and void (Chap. 31), summarizes the theory of elements (Chap. 11, based on Philoponus’ commentary on Aristotle’s *De generatione et corruptione*), outlines meteorology (Chaps. 12–23, based on Alexander’s commentary on Aristotle’s *Meteorology*), the theory on heaven (Chap. 24, based on Simplicius’ commentary on Aristotle’s *De caelo*), and astronomy (Chaps. 25–30, based on Cleomedes’ *Short Astronomy*). The latter was included in physics as a bridge to metaphysics and theology. It is characteristic that the work concludes (Chap. 32) with an explanation of *Psalm* 8.

The *Epitome* is a synthetic introduction to physics, the best available for that period in Byzantium and one that exhibits its writer’s adequate knowledge of the relevant ancient Greek literature. Blemmydes uses extensively all the available sources, not only Aristotle and Plato but also Archimedes, Posidonius, Galen, Alexander, Ptolemy, Cleomedes, Philoponus, Damascius, and Simplicius.

Blemmydes’ main principle to explain all the natural phenomena is the existence of a primordial and continuous efficient cause (God) within the Universe. He finds Aristotelian physics to be consistent with the Christian worldview and he is critical to certain points that he finds incompatible with Christianity. Thus, he argues against the eternity of the world, contrasting Aristotle with Plato; he criticizes Aristotle’s theory of the fifth element (i.e., ether); he probably disagrees with the view that the material medium (e.g., the air) has a propulsive role; he assumes that there is no void since God is everywhere; and he rejects astrology in favor of astronomy. His knowledge and his use of scientific method can be attested when he accurately describes and explains a moon eclipse that occurred in 1258.

In both these treatises Blemmydes shows his erudition and his ability to present the issues comprehensively and to rephrase intelligibly his sources. Due to its educational purpose the *Epitome* is written plainly and contains many examples, thus making the text suitable for the students and attaining their author’s purpose to “to be as clear as [he] possibly could” (*Autobiography*, II.75).

As the majority of Byzantine philosophers Blemmydes had not tried to establish not even to

compile an anthropological theory. He dealt only with certain issues mostly as a response to questions raised by the circumstances or by his students.

The treatise *On the Soul* (1263) came out when Blemmydes' students asked him to give them a simpler explanation of Aristotle's theory of the soul, and – at the most part – it is a summary of the *De anima*. He does not depart from the Aristotelian definitions that he explains. The distinctive Christian elements are the rejection of the preexistence of the created soul and the concluding reference to the inexplicable resurrection of bodies.

The short treatise *On the Body* (1267) was written as an appendix of Blemmydes' *On the Soul* for his students. Its main issue concerns corporeal principles and elements, concluding that both terms mean the same.

The two earlier treatises *On the Terminus of Man's Life* (1242–1249 or 1250s), both written in dialogue form, accumulate arguments against the predetermination of the time of everyman's death. Perhaps Blemmydes' motivation for writing these treatises was to confront the Latin opinion that had circulated in Constantinople at the middle of thirteenth century that God's preknowledge involves predetermination. For Blemmydes the Dominicans' thought was an innovation. So he prefers to argue exclusively on a scriptural and patristic basis and not with the help of "rhetorical techniques or philosophical sophistry." The use of evidence, the hundred of quotations and allusions to the Bible and to the Church Fathers and other authors, make *On the Terminus* a typical work of a Byzantine scholar on a common Byzantine topic. He is in the same line with Theophylaktos Simokattes, Photios, and Nicholas I Mystikos but contrary to Church Fathers and writers such as Germanos, John of Damascus, Niketas Stethatos, Psellos, Nicholas of Methone (and later such as Theodore Metochites and George Scholarios). Blemmydes' main concern is to defend the primacy of free choice that he thinks is violated by the belief in the predestined end of life. For him death is the consequence of sin and the responsibility for its cause lies with human beings and not with God, who nevertheless has the power to change (and to terminate) the course of human

life. Thus in his *Autobiography* Blemmydes describes the death of nine of his opponents and he explains their end by terms of their specific actions and God's wrath against them.

Blemmydes wrote a short treatise *On Virtue* where he adopts an Aristotelian view and he takes virtue to be a product of knowledge and judgment. The role of education is indispensable because it is through exercise (*askêsis*) that human beings can control irrational desire and replace it by rational will.

A conventional work, written in the ornate style appropriate to its genre, is *The Statue of a King* (c. 1250), dedicated to Blemmydes' student and future Emperor, Theodore II Lascaris. It continues the long tradition of "mirror of princes" and it is more an ethical discourse than a political treatise. Blemmydes advises how the Emperor should be, listing all his virtues and subordinating politics to ethics. The ideal king, who will regenerate the Byzantine world, must be a philosopher, having no property and no interests other than the truth and his subjects. Numerous passages from the Bible and many more from classical literature, history, and philosophy are brought to reinforce his argument; but the classical reminiscences cannot offer solutions to real political life and administration.

Influence

Blemmydes' works, namely the *Epitome*, contributed to the study of philosophy in Late Byzantium and afterward. His work influenced later thinkers like Nikephoros Choumnos, George Pachymeres, and Joseph the Philosopher. From the end of the fifteenth century began the study of his work and its widespread educational use. *Epitome logica* served for almost six centuries in the Greek-speaking East as a handbook of Logic (until the eighteenth century) and it was also influential in the West; it survives in 100 manuscripts.

Nikephoros Choumnos

John A. Demetracopoulos

Department of Education, University of Patras,
Patras, Greece

Abstract

Nikephoros Choumnos (c. 1250 – Constantinople, 1327). Choumnos, a scion of a noble family, held from a very early age up to almost his last years' high official positions in the administration of the Byzantine state, playing an active role in its external and religious affairs. In his last years, he launched a bitter attack on another important scholar of that time, Theodore Metochites, who succeeded him in the imperial court, being in his turn attacked by Choumnos. His nine philosophical treatises date from that period. Six of them regard natural philosophy and cosmology; the remaining concern metaphysics, anthropology, and psychology. Most of them exhibit a strong and plainly expressed intention of taking liberties from some specific doctrines of some

giants of the Ancient Greek philosophy, especially Plato and Aristotle. Choumnos argues both against the Platonic “ideas” and Aristotle’s “forms,” as well as against Plotinus’ arguments for the preexistence of the human soul. Elsewhere he subscribes to some of Plotinus’ arguments against Aristotle’s theory of the “quintessence,” which he also deems as incompatible to some other parts of Aristotle’s physics, and states that the nature of heaven is “light” or “fire.” To the traditional four-element worldview, he adds the Christian idea of the existence of some water above the firmament. He also describes the Christian God in terms of Plato’s timeless, unchangeable being and deems him as the cause of the world’s existence, nature, and structure. Further, he elaborates an Aristotle-based but Neoplatonically colored theory of cognitive faculties, the highest of them being “intellect,” which, when functioning by itself, is infallible. Choumnos’ claims for originality should be tested against his sources, which have not as yet been adequately explored. This will be practically possible whenever his writings will be properly edited.

mesazôn), he worked for the resignation of patriarch Gregory II and Athanasius I (1289–1293; 1303–1309), according to the emperor’s wish. He succeeded to have his son John married with a daughter of the Palaiologan dynasty. Probably in the end of the first decade of the fourteenth century, Choumnos was deposed from the office of *mesazôn*, placed at the head of the administration of Thessaloniki, and succeeded by the person who came to be his bitter enemy in the intellectual field, that is, Theodore Metochites (1270–1330). He also intervened to the patriarch Niphon I (1310–1314) for the solution of the so-called Arsenite schism. He also contributed to the deposition of Niphon. Gradually put aside in favor of Metochites, he devoted himself to the study of natural philosophy. His natural treatises date from this period (c. 1315–1321). In the next five years, Choumnos, vindicating for himself the pride of place in erudition, launched a bitter attack on Metochites for his ideas of what good style is supposed to consist in; then he was accused by Metochites of ignorance both of the *trivium*, especially of rhetoric and logic, and of the *quadrivium*, especially of astronomy. In 1326 he became a monk; he died in early 1327.

Life

Choumnos was born c. 1250 as a scion of a noble family, whose members had normally held high public offices and had direct access to the emperors. He received his high education from Gregory of Cyprus, the future patriarch of Constantinople (Gregory II; 1283–1289), who laid emphasis more on the *trivium* (especially rhetoric) than the *quadrivium*. Very early in his life (1272), he held the office of “quaestor” and joined a diplomatic mission to Persia. The succession of emperor Michael VIII Palaiologos (1259–1282), who promoted the union of the Church of Constantinople with the Church of Rome, by Andronikos II (1282–1328), whose religious policy was quite different, did not affect Choumnos’ career; on the contrary, he got to hold higher offices, being practically second only to the emperor himself. From such positions (*mystikos*;

Thought

Apart from few theological orations, the majority of Choumnos’ writings concern rhetoric and philosophy. Of his nine philosophical treatises, one has to do with ontology and metaphysics (*That Matter Does Not Preexist Bodies and That Forms Do Not Exist Separately, But They Both Coexist*), one with anthropology (*On the Soul, Against Plotinus*), one with psychology and epistemology (*On the Nutritive and Sensitive Soul and Their Activities*), and six with natural philosophy and cosmology (*On the World and Its Nature; On the Primary and Simple Bodies; That the Earth Stands at the Middle of the Universe and That Nothing Lies Beneath It, Since All Other Things Stand Above It; That It Is Not at All Impossible, Even According to the Natural Order; That Some Water Was Placed Separately Above the Firmament, Still Remains There and Will Remain There*

Forever; On the Air, Why, in Spite of Its Being by Nature Warm, It Gets Cold When Blowing; Further, on the Generation of Hail and on the Nature of the Winds and Their Oblique Blowing and Movement).

