

CODEX SINAITICVS

PETROPOLITANVS

THE

NEW TESTAMENT

PREFACE

The following facsimile of the New Testament text of the Codex Sinaiticus is made from negatives taken at St Petersburg by my wife and myself in the summer of 1908. In the library we were greatly helped by the courtesy of the officials, especially Dr. Bischoff and Dr. Papadopoulo Kerameus, who did everything possible to assist us, and outside we were so fortunate as to find in Ds. and Mevr. Pantekoek of the Dutch Church in St Petersburg friends who were willing to take more trouble in forwarding our interests than many would have devoted to their own; the difficulty of finding an adequate dark room for the development of such large plates was considerable, and seemed likely to prove insuperable till our Dutch friends came to our rescue.

In the introductory pages I have had the benefit of consulting Dr. Kenyon and Sir George Warner in the British Museum and Dr. Hunt in Oxford, to the last of whom and to the authorities of the John Rylands Library, whose Papyri he is editing, I owe the permission to reproduce a specimen of Rylands Papyr. 28. I am also greatly indebted to the Rev. Dr. Ehrle, S.J., Prefect of the Vatican Library, for his permission to print a specimen of the Codex Vaticanus. My warmest thanks are due to my friend and former pupil Dr. J. de Zwaan, who spent much time and trouble in making lists of the various corrections in the Codex Sinaiticus. These lists have, of course, a special value for the textual criticism of the New Testament, and I hope that Dr. de Zwaan and myself will be able in the course of time to publish some of the results which are based on them, in the direction of distinguishing the types of text which the various correctors preferred.

Finally, on behalf of my wife and myself, I must express a gratitude, in which I feel sure that those who may find the facsimile useful will join, to the Trustees of the Revision Surplus, Hort Memorial, and Hibbert Funds, and to the Governing Body of Magdalen College, for the grants of money which rendered possible our journey to St. Petersburg, as well as to the authorities of the Imperial Library for their permission to photograph their famous Codex, and to the Delegates of the Oxford University Press for undertaking the publication.

KIRSOPP LAKE.

Leiden, 1911.

THE DISCOVERY OF THE CODEX

The discovery of the Codex Sinaiticus by Tischendorf is one of the best-known stories in the history of Palaeography. In 1844 Tischendorf, who had planned a fresh critical edition of the New Testament, and had already visited most of the great libraries of the West, was travelling in the East in order to discover what new light might still be obtained from the monastic libraries. In the convent of St. Catherine on Mt. Sinai he found in a basket, which he understood to contain material for lighting the fire, forty-three leaves of the Septuagint. These he obtained, and published in 1846 under the title of the Codex Friderico-Augustanus.¹ This codex is now at Leipzig. He ascertained that the rest of the MS. was in existence; and though he was unable to obtain possession of it, he cherished the hope of returning at some later period and of then being more successful. That in this way Tischendorf rightly earned the fame of discovering this valuable MS. would be denied by no one; but M. Seymour de Ricci, in the *Revue Archéologique*, 1909, p. 159, has recently pointed out that it was probably seen as early as 1761 by the Italian traveller, Vitaliano Donati, in his visit to Mt. Sinai. Donati's diary is still unpublished, but extracts were made from it by G. Lumbroso, in the *Atti della R. Accademia dei Lincei* in 1879, in which on p. 501 the following statement is found: 'In questo monastero ritrovai una quantità grandissima di codici membranacei . . . ve ne sono alcuni che mi sembravano anteriori al settimo secolo, ed in specie una Bibbia in membrane bellissime, assai grandi, sottili, e quadre, scritta in carattere rotondo e bellissimo; conservano poi in chiesa un Evangelistario greco in carattere d'oro rotondo, che dovrebbe pur essere assai antico.' The MS. in gold letters is no doubt the Evangelistarium Aureum (Gregory Evst. 300) which is still shown to travellers, and the 'Bibbia' may well be, as

¹ From the name of the King of Saxony, under whose patronage he was travelling.

M. de Ricci suggests, the Codex Sinaiticus. The objection that the script is described as 'rotondo' is adequately met by the fact that the Evangelistarium Aureum, which is also 'rotondo', is an uncial: no doubt Donati meant to distinguish the script from the narrow contracted type of uncial found in some late MSS.

After Tischendorf left the monastery, the MS. seems to have been seen by two other scholars. In 1845 Porphyrius Uspenski visited Sinai, and saw the MS.—not only the remnant which Tischendorf had seen, but also the other parts to which it was now reunited. It would therefore seem that Tischendorf's conversation with the monks had aroused them to a sense of the value of their property. Porphyrius Uspenski also found some fragments of the MS. in the bindings of other MSS.* Besides Porphyrius Uspenski it is generally thought that the MS. was seen by Major Macdonald, a Scotsman who visited Sinai in 1848? Whether, however, this MS. was really the Codex Sinaiticus or another MS. of later date is doubted by Prof. Gregory⁴; fortunately the point is as unimportant as its discussion is indecisive.

In 1853 Tischendorf returned to Sinai, but could find no trace of the MS., or even discover whether it was still in the library. In 1859, however, he again visited the Mountain, armed with an introduction from the Tsar, and was warmly welcomed, but did not venture directly to approach the search for the MS. until one evening he found a favourable opportunity for leading the conversation on to the subject of the

¹ See his *Ilepos nyremecnie v Casaficni MoBsellMpt* m. 1845 r. Petersburg, 1856, pp. 225-38. Porphyrius was afterwards Archbishop of Sinai.

THE DISCOVERY OF THE CODEX

Septuagint. These tactics proved successful, and later on the *oxoro/ioç*, desirous of showing that the monks also had a MS. of the Septuagint, brought him the Codex wrapped in a red cloth.' Tischendorf's delight can be imagined, when he found that it contained not only a great part of the LXX, but the whole of the New Testament, Barnabas, and part of Hermas.

An arrangement was made with the monks that, if the superiors of the monastery, who were living at Cairo, were willing, the MS. should be sent to Cairo to be copied. Hurriedly returning thither, Tischendorf persuaded the representatives of the monastery to make this concession, and, in consequence, a messenger was sent to St Catherine's to fetch the MS., which on Feb. 24, 1859, reached Cairo, where it was copied by Tischendorf and two assistants in the extraordinarily short space of two months. After this Tischendorf suggested to the monks at Cairo that the MS. should be given to the Tsar. There was, however, at that time an election in process to the archbishopric of Sinai; a candidate had been unanimously selected, but he was not yet consecrated, and under these circumstances it was ultimately (in Sept. 1859) agreed that Tischendorf should take the MS. to the Tsar in anticipation of the formal gift which would be made when the archbishop was in a position to ratify it.

There has been much not very edifying controversy as to the terms on which this arrangement was made. Some of the monks have maintained that it was never their intention to make a permanent gift of the MS. Another version is that they bargained for a steamship to connect their harbour on the Red Sea with Port Said. Those who have had much to do with Oriental monks will understand how improbable it is that the terms of the arrangement, whatever it was, were ever known to any except a few of the leaders. The latter probably regarded the whole affair as a speculation. In any case, the fact is certain that Tischendorf was allowed by the archbishop to take the MS. to St. Petersburg.

The Tsar was pleased to accept the present brought by Tischendorf; in November, 1859, the MS. was exhibited for a fortnight, and was then taken to Leipzig, in order that Tischendorf might issue a facsimile edition in accordance

* In which it is still wrapped, and, I hope, always will be.

* Sinai is under the control of an archbishop, who is consecrated at Jerusalem, but has independent jurisdiction.

with the Tsar's orders. Photography was not in those days sufficiently advanced to enable it to be employed, though Tischendorf considered its possibility, but special type was cut to imitate the MS., and the result may fairly claim to be the most perfect facsimile edition which was ever published in the pre-photographic period. It is a triumph of printing,' and Tischendorf's notes will always remain an indispensable aid to the study of the MS. It was issued in four volumes from St. Petersburg in 1862, under the title *BIBLIORUM CODEX SINAITICUS PETROPOLITANUS. auspiciis augustissimis Imperatoris Alexandri II. ex tenebris protraxit in Europam transtulit ad iuvandas atque illustrandas sacras litteras edidit Constantinus Tischendorf.*

When the MS. was no longer needed for the purposes of preparing this edition it was finally handed over to the Tsar, and deposited in the Imperial Library, where it is still to be seen in a special show case in the Great Hall.

Meanwhile the monks of Sinai had received nothing in return for their magnificent present; and in a letter dated July 15, 1869, the Archbishop of Sinai hinted to Tischendorf that the time was approaching when the monks might reasonably expect some suitable acknowledgement. In consequence of this letter Tischendorf appears to have written to the Russian Ministry, and the result was that on Nov. 18, 1869, 7,000 roubles were received by the monks of St. Catherine's, 2,000 roubles by the affiliated monastery of Mt. Thabor, and various decorations by the leading monks. The latter, however, have always claimed that they did not accept this as a satisfactory settlement, but no written protest on their part is known to exist, and the archbishop, at all events, remained on friendly terms with Tischendorf.²

Finally, it is perhaps sufficiently curious to deserve mention that Simonides the forger attempted to discredit the experts who had helped to detect his fraud, by claiming that he had himself written the Codex Sinaiticus, and had deceived them all; but the details of this absurd story belong rather to the annals of crime than to the history of palaeography.

* A full account of its preparation is given in the preface to Tischendorf's edition, vol. i, pp. 5 ff.

* See the quotations from Tischendorf's correspondence in C. R. Gregory's *Prolegomena to the Eighth Edition of Tischendorf's Novum Testamentum Græce*, 1894, pp. 351 ff.

THE EARLIER HISTORY OF THE MS.

