Preface to the Second Edition

The second edition of the *Encyclopedia of Medieval Philosophy* is substantially revised and expanded from the first edition, which was published 10 years ago. It was already at that time the largest reference work on medieval philosophy in English (or for that matter any language as far as I know) and continues to be with almost 500 entries in the new edition. The expanded material foremost consists of new entries on lesser-known figures in medieval philosophy. In all other aspects the *Encyclopedia* is the same as the first edition and includes entries on philosophers, concepts, terms, historical periods, subjects, and the cultural context of philosophy in the Middle Ages. Furthermore, it covers Latin, Arabic, Jewish, and Byzantine philosophy and includes entries on the cross fertilization of these philosophical traditions.

A unique feature of the *Encyclopedia* is that it does not aim to define what medieval philosophy is. It simply aims to cover philosophy between the period 500 C.E. and 1500 C.E. It is my belief that there is nothing that is distinctly medieval about philosophy between these dates. Instead, philosophers and theologians worked (as in other times) with the historically given material that they had access to and formed their own answers to philosophical questions, some of which were as old as philosophy itself, while others had emerged in the thinker's own cultural context. Their answers were sometimes restricted by the culture and political atmosphere, and sometimes not. Some of these answers led to the development of new ways of thinking and conceptualizing the world, which were contrary to the traditional. This makes it possible to approach medieval philosophy without any preconceived idea of what philosophy is or was, which allows the inclusion of all the facets of medieval thinking that make up philosophy of the time.

A new feature is also that the *Encyclopedia* contains a table of contents, which allows the reader to get a fast overview of the contents. The entries in the *Encyclopedia* are organized in an A–Z format for easy access, as in the first edition. Each entry begins with an abstract and ends with references to related entries and a bibliography divided into primary and secondary sources. All authors are experts in their topic, and their entries have been read by at least one member of the editorial board to ensure the highest quality and standard of scholarship.

I have reconceived the editorial board slightly for the second edition and I would like to thank the old board for their invaluable contribution. The new board, which includes some members from the first edition, have been equally invaluable in finishing this new edition. The *Encyclopedia* is now online as

well and exists as a live reference work, which means that it is continuously updated and expanded. In that form, I hope it will live on for many more decades. I also need to thank the staff at Springer Reference for helping me and for working tirelessly to make this work such a good resource.

Henrik Lagerlund
Editor

Preface to the First Edition

Although there are many handbooks, companions and histories, this is the first encyclopedia of medieval philosophy published in English. It is, therefore, with some excitement that I present it here to you, dear reader. The aim of this book is to provide scholars with an easy access reference work that gives accurate and trustworthy summaries of the present state of research. It includes entries on philosophers, concepts, terms, historical periods, subjects and the cultural context of philosophy in the Middle Ages. Furthermore, it covers Latin, Arabic, Jewish and Byzantine philosophy, and includes entries on the cross fertilization of these philosophical traditions.

As mentioned in the first edition, a unique feature of this encyclopedia is that it does not aim to define what medieval philosophy is. It simply aims to cover philosophy between the period 500 and 1500. It is my belief that there is nothing that is distinctly medieval about philosophy between these dates. Instead, philosophers and theologians worked (as in other times) with the historically given material that they had access to, and formed their own answers to philosophical questions; some of which were as old as philosophy itself, while others had emerged in the thinker's own cultural context. Their answers were sometimes restricted by the culture and political atmosphere, and sometimes not. Some of these answers led to the development of new ways of thinking and conceptualizing the world, which were contrary to the traditional.

Although the scope of this encyclopedia is, with over 400 entries, considerable, it is of course not exhaustive. Practical obstacles precluded the creation of the reference work that I had in mind, and I had to revise and downsize my aim several times. However, I am proud of the work and hope that it will be useful for many years to come. A dream is to develop it into a web-based internet encyclopedia, which will come closer to my idea of an ideal reference work. Despite this it is nonetheless the most exhaustive reference work on medieval philosophy available.

The entries in the encyclopedia are organized in an A-Z format for easy access. There are short entries of about 1500 words, medium entries of about 3000 words and survey entries of about 5000 words. Each entry begins with an abstract and ends with references to related entries and a bibliography divided into primary and secondary sources. All authors are experts in their topic, and their entries have been read by at least one member of the editorial board to ensure the highest quality and standard of scholarship.

As with all projects of this kind, it is really a team effort, and this encyclopedia would never have been completed on time without the editor and

editorial assistants at Springer Reference. They have done a wonderful job and I am truly grateful for their knowledge and patience. I also want to thank the editorial board, especially Cristina D'Ancona, John Marenbon, and Stephen McGrade, for doing a fantastic job much beyond the call of duty. I would also like to thank Eliza Benedetti and Alain Ducharme for helping with some of the translations and I would especially like to thank Alain Ducharme for helping with proof reading. The encyclopedia is, however, foremost a product of the individual authors that have contributed towards it. I would like to thank all of them for their invaluable support and input.

Abstract

Between the eight and the ninth centuries, the production of original philosophical and scientific treatises became dominant with respect to the study of Greek philosophical and scientific literature in Arabic translation. This is due to the contribution of translators and al-Kindī’s thought, as well as to the experience of the teachers in the tenth-century Aristotelian circle of Baghdad, mostly al-Fārābī. All these teachers had the intention to classify the sciences, to return to a literal commentary of the Aristotelian text following the Alexandrine model, and to single out the nature of *falsafa* and the Greek-Arabic sciences and their relationship with the Qur’ānic sciences – an approach that extends from the end of the eleventh, throughout the twelfth, and up to the beginning of the thirteenth century. It is enough to mention Avicenna to get an idea of this development in the Arabic-Islamic philosophy and medicine of these centuries. The

claim has been made that this generated a sort of “purist” reaction (Gutas, Greek thought, Arabic culture. The Graeco-Arabic translation movement in Baghdad and early ‘Abbāsīd society (2nd–4th/8th–10th centuries). Routledge, London/New York, 1998), best exemplified by Averroes and his program of going back to Aristotle and the Greek tradition. Such a phenomenon took place not only in al-Andalus but also in the East of the Islamic world: Muwaffaq al-Dīn Muḥammad ‘Abd al-Laṭīf ibn Yūsuf al-Baġdādī would be the best representative of this current of thought.

‘Abd al-Laṭīf al-Baġdādī has been considered a pedantic scholar, whose approach to science and philosophy was scholastic and legalistic rather than experimental and creative. Nevertheless, the labels of “purist” and “compiler” are not suitable for describing the intellectual life of this writer. ‘Abd al-Laṭīf al-Baġdādī cannot be considered as a supporter of a sort of coming back to Aristotle or Galen sic *et simpliciter*. True, he claimed in his autobiography the necessity to go back to the Greek sources. Still, the reader must go beyond this claim and try to see what corresponds to it in the historical reality of ‘Abd al-Laṭīf al-Baġdādī’s sources. In doing so, the reader will realize that ‘Abd al-Laṭīf al-Baġdādī’s sources are by no means the Greek scientific and philosophical texts in themselves – too far from him – but those

produced by the assimilation of the Greek thought in Islamic culture, that have been reworked by ‘Abd al-Laṭīf al-Baġdādī not without originality.

We possess two coeval biographies of him. The first is embedded in Ibn Abī Uṣaybi‘a’s biographical work, the *Sources of Information on the Classes of Physicians* (*‘Uyūn al-anbā’ fī ṭabaqāt al-aṭibbā’*). The second is an autobiography, survived in a manuscript of Bursa and its title is *Book of Two Pieces of Advice* (*Kitāb al-Naṣīḥatayn*). Finally, further information on ‘Abd al-Laṭīf al-Baġdādī can be found in the report of his journey in Egypt entitled *Book of the Report and Account of the Things Which I Witnessed and the Events Seen in the Land of Egypt* (*Kitāb al-ifāda wa-l-iṭbār fi-l-‘umūr al-mushāhada wa-l-ḥawādiṭ al-mu‘ayana bi-‘ard miṣr*). From these (not wholly concordant) texts, some elements emerge, that shed light on ‘Abd al-Laṭīf al-Baġdādī’s activity and philosophical and scientific doctrines, between the Ayyūbids’ and Mameluks’ ages. ‘Abd al-Laṭīf al-Baġdādī’s activity was often characterized by violent controversies, as well as by the independence of his convictions, slowly matured but passionately put forward in his writings, and, finally, by his dedication to diverse fields of research. We can follow his purposes and interests, the paths of his education – thanks to the names of the schools, of his teachers, of the travels done – the library he had at his disposal, his encyclopedic work on medicine and philosophy, and his attitude towards both the ancient philosophers and his contemporaries.

‘Abd al-Laṭīf al-Baġdādī was born in Baghdad in 1162 and died there in 1231, after 45 years of absence during which he traveled all over the Islamic world looking for a good teacher in philosophy, under whose guidance he could resolve the problems generated in him by his reading of the works of Avicenna and those on alchemy. As for his education, we know that he got a solid training in Islamic sciences such as grammar, lexicography, and law, and also that then he turned to natural sciences, medicine, philosophy, and alchemy, albeit in a critical vein. His spasmodic search for a teacher in philosophy brought him to meet, directly or through their writings, Avicenna, al-Ġazālī, and Suhrawardī. Many schools’ teachers weighed heavily on his

education and many different environments: Baghdad, Mosul, Halep, Damascus, the centers in Anatolia, and mostly Cairo. Cairo represented for ‘Abd al-Laṭīf al-Baġdādī the much-desired goal of his pilgrimage, the place where he finally met Aristotle and his philosophy, that of his commentators Themistius and Alexander, and where he finally met the greatest Arabic Aristotelian commentator of the East, al-Fārābī, who was for him the first to be able to integrate Islamic and Greek knowledge and to lay the foundations of a new system of sciences. The experience of Cairo also meant for ‘Abd al-Laṭīf al-Baġdādī the progressive abandon of Avicenna’s philosophy, which in the years of his education he had held to be the only possible one and which, after he gave allegiance to the Peripatetic tradition, he vehemently criticized.

He had many patrons and came into contact with many prime order men of his era: scholars, philosophers, physicians, and leaders including Saladin and his secretary ‘Imād al-Dīn al-Kātib al-Iṣfahānī, Maimonides, and Ibn Sanā’ al-Mulk. In his mature years, he taught Koranic and traditional Islamic sciences in the most important schools (*madāris*) of his time: at *al-Azhar* mosque in Cairo, *al-Aqṣā* mosque in Jerusalem, the ‘*Azīziyya madrasa* in Damascus, and finally in Aleppo.

He was one of the few Arab authors known in Europe at the beginning of the nineteenth century. As a matter of fact, the *Kitāb al-ifāda wa-l-iṭbār*, i.e., the description of one of his journeys to Egypt, which he undertook after 1189, preserved in an autograph manuscript (Oxford, Bodleian Library 1149), was translated into various European languages.

‘Abd al-Laṭīf al-Baġdādī was a versatile scholar and a prodigious writer: he wrote several medical and philosophical treatises, still little studied up to now. Many of his works were destroyed in the wave of religious fanaticism of the thirteenth and fourteenth centuries or are still in manuscript form, and in this case, the precise whereabouts of few manuscripts in the various libraries of the Near East, Asia, and Europe are known.

The oldest list of ‘Abd al-Laṭīf al-Baġdādī’s works is that given to use by Ibn Abī Uṣaybi‘a

at the end of his biography of our author. A later list is found in the *Fawāt al-Wafayāt (Omissions of the obituaries)* by Ibn Shakir al-Kutubī (d. 1363). The list presented by Ibn Abī Uṣaybi’a numbers 173 works, including brief essays and treatises. The subjects are extremely varied and reflect the variety of the author’s interests. Thirteen writings are listed which deal with the Arabic language, lexicography, and grammar, 2 with *fiqh*, 9 with literary criticism, 53 with medicine, 10 with zoology, 3 on the science of *tawhīd*, 3 on history, 3 on mathematics and related disciplines, 2 on magic and mineralogy, and 27 on other themes. There are 48 works concerning philosophy: 19 on logic, 10 on physics, 8 on metaphysics, and 9 on politics. Two general works are also mentioned, subdivided into three sections: logic, physics, and metaphysics; one of these is in ten volumes and was completed by the author over a span of 20 years. Ibn Shakir al-Kutubī’s list numbers 15 discourses by ‘Abd al-Laṭīf al-Baġdādī which are not mentioned by Ibn Abī Uṣaybi’a and 81 works, all mentioned, with one exception, in the previous list.

Among the works which have come down to us – or at least those contained in manuscripts so far identified – the following are really significant to comprehend ‘Abd al-Laṭīf al-Baġdādī’s approach to medicine, science, and philosophy: the *Commentary on the Advantages of Knowledge According to Hippocrates*; the *Commentary on the Aphorisms of Hippocrates*; the *Commentary on the Questions of Hunayn*, the *Book of That Which is Evident in Indian Mathematics*; the *Essay on the Senses*, the *Two Questions on Their Function and Natural Questions*; and the *Book on the Science of Metaphysics*.

In this metaphysical work, ‘Abd al-Laṭīf al-Baġdādī presents a synthesis of all the metaphysical knowledge of the past, which is, according to him, the result of an uninterrupted process from Aristotle’s *Metaphysics* to his times through the commentators Themistius and Alexander of Aphrodisias, and through the *Book on the Pure Good of Aristotle* – a selection from Proclus’s *Elements of Theology* – and the pseudo-*Theology of Aristotle* – a paraphrastic translation of *Enneads* IV–VI – a progression that was potentially compromised by Avicenna’s philosophy.

‘Abd al-Laṭīf al-Baġdādī’s project reflects the “theologizing” one elaborated in al-Kindī’s *First Philosophy* (Zimmermann 1986): the knowledge of the causes coincides with the natural theology that investigates the first principle. According to ‘Abd al-Laṭīf al-Baġdādī, the science of Metaphysics includes the knowledge of the truth, which is knowledge of the causes back to the spiritual causes and to the first, which is separate from matter and is the cause of all the others because it gives a limit to the multiplicity of the things which begin and spread out from it. God has such prerogatives. Following Themistius, ‘Abd al-Laṭīf al-Baġdādī states that He is the law of laws, the cause for the existence of the worlds and their ordering, organization, and beauty. His substance is his science and from him derives the order of beings and their organization. In the first divine principle, the substance equals his science.

‘Abd al-Laṭīf al-Baġdādī grafts the features of the Neoplatonic One onto the Aristotelian characterization of the first principle and the point of fusion lies in the doctrine of the self-reflection of divine thought, which for him, under the influence of Themistius and al-Fārābī, does not imply composition and multiplicity within the first principle, as was the case with Plotinus. ‘Abd al-Laṭīf al-Baġdādī assumes that the self-reflection of the divine thought does not cause composition and multiplicity within the First Principle, because in it there is the perfect coincidence of the thinking principle, the act of thinking, and the object of thought. The First Principle thinks its intelligible contents because they are one and the same thing with it. It is the Pure Good, the Absolute Simple, its essence is its attribute, and its attribute is its act. The First Principle is Pure Good and Pure Generous (*jawād*), and therefore, it thinks of itself in this way: the Good Generous is that from which everything emanates (*ṣadara*) and when it thinks of itself, it thinks at the same time of all that emanates from it. All the things have being because of the First Being by way of creation (*ibdā’*), which belongs to the First Cause pouring forth goodness over all things in one emanation and everything receives that emanation according to its own potentiality. The First Cause acts through its being alone (*bi-anniyya faqat*), without any intermediate – whether an instrument

or an additional characteristic – between itself and its effect. Yet the First Cause is true agent. ‘Abd al-Laṭīf al-Baġdādī’s explicit refusal of the handcrafted model of divine causality has its source in the pseudo-*Theology of Aristotle* where the First Principle does not need tools, rather creates according to the Neoplatonic model by only being itself.

Besides this work, other very important treatises are preserved – among which the *Kitāb al-Naṣīḥatayn* already mentioned – in the miscellaneous manuscript *Husayn Çelebi*, 823, discovered in Bursa in 1959 by S. M. Stern and described by him. These treatises are the following: the critique of the notes written by Fakhr al-Dīn al-Rāzī, the *Khaṭīb* of Rayy, on several passages from the *Kullīyyāt* section of Avicenna’s *Qānūn*; the treatise *On the Quiddity of Space According to Ibn al-Haytham*; the *Dispute Between an Alchemist and a Theoretical Philosopher*; the treatise *On Minerals and the Confutation of Alchemy*; and the treatise *On Diabetes*.

From the analysis of ‘Abd al-Lal-L al-Baġdādī’s huge production, the conclusion can be reached that he never held Islamic knowledge to be in contradiction with that of the ancients; indeed, he thought that the critical awareness of the appropriate method for the science under examination came to the scholar of the Qur’ānic sciences precisely from the wisdom of the ancients. His criticisms of Fakhr al-Dīn al-Rāzī can be explained in this sense: this latter was not only unable to undertake the study of the science of the ancients, and in particular medicine, because he did not have the correct use of language and method. Precisely because of this lack, he should not even set out to approach the sacred text of the Qur’ān.

‘Abd al-Lal-L al-Baġdādī constantly set authors defined by him as “moderns” against the ancients and he did not refrain from harsh polemic attacks against the “modern” works. His privileged targets were Avicenna and Fakhr al-Dīn al-Rāzī. The writings of these authors, if compared with those of the ancients on similar themes, reveal to his eyes their low scientific level: they are confused, and lack detailed analysis, as it appears in the criticisms of Avicenna’s

logical writings. ‘Abd al-Laṭīf al-Baġdādī maintained therefore the need to return to the books of the ancients and in particular those of Aristotle, Alexander of Aphrodisias, and al-Fārābī in philosophy, and to those of Hippocrates and Galen in medicine.

During his stay in Cairo, he acquired a profound knowledge of the philosophy of Aristotle and his interpreters. From the list of his works, in fact, he seems to have written treatises which cover the entire Aristotelian corpus. There is also frequent mention of the treatises of Alexander of Aphrodisias, who was a benchmark for ‘Abd al-Laṭīf al-Baġdādī. The same is true for al-Fārābī, the only philosopher of the Islamic age deemed worthy of study by him. Al-Fārābī’s writings were often paraphrased by him and inserted into his own. The very notion of science which transpires from the work of ‘Abd al-Laṭīf al-Baġdādī, namely a systematic corpus capable of integrating Islamic and ancient knowledge, derives from al-Fārābī.

As far as medicine is concerned, ‘Abd al-Laṭīf al-Baġdādī’s attitude is analogous to that he has in philosophy. He criticizes Avicenna and Fakhr al-Dīn al-Rāzī and wishes for a return to Hippocrates and Galen. He was an active promoter of this return: from the list of his works, he seems to have commented or summarized many of Hippocrates’ and Galen’s writings. Nevertheless, he was not a sterile compiler of the medical works of the ancients but merged the knowledge derived from them into his own talent at observation, as we can see from his treatise on diabetes, in which he completes all that has been written by ancient and Arabic authors on its cure by a description of the symptomatology of the illness. Another example of this attitude can be found in the last chapter of the *Kitāb al-īfāda wa-l-ītibār* where he discusses the structure of the lower jawbone and corrects Galen’s opinion that it was made up of two bones instead of one, and then discusses the sacrum-coccyx complex which, according to Galen, was made up of six bones, while ‘Abd al-Laṭīf al-Baġdādī held it to be formed by a point of reference a single bone.

Finally, ‘Abd al-Laṭīf al-Baġdādī was profoundly averse to alchemy, which was much in

vogue in his time. Alchemy can in no way belong in the system of sciences. Alchemy and its false presumptions must be distinguished from scientific knowledge which possesses a rational basis, such as that of mathematics, mineralogy, chemistry, zoology, and botany. Proof of this is that the ancients never spoke of it. Alchemy is guilty of having led astray generations of scholars.

Abdurrahmān Bistāmī

Veysel Kaya

Department of Islamic Philosophy,
Istanbul Universitesi, Istanbul, Turkey

Abstract

Abdurrahmān Bistāmī (d. 1454) was a polymath of the fifteenth century, who emerged as a towering figure in the Ottoman lands. His scientific production covers many areas in Islamic disciplines, mainly Islamic philosophy, Islamic theology (*kalām*), Islamic mysticism (*ṭasawwuf*), and secret sciences. While the scientific activities of many Ottoman scholars were within the borders of the classical *madrasa* curricula, Bistāmī was unique for his profound knowledge of the occult sciences. In fact, Bistāmī is particularly well-versed in the science of letters (*‘ilm al-ḥurūf*), a discipline which seeks to establish secret alphabetical and numerical relations between ontological and epistemological entities. In fact, he sees the science of the letters as the crown of the sciences, maintaining that the core teaching of this secret science was carried through a lineage of the prophets till it came down to the Prophet Muḥammad and then to Muslim scholars afterwards. Bistāmī’s magnum opus is *al-Fawāyih al-Miskiyya fi l-Fawātiḥ al-Makkiyya* (literally “Musky Fragrances in Meccan Revelations”), an encyclopedia and anthology of sciences.

This is a work which exhibits a mosaic of all Islamic sciences and disciplines that have come to the time of the author, along with many quotations from the classical Islamic literature. In *al-Fawāyih*, Bistāmī preliminarily presents a classification of the sciences, closely following the Epistles of the Brethren of Purity (*Ikhwān al-Ṣafāʾ*), a comprehensive and syncretic philosophical work which was produced in tenth century Iraq.

Historical Background

Born in Antakya around 1380, Bistāmī made journeys to several parts of the Islamic world in order to seek his intellectual and spiritual education, places such as Aleppo, Egypt, and Khorasan. In these places, he also participated in many sufi circles, having gained *ijāzas* (educational degrees) from sufi masters. His scientific and political agenda brought him finally to the Ottoman lands, in which he lived till he died and was buried in the city of Bursa (the first capital of the Ottoman Empire) in 1454. According to his autobiographical work titled *Durra Tāj al-Rasāʾil* (*The Pearl of the Crown of the Epistles*), Bistāmī came to the Ottoman lands in 1408. This period in the history of the Ottoman Empire is known as “Fetret Devri” (Ottoman Interregnum), an era in which the Ottoman Empire faced harsh political rivalries and civil wars among the sons of Yıldırım Beyazıt (r. 1389–1403) after the latter’s defeat by Tamerlane in the Battle of Ankara. In such unsteady ground, Bistāmī began to spread his occult doctrines among the Ottoman elite. According to his own reports, many Ottoman scholars became his disciples and colleagues as they studied Bistāmī’s works with him, including his *al-Lamʾa al-Nūrāniyya* (*The Illuminative Glare*), *Qabs al-Anwār* (*The Catch of the Lights*), and *Ṣayḥat al-Būm fī Ḥawādith al-Rūm* (*The Cry of the Owl for the Happenings in Anatolia*). Bistāmī’s activities in Anatolia triggered disputations among Ottoman scholars and statesmen as well, because some saw his highly occult writings in relation to the Hurūfī propaganda (the lettrist and heretical teachings of Faḍlullāh al-Astarābādī

al-Ḥurūfī, who died in 1394), which threatened the authority of the Ottoman scholars. There are also clues as to indicate that Bistāmī had some political agenda behind his academic activities. His writings frequently allude to some messianic prophecies and predictions. He believes that his time is about to see the end of the world, and that in that time, God’s caliph will come to the world in order to set up a just world order under one religion and one sovereignty. Bistāmī’s taking part in the cultural and political atmosphere of the Ottoman lands, together with his famous acquaintances such as Mulla Fanārī (d. 1431) and Badraddīn Simāwī (d. 1420) is meaningful in that it evinces Bistāmī’s purpose to constitute a web of scholars who would guide the ideological currents within the Ottoman and extra-Ottoman sphere. Bistāmī addresses his spiritual colleagues as “the Brethren of Purity,” a clear allusion to the Brethren of Purity of Iraq five centuries before. Just as Bistāmī’s corpus is grounded in the Islamic Brethren of Purity, his elitist philosophy with strong Hellenistic tones is also historically related to the philosophical activities of his Western contemporary Gemistos Plethon (d. 1452), who himself attempted to revive the Hellenistic tradition and alluded to an esoteric circle inside Byzantium and Ottoman backgrounds (Siniosoglou 2012).

Philosophical Teachings and the Classification of the Sciences

In the introductory section of his magnum opus *al-Fawāyih al-Miskīyya*, Bistāmī sketches the classification of the sciences, and in doing so, he closely follows the classification which was done by the Brethren of Purity. Accordingly, the entire structure of sciences (whether they are religious or nonreligious) can be divided into three main parts: (1) Pedagogical sciences, which have nine subdivisions: writing and reading, lexicology and grammar, accounting, poetry and prosody, foretelling, magic and alchemy, arts and crafts, buying and selling, and biographies and history. (2) Religious-canonical sciences, which have six subdivisions: revelation, interpretation, transmissions and reports, laws and canons,

remembrance and mysticism, and interpretation of dreams. (3) Philosophical sciences, which have four subdivisions: mathematical sciences, logic, physics, and theology. Mathematical sciences comprise the *quadrvium*, that is, arithmetic, geometry, astronomy, and music. The other two philosophical sciences are defined in accordance with the Aristotelian corpus, as is seen in the traditional Aristotelianism of the Alexandrian School in Late Antiquity. Nonetheless, the idea of the science of theology exhibits much more religious underpinning: theology covers such noble subject matters as the knowledge of God, the science of spiritual beings (*rūḥāniyyāt*), the science of soul (*nafsāniyyāt*), politics and the science of the Hereafter. Bistāmī's originality lies in his depiction of this Ikhwanian classification as a "tree of sciences" (see image "the tree of sciences"). According to this schema, pedagogical and religious sciences are the roots, philosophical sciences and disciplines are the trunk, and the four subdivisions of the philosophical sciences, which are mathematics, logic, physics, and theology, are the branches. This idea clearly gives an "organic" setting to the idea of sciences, implying that philosophy, with all its contents, is actually planted and raised upon its religious and pedagogical roots.

The authority of the writings of the famous mystic and polymath Ibn Arabī is always present in Bistāmī's writings. Ibn Arabī's profound influence on Bistāmī can be seen in the latter's hierarchical perspective of knowledge in general. According to this perspective, there is not one level of knowledge to be applied to all human beings. Rather, human beings differ in the capacity of their share of the knowable things. The knowables which are the results of the perceptions of the five senses, are described as "necessary" (*darūriyyāt*), and they pertain to the level of common people. These people know things so much so that their five senses make it available to them. People who are at the higher level, called "the distinguished" (*khawāṣ*) by Bistāmī, are capable of knowing intellectual subjects by way of logical reflection and demonstration. However, there is a third level which is not achievable either by common people or the distinguished intellectuals: the level of the distinguished of the

distinguished (*khawāṣ al-khawāṣ*). Those who are in this level have only God in their hearts, and they have "revelational" (*kashfī*) and evidential (*shuhūdī* – depending on mystical observation) knowables pertaining to divine realities that no one else has. Such notion of Bistāmī is evidently imbued with his theory of the acquisition of knowledge, which posits three levels of knowledge (Kaya 2016, p. 208). The knowledge of reason is the one that is produced out of necessity or logical inference. The knowledge of the states (*ʿilm al-aḥwāl*) is the knowledge that is beyond the reach of pure reason and can only be perceived via "spiritual taste." Last but not least, the knowledge of the secrets (*ʿilm al-asrār*) is special to people who receive revelations from God, that is, the prophets and the friends of God.

According to Bistāmī, the science of letters (*ʿilm al-ḥurūf*) is the crown of all human sciences. In fact, like his predecessor Abū l-ʿAbbās al-Būnī (d. 1225), he was the author of preliminary books on the secrets of letters, including *Shams al-Āfāq fī ʿIlm al-Ḥurūf wa l-Awqāf* (*The Sun of the Horizons in the Science of the Letters*). Bistāmī holds that the occult knowledge of letters had come down to his age via the chain of the holders of this secret science, having started from the prophets through the respected scholars. He includes the names of prominent figures such as al-Ġazālī and Fakhr al-Dīn al-Rāzī among the masters of this science, depending himself on their works written in the subject. Bistāmī does not restrict the science to the Muslims only, contrarily, he traces back the roots of this secret knowledge to ancient Greece and Egypt, particularly referring to the hieroglyphs inside the pyramids in Egypt.

Bistāmī does not hide his owe for Greek philosophy and sciences whenever opportunity arises. In fact, he is of the opinion that the prophetic knowledge is disseminated throughout the nations which have had their share of an aspect of the *philosophia perennis*. Wisdom was bestowed from the skies onto the minds of Greeks, the hands of Chinese, the tongues of Arabs, an ancient saying quoted by Bistāmī in this regard. Greeks have special treatment in the writings of Bistāmī, for they had represented the peak of intellectual wisdom among other nations. In an interesting

sentence that appears in *al-Fawāyih*, Bistāmī states that his book “is written in Arabic by language, in Hebrew by implication, in Syriac by meaning, and in Greek by foundation and structure (*mabānī*)” (Kaya, p.198). This posits that he takes the Greek wisdom as a foundational base for his overall perspective in philosophy and sciences. In accordance with this, he essentially depends on the Late Antique Aristotelian tradition, as it was represented in the Graeco-Arabic translation movement in the second and third centuries of Islam. He describes Aristotle as “the first philosopher” in the true sense, praising his work on logic, which had set the introductory ground for all sciences. With his works on the five basic arts of logic, “Aristotle has guided us to the right path and enlightened our minds.” With his work on metaphysics, which consists of 13 books, Aristotle has walked through those who study this discipline to their goals (Bistāmī, *al-Fawāyih*, fol. 13b-14a) (Fig. 1).

Abraham ibn Ezra

Angela Guidi

ATER (Attaché Temporaire de Recherche et d'Enseignement), Collège de France (Paris), Paris, France

Abstract

Abraham ben Meir ibn Ezra (c. 1093–c. 1167), a native of Tudela, has been a key figure of medieval Jewish thought. He has played an

important role in the fields of biblical exegesis, poetry, grammar, astronomy, astrology, mathematics, and natural sciences. During his life, Ibn Ezra traveled all around Europe, settling in France, in England, and in Italy. He composed his works in Hebrew, in order to reach especially those Jewish communities that did not speak Arabic. His astrological and astronomical treatises were translated into Latin and were also greatly appreciated by medieval Christian thinkers. The popularity of his exegetical opus throughout the Jewish medieval world is testified by the great number of super-commentaries. Although Ibn Ezra's philosophical teachings are not systematically exposed and have to be reconstructed all along his exegetical, poetical, and scientific production, his thought is characterized by some distinctive features. In the field of philosophy, he was mainly interested in psychological and cosmological questions. He accepted – and often reinterpreted – some earlier Neoplatonic and proto-cabalist conceptions about the soul. His reflection mainly deals with the nature of the human soul and man's destiny after death, and with the effects of celestial bodies on the physical world. Some doctrines that he adopted in those fields have deeply influenced the thought of his successors.

Abraham ben Meir ibn Ezra (c. 1093–c. 1167) (known by Latin medieval thinkers as Avenezra) is one of the prominent medieval Jewish thinkers. A native of Tudela, in Al-Andalus, he grew up in the Arabic-speaking milieu of the *sefardi* Judaism. Jewish folklore reserved him a central place, and his life has been, under more than one aspect, a picaresque one. Ibn Ezra became a close friend, and may be a relative, of Yehudah ha-Levi (1180–1141), with whom he discussed exegetical and philosophical problems concerning the election of Israel among the peoples, as reported in his commentary on *Exodus*; he was also in touch with other Jewish philosophers, like Yosef ibn Tsaddiq and Abraham ibn Daud, and with the poet Moshe ibn Ezra. During this first period of his life, Ibn Ezra devoted himself mostly to writing religious

and profane poetry. In 1140, to escape the Almohades' persecution, Abraham ibn Ezra left Spain, possibly after the conversion of his son to Islam. He spent the rest of his life in traveling from one country to another, among the Jews of Christian Europe: he settled for short periods in Lucca, Mantua, Verona, and then, he moved to France's Provence: Rouen and Béziers. In the second part of his life, he composed the main part of his astrological, astronomical, and exegetical works. Exile and precarious conditions of life marked both his works and his personality: his permanence in Christian Europe forced him to choose Hebrew – instead of Arabic – to compose his texts, whereas his autobiographical poems relate to misadventures, difficulties, and misfortune, consequent, to some extent, to restless moving due to uncertain patronages and difficult circumstances. He died, perhaps in London, around 1167.

Abraham ibn Ezra's productions and interests were extremely large. In his *Sefer ha-shem* (*The Book of the Name* [of God]), he traces an ideal portrait of the perfect *Torah* scholar: in his effort to understand the true meaning of the holy text, the Jewish exegete combines and integrates many scientific disciplines: astronomy (*hokhmat ha-mazalot*), astrology (*mishpetey ha-mazalot*), arithmetic, geometry and ratios (*hokhmat ha-heshbon*, *ha-midot we ha-'arakhim*), natural science (*hokhmat ha-toledet*), psychology (*hokhmat ha-nefesh*), cosmogony (*hokhmat toledet ha-shamayim*), and logic (*hokhmat ha-mivt'a*). This list represents just a part of the wide-ranging studies' curriculum of Ibn Ezra, whose interests also embraced grammar, poetry, and theology.

Even if it began late – that is, after his flee from Spain – Abraham ibn Ezra's activity in the field of exegesis was very intense. His works are extant in a great number of both manuscripts and ancient printed editions, and they received an exceptional appreciation in the Middle Age. Proof of the consent he had is the super commentaries, which play a part in diffusing his teachings, especially among Jewish communities. We possess Abraham ibn Ezra's commentaries to *Torah*, *Isaia*, the *Twelve Minor Prophets*, *Psalms*, *Job*, the *Five Megillot*,

and *Daniel*; we are also informed by Ibn Ezra himself about his writing the commentaries on *Joshua*, *Judges*, *Samuel*, *Kings*, *Jeremiah*, *Ezekiel*, *Proverbs*, *Ezra-Nehemiah*, and *Chronicles*. Both astrology and astronomy took a huge place in his reflection; he wrote, *inter alia* a treatise on the astrolabe (*Keli ha-Nehoshet*) and a polemical work on the theoretical fundamentals of the Jewish calendar (*Sefer ha-'Ibbur*). His astrological *chef-d'œuvre* is the *Reshit Hokhmah* (*Beginning of Wisdom*), which was translated in French and in Latin, and promptly became a fundamental reference in the field. Furthermore, he makes use of many important astrological arguments in his exegetical explications, especially in order to offer a rational interpretation of the biblical passages concerning the sacrifices of the animals. His astrological works had a deep influence on Christian medieval thinkers, and were a relevant source of information for Petrus de Abano up to Pico della Mirandola's *Disputationes adversus astrologiam divinatricem* (1493), and for later thinkers. Ibn Ezra devoted to mathematical speculation his *Sefer ha-'Ehad* (*The Book of the Unit*), a short treatise on the attributes of the number, and the *Sefer ha-Mispar* (*Book of the Number*), which deals with the different mathematical operations. His poems, both religious and profane, contain many philosophical ideas and were an important vehicle of transmission of psychological and cosmological doctrines' issues from medieval Islamic and Jewish Neoplatonic tradition. In addition to that, Abraham ibn Ezra translated from Arabic to Hebrew three books of the grammarian Judah ben David Hayyuj (c. 950–c. 1000) and composed himself some very popular grammars of Hebrew.

Indeed, Ibn Ezra's literary activity is particularly rich, and perhaps even somewhat disordered. Since he was not a systematic thinker, he did not compose specific philosophical treatises; his philosophical teachings are to be deduced from scattered material incorporated in his exegetical and scientific works. Moreover, his doctrines are often concisely expounded and do not form a consistent arrangement. Ibn Ezra's points of view may change according to different contests and they occasionally reveal contradictions and

lack of consistence. In spite of his nonsystematic approach – or possibly thanks to it – Abraham ibn Ezra has played a key role in the formation of a standard cosmological and psychological teaching among medieval Jewish thinkers, perhaps owing to the popularity of his exegetical work among Hebrew readers and to the conciseness of his account. His works have been an important diffusion channel for some doctrines concerning the human soul, the rule of the stars on the sublunar world, and the salvation of individuals. It is possible that his philosophical background was not a really wide one, even if he was familiar with some philosophical and mystical Jewish works. He openly cites Sa'adiah ben Gaon's *Beliefs and Opinions*, and uses prekabbalistic treatises, such as *Sefer Yetsirah* or *Shi'ur Qomah*'; *kalām* tradition was doubtfully one of the sources of his thought, but he was also influenced by Ibn Gabirol's poetical production, though he does not seem to make references to Gabirol's *Fountain of Life*. Abraham bar Hiyya's astrological and astronomical teachings also influenced him deeply.

On the other hand, Ibn Ezra's philosophical interests are not homogeneous and equally distributed. He did not produce a real metaphysical or theological teaching and did not deal too much with the epistemological dimension of philosophy. Despite the fact that he develops some ideal *divisiones scientiarum* in his exegetical works, Ibn Ezra did not offer a major reflection on the relation between the secular sciences and the Torah. In fact, he limits himself to observe that the Bible concealed a certain number of secrets (*sodot*), whose meaning must not be revealed and which he precisely points out in his commentaries. Psychology is the only branch of philosophy to which he deserves an almost systematic reflection. Ibn Ezra detailed the doctrine of the human soul, both in his poetical and in his exegetical production, especially in his commentary on Ecclesiastes. His psychological system is similar to that of Jewish philosophers belonging to a Neoplatonic tradition, as Ibn Gabirol or Ibn Tsaddiq. He usually distinguishes between three different souls: *nefesh* (the vegetative soul, located in the liver), *neshamah* (the animal soul,

located in the heart), and *ruah* (the rationale soul, located in the brain). Rational soul belongs to human beings only; it is able to discern truth from falsehood, to formulate a correct reasoning, and to obtain an intellectual vision of the intelligible world. This soul originates from the supernal world and is composed of the same incorporeal substance; after the death of the body, it is supposed to return to its source. The soul yearns to return to its Creator, and during his permanence in the sublunar realm, has to oppose the violent appetites of the body, which is described, in a genuine Neoplatonic style, as a prison or a cage. Since man is a microcosm reflecting the structure of the creation and containing a trace of the divine substance in itself, the soul may gradually approach God through self-knowledge. The individual soul, his destiny, and his ultimate felicity, is one of the main concerns of Ibn Ezra's speculation, emerging also in his astrological reflection. In his opinion, the universe is composed of a celestial and a terrestrial realm; the stars and the planets rule over the sublunar world and over human beings. Nevertheless, man could escape to the astral influence determining terrestrial events, doing to the nature of his soul, which is made of the same substance of the supernal realm.

Abū Bakr al-Bāqillānī

Jan Thiele

Centro de Ciencias Humanas y Sociales, Consejo Superior de Investigaciones Científicas, Madrid, Spain

Abstract

Abū Bakr al-Bāqillānī is considered to be an important Muslim theologian, who significantly contributed to the development of Ash'arite teaching and its consolidation as one of the most influential schools of Sunni *kalām*. *Kalām* is a form of theology which – as opposed to scripture-based approaches – attempts to demonstrate its doctrinal claims by rational arguments and proofs. Al-Bāqillānī belonged to the third generation of Ash'arites,

and he studied with several disciples of the school's founder. He broadened the conceptual framework of Ash'arite theology, specifically under the impact of his debates with his intellectual rivals from the Mu'tazilite school of *kalām*.

Life and Works

Abū Bakr Muḥammad b. al-Ṭayyib al-Bāqillānī was an Ash'arite theologian, Mālikite jurist, and legal methodologist. He was born in Basra, in most likelihood at the beginning of the 940s. The precise date of his birth is unknown. During al-Bāqillānī's lifetime, the 'Abbāsīd caliphs remained in titular authority only – in fact, they had lost their actual power. Significant territories of their former state had been ceded to regional dynasties: the Fāṭimids took control over North Africa and Egypt, the Qarmatians over the eastern coast of the Arabian Peninsula, and the caliphs in Baghdad delegated their political power to the Būyids, a dynasty of non-Arab soldiers. Although Fāṭimids, Qarmatians, and Būyids were all Shiites, these dynasties had no common agenda, but rather they were political rivals. Only the Fāṭimids and the Qarmatians were in fact religiopolitical movements with an explicit Ismā'īlī identity, whereas the Būyids were somewhat concerned with adopting a policy of denominational balance. This stance was also of some importance for al-Bāqillānī's intellectual career.

Al-Bāqillānī studied *kalām* theology with two disciples of the founder of the Ash'arite school, Abū l-Ḥasan al-Ash'arī (d. 935–6), namely, with Abū l-Ḥasan al-Bāhilī (d. c. 980) and Abū 'Abd Allāh Ibn Mujāhid (d. 980–1). In law, al-Bāqillānī studied under the leading Baghdadi Mālikite scholar Abū Bakr al-Abharī (d. 985). Al-Bāqillānī received his formation in *kalām* together with Abū Bakr Ibn Fūrak (d. 1015) and Abū Ishāq al-Isfarā'īnī (d. 1027). All three became leading representatives of Ash'arism and contributed to the consolidation and dissemination of the school. While both Ibn Fūrak and al-Isfarā'īnī moved to Nīshāpūr, al-Bāqillānī was invited around 970–971 to the Būyid court of Shīrāz to teach the son of

the *amīr* 'Aḍud al-Dawla (d. 983). This is remarkable because, on the one hand, al-Bāqillānī belonged to the Sunni community, and on the other hand, the Būyids rather tended to patronize Mu'tazilite theology, that is, the major theological rivals of Ash'arism. However, the administrative and intellectual elite at the Būyid court was a quite pluralistic environment and included an important number of Imāmī Shiites, Zaydīs, Zoroastrians, Nestorians, and Jews. After a couple of years in Shīrāz, al-Bāqillānī moved to Baghdad, where he gave lectures at the al-Manṣūr mosque. At some point, he was appointed judge, and in 982–983 he was even sent on a diplomatic mission to the Byzantine court in Constantinople.

Al-Bāqillānī had several prominent students, including the traditionist Abū Dharr al-Harawī (d. 1043) as well as Abū Ja'far al-Simnānī (d. 1052), a Ḥanafite scholar, who became judge in Aleppo and Mosul and an authority in Ash'arite *kalām*. Several of al-Bāqillānī's students, including Abū 'Imrān al-Fāsī (d. 1037 or 1039) and Abū 'Abd Allāh al-Adharī (d. 1031–2), transmitted al-Bāqillānī's teachings to the North African city of Kairouan, and their study circles significantly contributed to the dissemination of Ash'arism in the Islamic west (Idris 1953; Fórneas Besteiro 1977–1979; Ansari and Thiele 2018). Al-Bāqillānī died in Baghdad in 1013 (Allard 1965; Ibish 1965).

As compared to his two prominent fellow theologians Ibn Fūrak and al-Isfarā'īnī, comparatively much of al-Bāqillānī's work has survived to the present day (still, this means that the vast majority of his body of work is missing; see 'Abd al-Ḥamīd 1993–1994; Gimaret 2009; Schmidtke 2011). These texts include a comprehensive manual of theological polemics, entitled *Kitāb al-Tamhīd* ("The introduction"). It contains an important refutation of Christian beliefs, actually one of the most detailed that has survived from the earlier period of Islam (Thomas 2008). The *Kitāb al-Tamhīd* is dedicated to an *amīr*, in all likelihood al-Bāqillānī's Būyid patron in Shīrāz, and was consequently one of his early works, written around 970. The early dating of the book is coherent with its general style: it actually bears witness to al-Bāqillānī's attempt to systematically

organize the teachings of his predecessors. However, systematic coherence remains the main purpose of the work, while it does not contain the more independently minded theories that al-Bāqillānī developed in his mature works (Allard 1965; Gimaret 1970, 1980, 2009; Eichner 2009). A shorter theological treatise that focuses on disputed questions between Ashʿarism and the Muʿtazila circulated under two titles, *al-Risālā al-ḥurra* (“The excellent epistle”?) and *al-Inṣāf fī-mā yajibu ʿtiqāduhu wa-lā yajūzu l-jahl bihi* (“The just treatment of what is obligatory to know and what cannot be ignored”). Much more important and comprehensive in length is his main work in theology entitled *Hidāyat al-mustarshidīn* (“Guide for those seeking right guidance”). Originally, the *Hidāya* must have been a monumental work, comprising at least 16 volumes, but only four have as yet been rediscovered. It is in this text that al-Bāqillānī expounded his original teachings and sometimes revised or further developed a number of al-Ashʿarī’s positions, including some he had still defended in earlier works (Gimaret 2009; Schmidtke 2011). An additional later work in theology is a refutation of the doctrines of Ismāʿīlī and Hellenizing philosophy (*falsafa*), entitled *Kashf al-asrār fī l-radd ʿalā l-Bāṭiniyya* (“Unveiling of the secrets to refute the Bāṭiniyya”) (Ansari and Thiele forthcoming). Al-Bāqillānī also wrote works on the Qurʾān, in which he specifically addressed the scripture’s miraculous nature and its faithful transmission, namely, *Iʿjāz al-Qurʾān* (“The inimitability of the Qurʾān”) and *al-Intiṣār li-naql al-Qurʾān* (“The victory of the Qurʾān’s transmission”). A major work in the field of legal methodology, which has partially survived, is the short version of his *al-Taqrīb wa-l-irshād* (“The approximation and guide”) (Chaumont 1994).

Teaching

Al-Bāqillānī did not follow a consistent teaching throughout his life. This is indicated by the reports of later Ashʿarite thinkers on the one hand and corroborated by textual evidence in al-Bāqillānī’s

surviving works on the other. It is specifically in his later works that he develops or even revises doctrines and arguments of Abū l-Ḥasan al-Ashʿarī, the founder and eponym of his school of *kalām*. In addition, al-Bāqillānī contributed to broadening the conceptual framework of the Ashʿarite doctrine.

To a significant extent, al-Bāqillānī developed the system of Ashʿarite doctrines in response to his debates with his intellectual rivals from the Muʿtazilite school of *kalām*. Yet, he also appears to have been preoccupied with the doctrines of Hellenizing philosophy – something that can be observed in his *Kashf al-asrār*. An additional indication for al-Bāqillānī’s engagement with *falsafa* could be the fact that he appeals to the notion of “necessarily existent” (*wājib al-wujūd*) that was to become a central element in Avicennian metaphysics. Al-Bāqillānī does so in his *Hidāyat al-mustarshidīn*. This work can be thus considered as an early example of a *kalām* text that applies the notion to God and equates it with the meaning of “eternal” (*qadīm*) (Thiele 2016b).

From his rival *kalām* theologians among the Muʿtazilite school of theology, al-Bāqillānī borrowed the so-called notion of “states” (*aḥwāl*). As we are told by later reports, he only came to adopt it in his later writings, while he expressed his categorical rejection of the theory of *aḥwāl* in his early works. This is actually echoed in his surviving treatises: the *Tamhīd* still contains an extensive refutation of the theory, whereas the later *Hidāya* and *Kashf al-asrār* both appeal to the theory (Ansari and Thiele forthcoming).

The notion of *ḥāl* was introduced into the ontology of *kalām* to conceive of the properties attributed to beings – and more specifically to conceive of the attributes by which God is described. With this concept, *kalām* theologians attempted to overcome an ontology that only admits the reality of actually existing “entities” or “things” (*dhawāt*, sing. *dhāt* or *ashyāʾ*, sing. *shayʾ*). Their understanding of “entities” or “things” included God, atoms (*jawāhir*, sing. *jawhar*) – that is, indivisible particles from which bodies can be composed – and accidents

(*a'ṛād*, sing. *ʿaraḍ*) that inhere in atoms and determine their changeable qualities. Yet, this ontology set significant limitations to the theologians' metaphysical system: since predications about beings, such as "knowing" or "living," were not believed to reflect any reality, their system did not provide any coherent framework that allowed to account for how properties of beings can be mentally conceived and known.

In his *Tamhīd*, al-Bāqillānī still considered that there is actually no need to posit that such predications as "being knowing" or "being living" express any reality in themselves. Rather, he criticizes the Mu'tazilites' concept of *aḥwāl* as self-contradictory. And, in fact, his objections were not entirely pointless. For the Mu'tazilites, a central idea behind positing the *aḥwāl* was to admit some form of reality that is not described by existence. This allowed for admitting that descriptions of God as eternally "living" or "knowing" reflect an actual reality, yet without positing the existence of some coeternal entity of "life" or "knowledge" in God – something that could be interpreted as positing multiplicity in Him and that would consequently violate the idea of monotheism. However, as a corollary of their doctrine that only "entities" or "things" can be known, the Mu'tazilites had to concede that these neither existing nor non-existing *aḥwāl* cannot be knowable. This opened the room for one of al-Bāqillānī's principal points of critique: how is it possible, he asks in the *Tamhīd*, to establish the *aḥwāl* as an ontological reality if they cannot be known?

The reason why al-Bāqillānī eventually revoked his rejection of the *aḥwāl* was what he must have considered as an incoherence in al-Ash'arī's proof for the existence of coeternal entitative attributes (*ṣifāt*, sing. *ṣifa*) in God – a doctrine that Ash'arite theologians defended against the Mu'tazilite denial of such entities. To support his theory, al-Ash'arī had argued that predications such as "he is living" or "he is knowing" always express the same meaning or truth (*ḥaqīqa*), irrespective of who is subject to predication: if we affirm that man is living and knowing by virtue of entities, namely, "life" and "knowledge," the same must be true for God.

Consequently, we cannot describe Him as eternally living and knowing without affirming a coeternal entity of "life" and "knowledge" that subsists in Him. Now, al-Bāqillānī objected that this claim can only be valid if "being living" and "life" – and similarly "being knowing" and "knowledge" – express distinct realities. His reasoning behind this was that if "being living" referred to an entity of "life" and "being knowing" to an entity of "knowledge" that subsists in God, al-Ash'arī's claim would be circular reasoning, because one would attempt to prove the existence of God's entitative "life" and "knowledge" by themselves.

Al-Bāqillānī describes the link between the reality expressed by our attributing properties ("being living") and the presence of entities in the object of predication ("life") as a reciprocal correlation (*ta'alluq*). Entities of "life" are the cause (*illa*) for somebody's "being living," and, vice versa, somebody's "being living" is evidence (*dalāla*) for an entity of "life" that subsists in somebody described as "living," such that they necessarily entail each other. Now positing that "being living" and "being knowing" on the one hand and entities of "life" and "knowledge" on the other hand are distinct realities raised the question of the ontological status of the properties "living" and "knowing." They could not possibly refer to entities, because this would mean that they are caused by other entities, and this would result in an infinite regress of causal sequences. Al-Bāqillānī therefore appealed to the Mu'tazilite conceptualization of the properties of beings as *aḥwāl*, that is, neither existing nor non-existing realities. He followed the Mu'tazilites' analysis insofar as he agreed that *aḥwāl* are not entities or things, but he nevertheless rejected the Mu'tazilites' conclusion that for this very reason, *aḥwāl* cannot be known. Al-Bāqillānī actually argued on the basis of the Ash'arite school's epistemology: unlike the Mu'tazilites, the Ash'arites denied that which can be known must necessarily be entities. Al-Bāqillānī could consequently conclude that *aḥwāl* are knowable and coherently claim that it was precisely by virtue of these *aḥwāl* that things can be distinguished, or, on the contrary, said to be alike (Thiele 2016a, d; Ansari and Thiele 2018).

It was not only in order to resolve problems related to the nature of God's attributes that al-Bāqillānī relied on the theory of *aḥwāl*. Rather, the concept was also part of his reflections on the human act, which he developed within the framework of al-Ash'arī's theory. This theory departed from essentially two principles, namely, that (a) God's power is absolute and man's acts must consequently be determined by Him and that (b) even in the absence of freedom of action, it can be rationally established that man is morally accountable for what he does. The latter claim was supported by appealing to our intuition that two types of human acts have to be distinguished: "necessary" acts like shivering, whose omission is beyond our capacity and deliberate decision and acts we do in accordance with our willing and wanting them to happen. These latter acts are denoted by al-Ash'arī as "acquisition" (*kasb* or *iktisāb*). Because "necessary" acts imply our weakness, he argued that the contrary must be true for non-necessary – or "acquired" – acts: they involve the agent's capacity or "power" (*quwwa* or *qudra*) to act. In some instances, al-Ash'arī tied acts performed on account of an instance of "power" to the agent's "will" (*irādā*). That is, only acts that involve our "power" occur in accordance with our will, whereas "necessary" acts like shivering happen against our will. Since both "necessary" and "acquired" acts are determined by God, it was completely irrelevant for al-Ash'arī's conception of moral responsibility that man does not cause his acts to happen. Rather, he considered that nobody can be blamed for his "necessary" acts such as shivering, but that man is responsible for his "acquired" acts, because he performs them voluntarily.

Al-Bāqillānī followed the major lines of this reasoning, but he revised some aspects of the theory of "acquisition." He thereby attempted to achieve a greater coherency of the theory and also to address a number of questions that remained unresolved by al-Ash'arī himself. For example, he explicitly rejects the assumption that our acting intentionally depends in any way on our will being involved. For him, this claim is established by the fact that we sometimes fail to exercise our will – which is always the case with "necessary acts." As a logical corollary, he goes on to argue that our incapacity to do what we want reveals a

lack of power. Consequently, the opposite must be true for all other acts: they occur by virtue of man's power.

It was specifically in the *Hidāya* that al-Bāqillānī eventually went a step further and asked about the precise function of man's power in his performing "acquired" acts. Al-Ash'arī had already posited its presence whenever we "acquire" acts, but he contented himself to affirm that there is only conjunction between man's power and his "acquired" acts, while he appears to have denied any correlation between that power and the "acquired" act. Against this claim, al-Bāqillānī posited that man's power really *has* an effect (*ta'ḥīr*). He even proposes three different approaches to explaining how our power affects our acting.

His first explanation as to the effectiveness of human power is in line with his conception of the reality that underlies our predications about beings: as mentioned above, he believed that they reflect a *ḥāl* – in the case of agents of "acquired" acts the feature of "being powerful" (*kawnuhu qādiran*). The *ḥāl* is, according to al-Bāqillānī, caused by the agent's power, and it is precisely this feature that distinguishes him from compelled agents, who have no power and are consequently not responsible for their doing. The mere distinction between powerful agents and others who are not did not, by itself, sufficiently explain why acts created by God should be considered as ours. Al-Bāqillānī addressed this issue by claiming that it is by virtue of their power that agents are related (*yata'allaqu*) to their "acquired" acts. He claims that acts do not have to be created by man himself in order to suppose a relation between his power and his acts. Rather, al-Bāqillānī describes the nature of this relation by drawing a parallel to sensual perception, which, as he argues, implies a relation between the one who perceives and the object perceived. This correlation does however not mean that perception causes the perceived object to exist. Finally, al-Bāqillānī adds a further explanation as to how man's power affects his acting. In this approach, he specifically addresses the question of man's individual moral responsibility. Here, he appears to be specifically concerned to resolve the logical problem that man can hardly be held responsible

for the *existence* of acts if he does not create them himself. Al-Bāqillānī therefore proposes an alternative solution as to what is subject to moral assessment in our acting. He suggests that man determines an attribute (i.e., a *ḥāl*) of his “acquired” acts by virtue of his power and that it is to this very attribute that God’s command, prohibition, reward, and punishment relate (Thiele 2016c).

Abū Bakr al-Rāzī, Muḥammad ibn Zakarīyā' (Rhazes)

Antonella Straface

Facoltà di Lingue e Letterature Straniere,
Università degli Studi di Napoli L'Orientale,
Napoli, Italy

Abstract

The most famous physician of Islam after Ibn Sīnā, Abū Bakr Muḥammad b. Zakarīyā' al-Rāzī (known in the Latin world as Rhazes) was also a philosopher and a chemist, and before being a physician, he is said to have been an alchemist. Although al-Rāzī's name is mainly related to his medical works, his masterpieces *Kitāb al-jāmi' al-kabīr* (*The Great Comprehensive Book*) and *Kitāb al-ḥawī fī l-ṭibb* (*The Comprehensive Book on Medicine*), he wrote also on cosmology, theology, logic, mathematics, and philosophy, as he believed, just like Galen, that an outstanding physician must also be a philosopher. Among his philosophical works are a commentary on Plato's *Timaeus*, a criticism of the Mu'tazilite doctrine, and a polemical writing against the Ismā'īlīs and their idea of the infallible Imam. As he believed in independent thinking, although he did not exclude the cumulative value of knowledge, he thought that every man could think by himself and did not need any guide teaching him what to think or what to do. Starting from this, al-Rāzī carried out his criticism against religion in general, and against prophecy (that was considered an imposture and a trick) in particular as, according to al-Rāzī, reason is sufficient to distinguish good from evil. Although al-Rāzī was not imprisoned or executed because of his ideas on religion and prophecy, he was censored for his opinions, so that his philosophical and theological works were destroyed. Anyway, thanks to some fragments that had survived in later sources, it has been possible to reconstruct al-Rāzī's cosmology, which was

based on five eternal beings: Creator, Soul, Space, Time, and Matter. In this system God, considered a kind of "maker," does not create from "nothingness," but He molded a preexistent matter, which was conceived of in an atomistic way.

Al-Rāzī was the most liberal and independent Islamic thinker who believed in the authority of reason, the universal gift that God gave to all men without any distinction.

Abū Bakr Muḥammad b. Zakarīyā' al-Rāzī was a philosopher and a chemist, and well versed in musical theory and practice too (according to some traditions he played lute very well). Born in Rayy (near the present-day Teheran) in 850, he is said to have been an alchemist before being a physician, as testified by his *Kitāb al-asrār* (*The Book of Secrets*), translated into Latin by Gerard of Cremona.

Because of sighting impairment (probably due to his alchemic practices), which gradually caused him blindness, al-Rāzī devoted himself to medicine, a field in which he excelled. As he believed that a physician should practice medicine in a big city with plenty of potential patients, he went to Baghdad, where he studied and practiced medicine in its hospitals. Later on he went to Rayy, having accepted the invitation of the Samanid governor Maṣṣūr b. Iṣḥāq to assume the direction of the hospital of the city. After becoming famous in Rayy, he went back to Baghdad where he headed the hospital that had been founded by al-Mu'taḍid shortly before. He died in Rayy in 925 or 935.

Al-Rāzī was a prolific author (he is said to have written some 200 works) and a versatile one indeed; Ibn al-Nadīm, who attributes to him dozens of works on different fields of knowledge, lists in his *Kitāb al-Fihrist* (*The Book of the Catalogue*) many of al-Rāzī's writings on cosmology, theology, logic, mathematics, and alchemy.

However, al-Rāzī's name is mainly related to his medical works: his masterpieces *Kitāb al-jāmi' al-kabīr* (*The Great Comprehensive Book*) and *Kitāb al-ḥawī fī l-ṭibb* (*The Comprehensive Book on Medicine*). In addition to these works, during

his stay in Baghdad al-Rāzī wrote two other medical works: the *Kitāb al-Manṣūrī* (*The Book of al-Manṣūr*) and *al-ṭibb al-rūḥānī* (*The Spiritual Medicine*). The *Kitāb al-Manṣūrī*, dedicated as suggested by its title to his patron Manṣūr b. Ishāq, and divided into 10 volumes, had for a very long time (from the twelfth to the sixteenth century) a great influence on the teaching of medicine in the Latin world, thanks to Gerard of Cremona's Latin translation (*Liber Almansoris*). As for *al-ṭibb al-rūḥānī*, which seems to be complementary to the *Kitāb al-Manṣūrī*, it deals with the "diseases" of the soul.

The *Kitāb al-ḥawī fī l-ṭibb*, translated and known in Europe under the title of *Liber continens*, is not a medical encyclopedia in the usual sense, although it is of a monumental size; it can be considered as a kind of private medical notebook, divided in several "study-files," each of them arranged according to the method of the time, that is to say "from the head to the toes." This private record of comments and reflections deals not only with case-histories of patients, but also with medical works which marked the history of medicine, from Hippocrates down to al-Rāzī's times. Because of its encyclopedic size and completeness, it was often confused with the *Kitāb al-jāmi' al-kabīr* that can be considered the most complete and voluminous Arabic medical text.

This work, which according to Ibn al-Nadīm and Ibn Abī Uṣaybi'a consists of 12 parts, is often mentioned by al-Rāzī himself in the *Kitāb al-ḥawī fī l-ṭibb*, in the *al-sīra al-falsafiyya* (*The Philosophical Life*, where al-Rāzī says that he had spent 15 years of hard work to write the *Kitāb al-jāmi' al-kabīr*), and in *al-fuṣūl* (*Aphorisms*), where he provides future physicians with a list of all the medical books they needed to read. One of the parts of the *Kitāb al-jāmi' al-kabīr* is a medical multilingual lexicon where al-Rāzī quotes the definition or the translation of unfamiliar terms, either foreign (Greek, Indian, Persian, Syriac) or Arabic.

Al-Rāzī, who wrote on several diseases (paralysis, arthritis, diabetes, colic, etc.) devoted a work to smallpox and measles (*Al-jadarī wa-l-ḥaṣba*), translated into Latin over a dozen times.

For the first time, smallpox and measles were considered two different diseases, as al-Rāzī showed in his description of their clinical details.

Although he made continuous references to Galen, al-Rāzī criticized him about some theories, as shown in his *Fī shukūk 'alā Jālīnūs* (*Doubts About Galen*). In particular, regarding the notion of humors, al-Rāzī did not believe that a body could be warmed or cooled only by warmer and cooler bodies. At the same time, he criticized Galen's excessive confidence in mathematics in explaining the theory of vision that, according to al-Rāzī, goes from the object to the eye and to the optic nerve. Nevertheless, al-Rāzī acknowledged Galen's greatness and role as a leading master and great teacher in both philosophy and medicine.

In fact, restoring Galen's idea that "an outstanding physician must also be a philosopher," al-Rāzī also wrote on philosophy. Noteworthy is his commentary on Plato's *Timaeus* (a probable epitome of Galen's), a criticism of the Mu'tazilite doctrine and a polemical writing against the Ismā'īlīs and their idea of the infallible Imam. Although all his philosophical works are lost, the very few and short excerpts which have survived are sufficient to show that al-Rāzī considered philosophy as a goal in itself and not simply as a support to medicine.

In particular, in *Fī makhāriq al-anbiyā'* (*On the Tricks of the Prophets*), a book of religious polemic attributed to al-Rāzī and which has gone lost, he said that religions are among the main causes of enmity and wars among peoples. He also believed in the cumulative value of knowledge but, at the same time, in the independent thinking too. In fact, if it is true that every man may learn from his predecessors, it is also true that he can surpass them in knowledge, because every man can think by himself and does not need any guide teaching him what to think or what to do. In the first chapter of his *al-ṭibb al-rūḥānī*, al-Rāzī exalted reason ('*aql*) that according to him is the ultimate authority and, consequently, represents the only power capable to control, lead, and govern. Starting from this, al-Rāzī carried out his criticism against religion in general and against prophecy and prophets, in particular.

In fact, he rejected the idea of prophecy as well as that of the necessity for an Imam; the consequence of his statements was that prophecy, as a privilege for few men, had to be considered as a trick and an imposture because, according to al-Rāzī, reason is sufficient to distinguish good from evil, to help man organize his life in a proper way, and to know God. In other words, there is no need for prophets. There are other evidences that can confirm that prophecy is not necessary; as God has given all men an intellect, there is no reason that can justify the intellectual predominance of some men over others. God, in His great goodness and benevolence, gave the universal gift of intellect to every man so that, in accordance with His supreme justice, no one is wiser than another. Finally, the evidence that prophecy is a trick is based on the fact that all the prophecies revealed during the various eras of human history contradicted each other; starting from this evidence, the consequence is that God's Word is contradictory (as each prophet considers himself as God's mouthpiece). According to al-Rāzī, this absurd conclusion demonstrated that prophecy is a trick.

Although al-Rāzī was not imprisoned or executed because of his ideas on religion and prophecy, he was censored for his opinions, so that *Fī makhāriq al-anbiyā'* was destroyed. Anyway, it is possible to recover his ideas on religions and prophecy thanks to some polemical writings of his adversaries, such as that of his contemporary Ismā'īlī *dā'ī* Abū Ḥātim al-Rāzī (811–891), who wrote his polemical answer in the *A'lām al-nubuwwa (The Signs of Prophecy)*.

Thanks to some fragments of his *Kitāb al-'ilm al-ilāhī (The Book of the Divine Science)*, which had survived in later sources, it has been possible to recover al-Rāzī's cosmology, which was based on five eternal beings (*al-qudamā' al-khamsa*), although al-Rāzī denied the eternity of the world. These beings, whose interaction created the world as we know it, are the Creator (*al-Bārī'*), Soul (*al-Nafs*), Time (*al-Zamān*), Space (*al-Makān*), and Matter (*al-Hayūlā*). God, who is considered a kind of "maker" (*formator*

mundi, demiurge), did not create from "nothingness" but molded a preexistent matter, which was conceived of in an atomistic way, that echoes Democritus and Leucippus; in fact, the ultimate constituents of things are said to be indivisible because of their smallness and solidity. Al-Rāzī's atomism is quite different from that of the *mutakallimūn*: according to them, the existence of atoms depends exclusively on the continuous creative will of God. In al-Rāzī's atomism, the atoms possess "extension" and the characteristics of bodies depend on the number of atoms in proportion with the amount of void which has the force of attraction.

The eternity of Matter requires that Space and Time in which it is extended are eternal too. In particular, al-Rāzī distinguishes an "absolute" space from a "relative" one: the first is infinite and independent of the world, the second is an empty space, or void, which is inside Matter and which attracts bodies (a possible expedient to explain the Epicurean *clinamen*). Similarly, Time is distinguished in "absolute" time, that is to say "duration," and "limited" time, which is that of the spheres, the sun, and the stars.

The cosmological process began with the fall of the Soul, conceived of as living but not yet intelligent. Soul desired to embody herself into Matter that was not in motion yet. In doing so, Soul imparted a disordered and confused motion to Matter. God, who did not hinder this "desire" because He knew that Soul needed experience for learning, then sent the Intellect (*'aql*) to the Soul; in this way, the Soul became aware that this kind of matter had nothing to do with her true nature, and she tried to get rid of corporeal ties.

As previously said, before his formal training in medicine, al-Rāzī was an alchemist. Al-Bīrūnī, who attributes to him 80 works, lists 21 writings on alchemy. Although the primary sources for Arabic alchemy go back to Hermetism and to this corpus of traditions and writings, al-Rāzī's alchemy has nothing to do with mystery but with the fundamental chemical procedures, essential for pharmacology, which he explained in detail in alchemical works such as the *Kitāb sirr*

al-asrār (*The Book of the Secret of the Secrets*) and the previously mentioned *Kitāb al-asrār*. Here al-Rāzī spells out the alchemic procedures for plating and gilding metals and makes also a classification of minerals, divided into six sections: spirits, bodies, stones, vitriol, borax, and salts.

As to ethics, al-Rāzī can be considered “Epicurean in character” as he stated, especially in his *al-Ṭibb al-rūḥānī* and *al-Sira al-falsafiyya*, that pleasure is neither positive nor negative: it is the normal state of man when the pain ends (so man has to avoid not the passions, but their excesses). Besides these two works, al-Rāzī also wrote a work entitled *Kitāb al-ladhdha* (*The Book of Pleasure*), which has gone lost. Nevertheless, from the study of some of its excerpts and reports, survived in later authors, it seems that he believed in the replenishment theory of pleasure that, according to some scholars, is not Epicurean. In fact, “al-Rāzī thinks not only that all pleasure will be purchased at the price of harm, but also that the amount of harm will be at least as great as the pleasure that is achieved” (Adamson 2008: 94).

Al-Rāzī did not establish a well organized philosophical system, nevertheless he was the most liberal and independent Islamic thinker, as testified by his fight against the idea of an absolute authority granting power to few privileged men. The only authority in which he believed and which he accepted was reason, the universal gift that God gave to all men, without any distinction, and the intellectual support that helped Soul to recognize her origin and to return to it.

Abū Bishr Mattā ibn Yūnus

Cecilia Martini Bonadeo

Dipartimento di Scienze Storiche, Geografiche e dell'Antichità, Università degli Studi di Padova, Padova, Italy

Dipartimento di Filosofia, Università di Padova, Padova, Italy

Abstract

In tenth-century Baghdad, during the decline of the 'Abbāsid caliphate, a circle of Christian and Muslim physicians, philosophers, and translators grew up. They shared a deep and genuine interest in Greek scientific and medical knowledge and, following the tradition of the school of Alexandria, they devoted themselves to the study of Peripatetic philosophy through Arabic translations from Syriac. In their opinion, education should be grounded on this philosophy. School activity consisted of a teacher, his home, books, colleagues, pupils, and occasional visitors. On special occasions, open discussions were organized for huge crowds, often in the librarians' quarter. The principal promoter of this circle was Abū Bishr Mattā ibn Yūnus.

He was a Nestorian Christian who had been educated in the Syriac monastic school of the convent of Mār Mārī at Dayr Qunnā. Among his teachers, there were Christians who were the last followers of the Alexandrian school of philosophy: we know from the *Kitāb al-Fihrist* by Ibn al-Nadīm (written around 990) that Abū Bishr Mattā ibn Yūnus read the *Posterior Analytics* under the guidance of Abū Yahyā al-Marwazī and that he had as a teacher Abū Ishāq Ibrāhīm Quwayrā, a commentator of the Aristotelian *Organon*. He studied also under the *mutakallim* Abū Aḥmad al-Ḥusayn ibn Ishāq ibn Karnīb; Ibn al-Nadīm mentions in the *Fihrist* the interest for natural philosophy of this *mutakallim*.

During the caliphate of al-Rāḍī, Abū Bishr Mattā came to Baghdad where he revived the

Aristotelian studies through his translations, revealing to the Arabic readers an Aristotle much more complete than the one they had hitherto known. In particular, he translated for the first time into Arabic, from Syriac, the *Posterior Analytics*, not read in the Syriac monastic schools, possibly for dogmatic reasons (the Christians stopped at *Prior Analytics* I, 7): with this text, he offered to his readers the Peripatetic tradition of logic as a methodology of rational discourse. The *Posterior Analytics* or, in Arabic, *Kitāb al-Burhān* (*Book of Demonstration*) provided a paradigm for the subsequent generations of *falāsifa* “with a coherent system of deduction and demonstration, comprising all levels of rational activity, and serving as a guide for the division and hierarchical classification of the sciences, leading up to the First Philosophy” (Endress 1990).

Besides the translation of the *Posterior Analytics*, Ibn al-Nadīm mentions, among Abū Bishr Mattā ibn Yūnus’ translations, Alexander of Aphrodisias’ commentary on the *Posterior Analytics* and Themistius’ commentary of the last three books of *Prior Analytics* and of *Posterior Analytics*, the revision of the older version of the *Sophistici elenchi*, the *Poetics* (translated in Arabic for the first time), the *De caelo* and Themistius’ paraphrase of it, the *De generatione et corruptione* with the commentaries of Alexander and Olympiodorus, the *Meteorologica* with Olympiodorus’ commentary, *Book Lambda* of Aristotle’s *Metaphysics* with Alexander’s commentary as well as Themistius’ paraphrase, and finally Themistius’ commentary on the *Physics*. Only the translations of the *Posterior Analytics*, *Poetics*, and *Book Lambda* of Aristotle’s *Metaphysics* have survived. Besides, he wrote his own commentaries on Aristotelian works, for example, the *Categories*. We may assume from the manuscripts – as the MSS Paris, Bibliothèque Nationale, ar: 2346 and Leiden, Universiteitsbibliotheek, or: 583 containing, respectively, Ibn Suwār’s “edition” of the *Organon* and Ibn al-Samḥ’s “edition” of the *Physics* – that these commentaries were more or less in the form of marginal notes or passages placed between the lemmata of text.

Abū Bishr Mattā won the fame of the logician of his time, and for this reason he was involved in

a dispute against the champion of the traditional Islamic sciences of his time, the grammarian Abū Sa’īd al-Sīrāfī, who, on the contrary, reacted against the claim of Greek logic to universal truth, and defended the science of grammar (*al-naḥw*), considered by the traditionalists the propaedeutics to the religious sciences and by the same token to the truth of Revelation. This dispute took place in Baghdad in 938 in front of the vizier Ibn al-Furāt and is described by Abū Ḥayyān al-Tawḥīdī (d. 1023?) in the *Kitāb al-Imtā’ wa-l-mu’ānasa* (I, 108–128) as reported to him by Abū Sa’īd al-Sīrāfī and the grammarian ‘Alī ibn ‘Īsā al-Rummānī.

Abū Bishr Mattā ibn Yūnus considers logic as the tool to distinguish “truth from falsehood, veracity from lying, good from bad, proof from sophism, doubt from certainty” (*al-Imtā’*, I, 108) and, in so far as it is the science of demonstration, as the basis of the entire building of learning. He assumes that logic inquires into the intelligibles and considers the meanings of the things, that are identical for all men and nations, at variance with grammar, that considers the utterances that a natural language uses to indicate the significance of things. For this reason, logic is more universal than grammar and the Aristotelian logical texts in Arabic translation provide the tool to know the truth about man, cosmos, and God.

On his part, Abū Sa’īd al-Sīrāfī replies that no one translation is able to transfer the meanings from a language into another without confusing or at least changing them. For this reason, one can know the meaning of things only remaining within the boundaries of his own mother tongue. The logic was established according to Greek language and its conventional usage, and it was valid for Greek people: “Why must Turks, Indians, Persians or Arabs take Greek as judge and arbiter?” (*Imtā’*, I, 112). There is no universal logic as there is no universal grammar or language.

Abū Sa’īd al-Sīrāfī focuses not only on the fact that Abū Bishr Mattā ibn Yūnus does not know Greek, as he translates from Syriac, but also on the fact that he does not know even Arabic. Abū Sa’īd al-Sīrāfī asks him to explain the use of the conjunction *wa*, but Abū Bishr Mattā ibn Yūnus replies:

This is grammar and I have not studied grammar. For the Logician has no need for it, while the grammarian is very much in need of logic. For logic investigates the meaning, while grammar investigates the utterance. If, therefore, the logician comes across the utterance, this is a mere accident. Likewise, it is by sheer accident that the grammarian stumbles upon the meaning. And the meaning is nobler than utterance, and the utterance, humbler than the meaning (*Imtā'*, I, 114).

The debate about the merits of logic and grammar was reopened by the two more prominent disciples of Abū Bishr Mattā ibn Yūnus: Abū Naṣr al-Fārābī and Yaḥyā ibn 'Adī, who tried to eventually harmonize Greek thought and traditional learning: they were convinced of the possibility of presenting Aristotelian logic in genuine Arabic speech.

Abū Hāshim al-Jubbā'ī

Jan Thiele

Centro de Ciencias Humanas y Sociales, Consejo Superior de Investigaciones Científicas, Madrid, Spain

Abstract

Abū Hāshim al-Jubbā'ī (b. 861 or, more likely, 890; d. 933) was one of the most influential representatives of Mu'tazilism, a school of "rational theology" – or *ilm al-kalām* (literally "science of speech") as the discipline is termed in the Islamic intellectual tradition. He significantly developed the doctrinal system of the

“School of Baṣra,” and his followers are sometimes called after him “Bahshamiyya” or “Bahāshima.” The most important element of Abū Hāshim’s metaphysical thinking was his development of the so-called theory of “states” (pl. *aḥwāl*, sing. *ḥāl*). According to this doctrine, the qualifications of beings have an ontological reality that is neither described by existence nor nonexistence. The theory helped him to explain the nature of God’s attributes without asserting the existence of co-eternal beings in God. Abū Hāshim also claimed that the very being of things does not collapse into their existence. It was therefore debated whether or not his teaching had an influence on Avicenna’s essence-existence distinction.

Biographical Information

Abū Hāshim al-Jubbāʾī (b. 861 or, more likely, 890; d. 933) was one of the most influential representatives of Muʿtazilism, a school of “rational theology” – or *ilm al-kalām* (literally “science of speech”) as the discipline is termed in the Islamic intellectual tradition. He lived and taught in the early period of what modern scholars have called the “scholastic phase” of Muʿtazilism. This periodization describes a shift from an earlier stage, in which Muʿtazilite teaching was an endeavor of merely independent thinkers, toward the emergence of real schools of thought with an established and comprehensive doctrinal system. Abū Hāshim’s father Abū ʿAlī al-Jubbāʾī (d. 915) was the founder of one of the major schools of Muʿtazilism of the “scholastic phase,” namely the so-called “School of Baṣra.” Abū ʿAlī had made significant contribution to the systematization of the doctrines of the “School of Baṣra,” but a number of central theories were only developed, refined, or revised by his son. Therefore, the later followers of Abū Hāshim’s teachings were also called “Bahshamiyya” or “Bahāshima.”

Most historical reports about Abū Hāshim actually focus on his teachings. We therefore possess only very limited biographical information about him. He appears to have spent most of his life in ʿAskar Mukram in Khusestan and in the city

of Basra. He was trained in *kalām* theology by his father. The sources report that Abū Hāshim already developed independent ideas while studying with Abū ʿAlī. Controversial issues that came up in the discussions between the two Jubbāʾīs were later recorded in a lost treatise entitled *al-Khilāf bayn al-shaykhayn* (“Differences between the two teachers”) by the Bahshamite theologian ʿAbd al-Jabbār al-Hamadhānī (d. 1025). After the death of his father in 915, Abū Hāshim claimed the leadership of the Baṣran Muʿtazila. Because of his young age, and apparently also because he disagreed with some of his father’s doctrines, Abū Hāshim’s claim raised some opposition among several fellow students. His most important antagonists formed a group called “Ikshīdiyya.” Yet the historical significance of these adversaries is quite marginal, specifically as compared to Abū Hāshim’s influence even beyond his own school. Sometime between 926 and 930, he settled in Baghdad, where he spent the rest of his life. He died there in 933 and was buried in the city (Schmidtke 2016).

Abū Hāshim’s thought was transmitted via his disciples, including Abū ʿAlī Ibn Khallād (d. 961?) and Abū ʿAbd Allāh al-Baṣrī (d. 980), who were among his most important students. During the tenth and early eleventh century, the school saw a blossoming under the Buyid dynasty, with the city of Rayy as its intellectual center. In the twelfth century, Bahshamite theology was adopted by Yemen’s Zaydite community, a minor sect of Shīʿī Islam. The Zaydites of Yemen continued transmitting this intellectual tradition down to modernity, and so they significantly contributed to the preservation of the school’s literature in the country’s manuscript libraries. In addition, Bahshamite literature has survived in Jewish, specifically Karaite manuscripts, that have been preserved in Cairo’s Geniza store rooms (Adang et al. 2007).

Abū Hāshim’s numerous writings themselves have not survived. The most important source for reconstructing his body of works is the later Bahshamite literature, which includes copious references to it (a list of his works was compiled by Gimaret 1976, 1984). Important summaries of Abū Hāshim’s teachings – and specifically his

ontological theories – are embedded in fragments of a commentary by ‘Abd al-Jabbār al-Hamadhānī upon a work by the Buyid vizier al-Šāhib Ibn ‘Abbād (d. 995). Al-Šāhib’s summaries rely in particular on Abū Hāshim’s *Kitāb al-Jāmi‘*, one of his major works (Madelung and Schmidtke 2016). Apart from comprehensive textbooks, Abū Hāshim also dedicated a number of treatises to the discussion of more specific issues, and he also wrote refutations against theological opponents, proponents of a natural causality or Hellenizing philosophers (*falāsifa*). Due to the lack of primary sources, any reconstruction of Abū Hāshim’s teaching has to rely on scattered reports from later literature and therefore remains to a certain degree speculative.

Thought

Although generally described as a form of theology, *‘ilm al-kalām* was centrally concerned with a wide range of philosophical problems. Metaphysics was one of them, and Abū Hāshim made some significant contributions specifically to this field. His reflections departed from notions that were widely shared by *kalām* theologians (that is, not only by Mu‘tazilites like him). They had developed an understanding of beings that was conceptualized by two almost synonymous terms: *shay’* and *dhāt*. *Shay’* means “thing” and was defined as that which can become an object of knowledge and the subject of a predication. The translation of *dhāt* is somewhat more problematic: the medieval translators of Hellenistic philosophical works chose this term as the Arabic equivalent for “essence,” and so the *falsafa* tradition used it with this specific Aristotelian connotation. Yet this is not the case with *kalām*, where the term’s understanding was different and the translation “essence” would therefore be misleading. In this context, the notion of *dhāt* means that which can be described by properties and can consequently be distinguished or said to be similar or alike. Apart from “thing”, appropriate translations in the context of Abū Hāshim’s teaching for *shay’/dhāt* are “entity”, “self”, or “object” (Dhanani 1993).

The Baṣran Mu‘tazila accorded the status of “entity” to three kinds of beings. The first two are those types of entities of which the world was assumed to be made up: (1) atoms (pl. *jawāhir*, sing. *jawhar*), i.e., indivisible particles that occupy space and from which bodies can be composed; (2) accidents (pl. *a‘rāḍ*, sing. *‘araḍ*) that inhere in atoms and determine their changeable qualities, including color, taste, their position in space, or their movement. Finally, the third of the three kinds of “entities” transcends the physical world, it is God.

An important element of Abū Hāshim’s metaphysical thinking was that he considered both the existent and the nonexistent as “entities” or “things.” This in turn means for him that the true reality of things does not collapse into their existence: rather, Abū Hāshim conceives of existence as a property supplemental to the things’ very being. “Things” or “entities” that are predicated to be nonexistent are identified with the possible, and their number was believed to be infinite. An important argument in support of this theory of the nonexistent was that only “things” or “entities” can be objects of knowledge. Hence Abū Hāshim concluded that God’s omniscience necessarily implies that He has knowledge of the particular objects before they exist, and that without His antecedent knowledge He would be unable to create them (Frank 1980).

Now, when Abū Hāshim came to analyze what properties (such as existence) actually are, he developed his arguably most important theory. The question of the ontological reality of properties was particularly relevant – and difficult to resolve – with regard to the eternal qualities attributed to God. Several generations of theologians had already struggled with this issue, because their affirmation of God’s multiple qualities was, from a logical perspective, difficult to reconcile with the monotheistic idea that He is one. The problem was consequently very much linked to the claim that whatever we conceive of has the ontological status of entities.

In order to resolve this dilemma, Abū Hāshim overcame the limitations set by an ontology that only admits the reality of either existing or

nonexisting things. He introduced a new category of so-called “states” (pl. *aḥwāl*, sing. *ḥāl*). “States” were a concept borrowed from the grammarians, who used it to describe predicates that express a manner of being or circumstance of a subject in a predicative sentence. Abū Hāshim applied this analysis to the properties we attribute to beings and then reinterpreted such predications as “Zayd is knowing”: “being knowing” would accordingly not refer to “knowledge” (that is an entity distinct from the entity described as “knowing”). Rather, the predication means that Zayd is (or exists) and that his being is further qualified by a circumstance or manner of being, i.e., the “state” of “being knowing.” Abū Hāshim conceived of these “states” as something real. Yet, unlike “things” or “entities,” they are not said to be real because they exist (*wujida*, *yūjadu*). Rather the reality of “states” – or their becoming actual – is described by the term *thubūt* (or referred to by the verb *thabata*, *yathbutu*, “to be actual/real”).

As against theories that admitted a description of the very nature of entities by a set of properties, Abū Hāshim believed that the identity of things finds its expression in one quality (or “state”) specific to it. The “state” that describes atoms as that which they are in and by themselves is their “being an atom.” It distinguishes atoms from other kinds of things, e.g., accidents of the color black, whose specific quality is their “being black.” Similarly, God has also His “most specific attribute” that distinguishes Him from all other beings. Abū Hāshim’s conceptions of these qualities as being real now allowed him to explain the foundation of other properties by arguing that one “state” is grounded in another. He could therefore claim that such eternal attributes as God’s “being knowing,” “being powerful,” “being living,” and “being existent” are entailed by His very being. Rather than by virtue of eternal knowledge, power, life, and existence, He deserves these qualities because He himself is eternal. This view helped Abū Hāshim to avoid positing a multiplicity of entities in God. The same principle of correlation between “states” was also applied to specific properties of things in this world. Abū Hāshim argued that whenever an atom comes

into existence (here the property “existence” is caused by an agent, namely the atom’s creator), it must occupy space. Its quality of “being an atom” entails that it occupies space whenever it exists, so that Abū Hāshim concluded that “occupying space” is caused by (the “state” of) “being an atom.” Atoms then may acquire additional properties: they may exist at different locations (and also change their locus), be composed to bodies, be white or black, etc. These additional properties are contingent and subject to change, and so Abū Hāshim posited that the “state” of moving from locus A to locus B or of being composed with other atoms is caused by accidents of movement or composition that inhere in atoms – reasoning that accidents themselves are contingent beings (Frank 1978; Thiele 2016).

Abū Hāshim’s doctrines had a significant impact even beyond his own school of *kalām* theology. His theory of “states” was later adopted by representatives of Ash‘arism, a rival school of *kalām* that later came to be the predominant strand in Sunni Islam. In addition, Abū Hāshim’s teachings were of significant relevance to debates on Avicenna’s essence-existence distinction, and it was discussed in this context to what extent the latter’s reflections built upon Abū Hāshim’s thought.

Abu L-'Abbās Lawkarī

Mohammad Javad Esmaeili
Iranian Institute of Philosophy, Tehran, Iran

Life – Abū l-'Abbās al-Faḍl b. Muḥammad al-Lawkarī was a second-generation student of Avicenna (d. 428/1037) through his most talented and devoted disciple Abū l-Ḥasan Bahmanyār b. Marzbān (d. 458/1066). Lawkarī belonged to one of the most influential families in the district of Merv and traced his origin to the town of Lawgar, situated on the road leading from Merv to Herat. It is not known when Lawkarī was born. But given that he was a student of Bahmanyār and

if it is true that Bahmanyār died in 458/1066, then he may have been somewhere in his 30s when Bahmanyār passed away. The fact that he was alive in 503/1110 – the year in which he compiled the table of contents of Avicenna's *Ta'liqāt* – is certainly consistent with such a hypothesis. It must then have been some time after 503/1110 that his eyes and general condition got so bad that he – as reported by al-Bayhaqī who explicitly refers to Lawkarī's advanced age (*shaykhūkhātuḥu*) – started to long for the end. While we know that Lawkarī passed away quite suddenly after a heavy midday meal, we do not know when this happened. In recent times it has been suggested that he passed away in 517/1123. There is, however, no evidence for this. The date in question was introduced by 'Abd al-Raḥmān Badawī (Avicenna, *Ta'liqāt*, Introd. p. 8) and was based on his understanding of the entry on Lawkarī in Carl Brockelmann's *Geschichte der arabischen Litteratur* (GAL vol. 1, 602, 10a). While there were always doubts on this date, the matter remained unresolved, until recently, that is, when GAL's entry on Lawkarī was published in English translation (Brockelmann, *History of the Arabic Written Tradition*, vol. 1, 526, 10a). Since then, there can be no more doubt that the dying date that is mentioned there is *not* Lawkarī's, but that of his contemporary 'Umar al-Khayyām (for whom we possess at least three death dates: 515/1121, 517/1123, and 526/1132): "Abū l-'Abbās al-Faḍl b. Muḥammad al-Lawkarī was a contemporary of 'Umar al-Khayyām, d. 517/1123 (p. 620), who, like him, was also active as a poet." So, all we know is that at the time of his death, Lawkarī was an elderly man who considered his life complete and looked forward to the end and that he died after a sudden illness, at some unspecified date after 503/1110.

Works – According to al-Bayhaqī, Lawkarī wrote many works, among them:

1. *Bayān al-ḥaqq bi-ḍamān al-ṣidq* (*An Account of the Truth, with the Pledge to State the Facts*)
2. A *qaṣīda* in Persian with a commentary (which must be his *Sharḥ Qaṣīdat asrār al-ḥikma*)

[*A Commentary on the Poem Called The Secrets of Wisdom*]

3. Essays (*rasāʾil*)
4. Learned annotations/comments (*taʿlīqāt*) and abridgements (*mukhtaṣarāt*)
5. A collection of poems (*dīwān shiʿr*)

From the above works, nos. 1 and 2 have survived. In connection with no. 5, it should be noted that, while we do not possess a *dīwān* by Lawkarī as such, still, Muʿīn al-Dīn al-Nīshāpūrī (d. 599/1203), in his *Itmām Tatimmat Ṣīwān al-ḥikma* (in several MSS in Istanbul), lists no less than 46 lines of poetry ascribed to him. As for no. 4, even if there is no trace of any *taʿlīqāt* or *mukhtaṣarāt* in Lawkarī's name, it is also true that the style of his philosophical works that do survive (viz., nos. 1 and 2 and the *ʿAwīṣ al-masāʾil fī ʿulūm al-awāʾil* which will be discussed presently) is all consistent with his declared intention to explain philosophy in a concise but intelligible manner (see Style of Writing below). And if someone should call these therefore explanatory abridgements, this is certainly not far beside the truth.

The *Bayān al-ḥaqq bi-damān al-ṣidq* is an explanatory summary of Avicenna's philosophical encyclopedia the *Kitāb al-Shifāʾ* (*The Book of Healing*). The word "truth" in the title must be understood as "the true sense of Avicenna's philosophy as set out in the *Healing*," which Lawkarī then promises to describe in a straightforward and unadulterated manner. In this work Lawkarī is mostly inspired by Avicenna, whom he quotes (almost) literally at times, turning this work into an important tool for future editions of the works of Avicenna, but also by Aristotle, Abū Naṣr al-Fārābī (d. ca. 339/950), and Bahmanyār.

The philosophical *Sharḥ Qaṣīdat asrār al-ḥikma* is also encyclopedic in character, but much shorter than the *Bayān al-ḥaqq*. Insofar as this work is philosophical, involves a *qaṣīda*, and is written in Persian, there are clear parallels with Avicenna's Persian *Dānishnāma-yi ʿAlāʾī* (*Philosophy for ʿAlāʾ al-Dawla*) and his didactical poems like *al-Urjūza fī l-manṭiq* (*The rajaz-Poem on Logic*).

Another work, not mentioned by al-Bayhaqī, is the *ʿAwīṣ al-masāʾil fī ʿulūm al-awāʾil* (*Difficult Questions about the Sciences of the Ancients*). The shortest of his three surviving works on philosophy, it addresses 30 questions in logic, natural science, mathematics, and metaphysics, listing the questions first and then, one by one, his answers. This treatise is not listed in any of the ancient biobibliographical sources, but in the one remaining copy, it is expressly ascribed to him. A close comparison of various sections of the *ʿAwīṣ al-masāʾil* with corresponding sections in the *Bayān al-ḥaqq* and the *Sharḥ qaṣīdat asrār al-ḥikma* confirms this ascription: there can be no doubt that Lawkarī is the author of this work.

Finally, another text by Lawkarī not mentioned in the *Tatimmat Ṣīwān al-ḥikma* is his very detailed table of contents of Avicenna's *Taʿlīqāt*, which is preserved in the oldest copy of Avicenna's *Taʿlīqāt* which was copied in 521/1127. Interestingly, Lawkarī's use of *abjad* numbers in the tables of contents of each of the sections of the *Tabīʿiyyāt* (the part on natural philosophy) of his *Bayān al-ḥaqq* is also found in this table of contents for Avicenna's *Taʿlīqāt*.

Style of Writing – According to al-Bayhaqī, who calls Lawkarī both an *adīb* (a man of letters) and a *faylasūf*, it was Lawkarī who was responsible for the spreading of the philosophical sciences (*ʿulūm al-ḥikma*) in Khurāsān. At a time when especially Avicenna's philosophy was facing severe criticism from al-Ghazālī (d. 505/1111), the importance of this fact can hardly be overestimated. According to Lawkarī's own statement, his philosophical writings were inspired by the desire to present philosophy in a new kind of format. Until then, he says, the only books that he had come across were either much too detailed or way too concise. This new format, which one could call the "explanatory summary" (i.e., a *sharḥ* and *talkhīṣ* in one, comparable to the paraphrases of Aristotle by Themistius [d. ca. 390 CE]), is sufficiently detailed to be meaningful philosophically while leaving out most of the historical and accessory material. In the process, Lawkarī filtered most of the Greek context out of the philosophy of Avicenna, which may certainly

have facilitated its reception in Khurāsān, through his immediate students (e.g., Sharaf al-Dīn al-Īlāqī, Ibn Abī Ṭāhir al-Marwazī, 'Abd al-Razzāq al-Ṣīghnākhī) and then, by his writings, in Khurāsān and elsewhere in the Persianate world, through thinkers like Shihāb al-Dīn al-Suhrawardī (d. 587/1191), Naṣīr al-Dīn al-Ṭūsī (d. 672/1274), and, finally, Ṣadr al-Dīn al-Shīrāzī (d. 1045/1645).

In Hellenistic times, the Greek commentators of Aristotle would often explain Aristotle with Aristotle, drawing on other parts of his works in order to explain some difficulty in the text. In the *Bayān al-ḥaqq*, Lawkarī does the same thing, explaining Avicenna with Avicenna. Interestingly, he uses Avicenna's *Kitāb al-ishārāt wal-tanbīhāt* to explain some difficulties in the *Shifā'*. This means that he saw a unity of doctrine in both works where today, the common view is that the *Ishārāt* – Avicenna's last major philosophical work – is in various ways different from, and meant to replace, the philosophy of the *Shifā'*.

Significance – Al-Bayhaqī considered Lawkarī more as a transmitter than as a thinker in his own right. And if one looks at his surviving works and at the style in which they were written, this judgment is certainly not misplaced. Still, Lawkarī was very much in charge of the ideas that he was transmitting, this in the sense that he would make his own choices in his selection of topics and the way or order to present them. In the case of the physics of the *Bayān al-ḥaqq*, for instance, he cut Avicenna's number of chapters in half, which is exactly what one would expect from a teacher who focuses on the essential. On the other hand, in the case of the soul's fate after its separation from the body, he even decided to introduce a special discussion on its capacity to know in this separate state, a subject which he believed had been mostly ignored as a result of an undue emphasis on man's reward and punishment in the Hereafter. So, yes a transmitter and a teacher, but also an author with a keen and independent mind.

Modern Scholarship – While modern scholarship in Iran has thus far mostly been limited to the edition of the *Bayān al-ḥaqq* (partial) (Dībājī, Khaḍrī), the *Sharḥ Qaṣīdat asrār al-ḥikma*

(Dībājī, Rūhī), and global descriptions of the contents of these (Qarīb, Dībājī), in the West the focus was mainly on content: Jules Janssens with his studies on the doctrinal and textual similarities between the *Bayān al-ḥaqq* and the works of al-Fārābī, Avicenna, and Bahmanyār; Roxanne Marcotte with her biobibliographical, lexicological, and partly doctrinal studies; and Frank Griffel with his studies on the spirit of the age of Lawkarī and the way in which it is reflected in the life and/or works of, among others, Lawkarī. However, in view of Lawkarī's pivotal importance in the history of Islamic philosophy in Khurāsān and other parts of the medieval Persianate world, it would seem that thus far much too little has been done. We still need reliable editions of (most of) the *Bayān al-ḥaqq* and the *Sharḥ Qaṣīdat asrār al-ḥikma* and of the whole of the *'Awṣ al-masā'il* and, besides, in-depth textual and doctrinal studies designed to lay bare the extent of Lawkarī's dependence on and, where applicable, modification of, the philosophy of Avicenna especially, though not exclusively. At the time of writing of this entry (April 2018), an edition of the entire natural philosophy – part of the *Bayān al-ḥaqq* (ca. 500 pages in print) – is in preparation, to be published in 2019 (M.J. ESMAEILI, Tehran).

Abū L-Barakāt al-Baġdādī

Roxanne D. Marcotte

Université du Québec à Montréal, Montréal, QC, Canada

The University of Queensland, Brisbane, QLD, Australia

Abstract

In Baghdad of the first half of the twelfth century, Abū l-Barakāt al-Baġdādī not only gained notoriety as an accomplished physician but also as a resolutely independent philosopher. In his philosophical *summa*, the *Book of Evidence*, he provided incisive criticism of a number of Avicennan Peripatetic theses that made for novel philosophical insights into concepts of space, time and motion, a priori knowledge and self-awareness, unity of soul and intellect, and God’s knowledge.

Abū l-Barakāt al-Baġdādī, also known as Hibat Allāh (Nathaniel) and Ibn Malka, was born near Mosul into a Jewish family around 1077. He headed for Baghdad where he studied medicine with Abū l-Ḥasan Sa‘īd b. Hibat Allāh (d. 1101). His reputation as a physician gave him access to the courts of Seljuq sultans and the caliphs of Baghdad to whom he attended. He also taught medicine, although he managed to remain on bad terms with Ibn al-Tilmīdh (d. 1164), the famed Christian physician (Langermann 1998). The exact reason for his alleged conversion to Islam, late in life, remains disputed (four different accounts) (Pines 1979: 260n.4; Stroumsa 1990; Madelung 2011), as does the date of his death (in Baghdad or Hamedan), perhaps after 1165 (Brockelmann 2017 I: 864, while in his eighties (or nineties), although it could well be sometime before 1157, according to a copy of his *Treatise on the Intellect* (al-Ṭayyib 1980, 127n.1) that contains a common expression used for the deceased, or as early as 1152, according to Bayhaqī’s (d. 1169) *Completion* (written after ca. 1165) (Ülken 1949).

al-Baġdādī wrote an Arabic translation (in Hebrew script), with a lengthy philosophical commentary, on the *Ecclesiastes* that he dictated to his pupil, Ishāq b. Abraham b. Ezra, who composed a (Hebrew) panegyric in praise of his master at the completion of the work in 1143 (Steinschneider 1964, no. 148), and of which four passages were edited, translated into Hebrew, and analyzed (al-Baġdādī 1964). He also wrote an astronomical work on the appearance of stars at night (Tunagöz 2015: 72–77); treatises on the soul (unedited), on weariness (*malāl*) (Tunagöz 2016: 29–39), on predestination, and on the intellect (al-Ṭayyib 1980; Marcotte 2004; cf. Madelung 2011); and a number of lost medical works: an *Abridgment of Anatomy* (based on Galen’s work), some pharmacological treatises, and glosses on Avicenna’s *Laws of Medicine* (Pines 1960; Madelung 2011).

In his commentary on the *Ecclesiastes* and notably in the introduction of his *Book of Evidence*, al-Baġdādī construed scientific knowledge (medicine, philosophy, etc.) as having been originally transmitted orally and then further transmitted via “esoteric” (symbolic or metaphoric) works penned by unknowledgeable individuals who corrupted the “truths” of earlier oral teachings. Therefore, remediation of the waning transmission of knowledge required individuals, like al-Baġdādī, who were able to recover the lost original “truths” of the *Book of Nature* (lit.: the “Codex of Being” [*ṣaḥīfat al-wujūd*]), the purported aim of his *Book of Evidence*, the *Kitāb al-Mu’tabar* (1938–1939; henceforth: *KM*) (Stroumsa 1996: 48–50; Sirat 1996: 132–133). While al-Baġdādī dabbled rather informally in philosophy, much of what we know derives from the three volumes of this philosophical *summa* (parts containing references to the Bible predate possibly his conversion to Islam late in life).

The *Book of Evidence* contains some of al-Baġdādī’s most penetrating philosophical insights, the fruits of his own personal investigations (al-Ṭayyib 2004). In this collection of personal notes on logic, physics (Sālim 2005; Wan Abdullah 2007a), and metaphysics (Abū Sa’da 1993), he re-examined earlier Peripatetic philosophical views, in particular those Avicenna included in his *Healing* (and *Salvation*). Throughout the work, he applied a “methodological

doubt” (an early version of Descartes’ methodological skepticism) with which he subjected systematically earlier philosophers’ definitions, demonstrations, and theories. This skeptical standpoint rests at the heart of the “dialectical turn” (Griffel 2011) in *falsafa*, during the first half the twelfth century, that initiated a new era of “critical philosophy” (Shihadeh 2014), which Ghazālī’s (d. 1111) skepticism introduced in theology (*kalām*), and which al-Baġdādī introduced in philosophy (al-Ṭayyib 2004), and upon which Fakhr al-Dīn al-Rāzī (d. 1209), Shihāb al-Dīn al-Suhrawardī (d. 1191), and Ibn Kammūna (d. 1284) built. al-Baġdādī stated that he only included what he was able to ascertain with his own personal investigations, findings, and conclusions. He achieved this by relying upon self-evident and a priori truths (or propositions) that he uncovered by making use of un-Aristotelian intuitions, thus upholding the epistemic self-evidence of certitude attached to those intuitions or the notions underlying them. This is what provides an overall unity to his collection of personal notes (Pines 1979: 96–108).

In logic, al-Baġdādī owed much to Avicenna’s works (including his *Philosophy for Arūḍī* for dialectics, sophistry, rhetoric, and poetics, cf. Janssens 2016). He remains an important witness, together with Boethius (d. ca. 524–526), to the existence of a second Arabic version of Themistius’ (d. ca. 388–390) commentary on Aristotle’s *Topics* (of which no Greek text has survived), distinct from the one available to Averroes. Of this lost commentary, we have fragments (*KM* I: 241–246.6) containing Themistius’ classification of places (*mawāqī’*) that lends an element of apodicticity to the *Topics* (Hasnawi 2004, 2007). al-Baġdādī also provided a critical evaluation of the *Isagoge* and disputed the possibility of acquiring definitions (*KM* I: 55–57), an insight that inspired Shihāb al-Dīn al-Suhrawardī’s (d. 1191) critical views on definitions (Pavlov 2017a: 284–349, cf. Janssens 2018).

In physics, al-Baġdādī rejected the Avicennan view that corporeity is a “substantial form superadded to prime matter” (*hayūlā ūlā*) that actualizes it, arguing that prime matter is a body, being essentially the corporeal and unchanging underlying substrate of all bodily objects (*KM* III: 200–203;

Shihadeh 2015: 160–164), an extension susceptible of being perceived by the senses (Dag 1970: 42–45; cf. al-Khalīfī 1995, 2008). Out of the four primordial elements (*hayūlāt awwal*), only earth is constituted of indivisible corpuscles (on account of their solidity) (*KM* II: 10ff.; cf. Pines 1997).

al-Baġdādī introduced novel un-Aristotelian (often more Platonic) views on space, time, and motion (some upheld by Abū Bakr al-Rāzī, d. 930). He upheld Philoponus' (d. 570) critique of the Aristotelian notion of space (adopted by Avicenna) and the impossibility of a vacuum, adopting Philoponus' geometrical concept of a tridimensional and infinite space empty of all bodies — a void (Nony 2010, 2011). He also provided a mechanical refutation of *quies media* (rest between two contrary motions) (*KM* II: 97; cf. Langermann 2008: 59, 60–61).

With regard to motion, al-Baġdādī challenged Avicenna's Peripatetic definition in terms of an *entelekheia*, conceiving of motion as gradual emergence from potency to act, since notions of “gradual” and “all-at-once” are grasped, with the assistance of sensation (having extra mental existence), instantly and self-evidently (*KM* II: 30–32; McGinnis 2015; Asad 2016: 228–232; cf. Nony 2012, 2016). Moreover, apperception (*shu'ūr*) of time (not space) becomes “a measure of being rather than a measure of motion,” a view he illustrated with his thought experiment of someone sitting in a dark cave, not being able to perceive motion, yet perceiving the passing of (one kind of) time (*KM* II: 72–73).

al-Baġdādī rejected the Avicennan Peripatetic distinction between time (*zamān*), *aevum* (*dahr*), and eternity (*sarmad*) (*KM* III: 41), terms that denote the same thing, somehow implying that the world would have existed eternally (Sözen 2001). Elsewhere, he proposed a thought experiment with three spheres (adopted by Ibn Kammūna) to isolate time from velocities, mobiles and movers, and other motion-related concepts (*KM* III: 37–39; cf. Langermann 2005: 315). No longer a measure of motion, time becomes a measure of the soul's own precognitive-like intuition of time “by and together with” its original apperception of its own self: time becomes a component of his metaphysics of being. Sharing much with

Bergson's concept of time, his a priori notion of time becomes an aspect of all existents, a measure of being, including the being of God who is existence per se and, therefore, somehow not beyond time (Dag 1970; Pines 1979: 289–296; Abū Sa'da 1993; Saydabī 1996).

al-Baġdādī also criticized the concept of inclination found in the Aristotelian explanation of natural motion, by building, once again, upon Philoponus' concept of inclination (“an impulse (*rhopē*) acquired by the projectile”) that embeds the cause of motion inside the projectile itself (the theory of *impetus* or *mayl* that found its way into Avicenna's physics). He then conceptualized inclination as the “cause of the change in motion of a projectile,” a “natural” inclination (*mayl ṭabī'ī*) existing also during ascent, thereby demonstrating the possibility of two opposite inclinations coexisting in the same body (Nony 2010; Pines 1986). He taught that the progressive acceleration of the motion of a falling body was due to the “continuous” action of the principle of “natural inclination” found in that body, a negation of a principle of Aristotelian/Avicennan dynamics that a constant force produces a uniform motion (Nony 2010, 2011).

In psychology, al-Baġdādī, following Avicenna, upheld the view that the human soul is originated and that it survives the death of the body. However, he rejected (in physics and in metaphysics) the view that all human souls belong to the same species (*KM* II: 303, 381–387; Muehlethaler 2010: 64–69, 115–118, 254–255). His unitary conception of the soul “does not allow for accidents” (Avicenna) “to make up for all the differences between the individual souls” which “encompasses more than a single quiddity” (Muehlethaler 2012: 602). The definition of the soul as an incorporeal substance acting in and through the body may have Platonic or Plotinian influences. Uncommon for the time, he upheld a “very strict” notion of immateriality, the soul being mostly preoccupied, in this world, with corporeity, hinting at the soul's limited capacity of “attention” and its reduced capacity of recollection of ideas (*ma'ānī*) (Abū Sa'da 1993: 197–246).

al-Baġdādī rejected the idea that the active intellect was the cause of human souls, arguing

that different classes of human souls have many causes, different groups of souls forming discrete species, with corporeal matter individuating human souls (cf. Davidson 1992: 154–161). The innumerable stars and the heavenly souls of the planets become the causes of human souls to which they return after death (*MK* II: 152–153). Critical of Avicenna’s arguments for rejecting metempsychosis (*tanāsukh*), he noted that the soul was essentially active and governing (*fa’ ʿāla mutaṣarrifa*) and that it was endowed with unceasing self-awareness. Hence, if the soul has no recollection of any previous existence, and if it acquires knowledge with the help of organs and activities of the body, then it could not have had an existence prior to its attachment to the body (Muehlethaler 2010: 115–118, 254–256; cf. Wan Abdullah 2007b).

The human soul’s foremost apperceptions include “awareness” of its own self (i.e., the soul), of existence, and of time (*KM* III: 39; Pines 1979: 289), all three being grasped by intuitive evidence. Thus, al-Baġdādī pondered the link between the soul and the self that Avicenna’s concept of the self-awareness of an incorporeal soul substance raised. His descriptions of the human soul can apply to the “I-referent” (i.e., the soul) once the soul’s subsistence in a body (*ḥulūl*) is understood more generally (Muehlethaler 2010; cf. Ajhar 2010; Yıldırım 2018).

al-Baġdādī also focused on precognitive-like knowledge as he enquired into Avicenna’s hypothetical “suspended person” experiment (in his *Healing*) and the associated issues of self-awareness and consciousness. He affirmed the primary certitude of one’s own self-awareness, distinct from one’s knowledge through any of the bodily faculties traditionally associated with the external and internal faculties. Hence, he developed a novel epistemic notion of primordial self-awareness (tapping into Neoplatonic views) that replaced the epistemic functions associated with the faculties at the heart of Avicenna’s psychology. The soul’s self-apprehension through its self-awareness provides it with “apodictic” certainty and access to evident truths (Arnaldez 1987; al-Khalifī 1995). The soul’s self-awareness also

provides a precognitive-like intuition proof of the soul’s independence from the body and its immortality after death. In order to link the self, as the seat of the unity of agency, to cognition (raised by the Avicenna’s concept self-awareness of the soul), he introduced a general self-awareness and a particular self-aware agency, depending on the type of activities (e.g., digestion and growth being different from remembering), in order to preserve the unity of self and soul (Kaukua 2015: 104–123, 2016).

Self-awareness is at the heart of al-Baġdādī’s theory of the “unity of soul and intellect.” He rejected the Peripatetic/Aristotelian distinction between the two and merged them into a single psychological subject (*KM* II: 413–417), a view that appealed to Fakhr al-Dīn al-Rāzī and Shihāb al-Dīn al-Suhrawardī. His nominalism, or conceptualism, emerges from his rejection of the doctrine of the intellect as a separate entity, and his elimination of forms “cognized by the intellect”, universals now being apprehended by the soul/mind as mere mental forms without any external reality (Pines 1997: 82–83; Davidson 1992: 154–161). Awareness of one’s own intellectual activities becomes identical with the awareness of the interior functions of the psyche that procures a priori and certain knowledge (Huwaydi 1979: 239–307). The intellect seems to be viewed as a substance, when it is the “subject” of an act, or as accident, or when it is an “act” of intellect (Cihan 2010; Marcotte 2019). His *Treatise on the Intellect’s Quiddity* (*fī Māhiyyat al-ʿAql*) (post-conversion) provides a variety of philological, scriptural, exegetical, theological, and philosophical accounts of the intellect (al-Ṭayyib 1980; Marcotte 2004).

al-Baġdādī took up neither the dominant Neoplatonic Peripatetic theory of effusion or emanation (*fayḍ*) (Nasrat 1973) nor the theory of one single active intellect as cause of all the souls existing in the sublunary world, preferring to postulate a theory of “successive divine volitions” (*KM* III: 157–158, 167). This introduced a plurality, preeternal or coming into being in time, of causes. The first volition, an attribute of the divine essence, creates the first being, the highest of the

angels (“spiritual beings” or *rūhāniyyūn*), elements of al-Baġdādī’s “angelology”: an indeterminate number of incorporeal “spiritual angels” become active “supernal” beings that now function as active principles, a view that inspired al-Suhrawardī’s ontology of lights and “lords of species” (cf. his *Philosophy of Illumination*) (Pines 1979: 302–319; Davidson 1992: 154–161; Corbin 1971: 299). Following Avicenna, al-Baġdādī provided a proof from contingency of the existence of God who remains the necessary existent. Essential attributes, such as wisdom, power, and knowledge, belong to God’s essence. As for God’s knowledge, it is manifold, the knowledge of particulars resting on God’s own intuitive knowledge and direct awareness of the world (Pines 1979: 310–315; Tunagöz 2012; Pavlov 2017b: 245–375, cf. Froissart 2018).

As for al-Baġdādī’s legacy, we know that his extensive Arabic commentary on the *Ecclesiastes* was studied in the Jewish (*yeshiva*) circles of Baghdad and still copied in 1335 (with acknowledgment of authorship), in spite of his reported conversion to Islam. As for his highly original, at times systematic though not always exhaustive, reevaluation of a great many Avicennan Peripatetic theses in his *Book of Evidence*, his views had their supporters and opponents. In his philosophical and theological controversies with Maimonides and Yosef ben Shimeon of Cairo over the former’s eschatological views on resurrection, Samuel ben Eli (d. 1193), the Gaon of Baghdad, quoted approvingly passages on the soul from his *Book of Evidence* (not translated into Hebrew, cf. Langermann 1996) and its orthodox theory of bodily resurrection (Stroumsa 1990, 1998, 1996; Pines 1979: 259–262). ‘Alā’ al-Dawla Faramurz b. ‘Alī defended his views against ‘Umar al-Khayyām’s objections (d. 1131) (Pines 1979: 3, 129); al-Bīṭrūjī (fl. twelfth century) used some of his views in his dynamics; and Sharaf al-Dīn al-Mas‘ūdī (d. late twelfth century) also defended some of his views in his commentary on Avicenna’s *Pointers and Reminders*. Others, like the logician ‘Umar b. Sahlān al-Sāwī (or Sāwajī) (d. ca. 1145), refuted al-Baġdādī’s criticism of Avicenna’s theory of God’s knowledge of particulars in their universal

aspect, while Bayhaqī (d. 1169) penned (prior to 1154) a refutation of his *Book of Evidence* (Madelung 2011). His influence was perhaps greater on Fakhr al-Dīn al-Rāzī who, in his *Eastern Investigations*, also criticized Avicennan Peripatetic theses, for example, his view that human souls share a common essence and his theory of faculty differentiation. Shams al-Dīn al-Shahrazūrī (d. 1288) noted that al-Baġdādī provided al-Rāzī with his best arguments against Avicenna, criticisms that Naṣīr al-Dīn al-Ṭūsī (d. 1274) set out to refute in his *Summary* of al-Rāzī’s *Muḥaṣṣal* and in a treatise on al-Baġdādī’s thesis on the infinitude of space (Madelung 2011). al-Baġdādī’s definition of motion appears in the work of Athīr al-Dīn al-Abharī (d. 1264) (McGinnis 2015). al-Baġdādī’s views are also discussed by Najm al-Dīn al-Qazwīnī al-Kātibī (d. 1276), in his *Wellspring of Wisdom* (and by its fourteenth-century commentator), by Barhebraeus (d. 1286), and even by Ibn Taymiyya (d. 1328) who, in his *Averting the Conflict (between Reason and Tradition)*, appreciated some of al-Baġdādī’s criticisms of Avicennan Peripateticism (Pines 1979: 1n.4, 129n.1; Madelung 2011). His theory of perception and of the soul, along with his discussions on self-awareness, had much impact on the psychology and epistemology of Ibn Kammūna and Shihāb al-Dīn al-Suhrawardī. Suhrawardī discussed al-Baġdādī’s views in his *Intimations*, a work commented by Ibn Kammūna who, having very good knowledge of the *Book of Evidence*, identified the anonymous positions rejected by Suhrawardī as those of al-Baġdādī (Pourjavady and Schmidtke 2006: 25; Muehlethaler 2010: 292–293). al-Baġdādī’s views also had an impact on the works of Eastern philosophers (al-Khalifī 2008), such as Mu‘īn al-Dīn Maybudī (d. ca. 1506) up to, at least, Mīr Dāmād (d. 1631), and his notion of time, and in Mullā Ṣadrā, Ṣadr al-Dīn al-Shīrāzī’s (d. ca. 1636) *Four Journeys*.

From the late 1930s to the early 1960s, Shlomo Pines (1960, 1979, 1986) truly pioneered Baġdādīan studies with the publication of groundbreaking works (cf. Corbin 1971, 1986). From the early 1990s onward, the likes of Abdullah, Abū

Sa'da, Ajhar, Cihan, Davidson, Griffel, Hasnaoui, Kaukua, al-Khalīfī, Marcotte, Nony, Pavlov, Saydabī, Shihadeh, Sözen, Stroumsa, and al-Ṭayyib have rekindled interest in al-Baġdādī's philosophical and scientific contributions.

Abū l-Faraj ibn al-ʿIbrī (Barhebraeus)

Samuel Noble

Yale University, New Haven, CT, USA

Abstract

Barhebraeus was the leading Syriac philosopher and man of letters in the thirteenth century. While not usually credited with being a particularly original thinker, he had an encyclopedic command both of Arabic and Islamic thought, especially that of Avicenna and al-Ġazālī, as well as of the Greek tradition as it was preserved in Syriac. Writing during the period of great social upheaval caused by the Mongol invasion of the Near East, he sought to create compendia in the Syriac language of philosophical and scientific knowledge as it was available to him. His most important work, the *Butyrum sapientiae*, was modeled on Avicenna's *Shifā'*, following it closely in form and content. It is not simply a translation into Syriac of the *Shifā'*, however, as Barhebraeus in many places synthesizes Avicenna's thought with the Syriac translations of Aristotle and other Greek philosophers. His shorter works the *Sermo sapientiae* and the *Mercatura mercaturarum* serve as primers to Aristotelian–Avicennan thought in Syriac. In addition to his purely philosophical pursuits, he was also a bishop of the Syriac Orthodox (sometimes called “Jacobite”) Church. In this capacity, he wrote extensive theological works which also discuss philosophical questions, occasionally in ways contradictory to the positions held in his philosophical writings. Despite this, Barhebraeus argued that philosophy and theology were ways of discussing the same truths using different vocabularies.

Barhebraeus (Abū l-Faraj ibn al-ʿIbrī) was born in 1225 or 1226 in Melitene in southeastern Anatolia. His father was a physician named Aaron; however, the belief of earlier scholars that he

was of a Jewish background is now generally considered to be unlikely. In 1243 or 1244, his family relocated to Antioch on account of Mongol attacks. It is possible that during his stay in Antioch, he took monastic vows. Some time after this, he studied medicine and logic with a Nestorian teacher in Tripoli and may have worked in Damascus at the hospital founded there by Nūr al-Dīn al-Zanjī. In 1246, he was ordained bishop of the town of Gubros near Malatya. Shortly thereafter, he was transferred to the see of Laqabin and was subsequently made bishop of Aleppo. He was soon ousted from his position in Aleppo due to ecclesial politics and was only able to obtain reinstatement in 1258. In 1260, Aleppo was taken by the Mongols under Hülegü, and Barhebraeus went to Hülegü's camp to personally appeal for the safety of his flock but was briefly imprisoned in Qal'at al-Najm, east of Aleppo. In 1263, he was again found at the Mongol court serving as a physician to Hülegü along with another Syriac Orthodox cleric. In 1264, Barhebraeus was elected maphrian, the Syriac Orthodox exarch in the territory of the former Sasanian Empire and second highest office in that church after the patriarch. As maphrian, Barhebraeus had his residence at the monastery of Mar Mattai near Mosul, though he traveled frequently. In addition to spending time in Mosul and Baghdad, he also went a number of times to Tabriz and Maragha in the region of Azerbaijan, where the Mongol court was located. He died in Maragha on July 29 or 30, 1286, and was buried in Mar Mattai.

Barhebraeus was a prolific writer on a wide variety of subjects, including biblical exegesis, canon law, grammar, history, medicine, mysticism, and belles lettres in addition to his philosophical works. Especially noteworthy are his historical works, as he provides a contemporary account of the Mongol conquest of Iraq and Syria, and his mystical writings, modeled on those of al-Ġazālī. In addition to his original writings, he translated the *Ishārāt wa-l-tanbīhāt* of Avicenna into Syriac.

The three chief philosophical works of Barhebraeus, the *Butyrum sapientiae*, the *Sermo sapientiae*, and the *Mercatura mercaturarum* (or *Tractatus tractatum*) all expound the

Aristotelian–Avicennan philosophical tradition, but at different levels of detail. According to Janssens (1937), the three works constitute a graded curriculum progressing from a summary introduction in the *Sermo* to a full exposition in the *Butyrum*. It is worth noting, however, that both the *Sermo* and the *Mercatura* do go into some questions, particularly of logic, in more detail than does the *Butyrum*.

The *Sermo sapientiae* is divided into four chapters, each of which is divided into sections. The first chapter, eight sections on logic, covers the material of the *Isagoge* and the six books of the *Organon* in various degrees of detail. The second chapter includes thirty-two sections on the natural sciences. The third chapter, thirty-four sections on metaphysics, deals with proofs for the existence of a necessary being, the problem of divine attributes, the origin of the world, and the abstract intellect. The fourth chapter, in thirty sections, also deals with questions of metaphysics, but from the perspective of their relationship to theological questions. It discusses providence, evil, punishment and reward in the afterlife, the relationship of the rational soul to the heavenly souls, prophecy, and the Resurrection.

The *Mercatura mercaturarum* is divided into three “treatises” on logic, natural sciences, and metaphysics. Though it is sometimes described as an abridgment of the *Butyrum*, it is in fact the first of Barhebraeus’ three main philosophical works to have been written (Takahashi 2006). According to Takahashi, the *Mercatura* was likely modeled on the *Maqāṣid al-falāsifa* of al-Ġazālī, which was itself based on the *Dānesh-Nāme-i ‘Allā’ī* of Avicenna.

The most extensive of Barhebraeus’ philosophical works and the last of them to be written, the *Butyrum sapientiae* was modeled on Avicenna’s *Kitāb al-Shifā’* and to a large extent follows it in its content, though it also draws on other Arabic and Syriac sources. It is made up of four parts: logic, natural science, metaphysics, and practical philosophy, each of which is divided into “chapters,” “sections,” and “theories.” This plan of organization represents a significant departure from the *Shifā’* in that it completely omits that work’s section on mathematics while

it adds a more detailed section on practical philosophy. In this way, the *Butyrum* stays closer to the content of the Aristotelian corpus.

In composing the *Butyrum*, Barhebraeus would generally select two sources to form the basis of each section. He would use one main source, usually the relevant section of the *Shifā'*, and harmonize and supplement it with material from another source, usually from the Greco-Syriac tradition. For example, the first section of the *Butyrum*, on logic, closely follows the *Shifā'* in its method of covering the material of the *Isagoge* and the *Organon* but Barhebraeus also made use of the Aristotelian texts themselves from Syriac translations. In the section on natural science, he supplements the material from the *Shifā'* by making much use of the Aristotelian *Compendium* of Nicolaus of Damascus, which is largely lost in the original Greek. In the section on practical philosophy, a subject given little attention by Avicenna, Barhebraeus models his writing on the *Akhlāq-i Naṣīrī* of Naṣīr al-Dīn al-Ṭūsī, a contemporary whom he likely met during his visits to Maragha.

In addition to his purely philosophical writings, two of Barhebraeus' theological works contain much material of philosophical interest. The *Candelabrum sanctuarii* is an extended exposition of the Christian faith according to the scholastic method: each problem of doctrine is stated, a solution is provided and supported by biblical and patristic quotations, and objections are raised and responses given. The much shorter *Liber radiorum* discusses many of the same theological questions in a more abbreviated format.

As Janssens (1937) observed, there is a noticeable lack of consistency between certain positions taken by Barhebraeus in his philosophical works and those he puts forth in his theological works. For example, in the *Sermo sapientiae*, he states that the brain is the center of the animal faculties, while in the *Candelabrum* he claims that it is the heart. Likewise, he explains in the *Sermo* that the celestial spheres are not composed of the elements which form the sublunar world, while in the *Candelabrum* the entire universe is composed of the same elements. Notably, he also implies support

for belief in the eternity of the world in the *Sermo* despite explicitly condemning this same theory in his theological works.

These discrepancies between different works by Barhebraeus can likely be explained by his methodology and variations in his audience. In his writings, Barhebraeus was not so much attempting to provide his own doctrine as he was attempting to make available in Syriac compendia of the knowledge available in his time. Thus, in the *Candelabrum* and the *Radiorum* which he called his "ecclesiastical" treatises, he used what was available in theological sources for a churchly audience, while in his philosophical works he compiled and synthesized various sources from the Aristotelian tradition as they were available to him. On the most central points of philosophy, however, Barhebraeus tried to demonstrate the essential correspondence between philosophical and theological concepts. Thus, he sees the necessary being as equivalent to God the Father, the First Intellect to the Son, the Active Intellect to the Holy Spirit, and the abstract intellects to the angels.

Barhebraeus' influence on later philosophy is rather limited due to the sharp decline in Syriac literary activity in the generations immediately following his life. While the Mongol conquest had initially encouraged hope among Syriac Christians that they would be freed from Muslim rule, the conversion of the Ilkhanid ruler Ghāzān to Islam in 1295 led to further marginalization of Syriac language and culture. On the other hand, Barhebraeus' works provide a comprehensive picture of the intellectual world of the Near East of the thirteenth century and his efforts at providing an updated Syriac vocabulary for expressing contemporary thought served as inspiration for literary revivals of Syriac in the nineteenth and twentieth centuries.

Abū Sulaymān al-Sijistānī al-Manṭiqī

Emily J. Cottrell

Department for Religious Studies, Leiden University, Leiden, The Netherlands

Abstract

Abū Sulaymān Muḥammad ibn Ṭāhir ibn Bahrām al-Sijistānī (also: al-Sijzī) was a philosopher and a logician (*manṭiqī*). He is thought to have been born in Sijistān during the first quarter of the tenth century and to have died in Baghdad during the last quarter of the

tenth century. He succeeded Yaḥyā ibn 'Adī as a head of the Aristotelian School of Baghdad. Seemingly, he never engaged in systematic teaching, but his philosophical circle became famous during his lifetime as it was the object of recorded sessions by one of the most important men of letters of tenth-century Baghdad, Abū Ḥayyān al-Tawḥīdī.

Biographical data about Abū Sulaymān al-Sijistānī's background are scarce, but according to his name, he must have been born in Sijistān (or Sīstān), in eastern Iran, at an unknown date (first quarter of the tenth century?). There, he was close to the Saffarid king Abū Ja'far ibn Banawayh (r. 311/923 to 352/963). J. Kraemer (following M. Qazvīnī, who pointed at the important information preserved in Abū Ḥayyān al-Tawḥīdī's *Muqābasāt (Enlightments)*) established that he must have settled in Baghdad before 327/939, when he was asked to give an horoscope for 'Abd al-'Azīz ibn Nubāta. Al-Sijistānī was by then probably in contact with 'Alī ibn Yaḥyā ibn al-Munajjim – a member of an important family of scholars of Iranian descent who served the 'Abbāsīd – who was also asked to give his predictions about the child.

In Baghdad, al-Sijistānī studied with the Christians Yaḥyā ibn 'Adī (d. 363/974) and maybe with Abū Bishr Mattā ibn Yūnus (d. 328/940), whom only the late bio-bibliographer Ibn al-Qifṭī mentions, while his relationship with Yaḥyā ibn 'Adī is documented by several extracts of conversations between him and al-Sijistānī recorded in Tawḥīdī's works, as well as by references in the works of Yaḥyā ibn 'Adī (see Kraemer 1986: 25, 102 and Khalīfāt 1988: 56). Sijistānī was to succeed Yaḥyā ibn 'Adī as the head of the "School of Baghdad" (see Sezgin et al. 2000) and high-ranking personalities seem to have been visiting him. This Aristotelian school of philosophy in Baghdad kept alive the tradition of lectures and commentaries on the Greek philosophical corpus, in the tradition of what had been practiced in Athens, Alexandria, Rome, Antioch, etc.

From an unknown date, al-Sijistānī benefited from the protection of the Buyid king and patron

of scholars ‘Aḍud al-Dawla (b. 324/936, d. 372/983), but it is not clear where Abū Sulaymān al-Sijistānī and ‘Aḍud al-Dawla first met. ‘Aḍud al-Dawla had succeeded his uncle ‘Imād al-Dawla as the ruler of Fārs at the age of 13, with Shīrāz as his capital, and it is only in 376/964 that he entered Baghdad, after saving the ‘Abbāsīd caliph al-Ṭā’i‘ from the threat of Bakhtiyār, a rival Buyid cousin. Al-Sijistānī kept visiting faraway Sijistān from time to time, as is recorded by his friend and disciple, Abū Ḥayyān al-Tawḥīdī, in chap. 89 of the *Muqābasāt*. Before 360/970, al-Sijistānī went to Rayy on his way to Sijistān, and paid a visit to the mathematician Abū Ja‘far al-Khāzin (d. between 350/961 and 360/971). Ibn al-‘Amīd’s court in Rayy was at the time a place of intense philosophical activity, to such extent that a rivalry between the intellectual circles of ‘Aḍud al-Dawla, Ibn al-‘Amīd, and later on of Ibn al-‘Abbād and Ibn Sa‘dān is recorded in a number of famous works of this period, among which are Tawḥīdī’s and Miskawayh’s, as well as the anonymous *Ṣiwān al-ḥikma*. The philosophical correspondence between ‘Aḍud al-Dawla and Ibn al-‘Amīd is preserved (see Daiber 1993), and Sijistānī’s visit to Rayy can be considered a friendly visit to the court of a friend and ally of his patron.

The *Ṣiwān al-ḥikma* (*Chest Box of Wisdom*), attributed to al-Sijistānī by the historian Zahr al-Dīn al-Bayhaqī (also known in Persian under the name of Ebn Funduq), has been the issue of a debate between scholars. Al-Qāḍī (1981), noticing that Abū Sulaymān al-Sijistānī is mentioned as passed away in the *Ṣiwān*, suggested that the book was composed from materials gathered with the help of al-Tawḥīdī and Miskawayh by a disciple of Abū al-Ḥasan al-‘Amīrī, the little known Abū l-Qāsim al-Kātib, to whom the book should be ascribed. On his side, Kraemer (1986) considers the *Ṣiwān* emanated from al-Sijistānī’s circle. The two interpretations are actually compatible, since Abū al-Qāsim can be considered a remote member of al-Sijistānī’s circle. The moral authority of the *Ṣiwān* remains al-Sijistānī, if we consider that the materials that constitute its bulk are, in addition to philosophical sessions held in the presence of Abū Ja‘far ibn Banawayh (d. 963) the king of Sijistān and a close friend of

al-Sijistānī, excerpts from the cenacles of Abū l-Faḍl ibn al-‘Amīd and discussions between al-Sijistānī and his friends.

Jaadane (1967) and Kraemer (1986) have given penetrating analyses of Abū Sulaymān al-Sijistānī’s philosophy and for the latter, two encompassing volumes on his epoch (see Kraemer 1993, in addition to the volume devoted to Abū Sulaymān al-Sijistānī, published in 1986). These two count as reference works. Classical sources such as Ibn al-Nadīm, Ibn al-Qifṭī, Ibn Abī Uṣaybi‘a, and al-Ṣafādī mention the relations between al-Sijistānī and prominent members of Yaḥyā ibn ‘Adī’s school, such as Abū ‘Alī ibn al-Samḥ (d. 418), Abū l-Khayr ibn al-Khammār ibn Suwār (d. 440/1048), and his disciple Ibn ‘Abbād, with whom al-Sijistānī exchanged letters.

As for al-Sijistānī’s closest disciples, they did not achieve the fame reached by the mostly Christian members of Yaḥyā Ibn ‘Adī’s circle, and it seems that al-Tawḥīdī, al-Ṣaymarī, al-Nūshajānī, Abū Muḥammad al-‘Arūḍī, and Ghulām Ḥuḥal were Sijistānī’s friends rather than his formal disciples. According to Ibn al-Qifṭī, commenting upon a verse written by al-Badīhī on al-Sijistānī, he was afflicted of a skin-disease and restricted himself from visiting people.

Metaphysical and ethical matters with concrete religious echoes were discussed in the circle. The primacy of logic or grammar was one of these. Yaḥyā ibn ‘Adī had devoted a treatise to this question (*Demonstration of the Distinction Between the Art of Philosophical Logic and the Art of Arabic Grammar*; *Tabyīn al-faṣl bayna ṣinā‘atay al-manṭiq al-falsafī wa-l-naḥwī al-‘arabī*, ed. Khalīfāt 1988: 414–424), as the gap between religious grammarians of the Arabic language and the Aristotelian philosophers was widening to become purely ideological (see Versteegh 1977). The dispute between Abū Sa‘īd al-Sīrāfī and Mattā ibn Yunūs was a landmark and kept being discussed in several of al-Tawḥīdī’s writings. In the *Muqābasāt*, Chap. 22, al-Sijistānī takes an opposite stand to his disciple’s (who supported al-Ṣīrāfī), telling him that “Grammar is an Arabic logic, and logic is an intellectual grammar,” affirming the superiority and universality of Greek logic. Materials on this issue have been gathered and commented upon by Kraemer (1986: 143–152).

From the same context emerged the question whether reason and religion can be reconciliated. Abū Sulaymān al-Sijistānī seems to have changed his mind regarding this issue (see Jaadane 1971: 74–80). As is well-known, the popular Pythagorism offered by the Brethren of Purity's *Epistles* had a far-reaching influence. Al-Sijistānī openly criticizes the Brethren for their attempt to unite Greek philosophy and Islamic religion into a single system. Jaadane notes that if in al-Tawḥīdī's *Imtā' wa-l-mu'ānasa* (*Enjoyment and Familiarity*), al-Sijistānī underlines that religion and philosophy have different methods and different goals, in the testimony of the *Muqābasāt* (after 391/1001) he develops a view that may be closer to the Neoplatonist theories that one could read in Pseudo-Aristotle's *Theology* and in the tradition of the philosophical commentaries, which would lead to the Avicennian synthesis. According to the *Muqābasāt*, al-Sijistānī admits that the prophets are, just as the philosophers, concerned with the salvation of human souls. Nevertheless, he blames the theologians (*mutakallimūn*, used for both Christians and Muslims) for claiming to use a rational method of inquiry while they fall into the trap of dialectics (*jadāl*) (see Jaadane 1971: 78–79 and Kraemer 1986: 246).

Greek theories on the soul were also extensively discussed in the circle, as echoed from the quotations gathered in the *Šiwān al-ḥikma* and in Tawḥīdī's works (*Imtā'* and *Muqābasāt*). As Yaḥyā ibn 'Adī had been studying with al-Fārābī, it comes as no surprise to see in the materials discussed the overwhelming influence of the *Plotiniana Arabica*. Tawḥīdī himself reports that he attended al-Sijistānī lectures on Aristotle's *De anima*.

The bulk of al-Sijistānī's cosmological system is to be gathered from three treatises written on metaphysical matters, for which translations and illuminating annotations have been provided by Kraemer 1986: 274–310.

In the *Maqāla fī l-ajrām al-'ulwiyya anna ṭabī'atahā ṭabī'a khāmisā wa-annahā dhawāt anfus wa-anna al-naḥs allatī lahā hiya al-naḥs al-nātiqa* (*Treatise on the Celestial Bodies, that Their Nature is a Fifth Nature and that They Have a Rational Soul*, translated by J. Kraemer as *The Supernal Bodies Possess Rational Souls*),

al-Sijistānī departs from Aristotle's doctrine of the principle of motion to follow Alexander of Aphrodisias. As shown by Kraemer, al-Sijistānī maintains that the body's principle of motion is an inherent motivating power, and that the heavenly spheres are animated. For al-Sijistānī, the natural forms, or souls, of the heavenly spheres are within the spheres as the souls of animals reside in their bodies. What moves the heavenly spheres is their desire to be assimilated with the First Cause, or First Mover. Familiarity of the author with the Pseudo-Aristotle's *Theology* is noted by Kraemer in his notes to the translation (Kraemer 1986: 278–285). In his *Fī l-muḥarrik al-awwal* (*On the First Mover*), al-Sijistānī departs from Alexander of Aphrodisias' theory of the First Mover. Probably following Themistius, he poses the existence of a distinct Unmoved Mover, while Alexander kept identifying the First Mover to the God of Aristotle's *Metaphysics*, book *Lambda* (see Kraemer 1986: 285–292). Finally, in his *Fī l-kamāl al-khaṣṣ bi-naw'ī al-insān* (*On the Specific Perfection of the Human Species*), al-Sijistānī addresses the emanation of the virtues through creation. This power, according to him, flows from the Ultimate Principle of this world to the individual who governs through just laws and imposes order and harmony (Kraemer 1986: 293–310). This perfect individual is identified here with 'Aḍud al-Dawla, to whom the treatise is dedicated (it might not be overlooked here that 'Aḍud al-Dawla was a Shī'ite, even if we have no traces of his own understanding of the Imamate theory). Al-Sijistānī enumerates the different positions held by the followers of different sects of his times on God and the higher beings, and mentions the views of the “Ancient believers”; different sects of the Christians, for whom these higher entities are human substances (the Jacobite, Nestorian, and Melkite views are given); groups who believe this Being can be united with more than one person (the extremist Shī'ites, or *Ghulāt*) among whom “those who speak of incarnation (*ḥulūl*)”; a group of the Sufis; the Dualists, who hold the two roots of Light and Darkness as being united with the supreme principle; the Muslim theologians (the *mutakallimūn*), who describe the Supreme Being by means of Its attributes; and the “most excellent philosophers”, who according to al-Sijistānī, hold

to negative theology. The importance of al-Sijistānī's writings has started to be appreciated with Kraemer's master study, but the full implications of his philosophical epistles remain to be inserted within the traditional narration of the history of medieval Arabic philosophy from al-Kindī to Averroes.

theology. Wodeham’s most important philosophical innovation was the “complex significant,” akin to the contemporary idea of States of Affairs. He developed this in his epistemological project of ascertaining what we understand when we claim knowledge of things in the world. Ockham had held that the objects of scientific knowledge are mental propositions in which the concept naturally signifies the perceived objects, which led to questions about whether we make judgments about mental propositions or things. Wodeham’s innovation was to argue that we formulate judgments about things in the world when things conform to the way the mind formulates propositions about them. While this does not introduce a new layer of ontological complexity to the extramental world, it does focus attention on the natural method by which we propositionalize what we perceive. Wodeham’s doctrine of complex significantes was to be influential in later scholastic epistemological discourse, and it contributed importantly to the logico-semantic approach of Oxford theology. Wodeham was also an important opponent of spatiotemporal atomism, a view that arose within the philosophical speculation about how to mathematize our understanding of the physical world that characterizes the thought of the Mertonian “Calculators.”

Abstract

Adam Wodeham (d. 1358) is an Oxford Franciscan protégé of Ockham and influential adherent of Ockham’s philosophical approach in the years of Oxford’s “Golden Age” of

Biography

Adam Wodeham (c. 1295–1358) is a Franciscan theologian and associate of William Ockham at Oxford where he is known to have been studying by 1320 and where he likely remained at least through the 1330s and possibly until his death. He began as a student of Walter Chatton, with whom he famously disagreed throughout his philosophical career. While Wodeham was known as the foremost expositor of Ockham’s thought following the latter’s departure from Oxford in 1324, he disagreed with his master on several critical points, particularly in epistemic questions and matters regarding the Trinity and Eucharist.

Wodeham lectured on the *Sentences* in Norwich, in London, (scholars continue to disagree regarding the dating of these two sets of lectures) and finally in Oxford in 1334. The set known as the Norwich lectures, entitled *Lectura secunda*, are the only widely available Sentence commentaries, having been published in 1990. The Oxford lectures, which contain references to many of the views of his contemporaries, as well as a rich offering of his philosophical theology, remain unpublished. In addition, Wodeham's *Tractatus de indivisibilibus*, a compendium of arguments against spatiotemporal atomism then at issue in Oxford, remains, while his commentaries on the *Cantica canticorum* and Ecclesiasticus, *Postilla de sacramento eucharistiae*, and several other works appear to have been lost. Wodeham's reputation as a philosophical theologian remained considerable into the sixteenth century, when John Mair published Henry Totting of Oyta's abbreviated account of Wodeham's Oxford lectures. His postulation of the complex significable as the object of knowledge remains an important philosophical innovation, arguably prescient of contemporary understanding of States of Affairs.

Epistemology in the Norwich Lectures

The Norwich lectures begin with a 250-page analysis of the epistemological problems associated with scientific knowledge, a necessary preamble to understanding the possibilities open to theology as a science. How is scientific knowledge of the world possible, and how do we glean understanding from what we perceive? Ockham and Scotus had argued that there is a difference of kind between intuitive and abstractive cognition correspondent to the sensitive and intellective souls that compose the knowing self. While Scotus understood the two kinds of souls to be formally distinct, for Ockham, the distinction was real, making a unified, composite perceiving and understanding self, which Wodeham felt to be philosophically untenable, better explained by one soul capable of both perceiving and understanding. This forced him to admit that perceiving a red apple counts as an intellective act, which fits

uncomfortably into the Aristotelian epistemic scheme. Wodeham maintained the distinction between intuitive and abstractive cognition, in which our cognition of this individual apple is distinct from the more general cognition of redness or apples as such, which we abstract from perception experiences, but in rejecting a corresponding distinction between kinds of souls to which these differing kinds of cognitive acts are suited, Wodeham stands out among fourteenth-century philosophers. His articulation of the relation between intuitive and abstractive cognition owes more to Scotus than to Ockham, who had posited an intermediate, imperfect intuitive cognition to account for objects once, but not now presently, perceived. Our presence to memory of a once-perceived object, Wodeham argues, is an abstractive cognition correspondent to an act of memory, and we need not posit an intermediate species of cognition to account for it.

Ockham had famously argued for the possibility of an intuitive cognition of nonexistent objects, provided that God brought about such cognition through *potentia absoluta*. A lively philosophical dialogue ensued regarding cases in which we seem to have intuitive cognition of nonexistent beings without direct divine intervention, which contributed significantly to Wodeham's epistemology. Peter Auriol had dominated the argument by describing our intuitive cognition's reliance intentional beings, created as direct result of our raw sense perceptions. The force of this argument had been powerful, likely contributing to Ockham's earlier theory of concepts as "thought objects," *esse obiectivum*. Auriol had noticed that our raw sensations can produce illusions, as when someone whirls a torch quickly in the night, creating an afterimage of a circle immediately present to our eyes. The afterimage is, in reality, not there, not outside our eyes, but it has a presence that suggests a regular tendency in our perception to create intentional beings for our intuitive cognition of external objects. Chatton had interpreted Auriol's account as being a good argument in favor of skepticism, the thin edge of the wedge that might lead to doubting the veridicality of all intuitive cognition. Wodeham was determined to oppose this, arguing that Auriol's illusions arising

from raw sensations did not necessitate recognition of an intuitive cognition of nonexistents; reason and experience both help us to recognize illusions that arise from our perception, and they rein in tendencies to imagine these illusions as having sufficient force as to threaten our knowledge of the perceptible world. The real problem here is Auriol's interposition of an intentional being arising from raw sensation that serves as the object of our intuitive cognition. Wodeham argues vigorously against these phantom intermediaries, recognizing that Auriol's arguments rely heavily on the illusion problems that can be laid to rest by relying on reason's mediating role in intuitive cognition. In opposing Auriol, however, Wodeham is not ignoring the possibility that God could be causing our intuitive cognition of something that appears present to us, but is not. Ockham had argued that such a divinely caused apparent presence would become rapidly apparent to us as illusory, which position Wodeham regarded as untenable. Wodeham was more willing to face skepticism than was Ockham, recognizing the possibility of divinely caused intuitive cognition of nonexistent entities as leading to the impossibility of certain empirical knowledge of perceived objects. This impossibility is ultimately not deleterious to scientific knowledge, though; provided that God is not actively deceiving us, our perceptions may function as direct evidence of objects in the world.

The focus of theological knowledge is, of course, God. Intuitive cognition of God would be beatific vision, available only to the blessed in heaven. When Wodeham was lecturing, John XXII was arguing against the beatific vision prior to Judgment Day, throwing the theological world into a furor; Adam makes no mention of this in the Norwich lectures. So the question is about the possibility of abstractive cognition of God, and here need arises to distinguish between three kinds of abstractive cognition. The first arises from reasoned argument grounded in concepts themselves abstracted from experiences in the world, as with the proofs for God's existence common in the schools. The second is a more specific, simple concept not dependent on other abstracted cognitions, but specific to its object

alone. The third abstractive cognition arises from intuitive cognition immediately, prior to rational analysis, as when we focus our attention to the red of an apple without yet forming assertions or denials in comparison to other reds we may have experienced. This kind of abstractive cognition is certainly possible in mystic vision, Adam argues, which fall short of the beatific vision but only just. Short of such mystic vision, though, will abstractive cognition arising from reason provide a simple concept proper to God alone? This "God-shaped" concept would be specific to divinity, in the way that "apple" is specific to apples only and not any other kind of fruit, but the "God-shaped" concept would be different in that it would have only one correlate in reality, an ontological being so unlike any created being as to stretch the referential functioning of a concept beyond breaking. Scotus, for whom the univocity of being came closest to creating such a concept, did not recognize such a simple God concept, and neither did Wodeham. Walter Chatton did, providing Wodeham opportunity to pour scorn on his predecessor, an opportunity he rarely denied himself when it arose.

Here Wodeham introduces the innovation for which he is perhaps best known, the complex significable. After having surveyed the fundamental questions of epistemology in the Prologue to the Norwich lectures, he fixed his attention on ascertaining what it is we understand when we claim knowledge of things in the world sufficient to undergird the concepts we use in theological argument. To do this, he triangulated between the views of Ockham and Chatton. Chatton had argued that the objects of scientific knowledge are extramental objects that we translate into the terms populating mental propositions. Ockham held that the objects of scientific knowledge are the mental propositions themselves. Both contain elements of the truth, Wodeham argued. Ockham had argued for a more instantaneous natural translation of perceptions into terms than Chatton had admitted, but both believed that our understanding grasps extramental reality and naturally arranges it into the subjects and predicates that make up our propositionally structured understanding. Chatton's disagreement with Ockham

lies in the mediation of mental propositions, which he felt were unnecessary mediaries. Wodeham agreed with Chatton that when we make judgments about things in the world, it is about the things, not mental propositions we construct about them. But the judgments we make frequently rely on temporal qualification; it would be folly to assume that “there was an elephant in the room” and “there will be an elephant in the room” are functionally equivalent. Hence, we make judgments not just about the bare particulars, in this case, elephants and rooms, but about how things are in the world. This is what Wodeham refers to as a complex significable, a thing known through having been signified through a complex proposition. We understand and make judgments about how things are in the world when the world conforms to the mode of signifying characteristic of the proposition formed in the mind. In effect, Wodeham’s complex significable “propositionalizes” the world. This is not to say that Wodeham has thereby added a rich ontological layer of qualifiers onto reality that correspond to the symbols, terms, and concepts we use to understand the natural world. There is no additional complexity to being beyond the things that exist in the way they exist in the world, but our propositionalizing what we perceive must be seen as taking into account both the existing and the mode of existing. Take the knowledge you now (presumably) have of there not being an elephant in the room. The object of this proposition, “There is no elephant in the room” is elephant-not-being-in-the-room. This is not a proposition enriching the being of some elephant somewhere, or of the room, nor is it wholly the product of the proposition-constructing mind intuitively cognizing the room. It is a truth about the room that corresponds to the proposition-constructing mind’s abstractive intuition. Another example will show the constructive steps that go into our use of complex significables. Take the proposition, “*Brontops* nursed its young.” On the assumption that you do not know what *Brontops* is, you cannot say whether the proposition is true or false, and the complex significable to which it may or may not correspond remains hidden. Upon learning that

Brontops is an extinct mammal, the general proposition “*Brontops* nursed its young” becomes evidently so. There is a complex significable to which this proposition refers, even though there are no *Brontops* now to which it refers. Contemporary philosophers are likely to recognize some similarity in Wodeham’s complex significable to States of Affairs, but this similarity depends very much upon the semantics and ontology to which one is willing to commit. Recent interpretations of Wodeham, particularly that of Susan Brower-Toland, argue in favor of this similarity, holding that Wodeham recognized that his theory of judgment committed him to complex significables having factual reality. In any case, Alexius Meinong and Adolf Harnack can certainly be counted as heirs of Wodeham’s approach; their conception of *Sachverhalte* suggests a sufficiently rich ontology as to admit of elephants-not-being-in-the-room being a real object of a proposition. Wodeham’s approach was influential on Wyclif, who developed it in his propositional realism, and on Gregory Rimini, who made use of the idea in his Sentence commentary as well.

Consequent to the complex significable account must be the knowledge or belief to which recognition of a complex leads. When one gives mental assent to a proposition like “Socrates is seated,” is the object of assent Socrates himself, the mental proposition “Socrates is seated,” or the complex Socrates-being-seated? Chatton had limited the object under consideration to Socrates and the mental proposition about him, but Wodeham insists that these two alone lead only to a partial object of assent; the complex is necessary for recognition as there being consistency between Socrates and the mental proposition. This further enhances the correspondent ontological commitment accompanying complex significables by making them not only correspondent to propositions we form about the world but also the truth-makers behind the acts of assent we give or withhold to these mental propositions. This seems to require that they be more than nothing, but Wodeham hesitates. He denies that the complex is but a nothing but stopped short at naming them “somethings.” Gregory of Rimini felt that Wodeham’s understanding of what entails a

“something” was at fault, and his account is notable largely for giving a broader definition of “something” than Wodeham’s. As mentioned, it can be argued that Wodeham in fact viewed the complex significant as a functioning something, real constituents of extramental reality, on a par with States of Affairs.

Indivisibilism

Fourteenth-century Oxford was famous for its attention to the relation of semantics and logic to the natural sciences, particularly Aristotelian physics. The Mertonian “Calculators” were especially concerned to explore the relation of mathematical analysis to questions about movement through media like time and space. A natural result of this was the philosophical investigation into the ultimate structure of spatiotemporal reality. The common view had long been that space and time are both infinitely divisible, but by the 1320s, sufficient disagreement had arisen to lead to three classes of “atomists.” The first, of whom Chatton was most prominent, held that any continuum, whether spatial distance or temporal duration, was made up of a finite number of indivisible points or atoms. The second group, of whom Henry Harclay was best known, held that a continuum was composed of an infinite number of indivisible points, each conjoined to the other without space in between. The third, associated with Grosseteste, argued that the infinite number of atoms making up the continuum was mediately conjoined. Divisibilists rejected indivisibles in physical reality, while admitting immaterial indivisibles such as the intellectual soul. Ockham and Wodeham were among the most thoroughgoing of the indivisibilists, holding that an indivisible particle of spatiotemporal reality was simply a contradiction, a term we can imagine, like “square circle,” without possible referent. Others, the majority, were willing to countenance indivisibles as real but unwilling to assert their uniform presence as the sole constituents of spatiotemporal continua. Wodeham’s position is noteworthy for two reasons. First, his *Tractatus de indivisibilibus* serves as a guidebook to almost all the major

positions and arguments in play in Oxford and, second, because his vigorous attack on atomists seems to have effectively ended the matter, at least until the 1360s. Wodeham collected a mass of arguments against indivisibles, cataloging every possible philosophical problem that can arise from supporting the infinite divisibility of space and time. Indeed, Wodeham eagerly wades into the Zeno paradoxes familiar to philosophy students today, exploring the soundness of Aristotle’s resolutions of these classic problems. An earlier *Quaestio de divisione et compositione continui* exists as evidence for the evolution of Wodeham’s thought; in it, he articulates the idea that all infinite series must be equal, when considered as infinite. Imagining one infinite series beginning early in the day, and another beginning at the end of the day, we are constrained to admit that the former has more constituents than the latter, but as infinities, the two are equal. In the later *Tractatus*, though, Wodeham shifts, arguing in Q.5 that one infinity can be greater than another, a position that had earlier been argued by Grosseteste.

Adelard of Bath

Charles Burnett

The Warburg Institute, London, UK

Abstract

Adelard was a Latin scholar and teacher of the liberal arts. He was a pioneer in writing about “natura” as natural science, and was also responsible for making the first translations from Arabic into Latin of works on geometry and astronomy. Several generations of students used his Latin adaptation of Euclid's *Elements*, and his *Questions on Natural Science* remained a popular text into the Renaissance.

Adelard of Bath (c. 1080–1150), scientist and translator, is the most eminent among several of scholars in the West Country of England who involved themselves in mathematics and astronomy in the early twelfth century. He was proud to call himself “a man of Bath,” and it is likely that

he spent most of his career in this city, which had been restored as a spa in the early twelfth century, and attracted people from far and wide for the curative powers of its waters. Adelard uses Bath in examples in astronomical and magical texts, whilst his name is attested in documents from Bath Priory in 1100, 1106 and 1120, as a steward and knight of the bishop, John de Villula of Tours. As was customary, he went abroad to study, and refers to sojourns both in Tours (where a famous, but unnamed, wise man, taught him astronomy) and in Laon. It is at Laon that he made a pact with his “nephew” – that he would devote himself to the “studies of the Arabs” whilst his nephew would pursue French studies. These studies took him to Salerno, “Magna Graecia” (southern Italy), Syracuse in Sicily, and Mamistra and Tarsus in the Norman Principality of Antioch. He may well have travelled to the Middle East in the wake of the First Crusade, which led to the capture of Antioch in 1099; a later scholar appears to call Adelard an “Antiochene.” In these journeys, he mentions meeting a Greek expert in medicine and the nature of things in Magna Graecia, attending an anatomical demonstration in Tarsus, and experiencing the volcanic eruption of Mount Etna and an earthquake at Mamistra (Misis). There is no evidence that he visited Spain, though the transcriptions of Arabic terms, which he liberally uses in his translations, reflect Spanish pronunciation; this may reflect collaboration with Arabic speakers of Hispanic origin in England. It seems that, on his return from his seven-year trip, he spent the rest of his life in England and Normandy where he wrote most of his works. His humanistic works, *De eodem et diverso* (*On the Same and the Different*) and *Quaestiones naturales* (*Questions on Natural Science*) were dedicated respectively to William, bishop of Syracuse and Richard, bishop of Bayeux (either FitzSamson, bishop 1107–1133, or of Kent, 1135–1142). In early 1150, in Normandy, he dedicated his *De opere astrolapsus* (*On the Function of the Astrolabe*) to the young Henry Plantagenet, who was to become Henry II in 1154. This is the latest of the sparse dates that we have for Adelard’s life.

Adelard wrote two kinds of works: original texts written in a polished and elegant Latin, intended for entertainment as much as education; and mathematical works translated or adapted from Arabic texts, written for students and professionals. The earliest of the first group is probably the *De eodem et diverso*, which is an exhortation to the study of philosophy, following the model of Boethius’ *De consolazione philosophiae*. His aim is to show how the epistemology of Plato and Aristotle can be reconciled in a theory of universals which is very similar to what was later called the indifference theory. Its protagonists are two allegorical figures, Philocosmia, the lover of worldly pleasures, and Philosophia, the lover of wisdom. Philocosmia criticizes philosophers for being inconsistent, useless and poor, but rather promotes her attendants, Riches, Power, Honour, Fame, and Pleasure. Philosophia, however, wins the debate and the second half of the text is devoted to the description of her own handmaidens, the seven liberal arts. Philocosmia epitomizes preoccupation with “things” (*res*), whilst Philosophia gives priority to “words” or “terms” (*voces*): that is, the names of the genus, species, and individuals, which can each be applied to the same actual substance, and the words of the books of the seven liberal arts, which prevent the human soul from lapsing into corruption.

The *Quaestiones naturales* was the most popular of his literary works, and often accompanies Seneca’s *Natural Questions* in the manuscripts. It takes the form of a lively dialogue between Adelard and his nephew. The dialogue is built on a framework of pre-existing “questions on nature,” which evidently formed the basis of debate in the medical school of Salerno, which Adelard had visited. As such, the topics are on natural science, arranged from the lowest parts of the universe (the roots of plants) to the highest (the stars and unmoving sphere). Although Adelard claims that he is drawing from his “Arabic studies,” no direct Arabic sources can be recognized; literal quotations rather come from Plato’s *Timaeus* and Cicero’s *On the Nature of the Gods*. Nevertheless, the tenor of the discussions

could reflect the conversations that he engaged in, on his sojourn in Sicily and the Middle East. The aim of the *Quaestiones naturales* is to show how one should work out problems rationally, on the basis of observation, rather than depend on the writings of authorities. Well known is his comparison of the letter of authority with a prostitute who makes herself available to the affections of all-comers. Reason is to be preferred. Why else did God give each man a brain, unless it was so that he could work things out rationally himself and not rely on what an “authority” had said? (*Quaestiones naturales*, 6, p. 105). One should push rational arguments as far as they can go, and only when human knowledge completely fails, should one refer to the agency of God (*Quaestiones naturales*, p. 97).

An example of an argument based on reason is his discussion of whether brute animals have souls. Adelard claims that they do. For every animal makes a judgement (*iudicium*) as a result of a sensation, so that it seeks out something and avoids something else. More than that, one can observe that dogs react to words spoken to them, so they must have understanding (*intellectus*). In a human body, judgment and understanding can only take place if the soul is present. Since human bodies are more perfect than the bodies of brute animals, it is irrational to believe that animal bodies can perform judgement and understanding without a soul. Nor can one argue that animals’ souls perish with their bodies, for if, as has been shown earlier in the *Quaestiones naturales*, the elements that make up bodies never perish, but continuously reform to produce new bodies, how can the soul, which is a superior entity, perish completely? Conclusions such as this may have prompted Adelard to say in his preface that his readers cannot accept anything “new,” so that, when he wishes to put forward his own discovery he must say: “Someone else said, not I” (*Quaestiones naturales*, p. 83).

This argument also shows a preoccupation of the *Quaestiones naturales* with psychology, and with the senses, which is absent from earlier sets of natural questions. In general, while most of the questions themselves are found elsewhere, Adelard’s solutions are his own. He sometimes

appears to use a pre-existent question simply as a convenient starting point to investigate a topic that concerns him more deeply: for example, the question “Why does fanning generate coldness, if movement generates heat?” prompts him to consider essential and accidental qualities, while the question “Where do winds arise from?” leads him to discuss the problem of infinite movement. While one cannot describe the *Quaestiones naturales* as a systematic work on physics, several topics relevant to physics are dealt with.

Adelard’s translations from Arabic are literal and technical in nature: they teach one how to compute on the abacus, to solve geometrical theorems, to chart the course of the stars, to draw up horoscopes and to make talismans for effecting magic. Adelard, however, was keen to provide more than literal translations. In the case of Euclid’s *Elements*, in addition to his literal rendering, either he or members of his school recast the work in the form of a “commentum” in order to show how theorems followed on from one another by a process of deductive reasoning (this is the so-called “Adelard II” version of the *Elements*). In a work on how to use an astrolabe, based on Arabic texts on the subject, he includes a summary of cosmology according to the Ptolemaic system.

Adelard contributed significantly to establishing of the teaching of the quadrivium in the Middle Ages. The “Adelard II” version of the *Elements* was included in Thierry of Chartres’ two-volume collection of texts on the seven liberal arts (the *Heptateuchon*), and was copied in more than 70 manuscripts. His translation of the tables of al-Khwarizmi was also copied into the *Heptateuchon*, but was soon superseded by the *Toledan Tables*. His abiding reputation, however, was due to the *Quaestiones naturales*, which were printed three times in the Renaissance and quoted by scholars such as Giovanni Pico della Mirandola.

like Albert the Great, Ulrich of Strasbourg, and Thomas Aquinas. They argued that beauty lies in the relation between the form and matter of a hylomorphic concrete whole. Although they were writing in the context of beauty as a property of all things that exist, some of them allowed for different degrees of beauty in different things. Traditionalist theorists put these ideas together with material from technical treatises on individual arts (such as poetry, music, and architecture) and ideas implied by medieval artifacts in order to construct a medieval aesthetic theory. Recently, however, strong arguments have been brought to suggest that there was no such thing as medieval aesthetics, given that the connection between beauty and human-made artifacts, central to many modern aesthetic theories, was not made.

Encyclopedia entries are not, usually, a suitable place for discussions of methodology, and least of all survey articles, to which readers look for a clear and balanced introduction to a field. Yet, a survey of what is called medieval aesthetics cannot avoid questions of method, because it is a matter of dispute whether medieval aesthetics is a subject at all. While there are a number of modern studies of medieval aesthetics, written by expert historians and philosophers, there are other recent historians and philosophers who put forward powerful reasons for thinking that there was no aesthetics in the Middle Ages. Given that encyclopedias are designed to celebrate the quarter-truth that there exists a stock of methodologically uncontroversial, fixed knowledge, which gives answers rather than poses fresh questions, most of this entry is devoted to explaining the "Traditional View," according to which there is medieval aesthetics. At the end of my discussion, however, I briefly explain the powerful arguments put by the Revisionists that medieval aesthetics is as much a nonsubject as medieval molecular biology or medieval nanotechnology. I do not discuss a recent revision of the Revisionist view (Marenbon 2009). Despite that difference, for some of my discussion here I draw on this earlier piece of mine.

Aesthetics

John Marenbon
Trinity College, University of Cambridge,
Cambridge, UK

Abstract

According to a "Traditional" view, there was a medieval aesthetics, which centered around the theories of beauty developed by theologians

Traditional View

The traditional view is based on a certain conception of the subject matter of aesthetics (in general), which lies behind most aesthetic philosophy from the later eighteenth to the later twentieth century. Aesthetics, they consider, is about beauty, but beauty especially (though not exclusively) as manifested in works of art (by which are meant literary, pictorial, sculptural, architectural, and musical artifacts). The traditionalists acknowledge that there was no single branch of study in the Middle Ages devoted to this subject matter. But they believe that there was an underlying medieval aesthetics that can be extracted from a variety of sources: theoretical discussions (often theological), technical manuals of the different arts, and medieval artifacts themselves. Many of them make use of the thirteenth-century discussions of beauty. Since these theories are quite intricate and seem *prima facie* to be the medieval material nearest to the concerns of aesthetic philosophy, I shall look at the most important of these, before considering more briefly the medieval treatises on individual arts – separately. Then, I shall consider how the traditionalists put together their views of a medieval aesthetics.

Theories of Beauty

Explicit and developed medieval discussions of beauty are not found until the early thirteenth century. In the background lie two different types of theory, which they could read in the ancient sources. On the one hand, there was the conception of beauty as a special sort of composite quality, which they read in Cicero and Augustine. For these authors, an object is beautiful in virtue of the arrangement of its parts in a congruent way, and the delightfulness of its color (a formula that would leave it open for a thing's beauty not to be a quality it has in itself, but in virtue of its effect on human observers). Some things, therefore, are (more or less) beautiful, and many things not at all beautiful. On the other hand, medieval authors read about beauty in

Chap. 4 of *On the Divine Names*, written in the fifth century by Pseudo-Dionysius and available in Latin from the ninth century. He presents beauty as a transcendental attribute, along with goodness (with which, he says, it is identical): all things have it by virtue of existing, since God is beautiful and he transmits beauty to all things.

It was in the early thirteenth century that the theory of the transcendentals was first carefully developed, and there are discussions of beauty in this context by writers such as William of Auvergne and the followers of Alexander of Hales who compiled the *Summa Alexandri* (cf. Pouillon 1946). At the same period, Robert Grosseteste was able, as a result of his general cosmological theory, to reconcile the idea that everything is beautiful with the Ciceronian–Augustinian definition in terms of color and proportion. Grosseteste conceived the entire universe as an irradiation of light from its ultimate source, God, and, on the medieval view, color is an effect of light. He also thought that the universe is constructed in accord with the laws of geometry, and so everything is proportioned as well as colored.

The three most important discussions of beauty by medieval theologians are those by Albert the Great and two of his pupils, Ulrich of Strasbourg and Thomas Aquinas. The theories are, on examination, very different from one another, but they are alike in attempting to bring together the Ciceronian–Augustinian view of beauty as a composite quality with Pseudo-Dionysius' transcendental conception of it. Albert treats the subject most fully in his commentary on *On the Divine Names* (Aquinas 1927: 417–443 – it is wrongly attributed to Aquinas in this edition), and so it is not surprising that he identifies beauty with goodness, though he allows that it differs from it “by reason” in certain ways. The identification is deeper than extensional equivalence ((x) (x is good) <-> (x is beautiful)), since all the transcendental attributes have by definition a universal extension and so are extensionally equivalent, and yet neither Albert nor anyone thinks that, for instance, truth (another transcendental) is identical to goodness. It is a moot point, therefore, whether Albert is thinking of beauty as anything more than a way of being

good. He helps us to understand what is involved in being beautiful through an analogy with more tangible beauty of the Ciceronian–Augustinian sort. Just as a body is said to be beautiful “from the resplendence of color over proportioned limbs,” so all things are beautiful by the “resplendence of the substantial or accidental form over proportioned and bounded parts of matter.” What does Albert mean by this comparison? According to the Aristotelian metaphysics that Albert and his contemporaries accepted, all natural things (except, in the view of some, angels and separated souls) besides God are composites of matter and their substantial form, which makes them the sort of thing they are – a human, or a dog, or a flower. They also are the subjects for accidental forms, such as having certain quantities and qualities and relations. For most thinkers of this period, it is matter which individuates forms, and so it makes sense to think of it as being “proportioned and bounded.” And so Albert’s comparison is not far-fetched. But there is the important difference that, whereas a person’s limbs may fail to be proportioned and, in the dark, may not have color resplendent over them, any matter-form composite will, on Albert’s theory, have the beauty of form resplendent over proportioned matter. Moreover, while in principle, a thing may have more or less even of a transcendental attribute, it is hard to see how any one matter-form composite is more or less beautiful than another in Albert’s sense. For this reason, Albert’s conception of metaphysical beauty is rather distant from what “beauty” normally means.

By contrast, Ulrich of Strasbourg (*De summo bono* (*On the Highest Good*) 1987–1989, II.4) does manage to find a way of admitting degrees of beauty into a theory which, like Albert’s, is based on the way in which forms inform matter. Not every bodily individual perfectly exemplifies the species of which it is a member. In order to be perfectly beautiful, the thing must satisfy the four criteria of quantity, number of parts, relation between the size of the parts and the whole, and disposition. The first two of these requirements are fairly straightforward and rule out certain sorts of abnormalities: for its quantity to be correct, something must be of the appropriate size for its

species; neither a dwarf, nor a giant, for instance; a human fails to have the correct number of parts if he or she is one-legged or one-eyed. The third requirement is stricter, since a dog with an unusually long tail or a person with too large a bottom would fail it (in line with a certain widespread intuitive notion of beauty). For the fourth requirement, disposition, Ulrich gives the example of the balance of humors in a human. Many people, according to the medieval theory of humors, do not have their humors in balance, but have, for instance, a choleric temperament or a melancholic one: they would therefore fail to be perfectly beautiful according to Ulrich. These criteria, therefore, would permit quite a fine ranking of beauty, based not just on the external characteristics of things, but on their internal bodily constitutions.

This sort of beauty is, however, just one of four general types distinguished by Ulrich. It is essential corporeal beauty. There is also accidental corporeal beauty. Ulrich separates the relationships between substantial form and its matter, and the matter-form composite and its accidents, which Albert considers together when analysing beauty. Essential beauty is the result of the correct relationship between the former pair, so that the bodily thing is a perfect example of its species, and accidental beauty results from the characteristics of symmetry and color that it has from accidents of quantity and quality. Rather than, like Albert, allude to the Ciceronian–Augustinian definition of beauty as an analogy, Ulrich thus incorporates it into his theory, as a different sort of non-species-based beauty. Ulrich also considers that noncorporeal things, such as angels and separated souls, can be beautiful, essentially or accidentally; for instance, a soul is accidentally beautiful through having knowledge. He does not, however, go into much detail over this side of this theory.