Choumnos' treatment of the nature of the "universals" places him in the minority of the Byzantine thinkers who took an anti-"realist" (not only anti-Platonic but also anti-Aristotelian) stand. Probably elaborating some ideas from Plotinus' *Ennead* II.1,1–2, he states that a "universal," for example, man, exists in the realm of sensibles only inasmuch as (and as long as) it is instantiated by particular men, that is, not in virtue of its being an eternal entity ("being") reflected on the sensibles, but in virtue of the "generation" of the sensibles, which renders the "universal" not eternal but just perpetual. He thinks that Plato's doctrine that the sensible and mutable things were made after some intelligible and unchangeable patterns collapses in view of the very fact that the copy is so radically different from the original. In other words, he rejects the Platonic doctrine of the relation between time and eternity. He also implicitly rejects Aristotle's immanent "forms" by stating that a "form" is just the result of a conception ("epinenoëmenon") of some similarities noticed in the world. He attributes the power of the "particulars" to reproduce themselves to God's will; this, though sounding as a Christian idea, roots also in a similar doctrine of Plotinus (*Ennead* II.1, 2–3; 7), according to whom the natural world cannot be explained in purely natural terms. Still, Choumnos' position is not extremely nominalistic since he stresses that the similarity between the individuals of a certain species is not imposed by our mind on the particulars, but is real. Choumnos' position looks, therefore, as an attack on metaphysics as a way of explaining the structure of the world.

Choumnos also rejects what he explicitly recognizes as the anthropological implication of the Platonic theory of ideas, that is, the preexistence of the human soul. Whereas he praises Plato's and Plotinus' description of the human soul as immaterial, simple, and immortal, he objects that this

does not entail eternal preexistence and he refutes especially Plotinus' arguments for that. He also tries to ridicule a corollary of this doctrine, namely, the transmigration of the souls, his main argument being that transmigration clashes with the rationality of the human soul as well as with the order of the created beings. Many of his arguments on this topic derive from Gregory of Nyssa's *Dialogus de anima et resurrectione*. Although he explicitly states that he combats Platonic anthropology because of its being anti-Christian, he argues not *ex auctoritate* but philosophically.

In the first and second treatise, Choumnos lays down some thoughts on the way one should philosophize in his age. Turning what the sceptics called rather negatively *dissensio philosophorum* and "perpetual seeking after truth" into a positive starting point, he states that there is still room for progress in philosophy; for it is false that the oldest an idea is, the closest to the truth it lies. He warns, however, that critically treating the doctrines of one's predecessors must not spring out of a contentious spirit but should be carried out soberly and on purely rational grounds. This looks like an implicit adoption of some Neoplatonists' critique of Aristotle's anti-Platonism as the result of his arrogance. With regard to his subject matter, he states that bodies have by nature both a temporal and a natural "limit," that is, on the one hand, a temporal beginning and an end, and on the other, some ultimate constituents or "principles." Stressing that the heaven, too, is a body, he argues, on Plotinian grounds, against Aristotle's doctrine of the "quintessence" or "aether" and states that the "principles" both of the sublunar and of the superlunar world are the four primary qualities (hot, cold, dry, and moist), which are perpetually and multifariously combined to produce the four natural elements (air, earth, water, and fire). He argues that the hypothesis of "quintessence" contradicts Aristotle's doctrine of "natural places" as well as his doctrine of the various kinds of locomotion. As for the nature of heaven, he adheres to Plotinus' view that it consists of "fire," whose essence is "light," which, if existing in itself (not

in any other “subject”), does not cause combustion. The cause of the existence as well as of the nature and the order of the world is the “will of God,” who lies beyond time, change, and limit.

In the third treatise, he argues that the world is not the result of an automatic process or of chance but was created by God, whose will and wisdom arranged matters so that the earth be placed at the center and surrounded by air, water, and fire. This can be shown by means of carefully using both one’s senses and reasoning. Contrary to the world, however, the nature, essence, and power of its Creator are incomprehensible.

In the seventh treatise, Choumnos defends the traditional doctrine of Christian cosmology (Gen. 1,7) that there is some “water above the firmament,” which he describes as “extremely thin.”

In the eighth and ninth treatises, Choumnos offers a tentative solution for one of the problems posed by Aristotle (*Problems* 945b8–34), that is, that the air is getting cold in spite of one of its natural qualities, i.e., warmth. To him, air does not really turn into a cold element; air, when blown, goes away and leaves its place to the water with which it is always mixed, which is by nature cold. He stresses that this explanation goes against the traditional views and that it should be judged impartially, that is, on the basis not of this or that old “authority” but of “reason” alone.

In the sixth treatise, Choumnos treats of the two constitutional faculties of the living beings, that is, the nutritive and the sensitive, as well as of the higher cognitive ones (representative faculty or imagination; “common sense”; reason; intellect), emphasis laid on the sensitive, which Choumnos deems as inadequately treated by Aristotle. In the course of his lengthy exposition of the function of the five senses, he tries to elaborate a theory of vision standing midway between this of Plato and that of Aristotle. Each cognitive faculty, to make its contribution to knowledge properly, stands in need of its superior. The highest of them, that is, the intellect, which is divine in nature, is the only infallible one; it can function only when the remaining faculties rest, in which case man enjoys full happiness.

Choumnos’ claims for originality should be tested against his sources, which have not as yet been adequately explored. His writings must be reedited.

Abstract

Nikephoros Gregoras was a theologian, philosopher, astronomer, and historian of the Palaiologan Renaissance called “polyhistor” for his great erudition. He was a conservative, anti-Latin Orthodox who indulged in polemics against Gregory Palamas. Following his mentor Theodore Metochites, he was a Platonist with highly skeptical tendencies, which he combined with Platonism after the pattern of Philo of Alexandria. He describes God in a Neoplatonic way as the “One” that transcends everything and contains in Itself the immaterial archetypes (the “secret and ineffable reasons”) of all created beings. He regarded most philosophical and scientific theories of the heavens, the earth, and human affairs uncertain, because he deemed them as results of man’s defective postlapsarian reason. In these terms, he repudiated Aristotle as an arrogant man, who pretended to possess truth, whereas he knew that he lied. In contrast, Plato instantiated for him the true ideal of sage, because he was conscious of his ignorance and turned to the transcendental reality to attain truth.

Life

After receiving primary education under his uncle, John of Herakleia in Pontus, Gregoras (1293–1361) moved to Constantinople, where he acquired the so-called *enkyklios paideia* under the future patriarch John XIII Glykys (1315–1320) with a stress on the *trivium* (1311–1312) and then (from 1315 on) under the learned Theodore Metochites (1270–1330) (in the Monastery of Chora, where Metochites had created a rich library of Classical education) with an emphasis

on the *quadrivium* and philosophy. He then joined the court circle of Andronikos II (1282–1328), where he served as a diplomat and started his teaching career. When Andronikos III overthrew Andronikos II (1328), the latter was forced to retire to a monastery. In 1331–1332, Gregoras held a public dispute with Barlaam of Calabria on philosophical, astronomical, and cosmological matters. Against Barlaam he composed *Florentios or On Wisdom*, in which he claimed to have put his rival to shame. Taking Barlaam for a “Latin” on account of his Italian provenance, he presented his victory as an index of the superiority of “Greek” erudition over the “Latin” and seized the opportunity to start teaching again in his private school. In 1334–1335, he pronounced a significant anti-Latin speech on the occasion of some discussions between the Byzantine and the Catholic Church. In the so-called hesychast controversy, a dispute for and against Gregory Palamas’ doctrine of the nature of the Taboric light, the attainability and the nature of the *visio beatifica* in this world, and the distinction between God’s “essence” and “energies,” Gregoras adopted at first (1336–1347) a neutral stance to the point of seeking conciliation between the disputants. On Ann of Savoy’s invitation to take part in the dispute, he expressed his disagreement with Palamas (even though he did not fully agree with Barlaam’s theology) and emerged as the leader of the anti-Palamite party, a reputation he retained until his death. In 1347–1351, he wrote his *Antirrhethica priora*. In 1351, shortly after becoming a monk, he engaged Palamas in a public dispute in a synod summoned by the pro-Palamite emperor John VI Kantakouzenos (1347–1354). The synod sided with Palamas and anathematized his opponents. Gregoras was confined under dreadful conditions in the monastery of Chora. Then he wrote his *Antirrhethica posteriora* (1351–1354) and the *Capita XL*. He was set free in 1354, when an anti-Palamite emperor, John V Palaiologos, ascended to the throne. In 1355, he held once more a public dispute with Palamas. He kept writing against Palamite theology until his death, but without meeting great success. After his death, his enemies desecrated his corpse in the streets of Constantinople.