THE CORRECTION OF THE CODEX AT CAESAREA

The only point on which practical certainty can be arrived at with regard to the history of the MS. before it was discovered by Tischendorf, is that at the time when one of the correctors belonging to the group C was working it was in the famous library at Caesarea. Palaeographical and historical grounds agree to fix this time as not later than the beginning of the seventh or earlier than that of the fifth century.

The library at Caesarea is one of the three great Christian libraries known to have existed in the third century. It is perhaps correct to speak of Pamphilus as the founder of this library,» but the nucleus of his collection was the MSS. of Origen, who in turn probably inherited the library of Juliana which is mentioned by Eusebius (*Hist. Eccl.* vi. 17), who says, *Taura Se ó 'ftpvvevrçç lacti «al çXàwf ciç ràç tppipwwv rov Sv/xua^ov enjpalvti napà TovXiarrçç rivos fy xai ýijat nap' nvrov Sv/xàyon ràç fiti^kova bia&ffairlai.* The actual words of Origen's statement are given by Palladius (*Hist. Laus.* Ixiv, ed Butler), who says, *cipor 8c ravra çyw yeypa/íicva Iv rç» raXaiorár^t fifikiip (rrc^pip, çýépanro Xtipi 'Clptywov? Tovro to (ii^kíov cvpov trapa 'lovkiav rg irapOcvtp iv Kaicrapeip, Kpinrrópevoi nap avrg, ijtiç ckeyc nap' avrov ^vppçxov T0^ ippgvctoç Tiàv 'louSaiwp avrô ciÀT^cvat.* Unfortunately the copyist of this note was apparently not very accurate, and thought that Caesarea in Cappadocia was indicated, but it is probable that this is merely a mistake and that Caesarea in Palestine was really intended. In any case there is little reason to

doubt that the library of Caesarea when it was organized by Pamphilus contained many MSS. of the third and second centuries, and it was certainly one of the main sources of Eusebius's knowledge of Christian literature, though unfortunately the catalogue which he published in his life of Pamphilus is no longer extant.

According to Jerome (*de vir. ini.* 3. 113) the library began to show signs of decay at the end of the fourth century, and Euzoius,* 'eiusdem postea urbis (Caesarea) episcopus, plurimo labore corruptam iam bibliothecam Origenis et Pamphili in membranis instaurare conatus ... &c. This statement may fairly be interpreted to mean that the Papyri on which the earlier MSS. were written were wearing out, and had to be copied on parchment. Of this second foundation by Euzoius there is at least one certain trace in a MS. of the eleventh century at Vienna (MS. Theol. Gr. 29) which contains (f. 146') the cruciform note, copied no doubt from its archetype, «uέοιοσ cvcaxoirof iv o-w/xartoia awveaxraro. It was much used by Jerome, who frequently refers to it, and at the beginning of the seventh century the copy of the Hexapla of Origen in the library at Caesarea was used by Paul of Telia for the Syriac Hexapla, as is stated in the subscriptions to the various books of the Old Testament; but after this there is no proof of the continued existence of the library. Its fate is unknown; but Caesarea was taken by the Arabs in 638, and we may guess with much probability that the library was dispersed or destroyed.

The evidence that the Codex Sinaiticus was once in this library is given by the notes added by one of the C correctors at the ends of Ezra and Esther, in the fragment at Leipzig (Codex

* The other two are Jerusalem and Alexandria. The history of the library at Jerusalem is given in Eus. *H. E.* vi. 20. 1; cf. Ehrhardt, *Rihn. Quartalschnft.* 1891, 217 ff. There can be little doubt that the Catechetical School at Alexandria had a library, though it is difficult to distinguish it from the private collections of Clement and Origen.

† Cf. Eus. *H. E.* vi. 33.

‡ The full list of references to Pamphilus and his work is given in Harnack's *Geuichte dtr alchrislshcn Littcratur*, vol. i, pp. 543 ff.

§ In Ep. 34. † Jerome says that Acacius also helped.

† See Field, *Hexapla*, i, pp. xcix-c.

THE EARLIER HISTORY OF THE MS.

Friderico-Augustanus). It has often been stated that these notes are by the corrector C*, but this is not the case, as will be seen when the facsimile of the Old Testament is published. There is a certain family resemblance between C' and the scribe of the notes at the end of Ezra and Esther, but they are not identical, and there is perhaps a difference of ink—C* used a redder, and the scribe of the note at the end of Esther a yellower colour—though I am inclined to doubt this, strikingly evident though it seems at first. The two notes happen to have been written on bad patches of vellum, which have not taken the ink well, so that the writing has faded, but at the end of the note to Ezra, where the parchment improves, the ink has the same reddish tint as C*. Further discussion of this point belongs to the introduction to the Old Testament: it is sufficient here to say that the probable solution of the question is that several scribes (of which C' was certainly one) were engaged in correcting the text according to that of the Codex Pamphili, and one of them (not C') wrote the notes at the end of Esther and Ezra to explain what had been done. That the writer of the notes belongs to the C group of scribes is tolerably certain, and his statements make it almost equally plain that this group was formed by the monks in the scriptorium at Caesarea. The text of the notes is as follows:—

(1) *At the end of Ezra* (Cod. Frid.-Aug. f. 13).

From the addition of the word ὁποῦ»jr>fc to the name of Antoninus it is clear that the writer identified him with the Antoninus who was martyred on Nov. 13, 309» shortly before Pamphilus, who was put to death on Feb. 16, 310 (see Eusebius, *de marty. Palest.* 9. 5 and 11. 1). The reference to the prison also enables us to date the MS. used by the corrector almost exactly in the year 309. Moreover, as the original Hexapla of Origen was at Caesarea, and Pamphilus claims to have corrected his MS. by it, there is really only one step—the MS. of Pamphilus—between the corrector and the original Hexapla.

It will be seen that the evidence connecting the Codex Sinaiticus, at the time of the C correctors, with the library of

THE EARLIER HISTORY OF THE MS.

Caesarea is not absolutely demonstrative: it is possible that the MS. of Pamphilus had been taken to some other place, and of course the view that all the C correctors belong to much the same place and time is a point on which it is possible that other opinions will be held when the facsimile of the Old Testament completes the presentation of the evidence. It is therefore all the more satisfactory that there is some indirect evidence for connecting another of the C group—O—with the use of a MS. of Pamphilus in the Pauline epistles.

It will be noted that the colophons at the ends of Ezra and Esther only refer to MSS. of a comparatively small part of the Old Testament, and there are no other notes elsewhere. It is, however, well known that in the Pauline epistles critics¹ have long been struck by the resemblance between the text of the corrector O and that of cod. Now, cod. H^{***} has at the end of the Pauline epistles a long colophon, beginning with the name Evagrius², and ending with the statement:—

Ἀντὶ Βαβυλῶν 41 Α ΒΒΑΑο·
 npoc rd In -AICApid Inri
 rp&4>ON' THC BiBāioBhkkc
 Tot ἵHoy n'M<τ>I&Aor ^elpi
 repMAM'HON [aytoy]§

Considering the close textual relationship between cod. H^{ful} and the corrector C' of the Codex Sinaiticus, it is legitimate to regard this evidence as increasing the probability that during the time that the corrector Ca was working the Codex Sinaiticus was in the library at Caesarea, in which there were certainly many MSS. of Pamphilus, rather than in some other library to which a MS. of Pamphilus might have been brought.

The date which must be assigned to the time when the Codex was in Caesarea depends entirely on that which palaeography gives to the writing of the C correctors, and especially of course to that of the scribe who wrote the notes at the end of Ezra and Esther. On this point opinions are likely

¹ See especially W. Bouwet, *Textkritische Studien* (nennen *Tatuwni* (*Texte und Unterschnngen*, xi. 4), pp. 45-73.

² The word is erased. It is possible, perhaps even probable, that it is really E^{trp}<v> rather than E^{trp}loc.

³ avrov is not now legible in the MS., but in the time of MontCaucon the final v was still visible.

to differ. The latest date suggested is the seventh century; the earliest is the fifth. Dr. F. G. Kenyon and Dr. A. S. Hunt agree in regarding the sixth century as possible, but the former is inclined to accept the seventh as equally possible, while the latter is more disposed to prefer an earlier date.

THE HISTORY OF THE MS. AFTER IT WAS IN CAESAREA

How or when the MS. passed from Caesarea to Sinai is absolutely unknown. There is not a trace of evidence. The monastery of St. Catherine's on Mt Sinai was one of the foundations of Justinian, and from the sixth century it became one of the strongholds of the Greek Church and the Malkite Syrians. Caesarea, on the other hand, was taken by the Arabs in 638. It is therefore a plausible guess that the MS. was taken to Sinai by refugees from Caesarea. But this is merely a guess: it may have been taken to many places after leaving Caesarea and have reached Sinai many years or centuries later.

THE ORIGINAL PROVENANCE AND DATE OF THE MS.

The only points in the pre-Caesarean history of the MS. which repay discussion are concerned with the place and time of its original writing, for from the day that it passed out of the scriptorium until the time that it was revised at Caesarea there is no other evidence of any kind to throw light on its history. It is of course true that the correctors B*, B, and possibly A⁸, A⁴, and A⁸, may have done their work outside the scriptorium, but there is nothing in their scripts to justify any suggestion that they belonged to one locality rather than another, and they are (see p. xxiii), if not contemporary with the original scribes, at least extremely close to them in age.