Despite the number of books that have been written on Thomas Aquinas’ theory of beauty (or even more ambitiously, his “aesthetics”), he writes about beauty only very rarely and always in passing, in his commentary on Pseudo-Dionysius’ *On Divine Names* and in the *Summa theologiae*. There are four passages that are

frequently quoted. In Chap. 4, Lectio 5 of the Commentary, Aquinas identifies brightness (*claritas*) and consonance (*consonantia*) as characteristics of beauty, and he remarks that “although the beautiful and the good are the same in subject, because both brightness and consonance are contained in the definition of the good, yet they differ by reason, because the beautiful adds beyond the good an ordering to the cognitive power that it is thus.” In the *Summa theologiae* (I, q. 5, a. 4 ad 1), Aquinas remarks that “in the subject the good and the beautiful are the same, because they are both based on the same thing, that is, on the form.” But the good is in respect of the appetite: good is what all things seek after. The beautiful, however, is in respect of the “cognitive power” (*vis cognoscitiva*), he says, “for things are called beautiful which please when they are seen.” And so, he argues, the beautiful consists in due proportion, because sense is “a certain ratio” and it delights in things that are similar to it. The idea of sense as a ratio is taken from Aristotle’s *De anima* 424a, where he sees the senses as means or ratios, which can be destroyed by sensations so strong that they lose their balance. In a later *quaestio* in the *Summa theologiae* (I, q. 39, a. 8), he explains – while talking about the beauty of the Son of God – that beauty consists, not just in due proportion, but also in wholeness or perfection (a thing must not be missing a part) and brightness (*claritas*), as exemplified by having a shining color. And in IaIIe, q. 27, a. 1, ad 3, Aquinas says again that the beautiful is the same as the good, but differs “by reason alone.” Then he goes on to explain that, whereas the good is that in which the appetite comes to rest, “it pertains to the definition of the beautiful that the appetite comes to rest in the sight or knowledge of it.” He adds that, for this reason, those senses are chiefly concerned with beauty which are most cognitive – sight and hearing (on which see McQueen 1993). Finally, he summarizes his point by saying that “the beautiful adds to the good a certain ordering to the cognitive power, so that the good may be said to be that which without qualification pleases the appetite, but the beautiful may be said to be that the apprehension of which pleases.”

Interpretations of these remarks center on two problems. The first is how to reconcile the side of the theory which identifies proportion/consonance, brightness, and wholeness as features in a thing which make it beautiful, with the side of the theory which emphasizes the role of the cognizer with regard to the beauty of a thing (by contrast with its goodness, for instance). Most interpreters insist that Aquinas has an objective conception of beauty – that is to say, things are beautiful in virtue of attributes that they really have, but that we have to make a special use of our intellectual faculties in order to grasp this beauty. Writing originally in 1920, Jacques Maritain (1965) identified a special power of intellectual intuition by which we grasp the beauty of things. More recent analysts (especially Eco 1970: 60–63, 2007: 281–317) have shown clearly that Aquinas does not suggest or have room for a notion of intellectual intuition, and they have elaborated their own accounts of how we cognize beauty (cf. Mothersill 1984: 323–366; Eco 1970; Jordan 1989; Marenbon 2017).

The second problem of interpretation is whether beauty is in fact a transcendental for Aquinas. Most interpreters believe that it is: their strongest argument for this view is that Aquinas identifies the beautiful with the good, and good is certainly a transcendental for him. But Aquinas never explicitly lists beauty as a transcendental, and in his presentation of the transcendentals in *De veritate* 1.1 beauty is not included. Kovach (1961) – the most thorough collection and analysis of texts on Aquinas and beauty – suggests that Aquinas came to include beauty among the transcendentals only after he had written *De veritate*. He proposes that for Aquinas beauty was a sort of super-transcendental, which brings the other transcendental attributes together. But Aertsen (1991) has argued powerfully that beauty is not an independent transcendental in Aquinas (nor in general in the thirteenth-century tradition). In his view, Aquinas thought that being beautiful is just a way of being good.

An even more radically minimalist interpretation of Aquinas’ remarks on beauty is possible. All things are good in respect of their forms, Aquinas believes (and he explains why – to be good is to be sought as an end; things are sought as

ends because they are perfect, and by being in act, they are in some way perfect; and it is the form which makes a thing be in act (*Summa theologiae*, I, q. 5, a.3)). Things are beautiful, too, in respect of their forms and the fact that – as perfections – these forms are objectively ends to be sought. There is nothing else in the nature of things on which beauty is based and so, in subject, beauty and goodness are identical. But a thing is called “beautiful” only when simply seeing or knowing its form is pleasing, and that happens when the object has, by virtue of its form, certain qualities (proportion, brightness, wholeness) that delight the cognizer. There is no reason at all to think that all things have these qualities. In the case of proportion, Aquinas says that it delights cognizers because the cognizing senses are themselves proportions. This would suggest that finding something beautiful depends on its having attributes that accord with those of the cognitive powers – not those of this or that cognizer, however, but rather those which cognitive powers must have if they are to cognize. And so on this interpretation, judgments of beauty are for Aquinas, just as they would be for Kant, subjectively universal.

However he is interpreted, Aquinas, like Albert, Ulrich, and the earlier thirteenth-century theologians, developed his ideas about beauty within the context set by Pseudo-Dionysius’ view that beauty is an attribute of God transmitted to all creation, and the Ciceronian–Augustinian view of beauty as a complex quality in the background. One contemporary author, who is not a theologian, had an entirely different source and so a completely different approach. Witelo’s treatise on perspective is an adapted translation from an eleventh-century Arabic author, al-Haytham. For al-Haytham (II.3), an object is beautiful just in case it has properties which affect viewers (he is concerned just with visual beauty, given that he is writing about optics) in such a way that they describe them as beautiful. What are these properties? They include color, but, in the main, they are grouped in antithetical pairs. For example, al-Haytham gives the pair discrete/continuous: separate stars, he believes, are more beautiful than nebulae, but a meadow is more beautiful when its vegetation is continuous than when it is broken up

into discrete patches and so is sparse. Clearly, al-Haytham does not believe that his paired characteristics provide a formula for showing what is or is not beautiful. Rather, things are beautiful because they affect us in a certain sort of way, and his antitheses provide a framework for recording some of the different characteristics of different things which have this effect. Witelo makes one important change to al-Hazen’s theory of beauty. Al-Hazen shows no awareness that what is considered beautiful may vary from culture to culture. Witelo (Baeumker 1908: IV.148) recognizes that many types of beauty are based on custom, and that each race will consider that the characteristics of its own members are beautiful. An Arab like al-Hazen will, therefore, judge different colors and proportions beautiful in a human being than a Dane, Witelo explains, perhaps with it in mind that al-Hazen condemns blond hair and blue eyes as ugly.

Treatises on the Arts

Many treatises in the various areas now classified as art or the fine arts were written in the Middle Ages. They are, with a few exceptions, technical treatises and handbooks for practitioners, rather than second-order discussions of the issues considered by aestheticians today in connection with these arts – for instance, the nature of musical expression, or pictorial representation, or the relationship between authorial intention and the meaning of a text. In music, there was a highly theoretical approach, based upon Augustine’s and Boethius’ musical treatises, which made music into a branch of mathematics; and then there were a host of more practical handbooks. The *De diversis artibus* (*On Different Arts*) by Theophilus, probably from the twelfth century, is a treatise on how to use various types of materials (pigments, glues, varnishes) and how to work on various sorts of objects – walls, books, panels, glass, metal. Even the series of *Arts of Poetry*, such as Geoffrey of Vinsauf’s *Poetria nova*, written in Latin at the end of the twelfth and the beginning of the thirteenth century and based partly on Horace and partly on rhetorical manuals,

are mainly devoted to giving practical advice to the would-be poet. Dante's *De vulgari eloquentia* (*On Eloquence in the Vernacular*) is an innovative and reflective discussion about language, but contains little in the way of philosophical reflection about poetry itself.

A Medieval Aesthetic: The Traditional Approach

Recent proponents of the traditional approach have included Edgar de Bruyne (author of a three-volume *History of medieval aesthetics*), the wide-ranging historian of aesthetics Władysław Tatarkiewicz, the renowned art historians Erwin Panofsky, Rosario Assunto, and Umberto Eco, as well as Neoscholastics such as Czapiewski and Kovach. The best of these studies are those by Panofsky and Eco: looking at them brings out the methodology shared by all these writers.

Although Panofsky concentrates on architecture and looks to general features of medieval thought rather than the more detailed theories of beauty and technical manuals discussed above, his way of constructing a medieval aesthetics shows very clearly the underlying methodology of the traditional approach. Panofsky was very impressed by the treatise written in the 1140s by Abbot Suger of St Denis, *De rebus in sua administratione gestis* (*On the Things Done Under His Direction*). Panofsky (Introduction to Suger 1946) argues that the treatise expresses ideas about aesthetics, inspired by Neoplatonism and the metaphysics of light, and that Suger was inspired by these theories in the way in which he had the cathedral built. Later, Panofsky generalized this way of seeing philosophical tendencies reflected in architectural design in his *Gothic Architecture and Scholasticism* (1957). The development of church architecture which led to the Gothic cathedral, unified in its space, and with its elements clearly differentiated, is seen as parallel to the path of scholastic thought towards the highly articulated clarity and the comprehensiveness of the synthesis of philosophy and religion which attributes to Aquinas.

There are two elements of soft Hegelianism underlying Panofsky's approach. The first is the assumption that there is a certain spirit of a period, which can be found in works so different as a cathedral and a theological treatise. The second is the idea that discerning this spirit in its different manifestations and variations is the main task for the historian of philosophy. Medieval aesthetics will therefore be, not a collection of different and often opposed arguments, but a rather a unified (if varying and developing) outlook. These two soft Hegelian tendencies permeate the monumental work of de Bruyne, and they provide the unstated rationale for Eco's studies of medieval aesthetics. Eco, however, is much more self-conscious than de Bruyne about his enterprise and the difficulties which it faces. He accepts that aesthetics did not exist as a recognized branch of philosophy, in the manner of, for instance, metaphysics or ethics, until Baumgarten's *Aesthetica* (1750–1758). Moreover, if aesthetics is to be centered, in the eighteenth-century manner, on beauty as something perceived by the senses, then, he admits, there was little aesthetic reflection in the Middle Ages. But "if we mean by 'Aesthetics' a field of interests around the value 'beauty,' its definition, its function, and the ways of producing and enjoying it – then the Middle Ages spoke of aesthetics." Particularly in his work on Aquinas' aesthetics, Eco shows great ingenuity in extending various hints found in his writings into a complete theory about beauty. He recognizes that Aquinas does not have a philosophy of art, in today's sense of the word, but, like de Bruyne and most of the other theorists, he makes the link between art and medieval theories of beauty by looking at technical treatises on individual arts.

Revisionist's Objections: Arguments Against the Idea of Medieval Aesthetics

In the period from c. 1980 to present, various Revisionist arguments against the traditional approach have been made, especially by Paul

Oskar Kristeller, Jan Aertsen, Andreas Speer, and Olivier Boulnois (2008). Putting together the various critics, the following counter-argument can be constructed.

There were indeed some scholastic discussions about beauty, but (Aertsen 1991) it is misleading to think that beauty was considered a transcendental attribute in its own right, like unity or truth. Rather, it is just envisaged as an aspect of goodness. Aquinas, who has been regarded as the central medieval aesthetic philosopher, had very little indeed to say about beauty (Speer 1990). Moreover, most of the theories of beauty were proposed in a theological context. Even where they concern a notion like that of beauty in its normal sense – an attribute that different things possess to different degrees, their subject is the beauty of natural things, not that of artifacts. The link between beauty and art, which characterizes modern aesthetics, is missing – and so, given medieval assumptions it must be. Human-made things were judged as being lower than natural – that is, created – ones. And there was no system of fine arts, distinguishing the subject matter of what is now aesthetics (centrally: literature, painting, sculpture, architecture, music) from other pursuits (Kristeller 1980). The “arts” were the liberal arts of language (grammar, logic, and rhetoric) and mathematics (arithmetic, geometry, music – studied theoretically – and astronomy). Even when, in his *Didascalicon*, Hugh of St Victor (1961: II.21–28) takes the unusual step of listing seven mechanical arts along with the seven liberal ones, he just shows how distant medieval thinking was from the concept of the fine arts or art, as it is now understood. The mechanical arts are mostly practical crafts, such as agriculture, sailing, and weaving; “theatrical knowledge” turns out to include gymnastics and athletics, and painting and sculpture are included merely as subdivisions of arms-making.

Investigations by revisionist critics into individual works that had been used as sources for medieval aesthetics support this powerful line of counterargument. For example, a recent study of Suger’s *De consecratione* (Suger 1995) makes the

case that, contrary to Panofsky’s reading, Suger’s treatise puts forward his views on the liturgy, ecclesiology, and history, in line with his political aims, and does not present St Denis as a work of art.

There is, besides, another type of criticism that can be made of the traditional approach, related to the second element of soft Hegelianism mentioned above. Even if the traditionalists’ conclusions are accepted, they merely establish that there was a certain, characteristically medieval way of thinking about aesthetics, but not that there was the rational debate about aesthetic positions that would make the period one in which the subject flourished as a field of philosophy. It is true that Eco (1970, 1956) presents a philosophically interesting theory as Aquinas’ aesthetics. But, as he makes clear, this theory is his own construction; Eco is informed by Aquinas’ overall thinking informs, but it is he who is responsible for this supposedly thirteenth-century aesthetic theory (see Marenbon 2017).

Addendum (2017). This article does not attempt to look at medieval aesthetics in Arabic, Hebrew or Greek. Some of the most important scholarly work recently has been done in connection with literature and literary criticism: see Allen 1982, Carruthers 2013, Minnis and Johnson 2005, Robertson 2017, Rosenfeld 2011.

Aesthetics, Byzantine

George Zografidis

Department of Philosophy, Aristotle University of
Thessaloniki, Thessaloniki, Greece

Abstract

Byzantine aesthetics comprises views on traditional aesthetic concepts (beauty, light) and problems (values and properties) as well as discussions relevant to art theory (the status of the work of art, the functions of art, the beholder). It does not form a coherent system and it has to be reconstructed through numerous texts of different genres (philosophical, theological, rhetorical, etc.). The sources of Byzantine aesthetics, concerning mainly the visual arts, are ancient Greek aesthetics (late Platonic tradition on and rhetorical descriptions of works of art) and early Patristic thought (presenting the Christian attitude toward art and an elaborated theory of beauty). Art is appreciated, but in so far as it is a human creation that appeals to the senses it could be justified only on metaphysical grounds. The Byzantines' major contribution was the theory of image that was elaborated during Iconoclasm (eighth to ninth century) and legitimated in theological and philosophical terms orthodox religious art.

aesthetic concepts (beauty, image, light) and problems (aesthetic values and properties, the function of the work of art, the role of the beholder). But in most cases this discussion was made in the context of wider theological and philosophical issues that mostly attracted the Byzantines' interest.

What we can call "Byzantine aesthetics" has certain main characteristics: (a) It neither has a systematic nature nor does form a coherent whole. It emerged as a response to specific problems that were occasionally aroused; so, in regard to its major issues (theory of image, attitude to Greek art) it is mostly polemic. (b) There is almost no particular thinker who treated traditional aesthetic issues per se, analyzing the concepts he used or concluding his discussion without reference to the spiritual domain. (c) The Greek and Patristic heritage was always present in the manner the Byzantines speculated about art and it must be considered as the major source for the formation of Byzantine aesthetics. (d) Byzantine aesthetics referred not only to Byzantine art but also to ancient Greek art.

Hence, Byzantine aesthetics unlike traditional aesthetics does not deal primarily with the categories of beauty and taste, aesthetic experience or pleasure, critical examination and evaluation of beauty. More than a theory of beauty Byzantine aesthetics must be considered as a theory of art, that is, about the status of the work of art, its functions, its reception, its beholder, etc.

The Nature of Byzantine Aesthetics

Modern discussions about the distinction between art and non-art or about the status of the work of art make us hesitant to apply unqualifiedly modern concepts (art, aesthetics) to the pre-modern era of Byzantium. The very existence of aesthetics in the Middle Ages is questionable and the medieval concept of art differs from that of antiquity and, even more, from that of the Renaissance. We cannot expect Byzantium aesthetics to be an autonomous branch of philosophy. On the other hand, the Byzantine writers often discussed

The Sources of Byzantine Aesthetics

Twofold is the background of the Byzantines' views on art, mainly the visual arts: (a) the aesthetic ideas of Greek antiquity, namely the late Platonic tradition (where the role of art is to lead the way toward spiritual beauty), and the analysis of works of art in the rhetorical texts of Late Antiquity. The Byzantines imitated the ancient Greek aesthetic vocabulary (especially in the description of works of art) and when needed they transformed it (especially in the theory of image). (b) The early Patristic thought, particularly the Cappadocians and Pseudo-Dionysius, in

which the Byzantines found a warranted Christian attitude toward art and an elaborated theory of beauty.

One of the problems about studying Byzantine aesthetic views is the absence of specific treatises and the need to reconstruct it using texts of different genres and, more precariously, from the works of art. There are numerous Byzantine texts whose significance for aesthetics is indiscernible because of their titles. They are (a) texts that deal (exclusively or not) with art, like for instance (1) the apologetic texts against ancient Greek art, (2) texts on the theory of image and (3) descriptions of works of art (*ekphraseis*); and (b) texts with occasional references to issues of art and art theory with variant content (theological, historical, philosophical, rhetorical, literal) and written for various purposes and for different audiences during a period of ten centuries.

Beauty and Other Aesthetic Concepts

In the Byzantine writings, many aesthetic concepts are used: beauty, resemblance, similarity, imitation, harmony, symmetry, image, prototype, imagination, symbol, color, form, light, place, time, artist, creation/creativity, life-like, etc. The vocabulary can sometimes be misleading since the language of Byzantine art criticism is completely different from the modern, and thus easily misunderstood. For instance, it is difficult to see why an icon was considered as a naturalistic copy of the original, if we do not take into account the beholder's reaction to the representation. The Byzantines' language has a philosophical background and was derived from late antique *ekphraseis*, rhetorical texts that were formulated to describe an art quite different from the Byzantine. Eusebius, Procopius, Paul Silentiarios, Photios, Psellos, and many others wrote numerous *ekphraseis* that help us to understand the parallel function of text and art, and discourse and image in Byzantium. These descriptions try to express something of the art's spirituality; the text shares a common end with the image described: they point to the truth that supersedes both.

The classical concept of beauty was used in the descriptions but it played no role for the iconoclastic controversy. The visible beauty, be it symmetry or appropriateness, is in earthly things and reflects the spiritual beauty of God (a theme common to the Platonic tradition). So beauty has aesthetic but more importantly ontological connotations. God is the beauty itself that surpasses and causes all created beautiful things.

The Negation and the Acceptance of an Art That Appeals to the Senses

Throughout the Byzantine period existed, but not dominated, a rigoristic attitude to art, that was inherited from Early Christianity. Pagan (religious) works of art were condemned as material, immoral, and dangerous (inhabited by demons) while the possibility of a Christian art was questioned on the basis of the Old Testament's prohibition against graven images and the fear of idolatry. The hostility toward art, in general, was also justified by the illusionary and seductive character of the sensible art-objects and by the total rejection of sensual pleasures in favor of spirituality that demands the formation of the inner image (in the soul) and not the worship of material representations that are incapable of circumscribing God.

The emergence of Christian art (third century) helped to overcome the earlier aniconism and gradually (from the fourth century onward) the Byzantines made a distinction between the ancient works of art that can be appreciated as such and their deplorable religious meaning that must be rejected and condemned. The transfer to Constantinople of ancient masterpieces to adorn the new Christian capital is indicative. But in general, the Byzantine beholder (if there can be a single category that comprises the emperor, the clergy, high officials and scholars, philosophers and theologians, illiterates, etc.) was embarrassed by what can be labeled as "aesthetic pleasure."

It was later, probably from the eleventh century onward, that things changed. For instance,

Psellos has written descriptions where he analyses the ancient work of art aesthetically, commenting on many of its aesthetic qualities and using Platonic and Aristotelian terminology. Detailed descriptions, evaluation of certain material features, the choice of the form, the connection between the sensible form and the theoretical content of the work testify to the aesthetic interests of the Byzantines. After all, the primacy of the visual was a commonplace in Byzantium.

The Theory of Image (Icon)

The development of Christian art and the cult of the images led to the need for the justification of religious imagery and to Iconoclasm (eighth to ninth century). The main problem was not the representation of natural objects (that was only a problem of craftsmanship and of style) or the artistic treatment of religious themes and personages. Thinkers like John of Damascus and Nikephoros of Constantinople, and the Seventh Ecumenical Council argued for the possibility and the legitimacy of the representation of the transcendence, that is, of the incarnated God.

In this perspective, the image was considered primarily as a liturgical object and secondarily as a work of art. The image represents its prototype (art as *mimesis*). Their relation is based on resemblance, which at first is an external one but it becomes internal, due to the anthropological premises of Byzantine thought and to a peculiar participation of the image in the prototype. Aesthetic qualities cannot play the first role; the artistic language is not irrelevant but its criterion is its functionality (it is questionable whether a more beautiful icon can serve better its purposes). As the art had to reflect the absolute beauty of God and testify to its immanence, likeness is not enough. What is needed is a symbolic language to convey the theoretical message. The image is a sign of the presence of an absence, an immanent trace of the transcendence. It does not express the artist's personal emotion but manifests a reality.

The truth of the image is not its appearance nor its beauty but its reference and its proper use. A functionalist approach is appropriate for understanding that the meaning of the image is its use. The image has many functions: didactic (not only for those who were illiterate), allegorical, mystical-anagogical, liturgical (in the process of liturgy), artistic. As Photios stated, the opposition between the external immobility of the image and the internal mobility of the spectator produces the artistic effect. The effect on the beholder is also psychological and moral as the image reminds him/her of events of the holy history and arouses many emotions: compassion, pity, affection and desire to emulate those who are represented. The response of the beholder is finally his/her spiritual ascent. It is not just the aesthetic pleasure that is produced by gazing the images. Beyond beauty and harmony what counts is the crossing of the gazes, of the holy person depicted and the faithful beholder. This is the ultimate function of a work of sacred art and, at the same time, it is overcoming.

Influence

The Byzantine theory of image offered legitimacy to religious art as it is practiced until today among the Orthodox Christians. The distorted reception of Byzantine iconophilia by Charlemagne scholars led to a divergence between the East and the West on the use of sacred art. The outcome of Byzantine Iconoclasm was significant not only for the development of Byzantine art but for European civilization in general and showed how important is the dominion over the production of the symbolic and the imaginary within theoretical and social contexts. The issues at stake were the power of images and the place of the holy in the society and who controls them.

Afḍal al-Dīn al-Kāshānī (Bābā Afḍal)

Mathieu Terrier

LEM (UMR 8584), CNRS, PSL, Paris, France

Abstract

Afḍal al-Dīn al-Kāshānī, known as Bābā Afḍal (d. ca 610/1213), was an Iranian philosopher and poet. Little is known about his life except that he had a lot of students and entertained relationships with princes. Although the term 'Bābā' is often used in the Persian world to refer to a Sufi master, it cannot be affirmed that he was a Sufi in the narrowest sense. Yet, he is to be seen as a philosopher in the ancient sense, as both a professor and a spiritual guide. He wrote most of his works in Persian, probably with the intention of establishing Persian as a philosophical language alongside Arabic. Combining freely Peripatetic and Neoplatonic tendencies, he can hardly be classified as belonging to a specific school of thought. All his concerns tend to the knowledge of the human soul or the "self" (*khūd*), and its progress towards perfection. He regarded self-knowledge as superior to all other sciences, being the unique access to immortality and eternity. In this respect, he set himself apart all other Muslim medieval philosophers and had some influence on the "philosophical renaissance" of the eleventh/seventeenth-century Safavid Iran.

Afḍal al-Dīn Muḥammad b. Ḥasan Maraḡī al-Kāshānī, known as Bābā Afḍal (d. ca 610/1213), was an Iranian philosopher and poet born during the second half of the sixth/twelfth century and died in the seventh/thirteenth century. According to an anonymous prosopography composed at the end of the seventh/thirteenth or the early eighth/fourteenth century, he died circa 610/1213 (*Mukhtaṣar*, pp. 322–323; Zaryāb, p. 31; Rypka, pp. 838–39). As he speaks in one of his letters of having pursued the quest for wisdom for 60 years (Bābā Afḍal, *Muṣannaḡāt*, 698; Chittick, 140), we can assume that he was born before 550/1155 and had been at least 70 when he died.

The name of Bābā Afḍal Kāshānī appears for the first time in the works of the great Shī'i philosopher, theologian, astronomer, and vizier, Naṣīr al-Dīn al-Ṭūsī (d. 672/1273). In his commentary on Avicenna's *al-Ishārāt wa l-tanbīhāt*, composed before 644/1247, Ṭūsī refers to an opinion of Bābā Afḍal on a point of logic (Ṭūsī, I, p. 283). In his *Sayr wa sulūk*, Ṭūsī also mentions having studied mathematics with Kamāl al-Dīn Muḥammad al-Ḥāsib, a student of Bābā Afḍal (Zaryāb, pp. 31–32).

As his letters and introductions indicate, Bābā Afḍal had children, family members, and a lot of students. He also entertained relationships with a number of princes. Yet practically nothing is known about his life. The only event mentioned by biographers is that he was briefly imprisoned by a local governor on charges of sorcery (*sihr*). The evidence is given by a poem he wrote in prison (*Muṣannaḡāt*, pp. 731–732; Chittick, p. 142).

As regards his religious affiliation, Muḡtabā Mīnuwī and Yaḡyā Maḡdawī, the Iranian editors of Bābā Afḍal's collected Persian works, are of the opinion that he belonged to the Ismā'īlī branch of Shī'ism, which was powerful at his time. The only fact that supports this assumption is that Kamāl al-Dīn al-Ḥāsib, a student of Bābā Afḍal and Ṭūsī's master in mathematics, was a reputed Ismā'īlī figure and probably the one who converted Ṭūsī to Ismā'ilism (*Muṣannaḡāt*, introduction, xxii). Furthermore, it is said that certain ideas developed in the *Jāmi' al-ḡikma* (*The Sum of Wisdom*), attributed to Bābā Afḍal, echo

Ismā'īlī teachings, but this attribution remains very dubious (Chittick, p. 27). Bābā Afḍal himself alludes to Sunnism as the best path (*Muṣannaḡāt*, p. 297; Chittick, p. 219), but this is not conclusive, since many Shī'i thinkers were observing "pious dissimulation" (*taqiyya*) by keeping their faith secret. More convincingly, his conception of intelligence (*ḡhirad*) is not only unrelated with the Ismā'īlī doctrine but also contradictory with it as it will be seen.

Seyyed Hossein Nasr has assumed that Bābā Afḍal was a Sufi (Nasr, p. 251). In the Persian world the term "Bābā," which literally means "father," is often used to refer to a Sufi master. Moreover, Bābā Afḍal refers to his students as his "religious brothers" (*barādarān-i dīnī*) and his "true companions" (*yārān-i ḡaḡīḡī*), which suggests very particular students, if not disciples (Chittick, p. 5). His pedagogical style of composition, as well as his choosing to write in Persian, indicates that these "companions" were neither trained in Islamic sciences nor at ease with philosophical Arabic, as a group of Persian Sufis could have been. This surely enables us to see him as a spiritual master and a Sufi in the broadest sense, since he prioritized the inner dimension of the Islamic teachings over its external and legalistic dimension. However, Chittick argues, as he was not formally affiliated to a spiritual guide (*murshid*) nor to a chain of transmission (*silsila*) tracing back to the Prophet nor was teaching the path to a direct perception of the divine, it cannot be affirmed that Bābā Afḍal was a Sufi in the narrowest sense (Chittick, p. 8). Ultimately, it would be vain to seek the origin of the ideas of Bābā Afḍal in a sectarian affiliation.

Bābā Afḍal is buried in Maraḡ, a mountain village north-west of Kāshān, in Central Iran. His tomb has been integrated in a mud-brick building surmounted by a pyramidal dome which is said to have been built in the Mongol period. The building contains a *miḡrab* in stucco dating from the Mongol period and two wooden frames delicately carved from the Safavid era. The building is said to have been built by an Ilkhanid prince, a devoted disciple of Bābā Afḍal, who is buried next to him and designated as "the king of Zanzibar." This unverifiable affirmation is further

evidence of the mystery of Bābā Afḍal's life as well as of his popularity (Qarā'ī Gurgānī, p. 735).

His Thought

What sets Bābā Afḍal apart among Muslim medieval philosophers is the fact that he wrote most of his works in Persian. Iranian philosophers such as Avicenna (d. 428/1037), Suhrawardī (d. 587/1191), and Naṣīr al-Dīn al-Ṭūsī also wrote in Persian but composed their major works in Arabic. Bābā Afḍal not only chose to write his major works in Persian; he also translated into Persian some of his own works first composed in Arabic – only the Persian versions of these works have survived – as well as some Arabic writings reputed to be translations from Greek sources. This linguistic choice may have been for a pedagogical need, as most of his students were unskilled in Arabic; however, it may well denote the general intention of establishing Persian as a philosophical language alongside Arabic. His effort to find Persian equivalents to philosophical terms in Arabic can be compared with Avicenna's in his *Dānishnāma-yi 'alā'ī*, but, in contrast with Avicenna, Bābā Afḍal devoted all his works to this undertaking.

As a philosopher, Bābā Afḍal can hardly be classified as belonging to a specific school of thought. He does not even use the word *falsafa* in his own compositions, nor does he refer to any philosopher other than “Hermes Trismegistus” and Aristotle. A contemporary of Ibn Rushd, alias Averroes (d. 595/1198) and Suhrawardī (d. 587/1191), Bābā Afḍal combines Peripatetic and Neoplatonic tendencies. More than for the originality of his views, he merits attention for the way he focused his reflections sharply on the goals he defined. Bābā Afḍal's intellectual research does not deal with the classical questions of Arabic medieval philosophy, such as the proofs of the Necessary Being, nor with mathematics, astronomy, or medicine, as did Muslim philosophers of the medieval period. The very center of gravity of his thought is “humanness”; his major goal is to determine the right path through life to become truly and perfectly, human. All his

metaphysical, ontological, and logical considerations lead ultimately to ethical conclusions. He is in this respect heir to the Socratic attitude, as well as a representative, after Ibn Miskawayh (d. 421/1030) – an Iranian thinker writing in Arabic – of “humanism in Islamic context” (Arkoun).

More precisely, all Bābā Afḍal's concerns tend to the knowledge of the human soul (*nafs*), typically designated as the “self” (*khūd*), and its progress toward perfection. The question of the self-knowledge – its enablement, its methods, its goals, and its fruits – lies at the heart of all his works, be they his own compositions or translations of others. Seyyed Hossein Nasr has rightly maintained that Bābā Afḍal's philosophy is primarily an “autology” in the sense of an exposé of the nature of the human self (Nasr, p. 260). This autology is not to be confused with psychology in the modern sense, as it is founded on metaphysical principles. On the other hand, nor should it be understood as a detached philosophical analysis of the human soul.

Bābā Afḍal's conception of humanness is situated within the framework of “anthropocosmism,” an Islamic philosophical tradition which considers the human and the natural world to be one. The idea that a human being is a *microcosmos* (*'ālam ṣaghīr*) while the whole world is a *macranthropos* (*insān kabīr*) can be traced back to the Neo-Pythagorean school and was especially developed in the Epistles of the Brethren of Purity (*Ikhwān al-ṣafā*) (fourth/tenth century) as well as in the writings of Bābā Afḍal's contemporary Muḥyī al-Dīn Ibn 'Arabī (d. 638/1240). According to Bābā Afḍal, when the self (*khūd*) or the human soul reaches the ultimate limit of its intellectual improvement, it finds and knows everything that is within in that “the human soul is general and encompasses all things, for they are within it” and that “all things are in the human” (*Rāhanjām-nāma*, in *Muṣannaḥāt*, p. 69; Chittick, p. 281). That is to say, “Whatever is of use and indispensable to humans is with them and in them. Its mine and fountainhead is the self (*khūd*). Whatever is outside them is similar to (*shibh*) and an image (*mithāl*) of their soul's forms. All the roots and realities are with them” (*'Arḍ-nāma*, in *Muṣannaḥāt*, p. 241; Chittick, p. 242).

In contrast with the Brethren of Purity, who were mostly concerned with the sciences of nature, and with Ibn ‘Arabī, who was deeply oriented toward theosophy, Bābā Afḍal dwelt upon the sufficiency of self-knowledge and its superiority over all other sciences. When the human soul knows itself, the nature of the whole of creation becomes clearly manifest to it (Nasr, p. 260). And this self-knowledge gives access to a higher plane of being and of perception: “When humans know that all things, whether apparent or hidden, exist within them, then the rank of their existence is much higher than those who know the existent things as outside of self” (*‘Arḍ-nāma*, pp. 238–239 Chittick, p. 240). Unlike disciplines such as astronomy, mathematics, medicine, or even Islamic law (*sharī‘a*), whose fruits and benefits are of no avail beyond the grave, self-knowledge provides real and enduring profit (*‘Arḍ-nāma*, p. 239; Chittick, p. 240). Bābā Afḍal’s critical attitude toward the most estimated sciences of his time, whether natural or religious, is noteworthy here. However, the passage that immediately follows expresses a deeper, if more implicit, opposition to a certain Sufism which endorses the annihilation (*fanā’*) of individual consciousness: “The hope in this explication was that knowledge-seeking humans would wake up and become aware of their own existence, subsistence, and sempiternity through certainty and plain-seeing, and of universal security from perishment, annihilation (*fanā’*), alteration, disappearance, unconsciousness, and without-self-ness” (*‘Arḍ-nāma*, p. 240; Chittick, p. 241).

Bābā Afḍal appears to follow Aristotle’s and Avicenna’s efforts to surpass Platonic dualism while conceiving the human being to be the substantial union of soul and body:

the human has two faces – one bodily, passing face, and one lasting, endless, soulish face that finds life from its own Nurturer. It is this of which [God] talks in the Divine Book: ‘Everyone upon [the earth] is undergoing annihilation, and there subsists the face of thy Lord, Possessor of Majesty and Generous Giving’ [Quran, 55:26-27]. The bodily face lasts through this soulish face, and every good and excellence that appears from it comes from the soulish face (...). So, when you seek the beginning and origin of humans, you must seek out the origin and beginning of both substances. (*Jāwidān-nāma*, in

Muṣannafāt, p. 303; Chittick, pp. 222–223; Mullā Ṣadrā, p. 51)

Bābā Afḍal adds that “The joinedness of these two substances (...) occurs because they are one in substance and essence.” Here, he clearly understands and adopts Aristotle’s hylemorphism as defined in the *De Anima*. Even more, Bābā Afḍal stresses the ontological precedence of the united substance: “the joining belongs to the root, and the difference and separation belongs to the branch” (*Jāwidān-nāma*, p. 305; Chittick, p. 223).

On these naturalist and non-dualistic premises, Bābā Afḍal elaborates an intellectualist definition of man: “the human is not human through bodily shape and guise” or “because he has soul, sensation, and movement,” but because he has intelligence – which Bābā Afḍal refers to both as *khirad* (Persian) and *‘aql* (Arabic). A human being is fully or perfectly human when the intellectual virtues such as correct thoughts, right seeing, knowledge of certainty, and truthful talking are actual or nearly actual in him. Anyone who cannot reach this rank only “has the name human by borrowing and sharing” (*Madārij al-kamāl*, in *Muṣannafāt*, pp. 9–10; Chittick, pp. 246–247). Elsewhere, he says that the completeness of humans is showed by the equilibrium of the animal potencies, especially appetite and wrath, between intensity and weakness, under the command of intelligence (*Madārij al-kamāl*, pp. 44–45, 94; Chittick, p. 184). Nevertheless, the ultimate rank of perfection of the human soul is the awareness (*agāhī*) of the self as being “the universal of the universals” (*kullī-yi kulliyāt*). This pure act of intellection is the perfection of life, and its own perfection lies in “the unification of the intellecter, the intellect, and the intellected” (*ittiḥād-i ‘āqil wa ‘aql wa ma‘qūl*). This perfect intellection is identical to “complete being, perpetual joy, and subsistent enjoyment” (*Madārij al-kamāl*, p. 51; Chittick, p. 270). This anthropological and epistemological doctrine, rooted in Aristotelian ethics (*Nicomachean Ethics*, X) and noetics (*De Anima*, III), eventually underwent considerable development in the eleventh-/seventeenth-century Safavid Iran, in the teaching of Mīr Dāmād (d. 1040/1631) and Ṣadr al-Dīn al-Shīrāzī (d. 1050/1640), alias Mullā Ṣadrā.

For Bābā Afḍal, intelligence (*khirad*) is neither the body nor the soul, because both body and soul are subject to opposition and incompatibility, while intelligence is beyond all opposition and contradiction, becoming one with everything beyond itself through the knowledge of it. Thus, intelligence is not a potency of the soul, but a superior entity which encompasses the soul, and it is only through a return to intelligence that humanity can overcome its own mortality: “Hence the path of release and security from perishment and ruin is for humans to seek refuge in intelligence and to enter under its guardianship” (*Imanī az buḷlān-i nafs*, in *Muṣannaḡāt*, pp. 604–607; Chittick, pp. 172–173).

Like many Arabic and Muslim philosophers, Bābā Afḍal embraces the Platonic division of worlds: below, the created things (*makhḷūqāt*), sensory and passive, and above, the intellective forms, innovated and beginningless (*azaliyyāt*). He adopts the Arabic terminology of many Muslim Neoplatonists distinguishing within God’s creative activity between “creation” (*khalq*) by means of a preexistent something and “innovation” or “instauration” (*ibdāʿ*) without intermediary, calling “innovated” the spiritual existents and “created” the bodily or natural things. In his turn, Bābā Afḍal identifies “the realm of the created things” (*makhḷūqāt*), “the world of engendering” (*ʿālam-i takwīn*), “the world of nature” (*ṭabʿ*), and “the particular world” (*jahān-i jūzī*) on one hand and the “realm of the innovated things” (*mubdaʿāt*), “the world of the beginningless” (*jahān-i azal*), “the world of intelligence” (*jahān-i khirad*), and “the universal world” (*jahān-i kullī*) on the other hand.

There are two worlds. One is reality (*ḥaqīqat*), the other image (*mithāl*). The reality is the root, and the image is the branch. The reality is the universal world, and the image the particular world. The existents of the particular world are the images of the existents of the universal world (...). The sensory awareness of this world – I mean the world of generation – is the image of the intellective awareness of that world. The bodily world (*jismānī*) is an image and an imitation (*hikāyat*) of the spiritual world (*rūhānī*). (*ʿArḍ-nāma*, pp. 191–192; Chittick, p. 78)

Such a Platonic manifesto is obviously inspired by the *Theology* of the Pseudo-Aristotle,

alias Plotinus Arabus (Badawī, pp. 56, 93). Even more, Bābā Afḍal seems to be a hyper-Platonist when he claims that the corporal world is the realm of all dissimulation, just as the spiritual world and the intelligence are the realm of all manifestation or revelation (*ʿArḍ-nāma*, p. 198).

However, it is noteworthy that Bābā Afḍal did not adopt the idealist meaning of the term *mithāl*, pl. *muthul*, for “model,” “archetype,” and, finally, of “Platonic forms” (*muthul aḡlāṭūniyya*), as employed in some of Fārābī’s and Avicenna’s works. Likewise, he ignored the status of images as intermediaries between intellective forms and corporal things. He was probably unaware of Ishrāqī doctrines about *mundus imaginalis* (*ʿālam al-mithāl*) and Ibn ʿArabī’s speculations on creative “separated imagination” (*al-khayāl al-munḡaṣil*). But more decisively, he intentionally relegated images into the realm of the senses and of the corruptible; his psychology – or “autology” – does not recognize role for the creative imagination, nor do his metaphysics allows for an intermediary world between the realms of sense and of intellect.

Nevertheless, the idealism of Bābā Afḍal does not limit itself to purely metaphysical and ontological speculations but brings us back again to humanism. In the world of intelligence or in the universal world, all the elements of the particular world are subsumed into universals. Although human beings, in the corporal world, are individuals from various kinds, the essential reality of “being human” is unique in the world of intelligence (*ʿArḍ-nāma*, p. 198). That allows us to reflect on the universality of human nature and of reason beyond the multiplicity of cultures and historical contexts.

Like many other Muslim philosophers, Bābā Afḍal resumes the homology between the Quranic topics of the “Origin from God” (*mabḍāʿ*) and the “Return to God” (*maʿād*) on the one hand and the Plotinian concepts of procession (πρόοδος) and conversion (ἐπιστροφή) on the other. In his *Sāz wa pirāya-yi shāhān purmāya*, he describes the hierarchies of the origin and return applicable to all existence (*wujūd*) with a special focus on humanity. The hierarchy of origin, which is the path of descent, goes from the First Intellect,

called “a viceregent of God” (*khalīfa-īst khudā-yi rā*), to the four elements. The hierarchy of return, or the path of ascent, goes from Nature – comprising the ranks of minerals, plants, and animals – to human beings, also called “a viceregent of God” (*Sāz wa pirāya*, in *Muṣannafāt*, pp. 90–91; Chittick, p. 182). The return of the human being, conceived as a microcosm, is to gain perfection by effecting the passage of all the degrees of the macrocosm from potentiality to actuality, one after the other, in himself. By governing themselves with intelligence (*khīrad*), human beings attain and unite with the first soul (or the universal soul) and finally with the radiance of the First Intellect (*‘aql-i awwal*) (*Sāz wa pirāya*, pp. 93–94; Chittick, p. 184).

In his *Jāwidān-nāma*, Bābā Afḍal proposes a detailed description of the degrees passed through by both the “bodily I” (*man-i jismānī*) and the “soulish I” (*man-i naḥsānī*) on the way of their return to God. The origin of the human body or the bodily I is the unqualified body (*jism-i muṭlaq*). By means of a process of progressive complexification, it becomes a compound body, then a vegetal, then an animal, and finally a human body. The origin of the soulish I is nature, corresponding to the unqualified body, proceeding to the potency of mingling (*quwwat-i mizājī*, equivalent of Greek κράσις), which corresponds to the compound body, then to the vegetal or growing soul, then to the animal soul, and then to the human soul, be it in its practical function as the “practical intellect” (*‘aql-i ‘amalī*) and the “writing soul” (*naḥs-i kātiba*) or in its theoretical function as the “reflective soul” (*naḥs-i fākira*) and the “speaking” or “rationally speaking soul” (*naḥs-i gūyā wa nāṭīqa*). And when the soulish I attains the ultimate term of its improvement, which is the knowledge of God, it is called “the sacred spirit” (*rūḥ-i muqaddas*) (*Jāwidān-nāma*, pp. 303–304; Chittick, p. 223; Mullā Ṣadrā, pp. 52–53). At this end, as we have seen the human self gains awareness of its own existence, security from perishment, subsistence, and sempiternity.

However, in the appendix (*mulḥaq*) of his *‘Arḍ-nāma*, Bābā Afḍal claims that the procession (*wurūd*) from the universal world to the particular one, such as the conversion (*ṣudūr*) or the return

(*bāz gasht*) from the former to the latter, has only a kind of mental existence, like a point of view or a consideration (*shumāranda*, equivalent of Arabic *i’tibārī*), in the belief (*gamān*) and the imagination (*khayāl*) (*‘Arḍ-nāma*, p. 251). No real relation between the two worlds can be proved by concrete evidences; the procession of the particular from the universal and the conversion of the particular to the universal remains hypothetical and indemonstrable. Even more, “Just as nothing can come from that world to this world, nothing can return from this world to that world” (*‘Arḍ-nāma*, pp. 252–253). Bābā Afḍal seems here to rally Aristotle’s positions beyond their Neoplatonic interpretations. Contrarily, the great philosopher – and Bābā Afḍal’s lector – Mullā Ṣadrā would devote his efforts to proving the reality of the universal process of return.

To be sure, Bābā Afḍal was far from being a skeptic and a nominalist. He asserts the persistence of the intellective soul (*naḥs-i ‘āqila*) by distinguishing between it and the animal soul which perishes with the body. “The intellective soul is the principle of an existence superior to that of the animal soul (. . .). Giving the fact that the act of the intellective soul is without any instrument, and that every corporal instrument is subject to nullification and destruction, the intellective soul is not subject to nullification or destruction” (*Dar baqā-yi naḥs-i ‘āqila*, in *Muṣannafāt*, pp. 623–624). While assuming this intellective immortality, Bābā Afḍal rarely touches upon the very specific teachings of the Quran regarding eschatology, paradise, and hell. Evidently, he conceived and practiced philosophy as independent from the religious sciences and the juridical religion.

All Bābā Afḍal’s works claim that the unique access to immortality is the realization of knowledge.

Hence the aeon (*dahr*), which is the duration of foreverness and everlastingness, stands through unconditioned existence, and unconditioned existence stands through the knower of unconditioned existence (*dānā-ye wujūd-i muṭlaq*). It is this that is the final goal and utmost end of all the sciences; knowledge is the perfection, final goal, and completion of humans; humans are the final goal and completion of life; life is the completion and

perfection of the movement of bodies; movement is the perfection of being a body; bodiment is the perfection of reception and acceptance; reception and acceptance are the trace of actorness; actorness is the trace of yearning and desire; desire is the trace of the essence of the knower (*dhāt-i dānā*); and the knower's essence is the first and the last of being. ('*Arḍ-nāma*, p. 240; Chittick, p. 241)

Such a conception hardly provides for the afterlife of humble people, nor can it be easily conciliated with the explicit eschatological teachings of the Quran. Obviously, Bābā Afḍal shared some of the Fārābī and Avicennian positions condemned by al-Ghazālī (d. 505/1111) in his famous *Tahāfut al-falāsifa*.

In conclusion, Bābā Afḍal is to be seen as a philosopher, not in the medieval scholastic sense, but in the ancient sense as characterized by Pierre Hadot: "The philosopher was a professor and a spiritual guide, whose goal was not to set forth his vision of universe, but to mold his disciples by means of spiritual exercises" (Hadot, p. 18). As a master of philosophy, Bābā Afḍal was not training his students in logical thought, instructing them in the natural sciences, nor glossing the books of his illustrious forerunners, but was trying to teach them how to know themselves through rational investigation, in accordance with Socrates' understanding of the Delphic maxim: "Know thyself!". Even more, he saw his particular conception of self-knowledge as a way of attaining immortality and eternity. Thus, it would be appropriate to think of him as a "rationalist mystic," in the sense that this term can be applied to Aristotle and other ancient and medieval philosophers (Chittick, p. 9).

In some respects, the philosophy of Bābā Afḍal, like that of Ibn Zakariyyā Rāzī (d. 313/925 or 320/932) and Ibn Rushd at the very same period, openly challenges the pretensions of both Shī'ism (Ismā'īlī or Twelver) and Sufism to be the exclusive way to knowledge and salvation. From a theoretical point of view, Bābā Afḍal conceives true knowledge as accessible by the means of rational thought and not as a suprarational science; practically, he assumes that every human being has ability to attain intelligence, self-knowledge, and world knowledge, without the guidance of an impeccable Imām or an inspired

Saint. Thus, if the thought of Bābā Afḍal integrates some elements of Shī'i and Sufi conceptions, it is with the aim of establishing "true" philosophy or wisdom as the only spiritual path toward a virtuous, fully human, and quasi-divine existence.

Edited Works

Nearly all of Bābā Afḍal's Persian works have been edited by Muḥtabā Mīnuwī and Yaḥyā Maḥdawī in 1331 Sh./1952–53. Some extended parts of them have been translated into English in the second part of William Chittick's monograph.

1. '*Arḍ-nāma* (*The Book of Displays*) (*Muṣannafāt*, pp. 145–253), in four displays: (1) on the bodies, (2) on the doers and the workers of the cosmic and human bodies, (3) of the things known by human, and (4) on the knowers (*dānandagān*), their quiddity (*māhiyat*), and that-it-is-ness (*inniyyat*).
2. *Īmanī az buḷlān-i naḥs dar panāh-i khirad* (*Security from the Soul's Nullification in the Refuge of Intelligence*), devoted to the demonstration of the title proposition (*Muṣannafāt*, pp. 601–607).
3. *Jāwidān-nāma* (*The Book of the Everlasting*) (*Muṣannafāt*, pp. 259–326). Contrastingly with Bābā Afḍal's other works, this treatise is largely founded on the teachings of Quran and Hadith. It also deals with philosophical issues such as the various kinds of science, the importance of self-knowledge, and the origin and the end of existence, but it does "by way of reminding, not by way of argument and demonstration (*hujjat wa burhān*)."
(*Muṣannafāt*, p. 321; Chittick, p. 233). In one chapter of the book (*Muṣannafāt*, pp. 323–326; Chittick, pp. 205–207), Bābā Afḍal explains the system of the Arabic *gematria*, which means the science of numbers and letters, in other words the philosophical alphabet adopted by many Iranian philosophers after Avicenna's *Risāla Nayrūziyya fī ma'ānī al-ḥurūf al-hijā'īya* (Ibn Sīnā 1999; Massignon 1952).

- Mullā Ṣadrā Shīrāzī would eventually resume the structure and much of the content of the *Jāwidān-nāma* in his *Iksīr al-‘arīfīn* (*The Elixir of the Gnostics*), without mentioning his source. The importance given by Bābā Afḍal to self-knowledge, to the issue of the origin and the return, as well as his reference to religious scriptural sources might well have been among the reasons for Mullā Ṣadrā’s interest in this work (Mullā Ṣadrā, Introduction, pp. xviii–xix).
4. *Mabādi-yi mawjūdāt-i naḥsāni* (*The Origins of the Soulful Elements*), a brief treatise on the general division of existents, with a special focus on some philosophical concepts (*Muṣannafāt*, pp. 585–597).
 5. *Madārīj al-kamāl* (*The Rungs of Perfection*) (*Muṣannafāt*, pp. 3–52). Bābā Afḍal’s most complete discussion of the human soul and her way to reach perfection in knowledge. The treatise was written first in Arabic and then in Persian. The Arabic version has not been published.
 6. *Rāhanjām-nāma* (*The Book of the Road’s End*). In three talks, explaining that the self-knowledge is the road to human perfection (*Muṣannafāt*, pp. 55–80).
 7. *Risāla dar ‘ilm wa nuṭq* (*The Treatise on Knowledge and Rational Speech*). Written first in Arabic and then translated into Persian (*Muṣannafāt*, pp. 477–579). It deals mostly with Aristotelian logic. The claim of certain scholars that the work was in fact by Avicenna seems to be invalidated by some discrepancies in the definition of the reasoning by contradiction (*al-qiyās al-khulḥ*), previously pointed out by Naṣīr al-Dīn al-Ṭūsī (see p. 574) (*Iranica*, III, 288–289).
 8. *Sāz wa pirāya-yi shāhān-i purmāyah* (*The Makings and Ornaments of Well-Provisioned Kings*) (*Muṣannafāt*, pp. 83–110), Presenting itself in the guise of a “mirror for princes,” this treatise seems more interested by the perfect soul (*naḥs-i kāmīl*) than by the perfect prince.
 9. *Risāla-yi naḥs-i Aristūṭālīs* (*Aristotle’s Treatise on the Soul*) (*Muṣannafāt*, pp. 389–458 and 467–474). A translation of an epitome from Aristotle’s *De Anima*, with passages inspired by, if not quoted from, the *Theology* of the Pseudo-Aristotle, alias Plotinus Arabus.
 10. *Mukhtaṣarī dar aḥwāl-i naḥs* (*An Epitome of the States of the Soul*) (*Muṣannafāt*, pp. 461–466), a short treatise on the soul’s attributes ascribed to Aristotle.
 11. *Risāla-yi tuffāḥa* (*The Treatise of the Apple*) (*Muṣannafāt*, pp. 113–144). This is the pseudo-Aristotelian *Liber de pomo*, well known in Latin and Hebrew, relating the last teachings of Aristotle on his deathbed to his disciples.
 12. *Yanbū’ al-ḥayāt* (*The Fountain of Life*) (*Muṣannafāt*, pp. 331–385). Persian translation of an Arabic text attributed to Plato or Aristotle in various manuscripts, but which Bābā Afḍal attributes to Hermes, identified with the Quranic prophet Idris. In 13 speeches, each containing a series of admonitions addressed to the soul.
 13. *Čahār ‘unwān-i kīmiyā-yi sa ‘ādat* (*The Four Headings of the Alchemy of Felicity*), an abridgment of the first part of al-Ghazālī’s Persian *Kīmiyā-yi sa ‘ādat*. The “four headings” are knowledge of self, of God, of this world, and of the hereafter. Uncritical edition Ḥ. Rabbānī in Jāmī, *Asḥī’at al-lama ‘āt*, Tehran, 1352 Sh./1973, pp. 338–58.
 14. *Makātīb va Jawāb as’ila* (*Letters and Answers to Questions*) (*Muṣannafāt*, pp. 681–728). Bābā Afḍal answered to questions from friends, disciples, or princes about various ethical, religious, or metaphysical subjects.
 15. Bābā Afḍal’s Persian poetry. More than 600 quatrains (*rubā’iyyāt*) are attributed to him (Chittick, 26), shared between three collections: (a) *Rubā’iyyāt-i Afḍal al-Dīn Kāshānī*, S. Nafīsī, ed., Tehran, 1331 Sh./1952, reprinted 1363 Sh./1984; (b) *Muṣannafāt*, M. Mīnuwī and Y. Mahdawī, ed., pp. 729–772; and (c) *Dīwān-i Ḥakīm Afḍal al-Dīn Muḥammad Marāqī Kāshānī*, M. Fayḍī and alii, ed., Kāshān, 1351 Sh./1972.

16. *Jāmi‘al-ḥikma*, M. T. Dānishpajūh, ed., Tehran, 1361 Sh./1982–83. As already indicated, the attribution to Bābā Afḍal of this book, absent from most catalogues of his works, is dubious.

Aḥmad ibn Ḥanbal

Livnat Holtzman

Department of Arabic, Bar-Ilan University,
Ramat Gan, Israel

Abstract

Aḥmad ibn Ḥanbal (780–855) of Baghdad, the eponymous founder of the Ḥanbalite School of law and theology was a prolific scholar of the Ḥadīth (*muḥaddith*), a jurisprudent (*faqīh*), and an influential public figure. Ibn Ḥanbal’s theological teachings reflected an ultra-traditionalistic worldview and relied mainly on a meticulous study of the Qur’ān and the Ḥadīth. Ibn Ḥanbal was in conflict with speculative theology (*kalām*) which in his lifetime was practiced by several theological trends, the most prominent of which was the Mu’tazila. An epitome of Islamic traditionalism, Ibn Ḥanbal refused to accept the Mu’tazilite dogma of the createdness of the Qur’ān. For this refusal, he was interrogated and tortured during the *miḥna*, the inquisition which the ‘Abbāsīd caliph al-Ma’mūn adopted in 833.

Life

Abū ‘Abd Allāh Aḥmad ibn Muḥammad ibn Ḥanbal (henceforth: Ibn Ḥanbal) was born in November or December 780 either in Merv (formerly an important city in the historic province of Khurāsān; today located near Mary, Turkmenistan) or Baghdad, Iraq. Ibn Ḥanbal’s family genealogy was of pure Arab lineage, and they lived for generations in Khurāsān where his grandfathers and father were military officers. Ibn

Ḥanbal was orphaned of his father at age three. Ibn Ḥanbal's mother moved to Baghdad and raised him in a Persian-speaking household. At the age of 14, probably due to the efforts of his uncle who served in the caliphal bureaucracy, Ibn Ḥanbal began his training as a scribe in the *diwān*, the office of the government. At the age of 15, the highly righteous and pious Ibn Ḥanbal abandoned the established post of a civil servant and began his training as a Ḥadīth scholar. For several years, he learned with teachers of low professional status in Baghdad. At the age of 19, following the Islamic ideal of travelling to acquire the knowledge of Ḥadīth (*al-riḥla fī ṭalab al-ʿilm*), he set out for the major Ḥadīth learning centers to be trained as a *muḥaddith* under the tutorage of great theological luminaries. He travelled to Kufa, Wasit, and Basra in Iraq, thereafter to Mecca and Yemen, and finally headed north to Tarsus (in today's Turkey) and Syria. His travels lasted for two decades, during which he collected a massive amount of Ḥadīth material. In the year 820, the 40-year old Ibn Ḥanbal finally settled in Baghdad and started his career as a *muḥaddith*. His household which included two wives, a concubine, six sons, and a daughter was constantly on the verge of abject poverty (Patton 1897, pp. 10–19; Hurvitz 2002, pp. 44–58; Melchert 2006, pp. 1–8).

As a *muḥaddith* with a growing circle of admirers, Ibn Ḥanbal belonged to the heterogeneous class of the Baghdadian *ʿulamāʾ* (religious scholars). This class comprised of hundreds of independent *muḥaddithūn* from different theological trends and a thin layer of judges and jurists who received their salaries from the state. Ibn Ḥanbal himself rejected the benefits of an official position. Although he was known as a scholar of high distinction, his modest lifestyle and aloofness from the ruling power led him to associate with the masses (*al-ʿamma*). Ibn Ḥanbal taught Ḥadīth, issued legal and doctrinal responsa, and gave spiritual guidance to a circle of devoted disciples who came from all walks of life, including two of his sons, Šāliḥ (d. 879) and ʿAbd Allāh (d. 903). ʿAbd Allāh would later become the prominent editor of Ibn Ḥanbal's works and an important transmitter of Ibn Ḥanbal's legal opinions and doctrinal aphorisms. Ibn Ḥanbal's

disciples also recorded his spiritual teachings which included moral guidance and instructions for proper everyday conduct. Another great canoniser of Ibn Ḥanbal's teachings was his preferred disciple, Abū Bakr al-Marwazī (or al-Marrūdhī, d. 888). (Hurvitz 2002, pp. 59–70; Ibn al-Jawzī 2013, pp. 365–511).

Ibn Ḥanbal's image as a martyr venerated by the masses emerged during the *miḥna*, a procedure of interrogation that the caliph al-Ma'mūn (reigned from 813 to 833) initiated as part of his efforts to restore the prestige and authority of his office. Al-Ma'mūn who came to power by overthrowing a legitimate caliph, wished to present himself as the successor of the Prophet Muḥammad and the absolute religious authority of the caliphate. To achieve this end, al-Ma'mūn had to undermine the religious hegemony of the traditionalistic *muḥaddithūn*, who enjoyed the loyalty and support of the masses, and to elevate the position of another class of scholars, known as the *mutakallimūn*. The *mutakallimūn* were the proponents of speculative theology (*kalām*). Several groups of *mutakallimūn* were active in Baghdad; among them the Mu'tazilites were the most prominent and influential in the caliphal court. Al-Ma'mūn had a keen interest in philosophy and science (he was a patron of the translation project of Greek writings to Arabic), and his courtiers enjoyed the logical reasoning and argumentative stratagems of *kalām*. A preferred pastime for the sophisticated elite was the public debates between the *mutakallimūn* and the *muḥaddithūn* which the caliph hosted in his palace. A frequent and prominent participant in these debates was the Murjī'ite (not Mu'tazilite; the Murjī'a was a rationalistic trend widespread in the eastern parts of the ʿAbbasid caliphate) *mutakallim* Bishr al-Marīsī (d. 833). Between 819 and 826, al-Ma'mūn consulted Bishr and other Mu'tazilite *mutakallimūn* about the preferred theological doctrines and religious practices that were to become the backbone of his religious policy. Bishr introduced to al-Ma'mūn the doctrine of the createdness of the Qur'ān (*khalq al-qur'ān*), which by that time became the spearhead of Mu'tazilite *kalām* (Patton 1897, pp. 48–52; Ibn al-Jawzī 2015, p. 73). (For a

description of this doctrine and the counter-doctrine of the uncreatedness of the Qurʾān, see below in “Works and Thought.”).

In 827, al-Maʾmūn was finally persuaded that the doctrine of the createdness of the Qurʾān should become the official state religion, and he publicly announced his support of this doctrine (Patton 1897, pp. 54–55; Lapidus 1975, pp. 378–382; Hurvitz 2001, pp. 93–97). In 833, al-Maʾmūn instituted the procedure of *miḥna* (often rendered “inquisition”; although literally it is “testing” or “trial”) during which prominent *ʿulamāʾ* (in the first phase from Baghdad, in the second phase from the major cities in the provinces) were interrogated by the caliphal officials on the createdness of the Qurʾān. Al-Maʾmūn declared that only *ʿulamāʾ* who subscribed to this doctrine were allowed to hold official positions, to give judicial opinions, or to teach the Ḥadīth. Seven *muḥaddithūn* were summoned to the house of Ishāq ibn Ibrāhīm (d. 850), the governor of Baghdad, and were made to testify that the Qurʾān was God’s speech, and that it was created by God. Thereafter, a second group of 25 *muḥaddithūn* which included Ibn Ḥanbal was summoned to the governor’s house. This time 23 *muḥaddithūn* declared under duress that the Qurʾān was created. Ibn Ḥanbal and another *muḥaddith* maintained that the Qurʾān was God’s speech, but refused to add anything to that declaration. Consequently, they were sent in irons to al-Maʾmūn who was at the Byzantine border preoccupied by the war against the Byzantines. Al-Maʾmūn was supposed to interrogate the two disobedient *muḥaddithūn*. They avoided interrogation and torture due to al-Maʾmūn’s unexpected death in August 833. Consequently, these two *muḥaddithūn* were sent back to Baghdad, yet only Ibn Ḥanbal survived the hardships of the return journey. Upon his arrival to Baghdad, he was immediately kept in detention, because the *miḥna* was pursued forcefully by al-Maʾmūn’s successor al-Muʿtaṣim Bi-ʿllāh (reigned from 833 to 842).

In September 834 Ibn Ḥanbal was put on a public trial. He was interrogated about his views about the uncreatedness of the Qurʾān and his belief in the beatific vision (*ruʾyat Allāh*;

Holtzman 2018, pp. 100–105). After 3 days of being interrogated, Ibn Ḥanbal was publicly flogged more than 20 lashes, whereas five lashes were enough to kill a man as fragile as he was. The later Ḥanbalite sources describe Ibn Ḥanbal’s endurance throughout the physical tortures, and how he fearlessly refused to declare that the Qurʾān was created. As a result of the flogging, he passed out, and the caliph al-Muʿtaṣim who feared that the masses would riot if Ibn Ḥanbal died during the interrogation, ordered his immediate release. By contrast, a Muʿtazilite source maintains that Ibn Ḥanbal finally acknowledged the createdness of the Qurʾān and was therefore released. A non-Ḥanbalite source presents the following version on Ibn Ḥanbal’s alleged retraction: Apparently, the governor of Baghdad, Ishāq ibn Ibrāhīm intervened during the interrogation and saved Ibn Ḥanbal’s life. Ishāq convinced the almost dying Ibn Ḥanbal that the caliph had retracted and no longer believed that the Qurʾān was created. When Ibn Ḥanbal murmured two Qurʾānic verses in response, the governor told the caliph that Ibn Ḥanbal had just declared that the Qurʾān was created. The caliph then ordered the release of Ibn Ḥanbal (*Ḥilyat al-awliyāʾ* 9, pp. 205–206). After the trial, Ibn Ḥanbal went into hiding and even stopped teaching the Ḥadīth. Ibn Ḥanbal kept a low profile after the death of al-Muʿtaṣim and the accession of al-Muʿtaṣim’s son, al-Wāthiq Bi-ʿllāh (reigned from 842 to 847), because al-Wāthiq continued to enforce the policy of the *miḥna*.

In 849, the caliph al-Mutawakkil ʿAlā Allāh (reigned from 847 to 861) reversed the pro-Muʿtazilite policy of his predecessors, abolished the *miḥna*, retracted the doctrine of the createdness of the Qurʾān, and toiled to establish positive relationships with the *ʿulamāʾ*. One of the qadis of Baghdad even included al-Mutawakkil in the trio of the greatest caliphs of all times, because “he eradicated the heretical doctrines and restored the Sunna” (*al-sunna*; the way of the Prophet; *Tārīkh* 8, p. 52). As another gesture of good will, al-Mutawakkil invited Ibn Ḥanbal to his court in Samarra (a city on the east bank of the middle Tigris, 125 km north of Baghdad) to teach Ḥadīth to the young prince al-Muʿtazz. Ibn Ḥanbal

made the journey in 851; however, he also clearly stated to the caliph and his advisors that he would not take this task upon himself. In July 855 Ibn Ḥanbal died of fever. The streets of Baghdad were filled with crowds of mourners. Some say that 800,000 men and 60,000 women were on the streets that day, lamenting the departure of this defender of the Sunna. Ibn Ḥanbal's funeral became one of the powerful symbols of the victory of traditionalism over rationalism. In the following decades, his disciples toiled to preserve his heritage and spread his teachings throughout the caliphate (Patton 1897, pp. 54–113, 172–173; Lapidus 1975, pp. 378–382; Hurvitz 2001, pp. 93–97, 102–111; 2002, pp. 117–148; Melchert 2006, pp. 8–16).

Works and Thought

Ibn Ḥanbal was not a typical author (*muṣannif*) who wrote in the seclusion of his home. His most important work, the voluminous Ḥadīth compilation *al-Musnad*, was based on the thousands of Ḥadīth accounts that he collected during the two decades he travelled throughout the Islamic world and during the subsequent three decades he taught in Baghdad. *Al-Musnad* assumed its final form posthumously, when his son 'Abd Allāh edited the book and included additional material such as summaries of his conversations with his father, notes from other sources, and personal correspondences of 'Abd Allāh with other *muḥaddithūn* (Patton 1897, pp. 19–26; Melchert 2005). *Al-Masā'il* (*The Responsa*) which are several different collections of Ibn Ḥanbal's *responsa* were also not written by Ibn Ḥanbal himself. His two sons and closest disciples recorded his answers to questions directed to him and issued these responses after Ibn Ḥanbal's death. It has been argued that contradicting quotations of Ibn Ḥanbal's opinions as they appear in the various editions of *al-Masā'il* are the result of disagreements between Ibn Ḥanbal's disciples (Al-Sarhan 2011, pp. 54–108).

The main source of Ibn Ḥanbal's theological thought is a collection of creeds (*'aqā'id*) which he presumably dictated to his disciples (Laoust

1956–7; Watt 1994, pp. 29–40). These creeds, fully quoted in Ibn Abī Ya'la's (d. 1131) biographical dictionary entitled *Ṭabaqāt al-Ḥanābila*, assumed their final form in the decades following Ibn Ḥanbal's death (Al-Sarhan and Melchert 2014). Some articles of faith in these creeds are concerned with the practice of religion, and not with theological issues. Ibn Ḥanbal's theological thought as reflected in these creeds relies heavily on the Qur'ān and the Ḥadīth. Most of the major articles of faith in these creeds challenge the rationalistic trends in Islam. For example, the creeds define faith as a combination of words, works, intention, and holding to the Sunna. Publicly declaring one's belief in God is not enough to be considered a believer. One should also perform works (or good deeds according to God's command) with the purest intention (*niyya*). Ibn Ḥanbal's perception of faith stands in stark contrast to the Murji'ite concept of faith. According to the Murji'a, faith consists of speech only, whereas works are considered legal matters. The major articles of faith in Ibn Ḥanbal's creeds also target the Mu'tazilite doctrines. Thus, the creeds state that God predetermines everything, including human actions. This statement defies the Mu'tazilite concept of free will or human free agency. The creeds also emphasize that the Qur'ān is the uncreated speech of God, as opposed to the Mu'tazilite concept of the Qur'ān as God's created speech. Moreover, the creeds emphasize the hypostatic character of God's essential attributes: God is hearing and seeing undoubtedly. He sits on His throne and places His feet on the Footstool. He moves, speaks, observes, looks, laughs, joys, and loves. These anthropomorphic descriptions, which Ibn Ḥanbal instructed to accept verbatim and never inquire their content, also defy the Mu'tazilite impersonal and transcendent perception of God (Watt 1973, pp. 292–294; 1994, pp. 33–39; Holtzman 2018, pp. 185–248).

Ibn Ḥanbal's major contribution to Islamic theology was the advancement of the doctrine of the uncreatedness of the Qur'ān as a counter-response to the Mu'tazilite doctrine of the createdness of the Qur'ān (*khalq al-qur'ān*). We learn about Ibn Ḥanbal's views on this topic primarily from *al-Radd 'alā al-Jahmiyya al-Zanādiqa* (*A Refutation*

of the Heretical Jahmiyya). This influential treatise of theological polemics is the most important source of Ibn Ḥanbal's theological thought. *Al-Radd* is also one of the only existing sources on the teachings of the early *mutakallim* Jahm ibn Ṣafwān (executed 746), who was one of the first proponents of the doctrine of the createdness of the Qur'ān. In this work, Ibn Ḥanbal presents his Mu'tazilite contemporaries as the followers of Jahm, the Jahmiyya, thus labeling them as heretics.

The doctrine of the createdness of the Qur'ān was first articulated by early *mutakallimūn* such as Ja'd ibn Dirham (executed in 742 or 743) and Jahm ibn Ṣafwān. The Qur'ān itself testifies that it is "God's speech" (*kalām Allāh*, lit. "the words of God"; Q. 2: 75, 7: 144, 7: 158, 9: 6). Ja'd and Jahm claimed that the Qur'ān, being God's speech, was created (Patton 1897, p. 47; Watt 1973, pp. 242–244; Madelung 1974, pp. 504–505). In the beginning of the ninth century, the Mu'tazilites refined and perfected this doctrinal formula as part of their project to defend God's unity (*al-tawḥīd*) by expelling all references to anthropomorphism (*tashbīḥ*) from the discourse about God. The principle of God's unity was the foremost principle in the Mu'tazilite thought, and it included a denial of the hypostatic character of God's essential attributes like knowledge (*ʿilm*), power (*qudra*), and speech (*kalām*). Focusing on the attribute of speech, the Mu'tazilites first argued that "God has never spoken and does not speak, because speech exists only by virtue of an organ. You cannot ascribe [to God] body organs" (*Al-Radd*, p. 100; Seale 1964, p. 99). Elsewhere, the Mu'tazilites substantiated their claim by adding the following clarification: "God has created a thing. This thing enunciated for Him. He created a voice, and this voice was heard... Speech on the other hand is created only by virtue of an oral cavity, a tongue and a pair of lips" (*Al-Radd*, pp. 135–136; Seale 1964, p. 114).

In parallel with the Mu'tazilite discourse about the createdness of the Qur'ān, the *muḥaddithūn* promoted sayings which they attributed to the successors (*al-tābiʿūn*), namely, the Ḥadīth transmitters who belonged to the generation which

succeeded the Prophet and his companions (*al-ṣaḥāba*). On the basis of these sayings, the *muḥaddithūn* declared that the Qur'ān, as divine speech, was uncreated (*al-qur'ān kalām Allāh ghayr makhlūq*). We note that the Prophet's companions, let alone the Prophet himself, never claimed that the Qur'ān was uncreated (Madelung 1974, pp. 518–519; *al-Sharīʿa*, pp. 81–93). In response to the sayings of the successors that the *muḥaddithūn* promoted, the Mu'tazilites developed the following declaration: "The Qur'ān is the divine speech. It was created (*makhlūq*) by God. First it did not exist, then it existed" (*Maqālāt*, p. 582). The Mu'tazilites supported their rationalistic argument with the following Qur'ānic verse: "We have made it a Qur'ān in Arabic" (Q. 43: 3). The Mu'tazilites claimed that the verb *jaʿala* (to make) that appeared in this verse was synonymous with the verb *khalāqa* (to create). Accordingly, in this verse God declared that He created the Qur'ān (*Al-Radd*, p. 101; Seale 1964, p. 101). The Mu'tazilite assertion that the Qur'ān was created corresponded with their denial of the hypostatic and independent existence of the divine attributes. By asserting that God's speech was created, the Mu'tazilites reaffirmed the temporality of this divine attribute and its dependency on the unchangeable essence of God. In other words, the Mu'tazilites reaffirmed that the Qur'ān was not eternal (*qadīm*; for a summary of the Mu'tazilite general principles in the question of the createdness and temporality of the Qur'ān, see: Tritton 1972, pp. 10–13; Peters 1976, pp. 335–336). We note, that Ibn Ḥanbal and the other *muḥaddithūn* never claimed that the Qur'ān was eternal. Several decades after the *miḥna*, traditionalistic scholars promoted the idea that the Qur'ān was eternal as a response to the Mu'tazilite negation of the eternity of the Qur'ān (Tritton 1972, pp. 8–9; Madelung 1974, pp. 516–518).

Al-Radd ʿalā al-Jahmiyya is arranged as a work of *kalām*. Its style is not typical of Ibn Ḥanbal's theological teachings. In fact, in this work Ibn Ḥanbal appears as a semi-rationalist, and almost as an Ashʿarite theologian. Doubts on the authenticity of this work have been raised by the Damascene historian and ultra-traditionalistic *muḥaddith*, Shams al-Dīn al-Dhahabī (d. 1352–3;

Siyar 11, pp. 286–287). Other traditionalistic scholars of the thirteenth and fourteenth centuries also admitted that doctrinal and legal opinions were falsely attributed to Ibn Ḥanbal by unscrupulous scholars who wished to promote their own agenda. However, it is also known from Ḥanbalite sources that Ibn Ḥanbal indeed collected Qurʾānic verses to refute the Muʿtazilite doctrine of the createdness of the Qurʾān, and perhaps these verses comprised the basis of the original *al-Radd* (Melchert 2006, p. 101). Two versions of this treatise were transmitted by Ibn Ḥanbal's son ʿAbd Allāh and his disciple al-Marwazī (al-Marrūdhī), who attested to the authenticity of the treatise which they found among Ibn Ḥanbal's notes after his death (Al-Sarhan 2011, pp. 48–53; Al-Sarhan and Melchert 2014, pp. 47–49).

One cannot ignore the fact that *al-Radd* presents a sophisticated view of Ibn Ḥanbal's doctrines, unlike the view expressed in his other works. In his creeds, Ibn Ḥanbal merely declares that “the Qurʾān is the speech of God by which He speaks. It is not created” (Watt 1994, p. 37). *Al-Radd ʿalā al-Jahmiyya*, on the other hand, is a tour de force of dozens of rationalistic proofs that address the uncreatedness of the Qurʾān from various angles. It is more reasonable to assume that Ibn Ḥanbal's contribution to the discussion was by collecting Ḥadīth accounts to back up this traditionalistic doctrine. Thus, for instance, there is a record that Ibn Ḥanbal was overjoyed when he heard a rare Ḥadīth account according to which the *ṣaḥābī* Ibn ʿAbbās (d. 687–8) interpreted the Qurʾānic expression “an Arabic Qurʾān, free from any distortion” (Q. 39: 28) as “uncreated.” The story goes that Ibn Ḥanbal could not understand how this particular Ḥadīth account escaped him and hurried to add this text to his collection (*Al-Sharīʿa*, p. 84).

As the epitome of traditionalism, namely, the trend in Islamic thought which relies solely on the teachings of the Qurʾān, the Ḥadīth (or Sunna), and the consensus (*ijmāʿ*) of the first generations of Islam, Ibn Ḥanbal perceived the religious content derived from these three sources of knowledge authoritative, homogenous, and undisputable (Al-Azmeh 1988, pp. 253–260).

By contrast, he perceived the religious content derived from *kalām* as erroneous, misguided, and self-contradictory. Relying on the opinions of past generations and even the Prophet himself, Ibn Ḥanbal forbade arguments on theological matters. Moreover, unlike his Muʿtazilite contemporaries and other *mutakallimūn*, Ibn Ḥanbal was not interested in proving the existence of God or His attributes (Abrahamov 2016, pp. 269–273; van Ess 1970, p. 43). But did Ibn Ḥanbal indeed reject the use of rational argumentations?

Long after the *miḥna* procedure was dismantled, one of al-Mutawakkil's courtiers arrived at the caliph's request to obtain Ibn Ḥanbal's opinion on the Qurʾān, namely, why he believed that the Qurʾān was uncreated. The courtier, ʿUbayd Allāh ibn Yaḥyā ibn Khāqān (d. 877) assured Ibn Ḥanbal that the caliph asked this question not because he wanted to put Ibn Ḥanbal to the test but because he nurtured a genuine desire to acquire knowledge and insight. The closing paragraph in Ibn Ḥanbal's answer as dictated to his eldest son Ṣāliḥ, included all the building-blocks of Ibn Ḥanbal's traditionalistic worldview: “Not one but many of our pious forefathers (*al-salaf*) used to say: ‘the Qurʾān is the word of God and it is uncreated’. This is also my conviction. I never engaged in *kalām*, and I see no use in talking about this topic unless you quote what is written in the Book of God, or quote Ḥadīth which is transmitted on the authority of the Prophet, his companions (*al-ṣaḥāba*) and their successors (*al-tābiʿūn*). Any discussion, which relies on sources other than these sources, should be condemned” (*Masāʾil* 2, pp. 419–430; *Siyar* 8, pp. 281–286). This apparently fierce rejection of the principles and methodology of *kalām* is in fact an apology. In the next to last paragraph of Ibn Ḥanbal's response, he presented to the caliph a rationalistic proof that he developed in defense of his credo. Based on “all creation and command belong to Him” (Q. 7: 54), Ibn Ḥanbal deduced that God's creation is other than His command (which is the Qurʾān). Hence, it is uncreated. Based on “If you [the Prophet] were to follow their desires, after the knowledge brought to you” (Q. 2: 145), Ibn Ḥanbal concluded that the Qurʾān is part of the divine attribute of

knowledge (*al-qurʿān min ʿilm Allāh*). Hence, it is uncreated (Madelung 1974, p. 518; Al-Sarhan 2011, p. 54). In this rationalistic proof, Ibn Ḥanbal demonstrated his skillful use of *istinbāṭ*, one of the devices of analogy (*qiyās*) which he forcefully condemned elsewhere. In *al-Radd ʿalā al-Jahmiyya*, Ibn Ḥanbal (or pseudo-Ibn Ḥanbal) used the *kalām* argument from disjunction (*qisma* or *taqṣīm*) to refute the Muʿtazilite doctrine that God was everywhere and prove the traditionalistic conviction of God sitting on His throne (*Al-Radd*, pp. 142–153; Seale 1964, pp. 117–118; Abrahamov 2016, pp. 273–274). Elsewhere in *al-Radd*, Ibn Ḥanbal proved by way of analogy that God’s knowledge could not be created, because if so, it would mean that there was a time, before God created His knowledge, that He was ignorant (*Al-Radd*, p. 162; Seale 1964, p. 123; Madelung 1974, p. 515). Ibn Ḥanbal’s skillful application of *kalāmīc* argumentations in *al-Radd* and in the letter to the caliph al-Mutawakkil do not correspond with historical accounts that present Ibn Ḥanbal as lacking any ability to respond to rationalistic argumentations in theological debates. Thus, during the *miḥna* Ibn Ḥanbal was asked to prove the traditionalistic belief in the beatific vision. The Muʿtazilite interrogator asked him how was it possible that the believers would actually see God when it was well known that the human eye could grasp only limited bodies while God had no limits. All that Ibn Ḥanbal was able to do in response was to cite one of the Ḥadīth accounts that promised that the believers would see God on the Day of Resurrection (Holtzman 2018, p. 101).

Numerous theological dicta attributed to Ibn Ḥanbal appear in Ḥanbalite and Ashʿarite writings that were composed between the late tenth to the fourteenth centuries. These dicta were exposed to massive processing and manipulations by later generations (Holtzman 2018, pp. 159–163). A systematic identification of the pseudo-Ibn Ḥanbal’s doctrinal opinions in Ashʿarite writings in particular is still a desideratum in Western research. Moreover, Western research still lacks a work which synthesizes Ibn Ḥanbal’s theological thought. Accordingly, our survey which relies on readings in both a selection of Ibn Ḥanbal’s

works and relevant researches is by no means definitive.

Alan of Lille

Christophe Erismann
Helsinki Collegium for Advanced Studies,
University of Helsinki, Helsinki, Finland

Abstract

Alan of Lille is a philosopher, theologian and poet of the twelfth century. He is the author of a twofold work: the transposition in poetical form of the major themes of Platonism on the one hand and treatises of theology that include many aspects of the logic and ontology of

Gilbert of Poitiers on the other. He was the last representative of the first age of medieval speculation based on Boethius and on the *logica vetus*, which preceded the rediscovery of Aristotle's physics, metaphysics, and psychology, and the discovery of Arabic philosophy.

As a scholar, Alan of Lille (Alanus ab Insulis, c. 1120/1128–1203, sometimes called the *Doctor universalis*) was influenced by two major currents of twelfth-century thought: the so-called School of Chartres, which inspired several of his research themes and the philosophical movement initiated by Gilbert Porreta (or of Poitiers). He was interested both in the philosophy of nature in a Platonic perspective grounded in the *Timaeus*, as was traditional among the scholars associated with Chartres, and in the philosophy of language, logic, and ontology in a Porretan perspective. In this, he synthesized the two major centers of interest of the twelfth century. He is said to have taught in Paris between the years 1170–1180, probably at Mont Sainte-Geneviève, at the same time as Simon of Tournai, before leaving for Montpellier; like Thierry of Chartres, he became a convert in Cîteaux. Alan had great familiarity with the liberal arts, in particular the *trivium* – grammar, logic, rhetoric – and excellent knowledge of some Platonic authors of Late Antiquity (Chalcidius, Martianus Capella, Macrobius, and Boethius in the *Consolatio*). Despite living at the time of the beginning of the western reception of Arabic and Muslim texts (Avicenna), his thought remained within the framework of twelfth-century Latin culture (with the noticeable exception of his knowledge of the *Liber de causis*). In contrast with his contemporary Adelard of Bath, he demonstrated little interest in the “Arabic innovation”; his intellectual world was that of the *Aetas Boethiana*, the first age of medieval metaphysics dominated by Boethius and the *logica vetus*, of which he was the last representative.

His works belong to various literary genres and to different fields of knowledge. He wrote allegorical poems, in which he considered issues of natural philosophy: the *De planctu naturae*, the

Anticlaudianus, and the *Rythmus de incarnatione et de septem artibus* (a text in which the Liberal Arts admit their incapacity to understand the Incarnation). His other works pertained to theology (*Summa Quoniam homines* and *Regulae caelestis iuris*) and to preaching (*Ars predicandi* and *Sermones*); they also included an apologetic treatise, the *De fide catholica*, which was aimed against Cathars and Waldensians as much as against Pagans or Jews, and one more philosophical text, the *Sermo de sphaera intelligibili*.

Through his poetical and allegorical writings, he contributed to the development, peculiar to the twelfth century, of a new philosophical conception of nature, thus testifying to the tradition of reading and glossing of the *Timaeus*, characteristic of the School of Chartres. Alan's work is in great part the poetical transposition of the major themes of Platonism.

The *Lament of Nature* (*De planctu naturae*) – a *prosimetrum* (a work comprising alternating verse and prose sections) written between 1160 and 1170 – is a poetical allegory intended for philosophical and moral meditation. Nature, the *vicaria Dei*, whose task is to make harmony reign on Earth, descends to the poet in order to condemn the vices of humanity, first and foremost homosexuality.

The *Anticlaudianus*, a long epic of 6,000 verses composed in 1182–1183, describes an allegorical voyage of Prudentia to visit God so as to receive the soul of a perfect man. In this work, Alan gives an encyclopedic overview of human knowledge (grammar, dialectic, oratory art, mathematics, geometry, and astronomy) and a descriptive praise of moral and intellectual virtues. He meditates on the perfect man, whom nature alone cannot produce.

The *summa Quoniam homines*, like the *Rules of Theology*, is a text that shows Alain of Lille concluding century-long thought and opening new perspectives, among other things, on terminism. The *Summa* belongs to the Porretan–Boethian theological tradition. It deals with the Boethian issue of the transfer of categorical language to predication *in divinis* and the possibility of using categorical discourse in order to speak about God. In a reasoning inspired by the Pseudo-

Dionysius on the ineffable aspect of celestial science, Alan speaks of the translation of the categories when they are predicated of God. In contrast with Boethius who used the term *mutatio*, Alan's source here is Eriugena, whose arguments he uses. According to Eriugena, none of the ten categories, not even substance, is predicable of God in the proper sense (*nulla categoria proprie Deum significare potest*). A category can only be predicated of him in a figurative (*translative*) or metaphorical sense (*per metaphoram*), by transfer from the creature to the Creator (*per translationem a creatura ad creatorem*). Alan's debt to Gilbert appears in these texts mainly in the field of the semantics of terms and of ontology (see last section). Alan grounds his theory of signification on the distinction between *suppositio* and *significatio*, which occurs in the wider framework of the opposition between the “proper use” and the “improper use” of a term.

The *Regulae caelestis iuris* circulated under several different titles: *Theologicae regulae*, *Regulae Alani de sacra theologia*, *Maximae theologiae*, *Liber de maximis theologiae*, *De maximis theologicis*, *Axiomata theologica*. Beginning with the postulate that “each science is grounded in foundations which are proper to it,” this writing is an attempt at stating systematically the rules of theology. This organized set of 134 propositions, which are analyzed, commented upon or demonstrated, offers an axiomatization of theology, that is, the definition of the set of principles that theology needs in order to be constituted as a rigorous science, reminiscent of Boethius' treatise *De hebdomadibus*. This is the first attempt to provide theology with a scientific character, by presenting it according to a geometrical organization, and by applying logic and grammar to it. This work is inspired by Boethius, the Chartrians, and the *Liber XXIV philosophorum* – an anonymous text of supposed “hermetical” origin – and is pervaded by Neoplatonic henology. The starting point is not, as it was for Boethius, *esse*, being, but the One in the form of the monad. The first rule is “the monad is that which makes any reality one.” God is first considered as One or unity (*monas*) before being considered according to the metaphysical categories

of *esse*, simplicity, and form. This monad is God-One, through which all unities and pluralities and, therefore, beings come into existence. Henology reacquires a form of primacy, but is now represented as acting on the order of nature, and not any more as the presence in all things of the transcendental One. According to Alan, God is really One, but does not have being: “of that which is being (*esse*), there is no being. Of God, who is the being of all things, there is no being, because in order to be he does not participate in anything.” A “form without a form” or “form of forms,” God is “the first substance [...] called *ousia*” – in the words of the *Liber XXIV philosophorum*, “an intelligible sphere whose centre is everywhere and whose circumference nowhere.” Alan’s axiomatization of theology contributed, more than any other work, to the evolution of the old *sacra pagina* into a proper “theological science,” which took place at the beginning of the thirteenth century. Alan’s text inspired Meister Eckhart’s idea of an *Opus propositionum*, the set of the 1,000 theses necessary to an axiomatization of theological knowledge.

The *Sermon on the Intelligible Sphere* is a treatise of Neoplatonic metaphysics, inspired among others by Boethius, and also by Bernard of Chartres and Gilbert Porreta for the theory of “native forms.” The universe consists in four spheres with four modes of being and four modes of knowledge. The first sphere is that of reality, dominated by nature, in which “the marriage of forms and their subjects is celebrated.” The second is that of primordial matter around which the forms revolve in a continuous movement. The palace of the World-Soul that illuminates the universe is the third sphere, in which the pure form returns to its origin. The fourth is the perfect sphere of intelligibles, of eternal ideas.

One of the salient traits of the philosophy of Alan of Lille is its Porretan character. Alan is one of the thinkers who echoes most strongly the thought of Gilbert. A large part of Alan’s philosophy of language, his theory of reference (in particular, the theory of the *nomen appellativum*), and, most of all, his ontology consist in the intelligent use, systematization, and

rethinking of Gilbert’s doctrines. Here Alan does not use allegory or poetry, but dry and technical reasoning. Although Platonism pervades part of his thought, one must not expect to find him defending a realist ontology. On the contrary, his ontology is grounded in strict particularism (and in this, Alan’s thought constitutes yet another example that realism and Platonism must not be considered as necessarily related). Alan’s position is nominalistic, and can be described more precisely as a trope theory. He does not accept universal entities, in the sense of entities that are common to several spatiotemporally distinct individuals. All properties, both essential and accidental, are particular. A man is man through his own humanity, this apple is red through its own redness, and Socrates is wise through his own wisdom. Complementary to this particularism, Alan also borrows from Gilbert his theory of exact resemblance or *conformitas*. Two individuals that belong to the same species or exemplify the same property are considered to be conform in this respect. Although they are both particular, the humanity of Socrates and that of Plato are exactly resemblant and therefore conform (*Regulae*, CXXX: “*Conformitas est singularium naturarum plena similitudo. Vt Socrates et Plato dicuntur naturaliter conformes suis singularibus humanitatibus eos similiter conformantibus*”). This form that makes Socrates a man causes him to belong to a group of individuals which have the same specific characteristic; it makes him resemble other men. Men do not resemble each other through a common form, but through the conformity of their own form.

On the basis of this exact resemblance, one can, through abstraction, obtain universal concepts that are ontologically grounded. The specific or generic universal is the reunion or collection of all the individuals which present the same specific or generic character; however, this universal is not a *res*.

Albert of Saxony

Sander De Boer

Center for the History of Philosophy and Science,
Radboud University Nijmegen, Nijmegen,
The Netherlands

Abstract

Albert of Saxony (early 1320s – July 8, 1390) was born in or near Helmstedt in the early 1320s. He studied at the University of Paris, and became the first rector of the University of Vienna. Albert was very influential in both

natural philosophy and logic, and many of his works were already printed several times by the early sixteenth century. He was thoroughly familiar with the works of many of his contemporaries at Paris (John Buridan and Nicholas Oresme), as well as with important works from Oxford philosophers (Thomas Bradwardine, William of Ockham, William of Heytesbury). He drew extensively on these sources, but made important innovations in both logic and natural philosophy. Among other things, Albert was one of the defenders of the so-called impetus theory for projectile motion. This theory claimed that the proximate cause of the motion of a projectile was a force inherent in the projectile itself, in contrast to the more traditional (Aristotelian) view that the proximate cause was inherent in the part of the air that was adjacent to the projectile. Albert died in Halberstadt on July 8, 1390, where he had been the bishop from 1366 onward.

Lemma

Little is known for certain about Albert of Saxony's (also known as Albert of Rickmersdorf or as Albertutius) early life. Traditionally, c. 1316 has often been suggested as his date of birth, but it has been shown that this date is merely the result of a misinterpretation of an early eighteenth-century source. Instead, he was more likely born in the early 1320s. This uncertainty concerning Albert's birth date is a result from the fact that the first dated record we have of his life is that in 1351 he determined as a master of arts in Paris.

Albert's place of birth was Helmstedt, or otherwise the region around Helmstedt, which lay in lower Saxony. Prior to studying at the University of Paris, he would have attended one of the schools in his diocese, at Halberstadt or at Magdeburg. In addition, he may have also studied for some time at the *studium generale* at Erfurt. There is, in fact, a reference to a stay in Erfurt in what might be the only work we have of Albert written before his stay at Paris, the *Philosophia pauperum*, but its authenticity is still uncertain.

After becoming a master of arts, Albert began studying theology but he apparently never incepted in it.

During his stay in Paris, Albert fulfilled different administrative functions in the university. For some time he was proctor and receptor of the English-German nation, and in 1353 he was appointed rector of the entire arts faculty. Albert probably left the University of Paris in 1361/1362 and little is known of his activities in the 2 years following his departure, apart from the fact that he was involved in some diplomatic transactions between Pope Urban V and the Duke Rudolph IV of Austria. In 1365, he became the first rector of the newly founded University of Vienna; in fact, Albert had played an important role in obtaining papal support for its founding. His rectorship in Vienna lasted only 1 year, because he was appointed bishop of Halberstadt in 1366, a position which he held until his death there on July 8, 1390.

Thought

Albert is well known both for his works in logic as well as for those in natural philosophy. His most important works in logic are the *Perutilis logica* (*Very Useful Logic*), the *Quaestiones circa logicam* (*Questions on Logic*), and his *Sophismata*. In addition, he wrote commentaries on the *Ars vetus* (*Isagoge, Categories and On Interpretation*) and on the *Posterior Analytics*. Albert's works in natural philosophy include commentaries on the *Physics*, *On the Soul*, *On the Heavens*, *On Generation and Corruption*, *On Sense and What is Sensed*, and on the *Meteorology*. He also wrote commentaries on the *Ethics* and on the *Economics*. In addition, he commented on John of Holywood's (Johannes de Sacrobosco) astronomical work *De sphaera* (*On the Sphere*) and wrote some (short) mathematical treatises including the *Tractatus proportionum* (*Treatise on Proportions*), which was modeled on Thomas Bradwardine's treatise *De proportionibus velocitatum in motibus* (*On the Proportions of Velocities in Movements*). None of Albert's theological writings – if he wrote any – survive.

A long-standing characterization of Albert was that he was only a transmitter and not an original thinker. This characterization, however, now seems no longer tenable. It is certainly true that he often relied heavily on others. For example, his commentary on the *Ethics* is strongly influenced by Walter Burley's commentary. But in natural philosophy as well as in logic, Albert made important contributions of his own.

The most important and influential of Albert's logical works is his *Perutilis logica*. This work is not a commentary, but an independent treatise consisting of six related tracts on various topics in logic. The first tract defines the basic terminology to be used in the rest of the tracts, such as sign and intention, and also discusses the basic structure of propositions. It is followed by tracts on the properties of terms, on propositions, on inferences and topics, on fallacies and, lastly, on obligations and insolubles. An important source of inspiration for the *Perutilis logica* was Ockham's *Summa logicae*, both for its structure and for part of its doctrinal contents, but Albert's work is considered to be both more systematic and more comprehensive than Ockham's and contains much that is not found in Ockham. Also closely related to the *Perutilis logica* is Buridan's *Summa logicae*, but since the relative priority between Albert's and Buridan's work is still unclear, it is difficult to answer questions on influence and originality. It is still possible, however, to point out some interesting differences between Albert's and Buridan's views.

One of the key differences that have been noted is the different ways in which Albert and Buridan understand how the copula "is" (*est*) functions in a proposition. Buridan interprets it in a manner that makes it atemporal, in the sense that in a proposition such as "man is an animal" the copula "is" not only applies to all men that exist presently, but to all men in the past and in the future as well. Albert, on the other hand, strongly emphasizes that "is" always and only signifies the present tense, which implies that in the proposition "man is an animal," the term "man" only stands for (in fourteenth-century terminology: suppositis for) all men presently existing. As a consequence, Albert and Buridan give a rather different explanation for

the reasons why scientific propositions are eternally true. Since the subject term of a scientific proposition in Albert's view only stands for presently existing things, he cannot just claim that the eternal, or universal truth of such a proposition is accounted for by the fact that it is true of all of the particulars that the subject term stands for. For, in order to claim universal truth, all the particulars in the past and in the future would have to be taken into account as well. Albert quite elegantly evades this apparent problem by saying that in order for a scientific proposition to be eternally true, all that is required is that each and every time the proposition is thought of, or uttered, or written, it is true of all the particulars existing at that moment.

Just like his *Perutilis logica*, Albert's *Sophismata* also shows an Oxford influence. *Sophismata* (sophisms) are sentences that give rise to difficulties in their interpretation, because of certain ambiguities or other characteristics. One of the tools Albert relies heavily on to solve such *sophismata* is a distinction between compounded and divided senses (*sensus divisus* and *sensus compositus*), in the sophisticated form into which it was developed by William of Heytesbury. This distinction enables one to take the scope of modal operators into account when analyzing the truth value of a proposition.

Albert's works in natural philosophy are closely related to the works of John Buridan and Nicholas Oresme. This has led scholars to believe that there was a so-called Buridan school in Paris, of which Buridan was the teacher and Albert of Saxony, Nicholas Oresme, Marsilius of Inghen, and Themon Judaeus were the students. This, however, was not the case. The fact that Buridan belonged to the Picard nation of the university, whereas Albert belonged to the English-German nation, more or less rules out the possibility of a teacher – student relation in the strict sense, and the fact that it is known that Albert incepted under Albert of Bohemia (from his own nation) does the rest. The doctrinal interconnections, however, between these philosophers are many and undeniable, even if the precise relations between them are unknown. The recently suggested description of this group as “a small intellectual network of

nearly contemporary masters of arts, who were familiar with each others' work and at times responded to each other” seems much more accurate.

One of the interesting themes in Albert's important commentary on the *Physics* is his analysis of projectile motion. This type of motion was problematic to analyze within an Aristotelian framework, because Aristotle had insisted that all local motion occurs by contact between a mover and the thing moved. What then, in the case of projectile motion, is the mover that remains in contact with the projectile? A traditional (Aristotelian) answer – though certainly not the only one – had been that the motive force is transferred by the original mover to the air, after which one part of air would pass on this force – with diminishing intensity – to the next part, so that there is always contact between the projectile and that part of the air which currently has the motive force. This solution, however, has a number of difficulties, not the least of which is that it is hard to see how motion can be a continuous process when the motive force is transferred from one (seemingly discrete) part of the air to the next. Albert gives a different explanation for this phenomenon, one that was also given by Buridan. According to Albert, the original mover (for instance the person throwing the projectile) transfers the motive force to the projectile itself. Because the moving force becomes a quality of the projectile, there is no longer any need for any other direct contact between a mover and the projectile. The name under which this moving force in the projectile became known and famous was *impetus*, but Albert still used the term *virtus motiva*.

The topic of *impetus* also sheds some more light on the relation between Albert's and Buridan's commentaries on the *Physics*. It has now been shown that Albert's commentary was composed somewhere between Buridan's third redaction and his final redaction of his commentary on the *Physics*. Part of the evidence for this is that the term *impetus*, which was not used by Albert, is only used in Buridan's final redaction of his commentary. But more importantly, in his final redaction Buridan, at times, responds to

Albert or takes over elements from his discussions.

There is more disagreement between Albert and Buridan on the ontological status of quantity. Albert sides with Ockham when he reduces the ontological category of quantity to the categories of substance and quality whereas Buridan had defended that quantity must be a distinct ontological category besides substance and quality. As a consequence, Albert considers condensation and rarefaction – the phenomena that had occasioned Buridan to assign a separate status to quantity – as merely forms of local motion of the parts of a given substance. Albert did not, however, always take Buridan's *Physics* commentary as his starting point. On the questions of the possibility of the existence of a void, for example, he models his discussions on Oresme's commentary instead.

Oresme's works have also, again together with Buridan's, influenced Albert's commentary on Aristotle's *On the Heavens*. But apart from the fact that Albert discusses many questions not found in either Buridan or Oresme, he also surprisingly and very interestingly organizes the material in a novel way. Instead of following the traditional division of *On the Heavens* into four books, he chooses to arrange the work according to the three major topics he distinguishes in Aristotle's work: the world as a whole, its noble parts, namely heaven and earth, and its less noble parts, namely the elements, especially insofar as they exhibit the qualities of being either heavy or light. As a consequence, Albert treats the traditional books three and four as a thematic unity and writes a commentary that is divided in only three parts.

To sum up, not only was Albert thoroughly familiar with a wide range of philosophical views in his time, but he was also responsible for introducing several new ideas into the philosophical discussions. Albert was very influential and remained so for a long time, which can be demonstrated not only by the number of surviving manuscripts, but also by the number of times his works were printed. His commentaries on the *Physics*, *On the Heavens*, and *On Generation and Corruption*, as well as many of his logical works were all printed multiple times in the late

fifteenth and early sixteenth centuries. His *Tractatus proportionum* was even printed at least 15 times. Albert thereby became one of the most important figures in the transmission of fourteenth-century philosophy.

Albert the Great

Julie Brumberg-Chaumont

Laboratoire d'Études sur les Monothéismes,
CNRS, Paris, France

Abstract

Albert the Great (c. 1200-1280) was a master in theology (Paris, 1245), a member of the Dominican order (he entered in 1223), a bishop (1260-1262) and he was declared a Saint, then a Doctor of the Church in 1931. His philosophical investigation reaches all the fields of knowledge, from mineralogy to theology; the spread of his readings is overwhelming, covering Ancient Greek, Latin, Byzantine, Arabic, and Jewish authors. His ambition was to

deliver to his contemporaries a deep understanding of the newly available Aristotelian philosophy (metaphysics, psychology, natural science, and “theology” through the *Liber de causis*) founded on a synthesis of the teaching of peripatetism and of that of Christian faith.

Life, Work, Influence

Albert the Great was probably born around 1200 in Lauigen in Germany and died in 1280. He was canonized and declared a Doctor of the Church in 1931. During his long and eventful life he has often been burdened with institutional and religious duties linked to his role within the Dominican order (where he entered in 1223), alternating with periods of intellectual and academic achievements, on which we will focus here. He was educated in Padua, then taught as a lector in various places in Germany within the Dominican order. He studied theology in Paris from 1241 on and became Master in 1245, the year Thomas Aquinas became his student. He taught in Paris until 1248. He was then sent in Cologne as the regent of the *Studium generale*, which he run until 1254. Thomas Aquinas followed his master to Cologne where he served as *magister studium* until 1252; Ulrich of Strasbourg was also his student there. Albert was appointed prior provincial of Teutonia from 1254 to 1257. The same year he was asked by Pope Alexander IV to discuss the separation of the intellect (the famous “Agnani dispute”, which led to the *De unitate intellectus* and to the chapters of his *Summa theologiae*, directed against Averroes, but only after the crisis of the 1270s about monopsychist theses and Averroism generally). He returned to Cologne from 1257 to 1259. He became bishop of Ratisbon from 1260 to 1263, then traveled in Germany many years after a stay in Würzburg. He was in Strasbourg from 1267 to 1270. He was in Paris in 1277 in order to defend his student Thomas Aquinas. He died in 1280 in Cologne.

The chronology of his philosophical works remains uncertain especially for the commentaries on Aristotle, which were written between 1250 and 1270. The first work was the *De natura boni*

(around 1223), then he wrote the commentary on the *Sentences* and the *Summa de creaturis* (around 1243 during his stay in Paris), the commentaries on Pseudo-Dionysus’ *De divinis nominibus* and *De ecclesiastica hierarchia*, the *Super ethicam* between 1248 and 1252 in Cologne. He composed the commentaries on the *Posterior Analytics* and the *Politics* during his bishopate (around 1262–1263), as well as his second commentary on the *Ethics* (*Ethica*) and the *De unitate intellectus contra Averroem*. The paraphrases on the *Topica* and the *Sophistici elenchi* were finished around 1269. The commentary on the *Liber de causis* was written between 1264 and 1267. A reconstitution of the order of the paraphrases on Aristotelian natural philosophy (which included some pseudepigraphs) has been proposed. We quote some major works (see Weisheipl 1980: 565–577): *Physica* (1251), *De caelo et mundo*, *De generatione and corruptione*, *Meteora*, *De minerabilibus*, *De anima*, *De intellectu*, *De vegetalibus* (= *De plantis*), and *De animalibus* (1258 for the first version). The logical commentaries that have not been already mentioned were probably written during the second part the 1250s, but there is no certitude. The *Isagoge* was for instance composed after 1251 (the commentary on the *Physics*) and before 1263–1264 (the *Metaphysica*). Most of Albert’s exegesis on ancient works is written in the style of the “avicennian” paraphrase, and not of the literal commentary, a choice in accordance with Albert’s philosophical style.

Albert’s work is generally acknowledged as a very important moment in the history of the transmission of ancient Greek and Arabic philosophy in the Middle Ages. He read and commented on the vast collection of philosophical texts newly available, together with works the tradition had already transmitted: Pseudo-Dionysus, all the Aristotelian works (including all the books of logic, natural philosophy, the *Ethics*, the *Politics*, the *Metaphysics*, and the *Liber de causis*), Avicenna, Averroes, and Maimonides, as well as Porphyry, Boethius, Augustine, and Euclid, mentioning only some of the most famous authorities he used and collected in philosophy, science, and theology. He was accordingly called the

Doctor Universalis. His encyclopedic approach led him to complete Aristotelian philosophy when some books were missing, as, for instance, for those treatises of the *Parva naturalia* that were known at that period, but not yet transmitted. His ambition was to bring a deep and complete understanding of Aristotelian philosophy to his contemporaries (who he called the “Latins”) and to show that there was no contradiction between the philosopher as interpreted through a well-ordered peripatetism and Christian teaching. He has also been praised and systematically seen as being essentially the master of Thomas Aquinas. But his thoughts have been subjected to various readings, very often quite critical. He was criticized for a gratuitous accumulation and curiosity, without being able to elaborate a coherent theory of his own. This unworthy reading of Albert is being revised (see de Libera 2005: 11 sq.).

Albert’s reception in the Middle Ages and beyond is a complex matter. Many apocryphs have been attributed to him such as the *Small and the Great Albert* (a treatise on the virtues of minerals, plants, and animals), and the *Women’s Secret*; he long enjoyed a strong reputation as an expert in magic. His sharp distinction between the objects and goals of philosophy led by reason and of theology where revelation prevails (though it has to be constituted as a science) has been often viewed as an ambiguous defense of the autonomy philosophy, dangerously near to the Latin Averroists and the “two-fold theory of truth.”

The very important number of manuscripts preserved speaks by itself for a great influence of Albert during the Middle Ages, but this impression is to be qualified: his writings have often been used as a mine of informations about ancient philosophers, new concepts, and interesting distinctions without his personal theory being adopted as such (see Ebbesen, “Albert (the Great ?)’s companion to the *Organon*,” in Zimmerman and Villemain-Diem (1981), for this phenomenon in logic).

As A. de Libera has argued (de Libera 2005: 40 sq.) Albert’s thought has led to different trends in medieval philosophy: the German Dominican school anchored in the *Studium Generale* of Cologne, which major figures are Ulrich of

Strasbourg (dead before his master in 1277), Dietrich of Freiberg (d. 1318–1320), and Bertold of Moosburg (d. 1361), even though Eckart can be seen as part of this school; Latin Averroism especially in Italy; and Albertism proper, a movement best illustrated by Heymeric de Campo’s (1395–1440) work, but spread all over Europe in the fifteenth century. Albertists adopted the Dominican’s realistic position on the problem of the universals against the Occamist nominalistic theses, and developed it as a philosophical path distinct from Thomas Aquinas’ realism.

Thought

Logic

The critical judgment to which Albert has often been subjected as a philosopher has been seen as especially justified in the case of his logic, so that S. Ebbesen (Zimmerman and Villemain-Diem 1981), following Prantl’s critique, goes as far as asking whether Albert “the Great” received this appellation according to the greatness of his thought, or, more probably, because of a labeling (“Great”) which was supposed to distinguish members of the Dominican order from those of the Franciscan one (minor friars). Albert’s dependence toward Kilwardby’s commentaries on logic is beyond question, long extracts of his paraphrases being almost copied from Kilwardby’s questions. This is true in particular for the *Analytics*, the *Peri hermeneias* and the *Sophistici elenchi*. But in others works, such as the commentaries on Porphyry’s *Isagoge* and on *Categories*, Albert’s writings are much less dependent, and represent a novelty in medieval Latin logic, because of their intensive use of Arabic texts, especially Avicenna’s *Logica*, together with al-Ġazālī, al-Fārābī, and Averroes (for his commentary on metaphysics) – the question of Albert’s knowledge of Averroes’ middle commentaries on logic remains unsettled. Despite Avicenna’s overall influence, the Dominican master produced a personal synthesis for important questions such as the division of philosophy and the place of logic, the division of logic (he adopts the Arabic “long *Organon*,” which includes

retorics and poetics), the object of logic (syllogism?, language?, reasoning?, secondary intentions?), the universals, etc. He does maintain those general theoretical choices within the commentaries marked by Kilwardby's influence so that he is led also in those texts to personal reformulations. One can say, in general, that Albert is much more interested in the ontological and noetical questions underlying semantic and logical problems, as it can be seen in the way he deals with the problem of the universals (see the section "[Metaphysics](#)"). His logic has been widely read, but has had no great influence on a philosophical point of view during the thirteenth century. His work encounters nonetheless some important echoes during the early fourteenth century, as shown by the sharp debate over the secondary intentions as the subject of logic where his position (and his ambiguities) is an obvious starting point.

Metaphysics

Albert sees the human intellect as a similitude of the separate intellect, extrinsic to matter and body. With Albert's refutation of the theory of the unity of the intellect we reach the core of the difficult question of his relationship to Averroes. Albert rejects clearly the monopsychist idea of the unity of the possible intellect he attributes to different philosophers (and not to Averroes proper) and advocates for a plurality of intellects. But the agent intellect as a part of human soul is itself an emanation of the separated agent intellect, extrinsic to the body and independent from him, so it is not essentially the substantial form of it. This theory leads to his adoption of the peripatetic theory of the conjunction of human soul to separate intellect, itself linked to his conception of human felicity.

Albert's metaphysical thought is clearly determined by his conception of the relationships between *Metaphysics* and what he considers as Aristotle's theology (the "philosophical" theology, the eminent part of metaphysics, to be distinguished from the Christian theology founded in revelation). It is not contained in book *Lambda* of the *Metaphysics*, but in the *Liber de causis*. This text, a Latin translation of an Arabic adaptation

(realized in the circle of al-Kindī) of a collection of propositions taken from Proclus' *Elements of Theology* is considered by Albert as an Aristotelian synthesis, which contains the authentic peripatetic teaching on the subject of the first cause and primary causes. He develops what we would today call a Christian version of the neoplatonic theory of emanation, clearly distinguished from the Latin Avicennian theory of the *Dator formarum* (which Albert considered as Plato's position). His theory of the influx incorporates the Aristotelian hylemorphism, through the famous theory of the education (*eductio*) of forms. It leads to a reconstruction of the Arabic and Greek peripatetism he finds in Alexander, Avicenna, Averroes, al-Fārābī, al-Kindī, and others authors (some of them Jewish, as "David," the author of the collection which constitutes the *Liber de causis* according to Albert) and corrects through his reading of Pseudo-Dionysius.

His position on the problem of universals is to be considered as a part of his metaphysics, much more than logic, both because of his avicennian position on the "accidental" role of significant expressions in logic – the universality of the logical predicate being systematically based upon the communicability of a real nature – and because his solution is mainly rooted on a Avicennian theory of essence combined with his conception of a Christianized version of the "neo-platonic" theory of the three states of the universal (*ante rem* = form pre-contained in the first cause, *in re* = immanent universals, *post rem* = abstracted concepts). This synthesis is itself founded on a conception of the causality (the essence being an ideal cause which pre-contains things) Albert has conceived with the *Liber de causis* and Pseudo-Dionysius.

Ethics

During the first part of the thirteenth century several anonymous commentaries on a partial version of the *Ethics* (called *Ethica vetus* = *Nicomachean Ethics* II–III, completed by *Ethica nova* = *Nicomachean Ethics* I) were produced, but Albert is probably the first Latin commentator of the complete version of the *Ethics* (known as *Ethica*

Lincolniensis, a new translation of Robert Grosseteste around 1246–1247). He was also the first to make a great use of the collection of Byzantine commentaries (especially Eustratus' called "the Commentator" by Albert) also translated by Grosseteste. He commented *Ethics* twice, first around 1250 in Cologne, a literal commentary with questions reported by Thomas Aquinas (= *Super ethica*, *Alberti Magni Opera omnia* IV/1–2, Münster, éd. W. Kübel), then he wrote another commentary around 1262 (= *Ethica*, ed. Jammy t. 4a, Borgnet t. 7). His commentaries had a great influence during the Middle Ages. He contrasts the theoretical and practical aspects of Aristotle's teaching through the distinction of *ethica utens* (ethics as a rule for life) and *ethica docens* (ethics as a subject-matter for teaching). He tried to clarify the relationships between human felicity and Christian happiness in God, a reflection linked to his complex theory of the human intellect, its place within the soul, its relationship to the body, and to man himself. Human felicity is described, in accordance with the second part of book X of the *Ethics*, as the form of pleasure attached to the activity of the best part of man's soul, the intellect, which is extrinsic to the body, and whose perfection is to be found in the conjunction with the separate agent Intellect.

Sciences

Albert is known for his great interest in all the sciences available at the time. He has commented on all the books of natural philosophy written by Aristotle, which was at the time complemented with pseudepigraphs (*De plantis*, *De mineralibus*, *De caelo et mundo* etc.), and by Albert himself through works of his own. As other masters of mid-thirteenth century (for instance Adam of Buckfield and Peter of Spain) he proposed a division of natural philosophy based upon the different aspects of its object (the mobile body), where each part corresponds to a precise treatise of the Aristotelian corpus. This includes the *Physics* (its object being the mobile body in general), the *De generatione et corruptione*, the *De caelo et mundo*, etc. The *De mineralibus* deals with the inanimate body, the *De anima* with the animated body according to the soul, its powers and parts,

the *Parva naturalia* describe the operations of the soul, Albert's *De intellectu et intelligibili* deals with the intellectual part of the soul, the *De plantis* describes the body as animated by a vegetative soul, the *De animalibus* as animated by a sensitive soul. But Albert's curiosity and competence extended beyond the sole Aristotelian corpus, and included the arts of the *Quadrivium* as he for instance commented on Euclid's *Elements*.

Albertism

Maarten J. F. M. Hoenen

 Universität Basel, Basel, Switzerland

Abstract

Albertism is a movement within late-medieval Aristotelianism that distinguished itself from other contemporary philosophical schools by taking Albert the Great as the most reliable interpreter of Aristotle. Its main representatives were Johannes de Nova Domo (Paris) and Heymericus de Campo (Cologne). Albertism was very critical of Nominalism and challenged Thomism and Scotism on a number of issues in the field of logic, natural philosophy, and metaphysics. Its main center throughout the fifteenth century was the *Bursa Laurentiana* at the University of Cologne, which housed Johannes Hulshout of Mechelen, Gerardus de Harderwijck, and Arnoldus Luyde de Tongeris. They were active in the writing of Albertist manuals and commentaries on Aristotle, most of which were printed in large numbers and distributed at many different universities. In these writings, the

Albertists took a well-defined stand on a number of issues without, however, developing an independent, all-embracing philosophical system – an observation that also applies to the other schools of thought. In the modern period, it lost much of its attraction because of its critical attitude toward Nominalism and due to the fact that, unlike Thomism and Scotism, it lacked support from the religious orders. Some of its ideas nevertheless survived within different Thomistic and Scotistic schools.

What Is Albertism?

Albertism is a philosophical and theological movement that was primarily active in the fifteenth century and which, in sources of the period, was called the *via alberti* or *via albertistarum*. Its adherents were labeled *albertistae*. For the most part, these terms appear in commentaries on Aristotle or in independent works dealing with issues related to the reading of Aristotle as this was practiced in the arts faculties of the various universities. Occasionally, references to the *via alberti* or to the *albertistae* can also be found in theological treatises.

Most characteristically, the Albertists defended a reading of Aristotle, which was drawn from the writings of Albert the Great and which they themselves distinguished from those of other late-medieval schools of thought, such as Thomism, Scotism, and Nominalism. This Albertist reading of Aristotle is documented in a great number of treatises written *secundum viam alberti* or *secundum processum albertistarum*, most of which were printed in Cologne in the 1480s and 1490s, but also in the writings of numerous other authors who refer to the views of the Albertists in their writings, such as the Parisian philosopher Johannes Versor and the theologian Denys the Carthusian.

Prior to the fifteenth century, thinkers also frequently referred to the writings of Albert the Great and used them as a starting point for their philosophical and theological reflections. A good example is Ulrich of Strasbourg, who in contemporary sources was referred to as *discipulus*

alberti. The influence of Albert the Great is also visible in the works of other thirteenth- and fourteenth-century philosophers and theologians, such as Dietrich of Freiberg and Meister Eckhart, sometimes even very prominently, not least because contemporaries considered Albert to be one of the main *expositores* of Aristotle. However, in none of these cases is there mention of *albertistae*, in terms of members of a school of thought with a self-proclaimed identity nor in terms of a specific reading of Aristotle that was programmatically applied in all main parts of the arts curriculum, as was the case with Albertism in the fifteenth century.

Johannes De Nova Domo and Heymericus De Campo

The precise circumstances under which the *via alberti* came into existence and established itself are still obscure. In any case, the role of Johannes de Nova Domo, a master of arts, active at the University of Paris at the beginning of the fifteenth century, was crucial. He quoted Albert extensively in his works, calling him *doctor meus*, and compared Albert's teachings with those of Thomas Aquinas. Most importantly, he considered Albert the most thorough and faithful interpreter of ancient Aristotelianism, that is, the philosophical movement represented according to him not only by Aristotle but also by Boethius, Avicenna, and Averroes. In fifteenth-century sources, as in the works of Johannes de Nova Domo himself, this movement was also called the "peripatetic tradition" and as such carefully distinguished from other ancient schools, like those of the Platonists, Stoics, and Epicureans. According to Johannes de Nova Domo, the *sententia peripateticorum* is best found in the works of Albert, much more so than in those of Thomas Aquinas, who in several places had not considered decisive issues as carefully as had his teacher.

Also of crucial significance was the relationship of Albertism to the Christian Faith. As Johannes de Nova Domo makes clear at the outset of his *De esse et essentia*, the Aristotelian tradition as documented in the writings of Albert was

especially well suited to explaining and corroborating matters of Faith, much more so than any other philosophical tradition, even the Platonist, all of which encountered serious conflicts with Revelation. Remarkably, it is in Johannes de Nova Domo that one finds the notion of the harmony between Aristotle and Faith most strongly expressed, a feature which later in the century became the hallmark of Thomism.

Johannes de Nova Domo taught in Paris. It was however through the activities of his pupil Heymericus de Campo at Cologne that Albertism developed into a school of thought with an institutional framework that secured its survival for many years to come. For Heymericus, as for Johannes de Nova Domo, Albert the Great was the best reader of Aristotle. In his *Tractatus problematicus*, written in 1423 in Cologne, Heymericus demonstrated that on many occasions the interpretations of Albert the Great and Thomas Aquinas were different and sometimes even radically opposed. However, before he entered into a discussion of the views of what he considered to be the main representatives of philosophical thought in his time, the *principales huius temporis philosophiae defensores*, namely, the Albertists and Thomists, he first critically examined and then rejected the views of the Nominalists in the opening parts of his *Tractatus problematicus*, which, for that reason, he entitled *Contra Modernos*.

Criticism of Nominalism

Nominalism does not deserve to be reckoned as part of the Aristotelian tradition, Heymeric argued, because its defenders deny the existence of real universals outside the human mind. According to Aristotle, the objects of scientific knowledge are necessary and universal. Therefore, if universals had only a mental existence, then the sciences would not deal with reality but only with human thought, which would be absurd. For this reason, Heymeric concluded, Nominalists can only do logic, which is indeed concerned with human concepts, but none of the sciences dealing with things outside the human mind, such as

physics and metaphysics. As the main representatives of Nominalism, he mentioned William of Ockham, John Buridan, and Marsilius of Inghen and considered the first to be the inaugurator of Nominalism, who out of jealousy had distorted Aristotelianism and invented an opposing school of his own.

This criticism of Nominalism, which in a less vigorous way was also present in the writings of Johannes de Nova Domo, had enormous impact. Both the argument that Nominalists are unable to engage in physics and metaphysics and the verdict that Nominalism does not belong to the Aristotelian tradition were repeated time and again until well into the sixteenth century. As a consequence, Nominalist authors were excluded from academic debates, which had an immediate practical effect. As a rule, in the commentaries on Aristotle written by Albertists, Nominalist authors were not mentioned and their positions not discussed. The most important conversants in their debates were the Thomists and, to a lesser extent, the Scotists. At Cologne, the Nominalists were also ignored by the Thomists, who, as far as this matter was concerned, shared the critical view of the Albertists.

From treatises produced within the faculties of theology, a more or less similar picture emerges. Here Albertists and Thomists also made a common stand against Nominalism. Exemplary is a disputation held at the Theological Faculty, at the University of Cologne in 1480. Here the Nominalist Johannes Rype de Alen was attacked by representatives of both schools but most powerfully by the Albertist Gerardus de Harderwijck, who accused him of not following the teachings of Aristotle when discussing the relations between the three divine persons. Johannes Rype de Alen identified these relations with the divine persons themselves, as had Ockham before him, and to whom he also openly referred. This caused Gerardus to object that Johannes denied any real distinction between the categories of substance and relation and that he thus ignored the principles of Aristotle. Significantly, for Albertists, the principles of Aristotelian philosophy also count when discussing the mysteries of Christian Faith, such as the Trinity and the Incarnation.

Not only in Cologne but also elsewhere the relationship between Aristotelian philosophy and Christian Faith was a matter of much debate. For many Albertists, Nominalism posed a serious danger to the adequate understanding of Christian Faith. They were supported in this perception by a large number of Thomists and Scotists. For this and other reasons, at the Universities of Heidelberg, Tübingen, Freiburg, and Ingolstadt, the arts faculties became divided into two different camps: that of the *via moderna*, defended by Nominalists, and that of the *via antiqua*, supported by Albertists, Thomists, and Scotists, each with their own reading of Aristotle and their own exams. In this way, the supporters of the *via antiqua* tried to avoid that students with a mistaken understanding of Aristotle would cause troubles in theology. As a result, Albertism, together with Thomism and Scotism, became one of the principal movements within the *via antiqua*.

The consequences of this development, which took place in the second half of the fifteenth century, cannot be underestimated. At one and the same university in the same year, the same texts of Aristotle were read by two different masters from two different perspectives, that of the *via antiqua* and that of the *via moderna*. In the case of the *via antiqua*, the works of Albert the Great, Thomas Aquinas, and John Duns Scotus were used and, in that of the *via moderna*, those of William of Ockham, John Buridan, and Marsilius of Inghen. Against the background of this institutional separation, it becomes clear why, in actual fact, the doctrinal profile of Albertism established itself largely through debates with Thomism and Scotism and not so much with Nominalism.

Albertism and Thomism

As Heymericus reports in a 1458 letter to the University of Cologne (the so-called *Invectiva*), when he first arrived in the city in 1422, he encountered the same philosophical schools he knew from Paris, including the Albertists and Thomists. When then asked to list the agreements

and disagreements between these two schools in an academic dispute, the Thomist Gerardus de Monte reacted ferociously, claiming that it was impossible to find any agreement between Albertism and Thomism or to harmonize their methodologies in any coherent way. The Thomists obviously felt compelled to draw a clear line of demarcation between themselves and Albertism, although the reasons for this attitude remain uncertain. In all probability, however, they were dissatisfied with the way Albert the Great had proceeded in his commentaries on Aristotle. For, as Albert repeatedly stated, he tried to understand Aristotle solely on the basis of the natural principles of Aristotle himself without any reference to miracles or Faith, even if this would lead to conflicts with Revelation – an approach clearly differing from that of Thomas Aquinas. That Albertists, like Johannes de Nova Domo, claimed philosophy should be in harmony with the Christian Faith was for the Thomists in Cologne void and not in accord with the approach taken in Albert's own commentaries. Heymericus was not taken aback by Gerardus de Monte, however, and in his account of the dispute (the *Tractatus problematicus*), he described not only the differences between the two schools but also those points where they were, to his mind, in agreement. Where he observed a disagreement, he added a so-called *concordantia* in which he tried to bring the two schools together, showing, for example, that a conceptual ambiguity was involved or that the texts of Aristotle were unclear. Obviously he viewed the opposition between the two schools from the perspective to which his training in Paris had accustomed him, one more moderate than that current in Cologne, as manifested by Gerardus de Monte's uncompromising reaction. From this, an initial conclusion may be drawn – one of paramount importance for an adequate understanding of the early years of Albertism – namely, that its image as a movement fundamentally distinct from Thomism, and not merely on individual points but taken as a whole, had its origin in Cologne. It was a product of Thomism and imposed upon the followers of Albert the Great, who were themselves far less radical, even if they also observed a number of clear disagreements.

However, the situation changed toward 1456, when Gerardus, by then one of the most important Thomists at Cologne, in his *Concordantiae dictorum Thomae Aquinatis et Alberti Magni* once again attacked Heymericus but this time from entirely the opposite angle. Gerardus now claimed that, in the *Tractatus problematicus*, Heymericus had opposed the views of Albert and Thomas where in fact there is no conflict between their views at all. Gerardus came to this conclusion, according to his own account, after a renewed study of the writings of the two Dominicans. This rereading made it evident to him that both authors operated from exactly the same premises and that Heymericus had fundamentally misunderstood Albert's and, above all, Thomas' positions. Heymericus, at that time no longer active in Cologne but teaching in Leuven as professor of theology, reacted immediately and with great ire. He defended his original views, arguing that there are points of both agreement and disagreement in Albert's and Thomas' reading of Aristotle and that while some of these disagreements can be resolved, others definitively cannot. This clash marked the beginning of the second phase of Albertism, which is characterized by the fact that its representatives, much more clearly than before, present the image of a school of thought opposed to Thomism, to the extent that it was now the Albertists themselves who, against the conviction of the Thomists, stressed the opposition of Albert's and Thomas' interpretations of Aristotle. This is also the period in which the majority of commentaries *secundum viam alberti* were composed and in which new points of doctrinal difference were noted and discussed. Remarkably, the treatises *secundum viam thomae* much less frequently entered into debate with their Albertist antagonists.

The Institutional Factor

Throughout the century, Cologne was the main center of Albertism, with important representatives in Paris, Krakow, and Uppsala. The special position of Cologne was closely linked to an institutional peculiarity. As was the general trend at

late-medieval universities, courses were held increasingly in the colleges and *bursae*, where students lived together with one or more masters. This meant that not only daily disputations and exercises but also the regular curricular courses were stamped with the personality of a specific group of masters, namely, those who had their home in the *bursa*. In Cologne, several *bursae* of this type existed, one of which bore a clear Albertist signature, namely, the *Bursa Laurentiana*, named after Laurentius Berungen de Groningen, who in 1439 or 1440 became its regent master, in the legacy of such famous Albertists as Heymericus de Campo and Johannes Hulshout of Mechelen. In its later years, the *bursa* housed masters like Gerardus de Harderwijck and Arnoldus Luyde de Tongeris, who were active in the writing of Albertist manuals and commentaries on Aristotle.

These manuals, some of which survived in manuscripts, others in printed editions, document the daily practice of reading Aristotle according to the *processus albertistarum*. The text was divided into small sections introduced by a division of the text and elucidation of its content. A number of short questions followed, in which specific problems linked to the text were discussed. It is especially in these questions that the doctrinal views of the Albertists came to the fore, and the arguments of Thomists and Scotists were refuted. The Thomists and Scotists employed largely the same arrangement in their own commentaries, the most important distinction being the sources they used in dividing and explaining the text of Aristotle. As a rule, in separating the different sections of the text, the Albertist used the commentaries of Albert the Great as a model, not those of Thomas Aquinas. Most of the distinctions introduced to clarify the meaning of Aristotle, as well as the solutions to the questions, also had their origin in the works of Albert.

The Question of Doctrinal Unity

It is hardly possible to construe from the writings *secundum processum albertistarum* a comprehensive doctrinal unity with a clear foundation in the

works of Albert the Great. Although in general the same texts of Albert were employed, and the same texts of Aristotle commented upon, the focus of the various commentaries differed. In addition, sometimes works were attributed to Albert, which were as a matter of fact not his, but were considered to be so in the fifteenth century. A telling example is the reference to *magister Albertus in libro De ortu et progressu scientiarum*, which appeared in an Albertist commentary on the *Isagoge* of Porphyry. In actuality the work quoted was not by Albert, but by Robert Kilwardby. However, in Cologne, there existed a manuscript in which the treatise was attributed to Albert the Great, carrying the same title of *Super ortu et scientiarum progressu*, and which was used by some Albertists. This means that for the Albertists the most important factor was not doctrinal unity and coherence, but the fact that the sources used stemmed from their professed master. The same can also be observed among the Thomists. To be sure, with the Thomists, the matter was even more complicated, as in the fifteenth century it was an open secret that the works of Thomas Aquinas contained many apparently contradictory statements, which made the construction of a coherent theory shared by all Thomists almost impossible. This ambiguity in the works of Thomas was readily exploited by the Albertists, as proof that his commentaries were not a secure guide when reading Aristotle.

It is important to recognize precisely how the Albertists (as well as the Thomists) proceeded in their commentaries, as the impossibility of finding a single, comprehensive doctrinal system based upon the works of Albert the Great himself led some earlier researchers to question the existence of an Albertist school of thought. However, the sources show that the *via alberti* was characterized not by internal coherence and unity, but rather by the shared use of a number of distinct doctrines when explaining Aristotle, which were taken from works attributed to Albert the Great. These were highlighted in individual questions in which these beliefs were defended against the views of other schools, primarily against those of the Thomists. Other works were entirely devoted to this purpose, such as the

Promptuarium argumentorum, a manual designed to help students of the one school to find arguments against the beliefs of the other.

A study of these doctrines reveals that the majority were concerned with difficult passages or items within the texts of Aristotle that had already been discussed by the Greek and Arabic commentators, and remained bones of contention within the Aristotelian tradition, such as the principle of individuation, or the question of whether humans can have direct knowledge of separate substances. As far as these points were concerned, all those authors representing the *via alberti* shared the same views. Conversely, on derivative and less crucial items, there were differences among the Albertists. These latter issues, however, were never labeled as being illustrative of the *via alberti*.

The main focus of those works labeled *secundum processum albertistarum* is always Aristotle and Albert the Great. Significant in this connection is that the independent works of Heymericus de Campo, such as the *De sigillo aeternitatis* and the *Ars demonstrativa*, which were clearly designed as coherent philosophical systems, were not labeled by him as Albertist. In the same way, contemporary historiography did not consider these works to be examples of the *via alberti*. Johannes Trithemius, for example, in his *De scriptoribus ecclesiasticis*, quoted these works without any references to the Albertist tradition. Moreover, he underlined their connection with Cusanus, an author who, like Heymericus in the abovementioned works, did not consider himself to be commenting on the works of Aristotle, even when Aristotle was occasionally discussed. Therefore, at least from a historical point of view, Albertism is to be regarded primarily as a movement within the Aristotelian tradition at late-medieval and early-modern universities.

Doctrinal Issues

Notwithstanding the fact that in his independent writings Heymericus does not present himself as an Albertist, it was he who in his *Tractatus problematicus* listed the doctrines of the *via alberti*

and commented upon them for the first time. His treatise was crucial, as in the period to come most authors followed his views on the matter. A number of doctrines were added to the initial catalogue of 18 items, reaching a total of approximately 30 toward the end of the century, but it remained principally the same list, as the items he had mentioned were the most essential.

The following sections list a number of doctrinal points which were characteristic of Albertism and in which Albertism distinguished itself from other late-medieval schools of thought, such as Thomism, Scotism, and Nominalism. These points were argued for in commentaries *secundum viam alberti* and were also attributed to the Albertists in writings by members of the other schools of thought.

Logic

Against the conviction of a number of Thomists and Nominalists, the Albertist claimed that logic in itself is a purely theoretical science. The fact that logic directs the mind to argue correctly does not mean that it is in itself practical or even partially practical, as some Thomists and Nominalists had argued. Logic is solely an activity of the intellect and not of the will, being a science that has as its goal to produce true statements. To make their claim, Albertists referred to the distinction made by Aristotle between practical and theoretical sciences, whereby the former produce something outside the human mind and involve the activity of the will, while the latter remain within the mind. In this sense, logic is not practical. Only in a derivative sense can it possibly be labeled practical, namely, when logic is used as a tool in other sciences. But this does not concern the nature of logic per se. To distinguish between these two senses, Albertists discriminated between *logica docens* which is the theoretical science of logic in itself, as laid down, for example, in the *Tractatus* of Peter of Spain, and *logica utens*, which is the practical use of logic in physics, metaphysics, and any other science or art.

Individuation

For the Albertists, matter is the sole cause of individuation. In this regard, Albertism was

opposed to Scotism and Thomism, as both of these schools tried to found individuality in a formal principle: the Scotists in the so-called *differentia individualis* and the Thomists in matter as determined by quantity. The Albertists, however, argued that according to Aristotle, form is always universal. Principles that are based on the form of a thing can, therefore, never account for the individuality of the thing, as individuation means to be distinct from others. The only possible candidate is that which is opposed to the form, namely, matter. Being last in the order of being, matter is in itself undivided and incommunicable. Hence, it is both the root of numerical distinction from others and the root of incommunicability. Particularly against the Thomists, Albertists claimed that quantity by nature is communicable and therefore cannot be the primary source of individuation, even if directly linked to matter, since it is shared by different individuals. Matter therefore remains the single most important and complete source of individuation.

Human Knowledge

It was the firm belief of Albertists that humans can have direct knowledge of separate substances already in their earthly life. On this point, Albertism distinguished itself from Thomism and Nominalism. For representatives of both these schools argued that, according to Aristotle, all human knowledge begins with the senses. Therefore substances that are not perceived by the senses, such as separate substances, cannot be known directly but only indirectly through the sensible effects they produce. The Albertist, however, maintained that this reading of Aristotle is too narrow. When dealing with the knowledge and being of separate substances in his *Metaphysics*, Aristotle had remarked that separate substances know themselves and that human beings sometimes, for a very brief moment, possess the same knowledge as separate substances. For the Albertist, this passage clearly confirmed that Aristotle was of the opinion that humans sometimes know separate substances directly, as they do themselves, even if this is the exception rather than the rule. To further corroborate their reading of Aristotle, Albertists referred to the theory of the

intellectus adeptus as put forward in the writings of Avicenna and Averroes. If humans have collected sufficient sense data, they are able to turn their intellect immediately to the source of the intelligibility of that sense data, namely, the agent intellect, which is itself either a separate substance or a direct emanation of a separate substance. In both cases, humans can know separate substances without first turning to the senses. It is in the immediate knowledge of separate substances that humans grasp the first principles of both theoretical and practical knowledge, such as the principle of non-contradiction or the rule that the good is to be striven for and the bad avoided.

Being and Essence

Albertists strongly opposed the claim of Thomists that there is a real distinction between being (*ens* or *esse*) and essence (*essentia*). As Denys the Carthusian reported in his commentary on the *Sentences*, it was the depth of the Albertist's response to the Thomists on this issue which caused him to switch from the Thomistic to the Albertist side. According to the Albertists, it is fundamental to the *sententia* of Aristotle that the substantial form and nothing else conveys being to the thing determined by this form. This being is not attributed to the thing from the outside, but flows from the substantial form, which is itself a substantial part of the thing. The essence and the being of the thing are no more distinct than the significates of a respective noun and verb: the former highlighting the thing of the act and the latter the act of the thing, as, for example, the noun "walk" signifies a distance walked or to be walked and the verb "walk" the moving or traveling this distance. A similar point had already been made by Dietrich of Freiberg against Thomas Aquinas. According to the Albertists, it was Averroes who, against Avicenna, made clear that this was how Aristotle needed to be understood. That being is given by the substantial form does not mean that the form is a completely independent source of being. The substantial form is only the principle of the formal being. Besides this form, there is the agent, which acts from without as an efficient cause and produces the thing, thus bringing it from non-being into being. According to

Aristotle, the agent is really distinct from the thing produced, as the efficient cause is not part of the thing in the way that the formal cause is. In this sense, and only in this sense, the Albertists maintained, can one speak of a real distinction between the thing and the being of the thing caused from without. If that is what the Thomists intend, then there is no real opposition between the two schools. If however the Thomists speak of being as something distinct from and added to the substantial form, then they truly depart from the Aristotelian tradition, according to the Albertists.

The Proper Object of Logic

Several items that in contemporary sources were labeled characteristic of the *via alberti* were not mentioned by Heymericus in his *Tractatus problematicus* but appear only later, in the second half of the fifteenth century. The most significant of these is the view that logic is primarily concerned with second-order rather than with first-order concepts. First-order concepts are concepts of things in reality, such as men and living beings. Second-order concepts, on the other hand, are concepts attributed to these first-order concepts, such as “species” and “genus,” in propositions like “man is a species” and “living being is a genus.” In maintaining that logic primarily deals with second-order concepts, the Albertist was in full agreement with the Scotist, against the Thomists and Nominalists. Although the debate concerned the genuine nature of logic according to Aristotle, its immediate source was a remark made by Avicenna in his *Metaphysics*, which stated that the subject of logic is second-order concepts added to first-order ones. Albertists thus saw themselves as the true followers of Avicenna’s reading of Aristotle on this point, a reading which, according to them, was imperative, because otherwise the distinction made in the Aristotelian tradition between logic on the one hand and physics and metaphysics on the other would collapse. Logic is a rational science, whereas physics and metaphysics are real ones. Although all these sciences can talk about man, logic is not interested in man as a real man, nor in the concept of man, but rather in the concepts that can be predicated of the concept used in the real

sciences to refer to real men. Because, the Albertists argued, the concept of man is predicated of numerically distinct men in reality, this concept has the nature of a species, and thus the second-order term “species” can be predicated of it. The Albertists admitted that there is a certain relationship between first- and second-order concepts, inasmuch as the latter, say “species,” are attributed to the former, say “man,” dependent on the fact that the first-order concept “man” refers to different individuals in reality. However, and this is crucial, they did not consider second-order concepts to be a natural property of first-order concepts, as the Thomists claimed, nor to be a natural sign of them, as the Nominalists maintained. Logic, for the Albertists, was a science concerned with second-order concepts ontologically independent of first-order concepts. In short, logic is a true science in its own right.

Conclusion

As said above, the majority of texts *secundum viam alberti* were written in the second half of the fifteenth century. In the century to come, their number declined, and the Albertists gradually disappeared as significant contributors to philosophical and theological debates, as was the case with other medieval schools of thought. To be sure, this does not mean that the reading of Aristotle put forth in the writings of Albert the Great was no longer of interest. On the contrary, his works continued to be published and read. However, his reading was no longer supported by institutions especially devoted to this task, as had previously been the case, and became henceforth the matter of a few dedicated individuals. The institutional death of Albertism was largely the result of shifting doctrinal interests. Its opposition to Nominalism was critically regarded by Cartesians, and its proximity to Thomism, despite all controversies, made it difficult for Protestant authors to accept. That despite the same pressures Thomism was able to persist was largely due to the establishment of chairs devoted to the reading of Thomas and especially to the enormous efforts of both the Dominican and Jesuit orders – an

institutional support system which was not granted to Albertism, consequently leaving the tradition to be divided and absorbed into the various Thomistic and Scotistic schools of the sixteenth and seventeenth centuries.

Alchemy in the Arab World

Paola Carusi

Dipartimento Istituto Italiano di Studi Orientali,
Sapienza Università di Roma, Rome, Italy

Abstract

Between the eighth and ninth centuries, Islamic civilization inherited from Greece, Persia, India, and ancient Mesopotamia the body of knowledge known as alchemy: a school of learning dealing with the ancient arts of fire (in particular: working metals, precious metals, manufacturing glass, and glazing and fake precious stones). After a first short period in which the body of their knowledge was acquired and translated, Muslims started putting forth their own works, and Arab-Islamic alchemy (al-kīmīyāʾ) took shape in its contents and literary genres; although documents, philosophical and allegorical texts, technical texts, and recipes sometimes seem muddled and disjointed, as a whole they formed a complex discipline. Many discussions have taken place and are still taking place regarding the real meaning of alchemy and its effective role within Islamic society: on its philosophy and cosmology, on its techniques and materials, on its goal, on preparing the elixir, a single procedure and a single purpose; beyond the veils of the tradition of secrecy, which by definition “hides,” alchemy has still clearly shown a close connection with other natural sciences, from medicine to physics, from botany to zoology. Glorified as a science, reviled as deception

or illusion, worshipped and despised by many but still studied, quoted and passed on constantly up to our modern age, alchemy, through the Islamic tradition, acquired the semblance that it would continue to bear for a very long time, throughout the Muslim world at first, and from the twelfth century onwards, up to the Latin Middle Ages.

The word *kīmiyāʾ* (*al-kīmiyāʾ*), from the Greek *χυμεία* or *χημεία* (*χέω*, to smelt, *χύμα*, molten matter), during the twelfth century, when alchemy came to the western Latin world, became the Latin *alchemia/alchimia*.

The History

According to various authors, alchemy first appeared in the Islamic world during the Umayyad era (Damascus, first half of the eighth century): interested in science, and particularly in alchemy, the Umayyad prince Khālid b. Yazīd – grandson of Muʿāwīya, the founder of the dynasty – is said to have summoned Greek philosophers from Egypt and ordered them to translate alchemical texts from Greek and Coptic into Arabic. Although to date there is no evidence to support these stories, they are still quite plausible and likely: during the first centuries of Islam, a fervent desire to obtain knowledge and translations often caused messengers being sent in search of books or foreign scholars being invited into schools to train local pupils.

Regardless of the true nature of the knowledge obtained during the Umayyad era, it was in the second half of the eighth century and throughout the first half of the ninth, during the ʿAbbāsīd era in Iraq that alchemy was first studied systematically. The wealth of knowledge that Islam inherited from more ancient traditions and which can be described as alchemy is, essentially, the heritage that one of its first authors, Pseudo-Democritus (Bolos of Mendes? Second century BCE) already considered as a part of his school of learning. In his book *Physikā kai mystikā*, he divided matter into four large groups: gold, silver, stones, and purple. Except for the latter, “purple” – if “purple” here really means a dye for textiles – alchemy would

therefore be a school of learning involving the most noble parts of the arts of fire: working precious metals and certainly imitating them and making colored glass (imitating precious stones and various kinds of glazing). The secrecy enshrouding all these techniques (the theory that probably lay behind these techniques remains unknown) would seem, on one hand, to be the legacy of very ancient times when techniques were considered sacred; on the other, it would seem to relate to the “operational” need to protect certain production secrets.

Between the eighth and ninth centuries, there was a rapid increase in translations into Arabic: certainly, the whole *corpus* of work attributed to Balīnās (Apollonius of Tyana), a *corpus* that seems to be the origin of alchemical cosmology (see below); a large group of works attributed to Hermes Trismegistus, an author that, according to a particular interpretation, was translated into Arabic as Hermes of the Hermeses (*Harmis al-Harāmisa*), “triple” (one name, three persons), or bearer of three sciences, as well as a great number of essays and comments attributed to more or less known real or pseudoepigraphical authors such as Cleopatra, Mary the Copt, Ostanēs, Zosimus, Stephanus, Olympiodorus, etc.

After incorporating Greek alchemical traditions, most likely along with traditions from Ancient Mesopotamia, Persia, and India, the Muslim world soon started producing its own works. Among its first authors, there is Jābir b. Ḥayyān (eighth–ninth century), credited by tradition with approximately 3,000 titles – no more than 500 according to recent studies – which obviously were not all his own work but came from his school of learning. Even the above-mentioned Khālid b. Yazīd is credited with certain works, and many other later authors who, as time went by, gave birth to the three fundamental genres within Arab alchemical literature: technical and philosophical alchemical texts, like those of al-Rāzī, Maslama al-Majrīṭī (tenth century, Iran, and Spain), and al-Ṭuḡrāʾī (twelfth century, Iran); allegorical texts, like those of Ibn Umayl al-Tamīmī (tenth century, Egypt) – and later (thirteenth and fourteenth centuries), those of al-ʿIrāqī and al-Jildakī – at once celebrations of

their ancient legacy and at the same time a continuation of the tradition of secrecy; finally the recipes, often included in many alchemical texts. Found as beautiful calligraphy within the works, or as mere scribbles in their margins or on white spaces and flyleaves, recipes complete a picture that becomes to be increasingly defined as a single “object” with infinite facets.

Since the middle of the twelfth century, all these works, which were known and translated in Muslim Spain, were transferred into medieval Latin: with Robert of Chester’s translation of the *Morienus* in 1144, Arab alchemy entered the Christian world: a different adventure, a different story, that we shall not deal with here.

The Texts and Their Contents

Since its first appearance in the Islamic world, alchemy was a school of learning that converged with various other natural sciences: as a testimony to an almost invisible and ambiguous dividing line, cosmological theories are appropriated from philosophy, embryological theories from philosophy and medicine, and the description and treatment of minerals, animals, and plants from natural sciences and pharmacology. Following a path probably already consolidated since ancient times, the scholarly alchemist was a man of great knowledge, yet not necessarily a philosopher, who absorbed everything, gathered all information adapting it to his science; while the façade of original theories faded away, it breathed new life into its subject and that which likely was not alchemical initially, or was expressed in a different manner, acquired, during the course of this process, the characteristics of Islamic alchemy.

The settlement process resulted in a proteiform and controversial school of learning; amongst its followers, some (al-Majrīṭī) paired it with magic, while others, more daring (Ibn Umayl), paired it with Prophecy; others yet, realists, tried to lead it back to dealing with nature: an operational science for experts dealing with the arts of fire in the footsteps of the ancient masters. Between the ninth and eleventh centuries, philosophers and scholars debated: al-Kindī was against it, while

al-Fārābī was favorable to it; Abū Bakr al-Rāzī, philosopher and physician, was also an alchemist, and Ibn Sīnā (Avicenna), another philosopher and physician, considered transmutation (see below) impossible; al-Bīrūnī accepts only its technical role. Approaching the modern age, Ibn Khaldūn (d. 1406), who was well versed in it and wrote of it in detail, tried to destroy it once and for all, but his attempts were in vain.

Philosophical Texts

A cosmology is undoubtedly at the root of the theory of transmutation; this is what needs to be studied if certain aspects of this elusive theory are to be understood. What we briefly describe here is the cosmology found in the first book of the *Miftāḥ al-ḥikma* (*The Key of Wisdom*, or *Philosophy*), the work of a self-styled pupil of Apollonius of Tyana; this cosmology has slightly different characteristics in the works of Jābir b. Ḥayyān and other authors, but the theory of transformation resulting from it is not substantially different.

At the origin of the creation of the universe, God, in his eternal solitude, expressed a desire to create; the result of this desire, which God expressed without further definition, is a substance bearing the characteristics of absolute potentiality; since opposites had yet to be defined, this matter is at once everything and nothing. Then (a “then” that is beyond time), God uttered the word *kun* (“let there be,” cf. the *fiat* of the *Genesis*). This word, which is light, defined its opposite, darkness; and with the creation of these opposites, light and darkness, which carried with them heat and cold and all other “physical” opposites associated with them (movement/stillness, hot/cold, light/heavy, rarefied/dense, etc.), the whole universe was produced through a series of opposites and intermediates. In the beginning, five “natures” (hot/dry, cold/dry, hot/damp, cold/damp, and balanced, or damp, intermediate) were formed as four concentric spheres of decreasing luminosity and mobility, gathered around a still and dark core. This first stratification was defined by three concentric regions: the higher realm (spiritual), the intermediate

(planetary), and the sublunar; within the sublunar world, the natures produce the four elements, which then produce the three composite bodies: minerals, vegetables, and animals.

If we were to compare the vast body of the universe with the bodies of the sublunar world, we would immediately notice a characteristic that makes them opposite: while the body of the universe presents itself as a creature of light with a dark inner core (where the darkest point is the Earth at its center), each body contained within it has a dark and passive exterior, which is matter, and a more “luminous” core where operational capacities reside: this is true for creatures at all levels, including the most noble, mankind, which hosts a rational soul within its body’s matter.

Still, aside from this inversion of conformation, there are two fundamental characteristics shared by the universe and each creature: (a) the recurrent stratification in opposites and intermediates, and (b) the shared substratum formed by the natures.

- (a) Just like in the universe between the higher and sublunar realms lies the intermediate planetary realm, joining the other two, and in the sublunar realm, between animals and minerals, there are plants: in each subject, be it mineral, plant, or animal, there is an intermediate state between two complementary compositions, exterior and interior.
- (b) Beyond and below the “actual” configuration that each formed creature manifests, in the innermost core of its being there is a substratum made up by the natures. The different arrangement of these natures, meaning the different relations in their composition, results in different creatures; yet the substratum itself, meaning the natures, is shared by each form.

This type of cosmology, which has been expressed with slight differences by different authors, still leads to very similar conclusions in what concerns the theory of transmutation – directly generating the theory of alchemical transmutation. In alchemy, transforming something (transmutation) means correcting the numerical

relations between the natures: an extremely difficult process of immersion in the structure of matter itself, moving gradually from the composite body to the elements and then to the natures, operating then on the natures themselves, where the transformation will occur. If we view the body as composed of three levels: exterior, interior, and intermediate, we see that correcting relations between the natures is especially achievable at the intermediate level, since, due to its position, it involves the other two adjacent levels; in any event, each body can be transformed into another simply by “correcting” its natures, and transformation will occur via the careful and experienced application of fire, since applying or subtracting its warm nature will result in the desired corrections. The highest and most noble of all transformation procedures within the alchemical tradition is the Great Work, which results in the obtainment of the “object of desire,” the *iksīr* (elixir): its nature, the most balanced, the nature of gold, can “tint with its color” (transform into itself) each inferior nature.

Jābir b. Ḥayyān’s work (*corpus giabirianum*, *Kitāb al-ahjār*) describes the theory of the composition of the bodies and transmutation and also defines what we might call quantitative aspects. The text states that each body, in the form in which it appears to our eyes, has an exterior “actual” composition and an interior “potential” composition; these two compositions, exterior and interior, together, form a total composition (where the relation between natures is 1:3:5:8). Operating a transformation means modifying the exterior “actual” composition by accessing the interior “potential” composition: at the end of this procedure, the total composition will remain unchanged, but the exterior (or “actual”) composition will have changed because actual natures will have transferred, in a certain percentage, to a condition of potentiality, while interior natures will have become exterior.

This Jabirian theory, although interesting because it attempts to mathematize the composition of matter, highlights a weakness of the alchemical theory: the impossibility of determining the two initial and final compositions between which the transformation is realized leads the

author to rely on improbable numerological theories (relations between names and compositions in natures). Unable to rely on a strong and solid theory, degenerating into the most pure forms of *empeiria*, alchemy often ended up attempting to simply repeat the procedures of its predecessors.

Allegorical Texts and Recipes

Since the beginning, alchemical literature of a more or less openly “scientific” nature was accompanied by translations of a great deal of allegorical literature. It is worth mentioning that this genre is not original to the Muslim world; already Greek alchemy had Zosimus, or Hermetic texts, or the vast body of works attributed to various authors of Alexandria during the early centuries: this literature, which originated to protect and expand on very ancient *techne*, reached Islam along with the other translations and was studied and commented upon by a number of authors. The mystery grew with the inevitable fracture between the polytheistic rebirths and Islamic monotheism and with the spread of quotes out of context; on the contrary, when characters were known and cherished, the various stories were expanded upon and details were added to them. A well-known case, for example, is that of Alexander the Great, who in Arabic became Dhū l-Qarnayn (the two-horned one); the *Alexander Romance*, attributed to Callisthenes, was the origin for the creation of an alchemical heroic figure, which combined the wisdom of the Greeks, the Persian tradition, and Indian science. Along with Alexander, there are many other revered characters that were adopted and are often mentioned in alchemical allegory: philosophers like Democritus, Aristotle, and Socrates; physicians like Galen; and also prophets, like Mūsā (Moses), ʿIsā (Jesus), and even Adam, father of the humankind, to whom God transferred, along with other knowledge, a few pages of alchemy.

In allegorical texts, the Great Work takes on various different forms. In its different stages, in the retort and alembic, it often became an event: a journey, an ascent, an access to the temple, an exile in a palace or chamber, a siege, the

destruction of a city and a pacification amongst its ruins, the hunt and cooking of prey, a gathering of rain and dew, the gestation of an embryo in the uterus, and an infinite number of other events that are vivid images of the procedure. In its condition of completeness, taken as a single entity somewhere between action and result, the event is replaced by an object: like the egg, be it a hen’s egg or the cosmic egg, which contains within itself each element and nature, or like the hermetic tree, firmly planted and motionless, but “readable” even in its becoming, from its roots to its leaves. At the core of all this proliferation, there was a unique reality: as the alchemists themselves wrote, the endless number of alchemical allegories is nothing but the descriptions of a single procedure and a single object.

At the root of this vast body of allegorical work, there is not only a religious or initiatic literature, or that of writers and poets; a large part of Arab alchemy is in fact based on philosophical texts, often Aristotelian: a great deal of imagery and names of minerals, plants, and animals, descriptions of man and other creatures, depictions of the skies, the heavenly bodies, etc., are “alchemized” borrowings from various sciences, from which alchemy borrowed more or less faithfully. And not all of it came from Alexandria and from the Greeks, as mentioned previously, Persia, India, and ancient Mesopotamia also had a strong influence.

Alchemical allegory had a strong impact on its readers, from East to Spain. Alchemical allegory appears sporadically throughout literary texts, poetry, and prose and, as time went by, even in the musings of mystics, with interventions that are often brief yet effective as lightning: in the East, alchemical allegory is quoted by al-Bīrūnī (d. 1048) the scientist who in one of his works even mocked the alchemists, and by al-Ġazālī, (d. 1111), the theologian; between the two worlds, it is mentioned by Ibn ʿArabī (d. 1240) the mystic; in the West, Ibn Ṭufayl (d. 1185), the philosopher, in his work *Ḥayy b. Yaqzān* mentions the unobtainable red sulfur, one of the names for the elixir.

In closing, a brief note on recipes: unlike the descriptions of equipment occasionally found

throughout alchemical texts, sometimes detailed in drawings and which can be reproduced, recipes are often difficult to decipher; although a few are quite clear, such as the recipes for purifying the *lāzaward* (lapis lazuli → natural ultramarine), or the instructions for coloring different materials (papers, precious woods, etc.), most of the recipes concerning the Great Work use terms and expressions drawn from allegory. The difficulty in interpreting them joins the already hard task set by other scientific texts, nonencrypted recipes, and pharmacopoeias, due to the difficulty in identifying minerals, plants, and various substances. Prudence in interpreting them is required, as hurried interpretations have often been detrimental; the challenge, however, is irresistible.

Alchemy in the Latin World

Sébastien Moureau

London, UK

Institut Orientaliste, Université Catholique de
Louvain, Louvain-la-Neuve, Belgium

Abstract

Alchemy, originally an attempt to find a process to transmute base metals (such as lead and copper) into gold or silver, may be considered a metallurgical science mixed up with considerations of theoretical philosophy. Medieval alchemy in the West may be divided into two main stages: from the middle of the twelfth century to the end of the thirteenth century, the Arabic material was assimilated and Latin treatises were composed on the basis of this material, but with an increasing level of distinctive features; during the fourteenth and fifteenth centuries, alchemy developed from the Latin texts of the thirteenth and fourteenth centuries rather than from Arabic sources.

Alchemy never came into universities; it was a knowledge on the fringe. However, it had a very close link with natural philosophy and medicine. The authoritative texts in alchemy are few in number: some Arabic translations (especially those attributed to al-Rāzī and Avicenna), the *Summa perfectionis*, and some texts attributed to Arnald of Villanova, Ramon Llull, and Johannes de Rupescissa. Authors used to compile ideas from previous major alchemists.

The Latin word *alchimia* is a transcription of the Arabic *al-kīmiyā*, which is itself a transcription of the Greek word *χυμεία* (fusion).

Before the Latin Translations of Arabic Texts

The Early Middle Ages in the West did not know of alchemy. The only traces observed are some technical recipes translated from Greek alchemical compendia but completely divorced from the context. For instance, the *Mappae clavicula*, a craft treatise dating from the ninth century or earlier, contains metallurgical recipes.

The first circulation of Arabic alchemical materials dates from the beginning of the twelfth century, but they were designed for a very practical use. The *Diversarum artium schedula* of the monk Theophilus (maybe the pseudonym of the Saxon Roger of Helmarshausen, who lived between 1106 and 1140) contains one alchemical recipe which comes probably from Arabic sources. Some additions to the *Mappae clavicula* attributed to Adelard of Bath (fl. 1140) also betray an Arabic origin. These observations allow us to conclude that some Arabic recipes were already circulating in the West from the beginning of the twelfth century but on a very small scale.

The Latin Translations of Arabic Alchemical Treatises

During the twelfth and thirteenth centuries, a wide movement of Latin translations from Arabic texts developed in Spain and Italy. Since various Islamic classifications of science did regard alchemy as a discipline in its own right, as well as Latin texts based on Arabic sources such as Dominicus Gundissalinus' *De divisione philosophiae*, many treatises were translated.

The *Liber de compositione alchimiae* of "Morienuis," translated by Robert of Chester in 1144, is generally considered to be the first alchemical treatise known in the Latin West. This text reports a dialogue between the Umayyad caliph Khālid b. Yazīd (c. 668–704/709), known as the first Arabic alchemist in the Islamic tradition, and the monk Maryānūs, a legendary disciple of the Greek alchemist Stephanos of Alexandria; the authenticity is very doubtful; this work is in all likelihood pseudonymous.

Translations of many classical works of alchemy were made in the subsequent period. Gerard of Cremona (1141–1187) translated three treatises, one from the corpus attributed to Jābir b. Ḥayyān (a very large corpus of texts probably written during the end of the eighth century and the ninth century), the *Liber divinitatis de septuaginta* (the *Book of Divinity*, a part of the *Kitāb al-sabʿīn*, the *Book of Seventy*); the *De aluminibus et salibus* (on alums and salts), a technical text which gained a wide diffusion (it was a major source to Vincent of Beauvais for alchemy); and a *Lumen luminum*. Other works of the two main Arabic alchemists, Jābir b. Ḥayyān and Abū Bakr al-Rāzī (854–925/935), were translated, such as the *Liber misericordiae* (*Kitāb al-rahma*, the *Book of Forgiveness*) of Jābir and the *Liber secretorum* (*Kitāb al-asrār*, the *Book of the Secrets*) of Rāzī, along with pseudepigraphical texts. Some alchemical treatises attributed to Avicenna were also translated, such as the *Ad Hasen regem epistola de re tecta* (*Risālat al-iksīr*, *Epistle on the Elixir*), which might be genuine, and the alchemical *De anima* (*On the Soul*), which is spurious and exerted a great influence. In a more allegorical vein, the *Turba philosophorum* (*Muṣḥaf al-jamāʿa*, *Book of the Community*), a discussion between legendary Greek alchemists, and the *Tabula chemica* (*al-Māʾ al-waraqī wa-l-arḍ al-najmiyya*, *The Silvery Water and Starry Earth*) by “Senior Zādith” (Muḥammad ibn Umayl, first half of the tenth century) were translated. Among these translations, we also find some treatises not originally imbued with alchemy, as, for instance, the *De secretis naturae* (*Kitāb sirr al-khalīqa*, *Book of the Secret of Creation*) of Balīnās (Pseudo-Apollonius of Tyana): translated by Hugo Sanctellensis before 1151, it contains the *Emerald Tablet*, a very short and enigmatic text attributed to Hermes, which gained currency in the West.

From Arabic alchemy major theoretical concepts were imported, such as the theory of mercury and sulfur as the two principles of metals. All metals are made by the mixture and cooking of mercury and sulfur in the depths of the earth during a period of hundreds of years. Modern appellations are misleading: mercury in that time was considered to be a cold and moist principle,

whereas sulfur was regarded as a hot and dry principle. The differences between metals depended on the purity of these principles and on the place and the duration of the cooking. The theory of elixirs is also typical of Arabic alchemy: in order to transmute base metals into gold, the alchemist has to balance the properties of a body (coldness, heat, moisture, and dryness). He will achieve this by using a preparation called “elixir.” This preparation is made from the distillation of materials (generally organic substances such as hair, eggs, blood, etc., but these substances are technically called “stones”).

Various trends of Arabic alchemy, technical, allegorical, etc., all found their way into the West. The reception of Arabic alchemy was a complex movement. Scholars believed that alchemy could offer a major technological contribution to the knowledge of minerals. Alchemy never penetrated durably the academic world, however, in spite of several attempts. One of the reasons for this is to be found in a translation made by Alfred of Sareshel around 1160 of a section of Avicenna’s *Kitāb al-Shifāʾ*, in which the possibility of transmuting species is denied (in a well-known passage called the *Sciant Artifices*). The translator added this section at the end of Aristotle’s *Meteora* (under the title of *De mineralibus*, more generally known today, although erroneously, as the *De congelatione et conglutinatione lapidum*), and it was therefore regarded as one of Aristotle’s genuine works. This wrong assumption was largely responsible for the development of what we commonly call the alchemical debate, in reference to the fierce discussion among the thirteenth- and fourteenth-century scholars about the possibility of transmutation.

One of the major problems met with by the translators of alchemical works was that a large part of the recipes that formed the basis of the *practicae* was transmitted orally. Reading these recipes was very difficult and many words were coded. Some of these Arabic codes are found in Latin alchemy, as translations or transcriptions. Moreover, the method called *verbum de verbo* (translation word for word) of many translators made texts quite difficult to understand.

The Thirteenth Century

From the beginning of the thirteenth century, the assimilation of Arabic alchemy went further. Treatises started being written directly in Latin in the style of the Arabic translations, and attributed to renowned authorities, such as the *Summa perfectionis* of Pseudo-Geber. The authenticity of these first Latin alchemic works is subject to various discussions.

The translator Michael Scot (d. 1235) probably wrote an *Ars alchemiae*. His alchemy is entirely based on Arabic elements. It contains very scanty theoretical information and is mostly concerned with recipes. The main scope of this author was to solve obscurities and contradictions of Arabic texts in order to provide a more intelligible alchemy to the Latin world.

Albert the Great (1193–1280) wrote a *De mineralibus*, in which he assumed the possibility of transmutation (even though he asserted that he never met an alchemist succeeding in his work, his philosophical principles did not allow him to deny this possibility). This work is the most accomplished attempt to develop a proper mineralogy in the Latin West. It is based on Greek and Arabic materials, which were assimilated and adapted. In addition to this, some 30 alchemical treatises are attributed to him, probably wrongly.

The Franciscan Roger Bacon (1214–1293), in his *Opus maius*, regarded alchemy as an important field of knowledge. Assuming that the alchemical work was a sort of medicine for metals, he was the first in the West to assume that it could be applied to the human body and, hence, that it could be used to remove its corruptions and prolong a man's life (the so-called *prolongatio vitae*). Alchemy was therefore to his eyes one of the foundations of medicine. Many apocryphal alchemical treatises are attributed to Roger Bacon, too.

At the end of the thirteenth century, in addition to the translations of Jābir b. Ḥayyān's texts mentioned above, a corpus of Latin texts began to circulate under the name of "Geber" (the Latin name of Jābir b. Ḥayyān), the *Summa perfectionis* being the most successful. Recent research tentatively attributes the authorship of this work to the

Franciscan Paul of Taranto, without any certainty. The alchemy of the *Summa perfectionis* had a very large diffusion and was regarded as a major source for centuries. The theory of "mercury alone" is one of its typical features: mercury is the main base of metals and is the only principle of their medicine. The alchemical work is no longer made on the basis of organic matters (as it was said in the pseudo-Avicennian *De anima*, the main text of this trend in the Latin West) but on the basis of various mercurial compositions made from minerals (mercury, ammoniac salt, sulfur, and arsenic).

The technological and economical rise of the thirteenth century led scholars of this time to be significantly interested in alchemy. During this century, alchemy was usually not mixed up with allegorical considerations. Neither was it more practical, however, as is often assumed, first because alchemy had always had a practical side and then because its development during this century was theoretical as well. However, from the end of the thirteenth century, the increase in the number of alchemical frauds aroused suspicion about alchemy's validity.

Scholastics (such as Vincent de Beauvais, Robert of Kildwarby, and Thomas Aquinas) never ranged alchemy among the *artes liberales*. They rather considered it as a mechanical art, a tool used for the sake of other disciplines (such as medicine and metallurgy). The theoretical side of alchemy was explained by physics, by natural philosophy. As an art basing its operations on philosophical principles, alchemy was linked with medicine and agriculture (which were also considered as secondary fields of physics).

The Fourteenth Century

During the fourteenth century, the main sources of alchemical authors were not directly the Arabic texts translated but the Latin treatises composed during the thirteenth century: the *Summa perfectionis* became one of the main authoritative texts. Moreover, the allegorical trend of alchemy began to expand in the Latin West; the *Turba philosophorum* and the *Emerald Tablet* came to

be used more widely. We also observe a Christianization of alchemy, the appearance of a more religious alchemy (as was already the case in Arabic alchemy). The pharmaceutical side of alchemy was particularly well developed (especially the distillation of alcohol). The attempt to find the elixir of life and the medical topic of body restoration became a core issue.

The alchemical debate remained intense in the fourteenth century. The opponents of alchemy, in addition to the *Sciant artifices*, asserted that the transformation of species was against nature; in reaction to this assertion, alchemists invoked the fact that they were doing what nature itself was doing (the creation of metals), the only difference being that they did it more quickly. A decree entitled *Spondent quas non exhibent* is said to have been promulgated (in 1316?) by Pope John XXII against false coiners (although this decree does not appear before the end of the fourteenth century). Although it did not condemn alchemy as such, this decree encouraged suspicion against alchemists (in addition to the increase in the number of frauds). However, no juridical condemnation of alchemists took place. One of the major opponents to alchemy was Nicolas Eymerich (1320–1399), who asserted in his *Contra alchymistas* that alchemists, once they had been disappointed with their art, were turning to demons or to the devil.

Some alchemical treatises are attributed to Arnald of Villanova (1240–1311), the famous Catalan doctor. These texts are probably not genuine, but the question is not solved yet. In the *Rosarius philosophorum*, the most widespread of these works, we find an alchemy based on the theory of the “mercury alone” (like in the *Summa perfectionis*). The alchemist has to reduce a metal to its *prima materia* (mercury containing sulfur) and project this mercury on a vile metal in order to transmute it. He rejected the use of organic matter. He also mentioned, following Roger Bacon, the possibility of healing the human body, thanks to alchemy. Other treatises attributed to Arnald of Villanova are characterized by a more religious doctrine, as the *De secretis naturae* and the *Tractatus parabolicus*, in which the alchemist established a link between the philosopher’s stone and Christ.

This allegorical and religious kind of alchemy is also found in the alchemical treatises wrongly attributed to Thomas Aquinas (such as the *De multiplicatione*, c. 1320).

Toward the middle of the fourteenth century, a commentary on the *Emerald Tablet* was written under the name of a certain Hortulanus, in which the alchemical Work is meant to be a reproduction of God’s creation.

In his *Pretiosa margarita novella* (written between 1330 and 1350), Petrus Bonus of Ferrara synthesized the main alchemical ideas of his time, mainly from the *Summa perfectionis*. He was more a philosopher than an alchemist, and considered alchemy as a divine art, introducing theology into the debate.