Thought

Gregoras, like Metochites, asserted the primacy of firmly holding Christian dogmas as absolutely true in terms of their having been revealed by the source of truth, that is, God. Like Barlaam, he combated the *Filioque* by declaring it illegitimate to use “apodeictic syllogisms” in theological matters, as the Latins audaciously and ignorantly did. On the grounds of this fideistic apophaticism, held by him as the only way of securing the transcendence of God, he also rejected Palamas’ pretension that God can be seen through the bodily eyes in this life and thus known in a way superior to that available to the conscious average member of the Christian folk. He likewise attacked Palamas’ *distinctio realis* between God’s “essence” and “energies” as being just a Christian adjustment of Proclus’ metaphysical doctrine of “henads.” At the same time, however, he confuted this doctrine both on theological and philosophical grounds. This offered to some strong opponents of his (apart from Palamas himself, Neilos Kabasilas and Philotheos Kokkinos) the opportunity to stick on him the label “philosopher,” by which they implied, according to a traditional Christian stereotype, “bad theologian.” In fact, Gregoras, like many other Byzantine theologians, built a philosophical conscience which he regarded compatible with the essentials of Christianity. In his philosophical works (*Commentary on the “De insomniis” of Synesios of Cyrene*, before 1330; *Against Those Who Do Not Recognize the Vile Character of Human Nature*, c. 1330; *Lover of Learning or on Arrogant Men*, 1332; *Florentios or on Wisdom*, 1332–1333 or after 1335; *Solutions to the Physical Problems Posed by Helena Palaiologina*; *On the Form Visible Only Through the Intellect, and on the Form That Is Seen Along with Accidents*) as well as in some special places in his theological writings, he elaborates the intellectual legacy of Theodore Metochites and proves influenced by Plato, Philo of Alexandria, Plutarch, and Sextus Empiricus. He describes God in a Neoplatonic way as the “One” that transcends everything and contains in Itself the immaterial archetypes (called by him “the secret and ineffable reasons”) of all created

beings. The realm of the sensibles as well as the sphere of human life is the region of mutability, instability, and corruption and forms an orderly whole only, thanks to God’s power and wisdom. Even the heavens cannot, for Gregoras, be known with accuracy; for, as a matter of fact, all astronomical theories, instead of starting from observation data and setting forth this or that hypothesis, start from some preconstructed ideas about how heavens go and tend to adapt the observation data to themselves. The way he sometimes puts this idea borders on epistemological nihilism, which appeared for the first time in Byzantium with him. His strong taste for “dogmatic skepticism” caused the reaction of an anti-skeptical Aristotelian, Nicholas Kabasilas (c. 1323–paulo post 1391), who wrote the only anti-skeptical medieval work (*On the Criterion of Truth, Whether It Exists or Not, Against the Accursed Pyrrho*; 1354/1361). One of Gregoras’ beloved philosophical topics was that of the cognitive faculties of man (senses, “common sense,” *phantasia*, reason, intellect). Mingling his Neoplatonic and skeptical views with Christianity, he held that the postlapsarian “ratio” (*logos* or *dianoia*) normally fails to reach truth (actually it may be regarded inferior even to the cognitive faculties of the irrational animals); whenever it succeeds, this is due to the fact that it was secretly guided by the scintilla that has remained from the light of truth possessed by man before his fall. Radicalizing Metochites’ anti-Aristotelianism, he regards Aristotle as an arrogant man, who pretended to possess truth, whereas he knew that he lied (and tried to hide his ignorance behind sonorous but empty words and phrases) and that he contradicted himself at every point (especially in logic and physics). In contrast, Plato instantiated for Gregoras the true ideal of “wisdom,” because he was conscious of his ignorance and turned to the transcendental reality to attain truth. This reality is, for Gregoras, the Christian God. Studying the *trivium* and the *quadrivium* and then being deeply trained in philosophy was for him just a way to learn the lesson of ignorance and then take refuge to revelation, which is the highest mark of God’s providence. Every sort of secular knowledge must be placed in this context. For example,

Gregoras, Christianizing a Stoic doctrine (accessible to him via Diodorus Siculus), stated that writing history (as he actually did) is a task pleasing to God, because in this way His providence both in nature and the human world is highlighted. Under this general stand toward heathen philosophy and literature, he felt as free as to integrate into Christianity any aspect of Greek thought he considered as admitting of such a usage; for instance, in a short but interesting allegorical introduction to Homer's *Odyssey*, he depicted Ulysses as the embodiment of the ideal sage, because he fully possessed all the "cardinal virtues." Some influence of his philosophical ideas, especially his bitter anti-Aristotelianism, is traced in George Gemistos (Plethon).

Obligations Logic

Abstract

Medieval obligations logic dealt with logical duties, primarily that of granting what follow from what has already been laid down. Technically these duties were put into the context of so-called obligational disputations, where the opponent puts forward propositions, which the respondent grants, denies, or doubts. For the most part, the answers do not follow truth, but some specific obligation given at the beginning of the disputation and the technical obligation rules. The main flourishing of obligations logic can be dated to the first half of the fourteenth century with authors like Walter Burley, Richard Kilvington, and Roger Swyneshed, who all presented somewhat different sets of rules for these disputations. It seems that medieval authors aimed generally at rules that take heed of two general dialectical duties: to follow truth and to remain coherent in one's answers. The latter becomes clearly visible when exceptions to the former are allowed through issuing some special duty at the beginning of the disputation. Obligations logic, thus, can be characterized as studying what it means to be

consistent and how one can remain coherent. This way, the area also contributed to the development of such modal notions as logical possibility and necessity.

Obligations Logic

Obligations logic is one of the branches of medieval logic that have no modern counterpart. In obligational disputations as they were known in the late Middle Ages, the opponent puts forward propositions that the respondent must evaluate. Standard answers include granting, denying, and doubting the proposition put forward. The title word “obligations” derives from the special setting that the respondent is at the beginning of the disputation given a special duty that he must follow during the disputation. In the mature form of the technique, this duty was that of holding a false sentence, called the *positum*, as something that has to be granted.

It is unclear how the historical origin of these disputations should be construed. In a wide sense, the setting derives from the dialectical encounters described by Aristotle in book VIII of the *Topics*, but obligations did not develop as straightforward commentaries of this book. Rather, the beginnings in the early thirteenth century seem to be connected to logical paradoxes like the so-called insolubles. The most important treatises on obligations date from the first half of the fourteenth century.

According to the rules formulated in Boethius de Dacia's questions on Aristotle's *Topics* (written between 1270 and 1276), the respondent should grant to the opponent anything except a proposition that is repugnant with what has been laid down as a *positum*. The gist of the game, as Boethius presents it, derives from the opponent laying progressively down a set of sentences as many *posita*, while the respondent must check that the set remains consistent.

Modern scholars have considered Walter Burley's treatise on obligations (written 1302) to be the most important one because it is a lengthy carefully argued text that presents obligations logic in a well-developed form. Furthermore, medieval authors seem to have taken Burley's rules as standard, while alternative formulations mainly appear as suggestions for a major revision. For the most part, these suggestions were rejected in the discussion. The only important revision that was accepted seems to have been John Duns Scotus' suggestion that the respondent need not deny the present when he has a false *positum* to defend. That is, the necessity of the present need not be respected in obligational disputations.

Burley's rules tell the respondent to keep the set of his answers consistent, but otherwise to follow the truth of the matter. That is, anything that follows from the *positum* together with previous answers must be granted, and anything that is repugnant with them, must be denied. Any other proposition must be deemed irrelevant and answered in accordance with truth-value. After the answer, the irrelevant proposition becomes relevant and can be used in inferences within the game.

Burley's rules have the odd consequence that the respondent can be forced to grant practically any proposition, if the selection and the order of propositions are chosen for such an end. Similarly, the correct answer to a particular proposition may depend on the order of presentation. These features are explicitly recognized by Burley and others, and no medieval author calls them problems. However, interesting revisions were put forward in the second quarter of the fourteenth century by Richard Kilvington in his *Sophismata* (written soon after 1321) and Roger Swyneshed in

a separate treatise (written 1330–1335). Neither of these revised sets of rules allows the order to have such an effect on the answers, though Swyneshed does provide a technique for achieving such effects if they are specifically aimed at.

The idea behind Kilvington's revision is straightforward, but logically unsatisfactory. He claims that propositions should be evaluated in respect to what their truth-values would be if the actually false *positum* were true. In other words, Kilvington seems to think that obligations logic should be understood as being based on counterfactual reasoning. Unfortunately, he is unable to spell out specific rules that would be unambiguous in the way Burley's rules are. Kilvington's revision seems to have received little attention among medieval authors.

Swyneshed's suggestion is based on keeping irrelevant propositions as irrelevant, not allowing them to be taken into inferences. That is, the respondent should grant what follows from the *positum* alone and deny anything that is repugnant with it alone. Swyneshed makes it clear that the whole set of answers need not be consistent if it also includes irrelevant propositions. Much attention was paid on his recognition that a conjunction can be denied when both parts have been granted (one as following from the *positum* and the other as irrelevant and true).

In the later period, the core of Burley's rules seems to have gained general acceptance. For example, Ralph Strode (later fourteenth century) and Paul of Venice (see *Logica magna*, written 1397–1398) follow this basic structure. In the later period, some further development can be found in discussions on disputational obligations concerning the meanings of the words uttered in the disputation.

In the modern research, much time has been spent in making obligations logic understandable to modern logicians. It seems impossible to give any clear counterpart for obligations among the fields of modern logic. Theories of counterfactuals and belief revisions systems have been pointed out, but they both proceed from a semantic perspective while the sets of granted sentences in obligational disputations typically lack any meaningful interpretation.

It seems clear, however, that one logically very interesting phenomenon, which is familiar to modern logicians, is especially carefully studied in obligations logic. When an increasing number of propositions are evaluated in a dynamic setting, their consistency can either be maintained or lost. Obligations logic studies this phenomenon and thus results in an increased understanding of what is at issue in determining consistency.