The *terminus a quo*, from which the date of the MS. must be reckoned, is provided by the fact that the Eusebian apparatus was added to it before it was issued from the scriptorium (see p. xix). It is unfortunate that we do not know the exact date when Eusebius made his apparatus, but it is

THE ORIGINAL PROVENANCE AND DATE OF THE MS.

at least plain that the first quarter of the fourth century is the earliest date which has any reasonable probability. The *terminus ad quem* cannot be so easily fixed. We are here entirely dependent on palaeographical considerations, and on the comparison of the writing with that of papyri. The earliest vellum MS. of which the date can approximately be fixed is the Vienna Codex of Dioscorides, which cannot be far removed from the year 50a. No one doubts but that the Codex Sinaiticus and various other MSS. are earlier than this; but the history of writing shows that the development of hands is by no means regular, and decisive dating is usually very difficult. Nevertheless a comparison with papyri suggests that the Codex Sinaiticus is more likely to belong to the fourth than to the fifth century; Dr. Hunt, indeed, expressed the view that if it had not been for the evidence of the Eusebian apparatus, he should have not regarded the third century as an impossible date. This view of the date of the MS. is based on the assumption that the provenance of the MS. is the same as that of the papyri—Egyptian; but an element of doubt cannot be excluded on this point, and it is clear that if the assumption be baseless, the date is proportionately less certain. Baseless, however, the assumption fortunately is not: as will be shown, an Egyptian provenance is actually the most probable for the Codex Sinaiticus; but it is not certain, and there have been competent scholars who have been inclined to think that Caesarea not only was the resting-place of the MS. in the sixth century, but also has the best claim to be regarded as its original home.

Of the various arguments, partly historical! partly palaeographical, bearing on this point, those which are purely palaeographical are likely to seem rather unsatisfactory to those who are acquainted with the splendid results reached by Latin scholars in fixing the date and provenance of their MSS. It is, however, the fact, regrettable though it be, that this line of research is much less fruitful in Greek than in Latin documents. We have not sufficient specimens of ascertained date and diverse provenance to justify any security of judgement. The literary hand in papyri which affords our only guide in this matter is an excessively fixed type, which those who are constantly engaged in papyrological research are least prepared to date with exactness, and as the papyri all come from the same country they afford little or no evidence

as to local peculiarities of script. It is indeed now possible to state with a certainty which was hitherto unattainable that this or that type of letter was common in Egyptian papyri, but it is not possible to say that it was characteristic, in the sense that it was absent in other schools of calligraphy; for we are almost ignorant of the history of literary as distinct from private hands outside of Egypt. Moreover, we do not know with any precision what changes may have been introduced by professional scribes when they passed from writing on papyrus to the somewhat different surface of vellum. The only analogy which we can study—that of the minuscule revival in the ninth century—is imperfect in kind and remote in date. In that century professional scribes on vellum began to abandon the uncial character, which they had taken over from the literary hand of the papyri, in favour of a cursive hand modelled on the earlier private hands. Obviously it is impossible to argue from this great revolution to the small one of passing from papyrus to vellum; but it is perhaps admissible to point out that as the changes made in the ninth century from the private cursive hand were comparatively small, *à fortiori* those in the fourth were probably smaller.

With these serious qualifications comparison with papyri affords the only palaeographical clue to the provenance of the Codex Sinaiticus. It tends to suggest that the papyri and the Codex come from the same place. There are no letters in the Codex Sinaiticus which cannot be paralleled in papyri of the fourth or earlier centuries. The three forms which attract attention in the Codex Sinaiticus are the so-called Coptic Mu, the curious shaped Omega with a long central line, and an occasional use of the cursive Xi. The Coptic Mu is common in papyri: it is called Coptic because it happens to be the form which passed over into the Coptic alphabet; but there is no evidence to show that it was rare outside of Egypt. The long Omega is much more rare: it is found in Pap. Rylands 28, a papyrus of probably the fourth century, but Dr. Hunt was not able to quote any other instance of its use in papyri, nor is it common in vellum MSS. I only know of it in the Codex Vaticanus, and here too it is comparatively rare. The use of the cursive Xi in uncial script is also rare: it is found in the additions of the corrector A* in the Codex Sinaiticus, in the superscriptions and sections of Codex Vaticanus, in Pap. Rylands 28, and in Pap. Oxyrhynchus 852. Probably

THE ORIGINAL PROVENANCE AND DATE OF THE MS.

further research will ultimately show that it is found in other documents, but it is in any case rare, and the fact that all the peculiarities of the Codex Sinaiticus are also found in Pap. Rylands 28, as well as in Codex Vaticanus, is remarkable: it is enough to suggest the possibility that these documents come from the same scriptorium, and, as will be shown later, in the case of the two vellum codices there is further evidence to support this suggestion. Moreover, it is obvious that this evidence points to Egypt for the provenance of the Codex Sinaiticus, in so far as there is nothing in it which is unparalleled in Egyptian documents; but it is desirable to emphasize once more that this fact ought not to be regarded as conclusive, so long as we have no evidence as to other local hands. As the matter stands the identity of script between the papyri and the Codex Sinaiticus may be due to a common provenance, but we cannot prove that it may not equally well be due to the existence of a single type of professional literary script throughout the Graeco-Roman world in the fourth century. One may, however, at least claim that so far as palaeography is concerned the *onus probandi* is on those who maintain any provenance other than Egyptian.

Besides this purely palaeographical evidence attention may be called to two orthographical points, which stand out among the otherwise quite ordinary spellings of the Codex Sinaiticus, for the interchange of λ and κ , c and t is so universally found in all MSS. of every time and place that it cannot be regarded as possessing any importance.¹

(r) In ten out of the eleven times that the word *Kpáfiarros* is found it is spelt $\kappa\rho\alpha\beta\alpha\kappa\tau\omicron\varsigma$ (Acts 5th has $\kappa\rho\alpha\beta\alpha\tau\omicron\iota\omicron\eta\iota$). This may be illustrated from P. Tebt. 406^b (about 266 A.D.) and P. Grenf. ii **in**" (fifth-sixth cent.). Prof. Moulton has an interesting note on this point in the German edition of his 'Prolegomena', p. 60. 'The mass of the good MSS.,' he says, 'spell thus [rpó/Sarrot], but B* in Me has «pájaros, and N nearly always $\kappa/\mu\epsilon\lambda\beta\kappa\iota\omicron\tau\omicron\varsigma$: E in Acts 5" seems about the best of the authorities for which is normal in late MSS. . . . The papyri vary between *npaflarros* (so P. Brit. Mus. ii 191" (p. 265) of the reign of Trajan), *K/mparoc* (*Mélanges Nicole*, p. 184, a "probably Ptolemaic"

¹ It is, however, worth observing that whereas the scribe A prefers κ to λ the scribe D prefers λ to κ but this is a purely personal idiosyncrasy, and is of no value for defining the date or provenance of the MS.

ostrakon, and $\kappa\rho\alpha\phi\alpha\rho\omicron\varsigma$ (P. Tebt. 406^b, of 266 a.d., cf. P. Grenf. ii **in** of v/vi A.D.). Now Thumb in *Indog. Forsch.* ii. 85 gives MGr κ/λ BjBán as the normal form, but *krevátti* Bova and *krévato* Rochudi: "die Obrigen italienisch-griech. Formen sind wahrscheinlich aus der Grundform *krevátti* hervorgegangen. The Latin *grabatus* shows that in the West a form with one ϕ prevailed: the β/β arises at a late date in some other district and spreads over the whole area, the late N.T. MSS. agreeing. The interest of the dialectical differentiation for us lies in the agreement of η with witnesses exclusively Egyptian, dating from the centuries before and after its own period: so far as that goes, it is very suggestive for the provenance of the MS., which is in this point sharply distinguished from its general associate B/ I would only add that the last words here must not be taken to imply that there is anything in the orthography of B which points away from Egypt. Prof. Moulton only means that the evidence as to $\rho\acute{\alpha}/\beta\alpha\rho\omicron\varsigma$ is not in its case *characteristically* Egyptian.

(2) The word $\lambda\pi\alpha\iota\chi\tau\iota\eta\iota\eta$ occurs nine times in the New Testament; and in eight of them the Codex Sinaiticus spells it $\iota\epsilon\iota\phi^*H\Lambda\leftarrow TH\epsilon$. This euphonic dental is commonly inserted in the MSS. of the Old Latin version, both of the African and of the European type, but among the Greek Uncials it appears to be found only in the Codex Sinaiticus and in the Codex Vaticanus, in the latter in the form of $\iota\epsilon\iota\phi^*H\mu\theta\eta\epsilon$. Westcott and Hort used this fact to support their theory of a Western provenance for one or both of these MSS., but strong though their argument seemed, it has been deprived of its force by the papyri of Egypt. The same spelling is found in the Magical Papyri (e. g. the great Paris Codex Suppl. Gr. 574), and although Traube in his *Nomina Sacra* (p. 106) says 'Die Form Istrahel ist wohl mit Ronsch, *Collectanea Philologica* S. 245, für einen Latinismus zu halten' he goes on to admit that 'im Griechischen findet sich $\iota\epsilon\iota\chi\eta$ oft in den Papyri magici'. M. de Ricci has also recently found the spelling $\iota\epsilon\iota\phi^*A\eta$ in an unpublished Graeco-Egyptian tablet in the Louvre, and also in a Jewish inscription in the Museum at Alexandria? Thus the evidence for this spelling in Egypt is probably as

¹ *Notts Épigraffiti Égyptiense, extrait du Bulletin de la Société Archéologique (Alexandrie, No. 1, 1909.*

THE ORIGINAL PROVENANCE AND DATE OF THE MS.

early as any which can be adduced in Latin, and even if it be ultimately a Latinism, it affords no argument against the Egyptian provenance of any individual MS.

Thus the argument from orthography does nothing to impugn the probability of the Egyptian provenance of the Codex Sinaiticus, and in the case of *Kpafik&xrot* even gives it somewhat strong support, though it is well to remember that orthography and palaeography can only define the nationality of the scribe, not the locality of the scriptorium: there is always a probability that an Egyptian was writing in Egypt, but he may have been living in a foreign land.