Ramon Llull (c. 1233–c. 1316), the Catalan philosopher, opposed alchemy. However, at the beginning of the fourteenth century, a corpus of apocryphal alchemical texts began to circulate under his name. This corpus gained a very wide diffusion (until the seventeenth century), and many different ideas and trends are found in it. The most important one (and probably the first) is the *Testamentum*: the alchemical doctrine of this work shows close resemblance to the doctrine expounded in the works attributed to Arnald of Villanova (but, as the dates of those texts are not clearly settled, it is impossible to assert which way the influence spreads). One of the specificities of the *Testamentum* lies in that it mentions for the first time in the West, in addition to the transmutation of metal and healing of the human body, the creation of gemstones through the alchemical work. The Arabic concept of elixir also occupies a very important place in this book. The observation of colors as signs of different stages in the alchemical work became central in the pseudo-Llullian corpus. This work was raising alchemy to the status of natural philosophy, which contributed to giving it a very long-lasting success (until the seventeenth century).

In the *Liber de consideratione quintae essentiae omnium rerum* (c. 1351–1352), Johannes de Rupescissa (d. after 1365) introduced into alchemy the use of the concept of the quintessence to designate the result of repeated distillations. In the trend of the *prolongatio vitae* of Roger Bacon, he asserted that the quintessence

provides incorruptibility for corruptible things (in the sublunary world), considering it as a terrestrial corollary to the celestial ether. He also showed a very religious fervor in his writings in defense of the Franciscan order. His ideas were followed by many alchemists: for instance, one of the pseudo-Llullian treatises, the *De secretis naturae*, is clearly indebted to his work.

The book of Guillaume Sedacer (d. 1382), the *Sedacina*, is an original work. Beside the list of major alchemical authorities of this period, he created a proper alchemical vocabulary (mainly from Arabic words).

The Fifteenth Century

To date, the alchemy of the fifteenth century has not received much attention. The main alchemical doctrines of this century are those of Arnald of Villanova, Johannes de Rupescissa, and especially Pseudo-Ramon Llull. This was the time of an enormous production of alchemical manuscripts. Among alchemists of this century, George Ripley (fl. 1470) should be mentioned as a very original author. He composed an alchemical poem in English entitled *The Compound of Alchymie* [...] *Containing Twelve Gates*, mainly inspired by pseudo-Llullian theories and by the work of a mysterious alchemist, Guido de Montanor. This poem quickly became a classic of medieval alchemy.

Conclusion

Medieval alchemy was at first based on Arabic texts and then specifically on Latin compositions. It remained a marginal knowledge, and never came into universities, but had a very close link with natural philosophy and medicine. Treatises were generally compilations of ideas of previous renowned alchemists, and the great authorities were just a few: some Arabic translations (especially those attributed to al-Rāzī and Avicenna), the *Summa perfectionis*, and some texts attributed to Arnald of Villanova, Ramon Llull, and Johannes de Rupescissa.

Alexander of Aphrodisias and Arabic Aristotelianism

Charles Genequand
Faculté des Lettres, Université de Genève,
Geneva, Switzerland

Abstract

Alexander of Aphrodisias, commentator *par excellence* of Aristotle, lived about 200 AD. A fairly important part of his works was translated into Arabic during the ninth century and greatly influenced the reception and

interpretation of the Stagirite's thought in the East. Important fragments of his commentary on the *Metaphysics* have been preserved in Ibn Rušd's own *Great Commentary* on that work. Among the independent treatises preserved in Arabic, the most important are *On the Principles of the Universe*, *On Providence* and *On the Intellect*.

The longest (about 25 pages) of Alexander of Aphrodisias' works preserved in Arabic is the treatise known as *On the Principles of the Universe*. As it happens, it is also a text which is totally unknown in the Greek sources, although its main theses can be found in the author's other works, the commentaries and above all the collection of short dissertations transmitted under the general name of *Questions*. It lays down that the heavenly bodies are moved by souls and that their motions arise in consequence of the desire that they feel for the First Cause of the universe (God). Their circular motion expresses their desire or their will (the two notions are not always clearly distinguished) to imitate or to become similar to the immutability of the self-thinking divine mind which moves them as object of thought and love. As the motions of the fixed stars and of the different planets are diverse, they are the cause of the diversity and variety of the physical phenomena which they originate in the world of generation and decay, situated below the sphere of the moon. This influence occurs through a "spiritual power," identified with nature, which penetrates all parts of the world, thus ensuring its cohesion and permanence. The condition of the universe is thus similar to that of the city or the household in which the authority of the leader is the cause of order at all levels. Although these theses have their origin in Aristotle, in particular in the twelfth book (Λ) of the *Metaphysics*, they are developed by Alexander in the sense of working out the connection between the heavenly and terrestrial realms and laying much more emphasis on it.

The treatise *On Providence* begins in truly Aristotelian fashion with a doxographical introduction which sets out briefly and rejects two

antagonistic conceptions of divine providence. The first is that of Epicurus and his school, building on the old atomistic doctrine of Leucippus and Democritus, according to which the gods do not play any role in the governance of the universe which is the product of pure chance and of the haphazard collision of atoms in the void. The second is that of the Stoics (Zeno of Citium is cited by name). For them providence rules all worldly processes and nothing escapes the benevolent care of the gods. According to Alexander, both positions are unacceptable. The harmony of the cosmos and the regularity of the natural processes make it totally unlikely that they should be entirely devoid of design. On the other hand, it would be unworthy of the gods' majesty to care for every individual being in itself. Such a conduct would degrade them to a position inferior to that of the creatures since the end, in any natural or moral process, is always above the entity acting towards it. Alexander's aim is to develop a theory of providence which should avoid the opposite excesses of the other schools while conforming to the principles of the Aristotelian system. His solution is based for the most part on astronomical considerations deriving from the *Metaphysics* and the treatises *On the Heavens* and *On Generation and Corruption*. The physical processes taking place in the world of generation and decay depend on the regular motions of the heavenly bodies and are themselves subject to unchanging laws. Just as the king does not personally look after each and every one of his subjects, but establishes general rules and ensures that they are observed and followed, in the same way God or the gods provide for the general welfare of the world as a whole, but it would be absurd to assume that they know each individual being as such. The annual motion of the sun causes the alternation of the seasons and thus creates the conditions appropriate for human life. As the annual motions of the stars are themselves dependent on the gods, that is, on the heavenly intellects which move them as objects of love, the beings of the physical world and man himself depend on them. Alexander however goes one step further by explaining that the gods have knowledge of what happens in the natural world, a thesis which is surely difficult

to reconcile with the Aristotelian notion of the self-thinking divine intellect. His doctrine is summed up in the idea that providence is not exerted by the gods "according to the first intention," but is the secondary and concomitant effect of their existence.

These two treatises, then, cover in part the same ground. They sketch a grand cosmological and metaphysical scheme in which the heavenly bodies constitute a level of reality intermediate between the purely immaterial intellects which govern them as final causes and the world of generation and decay situated below the sphere of the moon. The connection between the opposite realms of immutability, regular motion, and change is twofold: by desiring and imitating their immaterial and unmoved movers, the stars regulate the seasonal and regular alternation of physical conditions down on earth. The eternity of the species, contrasting with the constant coming-to-be and disappearing of individuals, reflects in its way this celestial unchangeability. The particular appeal of this system resided for the Arab philosophers in that it allowed to establish, between God and the world, the close and logical link which was missing in the original Aristotelian texts. By restricting God's knowledge of the particulars to the species, however, it paved the way for the antiphilosophical controversies of al-Ghazālī and others.

These two concepts, the downward influence of the heavens on the world of nature through the divine power emanating from them and the upward motion of assimilation, form the basic components of the "cosmometaphysics," as it has sometimes been dubbed, of the great Arab philosophers. These elements are found more or less scattered in the main works of al-Fārābī, the *Mabādi' Arā' Ahl al-Madīna al-Fāila*, and *Al-Siyāsa al-Madaniyya*, also known under the title of *Mabādi' al-Mawjūdāt*. The parallelism between the structure of the universe and that of the state which governs the plan of these two treatises also derives from the analogical conception which is particularly evident in Alexander's work. But it is Ibn Sīnā (Avicenna) who first built up these elements into a coherent and systematic whole. To be sure, he went beyond the

Alexandrian scheme, particularly in the distinction he established between the souls and the intellects of the heavenly spheres, as well as between necessary and contingent being. The fact remains that Alexander's exegesis provided the general framework and the main components of his theory as expounded in greatest detail in the ninth book of the *Metaphysics* (*al-Ilāhiyyāt*) of the *K. al-Šifā'*, the sixth chapter of which is devoted to the question of providence.

Although he opposed Ibn Sīnā's views on many topics, Ibn Rušd (Averroes) is equally under the sway of Alexander with regard to the problems sketched above. The impact of the latter's interpretation of Aristotle is felt in the *Paraphrase of the Metaphysics* as well as in the *Great Commentary* (*tafsīr*) on the same, although the source in that case is Alexander's own commentary rather than the short epistles. Other works of Ibn Rushd's are also indebted to the *Principles of the Universe*, notably the *De Substantia Orbis* preserved in Hebrew and the *Tahāfut al-Tahāfut* for the conception of nature as a divine power emanating from the heavenly bodies.

Many lesser works bear witness to the deep and lasting influence of Alexander in the Islamic world, though in many cases it may derive from the two great philosophers just mentioned rather than to the direct use of his epistles. Suffice it to name here the Jewish Arab philosopher of Spain Maimonides and the late compiler 'Abd al-Laṭīf al-Baġhdādī.

In the field of psychology, and more specifically with regard to the theory of intellect, the influence of Alexander's exegesis of Aristotle was also decisive through the Arabic translation of his short epistle *On the Intellect*. The re-interpretation of the active intellect postulated by Aristotle in the third book of the *De Anima* as an entity completely separate from matter and situated outside the human soul is the most outstanding feature of this short but hugely influential work. It is on this basis that the Arab philosophers, particularly al-Fārābī and Ibn Sīnā, evolved their own view of the Active Intellect as the last of the celestial intellects emanated from the First Cause and governing not only human intellection but the natural phenomena and the generation of forms in

their entirety. The translator of this text misunderstood it on several important points and thus unwittingly gave rise to new entities, in particular the so-called acquired intellect. These were then taken up by the Arab philosophers as genuine elements of Aristotle's system and incorporated in their increasingly complicated attempts at explaining the *modus operandi* of the human intellect and the way in which it abstracts intelligible forms from the sensibles. Al-Fārābī thus wrote a short *Epistle on the Intellect* which is heavily indebted to Alexander's noetics and exerted in turn a profound influence on his successors, culminating in Ibn Rushd's *Great Commentary on the De Anima* and initiating through it endless debates among the Western schoolmen.

Alexander of Hales

Christopher Cullen
Department of Philosophy, Fordham University,
New York, NY, USA

Abstract

Alexander of Hales (c. 1185–1245) is a thirteenth-century thinker who made major contributions to the development of Scholasticism, especially insofar as it became a rigorously systematic and philosophical method for doing theology. Alexander contributed to this development in two principal ways: he is among the earliest scholars to engage the thought of the newly translated works of Aristotle, and he is the first to use the *Sentences* of Peter Lombard as the basis for his lectures in theology. This momentous choice marks the shift of theology from focus on biblical commentary to systematic treatment of questions. Alexander also became the first Franciscan to be regent master of theology at Paris, when this “well-respected and rich man” entered the order in the academic year 1236–1237, while also retaining his chair of theology at the University of Paris. Alexander’s influence among early Franciscans came about in three important ways: through his leadership of the Franciscan *studium generale* at *le grand couvent des Cordeliers* at Paris; through his most famous pupil, Bonaventure (who reveres him as his mentor); and through a *summa* of theology that was compiled, to some extent, under his direction before his death. It was eventually attributed to him and was widely used within the order. Alexander provides evidence of

maintaining a fundamental, doctrinal loyalty to Augustine, while also trying to incorporate various doctrines of Aristotle into his systematic thought. It is this intellectual trajectory that has led scholars to regard him as the founder of the early Franciscan school. Like other famous scholastics, he is known by an epithet – he is the “Irrefutable Doctor” (*doctor irrefragibilis*).

Biographical Information

Alexander was likely born in Hales, Shropshire (now Halesowen, Worcestershire), between 1180 and 1186 (Doucet 1951). He studied at Paris and became a master of arts there sometime before 1210. He incepted as regent master of theology around 1220 or 1221. In 1230 he represented the university at the papal curia of Pope Gregory IX. He became a canon of St. Paul’s, London, and later at Lichfield (the cathedral city for the diocese in which Hales was); by 1231 he was archdeacon at Coventry. In 1235 he was sent on a diplomatic mission to France for King Henry III. In 1236, when he was at least 50 years old, he entered the Franciscans. He attended the First Council of Lyon (1244–1245) and died on August 21, 1245, shortly after returning from it. He was buried at *le grand couvent des Cordeliers* in Paris; his tomb was damaged in a fire in 1580. In 1795, it was demolished, along with the church, during the revolution (Wierzbicki 2008).

Thought

Until developments in scholarship in the twentieth century, Alexander was most famous for a *summa* of theology attributed to him, long referred to as the *Summa fratris Alexandri*. During the production of the modern critical edition, scholars began to question his sole authorship of the *summa*, and it is now clear that this work is not exclusively by Alexander. We know definite parts of this work are not by Alexander (Doucet 1948); the entire fourth volume, for example, is not by him. Although Alexander is not the sole author, he may have supervised the redaction of the text up

until his death in 1245, and those scholars whom we know did work on the compilation of this text were his collaborators in a common project: Jean de la Rochelle (c. 1190/1200–1245), Odo Rigaud (d. 1275), and William of Melitona. Jean de la Rochelle was a colleague of Alexander's at Paris and succeeded him in his chair when the latter resigned. Odo and William were students of Alexander; Odo succeeded La Rochelle in the Franciscan chair at Paris. It is thus at least accurate to say that this early and influential *summa* is the work of a "Halesian circle" of Franciscans which produced the final version, completed by 1257, and now usually referred to as the *Summa Halesiana* (or *Halensis*). "It was meant to provide students at *studia generalia* with an up-to-date systematic theological encyclopedia" (Roest 126). In this regard it had considerable influence within the Franciscan network of *studia*. Gilson takes this work to illustrate "the spirit of the thirteenth-century Franciscan school of theology" at Paris (Gilson 1955). It does provide evidence of doctrines that some scholars have called an "Augustinianism," at least as this was held prior to the 1260s: the identity of the soul and its powers, divine illumination, universal hylomorphism, and the impossibility of creation from eternity. Boehner (1945) provides a detailed exposition of the philosophical doctrines of this text. Given the complicated authorship of the *Summa Halesiana*, the definitive sources for Alexander's own teachings must be sought in those works that can be definitively attributed to him.

The discovery of the most important of these authentic works was announced in 1946, namely, his lectures on the *Sentences* of Peter Lombard, edited and published as *Glossa in quatuor libros Petri Lombardi* (1951–1957). The editors date this work to a period between 1223 and 1227. In addition to this work, we also have many disputed questions from Alexander's teaching career, both from before and after he became a friar. Sixty-eighty questions, dating from before he entered the Franciscans, were published in 1960. Several questions from after he became a friar are now available in critical editions, as well as certain other works, including an exposition of the Franciscan rule (Wierzbicki 2013a,b, 2015, 2016;

see list, Wierzbicki 2008). Wierzbicki has established that many of these disputed questions from his Franciscan years were incorporated into the second book of *Summa Halensis* (Wierzbicki 2015; Robson 2017).

Alexander's *Glossa* on Peter the Lombard's *Sentences* are important for many reasons, three to be considered here: its methodology, its sources, and its aim. It is based on the structure of the *Sentences*, and so is divided into four parts: God, creation, the incarnation, and the sacraments.

In his commentary Alexander adopts a dialectical method that becomes typical of scholastic methodology; this method allows him to treat questions one-by-one, presenting arguments on various sides of a question before responding to opinions contrary to his own position. This methodology did not go without criticism: Alexander's contemporary, Roger Bacon (c. 1214–1294), for example, faults him for his role in directing theology away from a biblically- focused method by his decision to teach by commenting on the *Sentences* of Peter the Lombard, into which he also introduced the distinctions within the text. As Gilson points out, the *Glossa* already contain, for many topics, the basic structure of the scholastic *quaestio*: (1) a statement of the question, (2) objections against the author's answer, (3) an affirmation of the author's answer with a theological authority, (4) the justification of the answer, (5) responses to objections (Gilson 1955).

The range of sources that Alexander brings together in the *Glossa* is extensive and reflects the range of the vastly expanded medieval library also being consulted by his contemporaries at Paris, such as William of Auxerre (1140/1150–1231) and William of Auvergne (d. 1249). His cautious eclecticism is worthy of considerable note for anyone surveying the development of thirteenth-century thought, for, although he is often hesitant to follow Aristotle, he is, by no means, hostile. On the contrary, he draws on major writings of Aristotle and is clearly working to take considerable account of various teachings of Aristotle as he constructs his theological synthesis. But he also incorporates various writings from the Christian tradition, both ancient – including Pseudo-Dionysius, Boethius, and John

Damascene – and more recent – Bernard of Clairvaux, Anselm of Canterbury, and the Victorines.

Alexander is attempting a theological synthesis that takes account of both the intellectual heritage of Christendom and Greek philosophical thought, while also covering the entire range of theology, from God to creatures to their return to their creator. Alexander is thus a major contributor to the Scholastic project of an all-encompassing synthesis, which attempts to harmonize discordant authorities in its quest for truth.

Alexander writes as a theologian who regards faith and reason as distinct in various ways even if they are ultimately harmonious. Although he has not worked out the nuances of this distinction, Alexander thinks that we can know that God exists by use of reason alone, despite the fact that we have no direct knowledge of the divine essence. Alexander presents a sort of anthology of proofs for God's existence, including a brief version of Aristotle's argument from the *Physics* for a first, unmoved mover: "Every mover, as such, is led back to some supreme immoveable principle; otherwise one proceeds *in infinitum*. Likewise, none of the things that are has being from itself, because being would have no term, and so, the existence of a supreme being is able to be inferred" (*Glossa* I 1951).

Alexander also thinks that we can accurately arrive at certain conclusions about the divine nature by negation and by analogy, that is, by denying what is unworthy of God or by coming to recognize how certain perfections can be predicated analogously of God. So, based on this intellectual foundation, Alexander works at length to articulate an understanding of God as simple, infinite, omnipotent, omniscient, and immutable.

Among these divine attributes, Alexander gives considerable attention to God's knowledge. He takes his starting point from Augustine who posited the Platonic forms as ideas in the divine mind. He tries to work out the difficulties of claiming a plurality of ideas in the simplicity of the divine being. Given this divine simplicity, he reasons that whatever is in God must, in fact, be God. And so, he concludes that the divine ideas only differ in a manner of speaking. It is in this

way that God himself is the exemplar of creatures. Alexander thus affirms the unity of God while also establishing "exemplarism" as a principal causal relation from which to consider creatures and their creator.

In contrast to God's simplicity, creatures are distinguished by various levels of composition. Alexander adopts a version of Aristotle's theory of hylomorphism, which holds that corporeal beings are composed of matter and form. The distinguishing principle of a human being is a rational soul, which then enters into union with matter. The rational soul is the principle of life, sensation, knowing, and willing. The powers of the soul are one with its substance; hence the human soul is the image of God in its substance (and not merely accidentally). Alexander understands freedom of choice to be a function of the complicated interaction of both intellect and will.

A focus on the will and freedom is found in the Alexander's ethical teachings, which clearly reflect his strong allegiance to Augustine. Morality is a matter of loving rightly and requires due respect for the hierarchy of goods. Alexander attempts to synthesize a charity-based ethics with a theory of divine and natural law. Many of his ethical teachings are developed at greater length in his disputed questions.

Alexander, influential among the early Franciscans, such as Richard Rufus and Jean de la Rochelle, represents a trajectory of scholastic thought that adheres closely to Augustine while attempting to synthesize a wide range of sources.

Alexandrian Tradition into Arabic: Medicine

Hans Hinrich Biesterfeldt
Seminar für Orientalistik, Bochum University,
Bochum, Germany

Abstract

Alexandria was the centre of Hellenistic scholarship. It is here that the works of the classical physicians Hippocrates and Galen (d. CE 216) were collected and commented upon, that the canon of (mostly) 16 books by Galen, meant for medical instruction, was established and abridged to the *Summaria Alexandrinorum*,

that the scholarly genres of (medical) encyclopedia and commentary were cultivated, and that “Galenism,” primarily Galen’s system of humoral pathology and his teleological interpretation of anatomy began to flourish.

All these texts and many more by authors other than Hippocrates and Galen, all the genres of medical writing and ways of medical instruction, not least a close relation between Galenism and Alexandrian Aristotelianism found their way into, and were to dominate, Arabic medicine. The principal vehicle for this complex transmission was the translation campaign, Greek into Arabic, of scholars, active under early ‘Abbāsīd rule (ninth century CE) in Baghdad, and led by the Nestorian master translator, Ḥunayn b. Ishāq. This campaign not only laid the foundation for a consistent medical and pharmaceutical terminology in Arabic but also paved the way for a more flexible postclassical Arabic. The creative appropriation of Hellenistic scholarship in general, and medicine in particular, as collected and canonized in Alexandria, constituted a defining political and cultural feature of early ‘Abbāsīd society. However, it remains a matter of dispute how direct and continuous that tradition “from Alexandria to Baghdad” was.

Alexandria, on the western corner of the Nile Delta, had become, soon after its foundation by Alexander the Great in 332 BCE, the centre of medical scholarship, represented mainly by the works of the early third century anatomists Herophilus and Erasistratus. Supported by the tolerant reign of the Ptolemies, Hellenistic literature and scholarship generally flourished. Although under Roman and Byzantine rule the institutional focus and symbol of this scholarship, the famous Library of Alexandria, and its successors, was destroyed on several occasions, and although some Christian thinkers tended to denounce Greek philosophy as “pagan,” the Hellenistic syllabus of learning as cultivated in Alexandria maintained its exemplary function. Particularly after Justinian’s closing of the

Athenian Academy in CE 529, Alexandria became the principal heir to a long tradition of Hellenistic philosophy and the sciences; its numerous medico-philosophical schools, called *academia* or *museion*, offered library services and instruction. It is in these schools that medical authors like John Philoponus (d. c. 570), Stephanus of Alexandria (middle of the sixth century), Palladius (second half of the sixth century), and John of Alexandria (early seventh century) taught, mainly writing commentaries on works by the classical authors Hippocrates and, foremost, Galen (d. CE 216), and it is the curriculum of these schools that was to dominate the academic teaching of late Antiquity and early Islam.

The core of the medical curriculum consisted of a number of Hippocratic works, mainly those commented upon by Galen, and a standardized set of, mostly, 16 works by Galen meant by himself to serve as an introduction for beginners, starting with *De sectis* (in Arabic *K. al-Fīraq*) and comprising, among others and in varying order, *De pulsibus ad tirones* (*K. al-Nabḍ al-ṣağīr*), *Ars parva* (*K. al-Ṣinā’a al-ṣağīra*), and *Ad Glauconem de medendi methodo* (*K. ilā Iğlawqun fī l-ta’attī li-shifā’ al-amrāḍ*). For school instruction, these 16 books were abridged and partially commented upon, around 500 (or perhaps only after the Arabic conquest of Egypt in 640), in compendia, called *Summaria Alexandrinorum*, and subsequently translated into Arabic (*Jawāmi’ al-Iskandarāniyyīn*). No Greek bibliographer lists this corpus; it is only extant in Arabic versions, followed by Hebrew and Latin translations. Apart from establishing the syllabus of medical textbooks, the Alexandrian scholarly tradition was also to shape Islamic medical literature by developing the genre of the encyclopedia, or compilation (e.g., that of Oribasius, who died after 395, and of Paul of Aegina, writing around 640), on the one hand, and of that of the commentary on the other, starting with Galen’s extensive commenting on the Hippocratic writings and culminating in the almost boundless Arabic, Persian, and Turkish commentaries spreading from Avicenna’s medical encyclopedia, the *Canon of Medicine*. A further feature of medical theory that originated in Alexandrian scholarship and was

destined to pervade adjacent cultures, that is, the Persian and the Syriac ones, and subsequent traditions, that is, the Islamic and the Latin West, was what has been called Galenism, that is, the system of humoral pathology and the teleological orientation of anatomy (as displayed in *De usu partium*) shaped by Galen.

The translators from Greek into Arabic, working under the first ‘Abbāsids, did not, however, stop at this core of medical texts, but undertook to make available the integral texts contained in the *Summaria*, the whole voluminous *Corpus Galenianum*, more Hippocratic works, numerous works by the important author Rufus of Ephesus (around CE 100), Philagrius (first half of the fourth century), Alexander of Tralleis (d. 605, his *Therapeutica*, Arabic *al-Kunnāsh*), and others, to medical theory and practice as cultivated in Baghdad, the new capital of the Islamic empire, and other urban centers. A priceless document of (a) the interplay between the political and administrative authorities active in ninth-century Baghdad and the translators, in a very broad sense the intermediaries between Alexandria and Baghdad, and of (b) their professional skill, reaching a remarkably high level within decades, is a letter of the master translator, Ḥunayn b. Ishāq (died in the seventies of the ninth century), to a patron on *What Was Translated of Galen’s Works*. From Ḥunayn’s inventory, we learn that he himself was engaged in the search for Greek medical manuscripts, beyond the canon of “works that were read in the school (*kuttāb*) of Alexandria,” trying to secure more than one copy of a given work in order to collate the texts and arrive at their “original” reading. In revising previous translations and providing new ones, many of them via Syriac versions, often in cooperation with colleagues, notably his son, Ishāq b. Ḥunayn, and his nephew, Ḥubaysh al-Ḥasan al-Aʿsam, and in composing original works following the models of Alexandrian medical writing, Ḥunayn created a broad basis for all medical scholarship in classical Islam. Moreover, he and his collaborators established a fairly consistent medical terminology and, challenged by the syntax of Greek technical texts and exploiting the inherent potential of classical Arabic, contributed to the

emergence of a more flexible “Middle” Arabic suitable for scientific and philosophical writing.

The immediate need for medicine in the Hellenized centers of the Islamic Near East is demonstrated by the fact that the Hippocratic and Galenic writings, as channeled through the Alexandrian syllabus, belong to the earliest texts that were translated from Greek into Arabic, as well as by the highly visible prominence enjoyed by physicians serving the ‘Abbāsid rulers in Baghdad. The most influential group of physicians is that of the Nestorian family Bukhtīshūʿ whose member Jurjīs b. Jibrīl (d. after 787) is reported to have been called from the Iranian city of Gondēshāpūr to Baghdad to treat the caliph al-Manṣūr (r. 754–775) and whose long line of successors represents the transition of Alexandrian medicine in Syriac language to that in Arabic and exemplifies the close cooperation between patrons and sponsors of the translation movement: caliphs, courtiers, administrative and military functionaries, and experts: physicians, directors of hospitals, translators, medical authors, a number of them in personal union. From the biographies of the Bukhtīshūʿ family as well as from many different sources it becomes clear that the creative appropriation of Hellenistic scholarship in general, and medicine in particular, as collected and canonized in Alexandria, constituted a defining political and cultural feature of early ‘Abbāsid society.

It is a matter of dispute how direct and continuous the tradition “from Alexandria to Baghdad” was and what role Christian scholars played in this tradition. Previous scholarship relies on the accounts of philosophers such as al-Fārābī who constructs an uninterrupted teaching tradition of Aristotle’s works from Alexandria to Baghdad with Antioch and Ḥarrān as intermediary stations and with Christian scholars as exclusive carriers of this tradition, and, on the other hand, of physicians such as Ibn Riḍwān (d. 1068) and Ibn Jumayʿ (d. 1198). These attribute a general decay of the medical art after Galen to the Christian authorities who, they write, had no interest in intellectual matters and were content to work with abridged and popularized compendia by, for example, Oribasius and Paul of Aegina and with digests in the form of the *Summaria*

Alexandrinorum. After the Muslim conquest of the Near East, specifically of Alexandria, the new rulers transferred the medical instruction to Antioch and Ḥarrān, and it is only with the ‘Abbāsīd ruler al-Ma’mūn (r. 813–833) that scholarly medicine was revived and saved from oblivion. The anti-Christian sentiment of these authors, absent from earlier accounts, but highly influential down to Ibn Khaldūn’s *Muqaddima* (end of the fourteenth century, and beyond), and the purported “humanist” role of the ‘Abbāsīd sovereigns as true heirs to Greek scholarship are due to a conscious anti-Byzantine policy initiated by these themselves. In fact, the tradition from Alexandria to Baghdad was carried to a considerable extent, but not exclusively, by Christian teachers and writers, and more importantly, the chain of that tradition was by no means a single, continuous one; rather one has to assume a simultaneous existence of philosophical and medical schools in the Hellenized cities of the Near East. At any rate, the consistency of the medical canon, of the ways of instruction, not least the close relationship between Galenic medicine and the Alexandrian Aristotelianism during the centuries between Alexandria and Baghdad remain remarkable.

Alexandrian Tradition into Arabic: Philosophy

Philippe Vallat

IFPO-Damascus, IFPO Abu Rumaneh,
Damascus, Syria

Abstract

The doctrinal impact of the School of Alexandria on Arabic philosophy becomes increasingly clear, thanks to a deeper knowledge of the textual tradition of Arabic and Syriac philosophy. One may go as far as to see in al-Fārābī (d. 950), Avicenna (c. 980–1037), and the respective traditions they initiated, the culmination of the scholarly endeavor of

Ammonius and his successors. But at first glance, this Arabic synthesis left no room for Plato and the *Chaldean Oracles*. In fact, the articulation of Aristotelian logical and physical inquiries with Plato's theological insights, which had prevailed in Alexandria, gave way to a system wherein the rational sciences reached their highest point in a nondiscursive contact with an Eternal entity, whether God or a lower principle. The process of reception of the Alexandrian tradition into Arabic began in the eighth century and ended in the eleventh century. Alexandrian philosophy continued to nurture Arabic thought up to Averroes' time (1126–1198) and beyond.

In what follows, the expressions "Alexandrian philosophy" and "Alexandrian philosophers" will refer to the School of Ammonius son of Hermias (around 470 to after 517), his students and their students, and Simplicius (c. 490–560), who was also known to the Arabic authors.

Introduction

The political, social, and economic reasons why Greek science was translated and adapted in Arabic have been examined and documented by D. Gutas in his *Greek Thought, Arabic Culture*. On one hand, the Islamic Empire was in need of science and techniques to assure its power and to subsequently overthrow the Byzantine Empire's claim to incarnating the Greek legacy. On the other hand, it was in the political and economic interest of all ancient, more learned, denominational elites living within the new Islamic Empire's frontiers to provide these sciences. They thus hoped to keep their previous influential positions. And since philosophy was conceived of as "the science of sciences," this may explain the efforts exerted to make it available in Arabic. The fact that ultimately the interests of Pagans and Christians involved in this endeavor socially converged is undeniable. This convergence is exemplarily embodied in the collaboration between the two most skillful and prolific scientists and translators of the ninth century, namely the Christian

Ḥunayn b. Ishāq (809 to c. 873) and the Pagan Thābit b. Qurra (836–901). But from this undeniable convergence of interests, one ought not to infer that their motivations were even remotely identical. Thābit wrote he yearned for the triumph of intellectual Syriac Hellenic Paganism over Christianity – thanks to or through Islam, one cannot be sure – while Ḥunayn wished to create the conditions for a *modus vivendi* founded on rational, Aristotelian grounds. Whatever their motivation, Greek philosophy found its way into Arabic-Islamic civilization and contributed to shaping Islamic theology, especially in the post-Avicennian tradition (Wisnovsky 2004).

General Appraisals

Unlike the term "Neoplatonist," which is commonly received among Hellenists to refer to the Alexandrian School, Arabic philosophy scholars have till recently debated whether we should refer to the latter and its members as Aristotelian, Neo-Aristotelian, Neoplatonizing Aristotelian, or representing Neoplatonized Aristotelianism. As for the latter two denominations, possibly coined by McGinnis and Reisman (2005), they seem a fitting description of the reception of the Alexandrian commentary tradition on Aristotle into Arabic. But none of these terms would befit qualifications of the Alexandrian School itself, unless one ignored that Alexandrian philosophers also wrote commentaries on Plato and almost certainly acknowledged the authority of the *Chaldean Oracles*. What thus possibly characterizes Arabic philosophy in its first stage does not apply to its Alexandrian sources. Historically speaking, the main question to address is what happened between the departure to Constantinople of Stephanus, the probable last headmaster of the School, at the beginning of the seventh century (about 610), and the very beginnings of philosophy in Arabic, which can tentatively be traced back to the time of Ibn al-Muqaffa' (c. 720–756). Doctrinally speaking, a related issue to address is how Neoplatonism became Neoplatonized Aristotelianism. Both questions have received various and sometimes contradictory answers.

This problem of appellation not only reflects the debate among specialists of Greek philosophy about the comparative assessment of the doctrinal trend within each one of the Neoplatonist Schools of Athens and Alexandria, but also reflects the lack of agreement on the nature and proportion of Neoplatonism which entered the first doctrinal elaborations by Arab or Arabic-speaking philosophers during the ninth and tenth centuries. Among the global appraisals which currently prevail in Arabic scholarship, I will content myself with sketching out those that have something to do with Alexandria and its influence. As far as I know, there are two.

The first significant global assessment was documented by Endress in some of his studies. Endress considers that the Arabic philosophers' progressive realization of the autonomy of philosophy vis-à-vis the only other, religious, form of knowledge, viewed at that time as the knowledge par excellence, occurred alongside a growing emphasis on philosophy's rigorously rational and demonstrative nature. In other words, as Greek philosophy was being translated, Arabic philosophers became increasingly aware of what might separate them and their discipline from the religious sciences practiced by clerics. That all Arabic Peripatetic philosophers considered religion a lower rhetorical or dialectical form of knowledge also originated in this conception of philosophy as a demonstrative science.

The second assessment was by Wisnovsky (2004: 151) who helpfully described it as follows: "In one sense Avicenna stands as the culmination of the 'Ammonian synthesis,' which I take to be the attempt by Ammonius son of Hermeias, and his successors such as Asclepius (fl. 525), John Philoponus (d. c. 570), and al-Fārābī (d. 950), to fold the broader, Neoplatonic project of reconciling Aristotle with Plato, into the narrower, Peripatetic project of reconciling Aristotle with himself." Wisnovsky's studies on Avicenna show firstly how a wide range of Neoplatonic texts, many of which belong to the Alexandrian tradition, influenced Avicenna's interpretation of Aristotle; and secondly, why a correct assessment of Avicenna's achievements in metaphysical inquiries can only be accounted for if one assumes

that he in some way knew Ammonius' interpretation of the *Metaphysics*, as reported in Asclepius' and Philoponus' respective commentaries on *Metaphysics* and *Physics*. Recently, Bertolacci (2006) also drew attention to the influence of Ammonius' metaphysics on al-Fārābī. And Vallat's study (2004) is entirely devoted to the impact of the School of Alexandria on al-Fārābī's understanding of philosophy as pedagogy.

In order to further characterize the Alexandrian tradition and the way Arabic philosophy inherited from it a part of its salient trends, one must not only take into account the tenet of the concordant reading of Plato and Aristotle, but also the role ascribed firstly to Aristotle and then to Plato within the Alexandrian curriculum of studies. Roughly speaking, one may state that Aristotle stands here for the logical and physical method of inquiry, and Plato for the dialectical and theological approach (see, e.g., Elias, *In Cat.*, p. 124, 17–23: sentence known in Arabic) as well as for all the doctrinal elements related to the salvation of the human soul. Thus, although Plato as an author disappeared from the very conception of the Arabic curriculum of studies for lack of translations, this articulation between rational physical science and theological knowledge lived on in the form of the connection between discursive or dianoetic understanding and an intuitive kind of knowledge. In other terms, even though the juncture between these two kinds of perceptual activities no longer applied to Aristotle and Plato but to Aristotle and his Neoplatonizing interpretation, the fact remains that a great deal of Arabic philosophers, and especially all Peripatetic philosophers, whatever their religion, admitted the need for articulating science with theology and, ultimately, for ordaining both of them to the eudemonic state attained through the conjunction of the perfected human intellect with a metaphysical entity, whether God, the Agent Intellect or a Celestial Intellect. Albeit schematic, this survey shows how Alexandrian Platonism mainly survived in Arabic philosophy through the Aristotelian texts and therefore beyond. In one unique case Platonism also meant politics (on this, see the entry on ► "[al-Fārābī, Latin Translations of](#)" in this volume).

Textual Evidence

From a literary point of view, the two main features of the Arabic reception of the Alexandrian tradition that I will retain are the following: (1) the almost complete disappearance of Plato's works and the irrelevant influence, if any, of the commentaries on Plato's works; (2) the fact that, although extensively used, the commentaries on Aristotle are almost never or only very rarely referred to explicitly, which makes their influence difficult to assess.

This stands out clearly when compared with the cases of Alexander of Aphrodisias and Themistius, whose names are well known in Arabic literature. Some of Alexander's and Themistius' Aristotelian commentaries and treatises were translated retaining their author's name, subsequently copied and hence preserved as independent works. Between them and the Pagan philosophers from Alexandria whose commentaries circulated anonymously, Philoponus offers a middle ground: his opposition to the doctrine of the eternity of the world earned him fame among Muslim and Christian philosophers who often relied on his arguments; nevertheless, his works were apparently not valued as much as those of Alexander or Themistius, since they were preserved only through excerpts and adaptations. I do not share Lettinck's confidence regarding Philoponus' authorship of the partial commentary *On Physics* preserved in Arabic. Some ideas from Simplicius' *On Physics* apparently also found their way in this commentary, but under another name. The possible influence of Simplicius' commentary on al-Kindī has been noticed by Jolivet (1993) and al-Fārābī's allusions to the *Poem* of Parmenides might also stem from it (see Vallat 2004).

Thus, with the exceptions of Olympiodorus' *On Meteorology* (different from the one preserved in Greek), the Alexandrian material preserved in the School of Baghdad's commentary on *Physics*, a few scraps of Simplicius' and Ammonius' *On Cat.*, fragments of some length of Simplicius' on Euclid's *Elements* (unknown in Greek), fragments of Philoponus' *Contra Aristotelem* and *Contra Proclum*, and a few quotations of Ammonius on

music preserved by Ishāq b. Ḥunayn and al-Kindī, all the Alexandrian commentary tradition known at some point in Arabic has disappeared as independent works. This means that the manuscripts of these commentaries were never copied or ceased to be very early. Once used by Arabic scholars, these works were apparently unworthy of being copied and therefore for the most part fell into oblivion.

As a result, one comes across only anonymous and indirect references, which, in order to be seen and identified, require that we know the underlying Greek or at least that the comparison between the meaning of the Arabic and the generally well-known Greek doctrines can be made with sufficient accuracy. In this respect, al-Fārābī's (d. 950) and 'Abd al-Laṭīf al-Baġdādī's (d. 1231) respective *Fuṣūlmuntaza'a* (*Excerpts from the Ancients' Works*) are representative cases. The former contains, for instance, anonymous quotations drawn from one of Proclus' work known both in Greek and Arabic (almost entirely preserved in Greek but only partially in Arabic) and echoes of Porphyry's *On Nicomachean Ethics*, which is sometimes referred to in Arabic works, but is no more preserved in Arabic (except for a few passages) than in Greek. Although Dunlop suggests it, it seems rather daring to ascribe to Porphyry the "Seventh Book" inserted in the Arabic textual tradition of the *Nicomachean Ethics* called in Latin *Summa Alexandrinorum*. As for 'Abd al-Laṭīf al-Baġdādī, Rashed (2004) has shown that his work contains anonymous quotations unknown in Greek but whose content is familiar enough to be safely attributed to Alexander of Aphrodisias.

Another hindrance further complicates the inquiry into sources. We possess Arabic anonymous Alexandrian commentaries or fragments, which testify to a posterior stage of the Alexandrian tradition to the one known in Greek, that is, apparently posterior to Stephanus. The best known example of this is Ibn al-Bīṭrīq's Arabic summary of a work entitled *Talkhīṣk. al-naḥṣ li-l-Iskandariyyīn*, the *Alexandrians' Epitome of Aristotle's De anima*, which has been masterfully edited by Rüdiger Arnzen. In all likelihood, Ibn al-Bīṭrīq (first half of the ninth century) worked on

an Alexandrian paraphrase, mainly composed of excerpts from Philoponus' *In De an.*, and whose Greek original is unknown. The Alexandrian sources that Ibn al-Ṭayyib (c. 980–1043) referred to in his *On Eisagoge* and *On Categories* also remain partly nameless, although both commentaries have been edited. The content of his *On Isagoge*, from which he failed to withdraw explicit Pagan allusions – a peculiar omission on the part of a Bible commentator – points to a translation of epitomized Alexandrian sources. As shown by C. Ferrari in her edition of Ibn al-Ṭayyib's *On Cat.*, this work displays countless similarities with all the known Alexandrian treatises from Ammonius to David. If ever rediscovered, his other commentaries on Aristotle's *Organon* would surely confirm this observation. Furthermore, Rashed (2005) has established that *On Cat.* is somehow connected with the *Marginalia* of Arethas of Caesarea (c. 850–944) to the *Isagoge* and *Categories*. An in-depth study of the sources remains to be done in the case of another member of the School of Baghdad, Ibn Zur'a (942–1008). His published epitome of *De interpretatione*, *Prior*, and *Posterior Analytics* has not yet been studied.

For all these Aristotelian works, Arabic philosophers made use of translated Greek commentaries without actually naming them most of the time.

The commentator called “Allīnus” or “Ilīnus” in Arabic sources deserves a special mention. Ibn al-Ṭayyib and his teacher Ibn Suwār frequently quoted him, the latter having even allegedly translated his *On Cat.* Apart from Olympiodorus and Stephanus, “Allīnus” is the sole name quoted by Ibn al-Ṭayyib in *On Isag.* Among the various attempts to identify the Alexandrian commentator behind the name, Rashed (2005) put forward David, whom Hugonnard-Roche (2009) has since shown not to be a possible option.

A newly discovered complete version of what is still erroneously called *Ibn al-Muqaffa'*'s *Logic* might provide useful additional information about the Alexandrian philosophical tradition in Arabic. This handbook on logic, which clearly can neither be ascribed to Ibn al-Muqaffa' nor to his son Muḥammad, constitutes in fact an epitome

of the whole Alexandrian *Organon* including *Rhetorics* and *Poetics*. The only version described in ancient sources, which is now published (Danish-Pazuh 1978), includes the epitome of Porphyry's *Isagoge*, *Categories*, *De interpretatione*, and *Prior Analytics*. To the best of my knowledge, the comparison with known Alexandrian commentaries has not been made yet.

Equally intriguing are the fragments of Paul the Persian's Syriac work preserved in Arabic thanks to Miskawayh's *Tartīb al-sa'ādāt*. According to Gutas (1983), Paul relies on some Alexandrian prolegomena to Aristotle's logic whose degree of scholarly refinement would suggest they are posterior to David's. This case is puzzling because Paul's floruit approximately tallies with Khosrow Anushirvan's reign (531–579), whereas the probable date of writing of David's prolegomena coincides with the end of this reign at the earliest.

How then could David or any later author have influenced Paul? Moreover, could the composition, the transmission, and the translation of the aforementioned work into Syriac have occurred simultaneously with the composition of Paul's treatise? No attempt has yet been made to solve this apparent chronological and geographical conundrum. In fact, it might be that Simplicius' *On Categories*, or another similar commentary, is the treatise used by Paul in one form or another. For that matter, Gutas, who examined Paul's fragments, envisages the possibility of Simplicius' influence. A new edition and study of Miskawayh's *Tartīb al-sa'ādāt* might bring further light on this issue.

Ways of Transmission

More likely from a chronological and geographical point of view, Simplicius' influence on Paul would reinforce a hypothesis which has not met much favor either among Greek or Arabic scholars, that is to say, the settling of Simplicius in a Graeco-Syriac speaking region after he and/or some of his colleagues from Athens returned from Khosrow Anushirwan's court in 532. The city of Ḥarrān (Carrhae), where intellectual Syriac Hellenism remained alive till the end of the tenth

century, has been proposed by Tardieu as the place where Simplicius might have stayed. C. Luna has challenged the part of Tardieu's hypothesis, which deals with evidence contained in Simplicius' *On Physics*, regarding the place where he composed this commentary. Nonetheless, the case has been bolstered by further elements brought forward and documented by I. Hadot. So far, the entire issue remains to be addressed comprehensively or disproved by any Greek or Arabic scholar, especially when it comes to the issue of Simplicius' school of mathematics, the existence of which has been recorded only by Arabic sources. This issue makes Simplicius' return to Athens problematic.

In addition to I. Hadot's most recent study on this issue (2007), it may be added that: (1) from the report of the tenth century bio-bibliographer Ibn al-Nadīm, it appears that the Arabic translation of Simplicius' *On Cat.* and its chapter on relatives in particular may at some point have been studied by readers of the Euclidean commentator and mathematician Theon of Alexandria. This constitutes indirect supplementary evidence for Simplicius' teaching activities, both mathematical and philosophical. (2) Al-Fārābī's *Book of Particles* (see Vallat 2004: 373–375; 2011a) also points to the fact that the gathering of logical and mathematical interests in relation to the question of Aristotle's treatment of relatives remained a well-established tradition among the Arabic philosophers after Simplicius' time. The possible influence of Simplicius on al-Fārābī's *On Elements* can now be assessed on the basis of Arnzen's recent edition of al-Nayrizī's "Sammelkommentar" on Euclid's *Elements*, which includes 24 quotations by Simplicius. Apparently (see Hogendijk 2008), Qusṭā b. Lūqā (d. c. 912) made use of Simplicius' *On Elements* in his *Introduction to Geometry*. (3) The Graeco-Aramaic name of the dedicatee of Simplicius' *On De anima* mentioned by Ibn al-Nadīm is in all likelihood a Ḥarranian name; (4) the historian Agathias is not the only surviving source for the exile of Simplicius and his colleagues. Ibn al-Nadīm's *Fihrist* not only bears witness to both of the philosophers' journey to Khosrow's court and of their departure, but notes at the same time that Priscianus' *Solutiones ad Chosroem* was sent

to Khosrow. Since Ibn al-Nadīm did not rely on any Greek source, it means that this treatise was somehow translated either into Pahlavi or into Syriac. Moreover, the second discussion between Khosrow Anushirwan and the philosophers reported in Ḥunayn b. Isḥāq's *Ādāb al-falāsifa* (p. 60) might well bring together distinctive features of Damascius' metaphysical agnosticism.

From I. Hadot's study, one may also retain that a Pagan genealogy might explain more satisfactorily the origin of the typically harsh Neoplatonic anti-Christian polemic echoed in various texts by Arabic scientists and philosophers (whether heathen or Muslim) than the 'Abbāsīd's philhellenism alleged by Gutas. A thorough examination of Thābit b. Qurra's praise of the triumph of the Graeco-Syriac heathenism over Christianity along with the consideration of the specificity of the Ḥarranian milieu studied by Pingree might justifiably lead to a reappraisal of the primary ideological context of the Graeco-Syriac–Arabic translation movement.

The other, much better known, means of transmission from Alexandria to the Syriac and Arabic-speaking world is exemplarily represented by a former Christian student of Ammonius in Alexandria called Sergius of Resh'aynā (d. 536). Plato's disappearance from the philosophical curriculum might be attributable, to begin with, to Sergius' decision to replace him with Christian theological works, such as those of Pseudo-Dionysius the Areopagite. Be that as it may, as Hugonnard-Roche and Watt have shown, from the sixth to the tenth century Christian Syriac scholars proficient in Greek and, later on, in Arabic, represent not only the best known channel through which Greek philosophy was subsequently transmitted to the Arab world, but also the other, monotheistic, matrix of Arabic philosophy. Whether clerics, monks or appointed translators, and scholars, their role should not be underestimated. Arabic–Islamic philosophy most probably owes to them not only its monotheistic form of Neoplatonism, which originated under the supervision of the Muslim philosopher al-Kindī within the "Kindī Circle" of appointed translators (Endress 1997b), but also its specific Peripatetic anatomy, shaped within the School of Baghdad to

which al-Fārābī belonged. The tenth century Arabic translation of Aristotle's whole *Organon* can thus be seen as the achievement of their four-centuries-long work. Through them, the Alexandrian conception of philosophy as an Aristotelian curriculum of studies passed on not only to al-Fārābī, Avicenna, and Averroes, but also, thanks to these three authors, to the Latin world where it contributed in some way to the elaboration of the *Gradus Philosophicus* in the Faculties of Arts.

‘Allama al-Ḥillī

Mathieu Terrier

LEM (UMR 8584), CNRS, PSL, Paris, France

Abstract

Abū Manṣūr Jamāl al-Dīn al-Ḥasan b. Yūsuf b. Muṭahhar al-Ḥillī, known as al-‘Allāma al-Ḥillī (648/1250 – 726/1325), is one of the most prominent Twelver or Imāmi Shī‘i scholars of Medieval times. His Arabic nickname *al-‘allāma* means “the man of most knowledge” or “the most learned one,” embracing the “traditional [religious] sciences” (*al-‘ulūm al-naqliyya*) and the “intellectual sciences” (*al-‘ulūm al-‘aqliyya*). He also seems to have been the first Shī‘i scholar to receive post mortem, by the famous theologian Muḥammad Bāqir al-Majlisī (d. 1111/1699), the title of *āyat allāh* (“sign of God”), that would eventually be granted to the most authoritative jurists (*fuqahā*) in modern and contemporary Twelver Shī‘i communities (al-Majlisī 1983, vol. 53, pp. 221, 252; vol. 106, p. 30). In the Shī‘i historiography, al-Ḥillī remains famous for his role in the conversion of the Ilkhānid ruler Uljaytū (r. 703–716/1304–1316) to Shī‘ism, as well as in the spread of Shī‘i beliefs in Iran. He remains as the main representative of the rationalist school of al-Ḥilla, in Iraq, whose influence replaced that of the traditionalist school of

Qum, in Iran, following the destruction of this city by the Mongols. With regards to the evolution of the Imāmi doctrine, he was one of the main artisans of the reformist current which, following the Occultation of the twelfth Imām in 329/940–941, turned the esoteric Shī‘i religion into a rationalized system of beliefs and practices, dominated by jurisprudence (*fiqh*) and progressively politicized (Kohlberg 1983). He is credited with more than 100 works in various fields that pertain to principles of law (*uṣūl al-fiqh*), theology (*kalām*), and other religious sciences, as well as philosophy and logic. His works, with those of his teacher Naṣīr al-Dīn Ṭūsī (d. 672/1273), represent the last school of original thought in Shī‘i Imāmi theology (*kalām*), the work of the later generations consisting mostly in commentaries upon them (Madelung 1970, p. 28). His compendium of theology entitled *Bāb al-ḥādī‘ashar* (“the Eleventh Chapter”), together with its commentary by Miqdād al-Suyūrī (d. 826/1423), still serve today among Shī‘i schools as an authoritative exposition of the principles of the Imāmi faith (al-Ṭihirānī 1983, vol. 3, pp. 5–7).

His Life

Al-Ḥasan b. Yūsuf b. al-Muṭahhar al-Ḥillī was born in 648/1250 in al-Ḥilla, one of the main centers of the Twelver Shī‘i community during the last ‘Abbasid period. His father, Sadīd al-Dīn Yūsuf b. ‘Alī b. Muḥammad b. al-Muṭahhar al-Ḥillī, must have been one of the leading personalities of the city; he is said to have written several works on Prophetic and Imāmi traditions (*ḥadīth*) and the principles of Twelver Shī‘i religion (*uṣūl al-dīn*). His uncle Ja‘far b. al-Ḥasan al-Ḥillī (d. 676/1277), later known as al-Muḥaqqiq al-Ḥillī or al-Muḥaqqiq al-awwal (“the first verifier of the truth”), was also a major scholar of this city, one of the first representatives of the theological school of al-Ḥilla.

Ḥasan b. Yūsuf b. al-Muṭahhar was 8 years old when the Mongols invaded Iraq, devastated

Baghdad, and murdered the last 'Abbasid calif al-Musta'ṣim in 656/1258. These events were frequently described as the end of the world by the representatives of the Sunni majority; however, for the Twelver Shī'is, they also offered a historical opportunity, since the Mongols had successfully defeated their two main adversaries, i.e., the Nizārī Ismā'īlī state of Iran, centered in the fortress of Alamut, and the Sunni califate of Baghdad. Thanks to the efforts of Shī'ī scholars and neo-diplomats, such as the philosopher and scientist Naṣīr al-Dīn Ṭūsī (d. 672/1273), the Shī'is of Iraq were spared by the invaders. According to al-'Allāma al-Ḥillī himself, his father went as an ambassador of the Shī'ī community to the court of Hülagü in 656/1258 and gained from him a grant (*firmān*) protecting al-Ḥilla, al-Kūfa, and the main Shī'ī centers of Iraq from destruction. Therefore, al-Ḥilla superseded Qum and Baghdad as the stronghold of Shī'ī learning for more than a century (Newman 2013, pp. 122–137). Many other Shī'ī scholars, including al-'Allāma al-Ḥillī, would actively collaborate with the new regime, in accordance with the *fatwa* of Radī al-Dīn b. Ṭāwūs (d. 664/1266) according to which it was preferable to serve a just non-believing ruler than an unjust Muslim.

The young al-Ḥillī first studied religious sciences (*tafsīr*, *ḥadīth*, *fiqh*) and sciences of Arabic language in his hometown, under the guidance of his father and his uncle. Many of his teachers were among the most famous scholars of his time (Khawāṣṣārī 1971, vol. 2, p. 278). In the field of *ḥadīth* and Imāmi tradition, he studied under Jamāl al-Dīn b. Ṭāwūs (d. 673/1274) and his brother Radī al-Dīn b. Ṭāwūs, mentioned above. In the field of philosophy and logic, he learnt the Metaphysics (*Ilāhiyyāt*) of Ibn Sīnā's (d. 428/1037) "Book of Healing" (*Kitāb al-Shifā'*) from Naṣīr al-Dīn al-Ṭūsī. He became acquainted with the works of Fakhr al-Dīn al-Rāzī (d. 606/1209) and Athīr al-Dīn al-Abharī (d. ca 663/1265, see Terrier 2018a) on logic and philosophy through Najm al-Dīn Dabīrān Kātibī Qazwīnī (d. 675/1277), who co-founded with al-Ṭūsī the observation center of Marāgha in 657/1258–1259. One can assume that al-Ḥillī met al-Kātibī at Marāgha around the year 670/1271–1272, while he was

studying there under al-Ṭūsī (Schmidtke 1991, pp. 12–22), and that he left Marāgha after the latter's death in 672/1273, when he was himself 24 years old. During the following 20 years, he stayed partly in al-Ḥilla and partly in nearby Baghdad (Schmidtke 1991, p. 19). Ḥillī's teachers include also Shams al-Dīn Muḥammad al-Kīshī, a Shāfi'ī scholar, and a Sufi well acquainted with the works of Ibn 'Arabī (d. 637/1240), as well as 'Izz al-Dīn Abū l-'Abbās al-Wāsiṭī (d. 694/1292–1293), a student of Shīhāb al-Dīn al-Suhrawardī (d. 586/1190). It is likely that al-Ḥillī became aware of the ideas of Ibn 'Arabī and Suhrawardī through these two scholars. However, it was in the field of jurisprudence (*fiqh*) that al-Ḥillī first became distinguished, reaching the rank of jurisconsult (*mujtahid*) at an early age, and his works on law soon became authoritative.

In 694/1295, when al-'Allāma al-Ḥillī was 45 years old, Ghazan Khān (d. 703/1304) was the first Ilkhān to convert to Islam. While adhering superficially to the "orthodox" Sunni Islam, he paid particular attention to the Shī'is in Iran and Iraq, enriching the Imām's shrines of Karbalā' and Mashhad. His brother and successor Uljaytū (r. 703–716/1304–1316), known in Islamic sources as Muḥammad Khudābanda, declared Islam the religion of state immediately following his accession to the throne. At first he was a Sunni Ḥanafī; later he adhered to the Shāfi'ī doctrine; finally, he became Shī'ī in 707/1307–1308. He then tried to enforce the Shī'ī beliefs among the Muslims of the kingdom, notably by ordering the names of the 12 Imāms to be mentioned in the Friday prayers and that of 'Alī b. Abī Ṭālib (d. 40/661), the first Imām, to be engraved on the coinage. However, his endeavor seems to have been unsuccessful. According to Mamluk sources, he rejoined Sunni Islam towards the end of his reign; but other pieces of evidence show that he continued to adhere to Shī'ī Islam until his death in 716/1316.

Certain biographical accounts suggest that 'Allāma Ḥillī was the main responsible for Uljaytū's conversion to Shī'ism; in addition to Shī'ī sources (Afandī Jīrānī 1991, vol. 1, p. 361; Khawāṣṣārī 1971, vol. 2, pp. 279–281;

‘Āmilī 1960–62, vol. 24, p. 231), Ibn Baṭṭūṭa also mentioned this fact (Ibn Baṭṭūṭa n.d., p. 156; Schmidtke 1991, pp. 24–25). A report says that after having divorced his wife, Uljaytū regretted deeply and required whether there was a lawyer of any juridical school who could nullify this divorce. Al-Ḥillī was summoned to court where he engaged in discussions with Sunni scholars and defeated them, making such an impression on Uljaytū that he adopted Shī‘ism (Khawāṣṣārī 1971, vol. 2, pp. 279–280). Yet the Shī‘i theologian and historian Nūrullāh Shūshtarī (d. 1019/1610) relates that Uljaytū had already converted to Shī‘ism, after witnessing a vision during a visit to the tomb of Imām ‘Alī at Najaf, at the time al-Ḥillī came to his court. The latter took part in discussion sessions with Shāfi‘i doctors and convinced them of the preeminence of the Shī‘i doctrine (Shūshtarī 2014–2015, vol. 3, p. 578; Idem, vol. 5, p. 282).

It is certain, however, that al-‘Allāma al-Ḥillī had an excellent relationship with the Ilkhān. It is likely that he accompanied him in Rajab 709/December 1309 visiting the tomb of Salmān al-Fārisī, a companion of the Prophet and an early figure of Shī‘ism, after which he stayed in his court at Sulṭāniyya, near modern-day Qazvin. He offered the new convert several treatises on Shī‘i theological dogmatic, such as *Minhāj al-karāma fī ma‘rifat al-imāma* (“The Path of Nobility in the Knowledge of the Imamate”), *Kashf al-yaqīn fī faḍā‘il amīr al-mu‘minīn* (“The Unveiling of the Certitude on the Merits of the Prince of the Believers [‘Alī b. Abī Ṭālib]”), and *Istiqṣā’ al-naẓar fī l-baḥṭh ‘an al-qaḍā’ wa l-qadār* (“The Profundity of the Research on the Divine Decree and Ordination”), demonstrating that man is a free agent (al-Ṭihirānī 1983, vol. 2, pp. 31–32); he also wrote at Uljaytū’s demand a treatise concerning the merit of the veneration of tombs. Together with his son Fakhr al-Muḥaqqiqīn (d. 771/1369), he was frequently engaged in public discussions with Sunni scholars on juridical or theological topics (Shūshtarī 2014–2015, vol. 3, pp. 578–584), and both were then appointed in the mobile school (*al-madrasa al-sayyāra*) which accompanied the Ilkhān wherever he went (Khawāṣṣārī 1971, vol. 2, pp. 281–282; Schmidtke

1991, pp. 29–31). Al-Ḥillī’s departure from the court may have taken place during Uljaytū’s lifetime, if we assume that the latter reconverted to Sunni Islam during his reign. Between 715/1315 and 716/1316, al-Ḥillī appears to have left Sulṭāniyya for al-Ḥilla, where he remained for the final 10 years of his life, which he dedicated to teaching (Schmidtke 1991, pp. 31–32).

Among al-Ḥillī’s numerous students, the most prominent was his son Fakhr al-Muḥaqqiqīn who accompanied him everywhere until his death and wrote commentaries on several of his works. Two of his nephews, ‘Amīd al-Dīn (d. 754/1353) and Ḍiyā al-Dīn al-A‘rajī (d. after 740/1339–1340), also wrote commentaries on a number of his works. Another of al-Ḥillī’s outstanding students was Quṭb al-Dīn al-Rāzī al-Buwayhī (d. 766/1365), famous for his works on logic and philosophy, who attended his lessons at the *madrasa sayyāra* between 709/1309 and 714/1414–1415 (Schmidtke 1991, p. 39).

Al-‘Allāma al-Ḥillī significantly contributed to the spread of Shī‘ism in Iraq and Iran through his teaching and his political activity. For this reason, he remains widely respected among the Twelver Shī‘is and is even credited by a popular account with an encounter with the hidden twelfth Imām (Shūshtarī 2014–2015, vol. 3, pp. 582–583; Khawāṣṣārī 1971, vol. 2, pp. 282–283). However, at the time that the temptation of revenge against the Sunnis would have been widespread among the Shī‘is, he always kept a moderate attitude, far from the fanaticism which he considered to have caused only painful trials for the Shī‘is. This attitude is obvious from his participation in many discussions with Sunni scholars, as well as from his theological positions presented below. In his works, he avoids discussing issues which had been distinctive of early Imāmi theology and commonly condemned as “heretic” by Sunni theologians, such as the change of God’s will (*badā’*), the particular resurrection of God’s best friends and worst enemies at the end of time (*raj‘a*), and the integrity of the Qur’an. Yet, he makes no concession concerning the succession of the Prophet, the imamate and the intercession, refuting the Sunni and Mu‘tazili conceptions with both rational and scriptural arguments (Laoust

1966, 1978). His moderate attitude did not prevent him from being the target of the Ḥanbali lawyer and theologian Ibn Taymiyya (d. 728/1328), who authored a violent refutation of his *Minhāj al-karāma* entitled *Minhāj al-sunna al-nabawiyya*, as well as fatwas against the veneration of tombs and various Shī'i practices. To be sure, the revival of Shī'ism under the Ilkhāns, in which al-'Allāma al-Ḥillī played a major role, also led to a recrudescence of the anti-Shī'i feeling in the Seljuq kingdom (al-Jamil 2009).

His Thought

According to the comprehensive study of Sabine Schmidtke, al-'Allāma al-Ḥillī is to be considered, together with Naṣīr al-Dīn al-Ṭūsī and Mītham al-Baḥrānī (d. 699/1300) – the author of a major commentary on the *Nahj al-balāgha*, the collection of sayings attributed to 'Alī b. Abī Ṭālib – as the main representative of the last Imāmi Mu'tazili theological school. This school started to develop sometime after al-Sharīf al-Murtaḍā (d. 436/1044) and al-Shaykh al-Ṭūsī (d. 460/1067), two prominent Twelver Shī'i scholars reformist scholars following the Occultation of the twelfth Imām, under the influence of the Mu'tazili school of Abū l-Ḥasan al-Baṣrī (d. 436/1044). Interestingly, the heresiographer al-Shahrastānī (d. 548/1153), in his famous *Kitāb al-milal wa l-niḥal*, considered Abū l-Ḥasan al-Baṣrī to have adopted the doctrine of the philosophers under the cover of theology (*kalām*) (Shahrastānī 1947, vol. 1, p. 78). In this respect, the Mu'tazili school of al-Baṣrī would also have influenced the Sunni theologian Fakhr al-Dīn al-Rāzī (d. 606/1209), who tried to adapt philosophical concepts – mainly borrowed from Ibn Sīnā – to the Ash'ari rather than the Mu'tazili and Imāmi doctrine (Madelung 1970, pp. 27–28; Schmidtke 1991, pp. 2–7; 1994).

As for al-'Allāma al-Ḥillī, one can argue, from the study of his extant theological works, that in contrast to Naṣīr al-Dīn al-Ṭūsī and similarly to Fakhr al-Dīn al-Rāzī, he was basically a theologian, yet a Twelver Shī'i, rather than a philosopher. Although well acquainted with philosophy and

influenced by some Avicennian ideas, he rejected philosophical doctrines whenever they disagreed with his theological views. In his demonstration of God as “necessarily existent by itself” (*wājib al-wujūd li-dhātihī*), “absolute existence” (*wujūd muṭlaq*) and “perfect existence” (*wujūd kāmil*), he appears to have been strongly influenced by Avicenna's concepts and arguments (*Bāb*, pp. 5–7; transl., pp. 9–12; *Kashf*, pp. 29–40). However, he rejected the Neoplatonist notion of emanation (*ṣayḍ, ifāda*), arguing that God is a voluntary agent and not a necessitating cause (Schmidtke 1991, p. 255). Likewise, he disagreed with the philosophers' (namely al-Fārābī (d. 339/950) and Avicenna) doctrine of the eternity of the world by conceiving God as a voluntary agent who may annihilate His creation if He has a reason to do so (Schmidtke 1991, p. 215). Furthermore, as seen above, it is likely that al-Ḥillī became acquainted with the ideas of Ibn 'Arabī and Suhrawardī; however, although he wrote commentaries on the latter's *Kitāb al-Talwīhāt* (see below), one can assume from his theological works that neither Suhrawardī's doctrine of illumination (*ishrāq*) nor Ibn 'Arabī's theosophy and monism had any influence on his thought.

Al-'Allāma al-Ḥillī authored many philosophical works, most of which are commentaries on various classical works of philosophers, apparently intended for students of religious schools. His first one was *al-Asrār al-khaṣiyya fī l-'ulūm al-'aqliyya* (“The Hidden Secrets about the Rational Sciences”), written before 680/1281. It is organized in three parts, according to the classical division of philosophy in logic (*manṭiq*), physics (*tabī'iyāt*), and theology or metaphysics (*ilāhiyyāt*). In this book, al-Ḥillī is highly critical of philosophical propositions disagreeing with fundamental theological views (Schmidtke 1991, pp. 56–57). He completed in 694/1295 a commentary on al-Kātibī al-Qazwīnī's (d. 675/1277) *Ḥikmat al-'ayn*, entitled *Idāḥ al-maqāṣid* (“The Clarification of the Aims”) (al-Ṭihrānī 1983, vol. 2, p. 501; Schmidtke 1991, p. 80). In 717/1317, he completed a commentary on Avicenna's *Kitāb al-Shifā'* entitled *Kitāb Kashf al-khaṣā min Kitāb al-Shifā'* (“The Unveiling of the Hidden from the Book of Healing”), one

of his most authoritative works in the field of philosophy, only the second part of which is extant. All his remaining philosophical works are lost and known only by title. Four of them concerned Avicenna's *al-Ishārāt wa l-tanbīhāt*, and two others different views of Avicenna. Two further works seem to have been commentaries on Suhrawardī's *Kitāb al-Talwīḥāt* ("the Book of Intimations"): *Ḥall al-mushkilāt min Kitāb al-Talwīḥāt* ("The Solution of the Problems of the Book of Intimations") and *Kashf al-mushkilāt min Kitāb al-Talwīḥāt* ("The Unveilings of the Problems of the Book of Intimations"). Most of these works were probably composed just before 720/1320 (Schmidtke 1991, pp. 56–59). Schmidtke assumes that "the reason why most of al-Ḥillī's philosophical works are lost was presumably that they were of little originality. Since he was a theologian rather than a philosopher, it is most likely that he composed most of his philosophical works as books of instruction for his students" (Schmidtke 1991, p. 60). However, one can also assume a disinterest, or even an aversion towards philosophy, on the part of the late Shī'i scholars. For example, Sayyid Ḥaydar al-Āmulī (d. after 787/1385–1386), who was a student of Fakhr al-Muḥaqqiqīn and a highly speculative thinker, paid little attention to Avicenna's ideas and concepts, more because of his mystical inclinations than because of supposedly "conservative" theological views (Terrier 2018b).

The thought of al-'Allāma al-Ḥillī can be adequately presented following the classical structure of two of his theological treatises. *Kashf al-murād fī sharḥ Tajrīd al-i'tiqād* ("The Unveiling of the Meaning. A Commentary on the Purification of the Belief"), completed in 696/1297, is the first commentary written on Naṣīr al-Dīn al-Ṭūsī's *Tajrīd al-i'tiqād*, historically one of the most influential Shī'i theological treatises, and the first to integrate the Peripatetic school of philosophy within Shī'i theology; al-Ḥillī's *Kashf al-murād* would eventually serve as basis for many later commentators of the work (al-Ṭīhrānī 1983, vol. 18, p. 60; Schmidtke 1991, p. 90; Kamada 1992). *Al-Bāb al-ḥādī 'ashar fī mā yajibū 'alā 'āmmat al-mukallaḥīn min ma'rifat uṣūl al-dīn* ("The Eleventh Chapter about the Knowledge of the

Principles of Religion Which Is Incumbent to All the Responsible Beings"), completed in 723/1323, was originally an additional chapter – the eleventh one – of *Minḥāj al-ṣalāḥ fī ikhtisār al-Miṣbāḥ*, a summary of *Miṣbāḥ al-mutahajjid*, a book of supplications and rituals authored by the earlier Shī'i scholar al-Shaykh al-Ṭūsī (d. 460/1067) (al-Ṭīhrānī 1983, vol. 23, pp. 164–165; vol. 21, pp. 118–119). Numerous commentaries have been written about al-Ḥillī's *Bāb al-ḥādī 'ashar* by Shī'i scholars, theologians, and philosophers, among which Ibn Abī Jumhūr al-Aḥsā'ī (d. after 904/1499) is to be mentioned (al-Ṭīhrānī 1983, vol. 3, pp. 5–7; Schmidtke 1991, pp. 80–81; 2013; Terrier 2018c). Both al-Ḥillī's treatises are organized in five parts: the question of God's essence and attributes; divine Justice ('*adl*'); prophecy; imamate; and destination (*ma'ād*) – all of which integrate many philosophical ideas.

At the very beginning of *Bāb al-ḥādī 'ashar*, al-Ḥillī considers incumbent (*wājib*) upon all responsible subjects (*mukallaḥūn*) the knowledge of God, of his positive and privative attributes, of prophecy, of imamate, and of the destination, "by proof and not by imitation" (*bi-l-dalīl lā bi-l-taqlīd*) (*Bāb*, pp. 3–4; transl., pp. 4–5). However, his conception of religious law (*fiqh*) was far different. Al-Ḥillī is well known for having divided the community into *mujtahids*, i.e., jurists who are habilitated to exercise personal judgement (*ijtihād*); and *muqallids*, i.e., lay believers who must follow the latter. Al-Ḥillī defined the principles of *ijtihād* in his *Mabādī al-wuṣūl*, stating that the *mujtahids* are fallible in contrast to the infallible Imāms and may revise their statements; that *ijtihād*, being fallible, allows for *ikhtilāf*, or "divergence of opinions," among *mujtahids*; and that despite its fallibility, *ijtihād* is authoritative as long as the infallible twelfth Imām has not manifested. To quote Farhad Daftary, "al-Ḥillī's acceptance of *ijtihād* represents a crucial step towards the enhancement of the juristic authority of the '*ulamā*' in Twelver Shī'ism in the absence of a manifest Imām" (Daftary 2013, p. 78).

Concerning fundamental theology (*uṣūl al-dīn*), al-Ḥillī took part in the debate on the ontological relationship between God and His attributes. He objected to the position of

the Ash'ari theologians according to which God's essential attributes are entailed by real entities (*ma'ānī*) subsisting independently of Him (*qā'ima bi-dhātihī*) and residing in His essence (Gimaret 1990, p. 236). Al-Hillī, in agreement with the Mu'tazilis and the philosophers (*falāsifa*), rejected the existence of such entitative attributes as inconsistent with God's unity (*tawhīd*) and stated that the divine essential attributes of being knowing, powerful, living, and existing are entailed by the divine essence itself. It means, God is not knowing through a knowledge, powerful through a power, living through a life, etc. but is knowing through his essence, powerful through his essence, living through his essence, etc. (*Bāb*, p. 24; transl., pp. 38–39). However, al-Hillī disagreed with the view of philosophers such as Ibn Sīnā and al-Ghazālī (d. 505/1111), according to which attributes are not existential matters (*wujūdīyya*). Distinguishing between mental existence and existence in the external world, as did Aristotle and the Muslim philosophers, he stated that God's attributes are additional to his essence in ratiocination (*ta'aqqul*) but do not have any extramental reality (*fī l-khārij*) (Schmidtke 1991, pp. 168–169).

Concerning the notion of existence (*wujūd*), al-Hillī mainly follows the Avicennian tradition (Schmidtke 1991, p. 180) by considering the quiddity (*māhiyya*) of all things as established before their existence. This principle of anteriority of the essence to the act of existing would be eventually reversed by the Iranian Twelver Shī'ī philosopher Ṣadr al-Dīn al-Shīrāzī, best known as Mullā Ṣadrā (d. 1045/1635–1636 or 1050/1640–1641). With regards to God's knowledge, al-Hillī stresses that it embraces universals as well as individuals, agreeing here with al-Rāzī against philosophers and Avicenna in particular, without going so far, however, as al-Ghazālī did, as qualifying as infidelity (*kufr*) the thesis that God knows only universals and not future contingents (Al-Ghazālī 1990, p. 254). As for God's will, he rejects the view, shared by Avicenna and al-Rāzī, that God determined things from all eternity by a pre-eternal will. He considered God's knowledge as the motive for His action: when God knows that a certain act has an advantage (*maṣlaḥa*), then that

knowledge is will and becomes the motive of its enactment (*Bāb*, p. 14; transl., p. 22).

The nature of God's justice (*'adl*) is another main chapter of all Islamic classical theological treatises, especially from representatives of the Mu'tazili school. On this issue, al-Hillī supported the Mu'tazili position of ethical objectivism, according to which good and evil have real existence and are independent from revelation; consequently, there are things the goodness and evil of which are necessarily known by reason (Schmidtke 1991, p. 99). He argues that "reason (*'aql*) of necessity passes judgement as to what actions are good (*ḥasan*), such as the return of a trust and doing good, and as to what are evil (*qabīḥ*), such as injustice and an injurious lie. For those who deny all system of law, like the atheists (*malāḥida*) and the philosophers of India, judge good and evil thus. . ." (*Bāb*, p. 25; transl., p. 40). On the contrary, the Ash'aris, i.e., the representatives of the Sunni "orthodoxy," maintain that both good and evil are standards determined by the law (*sharī'a*); good is what the Lawgiver commands and evil is what He prohibits. Against al-Rāzī, al-Hillī maintains that rational-objective ethical standards apply to God as well as to man. That is, God approves one act because it is good, disapproves another because it is evil, and it is not because God approves or disapproves an act that it is good or evil; revelation is essentially the detailed explanation of what can be synthetically known by reason.

On the issue of free will versus determinism, al-Hillī firmly adhered to the Mu'tazili position that man is a free agent: "We are free agents (*fā'ilūn bi-l-ikhtiyār*), and necessity requires this: because of the necessary difference between a man's falling from the roof and his going down from it by a ladder – otherwise our responsibility (*taklīf*) for a thing would be impossible, and there would be no sin; and because of the evil of His creating an act in us and then punishing us for it" (*Bāb*, p. 27; transl., pp. 42–43). As stresses his commentator Miqdād al-Suyūrī (d. 826/1423), "if man were not the bringer-into-existence of his actions, and did not have power over them, then God would be the most unjust of unjust beings" by imposing moral obligation upon him and

by rewarding and punishing him for them (*Bāb*, p. 27; transl., p. 44; Schmidtke 1991, p. 125). Another argument borrowed from the Mu'tazilis is that it is impossible for God to commit any evil; consequently, it must be man who produces his acts both good and evil (*Bāb*, p. 28; transl., p. 44). This was contradictory to the Ash'ari position, especially that of al-Rāzī, according to which God is the doer of everything, be it good or evil, and although man appears to be a voluntary agent as he acts in accordance with his motives, he is in reality "compelled in the form of a free agent" (*muḍtarr fī ṣūrat mukhtār*) (Schmidtke 1991, p. 134), an expression, interestingly, used by Avicenna himself (Ibn Sīnā 1983–1984, p. 51). Consequently, on this issue, al-Ḥillī's position does not converge with that of the philosophers. However, he remains in accordance with the Mu'tazili and Shī'i creeds: as a *ḥadīth* attributed to the fifth and the sixth Imāms states: "Neither determinism nor delegation of power [from God to man], but something between" (*lā jabr wa lā tafwīḍ wa lākin al-amr bayna l-amrayn*), a position eventually deepened by Shī'i philosophers such as Mīr Dāmād (d. 1040/1631) (Mīr Dāmād 2012–2013).

A necessary consequence of divine Justice, according to al-Ḥillī, is that grace or kindness (*luṭf*) is incumbent upon God. "Grace is that which brings the creature near to obedience and keeps him far from disobedience. [...] For whenever he who wills an act from another (i.e. when God wills that man do something) knows that he will not do it except with the aid of an act which the willer can perform without any trouble, then if he does not perform it he would be contradicting his own aim, and reason pronounces that evil – God is exalted upon that!" (*Bāb*, p. 32; transl., p. 50) Having made man responsible for his acts, God is obliged to provide him with every possible facilitation which enables him to fulfil his obligations, and this is the definition of grace (Schmidtke 1991, p. 109). Likewise, al-Ḥillī maintains, in agreement with the Mu'tazilis, that the existence of misery and pain is necessary in this world; however, it should always be for a hidden benefit. Consequently, it is incumbent upon God to compensate for the suffering He

imposes to man, either directly, or which He had ordered, made licit or caused through constraint (*Bāb*, p. 33; transl., p. 52; Schmidtke 1991, pp. 121–122).

Al-Ḥillī's statement on God's obligation to dispense grace upon the responsible beings leads him to affirm the necessity of prophecy and imamate according to reason. That is, appointing a man who brings a message from Him, received by inspiration (*waḥy*) without a mediator, to guide men towards good and salvation, is incumbent upon God; as well as appointing the successor (*khalīfa*) of the Prophet, who stands in its place, except in receiving divine inspiration without a mediator (*Bāb*, pp. 34, 39–40; transl., pp. 54, 62). This is again in accordance with the Mu'tazili teachings. However, Ḥillī differs from the latter by refuting the idea that the Prophet could commit an act of evil, be it major or minor. He argues that it is necessary that the Prophet be immune to sin (*ma'ṣūm*), from the first day of his life to the last, in contradiction with the Sunni conception that he was immune to sin only following the revelation (*Bāb*, pp. 34, 37–38; transl., pp. 58–59).

Concerning the purpose of the prophetic mission, al-Ḥillī, by upholding the Mu'tazili view that man rationally knows ethical values in a general way, maintains that besides the acts whose moral value is known to man by reason, there are some acts which will either hinder or help man to fulfil his moral obligation, the value of which is not discernable by reason. The task of the prophets is not only to confirm what is already known by reason but also to convey something supplementary to reason. Here, al-Ḥillī adopts al-Ṭūsī's definition of prophecy: "The prophetic mission is a grace which embraces benefits such as the support of intelligence in what it demonstrates, the teaching to [intelligence] of judgment in what it does not demonstrate, the teaching of good and evil, useful and harmful, the preservation of the human race, the perfecting of individuals according to their different predispositions, the teaching of the secret arts, morals and politics, and finally, the teaching of punishment and reward" (*Kashf*, p. 468).

As a proof of Muḥammad's prophecy, al-Ḥillī puts forward the miracles, the first of which is the

Qur'an. By supporting the thesis that the Qur'an is the principal miracle of the Prophet, which is a typical Sunni creed, al-Ḥillī may have intended to conceal and deny the original allegation of the Shī'is that the holy book has been falsified, such a denying having become widespread among the rationalist Twelver Shī'ī scholars following the Occultation (Amir-Moezzi 2011, 2015). He also shares al-Rāzī's view that God creates miracles (*mu'jizāt*) exclusively for the prophets and charismatic powers (*karāmāt*) for the saints or the "friends [of God]" (*awliyā'*) (Schmidtke 1991, pp. 159–164). Interestingly, this is a view shared by both Sufis and Shī'is, the former identifying God's friends with their saints or spiritual masters, the latter, including al-Ḥillī, identifying them with their twelve impeccable Imāms.

Concerning imamate, which is the fourth pillar of religion (*uṣūl al-dīn*) according to the Shī'ī creed, al-Ḥillī gives a rational definition: "imamate is a universal authority in the things of religion and of the world belonging to some person (no more than one individual at any one period) and derived from the Prophet." Imamate is necessary according to reason (*wājiba 'aqlan*), because it is a grace and grace is incumbent upon God. Imamate is a grace because when men have a leader and a guide whom they obey, they draw near to soundness and depart from corruption (*Bāb*, pp. 39–40; transl. p. 62). In addition, Miqdād al-Suyūrī claims that "everything which proves that prophecy is necessary proves also that the imamate is necessary. [...] In the same way in which prophecy is incumbent upon God on philosophical grounds, so also is the imamate." (*Bāb*, p. 41; transl. p. 64).

Secondly, it is necessary according to reason that the Imām be immune to sin, otherwise he would need another Imām, and there would be an endless chain, which is impossible (*Bāb*, pp. 41–42; transl. pp. 64–65). It is noteworthy that the impossibility of an endless chain is a typically Aristotelian argument, fundamentally irrelevant to the arguments found in the ancient Imāmi traditions, which are based on esoteric and nonrational statements. Thirdly, it is necessary according to reason that the Imām be specified (*manṣūṣ*) for the imamate, because immunity to sin is a hidden matter (*bāṭina*)

which no one perceives but God; that is, the Imām must be appointed by God, not by the people, according to the Shī'ī creed and contrasting with the Sunni creed (*Bāb*, p. 43; transl., p. 68). Finally, it is necessary that the Imām be absolutely the best of the people (*Bāb*, p. 44; transl., p. 69). Therefore, the Imām after the Prophet Muḥammad must be 'Alī b. Abī Ṭālib, and after him, their 11 descendants through Muḥammad's daughter and 'Alī's wife, Fāṭima, each of them who preceded having appointed his successor, according to the creed of the Twelver Shī'is (*Bāb*, pp. 44–45, 50–51; transl., pp. 69–70, 78). Al-Ḥillī's rational justification of imamate would be eventually resumed by the famous student of his son Fakhr al-Muḥaqqiqīn, the Shī'ī-Sufi thinker Sayyid Ḥaydar Āmulī, in a polemic epistle entitled *Risāla Raf' al-khilāf wa l-munāza'a* (Āmulī 2017; Terrier 2018b).

About the Destination (*ma'ād*), i.e., the hereafter, 'Allāma al-Ḥillī still stands on the crest line between theological tradition and philosophical (blameworthy) innovation. He agreed with al-Rāzī that God will restore men after having caused their passing away. However, while the latter, as an Ash'ari theologian, denied in principle that God is subject to any obligation, al-Ḥillī, in view of his notion of divine Justice, held that God is obliged to do so. Moreover, he asserted that this obligation is known by reason, which is a typical Mu'tazili view (Schmidtke 1991, pp. 207–208). Regarding the modality of this restoration, he adopted an ambiguous position and may have evolved in his view. On the one hand, he supported that a living being consists of basic parts which are not subject to change and additional parts which are subject to change and dispersed by death, and that at the time of its restoration, God reassembles only the basic parts of it; consequently, he disagreed with the view of the philosophers that man consists of a body and a rational soul (*nafs nāṭiqā*). On the other hand, he supported Avicenna's conception, first adopted by al-Ṭūsī, that the rational soul is the substance of man and that it is separate from the body and uncorruptible, taking it as a base for his own conception of the hereafter (*Kashf*, pp. 274–281; Schmidtke 1991, pp. 218–219).

Regarding retribution, al-Ḥillī maintained that man, in virtue of his free will, deserves reward and punishment for his acts of obedience and disobedience. In view of his Justice, God is obliged to render to man all the reward and punishment that he deserves for his action unless he pardons him or the Prophet intercedes on his behalf (Schmidtke 1991, p. 223). This is another view shared by the Twelver Shī‘is and the Mu‘tazilis. Concerning the question of the Muslim grave sinner, al-Ḥillī objected to the Mu‘tazili view of mutual cancellation of acts of obedience and disobedience, and of reward and punishment (Schmidtke 1991, pp. 227–230). On account of the Imāmi concept of belief, he rejected the Mu‘tazili notion of the intermediate position of the Muslim grave sinner. He also argued on the basis of reason against the eternal punishment of a believing sinner, considering God’s forgiveness (*‘afw*), the Prophet’s intercession (*shafā‘a*), and repentance (*tawba*), as ways in which the sinner’s punishment might be cancelled (Schmidtke 1991, pp. 235–249). Here again, it is worth noticing that this rationalization considerably attenuates the dualistic doctrine of the early Shī‘ism.

In conclusion, if al-‘Allāma al-Ḥillī was a theologian rather than a philosopher, playing a key role in the diffusion in Iraq and Iran of a moderate and rationalized Shī‘i creed in early modern times, he also played a significant role in the history of philosophy in Islam. With him, the idea arose that an authoritative religious scholar should be competent in philosophy, if not a follower of the philosophers. Above all, by adapting Avicenna’s concepts, arguments and ideas, as well as the Mu‘tazilis’ ones, to Shī‘i theology and imāmology, he bequeathed a doctrine suitable to be combined with Ibn ‘Arabī’s theoretical mysticism and Suhrawardī’s philosophy of illumination, and paved the way for the synthetic works of Sayyid Ḥaydar Āmulī, Ibn Abī Jumhūr al-Aḥsā‘ī, and up to Mīr Dāmād and Mullā Ṣadrā in modern times.

Al-Ḥillī’s Main Edited Works

In the reproduction of an *ijāza* (licence to teach), al-Majlisī gives a list of some of al-Ḥillī’s

books up to 720/1320 (Majlisī 1983, vol. 104, pp. 147–149). For a complete annotated list of Ḥillī’s works, see Schmidtke (1991, pp. 74–98).

Al-‘Allāma al-Ḥillī, *Al-Alfayn al-fāriq bayn al-ṣidq wa l-mayn* (ed.: al-A‘lamī, H.). Beirut: Mu‘assasat al-A‘lamī li-l-maṭbū‘āt, 1402/1982. This work was written between 709/1309–10 and 712/1312–1 (al-Ṭihirānī 1983, vol. 2, pp. 298–299; Schmidtke 1991, pp. 78–79).

Al-‘Allāma al-Ḥillī, *Anwār al-malakūt fī sharḥ al-Yāqūt* (ed.: Zanjānī, M. N.). Tehran: Dānishgāh-i Tihirān, 1959. This work was completed in 684/1285 (al-Ṭihirānī 1983, vol. 2, pp. 444–445; Schmidtke 1991, p. 79).

Al-‘Allāma al-Ḥillī, *Al-Bāb al-ḥādī ‘ashar fī mā yajibū ‘alā ‘āmmat al-mukallaḥīn min ma‘rifat uṣūl al-dīn*, edited together with its commentaries *al-Nāfi‘ yawm al-ḥaṣhr* by al-Miqdād al-Suyūrī and *Miftāḥ al-bāb* by Abū l-Faṭḥ b. Makhdūm al-Ḥusaynī (d. 976/1568–69) (ed.: Muḥaqqiq, M.). Mashhad: Mu‘assasat āstān-i quds-i riḍawī, 1372 Sh./1993–94. English transl.: Hasan b. Yūsuf b. Alī Ibnu’l-Mutahhar al-Ḥillī, *al-Bābu ‘l-Hādī ‘Ashar. A treatise on the principles of Shī‘ite theology* (W. Mc Elwee Miller, English Trans.). London: The Royal Asiatic Society, 1928.

Al-‘Allāma al-Ḥillī, *Īdāḥ al-maqāṣid fī sharḥ Ḥikmat al-‘ayn* (ed.: Munzawī, ‘A.). Tehran: Čapkānah-i dānishgāh, 1378/1959.

Al-‘Allāma al-Ḥillī, *Irshād al-adhhān fī aḥkām al-īmān* (ed.: al-Ḥasūn, F.). Qum: Mu‘assasat al-nashr al-islāmī, 1410/1989. This work was completed in 696/1296–7 (al-Ṭihirānī 1983, vol. 1, pp. 510–512, which mentions thirty-eight commentaries on this book; Schmidtke 1991, pp. 77–78).

Al-‘Allāma al-Ḥillī, *Istiḡṣā‘ al-naẓar fī l-baḥṭh ‘an al-qaḍā‘ wa l-qadar* (ed.: Tabrīziyān, F.). Tehran: Mash‘ar, 1418/1997–98. It was written after 709/1309 (al-Ṭihirānī 1983, vol. 2, pp. 31–32; Schmidtke 1991, p. 78).

Al-‘Allāma al-Ḥillī, *Al-Jawhar al-naḍīd fī sharḥ Mantīq al-Tajrīd* (ed.: Bīdārfar, M.). Tehran: Intishārāt-i Bīdār, 1363 Sh./1984–85. This work is a commentary on the logics of Naṣīr

- al-Dīn al-Ṭūsī's *Kitāb al-Tajrīd* (al-Ṭīhrānī 1983, V, p. 290; Schmidtke 1991, p. 85).
- Al-ʿAllāma al-Ḥillī, *Kashf al-murād fī sharḥ Tajrīd al-iʿtiqād* (ed.: Ḥasanẓādah al-ʿAmulī, Ḥ.). Qum: Muʿassasat al-nashr al-islāmī, 1437/2015–16.
- Al-ʿAllāma al-Ḥillī, *Khulāsat al-aqwāl fī maʿrifat al-rijāl* (ed.: Baḥr al-ʿulūm, M. Ṣ.). Najaf: al-Ḥaydariyya, 1972. This work was completed in 693/1294 (al-Ṭīhrānī 1983, vol. 7, pp. 214–215; Schmidtke 1991, pp. 85–86).
- Al-ʿAllāma al-Ḥillī, *Mabādīʾ al-wuṣūl ilā ʿilm al-uṣūl* (The foundations of jurisprudence: An introduction to Imāmī Shīʿi legal theory) (ed. & trans.: Shah Naqavi, S. A.). Leiden: Brill, 2017 (al-Ṭīhrānī 1983, vol. 19, pp. 43–44; Schmidtke 1991, pp. 91–92).
- Al-ʿAllāma al-Ḥillī, *Manāḥij al-yaqīn fī uṣūl al-dīn* (ed.: al-Anṣārī, M. R.). Qum: n.n., 1416/1995–96. This work was completed in 680/1281 (al-Ṭīhrānī 1983, vol. 22, p. 352; Schmidtke 1991, p. 94).
- Al-ʿAllāma al-Ḥillī, *Minḥāj al-karāma fī maʿrifat al-imāma* (ed.: Mubārak, ʿA.). Mashhad: Muʿassasat ʿĀshūrāʾ li-l-taḥqīqāt wa l-buḥūth al-islāmiyya, 1419/1998–99. Also in its refutation by Ibn Taymiyya, *Minḥāj al-sunna al-nabawiyya* (introd., pp. 77–202) (ed.: Salīm, R.). Cairo: Maktabat dār al-ʿurūba, 1962. This work was written after 709/1309 (al-Ṭīhrānī 1983, vol. 23, p. 172; Schmidtke 1991, p. 95).
- Al-ʿAllāma al-Ḥillī, *Mukhtalaḥ al-shīʿa fī aḥkām al-sharīʿa* (ed.: unknown). Tehran: n.n., 1323/1905. It was written between 699/1300 and 708/1309 (al-Ṭīhrānī 1983, vol. 20, pp. 218–221; Schmidtke 1991, p. 92).
- Al-ʿAllāma al-Ḥillī, *Nahj al-ḥaqq wa kashf al-ṣidq* (eds.: al-Ḥusaynī, F., & al-Ṣadr, R.). Beirut: Dār al-kitāb al-lubnānī, 1982. It was written after 709/1309 (al-Ṭīhrānī 1983, vol. 24, p. 416; Schmidtke 1991, p. 97).
- Al-ʿAllāma al-Ḥillī, *Nahj al-mustarshidīn fī uṣūl al-dīn*, edited with al-Miqdād al-Suyūrī, *Irshād al-tālibīn ilā nahj al-mustarshidīn* (ed.: al-Rajāʿī, M.). Qum: Manshūrāt maktabat Āyatullāh al-ʿuzmā Marʿashī al-Najafī, 1405/1984–85. This work was completed in 699/1299 (al-Ṭīhrānī 1983, vol. 24, p. 424; Schmidtke 1991, pp. 97–98).
- Al-ʿAllāma al-Ḥillī, *Nihāyat al-wuṣūl ilā ʿilm al-uṣūl* (ed.: al-Bahādūrī, I.). Qum: Muʿassasat al-imām al-Ṣādiq, 1425/2004–5. It was completed in 704/1305 (al-Ṭīhrānī 1983, vol. 24, pp. 408–409; Schmidtke 1991, p. 96).
- Al-ʿAllāma al-Ḥillī, *Qawāʿid al-aḥkām fī maʿrifat al-ḥalāl wa l-ḥarām* (3 vols.; ed.: unknown). Qum: Muʿassasat al-nashr al-islāmī, 1413/1992–93. It was completed on 699/1300 (al-Ṭīhrānī 1983, vol. 17, pp. 176–177; Schmidtke 1991, p. 88).
- Al-ʿAllāma al-Ḥillī, *Al-Risāla al-saʿdiyya*, in *Kalimāt al-muḥaqqiqīn* (ed.: unknown). Tehran: n.n., 1315/1898, pp. 338–379. This work was written between 709/1309 and 711/1312 (al-Ṭīhrānī 1983, vol. 12, p. 183; Schmidtke 1991, pp. 86–87).
- Al-ʿAllāma al-Ḥillī, *Risāla fī Wājib al-iʿtiqād ʿalā jamīʿ al-ʿibād*, together with al-Miqdād al-Suyūrī, *Iʿtimād fī sharḥ Wājib al-iʿtiqād*, in *Kalimāt al-muḥaqqiqīn* (ed.: unknown). Tehran: n.n., 1315/1898, pp. 380–422 (al-Ṭīhrānī 1983, vol. 25, p. 4; Schmidtke 1991, p. 87).

al-ʿĀmirī, Abū l-Ḥasan

Elvira Wakelnig

Department of Near Eastern Studies, University of Vienna, Vienna, Austria

Abstract

The tenth-century Khurasani philosopher Abū l-Ḥasan Muḥammad b. Yūsuf al-ʿĀmirī was one of the last representatives of the philosophical tradition initiated by al-Kindī. His works show a strong influence of Greek philosophy, for example, the *Book on the Afterlife* (*K. al-Amad ʿalā l-abad*) draws heavily on Plato's *Phaedo* and the *Chapters on Metaphysical Topics* (*K. al-Fuṣūl al-Maʿālim al-ilāhīya*) are, in fact, a paraphrase of parts of the *Elements of Theology* by the late Neoplatonist Proclus.

About al-ʿĀmirī's life not much information is preserved. Although he is said to have lived under the patronage of certain rulers at given times, he is also pictured as an itinerant Sufi in one of al-Tawḥīdī's accounts. At the beginning of his *On the Afterlife*, al-ʿĀmirī listed the titles

of his 17 major works, five of which are known to be extant today. This list provides a good picture of the topics he wrote on, namely, logic, physics, psychology, metaphysics, ethics, biology and medicine, different religions, Sufism, and interpretation of the Qurʾān, as well as of dreams. However, it seems that he was primarily known as a metaphysician.

Biographical Information

Whereas al-ʿĀmirī's date and place of birth are unknown, the exact day of his death occurring in Nishapur was apparently January 6, 992. The reason why this date has been preserved is that on the very same day, the religious scholar Abū Bakr Aḥmad b. al-Ḥusayn b. Mihrān al-Muqri' passed away and al-ʿĀmirī was said to have saved him from hell by being his ransom.

In his early years, al-ʿĀmirī studied with Abū Zayd al-Balkhī (d. 934), a student of al-Kindī, then spent some time at the courts of various rulers, and visited Baghdad twice. In the sixties and seventies of the tenth century, he was in Rayy under the patronage of Abū l-Faḍl b. al-ʿAmīd and his son Abū l-Faḥ b. al-ʿAmīd Dhū l-Kifāyatayn. In the entourage of the latter, al-ʿĀmirī came to Baghdad and attended the scholarly gatherings which Abū l-Faḥ organized there. Al-Tawḥīdī reports the course of many such sessions in his various works, among them an encounter between al-ʿĀmirī and the famous grammarian Abū Saʿīd al-Sīrāfī. The latter answered the former's question on the nature of the Arabic particle *bi-* in the *basmala* with silence.

Al-ʿĀmirī spent the last years of his life in Nishapur and Bukhara, where he was, at least temporarily, at the court of the Samanid vizier Abū l-Ḥusayn ʿUbaydallāh b. Aḥmad al-ʿUṭbī, most probably benefiting from the ruler's magnificent library.

Thought/Philosophy

Al-ʿĀmirī's concept of knowledge comprises traditional religious and philosophical sciences. The importance of the religious sciences lies in their

being based on divine revelation. Thus, they are able to provide answers to questions which intellect alone cannot solve, for example, what kind of acts of devotions and religious observances should be performed. As to religious sciences, al-ʿĀmirī distinguishes *kalām* which is attained by intellect, *fiqh* (law) which is perceived by intellect and sense perception, and the science of *ḥadīth* which is grasped by sense perception alone and linguistics, which functions as a tool to the former three. Correspondingly, philosophy is divided into metaphysics, mathematics, natural sciences, and logic. Only a person who has mastered the latter three sciences and proceeded to metaphysical matters can be truly called a philosopher. The history and development of Greek philosophy as such, and metaphysics in particular, are closely tied to the Qurʾānic revelation received by Luqmān and Solomon. The former is taken to be the first sage who taught Empedocles his knowledge, and the companions of the latter are said to have instructed Pythagoras in physical and metaphysical matters. Al-ʿĀmirī's own metaphysics is founded on the Neoplatonic hierarchy of being, which he either uses in its basic form (God – Universal Intellect – Universal Soul – Nature) or in a more detailed elaboration (God – Universal Forms and Intellect – Universal Soul and Sphere of the Spheres, which may correspond to Universal Nature – Spheres and Heavenly Bodies – Beings composed of the four elements). However, it is the dichotomy between the spiritual and the bodily world which is of crucial interest to al-ʿĀmirī's thought. Man is understood as forming a link between these two worlds as he consists of a spiritual soul and a body which is composed of the four elements. In this world, man acts as God's representative, and in the next one, he may become an eternal adornment, if he succeeds in likening his soul to the divine by grasping the eternal intellectual forms. The human soul and body are understood as two separate substances, which are independent of each other and may therefore overcome one another. Although the soul is able to prevent the body from giving into its desires, the body can lead the soul astray and distract it from its ultimate goal, that is, its ascent to the spiritual world. Whereas the soul provides life to the body, the body enables the soul to

experience good and evil and thus to discriminate between them by its own personal trial. This distinguishes men from the angels who have knowledge of the evil but no experience of it. However, as the human body constitutes a liability to the soul, God has set up the religious law by which man is guided from the lower to the upper world. Therefore, al-ʿĀmirī describes man as being religious by nature. Religious belief may be caused by one of two different powers or faculties of the human soul, either the intellective or the imaginative one. If it is by the former, true belief results, and if it is by the latter, either true or false belief may result.

Within the scope of religious belief, the problem of predestination and free will falls, which was prominent in the *kalām* discussions of his time and which al-ʿĀmirī tackled in two of his extant writings, the *Deliverance of Mankind from the Problem of Predestination and Free Will* (*Inqādh al-bashar min al-jabr wa-l-qadar*) and the later *Determination of the Various Aspects of Predestination* (*al-Taqrīr li-awjuh al-taqdīr*). His approach is to determine four essential causes of any given existence, namely, the four Aristotelian causes (matter, agent, form, and end) and countless accidental causes. Furthermore, matter, agent, and form are distinguished into a proximate and a remote matter, agent, and form and are, thus, twofold causes. Hence, God may always be understood as the remote agent of any human action, whereas man is the proximate cause of his actions. Thus, al-ʿĀmirī's position turns out to be a middle one between believing in predestination, which he explains as resulting from taking into consideration only the accidental causes and human deficiency, and believing in free will, which results from focusing solely on the essential causes and the generosity of God. As to heavenly influence, which is the mean by which divine predestination is communicated to the lower world, al-ʿĀmirī explains that man is subject to this influence due to his corporeal form but may escape it with the help of his purified soul.

In addition to the configuration of the celestial spheres and bodies, magic, witchcraft, spells, talismans, and the evil eye may also have an impact on man, although they are rarely able to affect his

rational soul. Contrarily, prayer may grant further reaching power over other bodies to saints and prophets, because prayer strengthens the soul's spirituality, provides the help of the angels, and is only granted by God as an honor.

Al-ʿĀmirī's philosophical thought does not seem to have had a strong impact on later generations. Therefore, it comes as no surprise that only seven of his writings are known to be extant today: The *Book on the Afterlife* (*K. al-Amad ʿalā l-abad*) which is influenced by Plato's *Phaedo*; the *Chapters on Metaphysical Topics* (*K. al-Fuṣūl al-Maʿālim al-ilāhīya*) which are, in fact, a paraphrase of parts of Proclus' *Elements of Theology*; the *Deliverance of Mankind from the Problem of Predestination and Free Will* (*Inqādh al-bashar min al-jabr wa-l-qadar*) which also discusses several *kalām* positions on the topic; the *Determination of the Various Aspects of Predestination* (*al-Taqrīr li-awjuh al-taqdīr*) which draws on the Aristotelian model of the sublunar world; the *Vision and the Visible* (*al-Ibṣār wa-l-mubṣār*) on sense perception in the tradition of Aristotle's *De anima*; *An Exposition on the Merits of Islam* (*al-Iʿlām bi-manāqib al-islām*); and *An Explanation of the Various Aspects of the Interpretation of Dreams* (*al-Tabṣīr li-awjuh al-taʿbīr*) whose existence in a Turkish manuscript has recently come to light. The *Seven Discussions between the Shaykh and al-ʿĀmirī* (*al-Majālis al-sabʿ bayna al-shaykh wa-l-ʿĀmirī*) contain reports about philosophical exchanges in the form of questions and answers. Recently the identification of the questioner with Ibn Sīnā and of the respondent with al-ʿĀmirī has been suggested. Al-ʿĀmirī's authorship of the *Book on Happiness and its Creation in Human Life* (*K. al-Saʿāda wa-l-isʿād fī l-sīra al-insānīya*), although often upheld, is far from being established for certain.

Abstract

Sayyid Haydar Âmulî (d. after 787/1385–86), is a Shī‘i Imāmi thinker, famous for his efforts to reconcile Twelver Shī‘ism, Sufism, and a certain form of philosophy. According to his autobiographical accounts, this member of a noble family of northern Persia relinquished his worldly career around the age of thirty, donned the Sufi cloak and became a wandering gnostic. His two major sources of inspiration are the early esoteric tradition of the Shī‘i Imāms and the theoretical mysticism of Ibn ‘Arabî. In most of his works, he intended to demonstrate the harmony between Law (*sharī‘a*), or the exoteric dimension of religion, Path (*ṭarīqa*), or the mystical tradition

of Sufism, and Truth (*ḥaqīqa*), or the intellectual knowledge of realities. For this reason, he is to be seen as a major representative of the ‘golden age of heterodoxies in Islam’ during the early modern period, and as a forerunner of the Shī‘i philosophical gnosis in the eleventh/seventeenth-century Iran.

Bahā’ al-Dīn Ḥaydar ibn ‘Alī ibn Ḥaydar al-‘Alawī al-Ḥusaynī al-Āmulī, known as Sayyid Ḥaydar Āmulī (b. 719/1320 – d. after 787/1385–86), was a Shī‘i Imāmi thinker in the fields of theology (*kalām* and *tafsīr*), mysticism, and metaphysics. He is still celebrated for his efforts to reconcile Twelver Shī‘ism, Sufism, and a certain form of philosophy and for this reason is frequently associated with Ḥāfiẓ Rajab al-Bursī (d. after 813/1410–11) and Ibn Abī Jumhūr al-Aḥsā‘ī (d. after 904/1499) (see their entries); he is also to be seen as a forerunner of the Shī‘i philosophical gnosis in the eleventh/seventeenth-century Iran (Shaybī 2011, II, pp. 104–115).

His Life

Ḥaydar Āmulī was a member of a large family of sayyids (descendants of Prophet Muḥammad) from Āmul, in the province of Tabarastān. He belonged to a subset of the Iranian population who had already converted to Twelver Shī‘ism before the Safavid era (906–1134/1501–1722), when it became the state religion of Iran. Under Ilkhanate rule (656–756/1258–1355) and the semi-anarchic post-Ilkhanate or pre-Timurid interregna (756–807/1355–1405), Iran was still predominantly Sunni; nevertheless, Shī‘i ideas permeated the empire, emanating from the resident Sufi brotherhoods which remained at least nominally Sunni (Molé 1961; Bausani 1968).

Most of the available information on the life of Sayyid Ḥaydar Āmulī come from his two autobiographical accounts, the first of which was included at the beginning of his *Muḥīt al-a‘ẓam*, completed in 777/1375–76 (MAa, I, pp. 528–531; MAb, pp. 202–204; *La philosophie shi‘ite*, French introd., pp. 18–19, Arabic introd. pp. 42–44), and

the second in his *Naṣṣ al-nuṣūṣ*, finished in 782/1380–81 at the age of 63 (NNa, pp. 535–537; NNb, II, pp. 851–853; *La philosophie shi‘ite*, French introd., pp. 21–23, Arabic introd. pp. 10–13). Both accounts are mainly apologetic and focused on his spiritual evolution. He begins the first account by retracing his lineage to the fourth imam ‘Alī b. Ḥusayn Zayn al-‘Ābidīn (d. ca 95/714). He relates therein how for 20 years he studied exoteric Imāmi sciences, first in his birthplace Āmul, then in Khurasān, and in Iṣfahān. After that, he returned to Āmul and entered the service of the Prince of Ṭabaristān, Fakhr al-Dawla Ḥasan ibn Kay-Khusraw ibn Yazdgard (r. 734–750/1333–1349), the heir of a dynasty going back to the Sassanid kings of ancient Persia, whose minister he ultimately became, attaining thereby wealth and glory.

Around the age of 30, in 749/1348 or before, in consequence of a spiritual crisis, Sayyid Ḥaydar Āmulī relinquished his worldly career, left his parents and friends, donned the *khirqā* or Sufi cloak, and set out on a journey to the Shī‘i shrines of Iraq and to Mecca. On the road, he sat for a time in Isfahan at the feet of a Sufi master called Nūruddīn Tihirānī (from a village close to Isfahan), from whom he received a second *khirqā*, reputed to have been offered by the Angel Gabriel to the Prophet Muḥammad, then given by the latter to ‘Alī ibn Abī Ṭālib (d. 40/661), then by Imām to Imām to the eighth one ‘Alī al-Riḍā’ (d. 203/818), then by the latter to the Sufi master Ma‘rūf al-Karkhī (d. 200/815), then to Sarī al-Saqatī (d. 253/867), then to Abū al-Qāsim al-Junayd (d. 298/911), and so on to Shaykh Tihirānī (MAa, I, pp. 534–535; MAb, p. 206). Having accomplished his pilgrimage (*ḥājj*) in 751/1350, he visited the tomb of the Prophet but had to leave Medina due to ill health and returned to Najaf, Iraq, settling near the shrine of the first Imām ‘Alī Abī Ṭālib. Two of his major works (*Asrār al-sharī‘a* and *Jāmi‘ al-asrār*) were written during this Sufi Iraqi period.

Sayyid Ḥaydar remained for some years in Baghdad, where he studied with Fakhr al-Dīn Muḥammad b. Ḥasan b. Muṭahhar al-Ḥillī, best known under his nickname of Fakhr

al-Muḥaqqiqīn (d. 771/1370), the son of al-ʿAllāma al-Ḥillī (d. 726/1326). In 759/1358, he exchanged with him a series of questions and answers, described in an autograph manuscript dated from 762/1360–61 and entitled *al-Masāʾil al-āmuliyya* (“The questions of Āmulī”) (al-Ṭihrānī 1983, V, p. 204–205; Dānashpajūh 1953, I, p. 70). In 761/1369, Fakhr al-Muḥaqqiqīn granted him an *ijāza*, a license to teach a considerable number of collections of Imāmi ḥadīths (*Maa*, pp. 531–534; *Mab*, pp. 204–206; *NNb*, intr., pp. 31–34). In 769/1367–68, Sayyid Ḥaydar composed at Fakhr al-Muḥaqqiqīn’s demand the *Risāla Rafʿ al-khilāf wa l-munāzaʿa*, a polemic epistle seeking to justify the passive attitude of the first Imām ʿAlī during the reigns of the three first caliphs, an argumentation opposed to both Sunni historians and Shīʿi “exaggerators” (*ghulāt*). This relationship certainly afforded Ḥaydar Āmulī a considerable legitimacy as a theologian and a transmitter of Imāmi ḥadīths and probably spared him the hostility of Shīʿi scholars over his Sufi sympathies and his own tendency to “exaggeration” (*ghuluww*) in the veneration of the Shīʿi Imāms.

Ḥaydar Āmulī spent the rest of his life in Najaf, where he completed most of his works. He died sometime after 787/1385, which is the date of his last known work, the *Risāla fī l-ʿUlūm al-ʿālīyya* (“Treatise of Sublime Sciences,” see al-Ṭihrānī 1983, XVIII, p. 327).

His Thought

If the intellectual life and the major thinkers of the Safavid period are well represented in historical studies, the Ilkhanid and post-Ilkhanid period remains poorly known despite its fertility. With the destruction of the Sunni caliphate by the Mongols (656/1258), “Sunni orthodoxy” had lost its hegemony in the Persian world. The lack of any fixed religious policy and the atmosphere of social chaos in the Ilkhanid state were favorable to the rise of many messianic movements but also to the flourishing of three spiritual movements previously considered heterodox, if not heretical, which are Twelver Shīʿism (after the destruction

of the Alamut state of its Ismāʿīlī rival in 654/1256), Sufism, and philosophy. Sayyid Ḥaydar Āmulī is to be seen as a, if not as the, major representative of what could be called a “golden age of heterodoxies.” He was involved in the rapprochement between Shīʿis and Sufis, which were at this time in Iran two minority yet powerful groups in a double process of conflict and coalescence (see Calmard 1997; Gronke 1997). Āmulī had been a Shīʿi since his earlier education, and he converted to Sufism when he was a mature man, without renouncing Shīʿism. His Sufism was both practical and theoretical: on the one hand, he donned the *khirqā* and travelled as a dervish for 1 or 2 years; on the other, he adopted most of Ibn ʿArabī’s (d. 638/1240) theosophical conceptions and sought to integrate them into Shīʿi theology and imāmology.

Consequently, the thought of Ḥaydar Āmulī had two major sources of inspiration: the early esoteric Shīʿi tradition, i.e., the teachings of the Imāms as collected in the classical collections of ḥadīths, and the theosophy of Ibn ʿArabī. These two sources were not only difficult to reconcile (Ibn ʿArabī is reputed to be a Sunni thinker) but were both also difficult to be accepted by the intellectual and religious milieu of Ḥaydar Āmulī. On the one hand, the esoteric aspect of the Shīʿi Ḥadīth was commonly disregarded by Shīʿi jurists-theologians, if not actually rejected on the grounds of “exaggeration” or “extremism” (*ghuluww*) – the term denoting anti-Sunni positions, messianic claims, deification of the Imam, pretension to the vision of God, etc.. On the other hand, the doctrine of Ibn ʿArabī was regarded as heretical by most of the Shīʿi and Sunni doctors (*ʿulamāʾ*).

In pursuing this rapprochement, Ḥaydar Āmulī was not only an audacious thinker; he was also an original one. Among the main axes of his thought are what he calls “the testimony to the unity of Existence” (*al-tawḥīd al-wujūdī*); the harmony between “religious Law” (*sharīʿa*), “mystical Path” (*tarīqa*), and “spiritual Truth” (*ḥaqīqa*); the correspondences between “the book of Qurʾan” (*al-kitāb al-qurʾānī*), “the book of horizons” (*al-kitāb al-āfāqī*), i.e., the physical world or *macrocosmos* (*al-ʿālam al-kabīr*), and “the

book of souls” (*al-kitāb al-anfusī*), i.e., the inner self or *microcosmos* (*al-‘ālam al-ṣaghīr*); and the spiritual, inner, or esoteric signification (*bāṭin*) of all the religious prescriptions, from prayer to holy struggle (*jihād*), in complement to their outer or exoteric form (*ẓāhir*).

Ḥaydar Āmulī sought to elaborate a theology which could be at the same time both intellectually rigorous and intuitively concrete. He investigates the Islamic notion of the “testimony to the unity of God” (*tawḥīd*), which he divides in a “theological” (*ulūhī*) and an “ontological” (*wujūdī*) unity. The latter is no other than the doctrine of “the unity of existence” (*waḥdat al-wujūd*), inherited from Ibn ‘Arabī and condemned as a form of pantheism by a number of theologians, whether Sunni or Shī‘i (NNa, Arabic introd., pp. 16–65). Ḥaydar Āmulī also combines two kinds of apparently contradictory discourse on God: *tanzīh*, i.e., the declaration of God’s incomparability with the created beings, leading to an apophatic theology or *via negationis*, supported in particular by the rationalist Mu‘tazilite theologians, and *tajallī*, i.e., theophany or God’s self-disclosure by the means of his Names. In this regard, prophets and Imāms are to be seen as loci of manifestation of God, as well as exemplifications of the perfect human being (*al-insān al-kāmil*). A lost treatise entitled *al-Asmā’ al-ilāhiyya wa ta’yīn maṣāhirihā min al-ashkhāṣ al-insāniyya* (“The Divine Names and the Designation of the Human Persons who are Their Loci of Manifestation”) was probably devoted to this typically Shī‘i-Sufi topic which pervades all his extant works.

The congruence between law (*sharī‘a*), or the exoteric and legalistic dimension of religion; path (*ṭarīqa*), or the mystical and existential tradition of Sufism; and truth (*ḥaqīqa*), or the pure contemplation of essential realities, lies at the heart of all Āmulī’s works. His still extant earlier treatise, *Asrār al-sharī‘a* (“the Secrets of the Law”), is more especially devoted to the demonstration of this congruence. Āmulī’s speculations in this regard take as their point of departure a saying attributed to the Prophet: “The Law is my discourse, the Path is my action, and the Truth is my states of being.” The five “principles” or

“roots” (*uṣūl*) of the Shī‘i faith, unity of God, prophecy, imāmate, divine justice, and final resurrection (*ma‘ād*), followed by its five “branches” (*furū‘*) – prayer, fasting, alms, pilgrimage, and *jihād* – are examined in their successive aspects of exoteric law, mystical path, and spiritual truth, in order to demonstrate that there can be no contradiction between them. This conceptual triad of law, path, and truth has correspondences with that of prophecy (*nubuwwa*), legislative mission (*risāla*), and divine friendship (*walāya*). Within all of them, the most esoteric or inner dimension encompasses the exoteric or outer ones. As a result, every prophet and legislator is first a friend of God (*walī*), but not every friend of God is a prophet. This enables our author to support at the same time the religious preeminence of the prophet and the ontological superiority of the Imām, which is a crucial tenet of Shī‘ism.

This perfect harmony seems to justify and to require a “sacred alliance” between Shī‘i jurisprudence (*fiqh*), Sufism, and philosophical gnosis (*‘irfān*). Indeed, the religious law is the object of the exoteric sciences, the spiritual path is the object of Sufism in its individual form, and the spiritual truth is the object of knowledge attained by “spiritual unveiling” (*kashf*), confirmed by rational-intellective (*ma‘qūl*) as well as scriptural-traditional (*manqūl*) proofs.

Āmulī’s most celebrated doctrine, elaborated in particular in his treatise *Jāmi‘ al-asrār wa manba‘ al-anwār*, is that in their essential reality, Shī‘ism and Sufism are not only compatible, but identical; i.e. the “true Shī‘is,” in the esoteric sense of the term, are the “Sufis” and the “true Sufis” are Shī‘i (Corbin 1972, III, pp. 178–190). Ḥaydar Āmulī addresses this argument to Sufis and Twelver Shī‘is with the aim of establishing harmony among them and to lead each group to its own truth, respectively, the esoteric (*bāṭin*) and the exoteric (*ẓāhir*) aspects of the same superior truth contained in the teachings of the Imāms (*JA*, pp. 40, 222, and 254). For this purpose, he dissociates “real” or “true” forms of Shī‘ism and Sufism from others considered to be “false.” On the one hand, “true Shī‘is,” in the exoteric sense of the term, are Twelver Imāmi Shī‘is, representing a moderate and – at that time – quietist branch of

Shī'ism, not to be confused with Ismā'īlis, Zaydis, nor with "exaggerators" (*ghulāt*). On the other hand, "true Sufis" are exemplary early masters and ascetics such as Abū Yazīd al-Bastāmī (d. 234/848 or 261/874) and Junayd al-Baghdādī (d. 298/911), both reputed to have been the disciples of the Shī'ī Imāms. These "true Sufis" are identical to the "well-tested believers" (*al-mu'minūn al-mumtaḥanūn*) referred to in a famous Imāmi ḥadīth: "Our Cause is difficult; the only ones able to bear it are a Prophet missioned by God, an angel of Proximity, and a faithful believer whose heart has been tested by God for faith" (*JA*, pp. 32–33, 36–37, 39 and 600; *Ibid.*, French introd., pp. 27–29; Amir-Moezzi 1994, p. 137). He rules out, as "false" forms of Sufism, the organizational aspect of the brotherhoods, i.e., the *ṭarīqa* as a social and historical institution, and antinomianism (*ibāḥiyya*), i.e., the rejection of the obligations of law (*sharī'a*) on pretext of having acquired the knowledge of the ultimate truth (*ḥaqīqa*). Ḥaydar Āmulī wrote two works, now lost, especially devoted to Sufism: a summary of the *Risāla Iṣṭilāḥāt al-ṣūfiyya* of 'Abd al-Razzāq al-Kāshānī (730/1329–30), a lexicon of the technical terms of Sufism, entitled *Talkhīṣ iṣṭilāḥāt al-ṣūfiyya*, and a *Risālat al-Faqr wa taḥqīq al-fakhr* ("Treatise of Poverty and Verification of the Glory [Attached to it]"), which purports to be a justification of the way of life of dervishes, basing itself on the saying attributed to the Prophet Muḥammad, "Poverty is my glory (*al-faqr fakhrī*); because of it I glorify myself above all Prophets and Messengers."

Ḥaydar Āmulī cannot be simply regarded as an ecumenicist theologian. He supports a radically Shī'ī and anti-Sunni historiography, claiming the divine right of 'Alī and rejecting the three first caliphs. In this regard, he claims that powerlessness (*'ajz*) is not contradictory with impeccability (*'iṣma*), which is the common attribute of the Imāms and the prophets and that the dignity of Imām, the guide of the community, is not dependent on the possession of the temporal authority (*RM*). Likewise, he develops a typically Shī'ī "historiosophy" assuming that each revealed law (*sharī'a*), from that of Adam to that of Muḥammad, "the seal of prophecy," was followed by a

cycle of divine friendship (*walāya*); that each prophet-legislator (*nabī mursal*) has had 12 legatees (*awṣiyā'*), those of the Prophet Muḥammad being the 12 Imāms; and that the task of these legatees is to conserve the exoteric dimension of the law and to unveil its esoteric dimension by means of spiritual exegesis (*ta'wīl*) (*JA*, pp. 240–242). As regards eschatology, he maintains against his gnostic master Ibn 'Arabī that the seal of the absolute divine friendship (*walāya muṭlaqa*) is the Imām 'Alī and not Jesus and that the seal of the determined divine friendship (*walāya muqayyada*) is the twelfth Imām, the awaited Mahdī, and not Ibn 'Arabī himself as pretended by his commentator Dāwud al-Qayṣarī (d. 851/1350) (*JA*, pp. 385, 395–448; *NNa*, pp. 167–261; *NNb*, I, pp. 244–394). Finally, regarding the hierarchies of initiation with its "poles" and "pillars," dominated by "the pole of poles," as received by numerous Sufi individuals and orders, he maintains that they are not more than 19, including 7 prophets and the 12 Imāms; by doing so, he makes Sufi doctrine subservient to Shī'ī tenets, on the principle that the "true Sufis" are Shī'ī or have to become so.

About imāmology, Ḥaydar Āmulī maintains positions irreconcilable with Sunnism. Not only does he affirm the consubstantiality of imāmate and prophecy, but also he emphasizes the theophanic nature of the Imām. He seems to be the first, in the modern period, to record as reliable the "theo-imāmosophical sermons" attributed to the Imām 'Alī, in which the latter claims his identity with the Qur'anic divine names (Amir-Moezzi 2011, pp. 103–131), followed in this attitude by Ḥāfiẓ Rajab al-Bursī and Ibn Abī Jumhūr. Contrarily, rationalist *fuqahā'* consider these traditions to be spurious and the conceptions that they corroborate to be pure "exaggeration". Āmulī's association with Fakhr al-Muḥaqqiqīn may have shielded him from condemnation and persecution like that faced by Rajab al-Bursī in Ḥilla one generation after him.

Henry Corbin has given the title of "Shī'ī Philosophy" to the first edition of the *Jāmi' al-asrār*, published along with the *Risāla Naqd al-nuqūd*. It was an enigmatic, if not provocative, association, since Ḥaydar Āmulī deals much less with

philosophical concepts and doctrines than with Twelver Shī'ī and Sufi notions and topics, conferring much more authority and efficacy to spiritual intuition and vision than to discursive argumentation. For example, as regards absolute existence, Ḥaydar Āmulī claims that it cannot be understood by reason and intellectual speculation (*naẓar fīkrī*) but only by “spiritual unveiling and tasting” (*kashf wa dhawq*) (NNa, pp. 413sq; NNb, II, p. 672) and that the philosopher (*ḥakīm*), while seeking the truth by means of intellectual demonstration, remains frustrated and veiled (NNa, pp. 479sq; NNb, II, p. 770); and he quotes Avicenna, “the most learned of the philosophers (*ḥukamā'*),” confessing in his *Ta'liqāt* that “the understanding of things in their essential realities is beyond the capacity of human being,” that means, in Āmulī's argumentation, beyond the capacity of rational philosophy, not of gnosis (NNa, pp. 480–482; NNb, II, pp. 772–774; Ibn Sīnā, p. 34–35). Consequently, it seems more appropriate, where he is concerned, to speak of “Shī'ī gnosis” (*irfān shī'ī*) rather than “Shī'ī philosophy.”

Nevertheless, the thought of Ḥaydar Āmulī touches on philosophy in the proper sense of the word. His works show clearly an effort of systematization and conceptualization of various elements in order to build a coherent onto-theology. If his knowledge of Greek philosophy seems to be limited to the account made by 'Abd al-Karīm al-Shahrastānī (d. 548/1153) in his *Kitāb al-mīlāl wa l-niḥāl* (“Book of Religions and Sects”), he is certainly influenced by Neoplatonism. In his *Naṣṣ al-nuṣūṣ*, he refers to the Neoplatonic scheme of procession according to Ibn Sīnā: “From the True God, which is the true One and the universal first Cause, proceeded the First Intellect, which is also One, according to the rule that ‘only one can come from one’ (*lā yaḍuru min al-wāḥid illā l-wāḥid = ex uno non fit nisi unum*), and the rest of being proceeded from the first Intellect in due order. The True God is absolutely free of any relation to the bestowal of existence on the world.” (NNa, p. 520; NNb, II, p. 829) Ḥaydar Āmulī also uses subtle philosophical arguments, as when he says that, since one cannot doubt one's own particular and determinate existence, nor can one doubt universal and absolute existence (NNa,

p. 410; NNb, II, p. 668; NNMW, p. 623). Finally, in his considerations on ethics, he adopts the Aristotelian system of the four cardinal virtues of wisdom, courage, temperance, and justice and their definition as happy mediums between two extremes. He considers that each of these virtues corresponds to a form of testimony to divine unity (*tawḥīd*) and encompasses a number of Islamic virtues, which he illustrates by examples from sacred history (NNa, pp. 370–381; NNb, II, pp. 592–613).

One of the most singular characteristics of Āmulī's works, on which Henry Corbin called attention, is his use of diagrams in complement to his discursive argumentation. These spherical schemes illustrate the hierarchies of worlds, levels of reality, modes of knowledge, prophets, saints, sages, etc.; they are based on the “science of balances” or correspondences as established by the famous – as well as mysterious – alchemist Jābir b. Ḥayyān (third/ninth century). As Corbin argues, this “diagrammatic art,” far from being merely an *ars memorativa*, as in Latin scholasticism, is conceived of being “an *ars interiorativa* or an *ars meditativa*,” providing experimental confirmation of his metaphysical investigations (Corbin 1972, III, p. 178; Corbin 2006, pp. 91–92; NNa, introd., pp. 33–34). Sayyid Ḥaydar presents these diagrams as being “intellectual images” (*amthila 'aqliyya*) obtained by spiritual unveiling and tasting, in order to give form (*tashkīl*) to metaphysical knowledge (*al-ma'ārīf al-ilāhiyya*) and theosophical truths (*al-ḥaqā'iq al-rabbāniyya*) (NNa, p. 31; NNb, I, pp. 42–43).

Ḥaydar Āmulī was also deeply concerned with the science of letters and numbers (*'ilm al-ḥurūf wa l-a'dād*), a kind of Arabic *gematria* whose purpose was to unveil the secrets of the named realities by their alphanumerical characters. Following Ibn 'Arabī in particular, he considered the letters of the Arabic alphabet to be the means of the creation, i.e., of the self-disclosure of God (*tajallī*). The first letter of the alphabet, the *ālīf*, symbolizes the pure divine essence, while the second letter, the *bā'*, symbolizes the first emanation, i.e., Intellect, and the beginning of the procession of all realities. Similar speculations can be

found in the *Mashāriq al-anwār* (“The Orient of Lights”) of Ḥāfiẓ Rajab al-Bursī (see the relevant entry). But while the latter applies this theory to the analysis of special names and formulas, Ḥaydar Āmulī emphasizes the general correspondence between letters, words, and verses of the three books of God, horizons, and souls. He has a strong predilection for the number 19, which is the number of the letters of the *bismillāh*, the opening formula of the Qur’an, which he considers to be the sum of all the spiritual and physical worlds, plus the perfect human being (Corbin 2006, pp. 118–142).

Finally, the concern of his thought with the phenomenon of revelation remains to be briefly examined. The thought of Ḥaydar Āmulī can be described as a philosophy of revelation or even, if we are to take his sayings at face value, as a revealed philosophy. His masterpiece is a monumental Qur’anic exegesis entitled *al-Muḥīṭ al-a’ẓam* (“the Greatest Ocean”). Of its seven volumes, only the first has been edited, and the others seem to be lost; the edited volume includes six introductions and the commentary of the first brief surah of the Qur’an, the *Fātiḥa*. In its present form, the opus is not so much a *tafsīr* as a treatise on the inner, esoteric dimension of the Qur’an, its point of departure being the ḥadīth: “Qur’an has got an outer and an inner dimension; the inner has itself an inner dimension, and so on till seven inner dimensions.” As a Shī’i, Ḥaydar Āmulī uses to interpret Qur’anic verses in the light of Imāmi ḥadīths and, reciprocally, considering the two texts to be equally revealed.

The book marks a turning point in the history of both Shī’i thought and Islamic philosophy, since Ḥaydar Āmulī is the first Twelver Shī’i thinker to practice Qur’anic exegesis in his own name. In the early doctrine of Twelver Shī’ism, only an Imām had the competence and the legitimacy to interpret Qur’an in virtue of his impeccability. The fragment of verse 3:7 states: “None know their [i.e., allegorical verses] interpretation except God and those who are firmly rooted in knowledge (*al-rāsikhūn fī l-‘ilm*),” where the latter are understood to specify the Imāms. Moreover, in this conception, the Qur’an remains a “silent book” without esoteric interpretation

(*ta’wīl*) by the Imām, whilst the Imām as hermeneutist is called “the speaking book.” Consequently, the “occultation” of the twelfth Imām in 260/874 left a gaping void in the Shī’is’ religious life. It would fall to philosophers and gnostics to assume the task of hermeneutics, not by any impeccability but by means of both reflection and inspiration. After Naṣīr al-Dīn al-Ṭūsī (d. 672/1274) had transmitted the principles of philosophical exegesis from Ismā’īlism to Twelver Shī’ism, Ḥaydar Āmulī would be the very first to assume this role, considering that the followers of the Imāms among the “masters of unity” (*arbāb al-tawḥīd*) are also among “those who are firmly rooted in science” and habilitated to interpret Qur’an (MA, pp. 148–150). As a consequence, contrary to what happened in the Sunni world, the practice of *ta’wīl*, the spiritual interpretation of Qur’an has remained alive in Shī’i milieus.

However, Ḥaydar Āmulī also claims to have a special legitimacy to interpret the Qur’an, superior to what a rational philosopher like Averroes could have claimed for himself. This claim appears in his *Naṣṣ al-nuṣṣ fī sharḥ al-fuṣūṣ* (“The Text of the Texts. A Commentary of the Bezels [of Wisdom]”), written after *al-Muḥīṭ al-a’ẓam*. It is a commentary on the *Fuṣūṣ al-ḥikam* of Ibn ‘Arabī, a series of theosophical speculations inspired by the figures of prophets, and undoubtedly one of the most influential and widely discussed works of Islamic philosophy and mysticism. Ibn ‘Arabī, in the introduction to the book, claimed to have received it from the hands of Prophet Muḥammad in a dream (Ibn ‘Arabī 2002, pp. 47–48). Ḥaydar Āmulī, as many Sufis do, apparently takes this saying at face value. Moreover, he develops a singular system of correspondences between the Prophet Muḥammad, Ibn ‘Arabī, and himself. He says that two books belong to the Prophet: the Qur’an, which was revealed to him (*al-nāzil ‘alayhi*), and the *Fuṣūṣ al-ḥikam* which proceeded from him (*al-ṣādir minhu*). Equally, two books are reputed to belong to Ibn ‘Arabī: the *Fuṣūṣ al-ḥikam* sent to him (*al-wāṣil ilayhi*) and the *Futūḥāt al-makkiyya* proceeding from him. Correspondingly, two books belong to himself: *al-Muḥīṭ al-a’ẓam*, his commentary of the Qur’an, which overflowed onto

him, and *Naṣṣ al-nuṣūṣ*, his commentary on the *Fuṣūṣ*, which proceeded from him. He concludes that the *Muḥīṭ al-a-ḥikam* is for him what the book of the *Fuṣūṣ al-ḥikam* was for Ibn ‘Arabī and what the Qur’an was for the Prophet Muḥammad, i.e., a book revealed by God (NNa, pp. 148–149; NNb, pp. 216–217).

It is of interest that in his *Naṣṣ al-nuṣūṣ*, and already in his *Jāmi‘ al-asrār*, Ḥaydar Āmulī criticizes some views of Ibn ‘Arabī, especially those on “the seal of the divine friendship.” The question arises: Did he really think, while doing so, that the *Fuṣūṣ al-ḥikam* had been revealed by the Prophet to Ibn ‘Arabī? Certainly he did not, since he explicitly addresses his criticism to “the greatest master” (*al-shaykh al-akbar*) and not to the Prophet. However, it seems exaggerated to say with M. Bidārfar that Ḥaydar Āmulī wrote a refutation under the cover of a commentary (NNb, introd., pp. 13–14). He was acknowledging the transcendent inspiration of Ibn ‘Arabī and attributing what he considered to be false in his sayings to his human fallibility; accordingly, he was qualifying him as a Gnostic (*‘ārif*), not as a friend of God (*walī*), the latter being essentially infallible. Despite the fact that Ibn ‘Arabī was not Shī‘ī, Ḥaydar Āmulī strived to incorporate his theosophy into mainstream Twelver Shī‘ism, something which can be regarded with Corbin as his foremost contribution to Islamic culture (Corbin 1972, III, p. 155). It is clearly in the Shī‘ī world, especially in Iran, that the thought of Ibn ‘Arabī has remained most alive and influential, while it is commonly rejected by Sunni doctors; and as in the case of Qur’anic exegesis, it would not have been possible without the undertaking of Ḥaydar Āmulī.

Āmulī’s syncretism itself would eventually be combined with the illuminationist theosophy of Suhrawardī, of whose work Āmulī gives no account, although he must certainly have been aware of it, by Iranian Imāmi thinkers such as Mīr Dāmād (d. 1040/1631) and Ṣadr al-Dīn Shīrāzī alias Mullā Ṣadrā (d. 1050/1640); and they would give all its significance to the syntagma of “Shī‘ī Philosophy.” In particular, his conception of resurrection (*qiyāma*), distinguishing between minor, median, and

major resurrection, each of them having an outer (*ṣuwarī*, *ẓāhir*) and an inner (*ma‘nawī*, *bāṭin*) aspect and each of them occurring in the “world of horizons” (*al-‘ālam al-āfāqī*) and in the “world of souls” (*al-‘ālam al-anfusī*) (MAb, pp. 570–599; ASh, pp. 330–403), could be one of the sources of the eschatological philosophy of Mullā Ṣadrā (Jambet 2017, pp. 57–67). In this respect, Ḥaydar Āmulī can surely be seen as one of the principal forerunners of the “Safavid philosophical Renaissance” in the eleventh/seventeenth century. Finally, it appears that an important part of the history of Islamic thought is due to the efforts of this remarkable thinker.

His Works

According to the writings of Ḥaydar Āmulī himself, he composed around 40 works in Persian and Arabic. In his *Jāmi‘ al-asrār wa manba‘ al-anwār*, composed around 752/1351–5, at the eve of his Iraqi period, he mentions seven previous works, at least three of them having been written in Persian, which are today reputed to be lost (JA, pp. 3, 614). In the introduction of *Naṣṣ al-nuṣūṣ*, composed in 782/1380–1, he gives a chronology of his works – not without some inconsistencies – beginning with the composition of the *Jāmi‘ al-asrār*. Most of these texts, certainly composed in Arabic, are also lost. However, some of his lost works may be summarized in later and preserved ones, especially in the extensive introductions (*muqaddimāt*) to the *Muḥīṭ al-a-ḥikam* and the *Naṣṣ al-nuṣūṣ*. To be sure, the whole of his *Asrār al-sharī‘a*, except its introduction and appendix, is summarized in the sixth introduction of the *Muḥīṭ al-a-ḥikam*. It could also be that *al-Arkān fī furūṣ-sharā‘i‘ ahl al-īmān* (“The Pillars, on the Branches of the Laws according to the People of the Faith”) is summarized in the same work, the “second rule” (*al-qā‘ida al-thāniya*) of which deals with branches of law (MA, pp. 537–599; 678–778). The *Muntakhab al-ta’wīl fī bayān kitāb allāh wa ḥurūfihi wa kalimātihi wa āyātihi* (“Selection of the Spiritual Interpretation [of the Qur’an]. On the Clarification of the Book of God, its Letters,

Words and Verses”), mentioned in *Jāmi’ al-asrār* and in *Naqd al-nuqūd* (JA, pp. 3, 108, 106, 549; NNMW, p. 695), may be summarized in the third introduction (on the correspondences between the letters of the Qur’an, of the “book of the horizons,” and of the “book of souls”), the fourth (on the correspondences between the words of these three books), and the fifth (on the correspondences between the verses of these three books) of *al-Muḥīṭ al-a’zam*. Likewise, his work entitled *al-Jadāwil al-mawsūma bi-madārij al-sālikīn fī marātib al-‘arīfīn* (“Diagrams Containing the Degrees of the Spiritual Pilgrims. On the Ranks of Gnostics”), composed in vis-à-vis with the famous *Kitāb manāzil al-sā’irīn* by Khwāja ‘Abdullāh Anṣārī (d. 491/1097–98), may survive in the introductions of the *Naṣṣ al-nuṣūṣ*.

Some of Āmulī’s works are also summaries of others, an example being the *Naqd al-nuqūd*, completed in Najaf in 768/1367, which is a summary of the supposedly lost *Risālat al-Wujūd fī ma’rifat al-ma’būd* (“Treatise of Existence. Of the Knowledge of the Worshipful”), on existence, its necessity, its unity, and its manifestation in the multiplicity of existents, the latter probably composed just after the *Jāmi’ al-asrār* in 760/1359 (JA, p. 125); and the lost *Nihāyat al-tawḥīd fī bidāyat al-tajrīd* (“The Ultimate End of the Attestation of Divine Unity. On the Beginning of Disengagement”) was a summary of the surviving *Jāmi’ al-asrār*. Some works of Ḥaydar Āmulī reputed to be lost may remain as manuscripts in different public or private libraries, as it was the case of his *Risāla Raf’ al-munāza’a*, recently discovered and published. In the list of our primary sources, the works of Ḥaydar Āmulī will appear in their chronological order of composition.

Anselm of Canterbury

Toivo J. Holopainen

Faculty of Theology, University of Helsinki,
Helsinki, Finland

Abstract

Anselm of Canterbury (1033–1109), also known as Anselm of Aosta, Anselm of Bec, and Saint Anselm, was one of the most important thinkers of the early Middle Ages. He was thoroughly familiar with the Boethian logic of his time, and he contributed to some themes within the art of logic. His main contribution, however, was in the area of philosophical theology. Following the examples set by Augustine and Boethius, Anselm developed the idea of “faith seeking understanding” (*fides*

quaerens intellectum), which aims at elucidating the content of the Christian faith through rational analysis and by providing rational arguments for the central Christian claims. Anselm's method has been seen as paradigmatic for medieval theology, and he has been called the “Father of Scholasticism.” In addition to his methodological ideas, Anselm's best-known contributions are the argument for God's existence based on the notion “that than which a greater cannot be thought” in the treatise *Proslogion*, taken to be the earliest formulation of the ontological argument, and the satisfaction theory of atonement in the treatise *Cur Deus homo*. Other important themes in his philosophical theology include the concepts of will and free choice and the questions about the relation of free choice to sin, grace, predestination, and foreknowledge.

Biographical Information

Anselm was born in the year 1033 to a family with a partly noble background in or near Aosta, a town situated in an Alpine valley in northwestern Italy, which at the time belonged to the kingdom of Burgundy. His father was Gundulf, his mother was Ermenberga, and he had one sister, Richeza. One of our main sources for Anselm's life, *Vita Anselmi* by Eadmer (an English monk who was Anselm's associate after 1093), discloses that the study of the liberal arts was Anselm's chief occupation some time in his youth, but Eadmer fails to give any details of Anselm's studies. He also tells us that Anselm later started giving himself to “youthful amusements,” which has led some commentators to infer, unnecessarily, that Anselm's youth was a misspent one. At some point Anselm's mother died, and after that Anselm's relation to his father grew difficult. At the age of 23, after a clash with his father, Anselm decided to leave his home country, and he crossed the Alps. Of the following 3 years, Eadmer only says that Anselm spent them “partly in Burgundy, partly in France.”

The year 1059 is a turning point in Anselm's life. At the age of 26, he arrived at the Benedictine

monastery of Bec in Normandy. At Bec, there was a school run by the prior of the monastery, Lanfranc, who was of Italian origin and had made a career as a teacher of the liberal arts in his youth. Anselm became Lanfranc's associate in the school at Bec, and a little later (1060) he decided to become a monk. In 1063, Lanfranc left Bec to become the abbot of a new monastery in Caen. Anselm was elected prior of Bec, and he served in this position for 15 years. In 1078, the founding abbot of the Bec monastery, Herluin, died. Anselm succeeded him and served as abbot for another 15 years, until 1093. Altogether, Anselm was "Anselm of Bec" for more than three decades.

In 1066, the Normans had conquered England. Lanfranc became the first Norman Archbishop of Canterbury. After Lanfranc's death, in 1089, King William II held the seat of archbishop vacant for several years to be able to expropriate ecclesiastical revenue. In the end, Anselm was nominated as archbishop. Anselm's tenure as Archbishop of Canterbury (1093–1109) was rife with heavy conflicts with the kings of England (William II and after him Henry I) about the relation of ecclesiastical and secular power (the investiture controversy). Because of the conflicts, Anselm was twice in exile: 1097–1100 and 1103–1106. During the first exile, Anselm went to meet the Pope in Rome and stayed in Italy for more than a year. Anselm died at Canterbury on April 21, 1109.

Influences

Many commentators have emphasized Lanfranc's role in Anselm's intellectual development, suggesting that Anselm had received little training before he came to the school at Bec (see esp. Southern 1963, 1990). This view is to be rejected. As previously mentioned, Anselm was engaged in studies in his youth, and it is probable that he received thorough training in the liberal arts and at least some training in theology already in Italy. Some features of Anselm's philosophical and theological thinking are reminiscent of the Italian school discussions as attested by Anselm's elder contemporary Peter Damian. As for the 3 years that Anselm spent in Burgundy and France, the

most plausible scenario is that he was studying and teaching, as Lanfranc had done in the corresponding phase of his career. There are explicit references to contemporary academic discussions in Anselm's writings, and they assume familiarity with a more developed scholarly environment than the one existing in Normandy. Anselm already was a competent scholar when he arrived at the little school at Bec. Lanfranc hardly had any notable role in Anselm's intellectual education, but he perhaps influenced Anselm's decision to pursue a monastic career.

In Southern's construal (see Southern 1963, 1990), Lanfranc was an eminent dialectician who offered to Anselm a model of how dialectic can be applied to theology. Southern's evidence for this claim cannot withstand scrutiny (see Holopainen 1996), but it is important to accentuate the role of dialectic in Anselm's development. Dialectic was a central part of the academic culture at the closing period of the early Middle Ages. Some of the best minds of the eleventh century, from Gerbert to Peter Abelard, spent major parts of their lives studying dialectic. It appears that Anselm was familiar with the same set of sources that served as the starting point for Abelard's philosophy: the Boethian corpus of early medieval "old logic." It included Boethius' translations of Aristotle's *Categoriae* and *De interpretatione* as well as Porphyry's *Isagoge*, commentaries on them (one on *Categoriae*, two on *De interpretatione*, two on *Isagoge*), a commentary on Cicero's *Topica*, and textbooks on different areas of logic (categorical syllogistics, hypothetical syllogistics, topics, division). The Boethian corpus of dialectic was the most important part of the philosophical library at the time. It offered an array of tools, techniques, and principles that, apparently, could be used for discussing any topic from a rational point of view. Many of Anselm's contemporaries saw dialectic as the representative of reason.

Another group of texts that highly influenced Anselm are the writings on philosophical theology by Augustine and Boethius. The only one of Augustine's works that Anselm mentions by title is *De trinitate*, but he was familiar with a large number of his works. In particular, he had studied

carefully some of the “philosophical dialogues” that Augustine had composed early in his career, including *Soliloquia*, *De magistro*, and *De libero arbitrio*. Boethius’ work on philosophical theology includes *Philosophiae consolatio* and the group of five short treatises known as *Opuscula sacra*. The works by Augustine and Boethius offered to Anselm a model of theology in which rational analysis is a central ingredient, and it was rational analysis based on dialectical insight. Like Boethius, Augustine was thoroughly familiar with the art of dialectic and frequently made use of it in the context of philosophical theology.

Anselm had first-hand experience of the ancient sources mentioned. He was also familiar with contemporary academic discussions about the same texts and the questions raised by them, but it is difficult to ascertain to what extent he is indebted to his contemporaries because the evidence for the school discussions is fragmentary. Above all, Anselm is an independent thinker who worked out his own unified approach within a broadly Augustinian framework.

Works

The main part of Anselm’s production consists of 11 densely written works (volumes I and II of *Opera omnia*, ed. Schmitt). Of them, all except one deal with topics pertaining to philosophical theology; the one exception, *De grammatico*, pertains to dialectic. Philosophically relevant is also a group of fragments known as the *Unfinished Work* or *Fragmenta philosophica*. In addition, Anselm left a collection of 19 prayers and 3 meditations, as well as a large collection of letters. Finally, there are collections of material based on Anselm’s oral teaching (edited in the *Memorials of St Anselm* 1969).

Six of Anselm’s works derive from the period when he was first prior and then abbot of Bec. The first two, the *Monologion* (*A Soliloquy*, c. 1076) and the *Proslogion* (*An Address*, 1077/1078), form a pair. Their main theme is the doctrine of God, but other important topics are also involved. The four other works that Anselm wrote at Bec are often referred to as his “philosophical dialogues.”

In the 1080s, he wrote a series of three connected dialogues: *De veritate* (*On Truth*), *De libertate arbitrii* (*On Freedom of Choice*), and *De casu diaboli* (*On the Fall of the Devil*). The fourth “philosophical dialogue,” the dialectical treatise *De grammatico*, derives roughly from the same period. In recent years, an early dating for *De grammatico* has been spreading: it is alleged that Anselm composed it c. 1060 when he was Lanfranc’s associate. The dating is based on Southern’s (1990) speculation about Lanfranc being an expert dialectician and Anselm not having any genuine interest in the study of dialectic. Neither of these claims is true.

Around the time he moved from Bec to Canterbury, Anselm was involved in polemics against the Trinitarian teaching of Roscelin of Compiègne. Anselm’s contribution is a treatise called *Epistola de incarnatione verbi* (*Letter on the Incarnation of the Word*). An early version of it was published when Anselm still was at Bec, in 1092; the final version was completed in 1094. In 1095, Anselm started working on a treatise in dialogue form that is commonly perceived as his theological main work, *Cur Deus homo* (*Why God Became Man* or *Why a God-man*). He finished it in 1098 in Italy during his first exile. Within the next years, he also composed the works *De conceptu virginali et de originali peccato* (*On the Virgin Conception and Original Sin*, 1099) and *De processione spiritus sancti* (*On the Procession of the Holy Spirit*, 1101). Anselm’s last work is *De concordia praescientiae et praedestinationis et gratiae dei cum libero arbitrio* (*On the Harmony of the Foreknowledge, the Predestination and the Grace of God with Free Choice*, 1107–1108), referred to in abbreviated form as *De concordia*.

Anselm’s works display a remarkable unity of thought. He had already consolidated the main features of his thinking before he published his first treatise at the mature age of 43.

Dialectic

Anselm’s only dialectical treatise, *De grammatico*, deals with the semantics of terms

of a type called “denominatives” (sometimes also “paronyms”). In the Latin translation of Aristotle’s *Categoriae*, the term *grammaticus* served as an example of a denominative. As the term *grammaticus* can function both as a noun (“a grammarian”) and as an adjective (“grammatical”), the title of Anselm’s treatise cannot be translated directly. Anselm says of *De grammatico* that it is “not without use to those who need to be introduced to dialectic,” but the treatise is far from being an elementary textbook. A solid working knowledge of the different areas of Boethian logic is assumed throughout, and Anselm indicates at the end (*De grammatico* 21) that the treatise is related to contemporary academic debates. *De grammatico* is a contribution to the advanced study of dialectic, but the treatise has pedagogical objectives as well. Anselm takes pains to make the treatment as accessible as possible, and he purposely includes passages that serve to rehearse the techniques of logical concept analysis, sentence analysis, and argument analysis.

De grammatico reveals Anselm as a highly competent dialectician. Anselm makes constant but inconspicuous use of dialectical insights in other works as well, and his dialectically molded habits of thought give a philosophical tone to almost everything that he writes. One dialectical theme that particularly interests Anselm is modalities and the interpretation of modal expressions. He presents remarks about possibility, necessity, and so on, in many of his works. In this and other contexts, Anselm often points out that linguistic usage can be misleading and appeals to a distinction between “proper” and “improper” usage.

Faith Seeking Understanding

The works by Augustine and Boethius offered to Anselm a model of philosophical theology in which dialectically based rational analysis is a central ingredient. From the same sources, he inherited a firm confidence in the harmony of faith and reason. The Christian teaching and the human reason testify to the same truth. The truth that faith proclaims has an intelligible structure

(*ratio fidei*, “reason of faith”), and believers can and ought to use their reason to explore and uncover that structure as far as possible. To express this idea, Anselm coined the dictum “faith seeking understanding” (*fides quaerens intellectum* – this was the original title of the treatise better known as the *Proslogion*).

Anselm was convinced that it is possible to reconstruct important parts of the Christian view of reality from a purely rational starting point. In his first treatise, the *Monologion*, he works to show how this can be done (see below). Anselm later states that he composed his first two treatises, the *Monologion* and *Proslogion*, to show that “what we hold by faith regarding the divine nature and its persons – excluding the topic of incarnation – can be proven by compelling reasons without the authority of Scripture” (*De incarnatione verbi* 6). However, Anselm did not allege that the whole content of faith could be established in this way. In his later treatises, he typically takes some of his assumptions or premises from authority. For example, in *Cur Deus homo*, he seeks to establish that it was necessary that God becomes man, given some general points about the background situation. Even so, rational analysis and rational arguments have a central role in all of Anselm’s works. He was dedicated to using reason under the guidance of faith: the content of faith provides fixed points that direct rational reflection. In the process, both reason and faith are transformed. On one hand, reason is led to scrutinize the validity of its own principles and at some points to qualify them. On the other hand, the items of faith that were formerly merely believed receive a rational grounding or at least become embedded in a network of rational connections that gives them intelligibility.

Anselm’s idea of faith seeking understanding is related to a Christian view of the human destiny. Man’s end is the vision of God in the life to come in heaven. In that vision, the chosen ones will see the truth (about all intellectual things) to the extent that God chooses to disclose it. Anselm characterizes understanding (*intellectus*) as “a middle-way between faith (*fides*) and sight (*species*)”; “the more anyone advances to understanding, the closer he comes to the actual seeing for which

we all long” (*Cur Deus homo*, *Commendatio operis*). In this overall framework, there is no fear that rational insight might make faith redundant. It is for their faith and not for their insight that the believers will get their reward in the life to come. What is more, the relevant kind of faith is not a mere holding true (“dead faith”) but an active striving (“living faith”): loving God and striving toward Him and loving the good and just and striving to put it into practice (*Monologion* 78). Faith’s quest for understanding is part of that striving.

Anselm’s methodological ideas have been seen as paradigmatic for medieval academic theology, and he has been called the “Father of Scholasticism.” On the other hand, Anselm was more confident about what reason can establish than the majority of his scholastic successors.

The *Monologion*

The rational aspect of Anselm’s theology gets its most pronounced expression in his first treatise, the *Monologion*. Anselm there offers a bold attempt at reconstructing the basic tenets in the Christian idea of God, and of the creation in relation to God, on a purely rational basis. The Prologue and the first chapter contain explicit and emphatic remarks about the rational method to be used. Anselm’s intention is to proceed “by reason alone” (*sola ratione*) and “nothing at all in the meditation would be argued on Scriptural authority” (even though the content of it is consistent, Anselm contends, with the teaching of the authorities). Anselm claims that even a person who has not heard Christian preaching can infer many of the central tenets in it by reason alone if he is of at least average talent. He writes the treatise from the viewpoint of a person who investigates things that he does not yet know, disputing with himself in a silent “meditation.” The original title of the treatise was *Exemplum meditandi de ratione fidei* (*An Example of Meditating about the Reason of Faith*); the title *Monologion* was introduced some years later. As the treatise markedly differs from Anselm’s three meditations properly so called, one may ask

whether the characterization of the treatise as a “meditation” is Anselm’s attempt to appoint a legitimate place for his boldly rational endeavor in the monastic context.

The *Monologion* includes 80 tightly argued chapters. Anselm builds his argument on notions that any rational person in his view ought to accept, on one hand, and on claims that he has already established in the course of the treatment, on the other. Chapters 1–4 offer a series of arguments for the existence of a Supreme Being. For example, Anselm argues in Ch. 1 that all the things that are good are good through one thing which is good through itself, and this one thing is supremely good and the supreme of all existing things. Contrary to what is often alleged, Anselm did not see Ch. 1–4 as Four Ways of proving God’s existence. Instead, they are an initial phase in an extensive argument for the Christian understanding of God. It is only in the last chapter, Ch. 80, that Anselm considers God’s existence as proven. Before he arrives at this conclusion, he establishes to his satisfaction that the Supreme Being whose existence is proved in Ch. 1–4 has created everything else from nothing (Ch. 5–14). Further, it is established that the Supreme Being has properties of the kind that the Christian reader will recognize as the properties of the Divine Essence (Ch. 15–28). What is more, it proves to be the case that there is a Trinitarian structure in the Supreme Being, consisting of a “Father,” a “Son,” and their “Spirit” (Ch. 29–63, 79). Toward the end of the treatise (Ch. 68–78), the treatment is focused on the relation between the Supreme Being and creatures of a rational nature, i.e., humans and angels. Among other things, it is established that the Supreme Being is the proper object of human love, hope, and faith and that the final destiny of a human being depends on his or her relation to the Supreme Being. At the end (Ch. 80), the Supreme Being is identified as God. Even here, Anselm does not give up the rational point of view. He does not appeal to the Christian teaching about God but instead makes a claim about what people who postulate god or gods mean by the word “god” and then argues that the Supreme Being is the only being that can adequately meet this description.

The *Proslogion* and Anselm's Argument

In the Preface to the *Proslogion*, Anselm describes the treatise in relation to his first treatise, pointing out two important differences between them. First, there is a difference in the complexity of argumentation: the *Monologion* includes “a chain of many arguments,” whereas the *Proslogion* will introduce “a single argument” (*unum argumentum*). Second, Anselm points out a difference in the mode of presentation: the *Monologion* was composed from the point of view of a person who investigates things that he does not yet know, whereas the *Proslogion* is composed from the viewpoint of a person who strives to elevate his mind to the contemplation of God and seeks to understand what he believes. The original title of the treatise, *Fides quaerens intellectum*, ostensibly refers to the last-mentioned aspect of the perspective chosen. The title that Anselm invented some years later, *Proslogion* or *Alloquium* (*An Address*), is related to the circumstance that the person who speaks in the treatise addresses God and his own soul in turn.

In the *Proslogion*, Anselm discusses God's existence (Ch. 2–4) and the properties of the Divine Essence (Ch. 5–23) within a devotional exercise. (Altogether there are 26 chapters.) Philosophical commentators have largely concentrated on the part on God's existence (Ch. 2–4) and especially on Ch. 2. This chapter counts among the most famous pieces of philosophical text written in the Middle Ages: it includes the inference known as “Anselm's ontological argument” or simply “Anselm's argument.” It is taken to be the earliest formulation of the ontological argument for God's existence.

Anselm's argument is based on the characterization of God as “something than which a greater cannot be thought” (*aliquid quo nihil maius cogitari possit*). Anselm uses various slightly differing formulations of this expression; we shall abbreviate it X. Basically, the argument runs as follows. We believe that God is X. One can doubt whether there is any such being, because the Fool of the Psalms (Ps. 14: 1, 53: 1) denies God's existence. But when the same Fool hears the expression X being used, he understands what

he hears, and whatever is understood is in the understanding (*in intellectu*). Therefore, X exists at least in the understanding. However, it cannot be the case that X exists only in the understanding. For if it existed only in the understanding, it could be thought to exist also in reality (*in re*), which is greater. Therefore, if X existed only in the understanding, it would not be something than which a greater cannot be thought, that is, X would not be X. This is impossible. Therefore, X exists not only in the understanding but also in reality.

The name “ontological argument” goes back to Immanuel Kant. He was not familiar with Anselm and thought of some later thinkers instead. Some commentators insist that the name “ontological argument” should not be used of Anselm's inference because it is different from, say, Descartes' argument. This depends on what is taken to be essential to the ontological argument. Anselm's inference is different from some later versions in that it does not appeal to the “concept” or “definition” or “essence” of God. However, it is an a priori argument that seeks to deduce the existence of a being starting from an expression signifying that kind of being, and it derives the force it has from the meaning of the expression that is used.

Soon after the publication of the *Proslogion*, someone, traditionally identified as the monk Gaunilo of Marmoutier, wrote a short text *Pro insipiente* (*On Behalf of the Fool*) criticizing Anselm's argument. Anselm appended the critique and his rejoinder, often called *Responsio* (*Reply*), to the end of the *Proslogion*. The considerations that Anselm presents in the *Responsio* elucidate his argument in many ways. A well-known part of Gaunilo's critique is the Lost Island counterexample: it is possible to use Anselm's strategy to argue for the existence of an island that is in every way excellent. Anselm rejects the counterexample as inappropriate and lets us understand that his argument does not apply to anything other than X, but he fails to offer any extended analysis of the matter.

There has been extensive dispute about the correct interpretation of the argument in the *Proslogion*. The traditional reading maintains that Anselm meant to introduce a strictly rational proof for God's existence. This view has been

challenged by fideistic and mystical interpretations of the treatise (see Hick and McGill 1967). The proponents of these interpretations can appeal to the fact that the *Proslogion* is a devotional exercise in which a believer strives to elevate his mind to the contemplation of God in prayer. Related to this, Anselm introduces the idea that God is X as a thing that “we believe” (*credimus*). The fideistic interpretation claims that Anselm’s aim in the *Proslogion* was to show the internal consistency of the Christian view by deducing articles of faith from other articles of faith, and this is said to be what the dictum “faith seeking understanding” actually means (Barth 1960).

Any adequate interpretation of the *Proslogion* needs to take the devotional character of the treatise seriously. From this it follows, among other things, that the common supposition that Anselm wrote the *Proslogion* in view of the Fool needs to be forsaken as absurd. Nevertheless, the traditional idea about the rational nature of Anselm’s proof can be shown to be correct.

Anselm makes it clear in the Preface that the argument that he will introduce in the treatise, the “single argument,” serves to prove God’s existence and “whatever we believe about the Divine Essence.” It is the single argument, and not the inference in *Proslogion* 2, that really deserves to be called *Anselm’s* argument. There is no scholarly consensus about what exactly Anselm refers to by the phrase “single argument.” It is clear, though, that a strategy of deriving divine attributes from the notion X is centrally related to it. Namely, Anselm believes that God’s attributes are of a kind that makes their bearer greater or more excellent: the Divine Essence is good, eternal, just, and “whatever it is better to be than not to be” (see *Monologion* 15; *Proslogion* 5; *Responsio* 10). Because of this, X can be proved to have any of the divine attributes, for if it lacks any such attribute, then it will not be X. Further, Anselm asserts that the ability to make correct value judgments belongs to the essence of rationality (*Monologion* 68). Consequently, on Anselm’s assumptions, it should be possible to present, starting from the notion X, a strictly rational demonstration for the existence of a being that

has all the attributes that the Divine Essence is believed to have.

Anselm does not explain why he chose to introduce the single argument by using it in a devotional exercise. One possible explanation is that his aim was to mold the attitudes of a conservative monastic audience toward the rational analysis of faith. In the *Proslogion*, Anselm does not yet say that understanding is “a middle-way between faith and sight” (cf. above), but the devotional exercise in the *Proslogion* in effect puts the search for rational arguments in this kind of framework (see Holopainen 2009).

Will, Choice, and Freedom

In many of his later works, Anselm deals with issues related to will, choice, and freedom. The discussions are intricate and aim at solving philosophical problems related to the Christian doctrine. In *De libertate arbitrii*, Anselm seeks to establish that human beings always have a freedom, namely, “freedom of choice,” which makes them accountable for their good and evil deeds, even though it is the case that a sinner cannot turn away from sin without the help of the divine grace. The main task in *De casu diaboli* is to explain the fall of the angel that was the first creature to sin and to explain it in such a way that God will not in the least be responsible for his fall. An analysis of the functioning of the will is a central ingredient in the explanation. In *De concordia*, Anselm works to show that free choice is compatible with divine foreknowledge, predestination, and grace.

Freedom of choice is a freedom that belongs to all beings that have will and reason: to human beings, to angels, and to God. Anselm defines freedom of choice as “the ability to keep the uprightness of will for the sake of uprightness itself.” The ground for this definition has been laid in *De veritate*, where justice (or righteousness) is defined as “uprightness of will kept for its own sake.” A will is just (or righteous) if it always wills what it ought to will and it wills it for the very reason that it ought to will it. Freedom of choice is, hence, the ability of rational creatures to

keep justice, that is, to continue willing what they ought to will for the reason that it is what they ought to will. Anselm, thus, did not conceive freedom in terms of choosing between different alternatives. He explicitly rejects the suggestion that freedom of choice could be defined as “the ability to sin and not to sin,” and he claims that a being who is not able to sin is freer than a being who is able to sin.

Both human beings and angels always have freedom of choice. They always have the ability to keep the uprightness of will because nothing in the world, not even God, can prevent the will from willing what it ought to will; the will wills only what it wills to will. However, it is not always the case that rational creatures can *use* their freedom of choice. A will can keep uprightness only if it has uprightness, and this is not always factual. Nothing can take uprightness from a will, but the will itself can desert it by willing what it ought not, and any slightest breach will have this consequence. Once the uprightness is lost, the will needs the assistance of the divine grace to recover it (and the grace also constantly assists the will when it has uprightness).

Regarding divine foreknowledge, Anselm argues, following Augustine, that it actually guarantees human freedom: it is part of God’s foreknowledge that some of the things that he foreknows to occur will occur for the reason that human beings will freely choose them. Further, Anselm appeals to the nontemporal character of divine existence and claims, as Boethius had done in *Philosophiae consolatio*, that God’s knowledge is not really *foreknowledge* but knowledge of what is present.

Atonement

Anselm’s best-known theological contribution is the satisfaction theory of atonement that he presents in *Cur Deus homo*. Anselm lays out a grand scheme of history directed toward the realization of a heavenly city in which a predetermined number of good angels and elect men will enjoy the presence of God. Sin threatened to destroy God’s

plan. Adam and Eve fell into sin, and thereby the whole human race was tainted by sin. Even the smallest disobedience by a creature is an infinite offense against God. In order that reconciliation between men and God is possible, a compensation for the offense is needed. It should be an infinite compensation, and it should be offered by a representative of the human race. Anselm argues that such a compensation is possible only if the second person of the Trinity becomes incarnated as a God-man: by his death, the God-man can offer satisfaction on behalf of the human race.

Apollonius of Tyana

Charles Burnett
The Warburg Institute, London, UK

Abstract

Apollonius of Tyana was a charismatic personality who lived in the second half of the first century CE. He achieved legendary status as a spiritual leader to whom works of magic and natural philosophy were attributed, and his works were known in Greek, Sanskrit, Arabic, and Latin.

Apollonius of Tyana's fame as a wise man, magician, and spiritual leader was such that he became a legendary personality from the early second century onward, with the result that it is difficult to piece together the facts of his life and writings. It is reasonably certain that he was active in Syria and the neighboring countries in the late first century CE, espoused a kind of Pythagorean philosophy, and, as a self-confessed "magician," cured people of various illnesses. He is probably the author of books *On Astrology* and *On Sacrifices*, to which references are made by later writers, but which have not survived. The details given in the early third-century *Life of Apollonius* by Philostratus, can sometimes be corroborated by independent evidence, but are embellished by rhetorical flourishes and colored by Philostratus' evident bias against magic and astrology. The

particular mix of divination by the stars, sacrifice to several gods, and magical cures that forms the core of his attested interests suggests that he is a late representative of the Babylonian tradition of omen-reading, of which a branch survived in Emesa, a Syriac city with which Apollonius is associated. This may also explain how his brand of Pythagoreanism included the worship of the Sun. Less certain are the accounts of journeys to Spain and India, but a fifth-century CE Sanskrit text refers to him as a sage. A corpus of letters in Greek endorsing his magical powers and promoting pagan Greek culture was written in his name, and he became a cult figure in several cities in Syria, and was worshipped by the Roman Emperor Severus Alexander. He became known as a spokesman for the wisdom of Hermes Trismegistus, in particular in the field of talisman making.

In this last capacity, Apollonius (usually in the form Balīnūs) became a prominent figure in Arabic literature, probably as a result of his veneration in Syria. A Greek text (the “*Book of Wisdom* addressed to his pupil Soustoumos Thalassos,” on talismans of the hours of the day and the night) was translated into Arabic as *The Greater Book on Talismans*, Balīnūs acquired the sobriquet *ṣāhib al-ṭīlasmāt* (*Master of Talismans*), and texts on this subject were attributed to him. Among these was a tablet made of emerald (*al-lauḥ al-zumurrudī*, *Tabula Smaragdina*) that purports to have been found by Apollonius in the hands of Hermes in an underground cave, and which gives, in enigmatic language, the creed of the “masters of talismans.” It was, however, adopted by alchemists as a mystical confirmation of their art, and was allegedly accompanied (in the same cave) by a book, which gives the cosmological basis for the practice of alchemy. This text, called the *Sirr al-khalīqa* (*The Secret of Creation*) is a kind of popular encyclopedia on natural philosophy, arranged according to the four Aristotelian causes (hence its subtitle: *kitāb al-‘ilal*, *The Book of Causes*). The first book, entitled *On the Creator and the Created*, deals with the material and formal causes. This is followed by books dealing with the final and efficient causes: book two on the effects of the higher beings, book three

on the causes of metals, book four on the causes of plants, book five on animals, and book six on the creation of man. Included in the *Sirr al-khalīqa* are questions about nature that continue the ancient Greek genre of *problemata*, and Nemesius of Emesa’s *On the Nature of Man* is a significant source for the book on man (a résumé of the work is included in an expanded version of the text). Throughout the book there is a concern to point out the underlying unity in all nature and the bonds connecting all things. The approach to nature is biological: the elements are alternately masculine and feminine, and from the mating of the masculine elements, fire and air, with the feminine ones, earth and water, everything generated in the universe is born. The description of the production of all metals from sulfur and mercury and the division between the “bodies” and the “spirits” of the metals are distinctly alchemical, and serve to introduce the alchemical recipes in other texts attributed to Apollonius or his pupils, such as the *Miftāḥ al-ḥikma* (*Key of Wisdom*).

Apollonius’ reputation as a magician and philosopher was known in the West (St. Jerome refers to “*Apollonius, sive ille magus, ut vulgus loquitur, sive philosophus, ut Pythagorici tradunt*”), which probably encouraged Latin scholars to seek out texts attributed to him (or to invent such texts). The *Sirr al-khalīqa* was translated under the title *De secretis naturae* by Hugo of Santalla in Tarazona in the mid-twelfth century (he correctly recognized the name “Apollonius,” though his place of origin, “Tyana,” became distorted into “Athawaca”), but the Latin diffusion of this work was limited. The texts on alchemy and talismans, however, had a better fortune. The *Key of Wisdom* was translated as the *Clavis Sapientie*, but attributed to “Artefius.” Other translations included *The Greater Book on Talismans* and books on talismans of the planets and the 28 lunar mansions, and corroborated Apollonius’ reputation (often under the name Belenus, Plinius, or even Plinius) as a Hermetic philosopher in the West. Additionally, Apollonius became the authority on a new kind of magic: that of acquiring mastery of the arts and sciences in a miraculously short time, which was popular in university circles, under the title “*ars notoria*.” The

talismanic texts were in turn translated into European vernaculars (the book on the lunar mansions can be found in English in a sixteenth-century manuscript, London, British Library, Sloane 3846). Philostratus' image of Apollonius was restored to the West through a Latin translation of Alamanno Rinuccini in 1473 and the Greek-Latin edition of Aldus Manutius of 1501–1504 (followed by a succession of further translations and adaptations), and from then on the figure of Apollonius became well established in western culture, and emblematic as the obverse to Jesus Christ in an increasingly secular society.