From the history of modal concepts, obligations thus address a crucial issue. In late medieval developments, it became increasingly important to consider possibility as related to logical consistency. But while earlier medieval logicians often defined logical notions like consistency by leaning on some kind of real possibilities, obligations provided a framework where consistency was attended to with conscious disregard to any kinds of real possibilities. That is, consistency was understood to obtain at the sentential level in abstraction from the possible interpretations of the sentences.

Optics, Latin

Yael Kedar

Multidisciplinary Studies, Tel-Hai College and the University of Haifa, Kiryat Shmona, Israel

Abstract

Medieval Latin optics had its sources in Greek and Arab thinkers, including Aristotle, Euclid, Ptolemy, Galen, al-Kindi, Avicenna, and Alhacen. Its prominent scholars had been Robert Grosseteste, Albert the Great, Roger Bacon, John Pecham, Witelo, and Theodoric of Freiburg. The medieval Latins discussed light's ontological status and whether its mode of existence in the medium is spiritual or material. They adopted from Alhacen the model of radiation from individual point-sources and the idea of spherical propagation, thereby opening their account to radial analysis. Grosseteste identified light with the first corporeal form, which inserts dimensions

onto matter, and Bacon developed the theory of multiplication of species, of which the activity of light was the observable instance. Light thus became the key to the workings of natural causality. The perspectivists formulated optical laws and applied them in explanations of natural phenomena such as the rainbow, pinhole images, and in their account of sight. They debated about the direction of the visual cone and subjected the eye to geometrical analysis. They explained sight as caused by the perpendicular species, since they are the shortest and therefore the strongest. Upon entering the eye, perpendicular rays pass through the cornea, refract at the rear surface of the crystalline lens, and project through the opening of the optic nerve. Sight perceives light and color directly, and twenty more visual qualities through complex processes of comparison, concept-formation, and reasoning. Attention was given to the various faculties of the brain – such as imagination and memory – and their role in processing visual information.

The Sources of Medieval Latin Optics

Medieval Latin optics – called the science of *Perspectiva* – was a discipline of diverse contents, covering a much broader field than modern optics. It was founded in the thirteenth century and had its roots deep in Greek and Arab achievements.

Among the Greek thinkers, medieval *Perspectiva* is indebted mostly to Aristotle (384–322 BC), Euclid (fl. 300 BC), Ptolemy (fl. 127–48), and Galen (d. after 210). Aristotle offered a well elaborated theory of sensation, of which visual perception formed a considerable part. It was presented in his books on natural philosophy, especially in *De sensu* and *De anima*. Aristotle stressed the passivity of the senses and described the details of the cognitive process of receiving visual information. Euclid established the equal-angle law of reflection and offered a qualitative understanding of the phenomena of refraction. By contrast with Aristotle, Euclid held to an extramissionist theory of vision, stating that the direction of radiation is from the

observer's eye. Ptolemy brought together the shared geometrical foundations of optics and astronomy. He analyzed reflection in spherical mirrors, and investigated the refraction of light. Galen provided a detailed description of the tunics and humors of the eye.

Among the Arab thinkers, al-Kindi (c. 800–870), Avicenna (Ibn Sina, c. 970–1037), and Alhacen (Ibn al-Haytham, c. 965–1040/1) were the most significant sources of Latin optics.

Al-Kindi presented in his *De radiis stellarum* a universally active natural world, in which everything produces rays in every direction. Optics became thus of special significance since it treats the radiation of power – the most fundamental natural mechanism. This idea was a source of inspiration for the medieval theory of the multiplication of species. Al-Kindi's *De aspectibus* was a thorough critique of Euclid's theory of vision, and a fierce defense of extramission theory (Lindberg 1976). Avicenna, one of the most prominent among the interpreters of Aristotle, provided an account of the cognitive assimilation of the visual information gained through the radiation of light. With its emphasis on the abstraction of formal representations and intentions, Avicenna's internal sense model was a central formative source for medieval Latin perception theories (Hasse 2000; Smith 2015).

Most notably, medieval optics owed its foundation to the Arab mathematician, astronomer and philosopher Alhacen. Alhacen's great optical treaty, the *Kitab al-Manazir*, translated into Latin as *De aspectibus*, was written as a criticism of Ptolemy's *Optics* and challenged its central supposition, that vision occurs by a visual ray in the shape of a cone emitted from the eye. Alhacen devised a unified theory of vision out of the three approaches: the Aristotelian, the Euclidean-mathematical, and the physiological (Galen). He argued that the forms of light and color issue in all directions from every point of the visible object, and that transparent bodies receive and transmit these forms. Vision therefore occurs by the reception of rays and not by extramission. From the infinity of rays emanating from each point of the visual object, only one falls on the eye perpendicularly and only this one is powerful

enough to stimulate the visual power in the crystalline humor. The collection of unrefracted rays from the various points on the object's surface form a cone of which apex is at the center of the eye. With this visual cone comes all the geometrical analysis of vision by Euclid and Ptolemy (Lindberg and Tachau 2013; Smith 2001).

These Greek and Arabic optical sources were translated into Latin in the twelfth and thirteenth centuries.

The main current in medieval Latin optics was paramountly Aristotelian. The practitioners of *Perspectiva*, called the “perspectivists,” inserted three changes in the Aristotelian account of visual cognition. Following Alhacen and the Muslim thinkers, they rendered light from the actualization of the transparent medium into a visible entity; they replaced Aristotle's holistic account of radiation of forms with a model of radiation from individual point-sources; and they adopted a model of spherical propagation, thereby opening their account to radial analysis (Smith 1981).

Writers and Texts of Medieval Latin Optics

The first medieval Latin scholar who seriously addressed perspective as a science in view of the influx of the new translations was Robert Grosseteste (c. 1169–1253). Grosseteste had at his disposal Euclid's *Optica* and *Catoptrica* (Ver Eecke 1959), Aristotle's *Meteorologica*, al-Kindi's *De aspectibus*, but not necessarily Ptolemy's *Optica* (Crombie 1953). There is no evidence that he had access to the *De aspectibus* of Alhacen. *Perspectiva*, in Grosseteste's scheme of things, was subordinated to geometry, taking its arguments from there, since “all causes of natural effects must be expressed by means of lines, angles and figures” (*De lineis*). In his treatise on the creation of the world from a primordial point of light (*De luce*), Grosseteste tied metaphysical and physical lights. He was convinced that the operations of metaphysical and physical lights are so similar that understanding the latter will aid in understanding the former (Smith 2015).

The second author to take visual theory seriously was Albert the Great (c. 1200–1280), who was well acquainted with the principal theories of vision formulated by Greek and Arabic authors. He devoted much effort to describe and refute those theories, all but Aristotle's. In *De homine* he attacked the theories of Plato (429?–347 BC), Empedocles (c. 495–435 BC), Euclid, and al-Kindi and in his commentaries on *De anima* and *De sensu* he added Democritus (c. 460–c. 370) to the rejected views. However, he did not take geometrical optics seriously enough to incorporate it coherently into his account of light and vision (Smith 2015).

The key figure in the reception of Alhacen's theories was Roger Bacon (c. 1214/20–1292). His first optical treatise, *De multiplicatione specierum*, was probably composed in the early 1260s and was followed by *Perspectiva*, and *De speculis comburentibus*. Bacon had at his disposal everything of importance from the Greek and Latin optical traditions. He knew Aristotle's works thoroughly; he was powerfully influenced by the optical works of Ptolemy and Alhacen and he cited Avicenna, Euclid, and al-Kindi. He made full use of Ptolemy's *Optica*, book six of Avicenna's *Healing*, and Alhacen's *De aspectibus*, works that had been so far totally unknown (Lindberg 1976). According to Bacon, the science of *Perspectiva* involves not only the laws of the radiation of light and the workings of the general physical causality (of which the radiation of light is an instance), but also the study of the anatomy and physiology of the eye and the parts of the brain which process visual information. It also concerns the cognitive aspects of vision, along with the internal faculties which treat and store visual information, namely, the five inner senses described in Avicenna's *De anima*. In Bacon's hands, the science of *Perspectiva* was turned from a mathematical into a physical science, which deals with sensory perception in general.

Bacon's influence was manifest in another work titled *Perspectiva*, which was written in the 1270s by the Silesian cleric Witelo (d. after 1281). It was meant to be an exhaustive, systematic account of the new discipline. Witelo endeavored

to collect in one massive volume the teachings of the entire mathematical tradition in optics, including Euclid, Pseudo-Euclid, Hero of Alexandria (c. 10 BC–70 AD), Ptolemy, al-Kindi, Alhacen, and Bacon. At about the same time, the English Franciscan John Pecham (c. 1230/1235–1292) wrote the *Perspectiva communis*, which became the most widely used textbook on *Perspectiva* in medieval universities. Pecham provided an effective summary of Alhacen's theory, with a minimal use of Bacon's doctrine of the multiplication of species (Lindberg 1976).