Partly, but not mainly, palaeographical is a further argument which seeks to bind up the Codex Sinaiticus with that of the Codex Vaticanus, and thus to establish their common provenance. This argument is somewhat complicated, and may best be divided into three stages. First, there is the palaeographical question of the relationship between the two codices, of which the most famous point is the attempt made by Tischendorf to identify the scribe of Codex Vaticanus with the scribe D (who is also corrector A*) of the Codex Sinaiticus; secondly, there is the treatise of Dr. Rahlfs connecting Codex Vaticanus with Athanasius; and, thirdly, there is an attempt first made by Dr. Rendel Harris, and afterwards more completely by Dr. Armitage Robinson, to connect both MSS. with Euthalius', and probably with Caesarea.

Tischendorf's view that the body of the text of Codex Vaticanus was written by the scribe D of the Codex Sinaiticus is unfortunately indefensible.¹ A comparison of the two hands, which can easily be made on Plate HI, will convince any one of this fact. It would be absurd to contend that on that plate the hand which wrote col. 3 is different from that which wrote col. 2, but nevertheless identical with that which wrote col. 4, and this is the contention which Tischendorf's theory implies. If it be said that there is an even greater difference between col. 3 (the writing of scribe D) and the script of corrector A*, which are nevertheless to be regarded as by the same hand, the answer is that the instances are not of the same kind. Corrector A' and scribe D may be identical,

in spite of superficially great difference of script, because two different kinds of writing were employed for the text, and for the corrections. The same scribe may write many distinct types of script, but the point is that he will not write the same type in two ways. The script of A1 is distinct in type from that of scribe D, while the script of Codex Vaticanus is the same type as scribe D's, but written in a different way. It is therefore necessary to abandon Tischendorf's view that part of the text of Codex Sinaiticus was written by the scribe of the text of Codex Vaticanus. Nevertheless there is, if the main body of the text be put aside, a high probability for the view that the two codices came from the same scriptorium. This view is based on the remarkable similarity subsisting between the hands of the scribes who added the superscriptions to Acts in both MSS. Typical specimens of these are placed together in the fourth column of Plate III, and it will be seen that the resemblance is so great that it is impossible to say with complete confidence that they are not by the same scribe. Especially noticeable is the occurrence of the cursive **f** in the middle of an otherwise uncial script. I am, however, convinced that the probability is rather that we have to deal with two hands of the same scriptorium. The tail of the **f** is more carefully rounded in Codex Vaticanus, and the **l** in the second syllable of *irpafeis* is exaggeratedly long in Codex Sinaiticus, and these differences, which are constant, seem sufficient to distinguish the two hands. Nevertheless the similarity is extremely great, and is scarcely explicable unless we assume that both hands come from the same scriptorium, while the differences might conceivably be taken merely to mean that there is a difference of time between the two hands,—that is to say that the Codex Vaticanus was written by a scribe in his youth, and the of Codex Sinaiticus by the same scribe in his old age. But whether this be so or not is not really of great importance: the serious thing is that there is in any case good evidence for thinking that the two great codices come from the same scriptorium, in spite of the fact that Tischendorf was wrong in thinking that they were written by the same scribe. The only possibilities which can really be regarded as weakening the force of this evidence, and preventing it from being demonstrative, are (1) it may be that the significant *irp&n* were written by two scribes who had learnt in the same school, but practised in separate scriptoria; (2) it may be that the

¹ This is, I may add, the opinion of every palaeographer who has seen the proofs of the facsimile. I have found none who are inclined to agree with Tischendorf, or even to hesitate on the subject.

THE ORIGINAL PROVENANCE AND DATE OF THE MS.

superscriptions in Codex Vaticanus were added after it had passed outside the original scriptorium to some other place. These are real possibilities, and with regard to the latter attention may be directed to Dr. Karl Dziatzko's *Untersuchungen über ausgewählte Kapitel des antiken Buchwesens*, especially to his seventh chapter, 'Die Einwirkung der Rollenform auf die Codexform.' In this he adopts the view that the custom of adding superscriptions (Seitenüberschriften) did not obtain before the end of the fourth century, and points out that the Codex Vaticanus represents a transitional period, in which the addition was not made by the original scribe. His theory seems to be supported by the evidence of the superscriptions in the Codex Sinaiticus (see p. xxi).

It will, however, probably not be denied that there is, in spite of all other possibilities, a probability that the Codex Sinaiticus and the Codex Vaticanus belonged to the same scriptorium. Where, then, ought we to look for it? It was suggested above that the fact that the Egyptian Papyrus Rylands 28 agrees with the two codices in practically the only palaeographical peculiarities which they present must be regarded as pointing to Egypt until contradictory evidence be discovered. So far, however, from rebutting this suggestion, Dr. Rahlfs, who investigated the historical and critical evidence for the provenance and date of the Codex Vaticanus in the *Nachrichten der königlichen Gesellschaft der Wissenschaften zu Göttingen*, has strongly corroborated it.

He has pointed out that the Codex Vaticanus agrees in the most remarkable way with the list of scriptural books given by Athanasius in the Paschal letter for 367. The points of agreement against other authorities are these: (1) In the Old Testament the book of Esther is not reckoned among the books which are *Kavwi&pcva*, but only among those which are *zvajyijic/câjltva*. (2) In the New Testament in Codex Vaticanus Hebrews is placed between the Epistles of the Captivity and the Pastoral Epistles. This agrees with the Greek and Syriac text of the Paschal letter; but the Sahidic version, agreeing with the usual Sahidic biblical text, places it between Corinthians and Galatians. It is argued that this represents

in a Sahidic text a return to an old local use in Egypt; and, curiously enough, Codex Vaticanus has a continuous numeration for the sections in the epistles, which is at present dislocated in such a way as to show that it was taken from a MS. which placed Hebrews after Galatians. This is not quite the same as the Sahidic, but Dr. Rahlfs thinks that it is near enough to justify the view that the Codex Vaticanus is an attempt to carry out Athanasius's views as to the order of the books, and that the text of the archetype, which was being modified, belonged to the old Egyptian type represented by the Sahidic Version. He therefore argues that the Codex Vaticanus comes from Alexandria and is at least as late as 367. It is of course plain that this is not a decisive argument: the parallel between the Sahidic text of Athanasius and that implied by the numeration in Codex Vaticanus is not quite perfect: and the textual facts in connexion with Athanasius are by no means clear. Nevertheless, when all these points have been discounted, it will probably be agreed that there remains enough to justify the statement that as our knowledge stands at present there is a presumption in favour of Egypt as the original home of the Codex Vaticanus. One may also, without unduly venturing on the domain of textual criticism, here draw attention to a further point. The Psalms quoted in the Coptic text of the Pistis Sophia have an extraordinary resemblance to the text of the Codex Sinaiticus,—in Prof. Hamack's phrase, 'Dieser Text steht dem Cod. Sinait. wie ein Zwillingbruder nahe.' This fact may be allowed to weigh in the scale in favour of an Egyptian provenance. Formerly one would have regarded Egypt as, in this connexion, synonymous with Alexandria, but in view of the wealth of Greek papyri from Oxyrhynchus and other places remote from Alexandria, it is necessary to hesitate, though it probably remains true that splendid volumes, such as the Codex Sinaiticus and the Codex Vaticanus, are more likely to have been produced in Alexandria than in the country higher up the Nile.

It remains to consider the connexion between the two codices and 'Euthalius'. The simplest way of dealing with this point is to begin by summarizing the points connected

* It is not here necessary to discuss the difficult question whether all the superscriptions in Codex Vaticanus are by the same hand, or the scribe who wrote *epdfus* ought to be distinguished from the rest.

1 'Philologisch-historische Klasse,' 1899, pp. 73-9.

* See his *Ein jüdisch-christliches Psalmbuch (Texte und Untersuchungen, xxxv. 4)*, p. 13. He gives a further reference to Rahlfs, *Die Berliner Handschrift des sahidischen Psalters*; but the textual relations between *x* and the Sahidic version is too complicated a question to be used as the basis for any argument as to the provenance of the Codex Sinaiticus.

THE ORIGINAL PROVENANCE AND DATE OF THE MS.

with 'Euthalius' which are important for the present purpose.

There are found in many Greek MSS. and in many versions the traces of something resembling a critical edition of the Acts and Epistles, giving a series of prologues and chapter divisions, and dividing the text stichometrically. Traditionally this edition was made by Euthalius—an unknown person who is sometimes referred to as a deacon, sometimes as a bishop, sometimes of Alexandria, sometimes of Sulci, which is probably Sulci in Sardinia. It is, however, one of the many difficulties connected with this question that critics are not agreed as to whether the name of Euthalius, or at least the name of Sulci, be not a later growth in the tradition. It is therefore wiser at present to speak of 'Euthalius*' rather than Euthalius, in order to show that the name is used as a symbol for the original author of this edition of Acts and Epistles, rather than as the name of an historical person. At one point in its history this edition was compared with the MSS. of Pamphilus in Caesarea by a certain Evagrius whose name is found in the colophon attached to Cod. H_{pm}—the oldest MS. of the 'Euthalian*' edition. In this respect the history of the edition is precisely similar to that of the Codex Sinaiticus, which was corrected by a C corrector by means of the same MSS. in parts of the Old Testament; but this does not prove that the edition was originally made in Caesarea, any more than it proves that the Codex Sinaiticus was written there. Now, among the characteristics of the earliest form of this edition—belonging, that is to say, to the original 'Euthalian' recension, and not due to the further work of Evagrius—is a rather elaborate system of dividing the Acts into chapters, and these chapters into smaller divisions, and a corrupt form of the same system is found both in the Codex Sinaiticus and the Codex Vaticanus. That this is so is the discovery of Dr. Armitage Robinson,¹ who has shown that though both codices have the same corrupt form, each has mistakes which the other has avoided. In the Codex Sinaiticus the chapter divisions were added by the corrector A₁, who worked in the scriptorium, and it is usually stated that in Codex Vaticanus they were also added by a very early hand. From this therefore Dr. Armitage Robinson concluded that the numeration 'must go back to a common source—some MS. which gave its numeration to them both: and this seems