Arabic Philosophical Texts, Jewish Translations of

Mauro Zonta

Dipartimento di Studi Filosofici ed

Epistemologici, Università di Roma, Rome, Italy

Abstract

Many philosophical texts written in Arabic or Judeo-Arabic by Islamic, Jewish, and Christian authors were partially or totally translated into Hebrew during the Middle Ages. The translation movement began around 1150 and ended in 1400 circa; it involved several geographical areas and a number of translators. Some translations were made in Spain, by local Jewish scholars such as Judah ibn Cardinal and Solomon ibn Daud in the second half of the twelfth century; by Abraham ibn Hasdai, Shem Tov ben Isaac, and Shem Tov ibn Falaquera during the thirteenth century; by Joseph ben Joshua of Lorca, Hayyim ibn Vivas, Isaac ben Solomon Israeli, and Isaac Natan in the first half of the fourteenth century; by Solomon ibn Labi, Samuel ibn Motot, and Zerahyah ha-Levi Saladin in the second half of the fourteenth century. A number of translations were made in Provence in the period 1160–1300 c.; they involved a school of professional Arabic-into-Hebrew translators, the Ibn Tibbons, as well as some minor authors (Judah al-Harizi, Solomon ibn Ayyub, Isaac Albalag). Other translators worked in Provence in the first half of the fourteenth century: Qalonymos ben Qalonymos, Samuel of Marseilles, Todros Todrosi, Solomon of Melgueil, Qalonymos

Todrosi, and possibly Moses Narboni. Three Arabic-into-Hebrew translators worked in central and southern Italy during the thirteenth century: Jacob Anatoli, Zerahyah Hen, and Ahituv of Palermo. Some Arabic philosophical works were translated into Hebrew from their medieval Latin versions, especially in the fifteenth century.

In southwestern Europe, during the last centuries of the Middle Ages, many Jewish thinkers were interested in medieval Arabic philosophical texts. Since many of them could not read these texts in their original language, they had to read them in Arabic-into-Hebrew translations. For this purpose, in the period 1150–1400 c. a number of Jewish scholars engaged in translations, which included not only many philosophical texts written in Arabic by medieval Islamic philosophers, but also the key-texts of medieval Jewish philosophy in Judeo-Arabic (Middle Arabic written by Jews), and even some philosophical texts by medieval Arabic Christian authors. After 1400, since Arabic was apparently no longer known by European Jews, some Arabic philosophical texts were translated into Hebrew not directly, but from their medieval Latin versions. A very rich and informative inventory of almost all these translations has been made by Moritz Steinschneider (Steinschneider 1893:42–460), but some new texts have been found or identified later on. A general sketch of medieval Arabic-into-Hebrew translations appeared (Halkin 1971), as well as an historical study of the medieval Hebrew translation movement of philosophical works (Zonta 1996). Medieval Arabic-into-Hebrew translations of philosophical texts include works about physics, natural sciences, metaphysics, and ethics; however, also many non-philosophical, mostly religious works, as well as scientific works about astronomy and astrology, medicine, and other sciences were translated from Arabic into Hebrew. Finally, a great amount of Hebrew quotations of Arabic philosophical texts are found in the medieval Hebrew encyclopedias (Harvey 2000) and elsewhere, for example in Shem Tov ibn Falaquera's works (Zonta 2004).

The first period of translations covers the second half of the twelfth century, in two areas: Spain and Provence. It almost exclusively involves Judeo-Arabic philosophical and philosophic-theological texts. Two translators were active in Spain: Judah ibn Cardinal and Solomon ibn Daud. The former translated into Hebrew, before 1167, Judah ha-Levi's *Book of the Khazar*; only a fragment of this translation is extant (Cassel 1853:344–361). The latter, probably the son of the well-known medieval Jewish philosopher Abraham ibn Daud, was active in Toledo between 1180 and 1200; he translated Ibn al-Sīd al-Baṭalyūsī's *Book of Circles*, a work including a number of doctrines of the *Epistles of the Brethren of Purity* (Richler 1978). Other translators of Judeo-Arabic philosophical texts worked in Provence. Probably in Narbonne, before 1170, Joseph Qimhi translated Bahya ibn Paqudah's *The Duties of the Hearts*; only a short fragment of this translation, including part of chapter 7 of the work, is extant (Bahyah ibn Paqudah 1846: xx). Possibly in Lunel, around 1170, Judah al-Harizi translated part 1 at least of Moses ibn Ezra's *The Treatise of the Garden*, under the title *Garden of Perfume* (Dukes 1842); probably in the same period, al-Fārābī's treatise *On the Intellect* was reworked by an anonymous Provençal Jew (Freudenthal 2002). Still in Provence, a family of Jewish scholars from Andalusia, the Ibn Tibbons, began to operate as professional Arabic-into-Hebrew translators of philosophical texts. In 1160–1186 the first of them, Judah ibn Tibbon, wrote in Lunel his translations of *The Duties of the Hearts*, the *Book of the Khazar*, and Saadia Gaon's *Book of the Beliefs and Opinions*: all these translations were copied and published many times, and replaced the previous ones. Apparently, Judah also translated al-Fārābī's *Compendium of Aristotle's Sophistici elenchi*.

The thirteenth-century period of translations still covers both Spain and Provence, but two important examples of Arabic-into-Hebrew translators appear in central and southern Italy. In Spain, a number of Judeo-Arabic philosophical works were translated into Hebrew by anonymous scholars during this century. These translations include Isaac Israeli's *Book of Definitions*

(if Moses ibn Tibbon was not the translator of this version), his *Book of Spirit and Soul*, and an otherwise unknown short treatise *On the Elements* by Israeli (Steinschneider 1871–1872; Altmann 1956, 1957). Another Spanish scholar (Nahum ha-Ma‘aravi?) translated Joseph ibn Zaddiq’s *Book of Microcosm*, whose original Arabic text is now lost (Horovitz 1903). Other Spanish Jewish translators were active in this period. In the period 1210–1230, Abraham ibn Hasdai of Barcelona translated Pseudo-Aristotle’s *Book of the Apple* (*Liber de pomo*) and Israeli’s *Book of the Elements* (Fried 1900). Maybe in the same area Shem Tov ben Isaac translated, around 1260, Averroes’ *Middle Commentary on Aristotle’s De anima*; Shem Tov ibn Falaquera summarized in Hebrew, around 1270, Solomon ibn Gabirol’s *The Source of Life* (Munk 1859; Shelomoh ibn Gabirol 2001), and Pseudo-Empedocles’ *Book of the Five Substances* (Kaufmann 1899); Isaac Albalag translated in 1292 al-Ġazālī’s *Intentions of the Philosophers*. During the thirteenth century, another minor Spanish author, a certain Moses ibn Lajis, translated one or more of al-Fārābī’s short logical works. Probably during this century some other Arabic philosophical works were translated into Hebrew: the “shorter version” of the *Secretum secretorum* (Gaster 1907, 1908), and Moses ha-Levi’s *Metaphysical Treatise*. Finally, in thirteenth century Spain Qūṣṭā ibn Lūqā’s treatise *On the Difference between Spirit and Soul* might have been translated into Hebrew not from the original text, but from its medieval Latin version.

At the beginning of the thirteenth century, in Provence, the main Judeo-Arabic philosophical work, Maimonides’ *Guide of the Perplexed*, was translated twice: in 1204 by Samuel ibn Tibbon, and before 1213 by Judah al-Harizi; the latter translation was much lesser known and was first published in the nineteenth century only. Around 1215, al-Harizi translated another Arabic philosophical work, Ḥunayn b. Ishāq’s *Sayings of the Philosophers* (Loewenthal 1896); in 1259, Solomon ibn Ayyub translated, in Béziers, Averroes’ *Middle Commentary on Aristotle’s De caelo*. However, the most prolific translator of that period was Moses ibn Tibbon, working in Provence (Montpellier) between 1240 and 1283.

Moses rendered from Arabic into Hebrew Averroes’ *Summaries of Aristotle’s Physics*, *De generatione*, *Meteorologica*, *De anima*, *De sensu*, and *Metaphysics*: three of these translations, made in the period 1244–1258, are available in critical editions (Averrois Cordubensis 1954, 1958; Ivry 2003). Moses also translated al-Fārābī’s *On the Political Regime* (Filipowski 1849:1–64) and, in 1255, his *Short Treatise on the Syllogism*; the *Book of Circles* by Ibn al-Sīd al-Baṭalyūsī (Kaufmann 1880), and Maimonides’ *Treatise on the Art of Logic* (Efros 1938:21–64). His work was completed by a relative of him, Jacob ben Makhir ibn Tibbon, who translated in 1289 Averroes’ *Summaries of Porphyry’s Isagoge* and Aristotle’s logical works, and in 1302 his *Summaries of Aristotle’s De partibus and De generatione animalium*. Other translations, made in Provence in the thirteenth century, are still anonymous, such as that of the short treatise *On Whether the Active Intellect Unites with the Material Intellect* by Averroes Junior, son of Averroes (Burnett and Zonta 2000), that of al-Fārābī’s treatise *On the Intellect*, and those of most of al-Fārābī’s short logical works. In Provence too, there was a case of an Arabic philosophical text translated, or better reworked into Hebrew via a Latin version: this is the Hebrew version of Pseudo-Avicenna (Ḥunayn b. Ishāq?)’s *De caelo*, by Solomon of Melgueil (Glasner 1996).

At least two non-Italian professional translators of philosophical texts from Arabic into Hebrew were active in Italy during the thirteenth century. Jacob Anatoli, a relative of Samuel ibn Tibbon working in Naples in 1231–1235, rendered into Hebrew Averroes’ *Middle Commentaries* on Porphyry’s *Isagoge* and Aristotle’s *Categories* (Averrois Cordubensis 1969), as well as those on the *De interpretatione* and *Prior and Posterior Analytics*. Zerahyah Hen, a Catalan Jew working in Rome in 1277–1290, rendered into Hebrew the Arabic *Book of the Causes* (*Liber de causis*) falsely ascribed to a number of authors (Rothschild 1994), a *Treatise on the Quiddity of the Soul* falsely ascribed to al-Fārābī (Freudenthal 2003), and Averroes’ *Middle Commentaries on Aristotle’s Physics* and *Metaphysics*. In Sicily, where Arabic was well-known among Jews, a

minor author, Ahituv ben Isaac, translated Maimonides' *Treatise on the Art of Logic* in Palermo, around 1280 (Efros 1938:65–100). In northern Italy, where Jews did not know Arabic, a renowned philosopher, Hillel ben Samuel of Verona, translated the *Book of the Causes* around 1260 from Gerard of Cremona's medieval Latin version (Halberstam 1874:41–42).

The third period of translations covered the first half of the fourteenth century; some of these translations were made in various Spanish places, but most of them were made in Provence. As for the Spanish translations, there is reliable information about three of them: between 1320 and 1340, Hayyim ibn Vivas translated Ibn Bājja's *Epistle of Farewell* for the Portuguese Jewish scholar David ibn Bilia (Hayoun 1990); around 1347, in Mayorca, Isaac Natan translated Abū 'Abdallāh al-Tabrīzī's *Commentary on the Twenty-Five Propositions of Maimonides' Guide*; probably during the fourteenth century, Joseph ben Joshua Vives of Lorca translated Maimonides' *Treatise on the Art of Logic* (Efros 1938:101–129). The places where other fourteenth-century translators worked are still uncertain. In Spain or in Provence, Nissim ben Solomon translated Isaac Israeli's *Book of Definitions* (Hirschfeld 1896), and an anonymous author translated al-Tabrīzī's work mentioned above (Hayoun 1996). A number of Arabic-into-Hebrew translators were active in Provence, in the period 1310–1350 c. At least one of them was a sort of professional translator, in the style of the Ibn Tibbons: Qalonymos ben Qalonymos of Arles. In 1314, he rendered into Hebrew some of al-Fārābī's philosophical works: the *Enumeration of Sciences* and the *Propaedeutic to the Study of Philosophy* (Zonta 1992), as well as his treatise *On the Intellect*. Many of his translations involve Averroes' commentaries on Aristotle: Qalonymos translated, in 1313, Averroes' *Summaries of the Topics* and the *Sophistici elenchi*; in 1314, his *Long Commentary on the Posterior Analytics*; in 1315 circa, his *Long Commentary on the Physics* and that on the *Metaphysics* (the latter being "edited" by Moses of Beaucaire), as well as some of his *Questions on Logic*; in 1316, his *Middle Commentaries on the Physics*, the *De generatione* (Averrois

Cordubensis 1958), and the *Meteorology*; in 1317, his *Middle Commentary on the Metaphysics* – a translation revised by Qalonymos himself some years later. Most of Qalonymos' translations might have been made on behalf of a famous Provençal Jewish philosopher, Levi ben Gershom (Gersonides), who made use of them in his works. In the same period, other professional translators were active in Provence: Samuel ben Judah of Marseilles, and Todros Todrosi of Arles. In 1320–1322, Samuel translated Averroes' *Logical Questions*, including works by three of Averroes' followers (Abū l-Qāsim ibn Idris, Ḥajjāj ibn Ṭumlus, Abū 'Abd al-Rahmān ibn Tāhir); he rendered into Hebrew also Averroes' *Middle Commentary on Aristotle's Nicomachean Ethics* (Averroes 1999), and his *Paraphrase of Plato's Republic* (Rosenthal 1956). In the period 1330–1340, Todros translated al-Fārābī's *The Sources of Questions*, parts two and three of Avicenna's philosophical encyclopedia, *The Salvation*, and three of Averroes' questions on metaphysical subjects; he also rendered into Hebrew two series of Arabic commentaries on Aristotle's *Rhetoric* and *Poetics*: al-Fārābī's *Summaries* and, in Trinquetaille in 1337, Averroes' *Middle Commentaries* (Averroes 1842; Lasinio 1872). Other translators were active in Provence in this period: around 1320–1325, Moses of Beaucaire revised Qalonymos' version of Averroes' *Long Commentary on the Metaphysics* (Zonta 2001); before 1328 or 1330, Judah ben Solomon Todros translated al-Ġazālī's *Intentions of the Philosophers*, and Qalonymos Todrosi translated Averroes' *Refutation of the Refutation of the Philosophers*. Some other works are still in need of identification: the anonymous translations of Averroes' *On the Substance of the Earth* (*De substantia orbis*) (Averroes 1986) and of his *Physical Questions*, as well as those of al-Fārābī's *Compendium of Aristotle's Metaphysics* and *Exhortation to the Way of Happiness*, might have been made in fourteenth century Provence, but it is not clear by whom. The same is true for some anonymous Arabic-into-Hebrew translations, commented on by the Provençal Jewish thinker Moses Narboni, who might have even written them by himself. They include those of Averroes' *Commentary on*

Alexander of Aphrodisias' De intellectu (Davidson 1988) and of his *Epistle on the Possibility of the Conjunction with the Active Intellect* (Ibn Rushd 1982), probably written before 1340; that of al-Ġazālī's *Intentions of the Philosophers*, probably written before 1344; that of Averroes' *Confutation of the Confutation*, written in 1347 or before; that of Ibn Ṭufayl's philosophical tale *The Alive Son of Awake*, written in 1349 or before (Hayoun 2002). In the same period, in Rome, at least two Arabic philosophical texts were translated into Hebrew from their medieval Latin versions and commented on by the Italian Jewish philosopher Giuda Romano: Pseudo-Aristotle's *Book of the Causes* (Rothschild 1994), and Averroes' *On the Substance of the Earth*.

The Jewish communities in Provence, where most of the translations had been made, were partially dispersed by the 1348 plague. Only few Arabic-into-Hebrew translations of philosophical works were apparently made in the second half of the fourteenth century, and all of them were probably written in Spain. They include the anonymous version of Joseph ibn Waqqar's *Treatise Reconciling Philosophy and Religion* (Vajda 1962:119); Solomon ibn Labi's first Hebrew translation of Abraham ibn Daud's *The Exalted Faith*, made around 1370 (Abraham ibn Daud 1986); Samuel ibn Motot's versions of chapters 1–4 of Ibn al-Sīd al-Baṭalyūsī's *Book of Circles*, made in 1370 in Guadalajara (Kaufmann 1880), and of Ibn Daud's *The Exalted Faith*, made in 1391 and partially based upon Ibn Labi's one; Zerahyah ha-Levi Saladin's translation of al-Ġazālī's *Incoherence of the Philosophers*, made around 1400.

In the fifteenth century, the knowledge of Arabic as the language of science and philosophy seems to have been almost disappeared among Jewish scholars, even in Spain. As a matter of fact, only three Arabic philosophical works were translated into Hebrew in this period, and all these translations were apparently based upon medieval Latin versions. A Hebrew translation of al-Fārābī's *Summary of the Nicomachean Ethics* was probably based upon a lost Latin version; it is found in an anonymous supercommentary on Averroes' *Middle Commentary* on Aristotle's

work (Berman 1978:302–311) dating back to the first half of the fifteenth century. Before 1470, in Castilia or in southern Italy, an anonymous author (Baruch ibn Ya'ish?) rendered into Hebrew Averroes' *Long Commentary on Aristotle's De anima* from the Latin translation of Michael Scot (Zonta 1994). In 1471 or 1477 Eli Habbillo, an Aragonese Latin-into-Hebrew translator of philosophical works, translated Pseudo-Aristotle's *Book of the Causes* from Gerard of Cremona's Latin version (Rothschild 1994).

Arabic Texts: Natural Philosophy, Latin Translations of

Charles Burnett
The Warburg Institute, London, UK

Abstract

Natural philosophy, as one of the major divisions of medieval learning, consists of texts by both Aristotle and his commentators (in Greek and Arabic), and a large number of practical divisions. Arabic authors contributed considerably to both branches.

Philosophy in the Late Antique Greek schools consisted of three divisions, mathematics, natural philosophy and metaphysics, of which the second and third divisions were based on the works of Aristotle. These divisions (with logic regarded as a fourth, introductory division, or a tool to be used for the other divisions), had formed the structure of teaching that passed into Syriac and Arabic, but was largely lost to the Latin West. Latin scholars

were well aware of some of Aristotle's works on logic (the *logica vetus*) from the translations from Greek made by Boethius in the early sixth century, but it was not until the early twelfth century that the remaining works on logic, and the texts on natural science (the "*libri naturales*") and metaphysics began to be translated, by James of Venice, Burgundio of Pisa, Henricus Aristippus, and others; the process was completed in the late thirteenth century by William of Moerbeke. In the Arabic world, however, thanks to the translations made (often via Syriac) in the ninth century of the whole of the Aristotelian corpus, together with a mingling of Neoplatonic works, a philosophical tradition developed based on an intelligent critique of Aristotle. The leading exponents of this Arabic tradition were al-Fārābī, Ibn Sīnā, and Ibn Rushd.

When Latin translators wished to fill the perceived gaps in their knowledge of philosophy, they turned to the *Classification of the Sciences* of al-Fārābī (d. c. 950), which detailed each of the divisions of grammar and logic, mathematics, natural philosophy, metaphysics, politics, jurisprudence, and theology. In the section on natural philosophy are listed in order "eight enquiries" (*fuḥūṣ*), together with the books of Aristotle that deal with them:

1. The principles shared by all bodies, corresponding to Aristotle's *Physics*
2. The simple bodies out of which the universe is composed; *On the Heavens*
3. The processes of coming-into-being and passing away; *Generation and Corruption*
4. The accidents and affects of simple elements; *Meteorologica*, bks 1–3
5. The accidents and affects of elements in combination; *Meteorologica* bk 4
6. Stones and minerals; the *Liber mineralium*
7. Plants; *On Plants* (a work by Nicholas of Damascus drawing on Aristotle's doctrines)
8. On what species of animals share and what is proper to each species; *On Animals* and *On the Soul*.

Gerard of Cremona (1114–1187), who made a translation of this work of al-Fārābī, inaugurated

the program of natural philosophy in Toledo by translating *Physics*, *On the Heavens*, *On Generation and Corruption*, and the first three books of the *Meteorologica* from Arabic. Alfred of Shareshill (who lived into the early years of the thirteenth century) completed the *Meteorologica* by adding Henricus Aristippus' Greek–Latin translation of the fourth book, and his own translation of chapters from Ibn Sīnā's *Shifā'* (see below) on stones and minerals; he also translated the *De plantis* (or *De vegetabilibus*) of Nicholas of Damascus, which was based on Aristotelian material. Michael Scot completed the series by translating, in Toledo before 1220, the book on *Animals*. Alongside these texts of Aristotle were translated works of Arabic scholars. Gerard of Cremona himself translated al-Fārābī's *Commentary* (or *Introduction*) to *Physics* (the work is not extant), several treatises by al-Kindī concerning topics in *Physics* and in *Parva naturalia*, and a whole text, *De causis proprietatum elementorum quatuor* (*On the Causes of the Properties of the Four Elements*), written by an anonymous Arabic author, which deals primarily with questions of physical geography; this text was inserted into the *Libri naturales*, between *On the Heavens* and *On Generation and Corruption*. But the most significant Arabic text belonging to the Peripatetic tradition that aroused the interest of Latin scholars was Ibn Sīnā's *Shifā'* ("The Cure" scil. from ignorance).

This text became known in Toledo at the height of Gerard's career there. It is a large compendium of philosophy belonging to the Peripatetic tradition, in which Ibn Sīnā (d. 1037) carefully analyzes, emends, and develops Aristotle's doctrines in the light of the Greek and Arabic commentators, and the Neoplatonic works that he knew, and through his original insights. It is divided into four large units, each called a *jumla* or "collection," on logic, natural philosophy, mathematics, and on metaphysics. Natural science is divided into eight sections, each called a *fann* (or "subject"), and very similar to the divisions described by al-Fārābī: (1) on principles, movement, place and time, the infinite and the finite (i.e., physics); (2) on the heavens; (3) on generation and corruption; (4) on actions and passions; (5) on minerals

and meteorology; (6) on the soul; (7) on plants; and (8) on animals. The *Shifā'* was apparently brought to Toledo by the Jewish scholar Abraham Daud who collaborated with an archdeacon there, Dominicus Gundissalinus (fl. 1161–1190), on the translation of the section on the soul ("*Liber sextus de naturalibus*"). An unknown twelfth-century translator, in turn, translated the first two treatises (together with the opening of the third) under the title *Sufficientia*. Alfred of Shareshill translated two chapters on mineralogy and possibly the chapter on floods from section 5, while another Jew and Christian ("Salomon" and Juan Gonsalvez de Burgos) collaborated in the 1270s on translations of treatise 3 of section 1, and sections 2, 3, and 4 of the collection on natural science. The last section, on animals, was translated apparently from an abbreviated Arabic version, by Michael Scot (d. before 1236) for Frederick II Hohenstaufen. The translations of Salomon and Gonzalves had little impact, surviving in only one manuscript, but the other translations were widely copied, and read in conjunction with the *Libri naturales*. Albert the Great followed the model of Ibn Sīnā in writing his own works on the different divisions of natural philosophy. Roger Bacon's estimation of Ibn Sīnā as the *praecipuus imitator et expositor Aristotelis* ("the eminent imitator and elucidator of Aristotle"), shows the respect he was held in.

Dominicus Gundissalinus, aside from embarking on the translation of Ibn Sīnā's *Shifā'*, translated, with a certain "magister Iohannes," *The Aims of the Philosophers* of al-Ġazālī. This was a summary of the doctrines of Peripatetic philosophy based very largely on the compendium of philosophy written by Ibn Sīnā in Persian for his secular patron, the *Dānesh-Nāmeḥ*. Ramon Llull was later to paraphrase the opening section on logic in his own "*Compendium Logicae Algazelis*."

The culmination of the Greek and Arabic tradition of commenting on the works of Aristotle is found in the œuvre of Ibn Rushd of Córdoba (Averroes, 1126–1198). He wrote his commentaries on Aristotle's works in the forms of Long Commentaries, Middle Commentaries and Epitomes, and his writings became well known to

Jewish and Latin scholars soon after his death. In the field of natural philosophy, the Long Commentaries on *Physics*, *On the Heavens*, and *On the Soul*, and the Middle Commentaries on *On Generation and Corruption*, *Meteorologica*, bk IV, and *On Animals* were translated from Arabic in the early thirteenth century. Common terminology and style between all these translations except that of the *Meteorologica*, and the explicit attribution of *On the Heavens* to Michael Scot, suggest that he was responsible for the translations. Ibn Rushd's original work, *On the Substance of the Orb*, which explores the differences between the substances of the heavens, the sublunar world, and the soul, belongs to the same context.

Thus far, Arabic works on natural science have followed the Aristotelian tradition, and they appealed to the Latin West because they supported and enhanced this tradition. Dominicus Gundissalinus, aside from translating some of these works, wrote his own text *On the Division of Philosophy*. In this, he sought to bring together definitions of the different sciences that he found in his Latin sources (especially the *Etymologies* of Isidore of Seville) with definitions from Arabic sources, among which al-Fārābī's *Classification of the Sciences* is the most important. Thus we see, in the chapter devoted to "*scientia naturalis*," a section beginning "*Partes huius scientie naturalis sunt octo*" ("the parts of this natural science are eight"), which is simply a transcription of the relevant part of the *Classification*. Gundissalinus describes natural philosophy in his own words as "the science that considers only things which cannot be abstracted from matter, and which are in movement. . . it considers matter with the form which cannot be abstracted from matter. . . Its matter is body, not as being, but as substance, not in that it is composed of two principles, form and matter, but in that it is subject to movement, rest and change" etc. This Peripatetic natural science is theoretical. But this is not the only kind of natural science that we find among Arabic writers, and the Latin scholars who depend on them.

In the same chapter on natural science in Gundissalinus' *De divisione philosophiae*, immediately preceding the eight "parts", as listed by

al-Fārābī, is another classification of the "sciences" or "species of natural science", this time into (1) medicine, (2) astrological judgments, (3) nigromancy according to physics, (4) talismans, (5) agriculture, (6) navigation, (7) optics, and (8) alchemy. This division comes from an Arabic work known only in its Latin translation under the title *De ortu scientiarum* (*On the Rise of the Sciences*), and attributed variously to Aristotle, al-Fārābī and Avicenna. Having stated that there is nothing aside from substance, accident, and the Creator of both, and that accidents are apprehended through the five senses, while substance is only apprehended through reason, with the mediation of accidents, the author explains how the four mathematical arts arose. He then turns to the "natural art" (*ars naturalis*) whose origin he explains as arising from the need to explain why substances change color, last for different lengths of time, and are healthy or ill. He goes on to say that the parts of the natural art

according to what the first wise men said, are eight: namely the science of judgements (astrology), the science of medicine, the science of nigromancy according to physics, the science of talismans, the science of agriculture, the science of the sea, the science of alchemy, which is the science concerning the conversion of things into other species, and the science of mirrors.

He states that astrology and medicine are the most important parts of this natural art.

That he uses "*ars*" instead of "*scientia*" in the heading is immediately significant; what we are dealing with is clearly the practical side of natural philosophy, an art or craft (probably *ṣinā'a* in Arabic). These sciences concern how to effect change in nature. By this art, one can "remove those causes (or "illnesses"; the word which is presumable in the Arabic original is *ilal* which means both "causes" and "illnesses") which are harmful and increase those that are beneficial."

This applies most of all to medicine, but also to katarctic astrology in which the best times are chosen for embarking on an activity, to avoid misfortune and gain success. The early translators of Arabic texts on medicine and astrology were keen to emphasize that medicine belonged to "physics" (Gerard of Cremona's medical

translations were called by his students “*De physica*”), and that the study of the effects of the stars on sublunar beings belonged to “natural speculation” (Hermann of Carinthia describing the subject matter of Abū Ma’shar’s *Great Introduction to Astrology*).

Arabic texts on the other subjects mentioned in *On the Rise of Sciences* can also be recognized. “The science of nigromancy according to physics” would be “natural magic,” rather than the invocation of spirits or daimons (*rūḥāniyyāt*). Among the Arabic texts on this subject translated into Latin was the *Kitāb al-nawāmīs*, translated as the *Liber vaccae* (*Book of the Cow* of “Plato”), which operates only with animals (whether natural or artificial) and not with talismans or spirits. This is, rather, the subject of the next division: the “science of talismans (*imaginibus*).” Two Arabic texts on this subject were translated into Latin: one by Thābit ibn Qurra (836–901), in which the positions of planets in the signs of the zodiac are observed; the other attributed to Ptolemy, which is based on the rising of third parts (decans) of signs of the zodiac. Under the titles *Liber imaginum Thebit ben Cora* and *Opus imaginum Ptholomei*, they were frequently copied in the Middle Ages.

The next two practical sciences, agriculture and the science of the sea, are also found listed, alongside medicine, among the seven “mechanical arts” in the Latin tradition. However, when we consider the possible Arabic original terms, their identification as natural sciences becomes more reasonable. The first is probably *filāḥa*. This involves man participating with nature in producing crops out of seeds, grapes out of vines, etc., but one should also consider the wider meaning of *filāḥa* in the title of Ibn Waḥshiya’s *Kitāb al-filāḥa al-nabaṭīya* (*Nabataean Agriculture*) that included all kinds of magical recipes. Although it was not translated directly from Arabic into Latin, passages were known through being quoted in the magical compendium, *Ġayāt al-Ḥakīm*, translated in the mid-thirteenth century as “Picatrix.”

“*Scientia de navigando*” is presumably *milāḥa*, which would mean not only the knowledge of navigating, using a quadrant or ship’s

astrolabe and a chart, but also the prediction of good and bad weather to ensure the success of the voyage. Weather forecasting, the practical aspect of meteorology, is a separate genre within Arabic astrology, and two treatises on the subject by al-Kindī were combined into a single text in Latin under the title *De mutatione temporum* (*On the Change of Times*).

In alchemy, man imitates and speeds up the processes of change that naturally occur in natural substances. The Latin alchemical corpus depended entirely on that of the Arabs, among whom the names of Khālīd ibn al-Walīd, Jābir b. Ḥayyān, and Abū Bakr al-Rāzī figure as authorities. Alchemy, too, is concerned with substances coming into being and passing away, and changing color, while it can prolong life – all subjects of the natural art as defined in *On the Rise of the Sciences*.

The last science listed – optics, *De speculis*, could be regarded as natural philosophy in that it deals with the physiology of the eye, the nature of color, and the behavior of rays of light in a medium, all topics occurring in Ibn al-Haytham’s *Optics*, which was rendered into Latin by two unknown translators before the late thirteenth century. But in another list of the eight branches of physics, found in Daniel of Morley’s *Philosophia* (written between 1175 and 1187), the science is described as being about *burning* mirrors, a subject which Ibn al-Haytham also had dealt with in an Arabic text possibly translated by Gerard of Cremona. Thus, “optics” again is about the knowledge of how to effect change in nature – in this case by reflecting the light of the sun to cause something to burn.

Thus, we see how the Arabs contributed both to the theoretical natural philosophy in the West and to what were regarded as the practical branches of natural science. The former became firmly embedded in the curricula of western universities and the paths of their dissemination can be followed in detail. The latter (with the exception of certain branches of medicine and occasionally astrology) were not included in the teaching of the universities, and their diffusion is more difficult to trace.

Arabic Texts: Philosophy, Latin Translations of

Anna Akasoy

Oriental Institute, Oxford, UK

Abstract

In the twelfth and thirteenth centuries, a vast body of philosophical and scientific literature by Greek and Arabic authors was translated from Arabic into Latin. The translation movement peaked with the School of Toledo and the translators Gundissalinus and Gerard of Cremona in the twelfth century and with the court of Frederick II and the translator Michael Scot in the thirteenth century. It was in the frontier regions between the Muslim and Christian realms, where learned individuals with the necessary linguistic skills were present, that the translations took place. In the area of philosophy, the impact of the translations can be seen in a renewed interest in the interpretation of the works of Aristotle and other Greek authors, shaped by their Arabic translators and interpreters, and in a transformation of the curriculum of philosophical learning as expressed in the teaching of the subject as well as in its conceptual shape. While it was mainly courts with their high-ranking patrons and rich resources that offered a social, intellectual, and institutional context for the translations, the later reception of the translated works took also place at universities. While some translators embarked on political careers or left, like Gundissalinus, their own, sometimes highly significant marks in the philosophical tradition of the West, other translators survive

only with their names. Jews played a particularly important role in these transmissions. Several philosophical works originally written in Arabic, in particular, by Averroes, have not been preserved in their original form but survive only in Latin translations. Even though religious texts were translated for polemical purposes, anti-Islamic motives did not affect attitudes to Arabic philosophy in the Latin West.

Introduction

In the twelfth and thirteenth centuries, a vast body of philosophical and scientific literature by Greek and Arabic authors was translated from Arabic into Latin. The translation movement peaked with the School of Toledo in the twelfth and the court of Frederick II in the thirteenth century. In the area of philosophy, categories of texts translated include (1) Greek works (mostly by Aristotle and his commentators) previously translated into Arabic, (2) summaries and *quaestios* by Greek and Arabic authors which deal with questions arising from Aristotle's works, (3) systematic treatises on *falsafa* (most importantly Avicenna's *Shifā'* (*Cure*) and al-Ġazālī's *Maqāṣid al-falāsifa* (*Intentions of the Philosophers*)), (4) commentaries (most importantly, Averroes' commentaries on Aristotle), (5) doxography (Burnett 2005: 370–371). The recovery of Aristotle's books via Arabic happened at about the same time as the Latin translation of his works from Greek by James of Venice (fl. 1125–1150) and Burgundio of Pisa (d. 1193). The Arabic versions had the advantage of bringing with them a much longer tradition of interpretations, that is, in addition to the late antique works mainly of Alexander of Aphrodisias and Themistius, those by the Arabic authorities. Sometimes it was through the lemmata in Averroes' Long Commentaries that a work by Aristotle became widely available to the Latin readers, as was the case with the *Physics*, *De anima*, and the *Metaphysics*, whose Graeco-Latin '*vetus*' translation was in a sense superseded by Michael Scot's translations of Averroes' commentaries. On the other hand, the *De caelo*

became available for the first time through the translation of Averroes' commentary.

Not unlike the Greco-Arabic translation movement in 'Abbāsīd Baghdad in the eighth–tenth centuries, the origins of the Arabo-Latin translation movement lay in an interest in science and medicine. The geographical center was in the north-western Mediterranean where, in the late tenth century, Latin texts about astrology including excerpts from Arabic works circulated in Catalonia. The first well-known translator was Constantine the African (d. before 1098–1099), who brought books about medicine from Kairouan to the medical school in Salerno and then to the Benedictine monastery of Montecassino where he translated them. This project was continued in the first half of the twelfth century by Stephen of Antioch in Pisa. In addition to texts by Isaac Israeli (ninth–tenth centuries) and his disciple Ibn al-Jazzār, the most important of these works was the *Pantegni* by 'Alī b. al-'Abbās al-Majūsī (Haly Abbas). The translators went beyond the area of medicine with their interest in texts about natural science and established thereby a new field of learning which supplemented the seven liberal arts of the traditional curriculum. Alongside philosophy which gained importance in subsequent years, medicine and science, in particular astronomy and astrology, remained important areas of translation.

It was in the second quarter of the twelfth century that the interest in philosophy increased due to the attention devoted to it at the School of Chartres which already aimed at a combination of Plato's and Aristotle's doctrines, a tendency which was later supported by the philosophical literature translated from Arabic. Apart from northern Italy, the translators were active in modern-day Spain and France. The most famous among them were Hermann of Carinthia (fl. 1138–1143), Robert of Ketton (fl. 1141–1156), Rudolph of Bruges (fl. 1144), Hugo of Santalla (fl. 1151), and Raymond of Marseilles (fl. 1141). Hermann's own *De essentiis* (1143) was inspired by Arabic sources; his five essences (cause, movement, place, time, and *habitus*) have parallels in works by Abū Bakr al-Rāzī, Pseudo-Apollonius, and al-Kindī. Furthermore, Hermann cites Abū

Ma'shar's *Great Introduction to Astrology* which he had translated 3 years before composing *De essentiis*.

Another trend that can be identified in this context is the significance of anti-Islamic polemics. In 1141, Robert of Ketton translated for Peter the Venerable of Cluny various Islamic texts, among them the Qur'ān and the *Apologia of al-Kindī* (a tenth-century Christian, not to be confused with the Muslim philosopher of the ninth century mentioned above). The more literal translation of the Qur'ān that Mark of Toledo completed in around 1210 had far less influence; it was Robert's translation that was printed for the first time in 1543. Even though the polemical tradition thus persisted, the Muslim identity of most Arabic philosophers did not constitute a problem for Christian translators and interpreters who challenged their views on purely philosophical grounds. Furthermore, works which Arabic authors had written on genuinely Islamic matters were not translated into Latin, which explains why, for example, Averroes as the author of the philosophical and medical texts translated into Latin is somewhat different from Ibn Rushd as the author of a much larger corpus of texts in Arabic.

The School of Toledo and Gundissalinus

In the middle of the twelfth century, the geographical center of the translations from Arabic into Latin was established in Toledo which became home to a more professional enterprise. The city, conquered in 1085 by the Christian armies, offered a number of advantages: the availability of Arabic books, the predominance of the Arabic language, the presence of learned Latin clergy and of Jewish scholars who had escaped from the persecutions in Almohad al-Andalus. The "School of Toledo" produced translations of works of Aristotle and his Greek commentators from their Arabic versions as well as of later commentaries and more independent works originally written in Arabic. Its two protagonists were Dominicus Gundissalinus (or Gundisalvi) (c. 1110–1190), Archdeacon of Cuéllar (in the

Diocese of Segovia), and Gerard of Cremona (1114–1187). Both of them were assisted by native speakers of Arabic, among them Abraham b. Daud (Avendauth), a Jewish philosopher who had left Almohad Cordoba and who cooperated with Gundissalinus. While Gerard's translations reflect the interest in Aristotle himself and the "second teacher", al-Fārābī, which was predominant among Muslim philosophers of Spain, the texts translated in Gundissalinus' circle, most notably parts of Avicenna's *Shifā'*, al-Ġazālī's *Maqāsid al-falāsifa*, and Ibn Gabirol's *Fons vitae*, mirror philosophical tendencies among the Jews of the Iberian Peninsula.

Al-Fārābī's *Enumeration of the Sciences* (*Iḥṣā' al-ʿulūm*) had an important impact on Gundissalinus as well as on Gerard. While the former based his own *De scientiis* on it, the latter used it as a program for his translation activities. As is obvious from a list of his translations posthumously compiled by his students, Gerard followed al-Fārābī's catalog, which offers short descriptions of Aristotle's works on logic and natural sciences, by translating the *Posterior Analytics* first and then proceeding with the *Physics*, *De caelo*, *De generatione et corruptione*, and *Meteora*, books I–III (Burnett 2001). Of particular significance is the fact that the place of Aristotle's *Metaphysics* among Gerard's translations was occupied by the *Liber de causis*, an anonymous treatise that circulated in Arabic under the title *Kitāb fī khayr al-maḥd* (*Book of the Pure Goodness*). The Latin version became enormously popular and, since 1255, part of the curriculum at the Faculty of Arts in Paris (Fidora and Niederberger 2001: 226). Based on Proclus' *Elements of Theology*, it presented a Neoplatonic cosmology and metaphysics. It is here that the Arabic contribution to the transmission of Greek philosophy becomes visible, since the Neoplatonic interpretation of Aristotle's philosophy and the assumption that Aristotle and Plato agreed on key philosophical matters were – although not unprecedented in the Latin West – part of the Arabic legacy. Thomas Aquinas, however, identified the author correctly with Proclus. Aristotle's *Metaphysics* only became prominent in the Latin West in the thirteenth century after the translation of Averroes'

Long Commentary which included the complete text in the form of lemmata, and later through William of Moerbeke's translation. The term "metaphysics", which had already appeared in manuscripts of Boethius' works, was established as a term for a philosophical discipline in the Latin West only through Gundissalinus' *On the Division of Philosophy* which was informed by various Latin and Arabic texts translated in Toledo. The impact of this text was even greater – Gundissalinus introduced here basic principles such as the division of disciplines according to their subject matter or that a science cannot demonstrate the existence of its own subject matter (Fidora 2003). While the sciences remain independent, they are also interrelated since they can be considered subordinate to one another. This principle had further implications for metaphysics. Gundissalinus endorsed Avicenna's argument presented in the *Metaphysics* (*Ilāhiyyāt*) of his *Shifā'*, that since metaphysics is concerned with proving the existence of God, its subject matter cannot be God, but rather being as being. Averroes was to disagree with Avicenna, assign the proof of the existence of God to the area of physics, and include God among separable beings as the subject matter of metaphysics (Bertolacci 2006, 2007). Later Latin authors continued to disagree about the subject. The distinction between essence and existence is another important concept derived from Avicenna's *Metaphysics*. His influence is obvious too in Gundissalinus' *De processione mundi*, which is also informed by Ibn Gabirol, Hugh of Saint Victor, Abraham b. Daud, and Hermann of Carinthia. Following Avicenna, Gundissalinus describes the first cause as necessary being from which all created beings, which have only possible existence, emanate. Another Farabian legacy mediated by Gundissalinus is the division of logic into eight parts including the *Rhetoric* and *Poetic*, and the distinction of five kinds of syllogisms.

The translations made in Gundissalinus' circle reflect his personal philosophical interests, in addition to the issues mentioned above, most notably, in the subject of soul and intellect. The Latin interest in these matters may have been inspired by Qusṭā b. Lūqā's *On the Difference*

Between the Spirit and the Soul, translated by John of Seville for Raymond, the archbishop of Toledo (1125–1152) (Burnett 2005: 376). While the text itself enjoyed great popularity, further texts were added from the Gundissalinus circle, among them the part on the soul from Avicenna's *Shifā'* and texts on the intellect by Alexander of Aphrodisias, al-Kindī, and al-Fārābī. The great importance of Arabic works suggests that Aristotelian philosophy may have been found wanting in this respect. An influential concept included in the *Shifā'* was the fourfold division of the states of the human intellect: the material, *in habitu*, *in effect*, and the acquired intellect. While the first three stages are characterized by different degrees of potentiality, the acquired intellect is in actuality when it connects with the active intellect and considers the middle terms of the syllogism (Hasse 1999).

Related to this area was another original import from Arabic philosophy, namely, the notion of happiness involving divine knowledge as the conjunction of the individual human intellect with the active intellect as conveyed by Averroes and his son Abū Muḥammad 'Abdallāh in two texts translated in the thirteenth century (Burnett 1999a). The very concept of the active intellect as a separate entity is prominent among Arabic authors such as al-Fārābī, Avicenna, and Averroes, and following Avicenna, this active intellect has been identified with God by authors such as Vincent of Beauvais and Roger Bacon (Gilson's *Augustinisme avicennisant*), a theory rejected by others including Thomas Aquinas (Hasse 2000: 200–221).

Among Avicenna's contributions to Latin philosophy, the five "inner senses" (common sense, imagination, cogitative faculty, estimation, and memory) which are not present in Aristotle's works and are closer to Galen also deserve mentioning. Another import was the definition of the subject matter of logic as presented in the *Shifā'*, that is, as dealing with second-order concepts ("second intentions"), which made logic an independent discipline and not merely a tool. Post-Avicennian developments in Arabic logic, however, were largely ignored by the Latin recipients (Street 2005: 248). Likewise, philosophical concepts of prophecy which are prominent in

al-Fārābī's works remained unknown in the Latin West.

The program of the "School of Toledo" was continued by Alfred of Shareshill (late twelfth century), Michael Scot (left Toledo after 1217, d. before 1236), and Hermann the German (mid-thirteenth century). They merged the two traditions of Gundissalinus and Gerard and tried to complete the program extracted from al-Fārābī's list of philosophical disciplines. Hermann is credited with the translation of Averroes' Middle Commentaries on the *Poetics* (the only text relating to Aristotle's *Poetics* available in the Middle Ages), on the *Nicomachean Ethics*, and on the *Rhetoric* as well as Aristotle's *Rhetoric* proper, which Hermann supplemented with passages from the corresponding works by al-Fārābī, Avicenna, and Averroes. These translations reached Paris within a short period and some of them became very influential.

Frederick II and Michael Scot

The milieu of Latin translations of Arabic philosophical texts changed considerably in the thirteenth century with secular rulers, most notably Frederick II Hohenstaufen (reg. until 1250) and Alfonso X of Castile and Leon (reg. 1256–1284), providing patronage and taking a personal interest. This was crucial for the transmission of Arabic philosophical and scientific ideas into western Europe.

Frederick hosted at his court Michael Scot, Theodore of Antioch (who translated the *Moamin* from Arabic for Frederick, arguably the most influential medieval text on falconry), and Jacob Anatoli who translated Averroes' Middle Commentaries on the *Isagoge*, the *Categories*, *De interpretatione*, and the *Prior* and *Posterior Analytics* from Arabic into Hebrew. Subject of the debates at court was also the *Guide of the Perplexed* which Maimonides had written in Arabic and of which Frederick may have commissioned a Latin translation. With the University of Naples, founded by Frederick in 1224, the emperor contributed to the creation of the intellectual context in which the ideas

included in the Arabic texts were most vividly received, debated, and adapted.

Michael Scot was probably the most important translator of the thirteenth century. Having started his career in Toledo, where he translated Aristotle's books on animals, he spent time in Rome and Bologna and established himself at Frederick's court in Sicily in the 1230s. In his Italian phase, Michael translated Avicenna's *Abbreviatio de animalibus*, Averroes' Long Commentaries on the *Physics*, *De caelo*, *De anima*, and the *Metaphysics*, the Middle Commentaries on *De generatione et corruptione* and parts of *De animalibus*, the Epitome of *De caelo*, *De animalibus*, and *Parva naturalia*, Averroes' *De substantia orbis*, and the treatise on the intellect by Averroes' son mentioned above. Because of their less literal style, these translations were more intelligible than earlier ones and became very popular. The books on animals, for example, were important sources for Albert the Great's works on the subject who based his *Quaestiones super libris de animalibus* on these translations. In addition to the translations, Michael left his own trace as the author of the *Liber introductorius* consisting of the *Liber quatuor distinctionum* (an introductory compendium of natural sciences), the *Liber particularis* which includes questions from Frederick, and the *Liber Physiognomie*. Preliminary studies of the text suggest that it is informed by Arabic sources. Michael's translations of Averroes' Long Commentaries are particularly important since they provided new translations of the complete texts of Aristotle's corresponding works.

Another key text for questions relating to soul and intellect possibly translated by Michael was Averroes' *Long Commentary* on *De anima* which is not preserved in the Arabic original. Averroes' commentary contained crucial material for later debates about Averroism and the Parisian condemnations of 1270 and 1277, in particular what is usually interpreted as the denial of the immortality of the individual soul in favor of an intellect common to all humanity and the resulting conflict with revealed religion. Another doctrine associated with Averroism is the eternity of the world that had already been the matter of great debate in

Arabic sources. Texts such as al-Ġazālī's *Maqāṣid al-falāsifa* or Maimonides' *Guide for the Perplexed* offered Latin authors a variety of arguments for and against this theory (Davidson 1987).

The project was continued under Frederick's son Manfred and Charles of Anjou. William of Luna translated at Manfred's court Averroes' Middle Commentaries on the *Isagoge*, the *Categories*, and probably *De interpretatione*, possibly also the *Prior* and *Posterior Analytics*, even though these texts did not exercise a great influence. Manfred himself is mentioned in the prologue to the text as having translated the pseudo-Aristotelian *Liber de pomo*, but he was probably only the patron. An enormously influential pseudo-Aristotelian text is the "Fürstenspiegel" *Secretum secretorum*, translated from Arabic into Latin by Philipp of Tripoli, a high-ranking man of the church. Philosophy was less important among the texts translated at Alfonso's court where the interest in astrology and astronomy dominated. In addition to this patronage, the exchanges between Latin scholars and Arabic native speakers became more frequent and vivid, and Latin scholars developed a more independent attitude to Arabic philosophy.

Translations mostly stopped at the end of the thirteenth century. A notable exception is the translation of Averroes' *Tahāfut al-Tahāfut* (*The Incoherence of the Incoherence*) in 1328 for Robert of Anjou, King of Naples. Until then, only Averroes' more strictly philosophical texts had been translated. Arabic philosophical texts were also used and translated among Catalan missionaries of the period. Ramon Llull (1232–1315) who campaigned successfully for the foundation of schools to teach Arabic to future missionaries composed a Latin prose and a Catalan verse version of the logic of al-Ġazālī's *Maqāṣid al-falāsifa*. In his *Pugio fidei*, the Dominican Ramón Martí (c. 1220–1285) used a variety of Arabic texts not available in Latin at that point, among them Fārābī's commentary on the *Physics*, Avicenna's *Pointers and Reminders* and *Kitāb al-najāt*, various texts by al-Ġazālī (*Tahāfut al-falāsifa*, *al-Munqidh min al-ḍalāl*, *Mīzān*

al-ʿamal, *Mishkāṭ al-anwār*, *Ihyāʾ ʿulūm al-dīn*, *Kitāb al-tawba* and *al-Maqṣad*), and Averroes' *Tahāfut al-Tahāfut* and *Damīma*. The writings of Albert the Great too show evidence of the knowledge of Arabic works which had not been translated completely into Latin.

The translations were resumed in the Renaissance due to the perceived necessity to revise the poor Latin style of the medieval versions. As in earlier centuries, Jewish translators and scholars were of great significance for the further transmission. At least 38 of Averroes' commentaries had been translated into Hebrew from the early thirteenth century onward, and scholars like Gersonides had written super-commentaries on them. In the Renaissance, Latin translations of philosophical texts originally written in Arabic were often based on Hebrew intermediary versions.

Arethas of Caesarea

Jozef Matula

Department of Philosophy, Center for Medieval and Renaissance Philosophy, Palacky University, Olomouc, Czech Republic

Abstract

Arethas is a representative of “the first Byzantine Renaissance” and a major figure in the transitional period of Byzantine intellectual history in the ninth and tenth centuries. He commented on ancient philosophical works and recognized the importance of philosophical learning. He provided a transcription of a complete copy of Plato’s works to which he added marginal notes. He is the author of a collection of scholia on Aristotle’s texts. His importance as a student of Aristotle’s works consists in his adoption of late Alexandrian Neoplatonism and his dependence on Porphyry’s ontology. Arethas promoted encyclopedic curiosity and encouraged the copying of ancient manuscripts. Much of our knowledge of Greek antiquity is the direct result of his work.

Biographical Information

Arethas of Caesarea, scholar and politician, archbishop of Caesarea (from 902), born in Patras in the middle of the ninth century, died between

932 and 944. Together with Photios and Leo the Mathematician he represents what would later be called the “first Byzantine Renaissance” (Lemerle 1971). Arethas was preoccupied with the compilation of lexicons and the preservation of classical works. He copied, commented, and lectured on the texts of ancient philosophers (Aristotle, Porphyry) and played an important role in the transmission of the philosophical traditions of antiquity into Byzantium. He annotated the margins of classical texts with numerous scholia (many of which are preserved), and copied and commented on several other texts (the nearly complete surviving manuscripts of Euclid’s *Elements*, Pollux, Clement of Alexandria, Aelius Aristides, Athenaeus, Athenagoras, Dio Chrysostom, Epictetus, Hesychius, Julian, Marcus Aurelius, Pausanias, Strabo). He played an important role as a commissioner of philosophical manuscripts of Plato (Oxon. Bodl. Clarke ms.39, Vatic. gr. 1, Paris. gr. 1807) and Aristotle (Vatic. Urb. 35), which are among the most valuable testimonies to Plato’s and Aristotle’s texts (Wilson 1983). Arethas commented on works by Aristotle (*Categories*) and Porphyry (*Isagoge*), and he wrote critical notes on logic, ontology, and psychology. Arethas is also thought as one of the most scholarly theologians of the Church and an important compiler of the oldest extant Greek commentary on the *Apocalypse* (based primarily on that of Andrew of Caesarea). After 902, he turned toward various theological topics (his defense against the accusations of paganism). He wrote exegetical works, letters, homilies, and pamphlets. Arethas paved the way for the revival of Byzantine rhetoric, he rejected the ideal of plain speech, and followed Hermogenes of Tarsus in the belief that obscurity can at times be a virtue. Thus, his language is adorned with proverbs, quotations, allusions, and poetic lines. Among the ancient authors, Plato, Aristotle, and Homer are most often mentioned in Arethas’ works.

Thought

Apart from the preservation of the ancient texts, Arethas deals with various philosophical issues

(metaphysics, anthropology). He is usually viewed as a Platonizing thinker, mainly because of the considerable editing and his extensive scholia on the Platonic dialogues (Westerink and Laourdas 1962; Brumbaugh 1961). The proof of his scholarly concern for Plato's texts are the marginal notes to Plato's works (Oxon. Bodl. Clarke ms.39). He has a certain ambivalence toward Plato, expressing sometimes criticism (*Charmides* 155D) and sometimes positive appreciation (*Phaedo* 114C). It is not sure whether he wrote a systematic explanation of Plato's treatises or whether these are only personal notes to certain issues or subject notes made in connection with sources that were available at that moment.

From the philosophical point of view, Arethas revived interest in Aristotle in Byzantine thought (Oehler 1964). He is the author of detailed comments on the first five chapters of Aristotle's *Categories* (up to 4b15) and on Porphyry's *Isagoge* (entire text). Arethas' text demonstrates dependence on earlier commentaries, though it became a supplement to the extant Neoplatonic commentaries (Kotzia-Panteli 1996). He wrote marginal notes in his text, which is the oldest surviving manuscript of Porphyry's *Isagoge* (Vatic. Urb. 35). He opposes Porphyry's critics and praises his clarity. Commenting on Porphyry, he identifies universals with genera and species, supposing that every difference, property, and accident is also a genus or a species (wisdom is an accident of Socrates but it is also a species of virtue). The commentary on the *Categories* shows that Arethas was using Aristotle's text primarily to expound within its framework the Neoplatonic ontology. In general, Arethas' scholia to Aristotle express ambiguities in his attitude toward the ancient philosopher; although in his *Letter to Stephanus* written about 907 (Westerink 1968, vol. 1, p. 325, line 15–27) he gives the impression of being close to Aristotle, his commentaries and some other letters (e.g. *Letter to Niketas*, written after 907) demonstrate Arethas' criticism of Aristotle.

Arethas frequently involved scribes who excerpted and adapted material from earlier commentaries, particularly in the case of the logical treatises that were widely used in higher education

in Byzantium. Although Arethas' attitude to Aristotle and his logic is not very clear, he is a critic of Aristotle on doctrinal issues that are considered fundamental to Christian thought (the theory of soul, substance). On the other hand with the help of Porphyry and the Neoplatonic commentators, he understands the importance of Aristotle's doctrine of categories.

Arethas' Christian thought and his distance from Aristotle can be seen in his treatment of the notion of the rational soul. Arethas rejects the doctrine of rational soul, which he considers to be Aristotle's, but which is actually never used by Aristotle himself. Arethas does not realize this mistake, which resulted from a misreading of *The Nicomachean Ethics* (*Letter to Niketas*). The expression *logike psyche* comes from Neoplatonic thought (Plotinus, Proclus) and was discussed by Arethas and other Christian thinkers. Arethas' teaching on the rational soul is in agreement with the teachings of the Greek Fathers (Gregory of Nyssa) that the soul and the body are created simultaneously and their coexistence is definite from the very beginning. The rational soul does not have the attributes of the sperm or of the father of the rational being, but of God, because it is produced by God (Benakis 1972).

Arethas, just like many other Byzantine commentators after him (Psellos, Blemmydes, Sophonias, George Scholarios), raises the issue of the number of Aristotle's categories. According to Arethas, the category of substance should be placed first, because substance is by nature prior to the other categories. The priority of substance is characterized by indestructibility (substance is not destroyed when other categories are, but with the destruction of substance all categories are destroyed), self-existence (substance is prior to what exists depending on other things), and singleness (substance is single, the accidents are many, and one always precedes many). Arethas analyzes, too, the order of the categories and he reverses Aristotle's order to introduce the category of quality before the category of *pros ti*, which indicates the influence of Neoplatonic commentators (Ierodiakonou 2005).

Moreover, Arethas' scholium on *Categories* 2a11–19 provides him with the grounds to replace

Aristotle's distinction between the first and second substance with the Neoplatonic sixfold variety of the meanings of the notion of substance (Anton 1997). Arethas redefines substance in a theological way and he endeavors to incorporate the Plotinian theory of hypostatic beings. He thus moved away from his earlier Aristotelianizing Neoplatonic treatment of the *Categories* and tried to define substance as a genus of being in order to accommodate the divine being. He classified substances into simple substances, that is, soul, intellect, and God, and complex substances, that is, matter and species.

Aristotelianism in the Greek, Latin, Syriac, Arabic, and Hebrew Traditions

John Marenbon

Trinity College, University of Cambridge,
Cambridge, UK

Abstract

Aristotle was the most important ancient philosopher for all four main traditions of medieval philosophy: Greek philosophy from Byzantium; Latin philosophy; philosophy in Arabic (the work mainly of Muslims, but also Jews and Christians); and, from the thirteenth century, philosophy written by Jews in Hebrew. All these traditions drew, directly, or indirectly, on Aristotle as transmitted by the

Neoplatonic schools of late antiquity. But the way in which the Aristotelian texts were disseminated (in translation, except in Byzantium) and studied varied in each of these traditions. And, although all the medieval philosophers had it in common that they lived in cultures dominated by a monotheistic religion, the range of attitudes to Aristotle varied from one to another. This entry has the strictly limited aim of giving enough basic information about each of these circumstances to enable comparisons to be made. Fuller treatment of each of the areas it covers will be found elsewhere in the Encyclopedia. Readers will also find a fuller exposition of most of the particular view suggested here in Marenbon (Medieval philosophy; an historical and philosophical introduction. Routledge, London/New York, 2007; Medieval philosophy. A very short introduction. Oxford University Press, Oxford, 2016).

Translations, Availability, and Methods of Study

Aristotle had his own school of followers in antiquity – Alexander of Aphrodisias (c. CE 200) was the most famous and talented of them, Themistius (c. 317–388) probably the last. But the transmission of Aristotle’s work to medieval philosophers was the result of his inclusion in the curriculum of the Neoplatonic schools, since Neoplatonism was the dominant school of philosophy in the ancient world from the third century onwards. The Neoplatonists believed that Aristotle and Plato did not disagree. Their apparent differences were the result of different subject matter: Aristotle concentrated on the world as it appears to the senses, Plato on supra-sensible reality. The study of Aristotle, especially his logic, was thus considered indispensable as a preparation for work on Plato, and it produced a large number of Aristotelian commentaries, a number of which survive. Porphyry (c. 232–305), the first of the commentators, was especially keen to read Aristotelian works in an Aristotelian way; some of his successors

tended, rather, to let their underlying Platonism tinge their reading even of his logical works.

The fullest, though not the most direct, medieval heirs of this tradition of Aristotelianism were the Arabic philosophers. The Platonic school at Athens had been closed by Justinian in 529 because it preserved pagan philosophy in an Empire by now strictly Christian. But the other great Platonic school, at Alexandria, remained open until the Islamic conquest in 641: first, its pagan teachers had been willing to compromise with the Christian authorities; then it came to be staffed by Christians. In the eighth and ninth centuries, there was a movement, encouraged by the ‘Abbāsid caliphs, to take over into Arabic as much as possible of the Greek texts and learning that survived in Alexandria. The Arabs were helped in this enterprise by Syriac-speaking Christians, who had already translated some of Aristotle’s logic into Syriac, a Semitic language like Arabic (Hugonnard-Roche 2004). The Syriac scholars themselves concentrated on logic and, perhaps as a result of ecclesiastical pressure, favored a shortened logical curriculum, consisting of Porphyry’s *Isagoge*, the *Categories*, *On Interpretation*, and the *Prior Analytics* up to the end of I.7 (avoiding, therefore, modal syllogistic) (Gutas 1999). But the translation movement into Arabic was not restrained by such boundaries, encouraged by such men as al-Kindī (c. 801–866), the first of the Arab philosophers. Al-Kindī, as a result of translations he had commissioned and other ones, was thereby able to read considerable amounts of Aristotle, including his *Metaphysics*, although he was more deeply influenced by the Plotinian material transmitted under the misleading title of *The Theology of Aristotle*. The Baghdad Peripatetics, such as al-Fārābī (c. 870–950/951) and his pupil, the Christian Yaḥyā ibn ‘Adī, studied almost the whole Aristotelian corpus in detail, and produced both short, epitome-type commentaries and longer ones (e.g., al-Fārābī on *On Interpretation*), which comment on the text section by section, looking in detail at the philosophical difficulties it raises, in the manner of the late ancient commentators (Gutas 1988; Pasnau 2010, Appendix B.3).

The way in which Aristotle was studied changed forever in the mainstream Arabic tradition with Avicenna (before 980–1037). Although Avicenna did write a section-by-section commentary on Aristotle, which has been lost, his main works are all philosophical encyclopedias, longer or shorter, complex or more simple, in which he puts forward his own understanding of Aristotle. Although he usually follows the divisions of Aristotle's work (dedicating separate books, or chapters, to physics, metaphysics, and the soul, for example), what he provides, by conscious contrast with the Baghdad Peripateticians, is not Aristotle's doctrine, understood with the help of the late ancient commentary tradition, but a coherent philosophical system, with many original elements, strongly influenced by Aristotle. For most Islamic writers, Avicenna replaced Aristotle as the primary philosophical authority (although in logic there was a further move, in which Avicenna was left behind too, and the subject was taught through independent textbooks) (Street 2004, 2013, Sect. 1). The main, and as yet little investigated, philosophical tradition everywhere except in the Islamic West sought to combine Avicennian philosophy with *kalām*, the Islamic tradition of theological speculation. Independent study of Aristotle ceased and translations of his works did not circulate (Gutas 2002). In the West (Islamic Spain and the Maghreb), an interest in Aristotle's texts, in the line of al-Fārābī, grew up in the twelfth century. Its greatest exponent was Averroes (c. 1126–1198). Averroes made a series of paraphrase commentaries and short compendia of almost all Aristotle's works, and he wrote detailed, section-by-section commentaries on five works, including *On the Soul* and the *Metaphysics*. Averroes' lifetime's work of commentary is the last flourish of any but very indirect Aristotelianism in the Islamic Arabic tradition. It was almost totally forgotten in Islam until modern times, but it had a profound effect on Jewish philosophy and Christian Latin philosophy.

Until the end of the twelfth century, medieval Jewish philosophy was written in Arabic and its exponents worked within a broadly Arabic (as well as Jewish) culture. Although earlier Jewish philosophers had been influenced by

Neoplatonism, it was not until Abraham b. Daud (c. 1160) and Maimonides (d. 1204), both of whom were educated in Muslim Spain, that Jewish thinkers began to look at Aristotelianism as the major philosophical system, to be reconciled or distinguished from their own views. In the thirteenth, fourteenth, and fifteenth centuries, Jewish philosophy was carried on most vigorously in Hebrew, especially among the communities in southern France. There was an Aristotelian translation movement among these Jewish scholars, from the Arabic into Hebrew, but the texts they translated were not (with two exceptions: the *Meteorologica* and *On the Soul*) Aristotle's own, but Averroes' commentaries, all of which (except perhaps for the long commentary on *On the Heavens*) were put into Hebrew; also translated were some of al-Fārābī's short expositions of Aristotle (Zonta 1996; Pasnau 2010). This preference for an indirect approach to Aristotle has been attributed to the influence of a letter from Maimonides to Samuel ibn Tibbon, in which he describes Aristotle's works as "the roots and foundations of all the sciences," but also remarks that they cannot be understood with the help of commentaries, by Alexander of Aphrodisias, Themistius, or Averroes (Harvey 1992). But Maimonides did not say that they should neglect the texts themselves altogether in favor of the commentaries: maybe there were no Arabic versions of Aristotle's texts themselves available to them to translate. In any case, the Jewish writers made the shorter texts of Averroes and al-Fārābī themselves the subjects of "super-commentaries."

By contrast with Arabic speakers, the Greeks were the direct inheritors of the tradition of the late ancient schools, and there was no problem of translation for them. The basic course of Aristotelian studies was, however, quite restricted, including just Porphyry's *Isagoge*, the *Categories*, *On Interpretation*, and the *Prior Analytics* 1.1–7 (as in the Syriac schools) and the *Sophistical Refutations* 1–7, and extracts from the *Meteorology* and *On Generation and Corruption*. In logic, the tradition of ancient commentary was continued by scholars like Photios in the ninth century and Michael Psellos and John Italos in the eleventh century. In the twelfth century,

Eustratios and Michael of Ephesus expanded the range of Aristotelian commentary. Michael wrote commentaries on parts of the *Ethics* and *Metaphysics*, on various of Aristotle's books on natural philosophy and on the *Politics*; Eustratios wrote on parts of the *Posterior Analytics* and of the *Ethics*. All these commentaries reuse a great deal of old material – just as had been done in the ancient schools. Indeed, one form of Byzantine commentary consists simply of marginalia collected from a variety of sources, with an introduction added. But twelfth-century writers like Eustratios and Michael drew this type of material to make an integral running commentary on the text. The tendency of the Byzantine commentators to base themselves on earlier writers, and ultimately the ancient tradition, makes it a difficult matter to work out the respects in which they contributed their own thoughts (Ierodiakonou and Börje 2008).

Medieval Latin philosophers had two strands of access to Aristotle independent of Arabic philosophy. The first strand was due to the work of one man, Boethius (d. 524/526), a philosopher who lived in Ostrogothic Italy but, thanks to his aristocratic background, knew Greek fluently. He translated all of Aristotle's logical works (except the *Posterior Analytics* – or, at least, his translation does not survive) into Latin. These translations came only gradually into circulation in the Middle Ages: the *Categories*, *De interpretatione*, and Porphyry's *Isagoge* by the ninth century; the *Sophistical Refutations*, *Prior Analytics*, and *Topics* during the twelfth century. Boethius' translations of these works remained standard until the end of the Middle Ages. Boethius also wrote widely read commentaries on the logical texts, which drew on the tradition of interpretation in the late ancient Platonic schools, especially on Porphyry (see Marenbon 2009). The second strand was due to the work of various translators, working in the twelfth and thirteenth centuries. Through the work of the twelfth-century translators (the best known was James of Venice), some of Aristotle's nonlogical works became available, in translations direct from the Greek, whole or part, by the early thirteenth century. The most important thirteenth-century translator, William

of Moerbeke (d. 1286), produced new or revised translations, from the Greek, of the whole Aristotelian corpus, and his versions became standard, except in the case of the logical works translated by Boethius. Before William's work, however, Latin thinkers had benefited from the third, Arabic-dependent strand of access to Aristotle. In the later twelfth and early thirteenth centuries, various nonlogical works of Aristotle's were put into Latin, in whole or part, from their Arabic versions. These translations would all be superseded by Moerbeke's ones from the Greek, and so this side of the Arabic strand was of limited importance. By contrast, the translation into Latin in the same period of parts (principally, the *Metaphysics* and *On the Soul*) of Avicenna's largest encyclopedia commentary, the *Shifā'*, and of many of Averroes' commentaries, including the long commentaries on the *Metaphysics* and *On the Soul*, had an enormous influence on Aristotelianism in the later Middle Ages. Although – mostly thanks again to William of Moerbeke – a selection of ancient commentaries on Aristotle became available in Latin, Boethius' role in introducing, explaining, and placing Aristotle's logic in context was played, for the nonlogical works, by Averroes (who was called, simply, the "Commentator") and, in a more general way, by Avicenna (see Pasnau 2010, Appendix B.1 and B.4; Brungs et al. 2017, 95–173).

Despite this debt to the Arabic world, the development of the Aristotelian tradition there could hardly differ more sharply from the ways in which Aristotle was studied in the Latin West. From the beginning, Aristotle's texts were central to the school curriculum, and they were commented on closely. Before c. 1200, when only Aristotle's logic was known, the study of logic – the central subject of the school curriculum – was based around these works (along with some by his translator, Boethius). From about 1250, the Arts Faculties of the universities adopted an Aristotelian curriculum, in which knowledge was divided according to his different works, and the study of each subject was the study of Aristotle's text. This intensive study of the Aristotelian texts is witnessed by an enormous number of medieval Latin commentaries on Aristotle, usually designed

for, or the products of, classroom teaching. From the ninth to the eleventh centuries, this commentary material usually took the form of marginal and interlinear glosses in manuscripts of the texts. From the twelfth century a large number of independent commentaries are found on the *Categories*, *On Interpretation*, and *Sophistical Refutations*. Normally they are anonymous, and very often survive in just one manuscript – the record of a particular teacher or student’s work, rather than a text disseminated in written form. In the case of the *Categories* and *On Interpretation* (and also Porphyry’s *Isagoge*), Boethius had written commentaries which drew on the ancient Neoplatonic tradition of commentary. These were, initially, very important sources for the twelfth-century commentators, although they soon started to develop ideas and discuss problems unthought of by Boethius (Marenbon 1993/2000). There was an important change in the most common form of Aristotelian commentary in the early thirteenth century – the period when the complete Aristotelian corpus was beginning to be studied and then became the basis of the Arts curriculum. Aristotelian commentaries began to be written in the form of *quaestiones*. These *quaestiones* would very often keep close to the text, and the solutions represent the Master in question’s view of Aristotle’s meaning, but they also gave the opportunity for ideas and problems to be raised which reflected current debates but were linked only loosely to the ancient text. There were, however, some important thirteenth-century commentaries in other forms. Albert the Great followed Avicenna in producing his own, discursive reconstructions of Aristotelian doctrine. Aquinas followed Averroes (and Boethius) in writing a series of detailed, sentence by sentence commentaries on Aristotle.

Aristotle formed the basis of the Arts curriculum up to and beyond the Middle Ages in Latin Europe. Even among those who consciously opposed scholastic modes of thought, there was a lively Aristotelian tradition, and a number of Averroes’ commentaries were translated for the first time (from the Hebrew) in that monument to Renaissance Aristotelianism, the *Juncta(s)* edition of 1550–1552 on Aristotle’s works with Averroes’ commentaries.

Attitudes to Aristotle

In the early Islamic world (from the eighth to the eleventh centuries), there were two different methods of thinking about ultimate questions such as the constitution of the world, freedom and necessity, justice, and merit. One was *kalām*, a sort of philosophizing closely attached to problems raised by the Qur’ān and conducted in terms partly borrowed indirectly from the Greek tradition, partly invented by the Islamic thinkers themselves. Exponents of *kalām* divided themselves into many different schools, of which the most adventurous philosophically, and the most influential at the start, was that of the Muʿtazilites. The other method of thinking about these questions was that of Greek philosophy, introduced by al-Kindī in the eighth century. Al-Kindī was a Muslim and belonged to an important Arab family. He seems to have introduced Greek philosophy consciously as an alternative to Muʿtazilite *kalām*: it was a foreign importation, but one which, he tried to show, could be adapted to fit Islam. Although there were some thinkers in the tenth and eleventh centuries – particularly the Ismāʿīlīs – who also followed a conciliatory approach, mainstream philosophy took a different direction. It centered increasingly on whose work was commented on in detail by Baghdad peripatetics, many of them Christian. The outstanding member of this school was al-Fārābī, a Muslim but one who, to judge by his work, accepted Islam because he saw in it a symbolic way, suitable for assimilation by the masses, of stating the truths which were demonstrated in their full and clear form by Aristotelian science (On the early period of Arabic Aristotelianism, see Rudolph 2012).

The most influential of all the Arabic philosophers, Avicenna, seems to have developed his rethinking of Aristotelian philosophy mainly in isolation from religious considerations, although he may have been influenced by some of the questions raised by the Muʿtazilites. He was willing, in line with his understanding of Aristotle, to deny the fundamental Islamic doctrines of the resurrection of the dead and the non-eternity of the world. For these views, Avicenna was fiercely attacked by al-Ġazālī (1058–1111), whose

writings had, and continue to have, enormous influence among Muslims. But, at the same time, al-Ġazālī was himself deeply influenced by Avicenna, and he played the pivotal role in infusing *kalām* with Avicennian philosophy. Although, then, Avicenna is the last major figure in the eastern Islamic tradition of Aristotelian philosophers, there continued into the late Middle Ages and beyond a stream of indirectly Aristotelian speculation – some of it conducted in commentaries on Avicenna – which now was part of, rather than a rival to, Islamic theology (Griffel 2009; El-Rouyaheb and Schmidtke 2017, 296 ff.).

In Muslim Spain and North Africa, as explained above, the tradition of direct study of Aristotle continued. Its outstanding representative, Averroes, was a dedicated Aristotelian who thought that the fundamental truth about the universe could be found just by the most careful scrutiny of Aristotle's meaning. But Averroes was not a covert freethinker, doing his day job as an Islamic judge just to keep up appearances. There is every indication that he agreed fundamentally with al-Ġazālī over when a Qur'ānic text should be "interpreted" and its literal meaning rejected – when it was contradicted by a demonstration. He held, however, that a wider range of truths than al-Ġazālī accepted are demonstrable through Aristotelian science (Griffel 2000).

The first Jewish Aristotelian, Abraham b. Daud, believed that Aristotelian science and orthodox Jewish doctrine were compatible, and in his rabbinic works Maimonides professed the same view. There he argued that the rabbis of old had honored philosophy and arrived at the same truths as were professed by the philosophers of the Arabic Aristotelian tradition, but they had kept them secret so as not to reveal them to the mass of the people. Maimonides' most famous work – indeed, the most celebrated text in the whole tradition of Jewish medieval philosophy – the *Guide of the Perplexed* is, however, mainly directed toward the perplexities faced by the firm believer in the Jewish law who has also studied Arabic-Aristotelian philosophy and science. It is hard to be completely certain of how Maimonides resolves these perplexities: whether he has really retrenched from his earlier acceptance of almost

everything in Aristotelianism, or whether he continues in and even extends his earlier position, though in a covert manner, hidden from those who read too straightforwardly. Such was Maimonides' influence on subsequent Jewish thinkers, that the dispute over Aristotelianism in Jewish philosophy became in large part a dispute about whether or not to follow Maimonides. Since Maimonides himself was, from the beginning, interpreted in a more radical and a less radical way, the contours of the debate are hard to follow; some Jews criticized even Maimonides under a moderate interpretation for conceding too much to Aristotle, while for some of the most enthusiastic Jewish Aristotelians, he had not – even under a radical interpretation – gone far enough. But even a thinker like Moses of Narbonne (d. after 1362), who followed Averroes' Aristotelianism closely, shared with Averroes the feeling that Aristotelianism did not in fact contradict the fundamental principles of his own religion. There was, then, a flourishing thirteenth- and fourteenth-century tradition of Jewish Aristotelianism, learned mainly through Averroes. But, at the same time, there was consistent opposition to this whole philosophical tradition, which resulted, for example, in an unsuccessful attempt of banning Maimonides' works in the 1230s and, in 1305, the banning of Arabo-Greek learning to Jews aged under 25 in Catalonia. The greatest of all these Hebrew-language philosophers, Gersonides (1288–1344), took an independent stance and rethought philosophical problems, using Aristotelian positions and tools, but not feeling bound to them, in a way which eliminated most of the obvious clashes between religious orthodoxy and the results of philosophy. But the mood among Jews in the following century and a half became more generally and resolutely set against Aristotelianism, and against philosophy in general.

Suspicion of Aristotelianism – which was put under the general banner of "Hellenism," that is to say, sympathy for the pagan thought of Greece – was a constant feature of the Byzantine tradition. It did not prevent scholars from maintaining a tradition of Aristotelian exegesis, but it could make life difficult or worse for individual scholars. Whereas, for instance, Michael Psellos,

though accused of heresy, managed to escape condemnation, his student, John Italos, was not so fortunate. After a series of trials, he was condemned and his books burned. The charges against him were related to his use of Aristotelian logic in theology, and he was said, probably unjustly, not merely to have enquired into the doctrines of the ancients but to have accepted them as truths (cf. Clucas 1981).

As explained above, scholars in the medieval Latin West knew only a few Aristotelian logical texts until the mid-twelfth century. For this reason, questions about the compatibility between religious teaching and Aristotelianism, like those faced by Byzantine Christians, Muslims, and Jews, were not posed in the early Middle Ages. Although from time to time a religious thinker would cast doubt on the study of logic, or at least on its appropriateness as for monks, it was generally accepted that logic was valuable, or indeed essential, as a tool for presenting and defending Christian doctrine. It was only when it was misused that it became dangerous. And the tradition of logic, they recognized, was Aristotelian. But it was not just Aristotelian. A paraphrase of Aristotle's *Categories*, widely read from the ninth to eleventh centuries, was attributed to Augustine (helping, incidentally, to ensure the Christian respectability of the subject). The curriculum usual in the early twelfth century included two Aristotelian texts, and five others, four by Boethius and one by Porphyry. Although the best logicians, like Abelard, seem to have shown a special respect for Abelard and to have had suspicions, rightly, about Boethius' logical acumen, all three figures were generally treated on the same level as authorities. Questions about the relationship between Christian doctrine and pagan philosophy were indeed posed in this period, but in connection with Plato and writings in the Platonic tradition.

Once translations of his nonlogical works began to be disseminated, this easy acceptance of Aristotle as a logical authority was no longer possible. Some of the earliest evidence for the study of Aristotle's natural philosophy and his

Metaphysics are the prohibitions issued in 1210 and 1215 against the study of this material in the Arts Faculty of Paris. But the authorities did not do much to enforce these prohibitions by the 1240s, and – as noted above – by the 1250s the curriculum of the Arts Faculties in Paris and Oxford was based around Aristotle. In a way that contrasts sharply with the Islamic, Jewish, and Byzantine traditions, Aristotelianism was thus incorporated openly and institutionally into the scheme of education approved by the religious authorities and which also was responsible for the formation of theologians and Church leaders. Although this theological formation took place in the Theology Faculty, students had either to have taken the Arts course or, if they belonged to the mendicant orders, its equivalent in their own schools: theologians were thoroughly trained in Aristotelian philosophy, and their approach to theological problems was deeply affected by it.

This institutional adoption of Aristotelianism did not, however, prevent there from being tensions between Aristotle's views and Christian doctrine, in two areas in particular, one of which related primarily to the Arts Masters, the other to the theologians. Granted that the Arts Faculty was officially dedicated to the study of Aristotelian science, and that it was not its business to deal with matters of Christian doctrine, to what extent should Arts Masters be permitted to develop views which actually contradicted Christian doctrine? Two positions were especially at issue: the Aristotelian principle that the world – in the sense of the whole universe – is eternal (which clashes with the Christian doctrine that the world had a temporal beginning), and Averroes' reading of *On the Soul* in his long commentary, according to which there is just one Intellect for all humans (which contradicts the idea of individual immortality and so the whole Christian teaching about heavenly reward and punishment). Although none of the Arts Masters seems to have proposed that either of these positions was true without qualification, there was some in the 1260s – such as Siger of Brabant and Boethius of Dacia – who tried to find some way in which, in

their capacity as Arts Masters and so teachers of Aristotle, they could develop these and any other arguably Aristotelian views in their own terms, even if they acknowledged that, as a Christian, one must hold a different, incompatible view. Although this movement in the thirteenth century was crushed by ecclesiastical opposition, there remained until the end of the Middle Ages an important strain of “Radical Aristotelianism” or “Latin Averroism” in the Arts Faculties – of thinkers who, while acknowledging, at least verbally, the truth of Christian doctrine, looked to Averroes as the most reliable interpreter of Aristotle, even where his interpretations made his thought clearly unacceptable to Christians (Hayoun and De Libera, 1991). In order to prevent such speculations, the authorities obliged fourteenth-century Paris Arts Masters to swear that, if they touched in their philosophy on any subjects that also concerned the faith, they would give the answers demanded by faith and provide refutations of the arguments against the answer consistent with Christian teaching. Yet, even the cautious John Buridan, who taught for about 40 years in the Arts Faculty at Paris from c. 1320, makes clear that, for instance, the Christian teaching on the immortality of the soul does not follow from Aristotle’s position and must be accepted as a matter of faith (Sylla 2001).

For the theologians, the problem was, rather, the extent to which Aristotle’s God, as interpreted by the Arabic Aristotelians, was their God, at least in philosophical guise. By and large, Aquinas believed that he was. But in 1277, shortly after Aquinas’ death, a long list of propositions, many of them reflecting positions held by Arabic Aristotelians and their followers, were condemned in Paris. Although largely directed against Arts Masters, the condemnations indicate a growing awareness that Aristotle’s God, and the physical and metaphysical context in which the Arabic Aristotelian placed him, did not fit well with Christian belief. Late thirteenth- and fourteenth-century theologians, stimulated by their doctrinal requirements, although deeply learned in Aristotelian science and indebted to it for much of their thinking, rethought many aspects of

Aristotelianism: consider, for instance, Duns Scotus’ account of God’s contingent causality or Ockham’s nominalism.

Abstract

The Arabic translations of Aristotle, taken from the Greek or Syriac, fit into the framework of the assimilation of the Greek scientific and philosophical knowledge of late Antiquity in the urban Arabic–Muslim civilization of the ‘Abbāsīd East. According to some, they responded to a project of vast scale, whose social and political implications have been highlighted by D. Gutas. In the vast enterprise of reconstructing a philosophical corpus from which the birth and development of Arabic philosophy gets its substance, Aristotle would assume the title of “First Teacher,” vouching for all the intellectual heritage of the Greeks, viewed as a systematic knowledge compatible with the Muslim worldview. Together with Aristotle's own works, the Arabs translated an equally great amount of commentaries tracing back to late Antiquity, particularly to the School of Alexandria.

Schematically, the constitution of the corpus of the *Aristoteles arabus* accompanies three distinct moments in the Arabic–Muslim *falsafa*: (1) The era of the Baghdad philosopher al-Kindī (d. between 860 and 870) and his circle. This early *falsafa* is deliberately syncretical: it integrates Aristotle's cosmology and metaphysics to a creationist and emanationist worldview adaptable to Islamic religion, and the role of Aristotelian logic is still modest. (2) The translation school whose prominent figures were Ḥunayn b. Ishāq (d. 873) and his son Ishāq b. Ḥunayn (d. 910), between the end of the ninth and the beginning of the tenth century. Very much connected to medical knowledge, this school completed the translation of almost the whole of the Aristotelian corpus. (3) The Peripatetic School of Baghdad

(mid-tenth to beginning of the eleventh century), characterized by a predominant interest in logic. The so-called Baghdad Aristotelians focused mostly on the re-elaboration and correction of previous translations, as well as on philosophical work on them, with the notable exception of the *Posterior Analytics* (called in Arabic the *Book of Demonstration*), only then introduced into the corpus. The learned of this time give themselves up to an organization of the *Organon* using the Syriac versions and the Arabic versions of Ḥunayn and his school: an outstanding example is the MS Paris, BnF ar. 2346.

Knowledge of the stages of the translation movement and their key figures comes mostly from the biobibliographical works, a literary genre cultivated in the classical age of the Arabic–Muslim civilization. The earliest are the *Kitāb al-Fihrist* (*Book of the Catalogue*) by Ibn al-Nadīm (finished in 987) and, in Islamic Spain, the *Ṭabaqāt al-Aṭibbāʾ* by Ibn Juljul (d. 1009).

Organon

The circulation of the *Organon* in Arabic was preceded by the Syriac assimilation of it, especially at the School of Edessa. The focus of this work was only on one section of the Aristotelian *Organon*: *Cat.*, *De int.*, *An. Pr.* (up to the end of chapter 7). Very early the Arabs had at their disposal a compendium to Porphyry's *Isagoge*, *Cat.*, *De int.*, and *An. Pr.*, perhaps translated from the Pehlevi (Middle Persian) by the courtier and secretary Ibn al-Muqaffaʾ (d. 760). This period (end of the eighth century) corresponds to a rebirth of the translations of logic into Syriac. To the six works of the *Organon* are added the *Rhetoric* and the *Poetics*, following the Alexandrian scholarly tradition. The work of the School of Ḥunayn counts as a direct extension of that of the Syriac circles.

Categories

Coming after three earlier versions, the Syriac translation of the *Categories* by Ḥunayn b. Ishāq

served as a model for the Arabic one, done by his son Ishāq and preserved in the Paris MS just mentioned. The many glosses contained in this manuscript (probably by the hand of the Baghdad logician Ibn Suwār ibn al-Khammār, d. 1020) mention some ancient commentators of Aristotle not without giving quotations also from their works. Many others are mentioned in the bibliographical sources: Ammonius, Philoponus, Porphyry, Stephanus of Alexandria, Themistius, Theophrastus, Iamblichus, Simplicius, and a certain “Alīnūs” whose identity is dubious. None of these commentaries on the *Categories* are extant in Arabic. Instead, a direct prolongment of the ancient commentary tradition in Arabic is represented by the Nestorian doctor Abū l-Faraj ibn al-Ṭayyib (d. 1043; see the entry), who was a follower of the masters of the Baghdad school Ibn al-Samḥ et Ibn Suwār. This school perpetuated the tradition established in late Antiquity of having an introduction to philosophy placed before the *Categories*, in line with Olympiodorus (whose commentary, however, did not exist in Arabic) and Elias (David).

Muslim thinkers like al-Fārābī, Avicenna, and Averroes did not maintain these introductory treatises at the beginning of their writings on the *Categories*, although they did not ignore them. Al-Fārābī provides an example of this: in an epistle on *What must precede the learning of philosophy* (*Fī mā yanbagī an yuqaddama qabla ta'allum al-falsafa*), he offers a general introduction to philosophy in nine points (instead of ten, as in the Greek writings of this kind) akin to those of the Greek commentaries on the *Categories*.

Ancient discussions on the nature and number of the categories were taken up by Arab philosophers. In the *K. al-Maḳūlāt* of the *Shifāʾ*, Avicenna holds that the study of the categories is not a part of logic but rather of metaphysics, a position that becomes the rule in the subsequent tradition. According to Avicenna, the curriculum of logic proceeds from the study of simple expressions (*alfāz*) to that of propositions, but knowledge of the ten categories plays only a marginal role in logic, that is, insofar as it applies to the theory of definition. This doctrine is followed by

later thinkers, notably al-Ġazālī, who omits the study of the categories in all his works in logic.

De interpretatione

The *De int.* was translated by Ishāq b. Ḥunayn, probably from an earlier Syriac version by his father Ḥunayn. The *Fihrist* names the Greek commentaries of Alexander, Philoponus, Iamblichus, Porphyry, Galen, and Theophrastus, specifying that those of Alexander and Galen are lost, a remark that obviously does not imply that the others were accessible. We have, nonetheless, a fragment from Alexander's commentary (on *De int.* 16 a 27), edited by Badawī. It is possible to get an idea of the Greek sources available in the tenth century, thanks to the analysis devoted by F. Zimmermann to al-Fārābī's Long Commentary on the *De int.* This work can be traced back to a double set of sources, which could also have existed in the form of a unique piece, a kind of exegetical record compiled out of different texts: first, of glosses inspired to Porphyry, that we can identify from parallels between al-Fārābī and Boethius; and second, of extracts from other commentaries later than Porphyry's one(s), that could have been inserted between the Porphyrian glosses in the model. In fact, al-Fārābī's work reveals many parallels, both structural (division of the text) and doctrinal, with Ammonius and especially with Stephanus of Alexandria.

A lost commentary by Abū Bishr Mattā is mentioned, and Ibn Zur'a too is credited with a commentary. As for al-Fārābī, in addition to the Long Commentary, which has come down to us, he made also an abridgment, which is lost. The Long Commentary, because of the sources it uses, was particularly important for the Arab philosophers of later centuries, notably Avicenna: the part of the *K. al-Shifā'* devoted to the *De int.* owes much to al-Fārābī, whose exegesis also inspires greatly the section of Ġazālī's logical treatise *Mi'yār al-ilm.* Averroes too, in his *Short Commentaries on Logic* (*al-Ḍarūrī fī l-manṭiq*: ed. Butterworth 1977), draws from Fārābī's abridgment mentioned above; Averroes also wrote a paraphrase (Middle Commentary) on the *De int.*

Prior Analytics

In the Paris MS mentioned above, the translation of the *Prior Analytics* is attributed to Tadhārī, a name pointing perhaps to the Melkite bishop of Ḥarrān, Theodore Abū Qurra (d. 826), but more probably to Tadhārī ibn Basīl Akhī Iṣṭifān, a translator of the circle of Ḥunayn b. Ishāq. The notes in the Paris MS attest to fragments of four earlier versions, one of which is attributed to Yahyā ibn al-Biṭrīq, a translator of the Kindī's circle. The *Fihrist* also mentions two different commentaries of Alexander of Aphrodisias, and one of Philoponus. These would not have been complete and would end with the commentary of *An. Pr.* I, 7. The *Fihrist* mentions Themistius' complete commentary as well. In the glosses of the Paris MS, only the citations and mentionings of Themistius, as well as those ascribed to "Alīnūs" are presented. One *Quaestio* by Alexander on the conversion of propositions, and a treatise of Themistius can complete the picture of the exegetical material on *An. Pr.* at the disposal of the Arab readers.

The biographical sources mention several lost Arabic commentaries, such as al-Kindī's. Beginning in the tenth century, a renewal in the study of logic gave rise to the study of the *Prior Analytics* in their entirety, whereas the earlier tradition – as we saw before – read only as far as chapter 7 of book I. We know that Abū Bishr Mattā commented on the work in its entirety, and so did al-Fārābī, following in his footsteps. The former is lost, but references subsist in the margins of the Paris MS, while of the latter what remains is only an important fragment of the final part, in a MS housed in Tehran.

Several works on the "syllogism" remain in the Arabic literature, such as those of Ibn Zur'a and Avicenna: the latter constitutes one part of the *Logic of the Shifā'*. To the "syllogism" is also devoted one section, modeled on al-Fārābī's abridgment, of the treatise on logic by the Cairene philosopher, astronomer, and doctor 'Alī ibn Riḍwān (d. 1061 or 1068), the *Book on the Application of Logic in the Sciences and Arts* (*Kitāb al-musta'mal min al-manṭiq fī l-'ulūm wa-l-ṣanā'i*). Averroes, in addition to a section

inspired by al-Fārābī of his *Short Commentaries on Logic* (*al-Ḍarūrī fī l-mantiq*), devotes to the *An. Pr.* a paraphrase (*talkhīṣ*), as well as several questions (*masā'il*) to issues pertaining to this part of the *Organon*. Finally, Averroes' disciple Ibn Ṭumlūs (d. 1223) in his *Introduction to the Art of Logic* follows the path laid out by al-Fārābī.

Posterior Analytics

We must wait for Ḥunayn's school for the theory of demonstration (*burhān*) to be introduced, thanks to Ishāq's Syriac version of the *Posterior Analytics*. Later on, this Syriac version was translated into Arabic by Abū Bishr Mattā, the head of the Baghdad school: it is Abū Bishr's version that is reproduced in the Paris MS. Some elements of Aristotle's doctrine of demonstration that feature in al-Kindī's writings could have been transmitted to him through a preexistent Syriac translation unknown to us. A paraphrased anonymous Arabic translation, echoing here and there Philoponus' commentary, peeps out in Averroes' commentary on the *An. Po.*: Averroes made use of the two versions, Abū Bishr's and the anonymous one. The latter also appears in the marginalia of the Paris MS, where it is attributed to a certain Marāyā. Ibn al-Nadīm's *Fihrist* mentions several commentaries, among which Themistius' paraphrase, translated by Abū Bishr Mattā. This one was then translated into Latin in Toledo, by Gerard of Cremona; it is much used by Averroes in his Long Commentary on the *An. Po.* Averroes mentions also a commentary by Alexander and one by Philoponus, whose fragments appear in the marginal glosses of the Paris MS; Alexander's commentary, cited only once by Averroes, could only have been known indirectly, through Philoponus'.

Many of al-Fārābī's writings are devoted to the *An. Po.*; as for Avicenna, the fifth part of the logic of the *Shifā'* focused on it. In this work, Avicenna stays the closer to Aristotle's text than in the other sections of his logic. Averroes' all three commentaries (the Short Commentary of the *Ḍarūrī*, the Middle, and the Long Commentary) are extant in Arabic, the last being incomplete. The editions of Aristotle's *Opera omnia*, along with Averroes' commentaries (Giunta

1562) include three Latin versions of the same text: that of Abraham de Balmes, of Francesco Burana, and of Jacob Mantino, respectively (the last is incomplete), taken from the Hebrew. Also, Averroes devoted several *Quaestiones* to doctrinal issues of the *An. Po.*, which abide partly in Arabic, partly in Hebrew, and partly in the Latin translations of the Renaissance.

Topics

The *Topics* were known in a Syriac–Arabic version from the times of the caliph Harūn al-Rashīd (d. 809). Subsequently, a Syriac translation was made by Ḥunayn, and the Arabic version by Yahyā ibn 'Adī (d. 974) was based on it, as well as that of Abū 'Uthmān al-Dimashqī, carried forward by Ibrāhīm ibn 'Abdallāh, and conserved in the Paris MS.

According to Ibn al-Nadīm, there must have existed in his time a work containing at least some passages of Alexander's commentary on the *Topics*, namely part of book I and books V–VIII of the commentary, as well as Ammonius' commentary on books I–IV. This work would have been translated into Syriac by Ishāq b. Ḥunayn and, on the basis of this version, into Arabic by Abū 'Uthmān al-Dimashqī. The *Kitāb al-baḥṭh* (*Book of Research*) attributed to Jābir b. Ḥayyān also contains a reference to Alexander's commentary. In addition, Ibn al-Nadīm is aware of a commentary by Themistius on the "topics" (*mawāḍi'*), which likely corresponds to books II–VII of Aristotle's work. According to the *Fihrist*, Abū Bishr Mattā commented on the first book; there was as well a Long Commentary by al-Fārābī, which is now lost, whereas the abridgment is conserved. As for Avicenna, he devoted the sixth part of the logic of the *Shifā'* to the *Topics*. Averroes' Middle Commentary makes use of the works of his predecessors; its main source is Themistius' commentary.

Sophistical Refutations

In addition to several lost translations of the *Sophistical Refutations*, we know of three

different Arabic versions extant in the Paris MS, whose attribution is discussed. The oldest in all likelihood traces back to al-Kindī's era, and it could be the work of Ibn Nā'ima al-Himṣī, the translator of the pseudo-*Theology of Aristotle*, while the most recent is attributable to Ibn Zur'a (d. 1008).

Ibn al-Nadīm's *Fihrist* makes no mention of extant Greek works other than a commentary by Alexander of Aphrodisias, which however seems not to have been used by the Arab commentators on the *Soph. El.* An abridgment by al-Fārābī is extant; the part of Avicenna's *Shifā'* dealing with this Aristotelian work is particularly brief, just as Averroes' Middle Commentary.

Rhetoric

According to the Arabic bibliographical sources, there were three different versions of the *Rhetoric*, one being ancient and anonymous, and likely made from a Syriac text. The obscurities and errors of this translation lie in the background of several particularities of the exegeses of the Arabic authors. Another version is attributed to Ishāq b. Ḥunayn, and a third one to Ibrāhīm ibn 'Abdallāh al-Nāqid (d. about 940). The only version conserved in the Paris MS is the ancient translation, which is reproduced in the "edition" made by Ibn al-Samḥ, who collated among them and with a Syriac version several different copies of the Arabic text. An abridged version of the same translation, excluding chapters 15–17 from book II, did equally circulate. The long version was read and used in the commentaries by al-Fārābī and Avicenna, while Averroes' Middle Commentary relies on the short version. This one evidently represents an Occidental branch in the tradition of the text, since the Latin translation (the *Rhetorica*) made by Hermann the German in Toledo in the thirteenth century depends on it.

Aristotle's *Rhetoric* had no commentaries in antiquity. There is thus no direct contribution of the Greek commentary tradition to the Arabic exegeses of the *Rhetoric*, but many themes

which would be elaborated by the Arabic exegetical tradition were foreshadowed, albeit unsystematically, in the ancient exegeses of other Aristotelian logical texts, notably Elias' commentaries. This is the case, for example, for the characterization of rhetoric as a kind of expression that deals with statements equally possible; the idea that the suppression of a premise in the enthymeme (i.e., the rhetorical syllogism), serves to hide falsity; the characterization of the rhetorical argument as resting on an "immediate point of view" (*bādi' al-ra'y*) not subject to scrutiny; and, even more important, the enlarged conception of the *Organon*, extended to the *Rhetoric* and *Poetics*, and viewing these two as branches of logic properly speaking.

In the tenth century, al-Fārābī commented on the *Rhetoric* at least twice: in the Long Commentary and in an abridgment. The first, *Kitāb al-Khaṭāba*, is an exposition following chapter 2 of book I of Aristotle's work, and it explains how the object of rhetoric is articulated around the concept of the "immediate point of view." The beginning of al-Fārābī's Long Commentary (*Sharḥ kitāb al-Khaṭāba*) is preserved in Herman the German's *Didascalia in Rhetoricam Aristotelis ex glosa Alfarabii*, which conserves the prologue, written in the style of the Alexandrian introductory schema, and the commentary of the first lemma. Other more or less sequential fragments of al-Fārābī's text are found in 'Alī ibn Riḍwān's *Book on the Application of Logic in the Sciences and Arts* mentioned above (see "*Prior Analytics*"). In the eleventh century as well, Abū l-Faraj ibn al-Ṭayyib (d. 1043), the Nestorian philosopher known for his commentaries on Porphyry's *Isagoge* and on the *Categories* in the style of the Alexandrian introductions, composed a commentary on the *Rhetoric*, according to the bibliographer Ibn Abī Uṣaybi'a (d. 1270). Ibn al-Ṭayyib is the target of the criticisms of his contemporary Avicenna. The latter is the author of a commentary *On the Significations of the Book of the Rhetoric* (*Fī ma'ānī kitāb Riṭūrīqā*) in his early work *al-Ḥikma al-'arūḍiyya*; later on, he devoted to the *Rhetoric* a section of the logic of his *K. al-Shifā'*, more paraphrastic in style.

Averroes' writings – an abridgment included in the *Ḍarūrī fī l-mantiq*, depending on al-Fārābī's abridgment, and the Middle Commentary, written in 1175 – are dependent on the Arabic exegetical tradition of the *Rhetoric*, which has little or no Greek antecedents, as we saw before. The logician and doctor of the Almohad court Ibn Ṭumlūs (d. 1223), author of *Introduction to the Art of Logic (al-Madkhal ilā šinā'at al-Mantiq)*, quite dependent on al-Fārābī's abridgments, makes use also of Averroes' Middle Commentary, who according to some sources was his teacher.

Poetics and Physics

See Carmela Baffioni's articles in this volume.

De caelo

For this work, called in the Arabic tradition *On the Heavens and the World (al-Samā' wa-l-'ālam)*, the *Fihrist* of Ibn al-Nadīm mentions Yaḥyā ibn al-Biṭrīq's translation, which would have then been revised by Ḥunayn b. Ishāq. Another translation of part of book I would have been done by Abū Bishr Mattā. These data partially agree with the information given by the manuscript tradition. The *De caelo* was thus translated into Arabic for the first time within the Kindī's circle, to which belonged Yaḥyā ibn al-Biṭrīq. This is the most widespread version. We can distinguish between an Occidental tradition and an Oriental tradition. The Occidental tradition is represented by the text commented upon by Averroes, and reproduced in full in the lemmas of his Long Commentary on the *De caelo*; this text exists only partially in Arabic, since the original of Averroes' Commentary is extant only for the part of Aristotle's text running from I 7 to II 7; however, the Latin translation by Michael Scot has come down to us in its entirety. The Oriental tradition, on the other hand, is represented by a group of Iranian manuscripts of the seventeenth century, stemming from a version copied in Damascus in the twelfth century. Ibn al-Biṭrīq's text has been more or less consistently

revised in the twelfth century, and it is one of the three MSS of this version that served as the model for Badawī's edition. Finally, there is a fragmentary version (extracts from *De caelo* I 9–II 9) preserved in only one MS, accompanied with Abū l-Faraj ibn al-Ṭayyib's commentary, who is also likely the author of this Arabic translation, that was made not from Greek, but from Syriac. This translation is occasionally cited by Averroes in his Long Commentary.

Ibn al-Nadīm mentions the existence of a commentary of Alexander (only fragmentarily known in Greek), which was translated by Abū Bishr Mattā. Themistius' commentary, translated from Syriac into Arabic by Abū Bishr Mattā and revised by Yaḥyā ibn 'Adī, is no longer extant in Arabic, but one can read it in the Hebrew version done in the thirteenth century by Zeraḥyā Ḥen, which, in its turn, served as the model for a Latin translation in the sixteenth century.

Many Arabic works are specifically devoted to the *De caelo*. According to Ibn Abī Uṣaybi'a, Ḥunayn b. Ishāq composed an abridgment of the book *On the Heavens and Earth*. This work has been often identified with the *De caelo et mundo* supposedly translated in Toledo by Gundissalinus and attributed to Avicenna in the Latin medieval tradition, but this identification is dubious. The same Ḥunayn composed a treatise on the nature of light (*fī l-daw' 'alāḥaqīqatihi*), containing an exposition of the doctrine of motion from *De caelo* I 2. The bibliographies mention a commentary by al-Balkhī, a follower of al-Kindī, on the beginning of Aristotle's work. We are also told that al-Fārābī commented upon the *De caelo*, and that Ibn Zur'a did so on a part of book III. Abū l-Faraj ibn al-Ṭayyib's commentary mentioned in the sources probably corresponds to the one which accompanies the translation of the *De caelo* in the incomplete *unicum* MS Paris, BnF ar. 2281. We also know of a commentary by Abū Sahl al-Masīḥī, a friend of Avicenna, who, in his turn, devoted the second part of the physics of his *K. al-Shifā'* to the paraphrase of the *De caelo*. Averroes composed an abridgment, a Middle Commentary and a Long Commentary. The only Greek commentary directly known by Averroes is Themistius'.

Generation and Corruption

The biobibliographical Arabic sources mention three translations of the *De generatione et corruptione*, although none is extant. Probably, the work was known in some ancient version from the time of al-Kindī, who had written a *Clarification of the Efficient Cause in Generation and Corruption* (*al-Ibāna 'an al-'illa al-fā'ila li-l-kawn wa-l-fasād*). Ishāq b. Hunayn's translation, made on the basis of the Syriac version of his father Hunayn, is what the Latin version of Gerard of Cremona (d. 1187) and the Hebrew one of Zerahyah Hen (d. after 1291) originate from. Another translator of the School of Hunayn, Abū 'Uthmān al-Dimashqī, seems to have produced his own translation – mentioned by Ibn al-Nadīm – from the same Syriac version. Ibn al-Nadīm mentions a third Arabic version, that he attributes to Ibrāhīm ibn Bakkūsh, a little known translator who was a contemporary of Yaḥyā ibn 'Adī.

The Arabic philosophers knew of several other Greek commentaries as well, notably Alexander of Aphrodisias', which is lost in Greek and in the Arabic version as well, but was used by Averroes in his Middle Commentary on the *De generatione et corruptione*, and in his abridgment of the same work: so, Averroes' Middle Commentary is a precious source for our knowledge of Alexander's work. One of the writings belonging in the alchemical corpus attributed to Jābir b. Ḥayyān, the *Kitāb al-taṣrīf*, has equally revealed important quotations of Alexander's work. If one has to trust Ibn al-Nadīm, the Arabic translation was done by Abū Bishr Mattā. Another partial translation would have been done by Qusṭā ibn Lūqā. Less certain are the traces that remain of Olympiodorus' commentary, which would have been put into Arabic primarily by Uṣṭāth in al-Kindī's times and in the tenth century by Abū Bishr Mattā, this time from Syriac. We also find mention of two different commentaries by Themistius, and one by Philoponus (the only one among these works whose original Greek text has come down to us). Philoponus' commentary is also mentioned by Avicenna in a letter to al-Bīrūnī. Avicenna devotes the third section of the physics of his *Shifā'* to the topic of coming-to-

be and passing away. In the Muslim West, Avempace devotes an abridgment to the *De generatione et corruptione*, which counts as a source of inspiration for Averroes in his own Compendium, written before the Middle Commentary on this Aristotelian work.

Meteorologica

There are two Arabic versions of Aristotle's *Meteorologica*, neither of which is a literal translation. The oldest one is attributed to Yaḥyā ibn al-Biṭrīq by the Ottoman bibliographer Ḥajjī Khalīfa. It was translated from Syriac. Ibn al-Nadīm's *Fihrist* mentions another translation by Ibn Suwār, who is also the author of a work on meteorological phenomena (*al-āthār al-mutakhayyala fī l-jaww*) in which he directs the reader to his translation of Aristotle's text for the second part of his work; however, the translation is lost. Ibn Suwār's translation was in all likelihood limited to the chapters that Aristotle had devoted to the halo and rainbow, which form the focus of Ibn Suwār's writing. It is thus the version attributed to Ibn al-Biṭrīq that is preserved, and was consulted by most Arabic authors. This translation is an adaptation, shorter than the original text, and adapted in several places for monotheistic purposes. It modifies the order of the chapters and incorporates sections from commentaries. This is the text that forms the basis of Gerard of Cremona's Latin version. In addition, we know of a *Compendium* likely having as a model a Syriac version of an abridgment tracing back to the Hellenistic or Imperial ages, which was translated into Arabic by Ishāq b. Hunayn.

Ibn Suwār also translated from Syriac Theophrastus' *Meteorologica*: this translation is extant. Alexander of Aphrodisias' commentary was translated into Arabic, as well as Olympiodorus'. They are lost, but have left important traces in the subsequent Arabic literature. Samuel ibn Tibbon (d. around 1230) made use of Alexander's commentary in inserting fragments in his Hebrew translation of Ibn al-Biṭrīq's version, under the name *Otot ha-shamayim*. An Arabic commentary

attributed to Olympiodorus is preserved, but it is different with respect to the Greek commentary, which is extant and whose Arabic version is lost. What we have in Arabic is a different work, in all likelihood the Arabic version by Ḥunayn of a work originally in Greek or Syriac, that intermingled Olympiodorus' commentary and other sources (Pseudo-Olympiodorus).

Al-Fārābī is credited in one source with a commentary on the *Meteorologica*, but this work is lost. The Arabic authors considerably reorganized Aristotle's doctrines in this treatise. Even though the authenticity of book IV is not in doubt to Avicenna's eyes, nevertheless, following Alexander of Aphrodisias, he thinks that book IV should follow the *De generatione et corruptione*, and deals with it as with the fourth part of the *Physics*, devoted to actions and passions, under the title of *al-Af'āl wa-l-infi'ālāt* (*De actionibus et passionibus*): this part should be located, according to Avicenna, after the doctrine of generation and corruption and prior to the sections that are properly meteorological, that is, *al-Ma'ādin wa-l-āthār al-'ulwiyya* (*Metals and higher traces*). Although not citing it literally, Avicenna read Ibn al-Biṭrīq's version, and his exposition is quite influenced by the writing of the Pseudo-Olympiodorus mentioned above. Avicenna's work then influenced the meteorology of the *K. Al-Mu'tabar* by Abū l-Barakāt al-Baġdādī. Averroes composed an abridgment of the *Meteorologica*, taking as his model a similar, less-refined work from his predecessor Avempace; Averroes also wrote a Middle Commentary that is a paraphrase of Ibn al-Biṭrīq's version. In his works, Averroes makes use here and there of Alexander's commentary as well as of Avicenna's and of that of the Pseudo-Olympiodorus.

De anima

The information from Ibn al-Nadīm's *Fihrist* on the translations of the *De anima* are incomplete and difficult to interpret. The *Fihrist* knows of only one translator, Ishāq b. Ḥunayn, and quotes the latter's account: Ishāq would have made two successive versions of his translation, one

incomplete and done in all likelihood on the basis of the Syriac version of his father Ḥunayn, previously mentioned in the text; and a second, complete, that he made after he had found a better manuscript. The *Fihrist* adds that this manuscript "was the commentary of Themistius." If this passage is not corrupted, knowing that Themistius' work is a paraphrase that does not cite literally the lemmas of Aristotle's text, one is led to suppose that the MS contained the text of the *De anima* in addition to Themistius' commentary, unless this passage limits itself to refer, quite awkwardly, to Ishāq's translation of Themistius' work, which is extant. The *Fihrist* also mentions (1) a commentary by Olympiodorus in Syriac, an information which is attributed to Yaḥyā ibn 'Adī; (2) a commentary by Simplicius in Syriac, existing "maybe in Arabic"; (3) an "Alexandrian abridgment" which has been identified by R. Arnzen as a Neoplatonic paraphrase of the *De anima*; this text circulated in one part of the tradition as Ḥunayn's *Book of the Soul*, and served as a summary of Aristotle's work combined with developments indirectly tied to Philoponus, possibly through Stephanus of Alexandria. Despite the attribution to Ḥunayn in part of the manuscript tradition, this work was certainly translated before Ḥunayn and Ishāq, the style and vocabulary betraying the ways of al-Kindī's circle; finally, (4) an abridgment by Yaḥyā ibn al-Biṭrīq.

The extant documentation on translations, properly speaking, is found in the following texts: (1) A version preserved in Arabic, which was falsely attributed to Ishāq ibn Ḥunayn by its editor, 'A. Badawī. Indeed, this text is a nonliteral and sometimes paraphrased version that has been traced back to al-Kindī's times by H. Gätje, who also attributed it tentatively to Ibn Nā'ima al-Ḥimṣī, the translator of the pseudo-*Theology of Aristotle*. Averroes sometimes cites this translation in his Long Commentary on the *De anima* (extant only in Latin) as "*alia translatio*" (2) A paraphrase by Avicenna, fragmentarily preserved in his *Book of Just Judgment* (*Kitāb al-Inṣāf*), citing the lemmas of the *De anima*: at the end of the text (after 431a14), these lemmas correspond to the aforementioned translation; as for the beginning of the text, they correspond, in Arabic, to

what we can read in Latin in (3) Averroes' Long Commentary on the *De anima*, which cites *in extenso* the Latin version of another Arabic translation of the *De anima*, that of Ishāq ibn Ḥunayn. Of the latter there is as well an Arabic–Hebrew version, done by Zerahyā Ḥen at the end of the thirteenth century. The comparison between the Arabic–Latin lemmas in Averroes' Long Commentary and in the Arabic–Hebrew shows that Zerahyā probably extracted the lemmas from Averroes' commentary. As for Avicenna, he commented on a composite version, constituted mostly from the version (or one of the versions) of Ishāq, and completed, as for the final part, with the translation of the Kindī circle. It is possible that that which was completed in this way was exactly that first version from Ishāq, which according to the *Fihrist* claims was unfinished. The version used by Averroes as the basic text for his commentary is different from Avicenna's, but the manuscripts of the Arabic–Hebrew version, that are identical to it, remark in the same place (431a14) that this is the end of Ishāq's translation, adding that it was completed by Abū 'Īsā (probably Ibn Zur'a). Thus, it seems that another supplement of the incomplete version did exist. Finally, it should be noted that the version used by Averroes in the paraphrase that constitutes the Middle Commentary differs here and there from that which forms the basis of the lemmatic exegesis provided in the Long Commentary.

The main Greek sources used by the Arabic readers of the *De anima* are Themistius' paraphrase in Ishāq's translation, mentioned above, and Alexander's *De anima*. The latter is no longer extant in Arabic, but is preserved in an unedited Arabic–Hebrew translation. Generally speaking, Alexander's doctrines as expounded in the *De anima* and *De intellectu* often prevailed over the reading of Aristotle's own work. Even if al-Fārābī had Aristotle's *De anima* at his disposal, he did not use it; the section on the soul in Avicenna's *K. al-Shifā'* recasts his reading of Aristotle within a synthesis of Alexander's and Neoplatonic doctrines. Avempace, who wrote a *Book on the Soul* (*Kitāb al-naḥs*), as well as Averroes when he wrote his abridgment on the soul, did not refer to Aristotle's work, but primarily to Alexander.

Parva naturalia

The small works gathered in the Latin tradition under the name *Parva naturalia* met different fates in the Arabic–Muslim world. The treatises were not translated in their entirety. The *Fihrist* of Ibn al-Nadīm mentions a book *On Sense and the Sensed*, in two treatises, and claims that there is no translation deemed worthy of mention, except than a small part glossed by al-Ṭabarī, a follower of the Baghdad scholar Abū Bishr Mattā.

We know of an Arabic version found in a unique MS from Rampur (India) by H. Daiber, lacking of the beginning: the text is a version in three books of six of the little works on natural history: *De sens.* (lacking in the MS), *De mem.*, *De som.*, *De ins.*, *De div.*, and *De long.*, that a compiler completed with Plotinian and Galenic elements: the edition of this collection, by R. Hansberger, is forthcoming. The comparison of this text with Averroes' commentary shows that the latter is a close paraphrase that should be classified as a Middle Commentary. The motley and clumsy version which was taken to be Aristotle's *On Sense and the Sensed* by all Arabic writers gave rise to the intense exegetical activity of these philosophers, whose outcome was the famous theory of the internal senses.

Zoological Treatises

Aristotle's zoological writings circulated in the Arab world in a review called *Kitāb al-Ḥayawān* (*Book of Animals*) in which treatises (*maqālāt*) 1–10 correspond to the *Historia animalium*, treatises 11–14 to *De part. an.*, and treatises 15–19 to *De gen. an.* The Arab translation of the ninth century is attributed to Yaḥyā ibn al-Biṭrīq in the Arabic sources as well as in several manuscripts, but the analysis of vocabulary and style by the editors of these texts strongly questions this attribution. The lexicon presents similarities but also notable divergences with Yaḥyā's; however, the translator did in all likelihood belong in the same circle, that of al-Kindī, so that the name of Uṣṭāth can be advanced, that is, the translator of the *Metaphysics* for al-Kindī.

Aristotle's treatises *De motu animalium* and *De incessu animalium* were not read by the Arabs, but in his Long Commentary on the *De anima*, Averroes claims he had at his disposal an abridgment of the *De motu* included in Nicolaus of Damascus' summary of Peripatetic philosophy (Περὶ τῆς Ἀριστοτέλους φιλοσοφίας); the abridgment of the *De motu*, however, is not found in the Syriac version of this work which has come down to us. The three treatises (*Hist. an.*, *De part. an.*, and *De gen. an.*) were also summarized in Nicolas' summary, probably available to the Arab writers in its entirety. The Arabic translation of the Περὶ τῆς Ἀριστοτέλους φιλοσοφίας is attributed to Ibn Zur'a (d. 1008). We also know of an abridgment falsely attributed to Themistius, translated by Ishāq b. Ḥunayn.

In addition to other abridgments completely lost, like that of Ibn al-Haytham (d. 1039) and that attributed to 'Abd al-Laṭīf al-Baḡdādī (d. 1231), also Abū l-Faraj Ibn al-Ṭayyib composed an abridgment of the *Book of Animals* which is lost in Arabic, but is extant in the Hebrew version, as for the books corresponding to the *History of Animals*. The *Book of Animals* occupies an important place in Avicenna's *K. al-Shifā'*, where it represents the eighth section of the *Physics*, covering the set of the 19 books, including the *History of Animals*. In his exposition of the generation of animals, Avicenna presents the interesting peculiarity of holding a reconciliatory position between Aristotle and Galen on the role of masculine and feminine semen.

Books 11–19, corresponding to the *De part an.* and *De gen. an.*, were particularly studied in the Muslim West, whereas the *Historia animalium* did not generate much interest. Avempace devoted a few treatises to books 11–19 (*K. al-Ḥayawān li-Abī Bakr Ibn Bājja*), and Averroes made a paraphrase of them in the Middle Commentary (*Talkhīṣ tis' maqālāt min Kitāb al-ḥayawān*), lost in Arabic but extant in Hebrew, as well as in a Latin translation of the Renaissance. Contrary to Avicenna, Averroes argues for Aristotle's doctrine on animal generation, and devotes a long critique to Galen's position.

Metaphysics

The oldest Arabic translation of the *Metaphysics*, made in the ninth century by a certain Uṣṭāth (Eustathius) for al-Kindī, is mainly known by the use Averroes makes of it in the Long Commentary on the *Metaphysics* edited by Maurice Bouyges S.J. after a MS housed in Leiden, which is the unique testimony of this crucial text. Uṣṭāth's translation contained most of Aristotle's text, with the exception of books A, K (which was not translated into Arabic), and N. For book *Lambda*, as well as Uṣṭāth's, Ibn al-Nadīm mentions a translation by Abū Bishr Mattā accompanied by Alexander of Aphrodisias' commentary (lost in Greek): this is the translation used by Averroes in his Long Commentary on the *Metaphysics* for book *Lambda*. Themistius' paraphrase, translated by Abū Bishr Mattā, is also preserved. Ibn al-Nadīm mentions several books of the *Metaphysics* translated by Ishāq b. Ḥunayn as well.

To the information given in the *Fihrist* we must add the mention of other translations echoed in Averroes' commentary. Bouyges claimed he could distinguish in these citations, designed as "second" and "third translation"-s, the traces of at least two translations other than Uṣṭāth's and Abū Bishr's ones, that are cited in the commentary. At one place, Averroes names the author of one of them: Yaḥyā ibn 'Adī. We do not have any other testimonies that Yaḥyā ibn 'Adī did this translation, but Averroes' mentions allow this possibility. As for the other version, Bouyges surmises that it could be the work of that Shamlī, otherwise unknown, who is mentioned by Ibn al-Nadīm. An annotation of the Leiden MS also names Ibn Zur'a as the author of another translation of Book *Lambda*. Of this book, another anonymous and incomplete translation exists, containing only chapters 6–10: its editor, 'A. Badawī, attributes it to Ishāq b. Ḥunayn, an attribution that, although not contradicting with the *Fihrist*, is purely speculative. This translation nears paraphrase in several places.

The version of Themistius' paraphrase of Book *Lambda* played a significant role in the Arabic philosophical tradition. This work is no longer

extant in Greek and seemingly was not known by Greek authors; on the contrary, it enjoyed a considerable diffusion among the Arab philosophers. The full Graeco-Arabic version is lost either, except for a small part, but it survives in its entirety in Hebrew, thanks to the translation by Moses b. Tibbon, achieved in 1255. Although the *Fihrist* indicates Abū Bishr Mattā as the translator, a MS attributes it to Ishāq b. Ḥunayn. Both attributions are accepted in modern scholarship.

Books A and N, missing from Uṣṭāth's translation were, according to A. Bertolacci, translated a bit later (end of the ninth century) by Nazīf ibn Ayman. Averroes also transmits the main part of book *alpha elatton* in Ishāq b. Hunayn's translation. In cross-checking the testimonies of ancient bibliographers and citations by the authors, we can infer that Ishāq's version would also include at least book B, Γ, Δ, Θ, H, I, and Λ. As for Book A, there are traces of a version other than Nazīf's (transmitted by Averroes), done by Uṣṭāth.

Abstract

The *Physics* deeply influenced Arabic philosophy and science. It was translated into Arabic several times in the ninth and tenth centuries, but only the version by Ishāq b. Ḥunayn (d. 910) survived. Many Greek commentaries were known as well. The most important center for the study of the *Physics* was the Baghdad school of Yaḥyā Ibn 'Adī (d. 973) and his pupil Ibn al-Samḥ (d. 1027). The *Physics* was studied and commented by the most important Muslim philosophers.

The Arabic Reception of Aristotle's *Physics*

The *Physics* deeply influenced Arabic philosophy and science, but Muslim authors often introduced new perspectives in front of Aristotle's doctrines.

The version by Ishāq b. Ḥunayn (d. 910), the only one survived, is transmitted in the Leiden MS (Bibliothek der Rijksuniversiteit, or. 583), which contains the transcription of lectures given in 1005, and is a witness of the continuity of the tradition of this work during the centuries. Ishāq quotes passages from the translations by Qusṭā b. Lūqā (d. 912) and by Abū 'Uthmān al-Dimashqī (d. 900).

The Greek commentaries on the *Physics* by Alexander of Aphrodisias (c. 200), Themistius (c. 320–390), and Philoponus (sixth century; called Yaḥyā al-Naḥwī, “the Grammarian”) were also known; the exegeses by Eudemos (fl. c. 320 BCE), Theophrastus (372–288 BCE), and Galen (131–201) are occasionally mentioned.

While a treatise by Alexander exists in Arabic, refuting Galen's position about a passage of the *Physics* stating that every moving object which is not moved by an external mover must have an internal mover (because when a part of it stops moving the whole stops moving), neither the Arabic paraphrase of Themistius nor the commentary by Philoponus survived (however, Books III–VII of this commentary are reported by Ishāq). A complete survey of the preserved Arabic commentaries, compared with each other and with the Greek commentaries, is given by Lettinck (1994).

A new approach is developed by Rashed (2009) regarding Thābit b. Qurra (d. 901). Despite the lacunous state of the sources, he demonstrates that Thābit was the first one to discuss Aristotle's *Physics* to elaborate an autonomous doctrine of motion. His providence-grounded conception of the world, however, did not make him accepted by theologians, while determined opposition by philosophers.

The most important center for the study of the *Physics* was the Baghdad school of Yaḥyā b. 'Adī (d. 973) and his pupil Ibn al-Samḥ (d. 1027). Besides the commentaries by Abū Bishr Mattā Ibn Yūnus (d. 940), Yaḥyā's teacher, and Abū l-Faraj Ibn al-Ṭayyib (d. 1044), the *Physics* was studied, mentioned, and/or commented by philosophers such as al-Fārābī (d. 950), Ibn Sīnā

(Avicenna, d. 1057), Ibn Bājja (d. 1138), and Ibn Rushd (Averroes, d. 1198).

Faith in a Creator God is claimed for Abū Bishr Mattā by Janos (2015). God's influence on heavens and his treatment of the "active nature" (as the final cause of motion and efficient cause responsible for creation) brings physical causality closer to metaphysics.

Al-Fārābī wrote an essay on the *Physics* under the title *On Changeable Things*, which is not preserved but was known to Ibn Bājja and Averroes. Avicenna dealt with the *Physics* extensively in his *al-Shifā'* and *al-Najāt*; he knew Philoponus' commentary but was independent from it.

Ibn Bājja was the first commentator on Aristotle in the Muslim West and the precursor of Averroes in this field. He often quotes Aristotle, sometimes deviating from Ishāq's version. As he seems familiar with Philoponus' ideas, he might have used Qusṭā's translation, which was accompanied with Philoponus' commentary. He was influenced by al-Fārābī and influenced Averroes.

Philoponus' ideas on place, the motion of physical bodies, and the eternity of the world differed from Aristotle's ones; they influenced the Arab thinkers and scientists. Ibn Bājja, too, differs from Aristotle in his commentary, for example, about the place of the celestial spheres and the universe as a whole. Sometimes his ideas were shared by Averroes, at other times he criticized them.

Ibn Bājja's commentary was not translated into Latin, but some of his theories were transmitted, thanks to some quotations of Averroes regarding the motion of a body in air or water, and the influence of the resistance of the medium on velocity; through the Hebrew translations of Averroes, Ibn Bājja's ideas were known to the medieval Jewish philosophers in Spain.

Ibn Bājja contributed to the discussion of three other subjects: (1) the divisibility of a body in motion or changing, (2) the idea that a motion does not have a beginning but does have an end, and (3) the question whether any motion or actuality must be preceded by a potentiality. He represents an important stage in the development of ideas about motion from Aristotle to Galilei.

Also Avicenna's concept of *mayl* (inclination) influenced the Latin West. Lettinck (2015) explores the chapters on movement in Aristotle's *Physics* as elaborated by Ibn Sīnā and Ibn Bājja.

Averroes wrote three commentaries on the *Physics*: the *Short* (1159), the *Middle* (1170), and the *Long Commentary* (1186). Only the first exists in Arabic, the *Middle* and the *Long* are extant in Latin and Hebrew translations. He relied on Ishāq's translation; he too was influenced by Philoponus and knew Avicenna's ideas well.

In recent years, the debate on Averroes' elaboration is reopened by Glasners' reference book (2009). The three commentaries on *Physics* cancel the old image of a servile interpreter of ancient doctrines in favor of that of the founder of a "new physics" grounded on the notion of "physical contiguity" (that substitutes Stoic continuity and atomistic discontinuity).

In a still wider perspective, Cerami (2015) examines Averroes' revival of Aristotle's theory of generation and corruption and considers his physics together with his theory of elements and his biology. These doctrines, strictly related, are shown in connection with his metaphysical theorization of essence.

Aristotle, Arabic: *Poetics*

Carmela Baffioni

Institute of Ismaili Studies, London, UK

Dipartimento di Studi e Ricerche su Africa e Paesi Arabi Facoltà di Studi Arabo-Islamici e del Mediterraneo, Università degli Studi di Napoli L’Orientale, Naples, Italy

Abstract

Though no Greek commentaries on the *Poetics* have come down to us, the work has a long tradition in the Byzantine and the Arabic world. It was translated at the end of the ninth century into Arabic.

While the most important Greek codex of the *Poetics*, the *Parisinus gr.* 1741, was written between the end of the ninth and the beginning of the eleventh century, the Arabic version known to us today is the one by Abū Bishr

Mattā Ibn Yūnus al-Qunnā'ī (c. 870/940), made from a Syriac version dating from around 700 CE, and perhaps relying on a preceding version by Ishāq b. Hunayn (d. 910). The bibliographers Ibn al-Nadīm (d. 995) and Ibn al-Qifṭī (d. 1248) speak of another translation by Yahyā b. 'Adī (d. 973), now lost, and of a commentary by Themistius (c. 320–390).

Jacopo Mantino's version in 1481 was made on the basis of the Jewish version by Tōdrōs Tōdrōsī (first half of the fourteenth century).

The Arabic Reception of Aristotle's *Poetics*

Ibn Abī Uṣaybi'a (d. 1270) reports that the famous scientist Ibn al-Haytham (Lat. Alhazen, d. 1038) possibly wrote a treatise on the Greek and Arabic tradition of the *Poetics*. On this tradition, the scientist Abū l-Barakāt al-Baḡdādī (d. after 1164–1165) also wrote in his *Kitāb al-mu'tabar*; an abridgment of the work came by al-Khwārizmī, the tenth century author of *Maḡāṭih al-'ulūm* (*Keys of the Sciences*).

In spite of the rich poetical tradition of the Arabs, the *Poetics* (Chaps. 20 and 21 being considered in particular by Edzard 2007–2008) was completely misunderstood in the Muslim world, due to inadequacies in the available translation of the *Poetics*. Abū Bishr's version, which lacks the last part, is very literal, but it attempts to interpret Aristotle – and fails in its goal.

The Arabs were unfamiliar with any of the Greek tragedies and, consequently, they were hindered from catching the sense of Greek poetry and of the *Poetics* in its Greek application. Hence, a proper understanding of technical terms such as περιπέτεια or ἀναγνώρισις was impossible for them.

The religious beliefs of the Arabs hindered them from a full comprehension of the concept of *mimesis* itself. Nobody can be a creator, apart from God; the Arabic word for “poetry” is *shi'r* (originally “hair”), while the idea of “making,” contained in the Greek ποίησις, is completely absent. In addition, the Qur'ān strictly distinguishes prophecy

from poetry (69:40; 36:69) and denies poetry value because of its untruthfulness (26:224).

However, the Arabs were interested in Aristotle's *Poetics*, perhaps thanks to the influence of the Persian culture and vision of life. Even if it is impossible to find in the Arabic tradition of the *Poetics* any help for a critical knowledge of the original, the Arab elaborations of this work are noteworthy.

The Greek commentators had organized the *Poetics* and the *Rhetoric* as the final parts of Aristotle's *Organon*. This asset came to the Arabs via the Syriac tradition, and it explains why the *Poetics* took its new “logical” coloring in Arabic. (Against the previous current opinion, however, Hugonnard-Roche 2003, 208–209 claims that there is no evidence of a Syriac version of the *Poetics* preceding the early Abbasid era.)

According to the geographer al-Ya'qūbī (d. in the early tenth century), the philosopher al-Kindī (d. c. 870) wrote a short commentary on the *Poetics*. Al-Fārābī (d. 950) and Ibn Sīnā (Avicenna, d. 1057) provided logic-oriented accounts of the work, evaluating poetry in its relation to truth.

Al-Fārābī, who might have known Abū Bishr's translation, gave a short account of the contents of the work and a theoretical treatment of poetry in his *Kitāb al-shi'r*. For him, the poetical syllogism was used in the Sacred Books to make the truth attainable by everybody.

Avicenna, sometimes judged as more faithful on this issue to Aristotle than Averroes, studied the relation between *takhyīl* (“imaginative representation,” occurring in poetic syllogisms) and *taṣdīq* (“assent” that occurs in demonstrative syllogisms).

As to Averroes (d. 1198), who probably relied on al-Fārābī and Avicenna, two commentaries of his on the *Poetics* are known: the *Short* (written before 1153) and the *Middle Commentary* (1175). Perhaps his source was not Abū Bishr, but another version now lost.

The *Middle Commentary* is a treatise of aesthetics, on the rules that should produce a good *qaṣīda* (the classical ode of the Arabs). Arabic poets are critically examined; so, the Greek original is adapted to the Arabic tradition, where poetry plays a role in maintaining individuals' consciousness of their group and their contribution to its

virtues. Hence, “good poetry” coincides with “morally good” poetry, while the terms and concepts of “tragedy” and “comedy” are completely misunderstood, and substituted by the terms *maḥd* and *hijā*, respectively, “praise” and “satire.”

Still on Averroes’ understanding of the key-concepts of *Poetics*, Vagelpohl (2015) emphasizes al-Fārābī’s interest for the parts more connected with logic, discusses Ibn Sīnā’s position in the *Organon*, and, besides Averroes, takes into account his pupil Ibn Ṭumlūs (d. 1223). Though in the limited impact due to inadequate translations, literary criticisms in Qudāma ibn Ja’far (d. 948?) and Ḥāzīm al-Qarṭajannī (d. 1285) is examined. Vagelpohl also remarks that eulogy and satire are approached by al-Kindī already, as an “instance of transcultural transformation of knowledge” (p. 90). A wider perspective is explored by Forte (2011).

Arnaldus de Villanova

Manfred Gerwing

Theologische Fakultät, Katholische Universität
Eichstätt-Ingolstadt, Eichstätt, Germany

Abstract

Arnaldus de Villanova (Arnoldus de Villa Nova, Arnau de Villanova, Arnaldo de Villanova, Arnald von Villanova, Arnaud de Villeneuve), born in Aragon, died on September 6, 1311, in a shipwreck near Genoa, was a philosophically educated medical doctor, a prominent physician and outstanding lay theologian. He taught medicine at the University of Montpellier and was private physician of various sovereigns, like Peter III of Aragon, James II of Aragon, and several popes, inter alia. He authored approximately 100 medical works and made translations from Arabic, which were edited in the sixteenth century, as well as numerous alchemical writings erroneously attributed to him. He based his medical theories mainly on Galen and Avicenna (Ibn Sīnā), while his medical practice was firmly established on detailed observation and concrete experience. His theology was first shaped by Dominicans (Thomas Aquinas), but later was increasingly influenced by Franciscans (Peter John Olivi). His theses about the oncoming arrival of the Antichrist provoked severe controversies at the University of Paris. His eschatologically

motivated and apocalyptically designed spirituality targeted a rapid and likewise, broad reform of clergy and order and a strengthening of the laity within the church.

Biographical Information

Arnaldus was born around 1238 as child of Catalan parents in Villaneuva di Jilóca close to Daroca, a city in the south of Aragon. From the year 1260, he studied medicine and theology in Montpellier. His wife Agnes Blasi, daughter of a merchant, also originated from this city, which belonged to Catalonia at that time. Arnald's daughter Maria became Dominican. Arnald himself took up a *studium linguarum* at the Dominicans and studied Arab and Latin, possibly also Hebrew, and certainly Humaniora. Soon he became a famous physician and advanced to the position of being personal physician of several rulers, like Peter III of Aragon, who in 1285 bequeathed the castle Ollers near Tarragona to him, as well as Alfonso III and James II of Aragon. To the latter, he dedicated his *Regimen sanitatis*, a book on health, which was passed on multiple times and finally became known all over Europe. Altogether, about 100 medical writings of Arnaldus were delivered to posterity among them numerous translations from Arab. From 1289/1291 to 1299, Arnald lectured medicine in Montpellier. There he worked at a place that established reputation not only for its highly regarded medical education institution, but also since the 1290s for the attachment of the controversial Franciscan theologian Peter John Olivi (Petrus Johannis Olivi), whom he loved discussing.

His multitudinous theological writings (Catalan and Latin) prove that Arnald received the spirituality of mendicant orders, the Dominicans, and – during the 1290s increasingly and eventually primarily – the Franciscan reformers, but he also placed his own emphasis. He died in a shipwreck near Genoa on the way from Naples to Avignon on September 6, 1311. By then, he had advanced to the personal adviser of the King of Sicily (Frederick III [II] of Aragon),

and presumably had been summoned by the pope, who sought medical aid from Arnald.

Thought of Arnald de Villanova

First, Arnald de Villanova became known as a philosopher and theoretical and practical physician. He advocated the widespread Galenism as a basic principle, which he, and Hippocrates' works likewise, illustrated didactically, commented, and completed – thanks to numerous own observations and experiences. He composed collections of aphorisms, among them his late but famous and all over Europe copied *Parabolae medicationis*, wrote a considerable number of textbooks, clinical monographies, as well as treatises about therapeutics and medical theory with practically oriented intention. He devoted himself to particular problems of the art of healing and sought manual-like and didactically reduced medical overview works. Altogether, he predominantly published works characterized by a strong inductive way of argumentation and oriented toward therapeutic effectiveness.

Moreover, the later editions of his medical achievements and the thereby found erroneous ascription of works present Arnald as a practical-oriented physician, who raised critical objection against superficial and hasty blending of philosophy and medicine, and in this regard polemicized against Averroes (Ibn Rushd) too. In particular, these are *Speculum medicinae*, *De intentionibus medicorum*, *De parte operativa*, *Liber de gradibus*, *De humido radicale*, *De simplicibus*, *De arte cognoscendi venena*, *Antidotarium*, *De vinis*, *De dosibus tyriacalibus*, and *De cura febris ethice*.

In the 1290s, Arnald increasingly advanced to a *homo spiritualis*. While Avicenna already understood medicine as a philosophical discipline and, moreover, perceived philosophy as therapy, “as cure from detrimental delusions,” Arnald adopted this view in a modified form. Cure for him meant turning toward salvation in Christ. His religiosity was not confined to religious service, prayer, family life, and caritas alone, but it imbued the entity of his existence, to which

belonged also his profession as a physician, an author, and – later more and more – a political actor. His writings *Introductio in librum Ioachim de semine scripturarum seu de prophetis dormientibus*, *Allocutio super significatione nominis thettagrammaton* as well as *De tempore antichristi et fine mundi*, and *Tractatus de mysterio cymbalorum* belonged to this period, while it is doubtful whether Arnald authored the apocalypse exposition *Expositio super apocalypsi*.

Thanks to his medical capabilities and accomplishments, Arnald gained special consideration of the pope at the beginning of the new century. Thus, he succeeded in presenting his idea of the imminent arrival of the Antichrist to Boniface VIII. Previously, his thesis raised a vehement conflict at the theological faculty of the University of Paris. Arnald's Antichrist tract was confiscated, and he was imprisoned for a short time and accused of heresy. However, pope Boniface VIII freed him. Pope Benedict XI took him to custody in Perugia but released him soon after. Arnald escaped to the court of Frederick III of Sicily. Frederick accommodated him friendly and called him the “new Plato.”

Arnald gratefully dedicated his newest work, *Allocutio christiani*, to the king. Here, Arnald expressed what and how a ruler had to be, had to do, and not to do, to be ruler in a true Christian sense. However, 1 year later – 1305 – the Catalan was back at the court of James II, who gladly received him and employed him as physician, personal adviser, and finally as ambassador. During this period, Arnald wrote *Antidotum*, referring back again to his earlier warning against the imminent arrival of the Antichrist, and *Informatio Beguinorum*, in which he took the side of the Beguines. For this, he was later, in 1316, condemned by the Holy Office. But even after his death, the pope defended Arnald. His sentence was invalidated, a fact that is often ignored even in specialist literature.

Clement V, James II, and Frederick III of Sicily employed Arnald's services during the last years of his life, as physician, as emissary, and as personal domestic and political adviser. His reputation as an influential character with

intensive spiritual concern qualified him as a contact and promising advocate for those who envisioned themselves as misunderstood, socially ecclesiastically marginalized, or even prosecuted in their mental-spiritual aspiration by clerical and secular powers. The Templars from Aragon asked him to support the existence of their order in front of the pope and against Philip IV of France; regrettably they failed, as we know. On the other hand, Arnald successfully supported the monks of Mount Athos and Ubertino of Casale.

Frederick III unwaveringly held on to Arnald; he defended him even against his brother's offenses and commendably sought to comply with the reform scheme of the Catalan physician in Sicily kingdom. He also was in close contact with King Robert. Robert did not have an open mind about the peaceful solutions proposed by Frederick, often submitted by Arnald, to nonviolently settle the present disputes between Sicily and Naples. Moreover, Arnald soon could count Robert to the friends of the spiritual and many "innovators."

In his theological-ascetic and spiritual-practical works, Arnaldus de Villanova declared himself impressed with the piety of the mendicant orders, namely the Franciscans. In them, he saw signs of hope for an emergence of a strong and convincing-efficacious Christendom. While he diagnosed the illness of the patient "mankind," he saw the medicine, the cure for the diseased body of Christianity in the practically lived spirituality of the mendicant orders, primarily in their option for the poor and the poverty. In doing so, Arnald presented an increasing tendency to rigorism, to the ideal of pure poverty advocated by the Franciscan Spirituals (*Spirituale*), and to a joachitically influenced end time expectance. However, he did not desire breaking with the church but a reform of the church. He sought convalescence of its head and limbs.

Athir al-Dīn al-Abharī

Mathieu Terrier

LEM (UMR 8584), CNRS, PSL, Paris, France

Abstract

Athīr al-Dīn al-Abharī (d. ca 663/1265), was an Iranian philosopher and mathematician, contemporary of the philosopher and polymath Naṣīr al-Dīn al-Ṭūsī (d. 672/1273). He composed about twenty works in the fields of philosophy, especially logic, and mathematics, especially astronomy. Considered during his lifetime as a prominent mathematician, he promoted an active appropriation of Greek sciences in Islam. His *Kitāb Hidāyat al-ḥikma* (“The Book of Guidance for Philosophy”), commonly used in Iran and India as a textbook in philosophical instruction, is a perfect example of the late Peripatetic (*mashshāʿī*) tradition in Islam. Moreover, by integrating some ideas of Suhrawardī’s (d. 587/1191) “wisdom of illumination”, it prefigures future developments of Eastern Islamic philosophy in fourteenth-to-seventeenth centuries.

Mufaḍḍal b. ‘Umar b. Mufaḍḍal (d. ca 663/1265) was an Iranian philosopher and mathematician, contemporary of the philosopher and polymath Naṣīr al-Dīn al-Ṭūsī (d. 672/1273). He composed about 20 works in the fields of philosophy, especially logic, and mathematics, especially astronomy. Considered during his lifetime as a prominent mathematician, he seems to have been less concerned with metaphysical and theological questions. He promoted an active appropriation of Greek sciences in Islam, against many theologians who condemned them such as Ibn Taymiyya (d. 728/1328) in the following century. His *Kitāb Hidāyat al-ḥikma* (“The Book of Guidance for Philosophy”), commonly used in Iran and India as a textbook in philosophical instruction, is regarded as a jewel of the late Peripatetic (*mashshāʿī*) tradition in Islam. Al-Abharī was also among the first thinkers to

integrate some ideas of Shihāb al-Dīn Suhrawardī’s (d. 587/1191) “wisdom of illumination” within this philosophical tradition, pioneering the development of Islamic philosophy in the Eastern Islamic world during the fourteenth-to-seventeenth (?) centuries.

His Life

Little is known about the life of Athīr al-Dīn al-Abharī. As indicated by his *nisba*, he was probably born in the city of Abhar, between Zanjān and Qazwīn in the North-West of Iran. Some recent scholars have referred to him as Abharī Samarqandī (Baghdādī, II, p. 296; Ziriklī (1986), VII, p. 279; Anawati (2014); Sarioğlu (2007)), but there is no historical evidence of his birth in nor his attachment to Samarkand (Muwaḥḥid, p. 586). The claim of G.C. Anawati making him a native of Mosul (al-Mawṣil) in Iraq, although followed by recent scholars (Sarioğlu; Thomas), must also be dismissed. This allegation stems from the fact that al-Abharī was educated by a famous scientist from Mosul, Kamāl al-Dīn b. Yūnus al-Mawṣilī (d. 639/1241–42), but al-Abharī himself indicated that he had gone to Mosul for this purpose (Ibn Khalliqān, V, p. 313; Muwaḥḥid, p. 586).

Athīr al-Dīn al-Abharī was in his youth a student of the famous theologian Fakhr al-Dīn al-Rāzī (d. 606/1209) (Ibn ‘Ibrī, p. 254; Muwaḥḥid, p. 586), probably in Khurasān and the area of Khwārizm, in the city of Ghazna or Hirāt, where the master used to teach during his tumultuous life. It is likely that he received from him an “orthodox” Sunni instruction in theology (*kalām*), jurisprudence (*fiqh*), and Qur’anic exegesis (*tafsīr*), but also a wide instruction in philosophy, which al-Rāzī highly valued, especially logic and Avicenna’s *Ishārāt wa tanbīhāt*.

Under the threat of the Mongolian invasion, al-Abharī, like many scholars of his time, migrated to seek refuge. In 625/1228 he went to Irbil, then to Damascus, where he studied under the direction of a certain Muḥyī al-Dīn Muḥammad b. Sa‘īd b. Nadī. From there, he moved to Minor Asia (Anatolia), a place of refuge for many scholars in the seventh/thirteenth century, where

he spent a few years teaching and composing his works (Ibn Khalliqān, idem; Mudarris, p. 104; Muwaḥḥid, p. 587). Then he went to Mosul, where he studied mathematics, especially astronomy, under the direction of Kamāl al-Dīn al-Mawṣilī. Ibn Khalliqān says that al-Abharī worked on the *Almagest* with al-Mawṣilī while he was already a reputed scholar whose own works were studied in the *madrasas* (Ibn Khalliqān, idem). It is also said that the Sultan al-Kāmil al-Ayyūbī, which ruled Syria in 1237–38, submitted to him some thorny mathematical questions which the scholars of his court had not been able to solve; al-Abharī, with the help of his master, would have provided him with the solutions (Qazwīnī, p. 463; Muwaḥḥid, p. 587).

Athīr al-Dīn al-Abharī was a contemporary of the philosopher and mathematician Naṣīr al-Dīn al-Ṭūsī, who also studied mathematics and astronomy in Mosul with Kamāl al-Dīn b. Yūnus al-Mawṣilī. Abharī and Ṭūsī exchanged letters on various scientific issues; the text of one of these correspondences in Persian has been preserved (Mudarrisī, pp. 197–201; Muwaḥḥid, p. 587). The fact that Ṭūsī, unlike Abharī, was a Shī‘ī – first Ismailī, then Twelver – and a close ally of the Mongol regime does not seem to have hindered this scientific friendship. The assertion of some scholars according to which al-Abharī, like many astronomers of his time, practiced astronomy in the observation center of Marāgha, founded by Ṭūsī in 1259 and located not far from Zanjān, is not borne out by any direct testimony (Nasr, p. 81). This is probably due to a mix-up with one of Abharī’s students, the astronomer Najm al-Dīn Dabīrān Kātibī Qazwīnī (d. 675/1276–77), who cooperated with Ṭūsī in the construction and scientific work in Marāgha.

As for Abharī’s students, Dabīrān Kātibī Qazwīnī is known as the author of *Ḥikmat al-‘ayn* (“Wisdom from the Source”), a sum of Peripatetic (*mashshā’ī*) philosophy which has remained among the most commonly used in the teaching of philosophy throughout centuries (Aminrazavi and Nasr, pp. 253–266). In this work, many of Abharī’s philosophical views are presented (Muwaḥḥid, p. 587). ‘Imād al-Dīn Zakariyyā b. Maḥmūd Qazwīnī (d. 682/

1283–84), who probably followed Abharī’s teaching in Damascus, authored two famous books in the fields of geography and cosmography, namely, *Āthār al-bilād wa akhbār al-‘ibād* (“The Monuments of the Countries and the Stories of Men”) and *‘Ajā‘ib al-makhlūqāt wa gharā‘ib al-wujūdāt* (“Wonderful Creatures and Strange Beings”) (Bosworth; Id. and Afshar). Last, Ibn Khalliqān (d. 681/1282), the author of *Wafīyyāt al-a‘yān*, is also one of our main primary sources about Abharī’s life and works (Muwaḥḥid, p. 587).

For what concerns the date of al-Abharī’s death, the reports are divergent. Some scholars say he passed away in 660/1261–62 (Iqbāl, 500). Ḥājji Khalīfa hesitates between 663/1264–65 (II, pp. 1493, 1616), before 700/1300–01 (I, p. 206; II, p. 1750), and after 660/1261–62 (II, p. 953). The date of 700/1300–01 has to be rejected, due to the fact that Kātibī Qazwīnī refers to his master with a formula of eulogy in his *Ḥikmat al-‘ayn* (Qazwīnī, p. 245). The more likely is that his death occurred during the reign of Khān Hülegü, i.e., between 660/1261–62 and 663/1264–65 (Muwaḥḥid, p. 587).

His Thought

Athīr al-Dīn al-Abharī’s works certainly played a key role in the conservation and revival of the Greek-Arab philosophical and scientific legacy in the late medieval and premodern period. In the field of logic, his compendium entitled *Isāghūjī*, an abridged translation of Porphyry’s *Isagogé* and, as such, an introduction to Aristotle’s *Categories*, gained an outstanding popularity and was the subject of numerous commentaries, the most famous of which being those of Shams al-Dīn Muḥammad b. Ḥamza al-Fannārī (d. 834/1430–31), Nūr al-Dīn ‘Alī b. Ibrāhīm al-Shīrāzī (d. 862/1457–58), and Zīn al-Dīn Zakariyyā b. Muḥammad al-Anṣārī (d. 910/1504–05) (See below, Primary sources). In addition to the developments on the concepts of genus (*jins*), species (*naw’*), specific difference (*faṣl*), quiddity (*māhiyya*), and individual (*shakhṣ*), which are almost translations of Porphyry’s *Isagogé*, the epistle treats of the modes of

representation (*taṣawwūr*) and assent (*taṣdīq*), as well as of the five divisions of syllogism according to the Islamic understanding of Aristotle's *Organon*: demonstrative (*burhān*), dialectic (*jadal*), rhetoric (*khaṭāba*), poetic (*sha'r*), and eristic (*mughālaṭa*). Al-Abharī himself composed an autocommentary on this epistle called *Aqwāl*, and marginal glosses upon this commentary under the title of *Mughnī al-tullāb fī l-manṭiq* ("The Book that Enriches the Student in Logic"). For centuries, this work was used in seminaries throughout Persia and the Indian subcontinent as a text-book in philosophical instruction. It was translated in Persian in 1244/1828–29 by Abū l-Faṭḥ al-Shīrāzī under the title of *Mir'et al-manṭiq* ("The Mirror of Logic") which was printed many times in India. Parallely, it was published in Rome in 1625 with a Latin translation by P. Thomas Novariensis, under the title *Isagoge*, i.e., *breve introductorium arabum in scientiam logicae cum versione latina*. Al-Abharī's advocacy of logic must be evaluated in the context of a persistent opposition of Sunni theologians to philosophical sciences, which they considered as foreign, useless, and pernicious in the presence of Revelation, a tendency which would eventually culminate in Ibn Taymiyya's attacks against logicians (Ibn Taymiyya 1949). Moreover, Abharī was not only, in the field of logic, a faithful transmitter, but also an original thinker. In his *Tanzīl al-afkār fī ta'dīl al-asrār* ("The Descent of Reflections on Balancing the Secrets"), he presents his own views on the rules of logic and philosophy (*qawānīn al-manṭiq wa l-ḥikma*) and criticizes some commonly accepted principles (Ḥājjī Khalīfa, I, p. 494). Naṣīr al-Dīn al-Ṭūsī wrote a commentary "balancing" (*ta'dīl*) Abharī's views on logic, under the title *Ta'dīl al-mi'yār fī naqd Tanzīl al-afkār* (Ṭūsī).

The importance of al-Abharī in the history of mathematics in Islamic world has been emphasized by many scholars. It is mainly due to his *Risālat Iṣlāḥ Uṣūl Uqlīdus* ("Epistle on the Correction of Euclid's *Elements*"), where he attempts to give a proof of the fifth principle or parallels postulate: "If a line segment intersects two straight lines forming two interior angles on the same side that sum to less than two right angles, then the two

lines, if extended indefinitely, meet on that side on which the angles sum to less than two right angles." Al-Abharī's demonstration is strictly identical to that of Naṣīr al-Dīn al-Ṭūsī, quoted by John Wallis in the seventeenth and by Giovanni Girolamo Saccheri in the eighteenth century (Rozenfeld, p. 147). The argument is based on three premises, the first of which is equivalent to the parallel postulate (Abharī, *Iṣlāḥ*, pp. 17–20; Rozenfeld, pp. 149–159). This demonstration is different of that attributed to Abharī in many sources (Jaouiche, pp. 116–118, 247–250).

Al-Abharī was also involved in the popularization of astronomy, as evidenced by his works in the field. He produced works such as treatises on the astrolabe, commentaries on earlier *zījās* (astronomical handbooks with tables), and at least one compendium of astronomy. He adopts the Aristotelian view that the celestial bodies do not undergo the changes that occur in the sublunary realm and maintains that stars are alive and have volition, which is the ultimate principle of their motion (Sarioğlu 2007). He also devoted many chapters of his treatises of general philosophy to astronomical issues.

In the field of philosophy, Abharī basically belongs to the Avicennian tradition of thought. To be sure, he authored two books, respectively, entitled *al-Ishārāt* ("Indications"), modeled after Ibn Sīnā's work of the same title, and *al-Maḥṣūl* ("Man's earned"), modeled after Ibn Sīnā's pupil Bahmanyār b. al-Marzubān's (d. 458/1067) *al-Taḥṣīl* ("Man's earning"). As for his other works in philosophy, most of them are organized into sections on logic, physics, and metaphysics, according to the classical division of philosophy inherited from Avicenna, with a more pronounced interest for the first two parts. Based on this plan, *Hidāyat al-ḥikma* is undoubtedly his most important work in this field, since it became one of the main text-books for generations of philosophers in the Iranian world. Among the numerous commentaries on this work, the two most significant are those of Kamāl al-Dīn Mīr Ḥusayn b. Mu'īn al-Dīn al-Maybudī (d. 909/1503–04), and of Ṣadr al-Muta'allihīn al-Shīrāzī, best known as Mullā Ṣadrā (d. 1050/1640). The former was a Sufi of Sunni obedience who faced severe opposition

after Shāh Ismā'īl's decree imposing Shī'ism as official state religion in Iran. The latter was a gnostic Shī'i who also faced the hostility of the jurisconsults (*fuqahā*) of his time because of his clear inclination towards philosophy.

In the lack of a critical edition of the *Hidāyat al-ḥikma*, al-Abharī's ideas in physics, theology, and eschatology can be detailed by means of the commentaries of al-Maybudī and Mullā Ṣadrā, both of which skipping the first part on logic. The glosses of Mullā Ṣadrā, entitled *Sharḥ al-Hidāya al-athīriyya* ("Commentary on Athīr [al-Dīn's] Guidance"), have recently been edited; they provide the essential of Abharī's text and quote many passages of Maybudī's commentary. The first part of the book, corresponding to the second part of the *Hidāyat al-ḥikma*, is devoted to physics and organized in three sections called *funūn* (sing. *fann*, litt. "art"). The first and lengthiest section is entitled "Lecture on Nature" (*al-samā' al-ṭabī'ī*, or *sam' al-kiyān*), like the Arabic translation of Aristotle's *Lessons on Physics* (φυσικὴ ἀκρόασις). It contains ten subsections supporting ten positions. The first one consists in a refutation of atomism, a theory adopted by the theologians of *kalām* in opposition to the Aristotelian natural philosophy; al-Abharī follows Avicenna's refutation of *kalām* atomism in the *Physics* of the *Shifā'*, which was supported by Fakhr al-Dīn al-Rāzī in a phase of his intellectual development (Shīrāzī, vol. 1, pp. 33–34; Dhanani 2015). The second one gives a proof of the prime matter (*hayūlā*, transliteration of the Greek ὕλη) defined as a substance disposed to receive the corporeal form (*al-ṣūra al-jismiyya*). Al-Abharī adopts Aristotle's theory of hylomorphism, according to which each body is composed of two substances, form and matter, separable in the mind but inseparable in concrete external existence. Consequently, neither form can exist without matter, nor matter without form, since neither is the cause of the other's existence (Shīrāzī, vol. 1, pp. 148–153). The fifth subsection gives a proof of the specific form (*al-ṣūra al-naw'iyya*), i.e., the quiddity (*māhiyya*) of a multiplicity of bodies, in addition to the individual form (*Ibid.*, pp. 130–132). The sixth and seventh subsections treat the quiddity of the

undetermined place (*makān*) and the natural place of each body (*ḥayyiz*) (pp. 165–168). The eighth one argues that each body has a shape (*shakl*) by nature and not by constraints (*qāsir*) (p. 169). The ninth one is about motion and rest, which is one of the main disputed subjects between theological and philosophical doctrines. Abharī defines motion as the shift from potentiality to actuality and asserts that each body in movement (*mutaḥarrik*) has a mover (*muḥarrik*) different from its own corporality (pp. 177, 182). He distinguishes between motion in quantity (*ḥaraka fī l-kamm*), like growth; motion in modality (*fī l-kayf*), called transformation (*istiḥāla*), or change of state; motion in space (*fī l-ayn*), or movement from one place to another; and motion in position (*fī l-waḍ'*), like the circularity of the planets' motions (pp. 191, 198–199). He also distinguishes between the essential motion (*al-ḥaraka al-dhātīyya*) and the accidental, and within the former, between natural, constrained, and deliberate (*irādī*) motion (p. 202). Finally, the tenth subsection is devoted to time (*zamān*), its existence (*annīyya*), and quiddity (*māhiyya*), which is another subject of lengthy debate between Islamic philosophers and theologians. Unsurprisingly, Abharī adopts Aristotle's definition of time as the measure of movement and asserts that time, therefore, has neither beginning nor end (pp. 218–220).

The second section focuses on the celestial spheres whose movement is circular, which are not subject of generation and corruption, and the mover of which is separated from matter (pp. 227–331). The third section treats the elemental bodies (*al-'unṣuriyyāt*), composed of the four elements of the world of generation and corruption, i.e., water, fire, air, and earth. Always by following Aristotle's system, Abharī deals successively with meteorological phenomena (*al-āthār al-'alwiyya*), minerals, plants, animals, and finally humans (pp. 325–441). He stresses that human beings possess, in addition to the vegetal and animal souls, a specificity which is the rational soul (*al-naḥs al-nāṭīqa*) (p. 417). According to the doctrine elaborated by al-Fārābī and Avicenna on the basis of Aristotle's noetic in the third book of the *De Anima*, Abharī distinguishes the four

degrees of the intellective faculty (*al-quwwa al-‘āqila*), which are the material or potential intellect (*al-‘aql al-hayūlānī*); the habitual intellect or *intellectus in habitu* (*al-‘aql bi-l-malaka*); the actual intellect or *intellectus in actu* (*al-‘aql bi-l-fi’l*); and the acquired intellect (*al-‘aql al-mustafād*) (pp. 418–419). Probably targeting Platonic philosophers, he stresses that the coming into existence of the soul is simultaneous to that of the body (*hāditha bi-hudūth al-badan*) and does not precede it (pp. 434–435). These developments upon human soul, which, according to the Aristotelian tradition, belong to Physics, nevertheless make a transition towards the second part of the work, devoted to metaphysics.

The *Divinalia* (*al-ilāhiyyāt*) of the *Hidāyat al-hikma* are divided into three sections. The first section deals with the categories of beings or the common definitions in metaphysics, in seven subsections: the universal and the individual; the one and the many; the prior and posterior; what is eternal and what is newly arrived (*al-qadīm wa l-hādith*), divided in eternal or new by essence (*bi-l-dhāt*) and in time (*bi-l-zamān*); the potential and the actual; the cause and the effect; and the substance and the accident (Shīrāzī, vol. 2, pp. 11–123). The second section discusses the issue of the Artisan’s (*al-ṣāni’*) Knowledge and other attributes, in ten subsections (pp. 127–260). After giving a proof for the Necessarily Existent by virtue of its Essence (*al-wājib bi-dhātihī*) (1), Abharī argues that the Necessary Existent’s existence is the same as its reality (*ḥaqīqa*) (2) and that its necessity of existence as well as its individuation (*ta’ayyun*) is identical with its Essence (3). He then gives a proof for the oneness of the Necessarily Existent by virtue of its Essence, according to the creed of *tawhīd* (4). He stresses that the Necessarily Existent by virtue of its Essence is necessary in all of its aspects (*jihāt*) (5), and it does not share its existence with contingents (6). For what concerns divine Knowledge, Abharī follows Avicenna’s positions by asserting that the Necessarily Existent by virtue of its Essence knows its own Essence (7), as well as it knows the universal entities (8) and the individuals under a universal mode (9). As for God’s other attributes, he says that the Necessarily

Existent by virtue of its Essence is willing and all-generous, which is attested by his creation of the world. The third section is devoted to the immaterial Intellects (*al-‘uqūl al-mujarrada*) identified with angels (*al-malā’ika*), in four subsections (pp. 263–310). Following the view of the Neoplatonists on the procession of reality, Abharī states that Intellect is the first emanation of the One, by the intermediary of which Soul and Nature consecutively emanated, in virtue of the principle that “only one can come from one” (*ex uno non fit nisi unum*). He then says that immaterial Intellects are ten, one for each celestial sphere, the last of which is the active Intellect (*al-‘aql al-fa’āl*) (2); that they are eternal *a parte ante* and *a parte post*, without beginning nor end in time (3); and that they are the mediators between the Creator and the corporal world (4).

The conclusion of the work (*khātima*) deals with the states of the afterlife (*al-ākhirā*), in six “guidances” (*hidāya*) (pp. 313–357). The author states that the human soul, after natural death, i.e., the separation from its natural body, remains unrelated with any other body; the doctrine of transmigration (*tanāsukh*) is strongly refuted, which is a commonplace of “philosophical orthodoxy” in Islam (1). He explains that the cause of happiness of the soul after death is the pure intellection of the intelligible, rising to the very intellection of the principle of all good, i.e., God (2); likewise, the cause of pain of the soul after death is the perception of negative realities (*manāfi’*) as they are negative (3). He asserts that the reason for the happiness and misery of souls after death is that the perfect souls break all bodily relationships and are transported to the world of Holiness (*al-‘ālam al-qudsī*), when the unpurified souls remain veiled to happiness (*maḥjūbūn*); however, the sufferings of the latter are doomed to vanish. This thesis, which was considered as heterodox, if not heretic, by Islamic theologians, would eventually be supported by Ibn ‘Arabī (d. 638/1240) and part of his pupils. In short, this work leads from Aristotelian physics to a philosophical doctrine of resurrection, in which the influences of Avicenna and perhaps Suhrawardī are still to be examined.

Indeed, although Abharī's thought mostly remains within the frame of the Aristotelian tradition, some of his works, namely, *Muntahā l-aḥkār fī ibānat al-asrār* ("The Summit of Thoughts Concerning the Clarification of Mysteries"), and above all *Kashf al-ḥaqā'iq fī tahrīr al-daḡā'iq* ("The Unveiling of Realities Concerning the Accurate Statement of Subtleties"), nevertheless reveal a clear influence of Suhrawardī's teaching (Aminrazavi and Nasr, pp. 267–268). To be sure, both works are quoted and commented by two famous disciples of Suhrawardī, Ibn Kammūna (d. ca 684/1285), and Shams al-Dīn al-Shahrazūrī (d. between 686/1288 and 704/1304) (al-Shahrazūrī, I, p. 42; III, pp. 244–245). Noteworthy, their organization differs from the conventional one in that they deal successively with logic, metaphysics, and physics. In the *Kashf al-ḥaqā'iq*, Abharī discusses several philosophical issues from an "Illuminist" (*ishrāqī*) point of view and devotes a chapter on eschatology reproducing many passages written by Suhrawardī himself. In the field of epistemology, one may find in Shahrazūrī's *Rasā'il al-shajara al-ilāhiyya* this quotation of Abharī's "Unveiling of Realities": "Not all science is restricted to representation (*taṣawwur*) and assent (*taṣdīq*). The Science of the Creator, the Highest, as well as that of Intellects and Souls, which is their science in virtue of their essence, in short, the sciences coming from enlightenment and unveiling (*al-ishrāqiyya wa l-kashfiyya*), to which the pure presence [of the known] is sufficient, do not proceed from these two divisions. However, if there is about the substitutive sciences (*al-tajaddudiyya/al-tajziyya*), I mean the knowledge of things in their absence, then they are restricted to them." (Shahrazūrī, I, p. 41; *Kashf al-ḥaqā'iq*, pp. 33–34) This is a clear echo of Suhrawardī's conception of knowledge by presence (*al-'ilm al-ḥuḍūrī*), which would be eventually developed by Shī'i thinkers in the late medieval and premodern periods such as Ibn Abī Jumhūr (d. after 904/1499), Mīr Dāmād (d. 1040/1631), and Mullā Ṣadrā.

In addition to being an outstanding mathematician and a skilled philosopher, Abharī was an accomplished poet, whose *diwān*, according to

the author of *'Urafāt al-āshiqīn* (Awḥādī, p. 58), contained nearly 3000 verses. A quatrain in Persian of his composition is reported by Dāghistānī, I, p. 93). Abharī also wrote several works on dialectics (*jadal*). He seems to have criticized the kind of argumentation prevailing in the theology of *kalām*, in name of the superiority of the demonstrative reasoning (*al-qiyās al-burhānī*). In this respect, his thought was in the wake of the Aristotelian tradition as represented in Al-Andalus by the famous Ibn Rushd, alias Averroes (d. 595/1198).

In conclusion, Athīr al-Dīn al-Abharī was a great representative of the late Peripatetic school of thought in Eastern Islam, at the time of its renaissance following Naṣīr al-Dīn al-Ṭūsī's undertaking, but also integrates elements of "Illuminative" (*ishrāqī*) philosophy, which has to be regarded as a reaction to Avicenna's philosophy. He was also and above all a resolute proponent of the autonomous development of the philosophical and natural sciences of Greek origin, opposing at the same time the Sunni theologians who condemned these sciences like Ibn Taymiyya, the Ismā'īlī theologians who subordinated them to prophetic revelation like Abū Ḥātim al-Rāzī (d. ca 322/933–34), and the philosophers of the tradition of al-Kindī (d. 261/873), namely, Abū l-Ḥasan al-'Āmirī (d. 381/992), who placed the religious knowledge above the natural and mathematical sciences.

Works of Athīr al-Dīn al-Abharī

1. Works on logic and philosophy:

- (a) *Īsāghūjī fī l-manṭiq*, or *al-Risāla al-athīriyya fī l-manṭiq*, with the commentary of al-Fannārī, Constantinople, 1263/1847; 1312/1894. See Ḥājī Khalīfa, I, pp. 206–208; GAL I, pp. 609–611; GAL, S, I, p. 841; Nīrūmand, pp. 313–320. English transl. of the Latin transl. by Edwin Calverley in *D. B. Macdonald Memorial Volume*, Princeton, 1933. French transl. of the Arabic by Anis Hani, *Le Philosophie*, 2004/1 (n°22), pp. 165–176.

- (b) *Hidāyat al-ḥikma* (“The Book of Guidance for Philosophy”), ed. M. Sa‘ādāt Ḥusayn, Karachi, Pakistan, 1432/2011 (not consulted). Quoted extensively in al-Maybudī, *Sharḥ Hidāyat al-ḥikma*, and al-Shīrāzī, *Sharḥ al-Hidāya al-athīriyya* (see below).
- (c) *Tanzīl al-afkār fī ta’dīl al-asrār* (“The Descent of Reflections on Balancing the Secrets”), on logic, physics and metaphysics (Ḥājjī Khalīfa, I, p. 494; al-Ṭūsī).
- (d) *Al-Zubda fī . . .* (Ḥājjī Khalīfa, II, p. 953; Mudarris, p. 105). This work is mentioned under three titles beginning by this word meaning “quintessence”: *Zubdat al-uṣūl* (“The Substance of Principles”) (Zāhidī, p. 6); *Zubdat al-kashf* (“The Substance of the Unveiling”) (Baghdādī, II, p. 469); and *Zubdat al-asrār* (“The Substance of the Secrets”) (Mudarrisī, p. 197). Organized in three sections on logic, physics and metaphysics. *Hidāyat al-ḥikma* could be an abridgment of this work. It was translated from Arabic to Syriac by Ibn ‘Ibrī alias Bar Hebraus (Mieli, p. 299).
- (e) *Muntahā l-afkār fī ibānat al-asrār* (“The End of Reflections on the Revelation of the Secrets”), on logic, physics and metaphysics. Ms. 2752, Kitābkhānah-i Majlis-i shūrāyi islāmī, Tehran.
- (f) *Khulāṣat al-afkār wa naqāwat al-asrār* (“The Quintessence of Reflections and the Purity of the Secrets”).
- (g) *Daqā’iq al-afkār* (“The Subtleties of Reflections”), on logic.
- (h) *Unwān al-ḥaqq wa burhān al-ṣidq* (“The Title of Truth and the Proof of Sincerity”), on logic, physics and metaphysics. Ms. 3134, Library of Istanbul University.
- (i) *Ishārāt* (“Indications”) (Ḥājjī Khalīfa, I, p. 97; Mudarrisī, p. 105).
- (j) *Risāla fī ‘ilm al-manṭiq* (“Treatise on the Science of Logics”), in Persian. Edited by Muḥammad Taqī Dānishpajūh with the *Hidāyat al-ḥikma*’s section on logic, Journal of the University of Tehran, *Du risāla dar manṭiq* (Two Epistles on Logic), 1349 h.s./1970–71.
- (k) *Al-Maḥṣūl* (“Man’s earned”) (Ḥājjī Khalīfa, II, 1616; Mudarrisī, p. 105).