The fourteenth-century authors accepted the broad outlines of the perspectivist theory of vision, namely, that vision is produced by intruded rays and that the radiation submits to geometrical analysis and the visual pyramid. They questioned this theory only on a few very restricted issues. For example, Henry of Langenstein (c. 1325–1397) inquired, in his questions on the *Perspectiva*, whether perpendicular rays are indeed stronger than oblique rays, and Blasius of Parma (c. 1347–1416), in his set of questions on the same text, inquired whether species are required for vision, and explored the possibility that bodies no longer in existence are nevertheless perceived. One also finds a text on the rainbow by Theodoric of Freiburg (d. ca. 1311), titled *De iride et radialibus impressionibus*, and a commentary on Pecham's *Perspectiva communis* by Wigandus Durnheimer (fl. 1390) (Lindberg 1976). Some optical issues can also be found in the Aristotelian commentaries on the *Meteorologica*, *De anima*, and *De sensu*. Nicole Oresme, (c. 1320/5–1382) for instance, dealt with visual theory in his *Quaestiones super quatuor libros meteororum*. He argued there that vision requires the arrangement of species within the eye exactly as the points from which those species emanated are arranged outside the eye. This was exactly the theory of Alhacen, Bacon, and Witelo (Lindberg 1976). Optical discussions occurred sometimes within the frame of the biblical commentaries on the book of *Genesis*, especially around the story of creation, and the commentaries on the *sentences* of Peter Lombard (1100–1160). Examples are Grosseteste's biblical commentary – *Hexaameron* – and Peter Aureoli's

(d. 1322) commentary on the *Sentences*, in which he inquired about the relationships among lux, lumen, and color (Lindberg 1976).

Key Issues of Latin Optics

As the science of light and vision, *Perspectiva* primarily concerns the nature of light. The medieval scholars endeavored to discover the nature of light and dealt with the interrelations between light (as lux and as lumen) and color. The origin of these discussions was Avicenna's commentary on *De anima* (Hasse 2000), and they are found already in 1200, for example, in John Blund's (c. 1175–1248) discussion of lux, lumen, color, and sight in his *Tractatus de anima*. In most such discussions, lux is defined as light attached to matter, and receives ontological priority as the form of the source of light. Lumen is the offspring, copy, or image of lux, its species or intention (Raizman-Kedar 2006).

A debate took place concerning light's ontological status and its mode of existence in the medium. Aristotle defined light as the intervening medium (*diaphanous*) when it is in an actual state of transparency. As such, its ontological status is that of a quality. Most medieval Aristotelians followed him on this point. Albert the Great and Thomas Aquinas (1225–1274) held that lumen is an *intentio* having spiritual being in the transparent medium. The perspectivists, however, endowed light a prominent and unique position in the ontological makeup of the universe. Grosseteste elevated light's status, to the “first corporeal form,” which is active by its nature, and which through its unceasing diffusion introduces dimensions into matter (*De luce*). The identification of light with the first corporeal form meant that the study of light became the key to the study of the material universe. Light thus became an observable instance of the latent processes and mechanisms of nature, and the details of its behaviour became the very features of the causal mechanism of nature. In Grosseteste's later writings light became the source of all causal action (McEvoy 1982). He laid the foundation of the doctrine of the “multiplication of species,” which states that

everything in the universe acts on its surrounding through the emanation of its species in all directions. Every natural power, according to Grosseteste, propagates species along lines, and the intensity of its effect depends on the length of those lines: the shorter they are, the stronger is their power. Bacon took up the concept of species from Grosseteste and developed it into a comprehensive system. He defined species as “the force or power by which any object acts on its surroundings,” and contended that it is produced by every active nature and not by light and color alone. The rays of species issue in all directions from every point of the sensible object. A species resembles its agent in “nature, specific essence and operation” and belongs to the same category as its agent. It is brought forth out of the potentiality of the matter of the recipient and through it an agent renders its surrounding similar to itself. For Bacon, universal causation is corporeal and material, uniform and necessary. The species’ activity conforms to a set of “laws of nature” (or laws of “material forms” or of “multiplication”). Being corporeal and physical, the action of species is temporal and finite (Raizman-Kedar 2009).

Some heated debates took place as to the existence of species in general, and the function of species in vision in particular. Peter John Olivi (1248–1298), for example, questioned the cognitive function of species, arguing that they stand as a veil between the perceiver and what he perceives, (Tachau 1988; Smith 2015; Demange 2016). However, most scholastic authors accepted their existence as vital to accounts of action at a distance.

Another issue of debate was the question of whether the progression of light is made in an instant or in time. Aristotle held that since light is a qualitative change in the medium, it advances instantaneously and not by local motion. Alhacen presented the alternative view and argued at length that the travel of light, and hence visual perception, takes time. Albert the Great, Thomas Aquinas, Bartholomew the Englishman (fl. c. 1220–1240), Witelo, and Blasius of Parma (1355–1416) sided with Aristotle, while Bacon and John Buridan (c. 1300–c. 1361) sided with

Alhacen, agreeing that the speed of light is imperceptible, yet finite (Lindberg 1978).

The perspectivists held that light acts uniformly and predictably, and hence searched for optical laws. The premise of the laws was that if no impediment is on its way, light advances in a straight line, which is the most effective in the preservation of force. Grosseteste formulated two laws. The law of reflection (which he got from Euclid’s *Catoprica*) states that when a ray of light encounters an obstacle which it cannot penetrate, it regenerates itself at an angle equal to the angle of incidence (*De lineis*). In case that the ray encounters a medium which does not block its path, but is of a different density, the law of refraction applies: if the second body is denser than the first, then the ray will pass closer to the perpendicular drawn from the place of refraction; if the second body is rarer, then the ray will refract away from the perpendicular (*De lineis*, Smith 2015). Bacon had followed suit and formulated similar laws, along with a few others, under the rubric of “laws of multiplication,” “laws of species,” or “laws of corporeal things” (Kedar and Hon 2018). Witelo added the “reciprocal law,” stating that a ray crossing the interface between two media would, when reversed, retrace its original path (Crombie 1953).

By using the principles of light’s propagation stated above, the medieval thinkers endeavored to find a satisfying account for some intriguing optical phenomena, such as the appearance of rainbows, the circular pinhole image, and the apparent distorted position of the stars.

In his *Meteorologica*, Aristotle suggested that the rainbow colors are produced by the variable weakening of the solar light by reflection and transmission through the nebular mists (Lindberg 1966). Grosseteste explained in *De iride* that the cause of the rainbow was not reflection, but refraction of the sun’s rays through successively denser layers of atmospheric mist. The cloud as a whole acted as a large lens and focused the sunlight so that it appeared as an image on a second cloud opposite the sun (Crombie 1953). Albert the Great, who read Grosseteste’s *De iride*, argued in his *Meteororum* that the efficient cause of the rainbow was the multiple refractions of the sun’s

rays in the raindrops. The refracted rays formed an image on the vapor opposite the cloud, and the colors produced in this manner were real colors existing in the external world. The differences of color resulted from the variations of the density in the moisture of the cloud. Green appeared in the denser drops and red in the thinnest parts. This was similar to what happens when sunlight passes through a prism, from which red emerges near the apex and the darker colors near the base (Crombie 1953). Bacon returned, in his *Perspectiva*, to Aristotle's view that the rainbow was produced by reflection. The rainbow, he argued, is seen in the rays coming from the cloud directly to the eye, not, as Grosseteste supposed, as an image formed on a second cloud. He called attention to the function fulfilled by individual drops, arguing that the rainbow appears in different set of drops for each observer (Lindberg 1966). The rainbow moves with the observer, Bacon noted, and therefore it is a subjective appearance and of a different cause than that of colors in hexagonal crystals. He rejected Albert's theory that the colors were due to differences in the density of the cloud, on the ground that there were no such differences in crystals or dew on grasses, where similar colors appear (Crombie 1953). He suggested instead that the different colors are caused by reflections from small drops of water, from each of which "reflection occurs as from a spherical mirror" (Lindberg 1966). Bacon discovered that the sun, the observer's eye, and the center of the bow were always in a straight line, and by means of observation, he found that the maximal elevation at which the rainbow can appear above the horizon is 42 degrees (Crombie 1953). In the fourteenth century, Theodoric of Freiburg (d. ca. 1310) gave for the first time a satisfactory solution of the causes of the rainbow. He argued that the primary bow was a result of both refraction and reflection of the rays within individual raindrops. Theodoric explained correctly the order of the colors of the primary bow, and the reversal of this order in the secondary bow (Crombie 1953).

The phenomena of pinhole images – in which radiation from a spherical body, passing through a small triangular or rectangular aperture, produced a circular image – attracted the perspectivists

because it seemed to cast doubt on the rectilinear propagation of light and thereby on the entire optical endeavor. Bacon devoted to this problem about a quarter of his treatise on burning mirrors (*De speculis comburentibus*), alas with no success. Witelo considered the problem in six propositions of his *Perspectiva*. He attributed light's circularity to the intersection of rays coming from all directions, especially those intersected at the periphery of the aperture (Lindberg 1968). In his *Tractatus de sphaera* Pecham distinguished between primary and secondary lights (primary light rays are produced by a luminous source whereas secondary light rays are produced from primary light rays). Primary light is propagated in straight lines and conforms to the shape of the aperture; the secondary rays diffuse outside the primary beam and give rise to a circular image. The primary and secondary images are superimposed, hence the composite image appear circular (Lindberg 1968).

Another puzzle that attracted attention was the apparent dislocation of the stars near the horizon. Bacon used the law of refraction to explain this distortion. When the star is on the meridian line near the zenith of the observer, its rays fall perpendicularly and therefore do not refract. Thus the star is seen in its true position. But when the star rises its rays fall at oblique angles. The rays refract between the celestial sphere and the sphere of fire because these two media differ in density, and vision sees by broken lines and errs in regard to the position of the star. Oresme devoted his *De visione stellarum* to this problem. He demonstrated that refraction can occur not only at the interface of two media, but also in a single medium of a varying density. He suggested that atmospheric refraction occurs along a curve and proposed to approximate the curved path of a ray of light in the atmosphere by an infinite series of line segments, each representing a single refraction.