to imply that M and B were at an early stage of their history lying side by side in the same library*. So far as the first part of this argument goes it holds good; but unfortunately a glance at the facsimile of Codex Vaticanus¹ shows that the hand which added the numeration is not really very early. It cannot well be put before the sixth century, and I should think that it more probably belongs to the eighth. Thus this argument throws no special light on the provenance of the Codex Vaticanus. However, the 'Euthalian' character of the numeration in the Codex Sinaiticus remains a valuable fact. It is important in two ways: in the first place it takes away the force of a suggestion made by Westcott and Hort¹ to the effect that the Codex Sinaiticus came from the West. They were struck by the similarity between its chapter numeration and that in the Codex Amiatinus and other Vulgate MSS. In the light of Dr. Armitage Robinson's work we can see that this similarity is merely due to a common use of a 'Euthalian*' system, and one is inclined to guess that if it be Hieronymian in the Vulgate it may be that the Evagrius who was a friend of Jerome is the same as he who collated the 'Euthalian' edition with the MSS. of Pamphilus in Caesarea, and that he is the connecting link between Jerome and the 'Euthalian*' numeration. In the second place it is important because the only clue—admittedly a slight one—which we possess for the provenance of 'Euthalius' is that in the prologue to Acts the whole is dedicated to Athanasius. It is true that critics have doubted the authenticity and the meaning of this dedication; but they have done so partly on erroneous theories as to the date of 'Euthalius'. There is not in fact any reason why he should not have been a younger contemporary of the great Athanasius. In any case, so far as it goes, this tradition certainly lends support to the theory that the Codex Sinaiticus came from an Egyptian provenance.

All these arguments point to Egypt, but inasmuch as they are not quite conclusive, it is necessary to point out the one serious argument which really seems to direct us to Caesarea for the provenance of the Codex Sinaiticus. It possesses the Eusebian canons, and the earlier the date assigned to the MS., the more probable, it may be thought, is it that a MS. containing these canons should come from Caesarea. There is

¹ *Euthaliana* (*Texts and Studies*, iii. 3), pp. 36-43.

¹ An example will be found in the specimen on Plate HI, col. 4.

¹ *The New Testament in the Original Greek*, first edition, p. 266.

THE ORIGINAL PROVENANCE AND DATE OF THE MS.

certainly weight in this contention: we should expect the Eusebian apparatus in Caesarea in the fourth century; it would be rather surprising to find that it had been adopted so soon in Alexandria.

Nevertheless the obvious force of this argument must be discounted by the fact that in considering the probability of one locality over another with reference to the early use of the Eusebian apparatus, the important point is really not the place in which Eusebius wrote, but the place in which Carpianus, to whom it was sent, received it. Now, our ignorance as to Carpianus is complete. He may have been a Caesarean, or he may have been an Alexandrian, or Byzantine: we know nothing about him, and therefore when we are discussing the provenance of the Codex Sinaiticus we have really not much more right to use the Eusebian canons as an argument in favour of Caesarea than we have to use the Ammonian sections, which are traditionally ascribed to an Alexandrian scholar, as evidence for an Egyptian origin. It must also be noted that the Caesarean theory has gained additional attractiveness from the hypothesis so often put forward, that the Codex Sinaiticus is one of the MSS. which Constantine instructed Eusebius to have made for Constantinople.¹ But it should be observed that this theory is not confirmed by the fact that the MS. was in the library at Caesarea—not in Constantinople—in the sixth century. There is also a further point which may be regarded as counting against Caesarea. In the note attached to Matt. ii. 15 a scribe contemporary with the MS., and working on it before it actually issued from the scriptorium, has given Numbers (*b ipiQpoty* as the source of the quotation *Alyvimv* órdXetra roí* vlón pov. Prof. Burkitt has pointed out to me that this reference is probably to Num. XXIV. 8 [Ô] ζζyyiprev avrbv i(Alynnrov. Now according to cod. 86s the Hexapla at Hos. xi. 1 had the note rovry ^pjaaro o MarFaibç, ζ\$ ovrwç c'ovros SifXopóri rov 'E^xúkov ζς «ai ó 'AicvXaç TjpiTjvcvae.⁸ One may say with some certainty that the Hexapla is here implicitly criticizing and correcting the exegetical tradition preserved in the Codex Sinaiticus. The question therefore arises, whether this tradition is likely to have been preserved in a MS. made in the scriptorium of the library of

which the Hexapla was the most treasured possession? The answer is obvious, and, so far as it goes, this point is distinctly against the theory that the Codex is a Caesarean MS.

No doubt the problem of the provenance of the Codex Sinaiticus does not permit decisive solution; nevertheless after weighing all the arguments I feel that there is much more to be said in favour of Alexandria, or at all events Egypt, than can be adduced in support of Caesarea. If one accepts this view, and desires to go on to guess at the occasion which led to the writing of so splendid a codex, it would perhaps be best to quote the statement of Athanasius in the *Apologia ad Constantinum*, cap. 4 (*Pair. Grate*, xxv, p. 600 c)

αλκκ^ε <rou (i. e. the Emperor Constans) owe epyaÿa, η pζvov orc 0l vtpi hv^tfitov iypa^ov avry <ar* ipov κοι iaxov tri &v iv rfi 'AXefavbpúf. ζre>koyi<rtur0aζ- irai orc irweria râv Giatiiv rpa^ûv KeXcvavroî avrov poi naraanevÁrtu, ravra votaras átrcarcUa. This must have been about a. d. 340, and it is a not impossible date for the MS. The Eusebian canons were by that time no doubt in existence: nevertheless, attractive though this guess is, I am unable to regard it as quite probable that Athanasius¹ would have used the work of so doubtfully orthodox a critic as Eusebius. Moreover, the suggestion is clearly untenable if Rahlfs' view be accepted as to the date as well as the provenance of the Codex Vaticanus, which, as we have seen, ought probably to be regarded as belonging to the same place and time as the Codex Sinaiticus, for according to his view the Codex Vaticanus is not earlier than 367. Personally, however, I do not regard his theory to be as cogent with regard to the date as it is to the provenance of the MS.

Even, however, if this connexion between Athanasius and the Codex Sinaiticus be given up as a guess which is too uncertain to render its consideration desirable, it remains true that all the arguments from history, criticism, palaeography, and orthography combine to give to the view that the codex is an Egyptian MS. of the fourth century a probability which cannot be approached by any other theory. It would be too much to call it certain: but short of this it may fairly be regarded as the hypothesis which ought to be used as the general basis of any discussions as to the critical value of the Codex Sinaiticus.

¹ Though it is true that 'Euthalius' used the *Chronica* of Eusebius and dedicated his work to Athanasius.

¹ *I'ila Constantini*, iv. 36-7.

¹ See Field, *Hexapla*, ii, pp. 957 f.

* The LXX has *Alynnrov jmtaXtoa rà r<«ra avrov*. It is therefore not surprising that the quotation was not recognized by a generation which never thought of looking beyond the LXX.

DESCRIPTION OF THE CODEX

The technical description of a manuscript ought logically to begin with the binding—the first thing to catch the eye of the observer—and thence to work through the various questions concerned with the vellum, the ‘make-up’ of the leaves, and the ink, to the more complicated problems of the differentiation of scribes and correctors. The Codex Sinaiticus, however, had lost its binding before Tischendorf discovered it, and therefore the only points to be discussed are those concerned with the vellum and ink, and the differentiation of the scribes and correctors.

THE VELLUM AND INK

The MS. is written on fine parchment made from the skin of some rather large animal—Tischendorf suggested an antelope, but in view of the manner in which this guess has been copied by successive writers on the text of the New Testament, and the certainty with which much repetition seems to have invested it in their eyes, it is perhaps not unnecessary to point out that there is nothing in the vellum to indicate an antelope rather than any other animal of the requisite size. It varies considerably in thickness: and the thicker leaves, which have generally preserved the writing better than the thin ones, are inclined to a yellowish tint. Many of the leaves are so thin that the writing from the other side is sometimes so plainly visible as to become confusing, and in a few cases the ink has eaten through the vellum so as to leave holes. As a rule, however, the vellum struck me as not quite so thin as that of the Codex Alexandrinus, and to have consequently suffered somewhat less from erosion.

The edges of the leaves have been slightly trimmed since the time of the C correctors; this can be seen, for instance, on f. 49 recto. So far as it is now possible to discover, there is no writing on the edges of the closed MS.

The Codex was prepared for writing in the usual way by rulings to regulate the lines and columns. There are, apparently always, 48 lines, and each of the four columns is regulated by a vertical line on each side. The prickings which were always made at the edge of the leaves as a guide for the preparer of the vellum have been cut away, but in a few places a mistake seems to have been made by the preparer of the vellum, and a line of prickings can still be seen in the middle of the first column of writing.

The gatherings into which the sheets of vellum were made up are as a rule quaternions of four conjugate leaves, but *αψ* (in Luke) has only seven folia, *ν* (the end of the Gospels) and *ϰλ* (in Barnabas) have six each, and *Ϸα* (the end of Barnabas) has only two.¹ Each gathering appears to have been signed in a dull red ink at the top left-hand corner of the first recto by a hand which was probably contemporary with the MS. It is therefore likely that these signatures ought to be reckoned among the work of the scribes who were employed in the original scriptorium, though there is no proof that this was the case. Most of these signatures have been cut off, but traces of them can be seen in the Epistles and later books. The best specimen will be found on f. 86r. A later scribe, perhaps as recent as the eighth century (it is impossible to fix the period of isolated figures with even approximate certainty), has added fresh signatures in the right-hand top corner of the first recto of each gathering. It will, however, be noted that his numbers are less by a single unit than those of the original numerator, and in the older signatures the right-hand figure has consistently been erased; it can, however, still be read on f. 78r. Either the original numerator made a mistake—a supposition which is by no means difficult—or a gathering has been lost at

¹ These numbers are those of the recent *signatura*.