Maqṣūd Muḥammadī, Dānishkādah-i Ilāhiyāt-i dānishgāh-i azād-i islāmī, Vāhid Karaj, 1277 Sh./1998–99; other ed. H. Sarioğlu, Istanbul, 2001. (Ḥājjī Khalīfa, II, p. 1493; Ziriklī, VII, p. 279; Baghdādī, II, p. 469).
2. **Works on mathematics and astronomy:**
- (a) *Al-Majisī* (“The Almagest”), a compendium of astronomy (‘Azāwī, p. 265), probably identical to the work mentioned elsewhere under the title *Mukhtaṣar fī ‘ilm al-hay’a* (Abridgment of astronomy) (Anawati; Ziriklī, VII, p. 279; GAL, S, I, p. 844).
- (b) Two epistles on astronomy and astrology (‘Azāwī, p. 265).
- (c) *Ghāyat al-idrāk fī dirāyat al-aflāk* (“The End of Understanding Concerning the Knowledge of Spheres”), a treatise on astronomy (GAL, S, I, p. 844; Ziriklī, VII, p. 279).
- (d) *Iṣlāḥ Uṣūl Uqlīdus* (“The Correction of Euclid’s *Elements*”), in thirteen chapters (*maqāla*). Microfilm n° 540, Kitābkhānah-yi markazi-yi dānishgāh-i Tihrān [Central Library of the University of Tehran] (GAS, V, p. 111; Id., VII, p. 401).
- (e) *Sharḥ al-Zīj al-shāmil* (“Comprehensive Astronomic Table”). Commentary of the astronomical handbook of Abū l-Wafā’ Muḥammad b. Aḥmad al-Būzajānī’s (d. 376/986–987) (Ḥājjī Khalīfa, II, pp. 968–969; GAS, VII, pp. 324–325).
- (f) *Al-Zīj al-ikhtiyārī* (“Selected Astronomic Table”), or *Al-Zīj al-athīrī* (“Athīr [al-Dīn]’s Astronomic Table”) (GAL, S, I, p. 844).

- (g) *Sharīk al-aqtār* ("The Partner of the Diagonals"), on various logical and mathematical issues. The fifth chapter deals with the famous "liar's paradox" (*jadhr al-aṣamm*) (Mudarrisi, p. 197).
- (h) *Risāla fī birkār al-quṭū* ("Epistle on the Compass of Sections").
- (i) *Risālat al-astrulāb* ("Epistle on the Astrolabe"), or *Risālat fī ma'rifat al-astrulāb* ("On the Knowledge of the Astrolabe").
- (j) *Risāla fī 'ilm al-hay'a* ("Epistle on Astronomy").
- (k) *Mukhtaṣar fī 'ilm al-hay'a* ("Compendium of Astronomy").
- (l) *Al-Zij al-muqannan* ("Codified Astronomical Table").
- (m) *Al-Zij al-mulakḥḥaṣ* ("Abridged Astronomical Table").

3. Works on dialectic:

- (a) *Tahdhīb al-nukat* ("The Correction of Wit Words"), on dialectics (*jadāl*). It is a critical commentary on a treatise entitled *al-Nukat fī 'ilm al-jadal* ("Wit Words. On the Science of Dialectic") authored by Abū Ishāq Ibrāhīm b. 'Alī al-Shīrāzī (m. 476/1083–84). One manuscript of this work is conserved in a library of Medina (Dānishpajūh, Maktaba, p. 456).
- (b) *Al-Risāla al-zāhira fī ibtāl ba'di muqaddimāt al-jadaliyya* ("The Flourishing Epistle Concerning the Refutation of Certain Premises of Dialectics") (Mudarris, p. 105), also known under the title *al-Risāla al-zāhira fī fasād muqaddimāt musta'lima fī l-jadal* ("The Flourishing Epistle Concerning the Corruption of the Premises Used in Dialectics"). Numerous mss are conserved (Markazī, Khaṭṭī, p. 149; Shūrā, V, pp. 269–270).
- (c) *Risālat al-masā'il* ("The Epistle of Questions"), dealing with eighteen questions debated between theologians and philosophers (Mudarrisi, p. 105; Shūrā, V, p. 272). One ms is conserved in the Library of the Islamic Council, Tehran.
- (d) *Al-Mughnī fī 'ilm al-jadal* ("The Book that Enriches on the Science of Dialectics"), an compendium of rhetoric and dialectics (Ḥājji Khalīfa, II, p. 1750).

Atomism

Aurélien Robert

Centre d'Etudes Supérieures de la Renaissance (CNRS), Tours, France

Abstract

At first sight, the philosophical idea that the world is composed of atoms, notably embraced by Greek and Roman authors such as Democritus, Epicurus, and Lucretius, seemed to have disappeared during the middle ages. It has been frequently said that it only reappeared during the Renaissance and then in modern philosophy and chemistry. In fact, atomism never ceased to exist as a theory of matter, space and time, both in western Latin tradition and in the Arabic and Jewish medieval philosophy. Different versions of atomism were developed in these traditions: from theological explanations of creation to pure mathematical theories about the divisibility of the continuum, through physical theories of matter and time. The first detailed accounts of atomism come from the ninth- and tenth-century Arabic theologians of Baghdad and Basra, immediately followed by the Jewish schools, notably in Egypt. A similar revival of atomism appeared in the West from the twelfth-century philosophers of Chartres to the fourteenth-century Christian theologians of Oxford and Paris. Most of these medieval atomist theories have very little in common with ancient atomism, for they are usually linked with more complicated theological concerns, such as the eternity of the world,

creation, the existence of prime matter, and more generally the finiteness of created things. On the other hand, they are similar to Platonic and neo-Pythagorean conceptions of reality as constituted from units and numbers, or from atoms and collections of atoms, which are equivalent to units in matter and space.

It has long been thought, until the end of the nineteenth century, that there were no atomist theories in medieval philosophy and that ancient atomists, such as Epicurus or Lucretius, remained unknown until the Renaissance, before Poggio Bracciolini worked on the manuscript of the *De natura rerum* discovered by him in 1417. This view of the history of atomism has been challenged during the last two centuries. In the nineteenth century, Kurd Lasswitz and Léopold Mabilleanu already endeavored to make room for medieval theories in their essays on atomistic philosophy (Lasswitz 1890; Mabilleanu 1895). But it is only recently that many efforts have been made to show the existence of very important atomist theories of matter and time in the medieval Arabic philosophy and theology from the ninth to the twelfth century (Pines 1936; Wolfson 1976; Dhanani 1994) and the existence of thorough examinations of them in the Jewish and the Christian traditions (Maier 1949; Murdoch 1974; Pabst 1994; Pyle 1997).

The main dispute in the medieval Arabic natural philosophy opposed hylomorphism (i.e., that the world is composed of matter and form) to atomism (an ontology which accepts only atoms and properties). If the former ontology was accepted by most of the philosophers (*falsafa*), a majority of the theologians of the *kalām* (the *mutakallimūn*), notably in Basra and Baghdad, both on the Muʿtazilite's (a school of rational theology founded in the ninth century in Basra) and the Ashʿarite's (another school founded by the theologian Abu al-Hasan al-Ashʿarite against the Muʿtazilites) sides, accepted atomism (Rashed 2005). The first atomists seem to be the Basrian theologians Abū al-Hudhayl and al-Nazzām (ninth century). Abū al-Hudhayl posited the existence of a finite number of discrete atoms without

extension, without quality, and without corporeal nature (for they are the constituents of bodies) that can move through the vacuum. The only feature that can really define the nature of atoms is their place or location. Al-Nazzām accepted the main tenets of such a view but argued lengthily against one of its points, namely, that there are a finite number of atoms in a body or in a line. Indeed, al-Nazzām maintained that this is impossible because there are an infinite number of positions in a continuum, for if an atom does not have any extension, this must also hold for its place. Strangely enough, he thus maintained that there are an infinite number of atoms with a typical argument against atomism. Al-Nazzām was conscious that in this case Zeno's paradoxes of motion and dichotomy may apply, for it is impossible for something to pass through an infinite number of places. In order to explain the possibility of motion, al-Nazzām affirmed that atoms move by means of leaps, which signifies that motion is always discontinuous.

The philosophical discussions in the later *mutakallimūn* were about the magnitude of the atoms, their number (finite or infinite?), and their qualities but always under the aspect of the possibility of motion. They were also very interested about related topics such as the compatibility of atomism with Euclidian geometry, as it appears in one of the best summaries of these later discussions in Fakhr al-Dīn al-Rāzī. The most vehement critic of atomism in the Arabic tradition was Abū Yūsuf Yaʿqūb ibn Ishāq al-Kindī in the ninth century. Of course, Avicenna (Ibn Sīnā), al-Ġazālī, and Averroes (Ibn Rushd) also detailed long argumentations against the *mutakallimūn*'s atomism in order to restore the Aristotelian hylomorphism.

If the argumentation seems purely philosophical, the main motives for their acceptance of atomism were theological and were related to their explanation of the creation of the world by God. According to them, the world must have been created because if it were not, the world should have passed an infinite time, which is not possible. Most of their philosophical arguments to support atomism are mainly derived from Zeno's paradoxes and from John Philoponus' use of them

in his refutation of the eternity of the world. As a consequence, some of them, mainly the Ash'arites, thought that God can create and destroy the world whenever He wants, for He can destroy or create new aggregates of atoms at each instant of time. As a consequence, they contend that accidents cannot exist longer than one instant. Therefore this radical version of atomism – occasionalist and deterministic – denied the existence of real causality in the created world. It appears that Arabic atomism has very little in common with Democritus' and Epicurus' atomist theories, even if they were known to the *mutakallimūn*.

Important echoes of these discussions can be traced back in the Jewish medieval philosophy, both in the *kalām* and in the Neoplatonic schools. For example, in the ninth and tenth centuries, Saadhia Gaon (Wolfson 1946) and Isaac Israeli (Zonta 2002) both rejected the Arabic *mutakallimūn*'s atomism. During the following centuries, Judah Halevi, Ibn Daud, Maimonides, Gersonides, and Crescas also argued against Arabic atomism. Maimonides' criticism in Chaps. 71–76 of book I of his *Guide of the Perplexed* is probably the better-known among them and is mostly directed against occasionalism and continuous Creation of the World. As Tamar Rudavsky has shown (Rudavsky 2000), Jewish discussions about continua of space and time are related to the theological problem of creation, as was already the case in the Arabic tradition. Although denying the eternity of the world, they contend that creationism does not necessarily imply atomism about time and matter. This is problematic for them because their argumentation for the non-eternity of the world is reminiscent of Zeno's paradoxes and is probably derived from Philoponus' book *Against Aristotle on the Eternity of the World*, where Zeno's paradoxes are used against the eternity thesis. If the world were eternal, then an infinite time would have been passed through, which is impossible; therefore the world's temporality is finite in some sense. But this argument could also be used in favor of atomism and finitism, as will be the case in the Latin world, which we shall see later. Strangely enough they denied on the one hand the eternity of

the world with some kind of atomist argument while accepting on the other hand the infinite divisibility of the continuum.

If we now focus on western Latin philosophy, it appears that atomism never really ceased to exist during the Middle Ages. Concerning the myth of Bracciolini, it must be noticed, as Philippe has shown in his pioneering study (Philippe 1895, 1896), that Lucretius' poem was copied and discussed throughout the Middle Ages with no interruption from the era of the Church Fathers to the twelfth century. The same is also true for Epicurus, whose works were partially known through a still longer chain of intermediate sources (Cicero, Lactantius, St. Jerome, St. Ambrose, St. Augustine). In the twelfth century, John of Salisbury dealt with Epicureanism in his *Metalogicon* and in his *Entheticus*, where he tried to refute its principal tenets. On the contrary, we find a defense of Lucretius and the Epicureans in the works of William of Conches, notably in his *Dragmaticon philosophiae* where he quotes passages from Lucretius' *De natura rerum*.

The idea of a total eclipse of atomism from the Latin medieval philosophy and theology seems to derive from the violent reactions of the Church Fathers. Everybody has in mind Lactantius' repeated attacks, notably in his *De ira Dei*. It is true, indeed, that for a long period, ancient atomists were not discussed for their theories of matter as such but rather for the theological consequences of their views, and among them the negation of Divine providence, the impassivity of God, and the eternity of the world. In the twelfth century, when William of Conches decided to defend atomism, he tried to make it compatible with Christian theology. In his *Dialogue on Philosophy* (I, 6), he wrote:

When the Epicureans said that the earth consists of atoms, they were correct. But it must be regarded as a fable when they said that those atoms were without beginning and 'flew to and fro separately through the great void', then massed themselves into four great bodies. For nothing can be without beginning and place except God.

This atomist lecture of Creation has never been more detailed until the fourteenth century. What is more, some twelfth-century thinkers, such as

William of Champeaux and Peter Abelard, also defended the existence of indivisibles in the continuum in their commentaries on Aristotle's *Categories*, in the chapter on quantity (King 2004). Indeed, they suggested reading Aristotle's view on the continuum with Boethius' treatise *On Arithmetic*, which was a Latin translation of the neo-Pythagorean mathematician Nicomachus of Gerasa. Boethius presented a general theory of the derivation of magnitudes from points, which were thought of as units with a particular position in space and called "atoms." As a result, three-dimensional geometric figures, i.e., solids or bodies, are at the same time continuous and metaphysically constituted of points.

The divisibility of a continuum and the notion of infinite remained of great interest during the thirteenth century (Trifogli 2002), but no atomist theory of matter and time can be found during this period, except in Robert Grosseteste's metaphysics of light. Indeed, in his *De luce* and in his *Notes on the Physics*, the Bishop of Lincoln explains that God created the world from a single point of light multiplied infinitely in all directions. As a result, every part of the material world, and every magnitude, is composed of these points, which were multiplied in the first instant of the world (Lewis 2005). Grosseteste clearly defends the Boethian derivation of magnitudes from points, but with his metaphysics of light, he also gave a new theoretical tool in order to answer the many arguments against atomism coming from Aristotle's *Physics* and Arabic sources, such as Al-Ghazali's *Metaphysics*, which gives a summary of Avicenna's arguments against the *Mutakallimūn* (Robert 2017).

After the thirteenth century, the main sources for this renewal of intense reflections on atoms were not Epicurus or Lucretius, but rather Democritus through the newly translated texts of Aristotle into Latin where the composition and division of a continuous quantity are discussed (*Physics*, *On Heavens*, *On Generation and Corruption*). Can a continuum be divided infinitely? Is it composed of indivisibles? Aristotle argued against Leucippus and Democritus that if the world were made of atoms, it would be impossible to explain how they can form continuous

magnitudes. The world would be totally discrete. Atoms either have a magnitude or not. If they have it, they are divisible and then ad infinitum. But if they do not have any magnitude, they cannot form continuous magnitudes because they cannot be in contact (*Physics*, 231 a26–b6), for if two things are in contact they either touch (1) part to part, (2) part to whole, or (3) whole to whole. The two first possibilities must be rejected for atoms because they do not have any parts by definition. And if they touch whole to whole, it would mean that they are superposed, and therefore they cannot form a new magnitude. Contrarily to thirteenth-century Aristotelians, some fourteenth-century philosophers thought that a continuum can be composed of indivisibles and that it is possible to respond to Aristotle's arguments.

The first atomist – or indivisibilist – of the fourteenth century is Henry of Harclay, Chancellor of the University of Oxford in 1312, who defended the existence of an infinite number of indivisibles in any continuum when disputing a *quaestio* about the eternity of the world. His main argument consists in refuting the Aristotelian thesis about contact. Harclay affirmed that two points can touch if they are situated in contiguous places. It is not very clear whether this can explain continuity or only contiguity of atoms, but Harclay clearly asserts that a continuum is composed of points or indivisibles and that they are infinite in number. As in the Arabic tradition, atoms are primarily defined by their position. His successors at Oxford, among them Walter Chatton, William Crathorn, and John Wyclif, also accepted the indivisibilist analysis of the continuum problem but restricted it with the assertion that the number of indivisibles is finite (Zoubov 1959; Murdoch 1974; Kretzmann 1986; Robert 2009). One of their strongest and recurrent arguments is derived from one of Zeno's paradoxes, called "the metrical paradox of extension." This paradox – probably known to the medieval philosophers through Simplicius' commentary on Aristotle's *Physics* – runs as follows: an extended thing is either composed of extended or unextended parts; if we accept infinite divisibility of the continuum, then either the extended thing is composed of an infinity of extended parts and is therefore infinite in

extension or it is made up of an infinity of unextended parts, but we cannot explain how extension comes from non-extension. Chatton, Crathorn, and Wyclif accepted Harclay's basic arguments – that is, that indivisibles are firstly defined by their positions in the continuum – but they added the metrical paradox to conclude that the number of indivisibles must be finite. We find the very same kind of argumentation in Gerard of Odo, General Minister of the Franciscan order in 1329 (De Boer 2009). Nicolas Bonetus, another contemporary Franciscan theologian, and Nicholas of Autrecourt also used Zeno's paradoxes, but they finally accepted the infinity of atoms (Grellard 2004).

According to John Murdoch, fourteenth-century atomism is merely a response to Aristotle's anti-atomism, and no real traces of ancient physical atomism can be found in this fourteenth-century indivisibilist literature. Therefore atomism would only concern the geometrical continuum and would be only directed against new geometrical arguments (Murdoch 1974, 1982; see also Pabst 1994). At any rate, it is clear that from the divisibilist side – as in Thomas Bradwardine's, Adam Wodeham's, or Gregory of Rimini's works against the atomists and as in the Arabic tradition – the strongest arguments against atomism were geometrical. As an example, the incommensurability of the diagonal and the sides of a square was frequently used against the finite composition of the continuum. For example, assume that the sides of a square are composed of n points. If you draw all the parallels from each point of a side to its counterpart on the opposite side, the diagonal which intersects the parallel lines turns out to be composed of n points too. From a mathematical point of view, however, the diagonal of a square is incommensurable with its sides. According to its opponents, this mathematical argument proved that atomism was an absurd theory (Murdoch 1969). Atomists, however, developed real atomistic physics and even built up some strong criticisms of the mathematical tools used by anti-atomists. Indeed, Chatton, Crathorn, and Wyclif argued against the relevance of geometry to deal with the problem of the continuum. According to them, indivisibles must be

considered as elemental components of reality and not as mere unextended points (Robert 2009; Michael 2009). The most representative philosopher of this physicalist way of thought is undoubtedly Nicholas of Autrecourt (Grellard 2009), who explains generation and corruption, condensation and rarefaction, and generally all types of motion by the local motion of atoms. The main motive of Autrecourt's atomism is the defense of the eternity of the world, one of the reasons why he has been condemned by ecclesiastical authorities. In any case, their positions are never reducible to a mere reaction to Aristotle's arguments nor to a reconstruction of Democritus through Aristotelian doxography.

It becomes quite clear that all medieval atomists were influenced by the same Platonic and neo-Pythagorean theory of the derivation of magnitudes from points (Robert 2017). For this reason, one finds the same kind of theories in Arabic, Jewish, and Latin writings. Indeed, with the exception of Nicolas Bonetus and Nicolas of Autrecourt, medieval atomists believe that atoms are point-like entities, not corpuscles with a minimal magnitude or shape. As a consequence, medieval atomism is a mathematical conception of reality, in which atoms are like units from numbers. Even though they accept the existence of indivisibles, they do not refuse the existence of continuity in the material world. They do not accept, for instance, the existence of void. There is no gap in matter, time, and space, but all magnitudes must be composed of units, which can be called "atoms." From the fourteenth century onward, the defenders of this mathematical atomism will try to apply this mathematical analysis to the problems raised by Aristotle's *Physics*, giving rise to a more physical form of atomism.

Augustine

Gareth B. Matthews

Department of Philosophy, University of
Massachusetts at Amherst, Amherst, MA, USA

Abstract

Augustine (354–430 CE) was born in North Africa and, except for a 5-year sojourn in Italy, lived out his life there. He is important for having defined the Christian heresies of Donatism, Manicheanism, and Pelagianism. His prodigious literary output includes *Confessions*, *City of God*, *On the Trinity*, and no fewer than five different commentaries on the first verses of *Genesis*. Augustine was the first important western philosopher to philosophize from a distinctively first-person point of view. His works include important replies to the threat of skepticism (“If I am mistaken, [still] I am”), a significant discussion of language acquisition, an epistemological theory of “illumination,” arguments for mind–body dualism, and the analogical argument for other minds. He has been credited (and debited) with introducing the notion of the will into philosophy. He made famous the problem of whether God’s foreknowledge is compatible with human free will. His subjective account of time has been particularly influential. His ethics gives important emphasis to the agent’s intention. Although he did not invent just war theory or the philosophy of history, he made significant contributions to both.

St. Augustine (Aurelius Augustinus) (354–430 BCE), Bishop of Hippo, was the first great Christian philosopher, and, until the ascendancy of

Thomas Aquinas at the end of the thirteenth century, he was the most influential Christian thinker in western philosophy. He was born in Tagaste (modern Souk Ahras, in eastern Algeria) in the waning years of the Roman Empire. He was educated in nearby Madaura and at the University of Carthage, where he studied rhetoric. In 383 he sailed for Rome and became professor of rhetoric at Milan. There he came under the influence of Bishop Ambrose, who baptized him in 387.

Augustine’s mother, Monica, who had followed him to Italy, rejoiced in his conversion. She joined him and various philosophically minded relatives and friends at a villa at Cassiacium, near Lake Como, where he wrote four of his earliest works, including his *Contra academicos* (*Against the Academicians*) and his *Soliloqua* (*Soliloquies*). Shortly after his mother’s death, he returned to Carthage in 388 and, after that, never left North Africa.

When Augustine became, first a priest, and then Bishop of Hippo (later Bône, now Annaba, Algeria) he sought to combine his pastoral duties with extensive writings in philosophy and theology. By defining three important Christian heresies, namely, Donatism, Manicheanism, and Pelagianism, he did probably as much as any single person to define Christian orthodoxy. Two of these three heresies, namely, Manicheanism and Pelagianism, are of special philosophical interest. The first is the view that there is a cosmic principle of evil and darkness coeval with, and equal in power to, the principle of goodness and light. Manicheanism can be seen as, in part, a radical solution to the philosophical and theological problem of evil. Pelagianism is captured by the slogan modern philosophers associate with Kant: “Ought implies can.” Against Pelagianism Augustine maintained that, after the fall of Adam, no human is capable of acting rightly apart from the gratuitous assistance, that is, the grace, of God. Adam’s fall produced “original sin,” which has afflicted all subsequent human beings.

No doubt the most popular of Augustine’s work is his *Confessions*, which is also the first significant autobiography in western literature. Next in influence is his mammoth *City of God*, in 20 books. This great work was initially a

response to those who said that the fall of Rome in 410 was the result of its Christianization. Enormous in scope, this work came to be regarded, in later centuries, as something of an encyclopedia of knowledge.

Of special importance, especially in the Middle Ages, is Augustine's *De genesi ad litteram* (*Literal Commentary on Genesis*). It is one of five commentaries Augustine wrote on the biblical story of creation. Of special significance to modern philosophy is Augustine's *De trinitate* (*On the Trinity*). Book 10 of that work had a clear and strong, though unacknowledged, influence on Descartes' *Meditations*.

Like the *Meditations*, some of Augustine's thought is expressed from the first-person point of view. In his *Soliloquies* he points out that he has coined the expression *soliloquia* for the soul's conversation with itself. Moreover, his *On Free Choice of the Will*, although it is now uniformly printed as a dialogue between Augustine and his friend and (later) bishop, Evodius, may also have been conceived as an inner dialogue. As Simon Harrison has recently pointed out (Harrison 2006, 31–50), the name "Evodius" does not appear in any of the manuscripts of this work and was first printed in Auerbach's edition of 1506. So the idea that this work is a dialogue between these two historical figures seems to be a Renaissance invention.

Augustine's literary output, produced with the aid of scribes, is prodigious. According to Chadwick, in his introduction to the *Confessions*, Augustine's works make up the largest body of writing left by any ancient author. Besides 100 books and treatises, there are some 200 letters and over 500 sermons. Three years before his death, Augustine catalogued and commented on each of his works in a volume he called the *Retractiones* (*Reviews*). They provide a final assessment, by the author himself, of his great opus.

Skepticism

Augustine's earliest surviving work, his *Contra academicos* (*Against the Academicians*), is a response to skepticism. In young adulthood Augustine had been a Manichean "hearer," or

disciple. But, after 9 years in that role, he became disenchanted with Manicheanism. About the time he left Carthage for Rome, he found himself attracted to the skeptical view of the "Academics," that is, the followers of Arcesilaus and the New Academy, who held that "everything was a matter of doubt and that an understanding of the truth lies beyond human capacity" (*Confessions*, 5.10.19). In the *Contra academicos* Augustine discusses the criterion for knowledge put forward by Zeno of Citium, according to which something can be known just in case it cannot even seem to be false. Augustine proposes a dilemma. Either Zeno's criterion can be known to be true, in which case it is false, or else it cannot be known to be true, in which case we have inadequate reason to accept it.

Augustine goes on to offer knowledge claims of his own that he dares the skeptic to reject, among them, certain logical truths, certain mathematical truths, and certain reports of immediate experience (e.g., "That tastes pleasant to me"). Especially interesting is his claim to know that the world exists. To the skeptic's taunt that he might be dreaming, Augustine responds that he will call "the world" whatever appears to surround him. In this way he introduces the idea of a phenomenal world, knowledge of which, he maintains, is impervious to skepticism.

No doubt Augustine's most famous response to skepticism comes much later, in Book 15 of his *On the Trinity* and in Book 11 of his *City of God*. Here is the latter passage:

In respect of these truths I have no fear of the arguments of the Academics. They say, 'What if you are mistaken?' If I am mistaken, I am [*Si fallor, sum.*] Whoever does not exist cannot be mistaken; therefore I exist, if I am mistaken. Because, then, I exist if I am mistaken, how am I mistaken in thinking that I exist, when it is certain to me that I am if I am mistaken (11.26).

The anticipation of Descartes' *cogito, ergo sum* is clear.

Language

Wittgenstein begins his *Philosophical Investigations* with a quotation from Book 1 of Augustine's

Confessions, which seems to say that, as a young child, he learned the meaning of words by having the objects they name pointed out to him by his elders. Wittgenstein rejects this view of language acquisition. But, as Myles Burnyeat (1987) has pointed out, the passage Wittgenstein quotes is prefaced with these words:

It was not that grown-ups instructed me by presenting me with words in a certain order by formal teaching, as later I was to learn the letters of the alphabet. I myself acquired this power of speech with the intelligence which you gave me, my God (11.8.13).

And in Augustine's early dialogue with his son, Adeodatus, *Concerning the Teacher*, Augustine brings out, with examples, the ambiguity of ostension:

Augustine: Come now, tell me, if I, knowing absolutely nothing of the meaning of the word, should ask you while you are walking what walking is, how would you each me?

Adeodatus: I should walk somewhat more quickly.

Augustine: Don't you know that walking is one thing and hurrying is something else? (3.6).

It is by an inner illumination, Augustine, argues, that we learn what things are. Or, as it puts it at the end of his *Concerning the Teacher*, it is by Christ, the "Inner Teacher", that we learn. This is the Augustinian Doctrine of Illumination.

In Book 15 of Augustine's *On the Trinity* we get the idea that an "inner word," or concept, mediates between the word or words of a natural language and items in the world around us our words can be used to refer to. This development helps him resolve a puzzle he had raised already in the *Concerning the Teacher* about how two words can mean "as much" without meaning "the same," that is, how they can have the same extension without having the same meaning. (cit.)

The idea that thinking is inner speaking, found already in Plato's *Theaetetus* and *Sophist*, is also prominent in Augustine, again, for example, in Book 15 of his *On the Trinity*. But it is Augustine to whom, for example, William of Ockham refers when he develops his own idea of mental language in his *Summa logicae* 1.1.

Epistemology

Augustine can be said to have an active theory of sense perception. "Active" in this context includes the idea that the eyes emit rays that touch the object of vision. "For it is not the body that perceives," he writes in *Literal Commentary on Genesis* 12.24.51, "but the soul through the body, which messenger, as it were, the soul uses to form in itself the very thing which is announced from the outside."

Augustine's theory of sense perception seems not to be "representational," if, by that term one means that it is an image or sense-datum that is the direct object of perception. In sensing a body, according to him, we immediately form an image of that body in our sense, yet we cannot distinguish between the form of the body we see and the form of the image we produce in our sense (*On the Trinity*, 11.2.3).

Augustine's account of knowledge is not based on the idea of abstraction, as we find in the Aristotelian tradition. Rather, as already noted, Augustine understands knowledge to be something arrived at by an intellectual illumination. He thinks that "intelligible realities," including especially a priori truths, cannot be learned, or even confirmed, in sense experience. All this, including the light metaphor so prominent in Augustine's idea of illumination, is very Platonic. But Augustine rejects Plato's idea that the soul might have been introduced to items in the purely intelligible realm before birth. "We ought rather to believe," he writes, "that the nature of the intellectual mind is so formed as to see those things which, according to the disposition of the Creator, are subjoined to intelligible things in the natural order, in a sort of incorporeal light of its own kind" (*On the Trinity*, 12.15.24).

Mind-Body Dualism

When Plato has Socrates argue in the *Phaedo* that we have knowledge we could not have acquired in this life and therefore our souls must have existed before they took on this bodily form, he argues for soul-body dualism from an impersonal point of view. Such is also true of his other arguments for

soul–body dualism. Augustine, by contrast, argues for mind–body dualism in Book 10 of *On the Trinity* from a first-person point of view. He argues there that the mind (*mens*) is fully present to itself and so knows and is certain of its own substance or nature. However, he goes on, the mind does not know nor is it certain that it is air or fire or any other body that philosophers have theorized it to be; therefore, it is none of these things, that is nothing bodily (10.10.16).

Like Descartes, long after him, Augustine argues that the mind is something that remembers, understands, wills, thinks, knows, and judges (10.10.14). Augustine adds that the mind also lives, and in this he differs from Descartes, who supposes life to be a purely material phenomenon. But the difference between these two thinkers on whether life is a psychological function is not as great as it might seem to be. In truth, Augustine does not understand living to be, necessarily, anything physiological. One can ask whether there is life after death without asking about post mortem physiology.

Anticipating the critics of Cartesian dualism, Augustine himself poses for himself the philosophical problem of other minds, that is, the problem of how each of us can know that other living creatures have minds. Augustine's answer is a form of the Argument from Analogy. "Just as we move our body in living," he writes, "so, we notice, those bodies are moved" and so we come to think that there is present in another body "such as is present in us to move our mass in a similar way" (*On the Trinity*, 8.6.9).

The Will

Albrecht Dihle (1982) and others have maintained that the concept of the will originated with Augustine. Certainly there is nothing exactly like the idea of the will to be found in Plato or Aristotle, whereas, by contrast, the notion of the will is prominent in Augustine. In *On Free Choice of the Will* Augustine writes that the will, which he thinks is the first cause of sin, is itself uncaused. "What cause of the will could there be?" he asks rhetorically, "except the will itself?"

(3.17.49.168). So the human will is free. It is also, he thinks, that component of our being that makes us moral agents, capable of sin, but also capable of moral rectitude.

In his efforts to define and reject Pelagianism, Augustine has to try to explain how the grace of God can influence a human will without destroying its freedom. To this challenge he responds that "free will is not made void through grace, but is established, since grace cures the will whereby righteousness is freely loved" (*On the Spirit and the Letter*, 30.52).

Another divine threat to human free will seems to be God's foreknowledge. Augustine's efforts to show that, contrary to appearances, God's foreknowledge is compatible with free will are most prominent in Book 3 of his *On Free Choice of the Will*. One of his responses is to say that we cannot will what is not in our power. So what we will is in our power, and, "since it is indeed in our power, it is free in us" (3.3.8.33). Evodius, Augustine's nominal interlocutor in that work, points out that the very same reasoning that leads us to suspect that God's foreknowledge of what we will choose to do should apply to God as well. His idea is that God's perfect knowledge should include what He will do, and yet God's will is perfectly free. Since God's foreknowledge does not rule out free will in God's case, it should not rule out free will in the case of a human agent either (3.3.6.23).

God

In Book 2 of *On Free Choice of the Will* Augustine offers an argument for the existence of God. It is a purely a priori argument. Although it is not as important as Anselm's famous a priori argument in his *Proslogion*, it is not without interest. Augustine gets his interlocutor to admit that x is God if, and only if, x is more excellent than our minds and nothing is more excellent than x. He then states that truth is more excellent than our minds, perhaps on the ground that truth sits in judgment on our thoughts. He then concludes that either truth itself is God or there is something more excellent than truth and it is God. In either case, God exists.

Although Augustine's argument for the existence of God does not use Anselm's expression for God, "something than which nothing greater can be conceived," Augustine does sometimes use, in other contexts, expressions quite like that of Anselm, who was a professed Augustinian. Thus, for example, in *Confessions* 7.4.6 he writes: "Nor could there have been or be any soul capable of conceiving that which is better than you, who are the supreme and highest good."

Augustine made important contributions in the project of giving a philosophical account of the divine attributes. But perhaps his most influential contribution to this topic is his espousal of the idea that God is metaphysically simple, so that God is not only, for example, good and wise, God is God's own goodness and wisdom. Here is a passage on the divine simplicity from *On the Trinity*:

But God is not great by a greatness that is not that which he himself is – as if God were, so to speak, a partaker in greatness when he is great. For in that case greatness would be greater than God. But there cannot be anything greater than God. Therefore, he is great by that greatness which is identical with himself (5.19.11).

Creation

Augustine wrote no fewer than five commentaries on the creation story in the book of *Genesis*. He rejects, or at least severely qualifies, the picture of God the Creator as a divine craftsman, which is, for example, in Plato's *Timaeus*. "You did not hold anything in your hand," he writes in *Confessions* 11.5.7, "of which you made this heaven and earth, for how could you come by what you had not made to make something?" According to Augustine God created heaven and earth out of nothing (*ex nihilo*). Although Augustine concedes that the opening verses of *Genesis* allow multiple defensible interpretations, he insists that nothing besides God exists, except through God's creation, not even space or time.

Interestingly, Augustine also, like Descartes, supposes that God sustains creation. If God's power "ever ceased to govern creatures," he writes,

their essences would pass away and all nature would perish. When a builder puts up a house and departs, his work remains in spite of the fact that he is no longer there. But the universe will pass away in the twinkling of an eye if God withdraws his ruling hand (*Literal Commentary on Genesis*, 4.12.22).

Time

A philosopher's favorite passage from Augustine is very likely to be the discussion of the nature of time in Book 11 of the *Confessions*. "What, then, is time?" Augustine asks; "if no one asks me, I know; if I should want to explain it to a questioner, I do not know" (11.14.17). This passage is emblematic of philosophy. In a way, time is an everyday notion. We all know what it is. We also know how to tell time and keep our appointments. But we will be unlikely to be able to give an account of the nature of time that will satisfy a philosopher.

To begin his discussion of the nature of time Augustine draws on a perplexity to be found in Aristotle (*Physics*, 4.10), but not likely to be original even with him. Augustine draws it out to underline its importance. Times are long or short. He points out. But it is obvious, he thinks, that the past is no more and the future is not yet. Only the present exists. But, strictly speaking, not all of the present century, the present year, the present day even the present minute is ever really present. Strictly speaking, only the "now," conceived as a durationless divider between the past and the future, is ever present. But that is neither long nor short, so it cannot be time. Thus, if only the present exists, there is no time.

Augustine resolves this conundrum by looking inward. "It is in you, my mind, that I measure my times" (11.27.37). So time is the measure of something mental. That is, it is the measure of past events as remembered, future events as anticipated, and present events as experienced and held together in the mind. This is a classically subjective view of time.

This famous discussion of the nature of time is embedded in an account of God's creation of heaven and earth according to the beginning of

the Book of *Genesis*. Augustine wrote no fewer than five commentaries on the biblical creation story, the longest being his *De genesi ad litteram* (*Literal Commentary on Genesis*). In *Confessions* 11 he responds to the skeptical challenge (which he attributes in other works to the Manicheans), “What was God doing before he made heaven and earth?” His response is that, in creating heaven and earth, God created both time and place. Thus there was no “before creation” (11.8.15), nor was there any place where God made heaven and earth (11.5.7).

In the *Confessions* Augustine rejects the idea that time could be the measure of the movement of the heavenly bodies. In the other commentaries, however, he claims that time is the measure of motion. On perhaps the most plausible interpretation of these writings, his idea is that “unordered time” began with the thinking of the angels. But human time began with the creation of Adam’s mind.

Evil

The problem of evil seems to have occupied Augustine’s thinking throughout most of his adult life. It is, no doubt, central to what he found attractive about Manicheanism in his 9-year period as a Manichean disciple. If there is a cosmic principle of evil coeval with, and equally powerful to, the cosmic principle of good, then there is no philosophical problem of evil, that is, no philosophical problem about how it can be that evil exists. It is when we suppose, as Augustine came to believe, that “God is good and is most mightily superior” to everything else that the problem becomes acute. “Then where and whence is evil?” Augustine asks (*Confessions*, 7.5.7).

Augustine considers simply denying that evil exists. “Can it be,” he asks, “that there simply is no evil?” Then, he reasons, the fear of evil is unfounded. Still, an unfounded fear of evil would itself be evil (*ibid.*). Augustine returns a little later in *Confessions* 7 to embrace the Neoplatonic idea that evil has no real substance; instead it is privation and so, in a way, does not exist.

In various of his writings Augustine finds the root cause of evil in human free will. And he insists that having free will is necessary for moral agency. His idea is that, first, even though God created human beings and they created evil, God did not therefore create evil. Moreover, genuine moral agency is such an important good that God, in His goodness, gave it to human beings, despite his foreknowledge that Adam and his progeny would choose wrongly and create evil.

In *On Free Choice of the Will* Augustine’s interlocutor, Evodius, is not satisfied with this response. “Doesn’t it seem to you,” he asks Augustine,

If free will is given for acting morally, it ought not to have been possible to turn it to sinning. Shouldn’t it have been like justice, which was given to a human being for living in a good way? (2.2.4.8)

We might expect Augustine to argue that, quite possibly, even an omnipotent being could not grant human beings free will without the possibility that they would use it wrongly. But, toward the end of his life anyway, Augustine allows that the blessed in heaven will have the most perfect freedom of the will, which carries with it an inability to sin (*City of God*, 22.30). But, he argues, this perfect freedom could not have been given to Adam or his progeny, without letting them partake in God’s impeccable nature.

Ethics

Augustine was an extreme intentionalist in ethics. In his *Commentary on the Lord’s Sermon on the Mount* he identifies three conditions necessary and sufficient for a complete sin: (i) suggestion, (ii) pleasure, and (iii) consent. The immediate inspiration for this account is the saying of Jesus, “Everyone who looks at a woman lustfully has already committed adultery with her in his heart” (*Matthew* 5:28). On Augustine’s view, consent to perform a sinful action already constitutes a complete sin; no “outward” action needs to have been carried out.

His intentionalism leads him to worry about whether he is responsible for the acts of his dream

self (*Confessions*, 10.30.42). Although it seems to him unfair to count dreamt adultery as a sin, it is unclear how his various ethical and metaphysical commitments can allow him to escape moral responsibility for acts he commits in his dreams.

Drawing on a contrast between those things that are desirable in themselves with those things that are desirable for the sake of something else, Augustine says that things of the first sort are to be enjoyed (*frui*), whereas things of the second sort are to be used (*uti*). Vice, he says, is wanting to use what is meant to be enjoyed or wanting to enjoy what is meant to be used (*On Diverse Questions*, 83.30). In the end, it is only God who is to be enjoyed.

Augustine followed Ambrose in adding the Pauline virtues of faith, hope, and charity to the classical virtues of temperance, courage, wisdom, and justice. He offers an interpretation of each of virtues that makes each one an expression of the love of God. Thus, for example, temperance is love “keeping itself whole and incorrupt for God” and courage is love “bearing everything readily for the same of God” (*On the Morals of the Catholic Church*, 15.25). In this way Augustine provides a Christian analogue to the idea of the unity of the virtues that one finds in Plato and Aristotle.

Just War

Augustine was certainly not the first thinker to suppose that a war could be a just war if, and only if, it satisfied certain conditions. Requirements for justice in going to war (*jus ad bellum*) and requirements for waging a war justly (*jus in bello*) were already laid out by Cicero in his *On the Republic*. But Augustine’s views on this topic have had great influence on later thinkers and even politicians.

Although Augustine takes the biblical commandment “Thou shalt not kill!” to be quite a strict prohibition, he supposes it does not apply directly to a soldier in a just war or to an executioner carrying out a lawful order; they are only “an instrument, a sword in the user’s hand” (*City of God*, 1.21). According to him, a war is truly just

if either it is commanded by God or at least it is waged by legitimate authority for just cause with the right intention and with the right love. “The real evils of war”, he writes, “are love of violence, revengeful cruelty, fierce and implacable enmity, wild resistance, and the lust of power” (*Reply to Faustus*, 22.74).

Philosophy of History

In *City of God* 12.14 Augustine illustrates the idea of eternal recurrence in history, which he attributes to Plato, but which most of us today link with Nietzsche. Augustine’s own conception of history is linear, starting with the creation of Adam and leading to the second coming of Christ. His account divides universal history into seven ages, analogous to the seven days of creation. He argues that divine providence, like divine foreknowledge, is compatible with human free will.

Augustine in Byzantium

John A. Demetracopoulos

Department of Education, University of Patras,
Patras, Greece

Abstract

Up to 1281, when Maximos Planoudes, an erudite Byzantine theologian and scholar, who had been engaged in the discussions of the Byzantine with Roman Church and was well trained in Classical Latin, translated Augustine's *De trinitate*, Augustine's thought was almost totally unknown to the Christian East. The *De trinitate* was widely read and used; still, this was done almost exclusively from the theological viewpoint, most usually in the debates over Palamite theology and the quarrel between pro-Latin and anti-Latin theologians. A probable minor exception, Nicholas Kabasilas' use of the anti-skeptical "Augustinian cogito," does not alter this image. In the second half of the fourteenth century, Demetrios and Prochoros Kydones, motivated by their theological stands, translated also the *Homilies on John's Gospel* 94–96 and 99–100; five excerpts from the *Contra Julianum*; the *De*

libero arbitrio I, 1–90; eight *Epistles*; some small sections from the *De vera religione*; the *De beata vita* and the *Enchiridion sive de fide, spe et caritate*; Pseudo-Augustine's *De decem plagis Aegyptiorum et de decem praeceptis*; Pseudo-Augustine's (Fulgentius of Ruspe's) *De fide seu de regula fidei ad Petrum*; the pseudo-*Soliloquia*; and Prosperus of Aquitania's *Sententiae ex Augustino delibatae*. It was the first time that these texts became available to the Byzantine world; yet, as far as we know, they contributed nothing to Byzantine philosophy proper; they found a place only in theological disputes.

Phases of the Byzantines' Knowledge of Augustine

From the Beginning Up to the Middle Thirteenth Century

Because of the gradually strengthened language barrier, the Latin Patristic literature was almost completely inaccessible to the Byzantines. Augustine's texts were no exception to this rule. In the Byzantine literature from the sixth to the middle of the thirteenth century, his name occurs only from time to time, usually mentioned among other Patristic authorities, in the context of ecclesiastical history or of the history of dogma.

From 1281 to the Middle Fourteenth Century

In 1281, Maximos Planoudes, an erudite Byzantine theologian and scholar, who had been engaged in the discussions of the Byzantine with Roman Church and was well trained in Classical Latin, translated (among several ancient Latin works) Augustine's *De trinitate* in its entirety. The influence of the translation was considerable; yet, it was confined to the theological field, in the context of which it was produced. Most (if not all) of the readers of this text, such as Barlaam of Calabria (c. 1290?–1348), Gregory Palamas (1296–1357), Prochoros Kydones, Makarios Chrysokephalos (c. 1300–c. 1382), Joseph Bryennios (c. 1350–c. 1431), and George Scholarios – Gennadios II (c. 1400–1472 or shortly after), were primarily interested in

Augustine's doctrine of the procession of the Holy Spirit. Most of them regarded the *De trinitate* as compatible with the Orthodox rejection of the *Filioque*. Palamas was also highly impressed by the soteriological theory of Book XIII, by the way Augustine elaborated Plotinus' doctrine of the inapplicability of Aristotle's Categories on God and used it in order to refute Eunomius' Trinitarian doctrine (Books V–VII), by the Trinitarian images in the human soul as well as by some minor moral remarks. Palamas found Augustine's doctrine of the way Categories (especially "relation") can describe God as a useful tool in his polemic against the deniers of his distinction between God's "essence" and "energies." Nobody, however, showed any interest in the rich philosophical aspects of this work, especially Augustine's doctrine of the human soul and its epistemological implications. The only probable instance of philosophical use of this work is Nicholas Kabasilas' (c. 1325–post-1391) *Contra Pyrrhonem*, where skepticism is combated, *inter alia*, by means of an argument close to the famous "Augustinian cogito," which occurs in many of Augustine's works, the *De trinitate* included, too.

Middle Fourteenth Century Onward

In the second half of the Byzantine fourteenth century, two issues dominated in almost every intellectual's mind: the tug of war between Palamite and anti-Palamite theologians and the conflict between pro-Latins and anti-Latins. Demetrios Kydones (c. 1324–1397), who was both pro-Latin and anti-Palamite, and his brother, Prochoros (c. 1330–c. 1371), who was an anti-Palamite (officially condemned in 1368), translated into Greek certain Augustinian (and pseudo-Augustinian) writings in order to reinforce their theological positions. Demetrios, by so doing, was cumulating authoritative texts over texts where the *Filioque* was explicitly stated (and thus making the traditional apologetic strategies of the Greek theologians difficult to follow) or Palamas' doctrine of the "divine light" was contradicted. The latter also holds true for

Prochoros. In particular, Demetrios translated four pieces as having allegedly been produced by Augustine: two genuine, that is, the *Homilies on John's Gospel* 94–96 and 99–100 (regarding the Holy Spirit) and five excerpts from the *Contra Julianum*, and two spurious, that is, Fulgentius of Ruspe's *De fide seu de regula fidei ad Petrum* and the late thirteenth century pseudo-*Soliloquia* (imbued with the devotional spirit of Augustine's *Confessiones*). In the pseudo-*Soliloquia*, written by Bernoaldus of Saint-Marien d'Auxerre in the first decade of the thirteenth century, probably translated in 1371–1373 and dedicated to the empress Helen Kantakouzene Palaiologina (1333/1334–1397; daughter of John VI Kantakouzenos and wife of John V Palaiologos), the translator believed that he found the sane doctrine of what “God's light” is, that is, not a strange sort of being “around God” but Jesus Christ himself (cf. Joh. 1, 9). Traces of influence of this work are seen in Nicholas Kabasilas' *De vita in Christo*. Demetrios also translated Prosperus of Aquitania's *Sententiae ex Augustino delibatae*, which consists of numerous genuine excerpts from Augustine's *œuvre*. Prochoros translated eight of Augustine's *Epistles* (132, 137, 138, 92, 143, 28, 147 in part, and 82), several of which touch themes of apologetics (Incarnation) and systematic theology. In some of them, it is stressed that God cannot be seen through the bodily eyes but only by pure heart. He also translated *De libero arbitrio* I, 1–90, and some small sections from the *De vera religione*, the *De beata vita*, and the *Enchiridion sive de fide, spe et caritate*, as well as Pseudo-Augustine's *De decem plagis Aegyptiorum et de decem praeceptis*. Investigation into the reasons why these texts were chosen by Demetrios and Prochoros for translation is still in process. In any case, both Palamites and anti-Palamites, as well as both pro-Latin and anti-Latin theologians, regarded Augustine as one of the greatest Fathers of the Church, though this was stressed particularly by the pro-Latins. Some of the above translations remain unedited or insufficiently edited. Offering a full account of their role in Late Byzantine thought requires that they all be properly edited.

for his *Summa de ecclesiastica potestate*, a systematic argument for the supreme power of the pope in both temporal and spiritual affairs.

Biographical Information

Augustine of Ancona studied at Paris and lectured there on the *Sentences* of Peter Lombard between 1302 and 1306. He then served as lector, probably at Padua, in a school of his monastic community, the Augustinian Order of Hermits. In 1313 or, more likely, 1315, he returned to Paris to lecture for 3 years as a master in theology. He became chaplain to Charles, son of King Robert of Naples, in 1322. He completed the *Summa de ecclesiastica potestate* by the end of 1326. The cognomen “Triumphus,” based on a supposed relationship to an ancient family of Ancona, is first used in 1581. It appears in the 1582 Rome edition of the *Summa*, along with an inflated biography of Augustine, later corrected by Ministeri (1951/1952).

Thought

Augustine of Ancona's *Summa de ecclesiastica potestate* is distinctly a theological treatise, relying primarily on arguments from the Scripture, the church fathers, and canon law. Nevertheless, it is of interest for political philosophy in two ways: for its recurrent engagement with philosophical themes, especially natural law, and for its outline of a global political structure dependent on one supreme power.

Augustine considers the pope's power first in itself (qq 1–34), then in relation to the acts of temporal and spiritual dominion or lordship (*dominium*) for which it is ordained (qq 35–75), and finally in relation to the graded perfections of status resulting from such power (qq 76–112). All ultimate earthly authority is claimed for the papacy. The world as a whole (*tota machina mundialis*) is a single governmental unit (*principatus*) and should have a single ruler (q 22, a 3; q 49, a 2; q 60, a 4). The pope is the

Augustine of Ancona

Arthur Stephen McGrade
Professor Emeritus of Philosophy, The University
of Connecticut, Storrs, CT, USA

Abstract

Augustine of Ancona (Augustinus [Triumphus] de Ancona) (1270/1273–1328), an Augustinian friar, wrote at least 32 theological and philosophical works but is chiefly known

intermediate between God and Christians (q 44, a. 1; cf. q 1, aa 1, 3–9), and, since Christ by his passion has merited judicial power over every creature, the pope's authority extends to pagans and Jews as well (qq 23–24). He can correct, depose, or institute (without the request or consent of others) the rulers of any realm (q 46, aa 1–3). Anyone suffering unjustly may appeal to him from the sentence of any man whatever, whether king or emperor (q 45, a 3). The pope could not relinquish such power even if he wished to, for just as God cannot deny himself to be lord of all, so his vicar cannot exempt anyone from papal jurisdiction and cannot deny that he has universal *dominium*. To do so would be to fall into Manichaeism (q 61, aa 2–3). Accordingly, all rights are derived from God to men through the pope, and it is principally for him to maintain others in these derived rights (q 1, aa 3, 7–8; qq 44–46; q 75, a 1).

Virtually all recent discussion of the *Summa*, reviewed by Walsh (2000), has been sparked by Wilks' 1964 monograph, *The Problem of Sovereignty in the Later Middle Ages: The Papal Monarchy with Augustinus Triumphus and the Publicists*. On the basis of theses such as those summarized above, Wilks argued that Augustine's account of papal power amounted to a theory of "true sovereignty" (287). Critics of Wilks have sometimes charged him with anachronism in applying a modern concept, sovereignty, to a medieval author and have pointed to passages in the *Summa*, which seem to show that for Augustine the pope's authority was not as absolute as Wilks made it appear. There are indeed important qualifying passages, as we shall see and as Wilks himself recognized, but it is not always clear that these are consistent with the maximalist theses above (Wilks thought not). Even if they are, Augustine's claim that only papal authority comes immediately from God places the pope's power on a distinctly higher plane than that of any other mortal. Considered in this light, the charge of anachronism seems ill founded.

The scholastic *quaestio* form of the *Summa* required discussion of positions counter to the one defended by the author. Augustine's discussion of claims to authority made for councils of

the whole church was sufficiently substantial to make his work an important resource in the conciliar period (Walsh 1991). His account of papal authority in relation to natural law is complex. The pope should not be obeyed if he commands anything contrary to natural or divine law (q 22, a 1). Consequently, he cannot justly deprive pagans of political authority, although he can punish them for acting against natural law (q 23, aa 3–4); he cannot free slaves (q 22, a 5) or arbitrarily take one person's property and give it to another (q 54, a 4, *ad* 1). Yet a papal precept binds more than the law of nature, since it binds not only potentially but also actually, not only universally but also particularly. Moreover, the "impressing" of the power of binding in the pope in Christ's committal of the church to Peter (Matt. 16:18) is more unfailing (*infallibilior*) than the impression in our minds of the law of nature, also made by God but only as a habit, which can fall into evil in its actual exercise (q 63, a 1; cf. q 60, a 1). On some matters, Augustine counsels restraint in the pope's exercise of his unlimited power. If the pope orders one thing and the emperor another, the pope is to be obeyed, not the emperor. However, since all power is from God, the pope ought to maintain and govern – not abolish or undermine – secular rulers and kings (q 22, a 3).

The most fundamental apparent qualification of Augustine's papal absolutism stems from his distinction between the perfection of the papal status and the possible imperfection of an individual pope (q 101, a 3). Augustine, who had been distressed at the election of Clement V, held that a faulty pope was subject to censure by any Christian (q 7, a 1). Further, a pope who fell into heresy was spiritually dead, *ipso facto* ceased to be pope, and could be declared deposed by others, most suitably by a general council (q 5, aa 1, 6; cp. q 22, a 1). The practical import of Augustine's acceptance of papal heresy as a possibility is unclear, however, since there is no formal procedure in his system for determining the actual occurrence of such an event.

The papacy has been a fact on the ground in the world since at least the fourth century of the common era. Accordingly, Augustine of

Ancona's argument for the supreme power of the pope in both temporal and spiritual affairs has abiding relevance for theology, philosophy, and political thought as papacy and world go on, for it combines the subtlety and precision of mature scholasticism with a sense of issues in later thought that continue to concern us.

Abstract

From the eleventh century onward, the axis of philosophical production in Arabic gradually moved from eastern territories to Andalusia (Muslim Spain), which was also the main center of Jewish culture until at least the mid-twelfth century. One of the most original and representative figures in this period is Salomon Ibn Gabirol (1021–1058), author of very popular poems in Hebrew and not so popular

(though no less important) philosophical treatises in Arabic. We find exactly in one of these treatises, the *Fountain of Life*, the most characteristic expression of Ibn Gabirol's thought, i.e., the doctrine of universal hylomorphism: all beings, unlike God, are composed of matter and form (hylomorphism derives from the Greek terms *hyle* "matter" and *morphé* "form"); this is also true of spiritual substances (intelligences and angels), whose matter is not corporeal or sensible, but purely intelligible.

Biographical Information

The scarce, essential biographical information on Salomon Ibn Gabirol (Abū Ayyūb Sulaymān Ibn Jabrūl l-Qurṭūbī in Arabic) has a double source: the internal one of his poetical compositions; and the external one of the Arab bibliographer Ibn Saʿīd of Toledo (1029–1070) and the Jewish thinker Mosheh ben Yaʿaqov Ibn ʿEzra (1055–1138).

Ibn Gabirol was born in Malaga around 1021, though his family originally came from Cordoba. He spent most of his life in Saragossa, distinguishing himself from the age of 16 in a series of poetical compositions of both a sacred and profane character. He was forced to leave the city because of a declared interest in philosophical enquiry, for which he was accused of heresy: he sought and obtained protection in Granada, under Shemuel ha-Nagid Ibn Nagrela, vizier to the local sovereign Habbus. He died prematurely in Valencia in 1058, when he was in his 30s, leaving a variety of writings, which as a whole can be classified on the basis of a precise linguistic distinction.

Reflecting the bilingualism of many Jewish thinkers of his day, Ibn Gabirol uses Hebrew for his poetical works and Arabic for his prose. On the one hand, he wrote a vast and popular collection of poems (*dīwān*), with over 500 compositions in various genres, and a grammar in verse (*ʿAnaq*), conceived specifically in order to extol the Hebrew language. On the other hand, he wrote philosophical works in Arabic: *The Improvement of the Moral Qualities* (*Kitāb iṣlāḥ al-aḥlāq*), written in Saragossa in 1045, is primarily an

ethical treatise with a psychophysiological bent that leaves no room for doubt as to Ibn Gabirol's religious and cultural identity (indeed the work is full of quotations from the Old Testament in support of his theses); the *Choice of Pearls*, of which only the Hebrew translation is extant, is a collection of proverbs, maxims, and parables taken from Arabic literature; the *Fountain of Life* (*Kitāb yanbūʿ al-ḥayāt*) is a work of pure metaphysics, freed from the theological or apologetic concerns that characterize so much of medieval Jewish philosophical production. No longer extant in the original Arabic (apart from a few quotations in Mosheh Ibn ʿEzra), the *Fountain of Life* has survived mainly in its Latin version: it was produced around 1150 in Toledo by Dominicus Gundisalvi and John of Spain, with the title *Fons Vitae* and ascribed to a certain "Avicebron". Given that the text had no bibliographical references, the Latin masters knew nothing of the author's actual identity, nor of his ethnic or religious background, and so they generally took Avicebron (or Avengebrol, Avicembron, Avicebrol, depending on the various deformations of the name in Latin due to the influences of the Iberian vernacular) to be one of the great Arab philosophers (*falāsifa*) or else an Arab who had converted to Christianity.

This misunderstanding persisted until the French scholar Salomon Munk demonstrated in 1846 that the Avicebron of the Latins could be identified with Ibn Gabirol, known in the Hebrew world as the author of famous religious compositions. And so the two figures, who until that time had enjoyed a parallel yet independent fame within a Hebrew and Latin context (it is now an indisputable fact that Ibn Gabirol's philosophical works were well known almost exclusively in the Latin world), were reunited in a single historical personage.

A Hebrew version of the *Fountain of Life*, with the title *Liquṭīm mi-sefer Meqor ḥayyim*, or *Extracts from the Fountain of Life*, also exists. It was produced around 1270 by the philosopher Shem Tov Ibn Falaquera with the purpose of reducing the work to its discursive nucleus. Apart from being later and shorter, the Hebrew version differs from the Latin in not being presented in the form of a dialogue (between a

magister and his *discipulus*), which instead characterizes the latter.

Thought

In the history of ideas the doctrine of universal hylomorphism is most often associated with the name of Avicbron: all beings other than God, as is frequently repeated in the *Fons Vitae*, are composed of matter and form, even though it is impossible to find in simple, or spiritual, substances the same matter (corporeal matter) that characterizes composite, or sensible, substances. Yet how does Avicbron develop his thesis?

The *Fons Vitae* is divided into five books that focus on the conceptual pair of matter and form, analyzed according to a progressive broadening of the field of enquiry: the first book establishes the metaphysical and cosmological premises necessary for the definition of universal matter and universal form; the second examines universal corporeal matter as a substratum of corporeal form; the third demonstrates the existence of simple substances; the fourth shows that these too are composed of matter and form; and the fifth analyzes universal matter and universal form in themselves. This is not all, however: looking at the different ways in which matter and form are present in the different levels of the universe, Avicbron offers the reader a path of progressive ascent from the sensible world to the “flowering garden” of the intelligible world, as the only means of finally achieving the happiness and the end for which man was created. In this sense, the expression “*evasio mortis et applicatio ad originem vitae*” with which the fifth book ends expresses in the most efficacious and suggestive way possible the idea that only those who have undertaken the path of self-purification can reach not only the afterlife, but also, and above all, the Fountain of Life itself.

The overall scheme of the *Fons Vitae* is typically Neoplatonic and therefore legitimates the general evaluation of Avicbron as the most important heir of the Neoplatonic tradition in Jewish philosophy. The universe is ordered hierarchically, descending from the First Cause, i.e.,

God, in less and less pure degrees of perfection, starting from which it is possible to re-ascend (and know), up to a certain point. The First Cause is in itself unknowable: the only access to it is represented by its effects, which depend on the Will, rather than the essence, of God. The presence of the Will as a link between the First Cause and Creation is indispensable to Avicbron’s cosmos, in order to preserve the purity and transcendence of God, since it is only one of his faculties (in Latin *virtus*), i.e., the Will, that comes into contact with all the rest.

So, if these are the general coordinates of Avicbron’s discourse, it is easy to conclude that the first effects of the divine Will are universal matter and universal form, purposely introduced as the “roots” of the whole universe or, in other words, as the principles from which every being is composed. These are followed, in descending order, by the Intellect (the Neoplatonic hypostasis *Nous*); the Soul, subdivided into rational, animal and vegetable; and finally Nature, which represents the lowest level of simple substances, from which corporeal substance originates. Of course, the term “matter,” which the different substances in Avicbron’s cosmos have in common, takes on different meanings in reference to the various hierarchical levels of the real. It indicates, first of all, primary universal matter, which, at least potentially, is simple and devoid of form, and as such functions as a common substratum of the intelligible and sensible worlds; next, intelligible matter, which sustains the simple and spiritual forms of intelligible substances; corporeal matter emanating from Nature, which functions as a substratum of the *forma corporeitatis* and the form of quantity; then, in succession, the incorruptible matter of the heavenly bodies, the matter of primary elements, and finally, the matter of composite single substances.

The basic premises of the doctrine of hylomorphism are expounded by Avicbron mainly in the fourth book of the *Fons Vitae* and can be summarized in the following three points:

- The need to indicate as clearly as possible the difference between the absolute simplicity of the First Cause and the composite nature of

every one of its effects (both intelligible and sensible).

- The analogy between the inferior, or sensible, world, and the superior, or intelligible, one. The inferior world is made in the image of the superior one and flows from it. Therefore, if the inferior world has a hylomorphic composition, then inevitably, the superior one has the same composition. In other words, the superior world cannot in itself be devoid of those properties that it communicates to what is inferior.
- The absolutely innovative idea that matter, as the founding dimension of all reality, is not a principle of differentiation, as instead Aristotle maintains. If it is true that even spiritual realities differ, they evidently converge in something (in matter, to be precise) and are distinguished by their form. The conclusion is unequivocal: every level of reality is configured in the framework outlined by Avicbron as a progressive determination, or limitation, of primary matter, wrought by the different forms (whether spiritual or corporeal) that imprint themselves on this matter, establishing, in each case, its spiritual or corporeal nature.

To his disciple's objection that if everything were effectively composed of matter and form, it would not make any sense to distinguish between simple and composite substances, Avicbron replies (once again in strictly Neoplatonic terms) that some things are called "simple" not in an absolute, but only in a relative sense: every being is simple in relation to that which follows it and composite in relation to that which precedes it, with the result that simplicity can coexist, without any inconvenience, with the composition of matter and form. Nevertheless, if this is still not sufficient to demonstrate the omnipresence of the two elements, we can also recall that matter does not exist without form, just as form does not exist without matter, not even in the twinkling of an eye (*ictu oculi*). Matter needs form in order to be actualized, just as form subsists only where there is a substratum to be in-formed. Therefore, given that matter and form are never present at different times (except *in opinione*), and that every substance is both simple and composite, the obvious

consequence is that these two roots characterize every finite being and are found at every level of the universe.

The doctrine of hylomorphism became an important subject of debate in the Latin production of the thirteenth century. Certain Franciscan masters – for instance, Alexander of Hales and Bonaventure of Bagnoregio – while not referring directly to Avicbron, use the theory of hylomorphic composition in order to distinguish the First Cause from its effects, demonstrating thereby that only of God it is possible to predicate simplicity, in the full and perfect sense. Angels, on the other hand, though they too are called "simple" in that they are incorporeal, nevertheless possess intelligible matter (and hence an element in potency).

The case of the Dominican masters (Albertus Magnus and Thomas Aquinas) is the exact opposite. Avicbron is expressly indicated by them as the creator of an unfounded and erroneous doctrine that has to be radically contested. More precisely, the exigency underlying the doctrine of universal hylomorphism – i.e., the need to postulate a composition that distinguishes God from spiritual creatures – is recognized in all its importance but is transferred to a deeper level. Indeed, Aquinas sustains the idea that the composition of finite beings is not the physical composition of matter and form, but rather the metaphysical one of essence and being, in which essence functions as a potential substratum and being functions as actuality; and since, in simple substances, essence coincides with form, the true metaphysical caesura is not to be sought between what is really immaterial and what isn't, but instead between that which is above every form (God) and that which possesses at least a formal determination.

Bahmanyār ibn Marzubān

Jules Janssens

De Wulf-Mansion Centre, KU Leuven, Leuven,
Belgium

Abstract

Bahmanyār ibn (al-)Marzubān is generally considered as one of the major first-generation students of Ibn Sīnā. He, however, presented ideas of his own. They show that he was not always blindly following the views of his “master.” His work was not unnoticed in the later Islamic and (Arabic) Jewish tradition.

Life

Not much is known about Bahmanyār’s life. Even his precise name was the subject of a great deal of confusion both in medieval and modern sources. His name does not appear in Ibn Sīnā’s *autobiography/biography* complex and is never explicitly mentioned by the latter in any of his writings. The name Bahmanyār appears only in a small letter and a note addressed to Ibn Sīnā that have been included in the materials transmitted under the name *Mubāḥaṭāt* (Ibn Sīnā 1992: 145 and 175). But there is easily convincing evidence that there was an important exchange of letters between him and Ibn Sīnā. When the latter uses the expression *al-Shaykh al-fāḍil*, “the eminent

Sheikh,” he almost certainly is referring to Bahmanyār (Michot 1997: 146). From these letters one gets the impression that Bahmanyār was Ibn Sīnā’s most beloved pupil. But, at the same time, one sees signs of tension. Bahmanyār, obviously under the influence of Abū l-Qāsim al-Kirmānī (with whom the young Ibn Sīnā had had a controversy and whom he continued to despise until his death), reveals on several occasions to be critical of some of Ibn Sīnā’s (innovative) ideas. At least in one of these cases, Ibn Sīnā expresses his disappointment about Bahmanyār’s lack of loyalty (Ibn Sīnā 1992: 175–176). That Bahmanyār was a disciple of Ibn Sīnā is explicitly said by the classical biographer al-Bayhaqī, who states, moreover, that he was a Zoroastrian stemming from Azerbaijan (al-Bayhaqī 1996: 113–114). However, whether Bahmanyār was a Zoroastrian, as said by Rukn al-Dīn ibn al-Malāḥimī al-Khwārazmī (Ibn al-Malāḥimī al-Khwārazmī 2008: 14), or a Muslim, or maybe a Zoroastrian by birth, who, in his later life, converted to Islam, as did his maternal uncle to whom he dedicated his major work, *Kitāb al-Taḥṣīl*, remains an open question. Also his being an Azerbaijani by origin is not absolutely sure, especially if one accepts the identification of his father with the brother of the Sayyida who was mother of Majd al-Dawla (Michot 1992: 154). According to al-Bayhaqī, Bahmanyār died in 1066. Although most scholars accept this date, one cannot totally exclude an earlier one (al-Rahim 2009: 11).

Works and Thought

Among Bahmanyār's works, his *Kitāb al-Taḥṣīl* is by far the most voluminous and best known. This compendium of philosophy consists of three parts: logic, metaphysics, and "science of the states of the essences of existent Beings" (*al-'ilm bi-aḥwāl a'yān al-mawjūdāt*). In spite of what Bahmanyār states at the opening of his work, namely, that he structures the work according to the structure of Ibn Sīnā's *Dānesh-Nāmeḥ* (Bahmanyār 1375H.S.:1), he presents a scheme that fundamentally departs from the latter. Most striking is his replacement of a metaphysics, labeled "divine science" by a metaphysics that is restricted to an ontology, and of a natural science ("physics" in the broad sense) by a science that encompasses both a discussion of God and of all parts of the natural sciences, excluding plants and animals (Janssens 2003, 2007; Eichner 2007: 156). Most telling is the fact that Bahmanyār, in sharp contrast with his "master," includes the discussion of evil inside the section "On Heaven." This does not mean that Bahmanyār consciously wants to mislead his reader in pointing to the structuring of the *Dānesh-Nāmeḥ*, but it makes evident that his affirmation has to be understood in a high qualified way. However, the many (implicit) uses of Avicennian works in the *Kitāb al-Taḥṣīl* make clear that for Bahmanyār Ibn Sīnā was a great thinker and a major authority. Nevertheless, the work contains several ideas that deviate from the (at least, mature) views of his master. In the overall restructuring that is proper to the *Kitāb al-Taḥṣīl*, one might see a tendency to re-Aristotelize Ibn Sīnā's "new" thought. Moreover, in spite of many similarities, one cannot but recognize the existence of differences between Bahmanyār and his "master." They concern such issues as, e.g., the consideration of the substance of a genus as the highest substance or the affirmation that the soul will undergo a change through death but remains similar to its previous status (Aminrazavi 1999: 333). Furthermore, Bahmanyār confers more importance upon the topic of sense knowledge and reduces the strict separation between sense and intellectual knowledge (Sebti 2012: 526). Finally, he makes self-

perception the core idea of his theory of knowledge and no longer attributes to it an anthropological function, i.e., the guarantee of one's personal identity, as his "master" had done (Sebti 2005–2006: 209). Hence, Bahmanyār is clearly not following Ibn Sīnā in every respect. This raises at once the question in which sense he really was a disciple of the latter. This question becomes even more pertinent if one accepts that Ibn Sīnā speaks to him using the term "Shaykh." Such address is, and was, normally only used with regard to someone older and/or higher in rank.

A very critical attitude on the part of Bahmanyār toward his so-called master comes also to the fore in several written exchanges, preserved in the *Mubāḥaṭāt*. Inside them one does not find only letters that in all likelihood are part of a larger, systematic correspondence between Ibn Sīnā and Bahmanyār, but, moreover, several critical questions posed by the latter (and Abū l-Qāsim al-Kirmānī?) to the former, as well as a small letter and note (Reisman 2002: 221–240). In the very same *Mubāḥaṭāt* is included what is maybe a "summary," *talkhīṣ*, by Bahmanyār of Ibn Sīnā's *Ilāhiyyāt* of the *Shifā'*, but this is still in need of further verification (Reisman 2002: 43, 253). The text has circulated in an independent manner (but with an additional chapter that – surprisingly – deals with the distinction between material soul and soul in act) under two different titles: *Fī ithbāt al-mabda' al-awwal* ascribed to Ibn Sīnā and *Mawḍū' al-'ilm al-ma'rūf bi-mā ba'd at-tabi'a* ascribed to Bahmanyār (Mahdawī 1954: 259; Bahmanyār 1851).

Whether Bahmanyār was involved not only in the transmission of Ibn Sīnā's *Ta'līqāt*, *Notes*, as indicated in one of the recensions, but also in their compilation, is questionable (Gutas 2014, 162–164). Indeed, the presence of an outspoken flavor of oral teaching in the work, as well as its belonging to Ibn Sīnā's late period given its including supercommentaries on earlier major works, makes it unlikely that Bahmanyār is their author. Even if Ibn Sīnā in all likelihood returned for a short period (or, maybe, even several short periods) to Rayy during his stay in Isfahan, nothing indicates that he was giving classes there. As seen, his major contacts with Bahmanyār, who

seems to have stayed in Rayy (as was the case with Abū l-Qāsim al-Kirmānī), were by letters.

The treatise *Maqāla fī (ārā' la-mashshā'in fī) umūr al-naḥs wa-quwāhā*, which has been preserved in one single manuscript, deals mainly with the perception of the souls of humans and stars. In his exposition of Bahmanyār's thought, Muḥammad Bāqir al-Khwānsārī (d. 1895) refers to one of the latter's works under the title *Kitāb al-bahja*. He suggests that the main topic of this work is God's self-knowledge and, moreover, stresses that according to it knower and known are identified with each other in God (al-Khwānsārī 1972: II, 158). Thus far no manuscript of this work (under the given, or a similar, title) has been found. Moreover, the very succinct information that al-Khwānsārī provides offers no guarantee that he had direct access to the work. He might have derived the given quotation from an earlier source, all the more likely since one finds mention of the work, albeit differently entitled, *Kitāb al-bahja wa-l-sa'āda*, also in Mullā Ṣadrā al-Shīrāzī and al-Narāqī. As to al-Khwānsārī's ascription of a few gnomological sayings to Bahmanyār, it is clearly based on al-Bayhaqī. Whether this ascription is correct or not is hard to say. Similarly, the precise qualification of the *Kitāb al-zīna fī al-manṭiq*, which is mentioned by al-Bayhaqī, as being part of the *Kitāb al-Bahja* or of the *Kitāb al-Taḥṣīl* (Rescher 1964: 157), or as an independent work, cannot be decided given its actual loss. Another lost work seems to be the *Kitāb fī l-mūsīqā*, which al-Bayhaqī mentions. Finally, the treatise *Risāla fī marātib al-mawjūdāt*, as well as an incomplete version of it entitled *Faṣl min Kitāb fī ithbāt al-'uqūl al-fa'āla wa-l-dalāla 'alā 'adad-hā min ithbāt al-nuḥūs al-samāwīya*, is ascribed in the manuscript tradition to Bahmanyār and has been edited under his name (Bahmanyār 1851). However, it turns out to be identical with the *Risāla fī ithbāt al-mufāraqāt*, which is recognized as a work of al-Fārābī by many scholars based on the testimony of numerous manuscripts. The very content of the treatise, namely, the discussion of four material substances, i.e., the Necessary Being, the Active Intelligences, the celestial souls, and the human souls, is clearly more conforming to the title

Risāla fī ithbāt al-mufāraqāt than the one that is linked with Bahmanyār's name, i.e., *Risāla fī marātib al-mawjūdāt*. However many uncertainties remain, all the more since the treatise (under the former of the two titles) has also been attributed to another of Ibn Sīnā's pupils, namely, to Ma'sūmī (Daiber 1989: 502). But if it turns definitely out that the work is not Bahmanyār's, it is not easy to explain why a work by one of the giants of classical Arabic philosophy has been transmitted under a slightly modified title with the name of one who is generally considered to be a lesser thinker. However, Bahmanyār's influence is clearly more important than was commonly thought until recent times.

Influence

Al-Lawkarī (d. ca. 1123), who may have been a direct pupil of Bahmanyār, quotes almost *verbatim* in his major work *Bayān al-ḥaqq bi-ḍimān aṣ-ṣidq* many passages of the latter's *Kitāb al-Taḥṣīl*, although without mentioning this (Janssens 2012). This practice is well attested in the part covering the *Isagoge (Madkhal)* of logic (Al-Lawkarī 1986) and the part entitled "Universal science" of the metaphysics (Al-Lawkarī 1995). In spite of these many quotations, al-Lawkarī, contrary to Bahmanyār, remains faithful to Ibn Sīnā's "new" metaphysical project. His integration of chapters based on the logic or physics of the latter's *Shifā'* can always be explained by explicit remarks in this work. Another possible use of Bahmanyār is maybe present in the first section of the appendix attached to the metaphysics, where one finds two almost literal quotations of the *Risāla fī marātib al-mawjūdāt/ Risāla fī ithbāt al-mufāraqāt*. However, as already indicated, this latter turns out to be more likely a Farabian work.

Fakhr al-Dīn al-Rāzī (d. 1210), in his *Jawābāt al-masā'il al-bukhāriyya*, which is clearly one of his earliest works, mentions twice Bahmanyār's name. In both he refers to the *Kitāb al-Taḥṣīl*, but in the first he mentions in addition the *Mubāḥaṭāt* (al-Rāzī 2014: 14, 55). In the former of the two, al-Rāzī detects a valuable supplement to Ibn Sīnā's

argumentation insofar as it expresses explicitly what is only implicit in Ibn Sīnā's very wording of it (Shihadeh 2014: 387–388). In the latter, he indicates that Bahmanyār mentions a little of what Ibn Sīnā had said in a more outspoken way. All in all, al-Rāzī presents Bahmanyār as remaining fundamentally in line with Ibn Sīnā's thought, having offered at best elements of clarification. In his later works, al-Rāzī seems no longer to make any explicit reference to Bahmanyār, but an implicit use cannot be excluded; on the contrary, such use looks likely in his two interpretative and expository works of Avicennian philosophy, i.e., *al-Mabāḥith al-mashriqiyya* and *al-Mulakhkhaṣ fī l-ḥikma* (Eichner 2009: 151, n. 11).

‘Abd al-Laṭīf al-Baghdādī (d. 1231), in his *autobiography*, points out that he summarized Bahmanyār's *Kitāb al-Taḥṣīl* (Ibn Abī Uṣāybi‘a 1965: 685; Martini-Bonadeo 2013: 122), but he does not say why he did it. The work seems to have been lost.

As to Athīr al-Dīn al-Abhārī (d. 1265), he is credited with a work, entitled *Kitāb al-Maḥṣūl*, that would have been modeled after the *Kitāb al-Taḥṣīl* (Mudarris Raḍawī 1975: 184). It also seems no longer to be extant. Hence, it is difficult to know whether the link with Bahmanyār's is real or is based only in a resemblance in title.

For the Jewish thirteenth-century philosopher of Baghdad, Ibn Kammūna (d. 1284), in his philosophical *summa*, *al-Jadīd fī l-ḥikma*, Bahmanyār's *Kitāb al-Taḥṣīl* forms one of the major sources, although Ibn Kammūna never mentions this or even points to it (Eichner 2009; Naji 2011: 148). In his commentary on al-Suhrawardī's *Talwīḥāt*, at least one passage reveals a similar use (Eichner 2009: 176).

In the school of Shīrāz, at least three thinkers paid attention to Bahmanyār's major work. Jalāl al-Dīn Dawānī (d. 1502), in his *Ḥāshiya*, quotes the *Kitāb al-Taḥṣīl*, namely, a passage where Bahmanyār states that in what is existent (*mawjūd*), being (*wujūd*), is external to it (Pourjavady 2016: 422). This affirmation can be seen as a particular (re-)formulation of the Avicennian idea of the so-called accidentality of existence to essence. Shams al-Dīn Khafīrī, on his

turn, in his *Risāla fī l-hayūlā*, refers to the very same work in order to emphasize that Bahmanyār has explicitly stated that a body is individually one, while Ibn Sīnā had claimed that it is numerically one (Khafīrī 2015: 108). Khafīrī sees neither a complete identity nor a radical opposition between both affirmations. Hence, he seems to consider Bahmanyār as having offered formulations of his own, but these remain more or less in line with the views of his “master.” Finally, Najm al-Dīn al-Nayrīzī (d. ca. 1536) uses in several of his commentaries on earlier works, as, e.g., al-Abhārī's *Hidāya*, Taftāzānī's *Tahdhīb*, and al-Shurawardī's *al-Alwāḥ al-‘Imādiyya*, Bahmanyār's *Kitāb al-Taḥṣīl* as a source text, but most interesting is the fact that he read Bahmanyār's work together with one of his masters, i.e., Ġiyāt al-Dīn al-Dasthakī, as mentioned in the *ijāza* he received from the latter (Pourjavady 2011: 56, 113, 127, 135). This indicates that the *Kitāb al-Taḥṣīl* was considered at the time to be interesting and valuable enough to be included in a teaching curriculum.

Also in the school of Isfahan, Bahmanyār figures as a major source, as evidenced by three of its major representations, i.e., Mīr Dāmād, Mullā Ṣadrā, and Sayyid Aḥmad ‘Alawī. The former of the three, Mīr Dāmād (d. 1631), quotes in *al-Qabasāt* Bahmanyār's *Kitāb al-Taḥṣīl* on several occasions (Rizvi 2016: 452). He refers to Bahmanyār in using the expression “his (i.e., Ibn Sīnā's) student” (Mīr Dāmād 2015: 140–141) and hence suggests the presence of a very close connection between the thoughts of both these thinkers. With regard to the second, and undoubtedly most famous of them, i.e., Mullā Ṣadrā al-Shīrāzī (d. 1640), Bahmanyār's works are among his most influential sources (Bonmariage 2016: 466). Indeed, Mullā Ṣadrā, several times in different works, quotes *verbatim* passages of the *Kitāb al-Taḥṣīl*. Moreover, he not seldom quotes elements of Bahmanyār's correspondence with Ibn Sīnā, as preserved in the *Mubāḥaṭāt*, although it is not clear on which basis – and, as is apparent, not always in a trustworthy way – Mullā Ṣadrā links letters or questions present in the latter specifically with Bahmanyār's name (Janssens 2014: 88–90).

The use of both works is well attested in Mullā Ṣadrā's opus magnum *al-Asfār al-arba'a*, but is present also in, e.g., his (super-)commentary on al-Suhrawardī's *Hikmat al-Ishrāq* (Mullā Ṣadrā/Corbin 1986: 470, 477, 492, 503, 588) or in his marginal glosses on the *Ilāhiyyāt* of Ibn Sīnā's *Shifā'* (Mullā Ṣadrā 1382H.S.:408, 438–439). Although Mullā Ṣadrā often presents Bahmanyār as Ibn Sīnā's disciple, he points now and then to important differences between them. Sometimes he finds the former's view even superior to that of his "master," as, for example, with regard to the very conception of the human life in the hereafter (Mullā Ṣadrā 1375 H.S.:300). However, on other doctrinal issues, e.g., the relation between "being" and "quiddity," Mullā Ṣadrā finds Ibn Sīnā's exposition more trustworthy than Bahmanyār's, who, notwithstanding his clear debt to Ibn Sīnā's wording, missed on this issue the deeper intention of his "master" (Mullā Ṣadrā 1967: 11–12; Jambet 2002: 94–98). At least on one occasion, Mullā Ṣadrā points to Bahmanyār's *Kitāb al-bahja wa-l-sa'āda* (Mullā Ṣadrā 1386HS: VI, 65). He quotes one single sentence that figures also inside the somewhat larger quotation of the same work that al-Khwānsārī offers. Finally, Sayyid Aḥmad al-'Alawī (d. 1638), in his commentary on Ibn Sīnā's *Shifā'*, appears to have an intimate knowledge of Bahmanyār (Nasr 2015: 261). With an explicit reference to the *Kitāb al-Taḥṣīl*, he quotes a passage of the latter, which concerns the qualifications of God's knowledge as active and is used by al-'Alawī as a valuable supplementary piece of information on what might appear as an inconsistency in Ibn Sīnā, namely, between the formulation in the *Ishārāt* and that in other of the latter's works (al-'Alawī 2015: 279).

In the eighteenth century, the Shī'ī thinker Muḥammad Mahdī Narāqī (d. 1794), in his commentary on the *Ilāhiyyāt* of Ibn Sīnā's *Shifā'*, refers to Bahmanyār most of the time by name, but on one occasion under the designation *Ṣāhib al-Taḥṣīl* (Narāqī 1986: 234, 290, 296). From these scanty remarks, one gets the impression that Narāqī detects in Bahmanyār a thinker who has expressed ideas that were not present in Ibn Sīnā, and therefore can be considered, at least with

regard to a few specific points, as worthy of attention in their own right. It has to be mentioned as well that in the Twelfth Investigation of his *Qurrat al-'Uyūn*, he quotes a sentence of the *Kitāb al-bahja wa-l-sa'āda* while presenting it expressly as a work of Bahmanyār (Narāqī 2010: 442). It is striking that this sentence is exactly the same as the one quoted by Mullā Ṣadrā.

Generally speaking, one detects two periods in which Bahmanyār's thought has received particular attention: the thirteenth century and the seventeenth–eighteenth centuries. On the one hand he appears as a proper "disciple" of Ibn Sīnā, but, on the other hand, also as a critical judge of the latter's thought, who did not hesitate to formulate "new" and "different" views with regard to some particular items. Even if his name seems to have been almost ignored for some time (but future search might reveal still undetected uses, both explicit and implicit), it is clear that his philosophical work was considered to be worthy of attention, both as a source of clarification and in its own right.

B

Abstract

Despite Abū Zayd al-Balkhī's (d. 934 CE) extensive and multifarious bibliography, he is known today almost exclusively as an author of geographical works and the founder of the so-called Balkhī School, a type of geographical writing that combines – highly stylized – regional maps of the Islamic world with detailed descriptions of its provinces, including information on climate, agriculture, etc. Regrettably, Abū Zayd's geographical work is lost, surviving only in later adaptations, as are almost all his works dealing with the Hellenistic scholarly, particularly philosophical, heritage on the one hand and with Islamic theology and Qur'ānic scholarship on the other – the latter an object of some praise from his contemporaries and later biographers. Abū Zayd's wide-ranging interests (which include topics of traditional Arabic culture) are shared by al-Sarakhsī (d. 899 CE), and both their "encyclopedic" outlooks belong to the tradition of the "philosopher of the Arabs," al-Kindī (d. soon after 870). Three fragments of works by Abū Zayd that are preserved as quotations – first on the definition of politics, second on the question of free will vis-à-vis divine determination, third on the typology of religious idols – show his independence of thought and ability to apply adequate categories; his one surviving monograph on the *Welfare of Body and Soul* is a witness to his limpid, elegant style and his virtuosity in integrating the Arabic–Islamic heritage, distinct elements of Sasanian political and ethical thought, and the Hellenistic philosophical and scientific tradition.

Life

Abū Zayd Aḥmad b. Sahl al-Balkhī is, along with Aḥmad b. al-Ṭayyib al-Sarakhsī, a prominent follower of “the philosopher of the Arabs,” al-Kindī. Though he is likely to have missed al-Kindī – born around 850 in a village near Balkh (halfway between today’s Kabul and Bukhara), he came to Baghdad only as a young man, that is, very close to, or after, al-Kindī’s death – he shares with him and his circle a keen interest in all branches of the Hellenistic scholarly heritage, particularly in philosophy, but also an encyclopedic approach to a number of indigenous Arabic–Islamic subjects. Abū Zayd spent 8 years in Baghdad studying philosophy, astrology and astronomy, medicine, the natural sciences, and Qur’anic disciplines. For unknown reasons, he did not stay on in the political and cultural capital of the Sāmānid ruler to act as one of his viziers at his court in Bukhara, but returned to Balkh, where he worked as a teacher, and eventually to an estate in his native village, profiting from a stipend of the local ruler of Balkh and his learned vizier, Abū l-Qāsim al-Ka’bī (d. 931) with whom he conducted a scholarly correspondence. His known pupils are the great philosopher and physician Abū Bakr al-Rāzī (d. 925, or later, whose prescription for Abū Zayd’s rose allergy is preserved), Abū l-Ḥasan al-ʿĀmirī (d. 992), and a little known author of a conspectus of the sciences, Ibn Farīḡūn. Abū Zayd died in 934.

Works

Arabic bibliographical scholarship has collected an impressive list of his writings – all of them lost, except a full-scale work on physical and mental hygiene, three fragments on diverse topics, and a few brief quotations. For classical Islamic scholarship, Abū Zayd’s merits lie, besides his exemplary prose style, in his mastery of theological subjects, that is, exegesis of Qur’anic passages or a study of the names and attributes of God. Today, he is best known as an early representative of Islamic geography, the eponym of the so-called

Balkhī School. Unfortunately, his geographical work is not extant and survives only in the later geographical descriptions by al-Iṣṭakhrī (d. 934) and Ibn Ḥawqal (d. after 973). Abū Zayd’s Geography is said to have consisted of 20 regional maps accompanied by descriptions; its principal new feature being, beyond the data of physical geography, a special interest in climate, agricultural produce, and their impact on the *géographie humaine*.

Abū Zayd’s smooth and elegant style, his appeal to the tastes of the educated court official, and his balance between technical terminology and common ethical sense can best be studied in his sole extant monograph on the *Welfare of the Body and the Soul*. Its first part treats the principles of the interaction between the four elements, seasons, bodily elements, temperaments, etc., and the traditional “non-natural” factors of health, among them food, drink, sleep, bath, and gymnastics, including a quite sophisticated chapter on music therapy. The second, shorter, part of the book on the hygiene of the human soul deals with four mental disorders: anger, fear, sadness, and hallucinations. The concept of interaction between body and soul, and particularly Abū Zayd’s demonstration of how the bodily disposition and dietetic and behavioral measures may correct an unstable condition of the soul, constitute a remarkable contribution to contemporary discussions between ethics and medicine in the Alexandrian tradition and Islamic theology. Obviously, Abū Zayd’s psychosomatic concept and his physiology are indebted to Galen’s writings; his ethics of the equilibrium between extremes (Greek *mesotēs*, Arabic *i’tidāl*) and his types of principal mental diseases are largely due to al-Kindī’s reception of Aristotelian and Neoplatonic concepts. In some contexts, notably in his discussion of themes in poetry and songs, we also find consideration of old Arabic Bedouin ideals, but more pervasive is Abū Zayd’s concern for the welfare of the ruler and his entourage, which he sees as a prerequisite for the welfare of his subjects and which is a distinct echo of Sasanian political thought and court ethics.

In a fragment, preserved in an anthology of the great littérateur al-Tawḥīdī (d. after 1009), Abū

Zayd defines politics (*siyāsa*) as a craft which serves the cultivation of a country and protects its inhabitants. The “product” of politics, he says, is owed to five causes (*‘ilal*): the material cause that corresponds with the affairs of the subjects; the formal cause: their general welfare; the active cause: the ruler’s concern for the affairs of his subjects; the intentional cause: the perpetuation of the general welfare; and the instrumental cause: the employment of incitement and intimidation (*tarġīb wa-tarġīb*, echoing the Qur’ānic *raġaban wa-raġaban*, sura 21, verse 90). As an illustration of how these causes are valid for other crafts, too, Abū Zayd names architecture and medicine, where, for instance, the material cause is earth, clay, stones, and wood for the former, and the human body for the latter, etc. Another parallel between politics and medicine lies in the double function of both the ruler and the physician, to maintain and to restore order. The combination of the four established Aristotelian causes with the Neoplatonic instrumental cause may be due to al-Kindī’s understanding of Proclus’ commentary on the *Timaeus* (cf. I 263, 19–30, Diehl (ed)) or of the *Theologia Aristotelis*, and the parallelization of architecture and medicine as practical crafts is a common feature of the classification of sciences and arts in late antiquity. The inclusion of statecraft, however, especially the usage of terms such as *maṣlaḥa*, “common welfare,” and the pair *tarġīb-tarġīb*, is a feature of Abū Zayd’s own characteristic design to combine three traditions of political thought: Hellenistic, Islamic, and Iranian.

Another fragment of Abū Zayd takes the games of backgammon and chess as examples of the principles of deterministic thinking (*jabr*, “compulsion”) versus free will (*qadar*). Determinists, the backgammon players, he says, would attribute the source of human action to God or to the influence of the celestial spheres, and the proponents of free will, the chess players, would hold the individual good or bad choice responsible for a person’s fate. In the medieval discussions, notably among Islamic theologians, on the relative admissibility of chess and backgammon, chess was mostly given precedence. Abū Zayd refrains from offering his own

preference, and his noncommittal and rational report on both positions is as remarkable as his analysis of the types of, and motives for, the veneration of heathen idols, preserved in a Qur’ān commentary of Fakhr al-Dīn al-Rāzī (d. 1209). However, it has been suggested that Abū Zayd’s analysis of the principles of chess might be interpreted as “an argument in favor of Mu’tazilism, as against the ‘orthodox’ Muslim *nard* view of the world, and it could have been the brilliant invention of one of the proponents of Mu’tazilah views” (Rosenthal *Gambling* 167).

Although Abū Zayd’s orthodoxy has been attested to by his contemporaries, later Islamic scholarship has neglected his memory. This is shown by how small the extant part of his considerable œuvre is and how ambiguously later biographers have labeled him. For all of them, the range of his scholarship was notable, but some hesitated whether to list him as a philosopher or a littérateur, others wavered between putting him into philosophy or theology, yet others admired his ability to combine both, *ḥikma* and *sharī‘a*. This multiple outlook is precisely a central feature of the scholarship as it was conducted in the Eastern provinces of the Islamic Empire in the few decennia between al-Kindī and al-Fārābī.

Barlaam of Calabria

John A. Demetracopoulos
Department of Education, University of Patras,
Patras, Greece

Abstract

Barlaam of Calabria (c. 1290?–1348) was a theologian, philosopher, and mathematician. Born Orthodox in Calabria (South Italy), he fled to Byzantium to join Greek monasticism. Commanding both Greek and Latin and well versed in ancient Greek, Patristic, and Byzantine literature, he was recognized by most Greeks as a sage both in profane and religious matters. His attack, however, on Gregory Palamas, a leading spiritual authority at the Mount Athos, and on his peculiar trend of “hesychasm,” led to a condemnation of Barlaam by the Byzantine Church. Turning back to the West, he converted to Catholicism and became a bishop. Clashing with a strong Byzantine tradition, he highly evaluated philosophy, regarding Platonism as compatible with Christianity and Aristotle as compatible with Platonism. Though fond of Neoplatonic literature, he had no taste for its mystical aspect; instead, he regarded moral purification

and acquisition of scientific knowledge as means of one's "assimilation to God."

Life

Barlaam was born Orthodox in Seminara (Calabria). Ordained monk and priest, he was eager to live in some Greek coenobium imbued by genuinely ascetic spirit. He reached Greece through Arta (c. 1325); he then reached Thessaloniki and Constantinople. Though commanding both Greek and Latin, no Latin influences are traceable in him; his intellectual formation was based almost exclusively on a thorough knowledge of ancient Greek, Patristic, and Byzantine literature. Though admired for his philosophical and scientific (astronomical and mathematical) skills, in 1330 he was fiercely attacked by Nikephoros Gregoras as "arrogant" and a "Latin ignorant." Also admired for his theological erudition and being *hêgoumenos* of the Monastery of Our Saviour, he was probably appointed by emperor Andronikos III (1328–1341) and patriarch John Kalekas (1334–1347) as the representative of the Orthodox party in the discussions of the Byzantine Church with two papal legates held in Constantinople (1334–1335). His numerous treatises *Against the Latins* date from these years. Bad feeling as well as his peculiar method of refuting the *Filioque* (which seemed as threatening the Orthodox position alike) provoked a reaction by Gregory Palamas, who described him as a "Latin agent." From 1336 onward, he was engaged in the so-called hesychast controversy, by attacking the psychophysical method of "omphalicism" (probably deriving from the Sufi tradition). After coming back from a failed diplomatic mission to the West (1339), Barlaam published his *Against the Massalians*, where he described Palamas' doctrine of "seeing" God by means of the bodily eyes as a revival of the Massalian heresy. A synod held at Constantinople in 1341 condemned his anti-Palamite views and writings (the latter were destroyed) and exiled him. Turning back to the West, he was converted to Catholicism; in 1342, he was appointed bishop of Ierax

(Seminara). He then wrote some epistles and speeches on behalf of the Catholic doctrines. He was for a short while in personal contact with Petrarch (1304–1374), whom he taught some rudimentary Greek. In 1346, he was sent by Pope Clement VI (1342–1352) to Constantinople to discuss with the Byzantines a unionist project.

Thought

Most of Barlaam's philosophical ideas should be gathered from his theological and scientific works, the only purely philosophical work among his indisputably genuine writings being the short *Solutions to the Questions Addressed by George Lapithes* (c. 1334).

Barlaam regarded religion and philosophy as two distinct yet compatible ways (i.e., faith and reasoning) of reaching the same end, that is, truth. Placing reason side by side with revelation amounted to a revival of the Early Christian doctrine of "seminal reasons." Since, however, this clashed with the established Byzantine stereotype that "Hellenism" (i.e., fervently studying and ranking ancient Greek philosophy high) was an attitude incompatible with Christianity, Barlaam was presented by Palamas as a "crypto-pagan." Still, Barlaam explained that most of the ancient philosophical schools failed to raise themselves above the realm of the sensibles. Only Platonism did it; thus, it is the only philosophy compatible with Christianity. Neither the Stoic nor the Epicurean attendants of St. Paul's speech in Athens converted to Christianity but only Dionysius the Areopagite, whom Barlaam regarded as a Platonist in view of the *corpus Dionysiacum*. The close affinities of this *corpus* with Proclus made Barlaam feel free to integrate into his writings numerous terms and doctrines from several Proclan works (*Elements of Theology*, *Platonic Theology*, *Commentaries on Alcibiades*, *Parmenides*, *Timaeus* et al.) and eclectically combine them with Christianity. Barlaam did the same with Plato's texts (e.g., *Euthyphro*, *Phaedo*, *Phaedrus*, *Timaeus*, *Republic*) as well as with those by many other Neoplatonists (Porphyry, Iamblichus,

Syrianus, Olympiodorus), along with some Byzantine Neoplatonizing authors (Michael Psellos, Michael of Ephesus, Eustratios of Nicaea).

Doing philosophy has two prerequisites. (1) One must purify one's soul by "mortifying its passions." This is necessary, because the human soul is impeded on the one hand by the bodily needs, which tend to turn it into a slave of theirs, and on the other by the senses, which provide it with data which can show to the right direction only if carefully used. (2) One must get rid of the prejudices inserted into one's soul by the social environment and scrutinize one's mature views lest one mistakes a false statement for true. Barlaam presents Socrates as the ideal of living philosophically and adopts verbatim Proclus' elaboration of this ideal (firmly believing in one's own wisdom leads one astray from truth more than just lacking any belief at all, since it amounts to a "double ignorance," i.e., ignorance both of truth and of one's own ignorance). Discerning truth from falsehood can be achieved by using Aristotle's "dialectic," that is, by carefully evaluating the opposite doctrines on any matter. This, however, is a hard task, because falsehood often takes the appearance of truth. This results from one's own desires, which cause wishful thinking, as well as from a basic feature of reality, that is, its being divided into an intelligible and a sensible realm, the latter being a foggy reflection of the former. Man participates in both, "phantastikon" being the "mediator" between the intellect and the bodily senses.

True knowledge results from "direct acquaintance." Since, however, most men's knowledge derives either *ex auditu* or inferentially, error lurks everywhere. Still, although he states that detecting truth on intelligible realities, such as God's triunity, by means of syllogisms is impossible, because premises are meaningful only inasmuch as they describe things known by acquaintance, he did not share the radical skepticism of Nikephoros Gregoras; he only wanted to qualify what is accessible to humans (and how) and what not.

Aristotle's philosophy is in the main compatible with Platonism. Aristotle's logic is an indispensable tool for any high human activity

(philosophical, scientific, theological, and political). Aristotle's categories (which regard meaningful words) apply only to the realm of sensibles; using words to describe the intelligible realm can be only metaphorical (yet not fully univocal). Demonstration by syllogisms regards philosophical and scientific (strictly speaking, only mathematical and, probably, astronomical) statements. "Dialectical" conclusions regard natural science; as Plato says, any theory of nature is, in the best case, just a "plausible description," because, in contrast with mathematics, where deduction is possible, natural science uses induction. The remaining branches of Aristotle's philosophy are compatible with Platonism and Christianity; for most of Aristotle's statements regard the sensible beings and cannot, therefore, clash with Plato's tenets on what lies beyond sense experience and above discursive thought.

Knowledge consists in grasping the "reasons of beings," that is, the species of beings the sensible reality consists of as well as the regular activities of these beings. In this respect, Barlaam adheres to the Neoplatonic doctrine of the "universals" as preexisting in God's mind, inhering in the sensible beings, and grasped by means of philosophy and science. This knowledge is a sort of knowledge of God, inasmuch as it shows that the rationality of the creature reflects the wisdom of its Creator ("natural theology"; I Cor. 1, 21). Barlaam looks indecisive on whether the mind extracts the "reasons of beings" from the sensibles (Aristotle) or sense experience just "awakes" or "digs out" (i.e., renders conscious) what is innately yet implicitly present in the soul (Plato, Proclus).

Barlaam knew that Proclus and some of the contemporary "hesychasts" accepted a higher (nondiscursive) knowledge, "enthusiasm," or "ecstasy," but he rejected it, for he adhered to Synesius of Cyrene's idea that "Hellenic philosophy" differs from "barbaric philosophy" (i.e., Christian monasticism) inasmuch as the former deems knowledge as a quality of the *pars intelligibilis* of the human soul, whereas the latter naively claims that purifying the *pars passibilis* affords humans (even uncultivated humans) direct access to the things divine.

A Latin *Ethica secundum Stoicos* is of doubtful authenticity. If genuine, it must have been written after 1342, probably in the context of Barlaam's contact with Petrarch, whose moral thought is Stoically colored. Its main point is that the most important virtue is not *scientia* (which is left out from the prerequisites of happiness) but *constantia* (the Latin equivalent of the Greek *eupatheia*), which is attainable only through "extirpating" (not just "moderating") passions.

Bartholomaeus Arnoldi de Usingen

Pekka Kärkkäinen

Faculty of Theology, University of Helsinki, Helsinki, Finland

Abstract

Bartholomaeus Arnoldi (b. c. 1465, d. September 9, 1532) (also called Usingen after his birthplace) began as a philosopher in the *via moderna* school and later became a member and a theologian of the Order of Augustinian Hermits. Together with Jodocus Trutfetter, he was the most prominent philosopher in Erfurt in the early sixteenth century. Usingen's main authorities were John Buridan, William of Ockham, Gregory of Rimini, Peter of Ailly, and Gabriel Biel. The focus of his teaching was on a "common view of the *via moderna*," which was strongly involved in semantic–metaphysical questions. Usingen stressed the importance of logic as a necessary tool for gaining scientific knowledge, but it was his works on natural philosophy, in particular, that were respected by his contemporaries. In natural philosophy, he generally followed the tradition of Buridan. His discussion on the theory of supposition follows Ockham. On the relationship between theology and philosophy, he strongly posited the unity of truth by allowing certain theological truths a sufficient degree of plausibility as truths in natural philosophy. This view was partly based on Lawrence of Lindores.

Usingen began his studies at the University of Erfurt in 1484. He became a Bachelor of Arts in 1486 and Master of Arts in 1491. Together with his colleague Jodocus Trutfetter, he was active in an influential quodlibet disputation in 1497. In 1498, he became a member of the council of the Faculty of Arts and afterward was active in several official positions. During 1504, he was the dean of the faculty. Usingen joined the Augustinian hermits in 1512 and was promoted to doctor of theology in 1514. He became actively involved in the German Counter-Reformation and, in particular, opposed the Wittenberg reformers. In 1522, he became an archdeacon. He was forced to leave Erfurt during the Peasants' War in 1525 and ended up in Würzburg, where he stayed at the local Augustinian monastery. During his last years, Usingen followed the local bishop in visitations to the monasteries and even participated in the Diet of Augsburg in 1530, where he was appointed as a member of the commission to examine the Augsburg Confession and where he contributed to the writing of the Catholic Response. He died in Würzburg in 1532.

Along with his teaching activities, Usingen frequently published textbooks on the liberal arts that were reprinted several times. His compendium on natural philosophy was reprinted in Erfurt as late as 1543. Johann Eck made use of Usingen's writings in his philosophical works written in Ingolstadt in the 1510s. As a philosopher, Usingen belonged to the *via moderna* school, as did all his colleagues at the Faculty of Arts in Erfurt. After becoming an Augustinian friar, he distanced himself from scholastic philosophy, and from 1517 onward, he did not publish any books on philosophy. Instead, he wrote several theological treatises, most of them directed against the Wittenberg reformers. Already during his time as a Master of Arts, he had shown a strong affiliation with humanists, and as a theologian, his ideal was that of a humanist-oriented theology, which based its argumentation exclusively on the Scriptures and the Church Fathers.

As a follower of the *via moderna*, Usingen was committed to respecting certain authoritative writers and to adopting some key doctrines.

These authorities included, above all, Buridan and Ockham but also such authors as Gregory of Rimini, Peter of Ailly, and Gabriel Biel. None of the authorities were uncontested in the *via moderna* school at the time; on some points of doctrine, their views were disagreed with. As for the contents of the doctrine, the more or less commonly held views of the *via moderna* are also found in Usingen's writings. These include the use of the principle of parsimony, a moderate nominalist view of universals, and the denial of a real distinction between the powers of the soul as well as between the entities denoted by the Aristotelian categories other than substance and quality. He seems to have elaborated the views of the school to some degree, particularly the theory of signs. In his discussion of individual topics, Usingen frequently refers to the "common opinion of the *via moderna*."

For Usingen, logic is a science that provides scientific knowledge with a methodological basis. There is also a certain inner order to the logic itself, which places the logic of terms ("old logic") ahead of propositional logic ("new logic"). Usingen seems to reformulate some of his definitions of key logical concepts, such as that of universals, in a manner that points to some underlying changes in his conception of metaphysics and semantics. In his logic, he devotes special attention to the properties of terms and bases his account on supposition on Ockham's views.

In natural philosophy, Usingen also focuses on presenting the "common view of the *via moderna*." In some cases, he chooses to present or even defend conflicting views on a particular question (see, e.g., the probable arguments for and against the view that there is a real distinction between quantity and substance in his *Exercitium physicorum*). The authority of Peter of Ailly and Buridan over Ockham is evident, for example, in his discussion of species in psychology and his adherence to Buridan's theory of sense perception. On the relationship between natural philosophy and theology, Usingen offered a solution that strongly suggested a consonance of truths among diverse sciences. Disagreement between the views of some philosophers and the revealed

truths of theology were not to be attributed to distinct sources of truth but to these philosophers' deviance from the true natural light of reason. Usingen's view of the matter was also based here on the tradition of the *via moderna* and especially the views of Lawrence of Lindores. Usingen, in addition, wrote a commentary on the Latin grammar of Donatus, which gives a semantic reading of basic grammatical concepts such as terms and the modes of signification.

Basil Bessarion

George Karamanolis

Department of Philosophy, University of Vienna, Vienna, Austria

Abstract

Basil Bessarion (c. 1400/1408–1472) was an eminent scholar and philosopher of late Byzantium, engaged in the theological and philosophical controversies of his time, such as those regarding the union of the churches, the procession of the Holy Spirit, and the question of how the philosophies of Plato and Aristotle compare. After the end of the council at Ferrara/Florence, Bessarion left Byzantium and settled in Italy where he made a career as a cardinal. He was an avid collector of manuscripts, which he left to the Republic of Venice, now preserved in the Bibliotheca Marciana. Bessarion recommended to the West the study

of the classical philosophers from the original. His work *In calumniatorem Platonis* is a detailed exposition of Platonic philosophy and an attempt to place it in its historical framework. Bessarion's views on substance, the soul, on cognition, and the divine are mainly inspired by the Neoplatonists.

Bessarion was born at Trebizond between 1400 and 1408, originally named Basil. He was educated in Constantinople and Mystras by teachers like George Chrysococces and George Gemistos Plethon, and he became a monk in 1423 when he acquired the name Bessarion. After spending some years in the monastery of St. Basileios in Constantinople, Bessarion became bishop of Nicaea in 1437 in Asia Minor. Bessarion was invited to attend the council of Ferrara/Florence in 1438/1439 and was very active in supporting the union of the Greek Orthodox Church with the Latin Catholic, maintaining that their difference is minimal. Bessarion eventually sided with Catholicism and Pope Eugenius IV, who made him cardinal, yet he kept the Orthodox manners and rituals. Bessarion spent the rest of his life in Italy, appointed to several ecclesiastical positions, while he was twice a candidate for the papacy (1455, 1471). In 1465, he acquired the title of Patriarch of Constantinople by Pope Pius II.

Bessarion was strongly engaged in the contemporary theological and philosophical debates, such as on the union of the two Churches, on the procession of the Holy Spirit, the debate on the value of the philosophies of Plato and Aristotle, as well as on the question of the immortality of the soul and the divine providence. He wrote theological treatises in support of the union of the two churches (*Oratio dogmatice de unione, Encyclica ad Graecos*) and on the Holy Communion, arguing against the Greek-Orthodox positions (*De sacramento eucharistiae*; Mohler 1923: I.211–247), and rhetorical works such as the *Praise for Trebizond (Laudatio Trapezuntis)*. In the field of philosophy, Bessarion contributed a Latin translation of Aristotle's *Metaphysics*, presumably relying on the version of William of Moerbeke

(Wilson 1992, p. 58), while he also composed a summary of Aristotle's *Physics*. Most notable is his long treatise *In calumniatorem Platonis*, published in 1469, where he meant to discredit the attack against Plato by George Trapezountios in his *Comparationes philosophorum Aristotelis et Platonis* (published in 1458), which criticized Plethon's condemnation of Aristotelian philosophy in his work *On the Differences Between Plato and Aristotle (De differentiis)*. Philosophically important is also his treatise on *Whether Nature Deliberates or Not (De natura et arte)*, written in 1458 but published in 1469 as the sixth book of his *In calumniatorem Platonis* and a reply to Plethon about Aristotle's view of substance (Mohler 1942: III.148–150; see below).

Bessarion also translated into Latin Demosthenes' *First Olynthiac* and Xenophon's *Memorabilia*. The reason behind the translation of the former was to remind his compatriots of their duty to liberate Byzantium from the Ottomans, allegedly analogous with the duty of resistance to the Macedonians argued by Demosthenes. Xenophon's work on the other hand was translated presumably because it was considered a guide to ethical action, a kind of protreptic (Wilson 1992, pp. 57–58).

Bessarion became famous as a collector of manuscripts of Greek authors, which he left to the Republic of Venice, making the core of the later Bibliotheca Marciana (Mohler 1923: I.408–415; Labowsky 1979). The inventory of the Bibliotheca lists 482 manuscripts (Wilson 1992, p. 62). Bessarion was assisted by a number of copyists employed by him, such as Michael Apostoles and Demetrios Trivolis (Mioni 1994, p. 238). Most importantly, Bessarion often added comments to manuscripts, showing remarkable acumen about textual criticism and matters of interpretation. Bessarion had a circle of students and copyists (Wilson 1992, p. 66), and he was in contact with many intellectuals of his time. He had mastered both Greek and Latin, and he circulated his works in both languages, although the Latin version was probably taken care of by his secretary Niccolo Perrotti (Monfasani 1981, 2008). Bessarion died in Ravenna in 1472 and was buried in Rome.

Philosophy

Bessarion's more important philosophical works are the *In calumniatorem Platonis* and the *De natura et arte*. The former is a long and scholarly work, consisting originally of four books (Monfasani 1976). The first book refutes Trapezountios' criticisms of Plato, arguing that Plato was very erudite and covered all parts of philosophy (Monfasani 2008). Bessarion also puts Plato's philosophy in its historical framework; he adopts the view of later Platonists like Numenius and ancient Christian apologists that Plato borrowed from the wisdom of Moses and also that he shared several Pythagorean doctrines, another ancient view, which was also defended by Plethon. In the second book, Bessarion sets out to show that Plato's philosophy comes closer to the Christian doctrine than that of Aristotle, although he acknowledges that neither of them arrived at it. In order to substantiate this claim, Bessarion offers a detailed exposition of Plato's philosophy, in which he presents the most significant doctrines of Plato, making also reference to the relevant ones of Aristotle. Bessarion is not polemical to Aristotle, arguing that the defense of Plato should not entail the rejection of Aristotle (*In calumniatorem*, II.3). In his third book, Bessarion aims to show that Plato's doctrines had many followers, including Aristotle. A large part of this book deals with theology, the questions of divine providence, and the immortality of the soul, connecting Plato with Thomas Aquinas, Albert the Great, and Averroes (Mohler 1942: III.6.3–6.4, 10.9, 15, 17.2, 21.7). The final book takes issue with Trapezountios' claims that question the morality and usefulness of Platonic philosophy, such as the claim that Plato exhorts the youths to a life of pleasure and that he supports the sharing of wives. Bessarion argues that Plato must be judged by the standards of his time, which was ignorant of the Christian teaching (IV.3). The work as it appeared in 1469, revised by Niccolo Perotti, included two more books (Monfasani 2008). Book five criticized George of Trebizond's translation of Plato's *Laws*, while book six contained Bessarion's treatise *On Whether Nature Deliberates or Not* (*De natura*

et arte; Mohler 1942: III.92–147, Mariev et al. 2015).

This treatise addresses a topic much discussed at the time (Monfasani 1976, pp. 166–167). Replying to Plethon but also to George of Trebizond, who argued that nature acts for an end but does not deliberate, Bessarion defends the view that nature does deliberate when acting for an end, and he also argues that on this issue, Plato and Aristotle are in accord on the role and the status of nature (Chap. 2, "That Plato and Aristotle hardly disagree with each other on the nature's deliberation to the eyes of the careful student of their works, even if they may appear so"). Bessarion takes position on the perennial philosophical issue of how nature differs from the intellect that he identified with God (Chap. 7, "Reply to George's Question as to how intellect and nature differ"). Bessarion argues that the intellect is different from nature by being a moving cause of nature and yet, he claims, both intellect, that is, God, and nature deliberate albeit differently. Nature, Bessarion claims, is the instrument of the intellect, through which the latter gives, completes, and perfects things (Mohler 1942: III.132), a view reminiscent of Plotinus' argument in *Ennead* III.8. This is the view that George of Trebizond challenged, while Bessarion attributes different kind of deliberation to nature and to God, arguing that "deliberation" can mean both "investigating," which pertains to nature, and "reasoning or thinking," which pertains to God (Chap. 5, "Another refutation of the contrary view that seeks to show that the nature does not deliberate and does not do things for an end" Marchetto 2015, pp. 743–748; cf. Mohler 1942: III.114–122). Bessarion further maintains that the Christian fathers also acknowledge that God deliberates and on this, he argues, they agree with Plato (Marchetto 2015, pp. 749–750).

On the question of substance, Bessarion defends Aristotle against Plethon in his attitude to consider as substances the individual things, while he maintains that the universals, the Platonic Forms, exist essentially as concepts in the intellect (*Against Plethon on Aristotle About Substance*, Mohler 1942: III.149–150). Bessarion adopts an interpretation of the Forms that goes back to Neoplatonists from Porphyry

onward. According to this interpretation, the Forms are either “in the things” (*en tois pragmasi*), determining the nature of things, or applied “on the things” (*epi tois pollois*), being concepts in the human intellect by means of which man cognizes, and also “before the things” (*pro tôn pollôn*), being causes and models of everything that there is. Bessarion argues that Aristotle preserves all these uses of Forms, as he accepts immanent Forms, concepts, and also a first god who thinks (Mohler 1942: III.150), which means that Bessarion adopts the interpretation of later Platonists according to which the transcendent Forms exist only in the divine mind, in God.

Bessarion was important in the history of philosophy first for his attempt to introduce the classical Greek philosophical tradition to the westerners and also for raising the standards for the scholarly study of classical philosophers in the West. His detailed presentation of Platonic philosophy in his *In calumniatorem Platonis* was the first of its kind in the Latin world, and it was also the first to deal at length with later Platonists, such as Plotinus, Porphyry, and Simplicius, preserving long quotations from them. Unlike the medieval students of Aristotle, Bessarion makes the study of Greek philosophers from the original a requirement, while he also puts emphasis on the knowledge of the relevant philosophical tradition, ancient and medieval, before treating a philosophical question.

al-Baṭalyūsī, Abū Muḥammad ibn al-Sīd

Marc Geoffroy

Centre National de la Recherche Scientifique,
Villejuif, France

Abstract

Ibn al-Sīd was the first significant western Muslim philosopher whose works have survived. His main works are *The Book of Questions* and *The Book of Circles*; both show the introduction into the western Muslim world of themes of the *falsafa* that originated in ninth- to tenth-century Baghdad. In particular, the *Book of Circles* counts as an evidence of the circulation of an emanatist metaphysics of clear Neo-Pythagorean bent, as the one witnessed in the encyclopedia of the Ikhwān al-Ṣafā'.

Life

Abū Muḥammad ibn 'Abdallāh ibn al-Sīd al-Baṭalyūsī is the first *ḥakīm* (i.e., follower of the philosophical doctrines) of the western Muslim world whose written works have survived. Born in Badajoz in 1052 at the court of the Aḥṣad prince al-Muẓaffar, his education benefited greatly from the flowering arts and literature of the city under this *Taifa* prince. It is not known what kind of philosophical education he had, but he received primarily literary and grammatical training. After the city was taken by the Almoravids, he took refuge in Teruel, where he held the office of Secretary (*kātib*) to the local sovereign. He retired to Toledo, Zaragoza (before 1110, where he met the young Ibn Bājjā, or Avempace), and finally ended up in Valencia where he died in 1127.

Works

Ibn al-Sīd was the first author to explicitly seek to harmonize religion with the "sciences of the Ancients." He is best known for his many philosophical and grammatical works. His main works are a commentary on a classical source of Arabic literary art, *Adab al-Kuttāb* (*The Secretaries' Guide*) of Ibn Qutayba, entitled *al-Iqtidāb* (*Improvisation*), and a treatise on the dogmatic differences in Islam, *al-Inṣāf fī al-asbāb al-mūjiba li-khtilāf al-umma* (*The Equitable Judgment on the Causes Originating Discrepancies in the Community*).

In addition, he wrote two books of philosophical content. The first of these was the *Kitāb al-Masā'il* (*The Book of Questions*), which is a compilation of questions written in a sometimes lively and personal style. Several questions relate to philosophy. In the most important of these, he narrates that he had a visit from a friend who told him he regretted having heard the reciting of two verses of Abū l-Walīd al-Waqqaṣhī, a learned Mu'tazilite, then deceased, who was suspected of heresy. These verses were ambiguous and seemed to emphasize the futility of religion. Ibn al-Sīd then begins to explain to his friend that these words may also be understood differently. Referring to al-Fārābī, he shows that philosophy and religion come together as for their ultimate goal. The two channels differ only by the means used to reach this goal, namely the cognition of truth. One is concerned with demonstration and the other with persuasion and imagination. The reason for the existence of these two complementary, though distinct, modalities of science (*'ilm*) is the inequality of human nature. Some humans are not equipped with a power of understanding sufficient to reach the truth through demonstration: thus, religion establishes the same truths by means of persuasion. This is a theme that would subsequently be taken up by Averroes.

Religion need not be demonstrated by apodictic reasoning, since it is, according to the teaching of al-Fārābī, based on different modes of rhetorical persuasion. Its foundations, its

“demonstration,” as explained in the continuation of this text, is exterior to the discourse, and consists in the miracles accomplished by the Prophet. One can thus conceive of the coexistence of two models of truth that do not interfere with one another, namely that of the Law, “followed by persuasion and imitation,” and that of philosophy. The latter remains dependent on the maintaining of religion, because the acquisition of philosophy necessarily requires a habit of virtue that cannot be instilled by anything but religion.

Another “Question” reflects a controversy with Ibn Bājja, which was likely to have taken place in Zaragoza during Ibn al-Sīd’s stay in the city. Ibn al-Sīd accused Ibn Bājja of unreasonably reducing the grammatical notions of “theme” and “rheme” of the utterance (*mubtada’* and *khavar*) to the logical notions of “subject” and “predicate.” The latter imply an ontological relationship of inherence of the predicate in the subject, while the utterance on the linguistic level tells nothing about such a relation: instead, it is an act inscribed in the proper order of language, independent of categorical logic. Ibn al-Sīd testifies to a rejection of the introduction of logical concepts in grammar, stating that “their aim is not the same.” This debate introduced into Hispanic-Muslim territory the theme of the famous controversy held in Baghdad, between the logician Abū Bishr Mattā and the grammarian al-Siraḥī (see the entries on ► [“Translations from Greek into Arabic”](#) and ► [“Abū Bishr Mattā ibn Yūnus”](#) in this volume).

The second philosophical book is the *Kitāb al-Ḥadāi’q* (*The Book of Circles*). This book, divided into seven chapters, is the first relatively systematic presentation known in Andalusia of a Graeco-Arabic emanationist metaphysics inspired by Neoplatonism, which Ibn al-Sīd notably refers to “Socrates, Plato, Aristotle.” The symbolism of the three degrees of emanation, that is, the Intellect, Soul, and the body, as interlocked circles where the Agent Intellect, the universal Soul, and the human being, respectively, occupy the tenth place, the concept of man as a microcosm, the numerological determinism controlling the procession of beings, with the prominent place given to the Decade, all this refers to a source

inspired by Neo-Pythagoreanism, namely the encyclopedia of the “Brethren of Purity” (Ikhwān al-Ṣafā’), a major source of the early western Muslim *falsafa*. The general framework of the metaphysical “system” presented by Ibn al-Sīd is clearly dependent on al-Fārābī. The procession of beings from the One (explained in chapter 1) occurs through a process of successive mediations (*tawassuṭ*). The “secondary causes,” that is, the intellects moving the spheres, are distinguished, as in al-Fārābī, from the Agent Intellect that informs and enlightens the human intellect. The perfection of the human being, treated in chapter 3, consists in the return toward its principle. This requires an ascension through the degrees of the theoretical sciences, that is, mathematics, physics, metaphysics, and theology. This intellectual training produces the union of the human with the Agent Intellect, and allows the human to join a “boundary” between the inferior world and the world of separated beings. Overall, the work shows a high degree of eclecticism. The tradition of the “Sages”, whose doctrines Ibn al-Sīd wants to expound – as stated in the prologue – generates a kind of timeless continuum where Greeks are not distinguished from Muslims, included the theologians (*mutakallimūn*). This is illustrated by the fifth chapter, dealing with certain issues of negative theology (i.e., whether we can positively predicate the attributes of creatures of God, or we should limit ourselves to deny their opposites) with references directly issued from the treatises of *kalām*. The theme of the final chapter, i.e., proofs of the immortality of the soul, reflects the author’s concern to harmonize his doctrine with religious teaching.

The Book of Circles had a significant posterity in medieval Jewish thought, from Bahiya ibn Paquda to Isaac Abravanel. It was translated twice into Hebrew, and in particular by the famous Samuel ibn Tibbon (c. 1271). It was likely known, in the Almohad period, by Ibn Ṭufayl. In the thirteenth century, the fourth *Sicilian Question* by Ibn Sab’īn, *On the Soul*, follows verbatim the arguments of the last chapter of *The Book of Circles* on soul’s immortality.

Being

Gyula Klima

Department of Philosophy, Fordham University,
New York, NY, USA

Abstract

The notion of being is the most fundamental notion in medieval metaphysics, but in some ways also in medieval theology, logic and epistemology. Given its centrality, it would be impossible to provide here even a sketchy historical survey of the variety of ways in which medieval authors handled this notion. Therefore, this article will rather survey those paradigmatic characteristics of the medieval notion that make it most difficult for contemporary philosophers to approach it.

The Semantics of *Ens*, *Esse*, and *Est*

According to medieval philosophers, the notion of being is simple, indefinable, and in some sense precedes all other concepts we have. This, however, does not mean that it cannot be clarified. For instance, the notion of propositional conjunction

is also simple and thus indefinable in terms of other, simpler concepts. Still, the notion can be clarified by describing the semantic function of the word expressing it in the following manner: the word “and” in English has the function of joining two propositional clauses in such a way that the conjunctive proposition expressed by the resulting compound sentence is true if and only if both propositions expressed by the clauses of the compound sentence are true. Likewise, we may provide a similar clarification of the notion of being through first characterizing the semantic functions of the words expressing it as these functions were typically conceived by medieval philosophers.

The English word “being” translates both the present tense active participle form “ens” and the infinitive form “esse” of the Latin verb “est,” corresponding to the English verb “is.” Just like the English verb, the Latin verb functions both as a copula, joining subject and predicate into a proposition, and as an absolute verb, asserting the existence of the thing referred to by the subject.

Influenced by the post-Kantian/Fregean mantra according to which “existence is not a predicate,” many contemporary philosophers might be inclined to part company with their medieval colleagues already at this point. However, this oft-quoted slogan in the sense in which it is trivially true is simply irrelevant, whereas in the sense in which it is clearly relevant, it is simply false. For, in the sense in which it expresses the claim that the verb “be” and its cognates (including “exists” and its derivatives) used in the sense in which they express a Fregean second order concept (a concept that operates on other concepts) do not express a first order concept (a concept true of things), the slogan is trivially true. But in that sense it is irrelevant, as it says nothing about how medieval philosophers could or could not use the verb “est” and its cognates (cf. Klima 2004). However, in the sense in which the slogan would claim that medieval philosophers could not have possibly used “est” and its cognates as a predicate, the slogan, though clearly relevant, is simply false, for our medieval colleagues just did use them as such. Indeed, they did so consistently,

and reflectively, within the framework of some truly intriguing semantic considerations.

One question that immediately crops up if one reflects on the syntactic role of “est” both as a copula (*esse tertium adiacens*) and as an absolute predicate (*esse secundum adiacens*) is whether it is a mere coincidence that it is the verb expressing existence that is used in both roles, both to copulate subject and predicate (to distinguish the resulting proposition from a mere list of names) and to predicate the actual existence of something. The question was already systematically considered by Abelard, who deployed an impressive array of arguments concerning the issue. However, his preferred theory, which would provide a noun-phrase/verb-phrase analysis of all categorical propositions (and thus would accord the copula the function of merely turning a nominal predicate term into a verb phrase), did not catch on, and did not have followers in the thirteenth century (cf. Jacobi 1986; King 2008).

The typical thirteenth century analysis followed Aristotle’s considerations, not only in the *Peri Hermeneias* known to Abelard, but also in Aristotle’s later recovered works, especially the two *Analytics* and the *Metaphysics*, along with Avicenna’s and Averroes’ immensely influential interpretations of Aristotle’s doctrine. These considerations suggested both that the copula is essential in all predications for joining two noun-phrases in a proposition (thus, even a verb is supposed to contain an implicit copula, and so is to be analyzed into a copula-plus-participle construction, such as “A man runs” = “A man is running”) and that the sense of the verb “est” even in its copulative function is somehow related to or is even derivable from its existential sense. The idea is neatly expressed by Thomas Aquinas in his commentary on Aristotle’s *Peri Hermeneias*:

The reason why [Aristotle] says that the verb ‘is’ co-signifies composition is that it does not principally signify composition, but secondarily; for it primarily signifies what occurs to the mind in the way of actuality absolutely: for ‘is’, uttered absolutely, signifies being in act, and hence it signifies as a verb. However, since actuality, which the verb ‘is’ principally signifies, is in

general the actuality of every form (whether it is a substantial or an accidental actuality), when we want to signify any form or act to actually inhere [*inesse*] in a subject, we signify this by means of the verb ‘is’, either absolutely [*simpliciter*] or with some qualification [*secundum quid*]. . . (In *Perihermeneias* lb. 1, lc. 5, n. 22).

So, on Aquinas’ view, the verb “est” primarily signifies an act of being (*esse* or *actus essendi*) of that to which it is attributed (whether it is its substantial act, as in “Socrates is” or “Socrates is a man”, or some accidental act, as in “Socrates is wise” or “Socrates is tall”), and only secondarily signifies the composition of subject and predicate. Taking the verb “est” to signify an act of being (*esse*) is based on an analogy with any other verb that signifies some act, just as the verb “currit” (“runs”) signifies an act of running (*currere*) (cf. In *De hebdomadibus* lc. 2, n. 22). Thus, when “est” is used as an absolute predicate, when it is to be analyzed into copula and participle just as any other verb, as in “x est” = “x est ens”, then “est” signifies the substantial act of being of x (as does the nominal predicate “ens”), and it is the actuality of this act of being that verifies the predication. However, when “est” is construed with another predicate as the copula, as in “x est N”, where “N” is some noun-phrase, then it still primarily signifies existence, although in a sense somehow modified by the content of the predicate, which signifies a form of the subject. In that case, the act of being signified by “est” is the act of being of the form signified by the predicate, which is the substantial act of being of the subject, provided the form signified by the predicate is the substantial form of the subject, or an accidental act of being of the subject, if the form signified by the predicate is an accidental form (cf. Klima 2002a).

From Semantics to Metaphysics

We can have a better understanding of this somewhat obscure point, if we consider how Aquinas conceives of the modifications of the sense of “is” imposed on it by different predicates in different categories, relating his theory of the copula to his conception of *the analogy of being*, the semantic

theory that the term “ens” is neither univocal, nor equivocal, but analogical, because it applies to several things of different kinds neither in exactly the same sense (as the term “animal” applies to cats and mice), nor in utterly diverse, unrelated senses (as the word “bat” applies to flying mammals and baseball bats), but in different, yet related senses (as the word “sees” applies to the eye and to the mind). Thus, according to Aquinas, beings (*entia*) come in different varieties, expressed by the different, yet related senses of the verb “est”, signifying the different ways in which these things are, on account of having their characteristic way or mode of being (*modus essendi*) (cf. Klima 2002b).

In his commentary on the *Metaphysics*, Aquinas writes:

being cannot be narrowed down to something definite in the way in which a genus is narrowed down to a species by means of differences. [...] Being must then be narrowed down to diverse genera on the basis of a different mode of predication, which flows from a different mode of being; for ‘being [*esse*] is signified,’ i.e., something is signified to be, ‘in just as many ways as something is said to be a being,’ that is, in as many ways as something is predicated. And for this reason the first divisions of being are called predicaments [i.e., categories], because they are distinguished on the basis of different ways of predicating. Therefore, since some predicates signify *what* [something is], i.e., substance; others *of what kind* [something is, i.e., quality]; and yet others *how much* [something is, i.e., quantity]; and so on; it is necessary that for each mode of predication, being should signify the same [mode of being]. For example, when it is said that a man is an animal, ‘is’ signifies [the mode of being of] substance; and when it is said that a man is white, ‘is’ signifies [the mode of being of] quality; and so on. (In *Metaphysicam* lb. 5, lc. 9, n. 5)

The main point of this passage is that the division of being into the categories is not like the division of a genus into its species by means of specific differences, which is the division of a univocal term. This point is made even more explicit in the following passage:

There are two ways in which something common can be divided into those that are under it, just as there are two ways in which something is common. There is the division of a univocal [term] into its species by differences by which

the nature of the genus is equally participated in the species, as *animal* is divided into *man* and *horse*, and the like. Another division is that of something common by analogy, which is predicated according to its perfect concept [*ratio*] of one of those that divide it, and of the other [s] imperfectly and with qualification [*secundum quid*], as being is divided into substance and accident, and into being in actuality and in potentiality, and this sort of division is, as it were, midway between [the division of something] equivocal and [something] univocal (*In Secundum Sententiarum* d. 42, q. 1, a. 3).

So, Aquinas' idea seems to be the following. Every predication we make is a predication of being, but, depending on the predicate we use, it is a predication of being with some qualification or other. Thus, for instance, when I say "Tom is a cat" or "Jerry is a mouse", these predications assert the being of Tom cat-wise and the being of Jerry mouse-wise, respectively. This is because what the predicates of these predications signify are the respective essences of Tom and Jerry, which determine their modes of being, namely, cat-life and mouse-life, respectively. But as the above-quoted passage from the *Commentary on the Metaphysics* indicates, this idea is extended to all categories, including all nine categories of accidents. Indeed, the idea is further extended to all predicates, which may not even signify accidental forms, such as privative predicates, which signify rather the lack of such forms, and relational predicates that do not signify real inherent relations of things, but rather mere relations of reason. Such *significata* of predicable terms, then, were regarded by Aquinas (and practically everyone else working in the same semantic framework) as specifying the mode of being of an altogether different realm of entities, whose being consists in their being conceived by reason (*cuius esse est intelligi*), though not without some foundation in reality namely, beings of reason (cf. Klima 1996).

Thus, for Aquinas, the verb "est", both as an absolute predicate and as a copula, signifies existence (*esse*). As an absolute predicate, as in "Tom is" or "Jerry is" it signifies the acts of existence (*esse*, or *actus essendi*) of the things of which it is

predicated. But since these acts of existence are determined by the essences which they actualize and which are signified by the same things' essential predicates, the verb can also signify the same acts of existence when it joins the names of these things to their essential predicates, as in "Tom is a cat" or "Jerry is a mouse". But then again, when the verb copulates accidental predicates to their subjects, then it will signify the acts of being of their accidents, its sense now being determined to express the peculiar mode of being (*modus essendi*) of accidents, as in "Tom is black" or "Jerry is grey". And for the same reason the same verb will express yet another sense of being when its sense is determined by what is signified by a privative predicate, or any other predicate signifying some being of reason (*ens rationis*), as in "Tom is blind" or "Jerry is desired by Tom".

Accordingly, in Aquinas' view, the different analogical senses of being, related to its primary sense (expressing existence absolutely speaking) closely reflect the different ways in which things are: their *modi essendi*. In this way, his doctrine is akin in spirit to the theories of the modists (*modistae*), whose main tenet was that different ways of being are reflected in corresponding ways of understanding (*modi intelligendi*), expressed, in turn, in corresponding ways of signifying (*modi significandi*) (cf. *modistae*; Ebbesen 1998; Marmo 1999; Zupko 2008).

However, even the modists did not think that one could simply "read off" one's ontology from one's syntax, and neither did Aquinas, nor any other medieval thinker. On a general level, nearly everybody would hold that the ways in which things exist are reflected somehow in the ways in which we think, which in turn are reflected in the ways in which our words signify. But the important metaphysical differences between individual thinkers of the period can actually be characterized by the different ways in which they would depart from a simplistic "mirroring" interpretation of this "modistic principle": the different ways in which they think the structure of language and thought diverges from the structure of reality.

For instance, Aquinas insists time and again that Plato's main error concerning universals was

his failure to realize the difference between *modi essendi* and *intelligendi* and *significandi*: just because we have universal words and concepts, it does not mean that there are corresponding universal things, for our universal words and concepts represent only singular things (since every really existing thing is singular), but in a universal manner. So, there are certain words and concepts representing things in some way, but there are no things existing in the same way: things exist in one way (singularly and materially) and are represented in another way (universally and immaterially) (*Summa theologiae* I, q. 85 a. 1 ad 1). Therefore, the “modistic principle” in its simplistic, “mirroring” interpretation cannot be upheld by any philosophers who reject a naïve Platonic conception of universals, as did all major thinkers in the thirteenth century. The differences among these thinkers were always in the finer details.

The Analogy Versus Univocity of Being and the Thesis of Real Distinction

Although Aquinas’ theory of the analogy of being seemed to cohere well both with Aristotle’s teaching and with the requirements of religious and theological language about God, many authors challenged the view that the sense of “being” would vary with whatever it is attributed to. To be sure, thirteenth-century authors agreed that different kinds of things existed in radically different ways. Indeed, based on Aristotle’s considerations in the *Categories* alone, it was taken for granted that the mode of being of substances (namely, subsisting on their own without inhering in an underlying subject) is radically different from (indeed, opposite to) the mode of being of accidents (namely, inhering in an underlying subject) (see the entry on “► [Substance, Accident, and Modes](#),” this volume). And of course it was also generally held that the way God exists is infinitely more perfect and, hence, is radically different from the way limited creaturely natures can exist. But there were differences in how individual authors interpreted these differences themselves in their metaphysics and theology, and how they thought these differences are properly

reflected in thought and language, in their semantic considerations.

For Aquinas (who was influenced on this point by Avicenna’s doctrine), the ultimate difference between God and creatures is the real distinction between essence and existence in creatures and the identity thereof in the absolutely simple God. It is precisely this famous “thesis of the real distinction” that prompts Aquinas to think of creaturely natures as imposing diminishing determinations on being, which without such a limitation is unlimited:

A created spiritual substance has to contain two [principles], one of which is related to the other as potency to act. And this is clear from the following. It is obvious that the first being, which is God, is infinite act, namely, having in Himself the whole plenitude of being not contracted to the nature of some genus or species. Therefore it is necessary that His being itself should not be an act of being that is, as it were, put into a nature which is not its own being, for in this way it would be confined to that nature. Hence we say that God is His own being. But this cannot be said about anything else, just as it is impossible to think that there should be several separate whitenesses, but if a whiteness were separate from any subject and recipient, then it would be only one, so it is impossible that there should be a subsistent act of being, except only one. Therefore, everything else after the first being, since it is not its own being, has being received in something, by which its being is contracted; and thus in any created being the nature of the thing that participates being is other than the act of being itself that is participated (*De spiritualibus creaturis* q. un., a. 1).

Thus, for Aquinas, creaturely essences impose a limitation, and so a diminishing determination on being itself (as it would be found in God, without any limitation), precisely because of the real distinction between essence and existence in creatures, whereas the divine essence does not impose such a limitation on divine being, precisely because they are really one and the same infinite reality. It is this order of reality of the different modes of being that is reflected in the different, analogically related senses of “being”,

expressing an analogical notion of being. The reason for this parallelism between different modes of being and the analogical senses of “being” seems to be that predications of “being” of any creature *x* of nature *N* may be viewed as a predication of “IS” in the unlimited sense (in which it only applies to God) with the added diminishing qualification referring to *N*, determining precisely the sense of “being” in which it can apply to a creature of nature *N*; that is to say, “*x* is a being (of nature *N*)” if and only if “*x* IS-with-respect-to-*N*” (cf. Klima 2002c).

However, motivated either by Averroes’ interpretation of Aristotle, or by Augustine’s Neoplatonic theological doctrine, philosophers, such as Siger of Brabant, as well as theologians, such as Henry of Ghent, rejected a real distinction of essence and existence even in creatures, arguing that existence cannot be something really distinct, added to essence as another “thing” (although Giles of Rome held precisely this view in his debate with Henry of Ghent) (cf. Lambertini 2008). Consequently, these authors had a different interpretation of both the Aristotelian metaphysical doctrine of the analogy of being between substance and accident, and the philosophical-theological doctrine of the difference between God and creatures. However, if essence and existence are not really distinct in creatures, then essences cannot act as diminishing determinations on existence in the way Aquinas conceived.

On Henry’s view, essences in themselves, as they are eternally in the divine mind, have their own eternal essential being (*esse essentialae*), grounding the eternal truths of essential predications (such as “Man is an animal”). However, these essences are realized in actual existence in the creation of singulars, in which their acts of actual existence (*esse actualis existentiae*) are intentionally distinct (are represented by different intentions, that is, concepts), but not really distinct from the essences of these singulars (although, as Henry insists, this distinction is not *merely* a conceptual one) (cf. Porro 2008). But then this conception breaks the strict logical relationship of the Thomistic conception between different modes of being and the different analogical senses of the term “being” in which it is truly predicable of

different sorts of entities of different natures. If different creaturely natures are not construed as adding diminishing determinations to their distinct acts of being, then the analogically related notions of being are not regarded as derivable from a primary notion through extension by the addition of diminishing qualifications. Rather, different notions of being are arrived at simply through the specification of different kinds of beings in terms of their different natures. However, this move, at least in principle, gives rise to the possibility of abstracting some generic notion of being univocally applying to several kinds of entities, just as we can abstract generic notions of different specific natures, and so, the more specific notions of being expressing the different ways of being in which things of different natures exist are just different specifications of the original, confused, unlimited notion, applying to all.

To be sure, Henry still insists that our intellect cannot form a single concept that would equally apply to God and creatures, on account of the infinite essential difference of perfection between God and creatures. But, at the same time, he also granted that we at least appear to have a single concept of being applying to God and creatures, because we just tend to confuse the two different ways of abstracting the notion of being that applies to God and the notion of being that applies to creatures, resulting in a concept of being which is “something analogous common to Creator and creature, containing under itself being as principle and being as produced (*commune analogum ad creatorem et creaturam, continens sub se ens principium et ens principiatum*)” (Henry of Ghent 1520: *Summa*, art. 21, q. 3, f. 126rD).

Nevertheless, this conception quite clearly opens up the possibility of another departure from the “modistic principle”: different modes of being do not demand different senses of the term “being” to express them, for all these different modes can be apprehended indifferently by a single concept, providing the meaning of a single univocal term, allowing reasoning about any being as such, without a risk of the fallacy of equivocation. In fact, this was precisely one of the main motivations for Duns Scotus to endorse a theory of the univocity of being, as opposed to

the Thomistic theory of the analogy of being, or rather as more directly opposed to Henry's conception of two distinct, yet analogically related notions of being (cf. Scotus 1950: *Ord.*, 1, d. 3, pars 1, q. 1–2, n. 26–56; Dumont 1998).

Consider the following syllogism: Anything that is a bat is a flying mammal; any baseball bat is a bat; therefore, any baseball bat is a flying mammal. The argument is clearly not valid, insofar as the premises are true, because in the sense in which a flying mammal is a bat, a baseball bat is not a bat. The argument is vitiated by the fallacy of equivocation. But this holds, apparently, not only in the case of equivocal terms, but also in the case of analogical terms. Consider the following argument: Everything that is healthy is alive; but the food on your plate is healthy; therefore, the food on your plate is alive. Clearly, unless you are about to consume something that is alive, the food on your plate is healthy only in the sense that it makes you healthy, but not in the sense that it is alive and well. However, it is only in that sense of “healthy” that the first premise can be true. So, an argument of this sort is fallacious even with analogical terms. Accordingly, if “being” cannot be predicated of God and creatures in the same sense, then, apparently, all arguments arguing from creaturely being to divine being are fallacious (which would render absolutely all arguments about God fallacious, provided that all predications are just variously determined predications of being, and all our cognition derives from our cognition of creatures).

To be sure, Thomists could still respond, as for instance Aquinas' great commentator Cajetan did, that some analogical terms still possess sufficient unity to secure the validity of reasoning with them. Take for instance the following argument: Whatever is seen is cognized; this mathematical problem is seen by the intellect; therefore this mathematical problem is cognized. Clearly, in this piece of reasoning, the minor premise is true only in the secondary sense of “see,” in which it applies to the intellect, whereas the major premise is true whether “see” is taken in the bodily or in the intellectual sense. By contrast, consider the following argument: Whatever is seen is colored; this mathematical problem is seen by the intellect;

therefore this mathematical problem is colored. In this case, the major premise is true only in the bodily sense of “see,” whereas the minor premise is only true in the intellectual sense, and that is why there is fallacy in the argument. However, in the previous argument there is no fallacy precisely because the major premise is true in both related senses (cf. Hochschild 2007).

Nevertheless, however the case may be with the debate between Thomists and Scotists, it is clear that Scotus' doctrine is another step away from a simplistically interpreted “modistic principle,” although in the opposite direction: just as the order of being need not precisely match the conceptual order (that is, every distinction of concepts need not have a corresponding real distinction among beings), so different modes of being need not be reflected in different (although possibly related or “partially identical”) concepts. Thus, Scotus' doctrine of the univocity of being, while still recognizing different modes of being in reality, simply allows the possibility that the intellect can form a simple concept indifferently representing them all, without there being a simple, common reality directly and adequately represented by this concept. Viewed from this perspective, Scotus' move seems to fit squarely into a general trend in late-medieval philosophy: the elaboration of ever more refined accounts of just how the conceptual order may differ from the real order, culminating in fourteenth-century nominalism.

Although Scotus' treatment of the notion of being may be regarded as a part of this trend, his treatment of universals in general still seems to harken back to “the modistic principle”: common terms of our language apply to several, numerically distinct singular things of the same kind, because these things share a common nature, which, to be sure, is not some numerically one real entity on a par with the singulars themselves, but still has its own “less-than-numerical unity” and its corresponding mode of being, preceding any act of the intellect conceiving it. Yet, Scotus' treatment of “being” indicates that, at least from a semantic point of view, there is no real need to posit such common natures to account for the universal mental and linguistic representation of

singulars. Thus, his younger contemporary Henry of Harclay could rightly insist, precisely on the basis of Scotus' own doctrine of the univocity of being, that our intellect is capable of forming concepts that indifferently represent singulars of the same kind without representing a single common entity (whether it is supposed to be numerically or merely less-than-numerically one). It is precisely this idea that seems to have been seized upon by William Ockham, to be worked out in detail in his nominalist philosophy and theology (Henninger 2006).

From Metaphysics, Back to Semantics

Given its centrality in the semantic framework in which it was articulated, it is no wonder that the notion of being took on so many varieties and gave rise to so many metaphysical problems. After all, in this framework, all true predications are taken to be verified by the actual being of the *significata* of our predicates, whether those *significata* are taken to be the natures or substantial forms of substances, or their accidental forms, their quantities, qualities, relations, actions, passions, times, places, positions or habits, or even not any genuine forms, but rather the lack thereof, that is, privations, or other beings of reason, such as negations or relations of reason. In fact, we may add to the list of such "quasi-entities" demanded by this framework the *significata* of entire propositions, variously called *dicta*, *enuntiabilia*, or *complexe significabilia*, etc. (Nuchelmans 1973, 1980).

In general, one may say that in this framework there is some "nonchalance" toward admitting semantic values (as they called them, *significata* and *supposita*, cf. Read 2008) of our expressions in our ontology, relegating the task of sorting them out to metaphysics. And this is precisely what thirteenth-century metaphysicians do: they make various classifications of various sorts of beings (based primarily on Aristotle's system of the categories), and ever more refined distinctions and identifications among the semantic values of various expressions in different linguistic categories, leading to a burgeoning ontology of entities and

quasi-entities, having different degrees of reality (or unreality, for that matter), and different, sometimes rather obscure criteria of identity or distinctness (or quasi-identity and quasi-distinctness: see the above-mentioned examples of Scotus' less-than-numerical-unity, or Henry of Ghent's intentional distinction, let alone Scotus' formal distinction, or Suarez's modal distinction) (see Suarez 1947).

The following table provides a general overview of the varieties of being entertained by medieval philosophers working in this framework, sketching out "the big picture" of the ontology or "quasi-ontology" (containing also various sorts of quasi-entities) of what may be termed the framework of the realist "via *antiqua* semantics" in contrast to the nominalist "via *moderna* semantics," emerging in the works of William Ockham and his followers, such as John Buridan, Albert of Saxony, Marsilius of Inghen, Peter of Ailly or Gabriel Biel (Table 1).

Given the immense complexity of the resulting ontology, one can certainly understand Ockham's complaint, according to which his contemporaries are guilty of "multiplying beings according to the multiplicity of terms. . . which, however, is erroneous and leads far away from the truth" (Ockham 1974:169; see also page 171, where Ockham explicitly claims that this is the root (*radix*) of the errors of "the moderns").

To be sure, Ockham's charge is not exactly justified. After all, as we could see, even earlier authors could reduce the ontological commitment of their theories by either identifying the semantic values of expressions across different categories (as when following Aristotle, they declare that action and passion are the same motion, or when they identify relations with their foundations in the categories of quality or quantity, etc.) or by assigning them some "diminished" ontological status, by relegating them to some class of "quasi-entities." However, it is true that earlier authors, taking it for granted that our meaningful words are meaningful because they express concepts whereby we conceive of something, never worried about assigning semantic values to our phrases, and took it to be a *metaphysical task* to sort out the ontological status, identity, and

Being, Table 1 The “quasi-ontology” of “*via antiqua* semantics”

	Past	Present	Future	
Real beings	Ten categories of real entities, possible in the past	Ten categories of real entities, possible in the present	Ten categories of real entities, possible in the future	Possible
	Ten categories of real entities, actual in the past	Ten categories of real entities, actual in the present	Ten categories of real entities, actual in the future	Actual

	Individual quasi-entities (privations, relations of reason), <i>significata</i> of propositions, impossible in the past	Individual quasi-entities (privations, relations of reason), <i>significata</i> of propositions, impossible in the present	Individual quasi-entities (privations, relations of reason), <i>significata</i> of propositions, impossible in the future	Impossible
	Universals			Abstract

Note that I am using the designations of “*via antiqua* semantics” and “*via moderna* semantics” slightly anachronistically, to designate two radically different ways of construing semantic theory in late-medieval philosophy and theology, which I take to be the conceptual basis for the historically somewhat later separation of the two *viae* as the altogether different ways of doing philosophy and theology, leading to the so-called *Wegestreit*, the historical “quarrel of the ways” in the fifteenth and sixteenth centuries. For a detailed historical discussion of the late-medieval separation of the *via antiqua* and the *via moderna*, see Moore 1989. For the impact of the separation of these two ways on the emergence of “the battle of the faiths,” *Glaubenskampf*, in the age of the Protestant Reformation, see Oberman 1977

distinctness of these semantic values, leading to the ever more rarified metaphysical and theological questions in this framework.

Ockham’s real innovation, therefore, consisted not so much in producing a simpler ontology (since that, in principle, would have been available to his predecessors as well), but rather in reining in any unwanted “ontological excesses” *already in his semantics*. That is to say, the real novelty in Ockham’s approach is the elimination of unwanted ontological commitments, not only through metaphysical argument (resulting in identifying the semantic values of different expressions across categories or relegating them to some diminished ontological status), but rather through semantic analysis, which has remained ever since the most powerful weapon in the conceptual arsenal of nominalist philosophers (cf. Goodman and Quine 1947).

Just by way of a quick illustration, let us consider a simple example of how commitment to such quasi-entities as privations comes about in the older framework, and how Ockham can get rid of it through logical analysis (cf. Klima 1993). Take the privative term “blind”, which can obviously be true of something only if the thing in question lacks sight, that it could and ought to have by nature (namely, an animal that ought to have sight, but lacks it for some reason or other). In the older framework, if the predication “Jerry is blind” is true, then this is so, just as in the case of every other true predication, because what the predicate signifies in the subject is actually there in the subject (which is precisely the actuality that the word “is” signifies). But precisely because for blindness to be there is for the corresponding sight not to be there, the being of blindness cannot be taken to be being in the same sense as the being of

sight; therefore, blindness has to be a being in a different sense, a being of reason. And similar considerations apply to all sorts of privations, negations, or relations of reason, thus opening up the “quasi-ontological” realm of beings of reason in this framework.

Ockham, on the other hand, uses logical analysis to show that for the true predication of the term “blind” and similar privative terms we need not posit any such quasi-entities. As the nominal definition of the term shows, this syntactically simple term must have a complex concept corresponding to it in the mind, namely, the concept properly expressed by the nominal definition “animal not having sight.” Now, in this phrase, there are two *absolute* terms (terms applying equally and indifferently to whatever they signify, on account of being subordinated to the corresponding absolute concepts), namely, “animal” and “sight.” There is also a *connotative* term (signifying some of the things it signifies primarily and others secondarily, connoting them only in relation to the former, on account of being subordinated to a connotative concept), namely, the term “having”, primarily signifying the things that have something and connoting the things had by them. Finally, there is the syncategorematic term “not,” which does not signify anything in external reality, only the mental concept of negation, which is a mental act, merely modifying the representative function of the categorematic concept with which it is construed (cf. Klima 2006). Thus, the complex connotative concept to which the term “blind” is subordinated will signify animals, while connoting their sight; however, on account of the implied negation it will only apply to animals that do not have sight. Thus, on this analysis, the sentence “Jerry is blind” will be true just in case Jerry is one of the animals that do not have sight, just as it should be. However, the important difference of this analysis from the former is that this analysis does not require the actuality of some quasi-entity, namely, the privation of Jerry’s sight: the term “blind” applies to Jerry simply because he does not have sight, which is just what the negative connotation of the term requires. But this negative connotation is effected through the term’s signifying only

positive, real entities, namely, animals, their sights, and a positive quality of the mind, namely, the syncategorematic concept of negation.

Without going into further details, perhaps, even this brief illustration will suffice to indicate how, through such and similar analyses, Ockham is eventually able to come up with a much simpler, reduced ontological picture (see Klima 1999). In his semantics, all our linguistic expressions are mapped onto an ontology containing only two really distinct categories of entities, namely, entities belonging to the category of substance, and entities pertaining to the category of quality, some of which, however, are qualities of the mind, namely, those naturally representative mental concepts whereby we conceive of objects of our cognition (i.e., the categorematic concepts that provide the sense of our categorematic terms) or those mental concepts that merely have the function of modifying the representative function of the former (i.e., our syncategorematic concepts, providing the meaning of our syncategorematic terms).

As we can see, the semantic construction of the via *antiqua* certainly demanded the mapping of language onto a rich and complex structure of semantic values, accorded with different degrees or modes of reality, expressed perhaps in correspondingly distinguished senses of “being” (*ens*), among those who endorsed a strong doctrine of the analogy of being, such as Aquinas and his followers, or without such distinctions, among those who endorsed the doctrine of the univocity of “being,” such as Scotus and his followers. In any case, the rather “cavalier” assignment of semantic values to all linguistic items in any syntactical category in this semantic framework left it to metaphysics to sort out into which ontological categories these semantic values fall, and whether they are distinct or identical. Indeed, the latter questions led to distinctions among various forms of distinctions as well, ranging from numerical and real, to less-than-numerical, intentional, formal, modal, or mere conceptual distinctions. Nevertheless, the metaphysical strategies of distinguishing various modes of being and/or senses of “being” and allowing the identification or quasi-identification of semantic values of

expressions in various categories could in principle yield in this framework a real ontology (i.e., an ontology of real entities, not considering any quasi-entities) no more profligate than the parsimonious nominalist ontology of Ockham, acknowledging only two distinct categories of singular entities, namely, substances and qualities.

Ockham’s genuine innovation, therefore, was not so much in ontology per se, but rather in the ways and strategies he applied to reduce ontological commitment in the semantic theory itself. Thus, for him, the reduction of ontological commitment, in contrast to the via *antiqua* strategy, was not a separate metaphysical task to bring metaphysical order to a burgeoning quasi-ontology of “recklessly” assigned semantic values, but rather the direct task of semantic theory itself, carefully working out the mappings of distinct linguistic categories onto a parsimoniously construed ontology, containing only real entities in the “permitted” categories.

Thus, Ockham’s ontology can be represented by means of the following, much simpler diagram, cutting the former diagram in half, and reducing its inner contents as well (Table 2).

In this diagram, quasi-entities are gone: the phrases apparently designating them are all analyzed in terms of their nominal definitions, containing only phrases that denote or connote entities in the “permitted” distinct categories of substance and quality. A similar strategy allows the reduction of really distinct real categories from ten to just two. In fact, Ockham’s approach is so successful that one wonders why he even needs two categories. In principle, a simple homogenous category, the category of substance, would do for the purposes of his semantics.

As Marilyn Adams has convincingly argued (notably, on the basis of a passage from Buridan’s

Questions on Aristotle’s De anima, see Adams 1989:283–285), the need to posit a distinct category of quality stems from the need to explain genuine alteration as a change in quality, without having to resort to a “quantitative” analysis of it in terms of an atomistic physics. Thus, although logical analysis alone would allow a reduction of ontology to a single category, further considerations in metaphysics and physics do necessitate further ontological distinctions.

Indeed, it is precisely such further, metaphysical and physical reasons that prompt the great “systematizer and legitimizer” of Ockhamist nominalism, John Buridan to depart from Ockham’s ontology, despite sharing virtually the same semantics (see the entry on “► John Buridan,” this volume).

To be sure, despite the nominalist project of “ontological reduction,” in the nominalist semantic framework itself there is still what contemporary philosophers would identify as “quantification over non-existents,” and hence *ontological commitment* to some “weird entities.” However, in general, in medieval logic, quantification was not regarded as carrying ontological commitment. What we can refer to and quantify over may have been something, could be something, or, possibly, will be something, but if it is not actually one among the things presently populating our universe, then it is not anything, i.e., it is literally *nothing* (cf. Klima 2001:197–226, 2009:143–174). Thus, in the nominalist logical framework *to be* is simply to be identical with one of the actually existing things. Accordingly, although the affirmative copula in this framework still carries “existential import,” it does not *predicate* existence (whether absolutely or as qualified by the *significata* of the predicate). Rather, it is merely a syncategorematic sign of the identity of the *supposita* of the terms of an affirmative

Being, Table 2 Ockham’s ontology

	Past	Present	Future	
Real beings	Two categories of real entities, possible in the past	Two categories of real entities, possible in the present	Two categories of real entities, possible in the future	Possible
	Two categories of real entities, actual in the past	Two categories of actual real entities	Two categories of real entities, actual in the future	Actual

proposition. Therefore, perhaps paradoxically, the verb “est”, functioning as a copula, does not even express the notion of being. In this sense, nominalist logic completely broke the strong links assumed in the older framework between the various modes of predication (construed as various ways of saying that something is), and the various ways in which things are.

Bernard of Clairvaux

Constant J. Mews

Centre for Religious Studies, School of Philosophical, Historical and International Studies, Monash University, Clayton, VIC, Australia

Abstract

Bernard, abbot of Clairvaux 1115–1153, was one of the most eloquent preachers and spiritual writers of the medieval period. His

involvement in public affairs led him into conflict with two of the most distinguished schoolmen of his day, namely, Peter Abelard (1079–1142) at the Council of Sens (1141) and Gilbert of Poitiers (1076–1154) at the Council of Reims (1148). Nonetheless, he offered his own understanding on what he calls *consideratio*, strongly shaped by his reading of Augustine and other Church Fathers, of enormous influence over subsequent centuries. In particular, his emphasis on the role of experience and of desire for God in the spiritual life, and on the nature and character of love, would offer a perspective on the path to wisdom very different from that associated with either Aristotle or Boethius.

Biography

Bernard (1090/1091–1153), born to a noble Burgundy family, decided to join the fledgling monastic community at Cîteaux, along with a group of companions, in around 1113. Stephen Harding had established a new monastic community there in 1098, dedicated to strict observance of the *Rule of Saint Benedict*, free from the accretions of monastic practice that had grown up over the centuries – such as had happened at Cluny. According to his friend and biographer, William of Saint-Thierry (*Vita prima* 4, PL 185, 237C), his arrival there with more than 30 companions transformed the struggling community. In 1115, he was befriended and consecrated abbot of a new daughter house at Clairvaux by William of Champeaux, bishop of Châlons (1113–1121) and previously a distinguished teacher of grammar, dialectic, and rhetoric. Although he had previously founded a community of canons regular at Saint Victor, William spent much time until his death in 1121, in the company of Bernard, either at Châlons or at Clairvaux. By the early 1120s, he was emerging as a powerful voice in supporting the cause of monastic reform, not least through his *Apologia* – a devastating critique of worldliness in the monastic order – dedicated to William of Saint-Thierry in around 1121/1122 (according to Holdsworth

1994). He also became an important advocate for the cause of just war, in his *De laude novae militiae*, written for the Order of Knights Templar. He was a prolific writer of letters and, during the 1130s, became closely involved in supporting Pope Innocent II against a rival claimant, Anacletus II, to the papal throne. In Lent 1140, the more philosophically trained William of Saint-Thierry urged him to act against the influence of Peter Abelard, whose theological ideas, he feared, might provoke schism in the church. The situation was aggravated by the enthusiastic support Abelard received from Arnold of Brescia, expelled from Rome at the II Lateran Council, held in 1139. This led to Bernard confronting Abelard at the Council of Sens on May 25, 1141 and writing many influential letters to Rome that secured Abelard's condemnation by the Pope (Mews 2002). In 1145/1146, Pope Eugenius III (the first Cistercian Pope and a protégé of Bernard) asked him to preach the Second Crusade, following the loss of the short-lived colony at Edessa. In 1148, he was urged by admirers to act against Gilbert of Poitiers, whose sophisticated analysis of the theological writings of Boethius was construed by some critics as being as dangerous as that of Peter Abelard. These ultimately unsuccessful forays into public life may have harmed his wider reputation, but they did not detract from his enduring popularity as a writer and theorist of the spiritual life.

Thought

Little is known about Bernard's education at Châtillon prior to his becoming a monk at Cîteaux. William of Saint-Thierry would later recall that he gained his most important insights not from reading or from teachers but rather from the experience of solitude, gained from meditating "in woodland or field" (*Vita prima* 4, PL 185, 240CD). Monasticism provided a creative framework by which Bernard could channel his literary and spiritual energies, as well as formulate his own form of philosophical reflection, framed in terms of interior reflection rather than of academic enquiry.

Bernard was always interested in the need for authenticity in the religious life and the importance of *consideratio* or sustained reflection (Michel 1993). In an early work (1118/1119; Holdsworth 1994), the *De gradibus humilitatis et superbiae*, he builds on Benedict's relatively impersonal reflection on the stages of humility to reflect on the example presented by Christ in humbling himself to death. By overcoming personal obstacles, "they may cross over through contemplation to the third level of truth" (*De gradibus* 19; *SBO* 3:30). He was critical of monks who pursued vainglory rather than interior wisdom.

The first grade of pride is curiosity. You can see this in various ways: if you see a monk, in whom you had previously trusted well, standing, walking sitting everywhere, beginning to wander with his eyes, his head erect, ears attentive, you know the unchanged interior character of a man from external movements (*De gradibus* 28; *SBO* 3:38).

The monk praises fasting, commends vigils, elevates prayers above everything, disputes fully but uselessly about patience, humility or each of the virtues, so that you may say that the mouth speaks from the abundance of the heart, and that the good man offers good things from his good treasury (*De gradibus* 41; *SBO* 3:48).

His observations about false monasticism provide some of his most poignant insights and help explain his continuing popularity down through the centuries in an ascetic milieu.

In another early treatise addressed to William of Saint-Thierry, the *De gratia et libero arbitrio*, Bernard addresses a doctrinal issue, that of grace and free will, drawing firmly on the teaching of Augustine and the intellectual traditions of the school of Laon. He analyzes the nature of the free will or judgment that defines our humanity. This capacity for freedom is what defines us, as made in the image of God. He considers the various pressures acting against free will and the need for active consent to a good will. Everything good comes from divine grace but cannot be received without active choice on our part.

Bernard acquired perhaps the most distinctive aspect of his thought, his fascination with the Song of Songs as an account of the desire of the soul for the Word of God, through his encounter

with the commentary on that work of Origen, preserved in the Latin translation of Rufinus. Origen's writings had been little studied prior to the late eleventh century, having been officially condemned (apart from those approved by Jerome) in the fifth century. Bernard's discovery of Origen's commentary provided a new impetus for his reflection on the Song of Songs as a medium for reflecting on love and spiritual transformation. In the prologue to that commentary (In Cant. Prol. 2), Origen had spoken of the interest of the Greeks in composing many dialogues *de amoris natura* but sought to correct deficiencies by framing his reflection in terms of the Song of Songs – a treatise that he considered to focus on the contemplation of divinity, the ultimate focus of “true philosophy.” Origen's commentary, in which *amor* was used interchangeably with *dilectio* and *caritas* (even though Origen recognized that in scripture, the term *amor* was often replaced by *dilectio* and *caritas*), helped Bernard interpret the Song of Songs as the springboard for his own reflection on the spiritual life, in which he placed new attention on the role of experience. William of Saint-Thierry recalled the intimacy of the moment, when they were both convalescing at Clairvaux and debating the spiritual nature of the soul and the remedies offered by virtues against the vices (*Vita prima* 12, PL 185, 259B; dated to 1128 by Verdeyen 1992: 570, but perhaps earlier, following Holdsworth 1994). Bernard began to speak about the Song of Songs, very likely inspired by their reading of Origen, whose writings were preserved at Clairvaux.

Bernard was interested in the Song of Songs for what it had to say about the transformation of the soul in its desire for God. In his *De diligendo Deo*, composed probably in the early 1130s, he makes the first attempt in Christian tradition to write a treatise about loving God. While God should be loved for his own sake, he acknowledges that initially human beings love themselves for their own sake. Man must come acknowledge the supreme dignity that they have been accorded as creatures of free will made in the image of God. Self-knowledge is the most important path of any inquiry. Even those who did not know Christ were able to recognize that God should be loved for his

own sake, although this could not be achieved by their own effort (*De diligendo Deo* 6; *SBO* 3:123). He is acutely aware of the selfishness of human nature unredeemed by grace. This greed has to be subject to reason, in order to be transcended. Rather than urge the study of philosophy, he argues that the transformation takes place through loving God. Whereas William of Saint-Thierry had emphasized the gulf between carnal and spiritual love, Bernard focuses on the evolving stages of different kinds of love, beginning with love of self, evolving to love of neighbor, initially for one's own sake but subsequently for the sake of God. Man loves God initially for one's own sake, then for God's sake, and then only finally does man love himself for the sake of God.

Bernard started to compose his sermons on the Song of Songs during the mid-1130s, continuing to work on them over the next two decades. He sought to provide not a formal exegesis of its text but a reflection on the core themes of desire for God and the visiting of the soul by the Word of God. Because he was addressing monks rather than students of philosophy, he had no need to acknowledge formal sources of inspiration other than scripture. Nonetheless, his commentary was profoundly shaped by Origen's recasting of Platonist philosophy within the framework of the Song of Songs. In particular, he was excited by the bride's opening exclamation, *Osculetur me osculo oris sui* (Cant. 1:1) as a way of understanding scripture as a whole. The first kiss was the desire of those who longed for Christ, the second was that of Jesus as man, the third the anticipated mystery of the incarnation, and the fourth the incarnation itself (*super Cantica* 2; *SBO* 1:8–13). In a late sermon (*super Cantica* 74.3; *SBO* 2:241), he speaks of his having been frequently received visited by the Word, as a moment of mystical understanding that helped him understand scripture and Christian tradition. While Abelard emphasized the role of reason and the need to understand words in understanding God as supreme good and Hugh of Saint Victor the value of physical *sacramenta* as manifesting God's grace, Bernard highlighted the role of personal experience in this process. Although not the first monastic author to do so, his use of the

language of experience, of which he had great literary command, was of enormous influence within a monastic environment in creating an image of the self as alienated from its true goal (Pranger 1994). While more educated monks in the twelfth century would continue to study systematic works of philosophy and theology within a monastic context, his writings helped shape a more interior, devotional spirituality, employing the literary artifice of the devotional prayers and meditations of St Anselm.

Bernard's fame as a preacher led him to be increasingly involved in public affairs. In Lent 1140, William of Saint-Thierry – alarmed by reports of Abelard's influence within the Church – composed a detailed analysis of his theological errors to Bernard, who responded by addressing to Pope Innocent II a treatise of his own (*Epist.* 190; *SBO* 8:17–40) on the various errors of Peter Abelard, in large part derived from the writing of William of Saint-Thierry and a summary of texts, excerpted by an aide, very likely Thomas of Morigny. The final list of 19 heresies imputed to Abelard, agreed to by a meeting of these authors, was circulated by Bernard at the end of his *Epist.* 190 (Mews 1985). Whereas in the *De gradibus humilitatis et superbiae* he had inveighed against the spirit of *curiositas* in other monks, he now turned his rhetorical skills to caricature Abelard as embodying intellectual arrogance. He accused Abelard of undermining divine omnipotence and minimizing the significance of the redemption brought about by Christ's death. Misunderstanding Abelard's emphasis on the goodness of the Holy Spirit and reserve toward the doctrine of original sin, he painted his adversary as an arrogant philosopher, unwilling to submit himself to the discipline of the Christian faith.

In sermon 36 on the Song of Songs, written around the time of his confrontation with Abelard, Bernard defends himself against charges of anti-intellectualism:

Perhaps I might seem excessive in criticizing science as if rebuking learned men, and in prohibiting the study of letters. Far from it! I am not unaware of how great a service to the Church learned men have made, whether to refute adversaries or to instruct the simple (*super Cantica* 36.1; *SBO* 2:4).