The laws of optics were sometimes put to practical purposes. The actual construction of instruments was quite rare, but discussions of various types of lenses and mirrors abounded. In *De iride* Grosseteste suggested the possibility of magnifying lenses, which is based on a principle he learned from Euclid and Ptolemy, that the size

and position of the visible object depends on the size of the angle through which it is seen. A thing is made invisible not by great distance but by the smallness of the angle of vision. The use of lenses is meant to increase the angle of vision by the refraction of light-rays (Crombie 1953). Grosseteste used also the law of refraction to explain the operation of the burning glass. The rays going through double refraction (one on entering the glass and another on leaving it) concentrate beyond the burning glass, and at the point of meeting combustion occurs (Crombie 1953). Witelo reported the construction of a parabolic mirror that would concentrate the sun's rays at a single focal point. He described the actual manufacture of a parabolic mirror out of a concave piece of iron. Witelo also made actual measurements of the angle of refraction at the surfaces between different media. He used the detailed description of the construction of such an instrument, which he found in Alhacen. He used the same instrument to show that not only white light, but also colors travel in straight lines in a single medium (Crombie 1953).

When medieval thinkers addressed the explanation of sight, the first issue they had to tackle was the question of its direction. They have found among their sources two opposing schools: Euclid, Ptolemy, and Galen argued in favor of extramission, namely, that sight occurs by rays emitted from the eye. Aristotle, Avicenna, Alhacen, and Averroes (1126–1198) claimed that sight is caused by the reception of forms emitted by external objects (by intromission). The Muslim thinkers argued against extramission, adducing arguments based on the appearance of an after image when the observer shifts his gaze from a bright spot to a dark region, and the injurious character of bright light. These arguments were repeated by medieval thinkers. Albert, who was the first in the West to defend Aristotle's theory of vision, argued most forcefully and effectively when opposing the extramission theory of vision. In answering the argument that animals have light in their eyes since they shine at night, he insisted that this is simply the result of fiery particles in the outer surface of the eye and not light that issues forth (Lindberg 1976).

Grosseteste and Bacon opted for a two-way transmission. Grosseteste accepted the basics of the Aristotelian account, but insisted that the eye emits visual rays in order to complete the act of vision. Bacon affirmed, along with Aristotle and Alhacen, that sight is basically a matter of intromission. It was in fact a direct derivative from the theory of the multiplication of species that the senses participate passively in the visual process, while the species is the agent. However, Bacon argued that the eye, just like everything else, emits species, and that those species have a special function in vision; they “ennoble” the incoming species and render them suitable to being received by the soul. Pecham too modified Alhacen's theory in order to admit that visual rays issuing from the eye also play an essential part in the visual process (Lindberg 1976). Olivi presented the most outspoken opposition to intromission, claiming that it denigrates the status of the will in the human soul, and that it fails to account for the selectivity of sight (Tachau 1988; Demange 2016).

An account of the process of sight is not complete without a description of the physiology of the eye. The perspectivists, following Avicenna, described the eye as made of three coats and three humors. The inner coat consisted of the *retina* – an expansion of the nerve forming a concave net which conveys nourishment, and a thicker part called *uvea* (the choroid). Outside the *uvea* were the *cornea* and the *consolidativa* (sclerotic coat). Inside the inner coat were the three humors: the aqueous humor, the crystalline humor (the lens), and the vitreous humor. The crystalline humor is called the pupil and it is identified as the seat of the visual power (Crombie 1953). In his effort to understand the act of vision, Bacon extended the geometrical analysis into the human anatomy. He held that all the tunics and humors of the eye are enclosed by spherical surfaces, the centers of which are situated on a straight line running from the center of the pupil to the opening of the optic nerve (Smith 1981).

Sight begins to act upon receiving stimulation by species. According to Alhacen, each point of lux and illuminated color on the visible object's surface multiply its species to every point on the

surface of the eye. The lens makes a coherent image out of the multiplicity of rays, by selecting only the species that reach it orthogonally, since they are the shortest and therefore the strongest. The other species are ignored (Smith 2015). Perpendicular rays enter the eye without refraction, pass through the cornea and front surface of the crystalline lens, and refract at the rear surface of the crystalline lens. Then they are projected through the opening of the optic nerve, where species from both eyes join to form a single image (Smith 1981).

According to Bacon, sight can perceive twenty-two visible qualities, among which are light, color, remoteness, shape, size, motion, rest, transparency, density, beauty, and ugliness. Only two of those qualities produce *species*, and therefore only those two are directly perceived by sight, namely light and color. All the other visual qualities are deduced by inference from those qualities which produce *species*, that is, deduced from the way the *species* of light and color are arranged on the surface of the eye. Distance is grasped from the comparison between the sensible bodies intervening between the eye and the distant object. Magnitude is grasped from the size of the angle formed at the observer's eye compared with the distance from the observed object. To assess the magnitude, the viewer must compare it with familiar objects. The unfamiliar object is instantaneously compared and reduced to some reliable measure already available in memory. Motion is discerned by comparing a moving object with another object over an appropriate time span. Now it becomes clear why Bacon states that it is not the eye which sees, for the workings of comparison, memorizing, and judgment require the involvement of several internal faculties: imagination, memory, and cogitation (*Perspectiva*).

Following Alhacen, Bacon distinguished three modes of visual perception: sense alone, knowledge, and syllogism. Light and color are perceived through sense alone: that is, through the sense of sight and the common sense, without the help of any other faculty of the soul. This sort of cognition is fully valid, yet weak and revealing merely whether things exist or not. The ability to

distinguish universals from one another and from particulars, involving comparisons and the use of memory, belongs to the second kind of visual perception called "cognition by comprehension." By comprehension we grasp not only that what we see is light or color, but also of what kinds they are and what qualities they possess. We can gather whether we are seeing the light of the sun or of the moon, or whether a particular color is white or blue. Cognition by comprehension works by comparison with previous perceptions. When we grasp the species of an object that we have not seen before, we recognize the object only as belonging to a general category. But if we manage to find in our imagination a previous image of the same object, then we can also recognize it as a certain particular, such as a certain man or a certain dog. This second mode of visual perception requires imagination and memory. The third mode of visual perception, namely, syllogism, does not involve comparisons but considers the thing at hand absolutely. It resembles reasoning, using premises to arrive at conclusions. An example of such reasoning is someone holding a transparent stone in his hand. He only perceives its transparency by comparing it with a dense object placed at a suitable distance beyond the stone. He gathers that the stone in his hand is transparent because he could not see through the other object. We reason in this way naturally and without self-consciousness. All twenty visual qualities besides light and color, such as magnitude and beauty, are thus grasped by the syllogistic mode of perception, which is common to man and animals (*Perspectiva*).

Bacon's faculty psychology divided the brain into three chambers. The anterior chamber – *phantasia* – houses the common sense and imagination. Upon receiving the species, the common sense first makes judgments concerning each sense separately, discerning the distinctive kind of information supplied by the proper senses. The species are then retained in the imagination. In the middle chamber of the brain, the estimative faculty receives the species of the substantial nature of things, and memory, at the rear chamber, retains them. The species retained in both *phantasia* and memory are multiplied all the way to cogitation,

located in the middle cell of the brain. This faculty is responsible for the syllogistic mode of cognition, and serves as the link between the sensitive and the rational soul in men (Smith 2015).

One can now appreciate the scope and complexity of medieval Latin optics, which had a considerable impact upon early modern opticians, such as Kepler (1571–1630) and Descartes (1596–1650).

Oxford Calculators

Edith D. Sylla
Department of History, North Carolina State
University, Raleigh, NC, USA

Abstract

With Richard Swineshead's *Book of Calculations* taken as its characteristic product, the "Oxford Calculators" were a group of thinkers at Oxford University in the mid-fourteenth century, most but not all of whom were associated with Merton College, for which reason they were earlier called "the Merton School," and credited with contributions to astronomy and to the development of mathematical physics. The particularly "calculatory" features of the work of this group seem to have resulted from their connection to undergraduate disputations in the Faculty of Arts, particularly those devoted to the solution of so-called sophismata.

Historical and Systematic Development of the Movement

Several factors combined to bring about the work of the Oxford Calculators. First of all, undergraduate education at Oxford in the fourteenth century emphasized taking part in disputations as a way of training students to detect fallacies, argue logically, remember significant detail, think quickly, and so forth. The curriculum of the Faculty of Arts included grammar, logic, the quadrivium (arithmetic, geometry, astronomy, and music), natural philosophy, ethics, and metaphysics. The most important tool used in disputations was logic, especially the "new logic," which made use of the theory of supposition and related tools of analysis. All students took part in disputations on sophismata, that is perplexing propositions linked to a "case" with reference to which the truth or falsehood of the sophismata statement was to be judged. Typical calculatory sophismata from a relatively early period are those of Richard Kilvington, starting with the sophisma sentence, "Socrates is whiter than Plato begins to be white," taken together with the case that Socrates is now white in a given degree, while Plato begins to increase his whiteness from having no whiteness at all. This case and the related sophisma sentence are perplexing because "whiter" is understood to involve a geometric ratio between Socrates' whiteness and Plato's whiteness, but if Plato begins to become whiter from not being white at all, Plato will begin from zero whiteness and the initial ratios between Socrates' finite whiteness and Plato's very earliest whitenesses will be greater than any given ratio, or potentially infinite. To resolve the sophism, the respondent had to determine whether as Plato or any other subject begins to become white, there is a first instant of being white with some degree of whiteness or only a last instant of having no whiteness at all. If there were a first instant of being white, then there would be a finite ratio between Socrates' whiteness and Plato's first whiteness, but if there is no first instant of Plato's being white, as was normally assumed, then the ratios between Socrates' whiteness and Plato's whiteness will be greater than any given value as one considers

times closer and closer to the beginning of his whitening (see Richard Kilvington 1320s/1990).