² Nothing is missing from this gathering: therefore the suggestion that the Codex contained something between Barnabas and Hermas falls to the ground.

DESCRIPTION OF THE CODEX

the end of the Old Testament; it is worth noticing in this connexion that the larger divisions in the Old Testament in this Codex always were made to coincide with the end of a quire. That is why the lacunae generally include whole books, e.g. Ezekiel, Hosea-Amos-Micah, Daniel. It does not appear possible that anything has been lost earlier in the MS., as the traces of the original signatures agree in the Old Testament with those of more recent date. Tischendorf also suggested that there may have been some additional matter between the Gospels and Epistles; but this is improbable, for such an addition would be unique, and the verso of the last leaf of the Gospels is blank.

The ink which the original scribes used is the usual sepia colour commonly found in ancient manuscripts. As Tischendorf says, it varies from an ashy but yellowish grey to a somewhat red tint. It presents no unusual features: the facsimile makes it appear too much of a genuine black. The ink used by the correctors A is the same as that of the original—doubtless it was the ink which was always used in the scriptorium. The ink used by B is a trifle darker than the original ink. C* and C_b used a reddish-yellow ink, which has usually remained very bright and clear. C' and C_e* used a greyer colour, and the later correctors used black. Red (vermilion) was used for the Eusebian apparatus, the earlier signatures to the gatherings, and in some of the 'Arabesques', for instance, at the end of Mark. All these are printed in red in Tischendorf's edition.

THE SCRIBES AND CORRECTORS

The Codex Sinaiticus has been corrected by so many hands that it affords a most interesting and intricate problem to the palaeographer who wishes to disentangle the various stages by which it has reached its present condition, and to distinguish the different scribes who have contributed to its development. The task really consists in identifying the separate writers, beginning with the latest, and ending with those who seem to have been employed in the original scriptorium, and to have been engaged on the preparation of the MS. before (if the anachronism may be permitted) it was actually published.

The correctors may best be divided into three groups:

(i) The late correctors, probably belonging to the post-

Caesarean history of the MS., and possibly to the monastery of St. Catherine's on Mt. Sinai. (2) The intermediate correctors, of which certainly the earliest, and probably all, belong to Caesarea. They are probably not earlier than the fifth nor later than the seventh century. (3) The early correctors, all probably belonging to the fourth, and certainly not later than the fifth century. The earliest of them was engaged on the MS. before it left the scriptorium, so that at this point the question of the correctors passes into that of the original scribes, and the amount of work which they bestowed on embellishing the text with superscriptions, tituli, and similar additions.

The latest correctors. To these Tischendorf, whose notation it is convenient to preserve, gave the names of E and D. E is a quite unimportant scribe who made a very few corrections in the text, perhaps in the twelfth century, and it is possible that the same writer added the notes in Greek and Arabic, on ff. 128^r and 130^{*}. If E be taken to mean not so much a single scribe as the latest stage of correction in the MS., it may also be used to designate the writers of a few names scribbled in the Old Testament—Hilarión, Dionysius, and Theophylact. Tischendorf thought that E might be regarded as representing mediaeval monks at St. Catherine's. This is a probable guess, but, as was stated above, there is no evidence as to the date when the MS. was brought to Sinai. D is a scribe of the eighth century, or later, who restored the writing in the prophetic books, but does not appear to have touched the New Testament. In Hermas, however, another scribe (D^{Hinn}) of much the same date and character added breathings and accents, and made a few unimportant orthographical changes.

Specimens of D^{HTM} and E will be found at the foot of the third column of Plate II.

The intermediate correctors. To these Tischendorf has given the name of C. Taken together they have done far more work on the MS. than any others, and afford extremely important material for textual criticism; as was shown on pp. vii ff. they represent a Caesarean scriptorium, for one of them who does not, however, seem to have touched the New Testament states that he corrected part of the text of the Old Testament according to the copy of the Hexapla made by Pamphilus during his imprisonment, and preserved in the library at Caesarea.

DESCRIPTION OF THE CODEX

In the New Testament the earliest of these hands, who also made the most corrections, is C*. This scribe wrote a clear but not beautiful hand resembling, but certainly distinct from that of the scribe who wrote the colophons to Ezra and Esther. Whether he used the same ink as this scribe is perhaps doubtful. At first sight it seems clear that the colophons in question are in a different colour, as they are faint and scarcely legible, but it is possible that this is due to some accidental circumstance, and in other places it is not easy to see much difference between the inks of the two scripts. In any case the ink is brighter and redder than that of the original MS. C* has been assigned to dates varying from the end of the fifth to the beginning of the seventh century. Dr. Kenyon inclines to the latter, and Dr. Hunt to the former view. He corrected the whole of the New Testament, as well as much of the Old, and Hermas, but omitted Barnabas; examples of his script will be seen in the last column of Plate II.

C_b might be judged from the style of his writing and the colour of his ink to have been a contemporary of C', to whose script, though easily distinguishable in passages of more than a few words, his own has a general resemblance. The most characteristic feature is the 'feathers' attached to the end of letters containing a vertical line. In the Old Testament he has, it seems, occasionally altered a correction of C*, and is therefore actually later, but it may have been only by a very short time, and the probability is rather that C_b, like C% belonged to the scriptorium at Caesarea. His corrections in the New Testament are confined to the Gospels; specimens will be found in the last column of Plate II.

Besides C' and C_b, who are the chief of the intermediate correctors, two other hands of the same or almost the same period can be discerned—C_c and C@*, to use Tischendorf's rather cumbrous notation. C' has taken the place of C* in Barnabas, and freely corrected the text. Specimens are given in the last column of Plate II, from which it will be seen that it is similar to the scripts of C* and C_b, though probably somewhat later. Tischendorf thinks that this scribe is also the writer of the sign (ζιπαίων) which has been sometimes added in the margin, especially in the prophets. C_c* is a somewhat similar hand which corrected the Apocalypse; it also belongs to much the same type as the other C hands, but is probably

xviii

a little later. Specimens are given in the last column of Plate H.

On the whole the C hands so closely resemble each other, and can with such little confidence be much separated in date, that there is considerable force in the suggestion that they all coiné from the scriptorium at Caesarea, and represent a thoroughgoing attempt to accommodate the Codex Sinaiticus to a model which in the fifth and sixth century was more fashionable than the original text.

The early correctors, and original scribes. The discrimination of these hands is the most difficult point in the palaeographical treatment of the MS. The clearest and simplest way appears to be to break off from the method, which has hitherto been followed, of starting with the most recent hands, and to begin by trying to establish the condition of the MS. when it left the scriptorium.

To the work of the scriptorium, then, obviously belongs the text itself; so that the first question of all is concerned with the scribes of the text. After the text comes the 'apparatus' of the MS.—superscriptions, subscriptions, tituli, paragraph marks, Ammonian sections, Eusebian canons, and other chapter divisions. These may or may not belong to the scriptorium. Finally, it is well known that it was the custom to submit MSS. to a *SiopŪtwi*, or correction: so that the earliest corrections may possibly belong to the work of the scriptorium, and the question is to what extent this can be shown to have or not to have been the case with the various hands which seem to have corrected the MS. in the earliest period. Thus there are three points to discuss, (1) The original scribes, (2) the 'apparatus' (3) the corrections properly so called.

The original scribes. At the first sight the whole Codex seems to have been written by the same hand; but a closer inspection shows that this is erroneous, and according to Tischendorf four scribes A, B, C, and D were engaged on the text, of whom A, B, and D are represented in the New Testament. In his *Nomina Sacra* (pp. 67 f.) Traube goes further, and distinguishes the A who wrote part of the New Testament from the A who wrote the historical books of the Old Testament and Barnabas, and the B who wrote Isaiah from the B who wrote Hermas and the other prophetic books. So far as B is concerned this must remain a question to be discussed in connexion with an edition of the Old Testament part of the

DESCRIPTION OF THE CODEX

Codex Sinaiticus. So far as A is concerned I am unable to see any difference of script, and in the absence of any such difference I should hesitate to accept the very minute differences of treatment of the *nomina sacra* as sufficient proof of a change of scribe. Reserving, however, out of respect to the opinion of so distinguished a palaeographer, the possibility that Barnabas is by a different hand, it is tolerably clear that A originally wrote all the text of the New Testament except Hermas, which was the work of B, and that D wrote the text on the conjugate leaves, ff. 10 and 15, 29 and 30, 88 and 91, and possibly on part of f. 126. Specimens of these three scripts, A, B, and D, are arranged side by side in the three first columns of Plate III.

There is possibly room for legitimate doubt whether Tischendorf was right in distinguishing A from B, but personally I entirely accept his judgement, for after the prolonged acquaintance with the style of A, necessitated by photographing each page, I felt while watching the script 'come up' on the negative in the developing dish, that the first page of Hermas was different from the others, as it seemed to 'come up' differently, though from the nature of the case I did not know until afterwards which this particular plate was. The same thing was still more noticeable in the case of the D plates. It would, however, be too much to claim that this purely personal experience ought to weigh strongly in the judgement of others, and I admit both that I am unable to analyse satisfactorily the difference between A and B, and that it is not so clear to my own perception now as it was when I was spending the greater part of each day in the company of the MS. Nevertheless, it seems to me that if any one will spend some time in turning over a few leaves of Hermas, and then a few leaves of the rest of the New Testament, he will feel that there is a difference of script, and, if he concentrate his attention on the right-hand end of the lines, he will receive the superficial impression that more lines end in the horizontal stroke representing final -N in Hermas than elsewhere. Analysis will, however, show that this is not the case, or at all events not to any remarkable degree. The impression is solely created by the fact that the strokes in Hermas are longer, somewhat heavier, and instead of being partly over the final vowel, are inclined to begin after it, and to project far into the margin. This is no doubt

a small point, but it goes to justify the view that Hermas was written by a different scribe from the rest of the New Testament.