He insists that his criticism is reserved only for those who misuse science by seeking self-aggrandizement or *curiositas*, or seeking knowledge for its own sake, and fail to pursue the only true *scientia*, that of self-knowledge, "because this is what reason, usefulness, and order, demand" (*super Cantica* 36.5; *SBO* 2:7).

Bernard composed his last major work, *De consideratione*, between 1148 and his death in 1153, as a treatise addressed to Pope Eugenius III, urging him to turn from public affairs and engage in *consideratio*, mature reflection "that purifies the mind... confers knowledge of human and divine affairs... hunts down truth, scrutinizes what seems to be true, and explores lies and deceit" (*De consideratione* 1.8; *SBO* 3:403). In particular, he reflects in relation to the four virtues that *consideratio* guides the mind into conformity with virtue (*De consideratione* 1.10; *SBO* 3:405). While he addresses Eugenius, reminding him that he is still a man, even though he has been elected Pope, the treatise can be read as a reflection on his own struggle to free himself from the trials of public life. The final end of consideration has to be oneself (*De consideratione* 2.6; *SBO* 3:414). After reflecting on the corruption, wealth, and legalism that have crept into the Church and the curia in particular, he devotes a long final book to reflecting on the third kind of consideration, namely, that which goes beyond its first and second kinds, namely, practical (*dispensativa*) and reflective (*aestimativa*) to that which is speculative (*speculativa*) and frees itself for contemplation (*De consideratione* 5.4; *SBO* 3:469). He concludes the work by laying out his understanding of God, employing the formula of St Anselm "that than which nothing better can be thought" (*De consideratione* 5.15–16; *SBO* 3:479). What Abelard had presented as *theologia*, Bernard refers to as *consideratio*, his considered reflection on how God may be transcribed, what Origen had described as the goal of true philosophy. His response to the question "What is God?" offers reflection on divine simplicity. Speaking of God's charity, majesty, and wisdom, he observes "It is not disputation but sanctity that comprehends them, if, however, what is incomprehensible can in any way be comprehended" (*De consideratione* 5.30; *SBO* 3:492). This leads

him to reflect on contemplation, as distinct from consideration, namely, admiration of divine majesty, observation of the judgments of God, the recollection of divine blessings, and the expectation of what is to come.

Bernard never called himself a philosopher and stood in an ambiguous relationship to those who pursued philosophical enquiry. His public criticism of both Peter Abelard and Gilbert of Poitiers led to him being considered as an anti-intellectual by his critics. Yet, there was much that was philosophical about his reflection on the role of experience and the limits of reason (Brague 1993).

Bero Magni de Ludosia

Robert Andrews
Centre for Medieval Studies, Stockholm
University, Stockholm, Sweden
Georgetown University, Washington, DC, USA

Abstract

Bero Magni de Ludosia, a Swedish philosopher who lived c. 1409–1465, taught only at the University of Vienna. His two major surviving commentaries, on Aristotle's *De anima*

and *De generatione*, are based, respectively, on John Buridan and Marsilius of Inghen. Bero's extensive discussions defend Aristotelian doctrine, such as explaining away 46 examples of sensory illusion. As well he digresses into other areas, such as Buridan's Ass, the Liar's Paradox, and the earliest known appearance of Ockham's Razor in the form "Entities should not be multiplied beyond necessity."

Bero Magni de Ludosia (Björn Magnusson, in Swedish) was born about 1409 in Lödöse, before isostatic rebound the major seaport of western Sweden. He was educated at the cathedral school in nearby Skara, and was likely a promising scholar, for he was sent off to study at the University of Vienna in 1429, an exile from which he never returned. He became a respected, long-serving professor of the Arts; he began theological studies, but never acquired the doctorate. Occasional visits to the Papal Curia are also recorded before his death in 1465 (Kihlman 2011a).

Relative much is known of his teaching, since the records for a number of his teaching years have been preserved. He undertook the usual courses expected of an Arts Master: classes on the *Ars vetus*, *De generatione*, the *Physics*, and others (Ferm 2011). Of these courses it is his commentaries on the *De generatione* and the *De anima* which have survived – in the case of the latter a *disputata*, indicating instruction conducted for students of his *bursa* in the afternoon after the regular lectures.

A few others of his works are extant: two academic speeches, two sermons, a commentary on the *Doctrinale* of Alexander of Villa Dei, and a grammatical tract, the *Verba communia*. One sermon raised a controversy, for in it he referred to the *vulvae virginalis*, which was perceived as unnecessarily rude; his defense prevailed, since the offending passage could be shown to be a quote from the pseudo-Augustine (Gejrot and Kihlman 2011: 13).

Bero never returned to Sweden, but his library did, as witnessed by a list of books donated to the cathedral library of Skara (Kihlman 2011b). The

information supplied by this list further confirms the interests of a Viennese professor – although oddly no copies of Aristotle's *De anima* or *De generatione* were included. Bero was remembered a century after his death in by the chronicler Olaus Magnus, who called "the wise Bero" an example of the "brilliant talent in Scandinavia" (Olaus Magnus 1555: 70).

Bero is most important as an interpreter of others' works: John Buridan in the case of the *De anima* and Marsilius of Inghen in the case of the *De generatione*. Writing a century after Buridan, Bero represents the mature stage of the domination of Buridan's thought in the schools of Central and Eastern Europe. Bero follows Buridan's question titles exactly, and his conclusions are often verbatim those of Buridan. Yet in the course of discussion, Bero takes every opportunity to expand upon Buridan's arguments and supplements them with many intriguing and interesting observations; Bero's commentary is one of the longest (122,000 words) surviving *De anima* commentaries of the Middle Ages.

Bero's comments, presented as illustrations for his students, also provide definitive early interpretations of Buridan's ideas. A good case in point concerns the famous Buridan's Ass. Schopenhauer, among others, looked in vain for the example in Buridan (Rescher 2006: 127 n. 26); it is in fact in Buridan's *De caelo* commentary (Buridanus 1996: 50), in Bero formulated in terms of a dog equally attracted to ten portions of meat. It derives from Aristotle's case (Aristotle's *De caelo* II,13 295b32) of a man equally hungry and thirsty, who would fasten at a midpoint between food and drink. Much later commentators have debated whether the intent of the medieval example was to show that animals are slaves to their desires, or to argue for intellectual determinism, or even to ridicule Buridan (Kaye 2005). Bero's presentation is unambiguous: it is an argument that the senses do not supply freedom and that an animal lacking in intellect is unable to choose among equal sensory inputs. Bero's use shows the earliest stage of the diffusion of this philosophical paradox.

Bero's *De anima* commentary allows for digressions upon other interesting topics. *De*

anima Book III,6 430a6-7, gave grounds to explore the Liar's Paradox, otherwise traditionally addressed in medieval *Sophismata* or *Insolubilia*. Bero introduces the Liar's Paradox as a counterexample to the correspondence theory of truth and transfers it to the sphere of the mental. Bero begins with the notion of a mental entity which causes its own existence. Such an entity is "concept"; whenever "concept" is thought, it creates its own existence. But what happens when I think "I am thinking a false concept" or "The thought I am thinking is false"? Even more puzzling, is it possible for God to conceive the concept "This concept is false"? If so, has He created a concept that is true or one that is false? In the realm of concepts, we are also God-like in being able to create the existence of something, a concept, merely by thinking of it. What do I create when I think "This concept is false"? Am I thinking something true, or am I thinking something false? Bero's treatment is a rebuke to those who claim that the Liar's Paradox cannot occur in mental language (Dutilh Novaes 2008: 254).

Bero offers six different explanations for the Liar's Paradox, taken from John Buridan, Thomas Bradwardine, Albert of Saxony, and John Wycliffe. Bero's own original solution is similar to the move called *mediantes* by Bradwardine (2010: 90), that an insoluble proposition has no truth value or perhaps a third value other than truth or falsity – thus in violation of the principle of excluded middle. Bero Magni says that "all [insoluble propositions] are doubtful, so that in this life they cannot naturally be known whether they are true or false," implying that insolubles have truth-values now, just that we do not yet know them. Discussion of the Liar's Paradox has not been found in any other *De anima* commentary.

The expansiveness of Bero's commentaries allows for elaboration of traditional themes. One such is the listing of sensory illusions, raised as disconfirmation of Aristotle's perhaps ill-advised claim that our senses are never deceived about direct and immediate sensations (*De anima* II, 6 418a12). Many apparent counterexamples are well known throughout the history of philosophy: the stick which seems bent in

water, the apparent size of the sun, and a square tower which seems round at a distance. Other examples rather are natural phenomena which are difficult to explain: bioluminescence, mirrors, and the rainbow. A number of such examples were later used by Descartes but for a more confrontational purpose; Bero in all instances defends Aristotle.

Bero Magni's other major surviving commentary, on Aristotle's *De generatione et corruptione*, treats the expected Aristotelian topics: how the things of the world come into existence, the four causes and the four elements. But besides these issues, Bero addresses puzzles and curiosities which seem to challenge Aristotelian theory, such as: How can semen create a complete human? Why does black hair turn gray? How does wine change into vinegar? Bero also engaged the superstitions of the day: How can frogs and flies be created by spontaneous generation out of mud? How can the salamander survive in fire? How can swifts spend the winter under water?

The recovery of Bero's thought helps to clarify the historical record. For instance, Bero provides conclusive proof that Ockham's Razor, in the form "Entities should not be multiplied beyond necessity" (*entia non sunt multiplicanda sine necessitate*), often claimed to be post-medieval (see Maurer 1978: 247–248), was indeed current in the Middle Ages. Bero in his *De generatione* commentary presents this exact form, as does Master Thomas' *De anima* commentary, which accompanies Bero's in their sole manuscript (Andrews 2016: 279 n. 33).

Bero also lies behind an early printed work, the *Verba communia*, an incunabulum of 1489, which is a grammatical treatise perhaps arising out of his classroom teaching. It consists of a hexameter verse commentary on the *verba communia*, passive verbs with both passive and active senses; this in turn is accompanied by a prose commentary. It is not clear how much of this text is authentically Bero.

The complete recovery of the works of Bero Magni, one of the earliest philosophers from Sweden, will help to clarify the full extent of the Swedish contribution to European intellectual history.

Berthold of Moosburg

Irene Zavattero

Dipartimento di Lettere e Filosofia, Università di Trento, Trento, Italy

Abstract

Berthold of Moosburg was a fourteenth-century German Dominican. He was called to direct the Dominican studium in Cologne in 1335, where he was involved in resolving the crisis caused by the conviction of Meister Eckhart's doctrines (1329). The doctrinal solution proposed by Berthold is contained in his commentary on Proclus's *Elements of Theology* (*Expositio super elementationem theologicam Procli*), the only medieval commentary on Proclus, a veritable summa of Neoplatonism. Berthold's project was to promote the return to the Neoplatonic tradition of the German Dominicans, dating back to Albertus Magnus. He demonstrated that the Albertine school was an autonomous and unitary cultural identity that had its roots in ancient wisdom, of which Proclus, according to Berthold, was the most outstanding exponent. Berthold sees in the Greek diadochus a "divine man" who

could scan the divine properties, which are present in the totality of the real world, and therefore ascend to God only by means of the natural reason. In the same way, according to Berthold, the philosopher who studies Proclian theorems performs a cognitive ascent which leads him to the contemplation of God. This is possible by virtue of the presence in man of a divine faculty, i.e., the “One of the soul.”

The few data available about Berthold of Moosburg’s life date to the period between 1316 and 1361. He was one of the most prominent Dominican lecturers teaching in Germany in the fourteenth century, and his career was that typical of an intellectual belonging to the Dominican order. He studied abroad, in Oxford (1316), was lecturer in Regensburg in 1327, and from 1335 to 1343 held the prestigious office of “chief lecturer” (*lector principalis*) at the *studium generale* in Cologne, a position which had previously been occupied by such figures as Albertus Magnus and Meister Eckhart. He had to leave Cologne when the Dominicans were expelled by the city authorities (1346–1351) as the result of a dispute over their incomes. Berthold seems to have spent these years in Nuremberg, where his presence is attested in 1348 as “vicar of the preaching friars for Bavaria.” After this date we find his name only in the testamentary papers of a Beguine, for whom he was the executor until 1361, when he renounced his assignment in favor of another executor.

He most likely wrote his monumental work *Expositio super Elementationem theologicam Procli*, a commentary on Proclus’s *Elements of Theology*, during his stay in Cologne. This is in fact the only work by Berthold which has been handed down to us, if we exclude some glosses to a text by Dietrich of Freiberg concerning the determination of the poles of a rainbow.

Berthold, who was a contemporary of John Tauler (1300–1361) and Henry Suso (ca. 1295/97–1366), belonged to that group of young intellectuals who were directly involved in the crisis and the discussions caused by the trial for heresy brought against Meister Eckhart, which ended in

1329 with the promulgation of a conviction bull (*In agro dominico*). Appointed director of the Cologne *studium*, Berthold contributed to resolving the post-Eckhartian crisis by promoting a return to the philosophical tradition of the German Dominicans, which could be traced back, through Ulrich of Strasburg and Dietrich of Freiberg, to Albertus Magnus. He carried out his philosophical project by commenting on Proclus’s *Elements of Theology*, that is, by choosing a Neoplatonic work – instead of an Aristotelian text, as was usual at that time – which had had limited influence in Parisian scholasticism but was much-appreciated from a doctrinal point of view at Albertus Magnus’s school in Cologne (by Dietrich of Freiberg and Eckhart), definitely oriented toward Neoplatonism. Berthold ushered in the most mature phase of Proclus’s reception, also using the commentary on Plato’s *Parmenides* and the *opuscula*. In particular, the great novelty introduced by Berthold was the use of the *opuscula*, having understood its importance for ethics and anthropology.

In the *Expositio* Berthold gathers the doctrines of the principal authors of the Neoplatonic tradition – from Augustine and the Pseudo-Dionysius to the contemporary German Dominicans (Albertus Magnus, Ulrich of Strasburg, and Dietrich of Freiberg) – in order to construct a unitary system, a veritable *summa* of medieval Neoplatonism.

In the prologue Berthold states the reasons for his decision to comment on Proclus’s work. The metaphysics contained in the *Elements of Theology* is a “divine philosophy,” made up of 211 theorems, which deals with God and the divine properties. These theorems describe reality according to the twofold movement, typical of the Neoplatonic doctrine, of procession from the One and return to him. Reality, produced by God, is described by Berthold from a “natural” point of view. He deals with the natural order of totality made up of a series of symmetrical planes, identical to each other in terms of essence and different in terms of being: these are Proclus’s four *maneries*, i.e., One, intellect, soul, and body.

Berthold maintains that, by means of the philosophy contained in the Proclean theorems, man

performs the ascent which leads him to the contemplation of the “divine exclusively divine,” that is, of the highest good. Man returns to the final perfection for which he was created, that is, to beatitude, and becomes not only blessed but also divine. The aim of Proclus’s work thus lies in performing a gradual ascent which, starting from the real world – which is divine by participation – reaches the divine world, which is such by essence. In particular, he who contemplates, i.e., the philosopher, grasps the divine realities by means of that cognitive principle which enables him to perform the ascent. Said principle is the “One of the soul” (*unum animae*), which possesses absolute superiority compared to every other principle within us.

Berthold asserts that Proclean henology is superior to Aristotelian ontology because it does not stop at the dimension of being, as happens in Aristotle’s metaphysics. Actually, Proclus, like Plato and the pre-Socratics, exalts a super-intellective knowledge produced by the “One of the soul,” which grasps the principles of principles, i.e., the supreme beings (*super-entia*) and, above all, the first good. Berthold points out the limits of Aristotle’s metaphysics: it has failed because its range of investigation is confined to the plane of being and because it has not been able to see in man the presence of that divine principle – by far superior to the intellect – which enables him to know the divine things. Therefore, the “One of the soul” becomes for Berthold the reason for the superiority of Platonic thought over all other philosophies.

Berthold sees in Proclus an example of “divine man,” the most prominent representative of those pagans who scanned the divine properties (*invisibilia Dei*) by means of the natural reason so deeply as to ascend to God. The German Dominican wants therefore to tie his commentary to ancient wisdom, as is also demonstrated by his frequent use of the Hermetic writings. From the Asclepius Berthold derives the concepts of “macrocosm” and “microcosm,” and through the Hermetic definition of man as “link between God and the world” (*homo nexus dei et mundi*), he explains how man is the connection point between the two planes of reality, the material and the divine.

The topics mentioned so far do not exhaust the problems tackled by Berthold in his *Expositio*, which amounts to nearly 2000 printed pages (the critical edition in eight volumes is now complete), but they are crucial points in Berthold’s doctrine which echo the typical doctrines of the German Dominican school, i.e., of Albertus Magnus’s school. For example, Berthold explains the structure of the Proclian cosmos by means of the “fluxus-doctrine” of Albertus Magnus and Ulrich of Strasbourg, namely, as a causal emanation of the first principle, which, as light, spreads everywhere producing the multitude of the beings. The latter are identical to the first principle in essence but manifold in terms of existence. In order to explain how this emanation takes place, Berthold resorts to Dietrich of Freiberg’s theory of essential causality. Moreover, the doctrine of the divine man had already been developed by Albertus Magnus in his theory of the intellect. However, Berthold develops it further, concentrating his attention on the Proclian concept of the “One of the soul,” which he takes from the *opuscula*. In many passages of the *Expositio*, Berthold identifies the “One of the soul” with Augustine’s “profundity of the mind” (*abditum mentis*) and with Pseudo-Dionysius the Areopagite’s “union” (*unitio*, translation of Greek *henosis*) surpassing the nature of the soul. This identification had already been partially stated by Dietrich of Freiberg in defining the agent intellect and by Eckhart in describing the “ground of the soul” (*grunt der sêle*). Therefore, Berthold operates a speculative synthesis of all his sources and transforms the doctrine of the divine man into the theoretical bond of the German Dominican school. The principal source for the *homo nexus dei et mundi* theorem and other Hermetic doctrines is again Albertus Magnus. However, the writings ascribed to the mythical figure of Hermes Trismegistus were often used in the early fourteenth-century Germany in connection with Proclus’s philosophy because the Neoplatonic and Hermetic doctrines were thought to derive from an ancient wisdom and to be the product of a philosophical revelation granted to a chosen few.

Berthold’s *Expositio* elaborates a synthesis of medieval Neoplatonic tradition and takes stock

of the German Dominican school in the thirteenth and fourteenth centuries. By inserting the doctrines of his German predecessors into the vast panorama of ancient and medieval Neoplatonism, Berthold consolidates the cultural identity of the Albertine school and emphasizes its autonomy and unitary character. The recourse to Neoplatonism thereby assumes the attributes of a cultural plan carefully elaborated by the German Dominicans and overtly contrasting with Parisian scholasticism, which in those same years was engaged in interpreting Aristotle's texts.

Berthold's attempt to expand on the speculative tenets of the Albertine school by means of the *Expositio* failed soon after his death due to opposition from Thomists and orthodox followers of Eckhart. A century later this tradition would be revived, thanks to Nicholas of Cusa, an admirer of Berthold's commentary, who mentions him in his *Apology of the Learned Ignorance* together with the exponents of Christian Neoplatonism, in dispute with the Aristotelian school.

al-Bīrūnī, Abū Rayḥān

Gotthard Strohmaier

Freie Universität Berlin, Berlin, Germany

Abstract

Al-Bīrūnī, Abū Rayḥān Muḥammad ibn Aḥmad was one of the most original minds of the Muslim world, and by the encyclopedic scope of his interests, perhaps of the whole Middle Ages. In contrast to many less important scientists of the Muslim world, he left no impact on Western scholasticism. The titles of his works amount to 148, but only a part of them is still extant. They deal with astronomy and astrology, geography and geodesy, mathematics and calendar reckoning, mechanics, mineralogy and pharmacognosy, and history of religions and culture. Being a committed Muslim, he was at the same time an enthusiastic admirer of the Greek thinkers. His Arabic style is sometimes sarcastic, especially when dealing with Muslim theologians who rejected obvious facts. Remarkable is also a cautious use of experiments, which are not to prove some preconceived ideas but to falsify them.

From his native region at the Amu Darya river, he did not travel further westward than to the Caspian Sea, but he had the opportunity, when accompanying military excursions, to become acquainted with the religion and customs of the Hindus, whose beliefs and sciences he censures from the standpoint of both his Muslim conviction and Greek science.

Al-Bīrūnī was born in 973 CE in Kath, a city on the Amu Darya river, the ancient Oxus, then the capital of Khwarezm. Although, as it seems, of humble origin, he was fortunate enough of being educated at the court of the ruling Khwarezm-Shahs, where one of the princes, Abū Naṣr Maṣṣūr ibn 'Irāq, a leading mathematician of the time, taught him the elements of geometry and astronomy. Very early in his youth, he began with astronomical observations and the construction of the necessary instruments. Due to political conflicts, he had to settle temporarily in Persia, first Rayy, near modern Teheran, where he had the opportunity to participate in the observations with a large mural sextant. Here in Rayy lived 100 years earlier the great physician and alchemist Abū Bakr al-Rāzī. Al-Bīrūnī compiled a bibliography of his works while not failing to distance himself sharply from his heresies.

Later, he had to settle in Gurgān at the southern coast of the Caspian Sea, where he dedicated to the sultan Qābūs his *Chronology*. In this book, he discusses the astronomical foundations of calendar reckoning of all the people and religions known to him. It contains a lot of interesting details of cultural history. Remarkable in this context is also his intimate knowledge of the Bible. Back in Khwarezm, he became, as a counselor of the ruling Khwarezm-Shah, involved in the inner politics of the country that was threatened and in the end occupied by the sultan Maḥmūd of Ghazna, who extended his empire from Afghanistan to Persia, Georgia, and the whole Central Asia. Al-Bīrūnī was deported together with other intellectuals to Maḥmūd's residence in Ghazna, present-day Ghazni. Here he could continue his astronomical observations. For a woman named Rayḥāna who hailed also from Khwarezm, he

wrote an *Introduction into the Art of Astrology* in the form of questions and answers. From a mountain that offered a far-reaching sight over the Indus plain, he measured the circumference of the earth with a method that was already used by the Caliph al-Ma'mūn (r. 813–833). Either willingly or unwillingly, he accompanied the repeated military incursions into Punjab, where Maḥmūd pillaged the temples and took rich booty of gold and slaves. The fruit of al-Bīrūnī's observations is a great monograph on the Hindus, their language, literature, religion, and customs. He finds most of this bizarre and the state of their astronomy below the standard of Greek science. He even learnt Sanskrit and tried, with the help of indigenous assistants, to translate some basic mathematical and astronomical texts into this language for the benefit of Hindu colleagues who were, though, unwilling to learn something new. With Maḥmūd's son and successor Mas'ūd, he was, as it seems, on friendly terms as he dedicated to him a huge astronomical handbook which bears therefore the title *The Mas'ūdī Canon*. A description of precious stones and metals, written in a more entertaining style and nowadays called *The Mineralogy*, was dedicated to Mas'ūd's successor al-Mawdūd. In an earlier tract, he had determined with a specially designed vessel the specific weight of 18 such substances. The last big work is a pharmacognosy, a list of 1,116 articles, where he equates about 4,500 names in 27 languages of plants and mineral substances used in therapy and diet. The arid philological subject appears sometimes enriched with interesting anecdotes. He left it partly unfinished when he died in 1048 CE in Ghazna.

Al-Bīrūnī was one of those enlightened intellectuals in the Muslim world, who were firm adherents of the Greek scientific heritage that came down to them via the Alexandrian school of late antiquity and the indefatigable activities of the Syrian and Arab translators working in ninth-century Baghdad. In a sarcastic style, he censures often those people who did not share his belief in the primacy of the Greeks. Typical for a medieval intellectual, in general, are derogatory remarks on his mother tongue, the now extinct Khwarezmian. He praises instead the Arabic language that he had

to learn later in life as the only suitable medium for the cultivation of the sciences. Sometimes, he stands out by a new and daring approach to geodetic and astronomical problems. While celestial globes with the pictures of the Greek constellations were widely in use, he was the first to construct a terrestrial globe, that is, a model of the Northern Hemisphere with a diameter of 5 m where he could combine the geographical latitudes and longitudes of the cities with their distances in miles as reported by travelers. While being in Kath, he determined in collaboration with a colleague in Baghdad the longitudinal difference between the two cities. This was possible by a lunar eclipse, which was to be observed at different times of the day in both places, in Kath 1 h earlier, what corresponded to 15°. In a special treatise on the various types of the astrolabe, he mentions one which was constructed on the conception that the sphere of the fixed stars rests immobile while the earth is rotating on its place in the center. He adds that this would not be impossible on mathematical grounds, but he sees difficulties in bringing this in accord with the physical realities. Occasionally, he made a cautious use of experiments, but not to prove some preconceived ideas, as was often the case in Greek science and later on, but to falsify them when showing that the observed facts did not tally with them.

In a correspondence with his younger colleague Avicenna, he shows certain dissatisfaction with Aristotle's natural philosophy, while the latter feels obliged to defend the great master. Al-Bīrūnī touches on a variety of questions: When the heavy elements earth and water gather around the center of the universe and the water is less heavy, why does it not cover the earth equally from all sides? Air and fire are, according to Aristotle, absolutely light, while air is less light. Here al-Bīrūnī puts forward the alternative that both may possess also heaviness and that the air, while being heavier, presses the sphere of fire against that of the moon. We all know that the cold lets bodies contract, while warmth causes them to expand. But why do glass vessels shatter when water contained therein freezes? And why does ice swim on the water despite its solid

“earthy” nature? When water evaporates, does it really become air or are its particles only scattered in the air? This leads to the question of the existence of a vacuum, what both try to solve with the help of experiments. Al-Bīrūnī thinks that a vacuum in the air is necessary when one assumes a corpuscular nature of light. Al-Bīrūnī defends not only a physical but also a mathematical atomism, arguing that otherwise one side of a square and the diagonal would be of equal length, as both consist of the same, that is, an infinite number of parts.

In the correspondence, he articulates also his Muslim faith. He doubts the eternity of the world and defends the creationism of the Alexandrian Christian thinker John Philoponus, whom Avicenna on the other hand treats as a hypocrite. Al-Bīrūnī contradicts even the opinion that our cosmos should be the only exemplar of its kind and accuses Avicenna, who follows Aristotle in this respect, of trying to limit God’s omnipotence. It may be that his skepticism toward these basic tenets of the Aristotelian and Neoplatonic mainstream as prevalent in Arabic philosophy has earned him the nickname al-Bīrūnī, which sounds like the so-called *nisba*, which was usually given to a person after his birthplace. But a place called Bīrūn or Bērūn cannot easily be determined. The Bīrūniyyūn were in Arabic transcription the philosophical sect of the Pyrrhonists, whose radical skepticism was known through doxographies or occasional remarks of Galen of Pergamum.

He shows his truly scientific outlook when dealing with the reports about wondrous and unexplained phenomena, as, for example, Saint Elmo’s fire on high sea or strange therapeutic methods of the Indians or the fire that appears at Easter in the Church of the Holy Sepulchre in Jerusalem. He refrains from rash statements and leaves the question open until more evidence may be found. On the other hand, he is nevertheless, seen in the context of his time, an outstanding representative of historical criticism when he analyses, for example, the tendentiousness of the legends told by the Persians about Alexander the Great.

Due to the wideness of his interests, it proves to be difficult to appreciate equally all his various achievements. The last monograph by Pavel G.

Bulgakov about his life and works appeared in 1972 in Russian and was not translated into any other language.

Boethius

Andrew W. Arlig

Department of Philosophy, Brooklyn College
of The City University of New York, Brooklyn,
NY, USA

Abstract

Anicius Manlius Severinus Boethius, a late ancient Roman thinker, profoundly influenced western medieval philosophy, literature, and the liberal arts. Boethius translated and commented on a number of important Aristotelian logical works. These translations and commentaries provided the foundations for early medieval logic, philosophy of language, and metaphysics. Boethius' short theological treatises are remarkable for the way in which they apply Greek philosophical concepts to Christian doctrine. His *Consolation of Philosophy* is a vivid synthesis of Stoic, Aristotelian, and especially Neoplatonic ethics and philosophical theology. It is a masterpiece, whose literary qualities as well as its philosophical material have influenced generations of humanists.

Biography

Anicius Manlius Severinus Boethius was born into a Roman aristocratic family in the second half of the fifth century (c. 475–477 CE). For most of his life, Boethius lived and worked in Rome, where he was appointed consul in 510 CE and, perhaps subsequently, prefect. These traditional offices were mostly symbolic. The Ostrogothic king Theodoric ruled Italy from Ravenna. In 522 CE, Boethius accepted the appointment of Master of Offices at Ravenna and became one of Theodoric's most important functionaries. Shortly thereafter Boethius was accused of treason and practicing black magic. Boethius might have been the hapless victim of low-level political intrigues and rivalries, but some historians speculate that Boethius was active in a plot to undermine Theodoric. In the event, Theodoric was convinced that Boethius was guilty and he sentenced Boethius to death. Boethius was executed sometime between 524 and 526 CE. The time that Boethius remained imprisoned before his execution was sufficient for composing his most famous work, the *Consolation of Philosophy*.

Works and Thought

In addition to the *Consolation*, Boethius produced a number of important translations and treatises. He translated most, if not all, of Aristotle's *Organon* as well as Porphyry's *Isagoge*. He composed commentaries on several of the works that he translated, a series of handbooks on various topics in logic, a series of handbooks on the mathematical sciences, and five short theological treatises.

1. Translations. Boethius planned to translate and comment upon all the known writings of Plato and Aristotle (in *De int.* 2nd edn. 79–80). However, Boethius only managed to complete a fraction of his proposed project. Boethius might have produced a complete translation of Aristotle's *Organon*. Versions of his translations of the *Categories*, *On Interpretation*, *Prior Analytics*, *Topics*, and *Sophistical Refutations* survive and have been critically edited

in the *Aristoteles Latinus* series (Minio-Paluello et al. 1961–1975). Many scholars believe that Boethius finished a translation of Aristotle's *Posterior Analytics*, but if it ever did exist, it is now lost. In addition to the *Organon*, Boethius translated Porphyry's *Isagoge*, which is traditionally taken to be an introduction to Aristotle's logic. Those works of Aristotle that did not get rendered into Latin by his hand were, by and large, lost to the West until the latter part of the twelfth century.

Boethius labored over his translations. Some of them seem to have gone through several editions. Boethius aimed for accuracy over elegance, and by most estimates, he succeeded at rendering Aristotle's thoughts in a rigorous and faithful manner (Barnes, in Gibson 1981; Ebbesen 1990).

2. Commentaries. Boethius managed to comment on Aristotle's *Categories*, Aristotle's *On Interpretation* (twice, once in introductory form and once in intermediate), Porphyry's *Isagoge* (twice, first based on Marius Victorinus' translation and later in a version based on his own translation), and Cicero's *Topics*. He may have commented on at least some of the rest of the *Organon*, and he may have composed a greater commentary on the *Categories*, but only fragments of unknown authenticity survive (Hadot 1959).

Boethius' commentaries on Aristotle and Porphyry belong to the tradition of Neoplatonic commentaries on these logical works. Boethius' commentary on the *Categories* by and large follows Porphyry's shorter question and answer commentary. His greater commentary on *On Interpretation* primarily follows Porphyry's now lost commentary on that same work.

While Boethius tends to follow Porphyry, he is well aware of the views of other Neoplatonists. At least one scholar has argued that Boethius attended lectures at the Neoplatonic school in Alexandria (Courcelle 1948, 299–300 [= 1969, 316–318]). However, the current consensus is that Boethius probably learned about Neoplatonism in writings that he would have come across in Italy and that he did not study in Egypt or Athens.

The commentary is a genre that places a premium on passing on the received wisdom of a particular school. Boethius' commentaries are no exception to this general rule. One should not expect to find Boethius' most original and creative work in his commentaries. However, one should be careful before subscribing to Shiel's (1958) thesis that Boethius merely cobbled together the material that he found in the scholia of his manuscripts of Aristotle. Boethius probably had to make decisions about what to include, what to omit, and what to emphasize (Barnes, in Gibson 1981; Ebbesen 1990). Furthermore, there are a number of excurses scattered throughout Boethius' commentaries that do not appear to be merely copied from his source material.

Perhaps the most famous digression is Boethius' treatment of the problem of universals in his second commentary on Porphyry's *Isagoge* (in *Isag.* 2nd edn., I, 10–11, 159–167; English translation in Spade 1994). Therein Boethius developed a series of intriguing arguments in favor of the conclusion that universals do not exist outside the mind. The main thrust of these arguments is that something exists outside the mind only if it is a unity, but universals cannot be a unity and also exhibit the property of universality, viz., to be common to many things. Boethius, then, posed a dilemma for those who believe that universals do not exist outside the mind. We surely have concepts that are universal. But if these concepts do not represent the world as it truly is, then these concepts appear to be empty and false. Boethius offered a solution that he attributed to the third-century Aristotelian philosopher Alexander of Aphrodisias. The mind is capable of considering things in a manner different from that in which they exist. In particular, the mind is able to consider and compare the features of concrete particulars without reference to the particular, even though these features cannot actually be separated from the particulars. By abstracting features in this manner, the mind is able to construct universal concepts. Hence, while universals do not exist in things as something common to many, the concept of a universal – since it is abstracted from things in the right way – can be truthfully attributed to many things.

3. Logical Handbooks. In addition to his commentaries, Boethius wrote several handbooks on logic. Five of these treatises survive: *On the Categorical Syllogism*, *Introduction to the Categorical Syllogism* (incomplete), *On Division*, *On the Hypothetical Syllogism*, and *On Topical Differences*. Boethius planned to write an overview of the study of logic entitled *On the Order of the Peripatetic Disciplines*, but no such work survives.

On the Categorical Syllogism and *Introduction to the Categorical Syllogism* introduce the student to the forms of valid syllogisms presented in Aristotle's *Prior Analytics* and *On Interpretation*. These treatises were quickly superseded by Aristotle's work once it became available again in the West.

On Division presents an introduction to the logical exercise of "division" and its correlative process "collection." Division is a process of resolving wholes into parts; collection is a process of determining what items are contained by some whole. Hence, Boethius' presentation of division requires that he discusses the varieties of parts and wholes. Boethius' remarks about parts and wholes were instrumental in the development of medieval mereology (see the entry on ► "[Mereology](#)" in this Encyclopedia).

For historians of logic, Boethius' treatises on the hypothetical syllogism and the topics are perhaps the most interesting. In part, this is due to the fact that they are almost the only surviving late ancient treatments of these important fields in the history of logic.

Boethius' treatise on the hypothetical syllogism is the only surviving late ancient treatment of the conditional. Superficially, the treatise appears to present a version of the propositional logic that is credited to the Stoics. This impression has led to some puzzlement over Boethius' peculiar views about the conditional. For example, Boethius appears to have assimilated $p \rightarrow \neg q$ to $\neg(p \rightarrow q)$, whereas modern logicians sharply distinguish these propositions from one another (Barnes, in Gibson 1981). But as Christopher Martin (1991) has shown, uncritically representing Boethius' claims about conditionals

in terms of propositional logic is highly misleading. In order to have a propositional logic, one must have the concepts of propositional content and propositional operations. According to Martin, Boethius had neither. Rather, Boethius worked with a muddled version of Aristotelian term logic. Once this fact is grasped, one is in a better position to appreciate the remarkable innovations of the twelfth century. Peter Abelard and his fellow twelfth-century logicians, not Boethius, were the true heirs to the Stoics.

The treatise on topical reasoning, along with his commentary on Cicero's *Topics*, gives us a rare glimpse into the late ancient understanding of this complex outgrowth from Aristotle's *Topics*. Topical theory focuses upon the discovery of dialectical arguments. Boethius' discussion of the topics breaks down into two parts. One part consists of a list of key terms (the *differentiae*) that the dialectician seeks in order to construct an argument that will settle a dispute. The other part consists of a list of the "maximal sentences" that are associated with each *differentia*. The maximal sentence is a general proposition concerning the key term that will help the dialectician to construct his proof. Boethius noted that there are two different lists of topical *differentiae*, one handed down from Cicero and another handed down from Themistius, and he took it upon himself to show that these two lists really coincide.

As with his logical commentaries, most scholars believe that Boethius' textbooks are largely derivative. Some are believed to be adapted from earlier Greek works. For example, it appears that Boethius consulted Porphyry's commentary on Plato's *Sophist* and perhaps some earlier Aristotelian material when he composed his *On Division*. In other cases, Boethius may have had a greater hand in the selection and presentation of the material. It is possible that *On Hypothetical Syllogisms* is, as Boethius himself claimed, his most original work.

4. Handbooks on the Quadrivium. In the ancient world, music and astronomy (or astrology), in addition to arithmetic and geometry, were considered mathematical sciences. Boethius appears to have coined the term "quadrivium"

to denote these four sciences. There is some historical evidence that Boethius composed treatises on all four topics. However, only Boethius' treatises on arithmetic and music (in part) survive. There are a few fragments of a book on geometry that some have attributed to Boethius (Folkerts 1970), but this attribution has been questioned (Caldwell and Pingree, in Gibson 1981).

Boethius' book on arithmetic is in large part a translation with elaborations of a book by the second-century Neo-Pythagorean scholar Nicomachus of Gerasa. It is concerned with the abstract properties of number.

Boethius' treatise on music is probably also dependent upon the work of previous, mostly Greek, authors, but the arrangement of the material seems to be at least in part attributable to Boethius himself (Caldwell, in Gibson 1981).

5. *The Theological Tractates* (Opuscula Sacra).

Over the course of his career, Boethius composed five short treatises on theological topics. Several of these were written in response to theological disputes that were raging during Boethius' lifetime (see Chadwick 1981, chapter 4).

On the Trinity (Opusc. I) and, in much more superficial manner, *Whether the Father, Son, and Holy Spirit are Substantially Predicated of the Divine* (Opusc. II) deal with the unity and diversity of the Trinity. In these works Boethius aimed to show that statements involving the Trinity are not statements about God's substance, since that would compromise the unity of God. Yet, sentences pertaining to the Trinity are not merely figurative. Rather, the Persons are real features of God, and there is a real difference between the Persons.

To extricate himself from this dilemma, Boethius proposed a third way to predicate something of God – namely, by predicating certain *non-accidental relatives* of God (Opusc. I, 5; Opusc. II, 3). If the Persons are relatives, then the Persons are real aspects of the Divine, but they in no way compromise God's substance. Boethius devoted the rest of *On the Trinity* to the defense of the notion of a non-

accidental relative. He allowed himself a caveat, however: if one cannot fully comprehend the way in which the Persons are non-accidentally related to one another and to God, this is a function of the fact that God is transcendent and his nature is ultimately and ineliminably obscure to us (Opusc. I, 6).

The treatise *How Substances Can Be Good in That They Are When They Are Not Substantial Goods* (Opusc. III), which is known in the Middle Ages by the title *On the Hebdomads*, is perhaps the one work, apart from the *Consolation*, that has attracted the most scholarly interest (see Hadot 1963; MacDonald 1988; Nash-Marshall 2000; Marenbon 2003, and the bibliographies in the latter two works).

Boethius intended to explain how a corporeal substance is good in that it exists, even though it is not a substantial good. He began by presenting a list of terms and "rules" (*regulae*) that may or may not be axioms or even premises in his overall argument (Schrimpf 1966; De Rijk 1988). He then presented a dilemma. To illustrate Boethius' dilemma, let us pick a concrete example of a corporeal substance – say, an apple. The apple cannot be good by participation in the good, for if the apple were good by participation, the apple would be good in virtue of something else. It would not be good in virtue of itself. But this appears to conflict with a Neoplatonic thesis about being: everything that exists is good merely in virtue of the fact that it exists, which seems to entail that every independent being – i.e., substance – is good in virtue of itself. So, it seems that the apple must be good by substance, not participation. Yet, Boethius continued, there are reasons to reject the claim that the apple is good by substance. Anything that is predicated of God denotes God's substance. God is good. Hence, God's substance is the good. By hypothesis, the apple is also good in substance. Given that God's substance is not shared by anything other than Himself, it follows that the apple is God.

Boethius resolved the dilemma by, in effect, forging a middle way between its horns. He invited the reader to imagine the impossible scenario where God does not exist. In this scenario, it would be clear that the apple's existence is one thing and its goodness is something separate. The

apple's substance is not the good. Nevertheless, the apple in fact derives its being (*esse*) from God, and it derives its goodness from God in so far as He is the First Good. The apple is good merely in virtue of the fact that the First Good wills that the apple exists. Hence, it is proper to say that the apple is good in that it is, even though it is not a substantial good.

On the Catholic Faith (Opusc. IV) is a straightforward confession of Christian principles. It contains very little of the philosophical concepts and principles that inform the other theological treatises. In the past some have questioned the authenticity of Opuscula IV. The current consensus is that Boethius is the author.

In *Against Eutyches and Nestorius* (Opusc. V), Boethius applied his Aristotelian tools to the Incarnation. The orthodox position is that Christ is one person who consists in two natures. But a person seems to be an individual substance – a view reinforced by Boethius' preferred definition of a "person" as "an individual substance of a rational nature" (Opusc. V, 3, 171, 172) – and it is difficult to comprehend how any individual substance can have two natures. It is this difficulty that motivates the solutions that Nestorius and Eutyches, respectively, endorsed and which Boethius attempted to undermine in favor of the orthodox position.

Nestorius' position that Christ consists in two natures and in two persons is repugnant because either it entails that Christ is a universal or it entails that "Christ" is no more than the name of an aggregate. Boethius thinks that neither result is acceptable (Opusc. V, 4).

Eutyches argued that, because there is only one person who is Christ, there can only be one nature. But if Eutyches is right, which nature is now present in Christ? There seem to be only three options: (1) the two natures combine to form a divine nature, (2) the two natures combine to form a human nature, or (3) the two natures combine to form a new nature, which is neither human nor divine. The first and second options are ruled out because there is no common substrate that can stand under the exchange of corporeality for incorporeality or vice versa. The third possibility is ruled out since a rational substance must either

be corporeal or incorporeal (Opusc. V, 6, 497–541).

Hence, we must assert that Christ is one person who consists in two natures. Boethius attempted to make this intelligible by resorting to an analogy. The person of Christ is something like a gem-encrusted crown, which retains both the gem's nature and the gold's nature (Opusc. V, 7, 595–607). Just as the crown is one thing consisting both from and in two natures, Christ can consist in two natures.

6. *Consolation of Philosophy*. The *Consolation* is Boethius' masterpiece. In it we find a thinker at the height of his intellectual and poetic powers. The work presents a vivid outline of a systematic, monotheistic theology and theodicy, which is inspired by Aristotle, the Stoics, and most of all the Neoplatonists. From the beginning, commentators have noted that the *Consolation* has a lack of unambiguously Christian doctrines. This has prompted a number of commentators, from the Middle Ages forward, to worry that Boethius was really a pagan. Most modern commentators, however, point out that there is nothing in the *Consolation* that would be objectionable to a Christian with Platonic sensibilities.

The setting of the *Consolation* is a prison where the character Boethius is awaiting execution. Boethius finds himself tormented not only by his current situation but also by the more general suspicion that wicked people thrive, whereas the virtuous suffer. A personification of Philosophy offers to cure Boethius of his current distress. Despite appearances, Philosophy will argue, Boethius has lost nothing of true value, happiness is still within his grasp, and it actually is not the case that wicked people flourish at the expense of the virtuous.

In Book II, Philosophy argues that Fortune by her very nature is fickle. Humans have no claim on the goods that Fortune gives them. Hence, they should not lament the loss of those things that Fortune takes away.

In Book III, Philosophy discusses the nature of the Good and its relation to human happiness.

Philosophy reminds Boethius that one must distinguish between true happiness and the image of happiness (III.1). All humans strive for true happiness. The problem is that most humans either have a distorted understanding of true happiness or they go after happiness in the wrong manner. Philosophy shows how the paths that are commonly thought to lead one to happiness (such as the paths of acquiring money or political power) fail to produce true human happiness (III.3–8).

In the latter part of Book III, Philosophy gives an account of true happiness. She shows that there is an intimate connection between unity, existence, and goodness. In very rapid succession, she demonstrates that the highest Good exists and that God is identical to the highest Good. The highest Good is the source of all other goods. God's creations are by nature inclined to these goods because they are images of the creative source of everything. Something exists only insofar as it is one. If it is divided into many, it will cease to exist. This is why all creatures strive to preserve themselves. What an *x* strives for is the good for *xs*. Thus, the good is encoded into the very essences of creatures. To be happy, humans must discover their true nature and strive to realize fully that nature.

Despite agreeing with Philosophy's propositions to this point, the character Boethius has not yet forgotten his sorrow. At the beginning of Book IV, he asks how evil is possible when God is good – a problem Boethius finds especially troubling because Philosophy has just asserted that the world and all its affairs are governed by Providence. Philosophy answers the character Boethius by showing that the virtuous are always powerful and the vicious always ultimately without power. Both the virtuous person and the vicious person aim for the Good. But while the virtuous person achieves the Good, the vicious person does not. Given that one is powerful only if one achieves what one aims for, the vicious person is not powerful (IV.2). Indeed, Philosophy adds, humans who actively choose evil abandon their true nature. They are no longer human beings, but rather irrational animals with a human shape. Hence, the vicious are punished for turning away from the Good, whereas the virtuous are rewarded. While Boethius suffers

now, he has not lost the Good (IV.6). Philosophy adds that every hardship is part of the plan and in the end is a good. A bad change in fortune, such as the one Boethius now suffers, is an opportunity to improve one's wisdom and virtue (IV.7).

At the end of Book IV, Philosophy discusses the relation between Fate and Providence. She argues that they are really two aspects of the same thing. Providence is the law of Nature viewed from the perspective of the simplicity of the Divine Intellect. Fate is this same law viewed from the perspective of the complexity of the Divine Will's effects (IV.6). But this only prompts Boethius to raise a further worry: if everything is due to Providence, is there any room for chance (V.1)? For if there is no room for chance in the scheme of things, then there seems to be no room for freedom of the will. Philosophy rejects the notion that some event might be the result of random, uncaused motion, yet claims that there is room for freedom of judgment (V.1.8). Free deliberation is a necessary component of rationality. Hence, insofar as one is a rational being, one is a free being. Given that God is the perfect rational being, God is perfectly free. A human who exercises her rational capacities as they should be exercised is relatively free (V.2).

Given that God is the perfect rational being, God knows everything, including all future events. This prompts the character Boethius to voice his final worry: divine foreknowledge appears to be incompatible with human freedom, for if God knows what will be the case in advance, then what will be must happen (V.3). But if what will be must happen, then there seems to be no room for free human choices, for one's choice is free only if one could have done otherwise. Boethius continues by articulating the repercussions of this line of thought. But if what I will do tomorrow is not something I could refrain from doing, how can I be punished or rewarded for doing what I do? In other words, Divine foreknowledge seems to threaten the very basis of retributive justice.

Philosophy tries to get to the heart of Boethius' worry. It cannot be that Boethius is worried that somehow the fact that God knows that some event *E* will occur is the cause of *E*'s occurrence (V.4). The fact that *E* occurs causes the knower to know

that E occurs, not vice versa. If knowing that E occurs does not cause E to occur, then foreknowing that E occurs will certainly not cause E to occur. An action will be free and contingent provided that the agent is free.

Philosophy's considered diagnosis is that Boethius believes there is something fundamentally incoherent about the notion that a future event can be both contingent and foreknown (V.4.21–23). If someone knows that some event E is occurring, then he knows that E is occurring determinately. For if one were to comprehend an indeterminate event as if it were determinate, in no way could this be said to be knowledge. Only what is necessary can occur determinately. Hence, if God knows E is occurring, then E is necessary. But a future contingent event is, by definition, not necessary. Therefore, if God knows that a future event will occur, that future event cannot be contingent. It is logically impossible that there be any future contingent events that are foreknown.

Lady Philosophy responds to this worry by attacking the claim that someone knows that E occurs only if he knows that E determinately occurs. Philosophy insists, instead, that a knower does not know *x* as *x* is in its nature; rather, the manner in which *x* is known is dependent upon the power and nature of the knower (V.4–5). For example, a creature who possesses only the five senses will grasp the spherical properties of a ball in so far as these properties are manifested in this bit of matter. A creature with the power of imagination will be able to grasp the three-dimensional properties of the ball abstracted from the ball's matter. A rational being, such as a human, from its universal perspective can grasp the three-dimensional structure of the ball as it is manifested in a number of particulars. In other words, the senses grasp the spherical properties of the ball materially. The imagination grasps the same properties abstractly (yet particularly). And reason grasps these properties universally. God's mode of understanding is superior even to reason. His understanding transcends universality and views the one simple form itself (V.4.30).

Philosophy applies this principle to the problem of foreknowledge (V.6). Humans dwell in a world of constant change. Things only ever

partially exist at any one moment in time. Future things and their properties are especially obscure to us. Hence, we perceive them as if they were indeterminate and, thus, contingent. God, in contrast, does not exist in part by part fashion. He exists completely and all at once in what we might describe as an eternal "now." From God's perspective, all things and events have the same status. What I did yesterday, what I am doing now, and what I will do tomorrow are all comprehended by God as if these events are settled and determinate. Hence, from God's perspective all events, including future events, are perceived as if they were determinate and necessary. But one cannot infer that some event is in its nature necessary from the fact that the event is known in a determinate manner.

Philosophy concedes that there is a legitimate sense in which one can know something only if the facts have been settled, and so if Boethius insists on saddling her with the word "necessity," he may in the following sense (V.6.25 ff.). I can only know that there is a coffee cup on the table to my left if it is settled that there is a coffee cup and it is now to the left of me. It is even true that there is a sense in which if I know that there is a coffee cup to my left, it is necessary that there is a coffee cup to my left. If there were no cup there, I could not be said to know that it is there. But it does not follow from this "conditional" necessity that the cup is necessarily to my left on the table, where I mean by this that it could not have been the case that the cup were to my right (or that there was no cup at all). Clearly, the fact that I know that the cup is sitting to my left does not entail that stronger claim of "simple" necessity. Likewise, it does not follow from the fact that God knows that I will steal a bagel tomorrow morning that I could not have refrained from stealing the bagel simpliciter. All that the claim about foreknowledge entails is that if God knows that I steal the bagel tomorrow, then I in fact steal the bagel tomorrow. This is compatible with the notion that I could have done otherwise.

It is not clear whether Philosophy has really addressed the substance of Boethius' puzzle, for Philosophy's solution seemingly ignores the question whether any events really are contingent. When Philosophy lists the various grades of

knowing, she suggests that the higher grades are superior to the lower grades because they come closer to revealing things as they really are (V.4). Presumably God's mode of existing and knowing things is superior to our mode of existing and knowing things. But this suggests that events really are fixed and necessary, despite the fact that humans comprehend them as if they were contingent.

The *Consolation* ends with a brief summary of the results of their investigation and an exhortation to follow the path of righteousness (V.6.44–48). Some believe that Philosophy has more or less succeeded at consoling the character Boethius. But other scholars are not so sure. Boethius consciously appropriates some of the stylistic elements of Menippean satire, another ancient literary genre exhibited most notably by Petronius' *Satyricon*. Menippean satire is associated with works that ridicule those who pretend to make authoritative claims to wisdom. Hence, it has been suggested that the *Consolation* should be understood ironically as an account of the insufficiency of philosophy to provide consolation (Relihan 2007). A somewhat less extreme interpretation is that philosophy can provide arguments and solutions to many problems, but it cannot give us comprehensive understanding of ourselves and our place in the universe (Marenbon 2003).

Influence

Boethius' works have had a tremendous influence on subsequent generations of philosophers, humanists, and poets in the medieval West.

Boethius' commentaries and handbooks provided the foundations of the liberal arts curriculum in the medieval West. His handbooks on arithmetic and music were studied with keen interest continuously and well into the fifteenth century (White in Gibson 1981). Boethius' commentaries on the Aristotelian logical corpus as well as his logical handbooks provided not only the foundations of medieval logic but also medieval philosophy of language. In particular, the semantic theory that Boethius sketches in his greater commentary on Aristotle's *On Interpretation* greatly influenced the development of the

philosophy of language and mind in the Middle Ages. Even after the recovery of Aristotle's *Analytics*, *Topics*, and *Sophistical Refutations*, two of Boethius' logical handbooks, *On Division* and *On Topical Differences*, continued to be studied for some time afterward in the western universities (Lewry, in Gibson 1981).

Boethius also played a decisive role in the development of metaphysics in the early medieval centuries. Boethius' commentaries on the *Organon* and his theological treatises provided the concepts and principles needed to develop accounts of, for example, identity and difference, individuation, and the ontological status of universals.

Boethius' remarks on individuation provide a good example of the nature of his influence on medieval metaphysics. In his commentaries and theological treatises, Boethius hinted at four distinct theories of individuation. The first suggestion was that individuation is caused by all (or some specific set of) the thing's accidental forms (Opusc. I, 1, 56–63; In Isag. 2nd edn. III, 11, 235–236). The second suggestion was that individuation occurs when forms occupy different locations at the same time (also Opusc. I, 1, 56–63). Thirdly, Boethius suggested that individuation is due to matter (Opusc. I, 2, 102–110; cf. Opusc. V, 3, 213–220). And finally, Boethius suggested that a special form individuates things. Plato and Socrates are both human beings in virtue of a substantial form of humanity, but Plato has a formal component, "Platonity," that no other thing has, and Socrates has "Socrateity" (in De int. 2nd edn, 136–139). Boethius only hinted at these theories of individuation, he never gave a fully developed theory of individuals or individuation. However, the scattered remarks on individuals found in Boethius' works were picked up and developed into fully formed theories by subsequent generations of medieval philosophers (Gracia 1984; King 2000).

Boethius' *Opuscula* did not find a place in the formal curriculum of the major universities in the thirteenth and fourteenth centuries. Nevertheless, they were studied and they influenced subsequent philosophers in a number of ways (Gibson in Gibson 1981). Boethius' discussion of substantial goods in *Opuscula* III is one of the first in a long

line of treatises on the “transcendentals,” that is, properties that are possessed by a thing merely in virtue of the fact that it exists. Boethius’ suggestion that the Christian doctrines of the Trinity and Incarnation are, at least to some degree, amenable to logical analysis inspired other philosophers to try their hands at unraveling some of the deepest “mysteries” of Christianity.

The *Consolation* is without question Boethius’ most popular and enduring work. It has become a classic whose influence is felt far beyond the Middle Ages. The *Consolation* was not studied formally at universities, but it was studied and commented well into the sixteenth century. The *Consolation* was translated into vernaculars such as Old English and Old High German, and it influenced some of the greatest poets of the Middle Ages, including Chaucer, Dante, and Boccaccio. The discussion of foreknowledge and freedom, along with the particular interpretation of Divine eternity that Philosophy employs to develop her solution, has inspired generations of philosophers and theologians, from the Middle Ages to the present day.

Abstract

Boethius of Dacia was a Master of the Arts Faculty of Paris in the 1260s and 1270s of the thirteenth century. He was one of the main targets of the 1277 condemnation. His main contribution lies in the definition of both the limits and autonomy of philosophical inquiry and in his high appraisal of the figure of the philosopher.

Boethius of Dacia was a Danish Master of the Parisian Arts Faculty that was active in the 1260s and 1270s of the thirteenth century. Nothing more is known about his life, except that he might have entered the Dominican Order, judging by his inclusion in the fourteenth-century catalog

of Dominican authors composed by Stams. Together with Siger of Brabant, Boethius was arguably one of the most representative and influential philosophers of the Arts Faculty, his reading of Aristotle often being labeled as “radical Aristotelianism.” Siger and Boethius have also been identified as main targets of the 1277 condemnation by the Paris bishop Stephen Tempier of 219 propositions supposedly held by members of the Arts Faculty of Paris. Although Boethius is not cited by name in the condemnation, scholarship has traced 14 propositions of the condemnation back to statements diffused by various works by Boethius. Moreover, a “Boethius” is named in one manuscript of Raymond Lull’s *Declaratio* and in two manuscripts containing listings of condemned articles. His importance at the Faculty of Arts is attested by the fact that some of his works were abridged by Godfrey of Fontaines. There are no details about his academic career after 1277, it being impossible to know whether it was forcibly interrupted or even whether Boethius was still a Master at that time.

Apart from a set of questions on Priscian (*Modi significandi*), Boethius’s surviving output can be divided into commentaries on Aristotle, namely on the *Physics*, *Meteorology*, *On Generation and Corruption*, and *Topics*, and short treatises which cover different domains of philosophy, such as ethics (*De summo bono*), metaphysics (*De aeternitate mundi*), natural philosophy (*De somniis*), and logic (*Sophismata*). Recently, a commentary on the first two books of *On the Soul* has been attributed to Boethius and published under his name; however, doubt regarding the correctness of this attribution has been raised as well (Costa 2011). Boethius also commented on the *De animalibus* and on the *Perihermeneias* – as he himself explicitly states. Unfortunately, these commentaries have not reached us. His works were mostly transmitted in manuscripts that were either anonymous or under other authors’ names, which can be partly attributed to the fact that his name was associated with the condemnation. This could be why he was forgotten for more than six centuries. Analysis of his thought was long conditioned by anachronistic views of his positions and by various

historiographical categories, “Latin Averroism” being the first category used to label his work: scholarship used to refer to a set of philosophical theories supposedly defended by Arts Masters from the late thirteenth century onward who lectured on the *corpus Aristotelicum* through the interpretation put forward by Averroes and who totally supported Aristotle’s philosophy, regardless of its contrast with Christian views. According to this historical reconstruction, these “Latin Averroists” were opposed by theologians with an Augustinian–Platonic orientation, who simply rejected Aristotle whenever he spoke contrary to Christian teaching and allowed the use of philosophy only if integrated into theology. This reconstruction started to fade out with the first edition of Boethius’s *De aeternitate mundi* in 1954. Ever since, scholarship has disputed the very notion of “Latin Averroism,” as many of the theories advanced by the Arts Masters – including those put forward by Boethius himself – had their origins in Albert the Great and Thomas Aquinas’ writings. Scholarship has also disputed the identification of the doctrinal content of this philosophical current with the condemned propositions by Bishop Tempier (see Fioravanti 1966).

Despite these controversies, the theological conception underlying the condemnation – that any discipline has significance only if subordinated to theology – is certainly in contrast with Boethius of Dacia’s works. This is most apparent in his *De aeternitate mundi*, where Boethius strongly argues for the autonomy of philosophical inquiry as well as for precise delimited borders between the different branches of philosophy. For this reason, his works should be seen against the institutional and doctrinal background both before and after the statute of 1272 forbidding the Arts Masters to deal with theological issues. (Boethius’s relationship with this statute remains an open question; it is not clear whether he was at its origin or whether he was its target and he reacted to it.) Unsurprisingly, therefore, at the Arts Faculty, his methodological approach was not a unique one, as the numerous Aristotelian commentaries produced there have the same approach, one of leaving aside theological issues and commenting exclusively in terms of Aristotelian principles.

For Boethius, the principles of philosophy do not derive from another superior field but originate from generalization of empirical experience, which means that they do not hold the same degree of absoluteness as the principles of Christian teaching. Nonetheless, Boethius argues that any branch of knowledge can have a scientific status insofar as it exclusively follows its own principles, without considering the principles of other domains, such as Christian principles. Moreover, each particular science has to infer all of its conclusions from its own principles, regardless of their inconsistency with respect to conclusions inferred from principles of other domains. Analysis of the subject matter of a given science has to be carried out strictly within the borders of that science, but this does not prevent two different sciences from studying the same subject from different perspectives. As Boethius states in his commentary on the *Topics* (Book IV, q. 5), there is no contradiction in the fact that the utterance “homo est animal” can be regarded as necessary in grammar and probable in dialectics. While two sciences may come to opposing conclusions, this does not invalidate those conclusions. This sharp specialization *avant la lettre* has a twofold consequence: philosophical inquiry is limited to its principles, but precisely for this reason it is autonomous of every other domain. Applied to particular sciences, this means that the principles of each science are also its limits. Against the unity of knowledge, Boethius champions an “epistemological pluralism” (Bianchi 2003). The plurality of results reached by the different sciences is all legitimate and, in terms of their domain, true. Far from being a defense of a “double truth,” which Boethius never made, Boethius’s epistemological approach shows that the accusation in propositions 90, 113, and 184 of Tempier’s condemnation is theoretically mistaken. This is where the notion of “double truth” is expressed, that an utterance can be considered true according to philosophy and false in terms of faith, and also the reverse. However, this ignores a principle of Aristotelian logic that Boethius conscientiously observes: it is no contradiction at the same time to assert a predicate in a relative sense (*secundum quid*) and deny it in an absolute sense (*simpliciter*).

Boethius makes use of this distinction in his *De aeternitate mundi*, and this, in all probability, is what was targeted in proposition 90 (that the natural philosopher has to deny absolutely the world’s creation, while the believer can deny the world’s eternity). For Boethius, the natural philosopher can hold the eternity of the world in terms of the principles of his science. But this thesis cannot be sustained if taken in an absolute sense (*accepta absolute*), that is, outside the limits of natural philosophy; in such case, it is false (Bianchi 2003). Therefore, the notion that the world began to be, and that there was a first motion, is true according to faith and in an absolute sense; indeed, it is heretical to state otherwise and any attempt at rational demonstration is senseless. Although Boethius declares that the philosopher has the competence to deal with every aspect of reality and might dispute everything that can be rationally discussed, an idea targeted in proposition 145 of Tempier’s condemnation, he argues that the question of whether the world began at some point or has always been eternal cannot be determined by the philosopher: neither the natural philosopher, nor the metaphysician, nor the mathematician can reach a conclusion. The natural philosopher is not competent insofar as nature is the object of his science, and in nature everything is produced by way of generation, not creation. As generation presupposes a preexistent matter, the natural philosopher cannot argue for the Christian notion of creation, the existence of a first man, and the doctrine of resurrection and the numerical identity of the resurrected body (this last idea is targeted in propositions 17 and 18 of the condemnation). Likewise, the mathematician cannot consider the beginning of motion because the principles of his science remain the same whether the world is eternal or created. Finally, advancing a solution close to that of Aquinas in his *Sentences* commentary and to Siger of Brabant, Boethius argues that the metaphysician cannot consider whether the world began to be, because this was caused by God’s will *ab aeterno*, and metaphysics does not extend its inquiry to the divine will (being an individual which does not belong to any species, the First Cause can only be considered as an individual *qua* individual, and for this

reason it cannot be the object of scientific knowledge; see Ebbesen 2005). Further, the metaphysician cannot explain creation as he is unable to prove that an effect (creation) has not been immediately produced by its cause (God), assuming that its cause had all of the possible requisites to produce it.

What Boethius, following Aquinas, does not accept is the theoretical confusion between the ontological and the temporal dimensions of creation. The notions of “to be created” and “to be eternal” are not logically incompatible: the absolute dependence upon God is what distinguishes the state of being a creature, regardless of its temporality or eternity – this dependence lies both in its constitutive act and in its permanence in being. Having been created does not necessarily involve being temporally finite. In this way, Boethius does not reject creation because, following Aquinas, he does not equate eternal with uncreated.

The autonomy of natural philosophy is the grounds for Boethius’s *De somniis*, devoted to the delicate question of divination by dreams and whether the resulting knowledge can be regarded as scientific. The topic had previously been addressed in Aristotelian terms by Averroes and Albert the Great, who rejected scientific status for foreknowledge by dreams, as man does not hold in himself the principles of this knowledge, this being given by an external agent – the Agent Intellect for Averroes, a superior influence for Albert. Nonetheless, for both authors foreknowledge is possible only when the senses are withdrawn and the soul becomes more spiritual (*magis spiritualis*). In contrast, Boethius deals with the topic from the viewpoint of the natural philosopher: his explanations remain exclusively on a naturalistic, psychophysiological level, leaving aside the study of those cases depending upon divine will.

With regard to the different kinds of connections between dreams and foreknowledge, Boethius deals briefly with some kinds of dreams that do not produce divination. This is the case of dreams that seem to foretell an event and are nothing more than a random coincidence, and those dreams that might genuinely be causes of

future events, but only because thoughts occurring to a man while asleep might have as their effect the production of a phantasm, whose effect remains after awakening and leads that man to act in a similar way to that “preconceived in his dream.” The core of his exposition focuses on dreams that are signs of future events, whether those dreams involve external causes (such as the influence of some constellation) or causes internal to man, from both body and soul (as in the case of a strong passion). Boethius supplies a naturalistic account, based on Aristotelian natural philosophy. For all these cases, his account reveals numerous similarities with Aquinas’ treatment of the lawfulness of divination (*Summa Theologiae*, IIa-IIae, q. 95, art. 6). The causes of such dreams may be vapors originating from overheated nourishment, vapors that interfere with the organ of the imagination, or phantasms resembling the passions by which the body is affected. In contrast to Averroes and Albert, for Boethius the body is requisite that makes possible the occurrence of dreams as signs of future events. The explanation is thus built up in terms of natural causes and effects, that is, strictly within the borders of natural philosophy. And as with other sciences, it is possible to trace the cause from its effect, which makes it possible to diagnose and prevent the harmful effects of passions to which dreamers are subject.

Boethius’s epistemological principles, such as the limits of scientific knowledge and his view of science as a kind of archipelago made up of various self-coherent systems, are further asserted in his writings on logic and grammar. First, those principles can be related to his sophism *Omnis homo de necessitate est animal* and to his commentary on Aristotle’s *Topics*, where he denies that a proposition – tautologies included – can be true if its referent does not exist. This means that the philosopher cannot deal with the *figmenta mentis*, as Boethius repeatedly stresses throughout his writings, and principally that each scientific proposition on contingent objects is not strictly speaking necessary, being valid only with regard to the principles of its science and to the field in which it can be applied (Ebbesen 2000, 2005). Second, Boethius extends his idea of science to

grammar. Together with other *modistae*, such as Martin of Dacia, Boethius considers grammar as a science, its principles being the “modes of signifying” (*modi significandi*), that is, the ways in which a lexical notion, in addition to its essential reference, can express different values. These principles are rooted in reality, as they reflect the “modes of being” (*modi essendi*), which are conceptualized by the intellect in corresponding “modes of understanding” (*modi intelligendi*). As a result, the structure of grammar is universal, while the different particular languages are accidental. Boethius’s idea that grammar is universal and substantially identical in all languages is profoundly connected with his strong emphasis on the naturalness of human language (Rosier-Catach 2012). This is most apparent in his answer to the classical question as to which language children raised in isolation would speak and whether they would share the same common language. For Boethius, such children would be able to communicate and express their concepts to one another because they share the same grammar. This position was not followed by successive commentators, and some of Boethius’s affirmations were even the explicit object of criticism by the anonymous author of the text *Innata est nobis*, who felt that Boethius had merged the notions of *locutio* and *grammatica* (see Sekizawa 2010).

Boethius is extremely concerned with establishing a narrow connection between scientific knowledge and reality (Marmo 2009). This can be illustrated by calling attention to his disagreement with Martin of Dacia regarding a crucial logical issue, namely the question of the signification of terms and the truth value of general assertions (Mora Marquéz 2014, 2015): for Martin, and for the greater part of the commentators on Aristotle’s *Perihermeneias* writing in the first half of the thirteenth century, a general assertion – such as “*homo est animal*” – is true if it expresses an intellectual composition of elements that are concordant, irrespective of their actual existence. Boethius opposes this view, reasoning that the truthmaker of general assertions is necessarily rooted in external reality. In so far as signification is concerned, existence does not necessarily mean actual existence, for to exist or

not is an accident and, therefore, is not part of the essence of a thing. The essence of a man does not change whether he exists or not. By contrast, concerning truth, actual existence is the necessary requisite to assess the truth of a general assertion.

This narrow connection to reality can be further noted by pointing to Boethius’s disagreement with Martin of Dacia regarding the connection between the three modes (*essendi*, *intelligendi*, *significandi*): against Martin’s claim of the strict derivative connection between them, Boethius maintains a certain degree of autonomy between terms and signification of terms. This permits him to explain terms such as *nihil* or, generally, empty terms: a “mode of signifying” of a term does not necessarily derive from the signification of that term. However, while this solution solves this particular issue, it seems to undermine the foundation of grammar on reality, which, for Boethius, is the essential requisite for science. Hence, he provides a further solution in the same work – a solution to be followed by succeeding *modistae*, such as John of Dacia: he distinguishes between extramental entities (where the correspondence between “modes of being” and “modes of signifying” can be maintained through the mediation of the “modes of understanding”) and entities having only a mental existence (where only the correspondence between “modes of being” and their “modes of understanding” has to be observed because, in this case, “modes of being” and “modes of understanding” coincide).

A further divergence between Martin and Boethius concerns the fact that the latter defends a relationship of similarity, not of identity, between the modes (see the entry on Martin of Dacia). If the modes were the same thing, albeit accidentally different, then, according to Boethius, from the existence of the “mode of existing” of a thing, it would be possible to derive immediately the corresponding “mode of signifying,” and, therefore, everything that is signified would have a corresponding extramental reality, which is false, as the case of *nihil* shows. Thus, the “modes of signifying” are rather signs of the “modes of being” from which they derive and have as substrate of inherence the expression endowed with meaning (*dictio*) and not, as for Martin, the

signified thing. In this way, for Boethius it is possible that many properties of one thing are not signified by the “modes of signifying” of its *dictio*, or, in other words, not all the possibilities of meaning are expressed in grammar. Hence, grammar does not provide an exhaustive account of the whole structure of language, which means that, like all the other sciences, grammar has a limited range.

A full understanding of Boethius’s conception of philosophy is provided in his *De summo bono*, probably written around 1270, where he deals with the question of human happiness on strictly philosophical grounds, without any use of theological categories. In this short work, Boethius advances ideas also present, albeit in condensed form, in his commentary on Aristotle’s *On Generation and Corruption* and in the anonymous *Metaphysics* commentary influenced by him (ed. Fioravanti 2009). Drawing partly on the first book, but predominantly on the tenth book of Aristotle’s *Nicomachean Ethics*, Boethius enquires how man can reach happiness in this life and what this happiness consists of. His answer is that the kind of happiness accessible to man in this life can be reached through the activity of the highest faculty of the soul, that is, the speculative intellect, which is the divine element of man. This activity, according to Boethius, consists in carrying out philosophical speculation, its aim being the full knowledge of truth, including the knowledge of the First Cause of the universe, God. As the object of this happiness is God, the most honorable being, the activity of those who devote their lives to the knowledge of truth is not only the most enjoyable activity but also the most honorable kind of life. For this reason, those devoted to philosophical speculation – the philosophers – will be praised as a superior class of men worthy of being honored, a statement which echoes proposition 40 of Tempier’s condemnation. This activity is temporally limited, but it resembles the happiness of the afterlife. Although Boethius states that the “intellectual happiness” of this life is neither a necessary requisite nor a preparation for happiness in the afterlife, which he refuses to deal with, the fact that he affirms that those who are happy in this life are “nearer” to happiness in

the afterlife could be read by Christian authorities as rendering the lives of theologians and Christian saints useless, or at least inferior to those of the philosophers. In any case, Boethius does not tackle “the ultimate end,” happiness in the afterlife, in this work and limits to a small number of men the possibility of reaching philosophical happiness. This extreme intellectualist anthropology was based more on Albert the Great, Michael of Ephesus, and Eustratius’ commentaries on the *Ethics* than on Averroes (Bianchi 2002). Moreover, it was not exclusive to Boethius, but was asserted in the late thirteenth-century commentaries on the *Ethics* and by Peter of Auvergne in his two commentaries on the *Politics*. It, therefore, became common at the Arts Faculty of Paris.

Boethius' *De topicis differentiis*, Commentaries on

Heine Hansen

The Saxo Institute, University of Copenhagen,
Copenhagen, Denmark

Abstract

Boethius' *On Topical Differences* (*De topicis differentiis*) is a monograph in four books on topical argumentation, that is, argumentation based on so-called *topoi* or *loci* (literally: "places"). The seminal treatment of this subject is found in Aristotle's *Topics*, but Boethius'

treatise served as the main foundation of medieval theorizing in the field for almost two centuries before the gradual rediscovery and introduction of Aristotle's text. In this way, Boethius defined some of the basic features of the medieval approach to the issue, and as a consequence came also to influence the medieval interpretation of Aristotle's *Topics*. This article surveys the surviving medieval commentaries on *On Topical Differences* and their approach to two questions raised by Boethius' text, namely, what loci are and how they function.

Roughly, two dozen medieval commentaries on Boethius' monograph are known to be extant. The earliest of these date, as far as can be gathered, from around the end of the eleventh century, but from the discussions they contain, it appears that they were not the first to have been written. Interest in Boethius' text seems to have peaked in the twelfth century, and more than half of the extant commentaries were composed in this period. Little more than a handful of commentaries from the thirteenth century are extant, and no proper commentary from after 1300 has come down to us.

Only a few of these extant commentaries are, at this point, available in modern editions, and it is at the present stage of research not possible to establish more than a very rough chronology of the material. By far the larger portion of the commentaries have survived only in more or less fragmentary form, are found only in a single manuscript, and lack, as is often the case with medieval commentaries, a clear indication of the identity of their author, their place of provenance, and date of composition. But there are a few exceptions. Some of the commentaries do indeed have an ascription in the manuscripts or can on other grounds be attributed to a known medieval philosopher. In chronological order these are: an incomplete commentary attributed to Peter Abelard (1079–1142); a commentary on books 1–4 by Nicholas of Paris (fl. c. 1240); a fragment of a commentary by Martin of Dacia (d. 1304); and a commentary on books 1, 2 and 4 by Radulphus Brito (c. 1270–c. 1320). With the exception of

Nicholas of Paris' commentary, these have all been edited (Peter Abelard 1969; Martin of Dacia 1961; Radulphus Brito 1978). An anonymous commentary (Anonymous 2005) should perhaps be attributed to Arnulfus of Laon (fl. c. 1087), who was a contemporary of and seemingly associated with Roscelin of Compiègne. This commentary might well be the earliest of those extant.

According to Boethius, the aim of his work is to show which loci there are, what their differences are, and which loci are suitable for which syllogisms. To this end, he will give two lists of loci, which he will then compare, and he will show how one list can be reduced to the other (books II–III). Finally, because not only dialecticians but also rhetoricians avail themselves of loci, he will discuss rhetorical loci (book IV). All of this is prefaced by an explication of the basic concepts of the discipline, culminating in the concept of the locus (books I–II). On the whole, Boethius' discussion is rather sketchy and leaves much open to interpretation.

Following Cicero, Boethius defines the locus as "the basis of the argument" (*sedes argumenti*).

According to Boethius, a locus consists of a maximal proposition (*maxima propositio*) and a topical difference (*locus differentia*). A maximal proposition is described as a proposition that is self-evident (*per se nota*) and which is not provable by something else but whereby other propositions can be proved; Boethius' initial example of such a proposition is "If equals are removed from equals, equals remain." The topical difference (*locus differentia*) is likened to the specific difference and is said to be that whereby maximal propositions are differentiated. For example, as the species *man* is differentiated from other species of animal by the specific difference *rationality*, so the maximal proposition "That to which the definition of the genus does not belong is not a species of the genus defined" will be differentiated by the topical difference *from the definition*.

One of the central questions Boethius' text posed for its medieval interpreters was what type of items loci – or topical differences – are. Often, the answer to this question would be determined

by that given to a more general one, for example, what type of items does logic deal with?

Shortly before the turn of the twelfth century, logicians were in disagreement about the correct way of reading the ancient logical texts available at the time, some thinkers preferring to expound the texts as treating of words (*in voce*), others as treating of things (*in re*). This discussion is evident in the commentary perhaps attributable to Arnulfus of Laon. Here Boethius' text is subjected to a thoroughgoing *in voce* reading, according to which the loci are linguistic items, the maximal propositions being sentences, and the topical differences single words. Central to the interpretation is a distinction between two levels of language. On the first level, we find words such as "man" and "animal," which are names of things, and on the second level, words such as "species" and "part," which are said to be names of words occurring on the first level. A maximal proposition may only contain names belonging to the second level (a requirement that leads the author to reject or reformulate a number of Boethius' maxims). With regard to the topical differences, the author wavers between two different interpretations. Initially, the topical difference is described as the middle term of a valid syllogistic argument, which, occurring in both premises, is said to either join or disjoin the two terms of the conclusion. On this view, topical differences are words belonging to the first level of language; they are names of the things about which we argue. If one chooses this option, one will have to say that the topical differences differentiate the maximal propositions via their higher-level names actually occurring in the maximal propositions. Alternatively, one may take the topical differences to be these higher-level names themselves.

During the twelfth century, the purely linguistic interpretation appears to have been dropped, and the topical differences are now commonly construed as things (*res*). Famously, the century is one in which the problem of universals was a hotly debated issue, and whether one construed the topical differences as particulars or universals seems to some degree to have depended on what one was willing to include in one's ontology. Generally, however, commentators agree in

emphasizing the relative nature of the items, such as genus, species, part, whole, etc., around which Boethius' maximal propositions revolve, and in stressing that it is precisely by virtue of bearing some such relation (*habitus*) that things are capable of functioning as bases for arguments or loci.

In the thirteenth century, the discussion of the nature of the topical differences becomes tied up with the gradual elaboration of the doctrine of second intentions (*intentiones secundae*). The approach culminates with Radulphus Brito, whose commentary, written at the turn of the fourteenth century, is the latest of those extant. According to Brito, a topical difference is a concrete second intention, that is, a higher-order concept such as, say, generality (*generalitas*), taken not in its abstract but in its concrete form, i.e., genus (*genus*). In this manner, the locus is neither an intention nor a thing in itself but the intention taken as a way of conceiving the thing or the thing taken as falling under the intention.

Another difficult question posed by Boethius' text is how exactly the loci function. One aspect of this problem is whether or not they have a role to play with respect to formally valid arguments such as categorical syllogisms in the canonical figures and moods. In the late-eleventh-century commentary already mentioned, the topical difference is identified as the middle term of an argument, for example, "animal," or a higher level name of such a middle term, for example, "genus." The author exemplifies by means of a syllogism in the first mode of the first figure: All men are animals; all animals are substances; therefore, all men are substances. Here, then, the topical difference is "animal" or "genus" and the applicable maximal proposition will be: "What belongs to the genus, belongs to the species." The author is not too specific about the role played by the maxim here, but he appears to hold that it is not to make the conclusion follow from the premises but rather to make it more evident (*evidentior*).

The idea that maximal propositions have a role to play in even formally valid arguments such as categorical syllogisms was to be a matter of controversy in the twelfth century. Some

commentators draw a distinction between complexional (*complexionales*) and topical (*locales*) arguments. Complexional arguments are such as valid by virtue of the arrangement (*complexio*) of their terms, that is, formally valid arguments such as categorical syllogisms in the canonical figures and moods. Topical arguments are such as not valid by virtue of their form but where on the basis of a maximal proposition the conclusion can nonetheless be inferred from the premise(s). For example, the enthymeme "Socrates is a human being; therefore, Socrates is an animal" is not a formally valid argument, but on the basis of the maximal proposition "Of whatever the species is predicated, the genus is predicated," the conclusion can nonetheless be inferred from the premise.

With the advent of Aristotle's *Topics*, the debate changed. Aristotle begins his treatise on topical argumentation by defining what he calls the dialectical syllogism, the characteristic feature of which it is to have plausible premises. As the medieval commentators understood him, Aristotle is here speaking of categorical syllogisms in the valid figures and moods, and so they had, after all, to account for how loci function in such arguments. This was never done by compromising the insight that such syllogisms are valid solely by virtue of their form, that is, the figures and moods. In the first half of the thirteenth century, some thinkers suggested that the dialectical syllogism has an additional form or force (*virtus*) consisting in the topical relation (*habitus localis*), but the more common strategy seems to have become to posit a connection between the plausibility of the premises of the dialectical syllogism and the status of the topical differences as second intentions.

Apart from the commentaries on *On Topical Differences*, there are a vast number of medieval handbooks on logic containing sections on topical argumentation based on Boethius' text. These handbooks sometimes display developments that have little or no basis in *On Topical Differences*. There are, for example, some handbooks from the first half of the twelfth century that operate with a very short list of loci, different from the lists found in *On Topical Differences* and containing only four or five items.

Bonaventure

Matthew J. Pereira

Department of Theological Studies, Loyola Marymount University, Los Angeles, CA, USA

Abstract

Bonaventure O.F.M. (c. 1217–July 15, 1274) was a quintessential theologian of the thirteenth century and highly respected church leader, first serving as the Minister General of the Franciscan Order, then, he was named the Cardinal-bishop of Albano. In his ardent search for wisdom (*sapientia*), Bonaventure blended classical theologians (e.g., Augustine), ancient philosophers (e.g., Aristotle), and mysticism (e.g., Desert Fathers) within an indelible scholastic framework throughout his diverse range of writings that included theological treatises, many sermons, exegetical contributions, teachings on the mystical and spiritual life, numerous letters, and the authoritative biography on Francis of Assisi. Formed by classical Augustinianism, Bonaventure had privileged faith and theology over reason and philosophy albeit these two poles of enquiry coalesced within his impassioned pursuit of knowledge, beauty, and truth, wherever it was to be discovered. Bonaventure was at once a traditional and original thinker, steeped in theology (e.g., Augustinianism, Pseudo-Dionysian) and philosophy (e.g., Aristotle, Neoplatonism), both from the received teachings of Late Antiquity and the translated texts of the *res novae*,

thereby engendering a blended and textured approach of faith seeking understanding. Among his contributions, Bonaventure was the first theologian to critically reinterpret Anselm of Canterbury's (1033–1109) celebrated ontological argument. In one of his significant writings, *Disputed Questions on the Mystery of the Trinity*, Bonaventure provided a compelling argument for the existence of God whereby he concluded that there are three ways (or proofs) toward the existence of God, which were correlated with the soul, being, and truth or goodness. When the three ways have been explicated and understood, Bonaventure taught that the faithful seeker would arrive at the indubitable truth of God. In addition to many contributions in the fields of theology, philosophy, and mysticism, Bonaventure was heavily involved, both as leader of the Franciscans and as a cardinal in the Church, in the efforts at reconciliation during the divisive and contentious thirteenth century. Bonaventure was convinced that all truth, beauty, and wisdom was from God, which liberated him to place classical theology in conversation with emergent philosophical models of enquiry in order to encourage reflection upon the life of faith and reason that leads to the mystical ascent to God.

The Life of Bonaventure

Bonaventure O.F.M. (c. 1217–July 15, 1274) was Minister General of the Franciscan Order and the Cardinal-bishop of Albano. As the Minister General, Bonaventure promoted intellectual rigor within the monastic order by encouraging the harmonization of faith with reason within the spiritual life. In the thirteenth century, Bonaventure emerged as one of the foremost Augustinian theologians who had integrated theology and philosophy into a compelling account of the sensible and spiritual realities. In his substantial literary corpus, Bonaventure addressed a diverse range of theological and ecclesiastical issues, from monasticism, biblical exegesis, the coalescence of faith and reason, and the spiritual life of the Christian.

A Spanish Franciscan named Zamorra wrote the first biography of Bonaventure in the

thirteenth century; unfortunately, it has not been preserved. In the fifteenth century, Mariano of Florence wrote the earliest extant biography on the life of Bonaventure. In addition to Mariano's account on the life of Bonaventure, the *Chronicle of the Twenty-four Generals* (c. 1369) contains details on Bonaventure's life. Mariano's biography and the *Chronicle of the Twenty-four Generals* provide sufficiently reliable information for providing a general timeline on the life of Bonaventure.

Bonaventure was born in Bagnoregio, Tuscany, either in 1217 or 1221, the latter option is generally considered the traditional date (Crowley 1974). Bonaventure assumed his father's name (Giovanni di Fidenza) at birth. Bonaventure's father likely practiced medicine and belonged to the noble family of Fidenza di Castello. Bonaventure suffered a serious childhood malady whereupon his mother Maria di Ritello invoked the intercessions of Saint Francis of Assisi who then brought healing to the young boy (*Legenda S. Francisci Prolog*). According to one fifteenth-century legend, Francis bestowed upon the young Giovanni the name *O buona ventura* during this holy encounter.

In the mid-1230s, Bonaventure entered the University of Paris where he studied under the feet of the eminent philosopher and theologian Alexander of Hales. Upon receiving a rigorous education in Paris, Bonaventure then entered the Orders of Friars Minor either in 1238 or 1243. Around a decade later, in 1254, Bonaventure received his teaching license then relocated back to the University of Paris where he would teach until the conflicts of 1256 between the Mendicant orders (Franciscans, Dominicans) and the secular professors, which culminated in the cessation of Franciscans as teachers at the university. In 1254, William of Saint-Amour, one of the secular masters at the University of Paris, composed a polemical treatise titled *Liber de antichristo* in order to condemn the mendicant's life of poverty. Two years later in 1256, William completed a second treatise that continued renouncing the mendicants, titled *The Perils of the Last Times* (*Tractatus de periculis novissimorum temporum*). Upon receiving the request of Louis IX, king of France,

Bonaventure answered William's invectives in his *Disputed Questions on Evangelical Perfection* (*Quaestiones disputatae de perfectione evangelica*) wherein he advocated for a moderate approach to the spiritual life. Having weighed the opinions of both parties by October of 1256, Pope Alexander IV decided in favor of Bonaventure and reinstated the mendicant orders and concomitantly condemned the derisive writings of William of Saint-Amour. Thereafter, in October of 1257, with regained papal support, Bonaventure entered the academic association for the masters of theology. Having been vindicated by the papacy and the monarchy, Bonaventure assumed the Franciscan chair in theology at the University of Paris in August of 1257. On 2 February 1257, Bonaventure was elected as the Minister General of the Friars Minor as a highly contentious moment when two factions, known as the Spirituales and the Relaxati (later to be called the Coventuals), had broken off relations from one another. The Spirituales held to a literal observance of the Franciscan rule and placed more emphasis on the vows of poverty. Contrarily to the more rigorous Spirituales, the Coventuals were open to moderate alterations within the rule such as allowing for the possibility of the papacy permitting the use of property by the Franciscans. In his vital role as Minister General, Bonaventure sought to reconcile these two factions of the Friars Minor. After assuming the role of the Minister General, Bonaventure attacked the Joachimite Spirituales at a convocation held in Città della Pieve. Additionally, Bonaventure composed an encyclical letter that addressed reforming measures of the Coventuals. Three years after the encyclical letter, Bonaventure sought to reinforce reforms at the General Chapter of Narbonne by promulgating a guide for the monastic life, known as *Constitutiones Narbonenses*, in keeping with the Franciscan rule, it consisted of 12 chapters.

Upon the request of the Church, in 1260, Bonaventure completed a *Life of Francis* (*Legenda major sancti Francisci*) that was declared the authoritative biography during the Chapter of Pisa of 1263. In 1264, under the prompting of Cardinal Cajetan, Bonaventure reinstated the Poor Clares only 1 year after their condemnation

during the Chapter of Pisa. The status of Bonaventure's *Life of Francis* was further established at the General Chapter of Paris of 1266 where it was decreed that all the *Lives* of Francis, other than Bonaventure's version, were to be eradicated in order to promote unity among the Friars Minor. The opponents against the censuring of the other biographies of Francis argued that the decree was a blatant attempt to silence the earlier sources of the Franciscan history.

Bonaventure founded one of the earliest confraternities, the Society of Gonfalone in Rome, sometime around 1264, the fraternal community emphasized honoring the Virgin Mary. Five years later in 1269, Bonaventure convened the Chapter of Assisi, his fourth council, wherein he instituted a Mass in honor of the Virgin Mary with instructions to the Franciscans to sing it every Saturday.

In 1272, Bonaventure convoked another Chapter at Pisa that promulgated additional decrees to define the role of the Poor Clares. On 23 May 1273, Pope Gregory X appointed Bonaventure to the seat of cardinal. Later that year in November, Bonaventure was elevated to the bishopric of Albano. In May of 1274, Bonaventure resigned from the leadership role of the Minister General in order to focus on ecclesiastical affairs. Pope Gregory instructed Bonaventure to organize the Fourteenth Oecumenical Council, which convened at Lyons, 7 May 1274. Pope Gregory presided over the Council of Lyons along with Bonaventure who had a decisive role throughout the conciliar deliberations. Most notably, Bonaventure, who was a skilled and respected ecclesiastical diplomat, mediated the reunion between the Latin West and Greek East on 6 July 1274.

Bonaventure died at Lyons on 15 July 1274 while the Council of Lyon was in session. The cause of Bonaventure's death remains unknown. However, Peregrinus of Bologna, who was Bonaventure's secretary, has provocatively maintained that he was poisoned. The day after his death, Bonaventure was buried in the church of the Friars Minor at Lyons. On 14 April 1432, Pope Sixtus IV canonized Bonaventure. On 14 March 1588, Pope Sixtus V named

Bonaventure as one of the Doctors of the Church with the honorary title of the "Seraphic Doctor." Bonaventure's feast day is celebrated on July 14.

The Literary Works of Bonaventure

Beyond the aforementioned *Life of Francis* and the *Disputed Questions on Evangelical Perfection*, Bonaventure's many writings span a range of issues germane to thirteenth century Scholasticism. The majority of Bonaventure's writings are both philosophical and theological orientated falling under the literary genres of dogmatic, mystic, exegetical, and homiletic contributions. Four of Bonaventure's major contributions demonstrate the comprehensive nature of his synthesis of Augustinianism and Aristotelianism as faith seeking understanding in the scholastic context of the thirteenth century: *Commentary on the Sentences* (*Commentaria in quatuor libros sententiarum*), *Brief Commentary* (*Breviloquium*), *Journey of the Mind to God* (*Itinerarium Mentis in Deum*), and *On the Reduction of the Arts to Theology* (*De reductione Artium ad Theologiam*). In his longest and one of his most significant treatises, the *Commentary on the Sentences*, Bonaventure reflected upon a wide range of Scholastic teachings from the Trinity, to Creation, the Fall, the Sacraments, and the Last Judgment. In the *Breviloquium*, completed prior to 1257, Bonaventure provided an abbreviated and more concise summary on Scholastic theology within an Augustinian framework that emphasized the role of faith, illumination, and the interpretation of the scriptures. Bonaventure's *Journey of the Mind to God*, which was written on Mount la Verna in 1259, ascent to God is described within six progressive movements from that lift one up from the sensible world to greater contemplation and ultimately communion with God. In *De reductione Artium ad Theologiam*, Bonaventure evaluates the relationship between the arts, philosophy, and theology in relationship to what he describes as a natural center. In another one of his noteworthy theological contributions, the *Disputed Questions on the Mystery of the Trinity* (*Quaestiones disputate de*

mysterio Trinitatis), Bonaventure examines the possibility of knowing God's being in relation to Anselm's ontological argument. After establishing what he deemed to be the truth of God's being, Bonaventure considered how we apprehend the inner reality of God's being through natural reason and faith.

In addition to scholasticism, Bonaventure's mysticism, born out of the Victorine tradition, permeated and orientated his mystical, theological, and philosophical writings. In several treatises, Bonaventure examined the mystical and spiritual life of the prayerful Christian. In his *On the Threefold Way* (*De triplici via*), Bonaventure described the spiritual life in three stages of ascent, from the purgative, to the illuminative, and then the unitive. These three stages of the spiritual life belonged to the monastic tradition back to the Desert Fathers and throughout the Christian mystical tradition. Bonaventure's kindred affection toward the monastic tradition is evidenced in his spiritual commentary on sayings of the Church Fathers, known as the *Soliloquies* (*Soliloquium*). Among his writings on the mystical life, there is the 48 meditations on the life of Christ in his work the *Tree of Life* (*Lignum vitae*); *On the Six Wings of the Seraphim* (*De sex alis seraphim*) is a minor work on the virtues of superiors; *On the Perfection of the Life of the Sisters* (*De perfectione vitae ad sorores*) is a reflection on virtues germane to religious perfection; *On the Five Feasts of the Child, Jesus* (*De quinque festivitibus pueri Jesu*); *On the Rule of the Soul* (*De regimine animae*); and *Treatise on the Preparation for Mass* (*Tractatus de praeparatione ad missam*).

Another valuable source for evaluating Bonaventure's teachings is the extant lectures delivered in the university classroom. In 1273, Bonaventure had begun writing the unfinished *Collations on the Six Days* (*Collationes in Hexameron*) during his teaching duties in Paris. Other extant conferences are the *Collations on the Ten Commandments* (*Collationes de decem praeceptis*) and *Collations on the Seven Gifts* (*Collationes de septem donis*). In the *Collations on the Six Days*, Bonaventure examined chapter

one of the book of Genesis to make an argument against the Aristotelianism of the Averroists. He was in favor of a literalist interpretation of Genesis although he appreciated Augustine's figurative reading of the creation account. Bonaventure appreciated the mystical sense of scripture albeit his exegetical writings as a preacher were most concerned with a succinct exegesis of the Gospel. Bonaventure, who was a prolific preacher, has left behind 569 extant sermons. His sermons reflect the Scholastic method whereby the subject is divided and elaborated upon in accord with sensible and spiritual realities, then again, they also, often reached the heights of mysticism, love, and unity with God.

Bonaventure's exegetical works include four extant biblical commentaries on Ecclesiastes, Wisdom, the Gospel of Luke, and the Gospel of John. Furthermore, Bonaventure wrote on the religious life to encourage the monks of the Franciscan order. From his position as the spiritual master of the Friars Minor, Bonaventure indelibly shaped Western Christian spirituality and mystical theology. In one of his works on the explanation of the rule of the Friars Minor, Bonaventure strived to create a space for reconciliation, which was entirely in keeping with his approach during his 17-year generalship of the Franciscans. Bonaventure's *Life of St. Francis* may be read as another attempt at rapprochement among the divided brethren of the Friars Minor. Bonaventure's middle way (*via media*) approach to the monastic division proved unsuccessful largely due to intransigence of the two embattled factions. Following his explanation of the rule, Bonaventure wrote the *Constitutions of Narbonne*, wherein he instructed novices; also, he produced a minor treatise on the role of preaching and hearing confession within monastic community of the Friars Minor. Finally, Bonaventure composed many extant letters, both personal and then official and ecclesiastical in their nature, which have filled out the details of his life, his work, and objectives throughout his life as a professor in Paris, the Minister General of the Friars Minor, cardinal, bishop, and ecclesiastical statesman of the Church in the thirteenth century.

The Bonaventurian Synthesis

Bonaventure's dynamic synthesis of Augustinianism and Aristotelianism in collaboration with many other theologians and philosophers belonged to and illustrates the unitive pursuit of knowledge in the thirteenth century scholastic context. Contemporary interpretations of Bonaventure point to the depth, complexity, and originality, which characterized his theological and philosophical approach to faith seeking understanding. This entry provides an overview of the salient features in Bonaventure's integrative rereading of the intellectual and spiritual tradition to advance a Christian philosophy for his contemporaries.

Bonaventure was an ardent disciple of Alexander of Hales who modeled an Augustinian approach to Aristotelianism emblematic of the thirteenth century scholastic world. Alexander copiously examined Aristotle's works in order to advance a theology and spirituality that remained faithful to tradition and attentive toward philosophical insights. Beyond the teachings of Augustine, Bonaventure drew upon Pseudo-Dionysius, Bernard of Clairvaux, Richard of St. Victor, Anselm of Canterbury (1033–1109), and Hugh of St. Victor (1096–1141) (Cullen 2006). Bonaventure's synthetic approach provided a way to engage contemporary philosophy from within the Christian tradition (Gilson 1965).

While Bonaventure's philosophical commitments were traditional, his thought was also marked with originality, exemplified in the reconfiguring of Augustinianism and Aristotelianism in his theological worldview. Unlike his counterpart Aquinas, Bonaventure never composed a commentary on Aristotle, although he quoted the Stagirite 1015 times (Bougerol 1974). Bonaventure occasionally favored the teachings of Plato over Aristotle, which more than anything, illustrates the malleability and diversity in his appropriation of philosophical sources. The hybridization of "Neoplatonizing Aristotelianism" also points to the historical context at the University of Paris where the blending of philosophical traditions was becoming more common among those who had developed a high level of erudition. Bonaventure's Augustinian framework

was decidedly colored by the blended reception of the ancient philosophies that emerged within the intellectual climate of the thirteenth century scholasticism (Van Steenberghe 1955). In the 1260s, Bonaventure convened conferences wherein he attacked the errors of Aristotelianism, which must be assessed in the context of the Averroists movement. Bonaventure extensively employed Aristotle's teachings but he was against the particular strict readings epitomized among the Averroists. Bonaventure primarily employed Avicenna and Averroes to support his more favored authors such as Boethius and Aristotle. On the one hand, Bonaventure argued that the Church Fathers were the primary source for working through Christian philosophy then on the other hand, he often employed Aristotle on his own terms and merits (Quinn 1973).

Bonaventure's assessment of philosophy as a self-contained and independent discipline was nuanced, multilayered, and less systematic than exploratory in its approach. On one level, for Bonaventure, the discipline of philosophy was autonomous even while subordinated to theology, the eminent queen of the sciences (De Wulf 1926). However, Bonaventure deemed philosophy a valid if albeit incomplete science on its own. Bonaventure delineated philosophy from theology both in terms of their respective principles and methodologies even as he coalesced these disciplines in the rubric of Christian wisdom (*sapientia*) (Robert 1951). In summation, the Bonaventurian synthesis epitomized the high watermark of the scholastic pursuit to comprehensively organize knowledge in order to explicate universal truths that drew one closer to God. Furthermore, rooted in the Augustinian tradition, Bonaventure turned to a range of philosophical and theological teachings, most notably including Pseudo-Dionysius and the Neoplatonic cosmological worldview that encouraged an affective element within the mystical ascent toward God (Davis 2017).

The Ontological Argument

Among thirteenth-century intellectuals, Bonaventure was one of the first theologians or

philosophers to exhaustively examine and appropriate Anselm's ontological argument. Bonaventure believed that God and the human soul both belonged to the intelligible order of things (*I Sent.* 3, 1, 1, ad 2 m). On the basis of this shared intelligibility, Bonaventure then reasoned that humanity has been enabled to apprehend the truth and beauty of God. The human soul has been imprinted with and is nourished by knowledge of God. In the *Disputed Questions on the Mystery of the Trinity*, Bonaventure provided a sustained disputation concerning the existence of God in which he asserted three "ways" or "proofs" that stood as incontrovertible proofs of God's existence.

The first proof of God's existence is grounded in the innate nature of the soul or mind (*De myst. Trin.* I, 1). For Bonaventure, this innate knowledge is only related to God's existence, with no reference to God's essence. This is the case, according to Bonaventure, when humanity prescribes a false view of God, while simultaneously assuming God's existence (*I Sent.* 8, 1, 1, 2; *De myst. Trin.* 1, 1, ad 1 m). Bonaventure argues that innate knowledge of an immutable and eternal being is proved by the mind's desire for the true and the good. According to Bonaventure, the search for truth presupposes a perfect and absolute truth; consequently, every assertion of truth is simultaneously a positing of God's existence (*De myst. Trin.* 1, 1, 5–8). Furthermore, one presupposes the truth when denying the existence of truth; therefore, the denial of truth, or God, only affirms the reality of God and the truth (*De myst. Trin.* 1, 1, 26, t. v). More so, the soul's desire for the true and the good in their eternal and perfect forms resides within humanity as an innate predisposition. The intelligibility of God is recognized, even if in an imperfect state, within the intelligibility of the human soul (*De myst. Trin.* 1, 1, 10, t. V). Human knowledge of God is rooted in this relationship between the cause (God) and the image or likeness (soul) (*De myst. Trin.* 1, 1, Concl. t. V).

The second proof of God's existence is arrived at through an analysis of cause and effect revealed in the relationship between God and creation. Since God is the cause of creation, Bonaventure reasons one is able to gain knowledge of divinity

through these sensible effects. For Bonaventure, it is easier to approach God through the senses, rather than purely spiritual means. Consequently, Bonaventure asserts it is permissible to begin with creation in order to apprehend God (*I Sent.* 3, 1, 2, Contra 2 and Concl. t. 1). Bonaventure appeals to arguments of cause and effect in order to demonstrate that there is necessarily an absolute being that all other beings derive their being (*I Sent.* 3, 1, 2, Concl. t. 1). Bonaventure was not concerned with a formal starting point or a strictly defined set of proofs derived from creation. Rather, Bonaventure believed God was attested throughout all creation to such a degree that God's existence is readily apparent. All creation witnesses to a Creator God (*De myst. Trin.* 1, 1, 10–20, t. V). The human intellect recognizes the mind's knowledge of the First Being when it compares the perfections of God with the insufficiency of humanity (*Iten.* III, 3). Creation enables one to discover the innate conception of God within the soul, which is the foundation for the existence of God. For Bonaventure, humanity is certain God exists because of the innate capacity of the soul, which makes it impossible to think God does not exist (*De myst. Trin.* 1, 1, 20, t. V).

Bonaventure's third proof asserts that God's existence is immediately and absolutely apparent. With this assertion, Bonaventure demonstrates his steadfast adherence to Anselm's thesis, which he held throughout his theological work. God, as the first principle, does not require further demonstration beyond the fact that the predicate is assumed in the subject. Bonaventure simplifies Anselm's dictum, "God as the being than which no greater can be conceived." Accordingly, Bonaventure translates Anselm's ontological definition into an immediate experience. Further, Bonaventure posits since that which cannot not-be is greater than that which can not-be. Consequently, according to Bonaventure, the being which none greater can be thought of necessarily exists (*I Sent.* 8, 1, 1, t. 1). More so, Bonaventure refines the above assertion by stating that if God is God, where the antecedent is readily evident, the conclusion is likewise plainly evident (*De myst. Trin.* 1, 1, 29, t. V). Bonaventure recognizes the infinite gap between humanity and God; however, the soul and the Creator, which are both intelligibles,

analogously share a nature even if only by largely different degrees. Bonaventure differentiates between the “order of being” and the “order of knowledge.” God and humanity may be infinitely separated in the order of being; however, there may be a level of communion within the order of knowledge. Divine grace makes God knowable proportionately to our apprehension as an interior object of recollection (*I Sent.* 1, 3, 1, ad 2 m, t. 1). Bonaventure advances Anselm’s ontological proof within his own synthesis through positing the interiority of the soul as the epistemological foundation for knowledge of God. In summation, according to Bonaventure, divine illumination makes it impossible to deny God’s existence (*In Hex.* IV, 1, t. v).

The above three arguments for God’s existence are closely interrelated as each of the proofs is grounded in the kindred relationship between God and the soul, which has the innate capacity to apprehend God (*I Sent.* 1, 3, 2, Concl. t. 1). Bonaventure has often been read in opposition to Aquinas where it is noted that the latter Dominican theologian contended that the intellect does not possess an innate idea of God (*Sum. theol.* 1, 2, 1, ad 1 m, 3 m). For Aquinas, contra Bonaventure, knowledge of God is derived from nature or outside objects rather than an innate capacity within the human mind (Quinn 1973). Recent comparisons between the scholastic method of Bonaventure and Aquinas have led to a greater appreciation of their similarities (i.e., both believed that philosophical enquiry into the created world could lead to apprehending the creator God) and that their variances were not inherently oppositional and do point to the plurality of scholastic approaches to integrating the Christian tradition with philosophical thought within the thirteenth century (Hughes 2013). Reflecting upon the canonical status of these two eminent scholastic theologians, Pope Sixtus V famously declared that Bonaventure and Aquinas were “the two olive trees and two candlesticks lighting the house of God, who both with the fat of charity and the light of science entirely illumine the whole Church (Apoc. 11:4).

Bursī, al-Ḥāfiẓ Rajab al-

Mathieu Terrier

LEM (UMR 8584), CNRS, PSL, Paris, France

Abstract

Raḍī al-Dīn Rajab b. Muḥammad al-Bursī (d. after 813/1410–11), known as al-Ḥāfiẓ Rajab al-Bursī, was a Twelver Shī'i thinker of the post-Mongol period in Eastern Islamic world, reputed to be a prominent representative of the rapprochement among Shī'ism, Sufism, and philosophy. Little is known about his life, except that he completed his studies in religious sciences in the center of Twelver Shī'i scholarship of Ḥilla, from where he had to flee around 780/1378 to escape from persecution by his fellow Shī'is because of his "extremist" beliefs. His opus magnum, the *Mashāriq al-anwār*, is a monograph devoted to the very center of gravity of Shī'ism, i.e., the first

Imām ‘Alī b. Abī Ṭālib (d. 40/661) and the notion of “divine Friendship” (*walāya*). Although his thought is less systematic than that of Sayyid Ḥaydar Āmulī and Ibn Abī Jumhūr, with whom he is commonly associated, it certainly played a role in the coalescence of philosophical and mystical ideas, inherited from Avicenna, Suhrawardī, and Ibn ‘Arabī, with the doctrine of Twelver Shī‘ism, thus paving the ground for the “philosophical Renaissance” of the eleventh/seventeenth-century Safavid Iran.

Raḍī al-Dīn Rajab b. Muḥammad b. Rajab al-Bursī (d. after 813/1410–11), known as al-Ḥāfiẓ Rajab al-Bursī, was a Twelver Shī‘i thinker of the second half of the eighth/fourteenth and the beginning of the ninth/fifteenth century. He is commonly associated with Sayyid Ḥaydar Āmulī (d. after 787/1385–86) and Ibn Abī Jumhūr al-Aḥsā‘ī (d. after 904/1499), as a prominent representative of the rapprochement between Twelver Shī‘ism, Sufism, and philosophy, during the somewhat chaotic post-Mongol period in Eastern Islamic world, before the proclamation of Twelver Shī‘ism as Iran’s religion state in 906/1501. He seems, however, to have been quite a marginal and isolated thinker, since he is not known to have had any master, disciple or companion. From the Safavid times to nowadays, Shī‘i scholars have adopted ambivalent positions towards him, wavering between respect for his traditional knowledge and denunciation of his heterodoxy. His influence upon the “philosophical Renaissance” in the tenth–eleventh/sixteenth/seventeenth centuries Iran remains a subject of investigation.

His Life and Posterity

Little is known about the life of Rajab al-Bursī, whose name does not appear in any of the numerous biographical works produced in the Shī‘i milieu of Iraq throughout the ninth–tenth/fifteenth–sixteenth centuries. We owe our scanty information on him to late biographies of the

Safavid period, especially that of Mīrzā Afandī Jīrānī (d. 1130/1718), depending on some allusive and apologetic declarations disseminated in Bursī’s own works, namely, the *Mashāriq al-anwār* and his poetries. As indicated by his *nisba*, he is supposed to be born circa 743/1342 in a place called Burs, a hamlet set between Ḥilla and Kūfa in Iraq, an important area for Shī‘ism during this time (Al-Shaybī 2011, II, p. 225; Lawson 1999, p. 263). However, since the nickname (*kunya*) of Ḥāfiẓ (“the one who knows the Qur’an by heart,” or more than a hundred thousand Prophetic sayings), which he gave to himself, is not a typical designation for a Shī‘i scholar, there is a ground for suspecting that he was originally Sunni and then converted to Shī‘ism (Al-Shaybī 2011, II, pp. 226–227).

Bursī completed his studies in religious sciences in the center of Twelver Shī‘i scholarship of Ḥilla. He should have composed there in 778/1376–77 at least a first version of his *opus magnum*, the *Mashāriq anwār al-yaqīn fī ḥaqā’iq asrār amīr al-mu’minīn* (“The Dawning Places of the Lights of Certainty in the Divine Secrets Connected with the Commander of the Faithful [‘Alī b. Abī Ṭālib]”), so-abridged *Mashāriq al-anwār*, where he says that 518 years have passed since the occultation of the twelfth Imām in 260/874 (MA, p. 412; al-Shaybī 2011, II, p. 228). Probably circa 780/1378, he fled Ḥilla to escape from persecution by his fellow Shī‘is because of his beliefs about ‘Alī Ibn Abī Ṭālib (d. 40/661), the first Imām (MA, pp. 428–429). The *sharī’a*-minded ulemas of Ḥilla condemned him by using the notion of *ghuluww*, “exaggeration” or “extremism,” which is the generic label for different kind of heterodoxies within Twelver Shī‘ism, starting with the divinization of the Imām.

After his migration from Iraq, Bursī found refuge in Khurāsān, north-east of Iran. At this time, this region was ruled by the short-lived Sufi/Shī‘i dynasty of the Sarbadārīds (738–783/1337–1381) (al-Shaybī 2011, II, pp. 225–226). Bursī established himself in Ṭūs (nowadays Mashhad), to be near the mausoleum of the eighth Imām ‘Alī al-Riḍā (d. 203/818). He seems to have

spent there the rest of his life, devoted to piety and writing. He probably achieved here the definitive version of his *Mashāriq al-anwār* in 813/1410–11 (Afandī 1981, II, p. 307; al-Shaybī 2011, II, p. 229), providing us a *terminus post quem* for his date of death (al-Ṭihirānī 1983, VIII, pp. 64–65). As for the location of his grave, some memoranda say that he was buried in Ṭūs (Ma‘šūm ‘Alī Shāh 1999, III, p. 711); others claim that his mausoleum is located in Ardastān, north of Isfahan (al-Khwānsārī 1971, III, p. 345).

Bursī’s reputation did not overpass the boundaries of the Eastern-Shī‘i Islamic world. Taqī al-Dīn al-Kaf‘amī (d. 905/1499–1500) is the first Shī‘i theologian to quote an esoteric speculation – implying the “science of letters and numbers” – from the *Mashāriq al-anwār* (al-Kaf‘amī 2003, p. 425; *MA*, Persian transl., introduction, p. 43). Surprisingly, Bursī is absent in the *Majālis al-mu‘minīn* of Nūrallāh Shūshtarī (d. 1019/1610), a comprehensive encyclopedia of all known or supposed Shī‘i figures. In Safavid Iran, however, his works have spread and gained the attention of several prominent theologians, philosophers, and historians. Muḥsin al-Fayḍ al-Kāshānī (d. 1090/1679), in his *Kalimāt maknūna* (“The Hidden Words”), a synthesis of Shī‘i esotericism, Ibn ‘Arabī’s mysticism, and Mullā Ṣadrā’s “transcendental wisdom” (*ḥikma muta‘āliha*), considers Bursī to be authoritative and quotes from him the “theo-imamosophical sermons” ascribed to the Imām ‘Alī (al-Kāshānī 2011–12; pp. 197–199; see below). A Persian extensive paraphrase of the *Mashāriq al-anwār* was written in 1090/1680 under the command of Shāh Sulaymān (r. 1666–1694) by a certain al-Kirmānī or Sabziwārī (al-Khwānsārī 1971, III, p. 345; al-Ṭihirānī 1983, XXI, pp. 141–142; Amir-Moezzi 2017, p. 221). At the same period, al-Ḥurr al-‘Āmilī (d. 1104/1692) and Muḥammad Bāqir al-Majlisī (d. 1111/1699), two prominent Imāmi theologians, quoted many *ḥadīths* from Bursī while criticizing, at the same time, his tendency to “exaggeration” and his lack of reliability as a transmitter of traditions (al-Ḥurr, II, pp. 44, 117–118; al-Majlisī, I, p. 10; Afandī 1981, II, p. 307). In the Qajar period, al-Khwānsārī

(d. 1313/1895–96) mentioned him as a great knower of the Imāmi tradition (al-Khwānsārī 1971, III, pp. 340–344); and more recently, al-‘Allāma al-Amīnī (d. 1390/1970) tried to refute the accusation of extremism against him (al-Amīnī 1967, VII, pp. 50–52).

Around fifteen works are attributed to Bursī, half of them being reputed as lost or not yet edited, and all of them supposedly written in Arabic. The *Mashāriq al-anwār* is the only work ascribed to him with certitude. The number of its manuscripts and printings shows enough its popularity within Shī‘i Twelver milieu. The book also aroused interest among Western scholars, the first of them having been Henry Corbin, who devoted to it 2 years of teaching in the École Pratique des Hautes Études, Paris (Corbin 1993, pp. 104–107, 111–118). However, other works of interest are attributed to Bursī with high probability, among whose brilliant poetries and an esoteric commentary of a vast amount of Qur’anic verses.

His Thought

Although the thought of Ḥāfiẓ Rajab Bursī, in its thematic and language, could be more adequately described as “Shī‘i gnosis” (*irfān shī‘ī*) than as “philosophy,” it certainly played a major role in the coalescence of philosophical and mystical ideas with the original doctrine of Twelver Shī‘ism. This, at turn, paved the ground for the “philosophical Renaissance” of the tenth–eleventh/sixteenth–seventeenth centuries Iran.

The *Mashāriq al-anwār* is a monograph devoted to the very center of gravity of all Imāmi beliefs and ideas, i.e., the person of ‘Alī b. Abī Ṭālib (d. 40/661) and the notion of *walāya*. This notion connotes the significations of the spiritual and temporal “direction” of the faithful, as well as the “sacred Friendship” of God and towards God; it is inseparable of that of prophecy (*nubuwwa*), which it encompasses. In this sense, the notions of *walāya*, “divine Friendship,” and *walī*, “friend of God,” are widely shared by Shī‘ism and Sufism. According to the original Imāmi doctrine, however, *walāya* is a synonym

for Imāmate, i.e., the secret of the Law revealed to the Prophet as preserved from alteration by his heirs; it is the third “pillar of Islam” after God’s unity (*tawḥīd*) and prophecy; and the essential attribute of Imām ‘Alī, just like *nubuwwa* is that of Muḥammad and unity that of God. After ‘Alī, *walāya* passed to his two sons, Ḥasan and Ḥusayn, then to nine descendants of the latter, until the twelfth Imām, in “major occultation” since 370/941.

In the *Mashāriq al-anwār*, Bursī introduces himself as a Shī‘i insider, “a believer whose heart has been tested by God for the faith,” according to a famous *ḥadīth* of the Imāms: “Our teaching is difficult, extremely arduous; it cannot be undertaken except by a messenger prophet, an angel of proximity, or a believing follower whose heart has been tested by God for the faith” (*MA*, pp. 33–34). He distinguishes four kinds of people: those who have some knowledge of both the esoteric (*bāṭin*) and the exoteric (*ẓāhir*) aspects of the Law, i.e., “those who are firmly rooted in knowledge (*al-rāsikhūn fī l-‘ilm*)” as mentioned in the Qur’anic verse 3:7; those who have no knowledge of the exoteric nor of the esoteric, i.e., the infidels (*kuffār*); those who have some knowledge of the exoteric without the esoteric and who accept prophecy without Imāmate, i.e., the Sunnis; and those who have some knowledge of the esoteric without the exoteric, whom he calls the “insane wise men” (*‘uqalā’ al-majānīn*) (*MA*, p. 71). Moreover, he dissociates himself from two symmetrically opposed groups, those who deny the secret of Muḥammad’s heirs, i.e., the Sunnis, and those who exaggerate in their veneration, i.e., the “extremist” Shī‘is (*ghulāt*), claiming to be on “the middle ground” (*al-namṭ al-awsaṭ*), that of the “Gnostics” or “true knowers” (*al-‘arīfūn*) (*MA*, p. 368). Himself accused of “exaggeration” (*ghuluww*) (*MA*, pp. 425–428), he criticizes his censors for their conformism (*taqlīd*) and attachment to the mere exoteric dimension of religion (*MA*, pp. 31–37).

The book is not arranged by subject matter but declines some fundamental topics throughout its numerous sections – between two hundred and three hundred according to the editions – with

numerous variations. Among the main topics are the secrets of letters and numbers; the Divine Names and “the Greatest Name” of God (*al-ism al-a‘ẓam*); the procession of all things from the “Muḥammadian reality”; the esoteric meaning of Qur’anic surahs, verses, and formulas; the allusions to ‘Alī and the Sacred Family (*ahl al-bayt*) in the Qur’an; the eternal, both unique and dual, Light of the Prophet Muḥammad and the Imām ‘Alī; the complementarity and consubstantiality of prophecy and imāmate; the love for ‘Alī as the way of salvation; the division of humanity between those who acknowledge and love ‘Alī and those who disregard and hate him; the Imām as a theophanic person; the Imām as the Perfect Human, omniscient and almighty; Imāmate as “universal commandment” (*riyāsa ‘amma*) and “cosmic sovereignty” (*walāya takwīniyya*); Imāmate as the fundamental pillar of Islam, comprising the testimony of God’s unity and the faith in prophecy.

However, several successive groups of chapters can be distinguished. The first is devoted to the science of letters and numbers (*MA*, French transl.). The second is centered on the esoteric virtues of the Sacred Family, namely, the Prophet Muḥammad, his daughter Fāṭima, and the Twelve Imāms. A third group of chapters deals particularly with the person of the Imām ‘Alī as a locus of manifestation (*maẓhar*) of God. Finally, some brief chapters are concerned with the history of the division of Islam and the description of its sects (*firaq*), based on the famous prophetic saying: “My community will be divided in seventy-three sects, all but one of which are destined for Hell”; Bursī intends here to clearly distinguish the genuine Imāmism from the “exaggeration” of certain Shī‘i currents (Lory 2009, pp. 320–322).

With the *Mashāriq al-anwār*, Bursī appears as one of the foremost experts, in the early modern period, of the “science of [Arabic] letters” (*‘ilm al-ḥurūf*), the Islamic cousin of the Hebraic Kabbalah (Lory 2004), or one of the representatives of “lettrism” as metaphysics (Melvin-Koushki 2014). Belonging to the “occult sciences” (*‘ulūm gharība*) in Islam, it is highly valued in Shī‘ism where it first appeared in the teachings of the sixth

Imām Ja‘far al-Šādiq (d. 148/765). It was adopted in the esoteric Shī‘i milieu of the third/ninth century, as reflected in the corpus attributed to the alchemist Jābir Ibn Ḥayyān – supposed to have been Ja‘far’s disciple (Kraus 1986, 223–225; Lory 2003, pp. 139–142) – and in the epistles of the Ismā‘īlī “Brethren of Purity” (*Rasā’il Ikhwān al-Šafā*). It gained its philosophical respectability with a short epistle ascribed to Avicenna (d. 428/1037), *al-Risāla al-nayrūziyya* (Massignou 1958; Lory 2004, pp. 77–88). Ibn ‘Arabī (d. 638/1240) connected speculations on letters with the idea of theophany, God’s engendering of reality by means of His Names (Ibn ‘Arabī 1997, introd., pp. 412–436; Lory 2004, pp. 115–136). In Bursī’s time, this form of esotericism was not spread only by individual thinkers such as Ibn Turka of Isfahan (d. 835/1431–2) (Melvin-Koushki 2014), but also by the Ḥurūfiyya, a Shī‘i messianic and politicized group led by Faḍl Allāh Astarābādī (d. 804/1401–2) (Bashir 2005; Mir-Kasimov 2015). In the Safavid times, the “science of numbers and letters” (*‘ilm al-a‘dād wa l-ḥurūf*) would eventually be incorporated in “Shī‘i philosophy” by the great philosopher Mīr Dāmād (d. 1040/1631) (Terrier 2017).

Bursī’s speculations on letters go far below the theoretical sketch of Avicenna and do not seem to depend directly to the conceptions of Ibn ‘Arabī. It supports a conception of God’s creative activity as a self-disclosure (*tajallī*) by means of the Prophets and the Imāms, but also by means of their names, the letters composing their names, and the numbers corresponding to these letters. In this worldview, letters and names are constitutive of the hidden structure of the whole Creation. As a result, the “science of letters” is to be seen as the royal road to the knowledge of God through His Creation: “God’s secret is deposited in the treasury of the science of letters; and this is a treasured science (*‘ilm makhzūn*)” (*MA*, p. 42). Bursī also considers the knowledge of letters to be consubstantial to the immaterial faculties of human being as a *microcosmos*: “The significations of letters (*ma‘ānīhā*) lay in the intellect, their subtleties (*laṭā‘ifuhā*) in the spirit, their forms (*ṣuwaruhā*) in the soul, their inscription in the

heart, their potency of speaking in the tongue, their intricate secret in the ears” (*MA*, pp. 42–43).

As it appears in the previous quotation, the self-manifestation of reality is expressed by Bursī through the Neoplatonic scheme of emanation; however, he did not borrow the Plotinian hierarchy of the One, the Intellect, the Soul, and the Nature, but preferred that of God, the “luminous Intellect” (*al-‘aql al-nūrānī*), the Spirit, and the Soul. He associated the *alif*, the first letter of the Arabic alphabet, to the Intellect as the first being emanated from God, the True One (*MA*, p. 43). He symbolized the One, lying beyond all hypostasis, by the point as the origin and the end of all letters: “The speech ends in letters, the letters in the *alif*, and the *alif* in the point. [...] The point is the symbol of the descent of absolute and manifest existence with its inner dimension (*al-wujūd al-muṭlaq al-zāhir bi-l-bāṭin*), and of the beginning with the ending” (*MA*, p. 48). In this regard, he quoted a saying ascribed to ‘Alī: “I am the point under [the stroke of] the *bā*’ of *bi-smi-Llāh* [“in the name of God”, the opening words of the Qur’an],” suggesting that the first Imām is the first self-manifestation of God and the principle of all the existents (*MA*, p. 45).

As mentioned above, the “science of letters” in Islam has long been linked to the “science of numbers” (*‘ilm al-a‘dād*); unsurprisingly, the latter is also of great importance in Bursī’s thought. He upheld that “the secret of numbers in the souls is in correspondence with the forms of the existents” and that “the science of numbers is the first emanation (*fayḍ*) of Intellect upon the Soul; that is why it became firmly rooted in the potency of the soul” (*MA*, p. 58). Although he usually did not mention his sources, he was obviously inspired by Neopythagoreanism, a trend anciently linked with Neoplatonism. As a fervent Twelver Shī‘i thinker, he shows the number twelve at work throughout the structure of the cosmos and, following an alphanumeric calculation (Arabic *gematria*), in many ritual formulas of Islam (*MA*, pp. 194–196). It is noteworthy that his speculation on numbers, although drawing on the same traditional sources, clearly differs from that of his contemporary Ḥaydar Āmulī (see the relevant entry).

Bursī owes his reputation as an exaggerator, if not a heretic, to the fact that he was one of the main transmitters of certain controversial sermons (*khuṭab*) attributed to Imām ‘Alī. Contrary to the criticism addressed to him, he was not the first author to report these sermons, but borrowed them from an early Shī‘ī work, Ibn Jumhūr al-‘Ammī’s (first half of third/ninth century) *al-Wāḥida*, a book mentioned by Ibn Nadīm in his *Fihrist* achieved in 377/997 (Ibn Nadīm 2002, p. 371; al-Ṭihārānī 1983, XV, pp. 7–8). In these texts, ‘Alī claims his complete and exclusive participation in the Names, Attributes, and Acts of God, by using for himself some expressions that the Qur’an uses for God – or according to the creed, that God uses for Himself. For instance, in the “sermon of the Clear Declaration” (*khuṭbat al-bayān*), ‘Alī says: “I am the First, I am the Last, I am the Manifest, I am the Hidden,” like what is said of God in the third person in the verse 57:3; M.A. Amir-Moezzi has proposed to describe these sermons as “theo-imamosophical” (Amir-Moezzi 2011b, pp. 103–131). As for Shī‘ī scholars, they adopted very contrasting attitudes towards these texts. Rationalist jurists-theologians (*fuqahā’*) regarded them as spurious and their transmitters as “exaggerators” (*ghulāt*), while mystical or gnostic thinkers, such as Rajab al-Bursī, Ḥaydar Āmulī, and Ibn Abī Jumhūr (see their entries), regarded them not only as authentic, but also as reflecting the genuine doctrine of the Imāms. According to Amir-Moezzi, if “the apocryphal nature of these sermons, in their developed form, does indeed seem undeniable,” however, “on the one hand, similar speeches existed from an early period in Shī‘ī-Alid milieu and, on the other hand, Twelver imāmological doctrine as it has been reported by early compilations of *ḥadīths* enables such a conception of the Imām” (Amir-Moezzi 2011b, p. 106). The reason why rationalist Shī‘ī scholars aimed to censure these sermons is probably that such an imāmology jeopardized their project of conciliation with Sunni theology, as well as their claim to the “general representation of the Imām” during Occultation. Contrastingly, Bursī developed the original

Imāmī conception that the science owned by the “people of the Holy Prophetic Family” (*ahl al-bayt*) and particularly by Imām ‘Alī, is a super-rational omniscience beyond the reach of the ordinary human beings (Amir-Moezzi 1992, pp. 15–33; 2011b, pp. 193–229). This conception was rejected as “exaggeration” by the Shī‘ī jurists-theologians claiming their legitimacy to exert, by mean of rational interpretation of Law (*ijtihād*), the religious and political prerogatives of the Imām during his absence.

Despite its controversial reputation, the *Mashāriq al-anwār* has to be seen as typical of the Shī‘ī esoteric tradition, since it reflects the coexistence of both axial worldviews of Shī‘ism: a dual conception on the one hand, the dialectic of manifest (*ẓāhir*) and hidden (*bāṭin*), or of esoteric and exoteric, echoed in a series of complementary pairs such as prophecy and imāmate, Muḥammad and ‘Alī, revelation of the Letter (*tanzīl*) and spiritual exegesis (*ta’wīl*); and a dualist conception on the other hand, the antinomy of Good and Evil, or of Knowledge and Ignorance, dividing the whole humanity, since the beginning of History, between followers of the guides of Light and Justice and partisans of those of Darkness and Injustice (Amir-Moezzi and Jambet 2004, pp. 31–40). Yet, Bursī was informed of the doctrines of al-Ḥallāj (executed in 309/922), Avicenna, Suhrawardī (executed in 587/1191), and Ibn ‘Arabī; he integrated a number of philosophical and theosophical concepts taken from these sources, such as the Neoplatonic “primary emanation” (*al-fayḍ al-awwal*) (MA, p. 56), Avicenna’s “Active Intellect” (*al-‘aql al-fa’āl*), “First Intellect” (*al-‘aql al-awwal*), and “Universal Intellect” (*‘aql al-kull*) (MA, pp. 56, 59, 62, and elsewhere), Suhrawardī’s “Light of lights” (*nūr al-anwār*) (MA, p. 59), Ibn ‘Arabī’s “Muḥammadian Presence” (*al-ḥaḍra al-muḥammadiyya*), and “Muḥammadian Reality” (*al-ḥaqīqa al-muḥammadiyya*) (MA, pp. 59, 62, 69–70 and elsewhere). However, except an allusion to Ibn ‘Arabī (MA, p. 45), no philosopher or Sufi master is directly quoted and discussed in his works. In this bold synthesis, the

Mashāriq al-anwār reveals the intellectual tension, characteristic of the Shī'ī gnosis, between an universalist approach on the one hand, expressed by concepts such as “Universal Intellect” and “Universal Soul,” and a nominalist one on the other hand, focusing on particular historic persons, namely the “people of the Holy Family” and their enemies. These alternative worldviews are connected through the figure of ‘Alī, both the historical leader of the Shī'is and the archetype of the Perfect Human Being (*al-insān al-kāmil*), a concept shared by Sufism, philosophy, and Shī'ism (Lory and Terrier 2017).

Another work of importance attributed to Bursī is *al-Durr al-thamīn*, a commentary of the Qur'an focusing on numerous verses – but not 500, as announced in the title – interpreted as referring to the supra-human, if not divine, virtues of the Imām ‘Alī and the “people of the Holy Family.” This work belongs to a certain tradition of Qur'anic commentaries, probably the oldest form of Shī'ī hermeneutics, described by Amir-Moezzi as “personalized commentaries.” Such exegesis aims to disclose specific historical personages, in particular ‘Alī, his two sons Ḥasan and Ḥusayn, as well as their enemies, beneath the veil of the Qur'anic ambiguous letter (Amir-Moezzi 2011a, p. 91). It should be recalled that the ancient Shī'is maintained that the official Qur'an, whose elaboration was not achieved before the consolidation of the anti-‘Alid Umayyad dynasty, was a distorted version of the original Qur'an, which contained explicit mentions of both the “members of the Holy Family” and the “hypocrites” (*munāfiqūn*) among the Prophet's companions. The identification of allusive expressions of the Qur'an with positive or negative characters of the early Islam would therefore be a way of filling the gaps left by censorship. Although the claim of the falsification (*tahrīf*) of the Qur'an was progressively denied by the Shī'ī scholars after the Occultation of the twelfth Imām, the genre of “personalized commentaries” remained. Following a foremost principle of Shī'ī imāmology stating that the Imām is the only authorized (by God) and authoritative (for the believers) hermeneutist

of the *Book of God* (Bar-Asher 1999), *al-Durr al-thamīn* is mainly composed from Imāmi *ḥadīths*. Bursī, however, does not limit himself to the role of transmitter but also assumes the role of hermeneutist by exercising his own effort of interpretation (*ijtihād*), combining reasoning and spiritual intuition. By doing so, he also shares decisive feature of the nascent “Shī'ī gnosis” with Ḥaydar Āmulī (see the relevant entry).

Under scrutinizing Bursī's works, such as *Mashāriq al-anwār*, *al-Durr al-thamīn*, and his poetries, it appears that many of his assertions regarding the status of ‘Alī and his descendants, the issue of the Qur'an's integrity, as well as the use of “occult sciences,” do indeed fit the qualification of Shī'ī “exaggeration” (*ghuluww*) as it was defined by the so-called “moderate” Shī'ī scholars. However, other features of the “extremist tradition,” such as the return of the “hidden Imām,” his rising (*qiyāma*) and his advent (*ẓuhūr*), are absent from his works. Bursī himself defined “extremism” by the challenge of God's unicity, of the Prophet's primacy, and of the validity of the Law (antinomianism) (*MA*, pp. 399–402). Be as it may, it worth reminding that the opposition between “moderate” and “extremist” Shī'ism is mostly a late elaboration of reformist scholars aiming to find a *modus vivendi* with the Sunni majority (Amir-Moezzi 1992, index s.v. *ghālī*, *ghulāt*, *ghuluww*; 2011b, index s.v. *ghuluww*).

In sum, Bursī can be seen as a traditionalist Shī'ī thinker trying to restore the original esotericism against the increased power of law and jurists in the Shī'ī religion, a process undertaken by the rationalist scholars since the Occultation of the Imām. His thought is much less systematic and intellectualist than that of Sayyid Ḥaydar Āmulī and Ibn Abī Jumhūr, with whom he is commonly associated in scholarly literature; nor does he proceed, despite his mystical inclination, to an apology of Sufism. However, Bursī is rightly regarded, beside the two aforementioned thinkers, as a forerunner of the synthesis of Shī'ī theology, philosophy, and mysticism, elaborated in eleventh/seventeenth-century Iran by Mīr Dāmād

(d. 1040/1631), Mullā Ṣadrā Shīrāzī (d. 1050/1640) and their respective students.

Bibliography

Primary Sources

I. Unedited works of Ḥāfiẓ Rajab al-Bursī

Al-Alfayn fī waṣf sādāt al-kawnaẓn ("The book of the two thousand. On the description of the lords of the two worlds"). Mentioned by Majlisī (I, p. 10). It remains as manuscript in the library of the Ḥusayniyya Shūshtarī in Najaf (n°2/316) (al-Ṭīhrānī 1983, II, p. 299; Brockelmann 1938, II, p. 204).

Asrār al-nabī wa Fāṭima wa l-a'imma ("The Secrets of the prophet, [His Daughter] Fāṭima and the Imāms"). It remains as manuscript in the library of Ayatullāh Mar'ashī in Qum (ms 6162). The text is maybe inserted in the *Mashāriq al-anwār*.

Faḍā'il 'Alī ("The virtues of 'Alī"). Mentioned by Afandī (II, p. 308). No manuscript is known.

Fī ziyārat amīr al-mu'minīn [Risāla] ("On the visit of [the Tomb of] the commander of the faithful ['Alī b. Abī Ṭālib]"). Mentioned by Afandī (II, pp. 310, 342; XII, p. 78). No manuscript is known.

Inshā' al-tawhīd wa l-ṣalawāt 'alā l-nabī wa ālihi l-a'imma al-hudāt 'alayhim al-salām ("Dissertation on the testimony of God's unity and the prayers upon the prophet and his people, the guiding Imāms, peace be upon them"). Mentioned by Afandī (II, p. 305). No manuscript is known.

Kayfiyyat al-tawhīd wa l-ṣalawāt 'alā l-nabī wa l-a'imma ("The modality of the testimony of God's unity and the prayers upon the prophet and the Imāms"). Mentioned by Afandī (II, p. 308). No manuscript is known.

Lum'at al-kāshif ("The lightning of the uncovering"). Mentioned by Ṭīhrānī (XVIII, p. 354). No manuscript is known.

Mawālīd al-a'imma wa faḍā'iluhum ("The births and the virtues of the Imāms"), achieved in 801/1398-99. Mentioned by Ṭīhrānī (XXIII, p. 236). No manuscript is known.

Sitta 'ashara bāb^{an} ("Sixteen chapters"). A manuscript dated from the 11th/17th century remains in the National Library of Iran (collection 99, pp. 550–602).

II. Edited works of Ḥāfiẓ Rajab al-Bursī

Al-Bursī, al-Ḥāfiẓ Rajab b. Muḥammad. *Al-Ash'ar* ("Poetries"). Edited after *Mashāriq al-anwār* in both editions mentioned below.

Al-Bursī, al-Ḥāfiẓ Rajab b. Muḥammad. *Al-Durr al-thamīn fī dhikr khamsamī'a āya nuzilat min kalām rabb al-'ālamīn fī faḍā'il amīr al-mu'minīn 'alayhi al-salām* ("The precious pearl, mentioning five hundred verses of the Qur'an revealed about the virtues of the commander of the faithful ['Alī b. Abī Ṭālib]"),

'A. Āshūr, Ed.). Beirut: Dār al-kitāb al-islāmī, 1424/2003.

Al-Bursī, al-Ḥāfiẓ Rajab b. Muḥammad. *Lawāmi' anwār al-tamjīd wa jawāmi' asrār al-tawhīd* ("About the lights of God's glorification and the secrets of the testimony of God's unity"). Edited as an introduction of *Mashāriq al-anwār* in both editions mentioned below. According to Ṭīhrānī, it was conceived by Bursī as a complement to *Mashāriq al-anwār* (al-Ṭīhrānī 1975, XVIII, 362).

Al-Bursī, al-Ḥāfiẓ Rajab b. Muḥammad. *Mashāriq al-ā mān wa lubāb ḥaqā'iq al-īmān* ("The dawning places of the safety and the substance of the realities of faith", 'A. Zayn al-Dīn, Ed.). Beirut: Dār al-maḥajja al-bayḍā, 1430/2009. It is apparently an abridgment of the *Mashāriq al-anwār*. According to Ṭīhrānī, it was achieved in 801/1398-99 or 811/1408-9 (al-Ṭīhrānī 1975, XVIII, 362; II, p. 299).

Al-Bursī, al-Ḥāfiẓ Rajab b. Muḥammad. *Mashāriq anwār al-yaqīn fī ḥaqā'iq asrār amīr al-mu'minīn* ("The dawning places of the lights of certainty in the divine secrets connected with the commander of the faithful ['Alī b. Abī Ṭālib]"), 'A. Ashraf al-Māzandarānī, Ed.). Qum: Intishārāt al-maktaba al-ḥaydariyya, 1384 Sh./2005-06. Also: 'A. Āshūr (Ed.). Beirut: Dhawī l-qurbā, 1419/1998-99.

Al-Bursī, al-Ḥāfiẓ Rajab b. Muḥammad. *Mashāriq anwār al-yaqīn* (Persian trans.: Yazdī, M.Ṣ., Makhdūmī, Q. (Ed.). Qum: Āyat-i ishrāq, 1394/2015).

Al-Bursī, al-Ḥāfiẓ Rajab b. Muḥammad. *Tafsīr sūrat al-ikhhlās/al-tawhīd* ("Commentary of the Surah of sincerity/of testimony of God's unity"). In: M. Ḥ. Dirāyafī. *Tafsīr sūrat al-ikhhlās-i Rajab Bursī. Āfāq-i nūr* II (1384 Sh./20006), pp. 25–34.

Borsī, R. (1996). *Les Orient des lumières*. (French trans: Corbin, H, Lory, P., Ed.). Lagrasse: Verdier.

Canon Law

James A. Brundage
Department of History, University of Kansas,
Lawrence, KS, USA

Abstract

The history of canon law, the western church's legal system, reaches back almost to the origins of Christianity itself. Despite the aversion of Jesus and his earliest followers to legalism, their successors quickly discovered that good will and brotherly love were not by themselves sufficient to form a viable community. Rules concerning worship, property, and relationships within the community started to appear around CE 100 and multiplied rapidly thereafter. Canonical rules varied considerably from one region to another; however, until around 1140, when Gratian's *Decretum* finally provided a body of texts that all could accept as binding. Popes and councils during the following centuries promulgated a substantial volume of new canon law and by 1250, the church had a working system of courts, complete with professional canon lawyers. These courts and lawyers sought with mixed success to regulate the personal lives and religious practices of medieval Christians in great detail. While the sixteenth-century Reformation rejected much (but not all) of medieval canon law, the Catholic Counter-Reformation sought to reshape

the medieval law and to centralize authority firmly in the papacy, through the Roman Congregations that the Council of Trent established. In 1917, the Catholic church again reorganized its legal system, which had grown unwieldy over the centuries, in the form of a Code, which was further revised in 1983, which remains in force among Roman Catholics.

The earliest surviving set of canons (so called from the Greek *kanon*, meaning "a rule") is a brief collection known as the *Didache*, or *Doctrine of the Twelve Apostles*, written around CE 100. Further collections – the *Pastor* of Hermas, the *Traditio apostolica* of Hippolytus, and the *Didascalia apostolorum* – followed during the second and third centuries. These early collections, produced while Christians were a persecuted minority within the Roman Empire, dealt almost exclusively with internal concerns of the community of believers, such as the conduct of worship, fasting and penance, the authority and duties of bishops, priests, and deacons, and the conduct of Christians toward one another.

A revolution in Roman religious policy occurred when the emperor Constantine I proclaimed toleration for Christianity in 313 and then proceeded to embrace the religion himself. Imperial patronage made Christianity the most favored religion in the Roman world and under Constantine's successors, it was established

by the end of the fourth century as the Empire's official religion. Canon law quickly expanded in scope and force. Imperial authorities enforced decisions by popes, bishops, and church councils. Pronouncements by church fathers, such as Saints Jerome, Ambrose, and Augustine, were accorded the force of legal enactments. Church property and revenues became the subject of a complex body of law. The imperial government adopted many of the church's rules regulating marriage and family life. Bishops' courts enforced canonical rules about sexual morality, public entertainments, commercial and financial transactions, and even contract law.

As Roman government gradually faded away in the western part of the Empire following the barbarian invasions during the fifth and sixth centuries, bishops stepped in to fill much of the resulting power vacuum. They took over a host of functions previously performed by civil servants. We find them proving wills and supervising the administration of decedents' estates, provisioning garrisons, maintaining roads, bridges and aqueducts, operating schools, and overseeing tax collection. Church authorities, in brief, took over much of the day-to-day machinery of local government, in addition to their religious duties.

Canon law burgeoned during the early Middle Ages. New and increasingly voluminous collections of canons appeared in great numbers, as church law grew ever more complex. At the same time, however, the rulers of the new kingdoms that sprang up in western Europe began to appropriate church property and revenues. They likewise commenced to appoint bishops, abbots of monasteries, and the rectors of parishes, in contravention of canon law. As a reaction against these developments, a church reform movement materialized during the second half of the eleventh century. Its leaders saw canon law as one of the principal tools that they could use to reverse these developments. Once church reformers captured control of the papacy in the years following 1050, leading churchmen openly challenged the authority of kings, noblemen, and knights to control church property and institutions. The confrontation between Pope Gregory VII and the German Emperor Henry IV was only the most dramatic

episode in a struggle that continued into the middle of the thirteenth century and ended in at least partial victory for the papacy.

The reinvigoration of canon law that was a central goal of the church reform party led to what has been called a "papal revolution in law." Central to that revolution was the appearance around 1140 of the *Decretum* of Gratian. Gratian's book, which quickly became the basic textbook in the schools of canon law, attempted for the first time to rationalize canon law by applying dialectical analysis to resolve differences between conflicting canons.

The making of canon law intensified during the two centuries that followed Gratian's work, as teachers and students who studied his book became keenly aware of deficiencies in the earlier canon law. Popes and councils attempted to repair those deficiencies by creating new laws, which they codified in new collections that supplemented Gratian's text. In 1234, the pope promulgated a collection of new law in five books, the *Decretals of Gregory IX*. Pope Boniface VIII in 1298 published a further supplement, called sixth book (*Liber Sextus*), and this was followed in the fourteenth century by two more official collections.

Meanwhile, the volume of litigation in church courts grew dramatically. Lawyers trained in canon law fashioned a new and increasingly sophisticated procedural system that many secular courts adopted as well. By the end of the twelfth century, trained canon lawyers were beginning to dominate the College of Cardinals, and from the thirteenth century onward, the popes they elected were, not surprisingly, apt to be canon lawyers as well.

Church authorities increasingly undertook to supervise the public and private lives of the faithful, clerics and laymen alike, to assure that they conformed to the church's teachings. They monitored the lives of the clergy to force them to dismiss their wives and refrain from sexual activity. They permitted sexual relations among the laity only between men and women married to one another according to canonical rules. Popes and bishops issued regulations governing such things as commercial and financial transactions,

the times and conditions of labor, the prices of commodities, the administration of poor relief, and they attempted (with mixed success) to enforce them. Canonical courts punished adulterers, ruled on the legitimacy of marriages and the children they produced. They imposed penalties on usurers and on peasants who worked on Sundays and holidays. The church levied a variety of taxes from the faithful, which made it as a whole enormously wealthy, although that wealth was distributed very unevenly among different parts of the institution. Church authorities likewise attempted, with uneven success, to supervise peoples' religious beliefs and to penalize those who deviated publicly from the orthodox positions defined by popes, bishops, and councils. During the early Middle Ages, enforcement of theological uniformity lay primarily in the hands of local bishops and synods. From the latter part of the twelfth century onward, however, the papacy became increasingly involved in these matters and sought to centralize both the procedures for this purpose and their implementation through the newly created papal Inquisition. In short, canon law sought to regulate almost every aspect of the life of the population, although its success in doing so (like its wealth) varied from one region to another.

Although the leaders of the Protestant Reformation in the sixteenth century in principle rejected the canon law of the medieval church, in practice they retained many of its features. Stunned and shocked by the Reformation's success, Catholic leaders instituted a sweeping Counterreformation of their own at the Council of Trent (1545–1563), which radically transformed many features of the medieval canon law. Trent sought to centralize power within the church. It established specialized offices within the Roman curia, the so-called Roman Congregations, to supervise developments throughout the church in order to repress deviations from canonical norms swiftly, before they could lead to further departures from Catholicism. At the beginning of the twentieth century, Pope Pius X determined to reduce canon law, which had grown increasingly unwieldy over the centuries, to a codified form and in 1917 his successor, Pope Benedict XV,

promulgated the *Codex iuris canonici*, which sought to reduce nearly 2,000 years of canon law to a single modest-sized volume that every parish priest could keep at hand. Following the Second Vatican Council, Pope John Paul II revised that code in order to incorporate the council's decisions into canon law. He promulgated the new *Codex iuris canonici* in 1983 and it remains the official restatement of the law to this day.

Carolingian Renaissance

John Marenbon
Trinity College, University of Cambridge,
Cambridge, UK

Abstract

The Carolingian Renaissance was a cultural revival inspired by Charlemagne who, during his long reign (768–814), extended the Frankish kingdom to include most of present-day France and Germany as well as parts of Spain and Italy. In this entry, it is taken to cover philosophy of the period c. 780–c. 900, except for the work of the best known philosopher of the time, John Scottus Eriugena, who is treated in separately. After a section discussing the cultural background (see “The Carolingian Renaissance and Carolingian Philosophy”), the two philosophers at Charlemagne’s court, Alcuin and Theodulf of Orleans, are considered (see “The Founders: Theodulf of Orleans and Alcuin”), and then Alcuin’s circle of pupils is examined (see “The Circle of Alcuin”). The next two sections look at two of the disputes (on predestination (see “Gottschalk and the Debate on Predestination”), and on the world-soul (see “Ratramnus of Corbie, the Soul, and Universals”) – but really on universals), which encouraged some of the liveliest ninth-century philosophizing. Central to philosophy in the early Middle Ages were the gloss traditions on important school texts: these are examined in “Ninth-Century Glosses to School Texts.” The “Concluding Remarks” emphasize that this whole area is in need of more research and that a synthesis such as that offered here is premature.

The Carolingian Renaissance and Carolingian Philosophy

In its broadest meaning, “Carolingian Renaissance” refers to the centrally inspired cultured revival that accompanied Charlemagne’s achievement at the end of the eighth century in making himself ruler of a large empire, and took up the theme, which, in his politics, reached its apotheosis in his imperial coronation at Rome in 800. It was a movement, primarily, to reform the Church: clerical corruption was tackled, new standards of Latinity were imposed, and the text of the Bible and the Liturgy standardized. Among a small elite, there was a cultural and intellectual renaissance, also encouraged by Charlemagne. Intellectuals from Lombardy and Spain such as Paul the Deacon, Peter of Pisa, and Theodulf of Orleans were invited to the court, where they not only engaged in theological controversy but also wrote classicizing Latin verse. Later, the Anglo-Saxon from York, Alcuin, became the most influential of these figures. A library was built up at court which contained the texts of Latin authors such as Lucan, Terence, Horace, Juvenal, Martial, and Cicero, as well as Calcidius’ translation of Plato’s *Timaeus*; and after Charlemagne’s death, his biography was written by Einhard, in a form imitated from Suetonius. The intellectual renaissance survived the gradual disintegration of the Empire during the reign of his son Louis the Pious (814–40) and his grandson Charles the Bald (d. 877). Indeed, Charles the Bald seems to have been enthusiastically interested in poetry, theology, and philosophy, protecting the greatest thinker of the whole period, John Scottus Eriugena. Encouraged, perhaps, by the way in which his court looked to Byzantium as a model, this period was a time in which knowledge of Greek, rare in the Middle Ages, was cultivated, not just by Eriugena but also by his fellow Irishmen Sedulius Scottus and Martin of Laon (see in general the essays in McKitterick 1994).

The Carolingian Renaissance is clearly important, then, in the story of the transmission of classical civilization and for intellectual history. But what relevance does this period have to the history of philosophy? To gather from the bulk of

older and recent discussions, it is Eriugena, and Eriugena alone, who deserves to be considered as a philosopher. Moreover, Eriugena is usually considered to have cut himself off from his own background and century through his reading of Greek Neoplatonic Christian authors, and so to have been a virtual inhabitant of Constantinople rather than Laon or Soissons in the North of France. Other Carolingian scholars seem just to have been preservers and compilers: avatars of their epoch's renaissance perhaps, but hardly thinkers in their own right. This impression, however, is far from wholly accurate. The characteristic methods of Carolingian thinking – excerption, paraphrase, compilation, and glossing – give the misleading impression of servility. But, often, the thinkers are exercising a careful choice, and even by the way they selected and interwove others' material, they are indicating a clear set of their own ideas. And, arguably, these ideas and the more general approach and caste of mind from which they emerged cast medieval Latin philosophy in the mold which, from then on, it would continue to exhibit. I shall return to this point at the end of my discussion. The three areas in which Carolingian philosophy flourished were in logic, in the confrontation, as Christians, with pagan philosophical ideas, and in controversies over Christian doctrine. I have presented it under these headings elsewhere and tried to give an impression of the nature of philosophical thinking at the time through examples (Marenbon 1994, 1998; see also, for a logically oriented view Marenbon 2008). Here, rather, I shall try to set out the different phases of philosophy in period from c. 780–c. 900, with bibliography to help any new explorers of this neglected area – but perhaps they should read the two caveats in my conclusion before they read any further.

The Founders: Theodulf of Orleans and Alcuin

The two men who revived philosophy for the first time in the medieval Latin West, at the court of Charlemagne, were Theodulf (d. 821), a Visigoth from Spain, and the Anglo-Saxon Alcuin (d. 804)

from York (see Bullough 2004; Jullien and Perelman 1999). Both were accomplished poets in the classical style, theologians, and among Charlemagne's most trusted administrators; Theodulf was rewarded with the bishopric of Orleans (798) and the abbacy of Fleury; Alcuin was made abbot of Tours (796). Their principal contribution was, in each case, in reviving logic and using it for theological purposes. Theodulf's most important theological work is the *Opus Caroli regis contra Synodum* or (as it is more commonly known) the *Libri carolini*, the response written in 792–793 in Charlemagne's name to the Greek position on image worship taken at the Council of Nicaea in 787 (Theodulf of Orleans 1998; cf. Freeman 2003). Despite the work's achievement in proposing a moderate attitude to the use of images, it was never actually issued, probably because the Papacy accepted the Greek view. The most remarkable section for historians of logic is IV, 23. In order to show that “to kiss” and “to adore” do not mean the same thing, Theodulf indulges in a display of his knowledge of logic – far beyond anything required for his point – borrowing from Boethius' first commentary on *On Interpretation* and from Apuleius' *Peri Hermeneias*. Although the fate of the *Opus Caroli* means that this logical passage cannot have had any direct influence, it is perhaps no accident that Fleury became one of the outstanding centers for logic in the early Middle Ages.

According to the new datings proposed by Donald Bullough (1991:37, 1997:581–582), Alcuin's *De dialectica*, the first logical textbook of the Middle Ages, was not written until after the *Opus Caroli*. But if – as seems probable (cf. Rädler-Bohn 2016) – the traditional dating of 786–790 is correct, then Alcuin retains the credit for reintroducing the study of logic into medieval Northern Europe. The *De dialectica* (Alcuin 1851:951–976) is, with one exception, almost entirely derived from the accounts in Isidore's *Etymologiae* and Cassiodore's *Institutiones* (itself based on Isidore). But it seems to have been Alcuin's own choice to have shifted the attention away from how logic is presented in these sources, as a tool for composing arguments, especially syllogistic ones, to the ten

categories. The one textbook he draws from, extensively and verbatim, is a paraphrase of Aristotle's *Categories* from the circle of Themistius (fourth century) which he believed was the work of Augustine. This attribution points to the special theological purpose he saw in the categories: without them, the "profound questions" about the Holy Trinity cannot be explained, he says (see Lehmann 1917; Marenbon 1997a).

Some of Alcuin's ideas outside logic are also philosophically interesting. For example, in his treatise *De rhetorica et de virtutibus* (Halm 1863:523–550) he goes beyond his main source, Cicero, to discuss how philosophers can be said to be virtuous, and although he uses Augustine, he comes to a different view, much less hostile to pagan thinkers. Alcuin also wrote a short treatise *De vera philosophia*, as an introduction to his textbooks on the Arts (Alcuin 1851:849–854; cf. Marenbon 1994: 172–173), in which he melds the biblical idea of wisdom with the philosophical wisdom to be attained through studying the seven liberal arts.

The Circle of Alcuin

Two of Alcuin's pupils are known for their philosophical interests. The more celebrated of them, Fredegisus, wrote in 800 or later a letter *De substantia nihili et tenebrarum* (*On the Substance of Nothing and of Darkness*) (Fredegisus of Tours 1895, 1963). Fredegisus believes that God created names as well as the things named, and that he did not institute any names which lacked an object. He therefore believes that there must be something which corresponds to the names "nothing" and "darkness." This treatise is one of the few Carolingian works to have generated interest and debate among modern scholars over its interpretation (Mignucci 1979; Colish 1984; Haverkamp 2006). A controversy from later – the only record of it is a letter of Agobard of Lyons from about 830 – suggests that Fredegisus speculated about the origin of human souls and believed that they preexisted the body (cf. Marenbon 1981:64–66).

Alcuin's other philosophical pupil was Candidus, who was also very probably the

companion of Theodulf of Orleans when he went to Rome in 800–801 (Freeman and Meyvaert 2001:126). Candidus was probably the compiler of a set of philosophical passages (some original compositions, some extracts from ancient or patristic texts), that have been labeled the "Munich Passages," and he probably wrote one of them, labeled as "*Dicta Candidi*" (ed. and discussion in Marenbon 1981, to be corrected by Bullough 1991:178–181 and Dolbeau 1997:162–165; an excellent study of the composition, contents, and influence of this material has been made in Lebeche et al. 2009). Among the passages are some which show an interest, like Alcuin's, in the ten categories, and others which show a fascination for techniques of logical argument reminiscent of Theodulf. One passage consists of a dialogue-form argument for the existence of God, based on Augustine's *De libero arbitrio* but with some of its own, often simplistic argumentative moves. There is also an extract from Calcidius' Commentary to the *Timaeus*.

Gottschalk and the Debate on Predestination

Gottschalk was a child oblate and unwilling monk, first of Fulda, then Reichenau, then Orbais, and then – as a prisoner – at Hautvilliers. The reason for his imprisonment was the condemnation at the Council of Quierzy in 849 for teaching the doctrine of double predestination: that the good are predestined to eternal bliss and the wicked to eternal damnation (edition – Gottschalk of Orbais 1945; cf. Jolivet 1958). Gottschalk claimed, with a great deal of justice, that this was Augustine's position. His opponents, who included his former teacher Hrabanus Maurus, Archbishop of Mainz, and Hincmar, Archbishop of Rheims, accepted as orthodox the doctrine that God predestines the good to salvation, but rejected the idea of predestination to damnation. In their view, it made God responsible for the evils performed by the wicked and so an unjust judge in punishing them; moreover, they regarded the teaching as socially destructive, since it removed the incentive for Christians to behave well.

Although the subject matter of this dispute was, then, strictly theological, and much energy on both sides was spent in finding patristic texts that supported one or the other view, it was also the occasion for medieval authors to begin to tackle the complex of philosophical problems surrounding the idea of free will (cf. Schrimpf 1980; Marenbon 1990).

The outstanding philosophical contribution to the controversy was John Scottus Eriugena's *De praedestinatione*, written in the early 850s at Hincmar's request and discussed in the entry on Eriugena. But Hincmar's own *Ad reclusos et semiplices* (Gundlach 1889) and Hrabanus Maurus' letter to Noting (*Patrologia Latina* 112, 1530–53) setting out his position both show their authors struggling with some central ideas. Their difficulty results from the fact that, like Gottschalk, they accept that humans cannot act well without God's grace and that only some are predetermined to receive this grace. But then if God omits to give a certain person grace, and so that person cannot but be damned, is this not exactly the same as double predestination? Hrabanus and Hincmar are at least aware of this problem. Hrabanus tries to tackle it by suggesting that it may be the individual person who chooses to desert God, while Hincmar puts forward the suggestion (along lines which would be elaborated into a theory of Middle Knowledge by Molina in the sixteenth century) that God withholds grace from those who he has foreseen would misuse it if they received it. Further interesting contributions to the debate were made in the 850s in opposition to John Scottus' contribution by Florus of Lyons (*Patrologia Latina* 119, 101–250) and Prudentius of Troyes (*Patrologia Latina* 115, 1009–1366).

Ratramnus of Corbie, the Soul, and Universals

A much less public dispute, but of great philosophical interest, took place in the early 860s, between Ratramnus, a monk of Corbie (d. c. 868), and an anonymous monk of Sainte-Germer de Fly, who seems to have been presenting the doctrines of his (otherwise unknown)

Irish master, Macarius. The only record of the controversy is in the *Liber de anima* that Ratramnus wrote for his former abbot, Odo, who had become Bishop of Beauvais – a work which itself survives only in a seventeenth-century copy (Ratramnus of Corbie 1952; cf. Delhaye 1950; Marenbon 1981:67–70). The discussion arises from a passage in Augustine's *De quantitate animae*, at the back of which stand the Neoplatonic doctrines of Soul as an hypostasis – the lowest level of reality – and of the World Soul. Augustine asks whether all souls are one, or are individuals' souls entirely separate, or are they both one and many. Macarius apparently took this third answer as Augustine's own view, but, at least as presented by Ratramnus, the issues discussed are not to do with the soul as such, but rather with the status of universals. Ratramnus believes (almost certainly wrongly, but he would not have known the Neoplatonic background) that, when Augustine talks of a single soul, he is merely referring to soul as a species. Basing himself on passages in Boethius that go against a realist view of universals, Ratramnus argues that species do not have any subsistence, but exist merely in the mind. Indeed, he insists (1952, 29:9–23, cited by Erismann 2010) that properly speaking the only things that are substances are those we can see and can point to with our finger. Macarius' position is, by contrast, a type of realism – and it has recently been very convincingly seen as an inchoate version of a view that is found in his fellow Irishman Eriugena and remains important, perhaps central, to thinking about universals until the time of William of Champeaux: immanent realism (Erismann 2010:334–343). Immanent realists hold that the same universal substance is present in each member of a species, and that the individual members are differentiated from one another only by accidents: in substance, therefore – just as Macarius seems to have claimed – all souls are one soul.

Ninth-Century Glosses to School Texts

Outside the work of Eriugena, the most important philosophical work of the later ninth century is

found in what may seem to contemporary historians a strange place – the glosses written in the margins of manuscripts. These are not, in the case of some of the main school texts, simply readers' notes. Although the glosses in one manuscript are rarely exactly the same as those in another, there are strong family resemblances, and one can speak of a "standard set of glosses" (or in some cases a variety of sets of standard glosses) which a considerable number of manuscripts share more or less, often adding some nonstandard material. Of central importance for early medieval philosophy are the glosses found in manuscripts of Martianus Capella's *De nuptiis Philologiae et Mercurii*, the pseudo-Augustinian *Categoriae Decem*, Porphyry's *Isagoge*, Boethius' *Opuscula sacra*, and the gloss and commentary tradition on Boethius' *De consolazione philosophiae*. (Another important school-text was the commentary by Macrobius on Cicero's *Somnium Scipionis*, but little is known as yet about the extent of glossing and commentary as early as the Carolingian period.) An important figure in connection with these gloss traditions is Remigius of Auxerre (cf. Jeudy 1991). Remigius was born in c. 840, became a monk of Auxerre and, in 893, took charge of the cathedral school at Rheims. He wrote commentaries on a wide variety of works – classical grammarians and poets and, of the works listed above, the *De nuptiis* and *De consolazione* (and perhaps also Boethius' *Opuscula sacra*). But Remigius did not strive to be original, and his commentaries seem – especially from the evidence of the one on *De nuptiis* – to be compiled by merging together material from various gloss traditions.

Martianus Capella's *De nuptiis* is a fifth-century encyclopedia in prose with verse interludes, of the seven liberal arts (grammar, logic, rhetoric, arithmetic, geometry, astronomy, and music) preceded by two books which recount the allegorical marriage between Mercury (divine reason) and Philology (the human soul). Despite (or because of?) its rebarbative style of Latin, *De nuptiis* became a very popular textbook in the ninth century. Philosophically, the most interesting gloss material is that attached to Book IV and some of that to Books I and II. The

relations between the different traditions of glosses have yet to be properly established. Eriugena is known to have taught *De nuptiis* at Charles the Bald's palace school, and editions of two different versions of his commentary have been published (John Scottus Eriugena 1939; Jauneau 1978; the glosses to Book IV are better edited in Von Perger 2005). It is not certain that all this material is his (the basis for identifying the work as John's are some comments in Remigius' commentary, which attribute certain ideas to him), but most of it probably goes back to him, and his comments on logic show that – in what is very probably work from his earlier years – he is beginning to think along some of the lines which will be developed in his *Periphyseon* (cf. Von Perger 2005:264–301; Marenbon 2008:26–27). There are also glossed manuscripts that belong to an earlier tradition (Teeuwen et al. 2008), and another tradition, which has been associated with a writer called Dunchad, Martin of Laon, or Heiric of Auxerre (Pseudo-Dunchad 1944).

The *Categoriae Decem*, already Alcuin's favorite, seems to have been the most intensely studied logical text in the ninth century. Of the two manuscripts which date from the last decades of this century, one (Milan Ambrosiana B 71 sup.) is not very fully annotated, but the glosses it contains are in many cases obviously linked to the teaching of Eriugena and have little to do with the logical content of the text. The other set of glosses in Sankt Gallen 274 is much fuller. It contains more material which would be standard in tenth- and eleventh-century glossed manuscripts. Unlike all the other glossators of the *Categoriae Decem*, however, the Sankt Gallen glossator knows Boethius' commentary on Aristotle's *Categories* and uses it to help him gloss the pseudo-Augustinian text (Marenbon 1981:116–138).

It also seems that the tradition of glosses to Boethius' *Opuscula sacra* was begun in the ninth century. There have been attempts to link the glosses to a specific individual – Eriugena himself or, more recently, Remigius of Auxerre (Cappuyns 1931) – but such attributions are unreliable and the complexities of this gloss-tradition have yet to be unraveled. Boethius' discussions in these little treatises provided early

medieval authors with a chance to think about some basic metaphysical issues, such as individuation, and how they related to doctrinal problems.

The glosses to Boethius' *De consolazione Philosophiae* have perhaps the richest tradition of all. Pierre Courcelle (1967) distinguished two strands of a commentary tradition, one linked to Sankt Gallen and one from Remigius of Auxerre (extracts, but he acknowledged that some manuscripts contained glosses that belonged to neither tradition.) The most recent research (Godden 2003; Jayatilaka 2006) suggests that the position is as complicated for this work as for the other textbooks. Each manuscript contains a different assortment of glosses, and the main groupings have not yet been properly established. Boethius' *De consolazione* faced the early medieval authors with a special challenge. Although Boethius was a Christian, he wrote *De consolazione* without including any explicit references to Christianity, and in some passages – most obviously Book III, metrum 9, an epitome of Plato's *Timaeus* – he proposes, through the mouthpiece of the personification Philosophia, ideas which seem to be at odds with Christian doctrine. Different Carolingian exegetes had different approaches to resolving the tension. The late ninth-century glosses to Book III, metrum 9 in one manuscript (Vatican lat 3663; edited in Troncarelli 1981) – which seem to be distinct from the Remigius or the Sankt Gallen set – give the impression, at first, of accepting without demur the pagan nature of the material, since they consider the stars and their properties and do not avoid astrology. But what may seem like a daringly pagan moment – the equation of the World Soul with the sun – turns out to be a quotation from the very soberly orthodox Bede. Both the Sankt Gallen commentator's and Remigius' attitude fit with a line of interpretation found in Alcuin, and it has been argued (Troncarelli 1981) in the way the *De consolazione* was presented even shortly after Boethius' death: the work is interpreted in an explicitly Christian way, with the figure of Philosophia transformed into the Biblical Sapientia, and any passages which, taken literally, seem to go against Christian doctrine, read allegorically with a Christian

meaning. There is, however, one short, continuous commentary, just of Book III, metrum 9, which takes a very different approach (edited in Huygens 1954). It was written by Bovo, a monk of Corvey. Bovo died in 916, and so this piece of writing comes from the closing years of what can be considered the Carolingian period, if not later. Bovo recognized both that Boethius was a Christian author but that, in this metrum especially, he said much that was "contrary to the Catholic Faith." Using Macrobius' commentary on the *Somnium Scipionis*, he gives a remarkably penetrating interpretation of the Neoplatonic allusions in this poem, although he does so only – at least ostensibly – in order to condemn these pagan doctrines.

Concluding Remarks

A survey, like this one, of Carolingian philosophy without Eriugena is very much a case of *Hamlet* without the Prince. But history follows different rules from fiction. The real story of *Hamlet* is just the story that Shakespeare told, in which, because he so designed it, Hamlet plays a role so central that none of the other elements in the play would make sense without his presence. Although, from the standard *Histories* of philosophy, it would seem as if Carolingian philosophy without Eriugena is not so much lacking in sense as absent altogether, what the paragraphs above suggest is a very different conclusion. Although Eriugena had a very definite influence on a circle of followers (Marenbon 1981:88–115), the greatest achievement of ninth-century philosophers may have been that, in general, they did not follow him. His bold theology and imaginative but sometimes less than fully worked-out Neoplatonic metaphysics were largely ignored, and instead, scholars worked carefully over the ancient textbooks, absorbing the rudiments of the Aristotelian tradition of logic. In doing so, they set the mold for eleventh- and twelfth-century philosophizing and that, in its turn, for how philosophy developed even after the assimilation of the whole Aristotelian corpus in the thirteenth century.

This judgment, however, must, like any judgment about philosophy in this period, be qualified by two notes of caution, which are, in fact, the most important points that are made in this article. First, there is no good reason to choose Carolingian philosophy or philosophy of the Carolingian Renaissance as constituting a distinct period in the history of philosophy. The gloss traditions, which are central to the story of early medieval philosophy, run on into the tenth and eleventh centuries. Second, outside the writings of Eriugena, philosophy in the late eighth and ninth centuries (and indeed in the tenth) remains a mostly unstudied field (cf. Marenbon 2009). Scholars are only now beginning to understand the complexity of the major gloss traditions, and they are still a long way from being in a position to start to assess the philosophical achievements of these years. An encyclopedic synthesis, such as this one, is therefore premature: there is nothing in the above paragraphs which more thorough study may well not show to be inaccurate, wide of the mark, or plain false.

Abstract

The body of thought contained in Aristotle's *Categories* posed a host of questions for its medieval interpreters. This entry considers medieval approaches to five such questions:

1. What is the subject matter of the Categories, words or things?

2. Is Aristotle's list of ten categories complete and irreducible, and can its completeness be demonstrated?
3. What is the nature of the accidents in the last six categories (which are not covered extensively in the *Categories*)?
4. Are individual accidents individuated by the substances in which they inhere, can they be transferred from one substance to another, and what are the implications for the Christian doctrine of the Eucharist?
5. What is the ontological nature of relations and relatives, and what are the implications for the Christian doctrine of the Holy Trinity?

Aristotle's *Categories*

Aristotle's *Categories* (Aristotle 1963, 1b25) states that incomplex expressions signify either Substance (e.g., Man) or Quantity (e.g., Two cubits long) or Quality (e.g., White) or Relative (e.g., Master) or Where (e.g., In the market place) or When (e.g., Yesterday) or Position (e.g., Lying) or State (e.g., Shod) or Action (e.g., To cut) or Affection (e.g., To be cut). These are the ten Aristotelian categories. The non-Substance categories are known as Accidents.

In at least some categories, a distinction can be made between denominatives (e.g., Brave) and that from which they are denominated (Bravery).