Only a few of Richard Kilvington's 48 *sophismata* do not deal with situations involving natural philosophy and related issues of continuity and infinity, and thus Norman and Barbara Kretzmann are right in claiming in their edition of his *Sophismata* that it "may be taken as a paradigm of the philosophical problems and techniques that characterize the work" of the Oxford Calculators. Interestingly, Kilvington's series of commentaries on the works of Aristotle in the form of a few (usually about ten) but lengthy questions track the acceptance of the second major factor in the development of the Oxford Calculatory approach, namely Thomas Bradwardine's new theory of the relations of proportions of forces to resistances, on the one hand, and velocities produced on the other, which appeared in 1328 in his *On the Proportions of Velocities in Motions*. According to Bradwardine's new theory, the proportion of force to resistance must be "duplicated" for a velocity to be doubled, "triplicated" for the velocity to be tripled, and so forth – where "duplicated" not infrequently was rendered "doubled," and "triplicated" as "tripled." Thus the proportion of nine to one was said to be "double" the proportion of three to one, so that nine to one would, according to Bradwardine's theory, produce a velocity double that produced by a proportion of three to one.

Given that Richard Kilvington's *Sophismata* was earlier than Bradwardine's *On the Proportions of Velocities in Motions*, it follows that the context of disputations on *sophismata* was more important than Bradwardine's *On Proportions* in leading to the Oxford Calculatory movement, and yet Bradwardine's mathematical physics certainly contributed to the impact that the Oxford Calculators had, first at the University of Paris, and later at Italian, Spanish, and eastern European universities. For the next 200 years and more, university student textbooks would include the mathematics of proportions needed for Bradwardine's science of motion as well as the standard topics of logic and *sophismata*, etc. (Not discussed here are the external factors that may have contributed to the

turn to quantification, but see Kaye (1998) for an argument that economic factors were important).

In earlier surveys of the work of the Oxford Calculators, Richard Kilvington played a relatively small part, but that was because none of his work was in print until the *Sophismata* were edited in 1990; because his *Questions on Aristotle's Physics*, ascribed in manuscript to "Magister Richard," had tentatively been assigned to Richard Swineshead; and because his *Questions on Aristotle's On Generation and Corruption* and *Nicomachean Ethics*, and on Peter Lombard's *Sentences* had been little noticed. More recently Elzbieta Jung has begun to edit the rest of Kilvington's corpus beyond the *Sophismata*. Eventually, we will be able to see the application of the Oxford Calculatory approach throughout the curriculum, including theology and Kilvington will take a central place among the Oxford Calculators.

Jung has shown that the order of composition of Kilvington's works is (1) the *Sophismata*, before 1325; (2) the *Questions on Aristotle's On Generation and Corruption*; (3) *Questions on Aristotle's Physics*; (4) *Questions Aristotle's Ethics*; and finally (5) *Questions on the Sentences*, which she dates as before the end of 1334. In the *Sophismata* there is nothing to indicate that Kilvington had any idea of Bradwardine's new theory of the proportions of velocities in motions. In his *Questions on Aristotle's On Generation and Corruption*, Kilvington seems to know Bradwardine's usage according to which the proportion of nine to one is called "double" the proportion of three to one, but Kilvington rejects this approach because he says that in the case of proportions of lesser inequality (i.e., where the first term is less than the second), proportions become less by being duplicated, as the proportion of one to nine is less than the proportion of one to three. In his *Questions on Aristotle's Physics*, however, Kilvington accepts Bradwardine's theory of the relation of proportions of force to resistance to velocities. We may suppose then that in the years around 1330, Bradwardine's function came gradually to be accepted, and remained the dominant view for the next 200 years, despite a minority who protested against it, mostly on mathematical

grounds. Jung has argued that Kilvington's *Questions on the Physics* are before Bradwardine's *De proportionibus*, and hence that Kilvington influenced Bradwardine in the introduction of "Bradwardine's function" rather than vice versa. There is more evidence, however, that those who rejected Bradwardine's function often took arguments against it from Kilvington's work. It would be safer to say, then, that Bradwardine and Kilvington were sparring partners in this matter. In later years both Bradwardine and Kilvington, along with Walter Burley and others, were employed as members of the circle of Richard of Bury, Bishop of Durham (see articles on these individuals).

William Heytesbury's 1335 *Rules for Solving Sophismata* follows mainly in the footsteps of Kilvington's *Sophismata*, with some influence from the work of Bradwardine. In addition to discussing questions of dynamics—how velocities are related to the forces and resistances causing them—Bradwardine had also discussed the measure of motion with respect to effect (*tanquam penes effectum*). For instance, how should a velocity of rotation be measured? Should it be measured by the motion of the fastest moved point of the body rotating, or by some average of the velocities of the various parts or points of the body? Likewise, the question might be raised as to how motions nonuniform in time, that is, motions that are accelerated or decelerated regularly or irregularly, are to be dealt with. Heytesbury, Dumbleton, and later authors accept the so-called Merton mean-speed theorem, recognizing that a uniformly accelerated body will cover the same distance as it would cover if in the same period of time it moved uniformly with the velocity it had at the middle instant of the motion.

In Heytesbury's *Rules for Solving Sophismata* natural philosophical issues are involved in many, but not all of the chapters. Thus the sixth chapter concerns the measures of motion in the categories of place, quality, and quantity, but the earlier chapters concern: (1) insoluble sentences, such as the liar paradox; (2) paradoxes involving the terms to know and to doubt; (3) relative terms; (4) beginning and ceasing or first and last instants;

and (5) maxima and minima. Thus it is mainly the last three chapters that deal with the natural philosophical topics with which the Oxford Calculators are primarily identified.

It is generally accepted that most of the Oxford Calculators tended to follow a nominalist, ontologically minimalist, or Ockhamist line, as opposed to a realist line. Thus they assumed that there are no Platonic forms existing outside of individual substances and they tried to understand the intension and remission of forms in terms of the actual qualitative forms inhering in a body. Although they did not all discuss the matter explicitly, it appears that most of the Oxford Calculators (but not Walter Burley) followed John Duns Scotus in holding the so-called addition theory of intension or increase of quality (see Sylla 1973). In his 1968 article "Ockham and some Mertonians" (Weisheipl 1968, p. 173), James A. Weisheipl said that the Mertonians, except Walter Burley, accepted the Ockhamist teaching in logic and natural philosophy "as a matter of course." In contrast to the other Mertonian Calculators, Burley was a "realist" in the sense that he argued against Ockham's nominalism in logic.

If William of Ockham is not included as an "Oxford Calculator" – because he did not take a calculational and sophistical approach to natural philosophical problems – does it make sense to include Walter Burley? Burley had already left Oxford to study theology in Paris long before the late 1320s when Bradwardine's *On Proportions* appeared, so his Aristotelian commentaries are more like those of the late thirteenth century than like Kilvington's commentaries consisting of a short list of very long questions. Actually, Burley wrote a commentary on Aristotle's *Physics* with fairly long questions as well as an exposition of the text when he was still teaching at Oxford, not long after 1300. (Burley's early *Physics* commentary seems to have a close relationship to that of Thomas Wylton, something that has yet to be entirely sorted out.) But Burley revised his *Physics* commentary while teaching in the Faculty of Arts at Paris at the same time as his work in theology, and he completed the revision of the last books after he was already a member of

Richard of Bury's circle, back in England, and associated with Bradwardine and Kilvington. It is, however, Burley's work in logic and his separate treatises or questions that reveal his similarities to the likes of Heytesbury or Richard Swineshead. Two of his works, the so-called *Tractatus primus* and *Tractatus secundus* on the intension and remission of forms, were off-shoots of his bachelor lectures and disputations on the *Sentences* at Paris. Nevertheless, they pay the same attention to issues of indivisibles and continuity in a natural philosophical context as do the other works of the Oxford Calculators. Burley's quodlibetal question *On the First and Last Instant* is also calculatory in nature as are some of his later works composed in the 1330s.

Of all the Oxford masters who might be included among the "Oxford Calculators," it was Thomas Bradwardine, William Heytesbury, and Richard Swineshead whose works received multiple early modern editions, commentaries, and elaborations. Out of its Oxford context, Richard Swineshead's *Book of Calculations* (*Liber calculationum*) appears to be a work of mathematical physics, covering the sub-topics that might be expected to arise from Aristotle's natural philosophical works, but then elaborating quantitative "calculations." At Oxford itself, however, the work of Bradwardine, Heytesbury, and Kilvington was closely related to works on natural philosophy, to which logical and mathematical methods might be applied. Perhaps surprisingly, early modern printers did not choose to publish the more natural philosophical works of the Oxford Calculators, except in the case of Walter Burley, whose thorough commentary on Aristotle's *Physics*, as it was revised at the University of Paris in the 1320s and later, received multiple printings.