The discrimination of D from A and B is easier and admits of no reasonable doubt. There is a distinct difference in the script, though it is more easily perceived than described; possibly the letters are somewhat squarer in D than in A—the height being less in proportion to the breadth—and D is altogether prettier than A. But the decisive point is that D constantly fills out the end of a line with the sign >, which is rarely or never used by A or B. A specimen column of D is given in the third column of Plate HI. It was D whom Tischendorf identified with the scribe of the New Testament in the Codex Vaticanus; a specimen of the latter is shown in the fourth column of Plate III, and it will probably be at once conceded by those who compare this with the third column, which is by D, that there is no trace of justification for Tischendorf's theory. The wonder is that the fine eye, which saw the difference between A, B, and D—differences which any one might be excused for overlooking—could ever think for a moment that the script of D was identical with that of the Codex Vaticanus.

The conjugate leaves written by D are clearly 'cancel-leaves*'; that is to say, they were written after the MS. had been completed, in order to take the place of others, written no doubt by A, which were for some reason imperfect or spoiled. Such replacing of rejected leaves would naturally form part of the work of the scribe in the scriptorium, and that this was the case is rendered practically certain by the fact that D actually wrote the whole of Tobit and Judith in the Old Testament, so that he was clearly a member of the scriptorium. The importance of this point is that it shows that any work done on the MS. before the 'cancel-leaves*' were added must also be regarded as work done in the scriptorium, and it is convenient at this point to indicate the details of which this can be proved, (a) The Eusebian apparatus must have been added before the cancel-leaves in Matthew (ff. 10 and 15), as these leaves, and these only, lack the Sections and Canons. Thus the scribe who added the Eusebian apparatus belonged to the scriptorium. (b) Similar reasoning shows that the scribe who added the *trilxoi* in the Epistles belonged to the scriptorium, for, after the Epistle to

DESCRIPTION OF THE CODEX

the Romans, these are only omitted in i Thessalonians, the last page of which is one of the cancel-leaves (f. 88).

The apparatus. This may be defined as consisting of: (i) Superscriptions added at the beginning of each book, and afterwards inserted either on each recto, or distributed on the 'open page' between verso and recto, or, in the Gospels especially, on alternate 'open pages'. (2) The subscriptions at the end of each book. (3) The Eusebian apparatus in the Gospels. (4) The Paragraph marks in the Gospels, (5) The 'Euthalian' chapter divisions in Acts. (6) The *tituli* or chapter headings in Acts. (7) The reckoning of orixot at the end of the Epistles.

The questions in each case are whether the scribe belonged to the scriptorium or not; if he did, whether he can be identified with the scribe of any other part of the MS., and if he did not, to what date he ought to be assigned.

(1) *The superscriptions.* A full selection of these specimens is given in Plate I. It will be easily seen that there is great variation in the style, and that this variation is not regular. The scribe or scribes seem sometimes to write in small and sometimes in large letters on no fixed plan. This creates at first sight the impression of diversity of hands; but further study dispels this view, and leads rather to the conclusion that Tischendorf was right in assigning all the superscriptions to the original scribe D, except those in Hermas, which seem to be by B, the scribe of the text. That the scribe was D rather than A is shown partly by the general impression made on the eye, partly by the fact that the superscriptions are not wanting on the cancel-leaves written by D, where they are precisely similar to those on the other pages, and partly by their resemblance to the subscriptions written by D, and their difference from the subscriptions written by A. The most convincing proof that only one hand has been busy with the superscriptions is seen if instead of looking at the specimens given in the order in which they are arranged (that in which they come in the MS.), they are taken in the order of gradation of change of style. Take for instance the following series:—Luke (29), Mark (18v), Matthew (1r, 12r), Matthew (2r), Romans (62r), 1 Corinthians (69r), 2 Peter (124r), Ephesians (82r), i Thessalonians (87*), Colossians (85*), Hebrews (92r). Is it not impossible to say that any one of these is in a hand other than that of the example preceding or following? Is it

not rather almost certain that they are all by the same scribe? Nevertheless if we had only the first and the last of the series, there would be grave doubt as to the identity of the hands. As it is, the only example which really seems to differ essentially is 2 Thessalonians (89r); this really causes hesitation, and it is possible that it was omitted by accident by D and added later by another scribe, who may equally well have been working either inside or outside of the scriptorium.

A further conclusion follows from a consideration of the examples given in Plate I. Just as at the top of the series, if it were arranged in order of gradation of style, there would appear specimens in bold uncial, resembling closely the ordinary hand of D in the text, so the middle and end of the series supply specimens equally closely resembling the corrector A2. This suggests that the scribe D is identical with the corrector A*, and, as will be shown when the correctors are discussed, there is other evidence to corroborate this view.

(2) *The subscriptions.* These afford less room for doubt than the superscriptions. All of them were written by A except those to Mark and i Thessalonians, which come on the cancel-leaves written by D. Tischendorf, it is true, also regarded the subscription to John as written by D, together with the whole of the last verse of the Gospel, but an inspection of the subscription (given in Plate I) will probably suggest to most minds that there is on the contrary a close resemblance to the style of A, but not to that of D. Tischendorf argued that there was a change of ink visible at the beginning of the last verse. This is naturally too small a point to be observable in a photograph. My own impression is that the scribe took a fresh dip of ink, and possibly mended his pen, but I can see nothing more, and in general I should have said that A and D used precisely the same ink, and held their pens at precisely the same angle, so that no valid argument can be based on the minute variations of form, which may quite as probably be due to an alteration of posture by the same scribe as to a change of writers.

(3) *The Eusebian apparatus.* This is added in red, by a hand which is shown by the argument given above (p. xix) to be anterior to the cancel-leaves of D, and therefore to belong to the scriptorium. Whether this scribe can be identified with any of the original scribes or correctors is doubtful: it is impossible to decide definitely as the numerals do not afford

DESCRIPTION OF THE CODEX

sufficient evidence. I suggest that he should be called †Scribe E

(4) *Paragraph marks in the Gospels.* An attempt has been made in the first seven pages of Matthew to indicate the ends of paragraphs by inserting a short horizontal line, sometimes bifurcated, between the last line of one paragraph and the beginning of another. Either the same or nearly the same system is found in Codex Vaticanus, but with somewhat fewer paragraphs. In the absence of any other clue it is difficult to say whether these lines belong to one date rather than another. An interesting discussion of their possible meaning in the Codex Vaticanus will be found in Dr. Schmidtke's *Die Evangelien eines alien Unzialcodex,* and in the correspondence between him and Prof. Eb. Nestle in the *Theologisches Literaturblatt* in 1903.

(5) and (6) *The chapter divisions and 'tituli' in Acts.* The †Euthalian' chapter divisions which are given in the first part of Acts—they stop at 3—are added in a small neat hand which must in any case be very early, and cannot, on palaeographical grounds, be regarded as later than the MS. itself. The impression made on my own mind is that these numbers were added by the same scribe as added the †tituli' or chapter headings in Acts. The relation of these chapter headings to the chapter divisions is a problem which ought to receive attention from textual critics: it is here, however, out of place to do more than draw attention to the obvious fact that neither system is complete. There is also room for doubt whether all the †tituli' were written by the same scribe: the curious way in which *p* is sometimes written raises suspicions that two hands have been at work. I am inclined, however, to think that this curious letter is a peculiarity which the scribe only sometimes used, especially since in some of the †tituli[†] both the ordinary and the exceptional forms of *p* are found. Moreover, a comparison of the writing in the 'tituli' with that of the corrector A* suggests strongly that he was the scribe who wrote them. If this be so, and if the writer of the †tituli[†] were also responsible for the chapter numeration, this part of the apparatus, like the Eusebian canons, is brought within the scriptorium.

(7) *The <mix>i in the Epistles.* These are added in a small neat hand, which does not seem to be identical with the

corrector A*, but to have more affinity with A*. As was shown above (see p. xix) the evidence of the cancel-leaves shows that these <mix> were added in the scriptorium; if, therefore, their scribe were identical with A4 this would bring his corrections (of which there are but few) within the scriptorium. In spite, however, of the affinity between the *orixol* and the corrections of A4, I doubt whether they are really due to the same scribe: A4's style seems to be somewhat stiffer. I suggest that the writer of the cm'xoc should be called †Scribe S*.

The correctors properly so called. (1) *The uncial corrector A* In many places the text of the Codex Sinaiticus has been corrected by a scribe who used uncial script, clearly intended to resemble the original writing as nearly as possible. Some of ihçse corrections seem really to be in the same hand as the text; some vary slightly from it, but so slightly that they are clearly contemporary, and probably belong to the &,óρθωσις made in the scriptorium. Tischendorf ascribes them as a rule to the original scribe D: this is quite possible, and in some cases extremely probable, as the scribe has added at the end of a line the > which is characteristic of D (see p. xix), but it must be remembered that corrections made in *rasura* are almost impossible to handle with certainty, as the inferiority of the surface reacts unfavourably on the writing. Thus it is possible that A1 ought to be divided into two or more hands. A small selection of illustrative places is given in the first column of Plate II. Attention should especially be directed to the second specimen, which shows the > at the end of a line, and the third and fourth specimens should be compared with the rest. Are they a different hand or not?