Among substances, Aristotle distinguishes primary substances (e.g., the individual man) as being neither said of a subject nor present in a subject (Aristotle 1963, 2b11). Two types of predication are thus distinguished (2a19). What is "said of" a subject (as Animal is said of Man) is predicated, both in name and definition, of the subject. What is "present in" a subject (as Grammatical knowledge is present in Man) may be predicated in name, but not in definition, of the subject; it is not part of the subject and cannot exist apart from it (1a20).

According to the *Categories*, there are individual accidents as well as individual substances. Everything other than primary substance is either said of or present in a primary substance. Thus, it

is sensible individuals, such as this man or this horse, which are substance in the truest and primary and most definite sense of the word – a claim that is diametrically opposed to Plato's Theory of Forms, which states that intelligible Forms are most truly substances.

The *Categories* mentions features peculiar to some of the categories, whereby they can be distinguished from other categories. It is common to all substances, and also to the differentiae whereby one species is distinguished from another, that they are not present in any subject (3a7). It is common to all substances and also peculiar to them that, while remaining numerically identical, they can receive contrary qualities through a process of change (4a10).

What is distinctive of quantity is that subjects can be equal or unequal to one another in respect of quantity (6a26). (But Equal and Unequal are relatives, not quantities.) What is distinctive of quality is that subjects can be similar or dissimilar to one another in respect of quality (11a15). (But Similar and Dissimilar are relatives.)

It is distinctive of relatives that every relative has a correlative, as Slave is correlative with Master. It seems to be a peculiarity of relatives that correlatives are simultaneous by nature: when one man becomes a master, another becomes a slave, and when one becomes a slave, another becomes a master (7b15).

The category of relatives includes items like Master and Slave, which are denominatives, and also includes the items from which these are denominated: Mastery and Slavery. The latter may be called relations.

The Subject Matter of the *Categories*

The Neoplatonist Plotinus (d. 270) raised a number of detailed difficulties with Aristotle's account. The big problem, for him, was that if Aristotle's scheme of categories is supposed to be a classification of all beings, it seems unable to accommodate those intelligible entities that are the primary beings from which all others emanate (Plotinus 1988). Plotinus' disciple Porphyry (d. 305) wrote two commentaries on the *Categories*,

only one of which survives. He proposed an ingenious solution to Plotinus' interpretive problem. The *Categories* should not be read as a pretended classification of all beings but as a classification of the species and genera of sensible beings. By this means, Aristotle's book could be assimilated into Neoplatonic doctrine. Porphyry's most famous work is the *Eisagôgê* – an introduction to the *Categories* – which contains the structure later known as Porphyry's tree, a detailed account of the way in which the category of substances branches out into its genera and species.

The *Categories* talks sometimes about "things that are said" (1a16) and sometimes about "things that are" (1a20). Thus, there arose the interpretive question of whether the work is about words or things. Porphyry proposed that the book is about words insofar as they are used to signify things (Porphyry 1992). This compromise solution was to become influential in the Middle Ages.

The commentary on the *Categories* by Boethius (d. 524/525) takes over much of Porphyry's thinking. For example, he says that the substances of which the *Categories* speaks are compounds of matter and form, and not such things as God or the soul (Boethius 1891).

In the eleventh century, some interpreters rejected Porphyry's compromise concerning the subject matter of the *Categories*; they insisted either on reading the work as being about things [*in re*] or being about words [*in voce*].

The Sufficiency of the Categories

Since the time of Simplicius in the sixth century, commentators have tried to prove that Aristotle was right in naming the ten categories, and just the ten, which he did name (Sorabji 2005). They used a variety of principles to divide all beings into Aristotle's ten categories (Simplicius 2003).

In the Arabic-speaking world, Avicenna (d. 1037) proposed a division of beings into Substance, Quantity, and Quality (which can be conceived without regard to anything other than their substance) and the remaining seven categories whose conception requires reference to something

other than their substance (Thom 2015). This two-plus-seven division of accidents was taken up in the West by Albert the Great (d. 1280).

Robert Kilwardby (d. 1279) proposed a three-plus-three-plus-three division, based on a distinction between what attached to a substance intrinsically or extrinsically or in a mixed mode and between what concerned the subject's matter or form or the composite of matter and form (Hansen 2017). Kilwardby's division was later reproduced by Walter Burley 1497 (d. 1344).

In 1266, William of Moerbeke translated Simplicius' *Categories* commentary into Latin. Thomas Aquinas, whose derivation of the ten categories was based on the different modes of predication, consulted this translation: a predicate either indicates what its subject is substantially, or else it is in the subject, or else it is outside the subject. A predicate that is in the subject is so either absolutely (following either from the subject's matter or from its form) or it is in the subject relatively. A predicate that is outside its subject is either wholly outside the subject (either not as a measure of the subject or as a measure – and then either as a measure of time, or of place in relation to the subject's parts, or of the whole subject) or outside of it in the way that Action and Affection are outside their subject.

John Duns Scotus thought the method of division could never demonstrate the sufficiency of the ten categories, though he believed they were only ten.

Like Scotus, William Ockham (d. 1347) rejected the opinion of those who sought to construct a deduction of the ten categories from first principles. He believed it was necessary only to have categories of Substance and Quality, the remaining categories being reducible to these. John Buridan (d. c. 1361) thought all the categories were reducible to Substance, Quantity, and Quality (Klima 2008).

Problems About Accidents

Aristotle does not deal with the non-Substance categories in any detail. The *Categories* ends

with some loosely related chapters on contrariety and other types of opposition, on priority and simultaneity, on motion, and on having. In the Latin world, the *Book of the Six Principles*, formerly attributed to Gilbert of Poitiers (d. 1154), attempts to fill this gap in Aristotle's discussion.

In the Arabic world, Al-Farabi filled the gap by analyzing the remaining six categories in detail (Dunlop 1957–1959).

Regarding the individuation of accidents, Porphyry suggested that an individual accident such as the fragrance of an apple can be separated from its subject and thus can exist separately from what it was in, but only if it gets transferred to another subject. Porphyry's view of individual accidents as dependent on individual substance, albeit in a transferable way, was taken up and transmitted to the Latin Middle Ages by Boethius.

Peter Abelard took a different view of individual accidents. He understood Aristotle to say that what is in a subject cannot subsequently exist separated from that subject. He held that individual accidents are not transferable between subjects, but at the same time, he held that they do not attach with necessity to their actual subjects: an individual accident inhering in a given subject might have inhered in a different subject.

The question whether individual accidents are individuated by the substances in which they inhere takes on an added significance when considered in relation to the Christian doctrine of the Eucharist. The Church's teaching is that in the Eucharist the bread and wine become the body and blood of Christ. Berengar of Tours (d. 1088) argued that this doctrine entailed that if the bread changes substantially into the body of Christ while preserving the accidental features it had when it was bread (rather than merely preserving the appearance of those accidental features), then the same individual accidents must inhere first in one substance and then in another (Marenbon 2007). Thus, it seems that the Church's doctrine, when transposed into the language of the *Categories*, is not consistent with the theory that individual accidents are individuated by their substantial subjects and are not transferable from one substance to another.

Problems About Relations

Aristotle had suggested that perhaps not all correlatives are simultaneous in nature because knowledge and the knowable are correlatives but the knowable exists prior to becoming known. Al-Farabi, following Porphyry, gives a solution, namely, that potential knowledge is simultaneous with the potentially knowable and actual knowledge with the actually known.

Avicenna (2005, 118) asks whether a relation is something existing between two things (as "most have thought") or whether "there is for each of the two related things ... a special property." He adopts the second view, declaring that fatherhood is in the father and sonship in the son and "there is nothing here at all which is in both of them." Most of the medievals followed him in this judgment (Henninger 1989); but some, such as Nicholas of Paris (d. before 1263), held that "the specific relation that is paternity and filiation is in the father and son as in one subject and not in each of them taken separately" (Hansen 2014, 149).

In the Christian world, Augustine (1991) used the notions of substance and relation to illuminate the doctrine of three Persons in one God. He pointed out that when a relation inheres in a subject, the subject is something substantially besides being the relation's subject: the slave is substantially a man. What the subject substantially is was later called its ground [*fundamentum*]. Augustine held that God is a substance (not because God can receive contrary qualities through change, but because God is an essence not present in anything as a subject). The Father, Son, and Holy Spirit are said with reference to one another, in just the way that correlatives are; at the same time, each of them is substantially God. Augustine's elaboration of the doctrine of the Trinity became the source of a long tradition of theological thought.

Given that a relation inheres in its subject but stands toward its object, the question arises whether these two aspects are independent of each other and if they are mutually independent whether one or both are essential to relations. Robert Kilwardby (d. 1279) took these two aspects to be mutually independent and took the second aspect (standing toward an object) to be

the essential one. Given the independence of a relation's two aspects and given that its "towardness" is what is essential to it, there can be no contradiction in supposing a relation to stand toward an object while not inhering in any subject. If, then, the mark of a substance is taken to be not inhering in any subject, it follows that there is no contradiction in supposing a relation to be a substance (Kilwardby 1986).

This argument is rich in theological potential, because in Augustine's treatment of the Trinity, the three divine Persons are supposed to be both constituted by their relations and substantially identical with the Divine Essence. Clearly, if the Divine Essence is a substance and if it is not to be contradictory for the Father to be identical both with Paternity and with the Divine Essence, then it should not be contradictory for a relation to be a substance.

Aristotle had pointed out that a relation of similarity can come to characterize a subject without any change occurring in the subject (e.g., because there is a change in the relation's object). Some medieval thinkers concluded from this example that relations have no ontological content: a relation adds nothing to its subject beyond what is already contained in the relation's ground. Among the proponents of this view were Henry of Ghent (d. 1293) and Richard of Middleton (d. 1300).

Among the opponents of the view was Walter Burley, who posited five elements in a relational situation: the relation itself, its subject, its ground, its terminus a quo, and its terminus ad quem (Conti 2007b). Thus, he clearly distinguishes the ground of a relation from its subject and from its terminus a quo. For example, the relation of mastery is grounded in a power to coerce. Both the relation and its ground are distinguished from the man who happens to be a master (the subject) and from that master considered purely as a master (the terminus a quo). Mastery is a relation, the man who is a master is a substance, and the master as such is an aggregate of a substance and a relation. Both mastery and the man are per se beings, but the master as such is a per accidens being. Thus, what is a per se being (the man) is a relative only per accidens, whereas what is a per

se relative (the master) is merely a per accidens being.

Robert Alyngton (d. 1398) follows Burley on many points but posits four instead of five elements in a relational situation (Conti 2007a). These, it turns out, are the four per se beings that enter into any real relation: the relation itself, the subject (the man who happens to be a master), the ground (the power to coerce), and the per se being that happens to be the terminus ad quem (the man who happens to be a slave).

Alyngton's analysis, though original, does not depart from the standard medieval view of relations as inhering in a single subject (i.e., in modern language as monadic properties). A relation does require, besides its ground, two per se extremes. But it inheres in only one of these, namely, its subject. The relation does not inhere in its object; rather, the relation's correlative (e.g., servitude) inheres in the object.

Categories, Commentaries on Aristotle's

Heine Hansen

The Saxo Institute, University of Copenhagen, Copenhagen, Denmark

Abstract

Aristotle's *Categories* was a fundamental text in the medieval Latin philosophical tradition. Supplemented with an introduction by the late-ancient Neoplatonist philosopher Porphyry, it served, from the eleventh century onward, as the first book of the medieval philosophical curriculum. As a result of its theoretical and educational primacy, it became the object of an extraordinarily vast commentary tradition that includes commentaries by some of the most well-known medieval philosophers: Peter Abelard in the twelfth century; Robert Kilwardby, Albert the Great, and John Duns Scotus in the thirteenth; and William of Ockham, Walter Burley, and John Buridan in the fourteenth.

The Commentary Tradition

The *Categories* was translated from the Greek around 500 CE by the Roman senator Manlius Boethius (ca. 480–ca. 525), who also wrote an influential commentary to it. Boethius' translation (which circulated in two different versions) came into use as the basis for studying Aristotle's theory of categories around 1000 CE and soon became the object of commentary.

It is not known exactly how many commentaries survive, but the number certainly runs into the hundreds. No complete survey or even catalogue of the material known to be preserved in the medieval manuscripts exists, and only a small portion of the material is at the present stage available in modern, critical editions. Relative to other texts, the commentary tradition on the *Categories* has received quite a significant amount of

scholarly attention in the last decades, but much remains to be explored.

The first extant commentary is from the early eleventh century (Anonymus, *Excerpta Isagogarum et Categoriarum*). It is little more than brief excerpts from Boethius' commentary reworked into a very simple question-and-answer form. A more sustained tradition of writing free-standing commentary appears in the sources from about 1100, although it probably began decades earlier. Boethius' commentary is still a significant source in these twelfth-century commentaries, most of which take the form of literal commentaries that combine word-by-word exposition of the letter of Aristotle's text with more freestanding discussion of exegetical or philosophical issues in, or arising from, it. A lot of the material is fragmentary, and almost all of it is anonymously transmitted, the exception being Peter Abelard's commentary in the *Logica ingredientibus*. Although they cannot be attributed to a specific thinker, several of the commentaries can, however, be seen to have originated in a specific part of the philosophical milieu of twelfth-century Paris, which was dominated by a number of fiercely competing schools. Thus, for example, one commentary can be identified as the product of a follower of Gilbert of Poitiers (Anonymous Porretanus) and another clearly belongs to the school of Abelard's fierce opponent Alberic of Paris (Anonymous Patavinus).

By the thirteenth century, the Parisian schools seem to have pretty much vanished, and a new institutional setting for teaching and doing philosophy had arisen: the university. There appears to be a dearth of material from the early decades of the century, but once we reach the 1230s, a number of commentaries by philosophers connected to the arts faculty of the University of Paris are preserved: John Pagus, Nicholas of Paris, and Robert Kilwardby. Like their twelfth-century precursors, these commentaries are literal commentaries, but they have a more rigid structure which seemingly reflects a more standardized teaching practice. Aristotle's text is now broken down into a series of lectures (*lectiones*), and each lecture consists of a division and an exposition of a piece of text as well as

series of questions pertaining to the interpretation of it. From the second half of the thirteenth century, even more material is preserved. Prominent commentators include Albert the Great, Martin of Dacia, Peter of Auvergne, Simon of Faversham, John Duns Scotus, and Radulphus Brito. Literal commentaries are still being written, but many commentaries now take the form of question commentaries; they presuppose a thorough knowledge of the letter of the text and consist solely in a series of more sustained, free-standing discussions of selected questions that arise from it or the doctrines it contains. A prominent feature of the commentaries in this century is that most of Aristotle's writings have now become available, and so commentators increasingly try to understand the *Categories* in the light of these other works, the *Posterior analytics*, the *Metaphysics*, and the *Physics* in particular. Another prominent feature is that the text is increasingly read against the background of the theory of first and second intentions that came to dominate logical studies during the course of the century.

The commentary tradition continues seamlessly into the fourteenth century and here includes commentaries by prominent thinkers such as Walter Burley, William of Ockham, and John Buridan. The formats in use are still the literal and the question commentary. A prominent feature here is the fierce debate between those who defend a staunchly realist reading of the *Categories* and those who propose a more deflationary, nominalist approach.

Interpretive Issues

In spite of its diminutive size, the *Categories* is a theoretically rich and varied text. In it are discussed, in a suggestively brief manner, some of the most fundamental aspects of Aristotelian philosophy: kinds of predication, substance and accident, particular and universal, the list of categories, quantity, quality, relation, and modes of opposition, to name but the most central. The commentary tradition is similarly rich and diverse, and it will be expedient here to focus on

a few of the most basic interpretive issues that arise with regard to the text and the list of categories that lies at its heart: What is a category? What does Aristotle intend to categorize? And can a justification for the list of categories he advances be given?

What Is a Category?

Aristotle nowhere in his text explains the notion of a category; indeed, he hardly even uses the term. Porphyry, in his *Introduction*, attempts to rectify the omission by giving a brief explanation, according to which categories are genus-species hierarchies, which extend from a most general genus at the top down through subordinate genera and species to a number of ultimate species under which fall only individuals.

On the basis of this understanding, medieval commentators distinguished two ways of speaking about categories, both of which are relevant in the context of Aristotle's text. In one sense of the term, a category is simply the highest genus of such a genus-species hierarchy. In another sense, a category is the entire hierarchy extending from a most general genus down to the individuals. When speaking of the category of substance, we may thus either mean the most general genus *substance* or this most general genus plus all of its subordinate genera and species all the way down to individual substances.

What Does Aristotle Intend to Categorize?

One fundamental interpretive problem with regard to the *Categories* is what exactly it is meant to be about. Or, to put it slightly differently, what is it that Aristotle intends to classify with his list of categories? Is it linguistic expressions, mental concepts, or things in the world? Again, Aristotle doesn't say, and it had been a matter of lively debate in the late-ancient commentary tradition. In his commentary, Boethius gave an answer that he had taken from Porphyry: the subject matter of the treatise is "the

ten primary expressions signifying the ten primary genera of things insofar as they signify."

This understanding of the *Categories* became hugely influential, and it is the view, for example, adopted by Abelard in the twelfth century. But around the beginning of the thirteenth century, a new answer came to the fore, formulated in response to a new set of concerns with which commentators approached the text. Aristotle's *Posterior analytics* had now become available in Latin translation, and it made an important impact on the way commentators interpreted other authoritative texts. They now saw it as part of their task to show how each Aristotelian treatise could be construed as offering a scientific treatment of its subject matter. This implied certain constraints with regard to the subject matter. First of all, it had to be suitable to the relevant scientific branch. Second, it had to be unique to that branch, because the uniqueness of a science depends on the uniqueness of its subject matter. Third, the subject matter had to be unitary, since the unity of a science derives from the unity of its subject matter. But how will this work with the *Categories*? First, it is clear from the *Metaphysics*, which had now also become available, that Aristotle takes his categories to be categories of things in the world. But how can they be a *suitable* subject matter in logic, the branch to which the *Categories* was taken to belong? Second, if the study of the categories also belongs to metaphysics, how do they constitute a *unique* subject matter? And finally, if there are ten of them, as Aristotle claims, how do they constitute a *unitary* subject matter?

A version of the new standard reply appears already in the early thirteenth-century commentaries by John Pagus and Nicholas of Paris. As Nicholas puts it: "the subject matter of the book is the incomplex sayable capable of being ordered (*dicibile incomplexum ordinabile*)."

A sayable (or predicable) is not a real object (*res naturae*), but rather a kind of mental construct (*res rationis*). The logician's consideration of the categories is thus meant to be distinguished from that of the metaphysician's, because whereas the latter considers beings insofar as they constitute the furniture of the world, the logician considers them

insofar as they ground, or are, certain (higher order) concepts, in this case the concept of an uncombined predicable that can be ordered in a generic hierarchy. In this way, they constitute not only a unique but also a suitable subject matter for logic, since logic, on the predominant view in the period, is precisely a science concerned with reason and reasoning (*scientia rationalis*). This subject matter is also unitary (if only in a qualified sense), because the categories are considered under this common notion. This answer to the problem of the subject matter of the *Categories* occurs in various variations in most commentaries of the thirteenth century, and as the century progresses comes to be increasingly cashed out in terms of the theory of first and second intentions. Much the same answer as Nicholas' is thus found toward the very end of the century in the commentary by Radulphus Brito, according to whom the subject matter of the *Categories* is "the incomplex sayable capable of being ordered in a genus according to the higher and lower."

There were, however, a few who reacted against this reading of the *Categories*. An anonymous commentator (Domus Petri 205), writing around the middle of the thirteenth century, flatly rejects it, and on the basis of a passage in the *Metaphysics* (IV.2.1004b19–22) where Aristotle says that logic and metaphysics are both concerned with being in its entirety, instead claims that: "being insofar as it is common to the ten categories is the subject matter of this book, and it is on the basis of the unity of this subject matter that this science is said to be unitary." Toward the end of the century, John Duns Scotus similarly criticizes the standard view and argues, less radically, that the primary subject matter here is simply the notion of a category (*praedicamentum*) or highest genus (*generalissimum*). This notion is something intentional, a mental construct (*causatum a ratione*), which is unqualifiedly common to the ten categories.

In the fourteenth century, the standard answer is still embraced by Burley who insists that it means that the *Categories* really is about things (insofar as they ground certain concepts); if expressions are discussed, this is merely incidental. Ockham, in contrast, returns to Boethius' proposal: The *Categories* is about expressions that

signify things. If things are discussed, it is because signification is tied up with things. And this, Ockham claims, is where many moderns have gone wrong, thinking that much of what Aristotle says is about things when he is really only talking about expressions and, correspondingly, concepts.

How Many Categories Are There?

Another fundamental interpretive problem is with the list of ten items that Aristotle puts forth in Chap. 4: "Of things said without combination, each signifies either substance or quantity or quality or relation or where or when or being-in-a-position or having or doing or being-affected." Aristotle does not explain how he arrives at this list, nor does he give any sort of argument to justify it. And so, commentators have always been faced with the difficulty of explaining why one should think that there are these – and just these – ten categories.

One way in which medieval commentators tried to show the adequacy (*sufficientia*) of the list was by constructing a division, based on more basic principles, that somehow yields Aristotle's ten items. One of the very earliest examples is again found in the commentary attributed to the early Parisian arts master Nicholas of Paris. Taking it that all beings are either substances or accidents, Nicholas attempts to account for the non-substantial categories on the basis of how accidents hold of substances. Accidents, he posits, hold either intrinsically or extrinsically. If an accident holds intrinsically of a substance, it does so either in virtue of its form, its matter, or the composite whole; this, Nicholas claims, gives you quality, quantity, and relation, respectively. If, on the other hand, an accident holds extrinsically of a substance, it does so in virtue of certain of its intrinsic accidents. Thus, doing and being-affected hold in virtue of certain types of quality, where and when hold in virtue of certain types of quantity and being-in-a-position and having hold in virtue of certain relations.

Such attempts at showing the adequacy of Aristotle's list of categories abound in commentaries from the early thirteenth century onward. Indeed, they are found not only in commentaries

on the *Categories* but also in commentaries on other texts where the theory of categories is relevant. Thus, some of the most well-known examples are the two divisions suggested by Thomas Aquinas, who left no commentary on the *Categories*, but dealt with the question in his commentaries on both the *Physics* and the *Metaphysics*. Compared with the relatively economical divisions found in Nicholas of Paris and Robert Kilwardby at the beginning of the century, these later divisions tend to become more complex and invoke an increasing number of principles to account for Aristotle's list.

Toward the end of the thirteenth century, this way of accounting for Aristotle's list of categories began to meet with severe criticism from a number of prominent thinkers. Writing in the early fourteenth century, for example, John Buridan dismisses all such attempts as futile, because they proceed as if the categories had a common genus, which they do not. Ockham, in his commentary on the *Categories*, says merely that it is difficult to prove that there are just ten categories and proposes to discuss the matter elsewhere. The strategy he does suggest in his *Summa logicae* is that the distinction between the categories can be derived from the things that can be asked about an individual substance. Thus, all uncombined expressions with which one aptly replies to the question "What is it? (*quid est*)," asked about an individual substance, belong to the category of substance; all those with which one aptly replies to the question "What is it like? (*quale est*)" belong to the category of quality; and so on. This approach to the problem, which has been revived again in contemporary Aristotelian scholarship, did not, in fact, originate with Ockham but can be found already in the twelfth century. It, too, was seen as having its problems. One problem, as pointed out later by Francisco Suarez in his *Metaphysical disputationes*, was that as a way of accounting for the adequacy of Aristotle's list it doesn't really solve the problem, but merely pushes it back a step: Why should we think that there are just these ten kinds of questions? Buridan clearly saw the problem. Aristotle's list is a reasonable one, he argues, but if anyone can come up with a kind of question the apt reply to

which should turn out not to be reducible to one of the ten categories, then he would not be averse to positing an additional category.

Whether or not they thought a proof of it could be given, medieval commentators thus generally accepted Aristotle's list. An important thing to notice, however, is that this does not necessarily mean that they would also accept a ten-category ontology. This had been a matter of some debate already in the twelfth century, and it rose to the fore again in the fourteenth. Some, such as Burley, took a staunchly realist approach, but others, such as Ockham and Buridan, though happy to accept Aristotle's list of categories as a division of terms, fiercely denied that this implies that there are as many corresponding kinds of being. In fact, Buridan holds, the only things that exist are substances, qualities, and quantities; Ockham's ontology was even more sparse, comprising only substances and qualities.

The theory of categories was fundamental to the philosophy of the middle ages, and substantial discussions of it can also be found in commentaries on other texts such as Aristotle's *Metaphysics* and the *Sentences* of Peter the Lombard. Similarly, a substantial commentary tradition grew around the anonymous twelfth-century *Book of six principles*, which attempts to give a more in-depth discussion of the six final categories on Aristotle's list which get short shrift in the *Categories*. Finally, many medieval logical handbooks also include a chapter on categories.

Causality

André Goddu

Department of Physics, Stonehill College, Easton, MA, USA

Abstract

Modern philosophical accounts of causality deviate dramatically from medieval accounts, yet many of the views held in the seventeenth and eighteenth centuries represent the end of an evolutionary process that began in the thirteenth century with the reintroduction of Aristotelian natural philosophy to medieval authors. The entry traces the evolution from premodern to modern views, explaining the transition that occurred from early medieval authors through late medieval scholastics. The crucial turning point is the tendency to distinguish explanatory principles from causes

properly conceived. That tendency in turn corresponds to a critique of final causes in nature. The crucial change that occurred in the seventeenth century, however, was due less to a change in causal conceptions and more to implications of mechanical philosophy for commonsense inferences about nature and causal relations.

The history of Western accounts of causality can be divided into two long periods: premodern and modern. Premodern philosophers generally adopted a commonsense perspective that corresponds to ordinary experience. They concluded from observed regularities that some events are the causes of events that follow from them. In some of these cases, they further concluded that the regularity proceeded from intrinsic characteristics of things that, unless hindered, produce or generate always or for the most part the same effects. Premodern accounts of causality in human events (history, law, and ethics) depend on the purpose of the account. Accordingly, they may be very specific if the aim is to assign praise or blame or very general if the end is to understand human nature or the significance of a major event. In “sacred” histories, authors interpreted secular events as either divine actions or dependent somehow on divine intervention. Ancient Greek historians interpreted the causes of major events as general characteristics of a culture inferred from details about customs. This sort of view is sometimes portrayed as cyclical in the sense that humans in given cultures tend to behave in similar and predictable ways. Christian authors, following the lead of Sacred Scripture, superimposed directionality on history, a view that also depended on their belief in a providential order. This linear conception later contributes to modern ideas of progress (Funkenstein 1965).

In medieval European philosophy, we may also distinguish a major division between accounts prior to the thirteenth century and those after about 1250. The division arises from the introduction of Aristotle's treatises on nature in Western Europe around the middle of the thirteenth century.

Among Arabic philosophers there is also a division that appears in the ninth to tenth centuries between theological accounts that attribute everything and all events to a single cause (the Ash'arite doctrine sometimes referred to as "occasionalism") as opposed to those accounts that argued for the integrity and legitimacy of secondary causes. In Greek and Latin European thought of the early Middle Ages, there is also a major theological focus very much influenced by Neoplatonism, but unlike extreme Ash'arite thought, it preserves secondary causation (Fakhry 1958; Marmura 1965). The following focuses first on accounts of causality in the period prior to 1250 and then turns to developments after 1250 that advance a relatively more secular approach, leading, in the later Middle Ages, to critiques that influenced some early modern developments.

Late antique and early medieval Christian authors maintained that no new substance or change can be produced out of nothing. They believed that God created the world out of nothing, but Christian authors following the declarations of the early Fathers of the Church and of Neoplatonic philosophers conceived of divine creation in terms of overflowing of the divine essence or of emanation while maintaining a distinction between God and creation. Neoplatonic authors maintained that causes and effects resemble each other, and that an effect has a preexistence in a sense in the cause, and something of the cause continues to exist in a way in its effect (Bos and Meijer 1992).

Augustine of Hippo also believed that every effect must have a cause and adapted the Neoplatonic conception by positing the preexistence of created things as exemplars in the mind of God. Writing in polemical contexts, Augustine fashioned compromises influential on later Christian authors. How can one reconcile belief in an omnipotent and omniscient God with affirmation of free will and the contingency of natural and human events? The doctrine of original sin allowed for a distinction between prelapsarian and postlapsarian natural law, the latter justifying compromises in a world where nature and the human relationship with nature are corrupted by rebellion and sin. Thus is human history depicted

as a great drama subsumed by an eschatology in which the life of Christ acts as a pattern or model for the Christian life (Markus 1972; Matthews 1999). This is a comprehensive view of history and causation that we encounter in later authors such as Dante and Milton and in secular forms in Hegel, Marx, and Tolstoy.

What stands out among Christian adaptations of Neoplatonic ideas is the subordination of logical issues to ontology. Many of the major theses about causality held by medieval authors can be found in Proclus and the *Liber de causis*. All existing things are in each according to its proper nature, that is, to say, being is adapted to the level of the recipient. Every effect remains in its cause, proceeds from it, and returns to it. Representative authors maintain the dependence of lower creatures on the higher, adopting different views about the direct and immediate dependence of all things on God (Bos and Meijer 1992).

Perhaps the first Western medieval author to provide a systematic account is John Scottus Eriugena. In his *Periphyseon*, we find a kind of Neoplatonic summa written remarkably by an author with no direct knowledge of Plotinus, Porphyry, or Proclus. His study of nature elaborates the dialectical relation between creator and created. He describes four divisions of nature and works out the process of divine self-articulation and self-manifestation, creation as relating like to like with cause and effect expressed as mutually dependent relative terms. Eriugena exercised enormous influence on authors up to the thirteenth century when some of his formulations were condemned as giving occasion to misunderstanding and confusion. He nonetheless continued to influence the more Neoplatonic Aristotelians and the mystical thinkers of the fourteenth and fifteenth centuries (Eriugena 1987; Moran 1989).

The medieval proofs for the existence of God are variations on causal proofs or on the dependence of beings for their existence and well-being on a being that is totally self-sufficient. Saint Anselm's "faith-seeking understanding" represents an effort to articulate the extent of God's self-sufficiency and the relation of the divine attributes to that than which no greater can be thought (McDowell and Williams 2003).

With Saint Bonaventure appears a representative Franciscan author of the Neoplatonic tradition who employed Aristotelian causal categories to flesh out the relations (vestiges and images) that lead us back to the original exemplar (Noone 1999).

The influence of Aristotelian physics and account of scientific demonstration transformed discussions about causality, leading to more analytical treatment of the principle of causality and the achievability of scientific knowledge. The transformation also reflects the relatively more depersonalized and relatively more secular accounts of nature and causal processes. Aristotle sought explanation of nature and change in causal principles. All things tend to intrinsically determined goals. Every change requires a cause, and nothing can change by itself. These assumptions adopted from his predecessors and taken as self-evident led Aristotle to propose material, formal, final, and efficient causes (not necessarily all four) to account for change (Aristotle 1941b, 1968–1970; Falcon 2005). The basic principles that influenced his medieval commentators attest to their acceptance generally of commonsense notions and of the principle of the uniformity of nature. Things acting always or for the most part in regular and predictable ways cannot, they thought, be due to chance. They contrasted natural motions with forced motions and attempted to account for forced motions in terms of natural motions. Accordingly, they rejected the possibility that regularly observed events could be the result exclusively of external forces acting on a body. Even authors like William of Ockham who was skeptical about strict demonstration of causal connections, nonetheless, affirmed the certainty of causal relations and even the knowability a priori of some causal relations (Adams 1987).

Critics tried to refine notions and settle disputes about details. Most adopted Aristotle's formal and final causes, the material subject of change that is receptive of form and capable of being formed, and the efficient or producing causes of change and motion. In some cases, entities transmit the form they possess to the entity that they produce or in which they produce a change. Among motions, locomotion has a privileged status.

Because all change is dependent on contact or proximity, every change depends on locomotion. In Aristotle's cosmological vision, lower motions depend on higher motions. In a chain of efficient causes, the first is the moving cause, leading Aristotle to propose the unmoved mover as the ultimate and first source of all change in the universe. By his account no change is neutral; all change is either according to nature or contrary to nature. In Aristotle's account of natural elemental motions, their natures account for tendencies and directionality, but their moving or efficient causes are the entity that generated the elemental nature in the first place and the agents that remove obstacles. The distinctions among the elements are rooted in qualitative contraries in the case of the contrary motions of sublunar elements and in the eternal circular motion of the celestial element, according to the Prime Mover's emulation of the unmoved mover (Aristotle 1939; Bodnár 1997).

After 1250, Latin philosophers applied this general picture to their understanding of theological doctrine and modified it by their efforts to reconcile it with the views of their Neoplatonic predecessors. A general overview cannot do justice to the details, distinctions, and differences among them. Issues that they discussed and refined included numerous questions. Can a cause have a plurality of effects? Can a cause have specifically or numerically different effects? Can the same or a similar effect be produced by two specifically different causes? Are causes prior to their effects, simultaneous with their effects, or, in some cases, later than their effects? What are necessary and/or sufficient conditions? What is the difference between an efficient cause and a sine qua non condition? Finally, Aristotle's conception of strict scientific demonstration imposed a challenge to produce demonstrations from cause to effect and to justify our knowledge of causes (Aristotle 1941a). By the end of the fourteenth century, philosophers held to a variety of opinions on the demonstrability, certainty, and knowability of causes. In general, some authors affirmed all three (with significant variations by Robert Grosseteste, Bonaventure, Albert the Great, Thomas Aquinas, Giles of Rome, Duns Scotus, and their followers). Some rejected

demonstrability while affirming certainty and knowability (e.g., Ockham and other like nominalist and somewhat more empiricist Aristotelians). Nicholas of Autrecourt rejected the principle of causality while accepting some causal inferences in a very restricted sense (Thijssen 1987).

Among specific examples, explanations of elemental motion and accounts of the highest form of demonstration serve to illustrate the above general comments.

What causes heavy bodies to always move downward toward the center of the Earth? In *Physics* VIII, 4, Aristotle argued that heavy bodies fall because of an intrinsic principle of motion, but he characterized the principle as passive, a capacity for being moved, not for moving itself. A heavy body is capable of a natural motion if acted upon, so the weight or the matter of the body is not its mover, and no heavy body stops its motion. Heaviness is nothing more than a downward tendency. The heavy body is moved, then, directly by the agent that generated it and made it heavy and, incidentally, by the agent that removes any obstacle to its motion. The argument constitutes a step in Aristotle's proof of the unmoved mover (Bodnár 1997). In *De caelo* III, 2, he turned specifically to a discussion of elemental motions. The natural motion of each body is simple. Heavy bodies rest naturally at the center of Earth, and so their natural motion is toward their place of rest. In this account Aristotle characterizes nature as a cause of movement in the thing itself. Here he suggests that sublunar bodies owe their impulse or tendency to weight or lightness. He explains the acceleration of falling bodies by means of the instrumentality of air. He suggests that the weight acting as an original force transmits the force by impressing its motion onto air, which, having an intermediate tendency upward or downward, causes the body to accelerate as it falls. Aristotle's account here can be reconciled with the version from *Physics* if we keep in mind Aristotle's principles about the direct cause as the first cause and the nature of the element as the tendency placed in it by its generator. The remainder of *De caelo* III and IV is an extensive discussion of the generation of the elements and the

nature of weight and lightness, confirming its consistency with the account given in *Physics*. In *De caelo* IV, 3–6, Aristotle repeats the assertion that the essential cause of natural downward motion is the agent that first made the body heavy and, incidentally, the remover of obstacles to motion, adding that acceleration is also a function of the shape of bodies in relation to the divisibility of the medium through which they move.

The account in *De caelo* III, 2, is nonetheless susceptible to a more mechanical interpretation. When Aristotle refers to nature as a cause, he suggests that weight acts as a force transmitting an impulse or motion to air that in turn functions as an instrumental cause of faster motion. Such texts occasionally stimulated medieval commentators, dependent on Latin translations and commentaries to treat the motions of elemental bodies in a more mechanical way (Aristotle 1957–1990; Goddu 1981, 1999).

Albert the Great came to grips with an apparent problem in Aristotle's account and Averroes' interpretation. Heavy bodies move naturally downward because their tendency downward is in them, yet the direct essential cause of that tendency is the agent that generated them and the incidental cause is the agent that removes the obstacle to motion. Therefore, the cause of downward motion is both natural and extrinsic. With respect to acceleration, force or impetus assists a natural motion. As he considered the instrumentality of air, Albert concluded that natural motions are partly violent and projectile motions are partly natural (Albert the Great 1890, 1971; Goddu 1981; Weisheipl 1980, 1985).

The theory of impetus implied that the motor of a projectile would be intrinsic to the body. Thomas Aquinas rejected the theory of impetus in part because a violent motion would then have an intrinsic principle of motion, a conclusion that is contrary to the very notion of a violent motion – it must have its force or mover extrinsic to it. Likewise, Thomas recognized that the principle of elemental motion must also be natural and intrinsic, albeit passive and not active (Aquinas 1963a, b; Goddu 1981, 1984).

William of Ockham gave two not entirely compatible accounts. In one, he regarded weight as the

efficient cause of a motion downward. Elsewhere he also adopted the instrumentality of air in the account of both elemental and projectile motions (William of Ockham 1985; Adams 1987; Goddu 1984, 1999). The point in referring to all of these discussions, however, is to emphasize the extent to which some medieval commentators (e.g., Albert the Great, Duns Scotus, and Ockham) interpreted intrinsic and extrinsic principles as movers, motors, and forces, in short, as efficient causes.

With respect to the highest form of demonstration, these authors' views are also instructive. Aristotle aimed at scientific understanding of known facts, why facts are so and what causes explain them (Aristotle 1941a). With a great deal of experience, we can, Aristotle believed, discover the first principles that explain why subjects have the attributes that we know them to have. The form of argument that Aristotle made preeminent is the syllogism. Typically, a syllogism consists of two premises and a conclusion, linking the subject of the major premise to the predicate of the conclusion by means of a middle term. In the highest form of demonstration, the middle term of a syllogism expresses the cause why the predicate of the conclusion belongs to its subject. The cause is distinguishable from the essence yet follows from it. Medieval authors agreed that the middle term is a real definition, although they differed about whether it is a real definition of the subject or of the attribute (Longeway 2007; see also the entry on Posterior Analytics, Commentaries on Aristotle's by Longeway in this volume).

Robert Grosseteste established a pattern for understanding Aristotle's doctrine while attempting to reconcile it with Augustine's Neoplatonic account of knowledge. Knowledge of a real definition of a substance does not provide knowledge of its causal powers, according to Grosseteste. Only experience (usually oft-repeated experience) can provide knowledge of causal powers, a view that influenced Ockham. Grosseteste linked his account, however, to an emanationist metaphysics that subsequent authors rejected. Albert the Great adopted the Aristotelian view that each subject has its own principles, and he also argued that the highest form of

demonstration has a definition of the attribute as the middle term, a causal definition of an attribute whose existence depends on other things, demonstrating that the attribute actually belongs to the subject (Longeway 2007).

Thomas Aquinas maintained that a thing's nature is necessarily an efficient cause of its primary attributes, capacities that depend on the right conditions for their actualization. Therefore, Thomas argued for the definition of the subject term as the middle term, the minor premise being true because of the efficient causal connection between the essence of the subject (the real definition) and its attributes (Longeway 2007).

William of Ockham agreed with Thomas that the middle term is the definition of the subject, but only in mathematics does a demonstration show that an attribute actually belongs to the subject (Albert's criterion). Ockham held that causal connections can be known with certainty, a few relating to human voluntary operations even *a priori*, but they cannot be demonstrated. Talk about capacities is oblique talk using modal terms about actual events. Every conclusion that relies on natural efficient causes is hypothetical, not categorical. Ockham rejected final causes as exercising any real productive power, so that identification of an efficient cause implies the material conditions on which the operation of the efficient cause depends and entails a final cause only when the efficient cause is a conscious agent with a purpose. Both Duns Scotus and Ockham retained Grosseteste's empiricist bent. Ockham thought that in some cases the causal power of a natural kind can be known from a single instance, confirming the extent to which he accepted the principle of the uniformity of nature. Our knowledge of the effects, however, is entirely dependent on experience or the observation of at least one instance and, in most cases, repeated experience critically evaluated (Longeway 2007; Adams 1987; Goddu 1984, 1999).

In relation to the "mixed sciences" (optics, harmonics, mechanics, and astronomy), the Aristotelian doctrines of causality and demonstration allowed for the application of mathematics in syllogistic arguments. In Averroistically influenced Aristotelianism, the distinction

between the mathematical and physical and the superiority of the physical over the mathematical supported a reading of Aristotelian doctrine that emphasized their separation. The Averroist critique of Ptolemaic astronomy even challenged the legitimacy of mathematical astronomy. Other interpretations of Aristotelian doctrine, however, adopted an interpretation that considered some mathematical demonstrations as paradigmatic and especially as relevant in mixed sciences. The key to such interpretations lies in constructing a major premise according to which a mathematical property belongs to some sort of mathematical thing, and a minor premise that asserts that a certain physical object is that sort of mathematical thing. In other words, the minor premise contains a warrant for viewing the natural phenomenon as mathematical (Lennox 1986). For example, if being equal to or less than 180° belongs to every arc of a semicircle, and if being the arc of a semicircle belongs to every rainbow, then being equal to or less than 180° belongs to every rainbow. According to this reading, Aristotle's philosophy of nature provides a defense of the explanatory role of geometry and arithmetic in investigations of the sort in which Galileo was involved. "Explanation" and "cause" are used here, however, in a special sense. In Galileo's *Two New Sciences*, we find that he characterized some mathematical premises as "causal" but in a sense which is formal, not efficient, nor material, nor effect producing in the physical sense (Palmieri 2008). In short, even among some mechanistic thinkers, Aristotelian notions about formal and material causes were either retained or reinterpreted in a way that was conducive to the advancement of mathematical-experimental philosophy. It follows that Galileo's critique of Aristotle focused not on the aim and presentation of science, but rather on the *facts* to be demonstrated, namely, that a body falling freely from rest has a uniformly accelerated motion and that a body compounded of a uniform horizontal motion with a naturally accelerated motion describes a semi-parabolic path. From his effort to demonstrate that Earth's motions cause tidal phenomena, it is also clear, however, that Galileo did not completely abandon causal explanation in the physical sense.

The upshot of such discussions can be formulated as a list of tendencies. The notion of "cause" was distinguished from explanatory principles and accordingly restricted more and more to efficient or producing cause. This restriction did not entail the rejection of material and formal causes, although it did tend to entail the rejection of final causes in nature. Scholastic philosophers, for the most part, continued to find matter and form, whether as principles or as existing constituents of things, useful in the explanation of substances and their attributes, essential and accidental (Goddu 1999). Even in the seventeenth century, there was less a denial of the four causes than a decision to focus on efficient causes as the proper aim of practical investigations of nature. Paralleling this trend (restriction to efficient causality) was a process of secularization, by means of which personal and teleological conceptions of causality give way to more reductive and empiricist views, or, in cases where the linear conception of history was "secularized," history was seen as having an inner logic.

Finally, however much seventeenth-century mechanical philosophy reduced efficient causality in nature to contact-action, the belief in invisible particles and forces as causes of motion, behavior, and secondary qualities of bodies in nature undermined the foundation in ordinary experience for observing causal connections. Because the supposed fundamental causes are invisible, some even occult, ordinary experience could no longer serve as a reliable guide to our understanding of nature or for our inferences about causal relations. This evolutionary process began with the reintroduction of Aristotelian natural philosophy in the thirteenth century, leading to the critique of natural final causality in the fourteenth, influencing the practical reduction to efficient causality in the seventeenth, culminating in Hume's empiricist reductionism to invariable sequence and habit in the eighteenth, and collapsing into the modern notion of concomitant variation. The adequacy of early modern views may be questioned by considering the regular sequence between day and night – regular, sequential, and plainly non-causal (Taylor 1963). Contemporary philosophers have reintroduced notions of agency, capacity, power, tendency, disposition, impediment, and

the like into their discussions, perhaps in part as the result of renewed interest in ancient and medieval accounts.

Certainty

Christophe Grellard
Philosophy, University of Paris 1 Panthéon-Sorbonne, Paris, France

Abstract

The medieval reflections on certainty (*certitudo*) understood as an epistemic and psychological property of beliefs and of the

subject that possesses them are presented mainly in two fields, on one hand the examination of the status of knowledge facing skeptical criticism, and on the other hand, the demarcation of the role of faith in relation to knowledge and opinion. In general, we assume in the Middle Ages, that science is about truth, and science as a psychological state (act or habit) must be accompanied by guarantees that what is known, cannot be wrong. Knowledge must be certain in the sense that its truth must be unambiguous (excluding any possibility of doubt). To the extent that such immunity may be both objective and subjective, there are three types of certainty: first objective certainty, which rejoins the concept of evidentness (*evidentia*) and is linked to the idea of infallibility; second, a subjective certainty, as we do not hesitate to give our consent (the medieval philosophers use of the expression *sine formidine de opposito*, without fear that the opposite of what we assume is true); and finally a moral certainty, which refers to the reflection on the contingent action and designates enough certainty to an act. This latter kind of certainty comes closer to a form of probabilism. The main debate among philosophers and medieval theologians focuses on conditions of certainty and the objects of a certain judgment. In other words, one must determine what makes a proposition certain.

Thomas Aquinas exemplifies the primary position in the thirteenth century. The three forms of certainty distinguished above (epistemological, psychological, and moral) are clearly presented by him (In Sent. L. III, d. 23, q. 2, a. 1, q. 3, a. 1; ST I II, 14, 6, 112, 5, II-II, 4, 8). We must distinguish the certainty that refers to the strength of the adhesion (*firmitas adhaesionis*) from certainty assimilated from evidentness. This distinction in fact refers to a difference in the cause. Its object causes the evidentness whereas the firmness increases the disposition of the subject. Thus, the firmness will be considered as a state proper to every intellect, and will be only a relative judgment on the collection of beliefs and knowledge of

the intellect. A form of reflexivity, which is an additional guarantee, manifests this type of certainty that when I know by faith or science, I know that I know. However, the objective certitude called evidence is a certainty caused not by the dispositions of the subject but directly by the object. Thus, there is such a certainty when we judge from the principles of the object. To assess the certainty of assent, we must then identify its cause, but we must also determine how the mind apprehends the cause. In fact, in many ways (if not more) than the understanding of principles (*intellectus*) and science, faith should be entitled to this evidentness since its objects are immutable and eternal realities, the first infallible truth, simple and unchanging. But these objects are not fully apprehended by the intellect, since the will just supplements the work of the intellect as a cause of certainty. *De iure*, therefore, the highest certainty is one whereby the cause is the highest, that is to say wisdom as the science of divine things. Nevertheless, science, which is at the same time evident with regard to its object and firm, because of the mode of apprehension of the object by the subject, is more certain to us than faith. Thomas can then resume the hierarchy established by Hugh of St. Victor that places faith below science in terms of evidentness, but above opinion because of the strength that accompanies it. Thus, the perfection of a science is heightened by the more or less larger evidentness that accompanies it while that of faith will be in force (*vehementia*) of the adhesion. Besides this dual characterization of certainty in evidence and firmness, we must still distinguish absolute certainty, which covers objects immutable, from the certainty of the contingent which is related to a state of affairs, for example, the current status of the world when we make judgments. Therefore, Thomas concluded that one should not seek certainty in the same way as one would in all things. In human affairs, in particular, it is virtually impossible to achieve absolute certainty. One must therefore be content with a probable certainty (II-II, 70, 2). This certainty is one relating to objects that are true in most cases (*ut in pluribus*, I-II, 96, 1).

If we can say that, in general, the Thomistic distinctions are widely used throughout the Middle Ages, an important milestone is found in Duns Scotus' reflections on certainty, in his refutation of Henry of Ghent's "skepticism" (Ord. I, d. 3, §§ 224ss). Duns Scotus proposes a kind of architecture of reasoning whereby absolute certainty is a guarantee for all inferior forms of certainty specific to contingent knowledge. But alongside absolute certainty of the principles which warrant both experience (induction) and of sensation, Scotus adds absolute certainty of reflexive acts, following Augustine, in that we are certain about our own actions. Knowledge of self is an absolute knowledge in the same way as the principles. There is thus a dual foundation of certain knowledge, both necessary and contingent, so that self-knowledge, even if it is known in a secondary way, is a condition of experience and science. This epistemic revaluation of contingency is coupled with a reversal of Aristotelian epistemology, which is obviously dependent on the nature of the known object. Henceforth, the foundation of certainty is moved toward the subject of knowledge. The introduction of the infallible form of contingency cuts both ways in the medieval debates. On one hand, it highlights more clearly the fragility of our grasp of the contingent. This fragility will be highlighted in post-Scotus theology through the reflections on the intuition of a nonexistent object and divine deception. On the other hand, it provides the ultimate stopping point for skeptical doubt and a point of departure for a reconstruction of knowledge from the certainty of self, since we are dealing with a proposal absolutely indubitable and infallible, which brings subjective certainty on par with objective certainty or evidentness. This approach is generally taken in the treatment of divine deception. The inclusion of the *ego cogito* in the foundation of all certainty opposing divine deception appears explicitly for example in William Crathorn (In I Sent, q. 1, ccl. 14). This foundation is however strengthened by the argument that God cannot deceive, and it is the conjunction of these two theses that can save beliefs.

An alternative position, which allows support of contingency, without giving a special role to contingent knowledge like the cogito, appears in Buridan. This position, which can be described as reliabilism, will have some success in the epistemology of the late Middle Ages up until the circle of John Mair in the sixteenth century. In many ways, this is a restatement of the Thomistic position in a new context. In a sense, Buridan again clearly separates certainty and evidentness. Certainty refers to the firmness of the assent to truth, while evidentness indicates a causal relationship between an object and my mind (*Summulae*, tract. 8, from *Demonstrationibus*, *In Met* II, Q. 1). Thus, evidence implies certainty, but not vice versa as shown in the case of faith (in which the content may be obscure). From this starting point, Buridan distinguishes absolute evidentness, unfalsifiable by any power whatsoever (i.e., the evidentness of analytical principles), and relative evidentness (*ex suppositione*) that refers to any proposition always true under the laws of nature, but which can be falsified in supernatural circumstances. This natural evidentness ensures the certainty of experimental science and our sensations. In fact, the basis of this evidentness is the natural inclination of the human mind to truth. The inclination of the intellect to the truth is nothing other than the affirmation that there is no reason to think that an event that has always occurred, an observation that has always been confirmed, will be invalidated at once. When certain precautions are taken (repeated observations in different circumstances, the absence of counterexamples, similarities between cases), it is neither reasonable nor scientifically fruitful to doubt our cognitive processes. Indeed, the Picard Master argues that our inclination to truth is comparable to the inclination of wheat growing. Indeed, wheat cannot grow in exceptional climatic conditions, but it will under normal conditions. We must therefore understand that there is, similarly, in us humans a biological structure that enables us to sufficiently make a reliable capture of the outside world, under normal functioning of our cognition. Natural evidentness excludes error (the opposite cannot occur) in normal operating conditions.

That is to say, assuming that God does not intervene. Buridan requires only that such divine intervention does not need to be taken into account in practice in a theory of knowledge. The relative evidentness makes clear on the impossibility in some cases to control all parameters of knowledge. The inclination of the intellect to realize the truth reflects this general reliability. Justifying our knowledge is neither to exclude any objections that are logically possible, nor to reject a priori all sources of error, but only to exclude some relevant alternatives in a particular context. Thus, the error, exemplified by divine intervention, is a theoretical possibility, which reflects the ignorance of some possible parameters of knowledge in a given context, but does not call into question the criteria of the infallibility of truth and knowledge of the contingent.

Church Fathers

Stephen F. Brown

Institute of Medieval Philosophy and Theology,
Boston College, Chestnut Hill, MA, USA

Abstract

The Church Fathers are the early Christian authors who were considered the authentic witnesses of Christian life and belief. The first of these writers were the Apostolic Fathers, those closest to the time of the Apostles, and thus the earliest noncanonical witnesses to the Church's understanding of the Christian Scriptures. As the Church grew in numbers and became more noticed, it also became the target of criticism and needed to be defended against charges that were opposed to it. This work was done by the next generation of Church Fathers, the Christian Apologists. When the Church grew and spread even more, it gathered into its flock people of different cultural levels. This demanded that the Church develop schools and also sound teachers. These teachers, both in the East and the West, manifested the strength of Christian truth and the power of Christian life in their writings that marked this period as the Golden Age of the Fathers. The end of the Patristic era is generally marked in the West with the death of St. Isidore of Seville (d. c. 636) and in the East with the death of St. John of Damascus (d. c. 750). The writings of the Fathers have been given great respect both in their role of establishing the Christian tradition of beliefs and patterns of living and also as works that provide a deeper grasp of the meaning of Christian truths or provoke questions that lead Christians to a deeper understanding of their beliefs.

The Church Fathers, whose lives and writings were exemplary in building Christian community life and decisive in matters of doctrine, were the early Christian writers who were considered by the Church to be models of Christian living and

authentic witnesses of the Christian faith. Their sermons, letters, and treatises fostered understanding of Christian truths, fought against detractors and heretics, and encouraged strong moral habits and trust in God's grace and providential guidance.

Meaning of the Expression "Church Father"

St. Clement of Alexandria (d. c. 213), in the opening chapter of his *Stromata* (*Tapestry* or *Miscellanies*) (PG 8, 687–690), explains the meaning of the expression by acknowledging the importance of spiritual fathers: "It is a good thing, I reckon, to leave to posterity good children. This is the case with children of our bodies. But words are the progeny of the soul. Whence we call those who have instructed us, fathers." According to Clement, the Fathers of the Church replaced the fathers of the pagan world, Homer, and the other "theologians of vice" (*Logos protreptikos* (*Exhortation to the Heathen*), 4; PG 8, 133–164). St. Basil (d. 379), speaking for those attending the Council of Nicea (325), wrote: "What we teach is not the result of our personal reflections, but that which we learned from the holy Fathers" (*Ep. 140*, 2; PG 32, 588). These early Christian Greek writers sensed themselves as simply following the advice given in the *Book of Deuteronomy* (32, 7) that admonished the covenant people to "ask your fathers, and they will inform you; your elders, and they will tell you." Yet, even more, they viewed the Church Fathers as imitating the example of Saint Paul, who in his *First Letter to the Corinthians* (4, 14–15) said: "I am not writing this to make you ashamed, but to admonish you as my beloved children. For though you might have ten thousand guardians in Christ, you do not have many fathers. Indeed, in Christ Jesus I became your father through the gospel." In the West, St. Augustine (d. 430), in his late battle with the Pelagian, Julian of Eclanum, refuted the latter's charge that he was an innovator in his teaching about marriage by appealing to Sts. Irenaeus (d. c. 202), Cyprian (d. 368), Hilary (d. 397), Ambrose (d. 397), John Chrysostom (d. 407),

and Jerome (d. 420) (*Contra Julianum Pelegianum* 1, 7, 30–34; PL) as those supporting his position. While not employing the word "Fathers," Augustine was invoking as his justification a tradition followed earlier in the East by Sts. Clement of Alexandria and Basil.

The Community of the Fathers

Many writers in the later Christian tradition might speak broadly of their spiritual fathers, namely, their more immediate teachers. St. Bonaventure (d. 1274), for example, refers to Alexander of Hales (d. 1245), his teacher at the University of Paris, as his spiritual father. Dominicans and Franciscans invoked the founders of their religious communities, Sts. Dominic (d. 1121) and Francis (d. 1226), as their guiding fathers in imitating and preaching Christ. The traditional Fathers of the Church, however, had a longer and wider claim to respect. In the view of some scholars, they extended from the time of the Apostolic Fathers, like St. Clement of Rome (d. c. 100), to the last of the Western Fathers, St. Isidore of Seville (d. c. 636), and the last of the Eastern Fathers, St. John of Damascus (d. c. 750). Other modern scholars cut the era off with St. Gregory the Great (d. 604), while still others extend it to 850.

This community of respected Church writers also contained a special group of more renowned authors, the Doctors of the Church. At first, there were equally four doctors from the East (Sts. John Chrysostom, Basil the Great, Athanasius (d. 374), and Gregory of Nazianzus (d. 390)) and four from the West (Sts. Ambrose, Augustine, Jerome, and Gregory the Great). In modern times, a number of other traditional Fathers have been added to the list of Doctors: Sts. Cyril of Jerusalem (d. c. 386), Cyril of Alexandria (d. c. 444), Hilary of Poitiers, and John of Damascus. The criteria of qualifications for doctors include renowned sanctity as well as faithful learning. An outstanding learned man who had great influence in developing the understanding of Christian beliefs, such as Origen, is excluded from the list of Doctors of the

Church because he is not officially canonized and held some faulty doctrinal positions. Some, nonetheless, still consider him a Church Father, since he made strong contributions to the orthodox teachings of the Church both by opposing errors and by bringing greater understanding to the faith.

Those enshrined in the ranks of the Fathers form a much larger group than the Doctors of the Church. The general criteria for their admission to this community are antiquity, orthodoxy, moral goodness, and church approval. Disagreements over meeting these criteria are frequent. Antiquity is measured somewhat ambiguously by the undefined border between Antiquity and the Middle Ages. While full orthodoxy is desired, often, as in the cases of Tertullian and Origen, brilliance and vigor in presenting and defending the faith overshadow for many the errors or inexactness that are attached to some of their dubious teachings. Moral goodness is not the same as canonized sanctity, so this criterion in the eyes of some demands that the way of life of a Father of the Church only be such that it does not interfere with a firm grasp of divine revelation. Approbation certainly, at times, is a formal declaration of a pope or church leader or council, but it may also be attained in a virtual way through a general Christian consensus.

While these criteria for the most part function within a confessional context, often the study of the Church Fathers, called Patristic studies, extends to authors who are not considered Church Fathers, such as pagan authors like Celsus, Porphyry, and Julian the Apostate, who provide the context for apologetic works by Christians attempting to refute their attacks on Christian life and belief. Even of more importance for understanding many of the works of the Fathers are philosophers, like Plato, Proclus, Plotinus, Seneca, and Cicero, as well as Jewish authors, like Philo Judaeus, who influenced early Christian writers. Since a major role of the Church Fathers was to defend the Christian faith, it also is necessary to know its enemies and its heretical interpreters, such as Simon Magus, Arius, Nestorius, and Pelagius, who provide the context for many Patristic writings.

The Apostolic Fathers

The first of the authors considered to be Church Fathers are called the Apostolic Fathers. While also dealing with doctrinal issues, these authors are more generally seen as guiding the way of life of those who walk in the footsteps of Christ and his apostles. Clement of Rome, whose *Letter to the Corinthians* was written c. 96, was a successor to the apostle Peter as the bishop of Rome. His strong appeal to the Church at Corinth to cease its conflicts and disagreements is made with a sense of authority and duty. This letter was well received and respected, reestablished unity within the Church of Corinth, and has been judged by some as confirming the primacy of the bishop of Rome. Ignatius of Antioch, who suffered martyrdom under the emperor Trajan around 110, is renowned for seven letters he wrote to different Christian communities. He bears witness to a hierarchical structure of bishops, priests, and deacons in the early church. His strongest attacks against heresy were aimed at the Docetists, as he affirms the divinity and true humanity of Christ. The *Didache*, perhaps written in the 80s and 90s, may be the earliest Patristic document. It sets out in clear terms the difference between the demands of a Christian life and the evils of paganism. It is also considered the first code of canon law directing the lives of those in primitive Christian communities. Polycarp, the author of a *Letter to the Philippians* and a bishop of Smyrna, was a disciple of John the Evangelist. He also wrote a strong recommendation for the letters of Clement, many of which do not survive, and taught St. Irenaeus before suffering martyrdom c. 155 CE. In his surviving letter, written to the Philippians, he fought against the errors of Docetism and the demands of the Judaizers, who required converts to become Jews in order to become Christians. He urged a way of life that stressed charity, almsgiving, and prayer, including prayer for civil authorities. Another disciple of John and a friend of Polycarp was Papias. Only fragments of his work exist, but the surviving material is important, since it is the earliest witness to the authorship of the Gospels. Another work that is generally listed among the writings belonging to

the era of those who may have had contact with the Apostles is *The Shepherd of Hermas*. This treatise was respected for its many moral exhortations and was even considered canonical by some in the early Christian era. Its theme of the two cities is noted as a possible source for St. Augustine's portrait of the two cities in *The City of God*.

The Apologists

In the next era, as the Church grew, Christians became more noticed and their teachings and way of life criticized. The main pagan view of religion was connected with the gods of the city and with the emperors or rulers who were given divine honors. Refusal by Christians to consider the rulers divine marked them as atheists. Also, because their lasting city was the heavenly Jerusalem, Christians were considered to be disloyal to earthly kingdoms and unwilling to participate in political affairs or the defense of their homeland. Their love for one another and the closeness of their communities led to accusations that they shared their wives. Athenagoras (d. c. 190) addressed his *Apology for the Christians* to the emperor Marcus Aurelius and refuted philosophically the charges of atheism and appealed for a just dealing with Christians. The unknown Christian author of *The Letter to Diognetus* likewise attempted to defend Christians against the same charges. He therefore portrayed the followers of Christ in these words: "They play their full role as citizens but labor under all the disabilities of aliens . . . They share their meals, but not their wives." Justin (d. c. 165) is the greatest of the Greek Apologists. In his search for truth, he studied all the current philosophies before arriving at the true philosophy of the Gospel. His *Apologies* aimed at a Greek philosophical audience and argued that their philosophies needed revelation. Christianity did not need to become Greek, he contended; rather Greek philosophy, in order to become fully true, needed to be absorbed and transformed by Christianity. His *Dialogue with Trypho* is directed to Jews, showing the positive Christian view of the Old Testament, that worship of Christ is not opposed to monotheism and that the Church

is the New Israel. He attempted to show how the Jews and the Greeks each possessed some germ of the *Logos* (*logoi spermatikoi*), but that only Christians, joined to the divine *Logos* (or *Word*) which is found in Christ in its fullness, have the total and unadulterated truth. Not only did the Apologists attempt to answer the charges against Christianity mentioned above, they also tried to meet the challenge coming from those who twisted the Gospel teachings with their heretical interpretations. St. Irenaeus of Lyon (d. c. 202) left two large works: his *Adversus haereses* (*Against Heresies* or *The Overthrow of the Pretended but False Gnosis*) and his *Epideixis* (*Demonstration of the Apostolic Teaching*). Both works were written in Greek by the well-travelled Irenaeus, but *Adversus haereses* survives only in its Latin translation. In his effort to refute Gnosticism as a secularized imitation of Christianity, which reduced faith to a form of human wisdom, Irenaeus presented the varying teachings of different Gnostic teachers. He followed this catalogue with a contrast between the various forms of Gnosticism and true Christian teaching, using reason, tradition, and the teachings of Christ, the Prophets and the Apostles. Irenaeus' *Epideixis* is a much simpler work that presents the essential truths of Christian faith: the triune God, Creation, the Fall, the Incarnation and Redemption. He follows this exposition with a defense of Christian truth and completes the work with an effective appeal to Christian living. *Adversus haereses* strongly appeals to tradition in contrast to claims on the part of certain Gnostics to new supplemental revelations. Irenaeus searches for a tradition that goes back to the Apostles whom Christ instructed. Apostolic tradition under his influence becomes established as one of the main criteria for determining true Christian teaching and for judging the reliability of the teachings of the Church Fathers in their various works.

The Birth of Christian Schools

As those joining the Church gradually came from all levels of society, including lawyers, rhetoricians, and philosophers, a need for more

sophisticated presentations of Christian belief and life became necessary. This led to the development of Christian schools. At first, they were developed on already prepared locations. Alexandria for a long time had pagan and Jewish schools. Philo was representative of the Jewish tradition there and attempted to make the Old Testament meaningful for Alexandrian Jews, promoting allegorical interpretations of Biblical stories. Abraham, for him, was not just the literal Abraham from Ur in Chaldea who was told by God to search for the land of promise; he was every Jewish searcher for covenant fulfillment. Origen (d. 253) learned his allegorical principles from Philo and developed in the same local a Christian allegorical reading of the Old and New Testaments. The chief members of this school were Ammonius, Athanasius, and Clement of Alexandria. In 232, Origen was forced to move his school to Caesarea, a community that later counted among its members the Cappadocians: Basil the Great, Gregory of Nazianzus, and Gregory of Nyssa. In reaction to Origen's allegorical method, a Christian school was begun at Antioch by Lucian of Samosata at the end of the third century. It concentrated on grammatical exposition and the literal and historical interpretation of the Scriptures. It counted among its alumni John Chrysostom and Theodore of Mopsuestia. Antioch also established another school, in Edessa, that flourished under Ephraem the Syrian (d. c. 370) and Nemesius of Emesa (fl. 350–400). Although many controversies arose in these schools, it was also in them that the formulation of many Christological truths was established.

The First Latin Fathers

The Latin language with its concrete practical character was, unlike Greek, incapable of expressing philosophical truths in early Christian times. Neither did it have the capacity to present Christian truths with precision. This ability had to be developed, and it was gradually formed in the third century by Tertullian (d. c. 220), Cyprian (d. 258), Arnobius (d. c. 317) and Lactantius (d. 317). One of Tertullian's chief doctrinal

works was *On the Prescription against Heretics*, with its famous caution against the dangers of philosophy as the source of heresies. Asking "What has Athens to do with Jerusalem?" he pointed out how Christians have often been led astray in their beliefs by the teachings of various philosophers. Tertullian's *Against Marcion* defends the compatibility of the Old and New Testaments and challenges Marcion's rejection of the Gospels of Matthew, Luke, and John. His *Against the Valentinians* and *On the Flesh of Christ* both show his own philosophical acumen, however, as he fights against the different Gnostic positions. His *Against Praxeas* is one of the best expositions on the Trinity before the Council of Nicea. However, he speaks especially of how the divine plurality was manifested in creation and redemption and seems to contend that the Father became the Father only after the generation of the Word as the model of creation. He presents no awareness of an eternal generation. Many of his later works also were disrespected, since they were produced after he became a Montanist and embraced its rigorism. Cyprian, another Latin writer, is most praised for his treatise *On the Unity of the Church*, a twofold attack on the Roman schism of Novatian and the African schism of Felicissimus. Arnobius and his student Lactantius are known as competent rhetoricians, and certainly the latter is considered a master of Latin expression. However, neither is highly respected for theological originality in their works.

Clement of Alexandria and Origen

The outstanding third century Greek writers were Clement of Alexandria and Origen. The former was a convert who became president of the School of Alexandria around 200 and dedicated his life to writing and teaching, the first Christian to attempt a synthesis of pagan learning and Christian revelation. Clement's three main works that survive are the *Protrepticus* (*Exhortation to the Greeks*), the *Pedagogue*, and the *Stromata* (*Tapestry* or *Miscellanies*). Clement makes a strong case against the Gnostic contention that

faith and reason are irreconcilable. He does not claim that reason establishes faith, but rather argues that reason brings understanding to the truths of the faith. This, for him, is the true Christian *gnosis*. When Clement had to flee the School of Alexandria due to the persecution of Septimus Severus, he was succeeded as president by Origen. Origen is the greatest scholar of ancient Christian times. Some of his teachings, or the misinterpretations of his teachings by his followers, were condemned at the Second Council of Constantinople in 553. They were related to the divine processions, angels, the soul and the last things. In regard to the divine processions Origen described the Father as “self-existent God” (*autotheos*) and the Son as a secondary deity, distinct from the Father by an essential inferiority. He is considered the source of the heretical teachings that were initiated by the heretic Arius. Origen’s much admired exegetical work, the *Hexapla*, presented various forms of the Old Testament in six columns with cross references so that a reader could compare the different versions with the original. He also left scholia or explanations of difficult passages, as well as commentaries and homilies *On Matthew*, *On the Gospel of John*, *On the Epistle to the Romans*, and *On the Canticle of Canticles*. His main dogmatic work is his *Peri archon* or *De principiis* (*On First Principles*). It is a treatise on the Trinity: the creation and fall of angels; the creation, fall, and redemption of man; and the basic principles of the moral life and the sources of revelation. His *Contra Celsum* (*Against Celsus*) refutes Celsus’ portrait of Christ as a deceiver and contests his attempt to provide a naturalistic account of the extraordinary spread of Christianity. His *On Prayer* is an introduction to prayer in general, followed by an explanation of the *Lord’s Prayer*.

The Golden Age of the Fathers

In 313, the Edict of Toleration ushered in a new era for Christians. Apologetical writings were less necessary. Writers could aim their works at the Christianization of the world and the presentation and explanation of the Church’s teachings. The Greek

world of the East had talented Christians who were well-tutored in Greek culture; the Latin authors of the West were nourished on many of the same sources of Greek learning in translation. The works of both the Greek and Latin Christian writers took on diverse forms: exegetical, doctrinal, polemical, moral, and ascetical. Many of the doctrinal and polemical works were attempts to bring understanding to the basic truths of the Christian faith. Others were to correct heretical presentations of Christian truths or to clarify distorted representations of Christian life and beliefs.

The first ecumenical or general Council of the Church was held at Nicea in 325. One of its charges was to present the teaching of the Church in regard to the triune character of the one God. In a sense, the council was asked to rescue Christians from the ambiguity bequeathed by Origen. Origen had, in effect, used the correct Greek term *homoousios* (of the same substance) to indicate that the Father, Son, and Holy Spirit were of the same substance. Still, as mentioned above, he portrayed the Father as self-existent and the Son as in some way subordinate. The Word and the Spirit, for Origen and many of his followers, are in some way distinct from the Father by an essential inferiority. The Council of Nicea had to confront this puzzling Origenist portrait of the Trinity that had festered for more than a century and that was most forcefully represented just prior to Nicea by the subordinationist theology of Arius. The Council of Nicea understood *homoousios* (of the same substance) to mean that the Son possessed the entire Godhead or divine essence as the Father. Still, the declaration of the council did not settle matters for everyone: some of the strongest opponents of the Arians opposed the non-Biblical term *homoousios*, despite its use to defend an undeniable Biblical truth. Athanasius came to the council’s defense in his well-known three *Orationes contra Arianos* (*Against the Arians*), written between 335 and 356. He defended Nicea’s teaching on the unity of substance of the Son with the Father and his eternal generation. His *Epistola de decretis Nicaenae synodis* (*Letter on the Decrees of the Council of Nicea*), written in 351, explains and defends more broadly the Trinitarian terminology of Nicea. Though his doctrinal

contributions are his most notable, Athanasius supplied spiritual riches of another sort with his *Life of Anthony*, translated into Latin by Evagrius of Antioch (d. c. 392). It is considered one of the most able ascetical treatises of the Patristic era.

Athanasius was one of the principal writers preparing the way for the First Council of Constantinople (381), which extended the *homoousios* doctrine of Nicea to the Holy Spirit. This second ecumenical council established what would stand thereafter as the Trinitarian dogma: the Father, Son, and Holy Spirit are consubstantial, sharing one substance, but in three hypostases or persons. That this is the case was established by the two councils (Nicea and Constantinople). Three of the great Greek Church Fathers, Sts. Basil, his brother, Gregory of Nyssa, and their friend Gregory of Nazianzus, jointly called the Cappadocians, in many of their writings tried to go beyond the declarations of these truths and attempted to bring further understanding of them by attempting to explain how the three persons, who shared a common nature, were distinct. Basil, in his *Contra Eunomium* (*Against Eunomius*), taught that the distinctive element connected with each person was not that which made him to be God, but rather was the property that made the Father to be the Father and the Son to be the Son and the Holy Spirit to be the Holy Spirit. These properties, according to Gregory of Nyssa, were matters of generation or procession. In his four treatises on the Trinity, *Ad Eustathium de Trinitate* (*To Eustathius Concerning the Trinity*), *Ad Abladium* (*To Abladius*), *Ad Simplicianum* (*To Simplicianus*), and his *Adversus paganos* (*Against the Pagans*), Gregory explains that what made the Father to be the Father was his ungenerated character (not, however, in the sense of Origen's "self-existence"), and what made the Son to be the Son was his generated character. The latter property explained the unique way in which the undiminished or unsubordinated divine substance was communicated from the Father to the Son. Gregory went on to explain that the Holy Spirit likewise proceeded from the Father through the Son, and this particular explanation stayed with the Eastern Church. (In the West, the procession of the Holy Spirit was rather portrayed with

the Holy Spirit proceeding from the Father and the Son. This varying explanation formed what is called the *Filioque* debate.) Although less interested in dogmatic matters, Gregory of Nazianzus, has left a solid defense of the Nicea-Constantinople teachings on the Trinity, especially in his *Orations* (#27–31). His *De vita sua* (*On His Life*), a long poem, is heralded as a worthy competitor to Augustine's *Confessions*. Among the many other Greek Fathers of this period, certainly the most noteworthy is John Chrysostom, the "golden-mouthed" orator. His strong efforts in Constantinople to correct clerical abuses, reform monastic life, and uproot the vices of the rich met strong resistance and banishment, though the emperor, Theodosius II, later asked publicly for God's forgiveness for the ill-treatment suffered by Chrysostom. John Chrysostom, however, is best known for his literary output. He was a superb exegete, well-trained in the Antiochian method of clear exposition and practical application. He has left homilies on *Genesis*, the *Psalms*, and *Isaiah*, but his best work was saved for the exegesis of the New Testament, especially the *Epistles of St. Paul*. His most popular treatises are his *De sacerdotio* (*On the Priesthood*) and his defenses of the monastic life, which are found in three works: *On the Enemies of Monasticism*, *On Compunction*, and *Exhortation to the Fallen Theodore* (which inspired Theodore of Mopsuestia to re-embrace monastic life).

Among the many Latin writers of the West, in the Golden Age of the Fathers, the ones who stand out most prominently are Sts. Hilary of Poitiers, Ambrose, Jerome, and Augustine. Hilary of Poitiers must be ranked with Athanasius as one of the great defenders of the Nicean teaching on the Trinity. He opposed Arianism and effectively silenced it in the West. In fact, his *De Trinitate* (*On the Trinity*) was originally called *De fide contra Arianos* (*On the Faith against the Arians*). Ambrose of Milan is most noteworthy as the bishop who converted Augustine. He was well-trained in the works of the Greek Fathers. Like Hilary, he also opposed Arianism, which had a firm supporter in Empress Justina. His writings against them included his *De fide ad Gratianum* (*On the Faith to <Emperor> Gratian*) and his *De*

Spiritu Sancto (On the Holy Spirit). He wrote a number of treatises on the sacraments and also three guidebooks for catechumens. In his exegetical writings he followed the Alexandrian exegetes, Philo and Origen, with some help from St. Basil, especially on his exegesis of the *Hexameron*. His moral treatises show the influence of Cicero, especially in his *De officiis (On Duties)*, which takes its title from Cicero's work of the same name. Ambrose is also known as "the Father of Ecclesiastical Chant." Jerome mastered both Greek and Hebrew and was commissioned by Pope Damasus to rework the Latin Bible; the result was the Vulgate. He was without doubt the greatest Scripture scholar of his era, vastly improving on the *Vetus Latina (Old Latin)* text. He revised the *Psalter* on the basis of the Septuagint text and then reworked the whole Old Testament in view of the Septuagint of Origen's Hexapla and the original Hebrew text. His exegesis of so many Scriptural works, found in his "Prefaces" and homilies on various books of the Bible, demonstrates his concern with both the literal and allegorical understandings of the Biblical texts.

Augustine of Hippo is the most talented and respected Western Father of the Church. His *Confessions* treats many events of his life but places them in a larger Christian context that makes this work more an odyssey of a soul searching for God and meaning within a divine framework than the biography of an individual's self-reflective experiences. He shows true gratitude to Cicero for his *Hortensius* and its invitation to search for truth and praises the Platonists for their high spirituality. Still, in many of his works, especially *The City of God*, he criticizes the philosophers and shows their tendencies to place themselves at the top of the hierarchy of reality. Peace, man's goal in life is the tranquility of the soul that the Stoics sought, but it is a tranquility brought about by the pursuit of the right order of things, with God at the top. Augustine fought powerfully and untiringly against the Pelagians and Manicheans. Many of his doctrinal treatises, both philosophical and theological, are considered classics and his *De Trinitate (On the Trinity)* is not only his greatest dogmatic work, but at least for the Latins the most

important treatise on the Trinity written in the Patristic era. His *Retractationes (Re-Treatments)* provides an impressive picture of his later reflections on the aims and main ideas of the 93 works he had previously written. His *De doctrina Christiana (On Christian Teaching)* provides the model followed by later Christian writers for theological education. His sermons and letters are often simple in style, exemplifying the truth of his perception, that it is not necessary to use a gold key to open doors that can more readily be opened by a wooden key (*De doctrina Christiana* IV, 9, 11: PL 34, 100). His philosophical insights and theological vision markedly set the framework of Christian understanding in the Middle Ages, and even in the modern world.

The Last of the Fathers

Among the last of the Western Church Fathers, the most important were Boethius (d. 524), Gregory the Great (d. 604), and Isidore of Seville (d. 636). Boethius set for himself the task of translating the great philosophers Aristotle and Plato. He translated most of the logical works that make up Aristotle's *Organon*, though not all of these translations survived. He wrote commentaries on some of them: one on the *Categories* and two on the *Perihermeneias*. One of the *Perihermeneias* commentaries also provides much information about all the ancient Greek commentaries on that work. While a careful scholar, Boethius was also a deep, talented, creative artist and theologian. His *Consolation of Philosophy* is a masterpiece of philosophy and poetry, and his five theological tractates are dense works of technical linguistic precision aimed at those alone who could wrestle with the complications involved in attempting to attain some understanding of the mysteries of the Trinity and the Incarnation. Gregory the Great was a major force in reestablishing Rome and the Church after the barbarian invasions. His writings were extensive and influential. His *Moralia on Job* explained that text according to the numerous models of exegesis that descended from the schools of Alexandria and Antioch: providing literal, allegorical, anagogical, and tropological

interpretations that became universal patterns for reading all the works of Scripture. The tropological or moral interpretation of the Biblical texts revealed their rich teachings concerning the way Christians should live in the present life. His *Moralia* thus became for centuries a guidebook for Christian moral and ascetical practices. His *Liber regulae pastoralis* (*Book of Pastoral Care*), written when he became pope, provided specific directions for the spiritual life of pastors and prudent advice for developing the faith and moral character of their flocks. He also played a major role in revising the celebration of the liturgies and bringing reform to Church music. Isidore of Seville is considered by many to be “the last of the Fathers of the West.” He is recognized mainly as a compiler, but a compiler who preserves many of the riches of the Fathers and famous pagan authors. His most often cited work is his *Etymologies*, which, like many of his other treatises, provides interesting, but at times uncritical derivations and information. His books on grammar, rhetoric, dialectic, and the four mathematical sciences show his support for the educational basics of the seven liberal arts that many Church Fathers viewed as important for the development of Christian learning.

Before turning to John of Damascus, generally considered the last of the Eastern Fathers, special mention has to be made of Dionysius the Areopagite. This author was at first judged to be the first-century Dionysius converted by the preaching of St. Paul (*Acts* 17, 34). His chief works were: *De divinis nominibus* (*On the Divine Names*), *De mystica theologia* (*On Mystical Theology*), *De caelesti hierarchia* (*On the Celestial Hierarchy*), and *De ecclesiastica hierarchia* (*On the Ecclesiastical Hierarchy*). In the thirteenth century students of his works found that they showed signs of strong influence from the neo-Platonic philosopher Proclus, and thus had to be produced toward the end of the fifth century. In earlier times, some passages in his works were challenged, but when Maximus the Confessor (d. 662), aided by the sixth-century commentaries of John of Scythopolis, defended his orthodoxy in a work called the *Ambigua* (*On Ambiguous Points*), Dionysius’ reputation was restored. The intellectual

power of his books was so strong that they were recognized in the Latin West as worthy of translation. Hilduin, the abbot of St-Denis, first translated them in 827, but it was the translations of John Scotus Eriugena, about 25 years later, that were employed by mystical and theological writers throughout the Middle Ages. John of Damascus or John Damascene (d. 749), the last of the Eastern Fathers, is most respected for his *Fountain of Wisdom*. This three-part work begins with a treatise that serves as an introduction to the study of theology, the *Dialectica* (*On Dialectic*). The second part provides a history of heresies. The most famous section of the work was the third part, *De fide orthodoxa* (*On Orthodox Faith*), a compendium of the Christian doctrines of God, creation, providence, Christology, the sacraments (Baptism and Eucharist), veneration of the saints and their images, the books of Scripture, evil, and the last things. He also wrote many treatises on Christian morality and asceticism, exegetical works on Paul’s epistles, and produced a small collection of sermons and liturgical hymns. All of his works show a strong familiarity with the councils and the Patristic writings of the East. He underscored the strong respect for tradition that is exemplified by the Church Fathers and carried by their writings.

Influence of the Church Fathers

The later Church Fathers vouch for the moral, ascetical, doctrinal, and liturgical contributions of their spiritual fathers in the faith. John of Damascus, the last of the Eastern Fathers, shows his dependence on Dionysius the Areopagite, Gregory of Nazianzus, Maximus the Confessor, and Nemesis of Emesa in his *De fide orthodoxa*. His commentaries on the *Epistles of St. Paul* borrow frequently from John Chrysostom and Cyril of Alexandria. The Second Council of Constantinople (553) in its acts states:

We further declare that we hold fast to the decrees of the four Councils, and in every way follow the holy Fathers, Athanasius, Hilary, Basil, Gregory the Theologian, Gregory of Nyssa, Ambrose, Theophilus, John Chrysostom, Cyril, Augustine,

Proclus, Leo and their writings on the true faith (*Nicene and Post-Nicene Fathers*: 14, 303).

St. Augustine, as already mentioned, not only cited Sts. Irenaeus, Cyprian, Hilary, Ambrose, John Chrysostom, and Jerome as he battled with the Pelagian Julian of Eclanum; he cited them authoritatively as proof that his own teaching was in accord with the traditions of the Church. Still, this respect for Patristic authorities was not routine or slavish. Augustine, at the beginning of *Epistle 82* (PL 33, 277), says:

Only those books of Scripture which are called canonical have I learned to hold in such honor as to believe their authors have not erred in any way in writing them. But other authors I so read as not to deem anything in their works to be true, merely because of their having so thought and written, whatever may have been their holiness and learning.

Perhaps even more forcefully, in his *Letter to Fortunatianus* (*Epistle 148*; PL 33, 628–629) he argued: “Still, we are not obliged to regard the arguments of any writers, however Catholic and estimable they may be, as we do the canonical Scriptures, so that we may – with all due respect to the deference owed them as men – refute or reject anything we happen to find in their writings wherein their opinions differ from the established truth, or from what has been thought out by others or by us, with divine help. I wish other thinkers to hold the same attitude toward my writings as I hold toward theirs.” Vincent of Lerins, in his *Commonitorium* (*A Commonitory or Letter of Instructions*), I, 2, 6 (*Nicene and Post-Nicene Fathers*: 11, 132), written 3 years after the Council of Ephesus (431), indicates that both the Scriptures and the Church Fathers can be manipulated by heretics. He instructs his audience to be careful about the misuse of Scripture and the writings of the Fathers and he sets up a demanding standard before accepting any teaching found in Scripture or the works of the Fathers as a declaration of Christian faith: “Moreover, in the Catholic Church itself, all possible care must be taken, that we hold that faith which has been believed everywhere, always, by all.” Despite these cautions regarding the writings of the Fathers, whether due to the Fathers’ fault or misinterpretations of their statements, they still commanded

great respect as authors who were searching for a more profound penetration of Scriptural revelation. In the medieval period, theologians frequently went to their texts, even conflicting texts, to force themselves to pursue a deeper understanding of the faith or a richer appreciation of their examples of Christian moral, ascetical, or liturgical practices. Later, those who found the teachings of medieval theologians dissatisfying returned to the Church Fathers as more dependable guides of Christian faith and life.

Cicero in Political Philosophy

Cary J. Nederman
Department of Political Science,
Texas A & M University,
College Station, TX, USA

Abstract

The Roman philosopher and statesman Cicero was the most eminent pagan whose work on political ideas was available and known to the Latin Middle Ages. His ideas about the natural foundations of society and politics, natural law, and the best regime were widely debated and interpreted. Among the authors who read and interpreted his thought were John of Salisbury, Brunetto Latini, Thomas Aquinas, John of Paris, Ptolemy of Lucca, and Marsiglio of Padua. Even after the reception of Aristotle's political philosophy in the middle of the thirteenth century, Cicero continued to be an influential figure.

Marcus Tullius Cicero (106–43 BCE) was the only important political thinker of pagan antiquity whose ideas continued to be widely accessible without a break to the Christian West following the collapse of the Roman Empire. Cicero's two major political treatises, *De res publica* and *De legibus*, were not directly circulated during the Middle Ages. But the doctrines contained in these works were familiar through intermediary patristic sources such as St. Augustine and Lactantius. Moreover, Ciceronian tracts on moral matters (*De officiis*) and rhetorical technique (*De inventione*) contained many passages that were extremely germane to political speculation. Cicero's ideas on the subjects of politics and society were broadly disseminated because *De officiis* and *De inventione* were among the most widely read and revered texts in the medieval West. Significantly, both *De officiis* and *De inventione* present accounts of society and government also expressed in *De res publica* and other of Cicero's political works. Thus, by way of a variety of

sources, Cicero's political philosophy stood out as a separate and coherent theory to its medieval inheritors.

Central to the Ciceronian conception of human society is the claim that men join together because of their natural powers of reason and speech. Reason induces in human beings the desire to live in civil unity, while speech offers the method by which association may be achieved and maintained. Thus, for Cicero, social, political, and legal order was based on laws of nature that were knowable by and applicable to all human beings equally and without differentiation, on which grounds he has properly been credited with introducing a larger measure of universalism and egalitarianism into political philosophy than had been present among his Greek predecessors. On the other hand, Cicero recognized that some people enjoyed superior abilities to exercise their rational and linguistic facilities – and thus a better claim on leadership roles as statesmen and legislators. Indeed, he suggests that human societies could not have formed in the first place without the guidance of wise and eloquent men who awoke in scattered individuals the reason and speech latent in them. Magistrates and orators in mature political communities recapitulate the same function, appealing through persuasion to the rational powers and basic moral sense of citizens in achieving public decisions. These basic principles are retained throughout Cicero's *corpus*, whether in his rhetorical or his philosophical texts.

In turn, one finds these quintessential Ciceronian doctrines upheld throughout the Middle Ages. Beginning already in the eleventh century, glosses on *De inventione* underscored the idea that human association has its basis in the natural faculties of speech and reason. Likewise, medieval moralists were demonstrably imbued with the naturalistic description of social organization contained in *De officiis*. Perhaps the earliest medieval thinker to embrace a self-consciously Ciceronian perspective on political matters was John of Salisbury (1115/20–1180), a highly educated churchman. As a leading exponent of twelfth-century Latin humanism, John was intimately familiar with the extant portions of the Ciceronian

corpus and expressly identified himself as a devotee of Cicero. There is some evidence that John's famed organic metaphor for the commonwealth, sketched in his major work of political and moral thought, the *Policraticus*, was partially rooted in Cicero's ideas. Like Cicero, John holds that art imitates nature and hence that the precepts of justice could be discovered through reason and realized in political and legal institutions. His definition of justice itself, as a twofold duty to refrain from committing evil acts and to aid those who are threatened with injury, is derived directly from *De officiis*. John clearly upheld conclusions about one's responsibility to sacrifice for the good of the community that resonate with Cicero, not least his agreement with his Roman predecessor that violent action against an incorrigible tyrant is sometimes justified and necessary. Furthermore, in his treatise on speculative philosophy and education, the *Metalogicon*, John adopted an essentially Ciceronian approach to the natural origins of society. In that work, he regards the foundations of civil and social life to result from the human capacities of reason and language, so that political institutions and relations must rest on a proper theory of education.

John of Salisbury wrote prior to the reception into Europe of Aristotle's major writings on moral and political philosophy, the *Nicomachean Ethics* and *Politics*, which were not translated into Latin until the mid-thirteenth century. Although some scholars have attributed a fundamental change in medieval political thought to the appearance of these Aristotelian texts, Cicero's doctrines continued to be cited and utilized alongside, and sometimes in preference to, Aristotle's teachings. An early illustration of the continuation of Ciceronian thought is afforded by Brunetto Latini's *Li livres dou tresor*, a philosophical encyclopedia compiled between 1260 and 1266. Latini, a Florentine who was trained as a professional rhetorician, was not a scholastic in a narrow sense, but his education and career afforded him knowledge of the current Aristotelian learning. *Li livres dou tresor* relies heavily, for instance, upon Robert Grosseteste's recently completed Latin version of the *Nicomachean Ethics*, although it shows no direct awareness of Aristotle's *Politics*. The work

is divided into three sections, the last of which surveys both rhetoric and politics. Latini's rationale for associating rhetoric and politics in this fashion is expressly Ciceronian. With *De inventione* apparently in mind, he follows "Tully" in upholding the precept that the greatest skill a governor can possess is rhetoric, since without eloquent expression, neither cities nor justice nor bare social bounds would have come into existence and been sustained. Among the primary requirements elucidated by Latini for appointment to public office is that he must speak well as concerning matters of truth. These attributes indicate that a necessary precondition for competence as a governor is attainment of qualifications as a rhetor.

In order to bolster this position, Latini adopts the Ciceronian view that society itself would be impossible in the absence of an orator. He cites and embellishes on the doctrine of *De inventione* that human beings joined together in communal life only as the result of the stimulus provided by a wise and eloquent person who counseled his fellows to associate under the terms of justice. Latini indeed likens the contribution of the primitive orator to the creative power of God. Wise speech is placed by *Li livres dou tresor* at the center of the communal affairs of the city: public words are the fount of civic life. Moreover, Latini maintained that this oratorical role forms a continuing feature of the community, imbedded in the idea of "counsel" which runs throughout the third part of *Li livres dou tresor*. "Counsel" seems to connote wise speech for the purpose of achieving public welfare or rectitude. This impression is reinforced by Latini when he turns directly to the governance of the city: one of the primary duties of rulers is to assemble the chief and wise men of the city in order to request and consider their "counsel" regarding important matters, such as the conduct of diplomatic affairs. The magistrate, in turn, may be taken to speak on behalf of the interests of the community because his eloquence is coupled with the wisdom to recognize the public good.

The retention of Ciceronian doctrines after the full recovery of Aristotelian writings permeated more traditional scholasticism as well, even among authors who are normally counted

as devoted students of Aristotle, such as St. Thomas Aquinas (c.1225–1274). In turn, one of Aquinas's students, John of Paris (c.1240–1306), adopted an overtly Ciceronian stance in expressing his views about human nature and politics in his *De potestate regia et papali*. Although John cites Aristotle concerning the natural suitability of mankind for political life, he almost immediately supplements this source with a recapitulation of Cicero's views. Why does he bother making reference to Cicero? The answer to this question turns on John's deep-seated conviction that there exists an unbridgeable chasm between individual advantage and common welfare. Men who are oriented toward their own advantage cannot at the same time rule themselves and others according to a principle of public benefit. For this reason, it is necessary to distinguish sharply between that person whose duty it is to supervise the common utility and the great mass of individuals for whom self-regard constitutes the primary goal. Hence, human beings would not seem to be "political" in the sense Aristotle envisioned. Rather, John appeals to the Ciceronian position that however much men are naturally suited by physical need, linguistic facility, and gregarious instinct for communal life, their actual assembly is not a foregone conclusion. John postulates that primordial men live solitary lives, saved only from assimilation to the lesser animals by the fact that they are able to employ reason instead of relying merely on "natural instinct." Human beings require active prompting in order to be transformed according to the associative inclinations endemic to their nature. Thus, in John's view, nature does not impart its own inherent principle of motion. Rather, men only enter into communities when a wise man persuades them on rational grounds to do so, a claim for which Cicero is expressly cited as the authority. The activation of this capacity to accept communal order, law, and rulership depends upon the cogent presentation of the rationale for and benefits of allegiance to the principle of public utility. In no way, then, may the institution of government be regarded as the imposition of coercion over an unwilling populace. Rule is only legitimate (viz., in accordance with nature) when established by a consensual

process in which men agree on the basis of rational persuasion to be governed within the confines of the precept of the common good.

Ptolemy of Lucca (c.1226–1327), another associate of Aquinas, also found himself attracted to Cicero's conception of the foundations of human community. In *De regimine principum*, which was a continuation of the tract *De regno* that is usually ascribed to Aquinas, Ptolemy sets out to defend the proposition that the republican system of rule, and especially the Roman Republic, formed the best or ideal form of government. In part, he defends the view that God specifically ordained the Roman Republic as the vehicle for His lordship. But he supplements this claim with reference to a form of social and political naturalism indebted to Cicero. The Roman Republic was for him distinctively suited to redressing the failings of the human condition in its natural state, namely, that human beings are a frail and always endangered race, lacking the natural resources to survive enjoyed by other creatures, so that they must struggle to gain and retain earthly security and welfare. Ptolemy articulates the foundation of all systems of government to be the discovery of natural laws that preserve human society and direct men to the common good of all. This is a Ciceronian doctrine (perhaps most famously stated in *De officiis*, which Ptolemy knew); indeed, in the following paragraph, Cicero is cited directly in connection with the "art" of politics necessary to provide for human necessity. The primary "natural" duty of government is to assure that those whose preservation is threatened are served and hence that the bonds of human society are maintained and strengthened.

How does Ptolemy's characterization of the naturalness of human community relate to his defense of the special divine "calling" of the Roman Republic? In his view, the virtues embraced by the Republic naturally and in the absence of Revelation were identical to the end for which "the rule of Christ" was initiated: to promote sacrifice for the good of all and love of one's fellows rather than personal self-glorification or pursuit of private advantage. The virtues of patriotism, civil benevolence, and justice, while prefiguring the rule of Christ, were important

precisely because humanity's natural circumstances are so precarious and difficult. Although he cites the Aristotelian contention that human beings are naturally social and political animals, Ptolemy understands "nature" in a decidedly unAristotelian fashion. Cicero's definition of the republic as a common social bond woven from agreement about matters of right or justice, derived from his *De res publica* as reported by St. Augustine, is invoked and endorsed in support of Ptolemy's teaching. People join together in community – and political community more specifically – in order to protect and improve their physical as well as their moral well-being. The political virtue of governors in thus understood by him as comprising the qualities conducive to the defense of the bonds of nature, understood in terms of the provision to the community of the activities requisite for survival and peace.

A further scholastic figure who proves to have a strong affinity for Ciceronian political theory is Marsiglio (or Marsilius) of Padua (1275/80–1342/43), whose treatise, the *Defensor pacis*, is among the best known (if somewhat infamous) political writings of the fourteenth century. The *Defensor* is widely acclaimed for its emphatic insistence that only those rulers who govern strictly in accordance with the consent of their citizen-subjects are legitimate and deserving of obedience. It is precisely in order to bolster this position that the *Defensor* invokes the Ciceronian version of the generation of the human community. According to Marsiglio, men joined together not because they were coerced to do so, but because they responded to the exhortation of prudent men who were specially endowed by nature with extraordinary reason and eloquence. Human beings may be inclined to associate in communities and to submit to law and government, but they cannot be compelled to do so. The provenance of this doctrine is obviously Ciceronian. Thus, Marsiglio realizes that the inclination to associate differs from the Aristotelian notion of internally regulated motion towards an end, for which reason, perhaps, he, in contrast to John of Paris and other scholastic theorists, declines to state in the *Defensor* that man is a political animal. The natural inclination to enter into community is

instead constituted as an implicit feature of human nature, requiring reasoned persuasion in order to stimulate and direct it towards realization.

The Ciceronian aspect of Marsiglio's argument consequently precludes submission to any application of power which has not acquired the prior approval of the citizen body over which it is wielded. It is in these terms that we may best understand the *Defensor's* unwavering commitment to the consent of the populace as the prerequisite for duly constituted rulers, laws, and all other manner of government activity. Marsiglio's consent theory is complex, but its philosophical substance is rooted firmly in Cicero's idea of man's transformation into a civilized creature. Marsiglio recognizes that human beings often find it difficult to live peacefully with their fellows, yet earthly happiness and comfort make it imperative that people enter into a civil community. Therefore, political authority needs to be adequate to coerce those citizens who are incapable of controlling their temptation to behave iniquitously; yet government must still not interfere with the free choice to associate (in accordance with natural inclination), which forms the basis of all communal institutions, by enforcing obedience unilaterally. Marsiglio presumes, along Ciceronian lines, that the inclinations which nature imparts to man are only the beginning of social and political development. For Marsiglio, as for Cicero, the only valid path to a properly fashioned community is man's collaboration with nature in the fulfillment of those gregarious propensities inherent within him.

Cicero's political philosophy thus has clearly left an indelible mark on the thought of the Middle Ages. The sources scrutinized in this article are merely illustrative of the uses to which medieval authors put his ideas. Cicero's standing among the so-called Renaissance humanists only solidified his standing as a preeminent source for the articulation of European political philosophy. This suggests, in turn, the presence of greater continuity between medieval and early modern approaches than is sometimes recognized. Simply stated, the construction of too high a wall between the Middle Ages and the Renaissance, or between scholastic and humanist outlooks, is challenged

by the persistence of Ciceronian political ideas. Such an absolute historiographical division becomes an obstacle to the appreciation of the extent to which medieval philosophy more generally must not be shut off from successive intellectual traditions. Cicero's political philosophy exercised just as substantial an impact on medieval thinkers as on their humanist successors in the quattrocento.

Civil (Roman) Law

Joseph Canning

Girton College, University of Cambridge,
Cambridge, UK

Abstract

The Roman law was fundamental to medieval civilization – it was the greatest legacy of the Roman Empire. It was known through Justinian's codification, the *Corpus iuris civilis*. The systematic study of Roman law began at the University of Bologna toward the end of the eleventh century. The first school of Roman law jurists was that of the Glossators, followed by that of the Commentators. A combined *ius commune* jurisprudence including both civil and canon law developed. The Commentators sought to accommodate Roman law to their own society. Most of the *Corpus iuris* was concerned with private law but medieval jurists made major contributions to the language of government and politics. Both monarchical and republican elements existed in Roman law. The divine source of the emperor's power was stressed, as was also its popular origin. The jurists considered the problem of how the Roman Republic had been legitimately succeeded by the Empire. The notion persisted that the emperor's power was limited because it derived from the law. Custom preserved the notion of popular consent. Medieval jurists faced the problem of universal and territorial sovereignty, producing theories of the sovereignty of both kings and city-republics. Medieval jurists treated natural law and the law of peoples (*ius gentium*) as higher norms based on reason. There was a wide range of treatments of the relationship between temporal and spiritual power. The medieval scholastic treatment of Roman law was not supplanted by the sixteenth-century humanist approach but coexisted with it. In jurisprudence, as in other areas, scholasticism and humanism were both characteristic of Renaissance intellectual life.

Roman law played a fundamental role in medieval civilization. It was the greatest legacy from the ancient Roman Empire to medieval Europe. In the West, it was known through Justinian's codification (completed in 534), known as the *Corpus iuris* in the Middle Ages and as the *Corpus iuris civilis* from the sixteenth century. The *Corpus iuris* was divided into four parts: the *Institutes*, which consisted of a short introduction to the law; the *Digest*, composed of legal opinions of 39 classical jurists from the second to the fourth centuries; the *Codex*, comprising laws of emperors; and the *Novels*, containing further laws of Justinian, issued up to his death (565). In the early Middle Ages in the West, some knowledge of Roman law was transmitted through the barbarian codes, the *Lex Romana Visigothorum* and the *Lex Romana Burgundionum*, but a systematic study of the *Corpus iuris* was only reestablished through the revival of legal studies at the University of Bologna toward the end of the eleventh century. Thereafter, Roman law was central to the development of jurisprudence, especially in Italy, France, and the Iberian Peninsula. But most importantly, canon law and its scholarship grew in tandem with civil, thereby spreading the influence of Roman law all over western Christendom. In the Byzantine Empire, the simplified Greek version of the *Corpus iuris*, issued by Leo VI (886–912) and known as the *Basilica*, became normative.

In the West, the scholarship of Roman law began with the school of the Glossators. This culminated in Accursius' *Glossa ordinaria* on the whole text of the *Corpus iuris* (completed in the 1230s). From the late thirteenth century, the school of the Commentators became dominant. The method of these jurists was scholastic in that they applied Aristotelian methods of argument to an authoritative body of knowledge, in their case the *Corpus iuris*. The school began in France; the Italian jurist, Cynus de Pistoia (1270–1336/1337), brought the new approach to Italy. He taught Bartolus of Sassoferrato (1313/1314–1357), who in turn taught Baldus de Ubaldis (1327–1400), the most famous jurist of his day. The study of Roman law was initially distinct from that of canon, but the two forms of scholarship increasingly influenced each other. Indeed from the

mid-thirteenth century onward, some jurists were awarded a doctorate in both laws (*Doctor iuris utriusque*). Modern scholars have tended to see civilians and canonists as operating within an overall common law (*ius commune*). This legal system was seen by its practitioners as a complete worldview. It certainly provided a universe of discourse in terms of juristic language. Following the words of the famous classical jurist Ulpian (d. 223), the law was seen as “a true not pretended philosophy,” of which jurists were the priests (*Digest*, 1.1.1,1) – the law provided an explanation of the world in moral terms as the “art of the good and the equitable.”

The approach of the Commentators was not antiquarian. They sought to accommodate the text of the Roman law to the realities of their world. They were not concerned to resurrect the meaning of the law in its original historical context – nor were they philologically equipped to do so. For them, Roman law was no relic from antiquity but a living law, normative and applicable in their own day. The task of the Glossators had been to establish the meaning of the text as it stood, but with a developing tendency to apply their findings to their own society. The method of the Commentators was in stark contrast to that of the legal humanists of the sixteenth century who sought to recover the meaning of the Roman law in its original historical context. A Commentator, such as Baldus, was well aware of the historical distance between the fourteenth century and the first century BCE, but drew a different lesson: that it was more important to apply the law to the here-and-now – it served no useful purpose to try and resurrect a time long past.

The *Corpus iuris* enshrined the distinction between public and private law with its content being almost entirely concerned with private law. But the treatments of public law that it contained had a crucial and determining influence on the development of the language of government and politics in the Middle Ages. Modern scholars have been particularly concerned with this area.

The *Corpus iuris* was overwhelmingly the emperor's law. In his decree of promulgation, Justinian had given all parts of it equal status as imperial law. But the codification had been made

in a hurry and there were contradictions within it. Not least, there coexisted both monarchical and republican elements. The history of law under the Roman Republic was given in outline, and there were other traces of republican law. This meant that medieval jurists were able to use the Roman law as a treasure-house of passages to apply to the wide variety of political institutions they were confronted with: the Empire, kingdoms, city-states, and lordships of various kinds.

The divine source of the emperor's power was stressed and, indeed, he was described as "lord of the world" (*dominus mundi*) (*Digest*, 14.2.9). His laws were sacred and everlasting: Justinian had decreed that his codification would last "forever" (*in omne aevum*) (*Digest*, *Constitutio*, "Omnem," 11). The emperor was the "living law" (*lex animata*) (*Novel*, 105.2.4) – an echo of Hellenistic notions of kingship. There was a clear statement of his sovereign will: "what has pleased the emperor has the force of law" (*quod principi placuit legis habet vigorem*) (*Digest*, 1.4.1). Indeed, he was described as being "freed from the laws" (*legibus solutus*) (*Digest*, 1.3.31). This formulation was the distant ancestor of early modern notions of absolute monarchy but its meaning was restricted: the emperor was freed from the observance of the *leges*, in the sense of positive law.

But a problem remained. Rome had once been a republic in which power was ultimately derived from the people. How had it legally become an empire? How had a series of emperors been set up with legitimate authority? The answer given by the *Corpus iuris* was the so-called "royal law" (*lex regia*), whereby the Roman people had transferred all its power and authority to the emperor. The *Corpus iuris* only referred to this law and modern scholars have disputed whether it ever actually existed or whether it was a legal construction to explain the transition from republic to empire. Some have identified it with the *leges de imperio* by which the popular assembly gave power to an emperor on his accession. The problem with this interpretation is that only one such law survives (that concerning Vespasian) and only in a truncated form not conforming to the description of

the *lex regia* – it is a grant of specific powers and exemptions rather than a general transfer of power. Whatever the truth of the matter, reference to the *lex regia* kept alive the idea that the people was the source of the emperor's authority. Medieval jurists, in discussing it, broached fundamental political issues: was it revocable or irrevocable? In other words was sovereignty alienable? Furthermore, the notion of the *lex regia* was relevant to another issue. Did the emperor have a completely free hand? If he did, this would go against the spirit of the Roman law because the self-image of the governmental and legal system of Rome was that it was one which exemplified the rule of law. So, there was a passage that stressed that it was fitting for the emperor to obey the laws, precisely because his power was derived from the law (*lex Digna vox*) (*Code*, 1.14.4). But of course he could not be compelled to acquiesce.

The notion of popular consent persisted in another area within the *Corpus iuris*, that of custom. The treatment was sketchy and contradictory. *Digest*, 1.3.32, ascribed to the second-century jurist, Julian, stated that the people could express its will in abrogating a law by its tacit consent through disuse. This passage came to be used by late medieval jurists as a building block in developing ideas of consent. A contradictory constitution of Constantine (*Code*, 8.52.2) stated that a custom could not abrogate a *lex*. This view was determinative in the *Corpus iuris* and was reinforced by Justinian's statement that the emperor, whose will was the sole source of law, was its only interpreter (*Code*, 1.14.12). Interpretation was, of course, precisely what the late medieval jurists undertook in accommodating the Roman law to their contemporary social and political reality.

One of the most well-known maxims from Roman law, "what touches all should be approved by all" (*quod omnes tangit ab omnibus comprobetur*) (*Code*, 5.59.5.2), was used by medieval jurists to justify popular consent in matters of law and government. But they took it out of context: in the *Corpus iuris*, it belonged to private law – when a ward had more than one guardian,

all had to agree to certain acts involving the interests of all guardians.

The universal nature of imperial authority in the *Corpus iuris* posed a problem for medieval jurists faced with kings who did not accept subordination to the emperor and, in Italy, city-republics which from the twelfth century increasingly exerted their autonomy. *Code*, 1.1.1, according to the medieval Vulgate version (*littera Bononiensis*), referred to “all peoples whom the sovereign authority of our clemency rules” (*cunctos populos quos clementie nostre regit imperium*). Did this mean that all peoples were under the emperor’s rule or was it restricted only to those that actually obeyed him? A solution was approached first in terms of kingship. Two formulae which were distinct in origin became combined. The first was the notion that the king in his kingdom was the emperor of his kingdom (*rex in regno suo est imperator regni sui*). The source of this was to be found in canonist writings of the last decade of the twelfth century and in a *quaestio* written by the civilian Azo shortly after 1200. The second was that of the king who did not recognize a superior (*rex qui superiorem non recognoscit*). This was derived from a passage in Pope Innocent III’s decretal, *Per venerabilem* (1202): “Since the king himself [of the French] does not recognise a superior in temporal matters” (*quum rex ipse [Francorum] superiorem in temporalibus minime recognoscat*). The application of this thinking to independent city-states in Italy came in the fourteenth century with Bartolus who, basing his argument on the power of popular consent, produced the concept of the city, which was its own emperor (*civitas sibi princeps*) and which did not recognize a superior. Baldus developed further the implications of the sovereignty of such republics, giving particular attention to corporation theory and to citizenship as both a political and a legal concept. When faced with the apparent contradictions between the universal claims of the emperor and the territorial sovereignty of kings and then cities, jurists had from the thirteenth century used the *de iure-de facto* distinction. Canonists discussed whether the king of France did not recognize a superior *de*

iure or *de facto*. In the thirteenth century, civilians (with the possible exception of Johannes de Blansco) accorded *de iure* sovereignty solely to the emperor. Bartolus took the step of accepting that cities through the exercise of *de facto* power gained fully legitimate sovereignty; Baldus applied the same argument to kings. This approach meant that the facts of political life were fully recognized. The magnitude of Bartolus’ and Baldus’ achievements in justifying the sovereignty of Italian city-republics is shown if one reflects that, in the *Corpus iuris*, cities enjoyed the status of mere *municipia*, licit corporations subject to imperial confirmation of their legal rights. The *lex regia* applied solely to the Roman people and not to cities in general and was, therefore, not used by either jurist in their arguments supporting the sovereignty of city-republics.

The *Corpus iuris* had given cursory attention to the jurisprudential concepts of natural law (*ius naturale*) and the law of peoples (*ius gentium*). The treatment of natural law was contradictory. Ulpian considered it to be that which human beings shared with animals, whereas the second-century lawyer, Gaius, connected both laws, considering the *ius gentium* to be the product of natural reason. Gaius’ view predominated amongst Roman jurists. Given the prominence of the concept of natural law in scholastic discourse, medieval jurists, both civilians and canonists, treated natural law and the *ius gentium* as higher norms. In contrast there was no suggestion in the *Corpus iuris* that a provision of the *ius civile*, which went against natural law was in any way invalid. Medieval jurists treated the *ius gentium* as a legal expression of human beings’ natural reason. They found the *ius gentium* a particularly useful category for dealing with government and politics, because in the *Corpus iuris* it was described as the source of rulership and property. The Neapolitan school for instance, in support of the king of Sicily’s claims to independence from the Roman emperor, denied the latter’s *de iure* universal sovereignty, maintaining that there was a plurality of sovereign monarchs on the basis of the *ius gentium*. The inhabitants of the kingdom of

Sicily, like those of Spain, had conquered their territory by the effusion of their own blood. This argument bypassed the mainstream *de iure-de facto* one which only applied within the context of Roman law and rested on the premise of the *de iure* claims of the emperor. For the Neapolitans, the *ius civile* of the Romans was only one amongst many. Within the school of the Commentators, Baldus held that the *ius gentium* justified self-government by peoples and the election of kings by the inhabitants of a kingdom.

In the Middle Ages, the relationship between the church and secular rulers was of central importance and at times highly contentious. In the *Corpus iuris*, religion was considered to be part of public law. A distinction was, indeed, made between the emperorship (*imperium*) and the priesthood (*sacerdotium*), both of which were understood to derive from God. But the emperor, as God's vicegerent on earth, was the head of the church understood as the Christian Roman Empire, and legislated on ecclesiastical matters. The first 13 titles of the *Code* were concerned with the clergy and religious questions, as were many of the *Novels*. From the time of the papal reform movement in the later eleventh and early twelfth centuries, the church's rejection of this imperial role became insistent. Freedom of the church (*libertas ecclesiae*) from lay control became enshrined in the rapidly developing canon law. Civilian jurists had to consider church matters in the light of papal claims and the arguments of canonists. As regards the relationship between secular rulership (*regnum*) and the priesthood, juristic opinion within the *ius commune* ranged from a dualist approach, seeing both as derived directly from God and existing in parallel, to a hierocratic one, seeing the pope as mediating governmental power from God to the secular ruler. As a sign that canon law could not be ignored by civilians, the greatest of the Glossators, Accursius, had to consider the Donation of Constantine. According to this, the emperor had granted the imperial authority in the West to Pope Sylvester and his successors. This purported document was not mentioned in the *Corpus iuris* but a version of the supposed text was included in

canon law, notably Gratian's *Decretum*. The authenticity of this donation (which was not extant) was attacked by Nicholas of Cusa on grounds of historical evidence in his *Concordantia catholica* (1433) and proved to be inauthentic for philological reasons by Lorenzo Valla in 1440. But such arguments were not known in Accursius' day. The issue for him and other jurists was whether the donation was valid or not. He proved on Roman law grounds that it could not be relying above all on the emperor's duty to conserve the empire by virtue of his office. The Donation served as a title to the Papal States, but one which medieval popes were careful to have reconfirmed by subsequent emperors; indeed popes came to insist on such reaffirmation before they would conduct an imperial coronation. The division of Italy into lands of the empire (*terrae imperii*) and lands of the church (*terrae ecclesiae*) became embedded in juristic discourse. The range of opinion over the relationship between temporal and spiritual powers was wide: pope and emperor were seen as twin pillars of Christendom but the extent of their power as regards each other was disputed.

The scholastic treatment of Roman law outlasted the Middle Ages. From the early sixteenth century, it was indeed challenged by the emergence of humanist jurisprudence based on a sophisticated knowledge of Latin philology but it was not supplanted. Both methods, known colloquially as the old style "Italian manner" (*mos italicus*) and the new style "French manner" (*mos gallicus*), coexisted. Indeed, in those places in Europe where Roman law was applied, the traditional scholastic approach still remained dominant in the practice of lawyers and the law courts. Thus in jurisprudence, as in other areas, scholasticism and humanism were both characteristic of Renaissance intellectual life.

Conciliarism

Thomas M. Izbicki

Alexander Library, Rutgers State University of New Jersey, New Brunswick, NJ, USA

Abstract

Conciliarism was rooted in church tradition, which valued the great councils of Antiquity as defenders of true doctrine. It became a movement in reaction to the Great Western Schism (1378–1417). Theologians like Peter of Ailly and John Gerson, as well as canonists like Francesco Zabarella, argued for a general council to resolve the schism. Eventually, the Council of Constance (1414–1418) declared a council supreme in reuniting the church, defending orthodoxy and reforming the ecclesiastical institution. Some conciliarists argued that the church as a whole was the ultimate ecclesiastical authority, and that it was represented by a council. Calling a council, however, was the prerogative of the papacy under canon law. An appeal to equity was used to circumvent the law. If necessity required a council, other authorities could gather one. Nicholas of Cusa argued for a church, which balanced hierarchy with consent of the church as a whole. The Council of Basel (1431–1449) tried to impose reforms on pope and curia. This produced a papalist reaction led by Pope Eugenius IV (1431–1447) and the Dominican theologian John Torquemada.

Although shaped by the Great Western Schism (1378–1417), which divided the papacy between two and then three claimants, and the desire for reform of the church, conciliarism was rooted in

traditional texts. The history of the church highlighted the great church councils of the fourth and fifth centuries, which had defined key doctrines, and medieval popes had legislated through general and local councils convoked on their initiative. By the end of the thirteenth century, canon lawyers had examined the remedies available if a pope fell into error, some thinking he lost his office upon espousing heresy, while others thought a church council had to depose the pontiff formally. Canon law, however, restricted the power of summoning a general council to the Roman pontiff – preventing a pope's enemies from using such an assembly against him. Canonists also discussed the church as a corporation, an entity able to defend its own interests. Canonists and theologians also were aware of Augustine's idea that Peter had received the keys as the representative of the whole church (*in figura ecclesiae*), not just in his own right. Theologians, moreover, discussed the church as the mystical body of Christ. There was room for arguments that a council could represent Christ even in the absence of a legitimate pope.

A general council to decide between the rival popes was recommended soon after the outbreak of the schism. Henry of Langenstein, a theologian, and Conrad of Gelnhausen, a canonist, were among the first to propose this solution, arguing that a general council could assemble in the absence of an undoubted Roman pontiff. Equity (*epieikeia*, an Aristotelian concept) permitted the church to waive the letter of the law under such circumstances. Other measures were tried without success. These included a compromise between the claimants, the abdication of one in the other's favor, and election of the surviving claimant when his rival died, but none of these came to fruition. At last, Benedict XIII (Avignon) and Gregory XII (Rome) agreed, under pressure, to meet to find a solution to the schism. This failed to happen, provoking both colleges of cardinals to abandon their popes and come together. The cardinals agreed to hold a council of union in Pisa in 1409.

For this council, theologians, like John Gerson and Peter of Ailly, and canonists, like Francesco Zabarella, prepared tracts arguing for

the ability of a council to meet and end the schism. The power of the whole church over a pope was emphasized. The Pisan synod declared both popes deposed, electing Alexander V in their place. Alexander having died soon after his election, Baldassare Cosa was elected his successor as John XXIII. John proved unable to unite the church, and so Sigismund of Luxemburg, king of the Romans, urged on by Gerson and others, pressured John to call a council. John, driven from Rome by the king of Naples, called a council to meet in Constance. If John hoped to be confirmed in office, he found his future in doubt. So he fled, but the Council of Constance, after some hesitation, declared that it met with the authority of the Holy Spirit and had power from God, as the representative of Christ and the church, to resolve the schism. The council also claimed, in the decree *Haec sancta*, authority to defend the faith and reform the church "in head and members." John XXIII was deposed, and Gregory XII resigned shortly thereafter. (Some later papalists claimed his pro forma authorization of the council had legitimized it.) Benedict XIII refused to yield, but most of his followers, even in his native Spain, deserted him. The Council of Constance, once it had representation of all the former parties in the schism, was able to elect an undoubted pope, Martin V, a Roman noble of the Colonna clan. Constance also enacted the decree *Frequens*, which called for a regular succession of councils to regulate the conduct of church government, especially that of the Roman curia. Some reforms also were enacted at Constance, but the reformers were not satisfied. The next council, assembled at Pavia and then moved to Siena, failed to enact further reforms.

When the next council assembled in Basel in 1431, a new pope, Eugenius IV, a nephew of Gregory XII, had just been elected. He tried to dissolve the council or at least transfer it to Italy to meet representatives of the Greek church in an effort to restore ecclesiastical unity in the face of the advancing Ottoman Turks. The Basel fathers, deep in negotiations with the Hussite rebels in Bohemia for a debate over the issues dividing them from orthodoxy, refused to adjourn or

move. They threatened the pope with suspension from office if he did not yield.

Treatises favoring councils written at the time included Nicholas of Cusa's *On Catholic Concord*, which argued for a church governed by councils representing the whole body, including the pope, that would maintain order and enact reforms. This system of councils balanced the order of hierarchy with the need to obtain widespread consent. Cusanus' treatise shows the influence not just of canon law, but also the theology of Ramon Llull, who thought that harmony could be brought out of discordant elements. Nicholas also thought the church would benefit from reform of the Holy Roman Empire, which would be a strong element in the defense of Christendom against internal and external foes. (The failure of Basel to achieve concord eventually would drive Nicholas to become an agent of the papacy in defeating the council.) Also among the subtler thinkers at Basel, Heymeric of Camp, a professor from Cologne, argued for an idea of the council as the agent of the whole, including the pope, more fully representative of God than was the Roman pontiff on his own. This he argued from the works of Llull and even from Latin discussions of the Qur'ān. Some other conciliarists, however, thought in less subtle terms, arguing that the council represented the whole in very legalistic ways. The whole being greater than any part, even the most important part, the pope himself, a general council was supreme, holding plenitude of power. (The canonist Panormitanus would claim this before an imperial diet in 1442.) Consequently, a council could impose reforms on the curia. Basel also organized its own curia and assumed the power to issue indulgences, otherwise a papal prerogative.

Faced with this resistance and routed from Rome by local foes, Eugenius recognized the council, but he refused to be bound by its reform decrees. Eugenius dispatched a committee of presidents to Basel, but they were faced with an oath of incorporation into the council intended to make them compliant with the will of the majority. The Council of Basel began to divide internally, especially over the site of a council with the Greeks. The majority favored Basel or Avignon,

neither acceptable to the pope nor the Greeks. By 1437, Eugenius was able to decree transfer of the assembly to Ferrara. Some of the fathers left – seeing discord as a sign that the Spirit had departed – but the remainder resisted. They turned the decree of Constance on conciliar authority, *Haec sancta*, into a pronouncement of dogma. Then they deposed Eugenius IV, electing the semiretired duke of Savoy, Amadeus VIII, to reign as Pope Felix V.

This election set off a fierce diplomatic struggle, particularly in the Holy Roman Empire. Basel's apologists traveled to imperial diets to proclaim that general councils represented the church with fullness of ecclesiastical power. Even a legitimate pope had to obey, embracing reforms, or face deposition. Eugenius' envoys argued that the pope was supreme, the one who received the power of jurisdiction from Christ and distributed it to bishops and priests. This hierarchic view was supported by John Torquemada and others with allusions to ideas of celestial hierarchy, derived from Pseudo-Dionysius the Areopagite, and an idea of the natural order as monarchic. Bees – obeying a king! – and migrating birds following a leader were invoked, using a text from canon law, as proof that a plurality of rulers was against nature.

Eventually, Eugenius and his supporters prevailed through propaganda describing the Basel assembly as a mob of rebellious subjects and by making concessions to the princes, especially those in the Germanic lands. A temporary reunion with the Greeks, decreed at Florence in 1439, also buoyed the embattled pope. The Basel assembly yielded at last, after Eugenius' death, and "elected" his successor, Nicholas V, as pope. Felix V had already abdicated, retiring to Savoy.

Conciliar sentiment remained alive, especially in Paris, well after this defeat, and both rulers and prelates at odds with Rome appealed to a future general council. Even Pius II's prohibition of appeals from pope to council failed to destroy this conciliar tradition. It remained alive until the French Revolution destroyed Gallicanism in France. Ultramontane views of papal supremacy held sway unquestioned for more than a century. These dismissed conciliarism as

inspired by heretical critics of the papacy. The conciliarist example, however, has been invoked since the Second Vatican Council was announced in 1959. The possibility that a more consultative order might prevail in the church was tied to an argument that the decree *Haec sancta* of the Council of Constance defined a dogma that could not be overturned on behalf of pope and curia.

Conscience

Carl N. Still

Department of Philosophy, St. Thomas More College, University of Saskatchewan, Saskatoon, SK, Canada

Abstract

Medieval thinkers inherited from Jerome (d. 420) a perhaps unintended distinction between conscience and *synderesis*, or the “spark of conscience”. Once accepted, the distinction required an explication of how conscience and *synderesis* relate to each other. Philip the Chancellor posited that *synderesis* straddles the distinction between a potentiality (*potentia*) and a disposition (*habitus*). As a dispositional potentiality, *synderesis* could either supply truths to conscience (as in intellectualistic accounts) or motivate the will to do good (as in voluntaristic accounts). Both types of account held that conscience binds us to follow it, but also allowed that conscience could be mistaken and yet still binding. While Bonaventure had recognized that conscience can learn from experience, Thomas Aquinas took the step of connecting conscience with prudence. This latter move anticipated later medieval accounts, where conscience would be treated in relation to the moral virtues rather than *synderesis*.

The medieval period proved to be especially fruitful for philosophical analysis of conscience, even if it was stimulated by what may have been a textual error. The error concerns the Greek term for conscience, *suneidêsis*, which was translated into Latin as *conscientia*. Both terms comprise a range of meanings, ranging from simply

“knowledge” to knowledge that is shared with someone else. But *suneidêsis* became bifurcated into two terms as a result of a confusing passage in Jerome’s *Commentary on Ezekiel*. There Jerome used the term *sunteresin* instead of the more standard term to name a fourth part of the soul (in addition to the rational, irascible, and concupiscible parts), which he referred to as the “spark of conscience” (*scintilla conscientiae*). This led medievals to believe there was a distinction between conscience proper and the “spark of conscience.” By the twelfth century, the term *synderesis* (or the variant *synteresis*) was being used to refer to the “spark of conscience” distinct from and in some sense higher than conscience (*conscientia*) itself.

Jerome further reinforced this duplication in conscience by his inconsistent answer to the question of whether conscience can be lost. On the one hand, he says that the spark of conscience was not erased even in Cain; but on the other he concludes that some people become so sinful that they cease to have a conscience. The medievals would seek to resolve this inconsistency by distinguishing a conscience that cannot be lost (*synderesis*) from a conscience that can be lost (*conscientia*) in the case of the very wicked. Cain shows no remorse for killing his brother Abel, yet he complains about his punishment (Gen. 4:13). This vestige of regret might be regarded as evidence that the “spark of conscience” is still operative in him, even though it hardly indicates a *moral* conscience.

Medieval theologians sought other ways to distinguish *synderesis* from *conscientia*, including where each is located in the soul, what the function of each is, whether each is subject to error or immune to it, and whether each is innate or acquired. By the thirteenth and fourteenth centuries, treatments of conscience became a regular feature in commentaries on Peter Lombard’s *Sentences*, as well as in disputed questions and summas. The majority of medieval accounts on conscience began from *Sentences* 2.39, which considers how the will alone among natural goods can be bad. There Lombard invokes Jerome’s *Commentary on Ezekiel* to mention the “higher spark of reason” (*superior scintilla rationis*) that inspires us to desire good and hate

evil, even though we can obviously be overcome by evil desires and fall into sin.

While Lombard set the stage for subsequent discussions of conscience, Philip the Chancellor (d. 1236) produced the first medieval treatise on conscience (“De synderesi”) in his *Summa de bono* (ca. 1225–28). There he expounds the distinction between *synderesis* and conscience and revisits the question of whether conscience can be lost. Jerome had held that *synderesis* was a potentiality associated with reason, but Philip breaks new ground by considering it a “dispositional potentiality” (*potentia habitualis*). It resembles a potentiality in being innate, yet is like a disposition in embodying a tendency to do what is good. This duality in *synderesis* influenced later treatments of conscience, which are sometimes characterized as intellectualistic or voluntaristic, depending on whether they understand *synderesis* as a dispositional potentiality that supplies truths to conscience or as a desire for the good.

In question 3, Philip argues that conscience emerges from the conjunction of *synderesis* with free choice. Consequently, conscience can be mistaken, while *synderesis* cannot since it involves no deliberative judgment. In the following question, Philip considers whether *synderesis* can be lost through the example of heretics who died for their faith. While he regards them as mistaken in their religious beliefs, he finds that *synderesis* is still operative in them insofar as they resisted what they found to be evil. *Synderesis* is thus the counterpart to the impulse to sin evident in our fallen nature, but Philip rejects Lombard’s idea that *synderesis* is a special grace to compensate for the impulse to sin.

Once Lombard had set the context for discussing conscience and Philip had outlined two distinct ways of viewing conscience, the stage was set for two highly original expositions offered by Bonaventure (d. 1274) and Thomas Aquinas (d. 1274).

Bonaventure

Bonaventure’s treatment of conscience is highly distinctive and is generally interpreted as a

voluntaristic view of the difference between conscience and *synderesis*. Bonaventure distinguishes *synderesis* and conscience by locating them in different parts of the soul: conscience in the rational part and *synderesis* in the affective part. Conscience thus has a cognitive role, while *synderesis* provides motivation to the will. This has the effect of making conscience a disposition of practical reason that directs our judgment about what can be done and *synderesis* a potentiality of desire that stimulates us to do good.

While others ask whether *synderesis* is innate, Bonaventure raises this question with respect to conscience. Inasmuch as conscience is a disposition relating to basic dictates of nature, it is innate. Yet to grasp such a dictate as “one’s parents are to be honored” requires that we have acquired an understanding of *parent*. So conscience is in another sense an acquired disposition relating to what we learn by education and experience. Bonaventure thus recognizes that conscience can be “dynamic” in the sense of developing new practical principles based on experience. These principles then become new means to the good that we desire to attain.

Conscience performs two distinct but related functions: first, it enables us to discover the most general practical principles (e.g., “obey God,” “honor your parents”). As in other accounts where this function is attributed to *synderesis*, conscience is innate, unerring, and inextinguishable even in most morally corrupt person. Second, conscience applies these principles to specific situations: here conscience can err since a misapplication of the principles can occur through ignorance or incorrect reasoning. From this liability to error it follows that a mistaken conscience can become involved in doing evil actions.

One is obliged to follow one’s conscience both when it is conformed to God’s law and when it is in addition to God’s law. But a dilemma arises when conscience dictates an action *against* God’s law and so places one in a “double bind.” Whether one acts or does not act on such a conscience, one will sin mortally. Bonaventure counsels not acting at all when conscience dictates acting against a divine law or known church authority. Instead, one must educate oneself so as to correct one’s

erroneous conscience and thereby resolve the conflict with authority.

Turning to *synderesis*, Bonaventure sees in the “spark of conscience” the role of driving conscience to act. *Synderesis* cannot be extinguished by sin, but its exercise can be hindered temporarily, as when one is so thoroughly in the grip of the impulse to pleasure that reason has no sway over him or her. In cases where we fail to adhere to what conscience has determined to be good, feelings of guilt or remorse result, because our natural desire for the good has been frustrated.

With conscience and *synderesis* separated into two distinct powers, it may seem as if they are isolated from each other. But Bonaventure is careful to emphasize that they do interact, as *synderesis* drives conscience and conscience can direct *synderesis*. Their interaction mitigates the tendency to make these functions into faculties. Further, the recognition that conscience does not simply apply principles to situations, but learns and develops from experience makes Bonaventure’s account more akin to Aristotle’s conception of practical wisdom. But Bonaventure stops short of exploring the connections between conscience, *synderesis*, and the moral virtues, as Aquinas and others will do.

Thomas Aquinas

By comparison with Bonaventure, Aquinas offers an intellectualistic approach to distinguishing between conscience and *synderesis*. While both have cognitive and motivational roles for Aquinas, he regards *synderesis* as a disposition (*habitus*) within reason for apprehending general moral principles, while conscience is an act, applying these principles to activity in a particular situation. Conscience works both prospectively (prodding, urging, binding) and retrospectively (accusing or causing remorse), when it asks, before acting, “What ought I to do?” and, after acting, “Did I do the right thing?”

Aquinas holds that *synderesis* cannot be mistaken about basic moral principles for the simple reason that if it could be, none of our knowledge would be certain. Nor can *synderesis* be

extinguished except with respect to its actualization. The errors we make about what is to be done lie with conscience, either because it has misapplied a basic moral principle or has falsely derived a new principle from those known by *synderesis*.

Like Bonaventure, Aquinas recognizes that in order to act, conscience needs principles with more content than the most general dictates, such as “Do good and avoid evil.” These more explicit (or “secondary”) principles have to be derived from experience and instruction. Further, the agent will need the virtue of prudence, which enables one who has it to correctly apprehend particular circumstances. Aquinas advances the medieval discussion by linking conscience with prudence and other virtues in order to account for weakness of will.

Both Philip and Albert the Great (d. 1280) had found a role for *synderesis* and conscience in the Aristotelian practical syllogism. On Albert’s account *synderesis* provides the first premise, which expresses universal reasons relating to the good; reason provides the second premise by applying the particular to the universal; conscience draws the conclusion, which has the force of a command. In an example Aquinas develops from Aristotle’s *Nicomachean Ethics*, weakness of will takes on this form: an incontinent man knows the general principle forbidding fornication, but also holds the principle that pleasure should be enjoyed. If he pursues fornication, he still knows habitually that fornication is to be avoided, but in this instance his actual knowledge – that this fornication will bring pleasure – overcomes his habitual knowledge. This is not a failure of *synderesis*, but of the incontinent agent, who lacks the virtues needed to assess the situation correctly and deliberate appropriately about what is to be done.

Aquinas does not seem to have addressed the misapplication of moral principles to particular circumstances. But he does offer an explanation of how conscience can be mistaken. Conscience errs when it makes an invalid inference and when it introduces a false premise. Aquinas accepts that one can have a mistaken conscience in good faith, and one may be excused if the mistake is factual in

nature or concerns social norms. But if the mistake is about law, then he is not excused because he should have known the law. When heretics mistakenly think that swearing an oath is forbidden by God, they have made an error in their higher reason that is passed on to conscience.

The problem of mistaken conscience becomes acute in light of the fact that conscience binds us to act according to its dictate. Acting against conscience is always wrong, but Aquinas reasons that it is because one also acts against *synderesis* (which is infallible) that acting against conscience is always wrong. Conscience binds in much the same way as the commands of a ruler (including God) do: as soon as they are known, they bind with a conditional necessity. If one obeys, a reward may be expected; but if one disobeys, punishment will follow.

Aquinas modifies Bonaventure’s account of mistaken conscience. Bonaventure held that erroneous conscience cannot bind us to act, but instead binds us to correct it. Aquinas, however, accepts that an erroneous conscience binds as long as it remains and, moreover, puts one in a double bind. Suppose someone’s conscience tells him that a command of God is actually bad. If he follows his (mistaken) conscience, he will sin by rejecting God’s command; if he follows God’s command, he will sin by rejecting his own conscience. Yet Aquinas also reasons that while a correct conscience binds absolutely and in every circumstance, a mistaken conscience binds only relatively. Hence, a mistaken conscience can be set aside without committing sin, but a correct conscience cannot be set aside without sinning. The binding force of a mistaken conscience consists in its being taken to be correct; if and when its error is corrected, it ceases to have binding authority.

Aquinas modified the state of the medieval discussion of conscience in a number of ways. Where earlier accounts had treated conscience and *synderesis* in isolation from other elements in human action, Aquinas enriched the discussion of conscience by appealing to prudence to explain how we develop secondary principles. Prudence also plays a crucial role in correctly applying these principles to a given situation and in carrying out

the dictates of conscience. This innovative move of relating conscience to moral virtue anticipated how later medieval thinkers would address conscience.

Duns Scotus and William of Ockham

The linking of conscience with the moral virtues that we find in Aquinas continued to the point where *synderesis* and conscience ceased to be treated as topics in their own rights. Duns Scotus (d. 1308) offers very little explicit treatment of conscience or *synderesis*. His views on conscience must be gleaned from his treatment of the development of moral virtues. Scotus locates *synderesis* and conscience in the intellect, as Aquinas did, though he characterizes conscience as a habit (rather than an act) of reaching proper conclusions about what to do. But the function Bonaventure saw in *synderesis* – of driving us toward the good – Scotus finds in the will's affection for benefit (*affectio commodi*), which drives human beings to seek their highest happiness in God. Scotus also gives conscience a dynamic role in developing the human agent well beyond its function in applying general principles to situations. In particular, conscience provides one of the necessary conditions for acquiring a moral virtue: that one act in accordance with a correct dictate.

William of Ockham (d. 1349) continues the trend of discussing conscience in the context of the virtues. While Ockham omits any treatment of *synderesis*, he makes a place for conscience in developing virtues when he argues that we can act morally not only from knowledge acquired from experience but also from knowledge that is taught to us (which Scotus had denied). He accuses Scotus of conflating conscience with the prudence associated with each individual virtue ("proper prudence") and argues instead that conscience can direct actions based on dictates that are learned from others. Both, however, agree that conscience plays a critical role in directing action that can lead to the development of prudence and then the remaining moral virtues. In this mature phase of medieval thought about conscience, Bonaventure's conception of conscience as learning from

experience and Aquinas's connecting conscience to the acquisition of moral virtues reach their fullest medieval expression.

The high medieval period stands out for the sustained attention devoted to conscience as a key component in moral psychology. Yet along with the insights that were gradually arrived at from the twelfth to the fourteenth centuries, there are also aspects of conscience that medieval thinkers overlooked. While they considered whether a person could cease to have a conscience, they did not consider whether someone might fail to develop a conscience in the first place. In their focus on the innateness associated with *synderesis*, they did not consider that conscience might be largely shaped by social and cultural influences. They did not enumerate fully the stock of general moral principles that everyone should have by virtue of *synderesis*. If they had, it might have helped them grapple with the prospect that some people may be misguided in their moral formation and so miss supposedly innate moral principles. Finally, in their focus on conflicts between conscience and our bodily appetites, they neglected to consider that we also wrestle with conflicts between conscience and our psychological desires for goods such as prestige, honor, and power.

Consciousness

Mikko Yrjönsuuri

Department of Social Sciences and Philosophy,
University of Jyväskylä, Jyväskylä, Finland

Abstract

Medieval discussions recognize many of the issues that are nowadays associated with the philosophical term “consciousness,” but the conceptual schemes used in these discussions are very different from the modern ones. Thus, the modern interest in consciousness and self-consciousness relates to medieval interest

in perception, conceptual representation, attention, and self-knowledge. The phenomenality of conscious thought was not directly addressed. The medieval theories of self-cognition distinguish between knowledge of the essence of the soul and the acts of the soul. For the former, opinions varied so that the Platonic thinkers often affirmed that the essence of the soul can be directly perceived while the Aristotelians claimed that such perception is indirect. Knowledge of the existence of one's own soul was often given as an example of a certainty. Medieval authors generally agreed that acts of one's own soul can be self-consciously perceived, but opinions differed in respect to how such self-conscious thought is structured and whether all mental acts are actually perceived, or whether all thought is self-conscious.

Conceptual Changes

As a technical philosophical term, “consciousness” and its cognates in other languages became important only in modern philosophy. It has been claimed that the concept was unknown in Ancient Greek philosophy. For medieval philosophy, such a straightforward claim would be obviously misleading. The phenomena related to the concept in modern philosophy were intensively studied during the Middle Ages, though with somewhat different conceptual schemes. Medieval authors discussed issues that nowadays are associated to consciousness in distinct contexts and in settings very different from the modern ones.

Contrary to what has sometimes been claimed, the Latin term *conscientia* was used in Classical Latin in a meaning close to modern English “consciousness.” Augustine, for example, claims (*De trin.* 13.1.3) that he has most certain knowledge of the faith he has in his heart through *conscientia*. Such usage of the word continued to the Middle Ages, but the word did not gain any central position in philosophical discussions before the modern era. More relevant medieval terms include, for example, *cognitio reflexiva*, *notitia sui*, *cognitio intuitiva*, *intentio*, and *representatio*.

Historically, medieval discussions of philosophical topics related to consciousness can be traced back to the Neoplatonic–Stoic tradition, to which Aristotelian elements were incorporated. This tradition was taken over by Arabic thinkers like Ibn Sīnā (Avicenna) and Ibn Rushd (Averroes). Both had major influence on medieval Latin discussions. Also certain Ancient Roman thinkers like Augustine were important for the developments among Latin authors.

Phenomenality and Intentionality

Phenomenality as such, or the qualitative aspect of conscious experience, does not seem to play any significant role in medieval discussions of conscious experiences. It seems that medieval thinkers typically did not think that there would be any special private dimension in conscious experience. Rather, their view was that we normally experience the world as it is, and thus share phenomenally the same experience when perceiving the same object. Thus, in perceiving a white object, the species of whiteness informs the mind of any perceiver in the same qualitative way, and exact description of how the form informs the mind raised much interest. The viewpoint was not, however, subjective in the modern sense, and it did not become a topic of philosophical dispute whether there is a special “what is it like for a person to be perceiving whiteness.”

There were, however, elaborate discussions concerning how we experience our mental acts as our own. Do the phenomenal characteristics of mental acts include experiencing the acts as personally one’s own? Do we have consciousness of the unity of the mind? Can the so-called Averroist view that we all share the same intellect be refuted simply through reference to experiential consciousness? These questions did not receive unanimous answers. Generally, medieval authors thought that intellectual understanding is experienced as individually one’s own, although that experience may not reveal an incorporeal soul. Also, although most Latin authors thought that the sensory soul and the intellectual soul are distinct, even metaphysically distinct, it was

mostly thought that the subject of sensory perception was experienced to be the same as that of intellectual cognition. The discussion seems to be connected to Avicenna’s insight that the subject of visual perception and the subject of the resulting emotion are experienced to be the same.

Consciousness is about some object. Such intentionality of consciousness has been one of the main obstacles in twentieth-century projects of naturalizing consciousness. Medieval discussions recognized the intentionality, and aimed at explicating what exactly is it that serves as the object of consciousness, and what the presence of the object to the mind in consciousness amounts to. Representational theories gained little following, while the main thrust was toward direct realism, where the object of consciousness is typically an external real thing that somehow gains presence in thought.

Knowledge of the Essence of the Soul

It was a commonplace in medieval philosophy that no one can be in doubt about the existence of one’s own soul. For example, Matthew of Aquasparta refers to Augustine’s *The City of God* (XI, 26) as having given the final refutation of the radical skeptical position by pointing out the certain knowledge of one’s own existence. There was, however, a widespread opinion about exactly how such self-knowledge is grounded and what it contains. Can one have direct self-consciousness in the sense of experiencing oneself as a mental subject, or is such knowledge mediated through experiences of mental acts so that the subject of the acts is not as such a possible object of consciousness? If the soul itself can be experienced, does this experience yield knowledge of the incorporeality of the soul or its separability from the body?

Before Aristotelian thought gained importance in the thirteenth-century universities, Latin authors followed the Neoplatonic tradition and affirmed that it is possible to turn intellectually inward to one’s mental self. According to an Augustinian argument that was often quoted in the Latin Middle Ages, the soul’s incorporeality

can be directly grasped in the immediate awareness of oneself that is unlike any awareness of anything corporeal. Also, Avicenna's "floating man" thought experiment was well known among the Latin thinkers. In this thought experiment, one is to imagine oneself as being created as if floating in air without any sensory experiences. As Avicenna claims, the thought experiment shows how one can know one's own existence without any knowledge of the body, and that therefore one should conceive of oneself as an incorporeal soul. Franciscan thinkers developed the epistemological aspects of this Augustinian–Avicennian understanding of the structure of self-consciousness.

Aristotelian thinkers like Thomas Aquinas claimed that the essence of the soul cannot be directly experienced, and even knowledge of the existence of one's own soul comes through experiencing the acts of the soul. Knowledge of the incorporeality of the soul comes through scientific study rather than direct experience. Some other thinkers followed Averroes' interpretation of the Aristotelian position, which implied an even stronger denial of direct self-consciousness.

Knowledge of the Acts of the Soul

It was generally agreed in the Middle Ages that we perceive the acts of our own soul. When seeing a stone, say, we normally perceive the seeing and not only the stone. There were, however, disagreements concerning how this second-order perception ought to be understood and whether it is separable from the first-order seeing. Already Augustine recognized the implicit infinite regress resulting from perceiving the act by which one perceives one's own perceptual act, and welcomed it as showing even to the skeptics that we know not just something but an infinity of things, but the medieval authors did not take the infinite regress as a refutation of a theory involving second-order mental acts. William Ockham, for example, remarks that infinity is beyond human capacities. One perhaps can have a third-order perception of the perception that one sees, but

further levels of perception may be beyond the reach of the human mind.

Medieval authors often took up as a separate question whether habits or dispositions of the soul can be directly perceived. Normally, the answer is that they are perceived through acts of the soul.

As a part of his theory of intuitive cognition, John Duns Scotus took the view that we have indubitable knowledge of our own mental acts, because we perceive them directly and immediately. In his own theory, William Ockham made it clear that we perceive our own mental acts by second-order acts – that there are no literally reflexive acts which would not be directed at objects. These second-order acts are reflexive in the looser sense that they have first-order acts as their objects, thus yielding intuitive, certain knowledge of one's own mental acts.

Walter Chatton criticized Ockham's theory and claimed that all perceptual acts are experienced already through their presence in the soul. No second-order act would thus be needed for the first-order act to be experienced. Ockham, and his disciple Adam Wodeham, answered by making it clear that nothing can be experienced without a mental act taking it as an object, and interestingly pointed out that not all mental acts are conscious. Thus, if one sees a stone on a narrow path (and does not stumble on it), one notices and knows that one sees the stone only if one has a second-order act directed at the first-order perception of the stone. Thus, one must recognize the class of mental acts that remain nonconscious. Wodeham even presents the interesting case of a person thinking that he does not think. Otherwise, the examples found in the discussion are parallel to examples used in twentieth-century philosophy like stopping at red lights without noticing that one has seen any traffic lights.

Consequences, Theory of

Tuomo Aho

Department of Philosophy, University of
Helsinki, Helsinki, Finland

Abstract

The theory of consequence is a branch of logic that studies dependence relations between propositions as a separate subject. Thus it is, in a way, more general than syllogistics. It rests on old foundations but, as a distinct field, it was born around 1300. Its most creative phase was 1320–1340 (Burley 1955, Ockham 1974, Buridan 1976), but it was elaborated afterward and possessed an established place in the logic books. A “consequence” from antecedent(s) to a consequent is probably best regarded as a

valid inference. According to its standard definition, a consequence holds when the antecedent is incompatible with the opposite of the consequent. Logicians sought general rules for such relations. Some rules were “proof-theoretical,” that is, one consequence follows from others; some rules concerned the validity of a single inference type. A lot of theorems of propositional logic were proved in this connection, and modal qualifications were soon added. A large part of the discussion was about various distinctions of consequences. They could be *ut nunc* (under present conditions) or, simply, without temporal qualifications. Simple consequences were either formal or material. Roughly, the earlier writers (Burley, Ockham) declare that formal consequences are valid because of the meanings of terms, but Buridan defines formal validity in the manner of modern logic, as the validity of all instances of the same logical form. This initiative was criticized, but finally many logicians utilized both definitions, one amounting to analyticity, the other to logical validity.

History

The theory of consequence (*consequentia*) was a field of logic investigating how something follows (*sequor*) from something. “Consequence” was a broad notion that could be applied even to mean just inclusion between terms, but in logical theory it usually denoted the relation of entailment between propositions. This is obviously a crucial issue for logic, and both the Aristotelian syllogistics and the Stoic propositional logic provided backgrounds for the medieval development. The Latin term *consequentia* comes from Boethius, who was aware of both of these traditions and studied propositional inferences among “hypothetical syllogisms.”

A consequence consists of component propositions, the *antecedent* and the *consequent*, and some element marks them as so conjoined that the latter follows from the former. A modern reader will immediately ask what kind of relation is meant with this “following”: is the consequence

a conditional sentence, or an entailment, or an inference? But this question has proved extremely complicated, and perhaps no full answer is available, since the medieval classifications were not the same as ours and the authors differed in their opinions. Scholars have often emphasized the nature of medieval consequences as conditionals (if p , then q); indeed, this is how medieval logicians often express their *consequentiae*, and hence they have been read as complex propositions. More recently a different interpretation has gained ground: at least in the best era of consequence theory, consequences seem to function like inferences (p ; thus q). Note, for example, that an acceptable consequence is most often called, not true, but “good” (*bona*), or such a consequence “holds” (*tenet, valet*). And the study of consequences appears in its own place in treatises, separate from hypothetical propositions. Its nature was inferential, though even the close logical connection between conditionals and inferences was well known at least in the fourteenth century. However, consequential inferences could be expressed as conditionals if the conditional was to be read as “metalinguistic”: “if p is asserted, it is correct to assert q .” (Buridan’s preferred view seems to be like this.)

For simplicity, let us first give a rough outline of the external historical development and only then go to substantial matters.

After Boethius, the word *consequentia* was frequently used as a common name, though without further theoretical import. Closer inquiry began in the early twelfth century, when the *Dialectica* of Garlandus classified consequences according to the truth values of their propositions; he also stated explicitly the leading principle that no consequence with a true antecedent and a false consequent can be true. (He discussed these questions in the context of hypothetical propositions.) Abelard then made relations of consequence and inference a central subject in his *Dialectica*. There the theory had already achieved considerable philosophical sophistication. Abelard’s findings were radical, since he was clearly aware of the special logical character of necessary consequence and excluded all relations that were less binding.

Consequences did not figure as a distinct subject in the foremost textbooks of the thirteenth century, though they were applied and commented upon in some chapters; apparently the theme was well known. The definite genre of consequence theory was born after that. Its source is somewhat enigmatic; it has often been assumed that it originates from topics, but there is hardly any concrete evidence concerning possible links to the thirteenth-century topical literature. Anyway, the investigation of consequences by themselves began around 1300, and a few short treatises *De consequentiis* from that time have survived. The purpose of the emerging theory was to discuss especially consequence relations and to express their features in as general form as possible. The initiative clearly gained immediate response, since consequences were soon an established branch of logical inquiry. Its most creative period was perhaps 1320–1340, when three leading philosophers wrote, arguably, the most important contributions to it: Walter Burley’s *De puritate artis logicae* (two treatises); William Ockham’s *Summa logicae*, Part III-3; and John Buridan’s *Tractatus de consequentiis*.

After the central issues had thus been declared, the development of the theory caused some interesting philosophical debates. Broadly speaking, the English interpretation differed from that of Buridan’s continental followers (the “Parisian school”). The later fourteenth century achieved also considerable technical elaboration in the study of consequences, and the results of this process found their place in textbooks (e.g., in the influential books of Ralph Strode and Paul of Venice). The commenting and qualifying discussion continued during the whole fifteenth century, mainly in Italy. The last contributions were after 1500; then the authors were mainly interested in counterexamples and special cases.

Rules

It is hardly possible to find any clear and universal definition of consequence. In fact, the medieval authors seem to presuppose the notion of “following” as fundamental, as it well may be. But all of

them seem to assume that there is some modal element: if the antecedent of a valid consequence is true, the consequent cannot be false. Among other things, this means that consequence is quite different from our material implication. It must not be simply identified with the modern strict implication either. (Notice, moreover, that only correct inferences were usually called consequences, though it was admitted that the term could also have a wider sense.)

During the heyday of consequence theory, a special problem arose concerning the existence of the components of a consequence. Since the medieval practice was to regard propositions as concrete linguistic acts, truth and falsehood could only belong to actual propositions, and a consequence could hold only if its two components were simultaneously present. This trouble was avoided with a counterfactual assumption: if the two components were formed simultaneously, then the required relationships would occur. Yet, there are problems: in Buridan's example "No proposition is negative, therefore no donkey is running," the antecedent would obviously be false when asserted, and the consequence would become correct, though it is surely incorrect. The strategy recommended by Buridan is to say that, in a correct consequence, things cannot be as the antecedent signifies, without being as the consequent signifies: a semantical interpretation by means of a step from propositions to states of affairs. But especially conjoined with self-reference, the condition of the existence of propositions was a source of numerous problems.

It is remarkable that consequence theory can consider even relations between unanalyzed propositions, without entering the structure of subjects and predicates. In this respect it resembles propositional logic and is simpler than the Aristotelian syllogistics. Burley states, indeed, that propositional consequence rules must be utilized in all logic, and he places consequence theory before syllogistics, because syllogisms are just a species of consequences. Most writers do not say this equally explicitly, though they often proceed in the same order. And even in Burley's case, it would be quite mistaken to claim that he builds predicate logic upon propositional logic in the

modern sense. (Note, however, that from the case of syllogisms it is easy to see that the antecedent can include several propositions.)

The theory of consequences aimed at finding some universal rules about consequence relations. What were, then, these laws? Let us designate the relation with \rightarrow . Interestingly, a number of rules were about relations between different consequences, about proper steps from one consequence to another. (This is one context where it is best to regard the consequences as inferences and to think that the rules are about the universal validity of some inference forms.) These rules have therefore been occasionally called "proof-theoretical." In other words, such rules concerned the conduct of inference. One such universal rule was if $P \rightarrow Q$ and $Q \rightarrow R$, then $P \rightarrow R$. (This can be generalized to what is now known as the "cut rule.") Another central rule was that of contraposition: if $P \rightarrow Q$, then $\neg Q \rightarrow \neg P$. These two recur constantly in the texts. Burley, Ockham, and Buridan did not mention the fundamental modus ponens and modus tollens among consequence rules, but later, for instance, Strode began his exposition by stating these two with perfect elegance.

A different type of rules simply declared that a certain single inference form was universally valid. For instance, the consequence from "All S are P" to the particular "Some S is P" was valid, because the universal proposition had existential import, according to the medieval conception. Likewise, many consequences were considered valid because of the connection between "superior" and "inferior." For example, the consequence from "Every animal is running" to "Every man is running" is valid, since the subject term in the antecedent is superior to the subject term of the consequent. The study of such relations is connected to the semantical doctrine of suppositions of terms. No authors attempted to list an exhaustive array of present-day propositional tautologies as consequential rules, but a few basic principles occurred in this function. Thus, Burley already proved De Morgan's laws as consequence rules. He presents them as immediate corollaries of his rule: "The formal element that is affirmed in one contradictory must be denied in the other."

Therefore, if $\neg(P \ \& \ Q)$ and P , then $\neg Q$, that is, if $\neg(P \ \& \ Q)$ then $\neg P \vee \neg Q$. Such absolutely elementary tautologies of propositional logic as $P \ \& \ Q \rightarrow P$, $P \rightarrow P \vee Q$ do not appear among consequence rules; instead, there are rules about inference from conjunctive to simple terms and from simple to disjunctive terms.

Authors who wrote comprehensively about consequences had obviously systematic purposes, which they expressed by first laying down primary rules and then proving derived rules, which were occasionally even called theorems. The proofs could be long and detailed. However, the process did not amount to a calculus in any modern sense, since the principles of derivation were not spelled out beforehand. They were chosen case by case. Consequence treatises also listed examples of erroneous consequence rules: rules that resembled correct rules but produced fallacies.

During the fourteenth century, consequence theory was enriched with modal considerations. An increasing space was given to consequences with necessary or possible antecedents. To take the most elementary example, when the antecedent is necessary, the consequent is necessary too. At the same time the correct formulation of modal syllogisms was debated, and modal consequences reflect similar issues. The final addition was that of epistemic operators. Strode already gave a set of rules for consequences concerning knowledge, doubt, and understanding, and fifteenth-century authors then added more attitude operators, like belief. The various modal qualifications multiplied the number of given rules.

The first theorists said that the consequence holds because the negation (or “opposite”) of the consequent is repugnant to the antecedent. The “repugnance” was then explained with a modal condition about the necessary relation. The nature of this necessity disturbed logicians somewhat, and they referred to current modal theories. After the birth of possible-worlds semantics, Buridan offered one particularly interesting principle: if one proposition can have more causes of truth, that is, verifying states of affairs, than another, but not conversely, the former follows from the latter.

Philosophical Interpretation

The most interesting part of consequence theory for present-day readers is perhaps the discussion about various kinds of consequence. Logicians always gave much attention to such distinctions of types. Usually the first distinction was drawn between consequences *ut nunc* (“as-of-now”) and *simpliciter*. It stems from Boethius, but its precise meaning caused confusion.

A consequence $P \rightarrow Q$ held simply if it was valid always without temporal qualifications and as-of-now if P and the opposite of Q were incompatible only now, or alternatively, for a certain period. The consequence is thus valid *ut nunc* if the antecedent cannot now be true without the consequent, under the present conditions. Simple consequences were studied more, and they are more important than the temporally determined ones, but modern scholars have shown great interest in consequence *ut nunc*. The reason is that, as formulated for instance by Ockham, it reminds of the modern truth-functional material implication. Yet it is probable that even consequence *ut nunc* is essentially modal. Mere truth of the consequent does not suffice to make the consequence valid, but something more is required, since some propositions that are now true could, under present conditions, be false. Examples of this depend on modal theories, but at least propositions about future contingents as consequents can lead to such situations – the temporal import of “now” must be taken seriously. Keeping strictly to one single moment, the outcome can amount to material implication. During the fifteenth century, the role of *ut nunc* declined.

On the other hand, another issue kept its full importance, that is, the question about formality and materiality. This is founded on the conviction that even valid consequences can be valid for different reasons, some for more remarkable reasons than others. Let us consider the basic definition that the antecedent and the opposite of the consequent are repugnant or incompatible. What can be the explanation of such repugnance? Obviously, it often results from the contents of the propositions in question: the natures or essences of the mentioned things are such that the

antecedent and the opposite of the consequent are in conflict. This was noted by the thirteenth-century logicians who said, like Kilwardby, that this consequence was “natural.” But there existed even other cases where the repugnance was undeniable but had nothing to do with the contents of the propositions, with the natures of things, and here they spoke about accidental consequence.

We see the meaning of this distinction when we look at the doctrine of Burley which preserves basically the same scheme. For him, a consequence holds naturally when the antecedent “includes” the consequent, whereas the consequence “a man is a donkey, thus you are sitting” is only accidental because it involves no internal connection between the propositions. Attempting to get further, he introduced the notions of formal and material consequence, which were to become generally used. According to him, consequences are formal, when they depend either on logical theorems or on formal relations of inclusion between terms; otherwise they are material. This implies that “a man is a donkey, thus you are sitting” would be only material, but so would the consequence “Socrates is sitting, thus Socrates is not running” be as well. The incompatibility of man and donkey, sitting and running, are no formal conceptual features. Burley is possibly utilizing the Scotistic doctrine of formalities, but his presentation is rather vague.

Later, authors used and explicated the distinction between formal and material in very different ways. Ockham’s characteristic idea is to claim that consequences are valid because of “mediums,” which are either “external” general logical rules or some “intrinsic” principles which are more like additional premises and true because of the meanings of the terms in the propositions. Both cases can produce formal consequences: “Socrates is sitting, thus Socrates is not running” is formal for him, and so are syllogisms as well. On the other hand, at least “a man is a donkey, thus there is no God” is a material consequence. The reason is that the external rule guaranteeing its validity becomes applicable only because of the repugnant particular terms “man” and “donkey.” Ockham hints toward the notion of logical form, but his text is here very brief.

The idea of logical form was then fully developed in Buridan’s logic. According to him, the form of a proposition consists of its structure of syncategorematic elements plus the distribution of categorematic elements. And as he defines it, “a consequence is formal if any proposition with similar form would, when stated, be valid.” This means that formally valid consequences hold merely because of the logical forms of the propositions and do not depend on what the categorematic elements are. A consequence is formally valid if all its substitution instances are valid. The same definition is encountered in modern logic. Formal consequences are sheer instances of strict logical theorems, whereas material consequences are valid because they could be completed to formal ones by adding necessary propositions as supplementary premises. (Hence, Buridan called them enthymematic, and his pupils called them imperfect.) “A man runs, thus an animal runs” is not formal, since the substitution instance “A horse walks, thus a wood walks” is not valid, but it is materially valid since the addition of “Every man is an animal” leads to a formal consequence.

Buridan’s conception is a remarkable achievement in the history of formal logic. Some followers embraced it, such as Pseudo-Scotus in his famous logic commentary, Marsilius of Inghen, and Albert of Saxony. But it did not win general acceptance; on the contrary, critics argued that it did not capture the point of logical consequence, which was in entailment by conceptual inclusion. Actually, it became customary to see the formality of consequences as a matter of inclusion relations (analyticity). It has been argued that such an interpretation of consequence is psychologistic, but this is not necessary. Apparently the important writers were not mainly interested in psychology but in the contents of conceptual forms; that is why they called the corresponding consequences formal. Expressly psychologistic positions developed only toward the end of the fifteenth century.

Gradually, a number of logicians understood that the two criteria concerned different things, two senses of formality. For example, Paul of Venice explains that a consequence is formal if the contradictory of the consequent is formally

incompatible with the antecedent (but his account of this formal incompatibility is not quite clear). On the other hand, a consequence is valid *de forma* if every consequence of the same logical form is valid. This distinction led to somewhat awkward labels like “formally formal,” that is, formal in both senses. The double characterization was elaborated during the fifteenth century by several logicians, such as Paul of Pergula.

One final point must be mentioned. The basic definition of consequence immediately implies that anything follows from an impossible antecedent (*ex impossibili quodlibet*), and equivalently, the necessary follows from everything. These are the “paradoxes of implication.” Abelard pointed them out and regarded them as so intolerable that he rejected the standard definition of consequence. But in the ensuing debate, the opinion of the “Parvipontani” who supported them came to prevail. In later literature these rules were normally accepted and sometimes even definitely defended. For most authors, they were basic examples of material consequences. This conviction faltered only in the psychologistic wave near 1500.

Contemplative Happiness and Civic Virtue

Iacopo Costa
Paris, France

Abstract

According to medieval anthropology, man can reach his perfection through both moral virtue and contemplative life. This conception is developed in medieval commentaries on Aristotle's *Nicomachean Ethics*, in theological texts concerning the after-life and the beatific vision, and in texts concerning the secular-mendicant controversy.

Human perfection is a central concept in medieval anthropology. Like any other being, animate or inanimate, man is what he is thanks to a form. This form expresses the essence of the human being and realizes its fundamental characteristics. According to a tradition that goes back to late Antiquity, man is conceived as a two-sided

creature: he is a creature both material and spiritual, since he is composed of a body and a soul. As a spiritual creature, man is the less noble of all spiritual beings, inferior to God and the angels; as a material creature, man is the noblest of all material beings, superior to the inanimate things and to the irrational animals. As a corporeal creature, man has to dominate the passionate and irrational part of his mind; to achieve this, he needs to master moral and political virtues. As a spiritual creature, man has to try to improve the intellectual part of his mind through contemplation and philosophy. This conception stems from elements borrowed from Plato, Neoplatonism, and Augustine, and achieves its fullest development in commentaries on Aristotle's *Nicomachean Ethics* (first complete Latin translation a few years before 1250).

According to Aristotle, one can consider human life from two points of view. In so far as man is a social animal, he leads a political or active life, which requires him to exercise such moral virtues as justice, temperance, courage, liberality, etc. Nevertheless, absolutely speaking, the noblest activity of man is contemplation, realized through the use of intellectual virtues: leading the philosophical life improves the best part of the human being, the intellect, and brings him the purest and most complete form of happiness.

In their ethical writings, medieval thinkers examine the problematical question of the relation between active life and contemplative life, or in other words between the moral virtues and philosophical speculation.

The usual position taken on this problem, which accords with the views of Albert the Great and Thomas Aquinas, asserts that the active life is inferior to the contemplative, but that an active life prepares and eases the way to achieve the contemplative life. This position is frequently referred to with a saying quoted from Aristotle, *Phys.* VII: *in quiescendo namque et sedendo anima sciens fit et prudens*. The proper activity of the rational part of the soul, that is, contemplation and philosophy, is difficult if the passions of the irrational part of the soul (such as anger, desire, etc.) are not submissive to the rational part, and are not led by the right

rule (*orthos logos* – *recta ratio*) of the moral virtues.

But since the means is always inferior to the end, a contemplative life is always superior to an active life: for contemplation is an end that is self-defined.

Such is the view expressed for instance by Albert the Great (*Super Ethica* X, lect. 10–19; *Ethica* X, tract. II) and by Thomas of Aquinas (*Sent. lib. Eth.* X, 9–16; *Summa theologiae*, IIa IIae, qu. 179–182); it is also defended by the masters of arts, for instance in the *Nicomachen Ethics* commentaries of Giles of Rome (preserved in manuscript BnF lat. 16089) and Radulphus Brito.

During the thirteenth and fourteenth centuries, an effort was made to assimilate this Aristotelian conception to Christian morals and anthropology. This resulted in several problems, which emerged in particular in the years preceding and following the Parisian condemnations of 1270 and 1277. Christian doctrine and anthropology consider that the purpose of our terrestrial life is merely to lead to the after-life; only in this after-life can mankind achieve its own perfection. According to this Christian conception, our life on earth is an imperfect one, in which the body and sin hold back the human being from perfection and happiness. In contrast with this conception, the Aristotelian conception does not postulate that the soul survives the body and hence does not take into account any form of after-life: according to this conception, man can attain perfection only in this life. The condemnation issued in 1277 is in part a reaction against this Aristotelian conception of human perfection: see especially proposition 157 (*Quod homo ordinatus quantum ad intellectum et affectum, sicut potest sufficienter esse per uirtutes intellectuales et alias morales de quibus loquitur philosophus in ethicis, est sufficienter dispositus ad felicitatem eternam*) and 176 (*Quod felicitas habetur in ista vita et non in alia*).

Although this problem is still being discussed, it can be stated that these propositions, expressed in such a plain manner, are nowhere to be found in the texts of the period that are known today. Still, they may be related to the ideas defended by

Boethius of Dacia in his famous *De summo bono* (a brief work in which the author praises the contemplative life and philosophy); they also may have been maintained in one or several commentaries on the *Nicomachean Ethics* that have since been lost. But the only extant commentary on the *Ethics*, which could possibly precede the condemnations (namely the *questiones* contained in MS Paris BnF lat. 14689, tentatively attributed to the Parisian master James of Douai) is far from defending such radical views; furthermore, the date of this commentary is very uncertain.

In the theological texts, the contemplative life is held superior to the active life on the basis of evangelical authority, Luke, 10, 41–42: *Martha Martha sollicita es et turbaris erga plurima, porro unum est necessarium; Maria optimam partem elegit quae non auferetur ab ea*. The canonical interpretation of this passage identifies Martha with the active life, and Mary with the contemplative. The *Glossa ordinaria* explains that the “best part,” chosen by Mary, shall not be taken back from her, since the contemplative life starts in this life but proceeds in the after-life; on the other hand, the active life, represented by Martha, ends with the death of the body. Mary is therefore praised by the Lord in so far as she has privileged the contemplative life.

During the second part of the thirteenth century, the confrontation between the active and contemplative lives became the object of numerous discussions in the context of the dispute between seculars (*praelati*) and mendicants (*religiosi*): seculars typically led an active life, while mendicants typically led a contemplative life.

In this debate, Henry of Ghent defended the idea that contemplation in its perfect state, that is the metaphysical contemplation of the blessed, is superior to action but that in this earthly life the good works of an active life are superior to contemplation (which at this point is necessarily imperfect), since meritorious acts contribute to the salvation of the soul and, thus, they produce the contemplation of the after-life.

Opposing Henry, Godfrey of Fontaines maintained that the debate over the type of life must be separated from the dispute between

seculars and mendicants: according to Godfrey, the *praelatus* must devote himself to contemplation as much as he can, and devote himself to the works of the active life only when the community he is in charge of needs it (*Quodl.* V, qu. 16; *Quodl.* XI, qu. 6; *Quodl.* XII, qu. 19–20).

Corporation Theory

Magnus J. Ryan

Faculty of History, University of Cambridge,
Cambridge, UK

Abstract

Detailed medieval discussion of corporations began in the late twelfth century among the glossators of canon and Roman law. Although the concept of the corporation was later adopted, modified, challenged, and developed both by theologians and specialists in Aristotelian philosophy in the faculties of arts, it remained quintessentially a legal idea of fundamental importance in later medieval political debate. Canonists in particular were

confronted by practical difficulties arising from collegiate churches. Corporation theory designed to make sense of such institutions, and the law governing them was then applied by advocates of conciliar government to the relationship between the pope and the universal church and was integral to the juristic analysis of other communities such as kingdoms and cities.