A larger gap in our knowledge comes from the fact that John Dumbleton's *Summa of Logic and Natural Philosophy* has never been printed. Dumbleton's explanations of the theories of latitudes and degrees shared by the Oxford Calculators and of Bradwardine's theory of the proportions of velocities in motions go a long way to reveal what is tacitly assumed about natural philosophy by William Heytesbury and

Richard Swineshead. A start to fill in this gap has been made in the article on John Dumbleton elsewhere in this volume.

Of all the individuals who might be considered Oxford Calculators, this encyclopedia contains separate articles on John Dumbleton, Richard Kilvington, Richard Swineshead, Thomas Bradwardine, Walter Burley, and William Heytesbury, but it lacks an article on Roger Swineshead, probably because Roger has sometimes been lumped together with Richard Swineshead. Given this lack, something more about Roger Swineshead will be said here.

In his thorough work on medieval theories of insolubles and on the exercise of obligations, Paul Spade has made clear the significant place that Roger Swineshead held in each of these traditions. With regard to the exercise of "obligations," Roger Swineshead directed the respondent to reply taking into account only the position, which he had been obligated to affirm, whereas Burley had earlier required that the respondent in obligations exercises take account not only of the position to which he was originally obligated, but also of all the other propositions that he had accepted, rejected, or labeled doubtful earlier in the exercise. With regard to insolubles, Roger Swineshead took a position that might be regarded as a variant of the position held by Thomas Bradwardine. According to Bradwardine, for a proposition to be true, it must not only "signify as is the case," but also not signify other than is the case. To this Roger Swineshead added that for a proposition to be true it must not "falsify itself" (see Spade 2005). From this position, Swinehead concluded that some insolubles do signify as is the case, despite being false – as is true for the proposition "*a* is false," where *a* is the proposition itself. In some valid formal inferences, Swineshead said, falsehoods follow from truths. And, finally, in the case of insolubles, two mutually contradictory propositions can be false at the same time (Spade 2005). In his 1335 *Rules for Solving Sophismata*, Heytesbury added to the debate about insolubles the requirement that the circumstances in which the insoluble is asserted must be taken into account before anything can be said about its truth or falsehood.

In his *On Natural Motions* (c. 1337), Roger Swineshead compiled a work that included both natural philosophical theory and the particular methods of the Calculators (see Sylla 1987a). Unlike Dumbleton, who was to advocate the mainstream theories that the other Calculators simply assumed, Roger Swineshead advocated theories that, whether on purpose or not, made it easy to reach apparently paradoxical conclusions. Thus he defined “uniform degrees” of qualities or velocities and uniformly difform degrees, where the “uniform degrees” were indivisibly greater than a uniformly difform distribution that included every degree of a quality less than the given uniform degree. There is only one complete manuscript of Swineshead’s *On Natural Motions*, which currently is MS Erfurt Amplonian F 135, but a famous student notebook from the 1340s still existing as MS Paris, BNF 16621 includes excerpts from *On Natural Motions* (in a more accurate version than the Erfurt manuscript), along with excerpts from Dumbleton, *Summa*; Burley, *On First and Last Instants*; Bradwardine, *On Proportions of Velocities in Motions*; and other calculatory works (see Kaluza 1978).

But it is Richard Swineshead’s *Book of Calculations* that gives the Oxford Calculators their name (see Murdoch and Sylla 1976). That book begins by discussing the measures and intension and remission of qualities and works up to more and more complicated situations. With regard to bodies that are non-uniformly qualified with whiteness or heat, Swineshead asks what degree of quality should be assigned to the body as a whole – the maximum degree perhaps, or some sort of average degree? If there is a body that has two different qualities, say it is both hot and moist, is there an overall degree that might be assigned? And how will the substantial form of a body change as the qualities change? As water is heated, will it immediately begin to become air, or only after the hotness has reached a certain degree? And if two bodies with different degrees of various qualities like hot, cold, wet, and dry act on each other and resist each other, what will determine the force with which one body acts on another – will it involve the maximum degree? The average degree? The extent of the body? The

“quantity of quality” if certain bodies have, so to speak a greater density of quality than others (think of specific heats)? If the force must be greater than the resistance for action to occur, how can hot and cold bodies interacting with each other each act on the other at the same time (this is the problem of “reaction”)?

In later treatises of the work, Richard Swineshead deals with the power of light sources, as measured by the intensity of the light they cast together with the distance to which the illumination extends. He then turns to cases of local motion. After a treatise in which he shows how Bradwardine’s function works to calculate what velocity will result if it is known what velocity results from an initial situation and how the force or resistance changes, Swineshead attacks problems where the resistance to a mover results from the medium in which the mover is exerting its force. Here the Bradwardinian theory, as well as the classical Aristotelian theory, runs into problems, because both theories indicate what the “velocity” will be for a given force and a given resistance. If, however, the degree of resistance depends on the position of a moving body in a nonuniform resistance, there will be two, most likely contradictory ways to calculate velocity – either by the ratio of force to resistance (this is the measure of motion with respect to cause) or by the distance moved in a given time (this is the measure of motion with respect to effect).

As if this were not a sufficient problem, Swineshead then supposes that the nonuniform resistance of the medium moves, as the mobile itself moves. It is not difficult to see that if there were a medium with little resistance with a boundary layer next to a medium of high resistance, and if this boundary layer were moving in the direction the mobile is moving, then the mobile might move up very quickly to the boundary layer and get stuck there, if the boundary layer were moving faster than the mobile, given its force, was able to move in the more resistant medium. But then the velocity of the mobile within the boundary layer would not correspond to the proportion of its force to the resistance of medium, but rather simply to the velocity of the boundary layer.

In all of this, it appears that Swineshead is interested providing exercises that will give the students facility in working with such calculations as applied to physical problems. The problems are much more complex than the problems that Galileo would later deal with, assuming nonresistant mediums, and they bear some relation to hydrodynamics applied to biological systems. In later Treatises, turning from local motion to alteration, and assuming that an agent of qualitative change, such as a heat source, causes a greater effect next to itself, which decreases, perhaps uniformly, the farther away from the agent one gets, Swineshead considers how, over time, the maximum degree might be induced into an extended body. In the separate article on Richard Swineshead, reference is made to Swineshead's Treatise 11, which discusses what would happen if a thin rod were to fall through a channel in the earth until it began to pass the center, in which case part of the rod would begin to try to move back toward the center.

How then are we to understand the context and purpose of Swineshead's *Book of Calculations*? On one level, it seems to be a book of mathematics applied to various natural philosophical problems. But while the natural philosophical problems are indeed like problems that had long been raised in connection with commentaries on the natural works of Aristotle, they are often more complex and technical. Much has been made of the tendency of fourteenth-century philosophers to deal with problems *secundum imaginationem*, that is supposing imaginary situations, and inquiring what would happen in such a case. It has been supposed that this resulted from the condemnations at Paris in 1277, as a result of which philosophers teaching at the university of Paris were enjoined not to deny that God might do anything that is not a logical contradiction. So, it followed, God might create a vacuum by annihilating everything inside the sphere of the moon. What then? If there was a mobile without any resistance, would it not move infinitely fast, according to the theories of Aristotle or Bradwardine?

Swineshead, however, does not seem to be invoking God's absolute power in designing the problems to which he applies his "calculations" – almost all of which, notably, involve juggling

quantities in the mind without any actual numbers or arithmetic being involved. Rather, the point seems to be to exhibit what can be achieved with the available logical and mathematical tools. There really is not a special subject matter, in which the students are expected to be interested. The point is not to study the ballistics of cannons or the motion of ships through water or any other practical problem. The obvious conclusion seems to be that, just as Heytesbury's *Rules for Solving Sophismata* was written as a handbook for students who would take part in disputations on sophismata, so Swineshead's *Book of Calculations* was most immediately to be an aid to students in their disputations, whether in the very same disputations on sophismata as Heytesbury's book, or in disputations connected with the curriculum in natural philosophy or ethics. In fact, we can see Richard Kilvington and then later scholastics applying calculatory techniques in their commentaries on Aristotle's *Ethics* and on Peter Lombard's *Book of Sentences*.

When calculatory techniques were applied in theology, was it an incredible misapplication of technical brain power to matters better left to the heart? This may very well be a reasonable judgment in the case of a theologian such as Jean de Ripa, who seems to have been influenced by the Calculators (see Coleman 1975; Kaye 1998). This issue, however, goes beyond the work of the Oxford Calculators proper, and will not be pursued here.

Very soon after the 1330s when calculatory ideas developed at Oxford, they spread to Paris, perhaps as Oxford students traveled to Paris to study theology, as was the case of Burley and Dumbleton. Nicholas Oresme and Albert of Saxony wrote treatises extending, on the one hand, and simplifying on the other, Bradwardine's theory of the proportions of velocities in motions. Later the logical ideas of the likes of Heytesbury were widely studied in Italian universities and then in eastern European universities such as Erfurt (see Sylla 1996a). At the beginning of the sixteenth century, Alvarus Thomas of Lisbon, teaching at Paris, thoroughly mastered Swineshead's *Book of Calculations*, as well as some of the extensions of his work by Nicholas

Oresme, and discussed astutely some of Swineshead's knottier problems (see Sylla 1989, 2004). Although the label "calculators" was not applied in the fourteenth century to Swineshead or the men surrounding him – at the time, "calculations" was more likely to bring to mind the work of astrologers – the label began to be used in the sixteenth century, when it became common to label the different philosophical approaches or "ways" (*via modernorum, antiqui, nominales*, etc. see Wallace 1969).