The corrector A.* By far the greatest number of corrections of early date were made by this hand, the main characteristics of which are an alternation of large and small letters—not, however, by any means always equally marked—and the frequent use of a curious form of *o* in which the middle line is greatly elongated so that it becomes *o*. That this scribe belonged to the scriptorium is rendered probable by the superscriptions and †tituli' in Acts, which seem to show that A* is identical with the original scribe D (see p. xx). It appears, however, that he did his work as corrector before the superscriptions were added, as in 1 Corinthians the superscription is on f. 73r forced to one side by a correction in the hand of A2 which has already occupied the place where it ought to have

[†] The codex referred to is the archetype of MS. Paris. Nat. Gr. 97 (Cod. Evan. 579, or in von Soden's notation, < 376).

DESCRIPTION OF THE CODEX

been. If this superscription be compared with the correction, doubt will be felt as to the identity of the hands, but further study of other superscriptions and corrections will be enough to show that probably both were written by the same hand, though the scribe varied his 'stroke'. This passage is interesting as suggesting that it was usual in a scriptorium for the Swptfwnc to correct the text before the titles, subscriptions, and similar details were added; it also supports Dr. Dziatzko's contention that the custom of adding superscriptions began in the second half of the fourth century, and at first were not put in by the original scribe (see p. xiii). A further illustration of the same point is perhaps afforded by the first example classified on Plate II as doubtful. Here the scribe who added the Eusebian apparatus has placed the appropriate numerals against a correction in the lower margin. It is, however, doubtful whether this correction is from the hand of A', and there are in any case two possibilities; (i) that the correction was made before the Eusebian scribe did his work, (2) that the Eusebian scribe noticed that the beginning of his section was missing, and himself added it in the margin, affixing the proper number. I am inclined to think that the second is the correct view, as the writing of the correction seems to me to be identical neither with A' nor with A3, to both of which it has superficial resemblance. In this case we have in this correction a specimen of the writing of the Eusebian scribe: it is doubtful whether there are any others, though it is of course possible that some of the many corrections, which are too short to enable us to identify the hand, may be due to this scribe.

Tischendorf thought that he had found a convincing proof of the identity of A_g with the original scribe D in the correction to Matt. v. 45 (f. 3r), given in the second column of Plate II. Here the large uncial ends with the incomplete sentence «³ apex*| «"• and the missing words—Siwuoç HêlKovç—are supplied in smaller letters. The smaller letters are certainly in the hand of A', and Tischendorf thought that the larger letters are in the hand of D. But there is not, in my judgement, any reason for thinking that he was right; there is no real difference in the style, and in any case D's script is so nearly the same as A's that these words afford no means of deciding between the two hands. Moreover, his argument that no one would break off in the middle of a sentence with cm is

xxii

not sound: scribes were, and are, capable of any mistake, and an example of the same breaking off is to be found on f. 70^r, col. 3 (see Plate II, col. a), where the original scribe wrote h f y n h h Am and then went to the next line, ch te» &c., omitting the rest of the word ζ«arot. Nevertheless, that Tischendorf was right in identifying A* with the original scribe D is, I think, suggested clearly enough by the evidence of the superscriptions, and a true example of the kind he sought in Matt. v. 45 can be found in Jo. xix. 4 (f. 59^r, col. 3), where the correction ovSe/uw oATiav wptVK<o is written in a combination of large and small letters resembling the style of the scribe D and the corrector A1 respectively (see Plate II, col. 1).

A* must therefore be regarded as a script used by the original scribe D as an alternative to the large regular script of the text. Furthermore it is plain that the same scribe was the Stop^wnfç of the MS., but if the argument given above be sound, he probably did not add the Eusebian apparatus. Moreover, it will probably be agreed on the ground of general appearance that he was not the scribe who added the <rix0(and this view is rendered practically certain by the absence of the crtxoi from f. 88, which was written by D.

It will be convenient at this point to summarize the scribes who have so far been shown to have been working in the scriptorium, for none of the other early correctors can be proved with certainty to have belonged to it. The list is:—

- Scribe A, wrote the greater part of the text, and subscriptions.
- Scribe 6, wrote the Shepherd of Hennas.
- Scribe D, wrote the cancel-leaves, and superscriptions.
- Corrector A', probably identical with scribe D.
- Corrector A8, almost certainly identical with scribe D.
- Scribe E, the writer of the Eusebian apparatus.
- Scribe S, the writer of the orix04

All these writers worked on the MS. before it left the scriptorium. It is highly probable that the same is true of some of those which remain to be considered, but evidence is not forthcoming.

The corrector A\ A considerably smaller number of corrections have been made by a hand which cannot for any palaeographical reasons be regarded as later than A', but is clearly distinct from it. It is not marked by any alternation of size in the letters, or by the curious of A1, and is much

DESCRIPTION OF THE CODEX

addicted to monograms, or combinations of several letters into one form, such as H for HN. Possibly this scribe belonged to the scriptorium, but there is no definite proof that such was the case, unless it be thought that he was the scribe of the correction to which the Eusebian scribe affixed the number (see above, and cf. the first of the 'doubtful' examples in Plate II). At one time I was inclined to think that this was so, on the ground of the 'monogram' in this correction, but further consideration has made me think that this is probably not the case. Thus it remains uncertain whether A₃ belonged to the scriptorium or should be regarded as one of the earliest hands who touched the MS. after it had been 'issued'. Examples are given in the second column of Plate II.

*The corrector A**. There are only a very few corrections by this hand. It probably belongs to the fourth century, but according to Dr. Kenyon's judgement might possibly be a little later than the scribes hitherto mentioned. It is marked by an extreme regularity and neatness (see the fourth column of Plate II).

The corrector A₆. This scribe, easily distinguished by his graceful style, and the curious shape of his £, only made a few corrections. He is no doubt contemporary with the MS. or nearly so, but there is nothing to show whether he did or did not belong to the scriptorium. Examples are given in the third column of Plate II.

A "". Possibly distinct from all the other A correctors is one who seems to have acted as the ὀφθωρῶς of Hermas in a small delicate hand. Examples are given in the third column of Plate II.

All the scribes hitherto dealt with belong to the A group which Tischendorf regarded as belonging to the scriptorium. In some places he expressed himself in such a way as to give the impression that he meant A—the H* of the critical Greek Testament—to refer to a single scribe. This he certainly did not really think, and he only omitted to define the facts more clearly because it is so often impossible to say to which of the group any given correction belongs, even though it is plain that it is not to be assigned to any later hand.

Outside the pure A family come the scribes known as A*₁, B, and B*. They differ from those which have been already treated in that they probably do not belong to the scriptorium. They are, however, not much later than the

A group—the fifth century is the latest date to which they can be assigned—and they may be regarded as representing the corrections of some of the earliest owners of the Codex.

*The corrector A***₁*. This scribe, who, as his title suggests, used sloping characters, is quite unimportant. He only made a few casual alterations; Tischendorf only classed him in the A group because his is a clearly early hand, and he used ink which is indistinguishable from that of the A correctors. Specimens of his script can be seen in the fourth column of Plate II.

The corrector B. Far more interest attaches to the work of this scribe, whose writing is chiefly distinguishable from the A group by a slight difference of tint, which is not discernible in a photograph. He was contemporary with the A group or nearly so, and was chiefly interested in small points of spelling and scholarship. On the first pages of Matthew he made frequent corrections which are very important for the history of the orthographical tradition as to proper names, but his interest soon declined, and his hand is not found outside the first Gospel. He may very well have been a scholarly owner, who had strong opinions as to the proper way of spelling the names of the Patriarchs and Kings of Israel. Tischendorf gives a full list of the corrections; it is exceedingly difficult to see them either in the facsimile or in the MS., but there is not, I believe, any reason for doubting the correctness of his judgement. With great trouble I succeeded in verifying in the MS. all the corrections which Tischendorf indicates on f. i. So far as I can judge the facsimile is not more obscure than the MS., except in so far as in a MS. the sense of touch often helps to detect erasures, or the erosions of faded ink, and this is of course impossible in a photographic facsimile. It may, however, be thought with some probability that the MS. was in a better condition when Tischendorf first saw it than now. The Imperial Library at St. Petersburg is no doubt in every other respect an infinitely better home for a MS. than the convent of St. Catherine, but on the important matter of climate one may suspect that the advantage is with Sinai. Specimens of B are given in the third column of Plate II.

*The corrector B**. This symbol was used by Tischendorf to indicate a few corrections in a hand which cannot with certainty be identified either with B or with any of the A group.

DESCRIPTION OF THE CODEX

The colour of the ink resembles that used by the A group, and the script that of B. It is not important, but cannot be much if at all later than the MS. Specimens will be found in the third column of Plate II.

The following table may perhaps be useful as a summary of the results, with regard to the provenance, genesis, and history of the MS., which the foregoing discussion has rendered probable :—

Saec. IV. In a scriptorium in Egypt

Scribe A wrote the New Testament including the Subscriptions, Scribe B wrote Hermas, Scribe E added the Eusebian Apparatus, and Scribe S added the *οτιςκι* to the Epistles. Scribe D (=» corrector A1 and (?) A') added the superscriptions, and probably the 'tituli' in Acts. He also wrote cancel-leaves for eight folia, and (using

a smaller and different type of hand when necessary) acted as Diorthotes of the whole. He omitted to do the work of scribes E and S on the cancel-leaves. The rest of the 'A' group of correctors probably also belong to this period and place, but this is uncertain.

Saec. IV-V. In a locality which is unknown.

Scribes B, B*, and A0***, and possibly some of the doubtful members of the A group, worked on the MS., whether in the same or another scriptorium cannot be ascertained.

Saec. V-VII. In the monastery at Caesarea.

The MS. was corrected by the group of C correctors, C* Cb Cc Cc* Cp''pU, and possibly others.

Saec. VIII-XII. Possibly on Mt. Sinai.

At least two correctors, D and E, made unimportant and fortunately few corrections.