Roman law provided the technical starting point in the shape of the *universitas*, traditionally translated as “corporation.” The classical lawyers’ principal interest had been the procedural status of collectivities such as municipalities, particularly how such a collectivity could initiate or react to a legal challenge. In the course of their discussions, the classical jurists raised or implied a number of further questions, which would play a vital role in medieval jurisprudence and political theory. Undoubtedly, their most important legacy was contained under the rubric of *Digest* 3.4: (*Actions in the Name of Any Corporate Body*, or *Quod cuiusque universitatis nomine vel contra eam agatur*, in the *Littera Boloniensis* or vulgate version of the *Corpus iuris civilis* in use at the medieval schools). Corporations were not willingly recognized by Roman law (D. 3.4.1pr). Tax farmers, exploiters of mines and salt marshes, and providers of public services such as Roman bakers or Tiber sailors were all organizations that were “permitted to have a *corpus*.” However, the *Digest* also contained passages where things in public ownership were said to belong to a corporation (D. 1.8.1pr) and where the corporation was closely associated with the *res publica* in the sense of a city or municipality (D. 1.8.6.1; D. 3.4.1.1; D. 3.4.2). This capacity of the *universitas* to express a collectivity of public significance was greatly exploited and extended by medieval jurists in their glosses and commentaries on Roman law. The most dramatic example of this was the attribution of corporate powers to the entire Roman people by Johannes Bassianus, who taught at Bologna and Mantua in the late twelfth century. The immediate context was an exegete’s problem: Roman law seemed to ascribe sole legislative

powers to the emperor (*Code*, 1.14.12) at the same time as maintaining that the Senate could also make law (D. 1.3.9). Bassianus’ solution, which became famous thanks to its adoption by his pupil Azo (d. 1220/1229), was that the emperor was the only person who could legislate on his own and was in that sense superior to his subjects as long as the latter were understood as discrete individuals (*singuli*); however, taken collectively as members of a corporation (*universi*), the Romans still had the power to legislate. Since Roman law located the origins of imperial authority in a concession of governmental powers by the Roman people known to the compilers of the *Corpus iuris* as the *Lex regia*, then perhaps by corporate action that original act could also be revoked. The canonist Laurentius Hispanus (d. 1248) assumed this in pointing out that the emperor could be deposed because he received his jurisdiction from the people, whereas the pope could not be deposed by the college of cardinals because he held his authority by the word of the Lord. The contrast between the corporate and the single or private on which Bassianus’ distinction turns was reflected in the way the glossators of the Roman law handled a closely related question. They argued that the consent of private individuals could not establish someone as a judge; jurisdiction in the sense of forensic authority could only be created by a corporate act of consent (C. 3.13.3). The first statement was derived directly from the law itself, but the second was purely glossatorial and testifies to the willingness of the medieval jurists to deploy corporate notions. Accursius (d. 1263), the author of the standard gloss to the Roman law, went on to stress that such a judge received jurisdiction purely through his election by the corporation, although it remained true that if he wished to use that jurisdiction, he would still require the approval of a superior officer. For the jurists who followed Accursius, especially in the early fourteenth century, much would depend on the consequences if approval by a superior were not forthcoming. The contemporary political background against which many of these ideas were first ventilated was after all that of northern and central Italy, where autonomous cities routinely

defied, ignored, or usurped imperial authority both to legislate on their own and to pass coercive judgment over their own citizens.

In entering his proviso about the actual exercise rather than the mere possession of jurisdiction mentioned above, Accursius cited two further passages in Roman law (Novel 15pr and § 1), but it is hard to believe he was not at the same time thinking of another set of authorities and problems entirely. For although the technically juristic vocabulary of corporation theory was ultimately derived from the Roman law, it was not in fact the glossators of Roman law who made the most of it, at least in the twelfth and thirteenth centuries, but the canonists. The archetypal structure within the institutional church was the collegiate church, which by the later twelfth century was almost everywhere composed of the bishop and his chapter. In an earlier tradition, represented in Gratian's *Decretum*, the bishop was not merely the spouse of his church but also its representative, such that the bishop was said to be in his church and the church in its bishop (C. 7 q. 1 c. 9). But the nuances and complexities identified by Gratian himself, together with the burgeoning commentary both on this foundational text and subsequent papal letters or "decretals," rendered such a summary wholly inadequate. As a result of intensive legal scholarship, papal legislation, and yet more legal reflection on this new papal law, the bishop emerged by the early to mid-thirteenth century as the recipient of a legally articulated and tightly regulated delegation by his chapter. In his commentary on the Decretals of Gregory IX, the future Pope Innocent IV (*reg.* 1243–1254) argued that rectors chosen by corporations held jurisdiction, not the corporations themselves. Innocent's attribution of jurisdiction to the head rather than to the members of a corporation was primarily an intervention in the vexed question of bishop and chapter. Bishops were supposed to be elected by their chapters, but they were not supposed to take up the full active governance of their diocese until confirmation, consecration, and installation by their ecclesiastical superior, who in most cases would be a metropolitan or the pope himself. In the meantime, the chapter disposed of some powers of governance.

Thirteenth-century canonists were compelled by the exigencies of daily life to resolve the problem of where different authorities lay in an ecclesiastical corporation composed of head and members, bishop, and chapter. This question arose in its sharpest form during an episcopal vacancy but had continued relevance in a variety of other situations besides. Could a bishop bind his church without obtaining the consent of the canons, for example, and if so, on what business? Innocent IV's answer that the jurisdiction of an ecclesiastical corporation was concentrated in its head implied extensive powers for the bishop, but his was only a minority opinion. Moreover, it did not sit easily with other comments by the same jurist to the effect that jurisdiction was transferred to the chapter at the bishop's death and that voluntary alienations of ecclesiastical property were invalid without the consent of the chapter. Commentators on Gratian's *Decretum* ("decretists") had recognized from the mid-twelfth century that the goods of a church were not owned by its bishop, but by the church itself, understood either as the clergy of the diocese or even the congregation of believers subject to that church. This basic truth could not be ignored when, say, alienation of ecclesiastical goods was discussed, and explains why even Innocent IV was unable to present an entirely consistent picture of relations between bishop and chapter.

Innocent's pupil Henricus de Segusio (d. 1271), known by his later cardinal's title as Hostiensis, adopted a distinction originally put forward by the author of the standard gloss to the Decretals of Gregory IX, Bernardus Parmensis (d. 1266). Bernardus had differentiated between rights belonging solely to the chapter, those belonging solely to the bishop, and those held by bishop and chapter together. The results in Hostiensis' more thorough treatment of the problem were complicated by the different capacities in which a bishop interacted with his chapter. When the matter at issue concerned only the rights of the chapter, he voted simply as a canon; when the business affected everyone, he sat as prelate over the canons; when it pertained to him alone he not merely sat as prelate but could even act against the advice and wishes of the canons. The principle

was clearly established that where the matter touched everyone, the bishop had to consult his chapter. Hostiensis characterized the role of the bishop as that of a general proctor (*procurator generalis*) of his chapter, able to conduct administrative and judicial business simply on the strength of the ordinary jurisdiction bestowed on him at election, with no need for further mandate or commission on a case-by-case basis. When Hostiensis declared that the corporation made the ordinary judge (*iudex ordinarius*) by electing him, he was not just reflecting comparable ideas among the Roman lawyers, even though election by a corporation played a prominent role in their analysis of ordinary jurisdiction. Rather, he confirmed and stabilized a tradition of canonist scholarship, which went back at least a generation to the works of Tancred (d. 1236) and Laurentius, both of whom had specified that a collectivity conferred ordinary jurisdiction by electing its own lord or prelate. By combining the various comments of his predecessors into a systematic whole, Hostiensis provided the first fully articulated explanation of the ecclesiastical corporation. From then on, the majority opinion among canonists was that a bishop's jurisdiction came from the corporation that elected him, not from the subsequent ceremony in which he was raised to the higher sacramental rank of bishop. Otto von Guericke's famous criticism that canonist corporation theory opened the way to authoritarianism failed to take account of this by focusing on the metaphysical principle of unity of a corporation – never a canonist interest – rather than the legal source of jurisdiction within a corporation.

The distinction between the powers the prelates enjoyed by ordination, and the powers conferred on them by the corporate act of election, familiar to canonists since the twelfth century, assumed amplified importance in the first years of the fourteenth century when it was applied to the pope by the Dominican friar John of Paris (d. 1306) in his treatise *On Royal and Papal Power* (*De potestate regia ac papali*). This analysis owed most of its key elements to the canonists' meditations on the relationship between bishop and chapter and provided the main outlines of a conciliar theory, over a century

before the Council of Constance met to end the Great Schism. As we have seen, canonists since the twelfth century had been in no doubt that prelates were not the owners of the property of their churches. In conformity with this tradition, John characterized the prelate as an administrator or steward of ecclesiastical property; he took the tradition an important step further by asserting this of the pope, who thus became the general administrator rather than the owner of the universal church's property. Thirteenth-century canonists had also left important indications and hints about the relationship between pope and cardinals. Hostiensis had tried to provide a more structured, synthetic explanation, according to which the papal plenitude of power devolved on the cardinals during a papal vacancy. Under normal circumstances, Hostiensis argued the cardinals shared in the pope's fullness of power as parts of his body; the image was owed to Roman law, which presented the senators as parts of the emperor's body (C. 9.8.5pr), but the substance of the idea was more an extrapolation from the relationship between bishop and chapter at the diocesan level as Hostiensis and his canonist predecessors had construed it. Hostiensis went even further by hypothesizing that should the college of cardinals be wiped out during a papal vacancy, then their authority would devolve to the Roman clergy and people, who ought then to summon a general council of the church to elect a new pope. John of Paris' precise innovation lay in his claim that the cardinals held their authority even under normal circumstances as representatives of the universal church. Christ had certainly established the office of papacy on Peter, alone among the apostles as whose successors bishops in the modern church were routinely regarded. But the choice of incumbent pertained, John argued, to the church at large. Roman lawyers had long argued that the Roman Empire had been willed by God but actually created by the Roman people by means of the *Lex regia*. Something similar was now happening to the church under John of Paris' merciless combination of canon law with the Aristotelian conviction that governmental power – jurisdiction – was a natural quantity inherent in every self-sufficient perfect

community. What was of jurisdiction was not, he argued in a brilliant passage, beyond the normal course of human affairs but reached the ruler – in this case, the pope – in a certain sense naturally. What was bestowed by human agency could, in John's view, be withdrawn by the same means. This was all the more significant in that from their earliest commentaries on Gratian's *Decretum* onward, canonists had upheld the theoretical possibility that a pope could be judged and if necessary deposed for heresy, a category of misdemeanor which jurisprudence had enlarged to include persistent scandalous behavior to the obvious detriment of the church and the faith. John's solution was not entirely satisfactory because it is hard to accept the creation of the papal office by Christ in person as just another example of nature's most important process as outlined in Aristotle's *Politics*. But John's thesis combined most of the elements which, under pressure of the Great Schism, would issue in the conciliar theory, most of which were, to repeat, the fruit of canonist scholarship. The new ingredient was Aristotelian naturalism, allowing John to imply, in his comment about jurisdiction not being beyond the normal course of human affairs, what became a commonplace by the mid-fourteenth century and a cliché by the fifteenth: the "political" community was a corporation, which contained by its very nature jurisdiction within itself; the universal church was no exception. This contention rapidly became a load-bearing element in political polemic beyond the legal discourse, as the works of William of Ockham, Marsilius of Padua, Nicholas Oresme, and John Gerson demonstrate. It could be challenged, but not ignored. But the key argument had only been enhanced, not inspired, by the Aristotelian corpus. This was the recognition, given focus in the magisterial systematization of canonist conciliar doctrine by Franciscus Zabarella (d. 1417), that the jurisdiction, which constituted the pope's plenitude of power and hence his preeminence over other prelates, subsisted in the church as its foundation and was detained by the pope only in a ministerial capacity. With that realization, the distinction noted in the early thirteenth century by Laurentius

Hispanus between the emperor and the pope ceased to apply.

The resolution and legal articulation of the relationship between bishop and chapter was one of the most urgent and arduous tasks facing canonists from the later twelfth century onward. For them, the corporate nature of collegiate foundations was a given, whereas the precise structure of such corporations and its implications for the daily governance of the church were unfortunately anything but. Scholarship and supplementary papal legislation had to fill out the picture. For Romanists, by contrast, the *universitas* and the questions it raised might more properly be said to have constituted an opportunity.

In a famous gloss to *Digest* 3.4.7, Accursius had identified a corporation with its members (gl. *non debetur*). His conclusion was strange because it seemed to undermine one of the main purposes of the corporation. From the way the gloss is structured, moreover, it is not certain that this was Accursius' own opinion rather than just an argument put forward by other people, which he included for pedagogic reasons. Either way, other glossators disagreed. Roffredus Beneventanus (d. after 1243) related how as an advocate in the Tuscan city of Arezzo he had persuaded the court to put an entire subject town under ban and to compensate the plaintiff from that community's common property, even though the town was now divided between factions, the consuls who had contracted on behalf of the town no longer existed, and the offices they had filled were defunct. Roffredus argued that the *universitas* nevertheless remained liable although the town was functionally no longer a town. The example shows how robust the *universitas* could be as a bearer of legal capacity entirely distinct from that of its members. About a century later, Bartolus of Sassoferrato (d. 1357) carefully explained that by fiction of law, a *universitas* represented a single person distinct from the persons of its members. Philosophers and canonists denied this, he continued, and admitted that in a certain sense they were right: the whole did not differ in reality from its parts. Innocent IV had indeed described such a person as *persona ficta* and consequently denied it any legal capacity not

possessed by its members. Fictiveness was by contrast no obstacle for Bartolus and the other Romanists, but the precise advantage of the corporate person. As he went on to explain, by fiction of law the person represented by a *universitas* outlived its members. Bartolus referred in support of his claim to *Digest* 46.1.22, which only says that a municipality, a court of decurions, and a *societas* all function *vice personae* or “in the place of a person.” (Cities are also taken as private persons in *Digest* 50.16.16 and 46.1.22.) A major advantage of ascribing personality to a corporation was that it rendered more accessible the type of solution to otherwise intractable problems that Roffredus had advocated. It was also capable of some surprising extensions. Bartolus’ pupil Baldus de Ubaldis (d. 1400) applied the *universitas* so conceived to kingdoms: the *res publica* of the kingdom was distinct from the people of the kingdom and constituted a royal dignity that resided in the king for as long as he lived. If “the person of the king is the organ and instrument of that intellectual and public person,” and if “that intellectual and public person is that which is the principal source of action,” then it ought to be possible to ascribe sempiternity to some acts of the ruler, which lawyers had for years attempted to uphold against the strong counterargument that no ruler could be bound by his predecessor. Such acts might include contracts and enfeoffments, because a case could now be made for the principle of noncontradiction based on the identity of the contracting or enfeoffing *universitas* (*dignitas, res publica*) despite the change of ruler.

Medieval corporation theory was adopted and exploited wholesale by Calvinist polemicists in the 1570s and by their counter-reformation opponents. Via such works as Theodore Beza’s *On the Right of Magistrates* (*Du droit des magistrats, De iure magistratum*, 1574), the anonymous *Defences Against Tyrants* (*Vindiciae contra tyrannos*, 1579), François Hotman’s *Francogallia* (three versions: 1573, 1576, 1586) and William Barclay’s *On the Kingdom and Royal Power* (*De regno et regali potestate*, 1600) the notion of the corporate people as the source and residual repository of jurisdiction also survived to inspire and

revolt English and Scottish thinkers of the seventeenth century.

Abstract

Cristoforo Landino (1424–1498) was a leading humanist in Medici Florence; he was known as an accomplished Latin poet and an enthusiastic proponent of the Italian vernacular. He lectured on Latin and Italian literature at the Florentine *Studio* from 1458 to 1497, numbering among his students Marsilio Ficino, the most important Renaissance translator, commentator, and promoter of Plato. Though not himself a professional philosopher, Landino took a keen interest in philosophy, especially – though not exclusively – Platonism. He produced three philosophical dialogues: *De anima*, *Disputationes Camaldulenses*, and *De vera nobilitate*. Largely derivative, not only of classical authors but also of medieval and Renaissance thinkers, these three works, written in elegant Ciceronian Latin, dealt with philosophical themes such as the immortality of the soul,

the superiority of contemplation to action, the supreme good, and the primacy of virtue in determining nobility. In addition, he drew on various Platonic notions, mostly to do with ethics, in his allegorical interpretation of Virgil's *Aeneid* and his commentary on Dante's *Divine Comedy*, both of which were highly influential; and in this way he contributed to the Renaissance revival of Platonism.

Cristoforo Landino was born in Florence in 1424; his family, originally from Pratovecchio in the Casentino, was of modest means. In his early youth, he pursued legal studies in Volterra, earning a doctorate at the age of 15; however, he disliked the law and returned in 1439 to Florence, where he attended lectures in the *studia humanitatis* given by Carlo Marsuppini (1398–1453) and also came under the influence of other prominent humanists such as Leonardo Bruni (1369–1444). After Marsuppini's death, he sought to take over his chair in the Florentine *Studio*, but he had several rivals for the post, each supported by different factions within the city. In the end, the various disciplines covered by Marsuppini were divided between three scholars: the Byzantine John Argyropoulos (c. 1415–1487) taught philosophy; Francesco da Castiglione (c. 1420–1484) lectured on Greek; and Landino, who was a specialist neither in philosophy nor in Greek, gained the chair of rhetoric and poetry in 1458, with the powerful support of Piero de' Medici (1416–1469). In his long and successful career at the *Studio*, which lasted until 1497, the year before his death, Landino lectured mainly on the Roman poets (Virgil, Horace, Juvenal, Persius), and also on Cicero's *Tusculan Disputations* and *Familiar Letters*, and on the *Divine Comedy* of Dante and the *Canzoniere* of Petrarch. His lectures formed the basis of the line-by-line commentaries, which he published in Latin on Horace (1482) and Virgil (1488), and in Italian on Dante (1481); all three were frequently reprinted and influenced the later critical tradition of these authors. Landino took the view that the great poets – above all Virgil and Dante, and also Juvenal – included

philosophical truths in their writings; however, they hid these under the veil of metaphors and allegories, which he thought was the task of learned commentators like him to uncover. These truths, which were usually closely connected to Platonism, centered on ethics, with the poet seen as deploying his art in order to inspire readers to seek virtue and shun vice.

In his own Latin poetry, he imitated the Roman poets Catullus, Horace, and Propertius, and also the Italian verse of Petrarch – Landino's main major collection was entitled *Xandra*, after the woman who played the role of Laura in his poetry. The first book, begun around 1443, was originally dedicated to the humanist and architect Leon Battista Alberti (1404–1472), who later became a relative by marriage when, in 1459, Landino wed Lucrezia di Alberto di Adovardo Alberti. The final version of the collection, in three books, was rededicated to Piero de' Medici and completed around 1459 or 1460. Apart from amatory verses to *Xandra*, it includes poems in praise of the Medici and of Landino's circle of humanist friends: Carlo Marsuppini, Leonardo Bruni, Poggio Bracciolini (1380–1459), and Bartolomeo Scala (1430–1497).

Like Alberti, Landino was a champion of the vernacular. He published two Italian translations from Latin: Pliny's *Natural History* in 1476 and the *Sforziad* of Giovanni Simonetta (1420–1490) in 1490. He also composed a *Formulario di lettere e di orazioni in volgare*, which was first printed in 1485.

Following a well-established tradition among Florentine humanists, Landino attempted, in 1456, to enter the Chancery, the highest echelon of the Republic's civil service. He did not succeed, but in 1467 he attained the lower post of chancellor of the Parte Guelfa, and in 1483 he became a secretary to the *Signoria*, the ruling body of Florence. Landino's involvement in civic duties, which he carried in parallel to his career as a university professor, confirms his commitment to the view, put forward in his philosophical works, that the best life combines both action and

contemplation and that humanist intellectuals had a responsibility to act as advisors to those who governed.

Among Landino's students was Marsilio Ficino (1433–1499), who later became a close friend. In 1456, Ficino dedicated his treatise *Institutiones ad Platonice disciplinam*, now lost, to Landino, who impressed on the budding Platonist the need to study Greek in order to gain access to the original sources, thus setting Ficino on the course that would lead to his publication of the first complete translation of Plato into Latin (1484) and his emergence as the key figure in Renaissance Platonism. In his commentary on the *Symposium*, completed in 1469 and written in the form of a dialogue, Ficino cast Landino as one of the interlocutors, given the task of interpreting the famous speech of Aristophanes.

Landino himself composed three philosophical dialogues. The earliest, *De anima*, written around 1471–1472, features three interlocutors – himself, Marsuppini and the mathematician Paolo Toscanelli (1397–1482) – who discuss a variety of issues concerning the soul over the three days of Easter. Landino broadly structures the treatise on Aristotle's *De anima*: Book I deals with the nature of the soul and its origin; Book II with the faculties of the soul that interact with the body; and Book III with the mind, the intellectual virtues, and the immortality of the soul. As one would expect of a humanist, he draws on a range of classical, Christian, and Renaissance sources; more surprisingly, he makes extensive use of works by medieval scholastics, especially the commentary on *De anima* by Albert the Great (McNair 1993). Interestingly, Landino's account of the Platonic doctrine of the soul relies more on Macrobius, Albert the Great, and the treatise *In calumniatorem Platonis*, published a few years earlier in 1469, of Cardinal Bessarion (1403/1408–1472), than on the translations of Plato by Ficino, which may not yet have been in circulation (McNair 1992).

By the time Landino wrote his second philosophical dialogue, *Disputationes Camaldulenses*, now dated to around 1474 (Fubini 1996), he had

gained access to Ficino's translations of Plato and also to his *Theologia Platonica*, completed in 1474. The dialogue, which was first printed in 1480, is set in the summer of 1468 at the monastery of Camaldoli. Landino again includes himself among the interlocutors, along with Ficino and other Florentine intellectuals; but the main speakers in the first half are Alberti and Lorenzo de' Medici (1449–1492), who discuss the relative merits of action and contemplation, in Book I, and the ultimate good, in Book II. Although in the debate, Alberti, the spokesman for contemplation, triumphs over Lorenzo, the advocate of action, both sides accept that, in reality, the best life will be a combination of the two, as represented by the dialogue's dedicatee, Federico da Montefeltro (1422–1482), Duke of Urbino, a successful military commander, whose leisure moments were devoted to study. A discussion of the competing theories of the ultimate good leads to the conclusion that it lies in the soul's cognition of God in the afterlife, a position that is supported by arguments liberally borrowed from Book III of Thomas Aquinas' *Summa contra gentiles*. These themes are picked up in the second half of the dialogue, in which Alberti delivers an extended Neoplatonic interpretation of Books I–VI of the *Aeneid* as an allegory of the soul's arduous ascent from pleasure (Troy), through political activity (Carthage), avoiding moral hazards such as greed (Harpies) and ambition (Polyphemus), so that it can reach its final destination of true wisdom (Italy).

The last of Landino's philosophical dialogues, *De vera nobilitate*, is set in 1469 but could not have been written before 1487, since it refers to Ficino as a canon of the Florentine cathedral, an office he obtained in that year. Unlike his other two dialogues, the interlocutors are not friends and associates of Landino, but instead are given fictional Greek names: Aretophilus ("lover of virtue"), who is poor but learned, and his wealthy patron, Philotimus ("lover of honor"). In line with earlier humanist treatments of true nobility, the argument is overwhelming weighted in favor of virtue, in particular, the virtues of the mind and soul.

Dante Alighieri

Teresa Pugh Rupp
Department of History, Mount Saint Mary's
University, Emmitsburg, MD, USA

Abstract

Dante Alighieri (1265–1321) was a poet whose work was influenced both by his political experiences and by his study of philosophy. Born in Florence, he was educated in grammar and rhetoric and reports in his *Convivio* that he studied philosophy at the “schools of the religious,” probably the *studia* at Florence’s Franciscan and Dominican houses. Until his exile, he was an active participant in civic life, as a guild member, communal councilor, and prior. He was exiled in early 1302 after his faction, the Whites, was replaced by the Blacks (with the not-so-covert support of Boniface VIII). He never returned to Florence, dying in Ravenna in 1321.

Except for the early collection of lyric poems, the *Vita nuova*, most of his works were composed during his exile. *Convivio* is an unfinished encyclopedic work on human knowledge. *Monarchia* argues for a single universal ruler, who should be the Roman emperor and not the pope. The *Divine Comedy* brings together many of these philosophical and political themes, transformed into a masterpiece of imaginative literature.

Dante Alighieri (1265–1321) was a poet whose work was influenced both by his political experiences and by his study of philosophy. He was born in 1265 in Florence to Alighiero Alighieri, possibly a moneylender, and Bella degli Abati. He was educated in grammar and rhetoric and began his literary career by composing lyric poems in the *dolce stil nuovo* (“sweet new style”), many of them inspired by his beloved Beatrice, thought to be Beatrice Portinari, although he contracted marriage to Gemma Donati in 1277, with whom he had four children. After Beatrice’s death in 1290, Dante compiled 31 of his lyric poems into the collection *La vita nuova*, interspersing them with a prose commentary that narrates the transformation of his relationship with Beatrice from conventional courtly love of the earthly Beatrice to a purely intellectual love of her blessed spirit. Also in the 1290s, Dante tells us in the unfinished *Convivio* (*Banquet*) of 1304–1307, he turned for consolation to the study of philosophy *ne le scuole de li religiosi e a le disputationi de li filosofanti* (“in the schools of the religious and the disputations of the philosophers”; *Conv.* 2.12.7.). These “schools of the religious” would have been the *studia* attached to the mendicant orders in Florence. His teacher at the Franciscan house, Santa Croce, was probably Peter Olivi, who exposed him to the Spiritual Franciscans’ criticism of church property, while the Dominican teacher at Santa Maria Novella, Remigio dei Girolami, familiarized him with Aristotelian ideas.

In addition to his early poetic efforts and philosophical explorations, Dante also participated in Florentine civic life. He fought in the battle of Campaldino against Arezzo in 1289 and joined the guild of *Medici e speziali* (doctors and pharmacists) in 1295, making him eligible to hold political office under the recently passed (1293) Ordinances of Justice. Dante sat on communal advisory bodies, including the *Consiglio dei Trentasei del Capitano del Popolo* (Council of the Thirty-six of the Captain of the People) from November 1295 to April 1296, and the *Consiglio del Cento* (Council of the Hundred) twice, in 1296 and 1301. He served a 2-month term as one of the seven priors, the executive body in the Florentine commune, from June 15 to August 15, 1300. In a failed attempt to defuse factional tensions in Florence, Dante and his fellow priors exiled the leaders of both the Black and White parties. The subsequent priorate recalled the Whites, and the still-exiled Blacks turned for help to Pope Boniface VIII, who arranged with Charles of Valois, brother of King Philip IV of France, to intervene in Florentine politics as “Peacemaker” between the warring factions. In October 1301, Dante was one of three ambassadors sent by the commune to Rome to negotiate with Boniface to keep Charles out. Their efforts were unsuccessful, and Charles of Valois entered Florence on November 1, 1301. A few days later, the supposed peacemaker opened the gates to the Black exiles, who took over the government and condemned their enemies to punishments ranging from fines to exile to death. Dante, still in Rome on his embassy, was sentenced first to exile on January 27, 1302, and then to death, should he return to Florence, on March 10, 1302. He spent the rest of his life in exile, dying in Ravenna on September 13, 1321.

Most of Dante’s works, both literary and philosophical, were composed during his exile and in many cases were informed by that experience. The *Convivio*, for example, is modeled on Boethius’ *Consolation of Philosophy*, both in form – a mixture of prose and poetry – and in content – how the study of philosophy offers comfort to one in difficult circumstances (prison for Boethius, exile for Dante). Originally projected to have 14 books, the *Convivio*, which Dante worked on

from 1304 to 1307, was left unfinished and never made public during his lifetime. Each of the four completed books opens with one of Dante’s *canzone*, followed by a prose commentary. It opens with a statement drawn from Aristotle’s *Metaphysics*, *tutti li uomini naturalmente desiderano di sapere* (“all men naturally desire to know”). Knowledge is therefore necessary for humans to realize their souls’ potential and thereby achieve earthly happiness. The *Convivio* was meant to present that knowledge in the vernacular for the benefit of those without Latin. The completed books discuss cosmology and the moral virtues whose cultivation results in true nobility.

While the *Convivio* was conceived as encyclopedic in scope, the *Monarchia* (*On Monarchy*) focuses on a single topic – the necessity for a single universal ruler. The dating of the treatise is disputed; it may have been composed as early as 1309–1313, the period of the emperor Henry VII’s ultimately unsuccessful expedition to Italy to establish imperial rule, or, if the reference to *Paradiso* in *Monarchia* 1.12 is taken as part of Dante’s original text, as late as 1317. The three books of *Monarchia* each demonstrate a proposition: Book 1 asserts the need for a universal ruler; Book 2 explains why such a ruler must be a Roman emperor; and Book 3 argues that the authority of the Roman emperor derives directly from God and is not subordinate to the papacy.

Dante’s most famous work, the *Divine Comedy*, brings together many of the philosophical themes from these other works. The dating of the composition of the *Divine Comedy* is also imprecise, but Dante probably worked on *Inferno* from 1306 to 1309 and on *Purgatorio* from 1308 to 1312, publishing them in 1314 and 1315, respectively; he had completed cantos one through seventeen of *Paradiso* by 1316 and finished it in 1321. Setting the action at Easter time 1300 allows Dante to have several of the figures he meets on his journey through hell, purgatory, and paradise prophesy his coming exile. Other figures are the mouthpieces for his criticisms of papal policy and conduct and his exaltation of the Roman Empire. Beatrice returns as his spiritual and intellectual guide, explaining cosmological

concepts as she leads him through the heavenly spheres of paradise.

al-Dawānī, Jalāl al-Dīn

Mathieu Terrier

LEM (UMR 8584), CNRS, PSL, Paris, France

Jalāl al-Dīn al-Dawānī (830–908/1427–1502), known as al-Muḥaqqiq al-Dawānī, is one of the main representatives of the philosophical school of Shiraz, which flourished at the eve of the Safavid period in the tenth–eleventh/sixteenth–seventeenth centuries Iran. He was closely associated with contemporary courts, and the Turkmen rulers of Shiraz especially showed him great respect. Partly because of the political upheaval associated with the rise of the Safavids, he travelled throughout various cities in Arabia, Iraq, and Iran. His religious affiliation has been the subject of many debates, but it can finally be assumed that he was a Sunni Ashʿarite and moved to Twelver Shīʿism in the last part of his life, coincidentally with the advent of the Safavid realm (in 906/1501) and the conversion of the state of Iran to Shīʿism. Some 70 of his works, in both Arabic and Persian, have survived, on theology (*kalām*), metaphysics, and ethics. Al-Dawānī remains as an influential thinker in both Sunni and Shīʿi worlds, followed by students in the Ottoman world and in Iran, as well as in Muslim India.

His Life

Jalāl al-Dīn Muḥammad b. As‘ad al-Dawānī was born in 830/1427 in the town of Dawān, near the city of Kāzarūn, in the Iranian province of Fars. He first studied with his father Sa‘d al-Dīn As‘ad and Muḥzir al-Dīn Muḥammad al-Kāzarūnī, who had been both students of Mīr Sayyid Sharīf ‘Alī b. Muḥammad Jurjānī (d. 816/1413), a Sunni Ash‘arite theologian. Both introduced him to religious sciences (*ḥadīth*, *fiqh*, *tafsīr*) as well as to rational sciences. He then moved to Shiraz where he studied theology, *ḥadīth*, principles of Islamic jurisprudence (*uṣūl al-fiqh*), logic and philosophy under scholars such as Ṣafī al-Dīn Ījī (d. 864/1460), Muḥyi al-Dīn b. Muḥammad Kūshkinārī Anṣārī and Muḥammad Kāzarūnī. The two latter had been also taught by Sharīf ‘Alī Jurjānī.

Jalāl al-Dīn al-Dawānī was closely associated with contemporary courts, beginning with the Turkmen rulers of Shiraz, the Qarā Qūyūnlū followed by the Āq Qūyūnlū. While still young, he was appointed *ṣadr* (religious supervisor) by the Qarā Qūyūnlū Yūsuf (d. 872/1468); he soon resigned the post but was promptly affected as professor at the Begum *madrassa* (*dār al-aytām*). Under the Āq Qūyūnlū Sultan Ūzūn Ḥasan (r. 857–882/1453–1478) and Sultan Ya‘qūb (r. 883–896/1478–1490), he was appointed as a chief judge (*qāḍī al-quḍāt*) of Fārs and even reached the rank of minister. He wrote his *Akhlāq-i jalālī* (“Jalālīan Ethics”), also known as *Lawāmi‘ al-ishrāq fī makārim al-akhlāq* (“Flashes of Illumination on Praiseworthy Ethics”; Newman 1994), in Persian for the Sultan Ūzūn Ḥasan, and his *‘Arḍ-nāma* for the latter’s son Khalīl during his brief reign (882–883/1478). When staying in India, he dedicated to the Bahmani king in the Deccan, Sultan Maḥmūd I of Gujarat (r. 862–917/1458–1511), his commentary on Suhrawardī’s (d. 578/1191) *Hayākil al-nūr* (“Temples of Light”), entitled *Shawākil al-ḥūr fī sharḥ Hayākil al-nūr* (“Forms of the Houris of Paradise. On the Commentary of the Temples of Light”), authored in 872/1468, as well as his *Unmūdhaj al-‘ulūm* (“Epitome of Sciences”), and his *Risāla dar bayān-i māhīyat-i ‘adālat wa aḥkām-i ān* (“On the Quiddity of

Justice and its Decrees”). His treatise entitled *Risāla Ithbāt al-wājib al-qadīma* (“The Old Epistle Demonstrating the Necessary Being”), written before 870/1465–6, was offered to the Ottoman Sultan Mehmed II (d. 886/1481), the conqueror of Constantinople (al-Ṭihirānī 1983, vol. 1, pp. 106–107). The Shī‘i historian and theologian Qāḍī Nūrullāh Shūshtarī (d. 1019/1610), while praising his excellence in the fields of knowledge and religion, points to his apparent inclination for wealth, luxury, glory, and power, quoting a Persian verse of him: “Experience made clear to me at the end that man is worth as much as his science and his science as his wealth” (Shūshtarī, vol. 4, p. 543).

Dawānī experienced a chaotic period due to the dismantling of the Āq Qūyūnlū’s empire and the war between this dynasty and the young Shāh Ismā‘īl, head of the militarized messianic Sufi-Shī‘i order of the Ṣafawīyya and future first ruler of the Safavid dynasty in Iran (r. 906–930/1501–1524). Dawānī therefore composed his work in a situation of instability and insecurity, as testified in both conclusions of his *Risālat Ithbāt al-wājib al-qadīma* (*Sab‘a rasā’il*, p. 113) and his *Shawākil al-ḥūr* (*Thalātha rasā’il*, p. 255), and was frequently moving from city to city in Iran (Kāshān, Shīrāz, the island of Hormuz) and the Arabic ‘Iraq.

Regarding his religious affiliation, Dawānī is considered to have been a Sunni Ash‘arite theologian, according to most of his works and his political relationships. His writings were highly respected during his lifetime at the Ottoman court in Istanbul. In his *Sharḥ baytay az Ḥāfiẓ* (“Commentary of Two Verses of Ḥāfiẓ al-Shīrāzī”) and his *Sharḥ al-‘Aqā’id al-‘aḍadiyya*, a commentary on ‘Aḍud al-Dīn al-Ījī’s (d. 756/1356) *al-‘Aqā’id* (“Creed”), the latter composed in 905/1499, he identifies the “saved sect” (*al-firqa al-nājiyya*) of Islam with that of the Ash‘arites, while rejecting both Imāmi Shī‘is and Mu‘tazilites (Dīnānī 2011, pp. 5–8). However, a couple of his late works and some of his poetries have a strong Shī‘i flavor. In the *Nūr al-hidāya* (“The Light of Guidance”), a treatise whose authenticity remains doubtful, the author claims his veneration for the 12 Imāms (*al-Rasā’il al-mukhtāra*, pp. 118–127). His

Risālat al-Zawrā (“the Treatise of Baghdad”), certainly authentic, was written, according to Dawānī himself, following a vision of Imām ‘Alī which inspired him the subject of the book (*Sab‘a rasā’il*, p. 202). However, considering the pro-‘Alid tendency of Persian mysticism in pre-Safavid Iran, this testimony shall not be taken as a decisive evidence of his Shī‘i affiliation. Reciprocally, one may assume, like Nūrallāh Shūshtarī, that Dawānī’s first open claims of the superiority of the Sunni Ash‘arite theology were made by concealment (*taqiyya*) of his Shī‘i convictions, as well as by venality, in a chaotic period (Shūshtarī, vol. 4, p. 547). Shūshtarī also gives various testimonies of Dawānī’s secret Shī‘i practices and quotes some of his poetries claiming his veneration for Imām ‘Alī and the *ahl al-bayt* (Shūshtarī, vol. 4, pp. 545–546, 549–550). It is related that, when questioned on the identity of “the Imām of the age,” he replied ambiguously that the Shī‘is believed it was Muḥammad b. Ḥasan, the 12th Imām, and the Sunnis Sultan Ya‘qūb (Shūshtarī, vol. IV, p. 546; Newman 1994, p. 132). Although his late Shī‘i convictions may be suspected of opportunism (Newman 2006, pp. 37–38 and 160–161, n. 56), he was revendicated as a Shī‘i thinker by historians of the Safavid period, such as Shūshtarī and Quṭb al-Dīn Ashkiwarī (d. between 1088/1677 and 1095/1684) (Ashkiwarī, pp. 463–467).

Jalāl al-Dīn al-Dawānī counts as a main representative of the philosophical school of Shiraz with Ṣadr al-Dīn Muḥammad Dashtakī (d. 903/1498), his son Ghiyāth al-Dīn Maṣṣūr al-Dashtakī (d. 948/1541) and Shams al-Dīn al-Khafī (d. between 942/1535 and 946/1539) (Nasr and Aminrazavi 2015, pp. 27–116). However, when talking about the school of Shiraz, one should keep in mind that like in the case of the “school of Isfahan” (11th/17th century) the term “school” does not mean here a community of thought but merely a main philosophical dynamic, with shared problematics and divergent positions, among thinkers of the same city. The heated disputes between Jalāl al-Dīn al-Dawānī and Ṣadr al-Dīn Dashtakī remain famous in the history of philosophy in Iran. They generally took the form of public disputations which the young Ghiyāth

al-Dīn Maṣṣūr al-Dashtakī assisted to and related in later works. This controversy animates a number of both these philosophers’ writings. Dawānī and Dashtakī exchanged six commentaries or series of glosses on ‘Alā al-Dīn ‘Alī b. Muḥammad al-Qūshjī’s (d. 879/1474) commentary on Naṣīr al-Dīn Ṭūsī’s (d. 672/1274) *Tajrīd al-i‘tiqād*, a Twelver Shī‘i creed previously commented by al-‘Allāma al-Ḥillī (d. 726/1326) in his *Kashf al-murād*, and by Ash‘arite theologians such as Shams al-Dīn al-Iṣfahānī (d. 749/1348) and Sharīf ‘Alī Jurjānī. Al-Qūshjī was also an Ash‘arite scholar and primarily an astronomer. He wrote his commentary on *Tajrīd al-i‘tiqād* after 853/1449. Dawānī and Dashtakī may have become acquainted with him in person while staying in Tabriz. Dashtakī wrote a first gloss on Qūshjī’s commentary, known later as his “Old Gloss” (*al-ḥāshiya al-qadīma*). Dawānī criticized it implicitly in a subsequent commentary, also known as his “Old Gloss,” completed in 882/1477. Five years later, in 887/1482, Dashtakī wrote his “New Gloss” (*al-ḥāshiya al-jadīda*) on Qūshjī’s commentary on the *Tajrīd*, with the assistance of his son Ghiyāth al-Dīn, including a refutation of Dawānī’s gloss. At his turn, Dawānī completed his “New gloss” in 897/1491–2, no copy of which has remained available. Following the composition of this gloss, Dashtakī revised and expanded his New Gloss to respond to Dawānī’s positions. These commentaries, whose focus is mainly metaphysical, also contain a discussion about the famous logical “liar paradox,” which was a popular subject of discussion among Islamic philosophers and theologians, especially from the seventh/thirteenth century onward (Alwishah and Sanson 2009; Qaramaleki 2014). Finally, Dawānī wrote his third gloss on Qūshjī’s commentary on the *Tajrīd*, known as “Newest Gloss” (*al-ḥāshiya al-ajadd*), in which he responds to the “sophistries and criticisms containing contentions and arguments” presented by his adversaries Dashtakī father and son. Ṣadr al-Dīn Dashtakī died without having the time to respond to the latter work, but Ghiyāth al-Dīn Dashtakī continued the polemics (Pourjavady 2017, pp. 418–437). He first authored harsh refutations of Dawānī’s works, but after the death of

the latter, continued to discuss his positions while showing marks of respects towards him. Apart from their dramaturgy, these exchanges addressed some major philosophical issues, such as the principiality of quiddity or existence (*aṣālat al-māhiyya* or *aṣālat al-wujūd*), existence in mind (*wujūd dhihnī*), the immateriality of the imaginative faculty, the unicity and the gradation of being (*waḥdat al-wujūd*, *tashkīk al-wujūd*), which would eventually be assumed by the eleventh/seventeenth century philosophers Mīr Dāmād (d. 1040/1631) and Ṣadr al-Dīn al-Shīrāzī known as Mullā Ṣadrā (d. 1045/1636) (Kākā'ī 2008, p. 43).

As a professor, Dawānī taught, among other philosophical works, Naṣīr al-Dīn al-Ṭūsī's commentary on Avicenna's *al-Ishārāt wa l-tanbīhāt*, Shihāb al-Dīn Suhrawardī's *Ḥikmat al-ishrāq*, his own commentary of the latter's *Hayākil al-nūr* (see below), al-Qūshjī's commentary on al-Ṭūsī's *Tajrīd al-i'tiqād* (see below), and al-Ṭūsī's commentary on Euclid's *Elements*, *Taḥrīr kitāb Uqlīdis* (Pourjavady 2017, pp. 417–418). Among his students, Shams al-Dīn al-Khafrī, who also studied under Ṣadr al-Dīn Dashtakī, has to be mentioned (on him, see the relevant chapter). Jalāl al-Dīn al-Dawānī died and was buried in his birthplace of Dawān in 908/1502, 1 year after the Safavids captured Tabriz and established Shī'ism as the state religion of Iran, but 2 years before the capture of Shiraz in 909/1504.

His Thought

Dawānī's works seem at first sight to be divided into two fields, theology and philosophy, as if his thought went through two periods: a first one dominated by the frame of the Ash'arite school of theology (*kalām*); a second one under the influence of Suhrawardī's philosophy of Illumination (*ḥikmat al-ishrāq*). However, a brief overview of the works ascribed to him with certainty can show enough that Dawānī always held the same theological and philosophical ideas together.

Dawānī authored two epistles on the demonstration of God's existence, the necessary Being

(*wājib al-wujūd*), respectively known as “the old one” (*Risāla fī ithbāt al-wājib al-qadīma*) and “the new one” (*Risāla fī ithbāt al-wājib al-jadīda*). The first one was authored before 870/1465-6 (*Sab'a rasā'il*, introduction, p. 42); many commentaries were written on it (Ibid., pp. 45–46), notably by Nūrullāh Shūshtarī (al-Ṭihirānī 1983, vol. 13, p. 60) and Ghiyāth al-Dīn al-Dashtakī (al-Ṭihirānī 1983, vol. 6, p. 11). The second epistle was written at least 10 years after the previous one. From one to another, Dawānī affirmed himself as an Ishrāqī philosopher while remaining within the context of the Ash'arite theology. In his “Old Epistle,” he criticizes the insufficiency of the proof of the existence of God by the impossibility of an infinite regression from the possible existent (*mumkin al-wujūd*), an argument commonly used by the Peripatetics (*Sab'a rasā'il*, p. 76). In his “New Epistle,” he supports an ontological proof: God's existence is not added to Him but is his own essence (Ibid., p. 124). God, i.e., the necessary Being, is the pure existence (*al-wujūd al-baḥt*) remaining by itself, and the pure Essence (*al-dhāt al-baḥt*) without determination (Ibid., p. 125). The necessary Being is indivisible by essence (Ibid., p. 127).

In his *Risālat ithbāt al-wājib al-jadīda*, Dawānī borrows from al-Fārābī (d. 339/950) and Ibn Sīnā (d. 428/1037) the distinction between the intrinsically necessary Being (*wājib al-wujūd bi-dhātihī*), i.e., God the existence-giver, and the possible beings (*mawjūdāt*), whose existence is extrinsically necessitated. He stresses that the existence predicated of God, the necessary Being, and the existence predicated of possible existents, are not one and the same. “The existence (*wujūd*), which is the principle of derivation of [the concept of] existent, is a single entity in itself, and it is an external reality. The [concept of] existent is more general than this self-subsistent existence and that [existent] which is in some particular way related to it” (*Sab'a rasā'il*, p. 131). Consequently, the necessary Being is the only one who deserves to be referred to as “existence,” the only one whose existence is a reality outside the mind; and existence cannot be truly ascribed to possible beings. Symmetrically, the necessary Being

can be only metaphorically called “existent” (*mawjūd*), because it is not something of which existence is predicated, but is identical to existence (Ibid., pp. 131–132). The same idea is developed in Dawānī’s and Dashtakī’s glosses on Qūshjī’s commentary on *Tajrīd al-kalām* (see Pourjavady 2017, p. 422). In his *Shawākil al-ḥūr*, he ascribes to al-Fārābī and Ibn Sīnā this statement: “When saying that the necessary Being is existent, this world [‘existent’] has a metaphoric sense” (*Thalātha rasā’il*, p. 168).

Regarding the traditional issue of divine attributes, Dawānī argues that all the essential attributes of God (*ṣifāt al-dhāt*) are included in the attribute of Science (*al-Jadīda*, in *Sab’a rasā’il*, p. 141), which seems to be a departure from Ash’arite theology and a step closer to the views of philosophers. Nevertheless, he joins the Ash’arites, with an argument inspired by Suhrawardī, when he refutes the thesis of the philosophers, primarily Ibn Sīnā, that God does not know individuals as such (*Sharḥ Khuṭbat al-Zawrā’*, in *Sab’a rasā’il*, p. 211). According to his argument, since the necessary Being is at the highest level of immateriality, he knows himself by essence and is therefore Intellect, intelligent and intelligible; his essence being the requiring cause of all possibilities, and the knowledge of the cause implying that of the caused, God is knower of all existents (*al-Jadīda*, in *Sab’a rasā’il*, p. 144). Dawānī still fits into the Ash’arite doctrinal framework when he denies that man is the true agent (*mu’aththir*) of his actions. According to his argument, the possible existents are quiddities; quiddities are, by essence, in potentiality, and what is in potentiality cannot be at the origin of what is in actuality. Only the existence without quiddity, which is that of the necessary Being, is at the origin of the acts of the existents. The necessary Being is the one and only agent in the world of existence. This, according to him, was what philosophers, Sufis and theologians, with the exception of the Mu’tazilites, agree on (Ibid., p. 140). On the question of final retribution and divine justice, he also supports the Ash’arite theory of *kasb* (“acquisition”) against the theory of free will defended by the Mu’tazilites (Ibid., pp. 156–157; *Khalq al-a’māl*, in *al-Rasā’il*

al-mukhtāra, p. 71). According to the doctrine of *kasb*, the man who acts is in reality acted upon, but receives and acquires the imputation of his acts at the time of his action; he is therefore responsible for them, although he is not really their agent. In his *Jalālian Ethics*, he also supports the Ash’arite position that both good and evil are standards determined by the law (*sharī’a*), i.e., good is what the Lawgiver commands and evil is what He prohibits, and rational-objective ethical standards do not apply to God as the Mu’tazilites and some Shī’i theologians like al-‘Allāma al-Hillī were thinking (Dīnānī 2011, p. 388; on al-‘Allāma al-Hillī, see the relevant chapter).

Dawānī defends the same Ash’arite doctrines in his *Risālah-i Tahlīliyya*, a commentary in Persian of the first part of the Muslim credo, *lā ilāha illā allāh*, “there is no god but God,” as well as in his *Risāla fī Khalq al-a’māl* (“On the Creation of Acts”). He develops there three points of view on divine oneness (*tawḥīd*): the oneness of acts, meaning that all the causality of acts is ascribed to God; the oneness of attributes, meaning that all the reality of the attributes of science, power, life, etc., is ascribed to Him; and the oneness of the Essence, meaning that all perfection and existence are ascribed to Him (*Risālat-i tahlīliyya*, pp. 23–24; *al-Rasā’il al-mukhtāra*, pp. 75–76; Dīnānī 2011, pp. 443–444). According to this last point of view, creatures are mere loci of manifestation (*maẓāhir*) of the divine Essence. Similarly, in his *Shawākil al-ḥūr*, the Suhrawardian metaphysics of the Light of lights (*nūr al-anwār*) and intermediate lights, intelligences, and “lords of species” (*arbāb al-anwā’*) – corresponding to the Platonic Ideas – allows him to reinforce his theory that all influence derives from the First Cause, without real effectiveness of intermediate causes, a theory in accordance with the Ash’arite dogma (*Thalātha rasā’il*, pp. 190–191; Dīnānī 2011, pp. 358–360).

In his *Treatise of Baghdad* (*Risālat al-Zawrā’*) and his auto-commentaries on it (*Sharḥ Khuṭbat al-Zawrā’*, *Sharḥ Risālat al-Zawrā’*), Dawānī presents a doctrine of the Provenance and Destination (*al-mabdā’ wa l-ma’ād*) strongly influenced by Avicennism, Suhrawardī’s Illuminative philosophy, and Ibn ‘Arabī’s (d. 637/1240)

theosophy as well, both the latter being referred to in the introduction of his commentary (*Sab'a rasā'il*, pp. 203 and 205). In the *Treatise of Baghdad*, Dawānī addresses the question of the relationship between God and the existents through the relationship between the cause and the effect. He first asserts that quiddities (*māhiyyāt*) are non-generated (*ghayr maj'ūla*) but are, in their essences, the effect of the efficient cause (*athar li-l-fā'il*) (Ibid., p. 174; Engl. transl. in Nasr and Aminrazavi 2015, p. 39). He then argues that “the effect is nothing but a purely mentally posited entity,” which is real only when considered from the point of view of its relation to the cause, but inexistent and impossible when considered as an independent entity (Ibid., p. 174; Engl. transl., p. 40). According to a quote probably from Ibn 'Arabī, “the immutable entities (*a'yān thābita*) have not smelled the perfume of being, and verily they have never and shall never be manifested, but rather what is manifested is only a trace of them.” Dawānī thus denies any independent reality or existence to the possible existents (*mawjūdāt*), going to say that “[God] is the real essence and everything else is His aspects, modalities, facets and so forth (. . .). Thus, there are not multiple essences in [the realm of] existence, nay rather, there is only one single essence that possesses multiple attributes” (Ibid., p. 175; Eng. transl. p. 40).

Of one Dawānī's main assertions in his *Treatise of Baghdad* is that “the relation between the first and the second”, i.e., between God, the First Cause or the Necessary being, and the possible existents which are his effects, “is the mother of all relations” (*Sab'a rasā'il*, p. 176; Eng. transl. p. 41). This expression is borrowed from Suhrawardī's *Hayākil al-nūr*, in which we can read – with Dawānī's commentary between square brackets – that “the first fixed relationship in existence is the relationship of the existent subsisting substance, [that is, the first effect,] to the first eternally subsistent, [which is existent by its essence and gives existence to others]. It [that is, this relationship] is the source (lit. ‘mother’) of all relationships [because it contains them all]” (Nasr and Aminrazavi 2012, p. 116). The cessation of the effect in reality is the

appearance of the cause in another mode. Temporal extension, which is the origin of change and alteration and the seat of the temporally originated entities, is all one reality when considered as one of the aspects (*shu'ūn*) of the First Cause. With respect to the levels that are beyond the boundaries of that extension, there is no succession: “There is no dawn or dusk for your Lord” (*Sab'a rasā'il*, pp. 176–177; Eng. transl. pp. 41–42). Thus, the world of existence is nothing but the sum of God's manifestations or theophanies, which is one of Ibn 'Arabī's fundamental views: “all existing is the proof of its Artisan as it is a place of manifestation”, confirmed by a quotation of Qur'an 7:44: “There is not a thing but celebrates His praise” (*Sab'a rasā'il*, p. 189). In a note from a manuscript (quoted by Dīnānī 2011, p. 180), Dawānī adds: “The divine Real (*al-ḥaqq*) is the reality of realities, the essence of essences. Worlds are only manifestations, modes and ways of acting of the essence of Reality. The world refers to all the points of view taken on the relationship to the essence of its Oneness. . .”

In the view of Dawānī, the procession of Reality or the divine Essence is nothing but the movement of the soul. All worlds are forms of the unique Reality, differing according to the degree of elevation or lowering of the soul (*Sab'a rasā'il*, p. 219). One single reality like the human-kind appears with forms of multiplicity to senses and imagination and becomes unified when appearing to the Intellect. The intelligible form itself becomes varied in accepting multiplicity (Ibid., p. 178; Eng. transl. in Nasr and Aminrazavi 2015, p. 43). However, according to Dawānī, one should keep in mind that “the reality is other than the form. For [the reality] on the level of its essence and in its pure simplicity is devoid of all the forms in which it is manifest” (Ibid., pp. 179–180; Eng. transl., p. 44). The soul, when descending to the level of sense perception, reaches the furthest limit of multiplicity, and when ascending to the level of Intellect, i.e., pure immateriality, becomes one. Dawānī therefore asserts that “the nature of knowledge is multiplying the one and unifying the many,” according to the degrees of elevation and lowering

of the soul (Ibid., p. 181; Eng. transl., p. 45). This conception allows him to bring together Aristotle's psychology, the Neoplatonic system, and Ibn 'Arabī's theosophy, by writing that "the soul is the matter for all forms and the ground for all realities (...); and by and in [the soul] the Breath of the All-Merciful (*al-naḥās al-raḥmānī*), which is in its essence, becomes multiple" (Ibid., pp. 181–182; Eng. transl., p. 46).

In his auto-commentary on the *Epistle of Baghdad*, Dawānī addresses the classical issue of the principality of quiddity or existence. Following Suhrawardī, he supports the principality of quiddity (*aṣāliyyat al-māhiyya*) and the merely mental nature of existence (*i'tibāriyyat al-wujūd*). More precisely, he supports the principality of existence in terms of God alone, the intrinsically necessary Being, and the purely mental character of the existence of the possible. As for quiddities, existence is nothing but a mental point of view on them, since they are not established with existence (*Sab'a rasā'il*, p. 207). Existence in itself is not an attribute subsisting by other means, but a real essence; any other becomes existing when it is realized by existence, or when existence manifests itself in it (Ibid., p. 208). No existing object remains identical in itself despite the illusion produced by the senses: the forms that follow one another in the matter of the world are like the colors alternating in the qualitative change of any body (Ibid., p. 210). On all this again, Dawānī brings Suhrawardī's metaphysics in line with the dogmas of Ash'arite theology.

In his auto-commentary on the introduction of the *Treatise of Baghdad*, Dawānī, on the other hand, moves away from the Ash'arite framework, thanks to Ibn 'Arabī's inspiration. According to him, if every possible existent rationally proves the existence of its Maker (*ṣāni*'), being a locus of manifestation (*maẓhar*) for Him (*Sab'a rasā'il*, p. 189), the human being is the locus of manifestation of all the divine names and attributes, since he embraces in his essence all realities, whether material or immaterial, dense or subtle. Human being is an "epitome of all the worlds" (*unmūdḥaj jamī' al-'awālim*). This is the reason why he is called "microcosm" (*al-'ālam al-ṣaghīr*) but would better be called

"macrocosm" (*al-'ālam al-kabīr*) because he exceeds the world by comprehending also the mental being (Ibid., pp. 190–191). Dawānī here quotes a famous saying attributed to the Sufi master Abū Yazīd al-Baṣṭāmī (d. 234/848 or 261/874): "Shall the [divine] Throne and everything that surrounds it occupy one of the corners of the Gnostic's heart (*qalb al-'ārif*) for thousand times, it would even not fulfil it" (Ibid., p. 190). In response to the objection that the macrocosm, in the common sense of the term, also includes intellective beings which are the rational souls of spheres according to the philosophers, he writes: "The celestial intelligences have absolutely no sensation; neither do the souls of the spheres have any sensation through external senses, according to those who profess their immutability and immateriality, that is, the philosophers. Men of spiritual experience, on the other hand, think that the immaterial beings know the Most High only through His attributes of incomparability (...). On the contrary, the Perfect Man, as the gathering of all worlds, knows the Most High in all the dimensions He gives him." Even more, the Perfect Man (*al-insān al-kāmil*) is the highest degree of reality, the most perfect locus of manifestation of all God's attributes of perfection, which the rank of the Muḥammadian Sealing Reality (*al-martaba al-khatmiyya al-muḥammadiyya*) (Ibid., pp. 192–193).

In conclusion to his *Treatise of Baghdad*, Dawānī gives his reader a twofold precept: to preserve the wisdom of those who are not worthy of it, to provide it to those who are worthy of it. In support of this idea, he quotes a word attributed to Plato: "Do not let your knowledge about yourself be damaged by the ignorance of others about you" (*Sab'a rasā'il*, p. 183; Eng. transl. in Nasr and Aminrazavi 2015, p. 47). Interestingly, this ethical position is congruent with Shī'i esotericism and will be widely shared by Shī'i philosophers of the Safavid period.

Dawānī's *Shawākil al-hūr fī sharḥ Hayākil al-nūr*, a commentary on Suhrawardī's brief epitome of his doctrine, highly contributed to the spread of Ishrāqī philosophy in India. In this work, Dawānī aims to harmonize Suhrawardī's

metaphysics of Light, its Avicennian philosophical roots, Ash'arite theology, and Sufism. He also stresses the link between Suhrawardī's fundamental doctrine and his own worldview as expressed in his previous *Treatise of Baghdād*: "The whole world is a shadow of the Light of lights. On the verification of the relationship between the forms and the essential realities, we have a discourse in the *Treatise of Baghdād* and its commentary" (*Thalātha rasā'il*, p. 244). Besides the conception of the relationship between cause and effect, reality and forms, Dawānī embraces Suhrawardī's key principles of psychology and cosmology. On the first issue, he supports that the rational human soul knows itself by essence (*ya'qulu dhātahu bi-dhātihi*) (Ibid., pp. 129–130). He also supports the immateriality of the soul as well as the complementarity of the receiving (*qābil*) soul and the donating (*hādī*) Intellect: "The soul is called soul only as long as its perfections remain in potentiality. When they reach their actuality, the name of the soul is taken away from it and the name that belongs to it is that of the Intellect." This is what animals, even with immaterial souls according to the Ishrāqī philosophers, are incapable of, unlike man (Ibid., p. 116; *al-Jadīda*, in *Sab'a rasā'il*, p. 144).

On the field of cosmology, Dawānī agrees with Suhrawardī's that the circular motion of the sphere is the cause of the events of our world and that this motion is voluntary (*Thalātha rasā'il*, pp. 198–200; Eng. transl. in Nasr and Aminrazavi 2012, pp. 93–94). The heavens are perpetually in motion, not compounded of the elements, therefore they are not susceptible of generation and corruption; they are all spherical because of their circular motions, according to Ptolemy's *Almagest*; they are living, because their motion is voluntary; they are rational, because they comprehend universals (Ibid., pp. 221–222; Eng. transl., pp. 112–113). Like Suhrawardī, Dawānī sees cosmology as an inspiration for mystical psychology. The motion of the heavens, since it belongs to "the attainment of a holy and delightful thing, which is the dawning of lights from their sources above," is the model of "the motions issuing from the soul stripped of the connections of nature, on account of the holy gleams and intimate dawns, as

the masters of ecstasy and witnessing [i.e., the masters of Sufism] attest" (Ibid., p. 203; Eng. transl., p. 97). On the basis of this conception, Dawānī justifies the Sufi ritual of listening to music (*samā'*), a practice commonly condemned by lawyers, be they Sunni or Shī'i: "This is the secret of listening to music and, for the divine [sages], its principle leading to its establishment, so that one of the leaders of this group [the Sufi master Rūzbihān Baqlī] said, 'The wayfarer in the assembly of listening to music is opened up to things that are not found in forty-day retreats'. It is related by Plato that whenever he wanted to pray, he moved the power of his soul by listening to appropriate voices, when he wanted to be moved by the power of wrath or love." (Ibid., p. 204; Eng. transl., p. 97; see Corbin, *L'archange empourpré*, pp. 71–72) He then defines the "divine lovers" as "those stripped of material connections to the extent possible for them, as is said from the divine solitaires seeking perfection, or the lovers of the divine lights, which are the intellects that resemble them" (Ibid., p. 206; Eng. transl., p. 99). Dawānī pays special attention to Suhrawardī's assent that the spiritual observations made by the "pillars of wisdom and prophecy" should be considered more authoritative than the physical observations made by the astronomers such as Ptolemy and Hipparchus, commenting on it by saying that Suhrawardī's intention "was not to say that we should simply imitate (*taqlīd*) these pillars, but (...) to arouse the desire in the student so that he concentrates on the path that allows him to acquire, as far as possible, the separation (*tajrīd*) and subtlety of the intimate consciousness (*talqīf al-sirr*)" (Ibid., p. 188).

In his commentary on Suhrawardī's treatise, Dawānī also supports various philosophical ideas out of the framework of Ash'arite theology. He notably supports the Avicennian theodicy as resumed by Suhrawardī, arguing that "the good is existence and the perfections that follow from it" (Ibid., p. 211; transl., p. 103) and that "divine Providence (*ināya*) is connected with governance of the universal insofar as it is universal primarily and in essence, and with governance of the particular secondarily and by accident" (Ibid., p. 216; Eng. transl., p. 108). Consequently, "since it is

known that anything more perfect than the actual order is impossible, then this order is the best of possible orders” (*Ibid.*, p. 216; Engl. transl., p. 109). He also defends the hypothesis that perfect or pure human souls, after their separation from the body caused by natural death, are translated to internal imaginal bodies, in which they enjoy the witnessing of that other world’s forms. “If they are stripped of the connection with nature, which strongly attracts them to their origin, then they become linked with the heavenly spirits and intelligences, and are ranked differently according to their different degrees in separation” (*Ibid.*, p. 218; Eng. transl., p. 110). This idea, that appeared among Suhrawardī’s disciples and commentators, would eventually be linked with the concept of the “imaginal world” (*‘ālam al-mithāl*) by Shī’i philosophers of the Safavid period such as Fayḍ Kāshānī (d. 1090/1679) and Quṭb al-Dīn Ashkiwarī. Finally, following Suhrawardī’s commentators like Shams al-Dīn Shahrazūrī (d. between 687/1288 and 704/1305), as well as Ibn Sīnā’s *Treatise of love* (*Risāla fī l-‘ishq*), Dawānī emphasizes the cosmological and ontological role of love (*‘ishq*), arguing that love is diffused in all beings as the inclination towards unification with their cause and reaching perfection. According to his view, “this demonstrates that all existent beings have a certain consciousness (*shu’ūr*) differing in level according to the difference in the levels of love” (*Ibid.*, p. 210; Eng. transl., p. 103). Consequently, love is the reason of the motions of the heavens, whose purpose is “the illuminations that unfold to them from their origins, that they may resemble them by these illuminations, as indicated by [Suhrawardī’s] phrase ‘They love the radiance of holiness’, that is, the lights which are their origins” (*Ibid.*, p. 223; Eng. transl., p. 114). He also expressed this idea in a poetic verse in Persian: “Wherever beauty appears, love arises/As being is an unceasing beauty, love is perpetual” (*Sharḥ Rubā’iyyāt*, p. 72, quoted in Dīnānī 2011, p. 433).

In the fourth part of his *Epitome of Sciences* (*Unmūdḥaj al-‘ulūm*), dealing with the principles of religion (*uṣūl al-dīn*) or fundamental theology, Dawānī takes up the classical issue of eternity (*qidam*) or createdness (*ḥudūth*) of the world. He

starts from the observation that there has always been a conflict on this issue between philosophers and followers of the three religions, the latter supporting unanimously the createdness of the world when the former opt for its eternity. With reference to an ancient, anonymous, and untitled philosophical work, Dawānī reports Aristotle’s statement according to which no philosopher had ever supported the createdness of the world except one, presumably Plato. He points out that this is about the world’s temporal createdness (*ḥudūth zamānī*), since all philosophers equally support its essential createdness (*ḥudūth dhātī*) (*Thalātha rasā’il*, p. 284). The reasoning of philosophers who are committed to the eternity of the world is that God, the causer and agent of all things, being eternal, his effect is necessarily eternal (*Ibid.*, p. 286). Dawānī criticizes the arguments of the philosophers and supports the createdness of the world in all its aspects through a purely theological argument: “among the manifest aspects of [divine] wisdom in not having given existence to the world in past eternity, there is the fact of having reserved temporal eternity for Him alone as He reserved essential eternity for Him alone, to better manifest His uniqueness in eternal subsistence without partner” (*Ibid.*, p. 318).

Interestingly, in the *Light of guidance* (*Nūr al-hidāya*) attributed to Dawānī, the author addresses the same issue and defends the idea of a meta-temporal creation (*ḥudūth dahrī*) of the world – defined as the actuality of quiddity after a real and unquantifiable nonbeing – a concept which he believes is apt to reconcile theologians and philosophers (*al-Rasā’il al-mukhtāra*, pp. 114–116). This position would eventually become central to the metaphysics of Mīr Dāmād, the first great master of philosophy of the second century of the Safavid rule in Iran.

Finally, some attention has to be paid to Dawānī’s treatise on ethics, his *Akhlāq-e jalālī* (*Jalālīan Ethics*), also entitled *Lawāmi ‘al-ishraq fī makārim al-akhlāq* (*Flashes of Illumination on Praiseworthy Ethics*), based on the content of Naṣīr al-Dīn Ṭūsī’s *Akhlāq-i Naṣīrī*, intermingled with Ishrāqī elements and quotations of Sufi masters (Rosenthal 1958, pp. 210–223;

Lambton; Woods 1976, pp. 37, 101, 115–118). In this work, Dawānī aims to identify the moral ideal of human perfection, as borrowed from the Aristotelian Ethics, and the Qur’anic account of the nature and the function of man, stating that man’s goal is to become truly “the viceregent of God on earth” (*khalīfat allāh fī l-ard*). He starts from a definition of practical wisdom (*ḥikmat-i ‘amalī*) as “the science of the states of man’s rational soul as praiseworthy and blameworthy actions can proceed from it by will. The purpose of this science is for the soul to become free of vices and qualified for virtues in order to achieve the perfection that is its end” (quoted in Dīnānī 2011, p. 386). It is through wisdom that man achieves his perfection and shows himself worthy of the divine deposit (*al-amāna*) that he was the only creature to accept from God according to Qur’anic verse 33:72. He also defines wisdom as “gaining similarity to the Divine (*al-tashabbuh bi-l-ilāh*, equivalent to Ὁμοίωσις θεῷ) as far as possible,” echoing a famous passage of Plato’s *Theaetetus* (quoted by Dīnānī 2011, p. 391). He integrates Sufism into this definition of wisdom by considering after Suhrawardī (*Talwīḥāt*, pp. 73–74) the great Sufi masters such as Junayd al-Baghdādī (d. 298/911), Abū Yazīd al-Bastāmī, and ‘Abdallāh Tūstārī (d. 283/896), as true sages or philosophers. Moreover, while adopting the Aristotelian system of the four cardinal virtues, he defends the idea that theoretical wisdom is the condition and the end of the other virtues. It is therefore the science that completes all human virtue and perfection: “According to the unanimous opinion of the followers of reason and tradition (*ahl-i ‘aql wa naql*), no virtue achieves its perfection without science,” which he confirms with a prophetic hadith: “men are either teachers or students; the rest [of men] counts for nothing” (quoted in Dīnānī, p. 400). This is in line with the theological idea, as mentioned above, according to which all the essential attributes of God (*ṣifāt al-dhāt*) are included in that of Science. Thus, although wisdom can also be defined as a happy medium between two extremes, namely, cunning and foolishness, theoretical wisdom, the acquisition of which is the goal of philosophy, has neither excess nor end (quoted in Dīnānī, pp. 402–403). By assuming

this philosophical ideal, Dawānī clearly emancipates himself from Ash‘arite theology without remaining within the framework of Aristotelianism either. Rather, he assumes the Neoplatonist heritage as the Shī‘ī philosophers of the Safavid era would eventually do. In the same work, he also developed the view of ideal kingship, following the Platonist and Fārābian tradition, through a series of advices addressed to kings (Nasr and Aminrazavi 2012, pp. 119–133). *Akhḷāq-i Jalālī* has been translated into English by W. T. Thompson and published in London in 1839 under the title of *Practical Philosophy of the Muhammadian People*, a translation harshly criticized by G. M. Wickens (1984).

In conclusion, Jalāl al-Dīn al-Dawānī was an original and influential thinker of the pre-Safavid period, while participating in the encounter of the theological, philosophical, and mystical ideas that somehow prepared the philosophical renaissance in the eleventh/seventeenth century Iran. Alongside his influence in the Ottoman Empire and India, and despite his Ash‘arite orientation, his works had a definite echo in those of the famous Shī‘ī philosophers Mīr Dāmād and Mullā Ṣadrā.

Dāwūd al-Qayṣarī

Veysel Kaya

Department of Islamic Philosophy, Istanbul
Universitesi, Istanbul, Turkey

Dāwūd al-Qayṣarī (d. 1350) was the pioneer of the school of Ibn al-‘Arabī in the fourteenth century. Having authored many of his works as commentaries on the classics of theoretical mysticism, such as *Fuṣūṣ al-Ḥikam* (*The Bezels of Wisdom*) by Ibn al-‘Arabī (d. 1240), *Tafṣīr al-Basmala* (*The Commentary on the Basmala*) by al-Kāshānī (d. 1335), and *al-Qaṣīda al-Tā’iyya* (a mystical poem) by Ibn Fārīd (d. 1234), al-Qayṣarī can be regarded as one of the main theorists and interpreters of Islamic mysticism after the Mongol Invasion. His intellectual activities were mainly focused in Central Anatolia, Egypt, and Western Iran, and in these places, he sought to deepen his knowledge on classical Islamic sciences (Islamic theology and jurisprudence) as well as philosophical mysticism. Al-Qayṣarī is

also regarded as one of the scholars who prepared the intellectual background at the beginnings of the Ottoman Empire, a fact which was evinced by his appointment as a professor in Iznik Madrasa (the first madrasa in Ottoman times) by the Sultan Orhan Gazi (r. 1323–1362). Al-Qayṣarī’s writings had gained wide circulation in the Shiite intellectual communities and the Irfani (gnostic) schools in Iran, an impact which has continued till recent times, as is seen in the writings of the Iranian revolutionist, Ayatollah Khomeini (d. 1989).

Life

Dāwūd al-Qayṣarī’s time and place of birth is uncertain, although it has been conjectured that he was born around year 1260. The sources indicate that he was originally from Sāwa, a city in central Iran. His family migrated from there to Kayseri in central Anatolia, because of the turmoil caused by Mongol invasions in western Asia and Khorasan. Al-Qayṣarī received his early education in Kayseri, Konya, and Tokat; these cities were among the main centers in which scientific and intellectual activities during the Anatolian Seljuks had accumulated. A special reference must be made to his teacher Ibn Sartak, under the guidance of whom al-Qayṣarī studied the teachings of the Maragha school of astronomy and mathematics (Fazlıoğlu, “Osmanlı Coğrafyasında”, p. 25). After establishing many scholarly contacts throughout Anatolian cities, al-Qayṣarī went to Egypt, which was an important center for basic Islamic sciences (theology and jurisprudence) under the governance of the Mamluks at the time, in order to pursue further scholarly goals. A couple of years in Egypt gave him the opportunity to strengthen his ties with the Akbarī circles, namely, the followers of the ideas of Ibn al-‘Arabī. Al-Qayṣarī’s engagement with this dominant mystical school reached its peak when he met in Tabriz his master ‘Abd al-Razzāq al-Kāshānī (d. 1335), one of the influential commentators of the writings of Ibn al-‘Arabī, and spent a long time with him. When he eventually turned back to Anatolia, the new rising Ottoman state was ready to appoint him to the Iznik Madrasa (in the ancient city of Nicaea), the

first official college founded in Ottoman Empire, as professor of Islamic sciences. Dāwūd al-Qayṣarī died there in 1350.

Works and Ideas

Dāwūd al-Qayṣarī's monumental and most known work is *Matla' Huṣūṣ al-Kalim* (*The Explanation of the Special Words*). This work is a commentary on Ibn al-'Arabī's *Fuṣūṣ al-Ḥikam* (*The Bezels of Wisdom*). It comes with an essential introduction, in which al-Qayṣarī lays out the foundations of the philosophical mysticism according to the Akbarian school. This introductory section, which is titled *al-Muqaddima* (*The Introduction*), provides a full-fledged structure of the philosophical mysticism in 12 chapters: existence of God, names and attributes of God, unchangeable/fixed entities (*al-a'yān al-thābita*), substances and accidents, universal worlds and the five divine presences (*al-ḥaḍarāt al-khams*), the universe of ideas/images, the ranks of spiritual revelation (*kashf*), the world as the form of the human reality, the succession of Muhammad and *aqtāb* (so-called the human pillars of the world), the great soul (*rūḥ*) in human world, ascension of soul to God, prophecy, and sainthood. Within these chapters, al-Qayṣarī intended to develop a mystical theory of metaphysics, which was clearly seen as an alternative to that of Islamic philosophy and theology. This attitude of al-Qayṣarī is first and foremost apparent in his understanding of existence. Existence per se, when it is taken "as it is" in the absolute sense, corresponds to the Ultimate Deity itself. Existence per se is devoid of any contrary qualities, such as the distinctions real-mental, universal-particular, substantial-accidental. These qualities can only be predicated of existence or being as a result of the emergence of certain ranks and states that are related to beings other than God. Al-Qayṣarī even describes the ultimate existence as the pure goodness, the eternal, and last but not least the necessary being, all descriptions which are attested for God in classical Islamic thought (pp. 13–17). With this perspective, in which God is equalized with existence, every being in the scale of existence

becomes an appearance of an attribute or name of God. In fact, man is also an appearance (*maẓhar*) of God's most unique name, Allah (p. 48). Human beings can only grasp the true knowledge of things, if they are illuminated by the light of God. In short, God evinces universe, and universe evinces God. Thus, it is not surprising to see that al-Qayṣarī adheres to the Neoplatonic theory that advocates the immaterial concept of soul, rather than its materialist counterpart in classical Islamic theology. Al-Qayṣarī sees no harm in accepting the notions of intellects and souls as ontological entities. In his classification of beings, he places intellects and souls under the category of "spiritual substances," which in turn come under the category of "contingent entities."

In his treatise *Nihāyat al-Bayān fī Dirāyat al-Zamān* (On Understanding the Nature of Time), al-Qayṣarī delves into the discussions on time as a philosophical concept. He initially groups the overall views of philosophers and theologians in two parts: there are those who think that time is an immaterial substance and is necessarily existent like God. There are also those who think that time is an accident, and it is the measure of heavenly movements (Aristotle), or the measure of existence (Abū l-Barakāt al-Baghdādī). Basing himself on previous authorities, such as Avicenna, Naṣīr al-Dīn al-Tūṣī and Shams al-Dīn al-Samarkandī (d. 1322), he rejects all these views and states that the only solution to the question of time is to define it as "the measure of existence's endurance (*baqā*)," rather than "the measure of existence itself." The addition of the term "endurance" here is needed because it is not possible to ascribe to "existence *per se*" the material quality of measure. In the words of al-Qayṣarī, time is in fact a corollary of the divine entity; it emanates from the divine entity in order for the durations of all existent beings created by God to be measured (*al-Rasā'il*, pp. 165–170). This interpretation of al-Qayṣarī shows us again how he emphasizes the concept of existence per se in his philosophical mysticism and relies on it.

One of the works that is recently attributed to al-Qayṣarī (Fazlıoğlu 2017) is titled *al-Ithāf al-Sulaymānī fī l-'Ahd al-Ūrkhānī* (*The*

Dedication of Sulaymān in the Time of Orkhan). As stated in the introductory chapter, the work is dedicated to the Sultan Orhan Gazi (r. 1323–1362), who had invited him to teach in the Iznik Madrasa. Al-Qayṣarī wrote this treatise to raise and discuss certain questions in several religious and nonreligious sciences. The work belongs to the *anmūzaj* literature (*anmūzaj* means “modal examples”), a scholarly literature in classical Islamic thought which is dedicated to discussions of the selected examples in a given science. The aim of this kind of writing is to demonstrate the authority and erudition of the author and his capacity to deal with manifold areas of sciences and disciplines. Accordingly in *al-Itihāf*, al-Qayṣarī tackles the problems in religious disciplines (interpretation of the Quran, sayings of the Prophet, Islamic law, methodology of Islamic law, Islamic theology, and disputation theory) and non-religious ones (geometry, arithmetic, astronomy, optics, logic, metaphysics, physics, medicine, and ethics). In addition to these subjects, al-Qayṣarī also delves into the problems of Arabic linguistics. As regards religious sciences, he addresses such problems as the distinction between the definitions of belief (*īmān*) and submission (*islām*), superiority of prophets over angels, the legal issue of intention in ablution according to the Hanafite and Shafiite schools, the distinction between the inner and outer speech (*kalām*) as an attribute of God. As regards rational sciences, he discusses such issues as the problem of horn angle in Euclid's *Elements* (geometry), the problem of the roots of irrational numbers (arithmetic), the mutual positions of sun and moon (astronomy), the nature of light, colors, and darkness (optics), major and minor premise in conditional syllogism (logic), the problem of whether form is the cause of matter (metaphysics, the issue is discussed in the context of Avicenna's *al-Ishārāt*), the category of quantity (physics), the concept of mixture (*mizāj*, medicine), and lastly the relationship between medicine and ethics (ethics). With all these knotty problems, al-Qayṣarī appears to establish himself as the master of all disciplines, just as was expected of him when he was appointed to the first madrasa in the Ottoman Empire.

De caelo, Commentaries on Aristotle's

Edward Grant

Department of History and Philosophy of Science, Indiana University, Bloomington, IN, USA

Abstract

Aristotle's *De caelo* was his major contribution to cosmology, embracing the celestial and terrestrial regions into which he divided the cosmos. By translations, it passed from Greek to Arabic, and was finally translated from Arabic, and then from Greek into Latin in the twelfth

century. Numerous commentaries and treatises known as *Questions* were written on the *De caelo* from the thirteenth to the seventeenth century. One of the most problematic questions deriving from *De caelo* was whether the world is eternal, as Aristotle argued, or whether it was created as Christians insisted. This difficult question, and others, produced a theological reaction in the form of a Church condemnation of 219 articles in 1277. The central issue that emerged was about God's absolute power. Scholastic natural philosophers assumed that God could do anything short of a logical contradiction. By His supernatural powers, it was therefore assumed that God could do anything that Aristotle had regarded as naturally impossible. This gave rise to numerous hypothetical discussions about what things would be like if God created other worlds and what form that might take, or if He moved our world with a rectilinear motion, or if He made matter disappear and created a vacuum, and so on. In commentaries and *Questions on De caelo* in the sixteenth and seventeenth centuries – following the momentous contributions by Copernicus, Tycho Brahe, and Galileo that had completely subverted Aristotle's physical cosmos – scholastics sought, as best they could, to adjust to the new cosmology.

In his basic works on natural philosophy, Aristotle devoted *De caelo* (*On the Heavens*) to cosmology. Of the four books comprising the treatise, Aristotle devotes the first two to the celestial region, which includes all the stars and planets. Because celestial bodies are incapable of self-motion, they are carried around the heavens by spheres that are concentric with the earth's center. The celestial region extends downward from the outermost sphere of the celestial region – the sphere of the fixed stars – to the innermost sphere of the moon. Aristotle regarded the celestial region as eternal and therefore assumed it to be composed of an ether that was eternal and incorruptible. The third and fourth books treat of the terrestrial region that ranges from just below the moon to the geometric center of the earth. Here we find four terrestrial

elements in descending concentric circles of fire, air, water, and earth, the last mentioned constituting a sphere that lies at the center of our spherical universe.

The first significant commentaries on *De caelo* were written in Byzantium. In the fourth century CE, Themistius (fl. late 340s–c. 385), a Peripatetic philosopher, wrote a commentary on *De caelo*, as did Simplicius (fl. first half of sixth century CE), a Neoplatonic philosopher. Aristotle's natural philosophical works were virtually unknown in the Latin West until the twelfth century. But they were known east of Byzantium, in Syria and Persia, brought there by Nestorian and Monophysite Christians who had been driven from the Byzantine Empire as heretics. Nestorian Christians translated Aristotle's treatises on natural philosophy into Syriac and from the latter they were often translated into Arabic.

Aristotle's works played a significant role in Islamic science and natural philosophy. By far the most important Islamic natural philosopher to comment on Aristotle's works was Averroes (1126–1198), in the twelfth century, who usually made three different types of commentaries on most of Aristotle's natural philosophical works, including *De caelo*. There was the short commentary, which was really a paraphrase or summary, of Aristotle's text. The second, or middle commentary, was also not a direct translation, but gave the meaning of a brief segment of Aristotle's text intermingled with comments by Averroes. The third and last type of commentary was the Long Commentary, which included all of Aristotle's text presented sequentially section by section, with each section followed by Averroes' commentary on that section. In the short and middle commentaries, it was often difficult to distinguish Aristotle's text from Averroes' comments.

During the twelfth and thirteenth centuries, Aristotle's *De caelo* finally reached the West in Latin translation. Gerard of Cremona (c. 1114–1187), the greatest medieval translator of Aristotelian texts from Arabic to Latin, translated *De caelo*, while in the thirteenth century William of Moerbeke (c. 1215–c. 1286) translated some 49 works from Greek into Latin, including *De caelo* and virtually all works attributed to

Aristotle (Grant 1974). Two important commentaries on Aristotle's *De caelo* were also available to medieval authors, namely Michael Scot's (d. c. 1235) translation from Arabic to Latin of Averroes' (Ibn Rushd) Long Commentary on *De caelo*, which was popular between the thirteenth and sixteenth centuries (as evidenced by 30–40 extant manuscripts), and William of Moerbeke's translation from Greek to Latin of Simplicius' Commentary on *De caelo*.

In the thirteenth century, Albert the Great (c. 1200–1280) and Thomas Aquinas (c. 1224/1225–1274) followed Averroes in their commentaries on *De caelo*. Albert wrote a paraphrase and Thomas an *Exposition*, although instead of including the whole relevant text, he substituted a few words – known as cue-words – from the beginning of the passage that would presumably enable the reader to identify the proper text in Aristotle's *De caelo*.

In the fourteenth and fifteenth centuries, the most popular form of commentary on *De caelo*, and other of Aristotle's texts, was the *Questiones*. The questions format was developed at the medieval universities from a type of classroom disputation known as the "ordinary disputation." In such a disputation, the teaching master proposed a question and then selected one student to defend the affirmative side and another to defend the negative side. After both sides had presented their arguments, the master proposed a solution, thus resolving or "determining" the question. This formed the basis for the written questions on Aristotle's books on natural philosophy. They all bore the title *Questions on [title of Aristotle's treatise]*.

In the fourteenth century, Nicholas Oresme (c. 1320–1382) performed an extraordinary feat that was never duplicated. He produced two strikingly different interpretations of *De caelo*. In his earlier career, as a master of arts at the University of Paris, he wrote a questions treatise on *De caelo* between 1346 and 1356. Around 1370, King Charles V of France requested Oresme to translate four of Aristotle's treatises from Latin into French. The fourth treatise was *De caelo*, which Oresme translated around 1376 with the title *Le Livre du ciel et du monde*. Oresme not only translated

Aristotle's text into French, though usually by paraphrasing the text, but added a section-by-section French commentary. Each commentary was preceded by the entire relevant Aristotelian passage. It was Oresme's final treatise and was undoubtedly the most brilliant *Commentary on De caelo* in the whole of the Middle Ages. As recognition for his four French translations, King Charles made Oresme the Bishop of Lisieux in 1377.

To arrive at some idea of the number of extant commentaries on *De caelo* between the years 1200 and 1650, one should consult the indispensable catalogs compiled by Charles Lohr (1967–1974, 1988). A count reveals 278 authors who commented on *De caelo* treatises. Of these, 40 are known only from manuscript catalogs or were mentioned by other authors, which leaves 238 authors represented by a manuscript or a printed edition, or both; 139 are only in manuscript form; 76 are only in printed editions; 21 exist in both manuscript form and printed editions. If we add 76 and 21, we obtain 97 printed editions of *De caelo* (Grant 1994: 29–30). Of the 278 authors who commented on *De caelo*, a total of 71 wrote between the thirteenth and fifteenth centuries (18 in the thirteenth, 21 in the fourteenth, and 32 in the fifteenth centuries), while a total of 207 composed their commentaries during the sixteenth and seventeenth centuries (108 in the sixteenth and 99 in the seventeenth century). It is obvious that *De caelo* was still frequently commented upon well into the seventeenth century. Its popularity may have derived from the impact of Nicholas Copernicus' (1473–1543) heliocentric theory published in 1543 (*On the Revolutions of the Heavenly Bodies*).

Commentaries and *Questions on De caelo* ranged over numerous cosmological issues. Of great significance was Aristotle's argument that the world is eternal, having neither beginning nor end. Here Aristotle was in direct conflict with the Christian faith, which assumed that God had created the world from nothing and would eventually destroy it. In the Condemnation of 1277, of the 219 articles condemned, some 27 denounced the eternity of the world in many contexts. In their *Questions on De caelo*, natural philosophers such

as John of Jandun (1285/1289–1328), John Buridan (d. 1361), and Nicholas Oresme argued that the world could not have been brought into being by natural means, because no natural means could be identified. Hence, they argued that in terms of natural causation, the world should indeed be eternal, as Aristotle had argued. Nevertheless, almost all commentators on *De caelo* believed on faith that the world is not eternal, but was created by God (Grant 1994: 76).

A number of comments on *De caelo* were influenced by the Condemnation of 1277. In his *De caelo*, and in many of his treatises, Aristotle had argued that certain phenomena were naturally impossible, as, for example: an infinite world, the existence of other worlds, the existence of anything beyond our world, and so on. Christian theologians viewed Aristotle's claims as effectively denying God the power to perform any of these acts, even if He chose to do so. Thus, they viewed Aristotle's arguments as a denial of God's absolute power to do anything short of a logical contradiction. Thereafter, scholastics allowed that God could do all the things Aristotle had said were impossible. They showed this by hypothetically assuming that these naturally impossible conditions were real and arguing accordingly. Many *De caelo* commentaries included a number of hypothetical questions and many arguments were thereafter formulated "according to the imagination" (*secundum imaginationem*). Although God could do naturally impossible things, none believed that He had actually done any of them, or would do them. But since they were possible by God's absolute power, scholastics envisioned worlds that were radically different from Aristotle's, even though they agreed with him that these hypothetical phenomena were indeed naturally impossible. The alternative was to abandon Aristotle's cosmos, a possibility that was never seriously entertained during the Middle Ages.

De caelo commentators often asked whether a body moved circularly could be infinite, and similarly for a body moved rectilinearly. If an infinite body moved circularly and completed one circulation in a finite time, it would follow that an infinite body traversed an infinite space in a finite

time, which is absurd (Grant 1994: 109). It was also usual to inquire whether an infinite body could move rectilinearly. Buridan denied that it could, because many infinite places would have to exist as the body moved into and out of them successively. Moreover, all bodies moving rectilinearly must be in a place. But an infinite body cannot be in a place, because no body could contain it (Grant 1994: 109–110). These were Aristotle's arguments. But Buridan concedes that, according to article 49 of those condemned in 1277, it is an error to say that God could not move the whole world with a rectilinear motion. Thus, God could move the entire world rectilinearly even though the world is not in a place, because nothing lies outside of it to serve as a place.

In a question asking whether an infinite body is possible, Buridan denies that it is naturally possible, and also denies that God could create an infinite body, because then He could not create a body greater than that infinite body, since there is nothing greater than an infinite body. Thus would God's absolute power be limited (Grant 1994: 111). A number of scholastic theologians – for example, William of Ockham (c. 1285–1347), Gregory of Rimini (c. 1300–1358), Robert Holkot (c. 1290–1349), Henry of Harclay (c. 1270–1317), and others – argued the opposite: God could indeed create an actual infinite, although none believed he had done so. Those who adopted this interpretation were called "Infinetists."

Article 34 of the 219 articles condemned in 1277 declared, "That the first cause could not make several worlds" (Grant 1974: 48). This was Aristotle's opinion and was condemned because it denied to God the absolute power to create as many worlds as He wished. In the fourteenth century, *Questions on De caelo* always included a question as to whether God could create other worlds. Although medieval scholastics did not really believe that God had created other worlds, or would ever do so, they routinely argued that God could indeed create other worlds. Many assumed hypothetically that God did indeed create other worlds and then raised questions about the characteristics of those worlds. In refuting the existence of other worlds, Aristotle had assumed

they were all alike and were somehow distant from one another. But medieval natural philosophers posed questions that probably never occurred to Aristotle. If other worlds existed, did they exist simultaneously? Or did they exist successively, one world at a time? If simultaneously, were they all distinct and independent of one another? Or were they concentric, with one spherical world inside another?

Aristotle had claimed that if other worlds existed simultaneously, the earth of one world would move toward the earth of another world. This implied that an earth would have to rise up against its natural inclinations and somehow get through space and enter another world where it would seek to join the earth at the center of that world. To avoid this absurd consequence, Buridan and Albert of Saxony (c. 1316–1390) insisted, as did others, that each earth would remain at the center of its own world and have no inclination to join the earth of another world. In their view, each world is independent of every other world.

In his French commentary on *De caelo*, Nicholas Oresme used a plurality of worlds to introduce the subject of void space lying beyond our world. On the assumption of a plurality of spherical worlds, Oresme insisted that a void space would exist between any two of them. Thus did Oresme reject Aristotle's arguments that it was impossible that anything – place, plenum, void, or time – exist beyond our world. It was supernaturally possible. Indeed, Oresme argued that the void space beyond our finite world is infinite and is God's infinite immensity, although God is not an extended being (Oresme 1968: 177). Oresme's identification of God with infinite void space would be repeated in the seventeenth century by such figures as Nicolas Malebranche (1638–1715), John Locke (1632–1704) (Grant 1981: 239), Henry More (1614–1687) – although More viewed God as extended in His infinite space – and Samuel Clarke (1675–1729) (Grant 1981: 248).

Article 49 of the Condemnation of 1277 denied that God could move the entire spherical world with a rectilinear motion because a vacuum would be left in the place vacated by the world. This was a common question in *De caelo* commentaries.

Buridan and Oresme insisted that by his supernatural power, God could indeed move the world with a rectilinear motion even though the world is not in a place and would be moved through a vacuum, leaving a vacuum behind in its former location. Because there is nothing outside of our world, Oresme regarded the rectilinear motion of the world as an absolute motion, a concept that made no sense in Aristotle's world. Indeed such a motion would deny Aristotle's concept of place and motion.

Long before Copernicus, medieval natural philosophers were discussing whether or not the earth lies immobile in the geometric center of the world, as Aristotle argued. Indeed, it was one of the most popular questions in medieval cosmology. One form of the question inquired whether the earth rotates daily on its axis. Although numerous scholastic commentators posed this question, none accepted the earth's daily axial rotation as physically true. In his French commentary on *De caelo*, after extensive arguments in favor of the earth's rotation, Oresme rejected it, insisting, however, that it was nonetheless a viable hypothesis, because neither reason nor experience could resolve the issue.

Another aspect concerning the earth's motion was whether it might move slightly in the position it occupied at the center of the world. On this issue, John Buridan departed radically from Aristotle. Buridan agreed that if the earth were homogeneous and spherical, its center of magnitude and its center of gravity would coincide with the geometric center of the world. But the earth is obviously not homogeneous and therefore its center of magnitude does not coincide with the center of the world. However, the earth's center of gravity coincides with the true center of the world. But it does so in a very strange manner. Continual geological processes throughout the earth cause its center of gravity to change incessantly as it seeks to coincide with the geometric center of the world. Buridan concluded that the earth continually moves with small rectilinear motions that never cease because the earth incessantly undergoes geologic changes. Albert of Saxony and John Major (1467/1468–1550) adopted this position in the fourteenth and sixteenth centuries

respectively. After the Copernican theory was condemned in 1616, very few commentators on *De caelo* adopted Buridan's idea of a slightly moving earth.

When commenting on *De caelo* medieval scholars overwhelmingly emphasized the first two cosmological books, paying much less attention to the third and fourth books that were devoted to the heaviness and lightness of bodies and their motions. Some, like John Buridan, formulated a question in the third book that was concerned with whether the motive force that projects a stone, or continues the motion of an arrow, are moved by an external force or by an internal force that was usually called *impetus*.

Commentaries on *De caelo* continued to the end of the seventeenth century. The Catholic Church's condemnation of the Copernican theory in 1616, and of Galileo in 1633, made the heliocentric system unacceptable to Catholic commentators. But the geoheliocentric theory proposed by Tycho Brahe (1546–1601) in the sixteenth century was adopted by some scholastics. Brahe denied the daily rotation of the earth and retained its position in the center of the world. However, he assumed that all the planets – except the earth – moved with circular motions around the sun as their geometric center. The Jesuit natural philosopher, Melchior Cornaeus (1598–1665), adopted Brahe's geoheliocentric system in his *De caelo* commentary and thus made a dramatic departure from the traditional Aristotelian medieval system.

Tycho Brahe caused another major change in *De caelo* commentaries. By his observation of the comet of 1577, Brahe concluded that the comet moved in the celestial region and that the heavenly region was composed of a fluid substance, not hard celestial orbs, as had been generally assumed since the Middle Ages. If the orbs were hard, the comet would have smashed through them in ways that would have been detectable, which, of course, did not happen. As a consequence of Brahe's rejection of hard orbs, at least ten scholastic authors in the seventeenth century added a question to their *De caelo* commentaries that had never been discussed in the Middle Ages: "Whether the heavens are fluid or solid" (Grant 1994: 705). Those who opted for a fluid heaven also abandoned Aristotle's

fundamental concept that the celestial ether was incorruptible and unchangeable.

The new questions that were incorporated into early modern scholastic *Questions on De caelo* as a result of the cosmological changes proposed by Copernicus and Brahe were quite dramatic. Many scholastics, especially among the Jesuits, adopted Tycho's system in which the earth remained stationary in the center of the world, while the other planets moved around the Sun as their center of motion. Thus, *Questions on De caelo* underwent significant changes. But this should not obscure the fact that the great majority of questions first presented during the late Middle Ages, continued to be discussed to the end of the seventeenth century. We may conclude, therefore, that although traditional questions continued to dominate among *De caelo* authors, there was a genuine attempt to take cognizance of the revolutionary cosmological changes of the early modern era.

De generatione et corruptione, Commentaries on Aristotle's

Stefano Caroti

Dipartimento di Filosofia, Università degli Studi di Parma, Parma, Italy

Abstract

According to Andronicus of Rhodi's edition of Aristotle's works in the second half of the first century BCE, the two books of *De generatione*

et corruptione follow *De caelo* and antecede *Metereologica*. The three kinds of changes in addition to motion (dealt with in *Physica* and *De caelo*) are the main topics of *De generatione* as well as the attribution either to the four elements (material cause) or to the motion of the sun in the ecliptic (efficient cause) of the origin of such changes. They are: (a) generation and corruption when only the primary matter persists, while substantial form changes; (b) alteration, when substance persists and only qualitative properties change; (c) growth and diminution when change is limited to quantitative properties. Other very important physical notions such as action and passion, mixture and the role of simple bodies in mixed ones are as well discussed. This work reached the Latin middle age through the two main channels through which Aristotle's work spread in the Latin West, the Greek, and the Arabic. From the latter the medieval commentators borrowed a very useful instrument to get a better acquaintance with the topics discussed in Aristotle's work: Averroes' middle commentary, which contains also some hints to Greek commentators. In thirteenth-century Latin commentaries, the need to get to the heart of the text prevails, while in the fourteenth century the discussions of the more urgent philosophical topics overcome the literal explanation.

In the Greek tradition of *De generatione et corruptione* only Philoponus' commentary has been preserved; it was translated in Latin by Gerolamo Bagolino in the sixteenth century and published by his son in 1540. Philoponus' commentary (in which Alexander of Aphrodisias is often quoted) can be considered the model of the following commentaries: it provides precise informations about the Aristotelian context of the topics discussed in *De generatione et corruptione* (referring to *De caelo*, *Physica*, *Metereologica*, and *Metaphysica*) and goes deep into some of the most relevant problems dealt with, paying particular attention to the arguments against atomism.

Part of the Latin (the translation of Gerard of Cremona) and the Hebrew (the translation of Zerahyah ben Yshaq, end of the thirteenth century) tradition of Aristotle's *De generatione et corruptione* comes from the Arabian translation from the Syriac (by Hunayn b. Ishāq, Baghdad, ninth century). In addition to Hunayn's son Ishāq ben Hunayn's translation, more Arabic translations are recorded of the lost Greek commentaries by Alexander of Aphrodisias, Themistius, Olimpiodorus, and John Philoponus. In the Islamic world, Avicenna dealt with topics discussed in *De generatione et corruptione* in the third part of his *Shifā'*, known in Latin as *Sufficiencia*. The *Liber tertius naturalium De generatione* was translated only in 1280 in Toledo and it was not very diffused among the Latin scholars. It cannot be properly considered a commentary to Aristotle's work, even though it deals with topics discussed in *De generatione et corruptione*. The persistence of the elements in the mixed bodies is one of the main interests in Avicenna's text: he is convinced that they outlast without any change in mixed bodies, the changes interesting only the accidental forms. This was a problem largely debated in the Latin medieval tradition of *De generatione et corruptione* and was associated with topics such as the intension and remission and plurality of forms. Avicenna's solution was known through Averroes' censures in his *De caelo* commentary, where he attributes to substantial forms of the elements a weaker ontology (they are an intermediate stage between substantial and accidental forms). The mixed body, therefore, has a special substantial form with qualitative properties resulting from the mixture of the elementary qualities.

Averroes' (known in the Middle Ages also as "Commentator") middle commentary on the *De generatione et corruptione*, translated probably by Michael Scot around 1230, is by far more important for the western Latin tradition of Aristotle's work. Not only in the commentaries of the more prominent medieval thinkers, but also in the anonymous glosses the Commentator's interpretation of Aristotle's text is very often quoted as a sure authority. The difficult and often too concise Latin translations (both from the

Arabic and Greek) find in Averroes' explanatory notes a clear settlement, which consents a wider understanding of Aristotle's arguments; also the information about the ancient philosophical systems (Plato, Democritus, Leucippus, Anaxagoras, and Empedocles) is widely used by the medieval masters for a more adequate acquaintance with Aristotle's criticism.

De generatione et corruptione was available to the Latin world in two translations: from the Arabic by Gerard of Cremona (*translatio nova*) and from the Greek original by Burgundio of Pisa (*translatio vetus*). The latter was more widely diffused than the former and was used by Albert the Great, Thomas Aquinas, and Aegidius Romanus. Aegidius used both the old and the new translations, the former being according to him more respectful of Aristotle's intention.

The content of *De generatione et corruptione*, as well as of other works by Aristotle, Seneca, and Boethius, circulated since the thirteenth century in a very abridged form, namely as a list of sentences, in which the philosophical topics discussed in the two books were synthetically recorded (*Auctoritates Aristotelis*, ed. Hamesse 1974: 167–171). This kind of summary of Aristotle's philosophy was widely used by medieval commentators; very often quotations from *De generatione et corruptione* as well as from other works follow the text of *Auctoritates* rather than the original. Its favorable reception is confirmed, moreover, by the medieval tradition of comment on *De generatione et corruptione*: very often, in fact, the titles of the questions are drawn literally from *Auctoritates*; to mention only the more common: the persistence of matter in generation and corruption, the permanence of similar qualities in generated and corrupted things, the eternity of generation and corruption, reaction following action, the end of motion when properties are acquired by the generated thing, the permanence of primary qualities in the mixed, the elemental qualities, the easier transmutation between bodies with similar properties.

The *Auctoritates* records some sentences, in addition to those from Aristotle's text, from the commentaries on *De generatione et corruptione*

by Averroes and Albert the Great which are the two most important contributions to the full appreciation of the topics therein discussed in the Latin world. After the first early diffusion in some of the medical works from the School of Salerno, the fortunes of *De generatione et corruptione* depend exclusively on its use in the newly established university training.

Together with Averroes' commentary, the paraphrasis of Aristotle's *De generatione et corruptione* by Albert the Great can be considered the most influential contribution to the understanding of Aristotle's work in the Latin medieval culture. It is exactly this form of commentary which consents a more precise acquaintance with the not always perspicuous Latin translation. Albert's project, in order to make intelligible Aristotle's text, is to maintain part of the Latin words and expressions in a wider context of explanation; he reserves, moreover, a deeper analysis to particular topics in his digressions to the textual exegesis. Albert's choice of the topics to be more carefully considered, has a relevant role in the medieval commentary tradition, since part of the questions raised by the Aristotelian text have their origin in such digressions. According to Albert, *De generatione et corruptione* is the third and last part of the natural philosophy, having as its object motion concerning either substantial (coming and passing away) or accidental (alteration, augmentation, and diminution) forms of natural bodies. The special object of this part of natural philosophy, as well as its place in the wider domain of physics, is after Albert's commentary the first problem discussed in commenting on *De generatione et corruptione*. In several digressions Albert gives a more extensive presentation of Democritus, Leucippus, and Plato's solutions about the composition and the action of natural bodies, extending Aristotle's sketchy critical outlines. Albert deals also with the most relevant topics such as the role of potency and matter in generation, the different functions either of substantial forms and qualities in generation and mixture, or of the soul in human growth (where medical notions like the *humidum radicale* integrate Aristotle's solution), the permanence of the elements in the mixed bodies, the efficient

causality of celestial bodies, in particular the motion of the sun in the ecliptic.

Thomas Aquinas' commentary on *De generatione et corruptione* was prepared in Naples and it was, according to William of Tocco's biography, Thomas' last work on philosophy. Like other commentaries on Aristotle, it was not finished by Thomas; the lacking part of Book I (from ch. 5) and Book II was provided by Thomas of Sutton. Following his teacher Albert's lead, Thomas commented on Aristotle's text, but his explanatory strategy was very different from the paraphrasis of Albert the Great. The philosophical exegesis is introduced by a very careful presentation of Aristotle's text (*divisio textus*); the topics discussed by Aristotle are reconsidered and presented in a clear logical form, which permits a deeper acquaintance with philosophical problems (often labeled as questions). Albert's and Thomas' commentaries opened the way to the style of widely diffused commentary in the fourteenth-century Latin medieval tradition: the questions on Aristotelian works. In his commentary Thomas is particularly determined on arguing against the materialistic views of the atomists and of Plato, whose geometrical foundations of natural change ignore the importance of the formal structure of natural bodies. Generation and corruption include both matter's potentiality and substantial form's actuality. Thomas defends his conviction of the unicity of the substantial form arguing against Avicenna, who maintains in his *Fons vitae* that a plurality of hierarchically ordered forms is required for every being.

His two commentaries, in the form of explanation and questions respectively, bear witness to Aegidius Romanus' high interest toward *De generatione et corruptione*. The questions are limited to part of the first book, while the explanations are for the complete text. This latter commentary is different from both those of Albert the Great and Thomas; Aegidius limits himself programmatically to present Aristotle's intention and to clarify his way of arguing, reserving for the commentary through questions the discussion of the more important topics raised in the text (only at the beginning we find some topics widely discussed in a similar fashion to the questions

commentary). In commenting on Book II Aegidius introduces the wider analysis of philosophical topics as particularly relevant problems (*dubia*), after having explained Aristotle's text; these *dubia* are evidently what would have been reserved for the questions commentary, which Aegidius did not write. This change in the commenting strategy is very important: in the fourteenth century there is an evident distinction between the two kinds of commentary: the explanation is normally limited to an illustration of Aristotle's text, division of the text, and presentation of the main arguments, while the most relevant topics are discussed through the questions. Aegidius, like Albert and Thomas, is particularly eager in denouncing the limits of Democritus' and Plato's convictions about the primary components of natural bodies. In order to grant the infinite divisibility of matter as well as the natural bodies' possibility of action and passion Aegidius distinguishes between two different sorts of act: *actus in fieri* and *actus in facto esse*; the infinite divisibility is not consented in the latter. Discussing on matter Aegidius upholds his theory of the presence in matter of a certain formal element, labeled corporeity, which gives it an indefinite quantitative feature (*dimensiones interminatae*). In his questions commentary on Book I Aegidius deals with the problems raised by the atomists, with the essential features of generation, alteration, and augmentation, but also with the intension and remission of forms as well as with the limits of continuous motions like alteration.

Both Siger of Brabant and Boethius of Dacia, the two Masters of Arts who in Paris adhered to the new physical and moral doctrines drawn from Aristotle, commented on *De generatione et corruptione*. Siger limited himself to a concise explanation, while Boethius dedicated a certain number of short questions to the main problems discussed in Book I, privileging in the second the action of celestial bodies on the elemental sphere. In the prologue of his commentary Boethius states that man's highest perfection is in knowing the truth and in behaving rightly. In arguing against Plato's convictions about the origins of the world, Boethius points out that according to Aristotle cosmos has no beginning, contrary to what is

maintained by Christian faith; the same topic is discussed in the last question on Book II as well as in his *De aeternitate mundi*.

In the fourteenth century, Aristotle's *De generatione et corruptione* was often commented on at the University of Paris, where John Buridan, Nicholas Oresme, Albert of Saxony, and Marsilius of Inghen did their best to discuss in the wider context of Aristotelian philosophy the topics raised in the two books. Only John Buridan wrote two commentaries, an explanation commentary (*sententia*) and a questions commentary, while Nicholas Oresme, Albert and Marsilius limited themselves to the questions commentary; having been published in the early sixteenth century, Albert's and Marsilius' commentaries were largely diffused in Renaissance and Early Modern Aristotelian scholastic philosophy. Among others, the English philosopher Walter Burley wrote an explanation commentary, which had a much more limited circulation than his *Physics* commentary, edited in 1505.

In the fourteenth century, explanation commentaries had a minor role in comparison with those of the thirteenth century; their function was often reduced to the division of the text. The questions commentaries, on the contrary, assumed a complex and articulated structure so much so that a question or a group of questions could be sometimes considered a real treatise (for example, question 11 on Book I of Oresme's commentary on *De generatione et corruptione*, dedicated to reaction). In the central section of the questions, commentators usually provide a useful analysis of philosophical terms as well as different possible solutions to the problem(s) discussed; the opening arguments introduce a solution(s) different from that (those) introduced in the central section and the final arguments provide a critical view on this (these) same solution(s). Commentaries on *De generatione et corruptione* supply in this way a complete abstract of the more debated topics on natural philosophy, including logical and metaphysical aspects.

The French tradition from John Buridan to Marsilius of Inghen will be considered here as a whole. The opening questions of these commentaries enquire the possibility of a science

concerning generation and corruption. Together with the traditional distinctions between the different kinds of evidence in mathematics and in physics, a particular interest is devoted to the linguistic analysis, which permits to discriminate generation (interesting absolute, substantial terms) from alteration and augmentation (limited to connotative, accidental terms).

In canvassing the different features of generation and alteration new physical notions are introduced: changes which prelude and prepare generation and corruption (*alteratio praevia*) are continuous motions, while generation is an instantaneous transformation. These different kinds of changes occasion some very important analyses concerning natural, artificial, and violent transformations and consequently modal notions such as necessary, possible, and impossible. Determinism is ruled out by distinguishing between temporal and eternal necessity, the latter reserved only to the never-changing God's perfection, while even natural events like lunar eclipses can be frustrated, notwithstanding their apparent necessity.

According to Aristotle, generation is always coupled by corruption: this connection raises problems about the role of matter and above all about the relationship between the forms in both generated and corrupted bodies. All the Parisian commentators we are here considering adhere to the unicity of substantial form theory (with the exception of Oresme, who defends double substantial principle in human beings, which according to Marsilius of Inghen is an open adhesion to the plurality theory).

The problem concerning the identity of natural bodies interested in physical changes is raised in debating growth and diminution. Man's identity is assured by his soul, which is the same through different changes and ages, while in natural elemental bodies it is very hard to point out such a principle, precisely because of the continuous partial or total variations. Identity is a notion that can be properly used only for permanent things, while for successive ones (like those submitted to physical transformations) it can be used only in a larger sense.

The problem of action and passion in natural bodies heralds the last topic of Book I of *De*

generatione et corruptione, namely mixture. In addition to the traditional problems concerning the contact between agent and patient, in these commentaries the model of the diffusion of light (*multiplicatio specierum*) is assumed as a possible way of accounting for natural action. The atomist theory of change gives the occasion to John Buridan to deal with the possibility of the infinite division. The other commentators, beginning with Nicholas Oresme, introduce new philosophical notions such as intension and extension, referring respectively to the degree of intensity (*intensio qualitatis*) and to the spreading (*quantitas qualitatis*) of the quality in the natural body. These are the basilar notions of the *De configurationibus qualitatum* doctrine to which Nicholas Oresme dedicated a special treatise, which can be considered as one of the most innovative tools in natural philosophy, relying also on geometry and mathematics in order to explain physical changes. The latitude of forms is used in the questions of Book II to research into the ways of interacting of the elemental qualities.

Mixture raises very important problems concerning its natural or violent nature: all the elements, in fact, must be involved in order for a mixed body to be produced. The permanence of the elemental forms in the mixed body, moreover, revive the old contraposition between Avicenna and Averroes, the former against any possibility of change inside substantial forms, the latter more favorable to such a possibility for the elemental forms, exactly to let them survive inside the mixed bodies. In addition to the traditional topics either of intension and remission of forms or of the unicity/plurality of forms, new notions such as the temporal limits of alteration and generation of a mixed body (*primum/ultimum instans; maximum/minimum quod sic/quod non*) and reaction (the action of the patient on the agent) are introduced in these questions, together with the new mathematical tools to study motion (*de proportionibus*). In the last question(s) on Book II of *De generatione et corruptione* of the fourteenth-century Parisian commentaries we are considering here, a very significant change is to be recorded: the problem of the duration of natural bodies is analyzed relying on these new tools

(temporal limits) rather than on astrological notions, as in the case of Albert the Great's commentary.

With Lefèvre d'Etaples' *Paraphrases*, published in Paris in 1501 the tradition of Aristotle's *De generatione et corruptione* enters in a new age, in which the need of a more correct acquaintance with the text is more urgent than that with the philosophical topics (also the *Commentarii collegii Conimbricensis* on *De generatione*, where the late medieval discussions are very often recorded, have a similar approach).

Demetrios Kydones

Ivan Christov

Faculty of Theology, University of Sofia, Sofia, Bulgaria

Abstract

Demetrios Kydones (c. 1324 Thessaloniki to c. 1398 Crete), also spelled Demetrius Cydones, is a key figure in the intellectual and political life of Byzantium in the fourteenth century. Demetrios' greatest contribution is perhaps the intellectual challenge he poses to Byzantine conceit, as regards the cultural and spiritual achievements of the West. His translations of Latin theological texts as well as literary works indicate that the West was well aware of the Greek heritage, which the Byzantines considered as their prized national possession. The depth and clarity of

thought, pertaining to Western theology, put to test the dogmas, deeply engrained in Byzantium. Thus, Demetrios turns out to be one of those who stimulated an intense theological controversy, in the course of which Byzantine thought had to contend its identity against western Scholasticism. In his philosophical views, he is far from original. Just like his brother Prochoros Kydones, he supports Thomism, juxtaposing Christian Aristotelianism to the Neoplatonic aspects in the teaching of Gregory Palamas.

Life

Demetrios Kydones was born in Thessaloniki into a noble Byzantine family. He was instructed in the liberal arts by the distinguished scholar and theologian Neilos Kabasilas and was given spiritual guidance by the future ecumenical patriarch Isidore Boucheiras, who also taught him classical Greek language and literature. It is disputable whether he was in touch with Barlaam of Calabria during his stay in Thessaloniki (1335–1341). Following his father's death in 1341, Demetrios had to take over the responsibility of his family. He was in close connection with John Kantakouzenos and had to leave the town during the Civil War (early summer of 1345). When in February 1347 Kantakouzenos' army entered Constantinople, Demetrios was appointed Master of Requests at court. He soon became renowned as an expert in classical literature. Initially, his interest in Latin was dictated by a pragmatic impulse, but his making himself acquainted with Thomas Aquinas' work helped him discover his vocation, namely to introduce the ideas of Latin theology in Byzantium.

In December 1354, he finished his translation of *Summa contra gentiles*. Encouraged by his success and with his brother's help, he translated *Summa theologiae* (Parts I and II) and *De rationibus fidei ad cantorem Antiochenum*. In Byzantium, Demetrios introduced various other Latin patristic and scholastic texts: excerpts from Augustine's *Letters* (ep. 28, 82, 143), *Sermons on the Gospel of St. John*, complete translations of

Anselm of Canterbury's *De processione Spiritus Sancti* and *De asymo et fermentato*, and Ricoldo of Monte Croce's *Refutation of the Qur'ān*. The original literary work of Demetrios was highly influenced by his Latin sources. He wrote the moral philosophical essay *De contemnenda morte*, three apologies explaining his conversion to Latin Catholicism, and a still unpublished *Defense of Thomas Aquinas Against Neilos Kabasilas*. The voluminous collection of 447 letters and his *Exhortations* are a valuable source for the history of Byzantium and its relations with the West and with the Turks.

His detailed knowledge of Latin theology enhanced his dissatisfaction with the Palamite doctrine and with Byzantine theology in general. By 1365, Demetrios had made a profession of faith in the Latin Church. In this time of political maneuvers, this did not affect his career at court, and he was appointed prime minister from 1369 to 1383 and later from 1391 to 1396. In 1390–1391, Kydones opened an academy of Greek culture in Venice, introducing the study of the Greek language and thought to the Italian Renaissance. In 1396, hostility toward his Latin Catholicism grew, and he had to retire to the island of Crete, where he died.

Thought

Demetrios Kydones' primary reason for translating Latin theological works was to deal with the theological controversies of his age. From a Thomistic stance, Demetrios challenged the Neoplatonic aspects of Hesychasm. He supported the notion of God's simplicity, turning a cold shoulder to the distinction between essence and energies, which implies a distinction between essence and existence. On the contrary, according to Palamas there is a pre-eternal emanation of the energies of God's essence, constituting the divine wisdom or intellect, which is divine but not God and on the other hand is also not created. The philosophical sense of this debate lies in the juxtaposition of Aristotelian metaphysics, modified according to the scholastic teaching of transcendentals, to the Christian Neoplatonism of Palamas. From these

teachings, unlike Barlaam and Ankyndinos, Demetrios inferred that it is possible to apply apodictic syllogisms in theology. He tried to retain his adherence to this stance from a Thomistic point of view. In Thomas' doctrine, he saw a means of solving the problems of Hesychasm.

According to Demetrios, Thomas offered the best method of reaching the truth. Reasoning and the use of syllogisms lay in the very essence of man. The Creator attributed an intermediary place to the human soul between the intelligible and the sensible nature. This determines a midway mode of knowledge between the immediate intuitive knowledge and the experience of the senses. That is why knowledge cannot be carried out without change. Demetrios embraced the Thomistic conception of two modes of discourse. The first takes the sense data as a starting point, proceeds to the proximate truths, and is elevated to the prime and direct principles. The other type of discourse follows the opposite flow of thought, coming from the absolutely simple being to the composite things. Thus, knowledge enables the connection of the absolute and the contingent being. This is the essence of syllogism. Therefore, the use of syllogisms is a feature of human nature. Being the best of our faculties, reason exerts the best act and contributes to our final natural end. Paradoxically, Demetrios resembles Palamas, allowing for the application of apodictic syllogism in theology, but from a Thomistic point of view.

The literary work of Demetrios had as its consequence the most radical differentiation of conceptual patterns of Eastern and Western theology.

Denys the Carthusian

Alessandro Palazzo

Dipartimento di Lettere e Filosofia, Università degli Studi di Trento, Trento, Italy

Abstract

After having studied philosophy at the University of Cologne “in the way of Thomas” (in via Thomae), Denys de Leeuwis (b. 1402; d. 1471) entered the Charterhouse

at Roermond, where he spent, almost uninterrupted, the rest of his life. To him we owe a massive literary output, which he organized according to a three-tiered hierarchical scheme of wisdom: philosophy is the lowest level of a hierarchy which, through scholastic theology, culminates in mystical theology. The three orders of wisdom are analogical and isomorphic; that is, philosophy prepares for and somehow foreshadows the superior modes of supernatural knowledge. This explains Denys' keen interest in philosophical matters. Unlike the majority of fifteenth-century Carthusians, Denys conceived of mystical theology not as an affective act only, but as a cognitive act complemented by love. Influenced by Pseudo-Dionysius the Areopagite, Albert the Great, Henry of Ghent, and fifteenth-century Albertists, Denys came to challenge, during his life, some major doctrines of his early "patronus" Thomas Aquinas.

Denys de Leeuwis (b. 1402; d. 1471) was renowned during his life and after death for his extraordinarily extensive and versatile literary production. Born in Rijkel in the Belgian province of Limburg, he was given his first education in the Abbey school of Sint-Truiden; then (1415) he attended the famous school at Zwolle in the Netherlands, where he had his first contacts with Modern Devotion. Having been denied access to the Carthusian monastery at Roermond (Dutch Limburg) because he was too young, he went on the advice of the Roermond prior to the University of Cologne. There he matriculated (1421) in the Thomistic *Bursa*, later called *Bursa Montana*. Even though he studied "in the way of Thomas," at Cologne he might have come into contact with the rival "Albertist" group led by Heymerich van de Velde. After receiving his Master of Arts degree (1424), he returned to the Charterhouse at Roermond, and this time he was admitted (1424 or 1425). He spent the rest of his life in the monastery, save for a short period before his death (1465–1469), when he was entrusted with the foundation and direction of the Charterhouse in Vught near's Hertogenbosch.

It has long been assumed that Denys accompanied Cardinal Nicholas of Cusa on a papal legation through the Low Countries and the Rhineland around 1451–1452, but recent research has put into question this piece of information (Meuthen 1993). However, there were real contacts between the two because some of Denys' writings are either dedicated to or associated with Cusanus (Emery 1991).

Even though Denys spent most of his life in the solitude of a Carthusian monastery, he was not isolated from the cultural life of his time. Not only did he have contacts with Cusanus and study at Cologne in his youth – his writings show him taking part in the doctrinal disputes animating that academic milieu – but his person and his writings encompassed "all of the spiritual currents of the Late Middle Ages," namely, "monastic theology, Scholasticism, speculative mysticism, and the Modern Devotion" (Emery 1996). Moreover, he was often consulted by secular and ecclesiastical authorities, as well as private people, concerning various issues, and was involved in the affairs of the world, as his pastoral, reforming, and anti-Mohammedan writings reveal.

The astonishing list of his works – more than 150 titles are still extant – makes him one of the most productive writers of the Middle Ages (Emery 2000). His corpus is impressive for the variety of the genres practiced and the wealth of the topics discussed. He composed commentaries on all the books of Sacred Scripture; treatises on various issues related to monastic life and to the traditions of meditation and writings based on famous monastic works (i.e., a commentary on John Climacus' *Scala Paradisi* and a "translation" *ad stilum facillimum* of John Cassian's *Collationes*); numerous ascetical, devotional, pastoral, juridical, reforming, and apologetic writings; several hundreds of sermons; and a *Summa de vitiis et virtutibus*.

Even more noteworthy, however, is the fact that a large section of his literary output consists of works of scholastic philosophy and theology: his enormous commentaries on Peter Lombard's *Sentences* (written over a lifetime and completed around 1464) constitute a unique document of medieval theological learning, wherein Denys,

on each topic, reported and contrasted the views of the foremost thirteenth- and early-fourteenth-century theologians – except the *nominales*, whom he judged to be concerned with words and unable to grasp reality – and added his personal comments. Furthermore, he commented upon the whole of the writings of Pseudo-Dionysius and upon Boethius' *De consolazione philosophiae* and wrote works closely based on Aquinas' writings. Remarkable are also his independent philosophical and theological treatises, wherein he expounded his personal views by collecting the remarks scattered throughout his major commentaries.

The first book of the *De lumine christianae theoriae* (around 1452) was his first and most extensive philosophical work: while describing the procession of all creatures from God and their return to Him, Denys treated all the crucial issues of the philosophical tradition, displaying a complete mastery of the doctrines of all the major ancient, Arabic, and Jewish philosophers.

Denys' last word on all the philosophical questions, however, is to be found in his *Elementatio philosophica*, which, like its theological counterpart – the *Elementatio theologica* – was written by him late in his career after the completion of the *Sentences* commentary (1464–1465); he organized both works in propositions followed by comments, imitating the structure of Proclus' *Elementatio theologica* (Emery 1996).

Such a huge corpus included an equally vast selection of sources, which ranged from Sacred Scriptures to the Fathers, from Christian mystics to canonists, from scholastic theologians to ancient and pagan philosophers, read either first-hand in Latin translation – for example, Plato's *Meno* and *Phaedo* in Aristippus' translation and Proclus' *Elementatio theologica* – or via the writings of scholastic doctors, especially those of Albert the Great. To Denys' mind, the most authoritative source after Scripture is Pseudo-Dionysius, whose writings constitute a sort of rule of thought according to which the teachings of other sources have to be evaluated in the theological as well as in the philosophical domain.

Among scholastic theologians, Thomas Aquinas has the preeminence not so much for intrinsic merits of his thought or because of Denys' schooling in the *via Thomae*, as for Thomas' sanctity. Over the course of his life, however, Denys, influenced by other authors, came to question Thomas' authority on several crucial issues (see below).

Central to Denys' thought is his conception of the hierarchical order of wisdom. Philosophic wisdom is the lowest level of a hierarchy which, through scholastic theology, culminates in the union of mystical theology. Therefore, philosophy prepares the human intellect for the superior modes of supernatural knowledge, and the highest form of philosophy, namely, metaphysical contemplation, the objects of which are the First Cause and separate substances, adumbrates those modes at the natural level (Emery 1996, 2003).

In contrast with the majority of his Carthusian brethren, Denys contested a merely affective interpretation of mystical union and stressed its cognitive nature. According to his interpretation of Pseudo-Dionysius' teaching – which he saw confirmed in the writings of Jan van Ruusbroec ("alter Dionysius") – in the contemplation of mystical theology, the mind unites with God by penetrating, beyond all negations and affirmations, the inaccessible light of his essence, known *quia est*. Simultaneously the soul unites affectively with God because love in the will accompanies this act of cognitive union.

As one may conjecture from the *Protestatio ad superiorem suum* (1440s), a work which Denys seems to have written in order to gain permission to resume his writing activity, the very breadth of his intellectual enterprise, as well as his intellectualist conception of mystical theology, caused him some problems, as in the 1440s, he was forbidden to write for some years and at the 1446 Carthusian General Chapter was severely criticized for unspecified reasons, probably connected with his literary activity (Emery 1996).

A crucial focus of Denys' thought is constituted by the nature and acts of the rational soul. Influenced by Pseudo-Dionysius and Boethius, as well as Albert the Great and Ulrich of

Strasbourg, Denys developed noetic doctrines, which implied harsh criticisms of Thomas Aquinas' teachings. Denys held that the human mind can know without recourse to phantasms and that it can know the quiddity of separate substances and, through their mediation, can contemplate God *quia est* and thereby attain a natural happiness in this life. Given the reciprocity between the order of being and that of knowing, Denys read Thomas' denial of the human soul's ability to know without recourse to the body as an argument against the soul's immortality. Moreover, since knowledge without phantasms was one of the key points of disagreement between Thomists and Albertists at the University of Cologne, Denys adopted in fact a position identical to that of the Albertist school (Palazzo 2006).

The distinction between being and essence is another doctrinal point where Thomas' teaching was fiercely criticized by Denys. Denys' view on this question changed radically, however, over the years, moving from an early adherence to the Thomistic doctrine of a real distinction between *esse* and *essentia* to the adoption of the position, attributed to Albert, Ulrich, and Henry of Ghent, that the distinction was only intentional. Also in this case, Denys was in fact an ally of the Albertist school. Even more, it was the reading of the *Tractatus de esse et essentia* of Johannes de Nova Domo, founder of that school, that led Denys to interpret Albert's and Ulrich's position in terms of Henry of Ghent's doctrine of intentional distinction.

Denys' biography has been recently reappraised in light of new evidence or through the reinterpretation of documents already at our disposal. It is now believed that the reason why at a certain time in the 1440s Denys was prohibited of commenting on the Scriptures is that he was not a formally recognized theologian, unlike the then prior of the Charterhouse of Roermond, Bartholomew of Maastricht. A detailed account has been given of the controversy about the supremacy within the Church opposing the Pope Eugene IV and the Council of Basel (1431–1449) and the role played

by Denys, who adopted a middle way between the two factions. Denys criticized Bartholomew of Maastricht's views on this matter and, due to these criticisms, was censured by the General Chapter of the Carthusians in 1446. Long-standing misconceptions concerning the relationship between Denys and Cusanus have definitely been abandoned (e.g., the conviction that Denys accompanied the Cardinal on the papal legation through Germany and the Low countries). By contrast, it has become clearer that an important tie between them was the common defense of the pontifical prerogative in the dispute against the Council. Finally, we know today that around 1455, Denys took a radical position in the dispute over simony, arguing that it is never licit to accept money or goods from someone asking to enter a convent or a monastery. In so doing, he came into conflict with his former professor in Cologne, Bernardus de Reyda (Emery 2014a).

At a doctrinal level, a thorough analysis has been carried out on providence. This topic, as has been observed, is at the heart of Denys' thought, since divine providence coincides with divine wisdom. Quoting both the Fathers and the scholastic doctors, Denys addressed this crucial subject several times throughout his corpus from both a philosophical and a theological point of view. It turns out that divine providence cannot be reduced to the order of all created things and their governance by the First Cause, for it involves other related issues such as God's foreknowledge and its compatibility with free choice and contingency; predestination of the elect and foreknowledge of the reprobate; and fate and its relationship with providence (Emery 2014c).

New studies have enhanced our knowledge of Denys' attitude toward philosophical and theological sources, providing at same time a valuable insight into his views on more specific topics. Recently attention has been paid to Averroes, who is among the philosophers most cited in Denys' works. Denys oscillated between a respect for Averroes as an authoritative figure of philosophic wisdom and a disapproval of the perfidious Averroes who denies the basic Christian truths (Palazzo 2012).

Denys regarded Thomas Aquinas, who was canonized as a saint, as the most important among the scholastic authors. Nonetheless, Thomas does not escape Denys' criticisms on several key doctrinal issues (e.g., the distinction *esse-essentia*; the necessary recourse to phantasms in every act of cognition; the soul's impossibility to know the separate substances) (Emery 2020). Overall negative was Denys' attitude toward Duns Scotus and Durandus of Saint-Pourçain, whom he considered extraneous to the main tendencies of the thirteenth-century theological discourse, rebuking them on many major issues (Emery 2011a, b).

According to Denys, Pseudo-Dionysius the Areopagite, who is the model of the highest form of wisdom, also provides a criterion according to which it is possible to evaluate the lower degrees of cognition concerning divine attributes and essence. Further research has shed fresh light on Denys' commentaries on Pseudo-Dionysius' epistles and *De mystica theologia* with specific regard to his intellectual interpretation of mystical theology and his interpretation of the distinctions among symbolic, intelligible, and mystical theology (Emery 2014b).

Dietrich of Freiberg

Burkhard Mojsisch¹ and Orrin Finn Summerell²

¹Institut für Philosophie, Ruhr-Universität Bochum, Bochum, Germany

²Bureau of Public Information, UNESCO, Paris, France

Abstract

Dietrich of Freiberg (c. 1240/1250–1318/1320) was an important representative of the Dominican order in the Middle Ages. He focused on central philosophical problems taken up toward finding solutions applicable for philosophy as well as theology and the natural sciences. Methodologically, rational argumentation was key for Dietrich, even as he aimed, in line with Augustine's recommendation, at a concordance between authority (*auctoritas*) and reason (*ratio*). Characteristic of his thought are his theory of intellect, whose cognition renders it self-knowing knowledge: consciousness as self-consciousness; his doctrine of what is an essentially structured cosmos reflecting the comprehensible rationality of its absolute principle, the Godhead; and his theory of the rainbow. Dietrich was particularly influenced by Albert the Great, while he himself influenced the Proclus commentator Berthold of Moosburg.

Originally from Saxony, Dietrich of Freiberg (c. 1240/1250–1318/1320) was a member of the Dominican order who served as its Provincial Superior for the province of Germany from 1293 to 1296, as well as being its Vicar General from 1294 to 1296. In 1296/1297 in Paris, Dietrich obtained his master's degree in theology (*magister in theologia*), teaching there for about 2 years. In 1310, he was commissioned to lead the order as its Vicar Provincial. Dietrich probably died c. 1318/1320.

The bulk of his writings Dietrich devoted to specific philosophical problems. From the start, he considered intellect to be the central topic of

philosophical investigation. In his treatise, *On the Origin of Categorially Determined Reality* (*De origine rerum praedicamentalium*), Dietrich explores the relation between nature – after God, the intelligences (*intelligentiae*: immaterial forms), the spiritual substances and the heavenly bodies, the sublunary sphere dependent on these – and intellect. While Henry of Ghent asserted that intellect is affected by natural objects, Dietrich took the opposite view: intellect constitutes the essential being, the quiddity (“whatness”), of the natural object and in this quiddity the very “what” (*quid*) itself of the object. This he holds because the natural object cannot distinguish between itself as “what” it is and its “whatness,” or essence, nor can it in turn combine these so differentiated components. Intellect alone is able to do this. Intellect is not passive, but rather active, since it is intellect which through the process of definition provides the natural object its essence. Indeed, Dietrich ascribes to intellect the function of efficient cause (*causa efficiens*): Its very differentiation (between the components of the natural object as the object of cognition) is its efficacy, for it effects the definition and through the definition renders the natural object cognizable as something, as “what” it is. For intellect, it is only in this way that the object even becomes an object at all – as a unity of “whatness” and “what,” both constituted by intellect. Cognition of an object therefore means, “intellect effects its definition,” differentiating through the definition the “whatness” from the “what” and, at the same time, combining the “whatness” and the “what.”

Nonetheless, intellect is also passive, inasmuch as the cognizing possible intellect presupposes the activity of the agent intellect, for the possible intellect grasps its objects by conceiving this very activity. Indeed, the agent intellect is also an efficient cause (*causa efficiens*). In itself, in an intuitive act, the agent intellect cognizes: its principle, God, itself, and the universe of beings. In the possible intellect, however, the agent intellect effects the general contents (*species intelligibiles*) cognized by the possible intellect in cognizing the agent intellect, and the possible intellect cognizes the agent intellect only in cognizing these general contents. Exclusively in the

state of bliss (*in beata vita*) is the agent intellect not merely efficient cause, but also formal cause, when it is unified as a form with the possible intellect as a kind of matter – that is how man essentially cognizes God, according to Dietrich in his treatise *On the Beatific Vision* (*De visione beatifica*). All this illustrates the way in which Dietrich tends to proceed, drawing theologically important conclusions from philosophically justified presuppositions. Such presuppositions rest methodologically on rational argumentation concurring, as much as possible, with arguments of authority. Even so, for Dietrich, reason takes precedence before authority.

Authority for the view that the possible intellect in its cognizing enjoys general cognition is provided by Aristotle with his theory of science. Thus, Dietrich concludes his treatise *On the Intellect and the Content of Cognition* (*De intellectu et intelligibili*) by enumerating the features that an object must have in order to be an object of scientific cognition. What is important is that it has being, that it has general validity and necessity, and that the fundamental grounds for cognizing something are provided, hence that the elements of definition are given. Cognition, insofar as it is knowledge, cannot change; for change transforms cognition into non-cognition – on this premise Plato, Aristotle, and Dietrich all agree.

Intellect which knows that it knows and knows what it knows is for Dietrich “being” which conceives and which in conceiving conceives its object; such intellect is, at the same time, being which conceives itself as its object and therein is conscious conception, consciousness as self-consciousness, *ens conceptionale in quantum huiusmodi*. In this view, sense perception and imagination are conceptional beings (*entia conceptionalia*). The intellectual object alone is the same as its conception; solely for intellect is its conception intellect itself – is intellect itself its own object. Hence, intellect is consciousness of itself.

In his philosophy of nature, Dietrich treats such topics as continua, contraries, and optical phenomena. One continuum is time, which for Dietrich possesses merely intramental being, a view combining the philosophies of time developed by

Aristotle, Augustine, and Averroes. Dietrich differs from Aristotle to the extent that he situates contrariety only in the third kind of quality, which includes passive qualities and affections, no longer allying it with four categories. This reflects his consistent aim of reducing the principles of nature.

Dietrich's place in the history of science is assured by his work *On the Rainbow* (*De iride*), with its theory perfected only centuries later by Descartes and Newton. While most of his predecessors compared the colors of the rainbow to the spectrum issuing from the sun's rays on passing through a water flask, tending to equate the latter with a cloud or a collection of drops, Dietrich was the first to trace the light's path through the individual drop, discovering two refractions at the surface of the drop nearer the observer and one internal reflection at the surface farther away. So explaining the primary, or lower, rainbow, Dietrich elucidated the production of the secondary, or upper, rainbow as involving two refractions at the surface of the drop nearer the observer and two internal reflections at the surface farther away – thus accounting for the color inversion in the secondary rainbow.

Ḍirār ibn Amr

David Bennett

Representation and Reality, Department of Philosophy, Linguistics and Theory of Science, University of Gothenburg, Gothenburg, Sweden

Abstract

Ḍirār ibn ʿAmr (c. 728–796) was an early Muslim controversialist whose theories helped shape the development of Islamic theology.

He was associated with, but subsequently disowned by, the burgeoning Muʿtazilite school, a rationalist movement in Islamic theology. He is credited with advancing an apophatic theology, a materialist physics, and an ambivalent resolution to the problem of human action and divine predestination. His positions have survived almost exclusively in doxographic accounts of Islamic thought.

Biographical Information

Ḍirār's lifespan is uncertain: it will be noticed that many scholars give a later death date of 815 (from a report of a 90-year lifespan in al-Jāḥiẓ; see van Ess 1992, 2.32n.3). He was an Arab from Kufa in Iraq, a hotbed of early Imamist (proto-Shīʿite) thought. He travelled widely: to Basra, the early center of Muʿtazilism, perhaps as far as Yemen, and eventually to the court of the Abbasid Caliphs, Baghdad. His occupation as a court theologian of sorts inaugurated a tradition that led to the flourishing of state-sponsored Muʿtazilism in the early ninth century. He is attributed with numerous works on specific topics, including many refutations of contemporary sects (see van Ess 1993, 5.229–231 for a list). Only one of his works survives, a recently recovered treatise critical of hadith (traditions ascribed to the Prophet); his philosophical and theological positions must be recovered largely from hostile and later witnesses. By such witnesses, he is generally counted as a Muʿtazilite; major figures in early Muʿtazilism, however, such as Abū l-Hudhayl and Bishr ibn al-Muʿtamir, sought to distance him from the movement.

Philosophy

Although his contributions were inspired by theological concerns, Ḍirār is associated with a number of innovations which may be considered philosophical in nature; such was the case with most theorists of his era who ventured beyond the immediate scriptural, jurisprudential, and political aspects of Islamic life.

Early Muʿtazilites were especially creative in developing cosmologies which could account for contemporary natural scientific theories, usually based on Greek antecedents, in the context of Islamic revelation. The atomistic trend in Islamic thought, whereby the constituents of the universe were reduced to atoms and their accidents, faced several early challenges, among which was Ḍirār's theory of "constituent parts" (*abʿād*). For Ḍirār, bodies are made up of these constituent parts, which are co-extensive with physical properties: colours, weight, coolness, and so on. Another class of accidents supervene on bodies: these include states of being, such as knowledge or pain and the capacity to act (e.g., *Maqālāt* [i.e., al-Ashʿarī 2005] 305–6). The first class of properties endures, whereas the second class is momentary. The human capacity to act, however, was occasionally counted among the *abʿād* either by Ḍirār or his followers (e.g., *Maqālāt* 345). Van Ess has commented on parallels in the commentary tradition on *De gen. et corr* (1992, 2.42–43; English trans. 2018, 2.46–47). The most notable consequence of Ḍirār's view, however, was its neglect of substance as a physical principle underlying accidents (or constituent parts, for that matter). Bodies simply appear in the world formed out of their constituent parts, which can change to a certain extent. A human being, for example, is only the sum total of his constituent parts, with the momentary accidents supervening in turn (*Maqālāt* 330, where capacity to act is included among the *abʿād* again). This meant that the human being has no soul as such.

Ḍirār had a novel approach to the most vexing issue of the time, human agency. Strict monotheists and, later, mainstream Sunni theologians tended toward determinism, considering any attempt to justify human free will to be an diminution of God's omnipotence. Muʿtazilites, however, were notorious for their theodicy, which required the establishment of human responsibility for their acts. Ḍirār's position added "acquisition" to the resolution of human acts: God is the ultimate creator of acts (including perception), whereas humans "acquire" them. Yet, crucially, both parties are agents "in reality" (e.g., *Maqālāt* 281). This double agency

acknowledged several issues in causality, allowing for acts (and natural events) to be analyzed as real events while preserving God's role as the ultimate agent: a single act, as al-Ash'arī puts it, could have two agents (281). Later theologians would transform Ḍirār's model of "acquisition" so that the human side of the partnership would become significantly secondary.

Ḍirār introduced two somewhat contradictory innovations to theology. For one thing, he articulated a negative theology which sought to obviate the difficulties involved in predicating attributes of God by taking their inverse: God is not said to be "knowing," for example, but rather "not ignorant" (e.g., *Maqālāt* 166). On the other hand, Ḍirār proposed a quiddity (Ar. *māhiyya*, "whatness") for God which could be perceived by humans upon the creation of a "sixth sense," that is, in the afterlife (Malāḥimī 474–5). This intervention was notable in its approach to theophany, allowing for a category of sense perception beyond the ordinary for an extraordinary object. It also introduced a major metaphysical concept, of essences in themselves, early to Islamic theology.

Divine Law

Howard Kreisel

The Goldstein-Goren Department of Jewish Thought, Ben-Gurion University of the Negev, Beer Sheva, Israel

Abstract

This article deals with the question of how the notion of divine law was defined in medieval philosophy by exploring the thought of a number of prominent thinkers in the Jewish, Islamic, and Christian philosophical traditions – Judah Halevi, al-Fārābī, Maimonides, and Thomas Aquinas. All these thinkers were acquainted with the Platonic–Aristotelian tradition that laid much of the basis for medieval political philosophy and they all grappled with this tradition in formulating their approaches. Moreover, many played a prominent role within their religious community. For them the problem of divine law was not simply an interesting theoretical question but a problem that lay at the heart of their particular religious commitment. They saw their task not only as defining the characteristics of divine law but as defending the divine nature of their own religion. The article concludes with the seventeenth century philosopher Spinoza and explores the relation between his approach and the approaches of his medieval predecessors.

Introduction

What characteristics must a law possess in order to be considered "divine?" How is such a law to be distinguished from laws legislated by human beings or from the form of law known as "natural?" The question of the definition of divine law, and the positing of the very existence of such a law, are intricately related to one's conception of God and God's relation to humanity. Or to formulate it from a different perspective, it is related to how one views the structure of the world and the

role played by God and by human beings in this structure. Is God cognizant of human beings and exercises an immediate providential role toward humanity, which assumes the expression of laying down law among other activities. What is the purpose of such a law? How is it revealed and how can one verify that a particular law is in fact God's command. Even if one does not accept the view of God's immediate relation to humanity, and, by extension, rejects the view that God legislates particular laws, can one nevertheless accept the notion of certain laws being "divine" in a meaningful sense? What would "divine" mean in this context and how would it be distinguished from laws that are considered to be human?

Judah Halevi

The thought of the twelfth century Spanish-Jewish philosopher Judah Halevi provides a good illustration of many of the issues involved in the notion of divine law. Halevi begins his magnum opus, the *Kuzari* with the following story: An angel appears to the pagan king of the Khazars, and informs him that his thoughts are pleasing to God but not his actions. The king is faced with the dilemma of discovering which actions are pleasing to God, and in his quest, he turns to various sages to ascertain the answer. In Halevi's story, just as in the historical narrative upon which it is loosely based, the king ultimately chooses Judaism. Halevi takes poetic license in his retelling of the tale by having the king turn first to a philosopher to discover the desirable actions. Halevi's "philosopher" responds to the king's question by first summarizing many of the main points of the philosophers' credo, which is essentially based on the thought of the tenth century Islamic philosopher al-Fārābī: God is the source of emanation of the world and its order, an emanation that is without a beginning or an end. God is not cognizant of individuals and their acts, nor is God capable of volitional activity. The perfection of the individual lies in the perfection of the intellect, culminating in conjunction with the Active Intellect and immortality. Ethical character traits are necessary for bringing one's intellectual potential to fruition

by creating the proper external (social) and internal (psychological) state, which enables the individual to engage in the diligent search for truth leading to the attainment of conjunction. Halevi's "philosopher" concludes (*Kuzari* 1:1):

If you attain such a state of knowledge, do not be concerned with which religious law (*shari'a*) you follow in order to glorify God, or by what speech, language, and actions. You may also create for yourself your own law (*dina*), as well as for your family and the members of your state if they accept it, in order to glorify and praise God and to conduct yourself in an ethical manner. Or you may follow a law based on the rational *nomoi* laid down by the philosophers, and strive for purity of the soul. In conclusion, seek purity of the heart in any manner that you are able, after you acquire knowledge of all the sciences. Then you will reach your goal – conjunction with the spiritual being, that is to say, the Active Intellect. Perhaps it will then bestow upon you prophecy and inform you hidden matters by way of veridical dreams and truthful visions.

In this manner, the "philosopher" informs the king in a not so subtle manner that his dream is not a revelatory one at all; it is in fact a false one, the product of his own vain imaginings. True prophecy is attained as a result of achieving the state of conjunction with the Active Intellect. For the Aristotelian philosopher there is no divine law in the sense of a law whose immediate author is God. There exists no set of ritual acts that are preferable to any other, as long as the core of the religion is of an ethical nature and does not interfere with the pursuit of perfection, if not actively promote it. Halevi's "philosopher" appreciates the positive role religion plays in society. It is important that the members of society glorify God in prayer and ritual acts, not because God derives any benefit or pleasure from these acts or is even aware of them, but because of their beneficial affect upon their practitioners. Therefore, Halevi's "philosopher" is indifferent to the question whether one should choose an already existent religion or creates one's own religion according to the principles laid down by the philosophers.

The answers the king receives to his quest on the part of the proponents of Christianity, Islam, and Judaism, on the other hand, share in common the notion of a personal, volitional creator of the world who has the ability to communicate with

humanity. The religion commanded by God by means of revelation is the one that is pleasing to God. The question that is raised by this approach is how to establish the truth of revelation and hence whether a particular religion is in fact divine. For Halevi the answer lies in the nature of the miracles accompanying the revelation. The grandeur of the miracles that defy any naturalistic explanation and the multitude of eyewitnesses to their occurrence attest to the truth of the message and the fact that God is the author. The most reliable sign for Halevi is the audible speech that God created and which conveys the divine message directly to the people. This view emerges explicitly from Halevi's treatment of the revelation at Mount Sinai in which the Ten Commandments were given (*Kuzari* 1:87):

Fire encircled Mount Sinai and remained there for forty days. The people saw it, and they saw Moses enter it and emerge from it. The people heard the pure speech in the [giving of the] Ten Commandments. . . . The multitude did not receive the Ten Commandments from solitary individuals or from a prophet, but from God. However, they did not possess Moses' strength to behold that grand scene. Henceforth, the people believed that Moses was addressed by a speech that originated with God. It was not preceded by any thought or suggestion in Moses' mind. Prophecy is not, as the philosophers think, the conjunction of the soul whose thoughts are purified with the Active Intellect, also termed the Holy Spirit and Gabriel, and the apprehension of it. It is possible [according to the philosophers] that at that moment [of conjunction] the person would imagine in a vision, either while asleep or awake, that another person is speaking to him. He would hear imaginary speech in his soul, not by way of his ears. He would see this person in his imagination, and not by way of his eyes. He would then say that God spoke to him. These notions were negated by the great Gathering [at Sinai]. Accompanying the divine speech was the divine writing. God engraved these Ten Commandments on two tablets of precious stone, and gave them to Moses. The people saw the divine writing, just as they heard the divine speech.

The two different conceptions of God's relation to the world, that of the philosopher and that of the Jewish sage (as well as the Christian and Moslem sages) lead to two very different conceptions of divine law. Halevi is well aware of the naturalistic explanation the philosophers offer for

understanding the nature of revelation. From his perspective, the philosophers treat all religions essentially as human-made law. He knows that the philosophers draw a distinction between different laws by their content and their purpose, or by their material, formal and final causes – namely, by whether the law is based on rational-ethical *nomoi* and designed to contribute to human perfection or not. Moreover, they distinguish between the efficient cause of different laws in terms of the perfection of the legislator of each. For Halevi, however, divine law is precisely a law whose immediate efficient cause is God. He does not reject the view that divine law is distinguishable from all other legislations also by its content and purpose. He devotes much of his treatise to explore this issue and highlight the distinguishing characteristics of the divine law in these areas. Halevi's God is a wise deity who does nothing in vain or in an arbitrary manner, hence everything commanded by God must have a purpose and is designed to promote it in an ideal manner. Nevertheless, what makes a law divine in his view is first and foremost that it is given directly by God; all the other distinctions follow from this fundamental one. That there are rational *nomoi* is not disputed by Halevi. Every society, even a band of thieves, realizes that they must be governed by certain ethical propositions in order to survive (*Kuzari* 2:48). Passages in the *Kuzari* reflect Aristotle's distinction between natural and conventional/human law – namely law that consists of those general propositions that are binding everywhere and law that consists of particular practices and enactments that may vary from place to place (*Nicomachean Ethics* V.7, 1134b–1135a). For Halevi, while divine law contains laws that resemble natural law and human law, it is fundamentally different from both. In being commanded by God, it is ideal and completely obligatory not only in its general ethical directives but in all its particular commandments, whether they are of a social or ritual nature. Moreover, for him the divine law, as opposed to human law, remains forever constant in all its particulars just as human nature remains forever the same. The divine law molds the soul of the individual, and not only society at large, in a

perfect manner that is known only to God (*Kuzari* 1:79; 2:48–50; 3:7–11, 23; 4:19). This is the view of divine law that Halevi develops in his rejection of the approach of the philosophers.

Al-Fārābī

Halevi's "philosopher" belongs to the tradition of the great tenth century Islamic Aristotelian philosopher, al-Fārābī, whose approach to law is anchored in Plato's *Republic*, particularly in the notion of the philosopher-king, and in Aristotle's *Ethics*. In many of his writings, al-Fārābī dwells on the problem of the nature of the ideal polity, its lawgiver, and the characteristics of the law that he legislates. Following his Greek predecessors, al-Fārābī thinks of law primarily in terms of its final and formal causes, or its purpose and the way it goes about in achieving it. He traces the differences in the purpose and content of each body of law to the character of its legislator. In the *Book of Religion* he writes:

Religion (*milla*) is opinions and actions, determined and restricted with stipulations and prescribed for a community by their first ruler, who seeks to obtain through their practicing it a specific purpose with respect to them or by means of them [...] If the first ruler is virtuous and his rulership truly virtuous, then in what he prescribes he seeks only to obtain, for himself and for everyone under his rulership, the ultimate happiness that is truly happiness, and that religion will be virtuous religion (*Political Writings*:93).

Al-Fārābī goes on to deal with the nature of the opinions and actions prescribed in the virtuous religion. The opinions deal with God, the spiritual beings together with their ranks and functions, the generated material beings and how they are ordered, the nature of prophecy, and ultimate reward and punishment. These true opinions, al-Fārābī clarifies in the continuation of his remarks, and in more detail in his other writings, are often presented in metaphorical or imaginative form, as befitting the state of society for which they are intended. The virtuous religion also presents tales of edification describing the prophets and virtuous rulers and well as the wicked and what became of them. The actions it prescribes are

divided into those relating to the praise of God and the righteous, as well as condemnation of the wicked, and those concerning the mutual dealings of individuals with each other in society and how a person should conduct oneself. Al-Fārābī sees the virtuous religion as similar to theoretical and practical philosophy, and subordinate to these two branches of philosophy – the first one dealing with the order of existence and the second with human governance.

Al-Fārābī lives in an age in which society is governed by revelatory religion, a fact that he can hardly ignore. Yet it is interesting to note that he refrains from using the term "divine" (*ilāhī*) in characterizing religion. He characterizes religion either as virtuous (*faḍīla*) or errant (though some of the terms he uses for religion – *sharī'a*, *sunna*, *milla*, *dīn* – have the connotation of divine). He may have desired to sidestep the problem of dealing directly with Islam in developing his theoretical model, though he certainly thought that Islam should be understood in accordance with this model. Nevertheless, there is no suggestion in his model of a single virtuous religion – the contrary is true – or even of a virtuous religion that is the seal of all virtuous religions, as Islam is formally regarded by its adherents. This can be seen even more clearly from al-Fārābī's other political writings such as the *Political Regime* and the *Opinions of the People of the Virtuous City*. Al-Fārābī's model is a dynamic historical one in which one virtuous religion succeeds another, each with the appearance of a new ideal lawgiver, and each is framed in accordance with the changing conditions. Al-Fārābī does not ignore the relation of virtuous religion to revelation. He draws an integral connection between the two, as can be seen from the following passage in the *Book of Religion*:

Now the craft of the virtuous first ruler is kingly and joined with revelation from God. Indeed, he determines the actions and opinions in the virtuous religion by means of revelation (*wahy*). This occurs in one or both of two ways: one is that they are all revealed to him as determined; the second is that he determines them by means of the faculty he acquires from revelation and from the Revealer, may He be exalted, so that the stipulations with which he determines the virtuous opinions and

actions are disclosed to him by means of it. Or some come about in the first way and some in the second way. It has already been explained in theoretical science how the revelation of God, may He be exalted, to the human being receiving the revelation comes about and how the faculty acquired from revelation and from the Revealer occurs in a human being (*Political Writings*:94).

Revelation for al-Fārābī is a natural phenomenon that characterizes the reception of one who attains the state of conjunction with the Active Intellect, as seen from his description of the first ruler (*The Political Regime*:36). Al-Fārābī certainly does not think that God is the immediate efficient cause of revelation, just as God is not the immediate efficient cause of any natural phenomenon. While al-Fārābī's depiction suggests that God is in some manner directly responsible for the law laid down by the first ruler, his reference to theoretical science in this context indicates that he views this phenomenon along the lines of the Greek philosophical tradition – a point that is confirmed by his other writings. The “faculty” the first ruler acquires in revelation is not a new faculty at all. It is essentially the understanding of how to translate his perfect knowledge of the order of existence and of the purpose of human beings into an ideal polity that directs its members to the attainment of human perfection and ultimate felicity. In his *Selected Aphorisms*, al-Fārābī lists all the gifts possessed by the first ruler that enable him to accomplish this task – namely, perfect wisdom, prudence, rhetorical excellence, a perfect imagination, courage, and not possessing any physical impediments (*Political Writings*:37). In other words, the virtuous religion is seen as the product of the conscious deliberations of the ruler who possesses all these qualifications. These deliberations may be said to be the result of “revelation,” which essentially is an emanation from the Active Intellect that strengthens the activity of the individual's intellect and imagination, thereby enabling the individual to lay down a perfect law. Al-Fārābī's view that at times all the actions and opinions are revealed to the first ruler “as determined” should not be interpreted as indicating that God in this instance is more directly involved in laying down the virtuous religion. Al-Fārābī alludes to the view that in this instance the

faculties of the soul, particularly the intellect and the imaginative faculty, ascertain the opinions and actions to be laid down in the virtuous religion while the individual is in the prophetic state – that is to say, in the state of experiencing intellectual illumination – rather than his laying down the particulars of the religion on the basis of conscious deliberations while no longer in this state.

For al-Fārābī then, the virtuous religion is a natural phenomenon from a number of perspectives. It is the product of revelation, which itself is a natural attainment by the individual of perfect intellect. Furthermore, it is designed to direct society to the natural perfection of humanity that results in ultimate eternal felicity, which is a natural consequence of the attainment of perfection. If we equate al-Fārābī's virtuous religion with divine religion or law, the line between the natural and the divine is completely blurred in his thought. Divine law not only incorporates natural law as known by reason and which provides the foundation for human or conventional law; it is also the ideal expression of natural and human law. What divine law is not, according to this conception, is a law that God directly legislates. It is the latter notion of divine law, as we have seen, which Halevi seeks to defend against al-Fārābī's approach. Halevi is not in principle averse to blurring at times the distinction between the natural and the divine. All natural phenomena, he notes, are from a certain perspective divine in that they are created by God (*Kuzari* 5:21). When it comes to understanding the divine law, however, he insists upon maintaining the distinction between the natural and the divine. The former reflects God's governance by way of the fixed activities of His intermediaries while the latter is the product of God's immediate, personal activity.

Moses Maimonides

Al-Fārābī's political philosophy left a deep impress on subsequent Islamic thought. In a crucial sense, Avicenna, Ibn Bajja, and Averroes were al-Fārābī's disciples in this area, as was the Jewish philosopher Maimonides. Maimonides not only applied al-Fārābī's political thought to his

philosophic understanding of Judaism, but also to his pioneering Jewish legal activity. When Maimonides embarked on the project of writing the first complete code of Jewish law, he appears to have been strongly influenced by al-Fārābī's discussions of the characteristics of the virtuous religion. The question that faces students of Maimonides' thought is the limits of this influence. Does Maimonides understand Mosaic Law completely in accordance with al-Fārābī's model, or does he adopt this model only in part.

For Maimonides, the divine law is distinguished from all other legislations in that it imparts true opinions to its adherents, thereby showing them the way to intellectual perfection and true felicity (*Guide of the Perplexed* 2:40; 3:27). In Maimonides' terms, it is directed to the "welfare of the soul" and not only to the "welfare of the body," or body politic, which is the goal of non-divine legislations. Moreover, the divine law inculcates the moral virtues that contribute to the "welfare of the body" by prescribing actions that are perfectly equilibrated, neither too extreme nor too lax, whereas non-divine legislations fall short in this matter (*Guide* 2:39). On these points Maimonides' views are anchored in al-Fārābī's thought. Moreover, he opens his legal code, *Mishneh Torah*, with a section devoted to legally binding opinions regarding God and the order of the world that conform to al-Fārābī's conceptual scheme. Maimonides also agrees with al-Fārābī that only one who attains intellectual perfection can lay down a divine law. He employs this point to argue that one can distinguish true divine law from its imitators by looking at the intellectual and moral characteristics of the lawgiver (*Guide* 2:40). But he stops far short of al-Fārābī by maintaining that there was and will always be only one divine law, and that is the Law of Moses. More important, he appears to regard Moses as merely the recipient and transmitter of the divine law, with God being the actual author who communicates the Law to Moses by means of a created divine voice (*Guide* 2:33). In other words, Maimonides appears to be closer to his coreligionist, Judah Halevi, than he is to al-Fārābī by treating God as the immediate efficient cause of the divine law, with the divine voice created by God and heard by all of Israel attesting to the truth of this point.

Maimonidean scholars have debated the problem whether Maimonides in fact believed that God, and not Moses, was the immediate author of the divine law as contained in the *Torah* and that God created an audible voice heard by all Israel as the *Torah* relates. A number have argued that Maimonides' esoteric view on this matter was that Moses himself was the legislator of the law in one or both of the two ways described by al-Fārābī in the passage from the *Book of Religion* cited above. Maimonides draws a number of parallels between the divine law and nature. Like nature, he notes, there is nothing in the divine law that is in vain. Like nature the divine law does not pay attention to the isolated, but to what is beneficial in the majority of instances (*Guide* 3:25–26, 34). If we interpret Maimonides as agreeing with al-Fārābī that the divine law is the product of a naturally attained ability, even if Maimonides regards the level of perfection attained by Moses as a unique occurrence, then the distinction between divine law and nature breaks down even more. For Maimonides, as for al-Fārābī, the divine law is the ideal expression of both natural law and conventional or human law. It was framed by one who attained ultimate perfection and was designed to promote it in the most effective manner possible within a polity. Based on his perfect theoretical and practical apprehension, Moses organized the Jewish polity in a manner that best imitates God's ordering of the world.

Maimonides leaves little doubt that even non-prophetic legislators partake of a divine though natural gift – namely, the ability to rule. While people are by nature social animals, they are not by temperament capable of living together without destroying each other. Only one with the ability to rule, an ability that Maimonides traces to an emanation from the Active Intellect to those possessing a superior imagination, can bring about the social harmony necessary for communal existence. Yet in lacking theoretical perfection these rulers and lawgivers are not concerned about inculcating true opinions, nor are they capable of organizing society with the view of directing it to final perfection (*Guide* 2:37, 40). Only one who combines intellectual and imaginative perfection, the prophet, is the one who receives the emanation from the Active Intellect

to both faculties and is capable of ruling society in an optimal manner. Only the individual who achieved the ultimate intellectual perfection, Moses, was capable of legislating a permanent law that merits the label “divine.”

Yet even if we accept the interpretation that Maimonides understands divine law completely in accordance with a naturalistic model, his approach to the issue is not framed by purely theoretical philosophical considerations. His primary concern is to defend Mosaic Law as the unique divine law in a manner that is at least consistent with what he regards as philosophic truth regarding God’s governance of the world. The concern to uphold the validity of Mosaic Law is all the more evident if we interpret Maimonides as agreeing with the traditional belief that God is the immediate author of the law given to Moses. For all his commitment to medieval Aristotelian philosophy in general, and the commitment to al-Fārābī in particular, Maimonides’ first commitment remains to Judaism.

Thomas Aquinas

The characterization of one’s loyalty belonging primarily to one’s religious tradition rather than to philosophy per se is certainly true also for the great thirteenth century Christian philosopher, Thomas Aquinas. The influence of the Aristotelian tradition and that of Maimonides on Thomas’ political thought is striking. Yet, Thomas makes use of the philosophic tradition only insofar as it does not negate any of Christianity’s basic tenets. He is closer to Halevi than Maimonides in this matter. Thomas’ God is a very personal God, as is true of any Christian who believes in the Incarnation, a belief that flies in the face of the Aristotelian tradition.

In his *Summa theologiae* (Q90–108) Thomas distinguishes between different types of law in a much sharper and far more detailed manner than any of his predecessors. He is a strong proponent of the idea of an eternal natural law that is known by human beings by virtue of a reason that partakes of divine reason. He regards human law as the application of natural law to particular circumstances by means of practical reason. Thomas remains firmly in the Aristotelian tradition on

these points. Yet in addition to natural and human laws, Thomas posits the existence of divine law, which is not simply the ideal form of natural and human laws by another name, and he goes to great lengths to show its necessity. Law as such has as its final end happiness, but as Thomas’ discussion clarifies, both natural law and the human law derived from it are incapable of directing human beings to eternal happiness. Only the divine law can lay down the ideal external and internal acts by which to attain this happiness. For Thomas, as in the case of Halevi, only God knows the path by which God is to be reached, and this is made known only by revelation. Thomas further argues that only the divine law is concerned with humanity’s relation to God while human laws are concerned solely with human relations. Even in those cases that human law devises institutions relating to divine matters, it is only for the sake of human relations (Q99, A3). Echoes of this view can be seen already in the thought of Halevi and Maimonides.

Yet Thomas, as opposed to Halevi and Maimonides, accepts the existence of two divine laws and not one – the one contained in the Old Testament and the one contained in the New Testament. In order to account for two divine laws he must accept a historical model, one that posits progress over time in which the people become prepared for a more perfect law. The New Testament with its teaching and commands is the Law that leads to divine grace and eternal felicity by being a law that leads to perfect virtue (Q91, A5). He assigns an intermediary role to the Old Law. It goes beyond human law that is concerned only with earthly good by paving the way for the New Law; it does not in itself, however, make its adherents fit to attain everlasting happiness. Thomas devotes much attention to the divine wisdom as it is reflected in all aspects of the Old Law before coming on to show how the New Law completes and perfects it by directing more of its attention to the internal state of human beings and bringing about the reception of divine grace.

Thomas also distinguishes the Old Law and the New Law by their immediate agents. The New Law was transmitted directly by God, while the Old Law was given to Moses by God through the intermediary of the angels (Q98, A3; though

compare to *Quaestiones disputatae* 12, 14 where Moses receives intellectual vision without angelic help) – a view that characterizes prophecy in general in Maimonides’ thought, but not Mosaic prophecy given directly by God, at least according to his exoteric view on the matter. It should be noted that in other writings Thomas is influenced both by Maimonides’ view of the special nature of Mosaic prophecy as well as his naturalistic theory of prophecy in general. Nevertheless, he breaks with Maimonides by treating the biblical prophets as attaining their prophecy by divine grace and not because of their natural dispositions. Nor is the particular content of their prophecy in his view dependent upon the faculties of the prophet’s soul, or even on the angels who serve as intermediaries, but on God. For all of Thomas’ indebtedness to Aristotelian thought and his acceptance of much of their view of the natural order, in all matters pertaining to revelation he ascribes to God a personal role.

Baruch Spinoza

The seventeenth century Dutch philosopher, Baruch (Benedictus) Spinoza could not be more different than Thomas on the last point. God in his view is not a personal deity at all, and all divine activity is natural. In his *Tractatus theologico-politicus*, Spinoza sets out to overturn the project of the medieval political philosophical tradition in general, and Maimonides’ project in particular. For what is this project if not to understand the content, and not just the phenomenon, of biblical revelation philosophically, and show how the religion that was given by way of revelation promoted human perfection within a polity in an ideal manner. The foundation for this approach is the argument that revelation is only received by one who is intellectually perfect. On this basis one could read Scripture as containing theoretical truths, albeit often in metaphorical form, and one could see its commands as providing the ideal path to ultimate felicity. This approach to Scripture is undermined by the argument, which Spinoza goes to great lengths to make regarding the Old Testament in his *Tractatus theologico-politicus*, that the characterization Maimonides

draws of non-prophetic lawgivers – namely, individuals with a perfect imaginative faculty but imperfect intellect, hence they did not know where true perfection lies and how to direct the nation to it – is true also of all the biblical prophets including Moses. According to Spinoza, Moses possessed a perfect imagination but far from perfect intellect. He knew how to organize a nation of slaves but not how to lead them to a perfection that he himself lacked. What follows is that the Old Testament cannot be a source for theoretical truths, nor does it direct one on the path to felicity. It is a law that enabled the Jews to attain social stability for awhile and nothing more. In other words, it could aim no higher than earthly good. If Moses presents the law he laid down as designed to do more than that, and that he received this law by hearing an audible divine voice, then he was simply deluding himself and others in Spinoza’s view.

All the terms we have used till now take on different meanings in the context of Spinoza’s philosophy. Laws that are based on historical revelation, that is the product of those with superior imagination, do not deserve the epithet “divine.” Divine law is equated with natural law, which for Spinoza is the law that is known by the light of reason rather than by revelation. In other words, true revelation is the knowledge attained by the great philosophers and not the knowledge attained by the prophets. Furthermore all particular legislations cannot be considered to be divine for divine/natural law, according to Spinoza, has the following traits: (1) it is universal; (2) it is not dependent upon historical narrative; (3) it does not command ritual; (4) ultimate reward is integral to its fulfillment, that is to say it is the natural consequence of living according to the light of reason (*TTP*, chap. 4). While it is true that Spinoza attempts to interpret the New Testament as divine law, and this view brings him into an affinity with Thomas Aquinas, his interpretation of the New Testament shares little with Thomas’ view. For Spinoza, Jesus, as opposed to Moses, is the paradigm of the true philosopher teaching the universal truths of reason, nothing more.

In a crucial sense, Spinoza shares much in common with al-Fārābī, and with this point we come full circle. For both al-Fārābī and Spinoza

the divine and the natural are synonymous and there is no expression of divine will outside of the order of nature. Al-Fārābī's first ruler is the perfect philosopher. Divine law for al-Fārābī is the product of a perfect intellect and the ultimate expression of natural law in the context of any given society. If one rereads the speech of the philosopher at the beginning of the *Kuzari* cited at the beginning of this article, one might for a moment think that this philosopher is a proto-Spinozist. Yet for all the similarities between al-Fārābī and Spinoza there remains a great abyss between these two thinkers. Al-Fārābī accepts the Platonic model of the philosopher king and applies it to revelatory religion. He develops a model by which the revelatory religions can be viewed as expressions of philosophy and as directing their adherents to true felicity. It is the tie between religion and philosophy that Spinoza seeks to break; it is the view that religious law leads to true felicity, and hence should be the law of the state, that Spinoza writes his theological-political treatise to combat. Al-Fārābī maintains the optimistic Platonic view that the state can be ordered to actively promote true human perfection. Maimonides redefines Judaism accordingly, going so far as to dogmatize it in the attempt to convey the opinions, and not just the actions, that should be accepted by all. Spinoza's goal is the more modest one of making society safe for philosophers by not interfering with their pursuit of truth. For him this cannot be accomplished by understanding Scripture philosophically, let alone as providing theoretical truths closed to philosophy, but by undermining the authority of Scripture in teaching any theoretical truths or laying down the path society must follow. Thus, Spinoza sets the course for a goal alien to al-Fārābī, and certainly to most of the medieval political philosophical tradition, namely, liberal secular society no longer bound to the idea of revelatory religion but to human/divine reason alone.

Divine Power

Jeffrey C. Witt

Department of Philosophy, Boston College,
Chestnut Hill, MA, USA

Abstract

The explicitly scholastic Divine Power distinction developed out of the twelfth century theological discussion of the nature of God's power. At issue, initially, was the desire to preserve the constancy of God's nature and

yet to preserve his freedom from any sense of necessity. The distinction emphasized the difference between what God's raw power was capable of and God's power as identified with what he actually wills. The understanding of this distinction was later influenced by canonist discussions of papal power, and the distinction often came to be interpreted as two different powers that belonged to God. The development of this later understanding is frequently viewed as playing an important role in the emergence of the modern period.

While the history of the question of what God can and cannot do certainly has a long and almost untraceable history, the distinctive approach to the question in the Middle Ages owes much to the twelfth century debates between Peter Abelard and Peter Lombard and the forging of the influential formulation of the problem in Lombard's *Libri sententiarum*.
